

THE ECONOMIST

"Were all nations to follow the liberal system of free exportation and free importation, the different States into which a great continent was divided would so far resemble the different provinces of a great Empire. As among the different provinces of a great Empire the freedom of the inland trade appears, both from reason and experience, not only the best palliative of a dearth, but the most effectual preventative of a famine, so would the freedom of the exportation and importation trade be among the different States into which a great continent was divided."—ADAM SMITH.

Economic Danger Signals

BY material standards, Great Britain is amply blessed in this Coronation year, 1937. The statesmen of the Empire, now assembling from east and west and south and north, will be the guests of a country where more men are at work than ever before, where earnings and national purchasing power are still rising, and the volume of industrial production is the highest on record. It is expedient that they should understand the true causes of Britain's prosperity, since they will be called upon to take decisions which may have a far-reaching influence on its duration. Such an understanding will be not only desirable, but absolutely essential if, in fact, the situation is far less simple and the outlook much less unclouded than appears at first sight.

When Imperial statesmen were last in conference, at Ottawa in 1932, the essential steps had been taken which were to bring about Britain's economic recovery, though their effects had hardly begun to be revealed. Undoubtedly, the Government's policy of orthodox finance and balanced budgets made a substantial contribution to trade revival, by maintaining a favourable psychological background for business enterprise. Unfortunately, however, State intervention went much further, and has saddled the country to-day with a long list of measures of avowedly restrictive character. Old tariffs have been raised and new tariffs imposed on a wide range of commodities—raw, semi-finished, and manufactured. Import quotas have been set up for agricultural products, and international restriction agreements for essential raw materials—notably rubber and tin—have been buttressed by Colonial legislation

passed at the instance of the Home Government. Some of these measures were, perhaps, defensible in an emergency, as being in the nature of a crutch, which an invalid might discard on regaining health and strength. Others, however, were able to creep, intrude and climb up into the economic fold for no better reason than that the public is proverbially tender towards producing interests in time of adversity. The majority, however, had one point in common—that they were devised to meet the supposed needs of a period of sharply contracting activity and falling prices.

It is particularly important to remember this fact now, since the fundamental conditions have radically altered. Within recent months an extensive programme of public works, concealed under the name of a re-armament programme, has been superimposed upon peace-time industrial production in Great Britain at a time when the latter is not depressed, but is running at a high cyclical rate of activity. Both these horses are fast runners, and there is a serious danger that they may collide in the straight. This danger is now widely recognised. It is not the fault-finding complaint of political malcontents, but is shared by circles predisposed to believe that Conservative government and sound progress are synonymous and inseparable. Even *The Times*, which has certainly not been hypercritical, hitherto, of the policy of the present Government, has uttered a warning, this week, of the potential consequences of such a clash. Already, wholesale prices are rising at an alarming rate. Compared with only twelve months ago, our index number shows that, on the average, cereals

and meat have risen by 22 per cent., other foods by 15 per cent., minerals by 26 per cent., and textiles by 15 per cent. The expected rise in the price of bread to the highest figure for nine years shows how the increase in wholesale prices is affecting the cost of living.

In the second place, a serious shortage of skilled and even semi-skilled labour is developing in certain key industries. At a time when unemployment appears to have fallen to a hard core of $1\frac{1}{2}$ millions, the engineering, aircraft, automobile, electrical and shipbuilding industries are unable to obtain all the labour they require. Three years ago short-time was widely prevalent; to-day, overtime is being extended and the trade unions are being urged to relax their restrictions on apprentices and trainees. The unions, in their turn, are demanding higher wages, and sporadic strikes have already occurred in some branches of industry—not excluding the armament trades. Production of numerous goods for civil demand, such as automobiles, domestic wares, constructional steel and machine tools, is being damped down; and deliveries are being postponed for as long as a year ahead, in order to satisfy prior demand for armaments. The steel industry, operating at full capacity for the first time since the war, cannot meet current requirements, and prices have risen sharply. In certain industries to which, normally, export trade is particularly important—especially coal, steel and engineering—foreign orders are being refused or deferred because even the requirements of home consumers cannot be satisfied.

The coincidence of re-armament with a peace-time boom must clearly produce many stresses and strains in the industrial system, even if normally corrective forces are allowed free scope. But if their operation is deliberately impeded, the evil consequences of an inflationary boom and its disastrous aftermath may be inevitable. These tendencies, dangerous as they are, have yet to manifest their more extreme economic consequences. There remains a period during which the policy of statesmen may mitigate, or even avoid them, but that period is limited. Before it expires, the first task of the Empire's statesmen in London should be earnestly to

consider how far existing impediments to the free flow of national and international trade—for whose imposition they or their predecessors must take a large share of responsibility—can be speedily alleviated. They may rest assured that their efforts will evoke a sympathetic response in many quarters outside the British Empire. The direction of prevailing trade winds has been well indicated by the reception of Mr RUNCIMAN's tentative and almost secret hints at Washington, by the recent freer-trade initiative on the part of the Oslo group of countries and—last, but not least—by the visit of Mr NORMAN DAVIS to Great Britain this week.

Mr CHAMBERLAIN, speaking for the British Government, must now decide whether the raising of world prices remains, as it was at Ottawa, the keystone of Britain's commercial policy. On the answer to this question depends the further point whether the Ottawa system itself, with its complex machinery of tariffs and quotas on essential materials, and its jealous discrimination, should not be profoundly modified and not merely amended on bargaining lines. Inevitably, such a decision will pose the question whether a policy designed to raise the prices of domestic agricultural products and a system which allows steel producers quota facilities in a period of short supplies are reconcilable—to say no more—with the Government's interests as a large-scale consumer. Finally, the assembled statesmen of the Empire would do well to examine their actions as trustees for a large proportion of the world's resources of essential raw materials, and to ask themselves whether, in the changed circumstances of to-day, it is possible to justify any form of control which reduces the supplies available to the industries of the world even by a single ton. When prices are rising with frightening rapidity, and manufacturing industry is booming the world over—when, in short, the problem of the day is to protect the consumer from exploitation rather than to save the producer from ruin—the time has come for the complete reversal of all restrictive policies. They have outlived the crisis which brought them into being, and if they are long maintained they will prejudice alike economic recovery and popular welfare.

Anglo-Saxon Responsibilities

WE cannot tell what is going to happen to our world in the next few years. But there is at least one thing which we can prophesy with some confidence. When the drama has been played out to its close and judgment is being passed on it, the English-speaking peoples will find the largest entries opposite their names in the Recording Angel's book—for honour if the story has a happy ending, but for execration in the contrary event. We can be certain of this because this group of kindred peoples—and, above all, the two peoples of the United States and the United Kingdom—hold, between them, the fate of the world in their hands. And they do so however unwilling they may be to acknowledge the destiny that their fathers have bequeathed to them.

Friendship between able and energetic, but easy-going, peoples is not enough in the modern world. The British Commonwealth and the United States together command so vast a share of the world's total resources in man-power, machine-power, capital, raw materials and foodstuffs that, if they were ever to organise these immense powers in the service of one common policy for maintaining international law and order, they would be able with ease not only to ensure their own security but to police the whole face of the planet and frustrate the knavish tricks of every would-be aggressor.

The material means for performing this service for

mankind are actually at the English-speaking peoples' disposal. But in the light of what we have allowed to take place in the world since the end of the last war, this fact gives us no ground for self-complacency. Far from that, it gives the measure of our failure, so far, to act up to our responsibilities; and there are some aspects of both British and American foreign policy during these post-war years which, in moments of discouragement, might tempt us to conclude that we were already past praying for. There are the petty jealousies and rivalries—a legacy from the past, in which British capacity to snub has latterly been a good deal more conspicuous than American tail-twisting. Worse, there is the ignoble craving to take advantage of favourable geographical positions for the purpose of shirking a share in the world's common burdens and problems.

This is the gloomy side of the picture. Happily, we need not believe it to be the final record of the Anglo-Saxon rôle that will be stamped on the tablets of history. We may hearten ourselves by recalling what happened at the Washington Conference in 1921-22. That was an occasion on which Anglo-American co-operation was achieved on the grand scale in a large-minded way; and in these conditions it undoubtedly worked wonders. For a decade it kept the skies of a whole hemisphere clear of clouds. It is only, since Sir JOHN SIMON's failure to co-

operate in the same manner with Mr STIMSON, in and after the autumn of 1931, that the situation round the shores of the Pacific has gradually become as threatening once again as it was before LORD BALFOUR and MR HUGHES took things in hand at Washington in the autumn of 1921.

This week, Mr NORMAN DAVIS is arriving in London. PRESIDENT ROOSEVELT's Ambassador-at-Large is a large-minded and well-versed statesman with a great President, deeply concerned about the trend of world affairs, behind him. Is it too much to hope that he may find a British colleague of LORD BALFOUR's calibre? To-day, as in 1921, the whole question of naval armaments is in the melting-pot, and, as we show in a Note on page 10, Japan may unleash a wild naval arms race in which, willy-nilly, Britain and America will need a common policy. Now, as in 1921, the problem can only be solved by a statesmanship that sees the naval business in its wider economic and political setting and grapples in a generous spirit with the problem as a whole.

Meanwhile, the first task for the British Government is to clear away all those obstacles to the achievement of an Anglo-American understanding that lie on our British side of the fence. More than six months have slipped by since the Anglo-Franco-American currency agreement of September 26th. Yet its aspirations for freer trade among the democracies have not been followed up by our Government, despite French and American initiatives. The American Government has made no secret of its anxiety to cap its Trade Agreements policy by a treaty with the United Kingdom. But, if the reports are to be believed, the obstacles in the way of such a treaty are to be found in London. This is short-sighted in the

extreme, for, altogether apart from its direct importance to Anglo-American trade (which might well be small), an Anglo-American Trade Agreement would have a world-wide psychological effect. In its wake even the obstinate War Debt problem might yield to treatment.

In this and other ways we should have eagerly taken up the tentative yet unmistakable gestures in favour of freer trade that have been coming from the American and French side. It is common knowledge that Mr CORDELL HULL is a steadfast believer in freer trade—a believer who has patiently waited for time to tell in his favour. M. BONNET, also, a great worker in the cause of unrestricted commerce, has just been made French Ambassador in Washington, and is charged with discussing there the French debt to the United States and another international move for lowering trade barriers. That France would take this line has been evident since last autumn. When the time is ripening in America, is the harvest to be spoilt by chill winds from our side of the Atlantic?

Each of these issues is important and urgent in itself; but the main reason for grappling with them all is to clear the way for joint Anglo-American action in the world-wide fields. In an international situation more critical than that of 1921, it is possible for British and American statesmanship to repeat and surpass the miracle that was worked by Anglo-American co-operation at the Washington Conference. There are many fields in which miracles would be welcome, to-day. If the chance is now lost through pettiness or pusillanimity on either side, it will ultimately go hard with the English-speaking peoples. Unto whomsoever much is given, of him shall much be required.

Great Cities—VII

Belfast: Old and New

WHEN the indefatigable Arthur Young was in Ireland in 1776 he found Belfast "a very well built town of brick, they having no stone quarry in the neighbourhood. The streets are broad and straight, and the inhabitants, amounting to about 15,000, make it appear lively and busy. The public buildings not numerous or very striking."

At this time Belfast was at the opening of the first phase of its modern history. It had ceased to be of importance simply as a fortress some time in the sixteenth century, after taking its full share of the usual sieges and destructions of Irish history. In 1612 it was a hamlet of 120 thatched cottages, proud of a two-storey castle roofed with shingles. Its growth in the next couple of centuries was based mainly on its activities as a port, sending away linen and meat and bringing back consumption goods ("the imports of Belfast consist in rum, brandy, geneva and wines," wrote Young). A brown (i.e. unbleached) linen market with a market hall had been started in 1720, one of the earliest in Ireland, to replace the older fairs, which by then had become inconvenient for the growing scale of operations. Favourably situated for export to London and Chester and an important competitor of Londonderry for the transatlantic trade, Belfast already dealt with about two-thirds of the linen trade of Ulster, and was one of those lucky towns for whose especial benefit the Industrial Revolution appears to have been made.

The immediate stimulus seems to have been given, at this time, by the growth of Liverpool: all manner of goods were needed for the rapidly growing population of Lancashire. And when the great English canals were opened, Belfast, breaking the supremacy of Dublin as an exporter, could send her merchandise to the Midlands and right down to London by new and more energetic methods of trade. At the same time a Belfast man introduced cotton manufacture, partly as a philanthropic measure for increasing the variety of local industries. But the new trade grew with amazing rapidity, and within the next fifty years made the fortunes of Belfast, more than doubling its size and, in the process, the local linen bleaching industry.

This episode was soon over when the technical advantages possessed by the much larger area of Lancashire began inescapably to show themselves in the twenties of last century. Cotton weaving vanished, and few citizens now remember what Belfast owed to it. But the town's luck held—as the luck of Bristol did in a somewhat similar position—for at the same time, as one authority puts it, "improvements in transport, the growth of joint-stock banking, the spinning of fine yarns by machinery, and the use of steam power" brought the linen manufacture out of the villages into the industrial city, bringing with it a horde of weavers. Modern Belfast was thus born only a century ago.

Next to linen, at this time, stood the shipbuilding

industry. That too was a traditional occupation in the city. In 1636 a ship of 150 tons, no despicable size at the time, was built on the foreshore from timber felled from the surrounding forest, by a party of intending emigrants. Fifty years later Belfast merchants owned 40 ships; but it was not till 1791 that William Ritchie, a Scot, opened the first modern shipyard on Belfast Lough. Later the industry adapted itself readily to the use of steel and the introduction of steam power. And the Harbour Commissioners have always proved themselves an energetic and far-sighted body. In early times only small ships could reach the older parts of the city; for the channel was narrow and shallow. But it has been frequently widened and dredged in the last 150 years, and to-day the Lough boasts one of the safest harbours in the Kingdom. Many of our largest ships are built at Belfast, where, among other notable establishments, Harland and Wolff have their yards.

The third of Belfast's largest industries is rope-making, another occupation that can be traced far back in the city's rather meagre history. To-day one-half of the United Kingdom's twines is manufactured there. A fourth industry is the manufacture of tobacco; and then come the crowd of smaller products of every kind which are incidental to the activity of all great cities.

A visitor to Belfast shortly before the War would have found a busy industrial town of about 400,000 souls, with admirable communications with the rest of Ireland. He would have found the fine streets Arthur Young admired, but the same lack of any monuments of note—though he would have found plenty of large Victorian constructions, more imposing, perhaps, than beautiful. He would have seen a cathedral, a university, Victoria and Albert memorials and a more recent statue to Lord Kelvin in the Botanical Gardens. But he might have admired more the surroundings of the city, the ring of hills to the west, and the residential towns of the wealthier citizens pleasantly situated in the pretty country round the shores of Belfast Lough. He would, however, have been glad that efficient drainage had got

rid of the floods and epidemics for which the town had earlier had a bad record.

Revisiting Belfast twenty-five years later, the same traveller would have found a number of important changes. The industrial city has become, or is at least becoming, a capital city, with a population of close on half a million, more than a third of the whole population of Northern Ireland. Once again Belfast has enjoyed her full measure of luck. To some extent the rapid growth of her administrative importance offsets the depression of her main industries. The separation of the Irish Free State has hit her import trade. Shipbuilding has encountered the same depression in Belfast as on Tyneside, and though at present something of a boom is being experienced, long-range prospects are none too satisfactory. Rope-making is hit by the Australian tariff, though here, too, some revival has been felt; though technical advances have much reduced the employment offered. The growing popularity of fine cottons, artificial silk, and the mixtures of the two, and the loss of natural bleaching advantages with the growth of chemical science, form a very serious threat to the linen industry. There is an urgent and admitted need for a conscious re-adaptation of the city's life to these altered conditions.

Some progress has been made. The manufacture of constructional steel and locomotives has taken up some of the slack in the shipbuilding trades. An aircraft factory and an aerodrome point to a welcome readiness to explore the possibilities of changing technique. But the ultimate ways of escape seem largely to lie in raising still further the quality of the main products of the city—in improving, for example, the design of linen goods—and in developing a greater local demand for locally made articles of consumption. Belfast will progress further the more attention she pays to the efficiency and education and social life of her own citizens, the more seriously, that is to say, she takes her duties as a capital city. It is not often nowadays that a community is offered such a pleasant combination of duty and good business.

A Treasury Deficit

THE financial year 1936-37 has closed with a small deficit of £5½ millions. Three weeks ago, when we were discussing the prospects for the expiring year and the next Budget, it was still permissible to hope for a small surplus. But we added the warning that if expenditure continued at the rate reached by the end of February, the surplus would be converted into a deficit. The warning was timely. Expenditure on the Supply Services in the month of March was more than 45 per cent. higher than the average of the preceding eleven months. The lag in defence expenditure, which had invited comment earlier in the year, has evidently been removed in recent weeks.

The exact total of the deficit is £5,597,191. As in every one of recent years, however, it is necessary to explain that surpluses and deficits are defined, in British Treasury practice, on somewhat peculiar lines. The year's expenditure includes £3,127,270 of debt redemption, for which no provision was made in the Budget. If ordinary revenue be compared with ordinary expenditure, there is, in fact, a surplus of £7,630,079. Even this, however, is not a true surplus in any ultimate sense. At least one of the items on the revenue side (the "raided" balance of the Road Fund) should not strictly be regarded as current revenue, while the expenditure on interest on the National Debt does not include any provision for the interest on Savings Certificates which has accrued, but not been paid, during the last twelve months. In the year 1935-36 this item amounted to £9 millions and was probably no less in the year just ended. In the strict sense there was a deficit in the year 1936-37. The deficit was due in minor degree to a failure of the

revenue to come up to the estimates. The figures are as follows:—

REVENUE, 1936-37 (000's omitted)				
	Actual Receipts	Larger (+) or Smaller (-) than Budget Estimate, 1936-37		Actual Receipts 1935-36
Income Tax.....	257,237	-	1,763	+ 19,163
Sur-tax.....	53,540	-	2,960	+ 2,520
Estate, etc., Duties	87,990	-	1,010	+ 70
Stamps.....	29,140	+	2,140	+ 3,340
Other Inland Revenue	1,730	+	230	- 355
Total Inland Revenue	429,637	-	3,363	+ 25,093
Customs	211,282	+	3,757	+ 14,640
Excise	109,500	-	500	+ 2,800
Total Customs and Excise	320,782	+	3,257	+ 17,440
Motor Vehicle Duties (Exchequer share)	5,300	+	300	+ 323
Total Tax Revenue	755,719	+	406	+ 42,856
Post Office (net receipt)	10,970	-	286	- 700
Post Office Fund	100	+	100	+ 100
Crown Lands	1,350	-	...	- 10
Sundry Loans	4,550	-	450	- 384
Miscellaneous Receipts	24,601	-	649	+ 2,862
Total Ordinary Revenue ...	797,289	-	1,092	+ 44,369

All three of the main direct taxes fall short of the estimate—a fact which tends to show that the estimating

in the last Budget was less conservative than usual, as was suspected at the time. Sur-tax, in particular, seems to have been the subject of a somewhat optimistic expectation. Customs revenue is well above the estimate, assisted both by the expanding volume of imports and also, so far as *ad valorem* duties are concerned, by the rise in prices. Stamps also show a very healthy increase. The major responsibility for the deficit is to be sought in the excess of expenditure over the estimates:—

EXPENDITURE, 1936-37 (000's omitted)				
	Actual Issues	Budget Estimates 1936-37	Larger (+) or Smaller (-) than Final Estimates 1936-37	Actual Issues 1935-36
	£	£	£	£
Interest and Management of National Debt	210,873	- 13,127	- 13,127	- 661
Payments to N. Ireland	7,996	+ 496	+ 496	+ 792
Other Consolidated Fund Services	3,240	+ 40	+ 40	+ 2,409
Post Office Fund	421	- 179	- 179	- 706
Total Consolidated Fund	222,529	- 12,771	- 12,771	- 2,984
Army, Navy and Air Votes	186,072	+ 7,821	- 2,132	+ 49,123
Civil and Revenue Votes (exc. Post Office)	381,158	- 3,188	- 8,726	+ 6,107
Total Supply Services (exc. Post Office) ...	567,230	+ 4,633	- 10,858	+ 55,230
Total Ordinary Ex- penditure	789,759	- 8,138	- 23,629	+ 52,246
New Sinking Fund	13,127	+ 13,127	+ 13,127	+ 661
Total Expenditure...	802,886	+ 4,989	- 10,502	+ 52,907

Capital Market Anomalies

THE trend of interest rates, on the one hand, and the question of Treasury control of new capital issues, on the other, have been the subject of vexed discussion during the past three months. The slump in gilt-edged prices which followed the announcement of the financial details of the Government's re-armament programme has now been arrested; but Old Consols, which stood at 84½ at the beginning of this year, are now quoted at only 76½. By post-war standards, however, interest rates are still low, for the yield on Old Consols is about 3½ per cent., against over 4½ per cent. ten years ago. Meanwhile, the new capital market remains freely open to domestic industrial borrowers, but home municipalities and public boards must form a queue at the Bank of England, and borrowers who would remit funds abroad must run the gauntlet of a special Committee which, far from relaxing the severity of its control, has lately increased it by a process of progressive re-definition. What has been happening to this semi-bound and semi-free capital market during the past quarter? Which sections are active, and which are atrophied? How does the total volume of new borrowing compare with that of earlier periods of higher interest rates but greater freedom of action?

Direct light is thrown on all these questions by certain tabulations of capital market activity, which we have set out on the next page. Table I contrasts the total borrowing effected by direct offers of new securities to the public in the London market, under various heads, in the first three months of every year from 1928 to 1937. The conclusions suggested by these figures are striking. The total raised by direct public borrowing was approximately twice as great in the first three months of this year as the average for the corresponding period of the four depressed years, 1932-35, but it was only half as large as in the first quarter of 1929 or even of 1930, and only one-fourth as large as in the first quarter of 1928.

SELF-BALANCING REVENUE AND EXPENDITURE, 1935-36
(000's omitted)

	Actual Revenue or Expenditure	Larger (+) or Smaller (-) than Budget Estimate, 1936-37		Actual Figures, 1935-36
Post Office	71,880	-	64	+ 5,800
Road Fund	27,427	+	927	+ 1,652
Total	99,307	+	863	+ 7,452

It is obvious at a glance that the explanation lies in the heavy defence expenditure. In his Budget last April, Mr Chamberlain allowed £20 millions for Defence Supplementaries, but even this amount has proved to be nearly £8 millions too small. The expenditure on the Civil Services, on the other hand, has been more than £3 millions below the Budget estimate. Interest on the National Debt has also taken a fraction less than last year.

The deficit is not particularly encouraging to the taxpayer. On the assumption that the provision for the National Debt will remain unchanged, the Chancellor will have to find at least £36.2 millions more revenue in 1937-38 than in the year that has just expired. This figure will be increased in so far as he thinks it advisable to make provision for Supplementary Estimates. In *The Economist* of March 13th (page 517) we gave detailed reasons for believing that an increase of revenue of the order of £40 millions can be expected without any increase in taxation. In view of the rather disappointing performance of the direct taxes, however, it would be prudent to lower some of the estimates. Probably the closest approximation that the layman can make is that the Budget of 1937 will balance if there is no provision for Supplementaries. But the Chancellor will have to impose fresh taxation if he anticipates over-spending in any Department in the course of the year.

The British Government has been out of the market. Home corporation borrowings, which were a prominent feature a year ago, have this year been conspicuous by their absence. Between January and March last year, some eleven municipal or county authorities invited subscriptions of new money by prospectus; this year no solitary corporation prospectus has made its appearance. Last year, under the heading of borrowing by public boards, over £26 millions was raised by Treasury-guaranteed securities on behalf of British railways; this year, the only Treasury-guaranteed issue was the final tranche of less than £9 millions of the London transport electrification loan. Treasury control of foreign lending has been so stringent that not one penny has been raised by prospectus for use outside the British Empire. The one category which shows an increase as compared with a year ago is that of domestic issues by non-official borrowers—mainly home industrial companies.

The figures in the table, however, do not give a complete picture of the capital market. They take no account of the growing proportion of total borrowing which is effected, not by direct offer to the public, but by Stock Exchange "placing" after the granting of permission to deal. For the last three years we have made a supplementary calculation showing total borrowing under all headings. The results are given in Table II, with the proviso that, for technical reasons, the figures may somewhat exaggerate the volume of new securities actually taken up by the public.

Broadly, the comprehensive figures afford a more favourable comparison between total activity this year, so far, and that of the first three months of 1935 and 1936, respectively, than is suggested by our computation of "public offerings" above. But they confirm our conclusions as to the pre-occupation of the market with domestic industrial issues. Three-fourths of the past quarter's new money, under all categories, has been

raised for employment at home and four-fifths of the home borrowings have been mainly for domestic industry.

Although interest rates are still low, judged by pre-depression standards, there is some reason for the belief that the great bulk of *existing* long-term securities which are capable of being converted to lower interest in the near future, have already been so converted. Table III below shows that the British Government effected no conversion operation during the past three months, and that the volume of conversion offers by other bodies (including Dominion Governments, home and overseas corporations and domestic companies) receded still further this year from the peak figure recorded in the first quarter of 1935. The past quarter's total would, in fact, have been almost negligible, but for a special conversion operation which affected over £21 millions of debenture stocks of the Rhodesia Railways.

The public company, as distinguished from the public authority, has been much the most important force in the new capital market in the past three months. And the medium through which the greater part of new company offerings continues to reach the hand of the public is the ordinary share, rather than the preference share or the debenture, as Tables IV and V show. Ordinary shares have accounted for £18½ millions out of £33½ millions raised by direct company offers during the past three months. The predominance of the ordinary share is still more striking if the total be extended to include Stock Exchange "placings," for on that basis some 74½ per cent. of total company issues of £97 millions are shown to have been in the form of equity capital. On page 56 appear supplementary tables showing the distribution of new capital applications, in the first quarter of 1936 and 1937, between different groups of industries, and a list of the principal individual issues made in the last quarter. Taking the comprehensive "new basis" figures, the groups which have raised the largest amounts of new capital this year, so far, have been (in order of magnitude):—Manufacturing and Miscellaneous (a large residual group), (2) Exploration, Finance and Investment, (3) Iron, Steel, Coal and Engineering, (4) Breweries and Distilleries, and (5) Docks, Harbours and Shipping. These five groups together accounted for as much as 61 per cent. of the total company issues of the quarter.

TABLE I

TOTAL BORROWING BY DIRECT PUBLIC OFFER
First Quarter of Each Year
(Million £)

First Quarter of Year	British				Empire	Foreign	Total Issues	Index 1928 = 100
	Government	Home Corporations*	Others	Total Home				
1928 ...	85.8	1.0	47.6	134.4	21.6	13.0	169.0	100
1929 ...	1.9	0.3	55.9	58.1	26.4	12.4	96.9	57

1937 ...	0.3	8.9	28.8	38.0	5.0	Nil	43.0	26

* Including county and public board loans.

TABLE II

TOTAL BORROWING, INCLUDING "PERMISSION TO DEAL"
First Quarter of Each Year
(Million £)

First Quarter of Year	British				Empire	Foreign	Total Issues	Index 1935 = 100
	Government	Home Corporations*	Others	Total Home				
1935 ...	3.0	3.8	57.4	64.2	9.1	1.4	74.7	100
1936 ...	0.7	40.9	48.3	89.9	6.5	3.3	99.7	127
1937 ...	0.3	9.3	71.2	80.8	28.3	1.1	110.2	164

* Including county and public board loans.

On the whole, the quarter's results throw a somewhat discouraging light on the prospects of the new issue market in the immediate future. Its total activity remains sub-normal at a time of industrial prosperity, when money is still relatively cheap. It would be unfair to lay the responsibility for this condition wholly at the door of the Treasury. Trustee borrowers have sound reasons for holding off the market in a period of gilt-edged weakness. Many municipal corporations, again, are raising fair sums of money locally. The public investor will have ample opportunity to purchase new gilt-edged securities during the next five years, when the Treasury issues its re-armament loans; and in the meantime a certain damping down of local authority borrowing for capital works may not be wholly undesirable on general economic grounds.

From the investor's viewpoint, however, there is much to be said against a regime which discourages the best borrowers but leaves a clear field for the second best. The quality of a number of recent industrial issues has certainly been questionable. The larger industrial concerns are tending increasingly to finance themselves out of their own reserves. It is a striking fact that, while 69 companies combined to raise a total of nearly £22 millions, by public offering and permission to deal, in the Manufacturing and Miscellaneous group during the past quarter, only three made individual offers of £1 million or over.

In recent months, the typical new prospectus-issuing company has tended, too frequently, to be a small concern, of workshop rather than of factory size, whose shares cannot, in the best of conditions, enjoy a really free market. Its capital, nevertheless, has been split into preference and ordinary for "selling" reasons, and has been offered at prices discounting the results of a single favourable year, or even a broken period of less than a year. In this direction, the market's experience has come nearest to that of the boom year, 1928.

All things considered, the recent trend of the new capital market seems to suggest that if the higher authorities are determined to evolve a species of negative Investment Board by a process of elimination, it would seem advisable that the quality, as well as the geography of new borrowing, should be taken into official consideration.

Small Change

THE coinage of the modern world has had the good fortune to escape many of the complications of modern finance. With the development of the world's banking systems, coins, as such, have tended to be increasingly relegated to the rôle of small change. One result has been that every country in the world has abandoned the use of coins having a metal value equivalent to their face value, and has adopted a token coinage with a Government or State bank guarantee. Almost no coins now circulate, as they once did, outside the frontiers of the country in which they are issued. Few people realise how relatively recent and radical this change is, or how greatly it has simplified the problems of our present-day coinage.

These points are well illustrated by a book of surprisingly small size, in which Mr M. Comencini has recorded particulars of all the coins issued throughout the world since 1870.* Volumes of this nature are certainly no new invention. They have existed since the sixteenth century on the continent of Europe, and were originally designed to serve the needs of merchants who, in the course of business, regularly handled the coins of an infinity of different states. The majority of these coins differed both in weight and standard of fineness, and it was obviously desirable that merchants should have some guide to their value without having continually to employ the scales and the touchstone. The present book, naturally, claims no such lofty function and is mainly a collector's manual. Nevertheless, it provides the only comprehensive picture now available of present-day coinages, and it covers a particularly interesting period of final transition from a true coinage to a token coinage.

Although it is only since the War that the use of money worth its face value has been finally and irrevocably abandoned, a token coinage, in some form or other, has existed almost as long as coinage itself. The earliest Greek coinages were struck in electrum and silver, but at the end of the fifth century a copper token coinage was introduced for local use. The only reasonable way of using copper coins, indeed, is for token purposes, though, in fact, the first coinage issued by the Romans, the *aes grave*, was worth its weight in copper. Some denominations of these coins actually reached the size of six inches by four. The *aes grave*, however, was soon abandoned, and was replaced by a regular coinage of gold and silver, supplemented by a copper token series. Only once, subsequently, has the experiment of issuing a copper coinage of intrinsic value been repeated, when, in the eighteenth century, Sweden produced coins measuring up to two feet by ten inches!

For some time in the Middle Ages a true token coinage disappeared in Europe, when money became scarce and was seldom used for small transactions. On the Continent a number of base silver coins were issued for local use, but in England no base coins were struck, except for a short period in the reign of Edward III and at the end of Henry VIII's reign. The smallest coin current was always the farthing, which was frequently produced by cutting a silver penny into four. The Mint made less profit on the coining of small coins than on that of large coins, and it therefore issued few of them. Continual complaints were heard of a shortage of small change, and the deficiency was often met by the importation of base money from abroad. Queen Elizabeth was the first British sovereign to propose a true token issue, but though patterns for tokens were prepared, none were actually issued. In the reign of her successor, James I, however, the first regular token coinage was struck, in the form of farthings. Since that time a token coinage, legal or unofficial, has continuously existed.

* "Coins of the Modern World, 1870-1936." By M. Comencini. Methuen, 1937.

The farthings were regarded everywhere with suspicion, and English monarchs preferred that they should be issued under the authority of courtiers, such as Lord Maltravers or the Duchess of Richmond. Occasionally they bore apologetic legends, such as "for the relief of the pore" or "famulus nummorum." During the Commonwealth the issue was suspended, and private tradesmen all over the country illegally issued tokens of their own. Soon after the Restoration, however, a large coinage of copper half-pennies and farthings was issued. On these, Britannia appeared for the first time, and she has never since been ousted from her throne.

The final decision in England to abandon a silver standard came after a century-and-a-half of difficulties. These were, indeed, inherent in the system of bimetalism, introduced under Henry III, under which gold or silver was legal tender to any amount. From the first, fractional differences in the value of gold and silver as coin and as bullion had made it profitable to buy English coins at their face value and export them, somewhere or other, as bullion. In the late seventeenth century the problem was solved by allowing the golden guinea to have a fluctuating value in terms of silver. The guinea was first issued as a 20s. piece, and at once commanded a premium. During a crisis in the reign of William and Mary its value rose to 30s. It was subsequently reduced by stages to 21s., and there its value as a money of account has remained.

In the eighteenth century, with the guinea stable, the minting of silver became impracticable, since coins of full weight would have been worth more as bullion than as coins. In the reign of George III, indeed, the mint practically ceased to function. Coins in circulation became worn and clipped beyond recognition; and many lost as much as a quarter of their true weight. The Government finally was obliged to commit itself definitely to a gold standard, and to abandon silver, but at the outset it was unwilling to incur the odium of "debasement" the coinage. The first English official silver tokens were, in fact, issued in 1804 by the Bank of England under Parliamentary authority, and were inscribed "Bank Token." Only when they had proved themselves successful was a regal silver token coinage produced.

The process in England, whose main features we have described, has been repeated throughout the rest of the world. Even China, the last stronghold of the mediæval system, has now abandoned it. Until 1935, the Chinese silver dollar was worth a variable number of copper cents; it was liable to vary not only at different times but at different places at the same time. So complicated has been the money system of modern China, indeed, that Mr Comencini has devoted 48 pages of his book to its presentation, whereas he has covered the entire British Empire in 34 pages.

To-day, the great majority of countries have adopted a decimal coinage. Britain, however, remains intransigent, and shares the honour of non-adherence to the decimal system with Afghanistan, Albania, Goa and Turkey. In 1848 the florin—one-tenth of a pound—was actually introduced as a tentative beginning, but there has subsequently been no serious agitation for further progress, though a decimal coinage to-day has some influential supporters, including certain large business houses. The convenience of the new system would be great indeed, but the confusion of the change-over would be formidable. We may regret that our great-grandfathers lacked the courage of their convictions; but perhaps the greatest of all obstacles is the Englishman's inordinate but persistent pride in being a citizen of the only great country in the world which can afford to be illogical. Britannia, with her trident, still rules the pence as she rules the waves.

Notes of the Week

Trunk Roads.—On April 1st, the Ministry of Transport took over responsibility for 3,270 miles of road in England and Wales. This was the first stage of the nationalisation of trunk roads in this country, which will be completed on May 16th when 1,190 miles of road in Scotland will be taken over by the Ministry. These trunk roads constitute 17 per cent. of the Class "A" roads in Britain, and up to now they have been managed by some 80 local authorities at an annual cost of £666,000. The Ministry will assume full financial responsibility and control of maintenance and development. All the powers of the local authorities are transferred to the Minister, who will also have authority to exercise control over ribbon development. The local authorities will, however, continue to act as agents on the spot for the Ministry. It is to be hoped that this transfer of powers and responsibility marks the beginning of a positive and constructive road policy designed to make our system of roads adequate for the needs of modern transport and traffic.

Road Accidents.—The Ministry of Transport has published the results of a careful investigation of 100,000 accidents, involving 117,811 deaths or injuries, which happened last year between April 1st and September 30th, and were covered generally in the last annual report. The conclusion of the Ministry's experts that the results of accidents are more severe on the open road than in built-up areas emphasises the importance of the task which the Minister has undertaken in assuming responsibility for trunk roads. As we pointed out in a leading article last week, our present road system cannot cope with its new burdens. This is especially so in centres of population, where accidents may be less severe than on the open highways (only 23.3 per cent. are classed as serious against 38 per cent. on the open road), but are much more numerous. Three-quarters of the accidents analysed in the Ministry's inquiry took place in built-up areas. And it is significant that 42 per cent. of the total, and 47.4 per cent. of those in built-up areas, occurred at crossings and road junctions—but only 6 per cent. at controlled junctions. In the last resort the problem of safer traffic is concerned with the design of the road rather than with the road user. Nevertheless, given inadequate roads, and given the brave palliatives of Mr Hore-Belisha (which are to a large extent justified by this inquiry, as they were by the figures of the annual report for 1936), the immediate responsibility rests with the drivers of motor vehicles, pedestrians and pedal cyclists.

This latest report attempts to allocate the blame for 87 per cent. of the accidents analysed: some 32.9 per cent. are put down to the fault of drivers; pedestrians were apparently to blame in 28.1 per cent. of the cases, and pedal cyclists in 26.3 per cent. Crossing and turning without due care, misjudgment of distance and speed, overtaking and driving too fast were the commonest causes of disaster. Over a third of the victims were cyclists, some 29 per cent. were pedestrians, and nearly 20 per cent. were motor cyclists, the severest sufferers, over one-third of those involved being killed or seriously injured. It may be true that our roads are not yet designed to carry, say, the hourly load of over 4,000 cars which passed Staines on Easter Monday. Yet, in only 13 per cent. of these accidents could no cause be found; in the rest, the causes were human error, carelessness and neglect. New highways are necessary because they might save us from ourselves; but meanwhile a grave responsibility rests on us who use the roads to minimise the toll of life by common sense and caution.

Gresford Summonses.—On September 22, 1934, an accident at Gresford Colliery cost 265 miners their lives. An official inquiry was held, which revealed that

many of the necessary conditions for safety were absent at the pit. In a debate in the House of Commons on February 23rd of this year drastic action by the Attorney-General was foreshadowed. Since then officials of Scotland Yard have been investigating the circumstances of the disaster, and on Saturday, March 27th, summonses were served by the Denbighshire police on the Gresford Colliery Company and a number of its officials. The case will be heard on April 20th at Wrexham, and the charge will be alleged breaches of the Coal Mines Regulation Act. Such vigilance is proper, but the major problem still remains. We cannot be sure that existing safeguards in mines are adequate, or that the procedure of inspection is effective. Some 777 men were killed in our mines last year, and we cannot be satisfied simply by the legal liquidation of this single, though terrible, disaster. Our mines must be made uniformly safe.

Re-armament News.—The re-armament scene presents a mixed picture. Abroad, as Professor Gilbert Murray pointed out at the Oxford Conference of the League of Nations Union, the programme has had a considerable moral effect; at home, it has accentuated the industrial boom. On Friday, March 26th, the Admiralty decided to entrust the building of sixteen cruisers for the 1936 and 1937 programmes to eight firms, on the Tyne, on the Clyde, at Southampton and on the Isle of Wight. It has been estimated that on the Clyde alone forty warships of all kinds to the value of £25 millions are under construction. Nevertheless, despite these favourable signs, serious problems remain still to be solved. The two most difficult concern labour and profits and have been clearly illustrated by this week's strike of a number of workers at the Parkhead Forge of Messrs Wm. Beardmore and Company, Ltd., Glasgow, and by the Government's rejection of the tender submitted by Messrs Ransomes and Rapier for the manufacture of shells.

On Saturday, March 27th, some 1,500 engineers employed on armament contracts at the Parkhead Forge, and earning about 65s. a week, came out on strike because of their employers' refusal to pay an extra penny an hour. Their action was recognised by the Glasgow District Committee of the Amalgamated Engineers' Union, but was not considered by the National Executive of the Union until Wednesday, when no final decision was made. The Parkhead engineers have disclaimed any desire to precipitate a national stoppage, involving 120,000 men, since they hold that the episode is a matter for direct negotiation between them and Messrs Beardmore. Indeed, the strikers allege that, by joining the Employers' Federation only after due notice of this stoppage had been given, Messrs Beardmore have attempted to give an unjustifiably national character to the dispute. Accordingly, they deny that the procedure of conciliation through the Federation is properly applicable to this strike. The incident does, however, raise an issue of national importance. More than a year ago the Government declared its intention of consulting the trade unions about the details of the re-armament programme, about recruitment, hours, wages, overtime and excess profits. Nothing has yet been decided, and this stoppage involving 2,000 men (including 500 labourers) who were engaged in producing armaments for 24 hours in the day, is an index of the possibly disastrous effects of a short-sighted and negligent policy. Re-armament can only be effectively executed with the wholehearted co-operation of the unions, tactfully enlisted.

No less serious was the story of Messrs Ransomes and Rapier revealed by Opposition speakers in the House of Commons on Wednesday, March 24th. This Ipswich firm offered to make shells on a no-profit and no-loss basis at 17s. 11d. per shell, which was alleged to be 3s. 7d.

cheaper than the tenders which were accepted. Government spokesmen replied that the firm had not made a formal tender; that Ransomes were not in fact equipped to make shells; and that Ipswich was a vulnerable site. It was, therefore, more than a little disturbing when the managing director of the firm claimed that they had actually submitted a detailed tender; and that between 1915 and 1918 they had manufactured 600,000 shells. Provided that the losses against which Ransomes sought a guarantee were reasonable contingencies, this offer to make munitions on a no cost basis was eminently worthy of a more than careful scrutiny. The acute dangers of profiteering should be only too real to those who remember the blatant opportunism of the last Great War.

Congress Refuses Office in India.—Provincial autonomy, the first stage of the new Indian Constitution, duly came into force on April 1, and in a message to the Indian people the King has expressed the hope that the new opportunities will be used widely and generously. On the same day Burma ceased to form part of the Indian Empire. The new regime in India opens less favourably than had been hoped, for, to the general consternation, Congress leaders have refused to accept office in any of the six Indian provinces (out of a total of eleven) in which the party has absolute majorities. The discussions with the provincial Governors broke down over the proviso in the recent resolution that "Ministerships shall not be accepted unless the leader of the Congress party in the Legislature is satisfied and able to state publicly that the Governor will not use his special powers of interference or set aside the advice of Ministers in regard to their constitutional activities." It had been widely supposed that the Congress leaders would be satisfied with the general offers of sympathy and help which were obviously all the Governors could give. Mr Gandhi himself, who drafted the resolution, assumed that it was the road to office. "There was no intention whatsoever," he said on Tuesday, "of laying down a condition whose acceptance would mean the slightest abrogation of the Constitution." The provincial leaders, apparently, put a different interpretation on it. According to communiqués in similar terms issued by several of the Governors, their Excellencies explained that the terms of the Government of India Act are mandatory, and that the obligations imposed by the Act and by the Instruments of Instructions on Governors, in respect of the use of special powers, are of such a nature that even if the Governor wished to relieve himself of them it would not be in his power to do so. The conversations were amicable, and the Governors told the Congress leaders that they "could rely on receiving all possible help, sympathy and co-operation within the four corners of the Act." The refusal of Congress to accept these terms has compelled the formation of minority Ministries whose life must be precarious. They are, indeed, little better than stop-gaps, and it is to

be hoped that a compromise will be found which will enable Congress to assume responsibility proportionate to its representation.

Judicial Valour.—It may, or may not, be true that the United States Supreme Court "follows the election returns," but it appears to be true that some, if not all, of the Justices believe discretion to be the better part of judicial valour. President Roosevelt's first proposal for enlarging the Court was careful to attack neither the Court as an institution nor the Justices personally. The case was argued on the basis of the age (and merely presumptive senility) of the Justices, and the alleged congestion of Federal business. But this pretence has long ago been dropped. For the Constitution and the principle of judicial review there is still plenty of respect. But the attack is now directly levelled at the "personal economic predilections" of the Justices. The President would probably welcome a further series of conservative judgments, inhibiting still more New Deal measures, which would serve admirably to point the moral of his contention. But the Court apparently believes that its best chance of avoiding "reform" is to accommodate its interpretation of the Constitution a little more closely to the demands of public opinion. This new tendency was revealed in every one of a remarkable series of judgments given on Monday. Two controversial measures were not only upheld, but unanimously upheld, although both of them appeared to the lay eye to contain elements which have been condemned by the Court in the past. One of these guarantees the right of collective bargaining to the employees of railroads, even to those employees whose labour is rendered entirely within the borders of a single State. The Court has thus done for the railways what it has refused to do for other industries—namely, to recognise that, if the employer is engaged in inter-State commerce, his relations with his employees are a matter of inter-State concern.

The second Act which was upheld was the Frazier-Lemke Act, authorising a three-year moratorium on farm mortgage foreclosures—a revision of a previous Act of the same name which was declared by the Court to be unconstitutional. Even more surprising than these decisions was one affirming the validity of a State law establishing a minimum wage for women. It was the veto last June of a similar New York law which induced even the Republican Party to advocate an amendment to the Constitution. Both decisions were taken by a vote of 5 to 4, Mr Justice Roberts having meantime altered his opinion—or, possibly, discovered some minor technicality which made all the difference. The fact that a single Justice, by changing his mind, can alter the supreme law of the land on a vital issue is likely to undo some of the effect of the Court's new-found moderation. But it would be rash in the extreme to

predict any issue from the conflict which is still raging with all its original fervour and bitterness round the President's proposals.

Japan's Naval Policy.—To an accompaniment of soft and reassuring words, Japan has now gone, in action, another long step further towards an unlimited defiance of all the other naval Powers of the world. At the London Naval Conference of last year, the comprehensive quantitative limitation which had been successfully achieved between the three oceanic naval Powers at Washington in 1921-22 and at London in 1930 was undone by Japan's refusal to accept, for the future, any ratio lower than parity with the two English-speaking naval Powers. It was hoped, however, that the wreck of quantitative limitation might in some measure be retrieved by limitation agreements on qualitative lines—particularly in regard to gun-calibres, which may ultimately determine the displacement of the ships on which the guns are to be mounted. A fourteen-inch maximum for gun-calibres for the next six years was provisionally accepted at last year's conference on condition that the acceptance should have been endorsed by each and all of the principal naval Powers before this Thursday, April 1st. The endorsements of all the Powers in question, except Japan, have been duly received; but last Saturday, March 27th, a notification of the Japanese Government's refusal was handed to the British Ambassador in Tokyo. Therewith our hopes of qualitative naval disarmament descend into the grave in which quantitative disarmament already lies buried. The Americans are reported to be retorting by arranging for sixteen-inch guns to be mounted in the two American battleships that are to be laid down next summer. On the other hand, they have shelved a cruiser-building programme which would have raised their cruiser strength above the 1930 maximum.

What is the Japanese Government after? There are rumours that they intend to build 40,000-ton or 50,000-ton capital ships which would confront the Americans with a choice between enlarging the Panama Canal or else resigning themselves to seeing their own fleet—on this new high level of capital-ship tonnage—once more divided into an Atlantic and a Pacific squadron which could not join forces without rounding Cape Horn. If this is really the Japanese plan it is puerile. In any competition in bearing financial burdens, the United States is bound to win. At this moment we have the extraordinary spectacle of the pace of the armaments competition being recklessly forced by just those Powers that are the least capable of standing the economic strain. In the Japanese Diet the other day, the Ministers of War and Marine had to reply to a Parliamentary question asking whether Japan was in a position to maintain parity with, or superiority over, Russia and China on land, and the British Empire and the United States at sea. The Minister's answer was that the Japanese Government desired "to carry out war preparations on the minimum basis essential for autonomous national defence, and not to compete with other Powers in the expansion of armaments." These words are presumably to be interpreted as signifying the exact opposite of their *prima facie* meaning.

Italy, Spain and the Commons.—The passage of arms in the Non-Intervention Committee on Wednesday of last week and the debate in the House of Commons next day must have drawn Signor Mussolini's eyes to London. If he is wise he will keep them fixed there while he is making his next decision. For the Duce has already decreed that this decision shall be momentous. On March 23rd, Count Grandi expressed a fervent hope to the Committee that the Italian troops in Spain would not be withdrawn. His master has thereby given himself the choice between reinforcing them or else allowing them—after their defeat at Brihuega—to languish in a campaign which could not then end in a victory but might very well end in a complete *débâcle*. Since the

week-end it has become evident that there is no substance in rumours of a divergence between British and French policy in this matter, so that, if Signor Mussolini does decide on sending reinforcements, he has to face the prospect of a solidly united Anglo-French front and a very grave reaction on the part of both Powers. Perhaps he will try to smuggle in aeroplanes by night. But, however surreptitiously he might set about it, further intervention in the teeth of his own undertakings would be a risky business.

The degree of this risk may be gauged from what has been passing, not in Rome, but in London. At the Non-Intervention Committee's meeting on March 24th the Russian Ambassador accused the Italian Government of having thrown a regular invading army into Spain, and he asked for an international commission to be sent to make an investigation on the spot. In the House of Commons on the 25th, Italian policy in all its aspects, and British policy in its Italian aspect, were the subjects of a noteworthy debate on the motion for the adjournment. Mr Henderson opened with a demand for another commission of inquiry into Italian conduct on foreign ground—in this instance, into the Addis Ababa massacre. He also brought the Spanish situation into the picture, and both subjects were taken up by the following speakers. The now rapid convergence of views in all parts of the House (with the apparent exception of the Treasury front bench) was illustrated by the Duchess of Atholl's support of Mr Henderson's demand for a League inquiry into the Addis Ababa butchery, and by her subsequent insistence on the peril in which the most vital of our British maritime lines of communication would be put by a victory of General Franco through the aid of Mussolini's arms. The outstanding speech, however, was made by Mr Lloyd George, who delivered a telling attack on the Government's lack of policy on all fronts in Spain, in Africa, and in Europe. He asked the Government what they proposed to do—in particular if Signor Mussolini were to send a couple of additional divisions to Spain, and in general if he went on with his avowed policy of turning the Mediterranean into an Italian lake. To all this, the only answer that Lord Cranborne had to give was the Government's now stereotyped refusal to answer hypothetical questions, which means, in effect, a refusal to look ahead. This would be condemned at once as an indictable neglect of duty if it were avowed by the directors of any private business enterprise.

The Italo-Yugoslav Pact.—At Belgrade, on Good Friday, a pair of new treaties, one political and the other economic, were signed by the Yugoslav Prime Minister and Foreign Minister, Dr Stoyadinovitch, and the Italian Foreign Minister, Count Ciano. The new trade agreement doubles Yugoslavia's quotas of Italy's foreign trade at the cost to Italy of an adverse annual trade balance amounting to no less than one-third of the value of the total Italian imports from Yugoslavia. The lure which has led Italy into agreeing to this at first sight one-sided arrangement is the hope of recovering the first place among Yugoslavia's foreign customers, which Germany wrested from Italy at the time when Yugoslavia was taking her part in the League's economic sanctions against the Italian aggressor. As for the political treaty of March 26th, it follows in most respects the common form of post-war bilateral treaties of friendship and non-aggression (e.g. the Italo-Abyssinian Treaty of 1928); and it may therefore mean anything or nothing, according to the interests and policies of the contracting parties in the course of the five years for which the new treaty is to run. The terms of the preamble would appear to commit Yugoslavia to an implicit recognition of the Italian conquest of Abyssinia. On the other hand, Article 6 safeguards Yugoslavia's prior right—and duty—to fulfil all her existing public international obligations—e.g. the Covenant of the League and the Statute of the Little Entente. An indication that the treaty may be seriously meant can be gathered from a report that it has been accompanied by reciprocal assurances in regard to the status of Albania as a *protégée* of Italy.

This Yugoslav-Italian Treaty comes aptly for the two chief protagonists—Signor Mussolini and Dr Stoyadinovitch—for it helps them both out of a hole. The Duce is thus able to restore his prestige, somewhat battered in Spain; and the Yugoslav Prime Minister may be enabled to consolidate his own hold on his country's politics. But both of these advantages seem wasting assets. The Slovenes—despite better conditions promised to their brethren in Italy under the treaty—will not feel kindly disposed to Belgrade; and the Croats prefer Vienna to Rome. Moreover, many Serbs themselves, as the demonstrations last week-end against Count Ciano in Belgrade seem to have shown, are not quite happy at the idea of being placed in the Caudine Forks between their old and trusted allies—the French, Czechs and Roumanians—and the Italians across the Adriatic. Many have the feeling that Germany, after all, is a safer friend than Italy. Dr Stoyadinovitch may be laying up future trouble for Jugoslavia at the present juncture.

Marketing and Food Prices.—The Report of the Food Council points out that in 1936 food prices were 30 per cent. higher than in July, 1914, measured by the Ministry of Labour index. The greatest rises were in the price of fish (101 per cent.) and milk (82 per cent.), while there were considerable increases in the price of potatoes, flour, bread, cheese, margarine and eggs. The report maintains that the present regulations on imports can only be continued, without an inordinate advance in food prices, if the various marketing schemes are thoroughly reorganised under a more independent and impartial control than at present. It is very properly pointed out that consumers have reason to complain about the way in which the schemes are operated by producers. The intervention of producers in the process of distribution, for instance, has meant that to win the co-operation of middlemen producers have guaranteed to them minimum profit margins not based on the ascertainable cost of the services actually rendered. It is true that, in the case of milk for example, pasteurisation, bottling and delivery have considerably increased the cost of service; but in actual practice milk retailers are guaranteed, even for the most rudimentary services, a margin based on the cost of the fullest service possible. The Food Council cannot see why the fixing of wholesale milk prices should entail the fixing of minimum retail prices. They deprecate also the way in which producers and curers of bacon combine to maintain prices by the strict regulation of imports. And they are of the opinion that the general tendency to fix minimum and not maximum margins, and regularly to exceed those margins, results in unnecessary additions to food prices. They recommend the investigation of middlemen's costs and the fixing of margins by an independent body. The consumer must be protected against the ungrateful abuse by producers of a power given to them only to safeguard their livelihood.

Is there a Wheat Shortage?—After a period of quietude, due to the heavy shipments from Argentina and Australia, the wheat market has suddenly sprung to life again. Since the beginning of this month the quotation for May futures in Liverpool has risen from 8s. 8d. to 10s. 2d. per 100 lbs., the highest level reached since the season ended July, 1928, during which the price reached 11s. 1½d. Already last autumn it was evident that the safety margin between probable world supplies and requirements during the season ended July, 1936, was extremely narrow. If anything, the safety margin was underestimated, for the extent of Italian and German purchases could not then be foreseen. Early this season, the *Corn Trade News* estimated the surplus over internal requirements in exporting countries in 1936-37 at 76½ million quarters and probable shipments to deficiency countries at 64 million quarters. Since then the estimates have been revised to 77.9 million quarters and 71 millions, respectively. But shipments since the beginning of the season have been at the rate of nearly 80 million quarters. Hence there is a possibility of a squeeze before the new crops come on the

market. The outlook can best be summarised in the words of our conclusion, reached in a survey of the wheat position in *The Economist* of October 10, 1936 (page 53). We then said that the wheel of the wheat cycle had almost turned full circle, adding, "the tendency of wheat prices over the winter is likely to be firm, and as there will be practically no old stocks to draw upon in 1937-38, nothing short of a bumper crop in that season may be sufficient to prevent a steep upward trend of prices next summer." While it is as yet too early to forecast this year's world crop, there are no indications that it is likely to be of bumper size, and prices have risen accordingly. As a result of the increase in the cost of flour, the price of the quarter loaf is to be raised from 9d. 10½d. next Monday.

Fresh Rise in Wholesale Prices.—The rapid advance in wholesale prices continues. During the past fortnight the complete *Economist* index number has risen by 2.5 per cent, and the British primary products index number by 2.1 per cent. There has been a reaction in non-ferrous metals, but wheat, maize, bacon, textiles and rubber have now taken up the advance. In the United States primary products have risen by 1.2 per cent, and the complete index by 1.6 per cent. Since the New Year there have been the following increases in England and the United States:—

	U.K.	U.S.A.
All commodities	+ 9.9%	+ 6.2%
Primary products	+ 11.0%	+ 6.6%

The increase is greater in England than in the United States. Moreover, in both countries "all" commodities, which include semi-manufactured products, are keeping pace with primary products. This points to a steady advance in production costs, equal to that in raw material costs:—

SEPTEMBER 18, 1931 = 100

Fears of Inflation

NEW YORK, March 23.—In recent years Wall Street has been subject to sporadic spells of inflation-mindedness; that is, there have been periods when the favourite topic of conversation was inflation and when numbers of persons were moved to make decisions expecting a decline in the value of the dollar. Sometimes, this expectation has been of a decline of the dollar in terms of other currencies, sometimes of goods and services. In the past few months a substantial decline has occurred in the value of the dollar in terms of goods and services. This decline is not merely visible to the statistician measuring the familiar indices; it is not merely obvious to every business man, whether manufacturer or merchant; it is patent to every adult consumer who finds his personal and household expenses perceptibly higher than last autumn. Hence Wall Street, which for two years has been describing our economy in terms of the "natural forces of recovery," suddenly became inflation-minded; and this was in no wise checked because it coincided with two administrative attempts to reduce the prospect of inflation. These were (a) the December decision of the Treasury to absorb incoming gold in an inactive fund, now amounting to about \$250 millions, which, under the previous procedure, would have gone into excess reserves, and (b) the increase in member bank reserve requirements, under which (in addition to the 50 per cent. increase decreed last August) a further 50 per cent. would be required in two stages, the first effective on March 1st, the second to become effective on May 1st.

Although Wall Street in early 1937 has been thinking and talking inflation, it should not be supposed that Wall Street wants inflation. An economic community retains a horror of its most recent disaster, and Wall Street, remembering 1929, has the same dread of credit inflation as the French public, remembering 1926, has of currency depreciation.

Doubts about the Future

A combination of events last week produced considerable nervousness in financial circles. After the solemn warning of the President (March 9th) that our economy was in a precarious condition, a formal statement was given out by Mr Eccles, Chairman of the Federal Reserve Board, emphasising the same idea in more explicit terms; this, in turn, was followed by other warnings from high official quarters.

These statements came almost simultaneously with a bad flurry in the Government bond market. The actual declines in long-term issues have not yet been very great, but the market was demoralised and the Treasury felt obliged to support its own issues—a fact which may have improved the quotations but was not conducive to a rally in confidence. At the highest point of the year the rate was a little under 2½ per cent. and currently it is a little over. As yet one could hardly describe it as a change in the long-term rate of interest; it rather appears that a weak technical situation had been built up by what can only be described as institutional speculation, and that this situation was uncovered by the conversion operation of March 15th, and aggravated by the official pronouncements. While this flurry was in process in the bond market, the stock market was experiencing its most severe shake-out for a year, and the second episode of this kind since the great bull market began in March, 1935. In part, this may be perfunctorily ascribed to profit-taking; but it must be admitted that several de-

velopments are slowly engendering a doubt about the continuity of business activity, or at least, about the expansion of corporate profits. Under the inflation-mindedness which featured the early weeks of the year, it was generally believed that any increase in labour or raw material costs could easily be passed on to the consumer—in short, that the phenomena of a sellers' market could be depended upon to last indefinitely. It is too early to state that this is not to prove valid reasoning; but doubts are more frequently encountered than in February.

Another fact has cast its shadow over the year. From the end of the great textile strike in September, 1934, to the end of 1936, the country was remarkably free from labour troubles. Since the closing months of 1936, labour troubles have been continuous—the marine strike, the glass strike, the automobile strike, and innumerable small, local sit-down strikes. Moreover, there have been continuous threats of strikes—in the steel industry (where no strike occurred), and in the coal and textile industries where the strikes may or may not occur in the near future. Nevertheless, the data currently available (such as steel output, car loadings, electric power consumption) all show new records for the recovery; the upturn which began in the fourth quarter of 1934 is continuing with unabated vigour. While there seems to be increasing doubt of the persistence of this rising trend, there is a complete absence of positive evidence to support such views.

Ways to Control the Boom

At the present time our general economy is somewhere in the twilight zone between prosperity and boom. In a good many places one can recognise the familiar marks of boom; but it is debatable whether there is a general boom. Whether this state of affairs has been reached by the natural processes of recovery, or is the consequence of the spending and reflation programme, or of a combination of the two, is a matter for economic casuists. The point is that our economy has reached a level in which more concern is officially expressed about the maintenance of something like the present status than about any effort to push it higher.

In other words, the emphasis of official opinion has shifted from reflation to control. But credit control in the usual or historic sense is precluded by the present commitments of the Treasury to the banking system in the form of a 2½ per cent. rate on its long-term debt, and it is by no means certain that the era of magnificent deficits is over—hence the emphasis on qualitative rather than quantitative control. Such a control has been effectively established in the stock market. But the focus of immediate disturbance is not the stock market; it is what might be called the bull market in labour, where a sellers' market has existed for some months; a bull market in primary commodities, in part created by the European armament boom; and a bull market in consumer goods, where consumer earned income is amplified by the generous extension of consumer credit. In the last four months the result of these forces has been a serious decline in the value of the dollar in terms of goods and services, and a widespread belief that the coming months will bring a further rise in costs—which in turn prompts consumers, whether individual or corporate, to anticipate their requirements, and impels labour, under pressure of the rising cost of living, to seek higher wages. In short, the familiar spiral is clearly in evidence. Even if our monetary system were free of commitments to the Treasury, it is questionable if the conventional quantitative monetary controls would be particularly applicable to the situation.

France

A Political Truce

PARIS, April 1.—The Croix de Feu as well as the Communists agreed not to accentuate the difficulties created by the Clichy riots, which public opinion had condemned; and M. Blum's appeal to the country did the rest. The Right obtained an assurance that no sanctions would be applied against the police, and the Left seem to have been appeased by the general strike. Parliament was then able to take a month's recess after passing a law to revise the wages of civil servants, but without endorsing other measures demanded by the Popular Front, such as the National Unemployment Fund and pensions for aged workers.

Politics are now at a standstill. The position of the Equalisation Fund has been improved by a slight return of flight capital and by the expenditure of tourists—whose affluence at Easter surpassed the highest hopes. The Treasury has been restocked for at least two months by the latest loan; and the money market is perceptibly relieved. The time is perhaps ripe for an effort to lower the rediscount rate of the Bank of France and for a rise in Rentes. There are still, however, many labour problems to be solved, although the relations between Capital and Labour are now better in such industries as coal and generally in the industries of North France. Unemployment on March 20th had fallen to 393,581, against 401,259 in the preceding week. A year ago it was 470,460.

The recent rise in prices is still perceptible, though it has been considerably slowed down. The following table gives the retail prices of a number of foodstuffs:—

	Feb. 15, 1936	Nov. 15, 1936	Dec. 15, 1936	Jan. 15, 1937	Feb. 15, 1937

The production of the coal mines was 3,799,139 tons in February, 1937 (21.6 working days), against 3,725,130 tons in January (21 working days) and 3,928,304 tons in February, 1936 (21.9 working days). Average daily production was 175,900 tons in February, 1937, against 177,400 tons in January and 179,400 tons in February, 1936. The number of men employed was 234,837 at the end of February, against 223,680 at the end of February, 1936. The production of coke in the coke plants of the mines was 318,801 tons, against 329,197 tons in January and 329,786 tons in February, 1936.

Germany

Divorcing Banking from Business

BERLIN, March 31.—All the leading banks developed in 1936 in much the same way. Common features were increases in turnover, gross and net profits, total expenditure, and, with one exception, in dividends; slight increases in deposits after a prolonged decline; and a movement from business to public credits and investments. The clearings of the commercial banks increased considerably, though not so much as those of many provincial

banks, which showed rises of 20-30 per cent. Deutsche-Disconto clearings rose 10 per cent.; Dresdner 12 per cent.; and Commerz- und Privat 8 per cent. The Dresdner Bank continued to pay a 4 per cent. dividend; but the other two raised their dividends from 4 per cent. to 5 per cent. The Berliner Handelsgesellschaft and the Reichskredit Bank increased their dividends from 6 per cent. to 6½ per cent. Except for the Deutsche-Disconto, whose displayed net profit was nearly doubled (probably owing to over-cautious policy in the matter of undisplayed profits in the preceding year), profits increased moderately. The factors operating against high earnings were the shift from loans and from advances on goods to the less profitable bills, and the heavy increase in taxes, which was due in part to the rise in the rate of the corporation tax.

Deposits rose from Rm. 6,159 millions to Rm. 6,341 millions. Of this total Rm. 668 millions represented foreign claims. Acceptances declined from Rm. 721 millions to Rm. 624 millions; and endorsements increased from Rm. 512 millions to Rm. 803 millions. The increase in deposits occurred in spite of foreign withdrawals, and consisted of business and private deposits. The decline in acceptances is part of the process of market fluidity and increased State financing. This process appears very clearly from the active side of the balance sheets. The banks show very substantial declines in their loans and in their advances on goods, and corresponding increases in their holdings of bills and securities; an increasing share of bills and securities represented public, and mainly Reich, financing. This means that the "divorce of banking from private business," of which so much has been heard during the past few years, made further progress.

Reduced Liquidity

Loans of the five banks fell from Rm. 3,438 millions to Rm. 3,131 millions; and advances on goods from Rm. 282 millions to Rm. 257 millions. On the other hand, bills increased from Rm. 2,409 millions to Rm. 2,687 millions. Not only did total bills increase, but the share of Reich special bills increased enormously. This appears from the shift towards bills classed as long term. The *Frankfurter Zeitung* has calculated the following increases in the proportion of long-term bills among all bills:—

	Percentage of all bills represented by long-term bills	
	1935	1936
Deutsche-Disconto	6.5	35.2
Dresdner	4.6	27.9
Commerz- und Privat	5.5	36.5
Reichskredit	1.2	28.5

This change has considerably reduced liquidity, for the longer term bills are not rediscountable. The five banks' securities and participations increased from Rm. 674 millions to Rm. 817 millions. Only the Dresdner Bank showed a decline in the percentage of

Family provision scheme

A scheme to secure a Capital Sum payable at death and a regular income over a period of years for dependants in the event of early death, at a cost which is little more than that of ordinary life assurance. It is readily adaptable, and rates will be quoted on application for policies to suit the needs of each individual.

Established 1844 Funds exceed £25,000,000

Reich and State loans in its total holdings of securities. The Deutsche-Disconto Bank announces that it is now fully "reprivatised." The D.D. Bank's reprivatisation was in part financed by sale to the Reich of the former Disconto Bank's central offices. The reprivatisation of the Commerz- und Privat Bank is not yet complete; of the Rm. 80 millions capital, Rm. 35 millions was originally held by the Gold Discount Bank and Rm. 22 millions by the Reich Finance Ministry. The Finance Ministry's holding has been reprivatised; and since the end of 1936 some of the G.D. Bank's holdings also. The Dresdner Bank is still virtually Reich-owned; of this bank's shares 97 per cent. were originally in Reich and G.D. Bank hands; and though there has been some reprivatisation it is understood that nine-tenths of the capital is still publicly held.

Drastic Measures for Food Production

The failure of food control, which is shown daily by rising prices, shortage and disorder in the retail market, has compelled the Government to adopt further measures. These measures are announced as part of the Four-Year Plan, but are in reality makeshifts designed to repair the failures and lack of system of the past four years. The producers' price for rye for the year 1937-38 has been increased by 20 marks a ton, and the price of potatoes for industrial consumption has also been considerably increased. In order to increase the output of cereals the price of nitrate fertilisers has been reduced by 30 per cent. and of potash salts by 25 per cent. These drastic price reductions depressed the shares of chemical and potash companies on the Bourse. The financial saving to farmers will be considerable. Under the Four-Year Plan are also promised increased public subsidies for land improvement.

The seasonal recovery of industry is well under way. The increase in the number of employed industrial workers in February was, however, confined to the consumption goods trades, in which the average time worked also rose sharply. Coal output in the first two months of the year was 29,150,000 tons, against 26,300,000 tons in 1936. Ingot steel production in February was 1,519,600 tons, against 1,534,000 tons in January. Orders in the machine manufacturing trade are reported unchanged. The Leipzig Technical Fair brought a great many foreign orders. About export prospects in 1937 Herr Wagemann, of the Trade Research Institute, writes optimistically. Since 1934, he points out, the export of capital goods has increased by 32 per cent., which is double the increase in total exports. There is also hope of an increase in the export of consumption goods, such as textiles, household articles and luxuries. If Germany's exports in 1937 merely keep pace with the expected recovery of world trade, she may expect a 10 per cent. increase over the figures of 1936.

Switzerland

Improved Trade in 1936

GENEVA, March 25.—Switzerland seems to be recovering from the economic crisis, which was aggravated by the high value of the Swiss currency. The recovery began in March and was partly due to increased activity on all the world markets; but it was hastened by the devaluation of the Swiss franc at the end of September. Foreign trade returns reflect the improvement. In 1936 imports totalled 1,266,261,754 francs, against 1,283,303,626 francs in 1935, while exports aggregated 881,633,419 francs, compared with 821,960,332 francs in the previous year.

Imports were still restricted by quotas, but some relaxation was authorised by the Government in the fourth quarter of the year, when there was a big increase in the importation of raw materials. The exports of the four chief industries (watchmaking, silk, cotton and the machine industry) aggregated 420,700,000 francs, against 372,000,000 francs in 1935. The watchmaking industry, which seemed to be doomed a few years ago,

exported watches and spare parts to the value of 150 million francs, compared with 123 millions in 1935, 109 millions in 1934, and 96 millions in 1933. Sales of silk and cotton goods showed a rise of 3 and 6 million francs respectively over 1935, and exports of machinery totalled 110 millions, against 97 millions in the previous year.

The main feature of the year was the recovery in trade with the United States as the result of a trade agreement concluded last year. The purchases of the British Empire as a whole from this country in 1936 represented about 16 per cent. of Swiss exports, while its sales to Switzerland amounted to 135 million francs, which is nearly 11 per cent. of Swiss imports.

The Effects of Devaluation

During the last three months of 1936 devaluation brought about no great rise in prices. That was due, on the one hand, to the measures taken by the Government to prevent any illicit increase in prices; and, on the other hand, to the relaxation of certain import quotas. The reduction, and in some cases the abolition, of Customs duties had a similar effect. The duty on petrol, for instance, was reduced, and there was no increase in retail prices, although petrol is exclusively obtained from abroad. The cost-of-living index (100 = 1914), which was 130 at the end of September, rose to 132 during the last quarter, and now stands at 134. Since the beginning of this year the price of some imported goods has risen by from 20 to 35 per cent., and some prices have been raised correspondingly on the Swiss market. White bread costs 20 per cent. more, and this increase is due not only to devaluation, but also to the rise in the world price of wheat. The Government has also authorised an increase of 6 to 9 per cent. in the prices of milk, butter and cheese. But, on the whole, the average rise in the cost of living so far does not exceed 4 per cent. It is, nevertheless, probable that the rise will continue during the coming months, and the Government now seems inclined to relax its control of prices.

The hotel industry has benefited from devaluation; during the present winter sports season the number of visitors to the Swiss resorts has been nearly 20 per cent. greater than last year. Hotel prices will not, however, remain at their present low level; they will be raised in the summer season to keep pace with the general increase in the cost of living. Devaluation has also had a favourable effect on the earnings of the railways; and the steady rise in unemployment seems to have been partially checked.

The Growth of Motoring

The Geneva International Automobile Salon met with great success this year. Of the 52 motor car firms, 17 were American, 11 German, 10 British, eight French, four Italian and two Czechoslovakian. Switzerland is entirely dependent on foreign countries for motor cars, since the last Swiss factory closed down a few years ago. She relies less on imports for motor lorries; several factories exist in Switzerland, including Saurer and Berna.

There are now nearly 97,000 motor vehicles in Switzerland, about one to every 43 inhabitants. Ten years ago, when the number of motor vehicles reached 56,000, it was forecast that motor traffic could not develop much in such a hilly country with narrow roads. In the past six years, however, the number of motor cars put into service averaged about 11,000 a year. The development of motoring is due to progress in the construction of cars, to the reduction of prices, and to the improvements which have been made on nearly all the Swiss roads.

Until 1935, American cars were in the majority, but they have now been outnumbered by Italian cars. To bring down prices and to compete with European cars, some American firms (such as General Motors) send separate parts to Switzerland where they are assembled by Swiss labour. British cars represent only about 2 per cent. of the total. In 1936, the value of British cars

imported into Switzerland reached 23,274,300 francs, and the value of British motor cycles was 450,000 francs, including spare parts.

The effort which the Swiss authorities are making to improve the roads is shown in the building scheme recently adopted by Parliament. The Alpine roads are generally good, but they are not all up to date, and the Federal Government and the Cantons concerned have agreed to an improvement and modernisation programme to be completed within the next six years at a total cost of 78 million francs. During about seven months in the year, the Alpine passes are blocked up by snow, and vehicular traffic is completely stopped. It is proposed to build a motor road in one of the Simplon tunnels, and a company has been formed to examine the proposal.

Austria

The First Schilling Loan

VIENNA, March 13.—The Loan of 180 million schilling (about £7,000,000), placed entirely in Austria, marks a turning point in the development of the monetary system of Austria. It is the first loan quoted solely in schilling. In all its previous loans post-war Austria has bound itself to repay either foreign money or gold schilling. Even the Lottery Loan of 1933 and the Work Loan of 1935, though placed entirely in Austria, contain elaborate clauses to secure the gold value of the repayments. The position of the schilling is now strong enough to dispense with the crutches of special gold promises. Preliminary measures were taken regarding private obligations, such as the abolition of the gold clause in agricultural mortgage contracts and in insurance policies; consequently the Government feels entitled to request the same latitude. The re-vindication of the monetary dignity of the schilling is not as a mere matter of prestige; it was substantially brought about when Austria repaid its foreign debts without taking cover behind the devisen law in force, and when the schilling withstood the example of the franc and of the Dutch guilder and was not devalued.

The conditions which the Government offers are quite normal, the issue being at 90 for 30 years at 4½ per cent. No Austrian Government since pre-war days could borrow cheaper. The prominent Austrian banks being more or less under the direct control of the Government, there is no doubt that the loan will be subscribed, and even over-subscribed, in a few days. Some 54 million schillings will be exchanged against Treasury bills, already issued in order to finance public works in 1936. The remainder of the loan is also designed for public works, for the State monopolies, State enterprises and railways, roads, bridges and waterworks. The army will receive 22 millions, and public building in Vienna and in other towns 10 million schillings. The International Committee charged by the terms of the Austrian League of Nations Loan with the control of Austrian indebtedness has already consented.

Czechoslovakia

Political Calm and Industrial Activity

PRAGUE, March 18.—The endeavours of the Powers to neutralise the Spanish conflict and the gradual increase in the world's economic prosperity have greatly contributed towards increased calm in Czechoslovakia. Both at home and abroad great significance is given to the negotiations with the German minority so success-

fully inaugurated by the Prime Minister, although the Henlein opposition group is putting great obstacles in the way. Similar negotiations are to take place with the Magyar and Polish minorities. The demands of the farmers are creating some difficulties. The Minister for Agriculture wants the cattle trade to be restricted by an Animal-produce Syndicate, which would regulate imports. He also wishes to establish a fund to pay off agricultural debts and to endow this fund with grants-in-aid from the State. Industrial production has increased, but foreign trade is still suffering from payment difficulties and autarkic tendencies.

The money market has been easy and shows a further tendency towards relaxation even in long-term loans. The market in Government securities has been stabilised by the activities of the Rediscount Institute. Since the beginning of the year deposits have risen. Treasury bills, payable on February 1st and March 1st, have been prolonged without difficulty at 3½ per cent. The prevailing tendency on the Stock Exchange has been firm, and the prices of industrial shares have advanced with the rise in the price of raw materials, the acceleration of industrial activity and the armament boom.

Industrial activity increased in almost every branch. Taking the year 1929 as a basis, it stood at the end of 1936 at 94.5, and at the end of January the production figures were as follows:—

	1936	1937
	Tons	Tons
Coal	999,694	1,232,633
Lignite	1,373,187	1,503,733
Coke	153,000	222,600
Pig iron	91,500	123,382
Raw steel	109,240	186,276

The production of raw steel is greater than in any previous period of prosperity.

Foreign Trade Agreements

Foreign trade in the first two months, in comparison with 1936, amounted to:—

	Thousands of Cz.K. (January and February)	
	1936	1937
Imports	1,076,418	1,481,512
Exports	1,098,479	1,526,753

Thus the export surplus in the first two months of 1937 was Cz.K44,833 against Cz.K20,624 in the corresponding period of 1936.

Among imports, raw materials and goods for investment purposes show the most substantial increases.

The usual meeting of the Little Entente Economic Council took place in February. Negotiations with Germany were concluded and resulted in an extended exchange of goods. After difficult negotiations some improvement has been made in trade with France. A new agreement was concluded with South Africa; and with Poland an adjustment in certain Custom duties was made. Negotiations with Italy have been started; negotiations with Hungary, Bulgaria, Belgium, Switzerland and the Netherlands are being prepared; and an attempt is being made to extend trade agreements with some South American countries. The Government intend to increase the export credit guarantees from Cz.Kr.850 millions to Cz.K3,000 millions. On February 11th the import permit formalities were unified under the Ministry of Commerce.

BRITANNIC
ASSURANCE COMPANY LIMITED
(Established 1866)

Annual Income : : : : £6,200,000
Funds : : : : £27,000,000
All classes of Life, Fire, Accident,
Motor and General Insurances transacted
Chief Office: BROAD STREET CORNER, BIRMINGHAM

Brazil

RIO DE JANEIRO, March 2.—There was an encouraging improvement in foreign trade in 1936. Compared with 1935, imports rose by 12 per cent. and exports by 10.5 per cent. The export surplus rose from £5,581,000 (gold) to £9,003,000 (gold).

	1935			1936		
	(1,000 tons)	(1,000 conts.)	(£1,000 gold)	(1,000 tons)	(1,000 conts.)	(£1,000 gold)
IMPORTS						
Live animals.....	28	12	69	14	7	54
Raw material.....	2,742	1,192	8,494	2,889	1,252	8,814
Manufactured products.....	483	1,953	13,884	521	2,105	14,826
Food supplies.....	1,003	699	4,964	1,053	905	6,372
the main increase being:						
Flour.....	45	31	226	51	46	325
Wheat.....	881	434	3,067	920	617	4,347
EXPORTS						
Animal products.....	193	379	3,063	194	468	3,718
Minerals.....	114	14	110	301	32	256
Vegetable products.....	2,454	3,711	29,839	2,613	4,395	35,095
Miscellaneous.....	63	71	562	91	116	958

There was a notable increase in the volume and value of wheat and flour imports.

Of the principal exports, coffee still ranks first, although its relative importance has declined. Cotton and cocoa showed significant advances:—

VALUE OF EXPORTS
(in £1,000 gold)

	Coffee	Cotton	Cocoa
1932.....	26,238	25	1,656
1933.....	26,168	369	1,340
1934.....	21,541	4,666	1,337
1935.....	17,373	5,223	1,307
1936.....	17,785	7,455	2,077

Certain products receive taxation advantages in the United States in virtue of the trade agreement of 1935. This largely accounts for the marked increase in the exports of manganese, vegetable oil and oilseeds. If the agreement were to be terminated, these exports would fall in both tonnage and value. Before 1936 only a few per cent. of vegetable oilseeds from Brazil went to the United States; in 1936 nearly 85 per cent. was taken by this market.

Letters to the Editor

Is it Inflation?

TO THE EDITOR OF THE ECONOMIST

SIR,—Not everybody will accept Mr Keynes's thesis as outlined in the Note "Is it Inflation?" in *The Economist* of March 13th. Can it be called inflation when the rise in price levels is almost without exception due to a rapid advance in demand, when demand is rising more rapidly than improvements are being made in the technique of production? Would an opposite tendency be properly called deflation?

The question is, even if we accept Mr Keynes's definitions, whether we have to fear inflation following the issue of the re-armament loan. I doubt it, because price levels had already soared before the announcement of the loan. Speculators anticipated the rising demand. Is it not rather probable that prices will shortly fall, when the present price levels have evoked increased production and advances in mechanical technique?

Even if domestic production cannot be increased enough to cope with armament requirements and to pay with exports for the goods which will have to be imported, this will not necessarily cause a rise in prices. Deficits in the foreign trade balance can be met out of (a) the accumulated savings of the past, (b) claims on foreign countries, (c) the partial liquidation of properties and objects of value in foreign countries, and (d) gold exports, etc. Probably none of these devices will have to be used because many foreign owners of goods will be only too glad to exchange their wealth for pounds sterling.

Mr Keynes's definition of inflation does not take into account alterations in the quantity of money in circulation or changes in velocity. Even so, let us consider the monetary aspect of the loan. Subscribers to the loan are simply exchanging their movable goods for the re-armament bonds; the amount of money and means of payment is not thereby increased. And even if the British economy cannot at once supply the raw materials and finished goods necessary for re-armament, it can still resort to the surpluses of its foreign income and to savings, without prices being materially affected.

Rising prices are of course inevitable if world prices are rising; if world demand exceeds world production and stocks are inadequate to bridge the gap. A world-wide shortage of goods will cause a rise in prices, but it would not be proper to call such a rise inflation.

Yours faithfully,

EGON VIRANY.

Budapest.

National Finance

TO THE EDITOR OF THE ECONOMIST

SIR,—Your readers are indebted to you for publishing a series of most valuable and instructive figures in your issue of March 20th showing the unprecedented peacetime figure of 6½ per cent. of the national income which it is intended shall be used for defence expenditure. May I supplement your figures with the following table which Mr Graham White, M.P., obtained from the Chancellor of the Exchequer on March 25th?

(Answered by the Chancellor of the Exchequer)

The following table gives the information asked for:—

Financial year	III Nominal total of National Debt at beginning of financial year				IV Interest and Management
	I	II			
	Income tax or £'000	Super-tax £'000		£'000	
1875-76 ...	4,109	...	720,037	27,120*	
1891-92 ...	13,810	...	684,071	25,905*	
1913-14 ...	43,929	3,320	656,474	16,894	
1925-26 ...	259,411	68,510	7,597,848	308,229	
1936-37 ...	259,000†	56,500†	7,795,855†	211,500†	

* Approximate figures. † Estimates.
† Includes £350 millions borrowed on Treasury Bills for the Exchange Equalisation Account and more than offset by corresponding assets.

It will be observed that it is estimated that the amount of income tax and super-tax to be realised in 1936-37 will be less than in 1925-26, although the National Debt shows very little change after allowing for £350 millions borrowed on Treasury Bills for the Exchange Equalisation Account. The charge for interest and management of the Debt is estimated to cost £96,729,000—less than in 1925-26, but this saving has been largely frittered away on subsidies to various interests. The situation thus disclosed is a grave one, and calls for the consideration of every right-thinking man and woman.

Briefly, it means (1) that we are spending, or proposing to spend, too high a proportion of our national income on defence expenditure; (2) that as a result of this expenditure we are unduly reducing our financial resources and therefore dissipating our reserves, on which, if war should overtake us, success will ultimately depend; and (3) that in view of a state of affairs which will result in weakness and not strength, it is our bounden duty to reduce the burden of our defence expenditure so as to increase that strength and security which it is the ostensible object of the Government's policy to promote.

I am, Sir,

Your obedient servant,

D. M. MASON.

Growth of a Monopoly

TO THE EDITOR OF THE ECONOMIST

SIR,—Mr Ranald M. Findlay, writing in your issue of the 20th under the above heading, very late in the day draws attention to what I said in the House of Commons last June when we were discussing Clause 6 of the Finance Bill of that year. What Mr Findlay does not realise is that all this mechanism of industrial control finds its chief supporters amongst Left Wing politicians who are ardent advocates of the modern doctrine of planning, and whose most robust opponents in the House of Commons have been invariably Protectionists. This mechanism of control is no part of a Protective policy proper.

Unfortunately, owing to the long delay in applying Protection, for which Mr Findlay must share some measure of the responsibility, certain industries in this country, or certain parts of certain industries, had shrunk to very small proportions, while these industries were being carried on through the help of Protection on a very large scale on the Continent. The mere existence of the Continental Steel

Cartel made it necessary and advantageous to us to build up a somewhat similar organisation, and during a period when it is necessary for us to import certain classes of raw steel, there may be obvious advantages in that importation being conducted in an orderly manner.

As the first person in this country, on the occasion of the Debate last June in the House of Commons, to draw attention to the dangers involved in it, I felt very justified when speaking in the Debate in the House of Commons on March 22nd in stating that all the grievances I had heard of had in fact been handled fairly by the British Iron and Steel Federation.

I quite agree with Mr Findlay that this modern development of which Free Traders are really the authors wants careful watching, but it is equally true that publicity has prevented the risk of the abuses to which Mr Findlay refers but in respect of which he fails to give any precise details. The main reason for the adoption of marketing schemes and other planning systems has been the failure to apply the Protective policy logically.

Yours faithfully,

HERBERT G. WILLIAMS.

Books and Publications

Mr Hawtrey Intervenes

THOUGH this book* constitutes a reply to Mr Keynes's "General Theory" and will probably be read as such, the author's primary concern is with a much more general criticism. In dealing with a practical situation, he says, a correct train of reasoning is worse than useless if due weight has not, at the beginning, been given to all the actual relevant circumstances. A formidable array of present theories of the trade cycle and of depression and unemployment depend on the assumption, express or implied, that working capital is insensitive to the short-term rate of interest, and that the only credit control possible is in a tardy operation through the long-term investment market. To Mr Hawtrey this assumption is the grand error, and he returns again and again to the attack upon it in the cause of more general arguments.

Capital, he argues, may be increased either by widening or by deepening, i.e. without or with an increase in the amount of capital per unit of output. Widening will take place when there is a prospect of increased sales without a reduction in prices and profits; it is what happens when new factories are built and old factories enlarged; deepening takes place when labour-saving machinery is introduced following a fall in the rate of interest. In the case of investment for production, yield is measured by cost-saving capacity; and, it is argued, the margin of error is such that this type of investment is sluggish and insensitive to changes in the (long-term) interest rate. Turning to working capital and the short-term rate, he admits that traders in seasonal products, and dealers in securities, are much more concerned with prospects of price-changes than with the rate of interest. But, he argues, genuine traders in manufactures—the most important element in the market—base their judgments not on future prices, but on present demand and present stocks. And, since such traders finance their stock-holdings from short-term loans, a small change in the interest rate is sufficient to cause an immediate change in the amounts of these holdings and, consequently, of their holdings of cash.

According to Mr Hawtrey, if costs of production, particularly wages, are fixed—as they are over short periods—the volume of output, and therefore the quantity of employment, is determined by the total money demand of final purchasers. Changes in this "general demand" are first felt as changes in the demand for consumption goods by consumers. This is the clue to trade fluctuations: if consumption-demand falls, traders will require smaller stocks, orders will contract and productive activity decline; and, as general demand is in turn derived from productive activity, a vicious circle of

deflation will result. Similarly, if consumption-demand rises, there will be an inflationary circle.

Mr Hawtrey is content to assume, without going deep into underlying motives, that changes in consumption-demand itself are due to changes in cash holdings, which can be counteracted by alterations in traders' loans from the banks. These changes frequently occur and from many sources; those originating in the investment market have no special significance and should not be allowed to affect trade through their purely monetary effects. Mr Hawtrey thus advocates a return to traditional Bank Rate policy with the banks refusing loans to borrowers to buy securities in "boom" periods.

The author begins his book by demanding a theory

which gives due weight to all relevant circumstances. The criticisms which occupy the second half of the book are principally on this ground. Thus, the non-monetary approach of Professor Pigou is criticised for dealing less with epidemics of unemployment than with technological unemployment. Of the money approaches, Professor Hayek's is deemed most satisfactory. He has missed the special significance of working capital by not making it sufficiently distinct from instrumental capital, but, unlike Mr Keynes, he does not deny the susceptibility of working capital to movements in the interest rate. Mr Keynes is also criticised for abandoning the classical theory of interest: the demand for idle balances, to which he appeals in making the urge to liquidity the determinant of the rate of interest, does not in fact fluctuate very considerably. It may be suggested, however, that this criticism is based upon an error: it is not so much the amount of the balances that matters as the inducement needed to make a potential investor reduce them that determines the rate—and this can fluctuate a lot without being shown in any statistics. Mr Hawtrey also avers that both Mr Keynes and Mr Harrod err about the deepening of capital. The latter assumes that there is an immediate possibility of the process failing; the former appears to ignore it altogether.

Whether Mr Hawtrey himself passes his own test of reality will doubtless be disputed; and he himself suggests mutual criticism as the best means to agreement. Certainly his constant reference to actual institutions and events gives the book an appearance of reality and, if its substance be disputed, its lucidity of statement is a model to other economists.

Shorter Notices

"Manchester Makes." Survey of Lancashire Manufactures other than Cotton. Published by the Manchester Chamber of Commerce.

The Manchester Chamber of Commerce has recently done very valuable work in analysing the peculiar industrial problems of Lancashire. Its latest publication is called "Manchester Makes," and is extremely important because it surveys manufactures other than cotton. An article on "Metropolitan Manchester" was published in *The Economist* on February 6th last (p. 289), which pointed out that Manchester was far more than merely a cotton centre; it drew attention to the great diversity of industries with which the city was closely concerned. It is unlikely that the cotton textile industry will regain a very large share of its lost trade; and Lancashire, though still primarily interested in cotton manufacture must depend more and more for stability and progress on other trades.

The Chamber's survey gives a remarkably clear bird's-eye view of the achievements and possibilities in this direction. There are 18,000 factories and 8,000 workshops in Lancashire not concerned with textile manufacture; over 30 per cent. of the total workers in the United Kingdom engaged in the production of glass, oil, glue, soap, wire-netting, boxes and packing cases, wallpaper, rubber goods and oil-cloth work in Lancashire. The area is now holding its own with the south in the attraction of new industries; and the resultant balance and variety will have a national importance. These facts need to be known *pour encourager les autres*. There is a new outlook in Lancashire; and the Manchester Chamber must be highly commended for telling the world about it in this survey.

"The Paris Commune of 1871." By Frank Jellinek. Gollancz. 447 pages. 8s. 6d.

Mr Jellinek seeks to show that the Commune of 1871 was a continuation and a transformation of 1789 and 1848: that the bourgeois revolution was transformed into a revolution objectively socialist, though subjectively still Jacobin; and that the bourgeoisie, now openly counter-revolutionary, found its fitting representative in Thiers, "that monstrous gnome," as Marx called him.

He tells the story of the Commune from its origin amidst the ruins of the Second Empire to its bloody repression by the Versailles. Heroes, poltroons, eccentrics and grotesques, all were caught in the web of the Commune; Félix Pyat, the Commune's evil genius, the personification of Jacobinism run to seed; old Delescluze in top hat and frock coat calmly walking to his death on the barricades as though to embrace a friend; the obtuse Admiral Saisset; the small boy, Dufour, sitting on a powder-barrel in the fort at Issy

ready to blow up the fort and himself at the approach of the Versailles; the gallant Dombrowski.

Mr Jellinek succeeds in recreating the atmosphere of the Paris of those days, the horror of "those tragic nights which were to strike seven times," the confusion and fumbling of the Commune's beginning, the heroism of its end. An avowed Marxist, the author, has based his work on a study of all the available documents and has written a balanced, exact and careful history.

"The Economic System in a Socialist State." By R. L. Hall. Macmillan. Pages xv + 263. 7s. 6d. net.

Mr Hall first explains the nature of the economic problem as the rational adjustment of scarce means to ends. The competitive solution provided—imperfectly—by modern capitalism implies private ownership and use of resources, and results in great inequality of incomes, two things unacceptable to a Socialist State. Socialism therefore means that a Ministry of Production must control the economic activities of the community, to ensure complete employment and the equality of real incomes. The author argues that there is no great difficulty in maintaining a market for consumers' goods, since any Socialist State will have some indication of consumers' preferences to work on in the form of past experience under capitalism.

"Force or Reason." By Hans Kohn. Harvard. Humphrey Milford. 167 pages. 6s. 6.

Professor Kohn, with a brilliant array of literary and historical references, attempts to restate the aims of modern democracy. He is concerned with enduring ideas rather than transient facts, although his use of history is always illuminating. He paints the historical background of modern dictatorships in philosophical colours, and sheds a dry light on modern politics.

"The Stock Exchange Official Year Book, 1937." 3,600 pages. £3.

This completely indispensable volume continues to expand at an increasing rate without being unwieldy or in any way padded. This issue contains particulars of 59 more Government and municipal loans and 428 more companies. A useful new feature is a list of British statutory companies.

"Banking, Insurance and Financial Review (1936-1937)." Annual review published by *The Financial News*.

This valuable yearly survey outlines the main trends of the moment; banking and the developing boom; the credit needs of industrial recovery; and the finance of rearmament. An assessment is made of the consequences of gold *bloc* devaluation; and the past year in France is carefully examined. The Stock Exchange, building societies and insurance companies are significantly reviewed; and the survey ranges over the United States, South America, Australia, India and the Far East. An authoritative, critical and comprehensive review.

"Hitler's Drive to the East." By F. E. Jones. Gollancz. 126 pages. 12s. 6d.

Mr Jones draws a grim, brief and pointed picture of the growth of Fascist parties and the use of Fascist methods in the countries of South Eastern Europe. He relates this uprising to the nature and direction of Nazi ambitions, and has written a suggestive book.

MONEY AND BANKING

Who Owns an Insurance Company's Assets?

[The great strength of the British insurance market is a most valuable asset to this country. But it has one curious disadvantage. The finances of the great majority of the companies are so sound that nobody ever questions them or troubles to think what would happen if a failure occurred. The consequence is that few people bother themselves about the law which comes into play if an insurance company does fail. The following article is an attempt to sum up the law of insurance assets as it stands to-day—an attempt that has not, we believe (apart from a few judgments dealing with isolated points) ever been made before].

TWENTY-EIGHT years ago Parliament passed the Assurance Companies Act, 1909, which was meant to be, and still is, the composite insurance companies' bible. It defined the security that must be provided by a British insurance office; it provided forms of account in which annual returns must be made to the Board of Trade; and it determined the rights and relations not of all but of several different departments of a composite office.

Unfortunately, this bible was so ambiguously worded that before many years had passed the higher critics were forced to get to work on it; and though they have been at work now for some twenty-five years their labours are still unfinished. A measure of agreement has indeed been reached, but whether that agreement enshrines the true meaning of those who passed the Act or is only a gloss on the sacred truth—that will never be known.

The main source of the obscurity is Section 3 of the Assurance Companies Act, 1909, which makes three points. They are: (1) That every composite company must keep separate funds for life, fire, personal accident, employers' liability and bond investment; (2) that each fund shall be as absolutely the security of policyholders of the class to which it relates as though it belonged to a company carrying on no other class of business; and (3) that in spite of having to keep separate funds a company shall not be obliged to keep the investments of the various funds separate. What does the law mean when it says that a man must keep separate funds but need not keep separate investments?

To the normal man the word "funds" denotes assets. "My funds at the moment are low." "I hope shortly to be in funds." "How can I replenish my funds?" In all these sentences the word funds is practically interchangeable with the word assets. If the legislators of 1909 had been content to use the word funds without introducing that other word investments, then their meaning would probably never have been in dispute. But with the two words there, and each in opposition to the other, some meaning other than the ordinary meaning must be given to one or other of them; for, in the ordinary meaning of the words, the Act would simply say that it is necessary to keep separate assets for each department and unnecessary to keep separate investments—which is absurd. Clearly, to make sense of all this a major operation had to be performed on one or other of the words, and it was decided to operate on the word funds.

What the lawyers did was this: they decided that "fund" in this Act does not denote wealth. Mr Justice Bennett, in the *Hearts of Oak* case, expressed the generally accepted view in the words: "The word fund is merely an accounting term in this Act." If the Act, therefore, were to be re-written in plainer language it would run on these lines:—

A separate account shall be kept and the receipts shall form a separate fund (which word in this Act shall be merely an accounting term) and the fund (which as aforesaid is merely an accounting term) shall be as absolutely the

security of the policy-holders of that class as though it belonged to a company carrying on no other business.

It really is confusing and the life policyholders of those few companies which have failed, finding that their life's savings, instead of being set aside for them in segregated investments, have only been carried to an accounting term, might be inclined to say that the Act had done nothing for them. That complaint would be natural, but it would not be entirely accurate, because the Act, despite its obscurity, has done something for life policyholders, and that something has at times proved to be of considerable value.

To appreciate what the Act did it is necessary to read with some care the proviso about investments, which runs:—

Nothing shall require the investments of any fund to be kept separate from investments of any other fund.

That is not a statement that a separate fund shall not have separate investments; it is only a statement that it need not have them. The matter is left open to the managers of every insurance company. If they choose not to segregate investments, they need not do so; if they prefer to segregate them, they may. But if they segregate them—if they decide to maintain the company's assets in such a way that it is possible to trace a connection between any particular asset and one particular fund—then that asset is segregated.

When a liquidator is appointed, therefore, to wind up the affairs of a composite insurance company one of the things that he has to ask himself is: On the evidence presented to me from the books and records of the company, do I find that some of the investments were bought and maintained for the service of one of the funds? Or do I find that the investment policy of the company was indiscriminate, and that when the directors bought War Loan and lent money on mortgage they had in mind only the general liabilities of the company? On the answer that is given to that question depends the policy of the liquidator—whether he uses a particular group of investments for the payment of a particular group of creditors, or treats all the assets as in hotch-pot and recognises a rateable claim of all the creditors on all the assets. And in the liquidations which have been carried out since the Act was passed it has in some cases been decided that there was in the minds of the directors an intention to segregate the assets. In others it has been decided that there was no such intention. Everything depends on whether the investments are tied to a particular fund and whether the string that ties them is visible to the expert eye of the liquidator, the registrar and the judge. Whenever the string has been visible the creditors of the solvent departments have benefited. When it has not been visible they have suffered. Unfortunately, until liquidation takes place nobody knows whether the string is there, whether the investments have been segregated.

The value of the separate fund, as set up by the Act, comes out clearly when we consider the investments deposited with the Board of Trade in respect of a particular class of business. The Act stipulates that there must (subject to certain conditions) be a deposit for life, for fire, for personal accident, for employers' liability; and it sets up a separate fund for each of them, saying that the deposit shall be deemed to form part of the fund. How a deposit of £20,000 can form part of an accounting term, which has nothing to do with assets or investments, is not clear; but there it is—a separate fund with £20,000 of investments forming part of it, so that whatever else happens to a life policyholder when his company fails he does at least have his share of the £20,000 deposit.

Now let us compare the position of the motor policyholder under the Act of 1930. The Act of 1909 did not deal with motors, but the Road Traffic Act of 1930 did. It said that every company doing motor business must deposit £15,000 with the Board of Trade, and thus it appeared to put the policyholders in the motor department into the same position as regards £15,000 as the life policyholders were in as regards £20,000. But, in fact, it did not. And the reason that it did not was that the Road Traffic Act, 1930, did not constitute a fund, and there being no fund to tie the deposit to there was no segregation of the deposit. The deposit for motor insurance under the Road Traffic Act of 1930 went into hotch-pot because there was no fund. The deposit for life under the Act of 1909 did not go into hotch-pot because there was a fund.

We may proceed, therefore, to sum up the law as it stands, or is believed to stand:—

(1) Separate funds must be maintained, but they do not necessarily carry separate assets.

(2) Where there is a deposit as well as a fund, the deposit is in every case segregated.

(3) Where there is a deposit and no fund, the deposit is not segregated.

(4) A company is permitted to segregate assets to each fund but (apart from the deposit) is not bound to do so.

(5) Whether a company has in fact segregated or not is a question to be decided on a consideration of the books by those in control of the liquidation, and it is not known before liquidation begins.

The Clauson Committee recommended that the assets of all departments should be segregated. That is going too far; for the objections to segregation all round are grave indeed. But the life investments stand alone and the reform needed at present is to segregate them while the remaining assets are left in hotch-pot.

Financial Notes

The Bank of England.—This week Mr Montagu Norman was re-elected Governor of the Bank of England, and so entered upon his eighteenth year of office. Mr B. G. Catterns, who became Deputy-Governor a year ago, has also been re-elected. Among the directors elected for the coming year there were two new candidates, Mr E. T. Bunbury and Mr John Martin. Mr Bunbury was formerly general manager of the Indian house of Forbes, Forbes, Campbell and Company, and he also served on the Central Board of Governors of the Imperial Bank of India. Mr Martin has had gold-mining interests on the Rand, and was president of the Transvaal Chamber of Mines. These new appointments therefore strengthen the Bank of England's connections with the Empire. Hitherto the tendency has been for the links to work the other way; for the Bank has lent its own officers to the newly-established Empire central banks. While there are already precedents in the opposite direction, it is advantageous that the Bank should draw upon the Empire for some of its directors, thereby strengthening its own connections with the Dominions. Nor does this imply any sacrifice of their independence by the Dominion central banks, but on the contrary it helps to foster mutual co-operation between them and the Bank of England. For these reasons we welcome these two new appointments, and our welcome is based equally upon personal and public grounds.

The Floating Debt.—In the following table we show the composition of the floating debt at the end of the last two financial years and also at the normal peak period of each year, namely, December 31st immediately before the last quarter, when the bulk of the year's revenue is collected. Treasury bills are divided into those issued by tender to the banks, the discount market and other private applicants; and those issued through the tap to Government Departments and others.

Unfortunately, the position is always distorted at these particular dates, for on December 31st the total issue of Treasury bills tends to be low, while on March 31st it tends to be high. The reason is the market's reluctance to pay for bills at the end of December, contrasted with its eagerness to pay for bills at the end of March, but it makes it difficult to draw any conclusions from the movements during the last quarter of the financial year.

	Dec. 31, 1935	Mar. 31, 1936	Dec. 31, 1936	Mar. 31, 1937
	(£ millions)			
Treasury Bills:—				
(a) Tender	565.0	498.0	609.0	500.0
(b) Tap	300.9	265.1	157.2	174.6
Ways and Means Advances:—				
(a) Public Depts.	33.1	19.1	27.8	23.5
(b) Bank of England ..	37.0	...	57.0	...
Total Floating Debt ...	936.0	782.2	851.0	698.1
Floating Assets*	333.9	284.2	185.0	198.1

* The floating assets of the Departments, etc., i.e., tap Treasury bills plus Ways and Means Advances by Public Departments.

During the past financial year there was a reduction of £84 millions in the floating debt, due mainly to the Government's debt refunding operations. This reduction, however, was confined to the Departments' floating assets, while tender issues of Treasury bills are unchanged. The Exchange Equalisation Account's net gold purchases during the year are one explanation, but it also shows how the Departments have been supporting the two last Funding Loan issues.

The Bank Return.—Easter currency demands have raised the note circulation by a further £3.3 millions and have reduced the Reserve by the same amount.

Special buying of early April bills to help the market over the end of March doubtless explains the fresh increase of £6 millions in Government securities. If so, there should be a big contraction here next week as the bills reach maturity. There is a temporary turnover of £20 millions from bankers' to public deposits, due to the heavy Treasury bill payments and the absence of maturities during the last two days of March.

The Money Market.—Heavy Treasury bill payments on the last two days of March and the absence of any maturities made money temporarily less plentiful. There was, however, no real stringency, and resort to the Bank was avoided. In addition to a big turnover from bankers' deposits to public deposits, there was further special buying of bills prior to March 31st, while on that day the market felt that special buying would be renewed if any real stringency developed. Meanwhile, there was a demand for Treasury bills of special dates in May and June, which helped the market, while the drop in bankers' deposits to £62.3 millions shows that the banks must have let their cash balances run temporarily very low. The payment of the 3½ per cent. Conversion Loan dividend on April 1st made money easier, but the heavy Treasury bill maturities on that day were of no assistance, as all those bills had been bought up by special quarters during the closing weeks of March with the object of supplying the market with cash at the end

of the month. All this suggests that the authorities are still determined to keep money easy.

	Mar. 11, 1937	Mar. 18, 1937	Mar. 24, 1937	Apr. 1, 1937
Bank rate	2	2	2	2
Clearing banks' deposit rate	1	1	1	1
Short loan rate:—				
Clearing banks	1-1*	1-1*	1-1*	1-1*
Others	1	1	1	1
Discount rates:—				
Treasury bills	1	1	1	1
Three months' bank bills	1-1	1-1	1-1	1

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

Three months' bank bills are now quoted 1½ per cent. higher, as they have become the unpopular July maturity. Conversely, last week's Treasury bills, being the popular end-of-June maturity, went at a fraction under ½ per cent. The discount market tendered at just over ½ per cent., so that many of the bills must have been allotted elsewhere. Only £42 millions of bills were allotted out of the original offer of £45 millions.

The Foreign Exchanges.—The fact that payments for the French Defence Loan fell due on April 2nd created a demand for francs, which lasted up to March 31st. To meet this demand the Control sold francs for sterling at Frs. 106.32, but on April 1st the demand subsided and the rate broke away to Frs. 106.37. Forward francs moved in the reverse direction. Early in the week they were offered, as operators were selling forward francs against their spot purchases, but so soon as the demand for spot francs subsided forward francs were bid. The three months' rate in consequence came back on Thursday from Frs. 2 to Frs. 1½ discount. Other currencies have been weak against sterling, mainly because they were being sold against purchases of francs. Dollars have depreciated from \$4.88½ to \$4.89½, while Swiss francs were offered up to Frs. 21.47, belgas up to Bel. 29.05, and guilders up from Fl. 8.92½ to Fl. 8.93½. The payments for the French Defence Loan will take a lot of money off the market in Paris and may create conditions of some stringency.

The Eastern Exchange Banks.—The chairmen of the Eastern Exchange banks have had an encouraging tale to tell. Broadly speaking, the Far East has benefited greatly from the rise in primary products prices to remunerative levels. This has not only helped the trade balances of wide areas such as India, Malaya and China, but has also restored the purchasing power of countless individual cultivators in districts far removed from the ports. Both Lord Catto, at the Mercantile Bank of India meeting, and Mr Haskell, in his speech to the Eastern Bank shareholders, were able to point to last year's striking improvement in India's active trade balance. India is now able to meet her current external obligations without resort to gold exports, while Government had been able to acquire large sterling reserves. Mr Langford James, at the National Bank of India meeting, pointed out that between 1934 and 1936 Indian gold exports fell from £45.4 millions to £24.9 millions. Mr d'Anyers Willis, at the Chartered Bank of India, Australia and China meeting, said that in 1936 India became an importer of silver for the first time for several years. There are various problems outstanding, including the future of the jute industry and trade relations between India, Great Britain and Japan, but it is clear that the inauguration of India's new form of Government has happily coincided with a period of recovery. Turning to China, Mr Paterson, at the Hongkong and Shanghai Bank meeting, alluded to the stability of the Chinese currency since the monetary reforms of 1935. The immediate needs were the balancing of the budget and the reorganisation of the Chinese Central Bank. This last point was reinforced by Mr Willis. Mr Paterson also said that the new Hongkong

currency was working satisfactorily. Several of the chairmen spoke in encouraging terms of the revival in Malaya, fortified by the higher prices of rubber and tin.

We regret that in the advertisement of The Chartered Bank of India, Australia and China in our issue dated March 27th, several errors crept into the text in the early editions owing to confusion in connection with the correction of proofs. We repeat the corrected advertisement in this week's issue.

Employers' Liability Assurance.—The great bulk of the premium income of this Corporation is derived from casualty business in the United States of America. Thus its accounts are always of special interest as an indication of the probable experience of the large composite offices whose figures are not available until a considerably later date. Last year total premium income was much the same as in 1935, being £365,000 against £358,000 in the fire branch, £332,000 against £323,000 in the accident branch, and £6,208,000 compared with £6,212,000 in the general branch. Roughly one-third of the premiums in the general branch are on account of motor insurance. In view of the narrow margin of profit in American casualty business, the results are very satisfactory. Actually, claims in this branch fell, on substantially the same premium income, from £3,909,000 to £3,736,000, but almost the whole of this saving disappeared in increased expenses and commissions, which rose by £46,000 and £121,000, respectively. The average reserve for unexpired risk amounts to 34.8 per cent. of the total premium income of this branch. The underwriting results of the last two years are given below:—

	1935		1936	
	Amount	Percent- age of Premiums	Amount	Percent- age of Premiums
Fire	£ 33,224	9.0	£ 27,757	7.6
Accident	6,408	2.0	15,878	4.8
General	191,194	3.1	209,994	3.4
Exchange profits	4,433		2,529	
Profits from invest- ments, etc.	59,019		...	
Gross surplus	281,462		224,402	
Taxes	...		125,000	
Net trading surplus..	281,462		99,402	

On this occasion no transfer is made to general reserve, against £300,000 in 1935, but the amount carried forward in the appropriation account is increased from £89,000 to £234,000; in addition the amount set aside as provision for income tax is £125,000, against zero in 1935.

Taking the American exchange at \$4.86 to the £, the book value of the Stock Exchange securities on December 31, 1936, was £6,996,000, compared with market values of £7,134,000. This margin of £138,000 compares with a depreciation of £176,000 at the close of the previous year. Total assets amount to £10,958,000, and taking into account the above margin of £138,000 and converting the currency liabilities and assets other than investments at the rates ruling on December 31, 1936, there is a net surplus of £51,000; at the end of 1935 there was a corresponding deficit of £243,000. The Corporation owns all the shares of the Clerical, Medical and General, which are taken at the price paid for them in 1921, namely £486,000. Their true present value is very greatly in excess of this figure. The general reserve remains unaltered at £2,500,000. The dividend is the same as in each of the past two years, namely 70 per cent., and costs £207,000 compared with interest income of £252,000. The market quotation of the shares is always on a higher interest yield than for other British insurance companies, since the business transacted depends to a preponderating degree on workmen's compensation and motor insurance conditions in the United States. The balance sheet is strong, however, and the corporation can meet the dividend out of interest income alone.

THE STOCK EXCHANGE

Electric Supply Share Outlook

A YEAR ago we reviewed the results of electric supply companies over a seven-year period from 1929. The figures quoted on that occasion (see *The Economist* of March 28, 1936) showed remarkable stability of earnings over this period, and they bore the obvious investment moral that the main consideration affecting the shares of supply companies in the future would be the course of interest rates rather than any fundamental change in the industry itself. The movements of the principal electric supply shares during the last twelve months have substantiated this view. Of the seventeen companies whose results were then discussed, the shares of sixteen have registered a slight fall, averaging about 5 per cent. We have extended our analysis of earnings in the first table below, which incorporates the results of fifteen companies. These undertakings together account for approximately 80 per cent. of that part of the industry which is in company hands (about one-third of the total). Of the remaining 20 per cent., approximately one-half is represented by the Edmundson's group, whose results are not yet available.

Details are not available of the number of units sold by some of the companies surveyed, but a 75 per cent. sample of companies (including all 15 companies except North-Eastern and Clyde Valley), which disclose the number of units sold, shows an increase over the period from 1934 to 1936 of 32 per cent. A 45 per cent. sample, which reports both units sold and revenue received (excluding, in addition to North-Eastern and Clyde Valley, Lancashire, Midland Counties, North Metropolitan, Electrical Distribution of Yorkshire and Scottish Power), shows a 31½ per cent. increase in the number of units sold and an increase of 23½ per cent. in revenue received. Company undertakings over the last few years have increased their output more rapidly than public undertakings. There are two reasons for this. First, public undertakings have a proportionately greater share of the denser centres of population where, four years ago, they were already closer to saturation than private undertakings, operating to a greater extent in more scattered areas. Secondly, some sections of the industry have now adopted a progressive sales policy, whereas a few years ago they were unduly mindful of their rights.

What does this improvement in sales mean in terms of revenues? Taking the 45 per cent. sample of eight companies, it appears that costs have kept pace with the increase in units sold. The rate of increase in operating costs since 1934 is in fact 32.6 per cent., against 31.4 per cent. in the number of units sold. Consequently, with a reduction in the average price per unit from 1.13d. to 1.085d., the increase in net revenue of 16.4 per cent. is little more than half the increase in the number of units sold. The 16.6 per cent. increase in net revenue of the whole group of 15 companies concurs closely with this result.

Allocations to depreciation reserves have increased at a greater rate than net revenue. The actual increase in depreciation provisions over the period 1934-36 is 23.8 per cent., while the proportion of net revenue appropriated for this purpose has increased from 36 per cent. to just over 38 per cent. To some extent this is due to technical requirements, but to a larger extent to increased appropriations by certain companies, which formerly made rather inadequate provisions.

Debt interest and preference dividends together now take a relatively smaller share of available net revenue, and earnings for ordinary capital show a proportionate increase nearly as great as the percentage

advance in net revenue. The average earnings on the amount of ordinary capital outstanding have shown an increase from 8.2 per cent. in 1934 to 9 per cent. for 1936. The increase, however, has not been fully disbursed in dividends, for the ordinary distributions paid in 1936 represented 87 per cent. of the amount available, against 89 per cent. in 1934. Two significant points which emerge from these figures deserve emphasis. First, costs have increased proportionately to the number of units sold, and more than proportionately compared with the revenue received. Secondly, depreciation now absorbs an increasing proportion of net revenues.

The outlook for electric supply shares now depends largely upon the effect of legislation, which has been promised for the reorganisation of the industry. There is no reason to expect that any of the companies which are under discussion will disappear from the investor's ken. There may, however, be changes. It is possible that Electrical Distribution of Yorkshire may eventually

SALES AND REVENUES OF ELECTRICITY UNDERTAKINGS

Note.—Fifteen companies include all concerns listed in second table. Thirteen companies reporting units sold exclude North-Eastern Electric and Clyde Valley. Eight companies reporting units sold and gross revenues includes: County of London, London Associated, Yorkshire Electric Power, Metropolitan Electric, British Power and Light, Northampton Electric, Mersey Power and Bournemouth and Poole.

merge with its associated company, Yorkshire Electric Power. Midland Counties may segregate its traction interests from its electric supply undertaking. Mersey Power might conceivably be amalgamated with the North Wales Power Company. Finally, British Power and Light may not retain the various subsidiary companies which it now owns and operates in various parts of the country, and the investor might well find himself instead a shareholder in its principal operating subsidiary, North Wales Power.

Apart from such possible changes, legislation would encourage the companies under review to absorb smaller undertakings operated by independent companies or municipalities in their areas, while they may also become subject to limitation of dividends under a sliding scale according to the prices charged. It is to be expected that basic dividends should approximate to the present rates of earnings, though there may well be some reduction where earnings arise substantially from under-

Investment and Company Notes

Course of Share Values.—The first quarter of 1937 has brought less happiness to the firesides of British investors than any since the markets began their long rise. Gilt-edged stocks have regained very little of the ground they lost in January and February. Commodity shares have benefited from the boom in wholesale prices, but the leading home industrial equities have trended almost uniformly downwards, as is shown by our customary chart on this page. The gradient, indeed, has been so steep that the index, at the moment, is very little higher than it was last August. Even Wall Street, which in January and February moved in counterpoint to London, has more recently declined in unison. Technically, both

BRITISH AND AMERICAN INDUSTRIAL SHARE VALUES OVER THE PAST TWO YEARS (1928 = 100)

British: "Financial News" Index of 30 Ordinary Shares
American: "Standard Statistics" Index of 50 Common Stocks

markets are now showing signs of greater strength, but professional investors are still reluctant to commit themselves very far. In the past the introduction of a British Budget has occasionally been a signal for renewed investment buying. This year, the omens suggest that the taxpayer may escape more lightly than was at first feared. The market, indeed, has probably discounted an additional 3d. on the income tax with the thoroughness with which it has discounted higher industrial profits. But confidence in the maintenance of existing interest levels has not yet been restored, and to start a renewed buying movement the market needs something really big on the equity side to go for. And that something, unfortunately, it has not got.

* * *

Industrial Share Outlook.—This thought may sober those investors who had counted on a good market response to this week's bullish company news. But the prospects for industrial shares generally are still clouded. If a spectacular increase in earnings is required to offset the hardening tendency of interest rates, whence is it to come? From the examination of the industrial situation in our leading article on page one, three significant investment pointers may readily be drawn. First, rising costs are now making themselves increasingly felt. And there are obvious limits to the extent to which they may be passed on to the consumer. These limitations particularly apply to capital extensions which would normally be undertaken, but may be postponed without technical dislocation until

takings operated under a franchise with a very short period to run. Among the companies discussed here, Northampton Electric is most likely to be affected by such a reduction.

It is, therefore, of paramount importance that the investor should form a view as to the real earnings of each company. In this matter, the question of depreciation, which we have invariably stressed in these columns, becomes crucial. Some uniform basis may well be established—indeed, it may be observed that practice is becoming more uniform, and that divergences from the standard scale which we have adopted as a yardstick for measuring depreciation have become less frequent. In total, the allocations for depreciation made by the fifteen companies analysed slightly exceed the amount disclosed as available for ordinary dividend. The importance of depreciation provisions in relation to "true earnings" can hardly be over-stressed.

Accordingly, we set out below the earnings of the various companies after making adjustments, where necessary, between the companies' own provisions for depreciation and those suggested by our standard scale:—

SHARE PRICES AND YIELDS

	Earnings Disclosed	Earnings Adjusted	Dividend	Price	Yield on		
					Disclosed Earnings	Adjusted Earnings	Dividend
B'th & Poole...	19.1	...	15	72/-	5.3	...	4.2

Yorks E.P.	8.8	13.4	8	43/6	4.0	6.2	3.7

Note.—Blanks in second column indicate that no adjustment is necessary.

The table of earnings throws an interesting light on the relative attractions of different shares. Lancashire Electric, for instance, ranks among the dearer shares, in relation to the adjusted earnings on our standard basis of depreciation. For the County of London and Metropolitan undertakings, the effect of the 1925 Acts introduces an element of uncertainty, and it is inappropriate to base any view on earnings yields in these cases. Mersey Power Company, on the adjusted figures, appears attractive, but this undertaking's load is subject to industrial fluctuations to a larger extent than most companies. Yorkshire Electric, Midland Counties and British Power and Light are more obviously interesting on these calculations. Midland Counties, it is true, depends upon its traction undertakings for an appreciable part of its revenue, but from the analytical point of view this is as attractive as any share in the list. The price of British Power and Light has apparently been depressed on the ground that, as a holding company, it may be prejudiced by legislation on the lines recommended by the McGowan Report, which drew critical attention to holding companies' profits made from contracting work carried out for subsidiaries. It is clear from the chairman's speeches in the past, however, that any such fear is unfounded.

Those investors who have bought electricity supply shares on their long-term dividend potentialities, in fact, may have to revise their reasoning. From every angle—costs and revenues, depreciation and legislation—there are powerful forces making for stability of dividends. Those companies which are still in the expanding stage may provide the incidental benefits of new share issues on bonus terms, although even here it is becoming fashionable to raise new money on prior charge. Altogether, investment in electricity supply shares—once regarded as the safest method of participating in industrial expansion—is in danger of becoming a negative art, calling for discrimination among the companies themselves on the lines indicated in this article, watching the legislature's next jump, and an unremitting eye on the rate of interest.

prices are somewhat lower. The field of electrical development may be an example of this sort. Secondly, additions to new capacity tend to be increasingly held up by the delayed delivery of essential equipment, while the news this week that the Lanarkshire Steel Works (acquired by Colvilles last year) has been compelled to shut down half the plant through lack of pig iron and scrap supplies reveals the extent of the prevailing shortage of basic materials. A regimentation of supplies for the rapid completion of the re-armament programme, moreover, cannot be ruled out. Thirdly, while the labour situation has not so far shown any marked deterioration, the Beardmore strike gives practical expression to a certain feeling of restiveness which is developing. Strikes have so far been sporadic and confined largely to the aircraft and light engineering trades. But the possibility—faint though it may appear at the moment—of a forward labour policy cannot be disregarded by any investor who imagines that the manna of capital appreciation falls eternally from the skies.

* * *

Foreign Bonds in March.—The trend in the foreign bond market last month was adverse. The index of bond prices calculated by the Municipal and General Securities Company shows a fall from 119.0 to 115.7, and only the Near and Far East group has improved during the month. The component indices follow:—

January-June 1934=100

	Europe	Near & Far East	Egypt	South and Central America			Complete Index	Un- faulted Bonds	De- faulted Bonds
				States	Pro- vinces	Total

The setback is clearly attributable to the speculative sections of the market. The South American groups, in particular, have been unsettled by unauthenticated rumours of the Brazilian Government's intentions regarding the debt scheme. European issues have been unsettled by the Polish Government's threat of default and by the demand for "adjustment" from Danzig. The most consistent group, indeed, were Chinese defaulted issues, whose rise more than offset a reaction in Japanese bonds. The number of bonds in the Index is now 110.

* * *

Imperial Chemical Profits.—The preliminary statement from I.C.I. will not satisfy inveterate optimists who hoped for an extra $\frac{1}{2}$ per cent. in dividend, for the distribution is maintained at 8 per cent. But the disclosed profits are distinctly good. A new gross income record of £9,049,422 has been achieved, compared with £8,352,430 for 1935. From this total, central depreciation fund receives its annual quota of £1 million, and after providing for income tax and pension fund provision, earnings for the ordinary capital have increased from £4,965,801 to £5,462,591. The 8 per cent. dividend is thus covered with the larger margin of 4 per cent., which has been employed in raising the general reserve provision from £1 million to £1 $\frac{1}{2}$ million. The following table compares the results with those of the two previous years.

	1934	1935	1936*
Total income	7,965,038	8,352,430	9,049,422
Income tax	615,931	645,891	846,093
Central obsolescence and depreciation	1,000,000	1,000,000	1,000,000
Pension fund	Nil	150,000	150,000
Preference dividend	1,588,897	1,590,738	1,591,014
Ordinary			
{ Earned	4,194,462	4,965,801	5,462,315
{ Paid	3,500,531	3,935,512	3,935,912
{ Earned %	10.0	11.0	12.0
{ Paid %	8	8	8
Deferred			
{ Earned	565,748	...	...
{ Paid	214,367	...	...
{ Paid %	2	...	...
To general reserve	1,000,000	1,000,000	1,500,000
Total carried forward	608,451	638,740	665,142

* Preliminary figures.

The board's treatment of last year's increase in earnings suggests that it is not to be tempted from its avowed policy of holding the balance between customer, worker and shareholder by the results of a year which, in some respects, may have proved exceptionally favourable. Even the assembled forces of a £72 million company are not proof against rising costs, and the notion that I.C.I. has a re-armament equity which renders it proof against normal trade fluctuations cannot seriously be entertained. It is interested to a much larger extent in prosperity in the construction trades and in economic recovery in agricultural communities. At 38s. 7 $\frac{1}{2}$ d., I.C.I. ordinary are essentially a stable investment medium, yielding £4 2s. 9d. per cent. But the present margin between dividend and earnings, coupled with an advance in profits for the current year, suggests that the directors might be able to combine conservatism with a slightly higher payment a year hence.

* * *

Associated Electric Report.—The report of this company is rather more encouraging than the raising of the dividend from 8 per cent. to 10 per cent. Profits have increased by no less than 27 per cent., from £828,519 in 1935 to £1,055,624, but their treatment is again markedly conservative. The following table analyses developments for the last three years:—

	Years to December 31,		
	1934	1935	1936
Profits, after management expenses	586,882	828,519	1,055,624
Taxation	129,752	179,674	267,574
Depreciation	90,439	91,832	149,574
Debiture interest	41,454	124,790*	...
Preference dividend	76,449	76,449	77,473
Ordinary shares:—			
{ Earned	248,788	355,774	561,003
{ Paid	227,778	303,750	375,290
{ Earned (%)	6.6	9.4	14.9
{ Paid (%)	6	8	10
General reserve	10,289	Nil	175,000†
Carried forward	113,336	165,405	176,118

* Interest £21,155; premium on redemption £103,635.

† Including £75,000 written off patents and goodwill.

The consolidated balance sheet reveals a liquid position. Large advances are shown by debtors, loans, etc., from £3,633,422 to £4,550,868, and a comparable expansion in stocks from £3,517,945 to £4,146,380. The company is evidently doing good business, and its export trade and indirect re-armament interests hold good promise. The substantial rise in the value of stocks suggests that the rise in raw material prices is making itself felt, and it would, perhaps, be prudent to limit estimates of future increases in profits for this reason. The £1 ordinary stock at 51s. 6d. yields £4 1s., and is a good investment of its class rather than a medium for rapid appreciation and earnings expansion.

* * *

Lever Brothers' Report.—The accounts of Lever Brothers are among the least illuminating documents offered to investors. The company has a share capital of £61.7 millions, of which all but the £8 $\frac{1}{2}$ millions of

ordinary capital (held by Unilever) is in public hands. The accounts show that £65.7 millions out of £74 millions of total assets consist of interests in subsidiary and allied concerns, while the profit and loss account shows a bald figure for "balance of profit and loss." The profits are, however, based on the company's proportion of the subsidiary companies' profits, less losses. The latest profits, however, do not repeat the previous year's jump, for they have increased by only £97,675 to £7,048,862, although this is a record figure. In consequence, the *status quo* is maintained throughout the appropriation account. Dividends are unchanged, with an ordinary payment of 15 per cent. And the reserve allocations—including £250,000 each to contingencies and to general reserve as before, and £320,473 written off shares in allied companies against £300,000 for 1935—leave the balance carried forward about £150,000 higher at £547,521. As a pointer to the forthcoming results of Unilever, the Lever Brothers' report is inconclusive. Rising butter prices are commonly regarded as a bull point for the group's margarine business, and the advance in West African produce prices is another favourable pointer. But the results of Unilever N.V., with which Unilever is linked under the dividend arrangement, will reflect Holland's departure from the gold standard last autumn. On balance, the prospects for Unilever ordinary stock, which has risen from 29s. 3d. last year to the present price of 41s. 6d., are satisfactory. But it is, as yet, impossible to translate this generalisation into firm estimates of prospective earnings.

* * *

Heard from the Chair.—Anyone who doubts the existence of prosperity should read the speeches at this week's company meetings. Four of them are of special investment interest. At the Associated Portland Cement meeting, Sir Malcolm Stewart commented on record production and delivery of cement, and upon the return of 17 per cent. on investments in subsidiaries. This company has just acquired considerable new raw materials deposits in Kent. Costs of production are mounting with wages and the price of coal, but the directors' policy is to seek agreements with competing producers abroad, to keep prices down and to rely for profits upon increased turnover. Sir Malcolm made a stimulating comparison between the differing success of international agreements between statesmen and industrialists. Another concern in the constructional industries, General Refractories (manufacturers of heat-resisting and heat-insulating bricks), celebrated a cheerful year. Mr Frank Russell, the chairman, also had record sales, a multiplicity of new products, plant working to capacity, and new financial arrangements to describe. He gave an extremely interesting table analysing the growth of the concern, scouted any idea that it was becoming top-heavy, and stated that it would follow a policy of "preparedness" in coming months by accumulating stocks of imported raw materials.

* * *

Two metal concerns, which enjoy practical monopolies in their respective industries, have also added to the investor's rejoicings. The International Nickel Company of Canada has pursued a liberal price policy with outstanding success. At the meeting in Toronto, Mr R. C. Stanley described big measures of re-equipment, including the opening of a concession in Finland, and a rise in profits of nearly 50 per cent. This company lately reduced its prices of nickel when base metals were soaring. It finances energetic research in new uses for its products and takes considerable pains to promote its employees' welfare. The chairman gave a well-documented disproof of its alleged dependence upon armaments. Aluminium shares in the prosperity of nickel. Mr R. W. Cooper told shareholders at the British Aluminium meeting that profits had risen by nearly 25 per cent., and that the plant was fully occupied. Some £2,500,000 is to be raised to develop the Lochaber plant, and a subsidiary has been formed in Australia. Mr Cooper gave a long list of new and extended uses for aluminium in transport, and in the electrical and steel industries, in the first of which

it is being increasingly used as a substitute for copper. Consolidated accounts are to be presented shortly for the first time. Both for their interest and their encouraging news, these speeches should be read in detail by investors.

* * *

Shell Union Earnings.—The year 1936 has put Shell Union firmly on its feet. For 1935, net profits amounted to \$6,812,835, and no payment was made on the preferred stock, then 4 $\frac{1}{2}$ years in arrear. During 1936, these \$8 $\frac{1}{2}$ millions of arrears were paid off, the normal preferred dividends distributed, and 25 cents paid on the common stock, the first distribution since 1930. The net profits actually amount to \$22,494,364, including a net profit of \$2,839,503 on the sale of an investment (evidently the Flintkote Company). This net result is struck, as usual, after writing off all development expenditure, which last year totalled \$9,450,000. With the restoration of regular preferred dividends, special interest attaches to the increase in common earnings (after normal preferred requirements) from 37 cents to \$1.57 per share for 1936, for the Royal Dutch-Shell group holds 64 per cent. of the common stock of Shell Union. If these earnings had been fully distributed, first by Shell Union and again by the Royal Dutch group, they would have represented some 4 $\frac{1}{2}$ per cent. on Shell Transport ordinary. The Shell Union directors have decided to introduce half-yearly dividend payments on the common stock. Meanwhile, the cash position has been strengthened by the net proceeds of the \$60 millions 3 $\frac{1}{2}$ per cent. debenture issued a year ago, although the company again spent \$36 millions on capital expenditure last year. Although the accumulation of stocks has recently been causing some head-shaking in the American oil industry, more optimistic observers expect that supplies will be rapidly absorbed when the seasonal de-

mand for gasoline increases this summer. The prospects for Shell Union, therefore, still seem promising. The 5½ per cent. preferred stock is quoted at 103½, and the common stock at 31½, against 15 last year.

* * *

United States Steel.—The full report of the United States Steel Corporation shows that last year's progress was due, not to rising prices, but to "a regularly advancing volume of orders." The increase in the rate of steel operations over the past two years is spectacular. Roughly 37 per cent. of capacity was in operation for the first nine months of 1935; in the next two quarters it rose to 47 per cent., and subsequently the rate exceeded 60 per cent. The payment of 14 per cent. on the preferred stock (the normal 7 per cent. for 1936 and 7 per cent. arrears) was declared two months ago, but the report shows that provisions were raised by the generous margin of \$9 millions, while taxes absorbed \$7.3 millions more. Preferred dividend arrears have now been reduced to 9½ per cent. Since these arrears total \$33,326,000, and the normal annual dividend requires \$25,220,000, a modest rise in net income (easily in sight for this year) would suffice to satisfy the preferred stockholders' claims. The results for the past two years are compared below:—

	Years to Dec. 31st (\$000)	
	1935	1936
Gross revenue.....	758,893	1,089,229
Depreciation, etc.	47,634	56,819
Operating income	4,392	62,054
Other income	6,030	5,117
Taxes	3,925	11,200
Interest and other deductions	5,351	5,387
Available for dividends	1,147	50,583
Preferred dividends	7,206(2%)	50,439*
Surplus for year	Dr. 6,059	144
Balance of earned surplus	252,517	252,661

* 7 per cent. for 1936, and 7 per cent. arrears.

The 1937 results, however, should be assisted by increased prices from January 1st to meet advancing costs for wages, materials and taxes. The effects of the wages increase were felt for only six weeks of last year, and they represent an addition to the pay-roll of \$34 millions annually. But even this formidable advance in costs does not seriously prejudice the prospects of the common stockholder. A more significant factor, perhaps, is the competition for pig iron and scrap from Europe. The current rate of operations, moreover, is probably close to efficient physical capacity. But economies from recent extensions should also be realised—some \$76½ millions was so spent last year, while ordinary repairs cost \$85 millions. The modernisation programme also contemplates an expenditure of \$157 millions. The current price of 122½ for the common stock, on which \$2.91 was earned last year, assuming normal preference dividends, is evidently a "blue-chip" valuation, but in all probability it does not exhaust the potentialities of the current year.

* * *

Westland Merger Surprise.—At the end of February the directors of Westland Aircraft announced the terms of the long-expected merger with British Marine Aircraft. The latter concern was to be acquired on the basis of one Westland 5s. share for one British Marine 10s. share. These terms, which appeared more closely related to the net assets position of the two companies than to their respective earnings prospects, were approved without dissent by Westland shareholders at an extraordinary general meeting as recently as March 22nd, although the managing director, Capt.

P. D. Acland, proposed an adjournment until this week, pending the clarification of a liability of British Marine under a management contract with British Aircraft Manufacturing Company. The chairman, Sir E. W. Petter, however, did not support this amendment, which was lost by nine votes to nineteen. Three days later, on the eve of the Easter holiday, the Westland directors announced that they had decided not to proceed with the merger. In a statement issued this week, the board declares that the *pro forma* balance sheet before the meeting "does not disclose the position as now existing." The Westland company understood that it would receive £115,781 cash, including a loan since repaid, subject to normal trading expenditure since January. Immediately after the extraordinary meeting, however, the board learned that British Marine had loaned £50,000 on January 14th to Aircraft Industries Corporation for four months, secured by the deposit of certain shares. The Westland directors declared that they had no knowledge of this transaction, and that they considered the security was not adequate. Having required the immediate repayment of this sum, they decided not to proceed with the merger on the ground that it had not been repaid.

* * *

On their part, the directors of British Marine declare that the company is in a position to carry out its part of the agreement and that no valid reason exists why the merger should not take place forthwith. It has since been reported that the board's solicitors have tendered a cheque for £50,000 to Westland, although this action does not necessarily imply that the merger will be completed. The behaviour of the market on this news was symptomatic of its attitude towards the scheme. On the report of the abandonment of the merger by the Westland directors, Westland shares rose from 8s. to 9s. 7½d., while British Marine were 2s. lower at a nominal quotation of 5s. 6d. Aircraft Industries Corporation, it will be recalled, acted as issuing house to the British Marine flotation, while British Aircraft Manufacturing appeared under the auspices of Yorkshire and Lancashire Corporation, of which Mr W. A. Phillips is also a director.

* * *

Other Company Results.—Our usual analysis of nearly 60 further profit and loss accounts appears on page 54. The full *Hudson's Bay* report is now available, and among the large companies' reports will be found *British Insulated Cable* and *John Dickinson and Company*. On page 52 the week's results are discussed under the heading "Shorter Company Comments."

* * *

Company Meetings of the Week.—On later pages of this issue will be found the reports of the following company meetings:—Bank of Australasia, Chartered Bank of India, Australia and China, National Bank of India, Banco di Roma, General Refractories, Associated Portland Cement, Telephone and General Trust, British Aluminium, International Nickel Company of Canada, and British Ropes. In a Note on page 27 will be found a discussion of statements made at the meetings of Associated Portland Cement, General Refractories, International Nickel Company of Canada, and British Aluminium. In connection with the meeting in Rome of the Banco di Roma, it was pointed out that the report showed an increase in deposits of roughly Lire 318 millions to Lire 982 millions. Sir Alexander Roger described the company's interests in the British West Indies at the Telephone and General Trust meeting. At the British Ropes meeting Mr Herbert Smith described extensions of his firm's manufactures in Canada and South Africa. Mr d'Anyers Willis reviewed the prospects for increased international trade in the East at the Chartered Bank of India meeting. A banker's view of recent New Zealand policy was given by Mr Livingstone-Learmonth at the Bank of Australasia meeting. At the National Bank of India meeting Mr Langford James surveyed the internal positions of India, Burma, Ceylon and East Africa.

Mining Notes

Anglo-American Corporation.—The accounts of the *Anglo-American Corporation* show a net profit of £1,161,640, compared with £819,820 for 1935. The sum of £1,500,000 received from share premiums is taken into the appropriation account, and £1,800,000 is transferred to reserve. After paying 30 per cent. on the ordinary shares, against 20 per cent., a somewhat increased balance of £154,730 is carried forward. The first report of the *Anglo-American Investment Trust*, to which the diamond interests of the group were transferred, shows an operating profit of £263,400. The 5 per cent. dividend absorbed £125,000, while £70,000 was reserved for taxation, £26,880 provided for preliminary expenses, and £18,750 for discount on debentures. The premiums received on the issue of 2,500,000 shares at 30s. have been taken to reserve fund. The company's principal interests are in De Beers Consolidated, Diamond Corporation, Cape Coast Exploration, Consolidated African Selection Trust and Société Minière de Beceka. These interests appear in the balance sheet below current values at £5,132,820. Market circles take a favourable view of this company's prospects.

* * *

Anglo-American Group Reports.—All the producing companies of the group milled record tonnages last year, but their financial results showed some variation. The following table summarises the results and the latest ore positions of the four constituent concerns:—

		Milled	Working Profit	Dividends	Ore Reserves		
		Tons	£	£	%	Tonnage	Dwt.
Brakpan	1934	1,479,000	1,321,850	596,750	52½	4,879,870	6-33
	1935	1,572,000	1,303,610	603,750	52½	5,857,170	6-29
	1936	1,631,000	1,319,200	661,250	57½	6,690,350	6-12
Daggafontein.....	1934	959,900	1,206,160	598,750	35	4,873,210	6-68
	1935	1,391,000	1,518,980	785,630	43½	6,401,200	6-60
	1936	1,524,000	1,558,410	853,130	48½	7,413,020	6-59
Springs	1934	1,077,700	1,835,800	806,250	53½	10,007,370	6-28
	1935	1,329,100	1,809,700	838,500	53½	10,110,960	6-07
	1936	1,660,300	2,008,820	819,000	52½	10,123,020	5-73
West Springs	1934	1,104,200	352,430	179,200	10	4,176,790	4-92
	1935	1,211,900	392,620	184,650	10	4,678,680	4-76
	1936	1,218,100	425,010	190,000	10	4,700,040	4-92

Brakpan derived benefit from the amended profit-sharing formula in connection with the acquisition of the Witpoort area and from the change in the basis of taxation. Taxation actually absorbed £473,730, compared with £490,100, and the Government's participation in profits required £133,270, as compared with £142,670. Capital expenditure at £44,260 was also somewhat lower. The company was thus able to increase the dividend by 5 per cent. and to carry forward a slightly increased balance. For *Daggafontein* the increased tonnage of higher grade ore was partly offset by higher costs, the average being 21s. 2d., compared with slightly under 20s. Both taxation and Government participation in profits required less than in 1935, and capital expenditure required £78,370, as against £132,940. After paying the increased 48½ per cent. dividend, £74,840 is carried forward, against £91,170 brought in.

* * *

Springs was the only company in the group which reduced its distribution. This resulted partly from a fall in revenue per ton milled from 46s. 6d. to 42s. 10d. and partly from substantially increased requirements for taxation and Government participation in profits. Last year's appropriations under these headings amounted to £449,150 and £638,280 respectively, as compared with £374,280 and £594,030 in 1935. No capital expenditure was reported for 1935, but last year some £97,200 was required. Despite the slight reduction in the dividend, the balance carried forward is about £9,000 down at £53,100. The consulting engineers state, however, that capital expenditure during 1937 will be considerably

less than last year. *West Springs* reported a small increase in tonnage crushed with a slight improvement in average grade. The small difference in profit, however, did not justify an increase in dividend. Capital expenditure amounted to £134,150, against a mere £2,440, but the current year's outlay should be less. This concern did not benefit from the new basis of taxation in 1936, and the Government's participation took nearly £165,000, against £128,400. The amount carried forward of £198,370 is consequently reduced by £15,000.

* * *

Of the two non-producing companies in the Anglo-American group, *East Daggafontein* shows somewhat improved development results, although the property still seems to be of only medium grade. The balance sheet shows cash in hand of £717,570, of which £502,120 represented subscriptions on account of £267,800 shares, taken up under option at 37s. 6d. The report of the *Western Reefs Exploration* gives a concise summary of the interests now owned and the results of drilling supplemented by a map. As already announced, a mining lease has been secured in respect of the Witkop area. At the end of the year the company's cash and cash assets totalled no less than £1,621,370.

* * *

The particulars of development results in the *South African Land and Exploration* report certainly appear to warrant optimistic views regarding the future of that company. Last year's footage amounted to 33,750, as against 14,260 in 1935. The footage sampled totalled 19,750, as against 8,110; the percentage of payability was 45.94, against 43.85; while the inch-dwts. are calculated at 479, as compared with 446 in 1935 and 438 in 1934. A further increase in the scale of operations is fore-shadowed during the current year. The ore reserve figures have, of course, already been published. Pre-

parations for the installation of crushing and treatment plants have begun and the treatment equipment has been ordered. At the end of the year the company's cash assets amounted to nearly £700,000. A further block of 250,000 shares is to be issued to Brakpan Mines, whose holding will then be increased to 355,600 shares.

"Johnnies" Group Results.—Of the Rand gold mines in the "Johnnies" group, only *Randfontein* earned a larger operating profit last year, but two others also paid increased dividends. In the following table we set out the working profits, dividends and ore reserve positions for the constituent mines in the group:—

		Dividends		Ore Reserves	
		Working Profit	Amount	Per cent.	Tonnage
Government Areas	1934	4,131,570	1,750,000	125	11,782,000
	1935	3,873,250	1,680,000	120	11,457,000
	1936	3,343,570	1,540,000	110	11,024,000
Langlaagte Estates	1934	400,080	341,960	22½	1,383,000
	1935	353,950	304,000	20	1,230,000
	1936	313,960	227,970	15	1,205,000
New State Areas	1934	1,909,930	416,360	27½	4,212,000
	1935	1,891,370	378,510	25	4,114,000
	1936	1,842,450	454,210	30	4,190,000
Randfontein	1934	1,352,310	558,740	13½	13,007,000
	1935	1,581,500	812,710	20	14,895,000
	1936	1,789,380	1,015,890	25	14,057,000
Van Ryn Deep	1934	615,610	388,990	32½	3,384,000
	1935	584,220	359,070	30	3,443,000
	1936	561,300	299,220	25	3,430,000
Witwatersrand Gold	1934	139,010	70,440	15	1,204,000
	1935	150,680	93,930	20	1,471,000
	1936	137,420	105,660	22½	1,614,000

Taking the companies alphabetically, *Government Areas* carried out an increased development footage, but values showed some decline. The ore reserve estimate includes the increased quantity of 1,143,000 tons in the upper leaders showing the somewhat reduced value of 5 dwts. over 56 inches. It should be noted, incidentally, that the ore reserve estimates of all companies are again

In every business organisation there is always one creative brain—one strong personality who is responsible for the destiny of the firm. It is to such men that with courtesy we address the question: "What provision have you made in the industries that you are interested in for the protection of the vital records against the ravages of fire?"

If you will kindly write to us we can let you have memoranda and data that we feel sure will be of great interest and value to you. The Chatwood Products can be seen at The Building Centre, Bond Street, W.1.

THE CHATWOOD SAFE CO. LTD.
SECURITY ENGINEERS & MANUFACTURERS
OF FIREPROOF PRODUCTS
SHREWSBURY, ENGLAND.
Branch Office: 3 Laurence Pountney Hill, LONDON, E.C.4

based on gold at 140s. per fine ounce (and current working costs), against 130s. in 1934. The Union Government's percentage of profits last year amounted to £1,928,700, compared with practically £2,200,000 in 1935, but capital expenditure was rather higher at £34,480. Despite the reduced dividend, the balance forward is £157,300 down at £35,500.

For *Langlaagte Estates* the payable footage averaged slightly under 54 per cent., compared with just over 56 per cent., the value being 8 dwts. over a channel width of 24 inches, as compared with 10.82 dwts. over about 20 inches. This accounts for the further decrease in the ore reserve values. The map suggests that the future of the company depends largely upon subsidiary development. In the case of *New State Areas*, although the Government's share of profits absorbed slightly less (£1,182,400), the amount is still nearly three times the total received by the shareholders. The company has paid an increased dividend, however, for capital expenditure last year required only £24,370, compared with £130,870 appropriated in 1935 for the same purpose, in conjunction with redemption of the balance of the debentures. The development footage was smaller than in 1936, while the payability (averaging 54.6 per cent. in place of 57.9 per cent.), average value and width were also lower.

Particular interest attaches to the explanation in the *Randfontein* report of the drop in quantity and value of the ore reserves estimated last December, which exerted an adverse effect upon the share market. The consulting engineers state that development work in the higher grade area was abnormally disturbed by faulting, so that the footage achieved failed to disclose a proportionate quantity of ore. Moreover, some of the blocks included in the 1935 estimate failed to give the expected results. The increased development footage gave 59 per cent. of payability in place of only 49 per cent. in 1935. Taxation took £568,000 in place of £452,430 in 1935. Using the additional plant, *Van Ryn Deep* last year crushed a larger tonnage; and a decline in average revenue was therefore largely offset, while working costs were also reduced. The development footage was somewhat lower, and the pay percentage fell from 47 per cent. to 46 per cent., the value being slightly lower and the channel width somewhat greater. The *Witwatersrand Gold Mining Company* increased its dividend, despite a decline in operating profits. The higher dividend follows a marked reduction in the amount required for taxation, last year's appropriation of £19,740 being £56,040 lower. The expansion in quantity and value of the ore reserves is the more significant since, of the tonnage mined last year, only 28 per cent. was obtained from ore included in the 1935 reserves.

De Beers Report.—Our mining correspondent writes:—The 1936 accounts of the De Beers Consolidated clearly indicate the arrival of new-found prosperity for the diamond industry. Revenue from diamonds amounted to £2,242,800, against £1,520,100 for 1935 and merely £900,300 in the preceding year. Interest and dividend receipts amounted to £843,850, compared with £619,100 in 1935, excluding a scrip bonus of £750,000. The great expansion in profits on investments realised—from £79,140 to £416,770—is attributable to sales made to provide payment of the preference dividend arrears. The balance available amounted to £4,529,350, from which £4 per preference share, absorbing £3,200,000, was paid. The carry-forward of £1,329,350 in fact represents rather more than the amount required to provide the further amount of £2 (expected to be paid in July) to bring the preference payments up to date. Allowing 30s. for the net amount of accrued dividend, the yield on De Beers preferred at £16 10s. would be approximately 6 per cent.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: APRIL 6 ACCOUNT: APRIL 8

THE aftermath of the holiday, the close of the long account, and the approach of Budget day induced very quiet conditions in this week's markets. The gilt-edged section showed a little firmness on the eve of publication of the full year's revenue figures, in the hope that the result would be better than anticipated. The figures were greeted with some disappointment, but gilt-edged were able to advance a little further. India stocks were depressed by the political developments in India at the zero hour of the new constitution, and there was a slight setback at first in Australian issues. Home Corporation issues attracted a little demand, particularly Bristol Threes.

In the foreign bond market, Potash Bonds made headway, and Roumanians were supported on the new debt proposals and the Council of Foreign Bondholders' advice. Brazil Funding issues rose in response to demand, and Japanese were slightly lower on the dissolution of the Diet. Elsewhere the foreign bond market was inclined to sag. Home rails were slightly depressed on fears of labour demands, and did not improve on the traffics, which compared moderately with those of Easter week last year. Foreign Railway issues remained very quiet.

Little business has been done over Easter in the Industrial market. The chief feature was a continued rise in almost all brewery shares following the quieting of fears of further taxation and the February beer production figures. Iron and steel recovered in the last two or three days, after considerable earlier dullness. Indian iron was a particularly bright spot on local buying.

Conditions were also quiet in the oil market. There was a recrudescence of French selling of international counters towards the end of the week, but prices remained more or less stationary. The main exception was the firmness of Trinidad Leaseholds and Apex, and the weakness of Mexican Eagle.

In the rubber market the boom continues. Some profit-taking last week was followed by a sharp recovery in sympathy with the new post-depression record of the commodity. There is a tendency for purchases to become less discriminating. Improvement in the tea market continues, and the biggest business for many months has been recorded, Indian and Ceylon issues being equally attractive.

Mining shares enjoyed on the whole a good week. Paris realisations appear to have stopped and substantial buying was reported from the Cape. Kaffirs have gone ahead steadily, the market taking a favourable view of reports published or yet to come. Rhodesians have recovered, with Rhokanas and Roans once more in the lead. West Africans have on the whole been firm; and among base metals, tin shares have moved in sympathy with the metal.

OVERSEAS STOCK EXCHANGES

NEW YORK

MARKETS re-opened after the Easter holiday without any improvement from the dullness which has prevailed for some time. The rulings of the Supreme Court on the Railway Labour Act and the Washington Minimum Wage Act did not influence the markets to any noticeable extent, although they came as a shock to Wall Street expectations. Irregular conditions were maintained until the last hour of trading on Tuesday when a sharp rally was staged, ostensibly on the excellence of business reports. Steel, railroad and rubber issues were in the lead, and commodity issues generally were strong, mainly in sympathy with world conditions. Metal and oil issues improved throughout the week, but in mid-week industrials were generally lower. Government obligations have been weak in the bond market, on the general expectation of higher interest rates, and on the report that Washington had exhausted its funds available for supporting Treasury issues. The steel industry has advanced to further heights; *Iron Age* estimates steel mill activity for this week at 91 per cent. of capacity with no signs of any reduction in the immediate future. Electricity output for the week of March 27th was 18.1 per cent. higher than for the corresponding week of last year. But the excellence of business reports is obscured for the time being by the uncertain monetary and budget outlook, and by the continuance of strikes, which are now threatening the soft coal industry.

Watch America the Banker's Way ...

To keep themselves well informed on the rapid changes in American business, leading bankers in Great Britain and on the Continent—as in America—depend on The Wall Street Journal.

The Wall Street Journal is complete, accurate, authoritative. It covers developments and trends in all industries, in banking, insurance, securities, commodities, import and export markets.

A wide inquiry conducted by certified public accountants revealed that American Bank Presidents consider The Wall Street Journal more useful to them than any other publication.

Free specimen copy, with subscription or advertising rates, furnished on request at London Office.

THE WALL STREET JOURNAL

DOW, JONES & CO., INC., 44 Broad St., New York.

PARIS

THE Bourse spent most of the month digesting the successful defence loan. The new financial programme came rather as a surprise after a somewhat uncompromising speech by M. Blum at the beginning of the month. But it was given a reasonably kind welcome, and prices rose considerably. Indeed, the substantial selling of international counters by French investors anxious to take up the loan seems to have produced its depressing effect almost entirely in other markets. After the completion of the awkward readjustments needed for so large an issue, however, the Bourse has remained nervous, and highly sensitive to political events. A big set-back was caused by the Clichy riots, and persisted until the Government had successfully faced the Chamber on the issue. Despite the subsequent recovery, some time seems likely to elapse, given political calm and continued economic recovery, before the market can return to normal conditions.

BERLIN

WHILE fixed-interest securities continued their advance in March, the general level of shares hardly changed. Early in the month a slight stimulus was provided by the official announcement that excess dividends impounded under the Loan Stock Law would be paid out to shareholders after the first three-years' term, and certain of the shares concerned rose sharply. But later uncertainty regarding the method of payment reduced even this group to inertia. Private railways and textiles were in occasional demand, and also certain specialties in the rubber, department store and non-ferrous metals groups. Bank shares were steady to firm, particularly mortgage banks. Standard industrials in the steel, engineering, and electrical groups were mainly quiet. Little interest was shown in colonials, an exception being Otavi on the announcement that mining would be resumed. Foreign-currency securities were unquoted, the only sales being to the Reichsbank, at prices generally corresponding to the last quotations of February. In certificated dollar bonds little business was done, but there was a decline in quotations owing to the deduction of coupons in connection with the issue of dollar funding loans by the Conversion Fund. Later in the month converted dollar bonds were firm. The official shares index (1926 = 100) for February was 108.14 as against 106.59 for January; bonds index 97.37 against 96.67.

AMSTERDAM

NEAR-BOOM conditions have been experienced throughout March. Rubber shares took the lead during the first week of the month, but sugar and metal shares followed, and the advance was little retarded by French liquidation. A bout of profit-taking and news of possible "boom-braking" measures in America later caused a fairly serious reaction. But in the last few days fears were forgotten, and industrials joined in a general advance. It seems, however, that more balanced views of the rubber situation in circulation in this market may tend to prevent the recurrence of a further bout of excited dealing in the shares.

CANADA

THE Canadian stock markets have recently been strong. Brokers' loans in Montreal reached \$40,680,541 in February, the highest point since October, 1931, and more than double the figure for February, 1935. The main factor was the upswing in base metal prices; stocks of steel and equipment companies and of base metal producers were heavily bought. The general market remained firm, during the opening days of March, but has since reacted. Some "shake-out" was overdue, but it was not carried very far. By mid-month the recession was checked, and most stocks are again moving upward. Gold stocks have steadily lost ground, owing to the diversion of interest to base metal stocks. Bonds continue weak; for the week ending March 11th the Bureau's index of long-term Dominion bond prices fell to 113.3, as compared

with 113.9 in the previous week. The drop this year is 5.1 points. The Bureau's "Investors" Index for the week ending March 11th was 149.5, as compared with a weekly average of 139.5 for February. The London Stock Exchange associated itself closely with the new Toronto Exchange on March 30th. In the presence of the High Commissioner for Canada, Mr R. B. Pearson, chairman of the London Stock Exchange Committee, officially inaugurated trading on the new Toronto floor, by pressing a button in the Committee Room.

1/- AN OUNCE

Made by the Imperial Tobacco Co. Ltd. (London and Bristol, Eng.)

(a) Interim dividend. (b) Final dividend. (c) Last two yearly dividends. (d) Yield worked on a 80 per cent. basis. (e) Annas per share. (f) Includes a Special Jubilee bonus of 24 per cent. free of tax. (g) Based on current annual dividend rate \$2-00 per share. (h) Including bonus of 5% free of tax. (i) Calculated on basis of 124 annas per share of Rs. 9. Taken at 16 annas to one rupee. (j) Worked on a 60 per cent. dividend basis. † Free of Income Tax. (k) Yield worked on a 55% basis. (l) Special Jubilee bonus. (m) Yield worked on a basis of £10 5s. 7d. per cent. less tax. (n) Yield worked on a 124% basis.

(Continued from page 33)

A. Reyrolle and Company.—Issue of 195,000 £1 ordinary shares at 25s. to holders on April 12th, in proportion of one new share for three held.

Stothert and Pitt.—Issue of 58,415 £1 ordinary shares at 28s., in proportion of one for four held.

Switchgear and Cows.—Issue of 80,000 5s. ordinary shares at 16s. to holders on March 1st, in proportion of one new share for five held.

Van Dyk Consolidated Mines.—Issue of 290,998 10s. shares at par, in proportion of seven shares for 100 held.

West Gloucestershire Power.—Issue of 68,500 £1 ordinary shares at par and 68,500 6½ per cent. £1 preference shares at 26s., in proportion of one preference and one ordinary for every £10 held.

CONVERSIONS AND REPAYMENTS

Barrow Hæmatite Steel.—Issue of £250,000 5 per cent. first mortgage debenture stock at par to holders of 6 per cent. debenture stock, to be redeemed at 102½ per cent. on July 30, 1937.

John Cotton.—It is proposed to extinguish the present preference shares and reduce the capital, by paying on the preference £1 per share with interest; holders may participate in an issue of £40,000 7 per cent. debenture stock.

ISSUE WITHDRAWN

Trafalgar Engineering.—In view of the small response to the offer for sale of 725,000 2s. ordinary shares at 3s. 6d. each, the directors have decided not to proceed to allotment. Subscriptions have been returned.

COMPANY MEETINGS

GENERAL REFRACTORIES, LIMITED

Manufacturers of Heat-Resisting and Heat-Insulating Materials, Sheffield

ANOTHER YEAR OF RECORD PROGRESS AND PROFITS

PRODUCTS IN EVER-INCREASING DEMAND

DIVIDEND INCREASED TO 16 PER CENT.

MR FRANK S. RUSSELL'S SPEECH

The thirty-seventh annual general meeting of General Refractories, Limited (manufacturers of heat-resisting and heat-insulating materials), was held, on the 31st ultimo, in Sheffield.

Mr Frank S. Russell (the chairman) presided.

The Chairman said that the year under review had been one of continued expansion, enlarged output and increased employment, the latter being a cause of considerable satisfaction to the board. The annual growth of the figures of the wages lists of the group was rather impressive, and he was very glad that the improvement in trade, which had followed the wise and brilliant policy of the National Government, had permitted the company to increase the number of its employees, and thereby ensure comfort and happiness to many households in which care and penury had previously existed. During the year the internal organisation had been strengthened and a portion of the selling arrangements had been decentralised into branch offices under efficient managers.

After offering thanks to his co-directors, the staff, and the employees generally for their co-operation, and announcing the establishment of a pension fund—to which the company had contributed £5,000—he said:—When we met here last year I said I trusted we should meet again twelve months later to celebrate still another record year. This hope has been fulfilled, and as you will have noted from the report our sales in the year are more than half as much again as they were in the previous year, and our profit is far in advance of any figure it has ever reached before. Our own operations alone, without dividends on our holding of ordinary shares in subsidiary companies, yielded us £66,741, as against the £55,392 realised in 1935, and which was the total of our own earnings added to the dividends mentioned.

The Genefax Group is now a very substantial combination for producing both refractories and profits. A close estimate of the gross profits earned by the other members of the group during last year (apart from our own) is in the neighbourhood of £79,000, subject to interest charges of about £9,000 and depreciation allocations totalling possibly £10,000. To the substantial bulk of the balance we are entitled by virtue of the proportion of the shares we hold, added to which there is, of course, an accumulation of substantial value standing to the credit of profit and loss accounts.

FINAL DIVIDEND

The board recommends the payment of a final dividend of 10 per cent. (less income tax), making, with the interim dividend of 6 per cent. (less tax) paid on August 17th last, 16 per cent. for the year (as against 15 per cent. for last year).

In order to save expense and trouble it is intended to post the dividend warrants along with this report and the provisional allotments of the new share capital, if the issue of the latter be sanctioned at the meeting which follows.

CONSOLIDATED ACCOUNTS OF THE SUBSIDIARY COMPANIES

Instructions have been given to our auditors to prepare a consolidated balance sheet as at March 31st from the accounts of the subsidiary companies which are being made up to that date, and this we hope to include with the progress report we intend to distribute early in August next along with the interim dividend.

This non-inclusion of the subsidiary dividends in current year's profits means that we can now always have a year of their dividends in hand. These provide a fund from which our own interim dividend can be paid and, in addition, the new system leaves plenty of time in which to prepare the accounts of the subsidiaries, hold their meetings, and declare their dividends—a strong and conservative position which I know you will approve. We look forward with considerable confidence to the combined profits of the other members of the group being well in excess of

our own, and feel we are entitled to expect this in return for our extension, improvement and reorganisation of their means of production.

On the advice of eminent accountants we are placing the audits of our principal English subsidiaries in the hands of our own auditors, and the Scottish audits in the hands of one firm of high standing there.

THE ACCOUNTS

Turning to the accounts there seems to be little for me to say because of the simple form in which they are presented. The capital was increased to £475,000 and has fully justified itself. The creditors are higher, but the debtors are proportionately higher still.

The total reserves are now within measurable distance of the total of the issued capital and may be equal to it next year. The credit balance carried forward to next year is only £8,000 less than it was last year, though this year's profits do not include the dividends I have mentioned, and we have put £3,000 more to income-tax reserve, £1,000 more to depreciation reserve, and have paid and are paying out in dividends nearly £20,000 more than last year. The value of our assets in the way of land, buildings, plant, etc., at cost, is £70,000 more than it was last year, and our holdings in other companies are worth £220,000 more than they were. Our stock-in-trade is higher by £25,000, and as against our creditor accounts of not more than £200,000 (including taxation) we have assets of over £1,000,000. The value of our stocks of raw materials has increased considerably since we acquired them.

NATIONAL VALUE OF HEAVIER STOCKS OF IMPORTED MATERIALS

With regard to this matter of stocks, it is our intention (for which we have already made arrangements) still further to increase the size of these stocks in order that our group may, in the event of a serious European disturbance, be independent of foreign supplies for many months to come. This is a measure of wise precaution which constitutes "preparedness" in accord with national policy, and works hand in hand with the national re-armament programme. As the cost of these materials is high, there is a considerable sum involved in financing them, and it is partly for this purpose that our new issue of capital is being made.

The country learned a lesson about stocks in 1914, and here I would emphasise to all parties concerned the value in any time of national emergency of a group such as our own, under one control, with its productive resources expanded, strengthened and mechanised during times of peace and prosperity, ready for the worst that may happen, whether it be the "rainy day" which many recent speakers appear to regard as inevitable, or an international conflict.

"HOW LONG WILL IT LAST?"

In mentioning the idea of a "rainy day" and being prepared for it, I am inevitably reminded of the "how-long-will-it-last?" query, which seems to epitomise the attitude of some who sit in high places. I have long pondered over the reason for this, and have after protracted thought arrived at the conclusion that such speakers and writers were so much impressed by the not far distant slump from which we have now happily emerged, that they began to regard it as a normal state of affairs, and are at this moment timorously counting the hours that it seems to them must elapse before they are once again plunged into despair. I cannot find that this pessimism is in any way justified. Looking back at figures extending over many long years of the past, I do not find the slump conditions of 1930, 1931 and 1932 to be normal at all but, on the other hand, definitely abnormal, and I

see no reason why (re-armament or no re-armament) we cannot with the added wisdom that our sufferings have taught us, continue indefinitely with that steady yet progressive "going on" which was accepted to be our due in Victorian years. What is known as "Prosperity" can easily be defined by such people as ourselves to mean "a demand for our goods." That demand arises from a demand for the goods of the consumer of our own products. The demand in its turn arises from other demands which can be shown to be born ultimately of a feeling of confidence in the future on the part of those with money to spend. This means that when those who hold the money bags are willing to adventure their wealth there is a larger demand for our products, our overheads cease to absorb the profits, and we become "prosperous." Because of the fact that they risk so much to gain so little, it is obvious that the inhabitants of the world of finance must necessarily be cautious, not to say timid, in their whole outlook. A breath of wind will ruffle the financial sea and it is only when those who navigate it feel certain that there is a reasonable expectation of calm weather that they will launch their golden argosies upon its somewhat treacherous bosom. It is important that their apprehensions be not aroused needlessly.

"THERE IS NOTHING TO FEAR BUT FEAR ITSELF"

The man who asks how long it will last is showing fear and thus tending to undermine confidence. "Good trade" is nothing more or less than the result of our being willing to spend our money because we feel reasonable confidence that conditions will be such as to permit us to earn some more money to take the place of what we spend—just the contrary to the thought that we must not indulge in cake for fear the money might be wanted for bread—in a phrase, "Prosperity is the daughter of Confidence."

The vast national expenditure on armaments cannot do other than create confidence. Armaments cannot be made without refractories (and neither can war), so for this industry at least it would seem that the future holds nothing in the way of cause for immediate despondency.

MILLION SALES

For the ensuing twelve months, we have set our hearts and minds on achieving the sale of a million pounds' worth of goods, and I see no reason why we should not succeed—in fact, I feel very certain that we shall do so, as our sales organisation is being strengthened and extended, our existing branch offices will have got better into their strides, new ones (Birmingham, Middlesbrough and Cardiff) are being put into commission, many of the works are being extended and their output increased, the demand continues unabated and is increasing, and the strength we derive from our combination grows daily more apparent in the way in which the large contracts tend to gravitate to our group.

I am looking forward with confidence to being able, at the silver jubilee celebration banquet, which the company intends to offer to its staff on April 1 next year, to make the announcement that this one more milestone has been passed. We increased our sales by nearly a quarter of a million pounds this year, and expect to achieve a still more important increase in 1937.

RECORDS AND STATISTICS—A MEASURE OF PROGRESS DURING RECENT YEARS

At Date of Report of	1934	1935	1936
The number of shareholders was.....	1,409	2,037	3,002
With an average shareholding of	327	328	344
The Group's annual output capacity of firebricks of all kinds, in millions	23	47	87
The number of works, mines and quarries, etc., in the group	41	68	105
Group expenditure on railway carriage during the year	£73,246	£102,330	£142,769

The number of super refractory bricks, such as magnesite, diazite, saxpyre and spinella, produced during the year at our now entirely mechanised model works at Worksop (probably the best equipped of its kind in Europe) was 41 per cent. greater than in 1935, which latter was 33 per cent. above 1934, which was 27 per cent. above 1933, which was 35 per cent. over 1932.

During the year the productive capacity of these works, which has been severely strained to keep pace with the demand, has been doubled, and they are now being additionally equipped by a hydraulic press at least equal to the most powerful in Europe, and certainly the most modern.

Record outputs of high-grade refractory bricks of quality still further improved are expected to follow.

NEW PRODUCTS

In the sales of new products the year has been chiefly remarkable for the increase in the output of "Saxpyre" bricks, which have definitely proved their value and reliability for use in basic open hearth furnaces, and have been sold in increasingly large quantities both in Great Britain and on the Continent.

The knowledge gained in the evolution of this brick has led to a close study of the whole question of "spalling" (by which is meant the destruction of the brick as a result of its surface peeling and cracking and flying off following exposure to heat). Its causes have been investigated and its cure discovered, and as a result we have placed on the market the non-spalling

"SPINELLA BRICK"

a compound of the spinels of magnesite, chromite, and alumina. The brick has successfully met the competition of a Continental brick of the same type which has made a certain amount of headway in this country in recent years, and those who have tried it report its superiority in every respect. There is an immense future before this type of brick, and we look forward to selling it freely in this country and abroad.

THE DOLOMAX BRICK—A BRICK BASED ON BRITISH DOLOMITE

Some two years ago we produced a basic brick consisting almost entirely of dolomite, a highly refractory mineral which may be freely obtained in our own country but which has ordinarily the defect of being subject to hydration. We evolved processes for its partial or complete stabilisation, but the demand for this class of brick being then uncertain, we did not put it on the market. Now, however, that so much interest is being shown in refractories which tend to render us independent of imported goods, we have done so, and with very encouraging results indeed.

We are pressing this introduction intensively, and though we are convinced that the field of application of any brick based on dolomite is limited, we shall explore that field to the fullest possible extent.

EXPORT TRADE

From time to time during the year British commercial leaders (and particularly Lord Riverdale) have emphasised the importance of this country developing its sales overseas (despite the intense home demand), because of its dependence upon imported food-stuffs. To this point of view we have fully subscribed, and we have by such means as are within our power developed our sales abroad.

The sales of this department of our business were, during the year, greatly in excess of those of the previous year, and arrangements we have completed point to a considerable further expansion during the current year, the sales for the month of February for example being twice those of February, 1936.

Our group is now building up a large export trade, based entirely on high quality, but so efficient are our processes becoming that we have little difficulty in competing in point of price also.

INSULATION AGAINST HEAT LOSSES THE EASIEST WAY OF SAVING MONEY

You will recollect the formation of International Diatomite, Limited, and its issue being subscribed 16 times over. You will remember also that it acquired the majority shares in Moler Products, Limited, and that we were to transfer the manufacture of our own Diatomite Heat Insulating bricks to the Colchester works of the last-named and take over from them the manufacture of refractory insulating bricks and the sales of both classes of bricks.

This has been duly effected, the whole of the selling arrangements have been rearranged, and the new sales campaign is in full swing.

The protection of furnace brickwork against the loss of heat is becoming every day more and more a matter of course, and the whole subject is becoming better understood.

Every shareholder can help in spreading the knowledge of the value of heat insulation, because of its universal application, an application which includes houses, shops, flats, refrigerators, firebricks, ovens, kilns, furnaces, and boilers, because Insulite and Economite bricks resist the passage of heat and keep it out just as well as they keep it in.

PROGRESS OF THE SUBSIDIARIES

The matter of their re-equipment and enlargement is being partially dealt with in the paragraph that follows, but you will be interested to hear that our Belgian works is now in full pro-

duction on the execution of important orders, with a plant which is second to none of its type.

In our last progress report I mentioned that one of our subsidiary companies was being enlarged to act as a holding company, to hold the shares of our subsidiary and associated companies. This has now been put into effect and the British Refractories Corporation, Limited, which has its own organisation under our own control, is already proving of considerable service in the simplification of the affairs with which we have to deal, and particularly in various types of joint action for the benefit of the group as a whole.

It is our ultimate aim to have only one subsidiary company whose accounts affect our own, and the arrangement whereby the year's dividends of the subsidiaries are being kept in hand is very helpful in this direction.

COMPANY'S POLICY

In reviewing the position of our company, which is that of the controlling unit of a combine consisting of a matter of 35 companies, I would say a few words to those who seem from time to time to express a little fear lest our group become too large. I find that such thoughts emanate mainly from individualists whose own businesses have never expanded, but reviewing the combines whose names are household words to-day, both for their importance and for the success of their operations, and whose size pales our own insignificance, I note "Allied Ironfounders" with a capital of over two and a half millions, "Associated Portland Cement Manufacturers" with six millions, "Calico Printers Association" with over five millions, "I.C.I." with 72 millions, "Lever Brothers" with 61 millions, "Radiation" with over three millions, and "Wall Paper Manufacturers" with over five millions. I feel we can safely follow where these and such as these have led.

Our own policy in this matter has been so successful (though only in its infancy) that it needs no defence, but in the *Financial Times* I find a paragraph referring to rubber companies, headed "That blessed word amalgamation," from which I quote some extracts:—

"What the boom did clearly demonstrate was the needless labour and expense involved in there being such a multiplicity of companies, when, by a process of amalgamation, the industry could be so materially benefited and shareholders financially advantaged. The policy of amalgamation, to the 'common-or-garden' mind, seems no more than sensible and obvious. Who there should be scores of different companies, each of them paying London and other office expenses, and giving rise to innumerable difficulties . . . it is hard to understand."

This is precisely what we have done with a proportion of the British refractories industry, and we are now settling down to a policy of peaceful development of its interests, of exploitation of its mineral and other resources, and a general concentration, simplification and consolidation of its activities.

"GENERAL REFRACTORIES" AND "REFRACTORIES GENERALLY"

Almost from the first inception of the company it has been the aim and policy of those who control it to arrange that its name should be a true description of its functions and position, that is to say, that General Refractories shall deal in refractories generally, and not merely one section of that industry. This is a policy that has been steadily pursued for the last 24 years, by the addition of first one branch and then another branch of manufacture to the company's activities.

No one class of firebrick or type of refractory material works can meet the need of every section of users or every user, or be able to supply a consumer with all he requires.

Even during our earlier years our expansion was mainly in the direction of the acquirement of interests in existing plants, and we have always been averse to the idea of entering a field in direct competition to those already existing in it.

We are now heavily interested in the exceedingly important firebrick industries of Scotland and Stourbridge. We have acquired almost inexhaustible reserves of high-grade fireclay in both areas. It would have been easy for us to have erected extensive modern works near them, but we preferred rather to take the line of least resistance and enter the field by the purchasing of existing interests, as, for instance, Glenboig, Turnbills, Castlecary and Stevens.

WORLD-RENOWNED "GLENBOIG" FIREBRICKS

Another advantage of this policy is that we thus acquire an existing connection and perhaps (as in the case of Glenboig) a brand held in high respect throughout the entire world.

Our expansion cannot be complete until our organisation is rounded off, and by your control of a supply of refractories of every known type and for every industrial purpose, and there are still left a few departments with which we are not closely enough in touch (notably glass, cement and refractory hollowware) and with which we must make alliances and provision therefor in our capital structure.

THE CENTRAL LABORATORY

Research is so essential a feature of our industry, which must ever be in advance of the needs of its customers, that there is no need for me to emphasise the advisability of our being second to none in Europe in our scientific equipment. Nothing will give our customers more confidence than this decision.

SILICA BRICKS—FAMOUS "LOWOOD" AND "MELTHAM" BRAND

The shortage of scrap iron makes the use of more pig iron imperative. To produce pig iron it is necessary to consume coke, and coke means coke ovens. The output of the famous Meltham silica bricks must therefore be expanded to help the country's re-armament programme (if for no other reason), and at the Lowood Works, where the insistent demand (based entirely on the quality of the brick produced from the unique Deepcar Black Ganister) calls for an output at least twice that of the past, the output is being doubled by ultra-modern plant.

We have undertaken to supply "refractories generally." We have secured an alliance with the makers of many of the best-known and most highly trusted brands, and we cannot sit with folded hands and say to our customers "Our output is limited to so much, and you must go elsewhere for the rest." This would be not only unpatriotic but in direct contrast to our policy, which has not been unsuccessful through the years, and we cannot consider its adoption, nor do we think that our shareholders would wish us to do so.

THE NEW ISSUE OF SHARES

All this, however, costs money, but so long as the money can be fully and adequately employed and earn a remunerative rate of return, this again is what the country needs to provide employment and prosperity.

This has a direct bearing on the meeting which follows, and whose purpose it is to authorise the increase in the company's capital. We have thought it wise, while conditions are favourable, so to equip ourselves financially that we may be in a strong position of independence, that we may be able to meet the conditions which may arise in less prosperous times, and, moreover, so to fortify our position (and that of your capital) that we may be able to resist all attacks upon it by way of either new refractories or new combinations of interest.

THE OUTLOOK

With regard to the future, I have learned not to pretend to be a prophet, and I am not prophesying now, but I do think that the extent to which new methods, reorganisation, modern machinery, and labour and fuel saving plant can increase earning capability is hardly thoroughly realised even by ourselves, nor the advantages we gain through our interests covering every field of our industry.

Our sales for the month of March are nearly twice those of last March. For much of our output of the cheaper grades of refractories we are obtaining a sorely needed advance in price. We shall have an increasing output to sell, and, on the whole, I shall be surprised if 1937 does not yield results very gratifying to all concerned.

I think that, between us, we have built up something with a high-survival value, something based on a sound economic plan, and something worthy to endure through the years that are to come.

The report and accounts were adopted, and at the extraordinary general meeting which followed the resolution to increase the capital by the creation and issue of a further 300,000 ten shilling ordinary shares was carried unanimously.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Bouverie Street, Fleet Street, London, E.C.4.

THE BANK OF AUSTRALASIA

A YEAR OF GENERAL PROGRESS

INCREASED PROFIT

MR LIVINGSTONE-LEARMONTH'S SURVEY

The 103rd annual general meeting of the Proprietors of the Bank of Australasia was held, on the 1st instant, at the office of the Corporation, No. 4 Threadneedle Street, London, E.C., Mr Frederick V. C. Livingstone-Learmonth, D.S.O. (the chairman), presiding.

The manager (Mr Edmund Godward) having read the notice convening the meeting,

The Chairman said: Ladies and gentlemen, At our last annual meeting, the chairman, in his speech to you, expressed on your behalf the bank's sorrow occasioned through the death of King George V, and I may therefore be permitted to express in this Coronation year our fervent hopes for a long and prosperous reign to King George VI and Queen Elizabeth.

You will all have received the report and the accounts for the year ending on October 12, 1936, and I presume that, as usual, you will take them as read. (Agreed.)

CHANGES ON THE BOARD

Before dealing with the balance sheet and accounts, I have to record with very deep regret the death, since our last annual meeting, of two members of the court of directors, Lord Aldenham, the senior director, who was elected in 1887, and Mr Charles Edward Barnett, who was elected in 1907. Both these gentlemen served you faithfully for a great number of years, and they were well known to many of you. We as their colleagues have felt their loss very deeply.

I have also to announce that the directors have appointed the Hon. Geoffrey Cokayne Gibbs to fill the vacancy on the board occasioned by the death of the late Mr Harold Nelson, and to fill the vacancy caused by the death of the late Lord Aldenham the directors have appointed Mr Edmund Godward to be a director of the bank. Mr Godward, as you know, is our London manager, and has been for some fourteen years. Later on I shall ask you to confirm these appointments.

BETTER PRICES

The year under review has been one of general progress in Australia, and although parts of that continent have suffered drought conditions, yet the prices of its production in overseas markets have materially appreciated, with a result that it has been possible for the Federal Government to give substantial relief in taxation to the encouragement of trade and enterprise.

Wool, which is Australia's staple product, after a difficult time in the previous year, has regained its position with regard to price. This has been partly accomplished owing to a shortage in the commodity, but it also reflects the greater buoyancy in the world's trade. You are aware that for some considerable time there had been a complete stoppage of our wool sales to Japan, one of our best customers, but I am glad to say that, after lengthy conversations between the Australian and Japanese Governments, the dispute has now been amicably settled and the Japanese buyers have now recommenced purchases, and the markets in Australia have become increasingly active.

Gold production in Western Australia in 1936 was more than double that of 1929. In 1929 it was 377,176 fine ounces, in 1936 it was 848,208 ounces, valued at £7,373,000 Australian. In New South Wales, a much smaller producer, the increase was even more remarkable, viz., from 7,496 ounces in 1929 to 60,739 ounces in 1936. Victoria's gold production last year was 113,940 ounces, and Queensland's 115,550 ounces.

The final official figure for wheat production in the Commonwealth is 137,400,000 bushels, which is very much below the average owing to drought conditions. Prices, however, are considerably higher than in recent years.

OVERSEAS TRADE EXPANSION

Australia's overseas trade for 1936 shows a considerable improvement over 1935, and the favourable balance of £24,500,000 compares with one of £21,508,800 for 1935. Exports were £113,600,000, against £101,000,000 in 1935, and imports of £89,000,000, compared with £79,500,000. Her favourable trade balance with the United

Kingdom amounted to £20,276,000, as against £18,629,000 in the preceding year.

If trade expansion had been met by a corresponding increase in currency, our balance sheet figures would probably have shown some increase, but apparently the responsible authorities, being apprehensive of boom conditions, were anxious to avoid inflation, with a result that, while our funds enabled us to meet legitimate demands for advances, speculation was checked and money was able to command somewhat higher rates of interest.

To emphasise the confidence felt by the Australian public in the trading Banks, it is only necessary to compare the rate of interest allowed by the banks upon a two-year Fixed Deposit, and that obtainable upon an investment in a Government short-dated loan with approximately a two-year currency. Three per cent. is the Bank rate, but on the 3 per cent. and 4 per cent. Government issues falling due in 1938, allowing for accrued interest and redemption, the yield on the former is some £3 9s. per cent., and on the 4 per cent. it is £3 10s. per cent., also on the Government investment the investor would be exempt from State income tax and sundry other taxes payable on interest received from Bank deposits. These facts are well known and the maintenance and stability of the volume of Bank deposits in such circumstances is somewhat remarkable.

Commonwealth finances for the year to June 30, 1936, showed revenue £66,640,000 and expenditure £46,050,000, exclusive of amounts distributed to States, £17,023,000; thus showing a surplus of £3,567,000. This surplus it is proposed to appropriate as follows: £500,000 to further assistance to the States, £2,000,000 towards the Defence programme, and the balance of £1,067,000 goes in reduction of the accumulated deficit of £17,000,000. This reduction is, if belated, very welcome; leaving the deficit undealt with in the past has raised the question whether that was in accordance with sound finance.

BALANCE SHEET

You will not find much to comment upon in the balance sheet, the total of which is some £100,000 lower than that of 1935. The only items that seem to call for explanation are cash balances, which are some £100,000 less, and Australian Investments, which are some £1,100,000 lower than in 1935. Naturally, when trade improves the demand for advances increases, and our liquid resources have naturally to be drawn upon to meet the requirements of our customers for increased accommodation. You will see that advances have increased by nearly £1,000,000. I will deal with the profit and loss account figures later on.

Money rates in Australia are tightening, and the last two Government issues there have not been so successful as the flotation of former loans, and it was suggested in certain quarters in Australia that it might be an opportune time to float a loan in London. It is understood that the Commonwealth advisers in London advised that it would not be wise to attempt such an operation at the present time, and I think that those in touch with Stock Exchange conditions here would have no hesitation in endorsing their judgment.

NEW ZEALAND

With regard to New Zealand, you were told by your chairman last year that a Labour Government had been recently put into power by an overwhelming majority of votes, and they have been in office for some 16 months. Their very laudable desire to better the living conditions of their countrymen, which should indeed be shared by all Governments irrespective of colour, has led them into experimental channels which it is hoped they will fully explore before developing. It is difficult to see how the price paid to a producer can be artificially maintained above world market prices without creating unbearable internal burdens in taxation and raising internal prices to levels which will counteract any advantage accruing to the producer.

The Government's first step has been the socialisation of the dairying industry and, having paid the producer a fixed price, they have proceeded to sell the output in overseas markets with the

result that the banks have ceased to handle the homeward exchange. Only that portion of the proceeds of the sales not required to finance Government undertakings and debts will be available for the financing of imports into New Zealand. This must result in a diminution of the already slender profits made at some of our New Zealand branches, but we have some hope that we shall receive more equitable treatment from the present Labour Government than we have had from their predecessors in the matter of taxation which, hitherto, as applied to banks, has been levied on a hypothetical profit which largely exceeds the actual one. The inequity of the present method, which applies solely to banks, has been admitted by more than one National Government in New Zealand, but has not been remedied. We have a promise that it will be looked into by those now in power.

AN IMPORTANT ACT

An important Act passed in New Zealand during the year and one which must affect banking interests and, indeed, the whole business community as it affects the viability of contract, is the Mortgagees and Lessees Rehabilitation Act. This Act provides for the adjustment of all rural mortgages on the basis of the capitalised figure of the productive value of the land over the last eight or ten years. Urban mortgages are also to be readjusted on present day valuations. The Court will have wide powers, and may order the reduction of the mortgages, the postponement, reduction or remission of interest, and can assess the basic value of any lands for the purpose of enforcing any of the adjustments. It is understood that over 30,000 applications for adjustment have been lodged.

Large sums are being expended by the Government on public works and the erection of large public buildings—their building programme aggregating £5,000,000. Expenditure for 1936–37 is estimated at £31,000,000 as against some £26,000,000 for the preceding year. The public debt of the Dominion at March 31, 1936 was £282,561,000, as against £280,581,000 at March, 1935. The population of New Zealand, excluding Maoris, was on April 1, 1936, 1,491,484, as against 1,485,046 on April 1, 1935, an increase of 6,438. The Maori population of 82,326 increased 7,748 during the year.

PROFIT AND LOSS ACCOUNT

Now, turning to the profit and loss account, it will be seen that we are showing an increase in gross profit of £72,700, a quite appreciable amount, but charges of management in the way of salaries and general expenses have increased by over £40,000 and rates and taxes by over £5,000. So far as salaries are concerned, the bulk of our staff is subject to awards; that is to say, the rates of pay are fixed by Arbitration Courts, but in addition to increases caused through higher awards, we have thought it right in consequence of the better times and prospects to let our senior officers participate in the general increase in rates of pay. I am sure the proprietors approve of our action.

We are always anxious that our London staff should keep in close touch with our staff across the seas, and with that object in view, Mr Cowan, our secretary, has only recently returned from a long visit to both Australia and New Zealand, where he took the opportunity of meeting all the senior officers of the bank and visiting most of our branches, besides making himself familiar with the conditions in both those countries, which will stand him in good stead in the future.

GOOD SEASONAL CONDITIONS

With regard to seasonal reports which have reached us recently, I may say that they are most encouraging. Through the greater part of Australia good rains have fallen since the beginning of this year, and especially in some districts which, until recently, had been suffering from partial drought conditions. I will conclude my remarks by reading a cable which the superintendent sends to give us the latest seasonal information: "Season's conditions Australia and New Zealand are good."

I now beg to move that the report be adopted, and I will ask Mr Hamilton to second that resolution.

Mr C. Gipps Hamilton seconded the resolution, and it was carried unanimously.

The election of the Hon. Geoffrey Cokayne Gibbs and Mr Edmund Godward as directors was confirmed; the retiring directors, the Hon. Geoffrey Cokayne Gibbs, Mr Kenneth Goschen and Mr Horace Peel were re-elected, and the auditors, Messrs Deloitte, Plender, Griffiths and Company, were reappointed.

The Chairman then moved a vote of thanks to all their officers in Australia, New Zealand and London, which was carried unanimously.

A vote of thanks to the Chairman and court of directors, which was unanimously accorded, terminated the proceedings.

INTERNATIONAL NICKEL COMPANY OF CANADA, LIMITED

RECORD SALES

Mr Robert C. Stanley, chairman and president of the International Nickel Company of Canada, Limited, addressing the shareholders at the annual meeting of the company in Toronto, on March 30th, said that since 1932 metal industries the world over had been gradually recovering from a very serious trade depression. The improvement generally had been progressive, not only in volume of sales but in market prices as well, with the result that in many instances deficits had given place to substantial profits. The nickel industry, in which this company occupied a predominant position, recovered somewhat in advance of other basic industries. The reasons for this early and gratifying progress he believed to be twofold. In the first place, research and sales activities were continued and even augmented during the years of depression, with the result that nickel had been introduced into diversified fields and had taken its place as an essential industrial metal. Secondly, the installation of modern facilities throughout all of the company's properties had widened the range and improved the quality of products.

From the financial viewpoint the company was in the strongest position in its history, since it had no interest-bearing indebtedness and the balance sheet as of December 31, 1936, showed cash and Government bonds in the amount of \$47,113,426.32 as compared with \$32,720,024.06 a year ago.

INCREASED NET PROFIT

The net profit of \$36,865,526.11 shown on the profit and loss statement compared with \$26,086,527.47 reported for the previous year. This satisfactory increase was due in large measure to a greater volume of sales and to an improvement in prices of copper and platinum. The amount paid as common dividends was \$18,951,619.70, as compared with \$10,933,626.75 in 1935. The rate had again been increased this quarter, and \$7,289,084.50, or 50 cents per share, would be disbursed on the following day. Capital expenditure in 1936 aggregated \$11,202,265.71, as compared with \$3,206,642.40 in 1935. Of the foregoing total \$9,965,885.62 was used in Canada for necessary additions to mining, smelting and refining plants.

On the commercial side 1936 was outstanding in that the company sold more nickel, copper and platinum metals than in any previous year. Sales of nickel totalled 168,927,980 lb., as compared with 129,850,207 lb. in 1935, the previous record year of consumption. It was of interest to note that 54 per cent. of the company's sales of nickel were in the United States and Canada and the balance distributed over the rest of the world. Consumption in the United States and Canada increased 35 per cent. over the preceding year and consumption elsewhere increased 25 per cent. These figures were significant in that they refuted the suggestion, sometimes made, that the prosperity and development of the company were based upon military expenditures.

SECURITY TO EMPLOYEES

A plan designed to provide security to employees, affording old age and disability pensions and benefit payments in the case of death, had been in operation since 1928. The plan had been financed entirely by the company without contribution by employees. As against liabilities under the plan, a reserve, which at December 31, 1936, amounted to \$6,772,957.26, had been set up out of annual appropriations and appeared as a liability on the company's balance sheet. Since the benefit payments under the plan related back and took into account periods of service prior to the plan having been put into effect, there was an initial "accrued liability" which was scheduled for amortisation over a period of years. This "accrued liability" had not yet been fully amortised, the amount remaining for amortisation approximating \$4,300,000.

The new research laboratory in Birmingham, which was opened on October 21 last, was one of the largest laboratories in Europe erected by a single company and devoted solely to metallurgical research. The work of this laboratory would enable a further expansion throughout Europe of the company's technical services furnished the users of materials containing nickel. The Canadian research laboratory now being erected at Copper Cliff would be completed shortly. Plans for this building were extended to include the general chemical laboratory and a geological laboratory in addition to the facilities originally contemplated.

In conclusion, the Chairman said that the company's further progress depended upon world trade, which was currently improving, and hence, barring any serious political disturbances, it would seem that the outlook to-day was as favourable as at any time in recent years.

NATIONAL BANK OF INDIA, LIMITED

AGRICULTURAL AND TRADE PROGRESS

MR LANGFORD JAMES'S ADDRESS

The ordinary general meeting of the National Bank of India, Limited, was held, on the 31st ultimo, at the Wesleyan Hall, Bishopsgate, London, Mr R. Langford James (the Chairman) presiding.

The general manager (Mr E. H. Lawrence) having read the notice convening the meeting and the auditors' report,

The Chairman, in the course of his speech, said: The net profits for the year amounted to £456,286 6s. 3d., and are slightly less than those of 1935. With the sum of £247,668 12s. 7d. brought forward from the previous year the amount available is £703,954 18s. 10d. An interim dividend at the rate of 18 per cent. per annum, less income tax, was declared in September last, and we now recommend the payment of a final dividend at the same rate. These dividends will absorb £360,000, and we propose to add £50,000 to the staff pension fund, to place £50,000 to contingencies account, carrying forward £243,954 18s. 10d. All bad and doubtful debts are provided for in full.

FUTURE DIVIDENDS

You may have observed that while there has been little variation in the net profits of the bank during the past few years less satisfactory results would have been achieved had we not been able to effect considerable reductions in the expenses of management. Such economies, however, appear now to have reached a point beyond which, in the interests of efficient administration, they cannot be expected to go. The board have hitherto held the view that during the difficult times through which we have been passing—and by "we" I mean the general body of shareholders—as large a share of the profits as possible should be distributed, but unless an improvement in trading conditions takes place, with a concomitant increase in our earning power, it may be in the best interests of the bank to recommend a slightly smaller distribution of profits, especially in view of the desirability of making more regular allocations to such purposes as writing down our premises account, etc.

The Bank rate in India was stationary throughout the year at 3 per cent., as against an average rate during 1935 of 3.45 per cent. Easy conditions prevailed in the money market, and it was difficult to find profitable outlets for our resources. India's favourable trade balance has been maintained and has actually increased from Rs. 72 crores in 1935 to Rs. 80 crores for 1936.

A GOOD MONSOON

Generally speaking, the 1936 monsoon was a good one and, with the upward trend of produce prices, the purchasing power of the Indian cultivator has improved. So far as this country is concerned any benefit is likely to be reflected to a smaller extent than would have been the case some years ago. Nationalism is, naturally, of no less interest to India than it is to other countries, and considerable progress is being made in the domestic manufacture of products and articles that have hitherto been imported. The great firm of Tata Bros., of Bombay, were the first to point the way in this respect with their now famous iron and steel works.

The remarkable developments in the cotton mill and sugar industries are other "pointers" and the progress generally of India towards self support, backed as it is by the growing of immense quantities of produce for sale to less fortunate countries, cannot but make for strength, more particularly when, as is now the case, her customers can afford to pay remunerative prices. Unless anything unforeseen occurs, therefore, trade prospects generally in India are promising, although some of her leading industries are experiencing difficulties. For the first time for some seven or eight years the railway budget forecasts a surplus in the coming financial year—all of which, it should be noted, is expected to be derived from goods and not from passenger traffic—and this in itself is an index of the improvement in trade.

JUTE AND COTTON

The jute manufacturing industry in Bengal has been and still is passing through an anxious time. The Jute Mills Association having failed to come to terms with the outside or "mushroom"

mills as to working hours, all restrictions have been removed from mills within the association and manufacturers are now free to fix the working hours most suitable to each mill. Jute goods continue cheap, and this, coupled with the improved purchasing power of buyers at centres where there has been a rise in commodity prices, has led to an increased demand and to a tendency to lay in stocks of bags. Consequently although profits of the mills have fallen away considerably there is still some margin over costs. If and when, however, competition for orders increases, even that small margin may disappear and prospects before the industry are not bright. It has been obvious for some time past that, with Government declining to intervene for the protection of the established mills, the outcome was bound to be a straight fight between them and the outside mills. Now that this situation has arisen it may well be that the ordinary laws of supply and demand will eventually settle the troubles of this important industry. Such settlement, however, is only likely to be achieved through the elimination of some of the less efficient producers.

Exports of raw and manufactured cotton amounted to Rs. 43,84,00,505, showing a very considerable increase in value of Rs. 9 crores, whereas imports of raw cotton into India were on a considerably reduced scale, 300,496 bales being imported as against 487,508 bales in 1935. As regards cotton piece-goods and yarns there was a further substantial decline in imports, the figures for 1936 being Rs. 18,82,67,000, against Rs. 21,86,31,000 for the previous year. Imports from Great Britain were lower by Rs. 2,32,20,000 and from Japan by Rs. 16,51,000. The Bombay mill industry is still in a somewhat struggling condition although an improvement has been noticeable during the past year and Japan has ceased to be so prominent a competitor. Up-country mills, who buy the raw cotton at their doors and have a local market for the disposal of their manufactures, are not faring too badly. Some of the Indian mills which have turned their attention to fine counts are now manufacturing very attractive goods, and this can hardly fail to mean a further replacing of Lancashire goods.

TEA AND RUBBER

As regards tea, the fifth and final year of the present Regulation Scheme for the control of exports begins on April 1st and the International Tea Committee have advised the Governments concerned to retain the exportable quota at 82½ per cent. of the standard. There has been a progressive reduction in bonded stocks in this country during the past 11 months, the figure at the end of February being 206,000,000 lb. as compared with 262,000,000 lb. a year ago. Consumption in the United Kingdom is steady at last year's figure and the heavy clearances from bond in January and February of this year are considered to be due to fear of a Budget increase in the duty. Prices have shown a slightly better tendency throughout the year and at present are on a scale remunerative to practically all growers, except perhaps those in Darjeeling. Negotiations, I understand, are in progress with the Governments concerned for a renewal of the control scheme for a further five years, while in the meantime a combined campaign by producers to increase the consumption of tea throughout the world is in active operation. India exported 309,815,118 lb. and Ceylon 217,982,639 lb. during 1936, against 321,078,609 and 211,252,607 respectively in 1935.

The plantation rubber industry is passing through an interesting phase. In 1933, the year prior to the inception of control, the average price for standard rubber was 3½d. per lb. The regulation scheme came into operation on June 1, 1934, and the average price in that year was 6½d. per lb., in 1935 6d., and in 1936 7½d. During the past few months there has been a sharp rise in price to over 18s. per lb., but, taking the whole period of regulation, it can be said that prices have not been forced up unduly. World absorption is on the up-grade. It advanced from 937,461 tons in 1935 to 1,113,348 tons in 1936, and the recent decision to increase the exportable percentage of quotas this year should provide for anticipated requirements. The International Committee would appear to be carrying out its work with due regard to the interests of both producer and consumer. Exports have been adjusted to meet varying circumstances, and the prospects

for the future are encouraging. Southern India and Ceylon along with other rubber producing areas will undoubtedly benefit by the higher prices and increased crops. The important manufacturing industry which is springing up in India is further assisting growers in that country. The total export of rubber from all Eastern ports last year was 832,000 tons, compared with 855,000 tons in 1935 and 1,003,000 tons in 1934.

SUGAR

It had been foreseen for some time past that the boom in Indian sugar, brought about by a heavy protective tariff, would result in the erection of mills with a producing capacity in excess of the country's requirements. This has now come about, and the price of sugar has fallen to a level where only a few of the factories can be showing profitable working. The Excise duty was raised in the recent Budget by 11 annas per cwt., from Rs. 1-5-0 to Rs. 2, while the import duty was increased at the same time by only 3 annas. So far the additional Excise duty has not been fully reflected in the price of sugar and, for the time being, manufacturers are worse off than ever. Sir James Grigg, the Finance Member, in his Budget speech, appeared to indicate that in his opinion the sugar industry should look to improved efficiency for any betterment in its condition. While this is a hard doctrine for an industry which has been existing in comfort behind tariff walls to assimilate, it may be sound advice when it is considered that in the near future India may be offering surplus sugar in the world markets and thereby entering into direct competition with countries that at present produce at a much lower figure than she does.

BURMA AND CEYLON

Total exports of rice from Burma during last year amounted to 3,122,000 tons, or 182,000 tons less than the total for the previous year. India took 1,728,000 tons, an increase of 163,000 tons on the previous year. Exports to Europe were slightly less than in 1935 at 535,000 tons. Other markets took in the aggregate 279,000 tons less than in 1935, but the bulk of this decline is attributable to China, which took only 22,000 tons, as against 209,000 tons the previous year. The price for paddy opened at about Rs. 90/ and fluctuated within narrow limits during the year. Supplies practically had ceased by the end of November, when the price was about Rs. 103/. The trade agreement between India and Burma, referred to last year, has, I am glad to say, recently been ratified by an Order in Council, and so comes into force for a period of three years as from to-morrow, concurrently with the political separation of the two countries. As Burma is practically entirely a primary producer, the recent general rise in commodity prices has meant a steady improvement in the economic condition of the country, and this is reflected in a steadily improving balance of trade. Relatively, however, rice prices still lag considerably behind those of other grains.

Prospects in Ceylon, in view of the improved conditions of her three principal industries—viz. tea, rubber, and coconut products—are, I am pleased to say, brighter than for some years past, and it is to be hoped that the island's recuperative powers will now manifest themselves in a return of prosperity.

EAST AFRICA

The general rise in the price of produce is having a marked effect on the fortunes of East Africa, the advance in the price of sisal being particularly noticeable. The efforts of the gold-mining industry have not effected any spectacular improvement in the finances of these territories up to date, but progress is being shown and hopes are expressed that these fields may yet become of substantial importance. A quite appreciable quantity of tea is now being exported from the very fertile estates in the Kericho district of Kenya, and it is meeting with a good reception from London buyers.

A banking institution such as ours does not concern itself directly with politics, but meeting as we do on the last day of the old regime it is not inappropriate for me, before closing, to make a brief reference to the momentous change in the Constitution of British India which comes into existence to-morrow, when the Provinces commence their autonomous life. In spite of the somewhat bewildering news that is being received from some of the Provinces I feel confident that it will not be long before we see India's responsible legislators applying their undoubted gifts to the working of the Constitution and the general good of the country. In those circumstances they will have the good will and the good wishes of us all.

The report and accounts were unanimously adopted, and the formal business having been transacted, a cordial vote of thanks to the chairman, directors, general manager, and staff terminated the proceedings.

BANCO DI ROMA

LARGE INCREASE IN PROFITS

The general meeting of the Banco di Roma was held in Rome on March 26th. The report shows that, during the past year, the bank has continued its great activity in all branches of banking business, and has created a large organisation in Italian East Africa, where no less than nine flourishing branches are already working: Addis Ababa, Dessiè, Harar, Asmara, Massaua, Assab, Mogadiscio, Lechemti and Gondar.

The report shows that the constant increase in the business of the Banco di Roma has been intensified, and that there has been a very large increase in almost every item in the balance sheet. Deposits on current account and savings account have increased to Lire 982,348,882.83, being an increase of no less than Lire 317,619,430.01; balances due by correspondents amount to Lire 2,245,670,371.57, being an increase of Lire 402,142,291.53; circular cheques have risen by Lire 33,701,965.15 to Lire 141,801,117.51; cash and funds with the central bank amount to Lire 360,980,845.42, being an increase of Lire 59,953,009.86, and funds with other banks have also increased by Lire 14,133,827.19 to Lire 174,224,138.11. The Portfolio has also risen to Lire 1,471,052,780.56, an increase of Lire 267,027,412.95, and contangos at Lire 109,801,283.25 have more than doubled. The same applies to balances due to correspondents, which have risen to Lire 1,012,400,505.06, being an increase of Lire 304,036,432.03, and guaranteed current accounts which have risen to Lire 260,547,067.75 (an increase of 27,058,613.60) and guarantees for third parties which have risen by Lire 63,572,703.23 to Lire 172,003,824.17. The total of the balance sheet items has increased from Lire 3,171,570,254.95 to Lire 3,977,631,628.56, being an increase of Lire 806,061,373.61.

The year closed with a profit of Lire 9,773,328.29, as against Lire 5,139,039.70 in the previous year. The meeting decided not to proceed to the distribution of any dividend from the available profits which, including the balance of undistributed profits brought forward from the previous year, amount to Lire 15,469,683.43, and it was decided to transfer Lire 12,000,000 to internal reserves, and to carry forward Lire 3,469,683.43.

BRITISH ROPES LIMITED

INCREASED PROFITS

FAVOURABLE OUTLOOK

The fifteenth ordinary general meeting of British Ropes, Limited, was held, on the 31st ultimo, at the Abchurch Rooms, Bishopsgate, London.

Mr Herbert Smith (the chairman) said:—The profits for the year showed a further increase as compared with the previous year and, before providing for income tax, amounted to £231,575, which was considered satisfactory in view of the disastrous fire which practically destroyed the works of the company's very extensive hemp factory at Leith.

The improved profits have been brought about by the general improvement in trade within this country coupled with the extensive programme of reorganisation which was commenced in 1929, embracing not only the actual works of the company but, also, the commercial and selling organisations.

There is little doubt that the time and consideration given to the reorganisation and re-equipment of the company has been well worth while, and in the event of any serious setback in trade its position will be very much stronger than when the last period of adversity had to be faced.

The home trade has shown considerably greater expansion than the export trade and, to some extent, the re-armament programme of the Government must be regarded as having given a stimulus to the home market.

The company had considerable manufacturing interests in the Dominion of Canada, and it had been decided to proceed with the erection of an up-to-date wire mill and wire ropery at Germiston, South Africa, close to the big consuming district of the Rand.

The outlook at the present time was very favourable, and he had every hope that the progress which the company had made during the last two years would be more than maintained during 1937.

A dividend at the rate of 25 per cent. per annum, less tax, on the ordinary shares was approved and a further £25,000 placed to general reserve.

The report was unanimously adopted.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

IMPORTANCE OF OVERSEAS TRADE

MR A. D'ANYERS WILLIS'S REVIEW OF CONDITIONS IN INDIA AND THE EAST

The eighty-third ordinary general meeting of the shareholders of The Chartered Bank of India, Australia and China was held, on the 31st ultimo, at the bank's premises, 38 Bishopsgate, London, Mr A. d'Anyers Willis (the chairman) presiding.

Mr A. H. Ferguson (chief manager) having read the notice convening the meeting and the auditors' report,

The Chairman, in the course of his speech, said:—Before proceeding to review the various aspects of world trade as affecting this bank, I propose to draw your attention very briefly to the more striking changes in our balance sheet figures, as compared with a year ago. Upon the liabilities side you will observe an increase of £3,141,786 in the total of our current and other accounts—a reflection of the large amount of funds seeking employment all over the world, and is partly due to the improvement in the rubber and tin industries in which your bank is so largely interested. Fixed deposits, on the other hand, show a decrease of approximately £943,000. Another increase, which is very welcome, is shown in acceptances on account of customers of about £1,063,000, indicating greater participation in the movement of certain commodities, which in parts of the East employ this method of finance. Loans payable, with an increase of just over £2,000,000, reverse the decrease shown last year, and are now rather above the figure in our 1934 balance sheet. As explained on previous occasions, these loans necessarily fluctuate considerably, and, generally speaking, represent temporary loans to finance exchange or other operations at a profit to the bank. These items account for the increase of almost £5,000,000 shown in the sterling total of the balance sheet.

ASSETS

Turning now to the assets, cash in hand and at bankers shows a slight increase of £413,000 at £4,834,863, whilst bullion on hand and in transit shows a comparatively large increase of nearly £1,000,000 from £249,861 to £1,230,534. Bills discounted and loans with a decrease of just over £500,000 and bills of exchange, including Treasury bills of about £700,000, illustrate only too pointedly the difficulty, to which I have referred in former years, of finding a profitable outlet for our funds. With an increase of over £3,000,000 in current accounts, deposits, and the decrease in loans and bills of exchange just referred to, we have been compelled to seek an outlet in the only other direction available—viz. Government securities, which have increased by approximately £3,700,000. I should perhaps add that a very large proportion of the bank's investments is in short-dated securities.

Other changes being of a minor character, I now turn to what is, I think, to both directors and shareholders alike, the most interesting part of our report—the profit and loss account. As compared with 1935, our net profits of £496,682 for the year show a small decrease of £1,961. After paying the usual interim dividend last September, we have available for distribution £467,719 18s. 10d., and we propose, subject to your approval, to pay a final dividend at the rate of 14 per cent. per annum for the half-year, absorbing £210,000; to add £35,000 to the officers' pension fund; to set aside £40,000 on account of contingencies, and to carry forward to this year the balance of £182,719 18s. 10d.

OVERSEAS TRADE

From this chair I have, as you know, been consistent in advocating that Great Britain's overseas trade should be fostered by every available means. It has been our policy, in the field in which we operate, to render every assistance, when approached, towards the culmination of business proposals which have appealed to industrial and manufacturing interests in this country, provided, of course, they carry with them sound principles of finance, making them a reasonable banking risk.

Since the slump of 1931, a great shrinkage has taken place in the volume and value of British export trade. This shrinkage has been mainly due to the effects of "Economic Nationalism" which has resulted in the establishment in most foreign countries of quotas and exchange restrictions, preventing the free movement of manufactured and capital goods. The increased prices now

being obtained for primary products, in most foreign countries in which we are interested, have produced a greater purchasing power. Resulting from this prosperity, it may be inferred there will be a tendency for a new or an increased demand for these very goods, the supply of which, hitherto, has been the mainstay of our overseas trade. Doubtless, in this connection, I must take into consideration the manner in which our home trade continues to expand and how the consumption of domestic goods and purchasing power go on increasing; also how industrial expansion is proceeding at a great pace all over the country, due, without a doubt, directly or indirectly, to the Government re-armament scheme. No matter how much we realise, on peace grounds alone, the necessity for our re-armament programme, it does not follow that the industrial structure, which has been created as the result of it, need be on a healthy business basis nor its durability extend beyond the life expected of it.

It is natural that export trade should seem less important when domestic trade is expanding, but for the above reasons I wish to emphasise the desirability of serious attention being devoted to overseas orders, especially as, should they be neglected now, they may not be available when the present abnormal domestic conditions have disappeared. I still hope at least when the overseas demand is not in actual conflict with domestic trade, it will not be entirely ignored, and that every effort will be made to retain a fair proportion of our pre-War supremacy in this direction. Bearing on the subject of the extension of foreign trade, the Ottawa Agreements, which expire in August this year, are shortly coming up for review. If, beyond the limits of the Empire, the scope of overseas trade can be widened by inviting other countries desiring freer trade to negotiate for a reciprocal lowering of the existing barriers, something definite may be achieved in furnishing a definite impetus to the volume of the world's commerce.

INDIA

Under the new Constitution, which becomes effective to-morrow, it is to be hoped that responsible Indian opinion will move along the line of effective co-operation, and in the end justify the responsibility which our Indian friends have now attained in the Government of their country.

India has given notice of terminating the Ottawa Pact, and a new trade agreement between her and Great Britain is now under discussion. Incidentally, the Japanese Government is also negotiating a fresh agreement, to take the place of the existing one, which expires this month. The result is of great importance to Lancashire with regard to her export of textiles.

An analysis shows that whereas in 1929 the United Kingdom exported 1,374 million square yards of cotton piece-goods to British India and Burma, the quantity had fallen to 485 million square yards in 1933, while the figure for 1936 had dropped to 416 million square yards.

Recent statistics indicate that 80 per cent. of the total piece-goods consumed in India are now produced by Indian mills and handlooms, and the balance of 20 per cent. is imported from Lancashire and Japan.

The high level of Indian protective duties continues to give Indian-made goods an overwhelming advantage over those manufactured in Lancashire, and, so far as the better qualities are concerned, current prices are beyond the range of prospective consumers.

It is to be hoped that, in view of Lancashire meeting India in the matter of increased purchases of her raw cotton, and taking into consideration a connection extending over a large number of years, with a complete understanding of local conditions, India will yield to the British market terms which Manchester will consider fair and reasonable.

India's export business is rapidly improving at higher price levels, due to the steady and increasing world demand for her products. It is interesting to note that the total imports were the lowest since 1930, with the exception of 1933, when they had declined to Rs. 116 crores. On the other hand, the exports are the highest during the last seven years, except in 1930, when they amounted to Rs. 257 crores.

CEYLON AND BRITISH MALAYA

Exports from Ceylon indicate a definite improvement in the last three months of 1936. Tea and rubber from the Customs return of 1936 show an increased valuation over the 1935 figures, but in comparison, the quantity of rubber exported is down by 3,864 tons last year. Coconut prices were generally higher, but the total yield from the produce was nearly Rs. 20 lacs less, owing to shortage of crop. Generally speaking, the trade outlook is favourable.

In British Malaya a general all-round improvement has taken place there during the past year. The ill-effects of the slump have now all but disappeared, and with rising prices of all her commodities there is an air of prosperity and a feeling of optimism for the future, which is in distinct contrast to the gloom of the past five years. Both the Straits Settlements and the Federated Malay States have large accumulated surpluses, and their Budgets continue to be framed with great caution. I am sure we all welcome the return to prosperity of the Dutch East Indies, which shared to the full the ill-effects of the recent depression.

CHINA

In happenings in China, which have made the greatest impression on the Western banking world in the last year or so, probably that of the change in China to a managed currency stands out relatively as the most important. In last year's speech, misgivings were expressed regarding the ability of the Chinese Government to maintain a managed currency. So far the arrangements have been successful, and if aided by a healthy export trade, and provided that no major political upheaval takes place to challenge the authority of the Central Government, there seems no reason why they should not continue to be a success.

The note issues of the three Chinese Government banks which at the moment constitute legal tender circulate freely in most parts of the country controlled from Nanking. No doubt the right to issue notes by other banks in certain parts of China will be withdrawn in due course. I have every reason to believe that the Government reserves of foreign funds, built to a great extent, I should say, from sales of bullion, are intact and have not been depleted in any way by the events of the year, which is all to the advantage of the currency control. According to Customs returns during 1936 net shipments of silver were \$249.6 millions, while gold shipments stood at \$40.6 millions.

To refer briefly to trade, I am very pleased to note that during and since the last quarter of 1936 a growing demand has arisen for China's products at enhanced prices, which, aided by a steady exchange, has made an encouraging change in the outlook for China generally. With a shortage of crops in other parts of the world, China has benefited and we begin to realise her advantage on the estimate that her crops, harvested last year, are worth \$3,000 millions more than the crops of 1935.

The returns of China's foreign trade for the year 1936 show imports valued at \$941 millions and exports at \$706 millions, compared with \$919 millions and \$595 millions respectively in 1935. The excess of imports thus amounted to \$235 millions in 1936, compared with \$324 millions in 1935. Making allowances for differences in exchange, etc., I find an important improvement has taken place in China's trade position since our last meeting.

It is gratifying to observe that the Export Credits Guarantee Department of the Department of Overseas Trade has recently sent to China a representative to explore and report upon commercial opportunities for British manufacturers. For some time to come, China is likely to be an important market for capital goods, and in particular, for machinery, to equip the new industrial plants that are being created under the supervision of the Ministry of Industries. A great deal of industrial progress is being made under the ægis of nationalised and semi-nationalised corporations.

JAPAN

Japan has had a difficult year, both from the political and economic point of view. The higher prices of the raw materials she imports for her manufacturing industries have recently put a strain on the exchange value of the yen. There is necessarily a time-lag before the higher value of her exports adjusts the position. I am glad to see that she is arranging for part of her gold reserves to be shipped abroad to strengthen her exchanges. This is a wise step, as, after all, reserves are of little value unless brought into front line defences when necessity arises.

The Finance Minister stated in Tokyo last month that the value of the gold reserve of the Bank of Japan was 1,700 million yen (say 100 million pounds), as against a note issue of 1,400 million yen. The annual production of gold in the Japanese Empire is stated to be about 100 million yen.

The report was adopted.

TELEPHONE AND GENERAL TRUST, LIMITED

STRONG FINANCIAL POSITION

The eleventh ordinary general meeting of this company was held, on the 31st ultimo, in London.

Sir Alexander Roger (the chairman) said that the profit for the year remained practically unaltered at £108,996, compared with £108,834. The Trust's investments at £1,535,029 showed a net increase of approximately £124,000. A valuation of the Trust's quoted investments at the end of the year showed that their market value in the aggregate was in excess of the figure shown in the balance sheet—without the help of the reserves—and, as regarded the unquoted investments, the directors considered they were conservatively valued.

WEST INDIES

The board had been urging forward the provision of a complete system of telephony and radiotelephony in the British West Indies, and to that end the Trust now held substantial interests in the telephone companies in Jamaica, Trinidad and Barbados, in addition to their large interest in Venezuela. He had just returned from a tour embracing all those properties, and he had noticed with great interest that, as compared with five years ago when he last visited that region, a large measure of prosperity had taken the place of depression. The greater activity in business merely emphasised the necessity for cheap and rapid communication which they were doing everything possible to further. In Jamaica the installation of automatic telephones had been completed in the area which they administered, viz. Kingston, but there was still no public telephone communication between Kingston and the rest of the island.

With regard to Trinidad, the company in which they were interested was doing well and, given an extension of the franchise on mutually equitable terms, the board could see the opportunity of spending at once probably £100,000 on extensions and improvements. In Barbados they were carrying out their policy of installing the latest form of Strowger automatic telephones. The companies in which they were interested in the West Indies represented a total capital expenditure of approximately £485,000, and, given reasonable conditions, they could see the expenditure of a further £500,000 which could be undertaken.

VENEZUELA

In regard to Venezuela it was again five years since he had been there, and in contrast to the feeling of repression which had been apparent to a visitor under the late regime, there was a more cheerful and hopeful feeling everywhere and a marked improvement in general business conditions. The Nacional Company, in which they had a large interest, had reduced its tariffs on January 1st last by arrangement with the Government beyond a point which the board considered to be an economic level. They had recovered nearly all of the telephone subscribers they had lost during the years of depression.

He had been most cordially received by the President, General Eleazar Lopez Contreras, and, in addition, he had met several of the Ministers and many of the other important people in the country. He had formed the view that Venezuela had a future before it of recuperation and even prosperity.

He expressed the hope and belief that their accounts for 1937 would be at least as good as those now submitted for the shareholders' approval.

The report was unanimously adopted.

OFFER TO READERS

Any reader who makes his first acquaintance with this journal with this week's issue is invited to fill up the attached:

To Publisher, "Economist Newspaper Ltd.,"

8 Boulevard Street, E.C.4.

In order to test the value of your publication I should like you to forward this to me by post for the next four weeks. If I then decide to become a subscriber, it is understood that there will be no charge for the copies thus received, but otherwise I shall be willing to pay 4s. to cover their cost.

ASSOCIATED PORTLAND CEMENT MANUFACTURERS, LIMITED

FURTHER RECORDS ESTABLISHED

SIR MALCOLM STEWART'S SPEECH

The thirty-eighth ordinary general meeting of the Associated Portland Cement Manufacturers, Limited, was held, on the 31st ultimo, at River Plate House, London, E.C.

Sir P. Malcolm Stewart, Bt. (chairman and managing director), said that the profit on trading at £1,149,494, compared with £1,041,694, an increase of £107,800, but in the previous year they had charged through the trading account £62,500 for contingencies reserve, so that the relative increase in the trading profits was £45,300, which was accounted for by an improved turnover. The total revenue for the year, at £1,687,350, once more established a record for the company, and was £106,594 more than in the previous year. In addition to the usual charges for debenture stock interest and redemption and the same provision for general and barge depreciation, etc., they had set aside a reserve for contingencies amounting to £87,500, as against £62,500 debited to trading account in the previous year. They had also thought it wise to write down one of their investments in a subsidiary company by £10,000. There remained a balance of £929,617, which compared with £857,729 in the previous year. In addition to paying the dividend on the preference stock, they recommended a final dividend of 15 per cent. on the ordinary stock, making 22½ per cent. for the year. There would remain £4,617 to be added to the carry-forward, which would then stand at £196,665.

GRATIFYING RETURN FROM INVESTMENTS

If the trade and liquid investments were added together, they gave a total of £3,172,635. The income from that sum was last year £536,468, equal to nearly 17 per cent., which was a gratifying return. It was, of course, considerably influenced by the increased dividend on their investment in the ordinary stock of the British Portland Cement Manufacturers, but important contributions had also been made from their investments in overseas cement companies.

Those overseas cement works had been extended or modernised in recent years or were in course of extension. The consequent increased production and that of their competitors had so far been absorbed by the higher demand, but there were signs of possible over-production in some countries. That might apply particularly to South Africa in the near future.

A feature of the accounts which added strength to the balance sheet was the allocation of £87,500 to their contingencies fund, bringing the total of that reserve, together with that for taxation, up to £370,000. They had steadily built up that reserve without having to check the provision of generous sums for depreciation reserve. The long-continued application of that policy had resulted in the elimination of over-valuation and, although the figure at which their fixed assets stood in the books was to-day sound, the time was not yet come for relaxing their efforts with regard to depreciation.

Their production and deliveries of cement both constituted records. The net average selling price realised on the total deliveries was approximately the same as in the previous year. It was again adversely affected by the low prices ruling in many of the export markets in which they did business. Happily there was a prospect of obtaining improved export prices as the result of negotiations undertaken with the principal European exporters of Portland cement.

INDUSTRIALISTS AND PEACE

It was remarkable that industrialists of many nations of widely differing circumstances and outlook could come to agreement over issues affecting their particular commercial interests, issues fraught with many difficulties and much complexity, yet, on the all-important question of limitation of armaments and the procuring of an enduring peace, which were vital to every citizen of every country, no satisfactory solution was forthcoming. Success was achieved for material interests, but the translation of the ideal of peace into practice met with relative failure, despite the horrors experienced in the last war and the certainty of increased terrors in any war to come. For long we did not rearm so as to help forward the cause of peace; now re-armament was regarded as strengthening the possibilities of its attainment. The cost was

endured with complacency because we were conscious we could no longer face the risks of unpreparedness.

He was not challenging the policy, but it was amazing to find that material objectives could be secured while the cause of peace was not voiced with a sufficient effectiveness or unanimity to provide a sure foundation even for commerce, irrespective of the far greater and outstanding need of the citizens of so many nations for the security and happiness which could only be found in freedom from the fear of war. Where was there to be found a better rallying ground for peace than the League of Nations?

TRADING PROFITS

The increased trading profits were due to the increased deliveries which they had made during the past year and had been earned despite the advance in manufacturing costs. Their productive capacity of cement was substantially increased last year and would be further increased during the current year. Owing to the strength of their financial resources those extensions and improvements at works were being effected without the necessity of increasing their issued capital. The quality of their products, greatly improved in recent years, continued to receive their unremitting attention. The work of the research department had led to valuable economies and improvements in the technique of manufacture, and further progress was being made.

SUCCESSFUL MARKETING ORGANISATION

Having referred to the good work of their technical department, he would like to add a few words regarding their selling organisation, the Cement Marketing Company, Limited, particularly for the benefit of stockholders of recent standing. When many years ago they had established with the British Portland Cement Manufacturers, Limited, the principle of joint selling, it was decided that that could best be accomplished by the formation of the Cement Marketing Company, Limited. It marketed their well-known Blue Circle products and it had proved successful.

The company was purely a selling organisation which did not operate for profit or dividends, but rendered to the manufacturing companies the net prices it received on all sales effected after deduction of its duly authorised selling and administrative expenses. It paid no direct remuneration to the managing directors, but bore a proportion of the emoluments paid to those responsible for their sales organisation.

CURRENT YEAR'S PROSPECTS

Regarding the prospects for the current year, the demand continued good, notwithstanding some change in its character, due chiefly to a marked growth in the requirements of larger constructional work, which was likely to expand further. They therefore looked for an increased demand and had anticipated that by the substantial extensions now operating and in course of construction.

It was only right, however, that he should express a warning, not only to their stockholders, but to their customers, that costs of production had increased and were continuing to increase. Coal, which vitally entered into the cost of the manufacture of cement, one half-ton of coal approximately being required to make one ton of cement, cost them more last year and would cost them considerably more this year. All other commodities which entered into the cost of making cement were higher, including packages both for the home and export trades. Their labour costs were also higher.

On two occasions during 1935 advances in wages were granted to their works' employees and a further increase was made at the beginning of the present year. It was desirable that those facts should be impressed upon the shareholders, but he would add that they had always favoured a policy of fair prices and had no intention of supporting any advance in the same unless circumstances fully justified its application. However, if their turnover increased as to-day appeared likely to be the case he felt they might look forward with confidence to showing satisfactory results when they had the pleasure of meeting the shareholders again next year.

The report was unanimously adopted.

BRITISH ALUMINIUM COMPANY, LIMITED

LARGER TONNAGE SOLD — CAPITAL INCREASE APPROVED

The ordinary general meeting of the British Aluminium Company, Limited, was held, on the 31st ultimo, in London.

Mr R. W. Cooper, M.C., J.P. (the chairman), in moving the adoption of the report and accounts, said that conditions at the commencement of the year were favourable, and as the year progressed the requirements of the users of their products had increased, resulting in their disposing of a larger tonnage of aluminium. The growth of the use of aluminium had been world-wide, and the year 1936 marked the highest peak so far reached. They now found themselves in the position which they had foreseen a number of years ago, when they had undertaken the completion of the second stage of the civil engineering development of their Lochaber Scheme, and they were engaged in making extensions of plant and buildings at Lochaber and in providing plant for the production of the necessary additional supplies of the raw materials, alumina and carbon electrodes. When those various extensions were completed the output capacity of aluminium at their Lochaber works would be doubled. Further money would be required to finance those extensions, and they were proposing to create £2,500,000 additional ordinary share capital to provide for the present programme and to give them flexibility for future expansion of the company's business, which might arise in years to come.

To the profit for the year 1936, amounting to £597,180, fell to be added the carry-forward of £62,227 from 1935, and, after providing for debenture interest, reserves and other charges, there remained a disposable balance of £361,158. Of that sum £90,000 was required for the payment of dividend on the preference share capital, and they recommended the payment of a dividend of 10 per cent. on the ordinary share capital.

They had commenced the year with a satisfactory order book, and the outlook for the immediate future was distinctly favourable, although labour and other costs had been increased.

The report was unanimously adopted and the increase of capital was approved.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the 11 days ended March 31, 1937, amounted to £30,317,000, against ordinary expenditure of £18,693,000. After allowing for an increase in Exchequer Balances of £129,603, the operations for the period, as shown below, decreased the gross National Debt by £9,939,000, to approximately £7,910 millions.†

THE FINANCIAL NEWS

Special articles due to appear next week on the Leader Page of THE FINANCIAL NEWS are as follows :

MONDAY, APRIL 5—ARMAMENT METALS AND METAL SHARES.—The four leading base metals have had their full share of the limelight during recent months. Less attention has been paid to the less prominent metals largely used in armament and engineering alloy steels—Wolfram, Manganese, Nickel, Vanadium, Molybdenum, etc. This article analyses the present position of these metals and the shares of the companies producing them.

TUESDAY, APRIL 6—COMPANIES AND THEIR PROFIT-EARNING CAPACITY. No. 40—BURMAH OIL COMPANY.—In view of the exceptionally favourable current outlook for the Oil Industry the present is an appropriate time for reviewing the position of the leading Oil Companies. Accordingly our previous reviews of "Shell" and "Anglo-Iranian" are followed this week by the Burmah Oil Company.

WEDNESDAY, APRIL 7—COMPANIES AND THEIR PROFIT-EARNING CAPACITY. No. 41—BRITISH ALUMINIUM.—The shares of British Aluminium, a frequent past recommendation in our columns, have been a firm market at steadily improving prices, and the latest results recently announced have created a favourable impression. The more extensive review given in this article is still justified by the excellence of the Company's further prospects.

THURSDAY AND FRIDAY, APRIL 8 AND 9—COTTON SPINNING SHARES.—For some time a Lancashire cotton revival has been an almost regular monthly legend, and an equally regular monthly disappointment. Lancashire is optimistic, but major profit increases are still absent. The scope for recovery, and the prospects of recovery materialising, are examined in a series of four articles.

THURSDAY—General outlook for the Spinning Trade.

FRIDAY—The Lancashire Cotton Corporation.

(Note.—Two further articles dealing with Fine Spinners, Amalgamated Cotton Mills, Combined Egyptian, Barlow and Jones, Dewhurst, etc., will appear in the following week.)

TRANSVAAL OUTPUT, EMPLOYMENT AND WORKING PROFIT.—Gold output, February, 1937: Witwatersrand, 901,676 fine ounces; outside districts, 21,265 fine ounces; total, 922,941 fine ounces. Value for purposes of declaration, £7 1s. 6d. Total output, January 1937: 980,268 fine ounces. The number of natives employed at end of February was: Gold mines, 309,822; coal mines, 15,068; total, 324,890. Total estimated working profit for February, 1937: Witwatersrand £2,567,261; outside districts, £8,844; total £2,576,105. Comparable figures for January, 1937: Witwatersrand, £2,728,541; outside districts £11,321; total £2,739,862.

UNION CORPORATION, LIMITED

(Incorporated in the Union of South Africa.)

ABRIDGED REPORT OF THE DIRECTORS

In submitting to the Shareholders the Accounts of the Corporation for the year ended December 31st, 1936, the Directors state:—

The Accounts are drawn up in Union of South Africa currency, English currency being taken at par.

The net profit for the year is £685,044 5s. 9d., plus £130,906 13s. 6d. brought forward, making a total of £815,950 19s. 3d. The Directors have set aside £40,000 to Reserve Account, thus bringing that Account to £1,320,000, have placed £50,000 to Exploration Reserve Account, and have declared a final dividend of six shillings per share, making with the interim dividend of two shillings and sixpence a total distribution of eight

shillings and sixpence per share, or £595,000 for the year; £130,950 19s. 3d. remains to be carried forward.

Holdings of Shares, Debentures and other securities have been taken into the Accounts at cost or under, but in no case above the market price of December 31st last, or, where no market price exists, above the Directors' valuation. At present market prices, these holdings show a very substantial surplus over the amount at which they stand in the Balance Sheet. The Directors, as on other occasions in past years, have thought it expedient to provide for contingencies by reducing the book cost of certain holdings both below cost and below market price.

The operating results of EAST GEDULD MINES have been as follows:—

	Tons milled	Gold output (and per ton)	Average price per oz.	Working costs (and per ton)	Working profit (and per ton)	Dividends (and per share)
1935	1,152,300	£2,580,093 (44/5)	142s.	£1,059,373 (18/5)	£1,500,715 (28/0)	£778,875 (8/9)
1936	1,388,500	£2,824,830 (41/3)	140s.	£1,215,243 (17/9)	£1,609,587 (23/6)	£855,000 (9/6)

The ore reserves at December 31st last were estimated to amount to 9,000,000 tons assaying 6.8 dwt. per ton over a stoping width of 60 inches.

The Union Inland Revenue Department has intimated that Income Tax on the Company is to be changed as from 1st January, 1938, to a new basis, which, if the Company is liable therefor, will involve an additional payment for 1936 of £97,000. The question is

receiving the attention of the Company's legal advisers.

The Company retains its important shareholding in the neighbouring Grootvlei Proprietary Mines.

The operating results of GEDULD PROPRIETARY MINES have been as follows:—

	Tons milled	Gold output (and per ton)	Average price per oz.	Working costs (and per ton)	Working profit (and per ton)	Dividends (and per share)
1935	1,160,300	£2,303,587 (39/8)	142s.	£837,533 (14/5)	£1,466,054 (25/3)	£1,022,600 (14/0)
1936	1,276,000	£2,300,653 (36/5)	140s.	£907,383 (14/3)	£1,413,270 (22/2)	£1,095,643 (15/0)

The ore reserves at December 31st last were estimated to amount to 9,100,000 tons assaying 5.0 dwt. per ton over a stoping width of 57 inches.

In addition to the profits earned from its own operations the Company during the year received revenue from other sources amounting to £342,284, which figure includes

dividends on its large shareholding in East Geduld Mines.

The operating results of THE MODDERFONTEIN DEEP LEVELS (in Liquidation) have been as follows:—

	Tons milled	Gold output (and per ton)	Average price per oz.	Working costs (and per ton)	Working profit (and per ton)	Dividends (and per share)
1935	573,000	£1,080,723 (37/9)	142s.	£466,800 (16/4)	£613,923 (21/5)	£450,000 (4/8)
1936	595,100	707,676 (23/9)	140s.	466,570 (15/8)	241,106 (8/1)	150,000 (1/6)*

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

AFTER a short respite before Easter, prices on the principal commodity markets resumed their upward trend.

Quotations for wheat in Liverpool rose to the highest level since 1927-28. As we point out in a Note of the Week on page 11, the safety margin between supplies and requirements during 1936-37 had been under-estimated earlier this season, and there is a possibility of a squeeze before the new crops come on the market. Sugar prices rose sharply, partly in anticipation of a favourable outcome of the International Conference convened in London for next Monday. Cocoa was also dearer. English beef and mutton sold at higher prices, but foreign meat is scarcely changed on the week.

Among industrial raw materials, rubber prices took a sharp upward turn on heavy American buying caused by reports of the difficulties in the way of increasing production at short notice. The four principal non-ferrous metals—copper, lead, spelter and tin—staged a smart recovery. Quotations for linseed and linseed oil continued to advance. Practically 40 per cent. of the Argentine crop has already been shipped, and the quantity still available for export, at about one million tons, is no greater than at this time a year ago. Demand for coal and pig iron in this country continues to expand, but supplies are inadequate to meet all requirements at current prices. Both raw cotton and wool registered an increase in price, and the British wool textile industry is experiencing difficulties in its attempt to pass on the rise in prices.

In the United States, too, the past week witnessed a further rise in the prices of numerous commodities. Thus Moody's daily index of staple commodity prices stood at 227.5 on Wednesday (December 31, 1931 = 100), against 222.2 on Tuesday of last week, 209.1 a month ago, and 169.7 on the corresponding day last year.

COAL

SHEFFIELD.—Owing to the holidays relatively little business was transacted this week. The shortage of small coal is causing difficulties, buyers being unable to place all the business they have to offer. The persistence of the cold weather keeps up the demand for household fuel. There is good buying of industrial fuel, and there is no easing of the demand for coke. Export conditions are unchanged, demand all round being good. Prices show no variation.

NEWCASTLE-ON-TYNE.—The market in all classes of coal and coke in this area is strong and demand is as active as ever. Northumberland steam collieries are fully sold for this year and already a large proportion of their output has been sold over next year at current prices. Durham screened steam coals are fully sold for some weeks ahead, whilst coking coal, except for odd parcels, is unobtainable this year. Patent oven coke of all descriptions is a firm market.

GLASGOW.—There have been no further price changes of note during the week, but the tone of the market remains strong. Production is fully taken up against contracts and previous sales, and the few parcels coming on the market command high prices. Enquiries continue on a brisk scale, but in view of the stringency of supplies and the collieries' reserve in committing themselves ahead, not a great deal of business is being arranged for the time being. Home business remains on an extensive scale, and many collieries have been in arrears with their deliveries.

CARDIFF.—South Wales collieries have been idle for the first three days of the week, and output is not likely to exceed 50 per cent. of the recent weekly level. At the docks, however, loading operations were resumed on Tuesday, and as the tonnage position is exceptionally favourable the week's shipments may not be much smaller than in the corresponding period last year. The Italian State Railways have placed a contract for 150,000 tons of Monmouthshire coals, thus increasing the purchases under the new trade agreement to 350,000 tons. Prices are firm for all classes of coal, cokes and patent fuel, but are nominally unchanged. On Saturday last a delegate conference of the South Wales Miners' Federation approved the provisional terms of a new wages agreement for a period of five years, but adjourned until Saturday this week pending the decision of the constituent lodges.

IRON AND STEEL

MIDDLESBROUGH.—The market was closed this week owing to the Easter holidays. Demand for iron and steel continues to exceed production. Producers of Cleveland foundry iron continue to ration supplies to home users. In some cases supplies are insufficient to meet all requirements. Consequently some consumers have to reduce their output. East Coast hematite makers, whilst rationing supplies to home buyers, have during this month been able to allocate certain quantities for shipment abroad against old contracts. Parcels have been despatched to Germany, Denmark, and Belgium, whilst a cargo of about 1,500 tons has been shipped coastwise to South Wales. Total shipments of pig iron from the Tees from March 1st to March 27th amounted to 9,473 tons, against 6,988 tons a month ago. Prices are unaltered at the official fixed minimum levels.

In both sections of the steel industry the position is as stringent as ever. Re-rollers are unable to secure semi-finished steel in sufficient quantities to cover their requirements, although makers are working at capacity. Finished steel of all kinds is in exceptional demand. Prices are unchanged. Imports of iron and steel scrap are mostly coastwise and the quantities are small. Merchants are experiencing a big demand for all classes of scrap, and, whilst official prices are not yet announced, heavy steel melting scrap remains at 67s. per ton. Prices of foreign iron continue to advance. Shipments of best Bilbao rubio are becoming more difficult, the freight from Bilbao to Middlesbrough being not less than 11s. 9d. per ton. Owing to the increasing demand for coke for shipment, blast furnace coke is more difficult to secure, the nominal quotation for good Durham qualities at present being 30s. per ton, delivered at the furnaces.

SHEFFIELD.—The iron and steel market has welcomed the slight relief afforded by the Easter holiday. There has not been much business, but it is clear that the pressure for supplies will be quickly resumed. Consumers of pig iron are desirous of placing orders for current or forward delivery, but with producers booked to the limit of production there is next to nothing on offer. Foundry sorts are particularly difficult to obtain, and although the stringency in forge is not so pronounced, only small parcels can be picked up. There are hopes of some expansion of output before long, but the immediate future is being viewed with a certain amount of anxiety. Derbyshire makers continue to be the principal suppliers in this area, the pressure at source for Lincolnshire iron leaving nothing for outside consumers. New business in hematite is almost negligible, there being virtually nothing for disposal. Any forward buying is subject to any increase in quotations, it being regarded as certain that prices will be revised shortly. Demand for finished iron continues on a good scale, especially for common and marked bars. Makers of crown bars are now doing very much better.

Conditions with regard to basic steel billets show no improvement. In spite of the enormous output, supply lags well behind demand, and rationing of customers is being adopted in some cases. Acid billets are in strong request, and it is not easy to meet the full requirements for wire rods. There has been a further increase in the demand for stainless sheets and for structural steel. Prices are firm and unchanged.

How far the control system is operating in the iron and steel scrap market is difficult to discover, and all concerned would welcome publication of the full official list immediately it has been completed. Meanwhile merchants and buyers are in more or less of a quandary, and apparently prices are the subject of bargaining. There is a big demand for heavy basic steel and for foundry cast iron, supplies of which are on the short side.

GLASGOW.—There is still a shortage of steel supplies in the West of Scotland, and curtailment of output has been necessary at several plants. It is hoped that curtailment will not be of long duration. Speaking

OIL OUTPUTS

BRITISH CONTROLLED OILFIELDS, LTD.—Production for February 1937, 62,808 barrels; deliveries for February, 1937, 75,593 barrels; production for week ended March 13th, 15,561 barrels.

THE MEXICAN EAGLE OIL COMPANY, LTD.—Production for the week ended March 13, 1937, was 611,000 barrels. Production for the week ended March 6, 1937, was 609,000 barrels.

TRINIDAD PETROLEUM DEVELOPMENT COMPANY, LTD.—Production for the week ended March 13th, 26,763 barrels.

THE VENEZUELAN OIL CONCESSIONS, LTD.—Production for the week ended January 30, 1937, was: Bolivar district, 543,368 barrels; Maracaibo district, 22,833 barrels; total, 566,201 barrels. Production for the week ended February 6, 1937, was: Bolivar district, 840,482 barrels; Maracaibo district, 28,985 barrels; total 869,467 barrels. Production for the week ended February 13, 1937, was: Bolivar district, 870,209 barrels; Maracaibo district, 28,431 barrels; total, 898,640 barrels. Production for the week ended February 20, 1937, was: Bolivar district, 886,110 barrels; Maracaibo district, 27,563 barrels; total 913,673 barrels. Production for the week ended February 27, 1937, was: Bolivar district, 847,451 barrels; Maracaibo district, 25,318 barrels; total, 872,769 barrels. Production for the week ended March 6, 1937, was: Bolivar District, 870,580 barrels; Maracaibo district, 24,078 barrels — 894,658 barrels. Production for the week ended March 13, 1937, was: Bolivar district, 871,611 barrels; Maracaibo district, 26,827 barrels; total, 898,438 barrels.

ELECTROLUX COMPANY (STOCKHOLM).—Profit for 1936 was S.Kr. 10,838,334, against S.Kr. 9,651,158. Swedish taxes, S.Kr. 1,800,000 (against S.Kr. 1,400,000). Final dividend of 5 per cent. again makes total of 10 per cent., and after reserving S.Kr. 750,000 for pensions, forward balance is raised from S.Kr. 7,957,996 to S.Kr. 10,096,332. It is proposed to reduce share capital from S.Kr. 60,000,000 to S.Kr. 45,000,000 by refunding S.Kr. 25 per share.

GAUMONT-BRITISH PICTURE CORPORATION.—Mr Justice Clauson, in the Chancery Division, adjourned until April 6th the motion to stop the Corporation, pending the trial of the action, from paying the 5½ per cent. preference dividend for the half-year to March 31, 1937.

HUDSON'S BAY COMPANY.—Net profit for 1936 amounted to £228,695, against £144,717. In addition to normal depreciation, £600,000 has been taken from general reserve and £523,253 from share premiums, and added to buildings, etc., depreciation account. That account now stands at £3,033,329, the share premium account being reduced from £1,982,102 to £1,496,324.

NESTLE AND ANGLO-SWISS HOLDING COMPANY, LTD.—Net profit for 1936 amounts to Frs. 24,579,361.96. Balance forward from 1935, Frs. 5,848,620.73. To statutory reserve, Frs. 1,174,362.00; special reserve, Frs. 1,416,838.00; pension and provident funds, Frs. 2,500,000.00; special relief fund, Frs. 2,500,000.00. Payment of dividend of Frs. 28.00 per share of Frs. 200, Frs. 1.40 per share of Frs. 10. Carry-forward, Frs. 6,261,331.83.

RANSOMES AND RAPIER, LTD.—Profits for 1936 £63,853, compared with £31,873 for 1935. Net profit £30,270, against £11,323. Ordinary dividend raised from 2½ per cent. to 8½ per cent. To reserve £12,000, making £100,000. Carry forward £1,394. An offer to shareholders of the unissued 50,000 ordinary shares is being considered.

The Full Report and Accounts, with general plan of properties, may be obtained from the London Secretaries
A. MOIR & CO., 4 London Wall Buildings, London, E.C.2.

generally, the tendency in this district is towards expansion, and a number of concerns have additions to plant and buildings already in hand, while quite a number are under consideration at the moment. Clyde ship-builders have now more work on books than for many years past, and seem confident that further Government and mercantile contracts will be placed within the next few months. Structural engineers in the Glasgow district are all fully employed, and an increasing number of skilled men are now finding steady employment in this industry. All the manufacturing industries are busy and making heavy demands on the steelmakers and others. While re-rollers have recently received some Continental material, the tonnages involved are not sufficient materially to ease the situation, and business in this branch is exceedingly difficult.

CARDIFF.—The mills and steel furnaces were idle on Easter Monday, and manufacturers did not hold their usual meeting on Tuesday. The general condition of the market for tinplates remains unchanged. Prices continue very firm, and deliveries both for the export and the inland trades continue satisfactory. Shipments totalled 8,427 tons, compared with 6,759 tons the previous week and 3,962 tons in the corresponding week last year.

OTHER METALS

COPPER.—Despite holiday influences, which had a restrictive effect on the volume of business, prices improved this week. Liquidation has eased and demand has shown an improvement. Prices are again being "talked" higher and, since rising production is not yet reflected in current supplies, this optimism does not appear to be altogether unfounded. In the meantime, the United States domestic quotation was advanced to 17 cents per lb. this week.

Sales on the London Metal Exchange: 2,300 tons on Tuesday, against 4,800 tons last week; 2,600 tons on Wednesday, against 5,000 tons last week. Domestic spot was quoted at 17.02½ cents per lb. in New York on Wednesday, against 16.32½ cents a week ago and 16.12½ cents a month ago. Wednesday's official closing price for standard cash in London was £72 17s. 6d. to £73 per ton, compared with £68 10s. to £68 12s. 6d. a week ago. Stocks of refined copper in British official warehouses at the end of last week, at 24,573 tons, showed a decrease of 694 tons, while stocks of rough copper, at 707 tons, were 150 tons larger.

LEAD AND SELLER.—Both metals rose in price, spelter being the firmer of the two. Indeed, at the close on Wednesday, the latter metal was quoted £1 16s. 3d. per ton higher than lead, the advance being traceable to the resumption of purchases in anticipation of large imports into the United States. The world smelter zinc output, according to the *Metallgesellschaft*, fell from 128,628 metric tons in December to 122,995 metric tons in January. The decline was entirely due to a smaller output in the United States; production elsewhere—which had already risen from 82,878 tons in November to 85,945 tons in December—showed a further rise to 86,685 tons in January. The future course of spelter prices must be largely dependent on developments in the United States. Should that country be forced to import—a possibility which is still much in doubt—prices might move to higher levels in the near future. If this possibility does not materialise, however, a setback is likely, for speculative holdings are heavy and production outside the United States is sufficient for requirements.

Sales of lead on the London Metal Exchange: 3,300 tons on Tuesday, against 2,750 tons last week; 1,650 tons on Wednesday, against 2,500 tons last week. The New York quotation on Wednesday was 6.95 cents per lb., against 6.95 cents a week ago and 7.00 cents a month ago. The official closing quotation in London for soft foreign for shipment during the current month was £31 16s. 3d. per ton, compared with £30 12s. 6d. a week ago.

Sales of spelter on the London Metal Exchange: 2,300 tons on Tuesday, against 3,000 tons last week; 2,100 tons on Wednesday, against 5,250 tons last week. Wednesday's quotation in East St. Louis was 7.50 cents per lb., against 7.50 cents the week before and 7.00 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £33 12s. 6d. per ton, against £30 12s. 6d. last week.

TIN.—After an early rise from £282 to £302, the cash price fell back to £294 per ton. Moreover, the "backwardation" (the premium on the spot quotation over the forward price) which was as high as £9 per ton at one time, narrowed to £4 on Wednesday. The removal of fears concerning a strike in Malaya was one factor responsible for the easier tone this week, whilst demand was also rather restricted. The strike situation in the United States tended to make buyers cautious and the market was also inclined to wait for the March statistics, which were published on Thursday.

These statistics, compiled by A. Strauss and Company, show that the visible supply rose by 575 tons to 22,256 tons last month, although deliveries were 1,293 tons larger, at 12,866 tons. New supplies amounted to 13,757 tons, an increase of 3,255 tons on the month. Although the increase in the visible supply is substantially less than the figure estimated by the International Committee, the position is better than the market had expected. Indeed, the March statistics show that, in the absence of speculation and the nervousness of consumers, the supply position would be normal.

Sales of tin on the London Metal Exchange: 450 tons on Tuesday, against 550 tons last week; 375 tons on Wednesday, against 425 tons last week. The New York quotation on Wednesday was 64.75 cents per lb., against 64.00 cents a week ago and 56.87½ cents a month ago. Wednesday's official closing quotation in London for standard cash was £294 to £294 10s. per ton, compared with £285 to £285 10s. a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 1,586 tons, an increase of 414 tons on the week.

WOLFRAM.—Wolfram ore, which was selling at 25s. a unit last autumn and at about 37s. when the defence White Paper was published in February, has now risen to over 60s. a unit. The rise is partly due to genuine supply-demand factors, but there is also much speculation. It is not easy to predict whether a reaction is likely in the near future; it is, however, certain that at the present price level tungsten will suffer severe competition from molybdenum. Ultimately, therefore, a heavy decline in wolfram prices seems inevitable.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted on Wednesday at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was quoted at £14 7s. 6d. per flask of 76 lbs., the same as last week. Chinese antimony was quoted at £79 to £80 per ton ex warehouse, the same as last week. Chinese wolfram for "April-May" shipment was quoted at 61s. to 63s. per unit, c.i.f., compared with 57s. to 59s. last week. Refined platinum was steady on Wednesday at £115s. an ounce.

TEXTILES

COTTON.—**Manchester.**—During the past week business has been interrupted by the Easter holidays. An outstanding feature has been the further advance in raw cotton prices. As a result spinners and manufacturers have put up their quotations.

Bullish sentiment in New York and Liverpool has increased as a result of the active trade demand, and a report that there will not be further releases of loan cotton before February next year. Forwardings to world mills last week were heavy, and the total so far this season is 1,000,000 bales more than a year ago. However, there is some anxiety of a decline in prices in a few months' time, owing to the probability of an appreciable increase in the acreage under cotton next season.

Yarn quotations have been firmly held at the higher level. Demand has continued healthy, but in some quarters the higher prices have checked business. The stronger position of producers of ring beams continues to be a feature. A rather irregular business has taken place in Egyptian yarns.

Manufacturers of piece goods have well maintained their stronger position. A favourable development has been the increased activity for India, some fairly substantial contracts being put through in bleaching and finishing styles for delivery up to the end of November. There is a little anxiety, however, with regard to the political situation. Further operations have occurred in fine goods for Rangoon, and special orders have been secured in heavy materials for Hong Kong. A steady business has been done in printed and coloured cloths for West Africa and in printing and finishing styles for South America. Rather more contracts have been reported for the Continent, especially Germany and Scandinavia. Poplins have been in request for Canada and heavy goods for South Africa. A good all-round business has been done in home trade fabrics.

COTTON PRICES

WOOL.—**Bradford.**—Woolmen, mill masters and operatives have all welcomed the short respite from business during the Easter holidays. The market remains firm. Since the close of the last London sales, cables from overseas have indicated the maintenance of prices with an expanding demand. Bradford topmakers are finding it somewhat difficult to pass on the rise in raw wool prices, and good 64's warp tops are costing fully 40d. per lb., no matter where the wool is being bought. It would seem as if 39d. per lb. is the utmost that can be obtained for these tops. Spinners are resisting the topmakers, while manufacturers are finding it difficult to hand forward the increased prices for cloths. Wholesale clothiers are concerned about sacrificing any profit margin they may have had in the past, and retail clothiers, anxious to maintain their returns, are in many cases inclined to lower quality. Quotations for crossbreds are advancing steadily, and the margin between fine wools and crossbreds is narrowing fast. At the Dunedin sale a week ago all qualities advanced a further 1d. per lb., clean. Consequently, topmakers have again put up prices. During the depression 40-44's B.A. crossbreds at one time sold at 5d. per lb., clean, c.i.f. Liverpool, and to-day's price is 21d.; other qualities are correspondingly dearer. This week mills have been standing two and three days, but machinery is being kept running well, and consumption is still large.

GRAIN MARKETS

WHEAT.—Despite the occurrence of the holidays, prices continued to rise in the period under review. The market has been sustained by the continuance of demand from Italy and Germany, while European crop prospects for the present season appear none too favourable. A similar advance has occurred on North American markets.

On Wednesday last, "May" futures were quoted in Chicago at 142½ cents per bushel, against 139½ cents the week before and 133½ cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba, ex ship, 60s. per 496 lbs.; No. 2 Northern Manitoba, ex ship, 59s. According to *Corn Trade News* total shipments of wheat and flour last week totalled 1,465,000 quarters, against 1,865,000 quarters in the previous week and 1,205,000 quarters in the corresponding week a year ago.

FLOUR.—The price of flour has further advanced in a strong market. Wednesday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 45s. 6d. per 280 lbs.; delivered inner London, 45s. Manitoba patents, ex store, 44s. 6d. to 46s. Australian, ex store, 35s. 3d. to 36s.

BARLEY.—Imported barley was firm in price, both before and after the holiday period. "May" futures were quoted at 84½ cents per bushel in Winnipeg on Wednesday, against 82½ cents a week ago. Quotations per 448 lbs. in London on Wednesday were: "English feed," at farm, 36s. to 38s., as against 36s. to 38s. a week ago; "English malting," at farm, 38s. to 45s., against 38s. to 45s. last week. Californian (new), ex ship, 54s. 6d.; Chilean, brewing (new), ex ship, 44s. 9d. to 50s., against 44s. 9d. to 50s. a week ago.

OATS.—On Wednesday, "May" futures were quoted at 49½ cents a bushel in Chicago, against 47 cents a week ago and 45½ cents last month. Quotations in London, Wednesday: "English black," at farm, 24s. to 26s. per 336 lbs. a week ago; "English White," at farm, 24s. to 26s.; mixed Canadian feed (Vancouver), landed, 25s. per 320 lbs.

MAIZE.—Under the influence of an active demand, prices have again advanced in the period under review. "May" futures were quoted on

Wednesday at 118½ cents per bushel in Chicago, against 110 cents a week ago and 104½ cents last month. Quotations in London, Wednesday: "Plate," landed, 29s. 9d. per 480 lbs.; "Plate," ex ship, 28s. 9d.; "Plate," March, 28s. 9d.; yellow maize meal, ex wharf, was quoted at £7 10s. to £7 12s. 6d. per ton.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1935-37:—

NEAREST FUTURE	Jan. 2, 1935	Dec. 31, 1935	April 1, 1936	Dec. 30, 1936	Mar. 23, 1937	Mar. 31, 1937
Winnipeg (No. 1, Manitoba) Cents per 60 lb.	82½	84½	81½	129	139½	146½
Chicago (No. 2, Winter) Cents per 60 lb.	98½	101½	96½	135½	139½	142½

The visible supply of wheat in Canada amounts to 83,841,000 bushels, against 85,333,000 bushels last week, and 112,300,000 bushels in the corresponding week last year.

SALES AND PRICES OF BRITISH CEREALS.—The following table gives the estimated sale of home-grown wheat during the harvest years 1933-34 to 1936-37:—

	1933-1934	1934-1935	1935-1936	1936-1937
Estimated sales of home-grown wheat—	Cwts.	Cwts.	Cwts.	Cwts.
1 week to March 27	201,524	265,111	251,142	190,881
30 weeks to March 27	9,142,000	10,948,582	11,041,648	8,248,861
Average price of English wheat per cwt.	s. d. 4 5	s. d. 4 8	s. d. 6 5	s. d. 9 2

The following is a statement showing the quantities sold and the average price of British cereals in the past two weeks, and for the corresponding weeks in each of the years from 1933 to 1936:—

Week ended	QUANTITIES SOLD			AVERAGE PRICE PER CWT.		
	Wheat	Barley	Oats	Wheat	Barley	Oats
March 25, 1933	Cwts. 155,384	Cwts. 94,059	Cwts. 37,902	s. d. 5 1	s. d. 6 3	s. d. 5 10
March 24, 1934	201,524	68,902	43,641	4 5	8 10	6 2
March 30, 1935	265,111	89,553	38,449	4 8	7 4	6 11
March 28, 1936	251,142	101,407	37,553	6 5	7 7	6 0
March 20, 1937	277,345	116,429	52,951	9 0	9 10	8 3
March 27, 1937	190,881	51,503	30,468	9 2	10 1	8 2

OTHER FOODS

BACON.—Bacon has remained in active request at steady prices. The official quotations (per cwt. for No. 1 Sizable) which formed the basis for dealings on the London Provision Exchange this week were: English, 92s. to 96s.; Canadian, 85s.; Danish, 92s., against 92s. to 96s., 85s. and 92s. last week. Arrivals in London last week included: Danish, 13,299 bales; Canadian, 6,584; Dutch, 2,713; Lithuanian, 1,190, and Polish, 3,006; as against 13,633, 6,777, 2,778, 1,069 and 2,748 bales, respectively, in the previous week.

BUTTER.—Colonial butters remained a firm market, other kinds being slow. Quotations (per cwt.) on the London Provision Exchange on Wednesday were: New Zealand, finest salted, 101s.; Australian, choicest salted, 101s.; Danish, 118s. to 120s.; compared with 101s., 101s. and 128s., respectively, a week ago.

CHEESE.—English and Colonial makes were a firm market, with other descriptions steady. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: English, finest farmers, 86s. to 92s.; Canadian, finest coloured, 73s. to 74s.; and New Zealand, finest coloured, 65s. 6d. to 66s., against 86s. to 92s., 73s. to 74s., and 63s. 6d., respectively, a week ago.

COCOA.—The spot quotation in New York on Wednesday was 11½ cents per lb., as against 11½ cents per lb. last week. In London, on Wednesday last, good fermented new crop, Accra, "April-May," was quoted at 52s. per 50 kilos, c.i.f. Continent, against 51s. a week ago. Last week's movements of cocoa in London were as follows: Landed, 20,406 bags; delivered, for home consumption, 5,874 bags; exported, 152 bags; stocks, 253,113 bags, against 137,984 bags a year ago.

COFFEE.—On Wednesday, Rio No. 7 (cash) was quoted at 9½ cents per lb. in New York, as compared with 9½ cents per lb. last week and 9½ cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, 9 cwt.; delivered, for home consumption, 20 cwt.; exports, nil; stocks, 3,087 cwt., against 11,600 a year ago. Central and other South American: Landed, 5,347 cwt.; delivered, for home consumption, 3,334 cwt.; exported, 986 cwt.; stocks, 92,292 cwt., against 100,173 last year. Other kinds: Landed, 6,819 cwt.; delivered, for home consumption, 3,652 cwt.; exported, 533 cwt.; stocks, 124,918 cwt., against 159,421 last year.

EGGS.—English and Irish eggs were a steady market this week, but other selections had an easier tendency. At Smithfield, on Wednesday, English (ordinary packing, Grade 1, about 15-15½ lb.) realised 10s. 3d. to 11s. per 120, as against 10s. to 10s. 3d. last week; while Danish (15½ lb.) made 9s. 3d. to 9s. 6d., as against 10s. 3d. to 10s. 6d. last week.

FRUIT.—Business at Covent Garden was brisk in the week before the holidays, but has since had a quieter tone. According to *The Fruitgrower*, apple prices were steady, on a good demand. Cape grapes rose in price, but Belgian were easier. South African pears were steady at the previous range, while Australian were a little dearer. The forced English straw-berries on the market declined in price. Plums from South Africa and Australia, although in steady demand, were a somewhat easier market. Supplies of grapefruit were plentiful, with quotations showing little material alteration; the orange trade was steady, and lemons were slightly easier.

MEAT.—At Smithfield Market, business has been rather quiet following the holidays. On Wednesday last, Argentine chilled hindquarters were quoted at 8s. 6d. to 4s. per 8 lbs., as compared with 3s. 10d. to 4s. 2d. quoted at 8s. 6d. to 4s. per 8 lbs., as compared with 3s. 10d. to 4s. 2d. a week ago. New Zealand frozen mutton was 3s. 4d. to 4s. per 8 lbs., against 3s. 4d. to 4s. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 8,692 tons, a decrease of 223 tons on the corresponding week last year. Beef and veal accounted for 4,806 tons, mutton and lamb 2,368 tons, and pork and bacon 913 tons, as compared with 4,789, 2,512 and 1,028 tons, respectively, in the same week of 1936.

PEPPER.—On Wednesday, Singapore white Muntok, spot, was quoted at 6d. per lb. in bond, against 6d. per lb. a week earlier. Black Lampong, spot, in bond, was quoted at 3½d. per lb. sellers, compared with 3½d. per lb. last week. Movements of pepper in London last week were as follows: Black, landed, nil; delivered, 1 ton; stocks, 1,806, against 1,685 last year. White, landed, nil; delivered, 32 tons; stocks, 11,782, compared with 12,699 a year ago.

RICE.—The spot price of Burma No. 2, cleaned, was 10s. per cwt. ex warehouse, on Wednesday, as compared with 10s. per cwt. a week ago. "March-April," in singles to Continent and U.K., was quoted at 9s. per

GOVERNMENT GOLD MINING AREAS (MODDERFONTEIN) CONSOLIDATED, LTD.

cwt., against 9s. last week. Movements in London last week were as follows: Landed, 25 tons; delivered, 38; stocks, 1,080 tons, against 1,240 a year ago.

TEA.—The following table shows the average prices (compiled by the Tea Brokers' Association) of tea sold in Mincing Lane on Garden Account in recent weeks:—

Week ended	Northern India	Southern India	Ceylon	Java	Sumatra	Africa	Total
Feb. 18, 1937	d.	d.	d.	d.	d.	d.	d.
Feb. 25, "	14-04	14-19	16-15	13-35	11-83	13-21	14-53
Mar. 4, "	14-32	14-71	16-60	14-35	11-84	13-65	14-84
Mar. 11, "	14-34	14-76	16-78	13-35	12-24	13-52	14-92
Mar. 18, "	14-29	15-01	16-82	14-18	12-38	13-34	14-82
Mar. 25, "	14-37	15-05	17-03	14-13	12-56	13-61	15-02
	14-97	15-81	17-27	Nil	Nil	13-91	15-81

The market was closed this week.

VEGETABLES.—Supplies of vegetables at Covent Garden were ample for the pre-holiday trade, states *The Fruitgrower*, but prices for most lines improved. An easier tone has, however, been displayed this week. Lettuces and new carrots realised good prices, and radishes were a better item. Asparagus, however, was easier, and house-grown beans declined slightly. Greenstuff in general was in keen request, but cauliflowers and leeks were easier in price. Potato prices were marked up before the holidays, and have since been firm. At the Borough Market on Tuesday, against 9s. 6d. to 10s. 6d. per cwt., ex market, against 9s. 6d. to 10s. last week.

SUGAR.—Raw sugar was a firm market both in London and New York this week. The New York spot quotation was 3-55 cents on Wednesday, as compared with 3-45 cents per lb. last week and 3-48 cents per lb. a month ago. Wednesday's sales of raw sugar in London included "May" delivery at 6s. 8½d. to 6s. 9d., against 6s. 4½d. to 6s. 5½d. a week ago. Movements of raw sugar in public warehouses in London and Liverpool last week were as follows: Imports, 19,353 tons, against 4,436 in the previous week and 9,976 in the same week of 1936; deliveries, 12,953 tons, against 17,728 and 15,134 tons, respectively; stocks, 206,940 tons, against 200,540 and 230,912 tons, respectively.

The payable **Ore Reserves** at the end of the year were estimated at 14,057,000 tons of an average value of 3.9 dwts. over a stoping width of 46 inches. The estimate of ore reserves is based on gold at 140s. per fine ounce and current working costs.

The full Reports and Accounts may be obtained from the London Agents, Johannesburg Consolidated Investment Company, Limited, 10-11 Austin Friars, London, E.C.2.

MISCELLANEOUS COMMODITIES

VEGETABLE OILS AND OILSEEDS.—Firm conditions rule for practically all oilseeds and prices continue to have an upward tendency. Linseed has further advanced mainly on Continental buying of Plate, which so far as English crushers are concerned is more or less neglected, and in sympathy with Argentine options. Some interest has been shown in new crop Indian seed, shipments of which are now beginning, but prices are considered too high to stimulate demand. In view of the heavy shipments from the River Plate some concern is felt concerning the adequacy of future supplies. Practically 40 per cent. of the Argentine seed already been shipped since the beginning of the year. In the past few weeks 662,000 tons have been exported, against 440,000 tons in the corresponding period last year, leaving around a million tons or approximately the same quantity as was actually shipped in the remainder of 1936. India is expected to have about the same quantity available for export as last season, so that probable world supplies are now no greater than a year ago, notwithstanding the heavier Plate crop. Large shipments continue to be made to the United States and Canada, the total for the past twelve weeks being 228,000 tons, against only 57,000 tons a year ago.

Prospects for a larger area under linseed in the United States are considered disappointing. The quantity of linseed now afloat for Europe has increased to 207,800 tons. Egyptian cottonseed is very firm but little business is passing at the higher levels.

Vegetable oils have moved up in sympathy with seed and a good demand. Linseed oil has reached £30 per ton, naked, ex Hull mill, and is at the highest level since September, 1930. Cotton oil is firm and a shade dearer. The demand for oilcakes continues good, and prices are maintained.

RUBBER.—The market has again been active and prices have risen to the highest level since March, 1928. The expectation of a labour shortage in Malaya was more than sufficient to offset the effects of the strike situation in the United States. The spot price in New York on Wednesday was 26½ cents per lb., compared with 24½ cents per lb. a week ago and 21½ cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 1s. 1½d. per lb., as against 1s. 0½d. on the corresponding day last week. In forward positions, business has been done at 1s. 1½d. to 1s. 1¾d. for "May" shipment, as against 1s. 0½d. to 1s. 0¾d. a week ago. Stocks in London and Liverpool at the end of last week totalled 53,818 tons, against 54,734 tons a week earlier. A year ago stocks amounted to 148,899 tons.

WHOLESALE COMMODITY PRICES

UNITED KINGDOM: LONDON, March 31st.

The prices in the following are revised with the assistance of an eminent firm in each department

CEREALS AND MEAT				POTATOES—				WOOL—

into deadlock? It is impossible to study the problems involved or to sample the opinions of those who in foreign countries have been wrestling with them in past months, without reaching the conclusion that the main stumbling-block is to be found in the attitude of the British Government—not in any wilful obstruction but in a refusal to modify preconceived formulas by so much as a single digit to accommodate them to the new opportunities presented by changing circumstances. It is not honesty of purpose that is lacking so much as breadth of vision and elasticity of approach.

The numbing effect of British policy can be illustrated in many ways. It is obvious, for example, that an Anglo-American Trade Agreement cannot be concluded unless it includes some concession by Great Britain on American agricultural produce. But in the face of all the advantages, political and economic, that would flow from such an Agreement, the British Government are apparently still tied to the slogan of "the home farmer first, the Dominions second, and the foreigner (including the American) nowhere." Is there no other way of protecting the British farmer from ruin than by holding up the whole movement of world commerce, snubbing the friendliness of the American Government and condemning our own export trades to lasting stagnation? Is it certain that the Dominions would object to any concession being made to America? The Dominion most closely affected would be Canada, and it should not be beyond the wit of man, or outside the reach of American goodwill, to find some triangular method of bringing advantage to all three parties.

It is doubtful whether the British public realises the depth of foreign dislike of the Ottawa Agreements. Even those foreign countries who are willing to concede to the British nations the principle of Imperial Preference, object to the restrictive manner in which it is applied. They remember that the British delegation to Ottawa promised that there should be no increases of tariffs to

foreigners, and then agreed to the precise reverse. So long as the Ottawa Agreements do not encourage trade, but merely divert and distort it; so long as they make it impossible for Great Britain to give anything in return for what foreign countries can offer, so long will they be regarded by the world at large as one of the major handicaps to commercial reconstruction. Insult is added to injury when Great Britain, invoking the sacred name of the most-favoured-nation clause, prevents other nations from doing what she and the Dominions did at Ottawa. The Ouchy Convention between Holland and Belgium was brought to naught by a British veto in 1932, although no duties were to be increased to anybody. A similar convention between all the Oslo States would be well within the realm of possibility to-day if it were not for the British attitude. Britain not only suspends the most-favoured-nation clause within the Empire, but in her dealings with foreign countries she virtually compels them to break it in her favour. What else are the coal clauses of the British Agreements with the Scandinavian countries but deliberate evasions of the most-favoured-nation clause? Yet these same countries are not allowed to suspend the clause in their own favour or in that of all-round freer trade.

We repeat that we do not believe this attitude to be one of deliberate perversity. Ministers are honestly of the belief that British restrictions are very moderate. So they are; but a low hedge across a highway may be more obstructive than an unscalable wall on a remote mountainside. The time has come for an act of high policy, for a deliberate decision by the British Cabinet to do all that it can to further the promising movement whose spokesmen are in London this week. As always, the disadvantages of such a course will lie on the surface and the advantages will be less direct. But there will never be a time when a more overwhelming measure of indirect benefit can be purchased for so little direct cost. It is now or never.

Profit and Loss in Spain

THE international atmosphere is still charged with war and rumours of war; yet there seems to be no reason to revise the more optimistic forecast upon which we ventured a fortnight ago. On the contrary, it looks to-day more than ever as though the clouds were lifting, and we may even see before long some patches of blue sky.

For one thing, it is now becoming increasingly unlikely that the outcome of the civil war in Spain will radically alter the balance of power in the Mediterranean and in Europe. On the Government side, the International Brigade has foiled the attempt of the Italian and German dictators to carry FRANCO to victory on a moving forest of foreign bayonets. Its sacrifices have given the Government time to build up a properly drilled and equipped loyalist Spanish army, and a second-line army behind it. The International Brigade can no longer be reinforced, but GENERAL FRANCO is now confronted by a far larger host of native Spanish fighting men—sprung from the ground out of the dragon's teeth which the insurgent leaders sowed when they plunged their country into civil war.

The insurgents *ne passeront pas*; but, on the other hand, it is unlikely that the Government, even with its new model army, will be able to make a clean job of crushing the insurgents by force of arms. It is true that FRANCO's foreign support is proving a broken reed; for the Italian troops in Spain have been demoralised; the Germans are trying to extricate themselves (we discuss the reasons below); and the French and British Govern-

ments have now made it clear to Rome and Berlin that they intend to see that the non-intervention agreement is genuinely carried out. The Western Powers will make a determined effort to obtain the withdrawal of all non-Spanish nationals who are already serving on either side; and, short of that, they will show their teeth if the German and Italian Governments attempt to introduce fresh men and munitions surreptitiously. This change in the diplomatic situation to the advantage of the Western Powers is all in the Spanish Government's favour; but it may well be offset, in part at least, by the old and apparently incurable domestic quarrels of the Government's supporters. The feud between anarchists, democrats and Communists has been waged so bitterly while all three factions have been *in extremis* that it threatens to pass all bounds if and when the consolidating pressure from the insurgents begins to relax.

Thus, while there seems a growing probability that the outcome of the Spanish civil war will be stalemate, what are Italy and Germany thinking and doing? In Germany, it seems that the Reichswehr has prevailed over the Radical Wing of the Nazi Party in the struggle to gain HERR HITLER's ear, and any reasonable excuse may be taken to liquidate Germany's Spanish commitments—which have apparently been limited since Christmas. If the Reichswehr is having its way, it owes this political victory to the incontrovertible logic of events both in Spain and elsewhere.

When the Spanish civil war broke out, the Reichswehr were not yet ready for action—not even for a colonial

war à la Mussolini—and the Spanish experiment which they have been compelled unwillingly to make has not been encouraging. As in 1914, the plans of the German Generals have been based on the assumption that an overwhelming offensive can achieve a swift and decisive success. While, *mirabile dictu*, the Generals appear to have learnt nothing and forgotten nothing as a result of their experience in the Great War, the "little war" which has been going on in Spain does seem to have made an impression on their minds. It is said to have convinced them that the defensive, even when hastily extemporised, is able to hold up the impetus of even the latest of modern weapons; and if this has happened in the Spanish civil war, it would happen *a fortiori* in a conflict between highly trained and well prepared armies. Tanks, in particular, have proved to be less difficult to put out of action than was expected; aeroplanes have been more deadly in counter-attack than in attack; and Germany's own new war-material has been less effective than that of her rivals—e.g. Russia.

Nor are these technical failures the worst of Germany's disappointments. Her military miscalculations have been less egregious than her political, if she has really been counting upon a revolution in France which would turn France into a second Spain and leave Germany with a free hand on the Continent in the *beau rôle* of the saviour of Europe from Communism. To-day, France is actually stronger than she has been for years. MONSIEUR BLUM is firmly in the saddle; financial as well as political confidence is returning; Franco-British solidarity is greater now than at any time since 1918; and Great Britain is re-arming. In these circumstances, HERR HITLER himself can scarcely be prepared to challenge the united forces of Britain and France—particularly when he cannot rely either politically or militarily upon Italy. Thus, to-day, Germany finds herself once again virtually single-handed and unprepared instead of being mistress of the European situation, as she had hoped to be.

Italy, too, is in difficulties which, at the moment, are even greater than Germany's. She is more deeply and more publicly committed than Germany to the Spanish adventure. She is faced, like Germany, with a choice

between withdrawing and reinforcing her expeditionary force; but, unlike Germany, she cannot comfortably take either course. If she brings her troops home from Spain, they will now certainly bring with them a political infection that will be likely to spread. If she leaves them in Spain unreinforced, they may fall into a serious plight which would do further damage to Italian prestige. If she tries to reinforce them, she now runs the risk of a serious encounter with the Western Powers.

From the Italian standpoint, these Spanish problems are harassing enough; and yet they are by no means the gravest issue which Italy has to face. Her worst nightmare is one of her own creation, and that is the new armaments race. For the weakest and poorest of the Great Powers to have hounded the sluggish and pacific giants to the west of her into an armaments race, in which they cannot fail to outspend and out-arm her is the crowning folly of SIGNOR MUSSOLINI's statesmanship.

If the two Fascist Powers are getting out of their depth while the Spanish civil war is approaching stalemate, can we begin to see a way out of Europe's Spanish impasse? On the assumption that the foreign driving force is going to die out of the Spanish civil war, we may go on to assume that the present civil war in Spain will end in the same way as its predecessors; and these have never ended in a military decision. They have ended in the patching up of some sort of an armistice, after which the troops on either side have melted away and have resisted all attempts to call them back to the colours. Given a repetition of history in Spain, the Non-Intervention Committee would at last have a really beneficent and constructive part to play. If it could turn itself into an international relief organisation to do in Spain what Mr HOOVER did in Belgium during the Great War, its humanitarian work might have a political sequel. The international representatives who had come in to start Spain on the path of material reconstruction might stay on to help her to get on to her feet again politically. An impartial election might be held under international auspices, on the model of the plebiscite in the Saar. Here is a golden bridge for all of us—Spaniards and foreigners, democrats and dictators. Can we not agree to cross it abreast?

British and American National Income

THE concept of the National Income is one which has attracted statisticians almost from the birth of their science. Not the least interesting chapter in MR COLIN CLARK's recent book* is that in which he collates the different estimates from those of GREGORY KING onwards. Nor is the National Income merely a statistician's plaything; it is of great importance for the formulation of economic policy to know the approximate dimensions of the National Income, and of even greater importance to measure its fluctuations. It is not merely the starting-point of economic policy, but also the criterion of the policy's success or failure; for the aim of all economic management should be to increase the aggregate incomes of the community's members.

To define the National Income in general terms is simple: it is the aggregate of the incomes of all the individuals comprising the community. But to define it in detail is much more difficult; and to give the definitions, when they have been reached, a precise numerical embodiment requires an elaborate statistical technique. Moreover, there is the difficulty of the changing value of money to contend with, since for most purposes (though not for all) it is the *real* national income, not its monetary equivalent, that is required. A great deal of progress has

been made towards solving these difficulties, especially in Great Britain and the United States. In Great Britain many eminent statisticians have written on the matter. In the United States regular estimates are published through the collaboration of the Department of Commerce with the National Bureau of Economic Research. The purpose of this article is to compare MR CLARK's figures for the United Kingdom with the Bureau's figures for the United States during recent years.

Before the figures are set out, however, it is as well to utter a word of warning. The two estimates which are to be compared are based, in their published form, on assumptions which are not always the same. For example, MR CLARK includes in his estimates indirect and local taxation and compulsory social insurance contributions; but the corresponding levies are omitted from the American estimates. On the other hand, the National Bureau for Economic Research includes interest on the National Debt, which is omitted from MR CLARK's estimate. In the present article, deductions have been made from the British and American figures to make them comparable. In addition, the American figures, as published, exclude income tax levied on corporations and also the value of residences occupied by their owners; estimates for these have been added to the published figures. Finally, both estimates are adjusted so as to

* "National Income and Outlay." By Colin Clark, M.A. Macmillan.

allow in the same way for changes in the value of stocks of goods due to both rising and falling prices. It need hardly be said that none of these adjustments is intended to imply any judgment on the correctness of one or the other set of assumptions; they have been undertaken merely to make the figures comparable.

But though steps can thus be taken to ensure that what the figures purport to show is the same in each country, we are still a very long way from being able to make a direct comparison between them. The statistics on which they are based may differ both in composition and in accuracy. Income tax statistics, for example, are one of the most important raw materials. But an identical income would be treated differently by the income-tax authorities of the two countries, and might appear very differently in the published statistics. Moreover, if any attempt is made to "correct" the money figures by an index number of prices (i.e. to allow for changes in the value of money), it is almost impossible to secure index numbers of identical composition in the two countries. And, finally, before any comparison can be made of average incomes in the two countries, allowance must be made for the differing cost of maintaining the standard of life made necessary by nature or human convention. An American with an income of \$490 may be better or worse off than an Englishman with an income of £100.

When all these allowances and adjustments have been made, there may be some ground for wondering whether there is anything left worth comparing. But whatever errors there may be in each estimate, or differences between them, it is legitimate to assume that these are the same from year to year. If so, even though the *absolute figures* of National Income cannot be compared, their *proportionate fluctuations* can be. In the following figures, accordingly, no attempt has been made to translate pounds into dollars or *vice versa*, and the comparison is intended to be limited to the index numbers derived from the money figures.

The first step is to set out the figures for the National Income in monetary terms:—

	UNITED KINGDOM		AND UNITED STATES	
	United Kingdom	United States	United Kingdom	United States
	£ millions 1929 = 100	\$ millions 1929 = 100		
1929	3,869	100.0	87,100	100.0
1930	3,817	98.7	77,700	89.2
1931	3,383	87.4	61,600	70.7
1932	3,303	85.4	44,800	51.4
1933	3,323	85.9	42,100	48.3
1934*	3,678	95.1	50,200	57.6
1935*	3,897	100.7	55,200	63.4

* Provisional.

The contrast between the two sets of figures is very striking. But the steep fall in the American National Income is in part due to the greater fall in the price-level in that country. To arrive at any measure of national welfare, the figures must be corrected for changes in the value of money. The British figures have been corrected by MR CLARK's own index of the "consumption price level," the American figures by the index of the cost of living published by the Bureau of Labor Statistics. At the same time, each set of figures has been divided by the estimated population in each year. The resulting figures consequently show the *per capita* income in each country, valued at 1929 prices:—

	UNITED KINGDOM		AND UNITED STATES	
	United Kingdom	United States	United Kingdom	United States
	£ 1929 = 100	\$ 1929 = 100		
1929	84.7	100.0	717	100.0
1930	85.3	100.7	645	90.0
1931	79.2	93.5	554	77.3
1932	77.7	91.7	446	62.2
1933	79.3	93.6	439	61.2
1934*	87.3	103.1	502	70.0
1935*	91.3	107.8	534	74.5

* Provisional.

Even with this correction, the contrast in experience is very startling. The fall from 1929 to the worst year was only 8.3 per cent. in the United Kingdom, but 38.8 per cent. in the United States. This can be partly explained

by the fact that the pinnacle of prosperity from which the United States fell was far higher than in Great Britain. But this is only a partial explanation; however "normality" may be defined, the slump carried the American National Income much further below it than the British. The British recovery started a year earlier than the American. Since the bottom point, the two recoveries have proceeded at about equal speed, relatively to the levels of 1929. Compared with the level touched at the bottom of the slump, the American recovery has, of course, been the more rapid.

Real income, even on a *per capita* basis, is not the same thing as consumption. Out of its real income, the community must provide for the augmentation of its capital equipment. Only if net investment in capital goods were a fixed proportion of total income would consumption fluctuate in the same proportion as total income. It does not therefore follow that, because the average American's real income fell by nearly 40 per cent. between 1929 and 1933, his personal consumption of goods and services fell by an equal proportion. MR CLARK has made estimates of the total consumption and investment of the United Kingdom. These are largely based on retail sales statistics, which began only in August, 1929. The series cannot, therefore, be carried back beyond the middle of 1929. No comparable calculations have been made for the United States, but it is possible to give a rough comparison with figures derived from material collected by the National Bureau of Economic Research and made available to a correspondent of *The Economist* (the Bureau is, however, in no way responsible for the use made of its figures). The resulting estimates are as follows†:—

	UNITED KINGDOM		AND UNITED STATES	
	Consumption per head at 1929 prices	July-Dec., 1929 = 100	Consumption per head at 1929 prices	July-Dec., 1929 = 100
1929*	78	100	650	100
1930	78	100	591	91
1931	79	101	538	83
1932	78	100	486	75
1933	79	101	492	76

* Whole year at rate of second half.

Both countries can derive cause for self-congratulation from these figures: Great Britain for the stability of consumption which has been maintained throughout the worst slump in history; the United States for the attainment of a standard of consumption which could be compressed by a quarter without starting a revolution. For America this reflection is likely to prove a rueful one. But in Great Britain there is some danger of self-congratulation becoming self-satisfaction. It seems likely from the figures that the average *per capita* real consumption of the Englishman, even in 1932, was less than that of the American, although, for all the reasons given earlier in this article, the comparison cannot be more than a first impression. And, in any case, the figures are averages; they conceal an increase of destitution among a substantial minority balanced by a slight increase of consumption by the majority. Averages can be deceptive; for it is impossible in any ultimate sense to balance the starvation of a miner's family in the Rhondda against the five extra hats of five housewives in Oxford and declare them equal. The National Income is the foundation of all political economy. But it is after all only an aggregation of individual experiences. Fashionable political philosophies notwithstanding, the welfare of the individual is the end of all policy.

† These figures are not calculated in exactly the same way as those given in the earlier tables. Investment cannot, therefore, be calculated by subtracting consumption from total income. Mr Clark gives estimates for net investment which fall from £314 millions in 1929 to £29 millions in 1932 and recover to £305 millions in 1935. For the United States, the inadequate data available show a fall from somewhere in the neighbourhood of \$9,000 millions in 1929 to a negative figure (i.e. net reduction of capital) of \$3,000 to \$4,000 millions in 1932 and 1933.

Nottingham and Its Industries

ROUND the city boundaries of Nottingham one may draw two wider circles. The innermost of the two encloses a ring of land stretching over into Derbyshire and close to Lincoln, Rutland and Leicester, which may be called Greater Nottingham. It embraces urban districts such as Carlton, Beeston, Long Eaton, Eastwood and Hucknall, is bound to Nottingham by the closest economic links, and had a population at the 1931 census of 464,937 persons. The broader band contains Mansfield and the great new coalfield around it; Southwell, Newark, Grantham, Lincoln, Bottesford and Melton, centres of agricultural areas to the east and north-east; and Derby and Ilkeston, industrial centres to the west. To all this area, from the Derbyshire hills to the sea, east of a line drawn somewhere between Sheffield and Leicester, Nottingham is the "big town," the metropolis of a stretch of very English England, even with a "Nottingham-by-the-Sea" doing duty as Brighton away on the East Coast.

A configuration like this is not, of course, unusual. But Nottingham is typical, to-day, in other ways as well. If one examines the detailed returns of the last Census, one finds that her industrial structure is representative in a very significant manner of the country as a whole. The percentage distribution of her working population among the twenty-two groups into which our working lives were classified corresponds sufficiently closely with those of England and Wales for her to be fairly regarded as typical, industrially, of the whole kingdom.

In a world in which industry is extremely localised, to be an average is to be at the same time very exceptional. And Greater Nottingham is remarkable for the immense variety of industrial activity she shelters. She has some agriculture and lies close to the extensive agricultural areas of Lincolnshire, Rutland and Leicestershire. Beet is one of her products and there is a certain amount of milling. A great variety of "earth" materials—sandstone, clay, marl, limestone and gypsum—forms the basis of a variety of small industries. Dyeing and bleaching are favoured with an excellent supply of water in the Bunter sandstone. Coal, however, is the greatest raw material of the town and district and a large section of the population is engaged in its extraction. There are three mines actually within the city boundary, but the great proportion of them lies, of course, in the outer ring of Greater Nottingham, out of which the coalfield stretches away to the North.

In manufacturing the district departs somewhat from the national standard in the weight of heavy industries. There is some heavy iron work at Ilkeston in the Erewash valley, very close to the western boundary and in the Nottingham postal area; and at one time there was some smelting within Greater Nottingham. The city is predominantly interested, however, in the higher stages of engineering and the lighter forms. Textile machinery is produced, together with a considerable output of heating apparatus; but her most prominent products of this type are cycles, typewriters, bearings, telephones and such light engineering products generally. In textiles, Nottingham is famous for her lace, lace curtains and plain net, hosiery, milanese, glove and warp

fabrics; and a rather small but useful relative of hosiery, "shetland" work. Wool, cotton, silk and artificial silk are all employed, and some of the early stages of yarn preparation, cotton yarn doubling, silk and artificial silk twisting, are conducted within the area, while artificial silk is produced within the "sphere of influence." But one should note that Nottingham is not a weaving centre; she only knits and "twists" her yarns. Other textile products manufactured in great quantities are ladies' and children's light clothing. In addition to all these industries Nottingham has others entirely different with which her name is popularly associated; tobacco and fine chemicals; and she has quite important "other chemical," leather and printing industries.

Transport (rail, road and air), building, commerce and finance, along with the professions, approach fairly nearly to the national proportions of workers, but "personal services" claim a much smaller percentage of the female workers. Textiles and clothing absorb nearly half and personal services only 18 per cent. of the women and girls employed, against national percentages of 20 and 32, respectively.

Though perhaps the violence of her recession has been rather less marked, the effects of the recent great depression have been similar, on the whole, in Nottingham to those in the country in general. The primary industries of coal and engineering have been severely struck, but the industries further removed from the primary end of the scale have saved her. The relative prosperity of textiles, and other industries employing female labour, has produced in certain parts of the area the rather unusual position of families being kept running on the earnings of daughters. Nottingham's extensive foreign trade—and almost without exception every one of her varied industries is concerned with export trade—has suffered with foreign trade generally. Not only has the fall in foreign trade affected exports, but the disturbance of relative costs and prices has led to serious inconveniences in obtaining imports. Nottingham therefore has had, during the depression, to worry about tariffs and exchanges quite as much as other better-known exporting centres.

The present balance of Nottingham's industrial structure is relatively new. It has been reached only in the present century and chiefly since the war. Formerly she was known as the lace town *tout court*. To-day she is still a "textile" town—but she is no longer so single-minded as she was. The lace trade has suffered a sea-change, though they make a mistake who regard the industry as moribund. It has suffered heavily in its foreign trade and its home trade, and in some respects there has been a fundamental change in fashion. Firms have disappeared, one or two with great names attached, and a journey through the Lace Market suggests a glory that is gone. But lace-making is a vigorous industry and still produces beautiful goods. Nor has the lace curtain gone out so thoroughly as some think. New "lines" are continually put on the market in cotton, silk, wool, artificial silk and mixed material, and the products of leavers, embroidery, plain net and curtain machines will long be in demand.

But shrinkage there has been, and with it a large transference of labour to other industries. The future industrial life of Nottingham will probably be healthier because it will not be nourished to the old extent by one industry. Fluctuations in the lace trade are as old as the trade itself, and they have always been violent, as a result partly of the violence of changes in fashion and partly of the great elasticity of an industry in which there are many small manufacturers who work through merchants.

Not only lace but coal has receded in Greater Nottingham. The coalfield is rich, but in the new equilibrium into which our national economic structure is tending the town will not produce so large a share, while the area just outside its boundaries will produce a greater. Here again there has been a considerable transference of labour to other industries.

But if some trades have shrunk, others have expanded, and some have bounded ahead. The experimental energy which made Nottingham one of the great pioneers in the textile trade has been active again, and hosiery, tobacco, fine chemicals, making-up trades, printing, telephones and cycles have notably gained from it. It is interesting to remark that expanding industries are

chiefly "natives," manned and piloted by Nottingham men, who yield nothing to their ancestors in foresight and enterprise.

At the moment the city has not quite reached equilibrium. Her new industries have absorbed, heavily, female and juvenile labour, and the unemployment figures show a rather large quantity of idle, unskilled male labour. Including part-time, 15.0 per cent. of the men are unemployed, against only 5.1 per cent. for women. The total average for January 25th was 11.4, a trifle better than the national figure of 12.6 per cent. Nottingham has need of additional male-employing factories. She has skill to offer—though there is a shortage of this in some directions—and real advantages in her situation. It is hoped that new armament work will assist in this way.

Thus Nottingham is, on the whole, a steadily prospering town. If in the past she was on the fringe of the industrial North, in the future she will be on the northern side of the industrial South. She has natural resources and human resources of skilled labour and entrepreneurship. She awaits settlement in international trade and further development of heavy industry to enhance her prosperity.

Raw Sugar Problems

LAST Monday, representatives of twenty-two sugar-producing and consuming countries, covering about 90 per cent. of world output, met in London to discuss the difficulties of the raw sugar-producing countries. This international gathering is being attended by statesmen of international reputation, like Mr Ramsay MacDonald, Mr Norman Davis and Dr Colijn. What are the problems with which it is endeavouring to grapple?

The beginning of the difficulties of the world's sugar

suggested that Cuba and Java might not only be able to retain their new markets, but even to expand their sales, by virtue of the growing disparity between their costs and those of the majority of beet producers.

Events proved, however, that economic policy is not necessarily determined by economic arguments. In the years preceding the world depression beet production was again rapidly increased under the shelter of tariff walls and with the help of lavish subsidies. Some countries even went to the length of subsidising exports at the

WORLD PRODUCTION AND CONSUMPTION OF RAW SUGAR

trade can be traced back to the war, when the production of beet sugar in Europe fell to insignificant proportions. In pre-war years the output of beet sugar had represented about 50 per cent. of the total world production. The deficiency in Europe was made good by a rapid increase in the output of cane sugar, mainly in Cuba and Java, the two great exporting countries. Costs of production in Java and in the section of the industry in Cuba controlled by the United States were reduced substantially by the introduction of a high-yielding variety of cane and of improved crushing and refining machinery. On economic grounds the policy of expansion in the low-cost exporting countries appeared well advised. The decline in the output of beet sugar in European importing countries

expense of home consumers. Consequently there was a chronic tendency to over-production even before the onset of the world depression. The proportion of beet sugar production to the world's total output of raw sugar rose from 27 per cent. in 1920-21 to about 40 per cent. ten years later. But the problem of low-cost cane versus high-cost and subsidised beet production was not the only factor in the equation. The United States and the United Kingdom normally take more than one-half of the total quantity of sugar which enters into international trade. These two countries simultaneously encouraged production at home by subsidies, and in certain cane-producing countries abroad by preferential tariffs. Many exporting countries were thus faced with a dwindling free market for their sugar.

These tendencies are illustrated by the first of the

BUDGET SUPPLEMENT

This detailed survey of British Public Finance discusses the National Accounts for 1936-37, the recent trend of Revenue and Expenditure, the position of the National Debt, and the Finances of Local Authorities. A concluding section sets out a series of estimates of the ratio of Tax Revenue to National Income since 1860, and reviews future budgetary prospects.

accompanying diagrams, which is based on Dr Mikusch's estimates of world production and consumption.

So long as consumption was expanding, the difficulties of the cane producers, though they were increasing year by year, were not acute. They quickly became serious, however, when world demand took a downward turn. To arrest the growing disparity between supplies and consumption, an international agreement known as the Chadbourne Plan was concluded on May 9, 1931. This convention provided for the restriction of the exports of the principal producing countries for a period of five years. Unfortunately, the agreement covered only about 40 per cent. of the world's total production at the time of its inception. World production was drastically reduced by the leading exporting countries which adhered to the scheme. Many non-adhering countries, however, continued to expand their output. Thus, despite the sacrifices made by Cuba, Java and certain other countries, the scheme failed to stem the downward trend of prices, and in 1934-35 it ceased to operate. Meanwhile the world's sugar trade was increasingly enlaced by restrictions and subsidies. Normally, about one-half of the world's output of sugar enters into international trade; last year the proportion of the total crop sold in the open market had shrunk to about 10 per cent.

The net result has been that, although consumption has increased rapidly since 1933-34, and has been above production during the past two seasons, prices until recently have failed to respond to the improvement in the supply-demand position. This tendency is clearly revealed in our second diagram, showing the world's visible supplies on September 1st each year, as estimated by Messrs C. Czarnikow; and the annual average price of Cuban sugar c.i.f. United Kingdom-Continent.

These, briefly, are the problems awaiting solution by the International Conference. A rational solution is easy to prescribe. A gradual relaxation of restrictions and a reduction in subsidies during the next few years would not only put the low-cost exporting countries on their feet, but would also stimulate world consumption as a result of the accompanying decline of prices in those importing countries which are now subsidising home production and exports. A rigid division of markets by a system of quotas, unaccompanied by a reversal of the uneconomic policies pursued by many importing countries, might bring about the adjustment between supply and demand in the open market which Mr MacDonald mentioned as the objective of the Conference. But it would involve an adjustment at the expense of consumers, whose case in Great Britain is urged in a letter from Mr J. G. Mathieson on page 84 of this issue of *The Economist*. Fortunately for the Conference, world demand for sugar is now fairly rapidly increasing, and prices in the open market are rising at last. Even if a comprehensive scheme designed gradually to restore freedom in the world's sugar market remains a pious hope, importing countries might at least agree to refrain from an intensification of their present policies. The Conference is a test case of the willingness of nations to begin the task of freeing the channels of international trade. Let us hope the verdict will be worthy of the cause.

The Cornucopia of Mars

By a Correspondent

THE social reformer, who has long and unsuccessfully appealed for public expenditure in the interests of a better country and a happier people, must be indulging in puzzled reflections at this moment. He sees the children of his dreams, escorted by the most unlikely foster-fathers, paraded before him dressed in the cloak of war-time economics. All his demands are being handed to him, if not exactly on a plate at least on a shield.

For two decades he has been agitating for comprehensive and bold road development, and has chafed while successive Chancellors callously raided the Road Fund. Now he is solemnly instructed (as if he had never before given a thought to the matter) that it is vital to relieve the congestion around our docks and in our urban centres, so that food and other supplies can be rapidly transported in an emergency. After a lifetime's agitation for consistent town-planning he sees the Philistine converted to his cause overnight by the long-distance bomber. He has watched Greater London sprawling, in the name of speculative building, until it threatened to engulf the whole of the Home Counties: now he is to have a green belt, if only of aerodromes. A year ago he was tendered the philosophic consolation that the distressed industrial areas would eventually revert to good pasture lands: now they are crowned with orders and the incense of calcium carbide. It needs no fantastic flight of imagination to suggest that one of the sights of London in 1950 may be a £50 million Charing Cross Bridge, stretching from Euston to Camberwell, and having at either end a statue of Benito Mussolini and Adolf Hitler. Its construction will, of course, have been necessary to provide a clear run for mobile anti-aircraft batteries between North and South London.

Poignant indeed must be the reflections of the moderate progressive who in the past has pleaded merely for investigation and not necessarily for action. The same quarters which have given shortest shrift to his modest request for information and proposals for research are to-day demanding shadow schemes for every eventuality, the co-ordination of all departments of State, the elimination of all overlapping, the stopping of all gaps and a comprehensive survey of all economic activities in areas specially vulnerable to attack.

In view of these developments, may one not urge progressives to introduce a little subtlety into their tactics? The usual social and cultural arguments for raising the school age make slow work of this reform. Let it be demonstrated that an important strategic move in the last war was thwarted by the distortion of a vital message by an illiterate bearer. No youth will then be allowed to leave school until he can decipher codes written in Sanscrit characters. Recently, a measure for securing a fortnight's annual holiday for workers came to grief, because it was urged on commonplace humanitarian lines. Had its supporters only been armed with a report, proving from scientific tests that after a fortnight's relaxation the average worker could dismantle and reassemble a machine gun in 25 per cent. less time, they would have had difficulty in preventing the authorities from thrusting a month's annual leisure on their constituents.

What purpose, again, can possibly be served by a march from Jarrow to London? When the contingent reaches the Marble Arch the military authorities heave a sigh of relief, for if, after four years of unemployment and short rations, men can complete a route march of 270 miles in the rain, then the heart and feet of the country are obviously sound. The organisers should arrange for half the contingent to fall out with sore heels within the first 20 miles and the other half to collapse at the county boundary. Such consternation would be aroused that public assistance scales would be revised forthwith.

Only thus shall we build Jerusalem in some of England's least green and pleasant lands. Let us raise three Heils and three Evvivas, and bend our energies to our herculean task.

Notes of the Week

Distributing Prosperity.—Speaking at Glasgow on April 3rd to a conference of the National Labour group, Lord de la Warr emphasised that wages and earnings ought in fairness to rise steadily with the general growth of trade and prosperity. On the same day at Dorchester, Sir Walter Citrine pointed out that, with industry booming, the trade union movement was getting impatient for better conditions. This view that the workers should be given the fullest possible share of the present prosperity would probably be generally endorsed. Certainly the programme of Parliament this week has reflected a general desire to take advantage of favourable conditions to improve the lot of the less fortunate members of the community. The Special Areas Bill, the Physical Training Bill, and the measure to institute voluntary insurance for blackcoated workers have this common characteristic. They follow appropriately upon the Factory Bill and the revision of block grants to local authorities; and although they share to some extent the unnecessary caution of these earlier measures they are undoubtedly signs of good times. Indeed, the speeches which have been made in the House this week have embodied a general generosity and a common agreement comparable to the consensus of support which has been accorded to the defence programme. For instance, in Thursday's debate the Physical Training Bill was clearly popular among all parties; and the Minister of Education's explicit statement that the success of the scheme must depend on an adequate standard of nutrition was warmly welcomed. Even on Wednesday, when the debate on the Special Areas Bill was much less cordial—the measure was condemned by several members as completely inadequate—there was very little dispute about objectives. The House seemed to feel that the Bill did not go far enough, but that it pointed in the right direction.

* * *

Labour's Problem.—It would be dangerous, however, to adopt a complacent attitude about the future because of this agreement that prosperity should be diffused as far as possible. Both Lord de la Warr and Sir Walter Citrine, in the speeches cited in the previous Note, were nervous about the possibilities of unauthorised and irresponsible strikes. That there should be demands for higher remuneration and improved working conditions at a time when prices are dramatically rising, when production is being speeded-up to the limit all round, and when the stress and strain of overtime are taking their toll, is clearly natural. But that we should be confronted with the fact of two serious strikes of engineers and engineering apprentices on Clydeside, and the threat of a national strike in coal and a London bus strike, is definitely alarming. The conclusion of a five-year agreement in the South Wales coalfield, involving the re-grading of mine labour at new basic rates and establishing an average weekly increase in wages of about half-a-crown, with individual increases ranging from 2s. 2d. to 10s., was a clear proof that tactful negotiation can deal adequately with the possible friction between Capital and Labour which the present trend of prices and activity involves. The settlement recently made in Edinburgh between the Scottish Motor Traction Company and the Transport and General Workers' Union points the same moral. The strike at Messrs Beardmore's Parkhead Forge does not, however, show the same faith in established methods of conciliation. Indeed, while the view of the National Executive of the Amalgamated Engineers' Union is that the Parkhead engineers should return to work pending the negotiation of a settlement of their claims, the strikers are supported by the Glasgow and District Committee in their determination to secure their objectives by direct strike action. Beside them are some 5,000 Clydeside apprentices who have

ceased work to enforce their demand for a uniform scale of wages during training from 15s. to 30s. a week, which would generally involve a rise of 2s. in weekly rates.

* * *

Coal and London Transport.—The position in the coalfields and in London transport is even more serious. No sooner had the wise and commendable agreement in South Wales been thrashed out than the Welsh miners were advised to vote in favour of strike action in support of the Miners' Federation in Nottinghamshire in a national ballot to be held on April 15th and 16th. The Yorkshire and Scottish miners have been similarly advised. The issues are simple. Since the events of 1926 the Federation has been weak in Nottinghamshire, and an Industrial Union, with employers' backing, has rapidly gained ground. Recent events at the Harworth Colliery brought matters to a head, and a draft agreement, endorsed by the president and the general secretary of the Federation, seemed likely to end the conflict between the Industrial Union and the Federation by amalgamation. This happily negotiated peace has, however, been repudiated, largely on the ground that victimisation and discrimination by employers against Federation members are to be feared. The Federation now demands recognition and assurances; and on the crest of prosperity, when, moreover, the wages agreement in South Wales has set a model for peaceful industrial conciliation—and when, in the Nottinghamshire coalfield itself, an agreement has been made to raise the wages of the lower-paid workers by 5d. a shift, and in Northumberland the improvement of trade has brought an increase of nearly 2 cent. in wages—the country is threatened with a disastrous stoppage.

* * *

There are important issues involved in the miners' claim, it is true. English unionism has lost ground, through the relative stagnation in its membership, the rise of new unorganised industries, and the relative decline of the organised staple trades. As in America until recently, it is confined largely to "craftsmen" in a number of old industries; affiliated unionists number only some 3,600,000 of a possible total of 13½ millions. The threat of company unions in one of the remaining strongholds is thus serious. But that threat was already allayed by the draft agreement. As it is, a fear (which may in part be justified) of victimisation at Harworth Colliery is being allowed to jeopardise the miners' own interest in new wages agreements and the national prosperity. The bus strike which is possible in London must provoke similar concern. The busmen have admittedly good wages and unusually good holiday, welfare and pensions agreements. There has been speeding-up, however, and a 7½ instead of an 8-hour day is demanded. The London Transport Board allege that the claim would cost £600,000 yearly, and that they cannot afford it. The union has given notice to terminate agreements at the end of April. London Transport, again, is of national importance; and to assume the bankruptcy of conciliation and to use too readily the strike weapon would be here, as in the coalfields, to endanger the interests of the men themselves, serious though speeding-up undoubtedly is—and to forget that a trade union is primarily an instrument of industrial peace. The way of prudence is seldom the way of force.

* * *

M. Van Zeeland's Mission.—A novel procedure has been injected this week into the international search for means of securing the general reduction of trade barriers, to which our first leading article is devoted. The British and French Governments have jointly requested M. Van Zeeland, the Belgian Prime Minister,

to undertake an international inquiry into the possibilities of reducing the obstacles in the way of international commerce. The reasons for entrusting M. Van Zeeland with this task are not far to seek. He is himself a distinguished and resourceful economist; Belgium's geographical situation and commercial contacts place her in the main stream of international commerce; and the Belgian Government has for years past itself pursued a moderate fiscal policy and taken part in many efforts to secure international collaboration in reducing tariffs. There is, in fact, some reason to believe that the initiative for this new inquiry came from M. Van Zeeland himself. If so, it is a good augury for the energy with which it will be pursued. But even the utmost skill and energy on M. Van Zeeland's part will be of no avail unless the British and French Governments are ready to act upon the recommendations when they emerge. M. Blum's Government, as is well known, is anxious to seize any opportunity for going further with the reduction of tariffs and the abolition of quotas, even against the opposition of French farmers and manufacturers. But the British Government, as was once remarked of it in another connection, seems to be adopting the attitude of an inverted Micawber, waiting for something to turn down.

* * *

Southern Railway Accident.—Among a recent series of accidents in and around London the most serious was a collision between two Southern Railway electric trains on a high viaduct between Pouparts Junction and Battersea Park Junction. The first train, having been held up at Battersea Park up local home signal, was about to proceed when it was run into from behind by the second train, travelling on the same line. The rear coach of the stationary train was telescoped. Known facts and evidence given in public at this week's Ministry of Transport inquiry show that the train was composed of wooden rolling stock. Had steel carriages been in use, one or more coaches might possibly have been pitched over the viaduct, with a far heavier death toll. The surface lines of the Southern Railway are not equipped with automatic train stops working in conjunction with the signals, so that full responsibility rests upon drivers for the proper observance of signals. This particular section of line is not provided with automatic signals, but has the older system of manual signalling, supplemented and protected by "lock and block." Before the signalman at Pouparts Junction, for example, can pull off his starting signal he must be given an electrical release from Battersea Park. This release is effective only for one train, and the Pouparts Junction signalman must replace his signals before he can give a release, for a following train, to Clapham Junction in the rear. Similarly, the Battersea Park signalman must dispose of the first train before he can give Pouparts Junction a release for a second train, and "disposal" means not only that the Battersea Park signals must be lowered for the train and replaced behind it, but also that the train itself depresses a rail contact after it has passed Battersea Park signals. This system has stood the test of time for over a generation, and must have prevented countless accidents in the past. Evidence was given at the inquiry that the apparatus was working properly. A journey over the line shows that the stationary train was standing on a track-circuit, which gave it additional protection.

* * *

To judge from the published evidence, although the first train was in the way, both Pouparts Junction starting signal and Battersea Park inner and outer distant signals and home signal were "off" (or at proceed) as the second train approached them. On the home signal being pulled off, the first train would, of course, have started, and so it appears that before it was really moving the second train must have covered a distance of several hundred yards, extending from the first view of the signals to the point of collision. The driver had a good view of all signals, but could not have seen

the first train, as it was concealed by the high girders of the bridge on which it was standing. One possibility is that one of the signalmen concerned used the emergency key provided for the resetting of his instrument in cases where a train is cancelled after it has been signalled. This would explain how the signals came to be lowered for the second train before the first had been disposed of, but it still fails to explain how the second train had time to catch up the first. There the matter must be left, for at this stage it would be unfair to do more than call attention to known facts and obvious possibilities. We gladly endorse the high tribute paid by the Battersea coroner to the railway's good record of safety—in which, we may add, the strong sense of responsibility felt by all railway workers plays a material part. On this occasion, the routine precautions, including the cutting off of the current, were promptly applied by men suffering from the shock of the collision. These brought all other traffic to a standstill and prevented any risk of a triple collision or of hurt to the passengers from the live rails.

* * *

The Week in Spain.—The past few days have seen some of the heaviest fighting in the Spanish civil war up to date, not round Madrid, but in the Basque country. In the early stages of the war the Basque Republic was cut off from communicating by land with the outer world by the insurgents' capture of Irun and San Sebastian; but since then they have held their own in their natural mountain fortress round Bilbao. On April 1st, General Mola launched a powerful offensive, backed by heavy artillery and air concentrations, against the Basque lines. In spite of the difficulties of the terrain, the strength of the Basque fortifications, and the desperate resistance of the Basque national forces, the insurgent attack has made such progress that, at the moment of going to Press, the fate of Bilbao and the Basque Republic is trembling in the balance. Militarily, General Mola's strategy is understandable. He is trying to crush a threat to his rear in order to liberate his army for employment on the Madrid front. Politically, this attempt to conquer the Basque country accords ill with the insurgents' claim to be fighting to save European culture from Red revolution. The Basques are a devoutly Catholic people who are fighting, not to impose communism or anarchism on other parts of Spain, but to throw off a Castilian yoke and enjoy their own right to national self-government. Meanwhile, in the far south-west, the Government forces that were lately hemmed in round Pozoblanco, in the mountains north of Cordova, have successfully broken out and taken the offensive in a westerly direction. If this offensive were to score a complete success, it would be still more important strategically than an insurgent conquest of the Basque country; for if they were to reach the Portuguese frontier the Government troops would

A

have severed the communications between the insurgent territories in Andalusia and Morocco and those in Estremadura and Old Castile. However, for reasons which we set forth in a leading article on page 66, it seems unlikely, on the whole, that any very sensational or momentous results will follow from these fluctuations—north and south, and east and west—in the Spanish battle line.

* * *

Danish Premier in London.—Though this week's welcome visit to London of Hr. Thorwald Stauning, Denmark's venerable and picturesque Prime Minister, is purely informal, Herr Stauning has had an opportunity of meeting numerous British statesmen and business people and discussing some vital problems. He has lunched with Mr Eden and been received by Mr Baldwin; and Count Ahlefeld-Laurig, with whom he has been staying at the Danish Legation, knows his London well enough to have arranged other important interviews. National defence, the practical application of the Oslo Convention and Danish-British trade questions are burning issues of the day in Denmark. Herr Stauning, who is much more of an elder statesman and national leader than a Socialist party man, has a unique authority in his country. He is a powerful orator, both in the Riksdag and on the public platform, who challenges comparison with Mr Winston Churchill in his wealth of imaginative phrases. British exports to Denmark have risen from £8.63 millions in 1931 to £14.95 millions in 1936. A little encouragement on our part might be gracious and helpful. Denmark is a traditional friend of Britain and has long been one of our best customers.

* * *

Controlling Inflation in America.—President Roosevelt, in his time, has been one of the greatest inflationists in history. But he and his Administration have recently been showing a commendable readiness to adjust their policy to the changing circumstances of the trade cycle. At the moment, their policy can almost be characterised as a deflationary one, at least in intention. It is widely known that the President foresees two dangers threatening his second term of office: a general war abroad and a repetition of the 1929 débâcle at home, and he is determined to do all that he can to prevent at least the latter. Various members of his Administration have recently issued warning statements and on Friday of last week the President himself added his voice. He professed himself to be particularly concerned with the rapid advance in the prices of some of the materials of the construction industries, especially steel and copper, which he considered to be too high. To counteract this tendency, he proposed to amend the spending policies of the Government, spending less on durable goods and more on consumers' goods. The economic theory of this pronouncement is impeccable, although it was, naturally enough, little to the taste of the durable goods industries or the manufacturers of steel and copper. It remains to be seen how the principle will be implemented in practice. Taken at face value, it would seem to imply that relief is henceforth to be given in cash rather than by the indirect method of providing relief work, a large part of which is necessarily of a capital nature. The epidemic of strikes, themselves an aspect of the same inflationary tendencies which are alarming the President, continues. But the largest controversy, which threatened to paralyse the bituminous coal industry, was settled at the last minute. The strike in the plants of the Chrysler Corporation has also been settled on substantially the same terms as those agreed between Mr Lewis and the General Motors Corporation. Each settlement, however, merely leads to another dispute. With General Motors and Chrysler out of the way, the next objective is Ford. It is not yet possible to foresee the end of the epidemic, which, so long as it continues, will necessarily disturb the general outlook for industry.

The Little Entente Conference.—Everybody has been professing satisfaction with the outcome of the Little Entente Conference which was held at Belgrade last week. But it is obvious that, whatever the result may have been, it cannot really be equally agreeable to France and to Italy or to Czechoslovakia and to Hungary. Evidently the Little Entente is not breaking up; it is still a going concern for its original purpose—namely, to provide local collective security for Hungary's three successor-States against Hungarian irredentism. On the other hand, it is equally evident that France and Czechoslovakia have been disappointed in their hopes of enlarging the scope of the Little Entente to an all-in system of solidarity against all comers (in effect, against Germany as well as Hungary). France appears to have asked Yugoslavia and Roumania to pledge themselves to assist Czechoslovakia against Germany, too, in exchange for a reciprocal pledge from France to them; but they have so far fought shy of entering into this anti-German commitment. The German menace to the integrity and independence of Austria-Hungary's central and South-East European successor-States is certainly more formidable to-day than the Hungarian menace. Yet the present failure of the Little Entente to line up solidly with France against the threat of German aggression does not mean that Germany now has a free field. The Little Entente statesmen were no doubt sincere when, in their *communiqué* last week, they publicly declared their conviction that the worst of the danger was now over. At any rate, there are strong rumours that the half-expected German assault on Czechoslovakia has now been postponed—partly because France has disobligingly refused to play her allotted part of going the way of Spain, and partly because the new German war material has given a disappointing response to its Spanish test.

* * *

Is it too much to hope that postponement in this case may spell cancellation? There are now signs that Austria and Hungary may consent to come together with the three Little Entente countries in a Danubian bloc based on Dr Beneš's policy of "the Danube Basin for the Danubian countries, and no fishing in Danubian waters for any of the Great Powers." Dr von Schuschnigg is not relishing the prospect of being made the victim of an Italo-German entente. M. de Kanya finds himself—now that Italy has made her peace with Yugoslavia—confronted with the choice between throwing himself into Herr Hitler's arms or putting off Hungary's dream of treaty revision to the Greek Kalends and making peace with his Danubian neighbours. From the Hungarian point of view the second of these two alternatives is the lesser evil; for Hungary cannot expect to recover Slovakia by force of German arms without being swallowed whole by the Third Reich. Prospects in the Danube Basin, altogether, may be less unpromising than was lately believed.

* * *

Minorities in Roumania.—If the present moment is propitious for a *rapprochement* between the Danubian countries, it is the more unfortunate that in Roumania legislation is pending for the penalisation of the minorities of non-Roumanian nationality. Between them, these minorities (Magyars, Jews, Ukrainians, Germans) account for about 30 per cent. of the total population of post-war Roumania. Their political and civil rights have been guaranteed in the minorities protection treaty which Roumania signed with the principal Allied Powers in 1919. These guarantees have been written into the Roumanian constitution; and to abandon them would be both illegal and impolitic. Roumania cannot afford to stir up anti-Roumanian feelings in Budapest and Berlin by twisting the arms of her Magyar and German minorities under the noses of the victims' big brothers. In drafting this legislation the Roumanian Government is simply yielding to internal pressure. Post-war Roumania has been breeding a large university-trained "intellectual proletariat" of Roumanian nationality.

These baulked and embittered young people are unwilling that their fellow-citizens of non-Roumanian nationality shall gain and keep jobs while the heirs of the kingdom remain unemployed. What they are demanding is a *numerus clausus* for members of the minorities in the black-coated professions; and they intend to keep the quota so small that the Roumanian majority will secure a virtual monopoly. Such a misuse of political power is likely to bring a swift and heavy retribution.

* * *

The Impeachment of Yagoda.—The rapidly thinning ranks of the Bolshevik Old Guard in the Soviet Union suffered a new and sensational casualty last week-end. Yagoda, who was the Chief of the OGPU (ex-Cheka) from the time of Dzershinsky's death in 1926 down to last August, has been arrested and prosecuted. His dismissal last year was ostensibly on the score of having failed to deal effectively with the machinations of his old comrades Zinoviev and Kamenev. In September he received, as a consolation prize, the post of Commissar for Communications. This office was only less formidable than that he had just vacated: for it carried with it the control over a special army, 200,000 strong, of frontier and railway troops, reinforced by a legion of secret agents. Yagoda has now been relieved of this post likewise, and his trial will presumably take the usual course. An outside observer can feel little sympathy with a man who is credited with having been the principal slave-driver of the political convicts in the Arctic circle.

* * *

The man who has hurled Yagoda from his second seat of power is Marshal Voroshilov. It seems that the Red Army objected to the existence and activities of the independent military force which the Commissar for Communications controlled; and we may guess that Yagoda's imminent condemnation will be accompanied by the absorption of this separate force into the Red Army's ranks. Does this mean that the heirs of the Bolshevik Old Guard are to be, not Stalin and his placemen, but the Red Army with Stalin for its puppet? And does this throw any light upon the probable course of events, not only in the Soviet Union, but in the Third Reich? The air has suddenly become thick with rumours of a Russo-German *rapprochement*; and this would imply a change of masters in both countries—that is to say, a change of the real masters behind the scenes, as distinct from the official figureheads. If Germany and Russia do come together again, the reconciliation will be the work of the Red Army and the Reichswehr, who have never had any quarrel with each other. If anything like this were to happen, it would completely transform the international situation.

* * *

Nazidom in South-West Africa.—One of the chief complaints which the masters of the Third Reich are in the habit of making against the masters of the Soviet Union is that the Moscow Government is not content with imposing its own ideology upon its own subjects but persists in carrying on an insidious campaign of subversive propaganda in the territories of foreign governments with whom Moscow is nominally at peace. The Nazi agitation in South-West Africa, against which the South African Government has now taken strong action, illustrates the strange truth that in this, as in so many other things, the Nazis have taken a leaf out of the Communist book—or at any rate out of Dr Goebbels' official version of it. The offence is flagrant, because the German minority of the tiny white population of the ex-German colony of South-West Africa has been treated by the South African Government, which holds the mandate, with singular generosity. In October, 1923, General Smuts negotiated personally, with representatives of the Reich, an agreement, signed by both parties, under which the Union Government declared

its intention "to accept the Germans of South-West Africa as part of the people, with the same privileges and responsibilities as other citizens." And this undertaking was scrupulously carried out until the advent of Herr Hitler to power in Berlin played havoc with the situation at Windhoek. In 1924, the Union Government, with the League Council's approval, passed an act conferring the Union's franchise upon all German inhabitants of the mandated territory who did not specifically ask to be excepted; and only 262 petitions for exception were filed as against 2,900 automatic acceptances of the status of British subjects. After the grant of local self-government to the territory in 1925, the voters of German origin, although they were in a minority, were given equality of representation with those of Union origin in the new legislative assembly.

* * *

This work of conciliation has been deliberately wrecked since 1933 by Nazi propaganda directed from Germany. A South-West African Nazi Party and Hitler Youth organisation were started with the avowed purpose of cajoling or terrorising the British subjects of German origin in the territory into going back upon the allegiance which they had voluntarily given to the Union Government. The ex-German community was split into two camps, one loyalist and the other irredentist, and the loyalists were subjected to continuous persecution. The Nazi organisations were banned in 1934. On June 1st a commission, appointed by the Union Government to study the problem, reported that, even so, civic freedom had ceased to exist in the territory. Accordingly the Union Government published, on the second of this month, a proclamation excluding aliens resident in South-West Africa from participation in public office and from membership of political organisations. This measure will hit not the naturalised German inhabitants, but their Reichsdeutsch Nazi tormentors. The official protest made by the Reich, in fact, serves to draw attention to the strength of the Union's case.

* * *

Two Imperial Committees.—Two Imperial committees whose work and constitution are to be reviewed by the Imperial Conference have just submitted progress reports. These throw a certain light on the problems of status, powers and terms of reference which will have to be faced. The Imperial Shipping Committee declare, indeed—whether pathetically or truculently it is hard to say—that they see no reason to ask for any change in the constitution and procedure of the Committee or for any extension of its terms of reference. This will scarcely satisfy adherents of closer and more active permanent co-operation between the members of the British Commonwealth in the economic and technical fields. For the limitations of the Imperial Shipping Committee's present function are clear from the report. During the

past four years it has published reports on marine insurance rates on the Hudson's Bay route, on freight rates between Great Britain and New Zealand, and on the possibilities of a British passenger and cargo service between Western Canada and Australia-New Zealand. It has also initiated a most valuable statistical survey of the ships of the world and the cargoes they carry. The Committee note, however, particularly with reference to the trans-Pacific service investigation, that where questions of high policy are involved they have been reluctant to make definite recommendations for action. Some critics will think their attitude unduly strict, and will hope for the regeneration of the Committee on lines that would enable it, for instance, to inquire into the underlying facts of such issues as foreign subsidised competition or air mail development before those issues have become acute, and before an interested party at last applies to the Committee. Incidentally, the presence of a single representative of civil aviation on the Imperial Shipping Committee seems an inadequate means of Commonwealth contact on so vital a portion of the communications problem. Similar comments spring to mind on a reading of the report of the Imperial Economic Committee, published a year out of date. The Committee has pursued with success its statistical inquiries into the trade in raw commodities, and has furnished valuable periodical information to producers and traders. But there appears to be nothing to show under that important fresh head of its terms of reference which the Skelton Committee added in 1933: "To make proposals to Governments in regard to other economic services and inquiries which, in its view, should be conducted on a co-operative basis," with a reservation concerning economic policy.

* * *

Imperial Defence Bases.—Sir Samuel Hoare's declaration that "we must have a fleet strong enough to carry out its responsibilities in both Eastern and Western hemispheres" has been followed by the report that £8,000,000 is to be spent in strengthening the defences of Hongkong. If this is confirmed it puts an entirely new face on imperial defence in the Far East. Hitherto British security in the East has been based, in effect, on a defensive line running from Singapore to New Zealand, beyond which it has not been possible to deploy a force capable of successful action against a great Power. Moreover, the whole Pacific security system has been founded, since the Washington treaties, on the principle that each of the three great naval Powers concerned should have undisputed naval supremacy in its own quarter of the Pacific area. This system has been destroyed by Japan's denunciation of the Washington treaties, and the Hongkong move may be a step towards a much more competitive scheme of national defences in that area, in which United States possessions may have an important part to play. It will be interesting to see the effect of this more distant projection of the extra-territorial defences of Australia and New Zealand upon the contributions of those Dominions to imperial security. The South African Government has just given fresh evidence of its will to co-operate. Last week Mr Pirow reaffirmed that "as long as the Navy want it" Simonstown "will be regarded by South Africa as an Imperial base and will be defended by South Africa." A scheme for carrying out the Simonstown agreement was being put into effect in consultation with Great Britain. In particular, there would be closer co-operation between the British fleet and the South African air force.

* * *

Social Credit in the Balance.—Mr Aberhart's confession that circumstances prevented him from fulfilling his promise to introduce Social Credit in Alberta within eighteen months of taking office precipitated a crisis among his followers. A large number of them, demanding that the policy on which they were elected should at least be tried, refused to accept the Government's "orthodox" Budget, and threw out a motion

to suspend the Budget debate. This motion was apparently designed to defer irrevocable decision until after the Province's finances had been investigated by the Governor of the Bank of Canada and the prospects of Federal aid had become known. Although a Conservative motion of No Confidence in his Government was roundly defeated, Mr Aberhart was faced with the virtual certainty that his "bankers' Budget" would be rejected by mutinous Social Creditors, who were demanding a scheme of taxation of securities that would more than double the tax-burden of the Province. Mr Aberhart capitulated, and last week introduced a Bill setting up a commission to draw up a plan for administering Social Credit. It is reported that Major Douglas himself will be invited to become chairman of the commission. This seems, for the moment, to be but a concession of principle, but the Albertan legislators will no doubt see to it that Mr Aberhart's millennial plan is put to the test of practice. And that is all to the good.

* * *

National Nutrition.—In last week's issue (on page 11) we noticed the serious concern expressed by the Food Council about the price of milk, which has risen by 101 per cent. since 1914. The grave implications of this fact were further emphasised by the First Report of the Advisory Committee on Nutrition, published on April 1st. Charged to enquire into the dietary of the people and to recommend desirable changes, this Committee found that the consumption of liquid milk per head, alone among necessary foods, had declined since before the war; and that the consumption of milk in all forms was only about half a pint per head per day, which was 40 per cent. below the minimum amount suggested. Since the Committee explicitly regarded the consumption of sufficient milk as the key to proper nutrition, they were considerably disturbed that the present consumption should be so perceptibly insufficient. They expressed hope that the primary objective of the State would be to ensure that an adequate supply of safe milk would be brought within the purchasing power of the poorest, especially for mothers, children and adolescents.

* * *

The Committee emphasised that their work was only just begun, but their preliminary impression was that a comparison of the food available in the national dietary with the optimum nutrition standards of the League of Nations would reveal that, apart from milk, there was a sufficiency of necessary foods—of calories, fats and proteins. Nevertheless, they were constrained to point out that a relatively small fraction of the population, the very poorest, were probably short in their diets of calories, fats and animal proteins. Compared with the conclusions of Sir John Orr and others, this report is optimistic; but the same morals can be drawn. Although there has been a general improvement in public health, and in mortality rates; although deficiency diseases such as rickets have declined; and although modern dietary is better balanced between body-building, energy-giving and protective constituents than was that of a generation ago; yet there is a section of the population which is isolated from nutrition by poverty, and others whose well-being is constantly insecure for economic reasons. We welcome, therefore, the Committee's recommendation that the consumption of protective foods such as fruit and green vegetables, of potatoes, and of sea-fish, which are rich in vitamins, should be increased forthwith. It is encouraging that the Minister of Health should, immediately on the receipt of this report, take steps to extend the supply of milk and meals through local authorities; and to point out how useful in this connection the recent raising of the block grants by £5 millions to nearly £50 millions a year would be, especially in the most necessitous areas. The root problem of poverty remains to menace health and nutrition, but these palliatives, at least, are praiseworthy.

Industry after Easter.—The interruption of work during the Easter holidays provided a breathing space for industry which was welcomed by workers and executives. But the respite has been of short duration, for order books are full and consumers are pressing for deliveries. The increasing demand for coal has disproved the popular notion of the existence of a vast surplus capacity which could be brought into operation at short notice. Although output is expanding, supplies are insufficient in certain districts and export business is hampered, despite the decline in household requirements. In Northumberland, steam collieries have already sold a substantial proportion of their output in 1938. As our correspondents indicate in their weekly reports (see page 122) the stringency of iron and steel is increasing with the growing pressure of demand, unaccompanied by a corresponding expansion of supplies. Hence much of the new business on offer has to be declined. A feature has been the marked improvement in the tinplate section, where both exports and prices are now substantially higher than a year ago. The wool textile industry continues active, though the industry is experiencing some difficulty in its attempt to pass on to wholesale clothiers the recent rise in raw wool prices. The improvement in the demand for cotton goods has been well maintained. For example, spinners have not reduced quotations in proportion to the fall in raw cotton prices this week. Reports that London finance houses are showing interest in the Lancashire cotton trade are another indication of better times. News from other industries is generally encouraging, and the indications point to a further expansion of production during the next few weeks. More detailed reports of conditions in various industrial centres will be found in our Commerce and Trade returns, on pages 122 to 126 of this issue.

* * *

Rising Wages.—Growth in the efficiency and smooth operation of collective bargaining in this country has enabled the restoration of average wage rates to pre-depression level to take place almost unnoticed. The Ministry of Labour's index of wage rates, which declined from 99 (1924 = 100) in the second quarter of 1929 to 94 in the first quarter of 1933, recovered to the pre-depression level in October-December, 1936. The number of individuals affected by changes in wage rates and in official working hours since the onset of the depression in the industries for which information is available, as well as the amounts involved, is shown below:—

WAGES AND WORKING HOURS IN BRITISH INDUSTRY

	Wage Rates			Official Working Hours		
	No. of individuals affected by increases (in thous.)	No. of individuals affected by decreases (in thous.)	Net weekly increase (+) or decrease (—) in wage rates	No. of individuals affected by increases (in thous.)	No. of individuals affected by decreases (in thous.)	Aggregate increase (+) or decrease (—) in weekly hours
1930 ...	788	1,100	— 56,600	13.2	349.2	— 873,500
1931 ...	47	3,010	— 401,150	294.0	111.0	+ 142,000
1932 ...	35.5	1,949	— 249,200	8.0	3.7	+ 7,000
1933 ...	179.5	894	— 65,250	2.5	12.5	— 36,000
1934 ...	1,344	83.5	+ 91,500	0.5	5.0	— 11,500
1935 ...	2,366.5	49.6	+ 192,100	2.4	43.7	— 153,850
1936 (a) ...	4,012.3	0.4	+ 487,050	0.1	133.0	— 299,550

(a) Provisional.

In general, wage rates continued to decline until 1933, when recovery was already well under way. This delay is partly explained by the method of bargaining, which frequently involves lengthy investigation and negotiations. Actually, the net weekly increase in wage rates during the three years ending 1936, at £770,650, corresponds almost exactly to the decrease of £772,200 per week (or £40.2 millions per annum) during 1930-33. No important changes in working hours have taken place in recent years, though the trend continued downwards. But such declines as have occurred in recent years have probably been more than offset by reductions in short-time working and by the increase in overtime,

especially in the metal industries. The total wages bill, therefore, has increased by considerably more than the official figures indicate. Rather curiously, the marked increase in the purchasing power of wages took place between 1930 and 1933, when money wages were declining. Since 1933 real wages, based on normal weekly wage rates, have actually declined slightly owing to the rise in prices, though this tendency may have been offset in many industries by longer working hours.

* * *

Reaction in Commodities.—As we have repeatedly pointed out in *The Economist* in recent weeks, the prices of many raw materials have been pushed up to limits quite unjustified by the underlying conditions of production and consumption. The rise has been induced largely by the anxiety of consumers to lay in stocks for longer periods than usual and by the activity of speculators. Prices of many commodities, therefore, had become increasingly vulnerable to a change in market psychology. Rumours, such as that crediting the United States Government with the intention of increasing the gold content of the dollar, were sufficient to cause a marked slump this week.

QUOTATIONS FOR PRIMARY PRODUCTS

	March 31		April 7	
	£	s. d.	£	s. d.
Copper, per ton	72	17 6	63	15 0
Lead, per ton	31	15 0	25	12 6
Spelter, per ton	32	12 6	26	0 0
Tin, per ton	294	0 0	272	0 0
Rubber, per lb.	0	1 1½	0	1 0½
Cotton, American, per lb.	0	0 8.09	0	0 7.87
Sugar, Cuban, per cwt.	0	6 9	0	6 8½
Wheat, May futures, per 100 lb.	0	10 2	0	10 5
Jute, per ton	19	17 6	21	15 0

Non-ferrous metals, which had been raised highest, naturally suffered most. Rubber and cotton were marked down slightly less, but the fall in raw sugar quotations reflects the market's appraisal of the probable outcome of the Conference now being held in London. In contrast to the general trend, jute rose sharply in price on adverse crop reports from India, while wheat continued to advance on heavy Continental purchases and the expectation of a "squeeze" before this year's crops come on the market. The events of this week clearly demonstrate the unsatisfactory conditions which have developed on the commodity markets. It is to be hoped that this week's bucket of cold water has been sufficient to clear the heads from intoxication.

* * *

Non-Residential Building.—In *The Economist* of April 3, 1937 (page 12), we showed graphically the trend of residential and non-residential building in this

country during the past eight years. The diagram, based on the value of building plans passed by 146 of the principal urban areas of Great Britain with a population of about 18 millions (exclusive of the County Council area), indicated that the boom in residential construction has passed its peak, while non-residential construction (the course of which since 1929 is shown in the diagram below) continues to expand. Non-residential building, however, comprises various unrelated forms of construction which may be grouped under the following headings: factories and workshops; shops, offices and other business premises; churches, schools and other public buildings; miscellaneous construction and additions and alterations to existing buildings. In contrast to dwelling-house building, which was scarcely affected by the depression, the volume of non-residential construction followed fairly closely the general trend of activity. The value of non-residential building plans passed reached its lowest level in 1932. There was a steady improvement in 1933 and 1934, followed by a period of rapid expansion which, apparently, has not yet reached a peak. The improvement has been most marked in the case of factories and workshops, an indication of the expansion of Britain's industrial capacity which is now proceeding, partly as a result of the re-armament programme. In the case of business premises, recovery did not begin until 1934, but has since made rapid headway.

Rising Shipping Freight Rates.—After a slight setback in February, shipping freight rates resumed their upward movement, largely as a result of the growing commerce in primary products. Shipments of wheat, for example, are now exceptionally heavy. To some extent the advance of freight rates has been facilitated by the rise in the prices of primary products:—

	Average, 1913	Mar., 1936	Jan., 1937	Feb., 1937	Mar., 1937
European waters	110.0	85.7	135.5	144.0	150.4
North America	113.1	89.4	117.2	116.6	117.1
South America	123.4	85.4	141.8	124.0	119.3
India	106.3	97.0	130.7	148.9	151.4
Far East and Pacific	117.4	87.9	140.5	132.2	143.3
Australia	127.9	92.6	147.8	140.5	145.1
Total	116.3	89.8	135.6	134.3	137.8
1913=100	100.0	77.2	116.5	115.5	118.4

As will be seen from the more detailed analysis of changes in freight rates between February and March, there was an increase in changes on all the major trade routes with the exception of South America:—

COURSE OF NON-RESIDENTIAL BUILDING (Approved plans of 146 urban areas)

	Index No.	Inc. or dec. Points		Index No.	Inc. or dec. Points
Home trade	132.3	+ 2.5	South America :—		
Bay—outwards	165.1	+ 18.3	Outwards	74.2	— 5.2
Bay—homewards	217.7	+ 9.6	Homewards	164.4	— 4.2
Mediterranean :—			India—outwards	113.7	+ 3.9
Outwards	110.3	+ 0.1	India—homewards	151.4	+ 2.5
Homewards	144.5	+ 5.1	Far East, etc.	143.3	+ 11.1
North America	117.1	+ 0.5	Australia	145.1	+ 4.6

Since the Easter holidays further increases in rates have taken place over a wide area, and the general outlook remains encouraging.

Recovery in Coal-mining.—Measured by profits, the past year has been the best in the coal-mining industry since 1924. Output in 1936, on the other hand, was still 11½ per cent. below the 1929 level. The increase in profits during the past two years is due mainly to the rise in prices, a consequence of limited supplies and control of output and sales.

Period	Tonnage Dis-posable (Mill.)	Costs per Ton		Proceeds per Ton	Profit per Ton	Output per Man-shift	Earnings per Man-shift †
		Wages	Total net				
1932		s. d.	s. d.	s. d.	s. d.	Cwts.	s. d.
4th quarter 1932	48.9	8 9½	13 2½	13 11½	0 9	22.62	9 2½
4th quarter 1933	50.2	8 6½	12 9½	13 6½	0 9	23.00	9 1½
4th quarter 1934	52.0	8 6½	12 11	13 6	0 7½	23.23	9 2½
1st quarter 1935	51.3	8 6	12 9½	13 6½	0 8½	23.40	9 2½
2nd "	47.6	8 7½	13 2½	13 2½	0 0½	23.10	9 2½
3rd "	46.6	8 8½	13 0½	13 2	— 0 1½	22.83	9 3½
4th "	54.1	8 4½	12 7½	13 11½	1 4	23.89	9 4
1st quarter 1936	54.4	8 11½	13 2½	14 8½	1 5½	23.95	9 11½
2nd "	48.2	9 3½	13 11	14 3½	0 4½	23.26	10 0½
3rd "	48.9	9 3½	13 11½	14 4½	0 5	23.12	10 0½
4th "	54.0	9 1½	13 7½	15 0½	1 5	23.76	10 2

† Excluding allowances in kind.

The tonnage disposable in the last quarter of 1936 was practically the same as a year earlier. Rather significantly, total net costs rose by almost one shilling per ton during this period, while the increase in wages was only 9d. per ton. Output per man-shift showed a decrease on the corresponding period in 1935, a reversal of the previous trend. *The Statistical Summary* of the Mines Department,* from which these statistics are taken, shows a profit in all the districts separately enumerated. As both home and export demand is still expanding, the outlook for coal-mining is encouraging in the absence of labour difficulties.

United States

The New Deal Defined

WASHINGTON, March 18. — The standard complaint against the New Deal is that its economic objectives are not candidly set forth, and indeed not even formulated. The visitor to Washington often finds men here and there who have a grasp of problems as a whole, but their views do not always coincide. Conversations with them may leave more of a blur than knowledge. The President himself is no theorist, and is not given to abstract thinking. During his first Administration there was the mark of improvisation on policy-making, resulting in more than a few fundamental contradictions. The second term, however, has produced a clear spokesman and a general clarification of thought in the capital. Marriner Eccles, chairman of the Federal Reserve Board, is the new authentic voice, and his statement of March 15th, defining the Administration's economic policy, must rank as historic.

"The country," he declared, "needs the full and co-ordinated utilisation of the three essential factors of man-power, natural resources and capital until we have attained a maximum production and distribution of wealth, in the form of housing, clothing and all other goods necessary to maintain and improve the standard of living of all our people. It is not sound public policy, and it is not in the ultimate interest of either capital, labour or agriculture, for any one of these three groups, broadly speaking, to try to gain advantage at the expense of the others, which only makes for instability of the national economy, and hence is bound to be temporary."

This strikes the keynote of "balance" as the ultimate aim of New Deal economy, the goal being the maximum production and distribution of wealth. Mr Eccles went on to elucidate: "Wage increases and shorter hours are justified and wholly desirable when they result from increasing production per capita and represent a better distribution of the profits of industry. When they retard and restrict production, and cause price inflation, they result in throwing the buying power of the various groups in the national economy out of balance, working a particular hardship upon agriculture, the unorganised workers, the recipients of fixed incomes and all consumers. The upward spiral of wages and prices into inflationary price levels can be as disastrous as the downward spiral of deflation. If such conditions develop"—and this sentence is particularly important—"the Government should intervene in the public interest by taking such action as is necessary to correct the abuses." "The remedy for a price inflation," he continued, "when the country has unused man-power, natural resources and capital, is through more, not less, production, through an orderly, balanced use of these three fundamental factors, and not by creating a needless, artificial shortage of any one of them."

The Danger of Inflation and Depression

Having decided against credit restriction, Mr Eccles denied that he was a Budget-balancer for the sake of orthodoxy. "I am not now in favour of balancing the Budget at the expense of the destitute and the unemployed who are unable to find private employment, but I am in favour of increasing taxes on incomes and profits if necessary to sustain the volume of relief, and at the same time to bring the Budget into balance and permit the payment of the public debt as private debt expands. Only by this process can monetary inflation be prevented."

"To resort to monetary restraints under such conditions would involve the risk of halting recovery," he went on, "and precipitating another deflation before we have recovered from the last one, and before the Government is in position to bear the costs of it without causing a monetary inflation." He then summed up his own doctrine with a quotation from Mr Roosevelt in his radio address on March 9th: "In 1933, you and I knew that we must never let our economic system get completely out of joint again—that we could not afford to take the risk of another great depression. We also became convinced that the only way to avoid a repetition of those dark days was to have a Government with power to prevent and to cure the abuses and the inequalities which have thrown that system out of joint. We then had a programme of remedying those abuses and inequalities—to give balance and stability to our economic system—to make it bombproof against the causes of 1929."

The excerpt is from the President's speech in defence of his proposals for enlarging the Supreme Court, and Mr Eccles now clears up one vital point: the emergency which is the President's justification for his proposals is economic. The danger now—that telling word repeated and italicised by Mr Roosevelt to the general mystification of American business men—is of a price inflation, followed by another depression. What the President will ask of a reformed Supreme Court is full governmental authority to intervene to keep the economy in balance. Not one specific power is at stake; what the New Deal must have is the blanket authority to act wherever action is needed.

This economic candour on Mr Eccles's part naturally gives new importance to the Supreme Court proposals, and it also gives the New Deal a coherence and an intelligibility not possessed heretofore. Mr Roosevelt is not crying "Wolf" simply to win an argument and save his prestige. He recognises that the boom creeping up on America is in some respects more menacing than a western dust storm. Mr Eccles shows that he is disturbed by it, disturbed equally by the rapid rise of industrial wages, the threatened shortage of skilled labour, and the whacking increase in the price of steel. The thesis of his pronouncement is clearly one of a government-controlled economy, involving planning of a scope never before dreamed of in this country. Even the critics appreciate Mr Eccles's willingness to formulate the objectives of the New Deal. At last it can be discussed as a system.

The Course of Building

NEW YORK, March 30.—In spite of ubiquitous strikes the business indices of the Federal Reserve Board showed for February a small increase over January. More remarkable is their comparison with a year ago. The current rate of business activity is about 20 per cent. above the level of early 1936. Perhaps even more remarkable is the fact that such a gain could have

The COMMERCIAL NATIONAL BANK and TRUST COMPANY of NEW YORK

An International Bank working with the principal banks of the world as correspondents. No foreign branches

FIFTY-SIX WALL STREET, NEW YORK

Cable Address: COMTRUST

Member: Federal Deposit Insurance Corporation

occurred with comparatively little help from the construction industry—thus emphasizing a major difference between the recovery here and in England.

The following table shows the items of this index:—

BUSINESS INDICES			
1923-25=100 (Adjusted for Seasonal).			
	Feb., 1936	Jan., 1937	Feb., 1937
Industrial production	94	114	116
Manufactures	92	115	116
Minerals	111	109	114
Construction contracts	52	63	64
Residential	25	45	47
All other	75	77	78
Factory employment	87.4	98.8	99.6
Factory pay rolls	73.7	90.6	95.7
Freight car loadings	70	80	80
Department store sales	83	93	95

Residential building has approximately doubled; but other building is about the same as last year. The residential building index at 47 is scarcely more than a third of the average of its peak year 1928, when the index was 126. So much importance attaches to this figure that the following table of annual averages is illuminating:—

INDEX OF RESIDENTIAL BUILDING			
1923-25=100 (Annual averages)			
1919 ... 44	1925 ... 124	1931 ... 37	
1920 ... 30	1926 ... 121	1932 ... 13	
1921 ... 44	1927 ... 117	1933 ... 11	
1922 ... 68	1928 ... 126	1934 ... 12	
1923 ... 81	1929 ... 87	1935 ... 21	
1924 ... 95	1930 ... 50	1936 ... 37	

So prevalent is the idea that a statistical base period represents a norm that it is invariably assumed that the residential building index below 50 must inevitably double at least. As will be seen from the table, the base years 1923-1925 were rather high, and included one year recognized as of boom quality. At the present time the bottle-neck in the building industry is the scarcity of labour. With the total construction index at 64, there is so tight a situation in building labour that the cost of construction is actually higher than it was during the peak years of the middle '20's. For a long time the highly organized building trades have had strictly limited apprenticeships; and this fact, combined with deaths or changes of occupation during recent years, appears to have reduced building craftsmen to a number which imposes a limit upon the volume of building. No one, however, would be prepared at the present time to designate this limit precisely.

Trade Cycle Data

In the past year factory pay rolls have risen more than production, although production has risen a little more than factory employment. In the year 1928 the manufacturing production index averaged 112, slightly below the February, 1937, figure of 116. In 1928 the employment index averaged 99 and the pay rolls 102, compared with the February, 1937, indices of 99.6 and 95.7. That is, manufacturing activity and factory employment are at present approximately at the 1928 average, but pay rolls are slightly less. From this comparison (for what it is worth) the wage increases of the past year appear more in the nature of restorations than otherwise. In making comparisons with 1928, however, it must be remembered that the 40 hour week has been widely adopted, against a weekly average of about 48 hours ten years ago.

The experience of the last eight years in this respect is very different, however, from that of the 1919-1928 period of about the same length. In that time the index of manufactures rose from 84 to 112, while the factory employment index actually fell from 107 to 99. This was attributed to an increase in the productivity of labour. If that explanation was correct, it would appear that there has either been no increase in the productivity of labour since 1928, or more probably that it has been neutralized by the shortened working week. Generalizations from statistics of this sort do not rest on too secure grounds; yet they can hardly be ignored.

From September, 1929, the index of production (then 123) fell to 58 in July, 1932. From this point it entered on a series of fitful movements (touching 100 in July, 1933), which lasted through the summer of 1934. In September, 1934, the index at 73 was the same as in October, 1931. The downward phase may be dated between September, 1929, and July, 1932 (just two months short of three years) and the bottom phase (overlapping of course) between October, 1931, and September, 1934 (again almost precisely three years). From September, 1934, when the definitely ascending phase began, with the index at 73, to December, 1936 (when the index at 121 was almost the same as the September, 1929, figure) was a little over two years; or, if one counts to the present, two years and a half. From top to bottom of the cycle, from September, 1929, to July, 1932, was three years; and the statistical recovery, from July, 1932, to the present, has lasted almost five years. In popular estimation the depression lasted from September, 1929, to September, 1934, five years; and the public did not really become conscious of recovery until early 1935, two years ago. It was the whole period up to the end of 1934 that stamped itself on people's minds as the "long depression"; and two years of conscious recovery have by no means obliterated this memory.

The flurry in the bond market seems to have subsided. It provoked far more nervousness in New York than one would infer from the magnitude of the declines in government securities, and, apparently, even more nervousness in Washington. The statement of the Reporting Member Banks shows that in two weeks these banks sold more than \$370 millions of Government securities.

REPORTING MEMBER BANK ITEMS (\$000,000)

	Mar 3, 1937	Mar. 24, 1937
U.S. Securities.....	9,067	8,696 —371
Reserve with Fed. Res. Banks.....	5,171	5,112 —59
Demand Deposits Adjusted	15,501	15,336 —165
U.S. Government Deposits	340	355 +15

The increase in reserve requirements of March 1st had been known some time in advance, and presumably most of the banks had adjusted their position in February. One is rather forced to the conclusion that, to some degree at least, the flurry was the startled reaction of a rather nervous market to an unexpected series of disturbing pronouncements from the highest official quarters.

France

An Uncertain Future

PARIS, April 8.—Parliament is in recess until the end of the month, and politics are on the surface very calm. But the future remains uncertain. There is a growing incompatibility between the Radicals and the Communists and a doubtful atmosphere between the Socialists and the Communists. The Opposition Press criticises the daily incidents which are caused in industrial undertakings by certain elements in the trade unions. But the revival of business, whether healthy or not, is obvious. The 40-hour week, on the other hand, is vehemently criticised by a minority of employers. Two days of full rest in the week is, however, a godsend which has brought in many neophytes to the ranks of the Popular Front.

Opinion is very divided about the effects of such reforms, particularly since the outbreak of social disorder in foreign countries, and the world rise in prices show that the French unrest is not an isolated case. The price of wheat, which in France remains at 145 francs for 100 kilograms, has risen in the past year in Chicago from 83 to 125 francs. The fixing of the price of wheat evokes many complaints from the farmers; many Socialists are opposed to the political truce, and many of the middle-class protest against the rise in prices. But none

of these sentiments is likely to cause a sudden political crisis, particularly when business is better. Generally speaking, everybody is agreed that the truce should last until after the Paris Exhibition at least; and it will be interesting to know what decisions will be made at the next Socialist Congress at Whitsuntide and at the Radical-Socialist Conference in October.

Unemployment continues to fall rapidly; it stood at 388,920 on March 27th against 465,127 in March, 1936, and 484,463 in March, 1935. This is, of course, the result of the revival of business and of the 40-hour week, but also in part of the work which is being done to prepare the Paris Exhibition, which should open its doors on May 15th. After that date the workmen will be absorbed by other great public works, for which new credits, totalling 1,000 million francs, have just been authorised; these credits have amounted to nearly 3,000 million francs since the beginning of the year.

Banks Maintain their Dividends

The great French banks have maintained for 1936 their dividends of 1935, although last year was a very difficult period for them. They suffered from the disappearance of private issues and a decline in the public ones. The Treasury was principally supplied in 1936 by monetary inflation.

Fiscal receipts in March showed further improvement compared with those of last year and the first month of this year. Total indirect taxes yielded 313 million francs more than in March, 1936.

Wholesale prices continue to rise, as the following table shows:—

	Feb. 27	Mar. 6	Mar. 13	Mar. 20	Mar. 27	Apr. 3
(1914 = 100)						
Wholesale prices (general index)	517	525	534	533	536	539
Domestic products	538	542	547	549	553	559
Imported products	480	494	512	504	506	504
Foodstuffs	506	513	518	518	518	527
Industrial products	528	536	550	547	552	551

The production of pig iron in February was 574,000 tons, against 587,000 tons in January and 500,000 tons in February, 1936. Steel production rose to 624,000 tons, compared with 607,000 tons in January and 538,000 tons in February, 1936.

Germany

Stocks, Shares, and Inflation

BERLIN, April 7.—The stagnation in the share market this year and the activity, accompanied by steadily rising prices, in home fixed-interest securities, is regarded here as an anomaly. Some inflation, testified to by statistics and shown in the rise in prices, is developing; and confidence in the currency has certainly not increased. In these conditions, according to precedent, fixed-interest securities might be expected to be weak, and shares strong. This was experienced in extreme measure during the 1919-23 inflation. To-day competent authorities admit that the abundance of money which has prevailed since the spring of 1935 (when the Gold Discount Bank first marketed promissory notes in order, ostensibly, to provide a supplementary investment) represents inflation; but they attribute the advance in bond quotations to this inflation. Measured by the violence of the industrial boom, and by the fact that most industrial concerns have more orders than they can fulfil, the rise in dividends has of late been very slight.

It is of course true that the present Government has from the first exclusively favoured fixed-interest investments; the open-market policy adopted by the Reichsbank in 1933 was one method. But the Reichsbank's policy of buying up securities under the new law has not been pushed too far. At the end of 1934 the Reichsbank held Rm. 445 millions of these securities, and at the end of March this year only Rm. 167 millions. In the meantime, however, the holdings of Reich and State

loans by banks, and in other quarters subject to official influence, have greatly increased. It seems that the stagnation in the share market is mainly due to a fear of new government measures against profits or dividends; of government pressure to invest, perhaps unprofitably, in Four Year Plan enterprises; and of compulsory price-cuts in the interest of suffering producers at the expense of particular industries. An instance of this was the enforced reduction last week in the price of potash and nitrate fertilizers. It is not suggested that the Government feels any antagonism of principle against industry; but merely that its hand-to-mouth and often unsuccessful policy in economic matters must compel it increasingly to intervene violently to make good past miscalculations. It is beyond question that the agricultural and food policy pursued since 1933, and indeed initiated before then, has failed; not merely because there is an unforeseen shortage, but because the whole process has differed from what was officially expected and predicted. In any hand-to-mouth policy the immediate emergency will naturally obtain prior treatment; later emergencies will be dealt with when they arise.

Industrial Shortages and Rationing

The steel syndicates continue to report shortages. The greater part of the home steel demand is now controlled, and deliveries are rationed. The scrap iron shortage is still acute. The export of heavy iron and steel goods (other than machinery) is slowly declining. The annual report of the Hamburg Association of Importers of English Coal shows an import in 1936 of 3,110,000 tons, an increase of about 5 per cent. compared with 1935, although total German coal consumption rose some 10 per cent. The import from Great Britain was one-third of the pre-war figure, and the import of English coke declined last year.

Rigid price control has been relaxed in the case of textiles to allow for advances in the prices of raw materials. The consumption of all textiles, raw materials, natural and synthetic, was 596,400 tons last year, of which 187,350 tons were home produced, against 535,390 tons in 1932, of which only 90,020 tons were home produced. The sharp rationing of raw materials to manufacturers has led to the increased use of rags and waste. The domestic output of linen yarn has about doubled since the depression, but remains only half that of the years before the war; as import has fallen the total consumption is also low. The export of chemicals, dyes, and allied products last year totalled Rm. 683 millions, against a recent highest, in 1929, of Rm. 1,418 millions. During these seven years the share of nitre in the total export has heavily fallen, and the share of general chemicals, dyes, and pharmaceutical products has risen.

FOREIGN TRADE

THE DOCUMENTARY CREDIT, whereby the Exporter is assured that he will receive payment immediately his goods are shipped for transit abroad, is the subject-matter of

*A Brief Survey of

Exports and Imports*

copies of which may be had by asking at
any local branch of the Westminster Bank

WESTMINSTER BANK
LIMITED

41 LOTHBURY, LONDON, E.C.2

Money has been again plentiful since the turn of the month. The first days of this week consequently witnessed heavy marketing of G.D. Bank promissory notes. The day-loans rate on April 6th was 2½-3 per cent. The heavy demand for cash at the close of March is reflected in the Reichsbank's weekly return for March 31st; discounts are shown to have increased by Rm.701 millions, and credits and investments taken together by Rm.696 millions. For this large credit expansion there are several explanations, including the intervention of Easter. Bank reports and press utterances refer to the rising pace of currency circulation, and also to the rapidly increasing use of cheques. Reichsbank clearings of cheques in 1936 rose by Rm.1,800 millions, or by 12 per cent. This last increase is remarkable because a recently enacted law aimed to expel certain kinds of doubtful or undesirable cheques from the market. Savings bank deposits increased in February by Rm.179 millions to Rm.14,756 millions.

The Conversion Office announces the issue of new 3 per cent. funding bonds against debt-service payments to the Office after January 1, 1937; and the issue in Great Britain of 4 per cent. sterling funding bonds payable to bearer and dated March 1, 1937. The coupons are payable on January 1st and July 1st at the Bank of England. In the field of exchange several new ordinances, mostly of a restrictive character, have appeared. No more permits are to be granted to pay for imports out of the exchange yield from sales of foreign securities.

Italy

The Capital Levy

TURIN, March 25.—Before March 31st the compulsory 5 per cent. redeemable loan must be fully subscribed. The loan was intended to give the Treasury the financial means to colonise Abyssinia. In fact, the loan is a capital levy on the owners of houses and land. Houses include all buildings used for dwelling, industrial, commercial and office purposes. Property belonging to State and public bodies is exempt from the levy; and proprietors possessing land and houses worth less than 10,000 lire are exempt. Proprietors are entitled to deduct from the value of their property debts guaranteed by a mortgage.

A levy equal to 5 per cent. of the capital value of land and houses must be paid in the form of a subscription at par to a 5 per cent. redeemable 25-year loan. For instance, the proprietor of land and houses valued at 2 million lire, on paying 100,000 lire, will receive a redeemable security. He must, however, pay on the same houses and lands a yearly tax of 7,000 lire (0.35 per cent. on the 2 million lire capital value), which tax is to last the 25 years allocated for the redemption of the loan. This is an ingenious plan for splitting the capital levy into its two constituent parts: the payment of the capital and the loss of interest. The man who prefers to keep the 100,000 lire security will, in effect, lose for 25 years the interest thereon and 2,000 lire in addition; but he will get back at the end of the period, or even before, the capital sum. The man who needs the 100,000 lire may sell the subscribed security, losing the difference between par and the current price, and pay the whole 7,000 lire tax yearly for 25 years. If the taxpayer prefers to pay the capital levy, he may compound it at 90 per cent. If the taxpayer has not the money, he can ask his bank for an advance up to 90 per cent. of his levy. The advance must be granted at the same 5 per cent. interest, and must be redeemed by instalments to begin after two years. The duty of subscribing to the loan (not the duty of paying the 25 years' tax) can also be transferred to the National Insurance Institute or any other authorised insurance company if the taxpayer insures himself for the corresponding capital sum and period.

Pessimists feared that many taxpayers would prefer to ask for advances; in this case the capital levy would have had an inflationary effect. Actually it seems that pro-

prietors prefer to pay with ready money, and only the biggest proprietors ask for advances.

The levy coincides with a period of abundant money. It may be that the abundance is temporary; and industrialists are lamenting their excess of cash, which they would prefer to convert into foreign raw materials. Whatever the cause, abundant money is a fact, which now enables banks to advance the necessary sums to capital levy subscribers without asking for advances from the Bank of Italy.

The Bank of Italy's shareholders' annual meeting, which is due in a few days, should throw light on the ways and means by which, notwithstanding the big war expenditure and the 1,500 million lire notes circulating in East Africa, the note issue was restricted to only 15,678 million lire on February 20, 1937, against 15,456 millions on December 31, 1935. In *The Economist* of March 13th it was asked if the item "gold deposited abroad due to the State, 1,773 million lire," was now included in the gold reserve. It is not. This item is more important from a legal than a practical point of view. The interpretations put upon it by the Treasury and by the Bank of Italy are probably not exactly the same; it is a sort of suspense account, partly connected with final liquidation of the war debt to Great Britain. But the figure was never intended to be added to the gold reserve.

Stock Exchange Optimism

March is rich in shareholders' meetings. The undertone is mostly optimistic. The Banca Commerciale report states that profits were 18.3 million lire, against half that amount in 1935; that less than half the capital and reserves of the Bank (850 million lire) are now invested in buildings (146 millions) and foreign subsidiaries (252 millions); that deposits and current accounts increased during 1936 by 850 millions to nearly 6,000 million lire; that, against these liabilities, the Bank holds assets, all short-dated, distributed in advances and discounts averaging 100,000 lire per customer; that present profits do not take account of the effects of devaluation and are mainly due to economies in overhead costs, which are estimated at 30 per cent. of the 1932 level. This is more or less the tale of most companies, which are emerging from the crisis with increased efficiency.

The bourses were not slow in registering the better feeling of the market. From December 31st to March 22nd quotations continued to advance:—

MOVEMENT OF BOURSE QUOTATIONS
(In lire)

	1936 (Lowest)	1936 December	1937 March
La Centrale (Electrical Trust)	590	795	827
Olcese (Cotton).....	236	374	448
Snia (Artificial Silk)	332	468	483
Monte Amiata (Quicksilver) ..	30	55	65
Montecatini (Chemicals)	143	185	198
Fiat (Automobiles)	334	448	480
Edison (Electricity)	237	314	320
Evidania (Sugar)	407	495	501
Pirelli (Rubber)	1,050	1,228	1,403

The most interesting feature is that the advance took place in spite of the Treasury's strong opposition to speculation booms in variable-dividend securities. The Stock Exchange, it is true, is usually apt to exaggerate the position; but current opinion is that shares ought to be valued 50 or even 100 per cent. more than their present prices. After the monetary alignment, the valuations of assets must be substantially increased. The progressive taxation of dividends in excess of 6 per cent. can for a time keep down the distribution of profits; but in the end increased prices and profits must somehow find their way into the shareholders' pockets. The same reasons explain why the capital levy on land and houses was received with comparative calm. It is true that land and house rents were fixed for two years from October 5, 1936; but owners are hoping for better days when the legal limits are lifted. In the meantime the market for intending sellers is better. Selling prices of land and houses are higher now, compared with pre-devaluation days, by more than the 5 per cent. levy.

Denmark

The Scandinavian Bloc

COPENHAGEN, March 17.—The recent speeches of the Prime Minister, Mr Stauning, at Lund and Stockholm, have caused a great stir in both Sweden and this country. The observations of the Prime Minister were both statesmanlike and prudent. To an impartial observer it was refreshing to hear the Prime Minister speak of practical Scandinavianism in the political and economic field, ruling out entirely the sentimental Scandinavianism of last century and the Utopia of an effective Scandinavian military alliance. The communal elections on March 9th further strengthened the Social Democratic Party. The Minister of Commerce has introduced a bill in the Folketing which resembles the price regulation Acts of 1914-18. The provisions of the bill will take effect from May 1st and a Government appointed committee will supervise the price regulation clauses.

Shortage of Raw Materials

In spite of exchange restrictions, import quotas and export premiums in many countries, the value of Danish industrial exports rose from 283 million kroner in 1935 to 313 million kroner in 1936. The Federation of Danish Industries ascribes this to the fact that the firms manufacturing for export have for years worked energetically to gain a footing in as many markets as possible. The following are the more important figures of industrial exports:—

	Total for:	
	1935	1936
	(in million kroner)	
Tinned milk and cream.....	11.8	11.0
Other tinned goods	10.0	12.4
Oil products.....	73.4	68.0
Machinery and vehicles.....	54.6	67.2
Ships	32.9	41.0

The general trend of trade and industry is still on the upgrade, although hesitancy is evident in the building trades after four years of great activity. The outlook for agriculture has somewhat improved and higher prices are expected for agricultural products. Shipping is experiencing a revival which does not fall far short of a boom. The rising prices of coal, fuel-oil and metals are, however, causing considerable difficulty to consumers as, owing to the hand-to-mouth policy of restricted imports enforced by the Exchange Control Office, no stocks of any importance have been permitted to accumulate. Therefore, the present demands of industry can only be satisfied by imports at much increased prices, a situation which puts a rather severe strain on the foreign exchange resources of the country.

Finland

Rising Prices and Active Business

HELSINGFORS, March 23.—The abrupt rise of prices in the world markets, which began to influence the level of prices in Finland last autumn, caused a continued rise here during January and February. The prices of imported and exported goods were affected most. The index for imported goods, which had for a long time stood at about 87 (1926 = 100), rose to 98 last December and to 106 in February. The rise in the price of exported goods was even greater; the corresponding indices are 77, 100 and 111. The wholesale price index for goods in Finnish wholesale trade rose from 90 to 95 last December and to 101 in February; but it by no means includes all classes of goods. Last year the rise in prices did not extend to retail prices and the cost of living, but this year it seems to be beginning to affect these also. This rise in prices has been latent in the national economy since the country abandoned the gold standard in the autumn of 1931, but has only now become an accomplished fact because of the state of world markets.

The continued liveliness in business and rising prices have created a larger demand for credit. The credits granted by the joint-stock banks increased in January and February by 371 million marks, compared with only 93 millions in the same months last year. At the same time deposits in the joint-stock banks increased during the first two months of the year by 242 million marks, compared with only 13 millions last year. As the total credits granted by the joint-stock banks amounted to 7,743 million marks at the end of February, while their deposits were 8,840 millions, their position was still a very easy one. No bills were re-discounted, and the cash of the banks still established record figures.

The credits granted by the Bank of Finland also increased appreciably by 102 million marks during January and February, though not to a greater extent than during the same period last year, when the increase amounted to 116 million marks. The total credits of the Bank, however, were slightly higher at 1,051 million marks than last year. Considerable business activity, growing purchasing power and the unusually abundant supply of lumber work are reflected in the growth of the note circulation. At the end of February it amounted to 1,757 million marks, compared with 1,445 millions a year ago. At the same time the Bank of Finland's balances with its foreign correspondents increased very much. After a rise of 255 million marks in January and February they amounted to 1,747 millions, against 1,263 millions a year earlier. As a result of these different changes the note reserve of the Bank decreased from 841 million marks at the end of February, 1936, to 503 millions on the same date this year. The ordinary note cover, however, still amounted to 77.1 per cent. of all liabilities payable on demand.

The improvement in the economic situation which has now gone on for several years has gradually resulted in a stronger position and better yields for the majority of banking, industrial and other undertakings. Some companies have raised their share capital or increased their dividends, and falling rates of interest have created a new valuation for shares. Last year, therefore, there was a continuous rise in the price of shares on the Stock Exchange. This year the rise has continued and developed into a regular boom at prices which in some cases no longer have any real foundation. The index for shares, which rose last year from 147 in January (1926 = 100) to 191 in December, reached 200 in January of this year, 213 in February and 233 on March 10th.

Canada

Provinces' Financial Plight

OTTAWA, March 20.—The Federal Government was forced to take action recently in the financial affairs of the two Prairie Provinces of Manitoba and Saskatchewan. Some time ago their Ministries notified Ottawa that unless help was forthcoming they would no longer be able to resist local pressure, stimulated by the example of the Social Credit Ministry of Alberta, for a drastic curtailment of interest rates on their bond obligations. The Federal Government felt it wise to secure a report upon the finances of the two Provinces, and Mr Graham Towers, Governor of the Bank of Canada, took charge of

Financial Agents of the Government of the Dominion of Canada in London
The Bank undertakes banking business in all parts of the world,
and with its numerous branches offers special facilities in Canada,
Newfoundland and the United States.

the investigation. His report about Manitoba confirmed the contention that despite taxation of abnormal severity and genuine efforts towards economy, there is no hope of meeting Manitoban obligations.

The appointment of a Royal Commission was then announced to investigate the broad problem of the Canadian public finance and the present allocation of powers and responsibilities under the Constitution. But since the situation in Manitoba and Saskatchewan did not admit of waiting, the Government agreed to come to the rescue of these Provinces forthwith. This announcement at once evoked a vigorous protest from Mr Aberhart, who maintained that unfair discrimination was being practised against Alberta.

Defence and the Federal Budget

The King Ministry experienced considerable trouble over its defence programme because of a maladroit speech delivered by Sir Samuel Hoare at Bradford, in which he branded as wasteful and inefficient such schemes of local defence as the one to which the Canadian Government was committed, and pleaded for a centralised scheme of Imperial defence. French-Canadian and other supporters of the King Government scented in this speech a scheme to inveigle Canadian Ministers at the post-Coronation Imperial Conference to co-operate in some grandiose plan of Imperial defence.

It is hoped that with a continuance of the process of recovery the Budget may be balanced for the fiscal year 1938-39. The opposition groups have directed their fire against the wheat-marketing policy of the Government; they contend that the Government's decree that its new Wheat Board would only accept deliveries of wheat from the farmers when the price fell below 90 cents per bushel has deprived the grain-growers of the opportunity of getting much benefit from the sharp rise in grain prices, and has let huge gains accrue to a ring of traders and speculators. Ministers deny this charge and maintain that their policy of getting

rid of the huge carry-over at the ruling market prices will prove the best service that they could have done for the Western farmer.

Growing Opposition in Alberta

The troubles of the Social Credit Ministry of Alberta are multiplying. Its legislation for the reduction of mortgage debts was pronounced invalid by the courts, and Premier Aberhart countered this verdict by declaring a moratorium on such debts for sixty days. He publicly admitted that he had failed to bring into operation a plan of Social Credit within the time limit of eighteen months which he set for himself. He then announced that he would abide by the verdict of his followers as to whether he should resign or carry on; and he afterwards claimed that he had received a flood of resolutions and letters urging him to persevere with his appointed task. There is a growing element in his own party, however, which holds that he has betrayed the Social Credit cause.

The sharp rise in the price of base metals like copper, lead and zinc is stimulating their production, and some Canadian plants are getting orders from Britain for shells and other munitions. The farmers are getting ready to resume work upon the land, and the further rise in the price of wheat will probably produce an increase in the western acreage planted to wheat. Visible stocks of wheat are rapidly declining under a brisk export demand, and on March 5th they had fallen to 88 million bushels, compared with nearly 219 million bushels on the same date in 1936. Employers are not happy about labour conditions, because the industrial ferment in the United States is infecting Canada. The railway unions recently refused to accept the verdict of an arbitration board about their demand for higher wages, and decided to take a ballot about a strike. Mr John Lewis has announced that he will try to organise the iron and steel workers in the Cape Breton area under the aegis of a Canadian affiliate of his rapidly expanding Committee for Industrial Organisation.

Letters to the Editor

The International Sugar Conference

TO THE EDITOR OF THE ECONOMIST

SIR,—The International Sugar Conference is now assembling, and although its deliberations will probably take place behind closed doors, we shall probably learn from time to time a little of what transpires. The object is said to be "to secure orderly marketing and an adjustment of supply to demand," but it is obvious that if the Conference is successful this can be achieved in more than one way. Demand is apt to depend, among other things, upon price, and as this country buys a good deal of sugar from elsewhere, and there are large and important industries here using sugar as a raw material, too rigid an "adjustment of supply" may be very much against our best interests.

For a long time the price of sugar on the world's market has been below the cost of production; though since last autumn it has risen, until to-day it stands well above what in the opinion of the Greene Committee is a remunerative figure in countries where sugar is cultivated upon up-to-date lines. It is common to ascribe the low prices which have prevailed to over-production; but stocks have not been excessive for some time, and the real cause is the shrinkage of the world's market due to two things: (a) the cutting off of great areas, owing to the spread of the policy of economic self-sufficiency in sugar; and (b) the artificially enhanced price of sugar, due to the efforts made to support cultivation in places which experience has long since shown not to be the best for the purpose. In order to counteract the advance of scientific research and discovery, tariff after tariff has been raised, with the result that the more out-of-date the producer is, the greater has been his reward, and the greater the braking effect upon any possible increase in consumption.

Our own country is no exception in this regard. The import duty on white sugar is now 11s. 8d. per cwt., a figure

in excess of the cost of production. Before the war, at 1s. 10d. per cwt., it was less than a sixth of this; yet the net revenue produced was then £4,000,000, and it is less than twice that now, the balance being dissipated in bounties, subsidies and preferences of all sorts and descriptions. In spite of great improvements in every branch of sugar technique, the raw material of the sugar using manufacturer now costs him 30 per cent. more than it did before the war, and for very many years he has paid much more than enough to reward efficient producers handsomely and leave a large margin for taxation.

Sugar using manufacturers do not desire to get their raw material at less than a fair cost of production, but they do consider that for the proper development of their businesses they are entitled to sugar produced in ways and in places which scientific research has shown to be most suitable, and that they should not be called upon to support obsolete methods. Their operations are carried out on a considerable scale, and they not only employ far more people than are engaged in sugar production, but their goods form an outlet for many products, agricultural and other, which it is important for the country and Empire to maintain.

Yours truly,

J. G. MATHIESON.

Growth of a Monopoly

TO THE EDITOR OF THE ECONOMIST

SIR,—It is gratifying to those of us who have consistently opposed "all this mechanism of industrial control" to know that Mr H. G. Williams himself is alarmed at the tendency; yet Mr Williams still justifies control of imports, and the

"logical" application of Protection for which he calls would doubtless involve an increase in the number and severity of our tariffs.

The substitution of increased tariffs for the present mixture of restrictions would not help us to get rid of the monopoly which has come into being. The iron and steel monopoly has grown up under a form of industrial control which Mr Williams dislikes; but how can your correspondent commit himself to the statement that we Free Traders are the authors of "this modern development" when we have consistently fought against its establishment and continued existence?

Mr Williams is at pains to inform us that the form of control which has in fact been established is "no part of a Protective policy proper," yet he feels it necessary to defend the monopoly in a mild way. He tells us that he is satisfied that all grievances are being fairly handled by the Iron and Steel Federation. He is evidently thinking only of the iron and steel interests themselves, since obviously the consumers who are compelled to pay more for their goods are not going to appeal to the body whose influence is exerted to keep the price up. The Glasgow business man who told me last week that the price of the steel he used had risen 125 per cent. would get little satisfaction if he complained to the central controlling body of the supplying industry.

Publicity, Mr Williams tells us, prevents the risk of abuse of the power which now rests in the hands of the iron and steel monopoly. I venture to disagree. The truth is, even those who, like one of my chief informants, are coerced into accepting conditions and fixing prices (both for the materials they buy and the goods they sell) dare not seek publicity. I have been shown documents on the strict condition that I mentioned no names—documents of a kind which, if they were published, would bring the wrath of the public heavily down upon the offending industrial dictators. It is one of the evil features of a Protectionist system that producers who are Free Traders have to submit silently to controls which they abhor, or risk the planned destruction of the businesses they have built up.

Mr Williams must pursue his praiseworthy inquiries further.

Yours faithfully,

RANALD M. FINDLAY.

Edinburgh.

Suicide and Life Assurance

TO THE EDITOR OF THE ECONOMIST

SIR,—The judgment of the Master of the Rolls in the case of *Beresford v. Royal Insurance Company* is disturbing in its revelation that every life policy is liable to be void in the case of death by *felo de se*. But this principle has always been established in law in the interests of public policy.

Books and Publications

Evolution or Revolution?

THE theory of Marx, reiterated by Engels and Lenin, that ultimately reforms can only be achieved by revolution and by war, seemed to have been corroborated by the turmoils of Central Europe and by the present struggle of the Spanish people against the forces of reaction. It was, therefore, particularly refreshing to read Mr Smellie's history* of the past hundred years of English government, and to find ample evidence that in this period our Constitution has been able to adapt itself peaceably to changing needs; and that such far-reaching reforms as the extension of the franchise and the creation of the social services have been achieved without civil wars, even if Chartists and suffragettes did occasionally compel magistrates to read the Riot Act.

Mr Smellie has written no mere outline of constitutional law or summary of political history. This is a survey of those social problems and economic ideas which brought about fundamental changes in the form

* "A Hundred Years of English Government." By K. B. Smellie. Duckworth. 15s.

Since, as I venture to submit, nothing novel is imported regarding the position of an assignee, your Note in *The Economist* of March 27th, p. 706, seems unduly sweeping in stating that the judgment has the effect "of impairing the security value of a life policy." From a banking standpoint the security value of a life policy by itself means "surrender value" and if this is to be impaired it will be a serious matter for everyone interested in life policies. One of the attractions of life assurance is that a policy has always been acceptable as undoubted security up to the amount of its surrender value by bankers and other lenders.

I find nothing in the recent judgment to shake the confidence of either assured or assignee in relying upon recognised custom. It should hardly induce any insurance company from now onwards to claim retention of the entire consideration against a *bona fide* assignee who can have no beneficial interest in *felo de se* of the assured.

Yours faithfully,

ARTHUR V. BARBER.

Whitehall, S.W.1.

[The fact that Mr Justice Swift, in the lower Court, found for the suicide's representatives suggests that the principle of voidance by *felo de se* was far from being established in law. In the light of the Court of Appeal's judgment, it would now appear contrary to public policy for an insurance company to pay either the insured sum or the surrender value. In the famous Greek scuttling cases, moreover, it was held that the assignee of a policy cannot recover where the *assuré* himself failed because of his criminal activities.—Ed., Econ.]

National Finance

TO THE EDITOR OF THE ECONOMIST

SIR,—With reference to my letter in last week's *Economist*, my appeal for a reconsideration of the Armament programme was based upon estimates furnished in the table supplied by the Chancellor of the Exchequer. Since that letter was written the actual figures of the sums realised from Income Tax and Super Tax for 1936-37 have now been published. These figures have realised less than the estimates of the Chancellor and show the staggering reduction of £17,144,000—compared with the amount received in 1925-26. They are the more significant as the income tax in 1925-26 was 4s. in the pound, against 4s. 9d. during last year. The super tax was also considerably less in 1925-26 compared with 1936-37. We have, then, the above serious reduction in income with an increase in taxation, thus indicating and confirming my argument that our excessive expenditure is not justified and, if continued, will lead to national weakness and not strength.

I am, Sir,

Your obedient servant,

S.W.7

D. M. MASON.

and spirit of the Constitution and in the administration of government. In these hundred years, government from being the spare-time activity of a few wealthy families, has become a process requiring the co-operation of every adult, extending its influence into every family of the realm, and appropriating an increasing proportion of the national income. Mr Smellie has succeeded in showing how and why this has come about.

The years from the passing of the Reform Act of 1832 to the Franco-Prussian War, the first of the three periods into which Mr Smellie divides his story, were hardly conducive to the successful establishment of a system of government. Yet even in this heyday of *laissez-faire*, it was born, a child of necessity, against the wishes of its parents. With the passing of the Reform Act, the Whigs who were the disciples of Bentham set about ridding the country from governmental interference; and yet they were forced to realise its necessity in the reform of poor law and public health. Even the Tories accepted the doctrine of the classical economists that industrial progress would produce a form of society in which the only function of the Government would be so to hold the

scales of justice that each individual could pursue his own interest, and the greatest happiness of the greatest number would automatically result.

After 1870 and until 1914, as Nature in her extravagance allowed other industrial Powers to threaten Great Britain's former monopoly, these theories became increasingly inapplicable. Although the market theory of wages may prove that a workman is paid what he is worth, there is no reason to suppose that this will be adequate for his needs, or prevent him from living in such a condition of poverty and squalor that he is a danger to his neighbours. To improve our competitive position it was found necessary to extend the social services, and to enlist the support of a larger proportion of the population by extending the franchise. Local government machinery was hammered out to administer drainage and public health duties, and education was added as soon as the religious opposition could be overcome. Even the Civil Service was made democratic to those of good education.

Yet, in Mr Smellie's judgment, this was not a successful phase. The Labour Party emerged as an indication of growing discontent; and it remained for Governments in the post-war years, with the franchise extended to include every adult, to set about removing the worst abuses of poverty and illness and to reform the machinery of administration. While governmental control is inevitably extended, the modern Civil Service, despite the Haldane Commission, remains riddled with departmental rivalries, unco-ordinated and unreformed. We may appreciate the irony of history that our Government was created by those who disbelieved in it; that it was made effective by the opposition of the Irish and the House of Lords, who willed its destruction; and that it had, nevertheless, become by 1914 a paragon among constitutions and the envy of the world. Yet it is disquieting that Mr Smellie should find in 1937 that "whatever value for the world the English system of government may yet have, it is not going to be the glass of fashion and the mould of form for the twentieth century." That reforms are necessary, that our Constitution and its administration must be rationalised to meet modern needs, is emphasised by another more sinister prophecy that "it is by now fairly clear that the despotic system of government will generally prevail if the democratic experiment of the British Commonwealth of Nations were to fail. . . . In four of the world's five continents this would mean that the application of natural science to the life of man would be made by force and not by persuasion."

Shorter Notices

"We or They." By Hamilton Fish Armstrong. Macmillan (New York). 106 pages. \$1.50.

In this striking essay, Mr Armstrong agrees that there can be no compromise between the economic, political and philosophical ideas of the dictatorial States and those of democratic nations. He therefore calls for a closer defensive understanding between the democratic States, and for a stern refusal by the prosperous democratic governments to

lend money to Germany or Italy to assist their rearmament. He does not stop at the advocacy of a mere social and economic boycott of the Fascist States. He would definitely invite the United States to abandon such meaningless peace treaties as the Kellogg Pact which lack machinery for enforcement, and to realise frankly that no amount of neutrality legislation is certain to keep America out of war.

"The Position of Women in Contemporary France." By Frances I. Clark. P. S. King. 259 pages. 12s. 6d.

Miss Clark's book contains a great deal of miscellaneous information and a mass of statistics. It has a certain usefulness as a book of reference, but it cannot be commended as a satisfactory work on the subject. There is some useful information on the economic position of French women, the attitude of the trade unions, the political parties and the Church, the education of women, and the feminist movement; but there are some serious omissions and the book is not clear in thought or exposition.

"New Zealand from Within." By Donald Cowie. Routledge (London). 293 pages. 10s. 6d. net.

This study of New Zealand is a scrap-book rather than a treatise, and its disjointedness makes a summary judgment difficult. Some chapters are much better than others. Mr Cowie does not seem to have quite made up his mind what he wanted to say about New Zealand. He deplores the urbanisation of New Zealand; at the same time he hankers after a much larger population, which could only come as a complement to urban development. Yet, in spite of some dull patches and its erratic quality, the book does give a realistic impression of a country whose future is uncertain and may even be great.

The I.C.S. By Sir Edward Blunt. Faber. 310 pages. 8s. 6d.

Traces the growth of government from trade in India, and the establishment of the Indian Civil Service to conduct administration. Describes vividly and in detail the growing scope and competence of the I.C.S., and the task which confronts it in modern times. Clear-cut and telling history, and a valuable and apposite assessment of the future of Indian administration.

A Visit to Russia. Report of Durham Miners on a visit to the U.S.S.R. Durham Miners' Association. 56 pages. 3d.

Frank and honest account of what was seen and heard by English miners in Russian mining districts and industrial areas. Interesting description of workers' meals, social welfare, housing, education and social insurance. Expert and invaluable survey of mining technique, working conditions, Trade Union activities, safety and health regulations, and the Stakhanovite movement. An authoritative and critical statement.

MONEY AND BANKING

Recovery in India

POLITICS and economics are ever closely connected, and this month's inauguration of provincial autonomy affords an opportunity for a review of the economic condition of India. By good fortune, this opportunity has coincided with the annual addresses of the chairmen of several of the leading exchange banks.

The Indian banking and monetary system is extremely complex. It begins with the village money-lender and ends with the great native banks, with the international exchange banks, and with the Reserve Bank of India itself. Some attempt has recently been made by law to define a bank in India and to lay down certain conditions of operation, but these problems will always remain formidable, owing to India's wide extent and diverse social and economic structure. Yet, inasmuch as the bulk of the financing of India's overseas trade passes through the exchange banks, which also have important internal connections, the chairmen of these banks are well qualified to expound the economic position of India.

The crux of India's economic problem was explained by Lord Catto at the Mercantile Bank of India meeting. "The prosperity of India," he said, "depends mainly on the condition of the cultivators, who make up the bulk of her huge population. They cultivate small-holdings and they reserve part of their crops for their own consumption and sell the rest. Part of the money they receive is spent on fixed charges like rent, rates and interest on loans, for they are almost always in debt. The balance they spend on the purchase of cotton cloth and on other simple necessities of life. At the best of times the margin is never much, and in bad times it is apt to disappear. Therefore the price of primary commodities is of paramount importance for the cultivator and for India as a whole."

Lord Catto proceeded to say that in 1936 the improvement in most primary commodity prices was noteworthy. This is clear from the course of the Indian wholesale price index numbers:—

Year 1929	100.0
Year 1933	61.7
Jan., 1936	65.2
Jan., 1937	69.5

The recovery during 1936 alone was greater than during the whole period from 1933 to January, 1936. But wholesale prices in India are still relatively lower, in terms of 1929, than those of England or the United States.

Over India as a whole, however, the recent rise in the prices of primary products has enhanced the value of exports, and in 1936 India had a favourable balance of payments, exclusive of her net exports of gold:—

(Rupees millions)

Monthly Average	Goods			Treasure Net Imports (+) or Exports (—)	
	Imports	Exports	Export surplus	Silver	Gold
1929	208.6	268.8	+60.2	+6.1	+14.9
1933	95.6	120.4	+24.8	—5.1	—41.8
1934	104.4	123.6	+19.2	—2.8	—49.7
1935	111.9	130.9	+19.0	—7.6	—36.0
1936	101.9	150.4	+48.5	+12.6	—26.6

Her export surplus, despite its recovery in 1936, is still well below that of 1929. On the other hand, since 1929 India has repaid or converted an appreciable part of her external debt. One consequence of the re-establishment of a favourable balance of payments, which affords striking evidence of recovery in internal

prosperity, is that in 1936 India was a net importer of silver for the first time since 1931. Her gold exports reached a peak of 62 million rupees a month in 1932, but have since steadily fallen to less than half the 1932 figure.

Mr Haskell, at the Eastern Bank meeting, called attention to another important consequence of India's favourable balance of payments. During 1936, he pointed out, the Indian Government were able to sell council bills (in exchange for sterling) much in excess of their external requirements, and they have now been able to build up a large sterling reserve. Mr Haskell gave a figure of £52 millions, as representing Government's total remittances to London in this way during the current financial year. This trend is confirmed by the latest returns of the Reserve Bank of India:—

(Rupees millions)

Assets:—	End of March		Change
	1936	1937	
Gold	444	444	...
Rupee coin	595	620	+25
Balances abroad	231	265	+34
Sterling securities*	673	793	+120
Rupee securities*	244	224	—20
Investments	51	76	+25
Liabilities:—			
Note circulation	1,688	1,943	+255
Deposits: Government	86	145	+59
Banks	363	231	—132

* Held against the note issue. The rupee securities are those of the Indian Government.

The year's increase in balances abroad, plus sterling securities, amounts to 154 million rupees (£11.6 millions sterling). The expansion in India's sterling resources raises several important banking questions both in London and India. In London it is possible that insufficient attention has been given to fluctuations in the sterling assets of members of the sterling area, and their effect upon the London market and the whole British banking system. In India's case, there are many gaps in the available data. We should like to know, for example, to what extent India's sterling assets are invested in Treasury bills ("tap" or "tender"), and in the gilt-edged market; and what proportion is on deposit either with the Bank of England, or with the British joint-stock banks; or with the London offices of the Indian banks themselves.

Meanwhile, it is of some importance to know how the Indian Government is financing the holding of its sterling assets. There may be a parallel here to the British Government's financing of the Exchange Equalisation Account's gold holdings by the issue of Treasury bills by tender to the British banking system. Under this system it was shown last year that if the Exchange Account's gold holdings became disproportionately large, the British banks might be required to take up sufficient Treasury bills as to threaten conditions of stringency. Is such a parallel likely to develop in India?

At the moment there is no sign of anything of the kind. India, like many other countries, is passing through a period of easy money, and several of the exchange bank chairmen have complained of the difficulty of finding remunerative employment for their resources. By way of contrast, the Reserve Bank's latest return shows a sharp drop of 132 million rupees in bankers' deposits during the preceding year. This is mainly due to the expansion in the note circulation—a further sign of prosperity—but Government has apparently been accumulating funds in India as well as in London.

THE THEORY OF FORWARD EXCHANGE

By Dr Paul Einzig

Dr Einzig has made the theory and practice of Foreign Exchange the study of his lifetime. His book contains a vast amount of new material on hitherto neglected aspects of the subject. It deals with innumerable points of interest to economists and practical bankers alike. Indeed, there is every reason to regard this book as Dr Einzig's magnum opus.

MACMILLAN

21s. net

The complex structure of the Indian banking system, however, makes it difficult to define closely ease and stringency. The exchange banks largely depend on external trade, and in spite of last year's recovery they may well find difficulty in employing profitably the whole of their funds. At the other end of the scale, talk of easy money might seem a mockery to the native cultivator who is still deeply in debt to the village money-lender. Somewhere between the two extremes the big drop in bankers' deposits suggests that some banks have less cash than they had a year ago, and this must indicate some loss of banking liquidity.

The channel, in fact, by which credit percolates in India from its central source to the countless small borrowers scattered all over the country, is over-long and tortuous. There are so many intermediate parties that the paradox becomes possible of cheap money in the centre and usurious rates of interest in the villages. To remedy this state of affairs is one of the fundamental problems of Indian banking, and it affects the big exchange and indigenous banks as well as the general population. It is not a problem peculiar to India. There are many borrowers in England paying 5 per cent. to-day, and to America's Middle-West farmer talk of one per cent. call money in New York City has only a derisory significance. The problem is not so much that of a glut or scarcity in the total volume of credit as of its proper distribution, and it is complicated by the varying credit-worthiness of individual borrowers. Whether a partial solution can be found in India depends largely upon the better education of the population. In the meantime, the fact that India has entered upon her new form of Government at a time of relative ease and prosperity is at least of good omen for her political future.

Financial Notes

An Unfounded Gold Rumour.—Last Wednesday London and New York markets were badly upset by a rumour that the American banks had cabled their London agents refusing to accept further gold consignments on American Treasury Account, and also refusing additional advances against gold in transit. It was further stated that there were strong rumours that the American Treasury planned to reduce the price of gold or to change the handling charge of $\frac{1}{4}$ per cent. with a view to reducing imports of gold. These rumours were quickly denied, but not before considerable disturbance had been caused. In London there was a sharp fall in gold-mining shares and general weakness in the commodity markets. A strong demand for dollars sprang up both in London and Paris, and the British and French Exchange Controls had to intervene. It is known that the American authorities are seriously perturbed at the inflationary effects of the continued influx of gold, now being augmented by heavy shipments from Russia, and this was probably the basis of the rumour. On the other hand, a moment's thought should have sufficed to show its absurdity. An embargo on gold imports or the lowering of the American Treasury's price of \$35 per ounce, less $\frac{1}{4}$ per cent. handling charges, would have meant the torpedoing of the tripartite monetary agreement, accompanied by a sharp appreciation of the dollar against the pound, the franc, and other currencies. While American opinion shares in the official alarm over internal inflation and the growth of boom conditions, it is still doubtful if it would tolerate a sudden depreciation of sterling below \$4.86. Nor is it likely that the British authorities would suddenly consent to lower the sterling price of gold, in view of the important Indian and South African interests involved. France too would require fresh legislation for this purpose. The American authorities in their turn have still to apply the final increase in member banks' legal minimum reserves, and so even there the time is not ripe for a new fundamental change. At the same time the world supply of gold is expanding, and this may make it difficult to maintain a fixed price indefinitely. We hope to return to this point at a later date.

America's Balance of Payments.—The preliminary estimates of the balance of payments of the United States in 1936 have recently become available in Washington. They are shown in the following table, together with the figures for 1935. The figures are in millions of dollars and, following the conventional notation, a plus sign indicates a net credit, or in-payment, to the United States, and a minus sign a net debit, or out-payment.

BALANCE OF PAYMENTS OF THE UNITED STATES		
	1935	1936
Merchandise	+ 236	+ 34
Freight and shipping	- 36	- 60
Tourist expenditures	- 292	- 373
Immigrant remittances, contributions, etc.	- 115	- 138
Interest, dividends, etc.	+ 375	+ 375
Other current items	+ 40	+ 30
Balance on current account	+ 208	- 132
Gold movements (net)	- 1,739	- 1,030
Silver movements (net)	- 336	- 180
Total gold and silver	- 2,075	- 1,210
Net movement of short-term funds	+ 970	+ 404
Net movement of long-term funds	+ 462	+ 792
Currency movements	- 1	+ 20
Miscellaneous capital movements	+ 105	- 75
Total capital items	+ 1,736	+ 1,141

The main outlines of this balance-sheet are similar to those of recent years. So far as the current items are concerned, America is gradually adjusting herself to the position of a creditor nation. Every one of the current items, with the exception of the receipt of dividends and interest, moved "against" the United States. The credit balance of merchandise trade was the smallest since 1895, and the total current account now shows a negative balance. This is, indeed, overdoing the adjustment, for a creditor nation should have some net balance for new loans. America, however, is still in the mood of preferring to recall her existing foreign assets than to lend afresh. And the outside world is responding by not merely buying back America's past investments but pouring capital of its own into the American markets. This is, of course, the explanation of the continuing inflow of gold which, though not as large as in 1935, was still of gigantic dimensions.

Further light on this capital inflow is shed by a return issued by the American Treasury this week. During the two years 1935-36, the total net capital inflow into the United States amounted to \$2,607 millions. Of this total, net purchases of securities totalled \$1,234 millions in 1935-36 as a whole, \$606 millions in 1936, and \$284 millions in the last quarter of 1936. There was thus a considerable acceleration in the flow towards the end of last year. The following table gives figures for individual countries:—

	1935-36	1936	Fourth quarter of 1936
		(\$ millions)	
Great Britain	484	218	132
France	83	41	20
Netherlands	168	145	54
Switzerland	214	107	38

Germany and Italy were small buyers of securities in 1935, but in 1936 they have been sellers on balance. Every one of the four countries shows a proportionately higher rate of purchase in the last quarter, but this is much less true of Holland and Switzerland than of Great Britain and France. This points to a certain repatriation of Swiss and Dutch capital after the devaluations of September.

The Foreign Exchanges.—The London market was seriously disturbed on Wednesday by the rumoured cessation of gold purchases by the American Treasury, discussed in another Note. A strong movement out of francs and sterling into dollars developed, and the spot New York rate came down from \$4.9110 to \$4.8940; it has since recovered to \$4.8960, while three months'

dollars remained unchanged at $\frac{1}{8}$ cent premium throughout the whole flurry. The pressure on the franc was rather greater, as is shown by the depreciation of the franc against sterling from Frs. 106.35 to Frs. 107.12. There were further rumours that the spot rate would be allowed to fall to Frs. 112, and as recently as Thursday there were sales of francs against dollars. Both the French and British Controls had to intervene on Wednesday to support their currencies. In spite of these uncertainties, three months' francs remained very steady at Frs. 1 $\frac{1}{8}$ discount. Dutch guilders, belgas and Swiss francs have followed the course of the dollar without any change in their cross-rates on New York.

March Clearing Bank Averages.—The March statements of the ten English clearing banks enable us to see the effects of the spring revenue collection in complete perspective. Between December and March, the total tender issue of Treasury bills was reduced by £110 millions. Clearing banks' discounts and call and short loans consequently fell by £99 millions. Deposits, on the other hand, were only reduced by £70 millions, partly because of the quarter's £50 millions increase in advances.

	March, 1936	Nov., 1936	Dec., 1936	Jan., 1937	Feb., 1937	March, 1937
Capital and reserves	131.8	131.8	131.9	132.5	132.5	132.5

This quarter there has also been a contraction of £18 millions in clearing bank cash. A comparison of the Bank returns for December and March shows a corresponding contraction of £18 millions in bankers' deposits, mainly balanced by an increase of £12 millions in public deposits. This transfer of funds was concentrated at the end of each month, and was due to the way in which Treasury bill maturities fell at the end of December and beginning of April, while payments for new bills fell at the beginning of January and end of March. These discrepancies of dates are due to preparations for the end of each banking half-year, and have nothing to do with the spring revenue collection.

The Money Market.—The increase in the supply of funds through heavy Treasury bill maturities at the end of last week has made money easier, but nevertheless the banks experienced a good demand for night money on both Wednesday and Thursday. The banks were also ready buyers of Treasury bills at $\frac{1}{2}$ per cent., but the market had not many bills to sell.

	Mar. 18, 1937	Mar. 24, 1937	Apr. 1, 1937	Apr. 8, 1937

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

Money generally was $\frac{1}{2}$ per cent. against bills, while outside bond money is now only $\frac{1}{8}$ per cent. The low March cash ratios of some of the clearing banks have inspired talk of dearer money, but it is not easy to find any real foundation for this.

The Bank Return.—This week's return shows that £3.9 millions of the Easter currency has now returned from circulation.

The return of approximately £30 millions from public to bankers' deposits is due to heavy Treasury bill maturities at the beginning of April. The surprising feature of this week's return is the absence of any reduction in Government securities, as it had been believed that to help the market over the end of the quarter the Bank had been buying early April Treasury bills.

Co-operative Insurance Society.—In the ordinary branch new sums assured advanced from £3,321,000 to £3,459,000, and the net rate of interest was £3 19s. 7d. per cent. against £4 2s. 10d. per cent. In the industrial branch, also, new business expanded from £17,535,000 to £19,549,000, and the rate of interest (no income tax is payable) fell from £4 16s. 4d. per cent. to £4 12s. 3d. per cent. Industrial premium income increased by 13 per cent., the same high rate of increase as in the previous year; the actual amount of increase was £466,000 to £4,198,000. Commission and expenses in the ordinary branch were only 12.9 per cent. of the premium income, compared with 13.3 per cent. in 1935, while in the industrial branch a substantial fall was offset in the expense rate from 36.8 per cent. to 35.7 per cent. The results of the last two valuations are given below:—

	1935		1936	
	Ordinary Branch	Industrial Branch	Ordinary Branch	Industrial Branch
Surplus earned during the year	235,846	201,278	260,707	299,209
Brought forward	62,790	79,065	65,457	98,752
	298,636	280,343	326,164	397,961
To bonuses to policy-holders	233,179	181,591	253,611	286,431
To carried forward to next year	65,457	98,752	72,553	111,530
	298,636	280,343	326,164	397,961

In the ordinary branch the rate of reversionary bonus declared is again 36s. per cent., calculated on the sum assured. The same satisfactory rates of reversionary bonus have been declared in the industrial branch as in 1935, but a new feature appears on this occasion: holders of whole-life policies attaining age 80 before March 31, 1938, and having paid at least ten premiums will have all future premiums cancelled. No doubt a considerable portion of the very large increase in allocation is due to this fresh privilege. In the fire and miscellaneous branch premium income increased from £1,543,000 to £1,657,000, and the amount transferred to profit and loss was £149,000 against £146,000. From that account, as in 1935, £70,000 has been transferred to general reserve fund and £42,000 was paid as dividends to policy-holders in the general branches. Loans increased by £829,000 to £4,906,000 and British Government securities remained practically unaltered. Debenture stocks increased very substantially from £5,593,000 to £7,320,000 and preference stocks from £2,437,000 to £2,505,000. Ordinary stocks amount to only £8,000. Total assets now amount to £24,618,000, an increase of £2,848,000.

THE STOCK EXCHANGE

"The Directors Recommend a Bonus . . ."

THE following article is concerned with the most cheerful topic in the entire range of investment. The word "bonus" is synonymous with prosperity, pressed down and running over. A bonus has all the characteristics of the proverbial good gift; for it comes unexpectedly and offers the most subtle of all financial satisfactions—the apparent receipt of something for nothing. In point of fact, few subjects are more conducive to confused thinking. Mr Hartley Withers first drew attention to the disturbing effects of over-economy in financial terminology, and instanced the diverse meanings of the single word "bill." The term "bonus" belongs to the same great etymological family, having for arms a red herring quartered with Humpty-Dumpty, who used a word to mean whatever he chose, no more and no less.

The investor is familiar with at least three different types of bonus. The first is illustrated by last week's announcement that the Dunlop Rubber Company would pay an ordinary dividend of 8 per cent. and a bonus of 1 per cent. The "bonus" in this case is a cash payment, entirely on revenue account. It is identical with the remainder of the year's dividend, except for a tacit directorial intimation that shareholders must regard it as more exceptional and, perhaps, more transient than the rest of the dividend. The second and third types of bonus, with which this has nothing in common, are exemplified—to take but one example out of many—by the decision of Murex Limited, last autumn (a) to issue to its ordinary proprietors 46,125 new £1 shares, in the ratio of 1 for every 12 held, at a cash price of £6½ against a prevailing market quotation of £9½; and, thereafter, (b) to issue two further shares, free of all cost, for every three then held. The former operation was a typical "issue on bonus terms," the latter a typical "share bonus." Let us examine each process.

The technique of share issues on bonus terms involves few difficulties for the investor in theory or in practice. Almost invariably, the assumption is that the company will at least maintain its existing rate of dividend on its enlarged capital. A simple proportion sum then gives the price at which a holder who does not wish to subscribe new capital can sell his "rights" in the market. If he elects to do so, his original holding and his income therefrom are maintained, whilst his general resources are augmented by the cash value of the "rights." This at first sight looks remarkably like eating his cake and having it. But, in fact, the non-subscribing holder loses something, since he holds a smaller proportion of the total capital after the issue. If he is a large shareholder, this fact may have important strategic and other consequences.

The Murex issue, however, to which reference was made above, provided an additional inducement to subscribing shareholders; for every holder of three shares, after the completion of the operation, was given two additional shares without any further expense whatever. Here we encounter the most familiar form of "capital bonus," and the one which is most subject to misapprehension. In the case of Murex, the offer may quite properly be associated with a legitimate tactical objective—the obtaining of new money. In the great majority of instances, however, it stands entirely by itself and is viewed as a process of "melon-cutting" by its beneficiaries and of "capital-watering" by its critics. How far is either term justified?

The basic factor in any discussion of the theory and practice of capital bonuses is the provision of British law that all limited companies must have a share capital expressed in terms of a fixed sum of money. If a hypo-

thetical concern has an ordinary capital of £1,000,000, divided into £1 shares, then every holder of one share has an equity in a one-millionth part of whatever profits are earned and a right to receive a one-millionth part of whatever amount of money is distributed as a dividend. The denomination of the shares is an accounting convention designed to define the relative claims of different proprietors in the distribution of a given *corpus* of funds. So long as profits and dividends are unchanged, it is immaterial, at any given moment, whether the company has a million shares of £1 each, or 10,000 shares of £100 each, or ten million shares of 2s. each, or even 960 million shares of ¼d. each. Whatever their denomination, the price of the ordinary shares on the Stock Exchange will be based on considerations of earnings and dividends, not of par values. And the latter may not even reflect the price at which the company obtained its capital in its initial stage. The new issue market in the last few months has afforded numerous examples of companies, previously unknown to the public investor, who have succeeded in obtaining subscriptions for their ordinary shares at premiums of 50 per cent. to 300 per cent. or more. On a break-up, again, the value of an ordinary share, unlike that of a debenture or preference share, is not its face value, but its proportionate part of the company's "net worth," i.e. the surplus of total assets over total liabilities, including preferential capital.

Does it follow, therefore, that, if the hypothetical £1,000,000 company considered above were to increase its capital to £2,000,000 by a hundred-per-cent. free capital bonus to shareholders, the operation would be merely a book-keeping transaction, which would leave the material position of the company and its shareholders unchanged? The answer is: Yes and No. The operation certainly would not, in itself, alter the company's profit-earning capacity by a penny. And if the directors had been paying dividends of 2s. per share before, and they continued to pay the same *total amount* of dividend afterwards, then the shareholders would merely receive 1s. on each of two shares instead of 2s. on one share. But, in the vast majority of cases, companies do, in fact, pay out larger *total amounts* in dividend after a bonus issue. And the combined market price of the old and new shares together is almost invariably higher than that of the old shares alone, before the bonus issue. So far as the rise is due to a mistaken impression that shareholders have obtained, gratis, something of value in itself, the movement is irrational; so far as it represents a discounting of increased aggregate dividends, in terms of money, it is strictly logical.

The considerations which induce directors to recommend capital bonuses are, indeed, nearly always psychological. In exceptional cases, directors may do as the Great Western Railway did on a single occasion in the 'sixties, and pay scrip dividends because they have no cash. In the vast majority of instances, however, a company which pays a capital bonus has accumulated reserves by ploughing back profits during a number of years, and the operation involves a transfer from reserve account to capital account. In such instances the term "capital-watering" may convey a misleading idea of the actual transaction. If Company A distributes its profits to the hilt for ten years and then issues £500,000 of new capital for cash, at par, to shareholders, while Company B retains £50,000 of each year's profits and finally capitalises its reserve, is B's new capital any less substantial than A's? In fact, B's earning power is probably the greater, for the company has enjoyed the use of the additional capital during the

nine years it has been accumulating. The expectation of future capital bonuses may, indeed, on occasion, help to reconcile shareholders to present conservatism in dividend policy. An extreme example is afforded by British Home Stores, whose shilling ordinary shares stand at 23s. 9d., and receive regular capital bonuses, although the directors have so far reserved every penny of net profits and paid no cash dividend at all.

The advantages, or otherwise, of a capital bonus policy, from a company's viewpoint, again depend on psychological questions. A company earns its profits by employing assets which may be represented, on the other side of its balance sheet, by so-called issued capital and by reserves. But dividends are expressed as a percentage of issued capital alone. If reserves are considerable, the resulting figure may convey a widespread impression that the company is earning inordinately large profits. In short, there is something to be said for a periodical adjustment which maintains a fair balance between reserve and capital account. In recent years, there has been a tendency among some companies—of which Marks and Spencer and British Electric Traction are prominent examples—to make this adjustment regularly by effecting annual capital bonus distributions of the order of 10 per cent. The process is relevant only for concerns whose profits are increasing more or less in geometric progression; for it ensures that capital shall also rise geometrically. The shares of such companies, incidentally, and for obvious reasons, have a special attraction for surtax payers.

The considerations discussed in the course of this article suggest that, in the last resort, the case for and against capital bonuses turns more on sentiment than on arithmetical considerations. To put the matter in its simplest terms, experience tends to prove that a given rise in the sterling amount of a dividend produces a higher market capitalisation when it is accompanied by a capital bonus than when it is not. The question arises, therefore, whether directors should consciously seek material ends—such, for example, as the issue of new cash capital on better terms than would otherwise be possible—by capitalising public exaltation based on nothing more substantial than a system of book-keeping? If ignorance is bliss, is it folly to be wise? Here we are on the borderland between finance and metaphysics. Our trans-Atlantic cousins have segregated the two aspects by authorising the issue of the no-par-value share. Under our own Company Law, their reconciliation must depend, like the spelling of Mr Samuel Weller's surname, on the taste and fancy of those chiefly concerned.

Investment and Company Notes

Markets on the Ropes.—Investment markets remain in a state of nervous defensiveness. Three months of almost uninterrupted technical correction leave them quite unable to resist the feinting attacks of President Roosevelt. A few months ago these would have been dismissed as mere sparring in the air; now, in the technical phrase, they make contact, with all the effects of a heavy blow. Last Friday the President declared that durable commodity prices were too high, and proposed to divert Federal expenditure to projects requiring more "consumers' goods" and the smallest proportion of high-cost durable materials. So vulnerable are the speculative markets in metals that this statement was read in the most bearish fashion, and not as a confession of the President's helplessness. On Wednesday of this week, the same tactics were employed of using a mouse for an elephant's work. Wall Street slumped; internationals in the London market anticipated their fall; and for a time Kaffir share

quotations were quite nominal. The significance of the rumours regarding a pending change in the United States Government's gold and "twenty-four hour monetary policy" are examined in detail on page 88. So far as the London market's position is concerned, the precipitate offering of good Kaffir shares was associated with fears of a collapse in the price of gold—and these fears are quite plainly exaggerated.

No profound effects were evident in the home industrial markets in mid-week—the *Financial News* index, indeed, was virtually unchanged at 118.1—and the weakness was confined almost entirely to gold and other mining shares, to commodity shares (rubber issues being lower all round on the further fall of the commodity to 12½d.) and to internationally traded securities. The following table shows the course of representative mining and international securities since their peak prices this year, before and after the President's boom-deflating speech of last Friday, and the effects of this week's gold scare:—

	Highest 1937	Thurs. Apr. 1	Fri. Apr. 2	Tues. Apr. 6	Wed. Apr. 7	Thurs. Apr. 8	Fall this week
Gold Shares—							
Anglo-Amer. Corp.	5½	5½	4½	5½	4½	5	½
Cons. Gold Fields...	6½	5½	5½	5½	5½	5	½
Crown Mines	16½	14½	14½	14½	14½	14	½
Randfontein	78/6	60/6	60/6	60/3	58/6	57/6	3/6
Venterspost	55/10½	49/9	48/6	49/6	47/6	46/3	1/9
West Witwatersrand	19½	18	17½	17½	16½	16½	1½
Other Mines—							
Rhod. Anglo-Amer.	42/4½	40/3	40/6	39/6	37/9	37/6	3/6
Roan Antelope	89/3	80/7½	79/6	77/6	75/6	71/1½	7/10½
Trepcan	45/6	41/6	40/6	40/6	38/6	37/6	3/6
Internationals—							
U.S. Steel	129½	121½	117½	119	113½	112½	5½
Int. Nickel	75½	69½	68½	67½	65½	65½	2½

Among metal shares, the reaction seems right and proper, for recent high share levels based upon famine metal prices were clearly not destined to hold. The rate of fall recorded by some leading Kaffir shares this week is perhaps more open to question. The notion that a sudden fall in the sterling price of gold might result

"I parted with £1,600, including all my securities."

Widows with a little capital and no experience in financial matters are sometimes easy prey. The tale is always the same. The tempting bait of high interest yields is swallowed . . . glowing promises are followed by bitter disillusionment and loss of capital. Tragedy indeed. For the protection of your wife, should you leave her a widow, choose the 'Safeguard' plan. None better. It provides a guaranteed income of £3, £6 or £9 per week according to her needs. It will free her from investment worries and shield her from traps laid for the unwary.

The 'SAFEGUARD' PLAN provides a non-fluctuating income of £3, £6 or £9 per week for a period of years after your death and a cash sum, if desired, when the income commences. When the annual income ceases a cash payment of £1,000, £2,000 or £3,000 is made. If you survive the period of your family responsibilities it can be arranged that the cash sums are payable to you.

An enquiry for full details and for an illustration suited to your own circumstances will cost you nothing; rest assured you will incur no obligation by doing so.

from any decision of the American Treasury to check the inflow of gold seems dubious in the extreme. It is, however, unlikely that the sterling price for gold has scope for any further increase (the balance of probabilities points in the other direction), while in terms of real income the value of gold is declining. At the same time costs of gold production are steadily advancing. The prospects for sound Kaffir shares, therefore, suggest that relatively stable dividends may be expected, accompanied in some cases by richer mining and reduced working life for certain mines. That is the argument for examining Kaffir holdings with some care at present. The idea that the President's advisers would counsel an attempt to check a developing boom by the woeful deflationary expedient of reducing the dollar price for gold is at this moment surely premature. But for all that, the mere suggestion acts with powerful force on the world's markets.

* * *

The President and Wall Street.—Prices on Wall Street have fallen off severely on similar reasoning of the President's intentions. The gold rumour was immediately repudiated, but the market was prepared to accept the suggestion as in accordance with the known desires of the Administration to restrain commodity and security prices. No serious direct consequences are anticipated from the Administration's determination to direct the flow of Government spending away from capital goods and towards consumption goods. Only for a few commodities is the volume of Government buying decisive. But for the present the repeated shocks of Administration attacks on high prices have produced the desired psychological effect on Wall Street, which begins to see deflation round the corner just as clearly as recently it saw an almost European inflation. In this mood the rumoured reduction in gold price seemed true in substance if not in fact. But it does not seem likely that so clumsy and indirect a weapon would be chosen by the President. Many critics of the Administration maintain that the principal cause of present high stock prices is the heavily unbalanced Federal Budget, and that if the Government wishes to reduce prices on Wall Street it must eliminate its deficits. At the moment this does not seem to be practical politics; recent proposals to cut relief expenditures met an outburst of indignation from numerous State Governors. And the Federal Reserve Board has now joined with other Government agencies in supporting the level of Government security prices. It does not seem unreasonable to suppose that the Government will be restricted to verbal attacks designed to create the right mental atmosphere; this is a time-honoured method in America. For an indefinite period it may doubtless be successful; but it is unlikely that the business boom can for long be completely ignored by Wall Street. Yet the effects of rising costs, labour disputes, and the approach of some industries to the limits of physical capacity, suggest that the time has come for discrimination among Wall Street's favourites.

* * *

Contango Restrictions.—For the last two or three months, brokers on the Stock Exchange have experienced increasing difficulty in arranging contangos. Despite the progressive reduction which has taken place since the beginning of this year, a further sharp curtailment in preparations for the Account which has just closed produced a sharp technical shake-out. An informal lead appears to have been given by the banks, who have increased the discrimination they show in dealing with jobbers' (and in some cases with brokers') loans on securities. In theory, there might be a large contango position without any very considerable proportion of bank finance, and in pre-war times, indeed, non-bank money played a predominant part in the market. To-day, however, the banks are in a key position, though at no time since the depression has the total of bank money approached undue proportions. A policy of circumspection, nevertheless, may be commended, in itself, both on banking and general financial grounds. The

resulting contraction has been effected without any disturbance or discomfort to brokers or their clients whose loans were obviously of first-rate standing; for the rest, the decision has presumably been made in the light of available indications—such as the nature of the securities concerned, and the general conditions surrounding the loan. Obviously, the highest authorities do not view the latest developments with disfavour; and obviously the science of steering the City along an ordained course by directional wireless from a central navigational tower is being steadily perfected.

* * *

Dunlop Report.—The Dunlop accounts inspire the highest praise for their technical excellence, quite apart from their investment interest. No investor could possibly require more information on the group's finances than the directors provide. The statement of group earnings is unrivalled, even by those American companies which show consolidated earnings. The report is issued with commendable promptness, and the 9 per cent. dividend is payable, less tax at 4s. 9d., on the day before the Chancellor's Budget speech. The results of the parent company are set out in detail below:—

	Years to December 31		
	1934	1935	1936
Profits from all sources	2,207,300	1,848,775	2,011,768
Refund of guaranteed preference dividends from subsidiaries	23,561	5,047	11,035
Net profit	2,230,861	1,853,822	2,022,803
Depreciation and obsolescence	396,322	386,459	351,248
Taxation	550,060	419,761	394,900
Directors' fees	8,000	8,000	8,000
Debt and other interest	138,852	171,119	160,848
Earned for dividends	1,137,627	868,483	1,107,807
Preference dividends	290,625	288,281	285,938
Ordinary shares:—			
Earned	847,002	580,202	821,869
Paid	486,765	478,914	571,853
Earned (%)	13.9	9.7	12.9
Paid (%)	8	8	9
Reserve allocations	350,000†	100,000§	250,000†
Carried forward	588,652	589,940	589,956

† £100,000 to general reserve and £150,000 to contingencies.
‡ £250,000 to dividend equalisation; £100,000 to contingencies.
§ Reserve for contingencies.

The aggregate profits of the group increased from £1,860,073 to £2,200,392, while the ordinary earnings of the parent concern have jumped from £580,202 to

The following Abridged Particulars are published for information only of an Offer being confined to the Holders of Ordinary and "A" Shares of Rhokana Corporation Limited.

A copy of the Full Prospectus has been delivered to the Registrar of Companies for registration. Application will be made to the Committee of the Stock Exchange, London, for permission to deal and to the Committee of the Stock Exchange, Johannesburg, for a quotation in the shares of the Company.

The subscription lists are now open and will close on Wednesday, the 21st day of April, 1937.

5,000,000		£5,000,000

OFFER FOR SUBSCRIPTION

of 2,900,002 shares of £1 each at par. Payable in full on application.

Two million five hundred thousand and two of the above-mentioned shares are offered to the holders of Ordinary and "A" shares of Rhokana Corporation Limited who were registered in the books of that Company at the close of business on the 2nd day of April, 1937, in the proportion of one share of this Company for each Ordinary or "A" share of Rhokana Corporation Limited held by each of such shareholders on that date. Rhokana Corporation Limited has in terms of the Agreement for Sale dated the 10th March, 1937, agreed to subscribe at par for the remaining 400,000 shares now offered. Provision is made in the Forms of Application accompanying the Prospectus to enable the holders of Ordinary and "A" shares of Rhokana Corporation Limited to renounce their right to subscribe for the shares of this issue in favour of other persons.

DIRECTORS:

SIR ERNEST OPPENHEIMER, M.P. (S.A.), (Chairman).
SIR AUCKLAND CAMPBELL GEDDES, P.C., G.C.M.G., K.C.B. (Deputy Chairman).
STANLEY SHELBORNE TAYLOR, C.M.G., D.S.O. (Managing Director).
SIR EDMUND DAVIS.
JACK BARNATO JOEL.
CARL RAYMOND DAVIS.
JOHN NEVILLE BUCHANAN, D.S.O., M.C.

SECRETARY AND REGISTERED OFFICE:

A. W. DURRANT, D.S.O., 11, Old Jewry, London, E.C.2.

The Company was incorporated in England on the 8th day of March, 1937, for the purposes set out in its Memorandum of Association and in particular with the object of acquiring from Rhokana Corporation Limited (hereinafter called "the Vendor Company") of 11, Old Jewry, London, E.C.2, Mining Rights over four contiguous areas in Northern Rhodesia known as Chingola (which includes Nchanga West), Nchanga, Mimbulu and Kakosa, together with the necessary Surface Rights. The above Mining Rights are all held under Special Grants from the British South Africa Company and the Surface Rights are held on leases from the Crown having terms of 92 to 93 years remaining unexpired at rents varying from £45 9s. 6d. to £11 per annum.

The properties are served by a branch line of the Rhodesia Railway system from Ndola, from which point they are 82 miles distant. The above Special Grants have a total area of 38.35 square miles and contain a continuous outcrop of the Lower Bwana M'Kubwa series which has been proved to be copper bearing.

Large sums of money were spent by Rhokana Corporation Limited in exploratory and development work on the above properties. The work accomplished included the sinking of many boreholes, which proved the existence of very large deposits of rich copper ore, details of which appear in the Consulting Engineers' Report, and thereafter the sinking of shafts and underground development work. In Nchanga West confirmation of the presence of high grade ore was given by the development on the 470 ft. level before the workings were flooded in 1931. Work was then suspended and in view of the condition of the copper market at the time was not recommenced.

In October, 1936, it was proposed to limit the initial operations of this Company to the opening of the existing workings in Nchanga West at an estimated cost of £400,000. The Directors have subsequently decided that development of the high-grade Nchanga West ore body on a larger scale and to greater depths than was originally contemplated is warranted and have, therefore, decided to undertake the enlarged programme set out in the Consulting Engineers' Report attached hereto.

The Company has also acquired from the Vendor Company 8 Mining Locations known as the King Edward Mine, situated in the neighbourhood of Lusaka. The Vendor Company has agreed to surrender, on the request of the Company, the Prospecting Rights which it holds over the areas known as Luano and as the Native Compound Site, which are contiguous to the four grants of Mining Rights above mentioned, and has arranged that upon surrender of these Prospecting Rights the British South Africa Company will on the request of the Vendor Company the grant to the Company Mining Rights over such areas, in consideration of the allotment to it of 2,500 shares of the Company, credited as fully paid, which will be taken from the 99,998 shares in reserve.

The Company obtained a Certificate entitling it to commence business on 16th March, 1937.

The following is a copy of the Consulting Engineers' Report:—
ANGLO AMERICAN CORPORATION OF SOUTH AFRICA LIMITED,
AMMEROSA HOUSE, JOHANNESBURG. 22nd March, 1937.

The Chairman and Directors, NCHANGA CONSOLIDATED COPPER MINES LIMITED,
11, Old Jewry, London, E.C.2.

Gentlemen,—Prior to the year 1931 an active diamond drilling and prospecting programme had disclosed the following ore reserve:—

	Tons	Total % of Copper	Of which Oxide %
Nchanga West	46,500,000	8.9	2.9
Nchanga River Lode	2,280,000	4.2	2.9
Chingola	2,000,000	7.0	6.6
Nchanga	93,000,000	3.51	2.25
Total	143,780,000	4.66	2.53

Note.—The Nchanga West figure includes 6,300,000 tons containing 17 per cent. copper, of which 4.5 per cent. is oxide.

COPIES OF THE FULL PROSPECTUS PARTICULARS CAN BE OBTAINED FROM THE OFFICES OF THE COMPANY, 11, OLD JEWRY, LONDON, E.C.2.

These ore reserves could be much increased by further diamond drilling in the vicinity of proved ore bodies, while there are good prospects of disclosing further ore bodies on Mimbulu special Grant.

Prior to the closing down of the property a shaft sinking and development programme which had as its object the opening up of the high grade Nchanga West ore body, had advanced to the stage where good grade ore was being disclosed by development on the 470 ft. level at No. 1 Shaft. At the end of the year 1931 an influx of water flooded these workings. At that time the low price and the uncertain outlook for copper led to the decision to close down the mine.

Preparatory work in connection with the reopening of the property has commenced and a programme providing for the early exploitation of the high grade Nchanga West ore body has been drawn up. This programme envisages the opening up of the ore body in the vicinity of No. 1 Shaft. The presence of soft hanging wall strata over the ore body which may cause intrusions of large quantities of water dictates that while the water level is being lowered below the level of active mining operations there should be access to the workings from more than one shaft. The safety of persons must be a first consideration and the smooth running of the pumps under all conditions must be ensured. This aspect of the problem has led to the development of a programme whereby two incline haulageways and one new vertical shaft will be sunk in the footwall. One incline will be completely separated from the mine by means of a concrete bulkhead equipped with pipes for drainage purposes. The other will be connected to the mine workings in the first place at the 470 ft. level, thus providing a travelling way to the surface in case of necessity. This incline will permit development of the ore body and the drainage of the overlying beds. With this arrangement it will be possible to run pumps in the pumping incline under all conditions even if the mine is flooded.

While these haulageways will provide for the safe and rapid dewatering of the mine, they will not be suited to the requirements of the mine during the production period, and for this reason it has been decided to sink a new vertical shaft. It is thought that the whole of the Nchanga West ore body can be mined from this shaft and these incline haulageways. It was originally thought that mining operations might be started by dewatering the mine to the 470 ft. level as a first step. Further consideration of the problem, however, had led to the conclusion that the proper course is to dewater the mine to not less than 1,000 ft. below the surface, and this course is recommended.

Power during the preliminary stages will be provided by the existing 500 kilowatt sets, while it is proposed in due course to provide pumping equipment to handle a large volume of water which may be encountered. A steam-driven plant will be installed to deal with pumping the requirements and the additional mine load, such as winding, air compression, etc.

The question of the treatment of the ore is one which requires attention. The Nchanga West ore body contains 46,500,000 tons of ore averaging 6.9 per cent. copper, of which 2.9 per cent. is in the form of oxide. Previous experiments have shown that satisfactory extraction of the sulphide copper should be recoverable by flotation. This method would appear to be more economical than a leaching process with its heavy capital expenditure and high running costs. There is every reason to expect that flotation tests on the ore when available will indicate that flotation will be successful. There are large tonnages of oxide ore at and adjoining Nchanga and the desirability of installing a leaching plant to treat these ores is a matter apart from the immediate problem which is the exploitation of the high grade sulphide and mixed ores on Nchanga West.

It is felt that the programme outlined above will result in the mine being brought to production with the minimum of risk and delay due to water difficulties. In view of the many unknown factors it is impossible at this stage to give a reliable figure for the cost of completing the programme. The amount of working capital which is being raised initially is £2,900,002, and it is estimated that this should cover the major portion of the expenditure on shaft sinking, preparing the deposit for mining and the erection of a mill of a capacity of five thousand tons per day.

Yours faithfully, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA LIMITED, Consulting Engineers.

per F. A. UNGER, Technical Director.
The Directors are aware that firm applications will be made for over 2,000,000 shares by shareholders of Rhokana Corporation Limited.

£821,869, equivalent to 12.9 per cent., compared with 9.7 per cent. for 1936. The report disposes of the myth—as the chairman has done in previous years—that the Dunlop Plantations are a source of enormous profits during a period of rising rubber prices. This company has, in fact, refunded only £11,035 during 1936 towards guaranteed preference dividends paid by the parent company in earlier years. It is believed, moreover, that its contribution to Dunlop's total rubber requirements are far smaller than the 50 per cent. figure which has been stated in the press, and that its output consists to a large extent of liquid latex, which is used mainly for the company's new products, such as shoes and clothing. Dry rubber, which is required for tyres, is obtained largely from the market. The company, however, appears to have been successful both in obtaining its rubber supplies on fairly favourable terms, in relation to recent market prices, and in passing on increased costs. In December last it announced an increase of up to 10 per cent. on most classes of tyres. Some of the overseas interests appear to have done well—particularly in South Africa, the Irish Free State and even in America. But the French factories have probably been affected by rising costs and by competition, while for three years the company has been unable to realise a penny of its profits from Germany. If present prices of rubber hold, costs will undoubtedly increase. An element of instability is thus inseparable from the Dunlop profits, for rubber manufacturing is an essentially speculative industry, depending upon rubber prices—now six times their slump level—and upon the company's success in passing on rising costs—a difficult matter where firm prices for rubber manufactures must be quoted. At 35s. 4½d. per £1 unit, Dunlop ordinary stock yields £5 2s. per cent.—a return which is associated with this tendency towards profits fluctuations.

Cable and Wireless Reconstruction.—The directors of Cable and Wireless (Holding) announced the preliminary details of the long-awaited capital reconstruction scheme last week. The market has since been attempting to guess the probable rate of earnings on the ordinary stocks, and to analyse the directors' reasons for putting out the scheme before the full results for 1936 are available. One year's dividend is to be paid out of the profits of 1936 on the 5½ per cent. preference stock, and the 1½ years' arrears are to be settled by an issue of 4 per cent. funded income stock. The "A" ordinary stock is to be reduced to 30 per cent. of its nominal value, and the "B" ordinary stock to £7 10s. nominal for every £100 now in issue. The reduced stocks will then be consolidated into new ordinary stock, together totalling £6,883,092. Stockholders will be asked to vote on these proposals on May 24th, but so far they are in the dark regarding the results of 1936. One school criticises the directors for putting the cart before the horse; another suggests that if good results were shown for 1936 the "B" stockholders might demur at the extent of their cut. Actually, the scheme appears reasonable in its

essential outline. The concern has long been waterlogged, and the "B" ordinary capital has always been valued as an option money speculation rather than on a strict evaluation of its rights.

On the question of earnings, the market moves in the dim light of estimate. Our own conclusion, put forward in *The Economist* of January 30th, suggested that about 1.6 per cent. was earned on the "A" ordinary stock last year, assuming the payment of normal preference dividends. If this basis of estimation is again used, it would appear that some 3½ per cent. might be earned on the new ordinary stock, after making allowance for the service of the new income stock. For the current year, guesses are unusually hazardous. Only two months' traffics indices are available, and even they must be related to the actual cash receipts of 1935. The January and February indices, however, were 17 per cent. higher than those of the corresponding months of 1935, and assuming this rate of increase were maintained, some £600,000 of additional net receipts might accrue (assuming an 80 per cent. operating ratio). On this basis, the earnings on the new ordinary stock might reach 11 per cent. Reliance cannot be placed on this figure, in view of its uncertain statistical basis, but it suggests that the possibilities of the new stock as an international trade recovery medium should be inviting to the speculative investor. On the present price of the "A" stock, the new ordinary would be worth 96.

Armament Company Meetings.—The chairmen's speeches at the Vickers, Cammell Laird and Firth-Brown meetings last week have caused a substantial reaction in the armament share market. At one time this week, Vickers 10s. shares were as low as 30s. 3d., and Cammell Laird 5s. shares at 14s., compared with levels at one time last year of 39s. 6d. and 21s. 6d. respectively. Yet the tenor of General Sir Herbert Lawrence's speech at the Vickers meeting, and Mr W. L. Hichens's speech at the Cammell Laird meeting, was not unsatisfactory. The speeches lacked points upon which the speculator could fix, but they gave ample promise of large profits in the future. Both chairmen, and also Lord Aberconway at the Firth-Brown meeting, gave extraordinary evidence of the increase in their companies' business. Cammell Laird has jumped from severe depression to "more orders now than ever before in the history of the company." The number of men employed by the Vickers group has increased from 35,955 at the end of 1934, to 64,068, and the armament orders alone still exceed the company's capacity. Firth-Brown's orders in hand "represent a substantial increase in the value at the same date in 1935," and the company has been passing through "a period of extreme activity." For the next five years, unless there is some striking change in international relations, these companies' positions should be assured, and, in the words of Sir Herbert Lawrence, "total profits should increase."

In order to handle this tremendous increase in business, however, the companies have been compelled to incur very heavy expenditure for technical reconstruction and extension of plant. The English Steel Corporation's scheme, for example, has cost £1,765,000; Cammell Laird spent £122,661 on capital account in 1936, compared with £62,412 in 1935; Firth-Brown's reconstruction cost over £1,000,000, of which £390,000 was spent in 1936. This work of expansion and modernisation has not yet been completed, and Mr Hichens pointed out that Cammell Laird, at any rate, would in 1937 have expended at least as much as in 1936. The companies will thus need to make large depreciation allocations at the expense of profits which would otherwise be available for dividends. Moreover, all the chairmen were impressed with the need for accumulating reserves against the double danger of a decline

in armament and commercial demand. The Vickers' chairman, indeed, was so insistent upon this point as to assert that "increased total profits would not necessarily mean larger divisible profits." Thus, although the actual "re-armament profits" have hardly begun to accrue yet—there is a time-lag of some two years in naval shipbuilding profits, as Mr Hichens explained—the companies are already talking of conserving a large proportion of them. It was this point which caused the fall in armament shares this week. It robs them of speculative interest, but endows them with investment stability.

Hadfields' Report.—Hadfields, the chief maker of shells, is probably appreciably nearer "re-armament profits" than other armament companies, and is certainly very much nearer them than the naval shipbuilders. The report for 1936 shows a striking increase in trading profits from £158,597 to £262,419. The following table shows the rapid advance during the last three years:—

	Years to December 31,		
	1934	1935	1936
Total profit	140,183	158,993*	270,074*
Fees	2,013	2,200	2,310
Pension fund	...	...	14,620
Debt interest	44,174	40,099	33,721
Preference dividend	41,850†	10,463	10,294
Ordinary—			
Earned	52,146	106,231	209,129
Paid	...	54,050	97,493‡
Earned %	5.8‡	14.7	29.5
Paid %	...	7½	13½§
Carried forward	50,516	102,697	214,334

* After unspecified allowances for depreciation. † Four years' dividend. ‡ Allowing only one year's preference dividend. § An extra distribution of 10 per cent. net was paid in respect of capital profits.

The balance sheet position is extremely strong, and the company has further fortified its capital position by selling its holding in Bean Industries at a profit of £366,900, part of which has been used for extensive capital development. This company's report is more interesting to the investor than recent armament reports, for the possibility of further distributions out of capital profits is hinted at. At 37s. 3d. the shares are not without speculative attractions.

Alliance Trust Progress.—This company is a leader among investment trusts. Its recent improvement in earnings stands out as something solid and appreciable among the somewhat inconclusive trust results of recent months. A rise in gross revenue of over £56,000 shows a satisfactory contrast with the modest increase shown by the previous accounts. Progress has been assisted by the receipt of dividend arrears, but the amount so obtained in the two latest periods was roughly the same—namely, £20,000. The course of earnings is shown in the following table, but comparison is affected by a tax reserve allocation of £60,000 made in the latest but not in the two previous years:—

	1935	Years to Jan. 31 1936	1937
Gross Revenue	596,786	603,473	659,780
Expenses	32,229	26,883	30,050
Taxes and Tax Reserve	90,513	94,428	166,174
Interest	175,779	165,271	160,214
Preference dividends	77,394	76,180	74,355
Ordinary Stock:—			
Earned	220,872	240,712	228,986
Paid	180,951	180,952	186,156
Earned %	26.9	29.3	28.3
Paid %	22	22	23
Contingent Fund	60,000	50,000	40,000
Carry forward	34,354	44,114	46,944

This Special Taxation Reserve Account is not new, though before this large provision it stood at £8,785

only. The earnings on the ordinary stock amount to 35.7 per cent. if this £60,000 is excluded. Allocations to the Contingent Fund, though declining, are still of appreciable amount: the accounts, however, do not disclose the uses made of this fund, for the reserve has remained at £2,100,000 since the 1931 balance sheet. The need for writing down investments is, however, clearly diminishing. It is pointed out that a further appreciation in the portfolio has occurred: bonds and stocks were 8 per cent. in excess of book value according to the 1935 report; while the following year this appreciation had apparently risen to about 15 per cent. At the present price of 600, the ordinary stock yields £3 16s. 9d. per cent. Other large companies among those whose reports have lately been published show a satisfactory if unexciting rise in earnings. *Caledonian Trust* with £131,185, and *Scottish Western Investment* with £149,500 income, have both achieved a rise in revenue of 5½ per cent. Both companies have raised their dividend by 1 per cent., the one to 9 per cent. and the other to 14 per cent., and in both cases this is covered by an extra 2 per cent. in earnings. The income of *Telephone and General Trust*, on the other hand, is practically unchanged at £125,680, though this company cannot be taken as typical owing to the special nature of part of its investments.

Midland Electric Progress.—The report of Midland Electric for 1936 well illustrates the considerable scope for increasing profits under certain sliding scale arrangements. In 1933 an order was made by which the company's tenure was extended by forty years to 1973. A standard tariff was devised, and provision made for a standard return of 6½ per cent. on the existing capital, and 6 per cent. on subsequent capital. The standard rate was to be augmented by ¼ per cent. for every 2½ per cent. reduction in prices below the standard tariff. For 1936, charges were 22½ per cent. below the

TRIPLE SHELL LUBRICATING OIL

WHITE DRUMMOND & COMPANY LTD.

(ESTABLISHED 1900)

CAPITAL ISSUES

9 CLOAK LANE, LONDON, E.C.4

TELEPHONE • CITY 5201

standard, so that the permissible return becomes 8½ per cent. on the 1933 capital, and 8¼ per cent. on subsequent capital distributed from free reserves. The results of the company's active policy are shown in detail in the following table:—

	1934	1935	1936
Capital expenditure	1,123,182	1,455,305	1,691,819
No. of units sold (approx.) (millions)	101	118	141
Increase over previous year ...	30%	17%	19½%
Revenue from sales of energy	385,396	434,668	500,328
Net revenue	118,618	138,053	165,747
Earned for ordinary	68,822	79,600	92,069
Paid on ordinary	43,400	57,866	64,050
Earned %	12.7	11.0	12.9
Paid %	8	8	9
To reserve account	385	20,000	20,000
Carried forward	34,509	36,243	44,262

It is not surprising, therefore, that the company having distributed a capital bonus of 33½ per cent. on its ordinary capital last year, is actually able to pay a dividend of 9 per cent. on the ordinary, against 8 per cent. for 1935 on the smaller capital. It is obvious from the report that the company's active sales policy is being accompanied by a forward-looking programme of capital expenditure.

* * *

Westland Merger Developments.—British Marine Aircraft have taken prompt steps to defend the merger agreement, which, as we reported last week (page 28), is threatened with breakdown. According to an announcement by the liquidator of British Marine, a writ has been issued for specific performance, and counsel has advised that the agreement could be enforced. The next move is with the shareholders, who will have, at the meeting on April 16th, three alternatives before them: to proceed with the action for enforcement, to abandon the merger, or to allow the liquidation to continue and to wind up the company in the usual way. The proprietors may find their choice unenviable, for they will have no further official information to assist their decision at the meeting. The liquidator's circular points out that if the action against Westland is to proceed it is undesirable that any detailed statement should be given of the position between the parties.

* * *

Recent Rubber Results.—After a long spell of exceptional activity the rubber market has relapsed into a disorderly retreat this week. Most observers were unprepared for the very considerable increase in Malayan shipments during March, and considerable doubt has been cast on recent prophecies of an imminent rubber famine. Nor were operators prepared for President Roosevelt's determined attempts to prevent boom conditions in commodity and stock markets. Rubber, however, is still above the shilling mark and the background is still propitious for considering rubber company reports for 1936, now appearing in spate. A

selection of recent results is summarised in the following table:—

Company and Share Denomination	1935		1936		Current Share Price	Yield on 1936 Dividend
	Earned per cent.	Paid per cent.	Earned per cent.	Paid per cent.		
Bukit Ijok (2/-)	6.7	7.5	12.2	12.5*	5/10½	4.3
Cluny (1/-)	0.8	2.0	5.2	4.0	20/-xd	4.0
Edinburgh (2/-)	1.0	Nil	2.2	2.1	1/-	4.2
Gadek (1/-)	2.2	2.5	6.3	6.0	38/9	3.1
Gula Kalumpang (1/-)	4.2	5.0	7.7	6.25	60/-	2.1
Johore River (2/-)	4.0	4.0	5.3	5.0	3/-	3.3
Kombok (2/-)	2.6	2.5	4.2	4.0	2/6	3.2
Lanadron (1/-)	1.3	3.0	4.7	5.0	21/3xd	4.7

* Plus 50 per cent. capital bonus.

With the exception of the *Gula Kalumpang*, none of the companies included can be regarded as a "market leader." All, however, tell the same story of increased profits as compared with 1935, with varying emphasis only on the magnitude of the advance. *Bukit Ijok* is the largest dividend payer in the group, with an extremely low capitalisation and hence a big stake in rising rubber prices. Receipts per pound increased from 5.8d. to 8.2d. during the year, though profits would have been larger but for the rise in costs by almost a penny a pound. The company's assets have now been revalued and a capital bonus of 50 per cent. paid to shareholders. Standard production this year has been substantially increased and prospects are excellent. Calculations based on ten-penny rubber do not wholly apply to this company (nor to many others), for approximately one-fifth of current output has been sold forward at only 8d. a pound. *Cluny* shows the most striking relative improvement in earnings, thus illustrating the maxim that, in a period of rising prices, high-cost companies are among the most attractive—provided of course that costs do not move upwards correspondingly. This company, too, has received a large addition to its standard assessment for 1937.

* * *

Edinburgh has again entered the dividend list, and its more favourable showing is partly due to its success in limiting the rise in costs. Its capitalisation appears high, however, and its gains from rising prices are limited. The supply of young rubber is satisfactory, however, and the current year's results should show a significant improvement. *Gadek Rubber* nearly trebled its earnings in 1936, thanks largely to its moderate capitalisation. But approximately one-half of this year's output has been sold at about 9½d. a lb., a price appreciably lower than the anticipated average market price. The directors of *Gula Kalumpang* have been conservative in their dividend distribution and have placed £7,500 to replanting reserve. The company has a very large acreage of immature and young rubber, while replanting is also going ahead rapidly. Future prospects are therefore excellent, but are strikingly discounted in the current price. *Johore River* experienced an increase in costs of almost 1½d. per lb., and though average receipts rose from 5.4d. to 7.7d., the increase in profits was limited. On the other hand, costs for *Lanadron* were almost unchanged and profits advanced more than threefold. Finally, *Kombok* improved the estate by manuring and replanting last year, and costs were thus unduly high. Prospects, however, have been much improved and 1937 results should reflect last year's work.

* * *

Company Meetings of the Week.—On later pages of this issue will be found the reports of the following company meetings:—Bank of Scotland, Bank of Czechoslovak Legions, Wesleyan and General Assurance, British Insulated Cables, United Glass Bottle Manufacturers, Associated Electrical Industries, Automatic Telephone and Electric, Anglo-Portuguese Telephone, John Barker, Vickers, Trussed Concrete Steel, and Jasin (Malacca) Rubber Estates. At the 242nd annual meeting of the Bank of Scotland, Lord Elphinstone discussed prosperity in various Scottish industries and made an appeal for free trade. Dr Rudolf Rase, at the Prague meeting of the Bank of Czechoslovak Legions looked forward to better conditions in view of the consolidation of the poli-

Mining Notes

tical situation. Orders last year from fifty countries and increased co-operation in the industry were described at the Automatic Telephone and Electric Company meeting by Sir Alexander Roger. He also gave a detailed review of the progressive rationalisation of the cable-making industry at the British Insulated Cables meeting, and reviewed the Portuguese telephone industry when addressing the Anglo-Portuguese Telephone Company shareholders. Mr J. B. Field described the very varied business of the Wesleyan and General Assurance Society at the Birmingham meeting. At the Associated Electrical Industries meeting, Sir Felix Pole described the company's large foreign contracts, and expressed fears that the Government's policy for the distressed areas would upset the balance of industry. At the John Barker and Company meeting, Sir Sydney Skinner described the effects of increased turnover and rising costs. At the Jasin (Malacca) Rubber Estates meeting, Mr G. H. Champion advocated the continuance of the rubber restriction schemes. Addressing United Glass Bottle Manufacturers' shareholders' meeting, Sir Max Bonn, after describing the race between increasing costs and increasing receipts, discussed the taking over of the Distillers Company's Bottle Works. Those works being ripe for reorganisation and the size of a new unit being such that it would necessarily cause surplus capacity in the industry, it was found more convenient to form a merger. Sir Herbert Lawrence's speech at the Vickers meeting is discussed in a note on page 94. New markets in India were discussed by Mr G. R. Holland at the Trussed Concrete Steel meeting.

* * *

Other Company Results.—On page 120 we give an analysis of the accounts again of about 60 further companies. A number of interesting rubber reports are included. The various reports are discussed on page 104 under the heading "Shorter Company Comments."

Union Corporation.—One of the most interesting features of the annual report of Union Corporation (whose profits were given in *The Economist* of March 27th, page 714) is the news of increased exploration work on the Corporation's new ventures. Perhaps the ageing of Modder Deep after its long life has prompted the widening of interests. Out of last year's gross profit of £773,600 (comparing with £663,230 in 1935), £32,000 has been absorbed by exploration expenses; while of the net profit of £685,040 the sum of £50,000 has been placed to the credit of exploration reserve. In addition, reserve account receives £40,000, bringing the total up to £1,320,000. The outstanding movements in the balance sheet are a marked expansion in temporary advances against securities to £568,950, against £385,950; and in British Government securities at cost, amounting to £1,448,940, compared with £730,730. These changes are reflected in a decline from £4,230,200 to £3,088,830 in cash. The progress of the company's East Geduld, Geduld and Grootvlei subsidiaries is discussed in separate Notes. As to other properties, it is early to form a definite judgment regarding Marievale Consolidated; but on Van Dyk the installation of a reduction plant is to be put in hand following upon the presentation of an ore reserve estimate. Among the Corporation's base metal interests, San Francisco, of course, recently re-entered the dividend list after an interval of six years; and, despite substantial increases in costs, is benefiting from the high metal prices now ruling. The Corporation retains its interest in Selection Trust, which provides a participation in copper, diamond and mixed metal undertakings. The 12s. 6d. shares at £9 12s. 6d. yield slightly under 4½ per cent.

WEST RAND CONSOLIDATED MINES, LIMITED

EXTRACT OF ANNUAL REPORT TO 31st DECEMBER, 1936.

Tons crushed	1,990,000 tons.
Yield (3.94 dwts. per ton)	392,013 fine ozs.
Working revenue (27.68s. per ton)	£2,752,469
Working costs (16.76s. per ton)	1,667,996
Working profit (10.90s. per ton)	£1,084,473
Sundry Revenue	59,836
Total Profit	£1,144,309
Credit Balance brought forward from 1935	55,059
Total Available Profit	£1,199,368
Appropriated as follows:—	
Miners' Pfrthesis—Provision on account of outstanding Liability as at 31st July, 1936	£8,400
Income Tax (Government of the Union) (less adjustment for 1935)	419,530
Sundry Taxes, etc.	647
Revenue appropriated for Capital Expenditure	12,476
Ordinary Dividends Nos. 10 and 11, totalling 25 per cent.	£531,250
Deferred Dividends Nos. 1 and 2, totalling £6.848878 per share	171,097
	702,347
Unappropriated Profit carried forward	55,968
	£1,199,368

Ore Reserve.—With gold at a selling price of 140s. per fine ounce, and with working costs at present-day level, the fully developed ore reserve, as re-calculated at the 31st December, 1936, amounted to 10,408,000 tons of an average value of 4.4 dwts. over 44 inches. (1935: 9,984,000 tons at 4.4 dwts. over 44 ins.)

General.—The South Reduction Plant, which came into operation during 1935, was responsible for the increase in tonnage crushed from 1,770,000 tons to 1,990,000 tons. Although the average selling price of gold showed a reduction from £7 1s. 11d. to £7 1s. 2d. per fine ounce, the extended scale of operations increased the profit for the year by £44,538 to the record total figure of £1,144,309, of which amount £432,904, equivalent to 37.63 per cent., was paid to the Government of the Union of South Africa as taxation. The year has been a record one in the history of the Mine from nearly every point of view.

Dividends.—During the year the total amount paid in dividends on the Ordinary Shares since the inception of the Company reached the figure of £1,500,000, and thereafter, in terms of Article 6 of the Company's Articles of Association, the holders of the Deferred Shares became entitled to one-fourth of any distribution of profits.

Copies of the Full Report and Accounts can be obtained from the London Secretary, Winchester House, Old Broad Street, London, E.C.2.

Grootvlei Proprietary.—Although development has so far been carried out only from the workings which extend into the property from the East Geduld property, the treatment plant has now been ordered. Since the close of the accounts the directors have decided to instal works with an initial capacity of 60,000 tons per month, with provision for a substantial increase if required. The financial resources on hand or available at the end of the year amounted to £548,840. As regards underground work, the three drives extended from the East Geduld give a grand total of 10,720 feet. Of this 5,100 feet proved payable, averaging 10.6 dwts. over a reef channel width of 36 inches, equivalent to 381.6 inch dwts. Meanwhile, No. 4 shaft has been sunk to its final depth of 4,382 feet, and driving north and south is now in progress and the sinking of another shaft is proceeding. It is rather early yet to form any idea as to the results likely to be secured.

* * *

East Geduld.—This company is still in its first youth. Production did not commence until about the middle of 1931, and each year since has shown progressive expansion in the results. As a result partly of the treatment of lower grade ore as the total tonnage milled increased, and partly of the lower price for gold, last year's earnings did not rise in proportion to the increase in the scale of operations. Nevertheless, earnings covered a further increase in the dividends. The main figures are set out below:—

	1934	1935	1936
Ore milled, tons	972,500	1,152,300	1,368,500
Average yield, dwts.	6.82	6.26	5.90
Working profit	£1,394,270	£1,500,720	£1,609,390
Dividends, amount	£691,870	£776,880	£855,000
" per cent.	41½	43½	47½
Carried forward	£63,880	£91,330	£91,000
Ore reserves, tons	7,000,000	7,950,000	9,000,000
Value, dwts.	6.6	6.5	6.3
Average price of gold	138/-	141/6	140/-

The outstanding feature of the figures is the growth of the ore reserves. The increase in the amount of development work performed last year opened up substantial quantities of ore, the total of which is sufficient for five years' work. The Union Government's share of the profits, less the allowance for increase in taxation, to which the company is entitled, absorbed £168,540, as compared with £58,800 in 1935. The shares yield slightly under 5 per cent.

* * *

Geduld Proprietary.—This established concern in the Union Corporation group treated a record tonnage of ore last year, but the results were more than offset by a decline in grade, and of course by the lower price of gold. Miscellaneous revenue—principally dividends on the company's holding in East Geduld—brought in slightly more than before; but the increase in the amount available for distribution was due chiefly to the reduced amount required for taxation—£631,470 as compared with £706,620 in 1935.

	1934	1935	1936
Ore milled, tons	1,116,000	1,160,300	1,276,000
Average yield, dwt.	5.81	5.6	5.2
Working profit	£1,413,080	£1,466,050	£1,413,270
Dividends, amount	£986,080	£1,022,600	£1,095,640
" per cent.	13/6	14/-	15/-
Carried forward	£275,590	£296,290	£312,230
Ore reserves*, tons	9,000,000	9,000,000	9,100,000
Value, dwt.	5.4	5.2	5.0
Average price of gold	138/-	141/6	140/-

* On basis of gold at 130/-.

It should be noted that the ore reserves are conservatively estimated on the basis of gold at 130s. per ounce. Even so, last year's computation, after making allowance for sorting, represents about six years' supply for the mill. A study of the map suggests that primary development is now nearing its end. On the basis of last year's dividends, Geduld Proprietary shares yield 7½ per cent.

Simmer and Jack.—Although this company last year treated the rather higher quantity of 1,126,500 tons and the cost average was little changed, the operating profit fell substantially to £441,200 from £548,000. The explanation lies partly in the treatment of a lower grade of ore, but mainly in the interruption to operations and the cost of repairs arising from the serious pressure burst in the Rhodes vertical shaft in the middle of the year. Provided there are no further accidents, results for the current year should show improvement, but fresh trouble has recently been experienced. The depth of the mine, of course, constitutes a handicap. Like its stable companion, Robinson Deep, the company paid less taxation—£94,500 against £164,500—but no less than £215,700 was required for capital. The accident involved a cut in the dividend for the first half-year, but the total of 5½d. paid for the year was only one halfpenny below the 1935 level. Despite the additional footage developed, the ore reserves fell from 2,523,000 to 2,358,000 tons, with a payable percentage of 45.9 as against 58.4. The value, however, was maintained at 4.9 dwts.

* * *

Rand Mines Report.—For the first time for some years this Kaffir finance house received a larger sum from sale of investments than it expended for new purchases. Increased receipts from the company's oil interests, as well as from some of its Rand mining holdings, produced an expansion of approximately £62,000 in profits. Of this sum, about one-half was distributed in an addition of 5 per cent. in the dividend:—

	1934	1935	1936
Total income	899,160	925,530	990,510
Administration expenses	27,030	25,030	28,350
Net profit	862,130	900,500	962,160
Dividends	785,840	811,870	844,230
Rate per cent.	150	155	160
Earned per cent.	148.2	169.4	181.2

To reserve account	193,330	106,010	Dr. 107,030
Carried forward*	400,500	383,700	609,080

* Including forfeited dividends refunded.

The company's investment holdings are conservatively valued in the balance sheet at £3,914,140, against £3,646,560 at the end of 1935. Substantial additions are shown in the number of City Deep, Daggafontein and Durban Deep shares. A new interest in 40,000 shares in the Welgedacht Exploration is also reported. The issue during 1936 of 30,840 ex-enemy shares at £8 10s. each is reflected in the rise of cash and cash assets, which now total £1,595,530, against £1,337,250. On the basis of last year's dividends, the 5s. shares at £8 5s. show a yield of approximately 4½ per cent.

* * *

West Rand Consolidated.—Last year's operations benefited to the full from the new reduction plant at the south shaft; and although (as intended) a lower grade of ore was milled, the profit rose from £1,009,770 to the record figure of £1,144,300. The prescribed cash total has been distributed on the ordinary capital, and the deferred shares ranked for their one-quarter of the divisible profits for the first time. The amount (£171,100) represented slightly over £684 per £1 share. The expansion in mining earnings clearly did not meet this rate of dividend on the deferred, in addition to the usual rate of 25 per cent. on the ordinary. A substantial reduction in taxation and capital expenditure provides the explanation. Under the former heading £420,070 was required against £494,300 and the latter only £12,480 against £54,190. The ore reserves show an expansion of 442,000 tons to 10,406,000 tons, with the value maintained at 4.4 dwts. There is every indication that results for the current year will equal those of 1936. On the basis of the 25 per cent. dividend the ordinary shares yield as much as 6½ per cent.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: APRIL 20 ACCOUNT: APRIL 22

THE New Account commenced with a show of cheerfulness, which, alas, was quickly nipped in the bud. Gilt-edged showed new promise, and leading industrials were well supported. Even tea shares reached the highest level of activity for some months. But this opening promise, already clouded by the struggling condition of some of the commodities on the President's statement at the end of the previous week, was not maintained. And in mid-week the whole market was in retreat on the gold rumours from the United States. Kaffirs were unsaleable for a time, and the leading international counters dropped sharply.

On the whole, however, the gilt-edged market has remained steady. Some early gains on Tuesday were not held, and the market relapsed into idle conditions with a subnormal turnover. In the bond market, Brazilian issues improved at first, but a little selling depressed quotations later. Far Eastern issues lacked drive, and the only features in the European group were an early rise in Germans, which was not held, and some moderate support for Roumanian issues.

Nothing of much note happened in the home rails market. Traffics have been conspicuously good, but though prior charges have remained firm throughout, the crop of accidents and the prospect of labour troubles caused some declines among the ordinary stocks. Among foreign rails, Argentine prior charges have made a good showing, but American and Canadian issues have been persistently weak.

Conditions in the industrial market were very varied. The new account opened fairly cheerfully, but uncertainty about American policy made transatlantic and international shares dull earlier, and distinctly weak later. Armament shares have been quiet as a whole, and some, especially Vickers, fell appreciably. Iron and steel have been generally firm with a particularly big rise in Indian Iron, and an even larger slump later. Among motors, Standard have done remarkably well; so have electric supply shares, and shipping on the news of higher freights. Among the miscellaneous

shares, Cable and Wireless ordinary reacted on the publication of the scheme, recovered and fell back once again. The scheme is discussed in a Note on page 94. Dunlops gained on the publication of the report. Profit taking was noticeable in British Oxygen, and Turner and Newall, but United Molasses did excellently.

Not much interest has been evident in the oil market, and after a strong opening to the new account with good support from Paris, conditions deteriorated later. Internationals lost their moderate gains, and the sharp rise in Mexican Eagles was partly wiped out.

Extreme uncertainty accounts for the very jumpy behaviour of rubber shares. Earlier in the week continued investment buying by the general public partly offset the depressing effect of the setback in the commodity price and the unexpectedly large shipments from the N.E.I., but the American news eventually carried all before it in a severe downward movement. Indeed, boom conditions seem to have been transferred to the tea market, where sharp price rises were caused by an unwelcome amount of speculative buying coming upon otherwise very healthy conditions. But later, uncertainty spread into this market too.

The consequences of Wednesday's rumour of a reduction in the United States Treasury's buying price for gold completely overshadowed all other developments in the mining market. Rhodesians had throughout been quiet and a little depressed, but base metals and West African issues had moved steadily upwards, and good reports from South Africa and a quantity of Cape buying had made Kaffirs firm, despite the labour troubles. These gains have all been obliterated in the last two days. These events are discussed in more detail in Notes on page 92.

Breweries and distilleries (21)	142.2	144.8	147.2	4.49	4.41	4.31

NEW YORK STOCK EXCHANGE

MARKETS opened this week still somewhat numbed by the President's attack on commodity and security prices, but the tone was improving, with steel and some motor shares higher. On Tuesday, prices closed above the worst but the trend was downwards. Copper issues were lower on the falling commodity prices. Oil shares gave way again, after an appearance of strength on talk of higher oil prices. Paper issues continued to improve on the strong newspaper position. Later in the week the whole market was overcast by the rumours of impending reduction in the price of gold, and prices fell substantially on a large volume of business. Settlement of the Chrysler strike passed unnoticed. Government issues improved early in the week on the Federal Reserve Board statement that it intends to support government bonds, but there was renewed weakness later on the gold rumour, and the Treasury statement that new borrowing would be required before the end of June. Business reports are as good as ever. *Iron Age* puts steel mill activity unchanged on last week at 91 per cent. of capacity, and does not think the industry will be troubled by the President's attack on steel prices. Electricity output for the week ending April 3rd was 15 per cent. higher than for the corresponding week of last year.

CAPITAL ISSUES

SOME speculators may be glad of the present respite in the new issue market to consider how best to restore their fortunes after the recent absence of opening premiums. Others who have played with small issues during the last six months or so may be discovering how quickly a market can dry up. The pause, in view of this week's market conditions, is clearly salutary. Only one public issue is reported, and that is not intended to appeal to a wide public, since it is not underwritten nor do the directors disclose any intention to apply for permission to deal on a Stock Exchange. This issue consists of 34,000 6 per cent. £1 preference shares at 21s. and 17,000 10s ordinary shares at 15s. in *Southern Counties Hotels (Southampton)*. The offer is presumably of purely local and private interest. Among this week's introductions, the particulars of *Nchanga Consolidated Copper Mines* (whose shares have been offered to the shareholders of Rhokana, Ltd.) have appeared, unfortunately, at a somewhat unpropitious moment, although the fortunes of this concern will probably extend over more than one boom and slump. Other statements have been published by *Prior Burners, Halesowen Steel, and Metropolitan Housing Corporation*.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields on fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where the stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is at a premium. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

SHORTER COMPANY COMMENTS

COMPANY RESULTS OF THE WEEK.—Stationary profits are shown by WHITBREAD. EXPRESS DAIRY COMPANY report a satisfactory expansion in earnings from £94,965 to £104,835, although the 8 per cent. dividend is unchanged. An increasing number of visitors from abroad, coupled with the modernisation policy, has increased the profits of SAVOY HOTEL by £70,700 to £83,352. Among shipping companies, KING LINE stand out with the remarkable increase in the latest profits of £73,114 by £44,500. This has been used, however, to make good arrears of depreciation, the provision for which is £73,000 against £31,708. MARCONI INTERNATIONAL MARINE, without changing their 7 $\frac{1}{2}$ per cent. dividend, have earned £116,842 against £90,118: the report points out that, although the effect of the international situation on their foreign interests cannot be estimated, the general reserve would cover any loss. With one exception, all the 13 rubber reports show substantial gains, with, perhaps, proportionately greater progress among the small companies. The more important results include CHEVIOT and LABU (F.M.S.), who have made a loss of £12,896 against a profit of £44,881, are ascribed to lower selling prices and to a strike. NORTHERN GENERAL TRANSPORT have suffered a small setback. Earnings of £148,585 compare with £155,794, but the 10 per cent. dividend is maintained. The first annual report of CARPET TRADERS shows profits of £89,632 and a dividend of 7 $\frac{1}{2}$ per cent., while another new company, HEATRAE, LTD., are paying a 10 per cent. dividend (actual), having earned £7,895. Excellent progress is shown by the BRITISH TIMKEN earnings of £111,824 against £66,427. DAILY MIRROR NEWSPAPER profits of £344,466 show a 9 per cent. increase, while the 15 per cent. dividend is again paid. STEEL BROTHERS' profits of £285,456 are £57,000 higher, while the tax-free deferred dividend is raised from 8 per cent. to no less than 25 per cent. VINE PRODUCTS record a satisfactory improvement in profits from £139,757 to £168,134.

APPOINTMENTS AND PERSONAL

The National Bank of New Zealand announces that Sir James Grose is retiring as general manager in New Zealand, and will become an advisory director. Mr. P. R. M. Hanna will succeed Sir James Grose and Mr. G. G. Littlejohn will become assistant general manager.

Viscount Goschen has been appointed to the board of the Bank of British West Africa.

Lt.-Col. Sir John Chancellor has been elected a director of Associated Electrical Industries.

At a meeting of the Bank of England held April 6th the Rt. Hon. Montagu Collet Norman was re-elected governor and Mr. Basil Gage Cattermole, deputy-governor.

Viscount Long of Wraxall has joined the Board of the Ocean Trust Company, Ltd.

Mr. A. E. Phipps has been appointed president and Mr. H. T. Jaffray general manager of the Imperial Bank of Canada.

Messrs Mullens and Company, announce that Mr. Edward Lambert Gosling has retired, and that they are admitting Mr. Cecil Henry Gosling into partnership.

Mr. Neil W. Gardiner has been appointed a director of Huntley and Palmers.

Lord Wardington and Mr. Colin F. Campbell have been re-elected chairman and deputy-chairman respectively, of the committee of London Clearing Bankers.

Mr. Noel Haywood Docker and Sir Eugene Ramsden, O.B.E., J.P., M.P., have been elected to the board of the Birmingham Small Arms Company.

Mr. Francis Goldsmith and Sir Alfred Ernest Tritton have been re-elected chairman and vice-chairman respectively of the London Discount Houses Committee.

Colonel S. E. Monkhouse, M.I.E.E., has been appointed general manager of the North-Eastern Electric Supply Company to succeed the late Mr. H. A. Couves. Mr. E. H. E. Woodward has been appointed assistant general manager.

Mr. H. Bamford has resigned as secretary of B. and F. Carter and Company and Mr. Stanley H. Wilde, A.I.S.A., has been appointed.

Mr. Morris Stephany has been co-opted to the board of Stephany (Furniture Trades) as a director.

Mr. Leonard Parker has been appointed agency manager for Car and General Insurance Corporation, Ltd., and The Motor Union Insurance Company, Ltd.

MINES

CAMP BIRD, LTD.—Profit, £203,702 against £81,296, including surplus of £166,253 against £65,621 on sales of investments. Ordinary dividend 6 per cent. against nil. Net amount of £156,366 against nil written off investments and advances; expenditure of £948 against £56,172 on sundry ventures written off; balance of capital reorganisation expenses, etc., £16,147 written off (last year £5,591); forward, £14,032 against £50,300.

BANKS

CHASE NATIONAL BANK.—Loans and discounts of \$811,209,000, an increase of \$202,000,000 since March 4, 1936. Deposits, \$2,271,211,000, compared with \$2,059,785,000. Total resources, \$2,553,060,000, against \$2,341,493,000. After semi-annual dividend \$5,180,000, undivided profits \$25,032,000.

GUARANTY TRUST COMPANY OF NEW YORK.—Total resources on March 31st, \$1,944,469,028.48 compared with \$1,812,633,568.65 a year ago; deposits total \$1,802,377,016.77 compared with \$1,488,284,606.87; capital and surplus unchanged at \$90,000,000.00 and \$170,000,000.00 respectively; undivided profits, \$9,893,212.80 as compared with \$7,317,042.28. The statement shows U.S. Government obligations of \$582,269,839.30. Cash on hand, in Federal Reserve Bank and due from banks and bankers \$537,924,641.21; and loans and bills purchased \$670,717,877.79.

MISCELLANEOUS

KING LINE, LTD.—Profit for 1936, £83,147 against £49,098. After cost of Lloyd's surveys, £73,000 against £31,708 applied to arrears of fleet depreciation, and £22,860 against £22,545 carried forward.

TURNER AND NEWALL, LTD.—It has been decided to establish an asbestos cement factory in Scotland, probably in the Clyde area.

(Continued on page 121)

COMPANY MEETINGS

BANK OF SCOTLAND

SATISFACTORY RESULTS—INCREASED PROFIT

STRONG LIQUID POSITION

NECESSITY FOR FOSTERING FOREIGN TRADE

LORD ELPHINSTONE'S ADDRESS

The annual general meeting of the proprietors of the Bank of Scotland was held within the Head Office, Edinburgh, on the sixth instant, the Right Honourable Lord Elphinstone, K.T., presiding.

In submitting the directors' report the Chairman said:—My lords, ladies and gentlemen, I assume that, as usual, we may hold as read the report by the court of directors of the affairs of the bank as at February 27th last, a copy of which you have no doubt received.

TRADE AND INDUSTRY

In addressing you a year ago I was able to refer to the improvement in trade generally which had been experienced up till that time, and it is gratifying to record that progress has been maintained and that there has been a steady revival affecting most branches of industry. The improvement is to be seen in the substantial decrease of unemployment, the rise in industrial production, increased profits, and higher wages, with the consequent expansion of the purchasing power of the community. One feature of present conditions, however, which prevents undue optimism is the fact that the improvement is largely confined to the domestic field. We must also keep in view that the rate of progress is bound to be influenced by the heavy expenditure on armaments which has become an unfortunate necessity. We must not overlook the dangers inherent in rising prices of raw materials, higher costs of production and an artificial prosperity in the home market, while our external trade shows only very moderate signs of recovery. The statistics of our foreign trade are by no means satisfactory, and we can only hope that the barriers still imposed throughout the world by a policy of extreme nationalism in the form of quotas, tariffs and currency restrictions will in time be modified and a freer exchange of commodities be possible.

In Scotland the heavy industries are experiencing much more favourable conditions. The iron and steel trade is exceptionally busy and existing plant is working to its full capacity. Engineering generally is also experiencing much greater activity. The output in shipbuilding shows a substantial increase, although this is partly due to Admiralty orders. The Scottish coal trade on the whole has maintained the improvement shown during the previous year, but this has been largely due to home demand, the exports showing a further decline. Agriculture, which we as a bank continue to do our utmost to assist, has experienced more remunerative prices for grain, sheep and wool, but the livestock industry still yields an inadequate return. Little improvement can be recorded in fishing, and the general acceptance of a settled policy would appear still to be essential if more prosperous conditions are to be experienced.

THE BANK'S BALANCE SHEET

Turning now to the bank's balance sheet, I think you will agree that the figures we present to you as the result of the operations of the past year—the two hundred and forty-first in our history—are satisfactory. I am glad to report that our connections generally, both throughout Scotland and at our London offices, continue to extend. Our foreign department again shows progress beyond our expectations.

The deposits amount to £37,635,697, compared with £39,518,484 a year ago. I indicated then, however, that the latter figure included a substantial sum representing lodgments of a temporary nature which came to us in ordinary course from our own customers, and if we exclude this exceptional business we find that the total this year shows a fairly substantial increase. The average for the first ten months of our financial year was again considerably in excess of the figures of the past few years. We experienced, as usual, heavy withdrawals during the last two months.

The note circulation at £3,239,247 is higher by over £110,000. The average circulation for the year is again substantially in excess

of the corresponding figure for the previous twelve months, which is to be expected under the trading conditions now prevailing.

The changes in drafts issued and acceptances do not call for comment.

LIQUID ASSETS

On the assets side, cash, bank balances, documents *in transitu* and money at call and short notice amount to £8,985,885, i.e. 20 per cent. of our liabilities to the public. Bills discounted (including a moderate holding of Treasury bills) and our investments amount to £26,528,655, or 60 per cent., giving a total of £35,514,540, or 80 per cent. of our liabilities to the public in liquid assets.

ADVANCES

When we make allowance for the temporary and exceptional business included in the total of the advances for last year, to which I made reference at the time, the figures this year, viz. £9,799,939, which include no such exceptional transactions, show a moderate increase.

The volume of our smaller advances continues to be fully maintained, and indeed indicates an increased demand for accommodation. It is in the sums normally taken from us by our larger borrowers that there is little evidence of expansion. This appears to be due indirectly to the cheap money policy for which our financial authorities are responsible. It has made available for financing business requirements credit other than that obtainable through ordinary banking channels, and higher prices have induced the realisation of invested funds and the liquidation of overdrafts. New issues of capital, amalgamation of businesses, and higher profits earned have also contributed to reducing the calls for banking facilities.

INVESTMENTS

Our investments at £25,677,231 show an increase of £1,417,181. The market value is substantially in excess of the value in our books. A holding of stock guaranteed by the British Government, which has hitherto appeared in the balance sheet under sundry investments, has now been included in the principal item of investments under the heading "British Government Securities and Securities guaranteed by the British Government."

BANK PREMISES AND HERITABLE PROPERTY

With the object of providing for increased accommodation at our London office which will probably be necessitated before long by the growth of the business there, we have acquired the freehold of the adjoining property at No. 28 Bishopsgate, the leasehold of which we have held for many years. During the year new branches have been opened at Lanark and Quarry Street, Hamilton, and a sub-branch at Westerton, Bearsden. In addition various properties have been acquired throughout the country as business premises and as houses for agents, and several offices have been reconducted. After writing down the initial expenditure involved in these acquisitions and reconstructions, the whole of the properties of the bank, including heritable property yielding rent, stand in the books at £435,000, which it will be recognised is a very moderate figure.

RESULTS FOR THE YEAR

I need not assure you that, in accordance with our invariable practice, before our profits are arrived at every known bad and doubtful debt has been fully provided for.

The net profits are	£317,712
Add the balance from last year	254,158
Together	£571,870
Deduct:	
Applied to reserve fund	£50,000
Transferred to trustees for officers' pension fund	30,000
Transferred to heritable property suspense account	30,000
Dividend at 18 per cent. per annum, less income tax	205,875
	315,875
Leaving to be carried forward	£255,995
The reserve fund will then be	£2,350,000
Add the balance carried forward	255,995
	£2,605,995

BANK STAFF

It is a pleasant duty once again to express on behalf of the court of directors our thanks for and appreciation of the excellent services rendered by the executive, managers, agents and staff throughout the year. In this connection I would once more refer

to the very successful work performed by the staff joint council, which includes five elected representatives of the staff.

Since we last met Mr William Alexander Tait, the secretary of the bank, has retired after long and valued service. The board have already expressed their appreciation of his services, and I am sure the proprietors will join with them in their good wishes. To succeed Mr Tait the directors have appointed as secretary Mr James Waddell Macfarlane, formerly manager at Glasgow.

DIVIDEND

I have pleasure in moving that the report and balance sheet as submitted be adopted, and that a dividend for the past half-year at the rate of 18 per cent. per annum, less income tax, be now declared, payable on 15th current, making, with the dividend paid in October last, 18 per cent. for the year, less income tax, being the same rate as paid for the previous year.

The motion was agreed to.

The Lord Elphinstone, K.T., and The Lord Henry Scott were unanimously re-elected governor and deputy-governor respectively for the current year. Mr James Gourlay, B.Sc., and Mr William Brodie, LL.D., were re-elected ordinary directors.

Mr H. L. Usher, C.A., and Mr R. Arthur Morrison, C.A., were reappointed to conduct the audit of the books for the current year, and a vote of thanks to the chairman terminated the meeting.

WESLEYAN AND GENERAL ASSURANCE SOCIETY

PROGRESS MAINTAINED

The ninety-sixth annual general meeting of the members of the Wesleyan and General Assurance Society was held, on April 6, 1937, at the Central Hall, Corporation Street, Birmingham, Mr John B. Field, the Society's Chairman, in the chair.

The Chairman, in the course of his speech, said:

In all the active departments of the Society its business is steadily increasing. The sums assured in the ordinary department have increased by 6 per cent., and in the industrial by 3 per cent. The other departments reveal satisfactory progress—namely an increase of 29 per cent. in the business of the annuity department and of 8 per cent. in that of the capital redemption. The premium income of the fire and general department has increased by 5 per cent.

The claims paid during the year amounted to £1,205,683, making a total of over £25 millions paid since the establishment of the Society.

The assets have a total value of £14,733,844, an increase of £865,030 on the year.

During the year, the Society earned interest on its funds at the rate of £4 11s. 5d. per cent.

BONUSES

The rate of reversionary bonus allotted to ordinary department with-profit policies has been maintained at 38s. per cent. for endowment assurances, and the same rate has been allotted to whole life policies.

The directors instituted a profit-sharing scheme in 1927, under which industrial department policy-owners are allotted a considerable share of the divisible profits of that department. Between the years 1927 and 1934 £484,378 was applied in providing for the cessation of premiums at age 65 under all whole life policies on which twenty years' payments had been made. Following the valuation at December 31, 1935, the directors decided to allocate £54,492 to provide additions to the sums payable on claims arising either by death or maturity on or before April 5, 1937. Now, the directors have allocated a further sum amounting to £56,055 enabling additions to be made to the sums payable on claims for a further period of two years; that is, up to and including April 3, 1939.

ACTIVITIES OF THE SOCIETY

The Society caters for all classes of insurance business. In the ordinary department the usual whole life policies and endowment assurances are issued on favourable terms. There is in addition a most attractive form of contract for the protection of the young married man. It is called the "Triple Benefit" policy. For a monthly premium of £2 3s. a young man aged 30 next birthday

can obtain the sum of £1,000 at age 65 or at previous death, and, in addition, should he die within twenty years from the date of the contract, his wife will receive £150 a year for the balance of the twenty-year period. It follows that the maximum benefit under the policy is £4,000 and the minimum benefit is £1,000. Furthermore, the policy-owner cannot pay more than £903 in premiums over the period (ignoring the benefit of income tax rebate), and he may pay a great deal less.

The Society continues to transact an increasing business in enabling persons to purchase houses for their own occupation. These transactions are carried through expeditiously, and payments may be made by the borrower in monthly instalments by banker's order or through a Post Office Savings Bank account for a period of twenty-five years or less, after which the house becomes the absolute property of the borrower. In addition, there is valuable protection for his dependants in the event of his death, for then the advance is automatically repaid and the house is freed from mortgage without any further cost.

Other activities of the Society include the granting of annuities at attractive rates, the issue of contracts providing a pension for life from a selected age, the insurance of groups of employees upon special terms advantageous to themselves, the issue of special policies for children, and the transaction of fire, motor vehicle, employers' liability and similar insurances.

The report and accounts were unanimously adopted.

BANK OF CZECHOSLOVAK LEGIONS, PRAGUE

DIVIDEND OF 6 PER CENT. MAINTAINED

The sixteenth general meeting of the Bank of Czechoslovak Legions, Prague, was held, on March 31, 1937, in the Banking Hall in Prague.

Dr Rudolf Raše, the chairman, having welcomed all shareholders and guests present, remembered then with gratitude the deceased collaborators and expressed thanks and appreciation for their services rendered to the Bank. He emphasised that the progressing consolidation of the political situation will consequently bring a further improvement of economical conditions.

At the meeting 205 shareholders were present, representing 51,465 shares and Kč 10,293,000 stock capital.

A detailed report of the activity of the bank during the previous year was then submitted by the general manager, Mr Josef Khyn, who gave an exhaustive explanation of the different items of the balance sheet. He stated that the year 1936 may be regarded as a turnpoint, and that the results justified them in looking forward with confidence. Mr Khyn further drew the special attention of those present to the items of the balance sheets of affiliated banks whose saving accounts amount to Kč 1,132,000,000, debtors to Kč 1,331,000,000, and the total of the balance to Kč 2,203,000,000.

The profits could be considered entirely satisfactory, and from the net profit of Kč 5,984,680.50 a dividend of 6 per cent. would be paid, besides the usual allocations.

The retiring directors, Dr V. Charvát, Ant. Pastýřík, Otakar Trčka and Bohuslav Václavík, as well as the members of the Auditing Committee, Václav Vondrák and Ing. Th. Růžička, were re-elected.

At the close of the general meeting the board of directors re-elected Dr Rud. Raše president, JUDr Aug. Straka first vice-president, and Mr Stanislav Zavadilík second vice-president.

BRITISH INSULATED CABLES, LIMITED

Manufacturers of all types of Bare and Insulated Cables and Overhead Conductors for the transmission and distribution of electrical energy, including Allied Accessories and House Wiring Systems, also Aluminium and Copper Sheets and Sections, Electric Resistance Welders and Rivet Heaters, Lead Strip and Glazing Sections, Meters, Rail-Joint Bonds, Static Condensers, &c.

RECORD TURNOVER—INCREASED PROFIT

SHARE BONUS DISTRIBUTION

PLANT AND WORKS EXTENSIONS

SIR A. ROGER ON IMPROVED POSITION AND PROSPECTS

The forty-first annual meeting of shareholders of British Insulated Cables, Limited, was held, on Friday, April 2nd, at Exchange Station Buildings, Liverpool.

Sir Alexander Roger, chairman, presided over a good attendance of shareholders.

The Chairman, in moving the adoption of the report and accounts, said: I have pleasure in formally submitting to you the directors' report and statement of accounts, circulated some days ago, which I presume may be taken as read.

Before proceeding with the business of the meeting I should like to refer to the recent resignation from the board of the Hon. Sir Arthur Stanley, owing, I am sorry to say, to increasing physical disability. Sir Arthur joined the board in March, 1909, and by his sound judgment and clear vision has rendered invaluable service to the company. His colleagues very much regret his retirement.

RECORD TRADING FIGURES

The past year's trading has established a record for the company, both in sales and in volume of output. Under fifty headings into which our various manufactures are divided for statistical purposes, as many as forty-three show the highest figures for all time. Our turnover during the year shows an increase of 32.5 per cent. over the previous year, and an increase over 1934 of 54.9 per cent. Whether measured by the volume of our turnover or by the variety of our products, we are comparable in size with the largest of the cable-making firms in the world.

PROFIT AND TURNOVER INCREASES

The net result of our trading shows an increased profit of £93,000 compared with 1935, and of £207,000 compared with 1934. These increases are not attributable to higher profit rates, but are the result of greatly increased turnover, made possible through the installation of additional plant, the expenditure of large sums during recent years in the continued modernisation of our factories, and last, but not least, because of really hard work on the part of all concerned.

The average rate of profit that we obtain upon our turnover shows a remarkable consistency from year to year, and this, of course, points to the fact that the substantial reductions in cost that we are continually achieving are passed on, in effect, to the public. This is, we think, as it should be.

From a manufacturing point of view 1936 may indeed, as in the case of 1935, be described as a year of works and plant extensions and improvements, following research and developments relative to the company's products and co-ordination with our subsidiary and associated companies. I mentioned to you last year that it is the policy of the board to scrap ruthlessly all plant which is no longer the most up-to-date and efficient of its kind, and the profit and loss account witnesses to the benefit of this policy.

You will observe that our profit on trading is struck after "contingent reserves adjustment," a phrase which has not hitherto been used. In businesses of our magnitude there are from time to time large transactions which cannot be settled in a single period of twelve months, and we have attempted in these cases to adjust their results, known or anticipated, to accord with the period under review.

If to the profit of £765,695 the balance brought forward of £303,860 be added, we have a total of £1,069,555. After providing for interest on debenture stock, dividends on both classes of preference stock, interim dividend on ordinary stock and directors' fees, there remains the sum of £874,561 to be dealt with.

We have allocated to depreciation a total of £143,681 14s. 2d. In increasing the amount of depreciation written off we have in mind the heavy capital expenditure of recent years, the speeding up of manufacturing processes and the consequent shortening of

the life of the plant. In former years the annual depreciation appeared in the accounts as a round sum, but as the result of closer investigation we have instituted a scientific basis for the determination of this important item, hence what may seem to you as the oddity of the amount provided.

CASH AND SHARE BONUSES

It is also proposed to set aside the usual amount of £100,000 to reserve account, leaving a balance of £630,879, out of which we recommend a final dividend of 10 per cent. to be paid on the ordinary stock, making, with the interim dividend already paid, 15 per cent. for the year, and your board feel justified in recommending a repetition of the payment of a cash bonus of 5 per cent. These payments will be subject to income tax, and will leave a carry-forward of £380,879, compared with £303,860 brought in.

At our last meeting I mentioned that a share bonus distribution had been suggested in some quarters, and I then informed you that your directors did not think this altogether prudent. Our hesitation arose from the consideration that a bonus of this kind must be paid at the expense of the reserves, and a consequent weakening of the company's position in that respect is not advisable in face of growing competition, and the need to be able to meet all contingencies and maintain our stability. An additional consideration in our minds was the fact that bonus shares, necessarily cause a weakness in the company's position relative to the maintenance of the current rate of dividend.

These considerations are still before us, but we have decided that in view of the company's further improved condition and immediate prospects, the payments of a share bonus at this time would be justified. (Hear, hear.) We therefore propose to ask you at an extraordinary general meeting, to be held after this meeting, to increase our ordinary capital to £2,000,000, to sanction the capitalisation of £333,334 of the company's reserves, and to appropriate that amount in paying up in full the like amount of new ordinary shares, which, when converted into stock, would be distributed as a bonus among the ordinary stockholders on the register at May 1, 1937, in the proportion of 1 of stock to every 15 of stock now held. It is further proposed that the bonus shares in stock will rank for dividend as from January 1st of this year. I may point out that this bonus has a market value much greater than the amount of stock distributed.

WORKS AND PLANT EXTENSIONS

As regards the details of the balance sheet, there are only a few items to which I would direct your attention.

The reserve account, with the addition of £100,000 is increased to £1,620,000.

The item of creditors is divided into two parts. The amount of £295,199 owing to subsidiary companies occurs mainly as part of the process of rationalising the companies concerned. General creditors are up by almost £500,000, owing to largely increased trade and certain contingent credit balances.

Turning to the assets, the item "land, buildings, plant, and machinery," after writing off £143,682 for depreciation already referred to, stands at £1,752,083, a small increase of £38,160, which, however, covers operations involving much larger sums. It embraces extensions to buildings and plant at both Prescott and Helsby for the purpose of increasing our manufacturing capacity to enable us to cope with increasing demands. It also includes plant and machinery and other assets of the Macintosh Cable Company, Limited, and the Croydon Cable Works, Limited, which we have purchased, and to which I shall refer later.

Investments in and accounts with subsidiary companies have decreased in total by £358,294. The first subdivision

is decreased by £186,000, again part of the process of rationalisation of our subsidiaries, while the reduction of the second subdivision is merely a reflection of our trading activities.

Other investments aggregate £1,665,188, an increase of £167,755, which includes investments taken over by us from the Macintosh Company.

As usual, the board have had prepared an estimate of the value of all investments and are of opinion that the intrinsic value is in excess of the value included in the accounts of the company. Most of our investments in these subsidiary and associated companies, not only yield us a fair return on our shareholdings, but in addition give us manufacturing advantages and reduced overhead costs, from which both they and the parent company benefit.

Stocks and works in progress are shown at £1,412,060, due to increased business and in part due to an appreciable rise in the price of raw materials.

Debtors and bills receivable at £1,561,395, show an increase of £760,000, almost wholly due to increased trading, and I think you will be interested to learn that our bad debts last year worked out at 10½d. per £100 of sales, which I should imagine is rather a record. (Hear, hear.)

Cash in banks and in hand at £191,833 is less than the amount usually held, and does not express our liquid resources.

TWO UNDERTAKINGS PURCHASED

Turning now to matters of more general interest, you will recollect that last year I intimated that the board were investigating a form of rationalisation within the ambit of our own group of manufacturing companies. We have since purchased the undertakings and assets of the Macintosh Cable Company, Limited, Derby, and the Croydon Cable Works, Limited, Croydon.

In the past these companies have been controlled by virtue of our shareholdings, but after a thorough investigation your board decided to centralise and distribute manufacture at Prescott and Helsby works. This will effect savings in works management expenses and in general establishment charges, which will ultimately be to the benefit of our profit and loss account, but no part of these savings is reflected in the accounts now under review, as the change-over was only made on September 30, 1936, and regular working under the new conditions was only brought about some time subsequently.

The buildings at Derby and Croydon have been sold at satisfactory prices, and in each case precautions have been taken to ensure that the premises cannot be made available for competitors for a long time to come. The best of the plant and machinery has been transferred to either Prescott or Helsby, to provide the increased manufacturing facilities there necessary. The remainder has been scrapped, and provision has been made in our accounts to cover the costs of the rationalisation.

Some extension of the buildings at Helsby has been necessary to house the plant taken over, and the opportunity has been taken to make provision for an increase in our manufacturing capacity, particularly in the direction of telephone switchboard cables, silk covered wires, etc., as well as for an improved layout for a considerable proportion of the plant.

PRESCOT ELECTRICITY SALE

During the year the formalities connected with the sale of our Prescott electricity undertaking were completed, and on April 1, 1936, it was formally taken over by Liverpool Corporation. It was right, and we believe in the public interest, that this transaction should be carried through and the undertaking placed under the vigorous and progressive administration of Liverpool. We have pleasure in acknowledging the amicable and fair spirit in which these negotiations were concluded. The electric supply needed for our Prescott factory is now obtained from Liverpool at satisfactory rates.

COPPER AUXILIARY

British Copper Refineries, Limited, continues to make good progress, and during the past year has substantially increased its output, measured in value and volume, and is proving in every way to be a very satisfactory auxiliary to your company, both in a financial and manufacturing sense. (Hear, hear.)

It will be interesting to you to know that your company absorbs about 20 per cent. of the copper of all kinds which comes into this country, and about 33 per cent. of the copper used for electrical purposes.

RAILWAY WORK ABROAD

International trade, though still beset with barriers and restrictions, is improving, and although we are exceptionally busy at

home, we have no intention of neglecting our overseas business. Three months ago, in conjunction with Metropolitan-Vickers Company, and the English Electric Company, we completed the first section of railway electrification in Poland, which comprises 179 miles of single track, and in Brazil, again in conjunction with Metropolitan-Vickers, we have actively in progress another contract for railway electrification, extending to 112 miles of single track overhead equipment. This, I may say, is a type of work for which we have a high reputation. Our order books at present generally show an improvement on the past year, and the works both at Prescott and Helsby are working to capacity.

You are, of course, aware of the increasing prices of commodities. These affect our business mainly so far as rubber, copper and lead are concerned. The average market prices of these commodities during 1936 were:—

Rubber, 9½d. per lb., against 5½d. per lb. in 1935.

Copper, £43 2s. per ton, against £35 19s. per ton in 1935.

Lead, £18 7s. per ton, against £15 5s. per ton in 1935.

These prices have again considerably increased during the present year, and you will appreciate that when raw materials have advanced to this extent heavy additional finance is required, which would no doubt have represented a burden upon us had we not built up our reserves over years for this and other purposes.

PLANT WORKING TO CAPACITY

The present excellent showing made by the profit and loss account has been arrived at largely by concentrated effort and by utilising the resources of the company in men and plant almost to the breaking point. A large proportion of our machinery has been working double-shift throughout the year, and in some cases even 23 out of the 24 hours.

One's natural comment on this is, "Why not expand further?" During the past year we have spent about £200,000 on capital, and the work now in hand or in contemplation will probably involve us in a similar amount this year, but we cannot view the future with equanimity, and we are determined to guard against over-expansion of productive capacity. Your board feel that it is dangerous to be carried away by excessive enthusiasm, on the crest of a wave of prosperity. (Hear, hear.)

We all know that soon or late a period of less active trading may be expected to follow in the wake of the present conditions, and it has to be remembered that it is only a comparatively short time since the cable-making facilities in this country were very considerably in excess of requirements. In all our capital expenditure we aim at so increasing our technical efficiency and reducing our costs of manufacture that in periods of depression, when the need is greatest, we may be strongly competitive. To this end also our financial reserves are directed.

DISTRESSED AREAS PROPOSAL

We note and follow with sympathy and interest the efforts being made to create employment in the Distressed Areas, but I am afraid permanent relief will not be found in the direction of building factories for the purpose of participating in a relatively small surplus demand arising from abnormal and temporary prosperity. We hear, for example, of proposals to build two new cable factories. If they come to fruition they will, of course, succeed in getting a certain amount of business, but the promoters would be well advised to pause and consider whether in more normal times the additional manufacturing capacity proposed is justified, even for the present purpose of unemployment relief.

I would suggest that permanent cure for unemployment has more solidity in the direction of new manufactures to meet new requirements, and we speak from definite experience. It is a policy we have pursued ourselves with success, as you will see from the varied lists given in the second page of our annual accounts, and I am not giving away any trade secrets when I disclose that cable-making itself represents less than one half of the turnover of this company and its subsidiaries.

MANAGEMENT AND WORKPEOPLE

In completing a survey of a year of extraordinary activity, I am sure you will join with me in tendering our cordial thanks both to the workpeople and to the staff for their loyal and efficient service, and in especial measure to our managing director, Mr G. H. Nisbett, upon whom the burden of the very hard work necessary to bring about the results placed before you to-day has chiefly fallen.

Last Christmas your board thought it fitting to make some tangible recognition of the excellent service afforded to us by

our workpeople during the year, and in their name and yours gave a gratuity of 20s. each to the higher-paid workers and 10s. each to the juniors. We have reason to know that this gesture gave much satisfaction. The staff, you will remember, have a reward for their efforts over and above their salaries by participation in the company's profit-sharing scheme.

I now beg to move that the report and accounts be received and adopted, and that the dividends and cash bonus therein recommended be paid. (Applause.)

Mr John Ferguson, vice-chairman, seconded the motion, which was carried unanimously.

DIRECTORS RE-ELECTED

Mr G. H. Nisbett, M.Eng., managing director, proposed the re-election of Sir Alexander Roger, Mr T. H. Martin-Harvey and Mr W. Travis, as directors of the company.

Major A. L. Chandler, M.C., seconded, and the resolution was carried.

On the proposition of Colonel Bates, seconded by Colonel Tennant, Messrs Chalmers, Wade and Company were appointed auditors.

Mr R. B. McFadden proposed a vote of thanks to the chairman and directors for their services during the past year, and to the chairman for presiding.

Mr T. Gillison having seconded, the motion was cordially agreed to, the Chairman briefly replying.

THE NEW SHARES

An extraordinary general meeting of the company was held subsequently.

The Chairman proposed a series of resolutions increasing the ordinary capital of the company from 1,666,666 to 2,000,000 by the creation of 333,334 ordinary shares of £1 each, undivided profits of the company to be utilised for the purchase price of the additional shares, and such shares to be distributed *pro rata* amongst holders of ordinary stock in the proportions of one new ordinary share in respect of £5 of ordinary stocks now held.

Mr John Ferguson, vice-chairman, seconded the resolutions, which were unanimously adopted.

VICKERS LIMITED

PLANT EXTENSIONS

The annual general meeting of Vickers Limited was held, on the 2nd instant, in London.

General The Hon. Sir Herbert Lawrence, G.C.B. (Chairman), who presided, in the course of his speech, said: The accounts show that net profits for the past year were £1,162,610, an increase of £234,505 compared with 1935. After the transfer of £250,000 to reserve, your directors recommend the payment of a dividend of 10 per cent. on the ordinary stock.

Vickers-Armstrongs Limited, the largest subsidiary in the group, has again had a satisfactory year and has earned sufficient profit to enable it to pay the net sum of £759,684 by way of dividend.

I have frequently referred to the policy we have pursued for some years of bringing the plant and machinery of the various works and companies to a highly efficient state. While this has meant considerable capital expenditure, I can again assure you that without it, we should not have achieved the improved financial results, nor should we have been able to maintain our position as the leading suppliers to the Government Services of the armaments required under the defence programme.

We have now in various stages of construction at our shipyards no fewer than 21 war and commercial ships, including H.M.S. "King George V," one of the first two new capital ships ordered by the Admiralty, and H.M. ships "Illustrious" and "Victorious," two of the new large aircraft carriers.

The English Steel Corporation, Limited, has again shown an increase in trading profits and has paid 20 per cent. dividend (free of income tax) on its deferred ordinary share capital.

The extensions to plant which are being carried out by certain of the subsidiary companies are not yet completed and the results of the past year do not appreciably reflect the increased armament production, the effect of which should begin to be realised during this year.

During this present exceptional period it is necessary and prudent that full provision for depreciation, obsolescence of plant and reserves should be made. With expanding business, total profits should increase, but such increased total profits will not of necessity mean larger divisible profits.

The report and accounts were adopted.

AUTOMATIC TELEPHONE AND ELECTRIC COMPANY, LIMITED

EXPANSION OF TELEPHONE SERVICES

The seventeenth ordinary general meeting of this company was held, on the 5th instant, in London.

Sir Alexander Roger (chairman of the company) presided, and, in moving the adoption of the report and accounts, said he was glad to report that 1936 had been a good year. The net profit on trading and dividends on investments, etc., amounted to £133,564, after making the usual provisions, and compared with £120,283 for 1935 and £97,757 and £87,361 for the two preceding years. Profits, therefore, showed satisfactory progress, and the board proposed to pay total dividends of 10 per cent. on both the ordinary stock and the deferred stock and shares.

Dealing with the balance sheet, the chairman said that a valuation had been taken of the "Freehold land, buildings, machinery, fixtures and fittings standing at £324,210," and the directors were satisfied that in adopting the foregoing basis of cost, less depreciation, they had been prudent and conservative. "Patent rights and goodwill" now stood at only £146,030, and were of much greater value than that figure indicated.

The most important of their subsidiary companies was now Telephone and General Trust, Limited, which had again issued a satisfactory report, and for the seventh year in succession had paid a dividend of 8 per cent. on the ordinary stock and "A" ordinary shares. The final dividends on those securities, declared last week, had not been brought into the 1936 profits of this company.

Elxcel, Limited, another wholly owned subsidiary, was as yet in its early stages, but its Xcel products were meeting with increasing favour. The cash position of their own company was satisfactory.

PROGRESSIVE POLICY OF G.P.O.

One of the most striking events in the national life of the country in recent years had been the expansion of the telephone service, a development which was only comparable with the extended use of electricity for light and power. The far-sighted policy adopted by the Postmaster-General and his Department in reducing rates and so forth had led to an enormous increase in the use of the telephone. Last year there had been a net increase of 238,000. The much-needed "On demand" trunk service was being developed as quickly as possible, and the automatisa-tion of rural areas was making steady progress, in all of which their company was bearing its share. Their new Strowger automatic telephone switch mechanism had been adopted in exchanges in this country, India, South Africa, Australia, Portugal, the Baltic States and elsewhere with complete satisfaction to all concerned, and the company was meeting an increasing demand for private telephone installations in offices, factories and elsewhere.

The company's excellent relations with the Governments and companies with which they had supply agreements had continued unimpaired, and they had carried out important works in Lithuania, Poland, and South Africa, while in Australia, in New Zealand, and other countries the prospects of business were improving, and it was pleasant to report that their large export business, which they hoped would be still further extended in the future, included orders last year from fifty countries.

THE OUTLOOK

Prospects of business for the current year, judged by their order-book, were at least as good as 1936. With some reluctance, as they felt the present prosperity in business was owing in a certain measure to abnormal causes and when those causes disappeared a contraction of business might be seen, the board had undertaken a further extension of the factory in order to increase the company's productive capacity, and they proposed to make use of this period of good business to extend it and improve their efficiency in every direction, thereby reducing costs.

In order to stimulate further efforts of their staff and enable them to realise their complete identity of interest with stock and share holders, the board were now engaged in working out a profit-sharing scheme based on other schemes which had proved of great value elsewhere.

They were associates in a large all-British group of companies which had formed a joint council for technical development and investigation of subjects of interest, which they believed would be productive of economy and efficiency, and be of great advantage to each participant in many other directions.

The report and accounts were unanimously adopted.

THE UNITED GLASS BOTTLE MANUFACTURERS, LIMITED

SATISFACTORY YEAR'S OPERATIONS

INCREASED DIVIDEND

MERGER ARRANGEMENTS

SIR MAX BONN'S REVIEW

The twenty-fourth ordinary general meeting of the United Glass Bottle Manufacturers, Limited, was held, on the 8th instant, at Winchester House, Old Broad Street, London, E.C., Sir Max J. Bonn, K.B.E. (the chairman), presiding.

The Secretary (Mr S. S. Kenyon), having read the notice convening the meeting and the auditors' report,

The Chairman said:—My lords, ladies and gentlemen,—I have first to report the result of the special meetings which have preceded this meeting, and to advise you that the resolutions which were before both meetings were carried unanimously.

Whilst you will, no doubt, regard the understanding reached with the Distillers Company as of paramount interest, I think I should first deal with the directors' report and accounts for the year 1936, by way of retrospect. They have been in your hands for some time, and with your permission I will take them as read. (Agreed.)

BALANCE SHEET

I wish to draw your attention to the expenditure on land and buildings of £17,532. During the year we acquired certain land adjoining the St. Helen's Factory, and it has enabled us to start upon the first section of a new warehouse, which should ensure a more economical way of handling our ware. Plant and machinery (after writing off £92,775, our normal rate for depreciation and wear and tear of moulds) is lower than last year by £1,522. Stocks and stores, debtors and cash, less amounts due to creditors, show a surplus of liquid assets of £682,381.

PROFIT AND DIVIDENDS

The net profit for the year amounts to £171,583 (as against last year £151,125), to which must be added the balance brought forward from the last account of £44,494, making a total of £216,077.

There has been paid and/or appropriated (1) the half-year's dividends to June 30, 1936, on the preference and ordinary shares, £28,957. (2) Amounts transferred to debenture redemption reserve, £16,090; general reserve, £40,000, bringing it to £340,000; staff benevolent fund, £10,000. (3) Provision for works improvements, £20,000, and since December 31st there has been paid the final dividend on the preference shares, £17,195, leaving a balance of £83,835, with which the directors propose dealing as follows: By payment of a final dividend on the ordinary shares of 6 per cent., less tax (as against 5 per cent. last year), and a cash bonus of 2½ per cent. (same as last year), less tax, £39,991, and by carrying forward a balance of £43,844. I should like to refer more particularly to the allocation of £20,000 to a works improvement reserve. This sum is now set aside for the purpose of meeting the cost of various improvements and new amenities, which Mr Moorshead strongly recommends, though they are not of a profit-earning character.

The increase of £21,000 in the net profit is more modest than would appear on the surface, inasmuch as the saving on debenture interest, which became operative this year, amounted to £7,500. The balance is due to the general improvement in trade, and the cumulative effect of many improvements and economies. It was only during the first eight months of 1936 that results showed an improvement over the previous year; as the year went on, the general increases in wages and costs made themselves more felt.

In common with other industrial users of coal, we are apprehensive of an increasing burden, which threatens to affect the general price level of all mass-produced articles.

During the year the board incurred an exceptional outlay by donating £2,500 to the Glass Research Delegacy of the University of Sheffield in response to an appeal for funds for the new buildings of the Department of Glass Technology. This contribution is not entirely free from an element of business interest,

inasmuch as we look to the Glass Delegacy as the Central Research Institute of our industry and the training ground for our young technologists.

HOLIDAYS WITH PAY

Quite recently notices were posted at the works, intimating that the board had decided in favour of the principle of one week's holiday with pay. With our continuous processes, it is unlikely that any offsets can be made which will reduce the full cost of this departure. Nevertheless, I am confident that shareholders will approve of the board's decision. We were guided by the consideration that industries which are mainly engaged in domestic trade, and thus benefit from any improvement in the standard of living and resulting purchasing power, should make contribution, to their full ability, to the spirit of the times. We rely on our operative staff to render some general compensation, by still better time-keeping and generally increased efficiency. If we can keep the cost within our estimates, it will be a further tribute to the efficiency of Mr Hecker and his staff at Charlton, and Mr Galbally's organisation at Sherdley.

SUBSIDIARY ACTIVITIES

I should like to refer to the excellent results obtained by the Box Shop, and to the ever-increasing activities of our subsidiary, Kork-N-Seal Limited, which manufactures metal and moulded closures, lead capsules, etc. Our customers obtain a great convenience by reason of the co-operation between your company and Kork-N-Seal, which ensures efficient sealing of their products.

Better times are reflected in a two-fold direction; firstly, our customers have been more inclined, in an atmosphere of generally rising prices, to order ahead, thus facilitating our production programmes; secondly, the greater sense of stability within the industry has caused all bottle makers to pay stricter regard to their production costs, and to resist the temptation to attract business by price cutting.

THE FUTURE

The first three months of the current year, as far as I can judge, compare favourably with those of 1936. I foresee a close race between increased costs and a better price level, aided by the normal benefits from our regular efficiency and economy campaigns; but barring untoward events, the final results of 1937 should be not less satisfactory. If this be so, the directors would wish to bring the interim dividend into a better relationship with the final dividend declaration.

MERGER ARRANGEMENTS

I would now like to make a few remarks in regard to the merger arrangements which have become operative by virtue of the preceding meetings. It would be difficult to over-emphasise the importance; at the same time it would be easy to exaggerate the immediate advantages.

For many years past we have had most friendly relationship with the Distillers Company as a valuable customer; but the bulk of their own requirements, and a growing measure of outside trade, were catered for by their own bottle works. They were confronted from time to time, primarily from the point of view of their own requirements, with the problem of the reorganisation of one or other of their works. As I remarked last year, it is practically impossible, under modern bottle-making conditions, for anyone to add a new unit of a size to be economical, without automatically creating surplus capacity for the industry as a whole.

Before committing themselves to a scheme of reorganisation which would in the long run have threatened chaos within the glass bottle industry, Mr Herd, the chairman of the Distillers Company, expressed a willingness to review informally the possibilities of some merger which would safeguard the Distillers' requirements, but would also avoid disturbance to the industry as a whole.

A merger, from our own point of view, held out the attraction of retaining a highly valued customer, and of avoiding possible competition on the part of a manufacturer whose general resources far outweighed those of anyone in the trade.

The conclusion of the merger is very largely due to the admirable way in which the initial *pourparlers* were carried on by our respective auditors, Messrs Moores, Carson and Watson, and Messrs Cash, Stone and Company. After the ascertainment of the respective earning powers, I had the pleasure of direct negotiation with Mr Herd, and the final terms were agreed in a spirit of give and take. I think it is a tribute to all those engaged in these protracted negotiations, and especially to the staffs in the various offices, that we were able to issue our first circular before the usual kind of rumours could create embarrassment.

A MILESTONE IN THE COMPANY'S HISTORY

I have had inquiries from several old shareholders on the question of general policy, seeing that the Distillers group will have a predominating interest by virtue of the number of shares to be issued to them in the discharge of the purchase consideration. In amplification of the information given in the circular of March 15, 1937, I wish to say that the merger is conceived to be for the mutual advantage of both parties, and that their interests will lie along the same path. We have already indicated in the circular that "generally speaking, the merger arrangement reflects a reciprocal undertaking for service to be rendered, in return for most-favoured custom and general support."

This, needless to say, was issued in agreement with Mr Herd, and for my own part, and on behalf of my colleagues, I am more than happy with this arrangement, both in its practical bearings and the general advantages which we foresee. I regard it as a milestone in the history of the United Glass Bottle Company, and I look forward to taking an active part in perfecting the new arrangements.

To those who view the merger from a more northern angle, I should like to say that it is our desire and intention to continue things substantially as they are. The works which we have now acquired are admirably situated to meet the special requirements of the distillers' interests as well as the demands of the general trade in Yorkshire and Scotland, which we can at present only serve at the cost of heavy freight.

We shall be manufacturing at Charlton, Kent; St. Helen's, Lancashire; Castleford, Yorkshire; Shettleston, Glasgow; Portobello, Edinburgh; and Kinghorn, Fife—a geographical position which is unique for any glass bottle-making concern in Europe.

CONSTITUTION OF THE BOARD

Before concluding my general observations, I must refer to the increase sought in the constitution of the board and for the directors' fixed remuneration in terms of Article 103, as distinct from the commission to which I am about to refer. In the immediate future we expect to co-opt four representatives of the distillers' interests; possibly, at some later stage, it may be advisable to enlarge the board in a more general way. We therefore require a substantial margin over the existing limit, though I doubt whether the maximum, which we are asking you to authorise, will be reached.

In view of the additional profits which should arise under the new arrangement the board feel that the commission to which they become entitled under certain conditions shall not become operative to the full extent provided in the Articles. They will review the whole situation in consultation with their new colleagues and will bring the matter before you next year.

THANKS TO THE STAFF

On behalf of the board I have to express their appreciation of the excellent manner in which the staff and all employees of head office, factories, warehouses and branches have carried out their duties during the past year. In connection with the recent negotiations I wish to extend a special thanks to the secretariat.

NEW HEAD OFFICES

It may be more than a mere coincidence that the lease of our head office should expire this autumn. We have secured new

accommodation, upon completion, by taking the lease of the upper floors of a building in Leicester Street, facing the Square. I should like to think that the new offices will prove a fitting background for our enlarged activities and a happy workshop for a contented staff.

I now beg to move the adoption of the report and accounts and that a final dividend of 6 per cent. (making 8½ per cent. for the year), less tax, and a cash bonus of 2½ per cent., less tax, on the ordinary shares of the company for the year ended December 31, 1936, be paid, and I call upon Mr Cannington to second the resolution.

Mr J. S. Cannington seconded the resolution, which, in the absence of question or comment, was put to the meeting and carried unanimously.

Mr T. C. Moorshead, M.Am.Soc.C.E., then proposed the re-election of the retiring directors, Sir Walrond A. F. Sinclair, K.B.E., and Major W. F. Dixon-Nuttall, D.S.O., T.D., J.P., which was seconded by Mr H. St. John Judd and carried unanimously.

The auditors, Messrs Cash, Stone & Co., were re-appointed.

The chairman added that, in spite of the presence of their friend, Colonel Smith, he wished again to say that anyone who shared the board's view as to the importance of the merger arrangements owed a great debt of gratitude to the ability of the auditors and their whole-hearted devotion to the interests of the United Glass Bottle Company and he wished to thank them once more.

A resolution was also passed determining the remuneration of the directors.

A GREAT ACT OF STATESMANSHIP

Mr C. V. R. Coutts, F.I.A.: My lords, ladies and gentlemen, before we allow this meeting to break up I think it would be seemly for some reference to be made from this side of the table to the very important agreement with the Distillers Company, to which the chairman has just referred. I think we shareholders ought to be proud of the record of this company in the past ten years. When I look at the figures I see that in 1928 we got a dividend of 5 per cent. and that all through the industrial depression that was actually increased to 7½ per cent., and it is now raised with the bonus to 11 per cent. I think that is an achievement of which the chairman and the board are entitled to be proud. (Hear, hear.)

But I think to-day our minds are mainly concerned with this agreement and merger with the Distillers Company. That agreement reminds me of the old problem of whether it is wiser to keep a cow or employ a dairy. (Laughter.) I think the answer to that problem depends in the main on whether you have an efficient and reliable dairy. Well, pursuing that simile, I think we can say that the Distillers Company have satisfied themselves that they have found a reliable dairy and that it is really a great compliment to the board and a tribute to our technical efficiency that they have seen their way to come into and put themselves in the same boat with us. I think I am voicing the opinion of everybody here when I say that you, sir, and Mr Herd and your respective colleagues deserve the congratulations of all of us on a great act of statesmanship. In these days the tendency is, I think rightly, towards horizontal rather than vertical arrangements, and that is clearly the opinion of the Distillers Company in giving effect to this arrangement. It means in effect that we devote all our energies to making the best bottles, and the Distillers Company devote their energy to making the best stuff to put into them. (Laughter.)

In conclusion, I should like to say how glad I am to see the arrangement under which the staff get a week's holiday with full pay. I am sure that is a very wise and far-seeing proposal. I have always felt there was something wrong with the system under which the lowest paid members and the wage-earners had to suffer a loss of pay when they took a holiday while they saw people about them enjoying their holidays and enjoying their salaries too. I have much pleasure in proposing a vote of thanks to the chairman and his colleagues. (Applause.)

The vote was passed with acclamation.

CHAIRMAN'S ACKNOWLEDGMENT

The Chairman: Mr Coutts, ladies and gentlemen, my colleagues would wish me on their behalf and in my own name to thank you very much, Mr Coutts, for your generous tribute, and you, ladies and gentlemen, for your kind reception of it, and I am sure that our new friends, Mr Herd and his colleagues, would wish me to claim the first prerogative of the merger to thank you also on their behalf. We are, I think, particularly happy that you have found time to come here to-day and give us your personal

ANGLO-PORTUGUESE TELEPHONE COMPANY, LIMITED

FIFTY YEARS OF PROGRESS

INCREASE OF CAPITAL APPROVED

The fiftieth ordinary general meeting of the Anglo-Portuguese Telephone Company, Limited, was held, on the 7th instant, in the Incorporated Accountants' Hall, London.

Sir Alexander Roger (the chairman), in the course of his speech, said:—"The profit and loss account shows a gross operating revenue of £306,862, an increase of £15,490, while operating and management expenses, including royalties to the Portuguese Government and increased allocation to depreciation amount to £182,997. Loan interest is reduced and income tax is increased because the normal charge for the previous year was substantially reduced by a non-recurrent obsolescence allowance on account of exchange plant withdrawn. The result is a net profit of £89,087, compared with £84,634.

Your directors recommend a final dividend of 5 per cent., less tax, on the ordinary stock, making 8 per cent. for the year, and 8 per cent., less tax, on the "A" ordinary shares. After allocating £20,561 to reserve for renewals, a sum of £26,285 is carried forward against £25,698 brought in.

Your company was incorporated in June, 1887, and to-day celebrates the holding of its fiftieth annual general meeting. As can be imagined, your company, which can rightly claim to be one of the pioneers in the telephone operating field, has passed through many vicissitudes, but to-day we are working under a concession which is proving satisfactory to all parties. Our tariffs are now on a modern basis, our 1,800 workpeople are keen and contented, and there is promise of further expansion to the advantage of the Government, the public and the company. We consider that your company is now more firmly established as an integral part of the economic life of Portugal than at any time during its past history.

GROWTH OF THE UNDERTAKING

From small beginnings, when revenues did not permit of dividends being paid, we have made substantial progress. I think we can fairly claim that the company is fulfilling its obligations and the results, in our opinion, have fully justified the large capital expenditure we have boldly undertaken in good times and in bad. So far as the standard of the service is concerned, this is recognised to be as efficient as any in the world.

During the year 3,165 stations (or telephone instruments) were added to the system, the station growth showing an increase of over 7.5 per cent. There was actually a gross increase of 8,900, or, say approximately, for every three stations added two were withdrawn.

Of paramount importance to every public utility company is the question of tariffs, and for some time we have studied how we could simplify the dual system, consisting of a flat rate and message rate, which has been in force since 1928.

The experts of the General Administration of Posts and Telegraphs of Portugal, in cordial co-operation with the company, finally devised a suitable measured rate tariff which met with the complete approval of the Government. Existing subscribers are now in process of changing over as and when their current period contracts expire, and all subscribers will be on the new rates from July 1, 1937, onwards. From results to date we are of opinion that revenue will be at least maintained and development and expansion greatly encouraged.

NEED FOR FRESH CAPITAL

We have continually under review the probable capital requirements of the next few years, for it is not economically wise in the telephone business to plan for short periods only. Suitable buildings must be provided, new exchange equipment designed, cables and associated plant planned. These matters call for specialised technique and your company and its engineers, through its associated companies, is in the fortunate position of being able readily to furnish this. Our studies show that to meet probable expansion for the next five years we can profitably expend about £1,100,000, calling for about £500,000 fresh additional capital.

Portugal continues to make good progress. The company's relationships with the Government and Municipalities continue to be on the most friendly basis, and we have every satisfaction in recording this association of interests and mutual assistance.

The report was unanimously adopted and a resolution passed increasing the capital of the company from £1,350,000 to £1,700,000 by the creation of 350,000 additional shares of £1 each.

bleasing, because I believe in the City you cannot often get away from the great institution which you represent so ably, and if the Mutual Provident Assurance Association come here to-day to give us a pat on the back, that has two very great significances.

First of all, ladies and gentlemen, you all know how high that institution ranks in the insurance world, but what most of us do not know, and what I learnt only recently, was that the Mutual Provident originated the system of staff insurance and have made it a growingly important feature for many years, and the man who insures such a number of staffs as he does must be in the very closest touch with industry as a whole, even if, as he very modestly pretends, he only finds time for his duties as actuary in the City of London. Therefore your tribute to us is very welcome, and the only thanks I can give you is that I pledge you on behalf of my colleagues that the annual premium will be paid as a sustained effort in order to ensure your continued support and confidence. (Laughter and applause.)

At a separate general meeting of the holders of the preference shares and also at an extraordinary general meeting of the company held previously to the annual meeting, resolutions were passed authorising an increase in the capital of the company to £2,600,000 by the creation of 1,100,000 new shares of £1 each, of which 600,000 are to be preference shares and 500,000 ordinary shares for the purpose of acquiring the issued shares of British Bottles, Limited.

JOHN BARKER AND COMPANY, LIMITED

IMPROVED RESULTS

The forty-fourth ordinary general meeting of John Barker and Company, Limited, was held, on the 6th instant, at Derry and Toms Building, Kensington High Street, W. Sir Sydney Martyn Skinner, J.P. (chairman and joint managing director) presided.

The Chairman, in moving the adoption of the report and accounts, said: In addressing you last year, I remarked that, "subject to unforeseen events, the trade barometer would appear to be at 'set fair.'" From the published results to date, that remark has, I think, been justified, and conditions in general point to a distinct revival, which we all hope will continue.

Having dealt with the balance sheet, the Chairman continued: If you will turn now to the profit and loss account you will see that the gross profit, rents received and other income for the year amount to £1,593,771, or an increase of £10,088; this increase is practically all in the gross profit on trading, and your directors consider this a satisfactory achievement.

This additional gross profit is somewhat offset by increases in expenses, mainly in salaries, wages, etc., and in rates. The increase in salaries and wages is largely due to the extensions in Wrights Lane; the increase in rates is in part due to the same cause, but also to a full year's burden of the increased assessments upon the company's properties to which I referred last year, together with advances in the actual rate in the pound.

From statistics published, covering the period from 1933 to 1936, I find that the rates paid by your company have increased by 35 per cent. during that time, and if you add to this impost the cost of imperial taxation, you will realise what a burden this is on our undertaking and upon industry generally.

The profit and loss account submitted to you is so full and self-explanatory that I do not propose to comment further upon it. The final result of the year's operations is a net profit of £390,201, as compared with £386,791, or an increase of £3,409.

To the net profit as above of £390,201 10s. 4d. must be added the balance brought in from last account of £223,791 5s. 11d., making a total of £613,992 16s. 3d.

The usual interim dividends on the preference and ordinary shares were paid during the year; these absorbed £78,404, leaving a balance of £535,588 16s. 3d. available for allocation.

The directors' recommendation as to the allocation of this amount are set out in the report; but I now put them formally before you for your approval—namely, that we write the amount of £50,000 off fixtures, fittings, plant and machinery; that we place the sum of £150,000 to rebuilding and modernisation reserve, and £10,000 to the pension and benevolent fund; further, that we declare a final dividend for the six months to January 31, 1937, on the 5½ per cent. and 6 per cent. preference shares, and a final dividend on the ordinary shares of 10 per cent., making, with the interim dividend already paid, 15 per cent. for the year. These recommendations will leave a balance of £191,868 to be carried forward.

Mr T. A. Bowen (vice-chairman and joint managing director) seconded the resolution, which was carried unanimously.

ASSOCIATED ELECTRICAL INDUSTRIES LIMITED

SUCCESSFUL RESULTS—INCREASED PROFITS

The 37th annual general meeting of Associated Electrical Industries, Ltd., was held, on the 2nd instant, at Bush House, London, Sir Felix J. C. Pole, the chairman, presiding.

The Chairman, in the course of his speech, said that the profit, including dividends from subsidiary companies, amounted to £1,955,624—an increase of £227,105. The directors recommended a dividend of 10 per cent. on the ordinary stock.

All the company's works had continued to be well employed during the year, orders received and in hand at December 31st showing a substantial increase. All their companies were, and had been, exceptionally busy, and orders received so far this year were in excess of the total for the same period last year. Actually they had in hand to-day far more home and export work than they had had for several years past.

As an indication of the fact that their Group had completely emerged from the slump conditions of a few years ago, he would say that whereas the number of employees in all their companies at one time had fallen to about 22,000, the latest total for the Group was 37,838, excluding workpeople away owing to sickness or other cause; never before had there been so large a staff.

The statement in the report that all the company's works continued to be well employed was very modest. How long would that state of affairs continue? So many factors had to be taken into consideration that he hesitated to give an answer beyond saying the board had every reason to anticipate good trade for another year or two. He hoped that the Government would not upset the balance of industry in their desire to help the so-called depressed areas. In the electrical industry productive capacity was ample, and unregulated additions thereto would be calculated to create future difficulties. He was a little alarmed at the possibility of subsidised competition from new factories, and it would be an added injustice to accord such factories preferential treatment in placing Government orders.

OUTSTANDING WORK

Outstanding items of work in progress or completed during the year by the Metropolitan-Vickers Electrical Company were the Warsaw Junction Electrification Scheme in Poland which was nearing completion; the electrification of portions of the suburban lines of the Central Railway in Brazil, the supply of two 60,000 k.w. turbo-alternator sets for the Fulham Corporation Power Station and additional 33,000 k.w. sets for the Victoria Falls and Transvaal Power Company, Ltd.

Much of the plant for which orders had been received was required to meet the growth of demand on the Power Stations of the Grid System of the Central Electricity Board. There was every reason to hope that consumption of electricity would continue to increase, seeing that even the present-day standard of electric lighting in many houses was below what it should be. That fact they and other manufacturers, in co-operation with the Electrical Development Association, were bringing to the notice of the public by what was known as the Better Light Better Sight Movement. There was also a constant increase in the use of a great variety of household electric appliances detailed in the "Modern Ideal Home" diagram in the pamphlet issued with the report.

Notwithstanding the increase of orders in the home market, the board's policy was to do everything possible to develop export business. The task was heavy, but by producing products second to none in quality and performance, and by maintaining an efficient staff overseas, and by personal contact, they were endeavouring to secure their share of the export market.

In his opinion it was necessary to have separate agreements with each of their Dominions, differing according to the circumstances and manufacturing aspirations of each. Throughout the world there was need for a wide extension of international trade, but it seemed unlikely that many of the barriers would be removed for a long time to come.

Few, if any, industries could record equal progress to the electrical industry, and it was gratifying to know that their associated and allied companies had contributed materially to the improvement. Both the British Thomson-Houston and the Metropolitan-Vickers companies spent large sums in research, and their scientific and engineering staff was of the highest order. The result was that throughout the world the companies were recognised as occupying premier positions among designers and manufacturers of electrical plant of all kinds.

The report was unanimously adopted, and a resolution was passed approving the conversion of the issued shares of the company into stock.

TRUSSED CONCRETE STEEL COMPANY, LIMITED

SATISFACTORY TRADING RESULTS

The annual general meeting of the Trussed Concrete Steel Company, Limited, was held, on the 8th instant, at Caxton Hall, London.

Mr G. R. Holland (the chairman), who presided, said that the company was first registered on March 12, 1907. The business had been progressive, and consequently it became necessary to enlarge its capital, and during March, 1936, it was decided to reorganise the company. Its flotation as a public company was a very great success. In the first year's operations under its present formation, the company had only had the benefit of its new capitalisation for nine months. Profits, prior to depreciation, were £41,906 2s. 3d., which, compared with the previous period, showed a substantial increase. From that the sum of £12,840 16s. 10d. had been utilised in depreciating plant and equipment, and in addition £12,314 8s. was written off earlier in the year against the valuation of their property.

Trading results for the past year must be considered satisfactory, representing as they did the largest turnover in the history of the company, and had it not been for certain unforeseen circumstances, there would have been a considerable increase in net profits.

The volume of business in Hy-Rib and Truscon floors continued to increase steadily and profits were maintained. A new and important market had been established in India and the company was in receipt of large orders and was expecting others. Subject to nothing in the shape of a thunder-bolt to disturb the country's affairs adversely, he looked forward to improved results from all departments.

The report was adopted and the payment of a dividend of 12½ per cent. was approved.

At an extraordinary general meeting which followed, a resolution was passed increasing the capital of the company from £250,000 to £285,000. The Chairman advised the shareholders that 114,666 shares would be offered to existing shareholders in the ratio of one in six of their existing ordinary share holding at a price of 9s. per 5s. share.

JASIN (MALACCA) RUBBER ESTATES, LIMITED

PROFIT MORE THAN DOUBLED

The twenty-seventh annual general meeting of Jasin (Malacca) Rubber Estates, Limited, was held, on the 7th instant, at 19 Leadenhall Street, London.

Mr G. H. Champion (the chairman) said: Gentlemen, last year saw a substantial improvement in the fortunes of the rubber-producing industry, with the result that we are able to show a profit on this occasion of £6,826, or more than double that earned in the previous year. The explanation lies partly in a reduction of some £600 in expenditure, but chiefly in the better price obtained for our rubber, which realised an average of 8.10d. per lb., compared with 5.87d. in the previous year. The improved price more than compensated for the small reduction of 16,000 lbs. in our crop, a reduction which, I need hardly say, was due to the greater measure of restriction imposed on the industry.

The results for the year under review enable the directors to recommend a dividend of 10 per cent., less tax, while allowing the carry-forward to be increased by £826, and the current year should show a further improvement. Our standard production for 1937 has been assessed at 813,569 lbs. We have sold forward 134,400 lbs., or 20 per cent. of our exportable allowance, at 8d. per lb. c.i.f., but the remainder seems likely to realise considerably more.

These facts sufficiently indicate that the prospects for the current year are encouraging. Prospects for future years depend largely on the continuation or otherwise of regulation after the expiry of the present scheme at the end of 1938. There is no doubt in my mind, at any rate, that regulation has conferred great benefits on the industry and that, if it were to be removed, we would soon see a repetition of the old evil of excessive planting in times of high prices, with the result of a sudden emergence of an excess productive capacity when the trees came to maturity some seven years later, and, moreover, possibly at a time when the industry was on the downward swing of the trade cycle. Given a wise and moderate measure of regulation I see no reason why the industry should not have in front of it several quite prosperous years.

The report was unanimously adopted.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

TREASURY BILLS BY PUBLIC TENDER

Tenders for £45,000,000 Treasury bills were opened on April 2, 1937. The amount applied for was £73,025,000. Tenders were accepted for Treasury bills at three months dated Monday to Saturday at £99 17s. 3d. about 50 per cent and above in full. The average rate per cent. was 10. 10-80d. The amount allotted was £43,000,000.

No gold movements were reported at the Bank of England between April 2nd and 8th. Details of previous movements appeared in last week's issue.

GOLD MARKET

Messrs Samuel Montagu and Company write on April 7, 1937:—
 The Bank of England gold reserve against notes amounted to £313,661,924 on March 31, 1937, showing no change as compared with March 24. In the open market about £2,200,000 of bar gold was available at the daily fixing and was mostly taken for New York. Prices ruled at about dollar parity and showed a decline during the week owing to the weakness of the dollar in terms of sterling. There was some uncertainty in the market early to-day owing to rumours that the United States Treasury contemplated lowering its price for gold in order to check the heavy influx; later, however, the rumours were officially denied, Treasury officials having been reported to have said that there had been no change nor any intention of any change in the Government's gold-buying policy. Large amounts of gold continue to arrive from the Soviet Union and are being re-forwarded to New York. Gold shipments from Bombay last week amounted to about £171,000; the s.s. "Viceroy of India" carries £91,500 consigned to London and the s.s. "President Monroe" £79,500 consigned to New York.

SILVER MARKET

A continuation of buying by the Indian Bazaars and speculators carried prices sharply upward during the week, 21 1/2 d. for both cash and two months' delivery being reached yesterday. Offerings consisted mainly of China sales and speculative re-sales, but the rise was again due largely to reluctance on the part of sellers, the price responding more readily in the absence of resistance. At the level mentioned, the market proved overstrained and as there appeared little justification for the sharp advance, the decline on April 7th when prices receded to 21 1/4 d. for cash and 21 1/2 d. for two months' delivery was not unexpected. The reaction may have been due in some measure to the report from Washington that the United States authorities will probably not work actively for the extension of the London Silver Agreement of 1933 which expires at the end of the present year, although in present circumstances it is unlikely that the termination of the agreement would have other than a sentimental effect on the market. In view of recent fluctuations the immediate outlook is uncertain, but a movement towards a slightly lower level, pending improvement in the technical position in Bombay, is not unlikely.

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

RECENT advances in commodity prices have encouraged speculation which, in turn, has left the majority of the markets vulnerable to psychological influences. Such a factor was responsible for the sharp general break in prices, which occurred on Wednesday. Unconfirmed rumours of action to check the importation of gold into the United States caused a heavy volume of selling in that country, which induced speculators here to liquidate their holdings. Recovery was, however, general on Thursday.

Thus, the non-ferrous metal markets, which had already developed weakness, suffered a further heavy decline on Wednesday and rubber also lost part of its recent rise. Cotton participated in the general movement, but jute was stronger under the influence of bearish crop reports, and other textile fibres were about unchanged. Linseed rose in price on the anticipation of a shortage of supplies.

Wheat prices, on balance, show little change; an active Continental demand was reflected in rising prices in the early part of the period under review, but most of the gain was lost on Wednesday. Maize, however, was substantially higher in sympathy with Argentina, where United States buying has imparted a strong tone to the market. The London sugar conference, the implications of which are dealt with in a leading article, failed to strengthen the market in sugar, while cocoa was also cheaper. On the other hand, competition was active at the Mincing Lane tea auctions and prices showed an advancing tendency. Among other foodstuffs, potatoes were marked up on short supplies, eggs suffered a further seasonal fall, and provisions were about unchanged in price.

The relapse of staple commodity prices in the United States is reflected in Moody's daily index (December 31, 1931 = 100) which fell from 227.5 to 223.9 in the week ended Wednesday. The index stood at 214.7 a month ago and at 168.8 a year ago.

COAL

SHEFFIELD.—There is a brisk demand for all classes of fuel and pressure for deliveries in view of possibilities of trouble in the coalfields. Full time is being made on the bigger quota for April. Small fuel is unobtainable in sufficient quantities to meet all requirements in the inland market. With the improvement in the weather the call for household coal is less pronounced. Furnace and foundry coke remains a strong market, and gas coke is fully taken up. Export inquiries are on a larger scale, and although prices are rising they do not hamper business. Best hard steams are well taken up for shipment over the next two months, and inquiries cover potential requirements well into next year.

NEWCASTLE-ON-TYNE.—Demand from home and abroad remains strong for all classes of North-East coal. Export merchants receive plenty of offers for odd cargoes, but they are rarely able to execute them through lack of supplies. Northumberland steam coals are unobtainable this year, and all classes of Durham manufacturing coal are in a similar position. Scandinavian consumers are now turning their attention to next year, and are buying large quantities of all grades of steam coal at current prices. Patent oven coke remains a firm market.

GLASGOW.—The coal trade remains busy, and output is expanding. The great bulk of supplies is taken up under contracts, which leaves only small tonnages available for new business for prompt or early delivery. The buoyant home demand continues to hamper exports. Mainly owing to lack of supplies shipments last week showed a fair decline. Prices in all branches of the trade and for all classes of coal are strong.

CARDIFF.—The Cardiff coal market remains firm. Quotations are nominally unchanged, but collieries are finding no difficulty in arranging sales at current figures, and inquiries are still very active. Up to the end of March, production showed an increase of between 8 per cent. and 9 per cent. over the corresponding period last year, and export supplies one of over 15 per cent. Export allocations for the current quarter are 25 per cent. greater than actual performance during April-June, 1936, so that the question of supplementary allocations is not likely to arise for some time. Coke is very firm and patent fuel steady, while in common with other timber prices those for pitwood are steadily advancing and are already being quoted up to 28s. ex ship. Shipments of coal and coke from Cardiff last week totalled 281,500 tons compared with 225,700 tons in last year's Easter week, and for the current year to date the increase in the foreign and coastwise trades is about 700,000 tons. A new wages agreement was entered into on Monday for a period of four years; its principal features are increased standard rates and an advance in the minimum percentage from 25 to 30.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates that the volume of new business since the holidays has been restricted by the inability of the steel manufacturers to add to their already crowded order books. On the other hand, requirements appear to be increasing, and a large amount of work has been held up by late delivery and the scarcity of steel materials. The difficulty of obtaining fresh supplies of steelmaking pig iron and scrap is still a serious handicap to the steelmakers in their efforts to maintain output; but recently additional purchases have been made abroad which should ease the situation in the near future.

The shortage of semi-finished steel has not been relieved, and the activity of the consuming industries is being seriously affected. Negotiations are in progress to obtain supplies of foreign material, and it is possible that shortly some of the arrears of the deliveries of Continental steel may be overtaken. In the meantime, the works which have to purchase their semi-finished steel have been obliged in some cases to close down part of their plant.

Demand for finished steel is in excess of supply, and, although producers are endeavouring to apportion their output amongst their customers, the shortage is causing delay in the execution of important orders. Little export business is possible in these circumstances, and orders from overseas markets have had to be refused by British works.

SHEFFIELD.—Conditions on the iron and steel market are becoming increasingly difficult and producers are unable to accept anything like the business on offer. Supplies of forge and foundry iron continue to lag behind demand. New business relates mostly to renewal of contracts, and to small parcels for early delivery. The quantity of imported iron has not been sufficient so far to ease the stringency. Moreover, prices of imported materials are somewhat above home quotations. Derbyshire makers have reached the limit of their present capacity, and Lincolnshire producers are still off the market in this area. With regard to hematite, makers of West Coast material have apparently nothing to offer, but the position on the East Coast is not so difficult, and fair supplies are available. It is expected that by the end of the first half of the year there will be a substantial rise in the prices of both grades. In finished iron business is on a large scale, and most makers are fully booked for some time. Crown iron is in good request, and marked bars are in greatest demand. Makers of basic steel billets are unable to cope with the heavy demand and delay in delivery is hampering re-rollers. The volume of business in acid billets is also on the up-grade. Stainless steel sheets and structural steel requirements are heavy. Iron and steel scrap demand is very considerable in virtually all sections, and merchants are not inclined to book forward business. The price control scheme does not appear to be in full operation at present, and prices are largely a matter of arrangement between buyer and seller.

MIDDLESBROUGH.—Demand for all classes of material remains greater than the supply. The output of pig iron is ear-marked for immediate consumption and for delivery against contracts already on the books. The rationing of foundry pig iron to home consumers continues, whilst the supply of hematite iron is just sufficient to enable home needs to be met, and allow small parcels to be shipped. Actual business is practically non-existent, and in anticipation of an increase in price which is expected to become operative on June 1st, iron masters are not keen to enter into further commitments.

Owing to the decline in imports of semi-manufactured steel, local producers are doing their utmost to keep re-rollers supplied; they have orders which will keep them busy for a long time. Steel manufacturers are concentrating on fulfilling existing contracts. The continued difficulty in securing supplies of raw materials renders difficult an increase in production. Blast furnace coke cannot be obtained under 30s. per ton delivered at the furnaces. Whilst no price is mentioned for best Bilbao rubio ore, odd lots continue to come forward at increasing prices, freight rates tending higher. The position on the scrap market is unchanged, no announcement having yet been made regarding official prices, but 67s. per ton is mentioned as the quotation for heavy steel melting material.

GLASGOW.—While there has been no further serious curtailment of operations in the steelmaking industry, the position is becoming increasingly difficult. There is no improvement in supplies of raw materials, deliveries of which are already much in arrears, and there seems to be no immediate prospect of steady supplies being available. At the same time, order books are well filled, and there is a substantial amount of new business on offer, which makers are unable to accept. Makers of semis and of finished steel are in much the same position. Clyde shipbuilders have obtained further contracts during the present week, and most of the yards are now busy. Carriage and wagon builders, structural and marine engineers, machinery makers and others, in the West of Scotland are all busy and are finding new work plentiful, but they are having difficulty in obtaining supplies of their constructional materials.

CARDIFF.—Business in the tinplate trade continues exceptionally good, and makers are now obtaining from 24s. 6d. to 25s. 6d. f.o.b., compared with the old minimum schedule of 19s. 9d. per basis box. Galvanised sheets are steady at £16 15s. 0d. per ton f.o.b. for export and £17 delivered for the home trade, while steel bars are nominally unchanged at £8 2s. 6d. Tinplate works are fully employed up to their increased quotas, and exports are twice as heavy as they were in April, 1936. Up to April 6th shipments totalled 101,348 tons, compared with 49,635 tons in the corresponding period last year, and in spite of the larger output stocks in warehouses and vans are at the relatively low total of 6,019 tons.

OTHER METALS

COPPER.—The market was easy throughout the period under review, which culminated in a sharp setback on Wednesday. The net loss on the week amounted to about £10 a ton. Heavy selling by frightened speculators on the one hand, and the reserve of consumers on the other, were the factors mainly responsible; but the decline was accentuated by President Roosevelt's statement on Friday of last week that prices of durable goods, especially copper, were too high, and that the U.S. Government would no longer support public works programmes which required mainly durable goods. The market was thus already in a weak condition when American markets slumped heavily on Wednesday, in consequence of the gold scare. In the present state of the copper markets, any forecast of the trend of prices in the immediate future would be futile.

Sales on the London Metal Exchange: 4,600 tons on Monday; 6,500 tons on Tuesday, against 2,300 tons last week; 9,000 tons on Wednesday, against 2,600 tons last week. Domestic spot was quoted at 14.67½ cents per lb. in New York on Wednesday, against 17.02½ cents a week ago and 17.25 cents a month ago. Wednesday's official closing price for standard cash in London was £63 15s. to £63 17s. 6d. per ton, compared with £72 17s. 6d. to £73 a week ago. Stocks of refined copper in British official warehouses at the end of last week, at 24,639 tons, showed an increase of 66 tons, while stocks of rough copper, at 807 tons, were 100 tons larger.

In the pig iron department energetic attempts are being made to increase production by putting blast furnaces into operation which have been superseded by more modern plant, but which may now be relighted as an emergency measure.

LEAD AND SELLER.—Both metals have suffered a substantial setback in price this week, lead falling to the lowest level of the present year, and spelter to the lowest since February 17th. The slump was more severe than in copper or tin, only because the speculative bull account in lead and spelter was heavier than elsewhere. Unsettled conditions prevail, and the future of both markets is at the moment somewhat obscure.

Sales of lead on the London Metal Exchange: 2,100 tons on Monday; 3,500 tons on Tuesday, against 3,300 tons last week; 5,500 tons on Wednesday, against 1,650 tons last week. The New York quotation on Wednesday was 6.00 cents per lb., against 6.95 cents a week ago and 7.75 cents a month ago. The official closing quotation in London for soft foreign for shipment during the current month was £25 13s. 9d. per ton, compared with £31 16s. 3d. a week ago.

Sales of spelter on the London Metal Exchange: 3,300 tons on Monday; 3,500 tons on Tuesday, against 2,300 tons last week; 9,500 tons on Wednesday, against 2,100 tons last week. Wednesday's quotation in East St. Louis was 7.00 cents per lb., against 7.50 cents the week before and 7.50 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £26 per ton, against £33 12s. 6d. last week.

TIN.—Although the cash price actually declined from £294 a ton on March 31st to £283 on April 6th, the market showed substantial resistance in the early part of the period under review. Tin shared in the general slump on Wednesday, however, the price dropping to £272. Consumers have been out of the market, but since speculation is not heavy, selling has been less in evidence on this market than in other metals.

Sales of tin on the London Metal Exchange: 200 tons on Monday; 675 tons on Tuesday, against 450 tons last week; 1,000 tons on Wednesday, against 375 tons last week. The New York quotation on Wednesday was 60.12½ cents per lb., against 64.75 cents a week ago and 65.75 cents a month ago. Wednesday's official closing quotation in London for standard cash was £272 to £273 per ton, compared with £294 to £294 10s. a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 1,846 tons, an increase of 260 tons on the week.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted on Wednesday at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was quoted at £14 7s. to £14 7s. 6d. per flask of 76 lb. the same as last week. Chinese antimony was quoted at £79 to £80 per ton ex warehouse, the same as last week. Chinese wolfram for "April-May" shipment was quoted at 65s. to 67s. per unit, c.i.f., compared with 61s. to 63s. last week. Refined platinum was steady on Wednesday at £11 15s. an ounce.

TEXTILES

COTTON.—Manchester.—Spinners and manufacturers continue to hold their ground. A steady business has been done and buyers have had to pay full prices. After a further upward movement in raw cotton prices there has been a reaction and American futures in Liverpool are now over 4d. per lb. below the highest level. Rather more attention has been paid to the probability of a much larger American crop for next season if current prices are maintained. The disposal of loan cotton is to be continued during April, subject to five days' notice of any change in price terms or conditions. Spinners continue to complain of the scarcity of good quality material. There is a tendency to increase estimates of world consumption.

Spinners have not reduced prices in proportion to the decline in the raw material, and there has been a tendency for profit margins to improve. Fair weights have been sold in coarse and medium American counts. There continues a strong call for deliveries of ring descriptions. Steady buying has occurred in Egyptian numbers.

Inquiry for piece-goods for foreign outlets has continued encouraging, with actual business rather patchy. The larger demand for India has been maintained and more business has been done since the beginning of this month than for some time back. Further buying has been reported in prints fine goods and specialties for Java and the Straits Settlements. Prints have moved off fairly well for West Africa and quite a number of manufacturers have had a good week for South America. The recent improvement in the offtake for the Continent has continued. A healthy mixed business has been done for the Dominions and the home trade.

LANCASHIRE AND LONDON FINANCE.—For some little time back it has been known that certain London financial houses have shown interest in the Lancashire cotton trade in view of the distinct improvement in conditions during the past six months. It has been reported this week that the Bee Hive Spinning Company, Ltd., Bolton, has been purchased by Mr W. H. Midwood, a leading Liverpool cotton merchant, and it is by understood that he is acting for a syndicate which is being financed by a London firm. A receiver was appointed for the Bee Hive Company several months ago. The concern owns two mills at Bolton, containing about 250,000 spindles. This week it has been reported that a London financial corporation is carrying on negotiations for the purchase of four or five textile merchant firms in Manchester which are chiefly interested in the home trade. The old-established firm of Messrs Fred Taylor and Sons, Ltd., merchants, Manchester, has already been acquired. This

concern, which was established in 1829, was reconstructed in 1924 and the limited company then formed had a nominal capital of £200,000. It is understood that the London house is interested in firms which have been able to make profits throughout the depression.

JUTE.—Dundee.—A decided change has come over the jute market. New crop prospects became unsatisfactory owing to lack of rain in the jute growing areas, and "bears" commenced to cover freely, while the Indian jute mills were reported to be buying considerable quantities. As a result quotations for raw jute advanced by about £2 per ton over last week-end, with sellers showing considerable reserve. The rise was assisted by a good demand for jute goods, which rapidly rose in price, and the jute market has not witnessed a period of such excitement for some years. Dundee spinners and manufacturers immediately raised their quotations, which brought out some business, but buyers have been very unwilling to have passed on to them the advance in raw jute prices.

The full group of Daisies-2/3, after being sold at £19 10s. per ton, rose to £21 10s. and is now quoted at £21 15s., while single marks are named at £22 7s. 6d. and Daisies-4 at £20 5s., April-May. Tossa-2/3, which was unsaleable at £20 10s. per ton, is now priced at £22 7s. 6d. Tossa-4 now stands at £21 15s., after being freely offered a few days ago at £19 10s., April-May. Good First Marks are now named at £24 15s. and good Lightnings at £23 5s., while Hearts, sold this week at £20 12s. 6d., are now £22 5s., April-May.

Buyers of jute yarns have been more interested and have paid from 2s. 1½d. to 2s. 3d. for common 8 lb. cops and 2s. 2½d. to 2s. 4d. for 8 lb. spools. Even yet, the rise in prices is insufficient to compensate spinners for the advance in raw jute. Twist is quoted lowest at 4½d. for 3 ply 8 lb., and sacking yarns are dearer at 2½d. for 24 lb. warp and 3½d. for 8 lb. chains. Rove is firmer at £21 10s. for 48 lb. and £17 5s. for 200 lb., while the finer yarns are up to 2s. 5d. paid for fourth grade 8 lb. warp. Carpet yarns are in good demand at 3½d. for 14 lb. warp.

Manufacturers have not transacted much new business following the advance in raw jute, but they have been compelled to raise their terms to 2½d. for 10 oz. 40 in. and 2½d. for 8 oz., and some are naming ½d. more. Inquiry is fairly good and an improved business can be expected once buyers are reconciled to the altered conditions.

Calcutta hessians were raised to 19s. 3d. for 10 oz. 40 in. and 16s. 6d. for 8 oz. April, 19s. 3d. and 16s. 4d. May-June, 19s. 6d. and 16s. 3d. July-September and 19s. 4d. and 15s. 11d. October-December, an advance of about 1s. 6d. since the end of last week. Indian mills' production is still curtailed by about 20 per cent. as the result of strikes at 15 mills.

GRAIN MARKETS

WHEAT.—After a reaction at the end of last week, the upward trend was resumed, and prices at the close on Wednesday showed little change on the week. An active Continental demand was the factor principally responsible for the rise, which was, however, reversed on Wednesday in consequence of the general slump which affected the markets on that day.

On Wednesday last, "May" futures were quoted in Chicago at 141½ cents per bushel, against 142½ cents the week before and 137½ cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba, ex ship, 58s. 9d. to 60s. per 496 lbs., as against 60s. a week ago, No. 2 Northern Manitoba, ex ship, 57s. 9d. to 59s. 6d., as against 59s. a week ago. According to the *Corn Trade News* total shipments of wheat and flour last week totalled 1,506,000 quarters, against 1,465,000 quarters in the previous week and 1,245,000 quarters in the corresponding week a year ago.

FLOUR.—Home milled is a little dearer on the week, but imported flour has an easier tendency. Wednesday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 45s. 6d. per 280 lbs., as against 45s. 6d. a week ago; delivered inner London, 45s., as against 45s. a week ago. Manitoba patents, ex store, 44s. to 45s. 6d., as against 44s. 6d. to 46s. a week ago. Australian, ex store, 35s. to 36s., as against 35s. 3d. to 36s. a week ago.

THE FINANCIAL NEWS

Special articles due to appear next week on the Leader Page of THE FINANCIAL NEWS are as follows:

MONDAY, APRIL 12—THAT METAL MARKET MOONSHINE.—Since the time when Copper and the other leading base metals were clinging tenaciously to the giddy prices reached during the recent boom, we have said very little about them. Having described that boom as "moonshine" at the time, and having recommended a shifting of attention to other commodities, we have simply waited for inevitable events in the Metal market to occur. Now, after a heavy reaction, it is again possible to discuss the metals on a sane and useful basis.

TUESDAY, APRIL 13—TEA AND TEA SHARES.—Tea, after one of its usual lengthy periods in the doldrums, has recently woken from its slumbers and a minor boomlet has developed. This article reviews current prospects for this hitherto disappointing commodity and discusses the outlook for representative shares.

WEDNESDAY, APRIL 14, and THURSDAY, APRIL 15—COTTON TEXTILE SHARES.—These two articles complete our short series on the prospects for the Lancashire Cotton Spinning and Manufacturing Companies.

Dividing the Companies into the Egyptian Spinning Section, the American Section and the Mixed Spinning and Manufacturing Groups, these articles discuss the outlook for such Companies as:

FINE SPINNERS	COMBINED EGYPTIAN
AMALGAMATED COTTON	BARLOW & JONES
MILLS	DEWHURST

FRIDAY, APRIL 16—THE RISE IN SHIPPING FREIGHTS.—The Shipping Share Market is one of the few in which there has been any sustained investment interest over the past month or two. Belief in the possibilities of expanding international trade, together with the continued upward movement of freight rates, has been responsible for this investment interest. This article analyses the rising trend in freight rates on the most important shipping routes and thereby aids the Investor to make his selection amongst the various shipping securities quoted in the Market.

THE FINANCIAL NEWS

(Twopence Daily)

On sale at all railway bookstalls and good newsagents everywhere

BARLEY. "May" futures were quoted at 82½ cents per bushel in Winnipeg on Wednesday, against 84½ cents a week ago. Quotations per 48 lbs. in London on Wednesday were: "English feed," at farm, 36s., to 38s., as against 36s., to 38s., a week ago; "English malting," at farm, 38s., to 45s., against 38s., to 45s., last week. Californian (new), ex ship 49s., to 55s., against 54s., to 61s., a week ago. Chilean, brewing (new), ex ship, 44s. 9d. to 50s., against 44s. 9d. to 50s., a week ago.

OATS. On Wednesday, "May" futures were quoted at 50½ cents a bushel in Chicago, against 49½ cents a week ago and 48½ cents last month, quotations in London, Wednesday: "English black," at farm, 24s. 6d. to 26s. 6d. per 336 lbs., a week ago, as against 24s. to 26s., a week ago; "English White," at farm, 24s. 6d. to 26s. 6d., as against 24s. to 26s., a week ago; mixed Canadian feed (Vancouver), landed, 25s. 6d. per 320 lbs., as against 25s., a week ago.

MAIZE. Since the week-end a firm tone has developed in sympathy with Argentina, which has been influenced by United States buying. "May" futures were quoted on Wednesday at 125½ cents per bushel in Chicago, against 118½ cents a week ago and 108½ cents last month. Quotations in London, Wednesday: "Plate," landed, 30s. 3d. per 480 lbs., as against 29s. 9d. a week ago; "Plate," ex ship, 29s. 3d., as against 28s. 9d. a week ago; "Plate," Apr (new), 29s. 3d., as against 28s. 9d. a week ago; yellow maize meal, ex wharf, was quoted at £7 15s. per ton, as against £7 10s. to £7 12s. 6d. a week ago.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1935-37:—

NEAREST FUTURE	Jan. 2, 1935	Dec. 31, 1935	April 8, 1936	Dec. 30, 1936	Mar. 31, 1937	April 7, 1937
Winnipeg (No. 1, Manitoba) —Cents per 60 lb.—	82½	84½	79½	129	146½	147½
Chicago (No. 2, Winter) —Cents per 60 lb.—	98½	101½	94½	135½	142½	141½

The visible supply of wheat in Canada amounts to 82,568,000 bushels, against 83,841,000 bushels last week, and 111,746,000 bushels in the corresponding week last year.

SALES AND PRICES OF BRITISH CEREALS.—The following table gives the estimated sale of home-grown wheat during the harvest years 1933-34 to 1936-37:—

	1933-1934	1934-1935	1935-1936	1936-1937
Estimated sales of home-grown wheat—				
1 week to April 3	Cwts. 152,463	Cwts. 235,416	Cwts. 204,620	Cwts. 289,717
31 weeks to April 3	9,294,463	11,183,998	11,246,268	8,538,578
Average price of English wheat per cwt.	s. d. 4 4	s. d. 4 9	s. d. 6 5	s. d. 9 6

The following is a statement showing the quantities sold and the average price of British cereals in the past two weeks, and for the corresponding weeks in each of the years from 1933 to 1936:—

Week ended	QUANTITIES SOLD			AVERAGE PRICE PER CWT.		
	Wheat	Barley	Oats	Wheat	Barley	Oats
April 1, 1933	Cwts. 133,958	Cwts. 57,826	Cwts. 28,179	s. d. 5 2	s. d. 6 3	s. d. 5 11
March 31, 1934	152,463	31,031	23,851	4 4	8 5	6 0
April 6, 1935	235,416	60,682	29,128	4 9	7 2	6 11
April 4, 1936	204,620	71,760	40,706	6 5	7 6	6 1
March 27, 1937	190,881	51,503	30,468	9 2	10 1	8 2
April 3, 1937	289,717	83,499	52,922	9 6	10 0	8 3

OTHER FOODS

BACON.—The market was steady to firm. The official quotations (per cwt. for No. 1 Sizable) which formed the basis for dealings on the London Provision Exchange this week were: English, 92s. to 96s.; Canadian, 85s.; Danish, 92s., against 92s. to 96s., 85s., and 92s. last week. Arrivals in London last week included: Danish, 13,435 bales; Canadian, 6,790; Dutch, 2,303; Lithuanian, 1,209; and Polish, 2,867; as against 13,299, 6,584, 2,713, 1,190 and 3,006 bales, respectively, in the previous week.

BUTTER.—After a slow opening, the market had a steadier tone in mid-week. Quotations (per cwt.) on the London Provision Exchange on Wednesday were: New Zealand, finest salted, 100s.; Australian, choicest salted, 100s.; Danish, 114s. to 116s.; compared with 101s., 101s. and 118s. to 120s., respectively, a week ago.

CHEESE.—Demand improved during the week and the tone of the market became firm. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: English, finest farmers, 86s. to 92s.; Canadian, finest coloured, 74s. to 75s.; and New Zealand, finest coloured, 65s. 6d. to 66s., against 86s. to 92s., 73s. to 74s., and 65s. 6d. to 66s., respectively, a week ago.

COCOA.—Prices have suffered a sharp setback, both in London and in New York. The spot quotation in New York on Wednesday was 10½ cents per lb., as against 11½ cents per lb. last week. In London, on Wednesday last, good fermented new crop, Accra, "April-May," was quoted at 48s. 3d. per 50 kilos., c.i.f. Continent, against 52s. a week ago. Last week's movements of cocoa in London were as follows: Landed, 22,159 bags; delivered, for home consumption, 17,500 bags; exported, 169 bags; stocks, 257,603 bags, against 148,209 bags a year ago.

COFFEE.—The London spot market was quiet, and in New York an easier tendency was evident. On Wednesday, Rio No. 7 (cash) was quoted at 9 cents per lb. in New York, as compared with 9½ cents per lb. last week and 9½ cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, 23 cwt.; delivered, for home consumption, 534 cwt.; exports, nil; stocks, 2,576 cwt., against 11,728 a year ago. Central and other South American: Landed, 9,968 cwt.; delivered for home consumption, 2,698 cwt.; exported, 483 cwt.; stocks, 99,079 cwt.,

against 106,469 last year. Other kinds: Landed, 12,706 cwt.; delivered, for home consumption, 2,647 cwt.; exported, 1,716 cwt.; stocks, 133,261 cwt., against 162,293 last year.

EGGS.—Prices showed an easier tendency in response to heavier arrivals. At Smithfield, on Wednesday, English (ordinary packing, Grade 1, about 15-15½ lb.) realised 10s. to 10s. 3d. per 120, as against 10s. 3d. to 11s. last week; while Danish (15½ lb.) made 8s. 6d. to 8s. 9d., as against 9s. 3d. to 9s. 6d. last week.

FRUIT.—Following the quiet spell which occurred after Easter, business at Covent Garden has shown an improvement and quotations are frequently higher. According to *The Fruitgrower*, apples remain an active trade at firm prices. Pears are selling fairly well, supplies from South Africa now being supplemented by arrivals from Australia; prices for the most part hold steady. South African grapes sell particularly well, quotations being firmer for all varieties. Hothouse grapes are now very limited. South African plums are steady, while peaches and nectarines from the same source are in short supply. English forced strawberries are a rather more prominent item, with finest selling up to 25s. per lb. With the approaching end of the season, oranges are inclined firmer for reliable parcels of Java and Spanish. Grapefruit are selling better, but lemons are a point easier.

MEAT.—After a moderate business had been transacted at Smithfield on Monday, demand became less active and prices eased. On Wednesday last, Argentine chilled hindquarters were quoted at 3s. 8d. to 4s. per 8 lbs., as compared with 3s. 6d. to 4s. a week ago. New Zealand frozen mutton was 3s. 2d. to 4s. per 8 lbs., against 3s. 4d. to 4s. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 8,488 tons, a decrease of 757 tons on the corresponding week last year.

PEPPER.—On Wednesday, Singapore white Muntok, spot, was quoted at 6d. per lb. in bond, against 6d. per lb. a week earlier. Black Lampung, spot, in bond, was quoted at 3½d. per lb. sellers, compared with 3½d. per lb. last week. Movements of pepper in London last week were as follows: Black, landed, nil; delivered, 4 tons; stocks, 1,802, against 1,695 last year. White, landed, 5 tons; delivered, 58 tons; stocks, 11,729, compared with 12,581 a year ago.

RICE.—The spot price of Burma No. 2, cleaned, was 10s. per cwt. ex warehouse, on Wednesday, as compared with 10s. per cwt. a week ago. "April-May," in singles to Continent and U.K., was quoted at 9s. 1½d. per cwt., against 9s. for "March-April" last week. Movements in London last week were as follows: Landed, 36 tons; delivered, 62 tons; stocks, 1,054 tons, against 923 a year ago.

SUGAR.—Although the week was marked by the opening of a world conference in London to discuss sugar problems, prices were rather lower, both in London and New York. The New York spot quotation was 3.45 cents on Wednesday, as compared with 3.55 cents per lb. last week and 3.55 cents per lb. a month ago. Wednesday's sales of raw sugar in London included "May" delivery at 6s. 6½d. to 6s. 7½d., against 6s. 8½d. to 6s. 9d. a week ago. Movements of raw sugar in public warehouses in London and Liverpool last week were as follows: Imports, 13,279 tons, against 19,353 in the previous week and 7,748 in the same week of 1936; deliveries, 17,894 tons, against 12,953 and 16,367 tons, respectively; stocks, 202,325 tons, against 206,940 and 222,293 tons, respectively.

TEA.—At this week's public auctions in Mincing Lane, 52,611 packages of Indian and 17,322 packages of Ceylon tea came up for disposal. Prices of Indian grades advanced under a strong demand. At Tuesday's Ceylon sale, common and medium teas made better prices, but fine qualities, although selling well, were rather easier.

VEGETABLES.—In consequence of heavier arrivals, cucumbers, forced beans and Canary Island tomatoes are easier in price, states *The Fruitgrower's* Covent Garden report. Asparagus is making a better showing, while lettuce is doing much better. New peas from Guernsey now realise 2s. 6d. to 3s. 6d. per lb., while a few tomatoes from the same source have put in an appearance. All good greenstuff and cauliflowers are doing better, while rhubarb meets a steady sale. Spring onions are dearer and business in carrots, turnips and parsnips has improved. Meanwhile, new potatoes are in increasing supply. Stocks of old potatoes are now reported to be low, and prices have again moved upward. Thus, at the Borough Market on Tuesday, best sitland King Edward realised 10s. to 11s. per cwt., ex market, against 9s. 6d. to 10s. 6d. last week.

MISCELLANEOUS COMMODITIES

VEGETABLE OILS AND OLSEEDS.—High and advancing prices have had a restrictive effect on business. Linseed is dearer in sympathy with Argentine options and partly by reason of higher freight rates, but there is very little demand from U.K. crushers. Plate seed is in some request on Continental account. Interest here is mainly centred in the new Indian crop, shipment of which has begun. Business, however, is very slow. The final estimate of the Argentine Government indicated a rather smaller acreage under linseed than that originally returned. Meanwhile, shipment has continued at a high rate, leaving an exportable surplus of only 893,000 tons on March 31st, the total given by the Government after a thorough investigation of stocks in warehouse, on rail, or in growers' hands. The quantity available from India is variously estimated at from 300,000 to 350,000 tons, but this is largely conjectural. Inclusive of supplies from Uruguay and elsewhere world supplies are probably no more than 1,300,000 tons, or rather less than the quantity actually shipped in April-December last year, notwithstanding the larger Plate crop. There have been heavier shipments to Europe, but the main cause of the speedy absorption has been the increased demands of the United States and Canada amounting to 260,000 tons, against 87,000 tons last season. Linseed oil is in fair demand from consumers and is on balance 10s. per ton dearer on the week, being now quoted at the highest level for some years. There has been a sharp break in Egyptian cottonseed and trade remains poor. The oil product, however, is firm and large shipments have recently been made from Hull to America.

RUBBER.—After last week's advance, the market developed an easier tone, and prices were already weak on Wednesday when the general setback on the commodity markets accentuated the decline. Meanwhile, United Kingdom stocks continue to decline, but the labour situation in the United States is still difficult. The spot price in New York on Wednesday was 24½ cents per lb., compared with 26½ cents per lb. a week ago and 23½ cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 1s. 0½d. per lb., as against 1s. 1½d. on the corresponding day last week. In forward positions, business has been done at 1s. 0½d. to 1s. 0½d. for "May" shipment, as against 1s. 1½d. to 1s. 1½d. a week ago. Stocks in London and Liverpool at the end of last week totalled 51,579 tons, against 53,818 tons a week earlier. A year ago stocks amounted to 147,557 tons.

WHOLESALE COMMODITY PRICES

UNITED KINGDOM: LONDON, April 7th.

The prices in the following are revised with the assistance of an eminent firm in each department

CEREALS AND MEAT				POTATOES—				WOOL—				INDIGO—

DAGGAFONTEIN MINES, LIMITED

(Incorporated in the Union of South Africa.)

CAPITAL : Authorised £2,000,000. Registered and Issued £1,750,000.
In 7,000,000 shares of 5s. each, fully paid.

EXTRACT FROM ANNUAL REPORT TO 31st DECEMBER, 1936.

Tons Milled	1,524,000.	Yield (per ton 5.95 dwts.)	453,418 ozs.
Revenue (per ton milled 41 7.791)	£3,173,670	Government Taxes	£411,476
Working Costs (per ton milled 21 2.372)	1,615,261	Government Participation in Profits	241,169
Working Profit (per ton milled 20 5.419)	1,558,409	Reserve for Liability under Miners' Phtisis Act	773
Sundry Revenue, less Expenditure	14,554	Dividend No. 7 - 23 1/2 per cent.	415,625
Total Profit	1,572,963	Dividend No. 8 - 25 per cent.	437,500
Add :-		Directors' Special Remuneration	4,382
Balance to credit of Appropriation Account at 31st December, 1935	91,172	Appropriated for Capital Expenditure	78,373
	£1,664,135	Balance unappropriated at 31st December, 1936	74,837
			£1,604,135

ORE RESERVE.—The Ore Reserve was re-calculated at the end of 1936, and disclosed the following:—

Tons	7,413,021
Stope width (inches)	41.13
Stope value (dwts.)	6.59
Inch-dwts.	271

DEVELOPMENT.—The development accomplished during the year amounted to 55,043 feet, which was a record for the mine. The percentage payable was 56.0, average reef width 18.04 ins., average assay value 18.19 dwts. and inch-dwts. 345. In addition 14,329 feet were developed for East Daggafontein Mines, Limited, and 905 feet for Vogelstruisbult Gold Mining Areas, Limited.

MAY SHAFT.—During the year the shaft was sunk 2,280 feet to a total depth of 3,985 feet, and a further 40 feet of sinking will complete it.

Kimberley Reef.—In view of the encouraging results obtained on certain reefs of the Kimberley Series in No. 3 Shaft, all bands of reef exposed in sinking the May Shaft through this horizon were sampled. At a depth of 2,481 feet one of the reefs of the Kimberley Series was intersected which disclosed satisfactory values. This reef over 8 sections all giving payable results, averaged 6.7 dwts. over a width of 44.4 inches, equivalent to 297 inch-dwts. A station is being cut at this elevation to permit of rapid development on this reef, but actual work will have to wait until the shaft is connected with the workings of this Company and East Daggafontein Mines, Limited, on the Main Reef horizon.

Main Reef.—Later in the year the Main Reef was intersected at a depth of 3,867 feet, and over 20 sections sampled disclosed an average value of 7.19 dwts. over 35.35 inches, equivalent to 254 inch-dwts.

THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED FROM THE LONDON SECRETARIES OF THE COMPANY, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LTD., 11, OLD JEWRY, LONDON, E.C.2.

WESTERN REEFS EXPLORATION AND DEVELOPMENT COMPANY, LTD.

(Incorporated in the Union of South Africa.)

CAPITAL : Authorised £2,000,000. Registered and Issued, £862,500.
In 3,450,000 Shares of 5s. each, fully paid.

EXTRACT FROM ANNUAL REPORT TO 31st DECEMBER, 1936.

FINANCE.—The Cash Receipts and Expenditure from the Inception of the Company to the 31st December, 1936, were as follows:—

RECEIPTS		EXPENDITURE	
Working Capital—		Property, Options and Rights on Farms	£ 507,640 10 10
2,442,500 Shares at 5s. each	£ 12,212,500 0 0	Shaft Sinking and Equipment	128,447 1 0
1,007,500 Shares at 37s. 6d. each	1,889,062 10 0	Boreholes and Prospecting	225,243 17 0
Sundry Revenue received to date	3,330 10 2	Joint Prospecting Ventures	11,511 6 6
		General Expenditure	40,817 14 6
		Cash and Cash Assets, less Creditors	913,660 15 10
			1,589,366 4 4
			£2,503,027 0 2

OPERATIONS.—The footage drilled during the year under review was 22,165 feet. This footage is considerably less than the 54,350 feet done during the previous year, but this is accounted for by the fact that towards the middle of the year the stage had been reached whereat it was unnecessary to incur further expenditure on diamond drilling. The information disclosed by this work was sufficiently positive to justify the commencement of shaft sinking and development work, and boring operations were discontinued in the area in respect of which it was intended to apply to the Government for a lease of the undermining rights.

Application was accordingly made on behalf of the Company for a Mining Lease, and after this had been granted the preliminary work in connection with shaft sinking was started in September. In this area two shafts are being put down, each of six large-size compartments. At the end of the year the No. 1 Shaft had reached a depth of 34 feet. No. 2 Shaft had been sunk to a depth of 19 feet and the collar set completed.

It is hoped to have the winders for No. 1 Shaft in operation by the end of May, after which rapid progress in sinking should be made. This shaft should intersect the reef at a comparatively shallow depth.

The equipment for No. 2 Shaft, in which the reef intersection is estimated to be at an approximate depth of 4,000 feet, is expected to be in operation towards the end of July.

The Company has also been granted a Prospecting and Mining Lease over an area adjacent to that covered by the Mining Lease. Drilling will shortly commence in this area.

THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED FROM THE LONDON SECRETARIES OF THE COMPANY, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LTD., 11, OLD JEWRY, LONDON, E.C.2.

EAST DAGGAFONTEIN MINES, LTD.

(Incorporated in the Union of South Africa.)

CAPITAL : Authorised £1,500,000. Registered £1,350,000. Issued £1,216,100 10s. In 1,501,251 fully paid shares of 10s. each, and 930,950 partly paid shares of 10s. each, 1s. per share paid up.

EXTRACT FROM ANNUAL REPORT TO 31st DECEMBER, 1936.

CAPITAL.—Since the end of the year, 267,799 shares have been issued in respect of options exercised, bringing the issued capital to £1,350,000 in 2,700,000 shares of 10s. each.

FINANCE.—The cash receipts and expenditure from the inception of the Company to the 31st December, 1936, were as follows:—

RECEIPTS		EXPENDITURE	
Working Capital—		Purchase of 50 per cent. undivided interest in 179 Discoverer's Claims	£ 100,000 0 0
1,169,050 Shares at 10s. each, fully paid	£584,525 0 0	Survey and Transfer Expenses	2,802 16 7
330,000 Shares at 10s. each, fully paid, issued at 30s.	495,000 0 0	Shaft Sinking, Permanent Haulageways and Equipment	645,609 9 6
930,950 Shares at 10s. each, 1s. per Share paid up	46,547 10 0	Development	124,009 2 0
2,201 Shares at 10s. each, fully paid, issued at 37s. 6d.	4,126 17 6	General Expenditure	54,534 13 3
Sundry Revenue	15,129 17 6	Cash and Cash Assets, less Creditors other than Applicants for Shares at 37s. 6d. as above	926,956 1 4
Sundry Creditors for 267,799 Shares at 37s. 6d., allotted 5th January, 1937	502,123 2 6		720,496 6 2
	£1,647,452 7 6		£1,647,452 7 6

DEVELOPMENT.—The development accomplished during the year was 14,135 feet. This footage was advanced by Daggafontein Mines, Limited. Of the footage sampled during the year, 48.5 per cent. (4,410 feet) proved payable and disclosed an average value of 29.43 dwts. over a width of 10.72 inches, equivalent to 315 inch-dwts. For the previous year the percentage payable was 30.4 per cent. (2,880 feet), the value being 22.59 dwts. over a width of 10.78 inches, or 244 inch-dwts.

ORE RESERVE.—The Ore Reserve was calculated at the end of 1936, disclosing the following:—

Tons	643,181
Stope width (inches)	37.32
Stope value (dwts.)	6.33
Inch-dwts.	239

MAY SHAFT.—During the year this shaft was sunk 2,280 feet to a total depth of 3,985 feet, and a further 40 feet of sinking will complete it.

KIMBERLEY REEF.—In view of the encouraging results obtained on certain reefs of the Kimberley Series in No. 3 Shaft, Daggafontein Mines, Limited, all bands of reef exposed while sinking the May Shaft through this horizon were sampled. At a depth of 2,481 feet one of the reefs of the Kimberley Series was intersected which disclosed satisfactory values. This reef, over 8 sections, gave payable results averaging 6.7 dwts. over a width of 44.4 inches, equivalent to 297 inch-dwts. A station is being cut at this elevation to permit of rapid development on this reef, but actual work will have to wait until the shaft is connected with the Daggafontein and East Daggafontein workings on the Main Reef horizon.

MAIN REEF.—Later in the year the Main Reef was intersected at a depth of 3,867 feet; the 20 sections sampled disclosed an average value of 7.19 dwts. over 35.35 inches, equivalent to 254 inch-dwts.

Development on this horizon is proceeding, and connections with the workings from the existing shafts should be made within a few months.

THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED FROM THE LONDON SECRETARIES OF THE COMPANY, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LTD., 11, OLD JEWRY, LONDON, E.C.2.

THE SOUTH AFRICAN LAND AND EXPLORATION COMPANY, LIMITED

(Incorporated in the Union of South Africa.)

CAPITAL : Authorised £1,000,000. Registered £350,000. Issued £306,250.
In 1,750,000 shares of 3s. 6d. each, fully paid.

EXTRACT FROM ANNUAL REPORT TO 31st DECEMBER, 1936.

CAPITAL.—The Registered Capital at 31st December, 1935, was 1,992,500 shares which was increased during 1936 by the creation of 7,500 shares, making it 2,000,000 shares of 3s. 6d. each = £350,000.

	Shares of 3s. 6d. each.
The Issued Capital at 31st December, 1935, was	1,727,486
Options exercised during 1936	2,398
Shares issued at the current market price in respect of Options not exercised	116
To Vendors of Witpoortje No. 2	20,000
Making the Issued Capital as above—£306,250	1,750,000
To be issued to Brakpan Mines, Limited, when the transfer of 714 claims from that Company is completed	250,000
	2,000,000

FINANCE.—The Expenditure and Revenue Account for the year shows a surplus of revenue over expenditure amounting to £3,494 3s. 8d. This surplus has been added to the balance of £23,380 16s. 11d. unappropriated at the 31st December, 1935, making a total of £26,875 0s. 7d. Appropriations as shown in the accounts call for £605 6s. 11d., leaving a balance of £26,269 18s. 8d. to be carried to the Balance Sheet. An amount of £12,998 5s. 8d. was expended on Property Account during 1936, representing transfer duty and expenses in connection with the claims acquired on Witpoortje No. 2. The expenditure during the year on Shaft Sinking, Permanent Haulageways, and Equipment, amounted to £468,499 10s. 4d. Development cost £73,076 12s. 1d., and these two items have been debited to "Expenditure on Witpoortje No. 2," increasing the balance of this account from £353,491 7s. 3d. at the 31st December, 1935, to £895,067 9s. 8d. as shown in the Balance Sheet.

OPERATIONS.—From the commencement of development work in 1933, nearly 55,000 feet had been done up to the end of 1936. This work to date has resulted in payable disclosures over 15,120 feet, representing 45.43 per cent. of the total footage sampled. The width of the payable disclosures was 39.3 inches, and the average value 11.8 dwts., giving a figure of 464 inch-dwts.

ORE RESERVE.—The Ore Reserve was calculated at the end of 1936, disclosing the following:—

Tons	1,542,210
Stope width (inches)	49.78
Stope value (dwts.)	6.18
Inch-dwts.	308

REDUCTION PLANT.—The design and layout of the reduction plant has been completed, and a start has been made with the excavations, foundations and erection of the sorting and crushing plant. Orders have been placed for the crushing and treatment plants.

THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED FROM THE LONDON SECRETARIES OF THE COMPANY, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LTD., 11, OLD JEWRY, LONDON, E.C.2.

BRAKPAN MINES, LIMITED

(Incorporated in the Union of South Africa.)

CAPITAL: Authorised £1,250,000. Registered and Issued £1,150,000.
In 4,600,000 Shares, of 5s. each, fully paid.

EXTRACT FROM ANNUAL REPORT TO 31st DECEMBER, 1936.

Tons milled	1,631,000	Yield (per ton 5.12 dwts.)	417,505 ozs.
Revenue (per ton milled 35 10.86)	£2,928,713	Government Taxes	£473,728
Working Costs (per ton milled 19 8.84)	1,609,516	Government Participation in Profits	133,267
Working Profit (per ton milled 16 2.12)	1,319,197	Reserve for Liability under Miners' Phthisis Act	2,519
Sundry Revenue, less Expenditure	13,156	Dividend No. 48—2½ per cent.	316,250
Total Profit	1,332,353	Dividend No. 49—30 per cent.	345,000
Add:—		Directors' Special Remuneration	7,500
Balance to credit of Appropriation Account at 31st December, 1935	86,153	Capital Expenditure	44,250
	£1,418,506	Balance unappropriated at 31st December, 1936	95,986

ORE RESERVE.—The Ore Reserve was re-calculated at the end of 1936, and disclosed the following:—

Tons	6,600,350
Stope width (inches)	48-65
Stope value (dwts.)	6-12
Inch-dwts.	208

DEVELOPMENT.—The footage accomplished was 65,561 feet which was an increase of 2,090 feet over the period 1935. The percentage payable was 40-0, the average reef width 34-84 inches, and the average assay value 11-36 dwts.

THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED FROM THE LONDON SECRETARIES OF THE COMPANY, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LTD., 11 OLD JEWRY, LONDON, E.C.2.

SPRINGS MINES, LIMITED

(Incorporated in the Union of South Africa.)

CAPITAL: Authorised £1,750,000. Registered and Issued £1,560,000. In 6,240,000 shares of 5s. each, fully paid.

EXTRACT FROM ANNUAL REPORT TO 31st DECEMBER, 1936.

Tons Milled	1,660,300	Yield (per ton 6.11 dwts.)	507,298 ozs.
Revenue (per ton milled 42 9.829)	£3,554,624	Government Taxes	£440,148
Working Costs (per ton milled 18 7.449)	1,545,801	Government Participation in Profits	638,277
Working Profit (per ton milled 24 2.380)	2,008,823	Reserve for Liability under Miners' Phthisis Act	7,238
Sundry Revenue, less Expenditure	397	Dividend No. 34—23½ per cent.	370,500
Total Profit	2,009,220	Dividend No. 35—28½ per cent.	448,500
Add:—		Directors' Special Remuneration	7,500
Balance to credit of Appropriation Account at 31st December, 1935	62,317	Capital Expenditure	97,212
	£2,071,537	Balance unappropriated at 31st December, 1936	59,112

ORE RESERVE.—The Ore Reserve was re-estimated at the end of 1936, and disclosed the following:—

Tons	10,123,021
Stope width (inches)	42-59
Stope value (dwts.)	5-73
Inch-dwts.	244

DEVELOPMENT.—The footage of 19,475 feet accomplished on the horizon of the Main Reef Lender shows a decrease of 3,747 feet compared with the previous year. The percentage payable was 39-35, average reef width 30-35 ins., average assay value 10-67 dwts. Inch dwts. 324. In addition some further exploratory development was done on the Kimberley Reef. In all, 617 feet was accomplished of which 455 feet was sampled disclosing an average value of 0-22 of a dw. over a width of 85-49 ins.

THE FULL REPORT AND ACCOUNTS CAN BE OBTAINED FROM THE LONDON SECRETARIES OF THE COMPANY, ANGLO AMERICAN CORPORATION OF SOUTH AFRICA, LTD., 11 OLD JEWRY, LONDON, E.C.2.

WEST SPRINGS, LIMITED

(Incorporated in the Union of South Africa.)

CAPITAL: Registered and Issued, £1,900,000. In Shares of £1 each, fully paid.

EXTRACT FROM ANNUAL REPORT TO 31st DECEMBER, 1936.

Tons milled	1,218,100	Yield (per ton 3.06 dwts.)	186,514 ozs.
Revenue (per ton milled 21 5.44)	£1,306,618	Government Taxes	£24,718
Working Costs (per ton milled 14 5.702)	881,612	Government Participation in Profits	164,949
Working Profit (per ton milled 6 11.738)	425,006	Reserve for Liability under Miners' Phthisis Act	2,488

COMMERCE AND TRADE

Labour's Share

AFTER several years of almost unprecedented industrial peace, there has been a marked recrudescence since the beginning of the year, and especially in recent weeks, of disputes between employers and trade unions. Few of these disputes, it is true, have yet reached the stage of strikes, and almost the only important stoppages are those which have occurred in the Clydeside engineering industry. But at least two disputes which are now in their earlier stages threaten to result in strikes of major dimensions. The miners have been polled this week on the question whether they will contemplate a national strike to oust the "industrial" union from the Nottinghamshire coalfield; and the London busmen are threatening to strike in support of their demand for a reduction in the length of the working day.

There are always, of course, at any time, some industrial disputes latent. What is new in recent weeks is not only the number of such disputes which have come to the surface, but the more resolute spirit to be observed in the unions. It is beginning to look as if the period of industrial peace which has lasted for several years is drawing to a close. In the seven years between the end of 1929 and the end of 1936, the number of days lost in trade disputes was only about one-tenth of one per cent. of the number of days worked—an average stoppage for each worker of two hours per annum.

A number of obvious explanations of this extraordinary period of trade union quiescence present themselves. British labour, for more than a decade, has been in a political rather than an industrial mood; during the depression the existence of a very heavy volume of

unemployment has acted as a deterrent to strike action; and the growing smoothness with which the machinery of collective bargaining in British industry works has made it possible for changes in wage-rates, both downwards and upwards, in recent years, to be accomplished peacefully. But more important than any of these causes has been the plain fact that the real income of the British worker rose during the depression. Money wage-rates fell, according to the Ministry of Labour index, by 4½ per cent. between 1929 and 1933 (the average figure for the whole year being taken in each case). But in the same period the cost of living fell by 14½ per cent., so that real wage rates rose by 11½ per cent. This figure refers, of course, only to those who remained in full employment; the percentage of unemployment rose in the same period from 10.3 per cent. to 21.9 per cent. of those insured, and there was a great increase in the amount of short-time worked which did not reveal itself in the unemployment returns. But the fully employed remained the great majority, and their gain in real income undoubtedly outweighed the losses of the unemployed and under-employed. Statistics of the consumption of foodstuffs confirm that the real standard of living of the people as a whole actually increased in the years of deepest depression.

Between 1933 and 1936 the level of real wages has been not quite maintained. Wage rates have increased by about 4½ per cent., but the cost of living has risen by about 5 per cent. Real wages, on the average of the year 1936, were within one per cent. of their 1933 peak. But by December, 1936, they were 2½ per cent. lower, and there have been further increases in the cost of living

since the New Year. During this period of recovery, both unemployment and short-time have been reduced, so that a stable level of real wage rates has not prevented a continued expansion of popular consumption. But the trade unions are always most closely concerned with the standards of workers in full employment, and the explanation of the sudden recrudescence of industrial disputes is mainly to be found in the sharp fall in the level of real wages which has begun in recent months and has every appearance of proceeding further in the immediate future.

There are, of course, other elements in the picture. Profits are still rising rapidly, increasing the unions' estimate of what the employer can afford to concede. In a growing number of industries a real shortage of labour, especially skilled labour, is daily increasing the unions' bargaining power. And finally, there are, as always, insurgent minorities in many unions pushing their leaders forward.

The public must, it thus appears, prepare itself for a period of increasing pressure from the unions for concessions. There is nothing in such a prospect to excite alarm. On the contrary, pressure by the unions in periods when their bargaining power is strong is one of the most valuable means for keeping the managers of industry up to the mark and for stimulating the efficiency of all enterprises. In the circumstances of the present, the distribution to labour of a considerable share in the advancing profits of industry would not merely be wise and equitable from the social standpoint, but would also have considerable economic advantages, since it would maintain, and perhaps increase, the output of consumption goods and prevent the national economy from being excessively diverted into the production of armaments.

It will be a pity, however, if these concessions to labour generally take the stereotyped form of flat-rate additions to standard wage-rates. We should not forget the lesson of 1920, when the principle of adjusting wages by the cost of living was abandoned, in many industries, at the peak of the price-curve, with an incalculable cost in later recrimination. Both Capital and Labour should recognise that no price-level and no wage-rate can be eternal in a world which promises to be little, if any, more stable in the future than in the past. There remains, moreover, the wider question whether Labour's share of advancing prosperity should always take the form of higher wages. There is some danger of Britain's becoming a laggard in the matter of hours, since the 40-hour week is now observed in large sections of American and French industry. The PRIME MINISTER has this week suggested the wisdom of reducing existing hours "in cases where nervous strain plays a large part in the lives of men"; and, in any case, Britain does not wish to be left on a par with Japan or with the slave-States over which the dictators rule. If the rise of prices continues, wage increases will have to become general. But they might well be admixed, where practicable, with reductions of hours, particularly in the form of the institution of the five-day week.

In all this impending period of adjustment, the public will hope that peace will prevail. Open strife, in the industrial sphere as in the international, is a shameful confession of the bankruptcy of statesmanship. But with goodwill, and recognition on both sides of the larger issues involved, there is reason to hope that the adjustments will be made without any serious disturbance of the progress of recovery and without any creation of lasting bitterness in either party.

World Politics and Prices

SEVEN years ago the collapse of world prices launched the Great Depression; and an era of high tension in world politics began. Now, on all hands, we see evidences that the Great Depression is passing. The rapid recovery in world prices which developed barely a year ago received a powerful impulse when the currencies of the erstwhile gold bloc were devalued last autumn; and to-day, despite persistent alarms and excursions in Europe, rising prices and expanding trade have begun to lower the tension of world politics.

But there is another side to this new picture. In dictatorships and democracies alike the Great Depression intensified autarkic expedients; and to-day the burden of self-sufficiency is beginning to be realised—not by the heads of States, but by the feet, where the shoe pinches. And it is natural that where the greatest measure of economic dragooning by the State has taken place for militaristic purposes the pressure of rising world prices should begin to pinch first.

The two European Great Powers most vulnerable to the present upward trend in world prices are Germany and Italy. They both depend on imported raw materials; they have both pushed distortion of their economic structures for military ends to greater lengths than any other European country; and, accordingly, those structures to-day do not possess the degree of adaptability necessary to meet a new, unforeseen state of affairs. In Russia, the third totalitarian Great Power in Europe, the process of autarky was begun early—not without some compulsion from the ex-Allied Powers—a score of years ago; and to-day she is beginning to exploit the forced savings of the past decade and to command the products of the outer world by means of her export surplus and her gold shipments. Of the five European

Great Powers to-day, Russia cannot be upset by the quick turnover of the world economy from depression to boom, while France and Britain still have the ability to adapt their economic structures to it. But Nazi Germany and Fascist Italy cannot do so without destroying the ponderous economic apparatus reared during the depression. Thereby hangs a political tale, the implications of which are worth pursuing.

Both Italy and Germany were able, during the depression, to drive hard bargains with the smaller States who could not dispose of their raw materials and foodstuffs elsewhere owing to the collapse of prices, the rise of tariffs, and import quotas. Then it was a buyer's, a debtor's, market. Hungary, Bulgaria, Roumania, Yugoslavia, Greece, Poland, even Scandinavia, the Low Countries, and Central and South America were constrained to sell to Germany and Italy; and when the time for payment came most of them found themselves with blocked balances, convertible only by degrees into imports of specific manufactures—even munitions. In some cases, so great was Germany's and Italy's need of free foreign currencies wherewith to pay for imports that could only be bought from the free markets of the world, that these totalitarian customers shipped their imports from the smaller States on to the world market. They made a loss, but they obtained at least some free devisen. Germany used up almost all her gold reserves; and the Abyssinian adventure depleted those of Italy. Moreover, both Governments requisitioned all foreign assets of their nationals, individual and corporate; and especially in the last twelve months, the export subsidies of Germany and the calamitous running import surplus of Italy (who has not yet recovered her pre-sanctions foreign trade) have had to be financed by regular sales

of such assets on foreign Stock Exchanges. Again, in the recent scramble for the available supplies of tin, zinc, copper, nickel, iron ore, rubber, and even wheat, cotton and wool, Italy and Germany have been the least favoured. Trade with them is hampered by cumbrous restrictions; they must secure more export orders to pay the higher world prices; and they cannot raise the prices of their exports in anything like the same proportion as those of the imported raw material. Both countries are so tangled up in exchange controls of their own creation that it is hard to see how, unilaterally, they could ever extricate themselves.

In these circumstances, the growing movement among the democratic nations for freer trade—led by the United States, Belgium, Holland and Scandinavia—acquires a deep political, as well as economic, significance. On Monday and Tuesday, DR SCHACHT was the guest of the Prime Minister of Belgium, M. VAN ZEELAND, who has for long been canvassing the possibilities of freer trade, and is now engaged in drawing up a report on the requisite first steps, with the concurrence of the British and French Governments. DR SCHACHT admitted on Tuesday that Germany's efforts at self-sufficiency in certain fields were much more expensive than a return to freer trade. He declared that Germany would co-operate with those countries undertaking to reverse the present trend; that Germany would contribute to M. VAN ZEELAND's preparatory work; and that Germany would certainly admit Russia into an international agreement. Although DR SCHACHT spoke for himself alone, the significance of his declarations cannot be overlooked. If less than a year of expanding trade and rising raw material prices can transform the economic and political outlook in Europe, even only to this extent, the possibilities of political and economic appeasement which

might be realised by determined and effective leadership among the democratic nations at this juncture impose on the British Government the responsibility for seeing that the opportunity is not allowed to slip. They are assured, beforehand, of the unstinted support of the Oslo group of the Scandinavian and Low Countries, of France, and of the United States; and the countries of the Danube basin, including Austria and Hungary, are to-day nearer economic harmony than at any time in the last seven years. This is too imposing an array of peaceable and powerful countries to be disarrayed by the British Government's attachment to the almost empty achievements of narrow, Ottawa imperialism. MR NEVILLE CHAMBERLAIN's answer in the Commons on Monday is therefore the more disturbing in its equivocation:—

Mr Boothby asked if the right hon. gentleman contemplated entering into negotiations with the United States and France for the conclusion of an economic agreement covering a rather wider field and of a more permanent nature.

Mr Chamberlain said he was not contemplating that at the present time "We did say at the time the agreement was made that we hoped it might be followed by further measures with a view to lowering the restrictions in the way of international trade. The question that I was asked just now was whether I contemplated entering into negotiations for that purpose to-day, and I replied in the negative."

We repeat what we said last week in this respect: for Britain, for the British Empire, for democracy, and for an economically well-founded peace, it is now or never. If the British Government reply "Not now," they are really replying "Never." Theirs is the responsibility; but the cost will have to be paid for many years after this Government and its members have passed away.

The Finance of Football

A WEEK ago 105,449 people watched Sunderland and Preston North End win their way to the Final in the two semi-final ties of the Football Association Cup. This figure is greater than the population of Grimsby, Burnley, Halifax or Walsall; but the enthusiasm which it illustrates is by no means new. From the ancient days of Greece and Rome crowds have flocked to witness games. Every competitive game is spectacular; and, to-day, when we live in a world of towns, we more than ever find release from the workaday round in the thrill and skill of athletic contests.

We no longer bait bears or match fighting cocks; nor, in this country, have we any enthusiasm for the bloodthirsty art of bull-fighting. But our sports are legion, and there is money in all our games. ARCHIE COMPTON is reputed to make £1,000 a year in side-bets alone on his golf games. FRED PERRY has earned £20,000 in a few months of professional tennis. One five-day Test Match at Melbourne brought in over £90,000 at the gate. The towering stands of Aintree, Epsom, Wembley, don, Wembley and Twickenham bear witness of the money spent on sport.

Association Football is, however, the most popular of all our games. It is the national sport. It is played by more people than any other game; and more spend their holiday afternoons in watching the clash of its highly-skilled professional exponents than in any other way. From September to May the competitions for the League and the Cup are waged before the eyes of millions of spectators. Over 90,000 people watch the Cup Final in April or May at Wembley, and they pay nearly £25,000.

Despite the national status of the game, however, the

financial side of football is shrouded in relative obscurity. Attendance figures for League matches are regularly estimated; the actual gate receipts of games in the later stages of the Cup competition are published; and large sums are occasionally mentioned in connection with the transfer of players from one club to another. The full facts, however, are little known. What are the sums involved, the incomes of well-known football clubs, their expenses and their profits? Only approximate answers can be given, but the available data are sufficiently accurate to give some idea of the money spent in England on our national game.

The majority of Football League clubs are organised as private limited companies, and some information can be gleaned from their balance sheets. But the main items of income and expenditure, i.e. gate receipts and wages, are not easy to ascertain. The figures of the money paid by spectators at the gate in the current Cup competition, from the Third Round (when the crack teams of the senior Divisions of the League began to participate) have, however, been published as follows:—

	Number of Matches	Receipts £'000
Third Round	36 (4 replays).....	58.6
Fourth Round	20 (4 replays).....	43.4
Fifth Round	10 (2 replays).....	34.0
Sixth Round	6 (2 replays).....	25.0
	72	161.0

The two semi-final matches (which followed the Sixth Round) realised over £10,500, and last year's Final brought in £24,857. We can, therefore, estimate that the receipts from Cup matches, from the Third Round to the Final, are about £190,000.

The gate receipts of League matches are much more difficult to estimate. The capacities of the grounds of different clubs vary greatly. Some clubs, like Charlton Athletic, devote most of their accommodation to banked standing places for spectators paying 1s. and 1s. 6d. Others, however, like the Arsenal, reserve much more space for the more highly-priced seats. The receipts of a First Division club may be anything from £1,000 to £3,000 for a home Saturday match; and £1,500 is probably a reasonable estimate of the average gate receipts on fine afternoons for First Division matches.

There are 22 clubs in the First Division. Each plays 42 League matches in a season, about 39 of which are arranged for Saturdays and Bank Holidays. The receipts of all the First Division clubs, taken together, can be put at approximately £16,000 a week, and £640,000 in a season. Receipts in the Second Division and the two sections of the Third are much smaller, but the average takings per Division (22 clubs) are probably not much less than half the average for the First Division. Thus we reach an estimate of annual takings for the whole of the Football League of about £1,500,000.

By far the most important charge on these large annual takings is the remuneration of the players. The Football League lays down certain maximum rates of payment. Most regular First Division players receive a weekly wage of £8 in the playing season and £6 in the summer. Each player also receives £2 for every match won in which he plays and £1 for a drawn game. The average earnings of the ablest players are probably about £420 a year. In addition, most regular players are given a benefit at the end of every period of five years' service, but the proceeds must not exceed £650. Actuarially, football is not among the overpaid professions. A footballer is lucky if he remains fit, skilful and unhurt until the age of 35. He usually plays for a crack club and earns the maximum wage for only a part of a short, precarious career and receives no pension.

It is impossible to determine from club balance sheets exactly what actual sums are paid out in wages and benefits, since these items are usually combined with transfer fees. The latter attract more notoriety than any other of the game's financial features. Price-levels in this traffic in men are sometimes spectacularly high. In June, 1934, Aston Villa paid Portsmouth £10,775 for the transfer of J. ALLEN. In 1928 the Arsenal paid £10,340 to Bolton Wanderers for the services of DAVID JACK. In the season 1935-36, Aston Villa, threatened with relegation from the First Division to the Second, spent £40,000 on seven players—and were relegated, after all. In 1929-30, Chelsea paid £25,000 for three players.

These transfers are commercial propositions with a high element of risk. In an accounting sense they may be regarded as an advance capitalisation of the financial advantages expected from the presence of new players. But a player who is brilliant in one team may be a complete failure in another. Transfer, consequently, is never a certain short cut to success. Against Aston Villa's experience in 1935-36 may be set that of Sunderland, whose brilliant team of 1935-36 was made up almost entirely of inexpensive men, transferred from junior clubs at a nominal fee.

The income of football clubs, after wages, benefits and transfer fees have been paid, is largely devoted to ground expenses, the payment of dividends and the repayment of debt charges. An examination of available balance sheets reveals marked contrasts in this class of expenditure.

Some clubs, like the Arsenal, Manchester City, Charlton Athletic and Brentford, own their grounds. Their fixed assets, consequently, are high and their liabilities proportionately large. The Arsenal has raised large sums to buy the Stadium at Highbury and to reconstruct and improve its amenities. Other clubs, like

Aston Villa and Chelsea, hold their grounds on lease, and their fixed assets and liabilities are correspondingly low. Chelsea's fixed assets, for example, are no more than £1,700 against the Arsenal's £137,548.

The following table summarises certain items from the balance sheets of ten prominent clubs.

Club	Issued Capital	Debentures and Loans	Total Liabilities	Fixed Assets
Arsenal	5,789	66,362	168,443	137,548
Aston Villa	9,765	409	14,948	9,765
Brentford	4,000	39,453	71,987	69,233
Charlton	1,000	111,540	120,684	73,409
Chelsea	6,932	...	16,425	1,700
Everton	1,947	...	50,404	38,006
Leeds United	9,523	29,024	43,983	38,341
Manchester City	1,216	45,000	128,668	117,057
Sheffield Wednesday	9,590	20,580	33,124	24,553
Sunderland	2,700	27,000	37,734	29,121
Total (10 clubs) ...	52,452	339,368	686,400	538,733
Percentage of liabilities	7.7	49.5	100.0	78.6

The proportion of share capital, as a rule, is small; and as the laws of the Football Association preclude the payment of more than 7½ per cent. on ordinary or preference shares, the clubs are usually unable to distribute more than a part of their profits. Thus, Manchester City carries in its profit and loss account a balance of £72,047, equal to 56 per cent. of its total liabilities and sixty times its share capital. The Arsenal has a general reserve of £60,000. In a few cases, the number of shareholders is also small. Charlton Athletic has only eleven shareholders, and two persons hold 88 per cent. of its shares. Four persons hold 35 per cent. of the shares in the Arsenal club.

That, in outline, is the tale of football finance: an income derived chiefly from gate receipts from Cup and League matches, and expended in the payment of wages, benefits and transfer fees, ground expenses, dividends to shareholders, and debt repayment; and the accumulation of large reserves. The sums involved are considerable, but the game is a precarious business, in which many are called but few are chosen. Industrial depression, or failure on the field, may shatter the goodwill of a team in a short time. The decline of Cardiff City and the more recent setbacks of Blackburn Rovers and Newcastle United can be closely correlated with depressed local industrial conditions. The rise to fame of numerous London clubs shows the other side of the same medal. For struggling clubs in the lower Divisions, moreover, these spectacular figures are unrepresentative. The Arsenal may regularly attract crowds of 40,000 or more; Gateshead must make both ends meet on gates of 3,000 or less.

Altogether, professional football is not a game in which large fortunes are directly made. Players, shareholders and directors earn only a modest reward, and take a good deal of risk. Their own receipts, indeed, are insignificant compared with the vast betting turnover for which the game provides an occasion. In *The Economist* of February 29, 1936, we estimated the total annual turnover of the football pools at £30 millions. That figure is twenty times the annual income of all the League clubs from all League matches. In any case, the game's professional exponents are but a small fraction of the number of those who regularly play it for health and pleasure. Indeed, recent events suggest that the most immediate danger to Association football lies not in its "commercialism" but in politics. The only football match which *The Economist* has "reported" in recent times was played at Vienna last month between Austria and Italy; and its upshot was certainly not helpful to international relations. Incidents at certain matches at last year's Olympic Games in Berlin provide a similar warning of the unfortunate consequences of confusing national flags with corner flags.

Great Cities—IX

Leicester's Growth

LEICESTER, with an estimated population of 262,000 since the increase in its area in 1935, is the smallest of the great cities of Britain. In all probability it is the youngest, for, despite the antiquity of its chief industry, hosiery, the industrial Leicester of to-day is almost completely the product of the heyday of Victorianism, the forty years following 1860.

A century ago, Leicester was not much more than a large country town, with rather less than fifty thousand people, a market-centre for the rich grasslands of the county. Though it was also the largest knitting centre in the country, the industry was entirely a domestic one. The 14,000 stocking-frames were operated by 28,000 workers on back premises in their own houses.

Frames were hired at a weekly rent, yarn was bought by the 200 "hosiers" and distributed among the "manufacturers," who knitted the articles required in their cottages. This purely cottage industry survived until well past the middle of the century and was to be found also in a hundred villages of the county. Except to satisfy a very local demand, the other great staple industry of Leicester, boots and shoes, had not appeared, even by 1850; nor, naturally, had the important engineering industry, which grew up to provide the necessary hosiery and boot and shoe machinery.

By 1860, the new trend was becoming apparent. The first steam-engine had arrived in 1818 in a yarn-mill, but the steam power-loom did not come until 1847, and its adoption was slow. Soon afterwards, the first hosiery factory was started, and about the same time a Leicester man, one Thomas Crick, devised the method of riveting soles to uppers instead of stitching them laboriously with waxed thread, and so made boots and shoes a factory industry.

Leicester's industrial revolution came, therefore, after 1860. In the last years of the reign the population of the city trebled. The last features of the country town, except the medieval open-air market which still occupies its old site, dropped away; cottage industry died out, though slowly; the long week-ends of the operatives, with hang-overs lasting until Tuesday and even Wednesday, became a thing of the past; and hosiery and footwear became entirely factory industries, with a new engineering industry to supply them with their specialised machinery.

Steam-power and factories concentrated the two industries to some extent in Leicester, but many of the surrounding villages, particularly to the south of the town, are purely industrial to-day. Leicester itself has a gainfully-occupied population of about 140,000, of whom just about one-half are employed in the two staple industries. Hosiery, which now embraces every variety of knitted goods, employs about 35,000; the boot and shoe industry, which is actually almost entirely the manufacture of shoes for women and children (men's footwear being made at Northampton) employs 30,000. Engineering, still chiefly the manufacture of hosiery and boot and shoe machinery, though electrical engineering is now also important, employs 10,000. Three hosiery workers out of four are women; two boot and shoe workers out of three are men. Engineering employs

mostly men. Leicester is thus remarkably well balanced in this respect. Family incomes tend to be much higher than in most industrial towns, though, partly as a consequence, the cost of living is also very high for a

provincial town; and there is no great surplus female population driven to accept low wages in domestic employment. If one of the two industries is temporarily depressed, wages are usually coming in from the other; and many workers are able to switch over from one industry to the other at short notice. Thus there is an unusual degree of stability in the employment of the town, and this, together with the peculiar character of its industries, has made it the most prosperous industrial town in the country, second only to Lille in the whole world.

It is, therefore, somewhat odd to discover that, since de-rating, all the mills, factories and workshops of such a city to-day pay less than half the rates paid by the poorest class of householder (those with houses of a rateable value of £10 and under) and considerably less than the small and usually struggling shopkeeper.

Three generations of practically uninterrupted prosperity have made Leicester a town with marked characteristics of its own. The residential districts are very extensive for a place of this size and still wear an air of late Victorian solidity and comfort. Most of the houses

THE GROWTH OF LEICESTER SINCE 1831

of the well-to-do are the massive but ill-planned structures of the days when domestic labour was cheap, bearing on their ornamented façades the date of their erection in the late 'eighties and 'nineties when fortunes were being made rapidly and by a great number of people. This comfortable middle-class, running family businesses of various sizes (and, however the public company may intrude elsewhere, more than ninety per cent. of Leicester's firms are still family concerns), is much more numerous than one finds in other towns of comparable size. There are no counterparts here of the Bradford millionaire or the Manchester cotton man; wealth was

more evenly spread in the hosiery and shoe trades when they were being built up, though every year death reveals at least one fortune of unsuspected magnitude. It is, perhaps, this expansive tree-lined suburb, with its large Victorian houses, that helps to give Leicester its air of somewhat old-fashioned complacency also, though this characteristic is common to all classes and parts of the town. Apart from the residuum of hopeless poverty of all cities, Leicester has never known the real poverty and want of industrial depression.

Nevertheless, all has not been plane-sailing; the profound changes of post-war years have struck here also. But the town has adapted itself to these changes solidly. The hosiery man does not profess to understand the remarkable change in clothing fashions since 1920, but he has met this new demand all the same. Heavy knitwear machinery is still being scrapped in large quantities. In Leicester, they say that it formerly took the wool of two sheep to clothe a woman; now it is a matter of a few inches of artificial silk. The other great change has been the loss of the export trade to a large degree, which is due to factors common to all our export difficulties.

The Trend of Profits

INDUSTRY, Parliament and the Press have lately been giving much time and space to the potential consequences of rising production costs. In the earlier stages of recovery, gross receipts easily outran total expenses, but more recently the margin has shown signs of narrowing. This possibility has contributed to the decline of 6½ per cent. in *The Financial News* index of ordinary share values since the middle of last November. Our latest computation of industrial profits, however, affords no evidence of a serious check, as yet, to the rising trend of industrial earnings. During the past three months we have analysed the annual reports of as many as 628 British companies, whose total paid-up ordinary and preference capital amounts to £852 millions. We propose in the following article to discuss the conclusions sug-

PERCENTAGE EARNINGS ON ORDINARY CAPITAL AND THEIR DISTRIBUTION, 1930-37

gested by the resulting figures, which are set out in the detailed tables at the foot of the opposite page and in supplementary tables on page 182.

The identity of the constituent companies in our sample of reports varies from year to year. To obtain a conspectus of their profits during the last seven years of depression and recovery, therefore, we have employed the statistical device of a "chain index." The results, as set out in Table I, suggest that disclosed profits declined by approximately one-third between

Before the war about 25 per cent. of Leicester's shoes went abroad; in 1930, only about 10 per cent. In hosiery the export trade has fallen by more than a half, particularly since 1925, when the large Dominions trade began to drop. As Leicester has found to its cost, hosiery is an easy industry to foster behind tariff barriers.

Few, if any, towns have benefited so much as Leicester from the remarkable rise in standards of consumption that has taken place in the post-war years, and on the same grounds one would expect the town to have an assured and prosperous future. Its industries are almost entirely producers of consumers' goods, and in the absence of a major catastrophe in the near future we may expect the standards of consumption of the world to go on rising. Yet it is a curious fact that Leicester's share of the provincial cheque clearings has dropped appreciably since 1930, and is now below the proportion of pre-war years. Whether this is a temporary relapse is difficult to say yet, but the grim probability of rising taxation may reduce Leicester's share of domestic trade still further in the next few years. Beyond that it is impossible to look.

the first quarter of 1929 and of 1933 (i.e. between accounting periods covering, for the most part, the calendar years 1929 and 1932 respectively). Recovery at the outset was relatively slow, but during each of the last three years the profits index has risen by approximately 11 points, and the pre-depression level of earnings has now been regained and surpassed. Table III confirms the impression that the process of recovery has been remarkably steady and continuous. Comparison of percentage rises in earnings between successive quarters may be misleading, for the size of our sample of companies varies considerably between one quarter and

ORDINARY EARNINGS AND THEIR DISTRIBUTION IN CERTAIN GROUPS OF INDUSTRIES

[Note—The chart is based on earnings published in the first three months of 1930, 1933, 1936 and 1937, respectively. In 1933 the textile companies paid out more, in the aggregate, than the year's earnings.]

another. If comparison be made, however, between each quarter and the same quarter of the preceding year, the percentage figures will be observed to decline as recovery proceeds. The amount of each year's increase, in other words, has been relatively stable, but it has been expressed in terms of a steadily increasing basic figure.

Table II gives an interesting insight into the distribution of the fruits of prosperity between different groups of industries. Among the 628 companies whose reports have been published during the past quarter,

the rubber concerns make the best showing. Next, in order of percentage rise (in those groups whose reports are sufficiently numerous to be representative) come finance, iron, coal and steel, electrical equipment, road transport (tramway and omnibus), shipping, tea, and newspapers and printing. Some of the more "prosperous" trades, such as brewing, tobacco, building materials, and retail trade (shops and stores), have, on the whole, shown less than the average rise in profits during their latest period.

The lot of the average investor has progressively improved in the last four years. But the relevant tables and the charts reproduced in this article confirm the view we have previously expressed that the majority of companies are paying out dividends more conservatively, and retaining a larger proportion of earned profits, to-day than in earlier years. On the basis of "first quarter" results, ordinary shareholders are receiving practically the same return (approximately 10 per cent.) on their capital to-day as in 1930, although the present rate of total earnings is as high as 14.4 per cent. against 13.0 per cent. Our first chart reveals that reserves have grown during the recovery period with the opportunity to make them. At the nadir of earning-power, the first quarter companies of 1933 retained only 16 per cent. of their total ordinary earnings; to-day, the proportion is as high as 29 per cent.

This tendency is even more clearly brought out by a comparison between different groups of industries in the crucial years. In our second chart we show the percentages of retained profits and dividends for all companies, for iron, coal and steel, textiles, electric

power and retail trade, respectively, according to reports presented in the first quarters of 1930, 1933, 1936 and 1937. Although the coal and steel companies have doubled their earnings since 1930, their percentage dividends show only a moderate increase, and the greater part of the rise in total profits has been put back into their businesses. The textile companies—whose earnings throughout have been well below the average for all industry, and have still to regain the level of 1930—have throughout been less conservative than the iron and steel companies. The electric power concerns and the retail trading companies have both secured profits well above the average, and their earning power was more than maintained in depression. The retail trading companies, however, have tended to put much the same amounts to reserves throughout; i.e. in other words, they have passed on most of the fruits of recovery to their shareholders. The electric power concerns, on the other hand, have allocated the greater part of their increased earnings to reserves, and only slightly increased their percentage dividends. Incidentally, "reserves" of many electricity companies include an element of depreciation provision.

The general conclusion suggested by our analysis is that while there is no evidence, as yet, of a check to recovery in earning-power, revival remains persistent rather than spectacular, and its incidence between different industries is strikingly uneven. How far these conclusions are confirmed by results drawn from a larger area of the industrial field will be evident three months hence, when our sample will be augmented by the figures of many additional concerns for the year 1936.

INDUSTRIAL PROFITS

TABLE I.—INDUSTRIAL PROFITS INDEX

(" First Quarter " Companies)				
Published during First Quarter of	No. of Com- panies	Net Profits (after Debenture Interest)		Chain Index (1930 = 100)
		Year stated	Same Companies preceding year

The Englishman's Bacon

"Mr Prohack's breakfast consisted of bacon, dry toast, coffee, marmalade. . . . In last week's Economist [declared Mr Prohack] it said that the Index Number of commodity prices had slightly fallen these last few weeks." "I don't know anything about indexes and The Economist," Eve retorted, "but I know what coffee is a pound, and I know what the tradesmen's books are." ("Mr Prohack," by Arnold Bennett. First edition.)

SINCE the day when Charles Lamb's house-burning Chinaman discovered a new dish and inspired a new proverb on the relationship of means to ends, the flesh of the domestic pig has been accounted a delectable delicacy among many peoples, though it has been wholly abjured by others. In most countries, however, it appears on the dinner table as pork, rather than on the breakfast table as bacon. The popularity of the latter form, indeed, is largely confined to English-speaking peoples.

The traditional English method of curing bacon is to sprinkle it with dry salt and to place it in a store for a lengthy period. This procedure was well suited to the leisurely days of the past, but the modern curer calls for a speedier process. Hence, the new bacon factories are adopting the Danish method of tank curing—i.e. curing in a solution of brine. Whereas the old method took several months to produce a good side of bacon, the Danish method achieves it in four or five days.

In the unregulated days before 1933, the pig market was subject to wide cyclical fluctuations and was further disturbed by the seasonal nature of the demand for pork. The latter dish, unlike bacon, whose vogue runs from January to December, is popular only between September and April, and especially around Christmas. Nature, however, has failed hitherto to recognise this fact and to make the necessary adjustment between demand and supply. In 1933 a serious attempt was made on the British Government's initiative to remedy this defect by the setting up of a marketing scheme. Actually two schemes under the Agricultural Marketing Acts came into force in September, 1933—one for bacon itself and the other for bacon pigs. But the pork market was left uncontrolled. The essential object of the schemes was to stabilise the total supply of bacon* at the average level of the years 1925 to 1930, namely at 10,670,000 cwt. annually. No provision was made for any increased demand due to the growth of population or for any rise in the standard of living; and it was apparently assumed that this restriction of supplies would be sufficient to restore bacon prices to their pre-depression level.

An important feature of the machinery thus created was the contract system, under which all pigs destined for bacon production were to be sold on contract between farmer and bacon curer, the terms of sale being negotiated between the two marketing boards. Since contracts were signed in the autumn, to cover supplies during the following calendar year, a fairly accurate estimate of the home supply of bacon was possible. When the home industry had decided what proportion of the permissible total it was capable of producing, overseas suppliers were to be allowed to make good the deficiency. Imports, accordingly, were regulated by quota. In practice, however, the contract system was not wholly successful. Negotiation of the terms involved the two marketing boards in an annual wrangle, and the farmers—who frequently claimed that they could secure better prices on the open market—appear never to have been satisfied with the treatment they received. By 1935, some of the smaller farmers were already voicing their strong dissatisfaction, and at the end of last year the contract system entirely broke down. The farmers failed to offer on contract sufficient pigs to keep the bacon factories working economically throughout 1937,

*For the purpose of the marketing schemes "bacon" includes hams.

and the curers are now obtaining their supplies on the open market at prices which are no longer fixed in advance. Meanwhile, the Board of Trade continues to regulate imports on the basis of its own estimate of home production.

Since 1933, therefore, the Englishman has been allowed to eat, at his breakfast table, only a fixed annual ration of bacon, partly produced at home and partly imported. The marketing scheme was explicitly designed to reserve an increasing share of the market for the home producer. How far, in fact, has this object been achieved? Although the total number of pigs in this country is at present declining, the Bacon Development Board recently estimated that it was 25 per cent. greater than at any time before 1933. The amount of bacon and hams cured by registered curers in Great Britain (including home production from imported carcasses) rose by 37 per cent. from 1,736,183 cwt. in 1934 to 2,376,891 cwt. in 1935, and by a further 16 per cent. to 2,752,910 cwt. last year. The comparable figures for Northern Ireland were: 488,000 cwt. in 1934; 583,500 cwt. in 1935, and 725,200 cwt. in 1936. Meanwhile, imports of bacon and hams into the United Kingdom have been:—

	(Thousand cwt.)		
	Empire	Foreign	Total
1931	436	11,529	11,965
1932	541	11,651	12,192
1933	911	9,042	9,953
1934	1,457	6,870	8,327
1935	1,589	6,015	7,604
1936	1,898	5,343	7,241

Imports, altogether, have been cut by 41 per cent. since 1932; but they still comprise over two-thirds of total supplies. Shipments from the Dominions have been fostered under the Ottawa Agreements, and the decline in foreign entries since 1932 has consequently been no less than 54 per cent. Denmark still occupies a pre-eminent position among overseas suppliers, accounting for about one-half of total imports. Canada, however, has made an impressive advance and now comes second on the list of supply countries.

How far have bacon prices been affected by the marketing schemes? In the absence of adequate data of retail prices the question must be decided in the light of available records of wholesale prices. The following annual average prices (in shillings and pence per cwt. of the "number 1 sizable" grade on the London Provision Exchange) have been calculated by the Imperial Economic Committee:—

	English	Danish	Canadian
1933	—	74/6	66/-
1934	93/-	88/3	81/3
1935	91/6	88/6	79/6
1936	93/3	93/6	84/-

These figures confirm the view that British and Danish bacon cater to some extent for separate and distinct tastes. English bacon has fluctuated with a stationary trend in the past three years, but a 39 per cent. cut in supplies of Danish has produced a 25½ per cent. price advance. Canadian bacon has enjoyed a comparable gain in price, in spite of a heavy increase in imports.

What of the future? The Bacon Marketing Board has formulated certain amendments to the marketing scheme. Its preference is for the regulation of imports by tariff rather than by quota, and it desires to use the proceeds in order to subsidise the British producer. Whatever happens, however, the principle that the home industry must be "adequately safeguarded" remains the cardinal purpose of official policy. There is every reason to believe that the Government shares this view at a time when the question of home-produced food in time of war looms large in contemporary discussion. Altogether, it seems unlikely that this particular constituent of British breakfasts will be cheaper in the near future.

Notes of the Week

Bilbao and Westminster.—General Franco's threat to prevent any ship carrying food and other goods not covered by the non-intervention agreement from reaching Bilbao, which he has invested, has led the British Government into a quandary. The Prime Minister announced on Monday that, in view of General Franco's declared willingness to risk an incident with a British warship conveying food ships within the three-mile limit, the British ships bound for Bilbao with food had been advised by the Government to go elsewhere. Government spokesmen in the debate on the Labour censure motion on Wednesday defended this decision on the grounds that to force an attempted "blockade" of Bilbao, even though the British Government had not accorded either side in Spain the status of belligerents, would, in fact, amount to partiality for the Spanish Government; and that this might lead other Powers who favoured the insurgents to tear up the arrangements for supervision of Spain's coasts and frontiers, due to begin next week. It is hard to see how General Franco, or Signor Mussolini for that matter, could have dared to wage war on this country if we had used the Navy in defence of our rights; and *The Times* correspondent at St. Jean de Luz described on Thursday how four British destroyers had sufficed to free British ships from molestation. The Labour spokesmen took the line that the British Government were really making General Franco's blockade effective, despite his legal inability to claim such a blockade *vis-à-vis* British shipping. Unfortunately this is true; for, as the Government's spokesmen confessed, if the British Government took their stand on their rights, they would be legally justified in convoying their ships into Bilbao harbour, as long as the ships did not carry goods prohibited under the non-intervention agreements.

The Government's maintenance of the principle of non-recognition of belligerency has faced them with the need to decide whether to throw overboard part of the *corpus* of international maritime law, or to convoy British shipping into Bilbao in defence of British rights. They have chosen the former, but have tried to soften the blow by asserting that, in principle, they maintain the rights which, in practice, they renounce. As Sir Archibald Sinclair and others in the debate pointed out, such casuistry is dangerous; and Sir John Simon's and Mr Eden's attempts to sweeten the pill by a declaration that British ships ignoring the Board of Trade's warning would be protected up to the three-mile limit carry little comfort. What is the British Government's position thereafter if they are confiscated or sunk by a piratical warship belonging to the insurgents? And what happens to

our jealously guarded principles, which the Government expressly reserve? The majority of British observers will think that *The Times* put it mildly on Thursday when it said "no one would pretend that this, in itself, is a very satisfactory position." If General Franco now enlarges his threats and actions to proclaim mined areas all round the Spanish coasts, and to declare similar "blockades" of Barcelona and other ports in the hands of the Spanish Government, the British attitude will, in effect, be actively assisting him to achieve an otherwise impossible blockade. There will not, then, be much chance for Mr Churchill's "daydream," in which both sides in Spain would be brought to an *impasse*, and would settle down under the ægis of an international commission. Many people by no means disposed to oppose the Government, especially those in the Services, will now feel that to give in to Franco for fear lest Signor Mussolini tear up the non-intervention agreements is running a very great risk. Everything now turns on the speed and efficacy of the supervision of non-intervention next week.

Mr Baldwin's Impending Retirement.—The Prime Minister took the first public step in his departure from politics when he spoke of his impending retirement to a meeting of his constituents last Saturday. On Tuesday, he addressed a much larger audience in a broadcast speech at a dinner of the British Federation of Industries. At Worcester, Mr Baldwin surveyed three decades of political change: the immeasurable effects wrought on European mentality by the Great War; the collapse of millions of people in Russia, Italy and Germany before the impact of new ideas alien to our own democracy; and the need to preserve the freedom of the British Constitution. At the F.B.I. dinner, the Prime Minister's theme was appropriately industry rather than politics. Again he looked back, this time for fifty years. Work and the conditions of work had, he said, become progressively easier; but increasing mechanisation had brought increasing speed, and nervous strain was fast becoming the common lot of all. He pleaded for shorter hours of work to ensure health. There was in all these sentiments the unrhymed and dignified idealism which we have come to expect from Mr Baldwin, whenever he withdraws from the sound and fury of political strife. On the eve of permanent retirement, Mr Baldwin remains typical of the so-called practical Englishman; unable easily to adjust himself intellectually to a period of radical change; a little afraid of progress and the future; always reduced to compromise accordingly; but comforted by a proper belief in personal responsibility and individual liberty.

Cabinet Salaries.—The Bill to revise the salaries of Ministers of the Crown was read a second time on Monday. This measure will raise the salary of the Prime Minister to £10,000 a year; and in addition to equalising the salaries of seventeen other Ministers at £5,000 a year, it will provide pensions of £2,000 for ex-Prime Ministers and a salary of the same amount for the Leader of the Opposition—at a total cost of £37,000 a year. In Monday's debate there was general agreement with the major propositions of Sir John Simon and Mr Baldwin that the salaries of men in responsible positions should be adequate to meet the calls made upon them; that at present the Prime Minister is underpaid; and that the existing anomalous differences between other ministerial salaries ought to be removed. There was, however, dispute over the scope and extent of the Bill. Mr Henderson wished to revise the salaries of Ministers without increasing the aggregate annual charge. Sir Archibald Sinclair was equally of the opinion that the proposed increases were excessive, and he agreed with Mr Henderson that the remuneration from fees enjoyed by English Law Officers was disproportionately large. A number of private members on both sides of the House were uneasy about the measure, either because to increase the rewards might endanger the integrity of politics, or because the rewards of Ministers seemed already unduly larger than the £400 a year paid to ordinary members of the House. Indeed, the possibility of an increase in members' salaries vied with the provision of a salary for the Leader of the Opposition for chief interest in the majority of speeches. It was shown that there were many unfortunate cases of poverty among the rank and file. Mr Baldwin promised his sympathetic attention to the matter and the possibility of an increase of £100 per annum has been unofficially canvassed. The dispute about the Leader of the Opposition was based on constitutional, rather than on economic grounds. On the one hand, it was argued that to pay him was to recognise his constitutional importance; on the other, it was contended that the salary would destroy his independence. The debate showed throughout a sense of the importance to democratic government to-day of these self-searchings. And the Home Secretary displayed an academic glee in contemplating the statutory recognition of the Prime Minister and the Cabinet, which this Bill will incidentally afford.

Labour Problems.—The epidemic of strikes—recorded on page 72 of last week's *Economist* and discussed in a leader on page 129 of this week's issue—is so intimately associated with the pace of industrial recovery and the rise in the cost of living that it is easy to overlook the deeper problems of industrial conciliation and trade union functions which are involved. Trade union methods and organisation are being equally tested, though in different ways, on the Clyde and in the coalfields. It is true that existing methods of wage negotiations have been proved markedly satisfactory by the recent agreements in the South Wales coalfield and in the transport area covered by the Scottish Motor Traction Company; the agreements which came into force this week in Lancashire, whereby 110,000 weavers have received advances in wages averaging over 7 per cent., provide a further example. In the cases of the engineers at Messrs Beardmore's Parkhead Works and the Clydeside apprentices, however, the present machinery has not been found adequate, and the strike weapon has been brought into use to bridge alleged gaps in procedure. Some 1,500 engineers at Parkhead, backed by all the engineers' associations on Clydeside, have refused, in spite of contrary advice from the national executive of the Amalgamated Engineering Union, to submit their case for wage increases to the national conciliation machinery—on the ground that Messrs Beardmore only joined the Employers' Association after the dispute had arisen. Last Sunday, a meeting of Clydeside engineering shop stewards voluntarily agreed to levy 1s. per man in support of the Parkhead strikers; and £87 has been contributed by engineers in other parts of the country.

Difficulties of procedure have proved even more important in the dispute which has brought out over 12,000 Clydeside apprentices on strike to enforce their demand for higher scales of pay. The youths have no formal machinery for arbitration with their employers, and the appropriate unions have no status in the dispute, although they have agreed to give strike pay. The Employers' Association have refused to discuss the apprentices' wages with the unions; and, in reply, a one-day strike of 100,000 Clydeside shipyard workers and engineers was called for April 16 in support of the apprentices' claims, and a ban on all overtime was declared until the matter is settled. These instances show how vital it is that there should be uniform, flexible and comprehensive machinery for negotiation between employers and all grades of workmen if the resort to force is to be avoided.

Unionism in the Coalfields.—Attention has been temporarily concentrated in the field of labour on the Clyde troubles, and the lightning strike of about 1,000 busmen in Kent. The Kent strike affects the employees of the Maidstone and District Motor Services and the Chatham Traction Company; it is a protest against speeding-up, like the threatened strike in London Transport, but resembles the Parkside strike in two important particulars—an increase in wages of 2d. an hour is demanded, and the strike has not been recognised by the national body, the Transport and General Workers' Union. By far the most important labour problem, however, and the one which involves most closely the basic principles of trade unionism and negotiation, is the threatened national strike in coal. The Nottinghamshire Miners' Association, which is affiliated to the Mine-workers' Federation of Great Britain, has been faced since 1926 with an Industrial Union through which alone the owners have negotiated. After a strike at Harworth Colliery last autumn, the management tried for a time to make membership of the Industrial Union a condition of re-engagement, and they refused to negotiate with the Association. In February, however, draft heads of agreement were drawn up between the Association and the Industrial Union, final consideration of which was deferred in March by the Mineworkers' Federation until the particular dispute at Harworth was settled. The Harworth management still refused to negotiate with the Association until amalgamation was completed; and the Association, speaking for the Federation, has refused to complete the amalgamation until it first secures recognition in its own right. In particular, the Association claims that the reinstatement of miners at Harworth should be done in consultation with its officials, in accordance with Federation practice, and to obviate discrimination. The fundamental principle of English unionism, that men should be free to join the union of their choice, is said to be at stake; and on Thursday and Friday of this week a national ballot was held in all the British coalfields, affecting half a million men, to decide whether or not the Nottinghamshire Association should be supported by a national strike in their attempt to secure the recognition of the Federation in that area. The danger is great, but the principles involved have been an accepted part of labour practice in this country for several decades.

Supreme Court and Labour.—The Supreme Court of the United States continues in its determination to demonstrate that even elderly justices can be liberal-minded. On Monday, five cases involving the constitutionality of the Wagner Labour Relations Act came up for judgment. The Wagner Act was passed after the demise of the National Industrial Recovery Act, and was an open attempt to salvage the famous Section 7 (a) of the latter Act. It imposes upon employers the obligation of bargaining collectively with their employees, establishes the rule that representatives designated by the majority of workers may negotiate for the whole, and

sets up a National Labour Relations Board, with some powers of compulsion, to invigilate. From the point of view of the Constitution, the crucial point is whether or not the power conferred upon the Federal Government of regulating commerce between the States covers the relations of employers with their workers. In the past, and the recent past, the Court has held that it does not. On Monday, the Court decided in all five cases that the Federal Government's responsibility for inter-State commerce must be held to cover the conditions under which the goods moving in that commerce are produced. One case concerned an omnibus company and the precedents for Federal regulation of transport are so strong that the Court was unanimous. In the other four cases—which concerned the production of newspapers, steel and clothing and the transport of goods—the Court divided five to four.

The direct effects of these decisions will be very large. The tactical position of the labour-unions will almost everywhere be improved; although, in places, the majority rule may work to exclude them from representation. The indirect effects are less obvious. To some people, the decisions have been welcome as showing that there is no need to "liberalise" the Court. But other sections of opinion are seizing the opportunity of the narrow majority to point out that the law of the land on a matter of vital importance has once again been decided by the "personal economic predilections" of one man. Moreover, the whole battle of labour is by no means decided, even if the Court's present interpretation stands. The Court has still to speak on such matters as the prohibition of child labour, the establishment of minimum wages for adult males and other such subjects. Mr Roosevelt has shown not the slightest sign of willingness to compromise on his demands, and the recent tergiversations of the Court, even though they have been in the direction of liberal ideas, may yet work upon public opinion in his favour.

A Setback for Fascism.—M. van Zeeland's courageous decision to take up in person the challenge from M. Degrelle has been brilliantly justified by the event. At the polling in Brussels last Sunday, the Prime Minister won 275,840 votes and the Rexist leader 69,242, which gave M. van Zeeland a majority of 206,598. Of the total votes cast, M. van Zeeland won 75.89 per cent. and M. Degrelle 19.05 per cent.—the remaining 5.06 being invalid. Most important of all, M. Degrelle, who this time received the Flemish Nationalist as well as the Rexist vote, polled 4,479 votes fewer than the combined figure of the Rexist and the Flemish Nationalist poll at the last election—and this although the total number of effective votes this time was larger than the corresponding total last time. If Fascism cannot afford ever to stop advancing, it can still less afford ever to retreat. On this showing the result of last Sunday's polling in Brussels is extremely disconcerting both for M. Degrelle himself and for his foreign backers; for it shatters a dream that Belgium might be made to revolve round "the Berlin-Rome axis." M. Degrelle and his friends had evidently been hoping to discredit M. van Zeeland (a banker!) as a creature of the Reds, and to induce the Catholics at any rate to spoil their voting papers, even if they might shrink from actually casting their votes in M. Degrelle's favour. These hopes were confounded by the action of the Cardinal Archbishop of Malines. On Friday of last week—that is, two days before polling day—Archbishop van Rooy declared, first that Rex was a danger to the country and to the Church, and second that no good Catholic ought to abstain from voting. The effects of this pronouncement are visible in the figures given above; for the percentage of spoiled or blank voting papers was very small, and an overwhelming majority of the Catholics must have duly cast effective votes and duly given these against the candidate who had been branded by the Cardinal's censure. Last Sunday's voting in Brussels may well be remembered as a landmark in

European history. The Fascist tide is still on the ebb; and it may so continue as long as democracies, too, can produce real leaders.

Great Britain and Italy in the Narrow Seas.—In spite of the signature of an Anglo-Italian goodwill pact on January 2nd last, Anglo-Italian competition in naval and air armaments is continuing in the Mediterranean and the Red Sea. An appreciable part of the British rearmament programme is allocated to the strengthening of our position in these waters and around their shores. That was the purpose of Sir Samuel Hoare's tour of inspection in the Mediterranean last September. And it is not surprising to find Italy retorting. On April 10th a Cabinet Council at Rome approved the creation of a naval command and an army corps in Libya, and the construction of a new port at Assab, and these measures follow upon the fortification of the island of Pantellaria. Pantellaria is a counter-Malta; Assab is capable of being turned into a counter-Aden. In fact, Italy is challenging the British Empire's naval command of both the Straits of Bab-el-Mandeb and the narrows between the eastern and western halves of the Mediterranean. It is not easy to see how this competition can be brought to an end by an Anglo-Italian armaments limitation arrangement on an agreed ratio, since either one or other of the two Powers must have the whip hand at each of these two vital strategic points; and neither Power is likely to acquiesce in being at the other Power's mercy.

Between Italy and Great Britain in the Red Sea and in the eastern and central Mediterranean there is now the same clash of vital strategic interests as there has long been in the western Mediterranean between Italy and France. The present Italian state of mind is displayed in the expulsion of English Protestant missionaries from Abyssinia and in closing the Abyssinian branches of the British-Indian firm of Muhammed Ali—in both cases on the charge that the missionaries and the firm have been acting as secret agents of His Majesty's Government. These cases were the subject of questions in the House of Commons on Monday. Italy's policy of expansion in the Mediterranean will doubtless draw together not only Great Britain and France but also most of the other countries with Mediterranean sea-boards; and against this array of forces it seems inconceivable that Italy should be able to establish a preponderance of armaments as a result of the present unrestricted armaments race. This obvious difficulty will no doubt incline the Italian Government to look for some continental means of redressing the Mediterranean balance; and the obvious means is for Italy to draw closer to Germany. But while the trouble in the Mediterranean and the Red Sea increases the danger of a division of Europe into two opposing armed camps, it is by no means certain that Herr Hitler will always assist Signor Mussolini to trail his coat before the British. Indeed, it is certain that the Führer will not pay for the Duce's new coat when he needs one.

South-East Europe and the Mediterranean.—In the Mediterranean setting the recent Italian-Yugoslav Pact is highly significant. It binds Yugoslavia not to do anything from which any aggressor against Italy might derive advantage. This is a bilateral pact—which is expressly forbidden by Article 6 of the Statute of the Little Entente; and Italy would in effect determine what constituted aggression. It thus enables her to close the Adriatic between Brindisi and Valona in her vassal-State, Albania. Italy need not, therefore, keep as strong a fleet in the Adriatic as she has had to do ever since 1919 in order to protect Pola, Zara, Ancona and other Italian towns in the event of a conflict with Yugoslavia. It enables her to strengthen *pro tanto* her West and East Mediterranean forces; and it puts Albania, Yugoslavia, and even perhaps Austria and Hungary at Italy's mercy; for they cannot be reached *via* the Adriatic now that Dr Stoyadinovitch has hung Yugoslavia on Signor Mussolini's "Berlin-Rome axis." In future, Albania can be nothing else than a base for Italy; and it will be hazardous for any British Government to repeat the small naval expedition to Durazzo, which in 1935 sufficed to make the Duce retract his Italianisation of Albania at the cost of British undertakings there.

Meanwhile, the closer relations between Czechoslovakia and Roumania, which were developed during the Roumanian Prime Minister's, M. Tatarescu's, recent visit to Prague, have been carried rapidly farther by three important events. First is the natural reaction to the Yugoslav Prime Minister's, Dr Stoyadinovitch's, accomplished pact with Italy. Second is the unification, under the leadership of M. Mihalache, of the long-divided Roumanian Peasant Party, the only effective alternative to the present Roumanian Government and the supporter of the former Foreign Minister, M. Titulescu. This will exert powerful pressure on the Government to deal with the notoriously Fascist Iron Guard. Third is the sudden blow, indirect but crushing, against the Iron Guard this week, in the form of the divestment of Prince Nicholas, the King's brother, of his royal titles and Inspector-Generalship of the Army, on the somewhat incongruous ground of his morganatic marriage. The ex-prince and his wife are to be exiled. As he was closely linked with the Iron Guard, and was in effect their representative at Court and in the Army, this event has a greater political importance than the popular Press has attributed to it. For with a now united Peasant Party friendly to M. Titulescu, with M. Tatarescu and his Government orientated away from Italy and Yugoslavia, and with the first real blow at the Iron Guard, the long-discussed Russo-Roumanian

pact is a real possibility. M. Titulescu fell last autumn because of his advocacy of this policy. Now there are reports that M. Tatarescu's Government, who ousted him, are prepared to enter both a Russo-Roumanian pact of mutual assistance on the Franco-Russian and Czecho-Russian models, and also a Black Sea pact comprising Russia, Roumania, Turkey and Bulgaria. This gradual *remaniement* in South-Eastern Europe owes a lot to Dr Stoyadinovitch's lapse into the Italian orbit. It is capable of bringing powerful influences for peace to bear, both in Central Europe and in the Eastern Mediterranean. For this, we in this country may have good reason to be grateful.

The Demand for Automobiles.—The demand for all durable goods is made up of two elements. First, there is the demand arising from the necessity of maintaining the existing stock of durable commodities by the replacement of obsolete units. Secondly, there is the demand which goes to satisfy additional requirements. Among other things, replacement demand varies in accordance with the life of individual commodities. In the case of houses, for example, replacement demand normally represents a much smaller proportion of the total output than in the case of wireless sets and automobiles whose life is appreciably shorter. The ratio between "additional" and replacement demand, moreover, is often subject to considerable variation from year to year. In the diagram below an attempt has been made to distinguish between the replacement and expansion demands for automobiles since 1929. The figures for expansion demand, represented by the lower area designated "new owners," have been obtained by tabulating the annual increase in the number of vehicles in existence. Replacement sales have been obtained by deducting expansion demand from the total sales in each year. The slight decrease in total sales of private cars between 1929 and 1932 conceals a marked fall in expansion demand during the downward movement of the trade cycle. Between 1932 and 1935, when incomes were increasing rapidly, the expansion demand for private cars rose very rapidly and considerably exceeded replacement sales in 1935 and 1936. The whole of the further increase in total sales last year, however, appears to have been for replacement purposes, thus indicating the approach of saturation point. In the case of goods vehicles, expansion demand has been limited by legal restrictions, replacements representing the bulk of total sales in recent years. The diagram indicates that the private car industry is now much more vulnerable to depression than in 1929, when replacement demand was relatively greater than in recent years.

Congress and Responsible Government.—A fog of misconception and distrust still hangs over Indian politics. Whether it is thickening it is difficult to say; the answer depends upon whether extremism or moderation is allowed to profit by the lapse of time. Some patches of misunderstanding may have been dispersed by Lord Zetland's statement of April 8th, the gist of which was in his final paragraph:—

"The reserve powers are an integral part of the Constitution, and cannot be abrogated except by Parliament itself. . . . Having said so much, let me add that . . . there is no reason why the reserve powers of the Governors should come into play. . . . It is in that spirit of cordial co-operation with and sympathetic understanding of the position of Ministers, from whatever party they may be drawn, that the Act will be administered."

Mr Gandhi's reply was to confess that he had never read the Act but had accepted the opinions of Congress lawyers, and to propose that a legal tribunal should decide whether their interpretation of the Act or the Government's was correct. This suggestion might be the more acceptable if Mr Gandhi were in a position to promise that Congress would take office without conditions if the tribunal pronounced in favour of the Government. He protests that Congress does not want to be treated as a privileged body, and desires only a "gentlemanly assurance." In a later statement he mentions "a previous understanding as to safeguards *within the Governor's discretion*." This is very different from Pandit Jawaharlal Nehru's comment:—

"There is nothing in common between us [the Congress and the British Government]; we shall go along our path resolutely and with a will to put an end to this bogus Act which has been forced upon us."

Obviously no compromise will content the Pandit. But between Mr Gandhi's attitude and that of the mass of the British people and Parliament the gap does not seem unbridgeable. In two letters to *The Times* and a speech in the Lords, Lord Lothian has urged that responsible government has always led to self-government, whatever reservations may be made on paper. When a Governor has to decide whether to override his Ministers "his decision, as all past history shows, largely depends on whether the majority in the Legislature is united and resolute and on whether it can count on the support of the electorate in the event of a dissolution." Is not the way out of the present difficulty, asks Lord Lothian, to recognise that once responsible government is in being the ultimate "arbitration" will almost inevitably be exercised by the electorate? Clearly, recognition of that truth must be mutual; the difficulty seems to be to find a means of expressing it that will satisfy Mr Gandhi's friends and not contravene the formal powers of the Governors. The search for such a formula certainly cannot be conducted by means of expostulations at long range. The need of the moment is quiet reflection and informal private conversations between the parties most intimately concerned.

The Activity of Industry.—Latest reports from the principal industrial centres all point to a further expansion of output in the heavy industries. But a continued stream of complaints attests the failure of the increase in supplies of certain grades of coal and iron and steel materials to keep pace with expanding demand. Coal is not a homogeneous commodity, and production of the various grades in accordance with the varying demand for each is encountering technical obstacles for which the quota system is not wholly responsible. The Joint Coal Committee of the Chamber of Shipping of the United Kingdom and the Liverpool Steam Ship Owners' Association have passed a resolution voicing their anxiety over the shortage of supplies and the rise in prices. They point out that all collieries should be free to supply bunker coals when, where, and at the prices at which they are able and willing to do so. In reply, the Central Council of colliery owners have issued a statement which indicates that the Government have decided to suspend the regu-

lations for the sharing of trade when output is below the quota level. This will remove, to some extent, the difficulties so far as they are due to the present operation of the quota system.

The output of iron and steel continues to expand, but not quickly enough to meet all requirements. The capacity of the industry is being enlarged; in Scotland, for example, Colvilles have announced this week a programme of further extensions. The trend of activity in the consumer's goods trades is also on the up-grade. Orders for cotton goods are still coming in satisfactorily, partly a reflection of the increased purchasing power of raw material producing countries, and in some cases manufacturers appear to have fallen into arrears with deliveries under contract. The linen industry has experienced a marked expansion in demand, and, as our Bradford correspondent indicates on page 186, the turnover in wool textiles remains heavy. Complaints about rising costs are becoming more insistent.

Rise in Wholesale Prices Arrested.—For the first time since May last year the rising trend of wholesale prices was seriously interrupted during the past fortnight by a sharp break in the quotations for non-ferrous metals and a number of other primary products. As our indices of the prices of primary products in this country and in the United States show, the fall was severe in both countries and was considerably more marked than a similar setback a year ago. Indeed, the decline in quotations for primary products was sufficiently marked to bring about a slight fall in the more comprehensive complete *Economist* and Irving Fisher indices. In France, on the other hand, wholesale prices registered a further small advance:—

PAID-UP CAPITAL - - - £2,250,000

RESERVE FUND - - - £3,050,000

ESTABLISHED 1810

As the following analysis of the complete *Economist* index shows, the minerals group index is sharply lower:—

The Economist INDEX (1927 = 100)				
	Sept. 18, 1931	Mar. 10, 1937	Mar. 31, 1937	Apr. 14, 1937
Cereals and meat	64.5	87.9	93.0	95.0
Other foods	62.2	70.2	70.4	70.2
Textiles	43.7	71.9	74.2	74.6
Minerals	67.4	114.9	113.2	107.4
Miscellaneous	65.8	83.9	87.0	87.0
Complete index	60.4	85.0	87.2	86.8
1913 = 100	83.1	116.9	119.9	119.3
1924 = 100	52.2	73.4	75.3	75.0

The decline, however, was by no means uniform and does not necessarily portend the beginning of a long-term downward movement in raw material prices.

Record Steel Output.—The increase in the output of pig iron and crude steel between February and March was much more marked than a year ago. As compared with March, 1936, the output of pig iron and steel showed increases of 7.3 per cent. and 13.2 per cent. respectively. Exports of iron and steel in March were 68,200 tons more, and imports 36,000 tons less, than a year ago:—

PRODUCTION AND FOREIGN TRADE IN IRON AND STEEL
(In thousands of tons)

Period	Production		Foreign Trade	
	Pig Iron	Steel Ingots and Castings	Total Imports	British Exports
1913—Monthly Average	855.0	638.6	185.9	414.1
1929 " "	632.4	803.0	235.2	364.0
1932 " "	297.8	438.5	132.7	157.4
1933 " "	344.7	585.3	80.9	180.2
1934 " "	498.2	738.3	113.9	187.8

" November	643.1	1,001.3	90.7	193.3
" December	671.4	1,019.2	94.8	204.8
1937—January	650.7	998.9	83.1	215.0
" February	603.7	955.9	82.9	200.5
" March	680.3	1,109.5	94.3	231.6

But although steel production is now higher than ever before, requirements are such that they have to go partly unfulfilled. The difficulties have been accentuated by the sharp decline in imports, due to the increase in demand abroad. An appreciable increase in prices is expected at the end of next month. Its effect on civil demand will be interesting to observe.

Shipbuilding Recovery Continues.—The *Lloyd's Register* Shipbuilding Returns continue to make pleasant reading. The total of merchant vessels under construction at the end of the first quarter of the year was 1,014,454 tons gross, an increase of 50,812 tons over the previous quarter, and of 172,093 tons on the figure for a year ago, a rise, that is to say, of over 20 per cent. The detailed returns show, moreover, that the expansion is now better distributed among the various centres. It is not particularly great on the Clyde, but Newcastle, Sunderland, and the Barrow district have moved ahead fast. Some of the smaller districts have suffered a small decline. The statistics for construction abroad give us less reason for satisfaction. The gross tonnage for the world as a whole shows a rise in the year from 1,820,114 to 2,452,051, or nearly 35 per cent., while the British proportion of this fell from 46.3 to 41.4 per cent., which, in turn, compares badly with the figure of 49.5 per cent. for the corresponding quarter in 1929. Thus, though we still construct more than the four largest foreign producers, Germany, Japan, Holland and Sweden, put

together, our pre-eminence is steadily diminishing. Excluding the 27 ships under construction for the Dominions, we are building only ten ships for registration in other countries, and thus come only seventh in the list of exporting countries. The long-run prospects consequently remain somewhat gloomy, even if the pressure of increasing international trade overbears rising costs and the shortage of steel and skilled labour for some time to come.

Overseas Trade in March.—The returns of overseas trade continue to be encouraging. Imports have once again increased in value over the figure for last year, but exports are up almost in proportion. And though the excess of imports over exports continues to grow rapidly, it is probable that the invisible items have expanded sufficiently to fill the gap. The following tables give the detailed statistics for the past three years:—

Month of March (000's omitted)				
	1935	1936	1937	Change between 1936 and 1937
Total Imports	60,507	68,000	82,691	+14,691
British Exports	35,952	36,510	43,470	+6,960
Re-exports	4,412	5,900	6,717	+817
Total Exports	40,423	42,409	50,187	+7,777
Excess of Imports over Exports	20,084	25,591	32,505	+6,914
Transshipments under bond	1,913	2,255	3,234	+979

First Three Months (000's omitted)				
	1935	1936	1937	Change between 1936 and 1937
Total Imports	178,419	200,150	229,533	+29,383
British Exports	105,498	106,081	121,121	+15,040
Re-exports	13,912	15,862	18,753	+2,891
Total Exports	119,410	121,943	139,874	+17,930
Excess of Imports over Exports	59,009	78,207	89,659	+11,453
Transshipments under bond	5,746	6,700	9,278	+2,578

The comparison by quarters gives a more favourable picture than the monthly statistics. Imports and exports have risen by an identical percentage. Prices have risen; and the recovery of the raw material producing countries is bearing fruit in a substantial and continuing rise in our exports both of consumption and capital goods. All the signs indicate that this trend will be maintained in coming months.

Trade by Commodities.—The changes in the quantities of the main classes of retained imports in March over the last three years are shown in the table below:—

RETAINED IMPORTS—MONTH OF MARCH			
Items and Measure	1935	1936	1937
Wheat	9,027	9,302	9,757
Beef and veal	1,102	933	1,021
Mutton and lamb	652	598	544
Sugar (unrefined)	3,006	3,106	3,442
Iron ore and scrap	368	666	637
Raw cotton	147	165	307
Sheep's and lamb's wool	930	1,133	778
Flax, hemp and jute	33,012	29,050	38,371
Crude petroleum	35,294	33,569	31,730
Hides, wet and dry	114	137	122
Wood pulp	128	120	181
Rubber	393	179	24,145
Unwrought copper	32,539	19,727	25,000
Pig lead	31,022	23,304	2,469
Tin: Ore and concentrates	3,394	3,305	2,018
Blocks, ingots, slabs and bars	930	2,506	84
Iron and steel manufactures	128	130	12,136
Machinery	6,352	8,061	

These figures reflect several familiar tendencies. In the case of wheat and cotton the increasing pressure on supplies and growing prosperity have led to a sharp expansion of imports. The consumers of wool and rubber are known already to be to some extent living upon stocks. The fall in mutton imports is almost entirely due to a shrinkage of New Zealand's exports, to be explained in turn by the growing profitability of dairy produce.

BRITISH EXPORTS—MONTH OF MARCH

Item and Measure	1935	1936	1937
Coal	3,198	2,626	3,043
Iron and steel scrap	10,188	9,751	32,937
Pig iron and ferro alloys	8,250	7,526	16,895
Railway materials	9,253	11,132	8,851
Total iron and steel manufactures	173,694	161,512	231,537
Textile machinery	5,829	4,240	4,919
Total machinery	32,199	32,824	35,723
Cotton yarns	11,667	13,339	15,252
Cotton piece goods	183,250	173,339	178,571
Wool tops	5,338	4,543	4,001
Worsted yarns	2,764	2,290	2,464
Woolen tissues	6,200	7,077	7,153
Worsted tissues	2,979	3,149	3,520
Linen piece goods	7,838	9,454	9,658
Leather boots and shoes	35,116	36,803	35,628
Leather	23,063	22,511	25,673
Paper and cardboard	311,519	363,590	305,087
Locomotives (complete and parts)	1,240	2,935	1,587
Motor vehicles and chassis	7,281	6,778	9,659

Among exports, it appears that the long-standing decline in coal shipments has at last been reversed. Poland and Belgium are conspicuous among the purchasers of the great increase in iron ore and scrap exports. But it is unlikely that the almost 50 per cent. rise in manufactured iron and steel exports can be maintained at all with the present congestion in the industry. The greater part of the total must be accounted for by contracts entered into before the armament programme was under way. The increased figures for textile machinery and wool, worsted and linen piece goods are due chiefly to heavier purchases by primary producing countries; but for yarns, the main explanation seems to be recovery in Eastern Europe. The rapid progress of our foreign trade in automobiles is once again noticeable.

State Aids to Industry and Agriculture.—Many people are asking how much the State is giving to agriculture and industry in one way or another. The Chancellor recently afforded some indication of the sum in a Parliamentary answer. He gave an interesting set of figures for the total of expenditure from national funds on development work, subsidies, financial aids, etc., in 1935-36 and in the financial year just ended. The two totals are, respectively, £119.8 millions and £133.8 millions. Of these, £87.7 millions and £93.2 millions, respectively, are charged to Budget votes, the rest being advances out of non-Budget funds, like the Road Fund, Post Office, Consolidated Fund, etc. From the table printed on cols. 1653-4 of *Hansard* on March 15, it is possible very broadly to deduce a total sum granted, directly or indirectly, to productive industry and agriculture out of Budget votes in the two years, as follows:—

Item	Expenditure	
	1935-36 actual	1936-37 estimated
Grants to public utility companies under Part I of Development (Loan Guarantees and Grants) Act, 1929	935	870
Slum Clearance and Housing	16,238	16,858
Special Areas	690	3,850
Employment Schemes Grants (Part II of 1929 Act, above)	4,179	4,100
Rural water supply grants	120	395
Agricultural subsidies, development, land settlement, etc. (grants only)	9,969	10,884
Forestry	450	700
Fisheries (grants)	65	136
Tramp shipping	1,989	1,990
Civil aviation	325	291
Light-horse breeding	5	5
Total grants	34,965	40,079

These two totals exclude (a) recoverable loans and advances, e.g. those of £1,536,000 in 1935-36 and of £400,000 (estimated) in 1936-37 to the Cunard White Star Company; (b) grants of £110,000 and £126,000 in the two years to scientific and industrial research associations and the British Standards Association; (c) expenditure of the Office of Works on new works of £707,000 and £1,026,000 in the two years, and of £1,103,000 and £2,200,000, respectively, by the Govern-

ment on transfer and training of unemployed—of which two sets of figures, an estimated £474,000 in 1935-36 and £647,000 in 1936-37, are recoverable from the Unemployment Insurance Fund; (d) ships replacement loans of £496,000 and £3,053,000, respectively; (e) grants totalling £51,292,000 and £50,314,000, respectively, for transitional payments, unemployment assistance allowances and to Public Assistance Authorities; (f) Road Fund grants of £19,087,000 and £22,994,000, respectively; and (g) Postal and Telephone loan expenditure of £10,447,000 and £13,630,000, respectively. In any case, in the 1936-37 financial year over £40 millions of subsidies have found their way directly to industry and agriculture from the public purse. Over £50 millions was spent by the State on unemployment and public assistance; and the balance of £20 millions odd—excluding Road Fund expenditure—went as advances, loan expenditure, etc. The Budget covered £93.2 millions of the grand total of £133.8 millions last year; so that £40 millions was the extent of extra-Budgetary State aids to various branches of our national economy and social services.

National Nutrition.—The Report of the Ministry of Health Advisory Committee on Nutrition (considered in *The Economist* of April 10th on page 76) was discussed by the Minister of Health on Tuesday, when Mr Rowson inaugurated a debate in the House of Commons on malnutrition. Sir Kingsley Wood pointed out that the Report had recorded no serious deficiency in the nation's dietary; and that the facts which the Committee had elicited in the course of its work, and those which it would elicit shortly in its collation of family budgets, should do much to confound the rumours of widespread malnutrition. That there should be a sufficiency of calories, fats and proteins in the food available to the people of this country is certainly encouraging. But, as Opposition speakers said in Tuesday's debate, the problem is one of distribution rather than total supply; the Report itself has stated that a small proportion of the population, the poorest section, is probably insufficiently supplied with calories, fats and animal proteins. Moreover, the consumption of liquid milk is agreed to be woefully inadequate. Indeed, the Report stated again and again its concern that the price of milk should be inordinately high when the majority of the population was going short of this invaluable food. The fact remains that many people in this country are only on the margin of nutrition, and even below it; and to use the labours and researches of the Committee on Nutrition as an excuse for complacency would be an intolerable error. The steps which the Minister has already taken towards increasing the consumption of milk are, to that extent, reassuring.

Sun Life Assurance Company of Canada

(Incorporated in Canada in 1865 as a Limited Company)

Congress Congested

WASHINGTON, D.C., April 1. — The Supreme Court issue continues to hold the centre of the stage, to the exclusion of all other Government business. Congress is already far behind in its legislative work, and the last months of the year are certain to see a log-jam of the worst kind, with eleventh-hour consideration for major bills which deserve careful debate. The President continues to show his most optimistic front. The opposition to his Court proposals appear to be elated about the legislative delay, counting on a "filibuster" to postpone action until next year. But in the press gallery the opinion of most seasoned correspondents is that the President will win, and without making any drastic compromise. The day of the successful filibuster is past, since short sessions are no more. The filibuster—debating a measure until adjournment and thus preventing a vote—is still barely possible. But a two-mile race has been changed to a marathon. A handful of speakers cannot easily talk continuously from now till the end of the year. Obviously the President cannot force a closure, since a two-thirds vote is needed to limit debate, and his Senate following is somewhat below this number. But the longer the Senate concerns itself with the Court, the more unpopular the opposition will become for blocking the consideration of other matters. So time is playing for the Administration, not only for this reason but for the reason, too, that the country is tiring of the discussion. The real debate is not of the ding-dong kind. It is bound to be subtle and even obscure, and the public cannot be expected to remain high-keyed and interested.

The most telling argument so far against the President's plan was Chief Justice Hughes' letter to Senator Wheeler, read with great effect to the Senate Judiciary Committee. The document did not attack the plan but appeared to silence the President's inference that the Court is behind in its work and needs enlargement. It demonstrated that an increase in members would cause inefficiency. A week later the Court reversed itself by finding the Washington State minimum wage law for women constitutional, and showed its first intimations of social generosity in sustaining the collective bargaining provisions of the Railway Labour Act. On the same day it approved the redrafted Frazier-Lemke Farm Mortgage Law, and upheld the right of Virginia to fix milk prices by a commission. This day's batch of rulings was hardly accidental, and constituted the Court's answer to the campaign against it. The No-Man's Land left by the New York minimum wage decision was again occupied. Account was taken of modern labour needs. And the road was opened for State initiative in the matters which the New Deal had sought to treat by Federal action.

But the influence of these rulings on the Senatorial situation was negligible. The Administration forces could point to the Washington minimum wage decision as proof that what was the constitution in 1936 and 1923 was no longer the constitution in 1937. Justice Roberts had changed his vote. Thus the constitution was what Justice Roberts thought it was, and a single member of the Court became the most powerful man in the nation. The opponents of the President's plan were just as pleased. The Court, they said, had shown itself both reasonable and abreast of social thought.

Jockeying for Leadership

It is well to point out that this controversy has not been free from well-calculated "crown-princing." Both Senators Wheeler and Bennett Clark have an eye on the party leadership in 1940, and relished the occasion to test their chances. They still profess to believe they can defeat the President, and if they are right they would stand out from the colourless subordinates of the party. They possibly figured that the South, with its essentially Conservative outlook, would be outraged by a proposal to tamper with the judiciary, and rally to their side. Senator Wheeler presumably hopes for a split in the party, and a realignment in the next campaign, with all the liberals in one camp, under his leadership, and all the conservatives under another banner. But the South is remaining in line. It may not like the President's proposals, but it is too regular to be easily lured into revolt. Not even Senator Carter Glass, the President's most vehement opponent, has managed so far to change Southern votes in the Senate. The second radio address of his career, made this week, was an hour's fullest measure of prejudice and passion. The prejudice was an attack on one of the Administration's speakers in the South (unnamed) who, according to Glass, also advocated the restoration of the Negro's rights in the States where the Supreme Court has so wisely left them submerged. The inference was that the South would be in peril of Negro domination if the present Supreme Court were not maintained, surely the most novel contention so far made in this embittered controversy.

The weakness of the opposition to the President is two-fold; the greater number of critics object to his method, not his aim, but they cannot agree on an alternative. The need for some change in the trend of Court decisions is widely admitted, but where the President argues that the personnel of the Court is at fault, his adversaries say the Constitution must be changed. This would be an effective answer if there were any hope of uniting the opposition on a given amendment. But there is none. Some want one requiring the retirement of judges at 70 or 75, thus carrying to the States rather than to Congress what the President asks. Others favour an amendment requiring a two-thirds vote in the Court before an Act of Congress can be avoided. Others want to define the whole range of social and economic subjects in which the Federal Government shall be given legislative power.

Boom Policy

NEW YORK, April 6.—The month of March has been a period of falling bond prices, falling share prices and declining bank deposits. The month opened with the increase in reserve requirements. On March 9th the President warned the country, in a radio address, that a catastrophe like that of 1929 was threatening in the not distant future. A few days later Chairman Eccles, of

the Reserve Board, issued a formal statement on the same theme; and on April 2nd the President, in his weekly Press conference, specifically described the level of production in heavy industry as dangerous and the prevailing price of metals (particularly of steel and copper) as too high.

This sequence of official acts and utterances does not seem casual or fortuitous. On a number of occasions towards the end of 1936 there were official declarations that the period of reflation had closed and that the next step was control. Indeed, three control measures were put in effect in 1936—the increase in margin requirements for Stock Exchange speculation (April); the increase in reserve requirements for member banks (August); and the absorption of gold into the Treasury inactive fund (December).

Notwithstanding the increased emphasis on controls, the months between November and March brought a real wave of inflation-mindedness, principally based on the rapid rise of costs of all kinds and prices of many goods. A true sellers' market developed in a wide variety of goods, orders were placed forward, the problem of deliveries began to appear, and talk of shortages became rather general. Complicating this movement was labour unrest, as a consequence of which employers generally raised wages, confident that in a sellers' market any price increase could be passed on to the consumer. The same spirit was visible in retail trade, individuals complaining of the rise in prices but buying to the extent of their ability, persuaded by advertising that prices would presently be much higher.

Market Reactions

The warning of the President was delivered on the evening of March 9th, and was followed by rather important movements in market quotations.

Dow-Jones Industrial Stock Averages	March 9	193.29
" Govt. 2½% bonds 49-53	April 5	183.54
" " " " "	March 9	100.88
" " " " "	April 5	97.42
\$ millions		
Demand deposits, Reporting Member Banks	March 3	15,501
" " " " "	March 31	15,126
U.S. Securities	March 3	9,067
" " " " "	March 31	8,396

These pronouncements have left the question of policy obscure. In effect the President announced on March 9th that unless controls were applied to the incipient boom, a catastrophe analogous to 1929 was not remote. On April 2nd, in his weekly Press conference, the President again referred to the dangers of a boom. In these informal conferences, the President is not quoted directly, but the purport of his remarks was that the prices of steel, copper and cement, for example, had been pushed to unjustified levels, and that the production of durable goods had expanded more rapidly than the production of consumer goods; that the Government had been a substantial factor in the demand for durable goods; and that it would, as far as practicable, withdraw from projects increasing the demand for such commodities. The relief programme would for this year concentrate on projects requiring less material. This statement was interpreted as a further announcement of a decision to exercise non-monetary control over an incipient or prospective boom.

In the meantime, the market in long-term government bonds had been experiencing a disturbing flurry—disturbing not so much in its magnitude as in its shock to a belief that had gained wide credence in banking circles, that no long-term Government security would be allowed to sell below par. When the long-term 2½ per cent. bonds dipped below 97, there was real nervousness in banking quarters. The Open Market Committee of the Federal Reserve System then announced that the Reserve Banks were prepared to buy U.S. securities "in such amounts and at such times as may be desirable," to exert its influence toward "orderly conditions in the money market" and to facilitate the adjustment of the member banks to the increased reserve requirements which would become effective on May 1st. On this announcement the Government bond market rallied.

The month of March has been largely concerned with questions about the transition in general economic policy from a programme of stimulation to a programme of stabilisation. It came as no surprise that the programme of stabilisation did not contemplate the use of the familiar quantitative monetary controls, but would seek non-monetary or qualitative controls. Precisely what forms these non-monetary controls are to take is still left to surmise.

Capital Movements

The Treasury data on the import of capital in the fourth quarter of 1936 have been made public. In this quarter the inflow amounted to \$325 millions, thus maintaining approximately the average rate since the data were tabulated, about \$100 millions a month. In the quarter, the purchases of securities approximately equalled the inflow—\$284 millions for the purchase of American securities, and the remainder for the purchase of foreign securities in this market. For the year 1935, the net inflow of short-term bank funds was \$964 millions; for 1936 it was \$397 millions. The net security purchases amounted to \$442 millions in 1935 and \$792 millions in 1936. In the two-year period, net British purchases in our market amounted to \$368 millions. The net capital movement for two years was: from England \$829 millions; France, \$300 millions; the Netherlands \$230 millions; Switzerland \$336 millions; Germany \$83 millions; Italy \$46 millions; other Europe \$228 millions; all Europe \$2,051 millions; Canada \$150 millions; Latin America \$199 millions; Far East \$184 millions; and from all other countries \$21 millions. In the aggregate the inflow has been almost evenly divided between the purchase of securities and the accumulation of dollar balances.

France

The Price of Trade Union Support

PARIS, April 15.—The political uneasiness, which has been perceptible ever since the "breathing space" began, still persists. This "pause" was a decision of the Government, which disgruntled its supporters without rallying the Opposition, and it is not backed by the trade unions, which the extremists lead. The building unions are asking for the expenditure of 10,000 million francs on great new public works after the Exhibition. These huge credits have been, very reasonably, refused. Accordingly, trade unions have organised a "National Day" for April 23rd; and their leader, M. Jouhaux, after having protested against the too numerous strikes, added that money could readily be found by nationalising the insurance companies. The Building Federation proposes that every person possessing an estimated fortune of 500,000 francs shall be compelled to subscribe to the projected loan. The trade unions are ready to co-operate with the Popular Front Government, but they emphasise that the present truce must be used to work out the forthcoming social reforms, i.e. the nationalisation or at least the control of coal mines, railways and electricity.

The political situation is thus incoherent. As long as it is controlled by the Radicals, there will be no change, since this party fears an alliance with the Moderates. But the Left extremists might easily, by an error of tactics, precipitate a change of front on the part of the Radicals; and this is now more and more desired by the Senate and by public opinion. Meanwhile, the Stock Exchange is alarmed by irresponsible rumours. The

BANKERS TRUST COMPANY

Rentes are heavy and the franc has fallen to 110 to the pound. This situation is not favourable to the issue of the 900 million francs loan by the Ville de Paris for the execution of great public works after the Paris Exhibition. The loan will be repayable in fifty years, and will be in 5 per cent. debentures issued at 91.

The Course of Production

The Statistique Générale has just published its monthly figures, showing industrial production in France (1913 = 100):—

	Feb., 1936	Dec., 1936	Jan., 1937	Feb., 1937
General index	99	100	101	103
Engineering	99	105	110	113
Iron and steel	84	89	94	101
Textiles	71	75	71	70
Mines (adjusted figures)	101	98	97	101
Building (" ")	70	58	62	65
Leather (" ")	93	91	92	95
Paper (" ")	135	150	145	143
Rubber (" ")	970	915	812	784
Motors (" ")	451	560	552	533

In the motor industry, 12,496 automobiles have been put on the road, compared with 12,740 in January, 1937, and 13,640 in December, 1936.

The figures for the cotton industry are as follows:—

	Nov., 1936	Dec., 1936	Jan., 1937	Feb., 1937
Spinning (average per spindle in kilograms):—				
Production	1,836	1,983	1,692	1,615
Deliveries	1,960	2,163	1,592	1,649
Stocks	1,322	1,149	1,221	1,719
Unfulfilled orders	5,583	4,856	5,574	5,448
Weaving (average per loom in pieces of 100 metres):—				
Production	5.53	5.46	4.90	4.63
Deliveries	6.04	5.67	4.64	4.40
Stocks	4.86	4.54	4.86	4.82
Unfulfilled orders	25.41	22.88	27.14	27.46

In March the number of bankruptcies was 596, compared with 541 in February and 592 in January; bankruptcies and judicial liquidations were 828, against 735 in February and 843 in January. Unemployment on April 3rd fell to 386,254, compared with 388,920 in the preceding week.

Germany

Rationing and Public Works

BERLIN, April 14.—The strain imposed on the national economy by the Four-Year-Plan for raw materials, coming after the work-creation and re-armament programmes, is becoming daily more evident. Last week new official restrictions and regulations were issued for raw materials. New control and compulsion measures in the labour market were announced, and there were also some unimportant new foreign exchange measures. Restrictions were also imposed on the industrial use of silver and gold. For the home market certain kinds of silver articles may not be manufactured at all; and the silver content of others must be reduced. In accordance with precedent, these restrictions do not apply to articles for export. The use of gold for decoration in the pottery industry has been restricted and in part forbidden. New restrictions have been imposed on the timber trade.

Owing to the steel shortage, the construction of some important buildings has been suspended. Building works which, although they are rationed, may obtain steel without special permits are those for armament purposes, for the Four-Year Plan for railways, posts and canals, for Reich motor roads and for certain other classes of roads. For housing, agriculture and the smaller industrial undertakings there is a general ration. The shortage of constructional steel is anomalous, because everywhere there have risen, and are still rising, Party (and often ornamental and useless) buildings which could only have been justified as mere work-creation, in times of depression. The Deutsche Bau- und Boden-Bank estimates

recent building values (including surface and underground works) as follows:—

	BUILDING VALUES (in Millions of Marks)		
	Housing	Industrial	Public
1929	2,900	2,700	2,700
1932	800	600	900
1936	2,000	1,400	5,400 to 5,800

This shows an enormous increase in public buildings since the depression. Last year the value of public buildings was twice as great as in the prosperous year of 1929, while dwelling and private industrial building remained much smaller.

According to another report, building on the surface or underground (in the main for re-armament and motor roads) constituted in 1936 just two-thirds of the total value, and employed on an average 592,000 persons. It is estimated that building programmes will this year be 25 per cent. higher than in 1936; but it is probable that the shortage of materials and workmen will prevent the complete execution of these plans. An attempt is being made to substitute reinforced concrete for steel framework in large buildings.

Self-Financing

At the annual meeting of the Deutsche-Disconto Bank on April 7th Dr Mosler referred to the increased participation of his bank in the financing of national undertakings. This participation took the form of the purchase of public securities and bills. There were, however, also direct Four-Year Plan loans to industry, of which part were Reich-guaranteed, provision being made for instalment repayments. In great part, however, the new Plan constructions are being financed out of the funds of existing concerns (those which need to expand, and those which open up new branches), and in part by new capital issues (mainly of bonds). There is, however, a limit to "self-financing."

The Four-Year Plan, Dr Mosler noted, requires not only investment to produce the new raw materials which are to replace imports, but also requires expansion in old raw materials, such as coal, cellulose, and chemicals. Further, industry will have to invest increasingly for the replacement of worn out plant. There will probably be an increase in borrowing from the banks. Dr Mosler declared that increased financing through the banks would ensure more careful expenditure. In "self-financing" there is not the investment-brake which operates in the use of bank credit—the interest burden and the compulsion to repay. The banks, said Dr Mosler, are best qualified to direct capital according to the needs and interests of business as a whole.

Dr Mosler also mildly protested against the official policy of favouring the bond market against the share market. Since 1931 the number of shares quoted on the Berlin Bourse has fallen from 725 to 489. Dr Mosler maintained that the bond capital of business undertakings ought not to exceed a certain proportion of total capital; share capital has the advantage that it adapts itself to the profit-earning conditions of the day. It is therefore held desirable that the embargo on new share issues should be relaxed.

Measures to Extend Cultivation

The import of wheat is at last increasing; it was nearly 19,000 tons in March, against an average of some 7,000 tons in the two preceding months. New measures are announced for the regulation of wheat, rye and flour. The last monthly report shows a decline in the consumption of wheat and rye, presumably due to the new restrictions on their use for feeding livestock. The shortage of farm labour is acute, and the number of unemployed in this occupation is only 28,000, including much unusable labour. The Reich Labour Leader announces that the whole Labour Service will this year be put at the disposal of the farmers who lack workers through no fault of their own. In order to prevent the depression of agricultural wages, farmers will be obliged to pay the Reich for the new compulsory labour.

According to a Ministry of Agriculture statement the cultivated area must be increased in the next four years

Foreign Debt Difficulties

No good purpose would be served by the premature branding of Poland as a defaulter because the interest payment due next October on the sterling portion of the Stabilisation 7 per cent. issue of 1927 may not be transferred in full. Even though the balance in Poland's favour in trade with the United Kingdom is substantially less than the official returns show, it covers many times the annual service on this issue, and a reasonable solution of the points at issue should not be difficult to find.

It became quite obvious, however, when exchange restrictions were introduced last April, that the transfer burden of external debt service would have to be lightened for a time until the foreign exchange position could be strengthened. There has been, in fact, a marked improvement in this position since the Transfer Restriction Decree took effect last September. Unfortunately, the efforts to reach a temporary understanding with American creditors might have been better handled and the serious damage which has now been done to Polish credit would have been avoided. If Colonel Beck, who has not been in good health this winter, had not been absent from Poland for the last two months, the matter so far as London is concerned would no doubt have been more intelligently handled.

The rise in raw material prices, especially in the metal and textile industries, is causing serious embarrassment; and it has been accompanied by an over-rapid increase in internal grain prices, due in part to excessive exports from last year's crops. After six years of deflation, wage rates in all industries are now very low, and the Government must therefore control internal prices as far as possible. There has already been an epidemic of strikes, and a complete stoppage of the coal industry was narrowly averted a week ago.

The industrial cartels are clamouring for higher prices in the home market, and they have a strong case because their profit margins—where they existed at all—have been wiped out by the increased cost of imported raw

Poland

Move for National Unity

WARSAW, March 29.—Strong action has been taken by the Government to arrest what the semi-official Press has called "political inertia and decomposition" and to bring about national unity and "the upraising of Poland." The new plan for national unity is based on the semi-Fascist Constitution of April, 1935; a powerful and respected Army; the Roman Catholic faith; the State as organiser of the life of the nation; opposition to Communism; State control of the relations between employers and employed; complete modification of the structure of the agricultural class and improvement of rural conditions; the reduction of unemployment; and respect for the rights of minority elements so long as they do not endanger the interests of the State. The plan so far has not gone much beyond a general statement of principles which points towards a totalitarian State; although it has been authoritatively stated that German, Soviet or Italian models are not being copied. The Poles do not readily respond to regimentation. Public opinion is in favour of national unity, a powerful Army, and a place of honour for the Catholic Church; but not of the perpetuation in office of the political collaborators of the late Marshal Pilsudski.

President Moscicki reminded the nation a few days ago that, thanks to the far-sightedness of Pilsudski, and the handling of foreign affairs by Colonel Beck, "favourable external conditions have been created for carrying out the task of national consolidation," but, he added, "these favourable conditions may not last much longer." There are many who feel that it would be a grave mistake for the leaders of the nation to try to build up a totalitarian system on the present narrow base. Pilsudski did not try to do it when he had a much broader basis on which to build.

One expects to pay a little more for a cigarette of such excellent Quality

materials. But if the Government yields to the cartels, increased difficulties with labour and the farmers would follow, and the Government itself would also be in serious trouble with its large-scale investment programme.

Egypt

All Eyes on Montreux

ALEXANDRIA, March 23.—The opening of the Montreux Conference for the abolition of the Capitulations regime is now so near at hand that all other matters have been pushed into the background. The Anglo-Egyptian treaty was signed by representatives of all political parties, but this time the Government will have to do without the support of opposition groups. The task has not been made easier by the encouragement given by the opposition to agitation by students and in the Press. It is feared in foreign circles that the break-up of the United Front may compel the Wafd to negotiate at Montreux with an eye on home affairs. This is fully reflected in the Stock Exchange; trading is slack and prices inclined to sag, despite sustained economic progress. The securities market has also been depressed by the announcement of the Government's intention to negotiate the abolition of the Public Debt Commission and to abstain from renewing a number of company concessions. The recent conclusion of yet another agreement between the State and the mortgage banks for a further reduction of land debts was also a disappointment for shareholders.

Bank clearings have shown a marked rise after stagnation. Business leaders are beginning to realise that countries producing raw materials are going to reap a larger proportion of the gains during the second period of the present economic revival.

Recovery has been gathering speed of late and the outlook is now decidedly good. Coinciding with the largest cotton crop on record, the sharp rise in prices has had already several beneficial effects. During the first two weeks of 1937, 342,052 bales were shipped, against 220,826 during the like period of 1936. Foreign trade

statistics have not been slow to reflect this better trend:—

	1936	1937
	£E	£E
Exports (January)	3,195,553	4,944,883
Imports (January)	2,958,744	2,857,046

For the month of January the export surplus reached a sum of £E2,087,837, against £E2,387,000 for the whole previous year. Nevertheless, the Minister of Finance, in his Budget speech, referred to the growing lopsidedness of trade with Germany and forecast appropriate measures should conditions fail to improve.

New Extraordinary Budget

The ordinary Budget is balanced at £E30,116,500, against £E35,153,260 in the previous financial year. One million pounds more have been allotted to irrigation, schools and sanitation. The actual increase in expenditure, however, is far greater than these figures would suggest, for a new extraordinary Budget has now come into being, which is destined to include not only the outlay resulting from the application of the Anglo-Egyptian treaty such as road and barrack building, but also the strengthening of the national forces and large productive works like the electrification of the Aswan waterfalls. The Minister of Finance is still unable to determine exactly the total of this extraordinary Budget, but he intimated that it would be about £E4 millions for the new financial year. The money will come from the reserve fund, the expected increase in Customs receipts, the projected stamp duty and professional tax, the sale of Government land and the profits of three enterprises (public markets, irrigation, town lighting) taken over by the State. A State lottery will also be instituted.

The old project for the electrification of the Aswan dam is to be taken up and greatly extended. It is proposed to use the energy obtained, not only for the production of fertilisers, but also for dyes and explosives. The plan includes the erection of iron works which will draw their supplies from the neighbouring ore deposits. An important industrial zone controlled by the State is therefore to spring up at the southernmost end of the country. The Government is also preparing to build factories for the manufacture of aeroplanes and vehicles, arms, ammunition and gas masks at an estimated total cost of £E1,200,000.

Letters to the Editor

Growth of a Monopoly

TO THE EDITOR OF THE ECONOMIST

SIR,—I find it a little difficult to understand the tone of Mr. Ranald M. Findlay's letter in your issue of the 10th under the above heading. I am one of the few Members of Parliament who have consistently opposed all this modern nonsense of the excessive control over the individual in industry; and on many occasions it has been a matter of sadness how little professed advocates of individualism, namely, the Free Trade Liberals, have moved in the matter.

Perhaps the worst of all these Acts were the Agricultural Marketing Acts, the first of which was passed in 1931 at a time when the Liberal Party held the balance of power, and when if they had thrown their weight into the scale they could jointly with the Conservatives have rejected the original Act. What Mr. Findlay will never understand is that there is all the difference in the world between freedom of trade and Free Trade.

The bulk of the pettifoggery interference with individual liberty has resulted from the unwillingness of many of our rulers to adopt the policy of Protection logically. Instead of so doing they have introduced all sorts of shifts and devices to avoid a logical Protectionist policy, with the result that we have interfered with the freedom of trade, when all that it was necessary to do was to kill that vicious intellectual delusion which has so long masqueraded under the title of Free Trade.

So far as the Iron and Steel Federation is concerned, I was the first person, as I mentioned previously, to point out the risks of the new monopoly. On the other hand

I like to be fair-minded, and I am not aware of any grievances which have arisen which have not been fairly dealt with. Mr. Findlay mentions the name of some anonymous friend of his who had to pay 125 per cent. more for his steel. I am sure he must be not only anonymous but incompetent, because I know of no general rise in prices at all comparable to that. I do not think that, unless Mr. Findlay is prepared to give detailed particulars, he should mention these vague statements which it is quite impossible for anyone to check.

Incidentally, in the last twelve months the price of copper, which is not subject to any duty, has practically doubled, whereas the increase in the prices of steel which in common with other commodities are going up all over the world, is much more moderate. I would advise Mr. Findlay to consult pages 496-97 of the *Board of Trade Journal* for April 8, 1937.

Yours faithfully,

HERBERT G. WILLIAMS.

S.W.1.

International Sugar Conference

TO THE EDITOR OF THE ECONOMIST

SIR,—In your issue of the 10th inst. Mr. Mathieson refers to the current values of sugar having risen to a level at which the low-cost producers can show some small margin of profit—on the basis of the Greene Committee's report.

Who Owns an Insurance Company's Assets?

TO THE EDITOR OF THE ECONOMIST

SIR,—Your article of April 3rd on Insurance Companies' Assets raises an important question, seldom considered by the public. With your contributor's statement of the law (save for one small slip mentioned below) few will now quarrel, but many will criticise his final recommendation.

If an insurance company's assets are to be divided between a life fund and a general fund, it is hoped, no doubt, that the former will be invested (even at the expense of bonuses) in better securities than the latter. But a mere direction to separate investments will not accomplish this end, and will indeed be substantially inoperative, except that it will necessitate entirely separate balance sheets, which the Clauson committee (reporting in 1927) seems to have considered desirable. For if a company carefully lays out its two funds on securities of exactly similar character, making each advance out of both funds in proportion to their respective amounts, the direction to separate investments remains, like the present direction to separate funds, a matter of accountancy, safeguarding the holders of one class of policy against losses incurred in a different branch of insurance. Otherwise, if investments are appropriated to the two funds more or less at random, the life policy holders are as likely to lose as to gain security.

We must imagine, therefore, that the life fund is invested in a higher class of security than the general fund. It would be interesting to know the present practice of those companies that do separate investments, but in any case legislative restriction is of doubtful wisdom. If the life fund is to be confined to trustee securities, life assurance will lose its attractions; if the investments are to be scrutinised by a special board, *quis custodiet ipsos custodes?* The Clauson committee did not propose any restriction, except by recommending that insurance companies' funds should not, without the sanction of the court, be invested in any insurance business.

One minor matter remains. Your contributor says that section 3 of the Assurance Companies' Act, 1909, established separate funds for life, fire, personal accident, employers' liability and bond investment business; but in fact the requirement of a separate fund does not extend to fire or accident insurance (*see* sections 31 and 32 of the Act). He correctly points out that the Road Traffic Act, 1930, "did not constitute a fund," and the reason for this is that motor vehicle insurance is, by section 42 of the later Act, assimilated, subject to certain modifications, to accident insurance under the Act of 1909.

I have the honour to be, Sir,

Your obedient servant,

E. IRVINE GOULDING.

National Finance

TO THE EDITOR OF THE ECONOMIST

SIR,—Mr D. M. Mason's theory, stated in two letters published in your issues of April 3 and April 10, according to which re-armament assists in weakening the national defence of Great Britain because it reduces the nation's financial reserves, is most ingenious. He all but succeeded in convincing me that it would be a wise course for this country to stop re-armament and to husband its financial resources until bombs are actually dropping on London. It occurred to me, however, that the letters may have been sent to the wrong address. They ought to have been addressed to Herr Hitler. Should Mr. Mason really succeed in convincing the Nazi Dictator that the Germany of 1937, armed to the teeth as she is, is really weaker than the disarmed Germany of 1933—because in the meantime she has used up her financial resources on re-armament expenditure—he would render a useful service to the cause of international peace.

I am, Sir,

Your obedient servant,

PAUL EINZIG.

Books and Publications

The Monetary Experience of Belgium, 1914-1936

BELGIUM'S monetary experience during the past two decades is certainly sufficiently important to merit widespread study. Before the war this country was considered to enjoy a standard of life which, if it was not the highest in Western Europe, was undoubtedly prosperous and rich. Then followed the world war, with its invasions and destruction, which caused such losses that they might very well have endangered the entire economy of the country. Moreover, considerable investments had been made in Russia, and were totally lost after the Revolution.

These setbacks were most noticeable in the monetary field. Wars normally cause a devaluation of the monetary unit, and it was not possible for Belgium to escape. Materially the country was soon reconstructed after the Great War, but at the same time it underwent a financial and monetary crisis which can be followed with interest in Mr. Shepherd's book. The author analyses, in par-

* "The Monetary Experience of Belgium, 1914-1936." By Henry L. Shepherd (Princeton University). Oxford. 13s. 6d.

ticular, what happened before and during 1926, the last year of the financial troubles of the post-war period. He has undoubtedly worked out a definitive account of these facts.

The new monetary regime of 1926 gave Belgium marked prosperity for a time. In consequence of the financial crisis of 1931 and the depreciation of sterling, the sky was again full of clouds in 1932, and a new crisis developed. The solution of these new problems was found at the end of March, 1935, when the Van Zeeland Government decided to devalue the franc by 28 per cent.

Mr. Shepherd has also written the history of this later period. But he has not allowed himself sufficient time to draw up a final balance. He has had to rely more on the programme stated by the Government than on the results which have actually been obtained. It is certain that if he were to write the account now he would be able to construct a much more complete and satisfactory picture of what has been done in Belgium.

The general conclusion of the author is favourable to the policy which was adopted. The devaluation was performed with the minimum of friction. It is, perhaps, not entirely true to say that devaluation was decided upon in order to restore and foster international trade through the advancing of exports. It was mainly on account of

reasons concerning the internal price level that Belgium decided to devalue. This is, however, only a slight difference in interpretation, which is, indeed, open to discussion.

Ever since Mr Shepherd's book was written, prosperity has been consolidated in Belgium. Unemployment remains important so far as statistics go, but an actual shortage of labour is being experienced; and one may draw the conclusion that, in the present circumstances, the unemployed are, in general, unemployable.

The state of the public finances has also improved. The market for Government securities is at present better than it has been for twenty-five years. Government spokesmen pointed out early in 1937 that taxation had been reduced by about 1,000 million francs, representing about 10 per cent. of taxation receipts. These indications confirm the optimism with which Mr Shepherd regards the situation in Belgium.

Shorter Notices

"Population and Poverty in India." By D. G. Karve. Oxford University Press. 123 pages. 4s. 6d.

This unpretentious work cannot be too strongly recommended to all who are interested in India's fundamental social problems. The main contention is that the present size of the population and the rate of growth are not so much causes of disease and poverty, as symptoms and results of social and economic backwardness. The author therefore concludes that what is needed is not a campaign for the restriction of numbers, but far-reaching, co-ordinated reforms in the cultural, economic and political spheres. He first gives an excellent summary of the trend of population movements and of production during the first thirty years of this century. He then proceeds to analyse in some detail the relation between the growth of population and changes in production, and attempts to construct an Index of Production. This index, which shows an increase of 35 per cent. in per capita production during the first three decades of this century, is open to criticism, as he himself admits, but it fully supports his cautious conclusion that there was no deterioration in the economic position of the population, despite the rise in numbers. It may be suggested that the vicious circle formed in India by inefficiency and poverty might be broken most easily by a frontal attack upon malnutrition, an attack which might concentrate, in particular, upon increasing the supply and consumption of milk.

"Armaments." By F. W. Hirst. Cobden-Sanderson. 172 pages. 5s.

Mr Hirst prefaces his survey of the unprecedentedly expensive arms race of to-day with an outline of warlike

expenditure since 1815. In a short, cheap book, he has assembled the salient facts about the cost of war preparation in Britain, the Empire, Germany, the rest of Europe, Japan, the United States and South America. In conclusion he points to the ill effects of this policy on national economies and international trade. A valuable collection of alarming information.

"Economics in Outline." By Arthur Birnie. Nelson. 2s. 6d. net.

Popularisation demands simplification and Mr Birnie adopts the method of simplification usual amongst writers of outlines of economics; he confines the main discussion to English classical theory and the easier parts of Marshall. The actual subject matter is well presented; the descriptive chapters on currency systems, banking, and markets for capital are excellent; and the literary style of the book makes it an attractive primer. Mr Birnie's book, by its very nature, often deals inadequately with the complications of economic practice, but as an introduction to economic theory, it is very satisfactory.

"Mining Year Book, 1937." Compiled by Walter E. Skinner. Walter E. Skinner and "Financial Times." 900 pages. 20s.

With the present issue this invaluable year book enters upon another half-century of usefulness. Like its predecessors, it contains comprehensive and clearly displayed particulars of all important mining undertakings, mining directors and engineers, and interesting gold statistics. For convenience of reference and the completeness and accuracy of the information it gives, the *Mining Year Book* takes an established place on the bookshelves of all investors and brokers.

MONEY AND BANKING

The Future of Gold

LAST week's rumours that the United States Government proposed to reduce its buying price of gold below \$35 per ounce, the price fixed in January, 1934, served to shake markets throughout the world. So far as this disturbance proved anything at all, it showed that both stock markets and produce markets were in a top-heavy condition, and a little clearing out of unsound positions may have done good rather than harm. The absurdity of the rumours should, however, have been patent. No reduction in the American price of gold is possible without either a proportionate reduction in Paris and certain other Continental centres, or a jettisoning of last autumn's tripartite monetary agreement. The current American price is equivalent to 59.06 per cent. of the gold content of the pre-Roosevelt dollar, and this percentage cannot be raised above 60 without new legislation; so that administrative action can only lower the price of gold by a few cents. Even if France agreed to come into line, legislation would equally have to be passed through the French chamber, and the whole temper of France to-day is in favour of an expansion of credit, based preferably upon new gold acquisitions, as a means of restoring prosperity. All three Governments are to-day large holders of gold, and they would be unwilling to take action which would automatically depreciate their holdings. Similarly, public opinion all over the world is still imbued with the post-1931 belief in the virtues of credit expansion. A proposal to reduce the price of gold would be regarded as reactionary and deflationary, and, even if it were not rejected out of hand, would precipitate an economic crisis.

If a really long-term view be taken, however, the significance of these rumours cannot be entirely ignored. Since 1931 the price of gold in national currencies has been raised considerably. To be more precise, in 1933-34 the dollar price of gold was raised by nearly 70 per cent., and the dollar price has since been the effective world price. Meanwhile, the American Treasury, in company with most central banks, has so far been prepared to buy gold without limit. The current price is high enough to give producers a generous margin of profit, and also to stimulate the dishoarding of India's enormous stocks. Thus a position has arisen in which the demand for gold is practically confined to a limited number of central banks and kindred Government funds, who nevertheless are prepared to buy without limit and at a generous price. Conversely, the right to supply gold is open to anyone who owns the metal.

It is not surprising, therefore, that there has been a big increase both in the supply and also in the acquisitions of central banks. We published, on March 27th, a chart showing world gold production in 1929, 1931 and 1936, and the relevant information is summarised below:—

	WORLD GOLD PRODUCTION		
	(Million fine ounces)		
	1929	1931	1936
South Africa	10,412	10,878	11,340
Russia	1,085	1,701	7,356
Canada	1,928	2,694	3,720
United States	2,057	2,214	3,714
Australia	427	595	1,160
Other countries	3,677	4,274	7,710
Total	19,586	22,356	35,000

The Rand has wisely taken advantage of the higher price to mine ore of a lower grade, and last year the total South African production, in fine ounces, was little higher than in 1929. A number of new mines, however, will shortly reach the producing stage, and these will increase the Union's total output. Other countries, notably

Russia, have multiplied their 1929 output several times over, and world output since 1929 has nearly doubled. Producers have obviously taken advantage of the central banks' and Treasuries' willingness to buy gold without limit at a higher price in national currencies.

The effect of this on the central banks themselves is illustrated in the following table:—

MONETARY GOLD STOCKS: END OF YEARS						
Central Banks of	National Currency	1929	1931	1936	1929	1931 1936
		(Millions of national currency)			(Millions of fine ounces)	
England	£	146	121	314	34	28 74
United States	\$	2,857	2,986	11,251*	138	145 322
France	Frs.	41,668	68,481	60,559	79	129 77
Germany	Rm.	2,265	985	66	26	11 0.8
Holland	Fl.	447	887	720	9	17 14
Belgium	Bel.	1,175	2,553	3,736	8	17 21
Switzerland	S.Fr.	581	2,299	2,683	5	21 19
Total		...	...	...	299	368 528

* Total monetary gold stocks.

In all cases except England, Germany and Holland, the 1936 "currency" totals are swollen as the result of devaluation. The second half of the table, showing all figures reduced to fine ounces of gold, places the position in better perspective. Broadly speaking, the holdings of these seven monetary authorities alone have increased since 1929 by 229 million ounces. This exactly equals the 1930-36 world gold production of 186 million ounces plus India's net gold exports for the period of 44 million ounces. In addition there are the undisclosed holdings of various national Exchange Funds, which may well comprise between 50 and 100 million ounces.

There are to-day two allied gold problems. First there is the question whether the world's central banks are becoming gorged with gold, and consequently whether the world is drifting into a state of gold inflation. This is a far cry from the late 'twenties, when the League of Nations was forced to examine the possibility of a world shortage of monetary gold; and this complete reversal of the position shows the potent effects of currency devaluation and the raising of the price of gold. Secondly, there is the problem of the maldistribution of world monetary gold, and this is as insistent to-day as nine years ago. In one respect it is more insistent, for Germany has now lost the whole of her gold reserves. Still, for good or for evil, Germany has cut herself out of the world economic system, and she can hardly hope to replenish her gold losses or hold other countries responsible for them so long as her present economic regime persists.

The obvious remedy for an excess of supply over demand is for buyers either to reduce their price or, in this case, to refuse to buy without limit. There are obvious difficulties in applying either remedy to gold to-day. World opinion is not convinced of the danger or imminence of gold inflation, and while maldistribution exists it will be impossible to convince the weaker and poorer countries of the need for remedial action. So long as gold is hidden away in exchange funds and until there is a uniform banking system throughout the world, concerted action against gold inflation will be impracticable, and if taken would probably have unexpected results. Moreover, public opinion would certainly regard any movement to reduce the price of gold as deflationary, and, as last week showed, the immediate reactions upon trade would be severe. In an ideal world there would be a strong case to-day for reducing the price of gold or for controlling the quantity of new gold which central banks are bound to buy. In the actual world of to-day this is

impracticable. But opinion might do well, nevertheless, to recognise the possibility that if the central banks were threatened with a flood of new gold they might be unable indefinitely to absorb it. This may be looking a long way ahead, but at least it implies that the existing price of gold will not necessarily last for ever.

In the meantime, there are various expedients which might be applied in case of need. Central banks can still use the old levers of Bank rate and open-market operations as a gentler substitute for alteration in their buying price for gold. Some of the steps taken in recent years to "economise" gold could be reversed. Other countries could follow the United States in tightening up minimum reserve requirements for both central and commercial banks. As an ultimate step, the restoration of gold as a medium of circulation could be considered, and this would go far to absorb any likely increase in future supplies. Finally, a more rational distribution of the world's supplies of the metal would save some countries from possible gold inflation as well as others from a shortage of monetary gold. Here the remedy merges in the general need for reviving world trade and exchange, for restoring the credit-worthiness of many nations, and for inducing the creditor nations with excessive gold reserves to lend freely to their weaker brethren. The gradual transition of the United States from a creditor to a debtor on current account will also help towards this end, so soon as other centres begin to compete with New York as a magnet for the world's capital.

Last week's disturbance, exaggerated though it may have been, has served as a reminder that even in the case of gold, supply must in the end be related to demand. While immediate action may be impracticable and hasty action subversive, the episode lays stress upon the urgency of the task of international political appeasement and economic reconstruction. If these insistent problems were solved, it should not pass the wit of economists and statesmen to agree upon such a future price of gold as would offer a reasonable chance of steering between the whirlpool of inflation and the shoals of deflation.

Financial Notes

British Monetary Policy.—The events of last week evoked several questions to the Chancellor on future British monetary policy. Mr Chamberlain was first asked if he could give the House an assurance that the Government had no intention of checking the rise in commodity prices by raising the price of sterling in terms of gold; or, in plainer English, by reducing the London price of gold. Mr Chamberlain was further asked if the maintenance of cheap money remained a fundamental object of Government policy. In his reply, Mr Chamberlain naturally had to state that it was not the policy of the Government to maintain a fixed price for gold in terms of sterling, for had he done so, he would have made a declaration equivalent to *de facto* stabilisation. Also the tripartite monetary agreement only provides for a reasonable stability of the exchanges. He was also careful to avoid any suggestion that either a rise or fall in the sterling price of gold was envisaged, for the former would be regarded abroad as implying a fresh depreciation of sterling, while the latter would be received everywhere as an indication of deflation. Instead, he stated that the Government were fully alive to the undesirability of interfering with the flow of business towards recovery, but did not give any specific undertaking to maintain cheap money indefinitely. In fact, Mr Chamberlain was at pains to show that there had been no change in the British Government's monetary policy. In doing so, he reinforced President Roosevelt's and Mr Morgenthau's emphatic disclosures of last week, and so placed the recent gold rumours in their proper perspective.

The Foreign Exchanges.—The past week has seen greater activity in the foreign exchange market. Last week's gold rumour and its unsettlements naturally

affected rates, but other influences were also at work. There were consistent sales of dollars early this week at rates from \$4.90 up to \$4.90½, these being perhaps against shipments of Russian gold. The London bullion market was for a time disorganised by the gold rumours, because no one cared to buy gold for shipment to New York. Consequently, the London price of gold fell to a slight discount below the dollar parity price, and part of the gold on offer had to be bought by the British authorities. Meanwhile, the new French Exchange Control took advantage of the general disturbance to let the franc depreciate from Frs. 106½ to about Frs. 110. This movement had probably been decided upon beforehand, but it was deferred until such time as public attention was distracted by something else. The gold rumours provided the French Control with an obvious opportunity. The general feeling now is that the spot rate will not rise above Frs. 111, and this week the three months' rate remained at Frs. 111 until Thursday, when it rose at 111½, each fluctuation in the spot rate being cancelled out by an equal and opposite change in the discount on forward francs. The guilder has remained pegged to the dollar, with the Netherlands Bank a buyer of dollars at Fl. 1.82½. This means that the guilder follows the dollar in its fluctuations against sterling.

The Money Market.—Conditions this week have been easy and dull. The banks have recovered most of the Easter currency and at the moment are well supplied with cash. They will remain so until the Coronation and Whitsun demand for currency begins, and for the next few months they will be the keen buyers of bills. They are naturally most anxious to secure June bills, but the market is not selling readily, and in many cases the banks are having to agree to take mixed parcels of June and July Treasuries. This week the market had few new Treasury bills to pay for, as last week's tender was partly missed, and so there has not been a keen demand for money:—

	Mar. 24, 1937	Apr. 1, 1937	Apr. 8, 1937	Apr. 15, 1937
Bank rate	2	2	2	2
Clearing banks' deposit rate	1	1	1	1
Short loan rate:—				
Clearing banks	1-1-1*	1-1-1*	1-1-1*	1-1-1*
Others	1-1	1-1	1-1	1-1
Discount rates:—				
Treasury bills	1	1	1	1
Three months' bank bills	1-1-1	1-1-1	1-1-1	1-1-1

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

The improvement in world trade and the rise in commodity prices is reflected in a larger supply of commercial bills, especially as traders are now increasing their stocks of commodities. Not only are a greater number of bills coming forward for discount, but individual bills are being drawn for larger amounts.

The Bank Return.—This week's return shows a further reduction of £4.2 millions in the note circulation.

BANK OF ENGLAND					
	Apr. 15, 1936	Mar. 24, 1937	Mar. 31, 1937	Apr. 7, 1937	Apr. 14, 1937
Issue Department:—	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Gold	201.6	313.7	313.7	313.7	313.7
Note circulation	421.9	470.5	473.8	469.9	465.7
Banking Department:—					
Reserve	40.5	44.1	40.8	44.6	48.9
Public deposits	9.9	27.9	52.2	24.5	22.4
Bankers' deposits	104.9	82.0	62.3	94.8	96.9
Other deposits	36.6	37.6	38.5	38.3	37.9
Government securities	106.7	94.5	100.5	101.1	96.9
Discounts and advances	5.8	4.8	7.1	7.4	6.9
Other securities	13.2	22.3	22.9	22.3	22.1
Proportion	26.7%	29.9%	26.6%	28.2%	31.0%

Bankers' deposits have increased slightly owing to Treasury bill maturities. The expected reduction in Government securities has now taken place. It has been delayed owing to the fact that a large number of bills maturing in early April had been bought by the Bank and have been allowed to run off.

The Bank of Scotland.—The report for the twelve months ended February 27, 1937, shows that the bank has had another good year. It is true that advances have fallen from £12.3 to £9.8 millions, but last year's report contained the warning that the increase of that date was probably temporary. Investments have again risen from £24.3 to £25.7 millions, while there is a further marked increase in acceptances from £1.9 to £2.5 millions. Deposits have fallen from £39.5 to £37.5 millions, this movement probably being the counterpart to the contraction in advances. Net profits show a further increase from £316,000 to £318,000. The dividend remains unchanged at 18 per cent., while last year's allocation of £30,000 to the officers' pension fund is repeated. The heritable property suspense account receives £30,000 instead of £25,000, while the Reserve Fund again receives £50,000, and the amount carried forward is increased by £2,000. This year's dividend was less, owing to the increase in income tax; for the bank's net profits are struck after full allowance for income tax, including the portion deducted from dividends.

Insurance Notes

Royal Exchange Assurance.—New life assurances, at £4,323,000, were only slightly smaller than in 1935, which was the closing year of a quinquennial period, but annuity consideration moneys fell from £312,000 to £195,000. Total net interest income credited to the life assurance and annuity funds increased by £5,000 to £574,000, but the net rate of interest earned on these funds fell from £4 6s. 8d. per cent. to £4 2s. 9d. per cent. Premium income in the fire branch was £1,409,000 against £1,484,000 and in the general accident branch £1,124,000 compared with £1,172,000, but Marine premium income increased from £597,000 to £659,000. The underwriting results of the last two years are given below:—

	1935		1936	
	Amount of Profit	Percent. age of Premiums	Amount of Profit	Percent. age of Premiums
Fire department	189,292	12.8	170,950	12.1
General department	32,490	2.8	61,684	5.5
Marine department	2,957	0.5	20,979	3.2
Life department	30,445		30,446	
Annuity department	11,174		11,174	
Capital redemption department	1,288		1,288	
Trustee and executor department	19,463		16,634	
Less Items debited to profit and loss account	287,109		271,197	
Net trading surplus	138,694		147,686	
	148,415		123,511	

No transfer has been made from the marine account to profit and loss, and the loss shown above is the amount of interest credited to the account. The marine fund amounts to £831,000, equivalent to 126 per cent. of the 1936 premium income; the comparable figure in 1935 was 138 per cent.

In the fire and general accident branches additional reserves are held apart from the usual reserve of 40 per cent. of the premium income for unexpired risk. These additional reserves have been increased during the past year from £600,000 to £800,000 in the fire account and from £200,000 to £300,000 in the general accident account by transfers from profit and loss; they amount to 57 per cent. and 26 per cent. respectively of the 1936 premium income. Total assets increased from £21,984,000 to £22,891,000. Among the life and annuity assets, which amount to £14,753,000, total loans are £2,699,000 compared with £2,727,000 in 1935, while British Government securities amount to £2,299,000 against £2,309,000. Debenture stocks increased from

£3,346,000 to £3,874,000, preference stocks from £787,000 to £856,000, and ordinary stocks from £707,000 to £837,000. The figures in this note relate to the Royal Exchange exclusive of its affiliated companies. If these companies be included, total assets are now in excess of £29,000,000, while the 1936 fire and marine and accident premium income was £2,454,000, £855,000 and £4,643,000 respectively.

Norwich Union Life Assurance.—New sums assured in 1936 with this society, the largest of the purely life offices, amounted to £11,091,000, compared with £10,788,000 in 1935; about 40 per cent. of the total came from various countries outside the United Kingdom. The society holds the whole of the share capital of the Norwich Union Fire Insurance Company, and the close relationship between the two offices must be of great mutual advantage. The net rate of interest in the life and annuity funds fell from £4 10s. 10d. per cent. to £4 7s. 10d. per cent., but as the valuation rate of interest is 2½ per cent. for assurances and 3 per cent. for annuities, there is still a very large profit-earning margin. Annuity consideration moneys were slightly smaller at £280,000, while death claims fell from £1,041,000 to £988,000. Total assets show an increase from £42,566,000 to £44,754,000. Mortgages on property, which have always formed an unusually large proportion of the funds, showed considerable expansion in the year, thus reversing the tendency of recent years. Loans on property in this country totalled £6,270,000 against £5,762,000, and outside this country £5,215,000 compared with £5,244,000, aggregating over one-quarter of the total assets. Policy loans showed little change at just over £3,100,000, but British Government securities increased by nearly £200,000 to approximately £3½ millions. Indian, colonial and foreign government securities were also greater. Debenture stocks, which amounted in 1934 to £6,710,000, rose sharply from £7,576,000 to £8,519,000, and preference stocks were £3,343,000 compared with £3,126,000. Ordinary stock holdings are relatively insignificant in amount except for the shares of the Norwich Union Fire Insurance Company, which, as before, are taken at £6,088,000. The published accounts for 1936, the first year of a new valuation quinquennium, indicate that trading profits were ample to meet the current cost of bonus at the high rates last declared.

Norwich Union Fire Insurance.—Fire premium income fell from £1,670,000 to £1,637,000, but there was a considerable reduction in the underwriting profit from the previous year's record figure. In the Accident Branch total premiums were £1,417,000, against £1,454,000, but much improved results were obtained. In pursuance of the policy of the directors, there was a further reduction in the U.S.A. casualty business, which more than offset the increase in Home premiums. The results of the last two years are shown below:—

	1935		1936	
	Amount of Profit	Percent. age of Premiums	Amount of Profit	Percent. age of Premiums
Fire	151,019	9.0	88,604	5.4
Accident and General	12,219	0.8	77,681	5.5
Less Taxes, etc.	163,238		166,285	
Total net Surplus	84,963		91,200	

The total assets of this Society and its subsidiaries at £5,815,000 increased by £94,000 during the year. British Government Securities showed little alteration, but other Government Securities increased by £84,000 to £829,000. The largest movement took place, however, in Debenture Stocks, which amount to £1,701,000 against £1,050,000. Preference and Ordinary Stocks also increased. The dividend on the share capital, the whole of which is owned by the Norwich Union Life Insurance Society, was again at the rate of 24 per cent., and costs £205,000, compared with aggregate interest earnings of £144,000.

Provincial Insurance Company.—This non-tariff company, which has now completed its thirty-third year of existence, has built up a steadily expanding business on sound and profitable lines. It does not transact business in the United States, but in addition to its home activities has entered many British dependencies and some few foreign countries. In the last ten years premium income has increased substantially in the fire branch from £135,000 to £196,000, in the accident and general branch from £385,000 to £959,000, and in the marine branch from £41,000 to £136,000. Last year total premiums amounted to £1,292,000, against £1,162,000 in the previous year, while a record underwriting profit was secured.

	1935		1936	
	Amount of Profit	Percentage of Premium	Amount of Profit	Percentage of Premium
Fire	25,261	13.4	34,185	17.4
Employers' liability ..	43,547	4.9	70,333	7.3
Marine	4,339		5,338	
	64,469		99,180	
Less items debited to profit and loss	39,488		46,470	
	24,981		52,710	

Motor insurance is known to figure very largely in the general branch accounts—unfortunately, no separate figures are published—and in the circumstances the profit ratio of 7.3 per cent. is obviously very satisfactory. The marine premium income increased 50 per cent. to £136,000, and the fund from £99,000 to £148,000, representing 107 per cent. of last year's premium income. There is no transfer to or from profit and loss, and the loss shown above is the amount of interest credited to the account. Total assets appear at £2,065,000 on a conservative valuation of the Stock Exchange securities. The cost of the preference dividends is £19,062 and compares with available net interest earnings of £58,000. The cost of the ordinary dividends is also £19,062, and the rate declared is increased from 35 per cent. to 50 per cent., free of tax. £50,000, against £40,000 in 1935, is transferred to general reserve, which now amounts to £450,000.

Life Association of Scotland.—The annual report is of special interest as it gives the results of the triennial valuation of liabilities at December 31st last. The basis of valuation of the life assurance contracts has been altered from OM 3 per cent. to Ar924/29 2½ per cent., but no indication is given of the cost of the change. This cost is, however, reflected in the figures given below; it will be seen that after taking credit for £50,000 profit on securities realised, the carry-forward has fallen by £52,000.

	Jan. 1, 1931– Dec. 31, 1933	Jan. 1, 1934– Dec. 31, 1936
Trading surplus earned during valuation period	443,815	308,289
Profit on securities realised	...	50,000
Brought forward	154,309	135,571
	598,124	493,860
To Bonuses to policyholders	399,553	352,345
„ Shareholders	38,000	33,000
„ Staff pension fund	25,000	25,000
„ Carried forward	135,571	83,515
	598,124	493,860

Under the Association's immediate bonus plan the rate of bonus was reduced at the preceding investigation from 44s. per cent. per annum, calculated on the sum assured, to 40s. per cent. per annum, and the rate has now suffered further reduction to the modest figure of 35s. per cent. per annum. Under the office's other plan, in which bonuses do not vest until attainment of the expectation of life, the rate of bonus remains unaltered at 60s. per cent. per annum where the expectation of life has not yet been attained, but has been reduced from 40s. per cent. per annum to 35s. per cent. per

annum in the remaining cases; in 1933 an additional special reversionary bonus of 3 per cent. of the sum assured was declared, to which there is no counterpart this year. New sums assured attained record dimensions at £1,661,000 against £1,568,000, while the net rate of interest fell from £4 3s. 10d. per cent. to £4 1s. 1d. per cent. Total assets increased from £8,058,000 to £8,191,000. The only change of note in the classification of the securities was an increase from £67,000 to £502,000 under the heading "Loans on Parochial and Other Rates."

Maritime Insurance.—This Marine company whose entire share capital is held by the Scottish Union and National, continues to lump claims together in one item, irrespective of the underwriting year to which they apply, while investments, which exceed one and three-quarter millions, also appear without any class subdivision. The underwriting results, however, have been consistently satisfactory, and last year £25,000 was transferred to profit and loss, against £30,000 in the previous year and £40,000 in 1934. Claims amount to £229,000, representing 70.1 per cent. of the premium income; the corresponding figures in the previous two years were 70.7 per cent. and 70.5 per cent. respectively. The financial position is very strong: there is a general reserve of £200,000, an underwriting fund of £399,000, equal to 120 per cent. of the premium income, and a profit and loss balance of £671,000. Total assets increased from £1,823,000 to £1,875,000. The dividend is again 6 per cent. and costs £23,000, compared with available net interest earnings of £66,000.

Marine and General Mutual.—This mutual office, which was founded in 1852 and has always had a close association with the shipping industry, is engaged almost exclusively in life assurance and annuity business. Out of the premium income of £248,000 last year, life assurance premiums account for £241,000, deferred annuities for £5,000, and "insurance of mariners' and passengers' effects" for the remainder. New business is well maintained at £462,000, while the net rate of interest was £4 5s. 7d. per cent. against £4 7s. 11d. per cent. in 1935. The mortality was apparently very favourable, and the amount paid in death claims fell from £116,000 to £80,000. Total assets, after showing some decline in 1935, increased from £3,687,000 to £3,823,000, and the amounts invested in Debenture, Preference and Ordinary Stocks all show well-marked increases. It is stated by the Chairman that there was "a handsome margin on December 31st last between the market and book values of the investments."

Beacon Insurance.—New sums assured created a record for the company last year at £1,153,000 against £1,049,000. As some reduction was made in the rate of bonus for the preceding triennium, this increase is satisfactory. In the "Abstainer" division the actual deaths were only 77 per cent. of the expected by the Ar924/29 table compared with 92 per cent. in the "General" division. The net rate of interest fell by 1s. 11d. per cent. to £4 1s. 2d. per cent. Total assets increased from £4,440,000 to £4,728,000, most of the increase going into mortgages on property within the United Kingdom, which rose from £1,796,000 to £2,032,000. A large proportion of these mortgages have been granted to policyholders in connection with the purchase of their homes. No marked changes took place among Stock Exchange Securities, of which, as usual, a detailed list is shown with individual book values of the holdings. On this occasion the relatively small holding, viz. £54,000, of ordinary stocks is omitted owing, it is stated, to the likelihood of alteration.

THE STOCK EXCHANGE

Unit Trust Problems

EIGHT months have passed since a Departmental Committee of the Board of Trade published a proposed constitution for the unit trust movement. It is known that official draftsmen are busy translating these and other proposals into legalistic English; but it is now practically certain that no unit trust legislation will reach the statute book this session. The delay may be inevitable, but it will be deplored by the movement's friends and critics alike. Though unit trust managers, naturally, were impressed chiefly by the stringency of the Report's recommendations, particularly on the financial side, they are aware of the many disadvantages of a period of suspense to a movement whose chief asset is its credit with the public. Their responsible representatives would undoubtedly prefer a speedy settlement on any reasonable terms to indefinite postponement of the inevitable.

What has been happening within the movement since the Committee's Report was made public in August? Readers of *The Economist* will find an answer to this question in a special Survey which we publish as a supplement to this week's issue. Thanks to the courtesy of the management groups, who have again supplied confidential data of their sales, we are able to give in our Survey the first informed estimate of the movement's total liabilities to the public that has been available since the Board of Trade Committee issued its Report. The figures are instructive. The first unit trust with an all-British portfolio was formed in April, 1931. At the end of 1934, the total sales of the entire movement amounted to £20½ millions. Twelve months later, the aggregate had increased to £45½ millions. At the end of February, 1937, the outstanding total slightly exceeded £71 millions. In other words, the total has increased during the past fourteen months by much the same amount—£25 millions—as in the preceding twelve months, which were recognised as the most satisfactory period in the history of the movement. The latter, evidently, has maintained its popularity with the investing public. The tide of the markets, until recently, has continued to run in its favour. Even after the reaction of late 1936 and early 1937 the *Financial News* index of industrial ordinary shares was 12 per cent. higher on February 26, 1937, than on January 2, 1936. There has been some tendency among unit and sub-unit holders to invest their regular savings in new certificates, and this the movement may not unfairly claim as a mark of confidence. The publicity attending the Board of Trade Committee's appointment and Report was temporarily unfavourable, but its effects cut less deep to-day.

The experience of individual trusts and management groups, however, has been curiously uneven. Some trusts have rapidly approached or surpassed the million sales figure; others have barely covered their minimum promotional expenses. The experience of the last few months, indeed, has confirmed the view, repeatedly expressed in these columns, that unit trust formation and management is a speculative financial industry. If it be true that as few as ten trusts are responsible for £20 millions of outstanding units, then the remaining 62 trusts have an average of only £820,000 each. These figures take on a special significance in the light of our earlier estimate that sales of £500,000 are necessary before managers cover even their initial charges. A fair number of trusts, evidently, have earned their promoters something less than a fortune.

In the second place, the vogue of the flexible as distinct from the fixed trust has brought its own peculiar problems of organisation, salesmanship, accounting and investment policy. The day is long past when in a

world of changes fixed trust portfolios stood like stone, and their constituent stocks could almost be numbered on the investor's hands and feet. The typical new trust has an eligible portfolio running into three figures, and its managers can switch into and out of new securities within very broad limits. The first question of the appropriate system of operation for a flexible trust is formidable, as a perusal of the pages of our Survey will show. The rival merits of the "appropriation" and the "cash fund" methods are keenly canvassed by their expert supporters. The absence of detailed recommendations on this subject—and, indeed, on flexible trust practice generally—is a regrettable *lacuna* in the Board of Trade Committee's Report, though perhaps an inevitable one, for the Report was composed nearly twelve months ago.

In other ways, the flexible trust has increased the cares, as well as the responsibilities, of management. In some respects, the response of the investor to the concept of flexibility has been disappointing. A few of the new flexible trusts have sold units approaching or exceeding seven figures in a comparatively short time. But, on the whole, experience seems to suggest that investors prefer to buy securities rather than *expertise*. Theoretically, those groups which have adopted "prestige" advertising have been on firmer ground than those which have concentrated on advertising the identity and advantages of a single trust—for the skill of the managers is the chief asset which a flexible trust unit purchaser buys. But the former method has not always achieved the best results. The unit trust investor, it seems, moves by sight and not by faith. He knows what he likes, and likes what he knows; and the implications of his preference may ultimately involve the unit trust movement in an awkward dilemma. If investment principles demand flexibility, but investors demand quasi-fixity, how can the two be reconciled? Some unit trusts may, perhaps, decide to make the best of both worlds by retaining flexibility but concentrating their publicity chiefly on advertising the particular stocks which figure in the portfolio of a given trust at a given moment. But no group, to-day, can regard a return to any form of fixity as even remotely practicable.

Indeed, as we go to press, one fixed trust—the British Empire "A"—is taking a referendum of its certificate-holders on the question whether both fixity and unit organisation ought not simultaneously to be thrown overboard. The managers of the trust, which as yet is scarcely adolescent, should surely lose no sleep over possible market conditions for a winding-up due 16½ years hence. But if a flight from fixity into the sixty-year-old organisation of the capitalistic investment trust becomes widespread—obviously a potential line of development, since of the twenty-four closed trusts, all but one are of the fixed type—the investor may well ask what will remain of the movement's permanent achievement. And is the admission of fundamental error a logical argument for bestowing powers which the managers explicitly disclaimed when they believed themselves to be right?

Fortunately, fixity and the unit method are not synonymous, and the movement need not yet lose the courage of its convictions. Within the past year it has, at least by implication, secured an endorsement of its fundamental principles in a high quarter. The Board of Trade Committee has decided that its further development, under a proper code of law, is in the public interest. The Committee's view, as we interpret it, is that the movement ought not to be restricted in an endeavour

to prevent black sheep from entering the fold; but rather that the public should be given regular opportunities for so close an inspection that it cannot fail to detect any contrast in colour. The recommendation which, more than any other, has evoked mixed feelings among the trusts is that which provides for the deposit with the Board of Trade of a substantial sum of money—the Committee suggested £20,000—by every trust which maintains active relations with the public. The same figure—£20,000—had been laid down in the Constitution of the Unit Trusts Association (a voluntary body to which all but two management groups now belong) before the Committee issued its report. But the Association stipulated only for £20,000 for each group, not for each trust. Presumably, the Committee's recommendation has two aims: to provide a fund for the investor in the last extremity and to close the movement to men of straw. It may or may not realise the former objective, but of its efficacy under the latter heading there seems little doubt. If every trust which is still "open" at the present moment were required to put down £20,000, the movement would, for the time being at least, have £960,000 of its resources immobilised. There are 12 separate management groups in existence. The total deposit per group would vary between £40,000 and £160,000, with an average of £80,000.

The sacrifice demanded of the groups would, on this showing, be considerable. But if public opinion were to endorse the Committee's view (as it appears, in fact, to do) there is no doubt whatever that the movement would be wise to accept the verdict with the best possible grace. Apart from the fact that the movement lives, literally, on its credit, a financial bar against the entry of the less responsible type of promoter would reinforce present trends which are all against the indefinite multiplication of new groups and new trusts. Under these conditions, it is unlikely that any soundly conceived legislation, on the lines of the Committee's Report—supplemented by the lessons of subsequent experience—would evoke formidable opposition in any influential quarter. The stronger, therefore, is the argument for its introduction with the least possible delay.

Investment and Company Notes

Market Aftermath.—Last week's fright over the mere suggestion of a possible change in America's gold policy has ended as such affairs usually end. The markets are much relieved, somewhat ashamed, and slightly uneasy. The reasonableness or otherwise of the occasion of last week's fears is of no great significance; what really matters is that the incident showed the market's technical strength in a less favourable light than had been hoped. Evidently, a number of forward positions are only lightly held. On Monday a good deal of stock was on offer from many centres, with the inevitable accompaniment of rumours of financial weakness—in Johannesburg and nearer home. Naturally, Kaffir shares suffered most, and after them mining and commodity shares. Under these conditions the traditional rôle of responsible financial commentators is to point out that correction in the more speculative sections will assuredly leave the whole market in a healthier state. And business, in fact, had a firmer undertone in mid-week. But the behaviour of some leading industrial shares, which declined during the "speculative" *malaise*, merits more detailed comment. Earlier this year, industrials suffered during the battering of the gilt-edged market; now they exhibit weakness when gold mining and commodity shares are under the knout. It would be unwise to draw exaggerated conclusions from this sensitivity to

other markets' troubles. The fact remains, however, that *The Financial News* ordinary share index has fallen from 124.8 on January 4th to 116.7 on April 15th, and neither the duration nor the extent of the reaction can be dismissed as insignificant. The explanation can scarcely be found in the market's own immediate background. New money is still coming forward for investment, and industrial profits continue to rise. A large sample of 628 companies whose results are examined in a special article on page 134 of this issue shows an increase of 12 per cent. in earnings in the latest period. Most chairmen, admittedly, are expressing concern over the possible effects of rising production costs, but none has suggested that these will do more than limit the scope of a future increase of profits. Altogether, large investors will watch the behaviour of the markets closely, after next week's presentation of the Budget; for the latter may be, as so often in the past, a turning point. If this year's reaction has been merely a temporary phase, there has now been ample time for technical correction. If, on the other hand, the markets have been half-consciously discounting a major cyclical turn in industry, then investors may soon have to consider a re-orientation of policy.

Stock Exchange Report.—The outstanding feature of the report of the Stock Exchange for the year ended March 25, 1937, is the increase in entrance fees received which, at £102,133, show an advance of £27,757, or 37 per cent. over 1935-36, and £20,667, or 25 per cent. over the average for the three years ending March, 1936. Except for 1928-29, when entrance fees totalled £109,468, the past year constitutes a record for over a decade. Members' and clerks' subscriptions reached the new high record of £354,303, an increase of £18,023 compared with 1935-36, and as much as £56,742 over 1929-30, the best year for subscriptions of the last boom. The increase in subscriptions proves on analysis to be due approximately as to 60 per cent. for clerks, the balance being attributed in about equal amounts to the increase in the average subscription per head on the basis of a stable membership and to the increased number of members paying subscriptions during the year. General revenue is also rather better at £76,595, owing mainly to improvement in dividends and interest received. From the increased revenue the managers have been able to increase the dividend by £1 per share to £15—absorbing £300,000 gross, as against £280,000 in 1935-36—and to increase the carry forward by £23,017. In addition, £15,000, as against £10,000, has been provided for buildings replacement. The financial situation of the institution thus makes an excellent showing and the managers have properly adopted a conservative policy in dealing with the available revenue.

British Empire Fixed Trust Proposal.—For record purposes, we set out the details of a proposal which the managing company of British Empire Fixed Trust Units Series "A" has this week presented to the sub-unit holders. An interpretation of the proposal will be found in the leading article on the unit trust movement which appears on page 155, and on page 34 of the special Survey which accompanies this issue of *The Economist*. The British Empire "A" Trust was formed in November, 1933, with a life of twenty years, and has been "closed" for the creation of new units since January, 1936. The managing company states that a number of holders have requested that a scheme might be prepared for converting the trust into a managed investment trust company, under which existing sub-units would be exchanged for shares in the new company. The reasons advanced are threefold. Firstly, the investment trust company would have an experienced board (although its proposed personnel is not disclosed in the circular); secondly, since the trust is closed, no additional holdings can be obtained; thirdly, permission to deal on the London Stock Exchange would be sought. The managers would undertake "to make certain contribu-

tions towards management expenses of the company for a period equivalent to the unexpired life of the present trust"—presumably out of the proportion of the original loading charge held in escrow. Sub-unit holders, therefore, are asked to state whether the suggested conversion is agreeable to them in principle. If a sufficient number are willing to receive the detailed scheme as a basis for considering the exchange, it will then be published.

On the broad issues raised by the suggested conversion of a fixed trust which is but 3½ years old, we comment elsewhere. There are, however, certain technical features which would require careful consideration if the scheme were introduced. The basis of transfer of the underlying securities is obviously one of the most important. The trust, being closed, is now valued on a "bid" basis, *ex* all loading charges, and the underlying securities are taken at their realisable value in the market, less all commissions and expenses, and a downward price adjustment to the nearest 1½d. multiple. This basis, clearly, would not be satisfactory for an exchange. The apparent proposal to make the escrow funds available over a period of years to the new company, again, does not appear to have any decisive advantages over the payment of an immediate sum. And thirdly, the status of the new management would require the most careful examination. These points will be further discussed if and when the scheme is published. For the moment, it is significant enough that the managers, having emphasised the disadvantages of fixity, do not propose to convert the sub-units into a new flexible trust of the unit type.

Lancashire Cotton Results.—The results of the Lancashire Cotton Corporation for the year to October last have limited relevance to the present capitalisation of the undertaking, but they serve as an indicator of earnings possibilities during the next few years. Trading profit increased from £57,192 to £127,899, and before providing for the debenture interest for the half-year to March last, the net profit amounted to £122,533. This profit may be divided between £59,247 in the first half of the year and £63,286 in the second. The results are analysed below:—

	Years to October 31st		
	1934	1935	1936
Trading profit	£57,192	£127,899	£127,899
Interest received	9,103	8,052	8,566
Total	44,867	65,244	136,465
Fees, etc.	14,688	14,177	13,932
Debiture interest ...	†130,000	†130,000	†54,167
Surplus, before depreciation	Dr. 99,821	Dr. 78,933	68,366
Carried forward	Dr. 1,368,485	Dr. 1,447,418	Dr. 1,379,052
	† Paid by guarantor.		

It is, however, more interesting to relate the 1936 profits to the present capital of the Corporation. The interest on the new debenture stock requires £75,000 (while sinking funds will commence in 1942 at the rate of £16,000 annually). If depreciation is ignored, it will be seen that this sum has been covered with the reasonable margin of £47,000. The new preference dividend, however, requires some £69,000. The prospects of the current year, therefore, suggest that a full preference dividend will be earned, again if depreciation is not taken into account. Although the directors declare that the plant has been maintained in good condition, the problem of depreciation must inevitably come to the fore as profits improve. If an over-all rate of 5 per cent. on the fixed assets is assumed, some £167,000 would be required. Before earnings become available for the ordinary capital, therefore, profits would need to increase by as much as £190,000. Such an achievement is, perhaps, not outside the realm of possibilities in the future. We pointed out on February 20th that, on the Corporation's present rate of capacity, a farthing increase in the spinning margin would represent an increase of £187,000 in profits. But

although the market regarded the results as justifying a rise from 18s. 7½d. to 19s. 4½d. in the ordinary shares, their prospects of dividends are still remote. The Corporation is probably fully conscious of the necessity for a conservative financial policy.

From the Chair.—All chairmen's speeches at our great company meetings, to-day, tend to be variations on the same dual theme. *Strophe*—"Business is active and profits higher. Let us give ourselves a pat on the back, for we had a good year last year." *Antistrophe*—"But costs are rapidly increasing and next year may be more difficult." No spokesman made this change of key plainer than Sir George Beharrell at the Dunlop meeting. The company has two distinct functions. It is a grower of raw material and a manufacturer of finished goods. But the advantages of the first line of business do not offset the disadvantage of the second when rubber prices are rising. Two years ago, Sir Eric Geddes sang in the same minor mode. At that time, over half the group's rubber crop was sold or used for special purposes, and the company now obtains an even smaller proportion of its requirements from its own plantations. Nor is the actual level of rubber prices the only important factor: stability too is necessary, and Sir George declared that the behaviour of the rubber market during 1936 showed none of the stability which was expected under the restriction scheme. He feared, moreover, that uncertainty would persist. The progress of the company last year appears to be due to successful development of new uses for rubber—in footwear, clothing and upholstery—despite competition from imports.

Other Viewpoints.—Investors will find the mood of qualified optimism in several other chairmen's addresses this week. Those present at the general court of the Governor and Company of Adventurers of England trading into Hudson's Bay were warned, at the outset, that the company would be asked to approve a conservative distribution policy in the future. Mr P. Ashley Cooper suggested that, if the wheat crop was good—it is faced at present with a shortage of sub-soil moisture—the stores and land departments might be expected to show a further improvement, while the more speculative fur trade is benefiting from world recovery. Mr John Cowley showed that the Daily Mirror Newspapers is faced with a problem akin to that of Dunlop. Newsprint costs are rising, and while the company's investment in Anglo-Canadian Pulp and Paper will benefit, the costs of newspaper publishing are rising. Mr Cowley was therefore led to speculate upon reducing the size of papers, or increasing their price, and was even able to draw encouraging conclusions from the economics of a three-halfpenny paper.

Hadfields' Debenture Offer.—Sir Robert Hadfield accompanied his financial review of 1936 with an interesting account of the technical side of the Hadfields' business. Of immediate investment interest, however, the offer to holders of the £1,040,000 4½ per cent. debenture stock stands out. This stock is callable after February 1, 1945, at par, and was quoted at 105 before the

PARKER STREET, KINGSWAY, W.C.2

offer and at 110 after. The directors offer in exchange for every £3 nominal of the stock an allotment of two 10s. ordinary shares. Stock so surrendered will cease to rank for interest from February last, and the shares issued in exchange will rank for dividend from January 1st. Since the ordinary shares fell from 37s. 3d. to 35s. on the news, the exchange is equivalent to £350 in cash for every £300 nominal of stock, showing on this basis a cash profit of £35 if the ordinary shares are sold. A bonus of this size is likely to attract the debenture holders. The company is operating at record profitability, and the equity is now valued accordingly. But the debenture holder who remembers the lean times of 1930 to 1932, when the debenture interest was not fully earned, may reasonably decide to take the opportunity presented to him. On the same line of reasoning, however, it may be doubted whether he should keep his ordinary shares. The company's prospects remain good for some time to come. But the investor who demands the equivalent security of a debenture is hardly likely to find it in the ordinary shares of a concern fully occupied on the re-armament programme. He may prefer, indeed, to seek a moderately dated debenture, perhaps in a more stable industry, for the re-investment of his increased capital. For the ordinary shareholder, the scheme involves a certain dilution of the equity, for the terms have, perhaps, been favourably pitched to secure the debenture holder's support. The 10s. ordinary shares will obtain a higher investment ranking, but their number will be increased from 1,859,784 10s. shares to 2,553,117 shares (disregarding fractions). With the prospect of fairly considerable selling by those debenture holders who accept the scheme, the ordinary shares appear to shed part of their speculative investment attraction.

Colvilles' Accounts.—During the whole of 1936 the Scottish steel industry was working almost to capacity, and the accounts of Colvilles, which now

controls the whole of the Scottish heavy steel trade and other interests, show a strong position. The company's own profits have increased by £47,929 to £658,538—a relatively small advance which reflects the incidence of increasing costs. But in these accounts the company for the first time takes credit from the acquisitions of 1936—Lanarkshire Steel, Steel Co. of Scotland, Smith and McLean, and a number of smaller concerns. These companies showed a profit applicable to the parent company of £252,055, and of this only £80,516 has been taken out in dividends. Thus, whilst the parent itself shows apparent earnings on the Ordinary stock, after generous depreciation, of 11.1 per cent.—a maiden dividend of 7 per cent. will be paid—the true figure of earning power, subject to subsidiaries' depreciation, is of the order of 17 per cent. The following table shows the company's progress during the last three years:—

	Years to December 31.		
	1934	1935	1936
Trading profit	589,439	610,709	658,538
Dividends from sub. cos.	...	...	80,516
Total profit	589,439	610,709	739,154
Fees, staff fund, etc.	1,500	21,500	2,000
Depreciation	125,000	125,000	185,000
Income tax	105,000	120,000	135,000
Preference dividend	246,159(a)	106,563(a)	84,219
Ordinary stock			
Earned	111,780	237,646	332,935
Paid	...	...	209,206
Earned (%)	13.8(b)	13.4(b)	11.1(c)
Paid (%)	...	...	7(c)
Preference div. reserve	130,000	200,000	...
Carried forward	85,762	123,408	247,137

(a) 2½ years' div. in 1934, and 1½ years' in 1935. (b) 1934 and 1935 earnings percentages struck after one year's Pref. div. In neither year were any earnings available for Ordinary div., for no distribution could be made until the Pref. div. reserve had been built up to £330,000. (c) Div. and earnings calculated on Ord. capital of £3,919,550, compared with £2,500,000 in earlier years.

The report details a striking list of extensions and reorganisation of plant. Moreover, it reveals plans for the erection of coke ovens, two new blast furnaces, and additional steelworks plant, which will cost £2,500,000 and will necessitate a further issue of capital. In Scotland the shortage of coking capacity and efficient blast furnace equipment is particularly acute, and these extensions will go far to rectify it, if the demand for steel remains at its present level. The ordinary stock £1 units, at 28s. 3d. xd, give a dividend yield of £4 19s. per cent. At this level they present no speculative attractions, for the company appears to be nearing its maximum profit-earning capacity, and the prospect of a new issue causes the market to value the shares conservatively.

Rolls-Royce Dividend.—The market showed a little disappointment with the Rolls-Royce dividend of 22½ per cent., although the final payment of 15 per cent. was declared on a capital increased by the 25 per cent. bonus last January. The preliminary profits statement shows that profits for 1936 amounted to £390,237, compared with £353,302 in the previous year, and with roughly £291,500 in 1934. The company has enhanced its reputation as a satisfactory profit-earner, without justifying the naïve speculator's hope of soaring profits. An increase in earnings of 11 per cent., though satisfactory in itself, is less encouraging than the large proportionate rises experienced in 1933 and the two subsequent years. The company is fully occupied on aero engine work, and while it should have no difficulty in passing on the due proportion of increased costs to its largest customer, the possibility of increased profit margins or expanding turnover should not be over-estimated. The prospects for 1937 suggest, in fact, a rather stationary earnings situation. The ordinary shares stand at 6½ and yield £3 16s.

New Company Results.—The majority of new companies which have recently issued their first reports have justified their prospectus promises. In many cases earnings show a considerable advance, though shareholders paid commensurately for the shares when issued. The net earnings of *Skefko Ball Bearing* for 1936 show a very satisfactory expansion to £236,304 after tax, compared with £195,700 before tax in 1935. The proprietors, however, must accept their 30 per cent. tax-free dividend, without the additional benefit of an informative report. The amount of depreciation is undisclosed in the report, but was fully discussed by Sir Ralph Glyn at this week's meeting. Another company which makes bearings, *British Timken*, has equally impressive progress to report. The 1936 trading profit of £131,127 is £51,618 higher, and in addition to the 15 per cent. dividend, a 20 per cent. capital bonus is declared. The chairman, however, has stressed the difficult situation regarding materials and skilled labour. The engineering industries are represented by *John Thompson Engineering*, a Lancashire boiler-making firm, which has earned £94,467 from mid-June to the end of 1936. The combined profit and loss account discloses a profit for the full year of £191,490, compared apparently with £165,983 for 1935. The subsidiaries have made extensions, and two other concerns have been acquired. *Cellon, Limited*, which makes aeroplane dopes, lacquers, etc., reports £35,380 trading profit, an increase of over 45 per cent.

Gaumont-British Dividend.—On April 9th, Mr Justice Clauson, in the Chancery Division, dismissed with costs the motion by Mr W. H. J. Drown to restrain

the directors of Gaumont-British Picture Corporation from paying the interim dividend on the 5½ per cent. preference shares, on the ground that it must be found out of capital. It was contended that the £200,000 set aside against production losses was insufficient to meet the total deficiency, to which Mr Isidore Ostrer replied that further funds totalling £662,000 were available. Ultimately, Mr Justice Clauson pointed out in his judgment that losses seemed to amount to no more than £750,000, and that if assets were insufficient to cover both capital and reserves the reserves must suffer first. The suggestion that the dividend had been declared partly to retain voting control in the hands of the ordinary shareholders was ventilated, though of course it was irrelevant to the decision. The fact remains, however, that preference shareholders gain a money payment and lose a contingent right of unknown value. The ultimate questions affecting the Corporation have still to be decided.

Oil Share Outlook.—Oil shares have displayed resistance to the liquidation which was common on the Stock Exchange during this account, and if no extra taxation is imposed on the motor industry next week they may well move into higher ground. An increase in the petrol tax would, of course, be passed on to the consumer, but as the tax is already 8d. per gallon, any increase might adversely affect the petrol consumption of the small car owner. An increase in the horse-power tax would have no effect on current consumption, but might react upon the sales of new cars. In any case the market is more concerned about the future of oil prices in America. If the export price of American gasoline

THIS TO-DAY

Disastrous fires occur every day, and only too often the vital and uninsurable records of a business are destroyed.

Figures of Foreign Branches are as of March 25, 1937.

Securities carried at \$68,486,932.31 in the foregoing statement, consisting of United States Government Obligations, \$30,925,872.42, State and Municipal Bonds, \$27,281,779.31, and Other Bonds and Securities, \$10,279,280.58, are deposited to secure public and trust deposits, totaling \$41,070,743.35, and for other purposes required by law.

is advanced, the price of British petrol must follow suit. Since the last ½d. per gallon advance was made, freight rates from the Gulf have risen further by 15s. per ton, which is roughly equivalent to ½d. per gallon. There is indeed every expectation that American gasoline prices will move upward this year. The seasonal increase in stocks has at last been checked. In the week ending April 3rd gasoline stocks at refineries declined by 91,000 barrels to 53,088,000 barrels. This is the first decline recorded in the last eighteen weeks. The Bureau of Mines, in its estimates for the month of April, expresses the view that although stocks are rather high as compared with a year ago, the additional quantities will be fully required if demand exceeds the present estimates. The crude oil output of the United States is being maintained at a very high level and stocks are increasing, but as new discoveries last year are estimated to be below withdrawals, it is natural that the large companies should begin to increase their stocks of crude. The granting of price premiums, ranging from 5 cents to 10 cents per barrel in East Texas, may be significant. Next month the dividends of the British companies will begin to appear, and the market will be disappointed if 20 per cent. tax free is not declared for the year on the increased capital of "Shell" Transport and Trading, 20 per cent. for the year on Burmah Oil and 17½ per cent. on Anglo-Iranian with perhaps a one-in-three share bonus.

Robinson Deep.—The annual report of this company provides agreeable reading for shareholders. The consulting engineer states that the reopening of the upper levels of the mine has made large tonnages of low grade ore available, while results in the lower levels were also encouraging. He records progressive improvement in the benefits obtained from the air-cooling plant and predicts, provided that the price of gold remains unchanged, a continued increase of profits during the

current year. Progress during the past three years is analysed in the following table:

	Years ended December 31,		
	1934	1935	1936
Tons milled	1,200,000	1,215,000	1,265,000
Yield, dwt. per ton	5.017	4.983	4.995
Working costs per ton	19/3	20/4	20/2
Working profit	£925,051	£911,210	£934,190
Dividends	£440,950	£326,570	£525,000
Rate per "B" share	4/-	2/9	4/6
Carried forward	£37,080	£60,910	£58,150
Development footage	57,138	55,870	52,547
Ore reserve, tons	5,846,000	6,032,000	6,102,000
Ore reserve, value dwt.	4.9	4.9	4.9
Average net price for gold, per ounce	138/1	142/-	140/1

The new treatment plant milled a record tonnage of ore. The appreciable decline in the average gold price resulted, however, in a slightly increased working profit. Dividends totalled £200,000 more than in the preceding year. The company paid this increased sum largely from the material benefit arising from the new basis of taxation. After this year, the fixed dividend on the "A" shares will be reduced from 2s. 6d. to 1s. 6d., and to 6d. only in 1940. These shares will then be extinguished.

"Kolar" Group Results.—Of the four gold-mining companies in the Indian goldfield, Champion Reef and Nundydroog paid increased dividends last year, the Mysore distribution was the same as before, but Ooregum made a further cut. Champion Reef offered 130,000 shares at 35s. a year ago to finance operations of greater depth. Total working costs fell £29,630 below the 1935 amount, and the fall more than accounted for the expansion in operating profits. Special appropriations were the same, apart from a reduction in the amount to contingency account. Development showed satisfactory results, a slight increase in the footage being fully reflected in the ore reserve total. Mysore treated a slightly increased tonnage, but the average value was lower. No difficulty, however, was experienced in maintaining the distribution at the previous year's rate. The reserve fund has been increased to £146,700 by £10,300 profit realised on the sale of shareholdings, and at the end of the year surplus liquid assets amounted to £279,680. The superintendent reports that in the deeper levels there are signs that the zone of disturbed ground is being passed. Some 2,920 feet of additional development work was carried out. The results of the four companies are summarised below:—

	Working Dividends			Ore Reserves		
	Profit	Amount	Per	Tons	dwt.	Value
	£	£	cent.			
Champion Reef....	1934 148,160	104,000	40	405,490	11.77	
	1935 169,990	110,500	42½	448,240	11.86	
	1936 197,230	146,220	45	471,149	11.36	
Mysore	1934 221,150	152,500	25	431,000	13.60	
	1935 254,450	167,750	27½	422,000	13.10	
	1936 252,000	167,750	27½	440,000	12.50	
Nundydroog	1934 320,870	191,030	67½	435,210	14.59	
	1935 317,560	191,030	67½	492,660	14.07	
	1936 302,280	205,175	72½	581,550	12.31	
Ooregum	1934 54,100	57,100	12½	139,400	9.38	
	1935 60,840	48,080	10	176,370	9.57	
	1936 57,590	39,060	7½	219,620	9.95	

* Fully developed only.

The favourable impression created by the Nundydroog dividend has been modified by statements at the annual meeting that a continued decline in the value of the ore would have to be faced, although efforts are being made partly to counteract it by treating a larger tonnage. The company paid a higher dividend despite lower profits owing to reduced depreciation requirements, and to the absence of a reserve allocation, compared with £15,000 for the previous year. Net cash assets amount to £234,020.

Nundydroog, in conjunction with Mysore and Ooregum, is prospecting land lying about 14 miles north of the Kolar field. Owing chiefly to a decline in the value of the ore milled, the profits of Ooregum were slightly below the previous year's total, while special appropriations were made on a slightly increased scale. Although development scarcely confirms the favourable rumours which were in circulation last year, improvement is shown both in quantity and value of the ore reserves; the quantity, however, still represents less than two years' supply for the mill. On the basis of last year's dividends the approximate gross yields are: Champion Reef, 10½ per cent.; Mysore, 10½ per cent.; Nundydroog, 13 per cent.; Ooregum, 6½ per cent.

Other Company Results.—The usual analysis of profit and loss accounts appears on page 183, covering some 65 further companies. The results are discussed in detail on page 181 under the heading "Shorter Company Comments."

Company Meetings of the Week.—On later pages of this issue will be found reports of the following company meetings: Eagle Star and British Dominions Insurance, Norwich Union Fire Insurance, Norwich Union Life Insurance, Southern Life Association (of South Africa), Dunlop Rubber Company, Olympic Portland Cement, King Line, British Timken, Hudson's Bay Company, Sunday Pictorial Newspapers (1920), Daily Mirror Newspapers, British Enka Artificial Silk, Champion Reef Gold Mines of India, Ooregum Gold Mining Company of India, River Plate Trust Loan and Agency, Humphreys, and Bukit Ijok (Selangor) Rubber. Sir George Beharrell's survey of the rubber situation is discussed in a note on page 157 on the Dunlop meeting. At the Norwich Union Life Insurance Society meeting, Mr Ernest Hicks sug-

gested that conditions for investment might become progressively easier. Addressing Norwich Union Fire Insurance Society members, he mentioned that though the home section of the accident account had improved, there was a continued tendency for the cost of claims to rise. Mr Walter Marshall, at the Southern Life Association of South Africa meeting, referred to the establishment of a conservation department with the aim of dissuading existing holders from terminating their policies. Sir F. Vernon, addressing King Line proprietors, pointed out that the profit for 1936 had included a non-recurring subsidy of £47,519. Mr John Cowley's discussion at the Daily Mirror Newspapers meeting is referred to in a note on page 157. At the Sunday Pictorial Newspapers meeting he reported that the company would be paying only a few more shillings per ton for newsprint during the financial year ending February 28th next. At the British Enka meeting, Mr C. T. Pott referred to the fall in the selling prices of rayon. He advanced the view that consumption would have been greater if prices were stable. Discussing the prospects of River Plate Trust Loan and Agency, the chairman took a hopeful view, but warned shareholders against hopes of a return to pre-depression dividends. Captain E. C. Eric Smith referred to the building contracts on the books of Humphreys, Limited. At the Bukit Ijok (Selangor) meeting, it was reported that the company's standard production had been raised to 730,200 pounds. The discussions at the Hudson's Bay and the British Timken meetings are referred to in notes on pages 157 and 159 respectively. Sir Edward Mountain, at the Eagle Star meeting, reported that a good proportion of the substantial new business was due to group life and pensions schemes. Addressing Olympia Portland Cement members, the chairman alluded to their good relations with labour in the U.S.A. The Hon. A. T. J. Fraser reported at the Ooregum Gold meeting that results on the West Reef had been satisfactory. To Champion Reef shareholders he commented on the big reduction in working costs.

Keeping Informed on American Affairs . . .

Dow, Jones & Co., Inc., publishers of The Wall Street Journal, maintain America's largest organisation on business, financial and economic news.

By virtue of specialised staff, offices or correspondents in 113 of the world's cities, an outstanding news bureau in Washington, and world-wide press-association facilities, The Wall Street Journal gives, with perspective, a reliable, daily scrutiny of American affairs.

In about a week The Wall Street Journal reaches London from New York—quickly enough to keep you informed currently and well.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: APRIL 20 ACCOUNT: APRIL 22

The markets this week have done their best to improve, but few observers would deny the necessity for further technical clearing-up—quite apart from Mr Chamberlain's Budget speech on Tuesday—before any decided advance can be shown. The immediate aftermath of the gold scare and commodity weakness is one of convalescence rather than recovery. The speculative markets in mining and commodity shares remain vulnerable. Arrangements are being made to ease the position for speculators who have recently been caught overloaded, but it is plain that, when the surface of the market improves, a considerable measure of adjustment will still be necessary. Meanwhile, as the settlement approached, the condition of the market again became dull and unenterprising.

Gilt-edged once more stood above the timid condition of markets generally. Little business was passing, and an early improvement was checked for a time. But mid-week again brought fractional improvements, New Zealand stocks were uneasy on the spreading of rumours regarding the debt outlook, to which the market was very receptive.

In the foreign market, Chilean bonds improved on a favourable market brochure, although they reacted slightly on Wednesday. Japanese issues attracted more support than of late, but Brazilian loans remain heavy on moderate selling.

Home rails opened in poor style, and all the ordinary stocks showed significant falls. An immediate recovery set in, however, and the traffics gave further impetus, particularly to Great Western. Argentine rails improved steadily, encouraged by the traffics, but the feature in the foreign rail markets was San Paulo, which rose to 97 on the increase in the dividend. Brussels buying was reported for Nitrate Rails.

Apart from a firm tone at the opening of the week, which was soon forgotten, the only sign of cheerfulness in industrial markets was in mid-week. Most sections of the market were dull, and conditions were not improved by the approach of the settlement. Trans-Atlantic issues fluctuated in accordance with movements on Wall Street. The iron and steel section lost ground quietly but steadily with few exceptions, among which Stewarts and Lloyds were outstanding on the news of an increase in tube prices. Indian Iron showed a moderate improvement in mid-week. Motor shares attracted a slight attention in mid-week at the low prices which prevailed, and Rolls-Royce were supported in a generally irregular aircraft section. Electrical equipment issues were dull throughout.

Brewery issues turned harder in mid-week, along with tobacco shares. In mid-week Lancashire Cotton improved on the results, and rayon issues gained on the higher yarn prices in America. There was consistently good support for shipping shares on the trade reports and rising freight rates. Most movements in the miscellaneous industrials section were against holders, although conditions improved in mid-week. Salt Union were a prominent feature.

Oil shares responded early in the week to encouraging news from America, and with a slight increase in the volume of business, prices of the leading shares were higher. But on Thursday the market turned heavy in sympathy with most other sections on the approach of the settlement. Prices in the rubber shares market drifted downward most of the week on the falling commodity price, although at one time there was evidence of a firmer tendency. Conditions in the tea shares market were similarly weak.

The mining markets opened with a further display of acute nervousness. For the first hour on Monday an immediate recovery in Kafirs was reported, but weakness reappeared when he Cape showed itself a persistent seller. Business later became small and subdued, as the volume of speculative selling dried up, and no further liquidation was evident. Copper shares advanced sharply in mid-week, but could not hold their gains. Base metal shares continued uneasy, and tin shares, which showed improvement with the rise in the metal, failed to maintain their levels.

NEW YORK STOCK EXCHANGE

A slight recovery in the general price level had been recorded on Wall Street at the end of last week, after the country had been assured that no reduction in the price of gold was contemplated by the Government. This week opened very quietly in expectation of a decision by the Supreme Court on the Wagner Labour Relations Act. The decision arrived and the market fell, but only for a short time. Recovery was prompt and prices closed higher on the day. The day after the decision markets opened to meet short covering, and most prices continued to rise. There were several sharp advances; Union Pacific, for example, gained \$7. In mid-week, dealings opened firmly, but by the close most gains had been more than wiped out. Over-all gains were shown by some steel shares, oils, and Celanese. Government issues had an irregular week, but improved toward the end on institutional demand, and on the request from the President to government departments to cut expenditure wherever possible. Business news is still very good. *Iron Age* estimates steel mill activity unchanged on the week at 91 per cent. of capacity.

CAPITAL ISSUES

The dearth of really large public issues continues, but the new capital market has shaken off its recent idleness. This week, investors have been able to choose or reject new issues in the cosmetics, gasholders, chocolate biscuits, metal containers, and brewing industries. *G. and T. Bridgewater, Ltd.*, amalgamates three biscuit concerns. The 6 per cent

In calculating yields on fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "any div" shares.

 (a) Interim dividend. (b) Final dividend. (c) Last two yearly dividends. (d) Yield worked on a 30 per cent. basis. (e) Annas per share. (f) Includes a Special jubilee bonus of 2½ per cent. free of tax. (g) Based on current annual dividend rate ₹2.00 per share. (h) Including bonus of 5% free of tax. (i) Calculated on basis of 1½ annas per share of ₹2 per cent. free of tax. (j) Worked on current annual dividend basis. (k) Worked on a 60 per cent. dividend basis. (l) Free of Income Tax. (m) Yield worked on a 35% basis. (n) Yield worked on a 15 annas to one rupee. (o) Worked on a basis of 10 Rs. 7d. per cent. less tax. (p) Yield worked on a 12½% basis. (q) Special jubilee bonus.

(Continued from page 163)

(trademarks, goodwill, etc., £22,627). Commissions of 5 per cent., 2½ per cent., and 2½ per cent. paid on net profits over £30,000. Anglo-Caledonian Corporation purchase from vendors above issue at 3s. 8-46d., including expenses; also 30,000 preference shares, purchased and sold at par, sold to three parties. Lists closed 9 15 a.m., April 13th.

BY TENDER

Colchester Gas Company.—Offer for sale by tender of £10,000 4 per cent. debenture stock at 98 minimum. Redeemable at par 1957. Net revenue, 1936, £18,163. Authorised capital, £158,816; loan capital, £134,933 (£41,072 remaining to be raised). Proceeds to provide stoves, extend mains, etc. Population, 51,400; consumers 13,205; output, 1936, 323 million cubic feet.

ISSUES TO SHAREHOLDERS ONLY

Beaton (G.) and Son.—Issue of 132,214 2s. 6d. ordinary shares at 4s., in proportion of one for five held on March 8th.

Watford Electric Manufacturing.—Issue of 20,000 6 per cent. cumulative 10s. preference shares at 10s. 6d., and 50,000 2s. ordinary shares at 4s. One new preference for every four and one new ordinary for every nine held.

Anglo-Burma Tin.—Issue of £35,000 6 per cent. convertible debentures at par to shareholders on April 3rd.

Carrier Engineering.—Issue of 300,000 5s. ordinary shares at par in proportion of one new for each share held on March 30th.

Clapton Stadium.—Issue of 119,783 5s. ordinary shares at par, one new for five held on March 10th.

Davis and Timmins.—Issue of 20,000 5s. ordinary at 15s., in proportion of one new for sixteen held on March 18th.

Owen (Thomas) and Company.—Issue of 1,000,000 1s. shares at 1s. 3d., in proportion of one for three held, and £50,000 6 per cent. debenture stock at 98 per cent.

Escot Rubber Estates.—Issue of £42,500 6 per cent. convertible debenture stock at 105 and 425,000 2s. ordinary shares at par.

General Refractories.—Issue of 50,000 10s. ordinary shares at 25s.

Trussed Concrete Steel.—Issue of 114,666 new 5s. ordinary shares at 9s., in proportion of one new for six held on March 31st.

Viborita Gold Mines.—Issue of 80,000 10 per cent. participating 2s. preference shares at par.

Waddon Investments.—Issue of 100,000 5 per cent. debenture stock at par to shareholders of Town Investments, Ltd.

Anti-Attrition Metal Company.—Issue of 200,000 new 2s. shares at 3s. each, in proportion of one new for every four held.

DIVIDEND ANNOUNCEMENTS

UNILEVER LIMITED AND UNILEVER N.V.—The Directors recommend a final dividend of the equivalent in sterling of 38 Dutch Cents per £1 of Ordinary Stock (payable May 26th). The sterling amount of the dividend will be fixed on May 5th on the sterling rate of exchange on Amsterdam on that day. A rate £1=Fl. 9 would give a sterling dividend of 9.6d. per £1 of Stock, making a total for the year of 7½%. The Directors of Unilever N.V. recommend a final dividend of Fl. 30 per Fl. 1,000 share, representing 36 Dutch Cents per Fl. 12.

W. T. HENLEY'S TELEGRAPH WORKS.—Final dividend, 6½ per cent., making 10 per cent. for 1936. Also cash bonus 5 per cent. and a centenary cash bonus of 3½ per cent., making 18½ per cent. for 1936, equal to 37½ per cent. on old capital, against 22½ per cent. for 1935.

PRICE'S TRUST.—Interim dividend, 12½ per cent., against 7½ per cent.

SOUTHERN STOCKHOLDERS INVESTMENT.—Interim dividend, 1½ per cent. against nil, payable May 7th.

BERGER (LEWIS) AND SONS.—Interim dividend unchanged at 6 per cent.

RIO TINTO COMPANY.—Final dividend on preference shares, 2½ per cent., making full 5 per cent. for year. Carry-forward about £451,775, compared with £469,752.

BRITISH GENERAL FIXED TRUST SERIES "B."—Half-yearly distribution on Series "B" of 5-2d. net per sub-unit (equivalent to 6.44d. gross). Of this, 0.5585d. represents proceeds of sales of rights and fractions.

COMPANY MEETINGS

DUNLOP RUBBER COMPANY, LIMITED

SUCCESSFUL YEAR — INCREASED PROFIT

SIR GEORGE BEHARRELL'S ADDRESS

The thirty-eighth ordinary general meeting of the Dunlop Rubber Company, Limited, was held, on the 14th instant, at the Hotel Victoria, Northumberland Avenue, London, Sir J. George Beharrell, D.S.O. (the managing director), presiding.

The secretary (Mr Charles Tennyson, C.M.G.), having read the notice convening the meeting and the report of the auditors,

The chairman first referred to the regrettable absence of Sir Eric Geddes through indisposition. Continuing, he said:

I am sure you will be gratified at the report presented to you, but before dealing with it I feel it will be helpful to a full realisation of its meaning if I make a brief survey of the period since the onset of the world economic crisis at the end of 1929, which has come to be regarded as the peak year of the pre-slump period. The first point which I wish to note is that the Dunlop Rubber Company's net profit for 1936 amounted to £1,502,707, compared with £1,576,585 in 1929. Out of the 1936 profits taxation required £170,000 more than in 1929, and this reduced relatively the amount available for dividend. From the point of view of earnings, however, you will see that we have very nearly returned to the 1929 level. This result is particularly creditable because, although the price of rubber in 1936 was approximately the same as in 1929, the prices of our tyres have been materially reduced. In addition, it has to be remembered that tyre performance in 1936 was very much better. Indeed, the tyres supplied by us, dependent on various sizes and types, gave from 50 per cent. to 100 per cent. longer wear in 1936 than in 1929, and are still supreme in safety and comfort. This necessitates higher cost due to increases in the weight of tyres and use of better materials and of new and improved compounds.

In all these circumstances you will, I am sure, share the satisfaction of your board that the net profit for 1936 should be within £74,000 of that for 1929. The success attained has been due to the ceaseless efforts of your board and the management to broaden the basis of our business, economise in manufacturing cost by improved methods and processes and reduce the cost of distribution at home and abroad.

Turning to the Dunlop Rubber Company's balance sheet position, there are very important changes.

SURPLUS AND RESERVES

The total surplus and reserves have increased by £759,000, and a most notable feature is the fact that at December 31, 1929, debentures and mortgages amounted to £6,513,000, whereas at December 31, 1936, these liabilities totalled £3,433,000, representing a reduction of £3,080,000. In spite of the fact that the company's funded debt has been reduced by this considerable sum, the surplus of current assets over current liabilities at December 31, 1936, exceeded by £1,569,000 the corresponding surplus at December 31, 1929.

To have so greatly increased the strength of the company's position during these seven difficult years is an achievement which must be a source of satisfaction to you.

Before I proceed to deal more in detail with the accounts, I would like to say a word on a subject of great importance to us, namely, the price of rubber.

PRICE OF RUBBER

There still seems to exist an impression that the Dunlop Company is in a different position from other manufacturers, and I have seen it stated that it is now producing about 50 per cent. of its rubber requirements, and that in the near future it should be producing 75 per cent. I cannot do better than quote a very careful statement which Sir Eric delivered at the annual general meeting of the company two years ago.

"There appears to be a popular misconception that a rise in the price of rubber is a favourable factor for the company, owing to the fact that it has its own rubber plantations. The Dunlop Plantations, however, provide a very small proportion only of the company's requirements, and by far the greater proportion of our sheet rubber requirements have to be purchased on the market. In fact, it is true to say that so far as tyres and many other products are concerned our position is quite comparable to that of manufacturers having no rubber plantations, because far more than a moiety of our crop is sold or used for special products."

The company's business has developed considerably since that time—new factories have been opened, and new products put into manufacture. The position, therefore, in so far as it has changed, is in the direction of the plantations producing even a smaller proportion of the company's total requirements.

At the same meeting and also in 1934 Sir Eric referred to the necessity of maintaining stability at a reasonable price level.

During 1936 the price of ribbed smoked sheet varied from a low point of 6½d. per lb. at the beginning of the year to a high point of 10½d. at the end of the year, and in the last three months the price has risen to over 1s. per lb. That, to my mind, does not give the stability of price which the manufacturers hoped for under the regulation scheme.

The committee, I know, intend that the scheme shall operate so as to enable them to carry out the mandate of the agreement, viz.:

"To regulate the production and export of rubber in and from producing countries with the object of reducing existing world stocks to a normal figure, and adjusting in an orderly manner supply to demand and maintaining a fair and equitable price level which will be reasonably remunerative to efficient producers."

I am sure it was not their intention that there should be such a serious and rapid rise in the price of the commodity, nor will they rest content till they have carried out their mandate.

PROFIT AND DIVIDEND

The net profit of the Dunlop Rubber Company for 1936 amounts to £1,502,700, compared with £1,288,000 for the preceding year, representing an increase of £214,700.

With the balance brought forward from 1935, namely £590,000, there is a total available for appropriation of £2,092,000. You will observe that there has been transferred to taxation reserve £395,000, and the directors have deemed it prudent to transfer to general reserve £100,000, and

substantially increased sales. During the year we introduced a new mattress, the "Deep Six." We claim that this is the most luxurious mattress now offered to the public and it has had a most encouraging reception.

Reports from all quarters encourage us to view the future of this product with every confidence. In comfort, hygiene and wearing qualities its advantages are undeniable.

Another novelty which we have introduced is the rubber wing for passenger-carrying vehicles. This has aroused great interest, since it reduces maintenance charges and will, it is believed, contribute to safety on the roads. The company commenced practical development in 1932, and over 2,500 vehicles are already equipped.

Reviewing the tyre division as a whole, one can see that the future has both favourable and unfavourable features. The general usage of both cars and commercial vehicles continues to expand, and this should offset the reduction of replacement volume caused by improved tyre life. We have an energetic and experienced sales force, and a body of distributors and retailers which favourably regards our selling policies and gives Dunlop splendid support. The board and the management and staff of the company appreciate warmly the co-operation received from the trade. The excellence of Dunlop quality is recognised beyond the need of emphasis.

We are faced with price competition, and whilst we make every attempt by our example to secure stabilised trading conditions, competition of an uneconomic nature frequently occurs. You may rest assured that everything possible will be done to protect your interests. Experience in certain other countries has shown how disastrous a policy of volume regardless of profits can be to the industry.

The rim and wheel factories have kept pace with the expansion of our tyre business in its various branches; in particular the cycle rim output exceeded all records. The development of aero-equipment has materially increased the output of these factories.

RUBBER PRODUCTS GROUP

This group, which embraces footwear, general rubber goods, garments and sports goods, plays an important and increasing part in the broadening of the company's basis, to which I have referred. The improved results from this group in recent years are a most encouraging feature of our operations.

The company's goodwill with traders has increased. The quality of its products has advanced, and this fact is generally recognised. The name of "Dunlop" is jealously guarded, and is only applied to a product when it is proved by test to be of absolutely first-class quality.

Unfortunately, we still continue to suffer from severe competition from British territories overseas. You will remember that the chairman has more than once referred to the competition in rubber footwear from British territories in the Far East, where very low standards of living and wage levels prevail.

We also suffer from the dumping in this country of Canadian made goods, some of which are sold here at prices below prices in the Canadian market.

If the footwear imported from Hong Kong and Canada in 1936 had been manufactured in this country, we estimate that this would have given direct employment to over 3,000 workpeople, and in addition indirect employment to a great many more in the cotton and other industries. The Import Duties Advisory Committee are doing excellent work in safeguarding our industries from foreign competition, but this unfair competition from British territories is beyond their scope. This is a matter with which, sooner or later, the Government will have to deal, if the country is not to suffer serious loss of employment and profits in a number of industries.

OVERSEAS MANUFACTURING COMPANIES

I now turn to our overseas business, and first I will refer to the associated Dunlop factories.

In spite of the critical situations in France which arose during 1936, the Dunlop position in that market was strengthened, sales of all main lines increased substantially, and the year closed with a satisfactory profit.

Conditions in Germany still continue abnormal. Sales of all main products showed increases in 1936, as in 1935. The year closed with a slightly better profit, but dividends cannot be remitted.

In America, after a long period of severe price competition, there is a definite trend towards the maintenance of a more reasonable level of prices in the rubber manufacturing industry. The American company is in a position to take advantage of this. Its turnover improved substantially in 1936, but the profit and

loss position was not satisfactory. If increased raw material costs can be absorbed by price increases (and there are good indications of this) and the improved volume maintained, the current year's results should be more satisfactory. Business in Dunlopillo upholstery is an increasing help to the American company, and there are definite signs that the perseverance of its management and your patience will be rewarded.

Sales of almost all products in Canada improved. There was an increased sale of Dunlop types in what is believed to have been a declining market. Prices generally were not satisfactory, but showed signs of stabilisation at a higher level towards the end of the year. The profit and loss position showed some improvement, though like that in the United States it is still not satisfactory. The quality and performance of the Canadian company's products are quite first class.

The volume and value of Dunlop business in Japan increased considerably in all lines and the year closed with a much improved profit compared with 1935. An increase in tyre prices has recently become effective. We hope to be able by a sale to Japanese interests of some part of our equity in the Far East company to consolidate the position of Dunlop in that very nationally-minded country.

The Dunlop Perdreau Company of Australia, in which you own a minority interest, has gone through a difficult time, but is now showing greatly improved results and dividends are being paid.

The good prospects foreseen last year for the South African factory were fully realised, and 1936 closed with a very satisfactory profit. A further expansion in productive capacity is now being provided.

The new Indian factory produced its first tyre in August, 1936, and its rate of progress is fully equal to that of the South African factory at the same stage of its development. The first year of operation of a new factory inevitably bears heavy expenses and exceptional production costs. This had its adverse effect on the 1936 results, and the year closed with the full payment of the preference dividend but no ordinary dividend. Provided selling prices can reflect the rise in raw material prices, 1937 prospects seem favourable.

Last year you were told that the factory established in the Irish Free State was producing giant, car and bicycle tyres, rubber footwear and tennis balls, and that the plant promised to be a most useful addition to Dunlop resources. I am glad to say that this forecast is being amply justified.

Quantity sales in all main lines exceeded expectations, and the profit position was satisfactory.

The Dunlop Rubber Company is indeed fortunate in its ability to take advantage of the desire of growing countries to become self-supporting in the products of our industry. This is due to the conservative policy of the board in building up a strong and liquid financial position.

PROSPECTS

You will expect me now to say something to you on the subject of future prospects.

I have dealt so fully with the affairs of your company that time does not permit me to dwell long on the general economic position.

I have mentioned the obstacles which still exist to the development of export trade and the difficulties caused by the competitive position here and elsewhere. I have dwelt, too, at length on the uncertainties in regard to our principal raw material. In five years the price of rubber has increased more than six times; due both to the operation of the Rubber Regulation Scheme and to the general trend of raw commodity prices. If the turn of the tide when it comes is not very gradual all manufacturers (not only in this industry) will, as in the past, be faced with the serious problem of the value of inventories of raw materials and finished products.

We are engaged in a highly competitive business. Two of our major raw materials—rubber and cotton—are subject to regulation of one kind or another. We are operating all over the world, and no one with any knowledge of international trade, with its quotas, currency risks and embargoes, would deny the need for continued prudence.

Although, therefore, there are factors in the excellence of our own organisation and the great goodwill of the "Dunlop" name, which incline your board to view the future with confidence, it is still necessary to continue the conservative policy of strengthening the company's financial position. The board feels that it can best do this by adhering to the rate of dividend paid for the last three years and giving you a share in the improved profits of 1936 by the 1 per cent. bonus recommended in the report.

The report and accounts were unanimously adopted.

EAGLE, STAR AND BRITISH DOMINIONS INSURANCE COMPANY LIMITED

SUCCESSFUL YEAR'S OPERATIONS

INCREASED DIVIDEND

RESERVE FUND RAISED TO TWO-AND-A-HALF MILLIONS

Presiding at the annual general meeting of the Eagle, Star and British Dominions Insurance Company, Limited, held on the 15th instant, Sir Edward Mountain, Bart., J.P., in moving the adoption of the report and accounts, said they continued to benefit by the increasing prosperity of the country, and he thought they would agree that the results for the past year were good.

LIFE DEPARTMENT

In the life department there was a large expansion of new business. 2,690 policies were issued for sums assured of £5,880,088, of which £146,441 was reassured. The whole of their life business, except a small sum in South Africa, was obtained in the United Kingdom. The increase in sums assured during the year was nearly £3,000,000. The amounts assured under their ordinary whole life and endowment assurance tables continued to show a pleasing increase. A considerable proportion of the new business was due to group life and pension schemes. They were one of the leading companies in that class of business, for which they had a special organisation of highly trained experts. The rate of interest earned by their current life and annuity funds in 1936 was £4 3s. 5d. per cent. after deduction of income tax. Having regard to the yield now obtainable on high-class securities and the high rate of tax, that yield they would consider satisfactory. The amount of surrenders in 1936 was the lowest for 15 years, clearly indicating the country's return to prosperity. Another good feature in their life department was that notwithstanding the large increase of business their expense ratio showed a substantial decrease of over 1½ per cent. The current life and annuity funds increased over £534,000 during the year, whilst, since the beginning of the quinquennium, they had increased by approximately 1½ millions.

In regard to the assets of the life fund, the Stock Exchange securities were taken at or under their mean market value (less accrued interest) whilst in regard to the other classes of investments the prices at which they stood in the books were, in the opinion of the directors, fully justified. They had realised certain of their securities at a considerable profit, and the realised profit and the whole of the appreciation have been left untouched.

BONUS DISTRIBUTIONS

In calculating the liabilities of the participating sections the new tables compiled by the Institute and the Faculty of Actuaries, viz.: A 1924-29 were adopted, the rate of interest assumed being 3 per cent. which brought out higher reserves than those required by the O.M. table used on the last occasion. The average rate of interest earned on their current life assurance fund during the past quinquennium was £4 4s. 10d. per cent. The valuation showed a gross surplus in the participating section of £339,087. Of this it was proposed to distribute £318,955 and carry the balance forward. The sum of £31,895 representing one-tenth of the distributable surplus had been carried to the shareholders' profit and loss account, the remainder amounting to £287,060 being credited to the policyholders. The policyholders' share was sufficient to provide reversionary bonuses of 40s. per cent. per annum of the sum assured in the case of both ordinary whole life assurances with profits and ordinary endowment assurances with profits, whilst in the case of the abstainers' section (full premium) bonuses of 42s. per cent. on whole life assurances and 41s. per cent. on endowment assurances were declared. In view of the excellent results achieved and the strong position of the life fund, the directors were pleased to announce that for the present they had decided to pay an interim bonus of £2 per cent. on all participating policies effected under their ordinary section and the abstainers' full premium section on all claims arising by death or maturity during the current quinquennium.

The liabilities in the non-participating section of the life fund were valued on the same basis as that employed five years ago which is even more conservative than a 3 per cent. net premium valuation by the A 1924-29 table and a gross surplus amounting to £129,044 was disclosed. Allowing for £40,000 already received by the shareholders during the quinquennium and the carry-forward of £18,044, the balance of £71,000 has been transferred to the shareholders' profit and loss account.

SINKING FUND ACCOUNT

The new business in the sinking fund account has increased by some £340,000 sums assured. The valuation has been strengthened by assuming 3 per cent. interest instead of 3½ per cent., and the gross surplus amounts to £17,552, of which £10,000 was transferred during the quinquennium and the balance has now been transferred to the shareholders' profit and loss account.

The liabilities of the annuity fund have been valued on the same basis as in the life fund, and while the sum of £34,961 realised profit has been brought into account in order to strengthen the reserves by reducing the rate of interest assumed, the appreciation in the value of the securities has been left untouched.

FIRE DEPARTMENT

In the fire department the premium income amounted to £795,917, compared with £808,087 in the previous year. The profit in the department was £74,073, which compared favourably with the previous year both in the amount and in the percentage. The loss ratio was 40.02 per cent. to premiums written and 39.41 per cent. to premiums earned. The fire department reserve for unexpired liability amounted to £418,367, or 52.57 per cent. of the premium income.

ACCIDENT AND GENERAL DEPARTMENT

In the accident department, after providing for claims paid and outstanding and setting up the usual reserve of 40 per cent. for unexpired risks in connection with the annual premium income, a profit of £9,749 was transferred to profit and loss account. In the general department, which includes miscellaneous classes of accident business not dealt with in individual accounts, the premium income showed a substantial increase at £461,044. Claims paid and outstanding amounted to £143,810, and after providing for the usual reserve of 40 per cent. of the income for unexpired risks, a profit of £98,544 was transferred to profit and loss account.

MOTOR DEPARTMENT

The premium income in this department of £1,633,231 showed an increase of £167,913 over that for 1935. The claims paid and outstanding amounted to £885,296 or 54.2 per cent., and after provision for increased reserve and expenses the sum of £5,683 had been transferred from the profit and loss account, showing a small loss.

MARINE DEPARTMENT

In the marine department they were able to transfer the sum of £20,000 to profit and loss account, and the marine fund at the end of the year stood at £328,557, which equalled 130.36 per cent. of the premium income.

PROFIT AND LOSS ACCOUNT

The credit balance brought in from last year was £257,264. The net interest on investments amounted to £264,276, whilst trusteeship and other fees yielded £8,658 net, and the net profit from the sale of investments was £146,762. The transfers from the various trading departments totalled £317,378. The premium on the issue of ordinary shares, after providing for expenses, was £1,116,060, and the profit on foreign exchange amounted to £26,129, making a grand total of £2,136,531. This amount had been dealt with in the following manner. There was paid an increased dividend of 27½ per cent., amounting with the preference and preferred ordinary dividends to £261,011 net, which payment was more than covered by the net interest earnings and twice over by the profits of the year. Provision for British and other taxation and expenses not charged elsewhere absorbed £137,759. Office equipment amounting to £18,937 and bad debts amounting to £4,533 were entirely written off, whilst a transfer was made to the motor insurance account of £5,683. These adjustments left the substantial balance of £1,708,605.

Out of the sum remaining the balance of cost of life businesses acquired, £145,000, and the balance of premium on shares in subsidiary insurance companies, £35,803, had been also written off. £100,000 was transferred on account of the provision for pensions. After these various deductions there remained a credit balance to carry forward of £277,802, which showed an increase of £20,538 on the amount brought in. They had therefore more than a year's dividend in hand. After writing off all expenses in connection with the recent share issue the premium on the new capital, together with the sum of £33,940, making a total transfer of £1,150,000, had been carried to reserve fund, which now stood at 2½ millions.

OUTLOOK FOR CURRENT YEAR

In conclusion, he wished to express his great appreciation and thanks to all the members of the staff who had contributed to the excellent results which they had achieved during the year and to add that the new year had opened well. Given peace at home and the fulfilment of their hopes in world conditions generally, he considered the future was full of promise.

The report and accounts were unanimously adopted, and the retiring directors having been re-elected and the auditors re-appointed, the proceedings closed with votes of thanks to the chairman, directors, officials and the staff.

HUMPHREYS, LIMITED

INCREASED DIVIDEND AND GOOD PROSPECTS

The annual general meeting of Humphreys, Limited, was held, on the 14th instant, at Winchester House, London.

Captain E. C. Eric Smith, M.C., presided in the absence of the chairman of the company, Mr A. V. Bridgland, and read his speech, which stated that the work in progress stood at £326,244 as against £290,879 in 1935, an increase of £35,365. That increase was brought about by the larger amount of business which the company had in hand. Approximately £156,717, or practically half of that work in progress was attributable to the contract for the erection of buildings for the Air Ministry in Iraq. The value of the work in progress had been certified by the company's officials on a conservative basis, and, as on every contract, provision had been made for all known contingencies in arriving at that valuation, they could safely say that that item would realise not less than the value placed upon it.

The intangible assets represented by underwriting commission and expenses in regard to the scheme of arrangement had been eliminated by writing off to profit and loss account the amount of £6,278 at which they had stood in the books. The total liquid assets of £382,270 showed an excess of £84,346 over the current liabilities.

The gross trading profit for the year under review was £34,742, against £25,507 for the previous year, an increase of £9,235, while the net profits were increased by £11,695 to £28,099. After payment of the preference dividend there remained a balance of £22,625 to be dealt with. The recommendations of the board in that connection were given in the report; the dividend recommended on the ordinary shares was 10 per cent., as compared with 5 per cent. for the previous year.

As to the current year, the value of contracts in hand was in excess of that for the previous year, and the company should show satisfactory profits for the year.

The contracting business had shown improvement during the last 12 months, but competition for the increased work available was just as keen as ever. Owing to their connections they had been fully supplied with work without having to accept the more competitive contracts, and he had every reason to feel satisfied about the future of the company.

The report was adopted.

OFFER TO READERS

Any reader who makes his first acquaintance with this journal with this week's issue is invited to fill up the attached:

To Publisher, "Economist Newspaper Ltd.,"

8 Bouverie Street, E.C.4.

In order to test the value of your publication I should like you to forward this to me by post for the next four weeks. If I then decide to become a subscriber, it is understood that there will be no charge for the copies thus received, but otherwise I shall be willing to pay 4s. to cover their cost.

BRITISH TIMKEN, LIMITED

MR MICHAEL DEWAR ON STEEL PROBLEM

The seventeenth ordinary general meeting of British Timken, Limited, was held, on the 14th instant, at 65 Cheston Road, Aston, Birmingham.

Mr Michael Dewar (the chairman and managing director) said: The results for the past year show that our machinery has been kept reasonably fully employed. The increase in profit is almost entirely due to greater volume of output and improvement in methods of manufacture.

Our current assets exceed our current liabilities by about £200,000, and we propose capitalising £50,000 of our general reserve so that the issued capital may be brought more into line with the actual capital employed in the company. When a proportion of the profits of a company has for many years been retained for capital purposes to the extent that this has been done in your company, we consider that the nominal amount of the capital should also be increased.

TURNOVER STEADILY INCREASING

Your company is getting generally better known in the industrial field, and our turnover in railway, machine tool and steel mill work is steadily increasing.

Unfortunately, although we obtained some portion of a large order for anti-friction bearings destined for what will be the largest continuous sheet mill in Great Britain, we were not so successful as we had hoped. Although the mill in question had been designed round Timken bearings, we were ultimately under-quoted by a European competitor. We have been assured that the cost of the steel used for these large bearings is so much less in the country from which our competition came that it more than counter-balanced the import duty on the finished bearings.

For forgings for large bearings we have recently been quoted exactly double the price we paid only eighteen months ago. Everyone is scrambling for steel and other raw materials and probably ordering far more than they really need with the object of making certain of some stocks. Everyone is also scrambling for skilled men. The supply of men in the engineering industries is limited, and if they are transferred to the manufacture of armaments they cannot be making other products as well.

THE ECONOMICS OF REARMAMENT

According to the information available (I am taking the figures from *The Economist* and the *Ministry of Labour Gazette*) the Government appears to be going to try to spend during the current financial year £90,000,000 more on armaments than they did in the last financial year. Assuming that this sum is spent in wages in this country, it will have to be spent in addition to those wages already being spent in the industries which contribute to the re-armament programme.

The total number of people employed in the metal, engineering, vehicle, ship-building, mining and other engineering industries is approximately 3,000,000. If we assume that each employee is earning £3 10s. a week, the total earnings for a year of 50 weeks amount to £525,000,000. The addition of £90,000,000 a year to be spent in these industries means an increase in the employees of these industries of something of the order of 17½ per cent.

I am one of the people who believe that this is impossible, and that the Government will not be able to spend the money at the rate implied by their re-armament programme.

It appears that there is trouble ahead. Some action should have been taken when the re-armament programme was announced. It is becoming daily more essential that something should be done if we are to achieve the re-armament programme without causing grievous harm to our economic situation. I would suggest two lines of action, one by the Government in taking off or reducing the duties on engineering products imported into this country and thus releasing men and plant for the re-armament programme while at the same time stimulating international trade; the second by action through the big trade associations in this country for the voluntary restriction of the consumption of essential materials, such as steel, in projects which could be postponed until the situation becomes easier.

With regard to the prospects of the anti-friction bearing industry, your works are at present very fully employed, and as long as the increasing cost of labour and material can be passed on to consumers of bearings, and provided such action does not jeopardise the ultimate demand, there is no reason to expect the current year to be less favourable than the last.

The report and accounts were adopted.

NORWICH UNION LIFE INSURANCE SOCIETY

INCREASE IN NEW BUSINESS

The one hundred and twenty-ninth annual general meeting of the Norwich Union Life Insurance Society was held, on the 13th instant, at Norwich.

Mr Ernest Hicks (the President) said that 1936 had been described as an eventful year, and when one recalled that it witnessed the lamentable death of a British monarch, as well as other constitutional changes later, that it was responsible for an African campaign, as well as a civil war, that it produced a currency crisis which terminated in the devaluation of the French franc, and, further, that it was overshadowed throughout its 12 months by disquieting developments in international politics, one was not inclined to find any serious fault with this description. Happily for this country, we emerged better than might have been anticipated from the consequences of more than one unfortunate incident.

The past year had also had other claims to distinction. There had been a substantial reduction in the figures of unemployed; the payment of higher wages and consequent increased purchasing power of the community; company profits showed increases; Stock Exchange business was unusually active; overseas trading was on the upgrade; and generally 1936 would long be remembered for its marked improvement amongst industrial and commercial activities in which the business of life insurance prominently figured. If, during the recent years of depression, the satisfactory new business figures of British life offices were partly due, as was then supposed, to the abundance of funds unemployed in industry, it might have been expected that the commercial revival which took place during 1936 would operate to some extent in a contrary direction, and this might quite possibly have actually taken place; but it must also be remembered that improving trade had brought to light a number of employees' insurance and pension schemes which had been previously held in abeyance, and, on balance, new insurances completed in most cases showed an increase over the corresponding totals of the previous year.

GROWTH OF PREMIUM INCOME

Their own production amounted to £11,090,783, after deduction of re-insurances, being an increase of £303,193. The total premium income was £79,844 higher at £4,235,021, while interest, dividends, etc., at £1,850,831, showed an advance of £39,157. The net rate of interest, however, was £4 7s. 3d. per cent., resulting in a reduction of 2s. 11d. per cent. on the rate earned in 1935, part of which was attributable to the increase in income tax, and the remainder to the natural effect of the continued unremunerative yield obtainable upon new investments. The tendency of prices of the fixed interest type of security, in which they as a board were mainly interested, was certainly downwards; in fact, it rather looked as if peak prices were reached during 1935. If this should indeed prove to be the case, conditions for investment might now become progressively easier, in which event directors of insurance companies were not likely to be among the first to complain, even if this involved a certain contraction in the hidden appreciation on existing holdings. Cheap money, no doubt, acted as a stimulus when trade was flagging, but with income tax at the present high figure, to say nothing of alterations which might be divulged in the near future, one wondered whether the universal applicability of this principle might not be a little over-emphasised.

Total claims under policies amounted to nearly 2½ millions, of which roughly 1½ millions became due under maturing contracts and the other million arose by reason of death. Under both headings payments were rather lighter than last year, those by death being particularly favourable in comparison with the sum expected according to the life tables employed. It was hardly to be expected that this low mortality could continue, although up to the present this year their experience had been almost equally fortunate. Sums paid in respect of surrendered policies showed a contraction of £51,000, but bonuses taken in cash or applied in reduction of premiums had increased by £168,000, which was not unnatural in view of the large profits allocated to participating policyholders in respect of the quinquennium ending December, 1935, which had a cash value of approximately £5,000,000.

The only other items on the debit side of the revenue account were commission and expenses of management. These latter were augmented upon the present occasion by the inclusion of the costs of the quinquennial valuation and distribution of profits which he had just mentioned.

The report was unanimously adopted.

NORWICH UNION FIRE INSURANCE SOCIETY, LIMITED

IMPROVED POSITION

The annual general meeting of Norwich Union Fire Insurance Society, Limited, was held, on the 12th instant, at Norwich.

Mr Ernest Hicks (the chairman) said that the accounts, in the aggregate, showed a somewhat improved position compared with those of the previous year. The fire premium income was £1,636,947, a reduction of £33,180, caused, as in previous years, by a decline in the volume of foreign business, chiefly in the United States and Canada, where, in spite of the improvement in trade, British companies generally appeared not to have benefited by increased business up to the end of 1936. The current year showed some improvement in this respect, and he hoped that this might continue. Their home fire business had again been progressive and the loss experience satisfactory. The profit in the fire account was 5.41 per cent. against 9.04 per cent. in the previous year, the reduced ratio being attributable to the smaller contribution from the foreign field.

The accident account showed the improvement they were expecting to report. The home section of the business was both progressive in volume and yielded a profit, but even in this field there was a continued tendency for the cost of claims to rise. The premium income for the whole of their accident business was £1,417,193, a reduction of £36,369, which was much less than the volume of business given up in the United States, so that there had been substantial progress elsewhere. The result of the account showed a great improvement on the previous year and they were able to transfer £77,681, or 5.48 per cent. of the premiums to profit and loss account, as against £12,220, or 0.84 per cent., in 1935.

The premiums in the marine department showed an increase of £22,265, being £173,906 for the year of account. They were again not making any transfer to profit and loss account, and this course enabled them to carry forward in the marine insurance fund the sum of £180,283, which was more than the total of last year's premiums and, in the opinion of their underwriters, substantially in excess of all liabilities.

In the profit and loss account they brought in from the preceding year a balance of £400,231, and to this they added the transfers from the fire and accident accounts totalling £166,285, which together with interest and dividends amounting to £157,083 and transfer fees, gave a total of £723,607. From this they had paid a year's dividend of £204,600 and carried forward £430,531, being £30,300 in excess of the amount brought in.

INCREASE IN TOTAL ASSETS

In spite of the smaller casualty business now conducted in the United States, and the consequent release of a substantial amount of the funds held for unexpired risk and outstanding claims, the total assets stood at £5,814,544, which was an advance of £93,869 in the year. Moreover, in arriving at this figure no credit was taken for the appreciation in their investments, the total amount of which reached a very substantial figure not included in the accounts and consequently forming a hidden reserve.

During the year under review Mr C. S. Weston, just before entering upon his present position as secretary, paid a visit to the United States and Canada, giving particular attention to the Norwich Union Indemnity Company in New York. The board had expressed their satisfaction at what he had done in this respect and in the other matters which he took up on his visit. Subsequently their Marine Underwriter, Mr Berridge, visited New York in connection with the business of his department in the United States. Later in the year his colleague, Mr B. B. Riviere, accompanied by the general manager and the secretary of the Norwich Union Life Office, paid a visit to South Africa, where both societies had very important interests. The prosperity existing in South Africa at the present time was a good augury for the continued success of their operations there. The company had still further augmented their home organisation, and they had been rewarded by a substantial increase in the business done.

The Norwich Union was one of the pioneers of British Insurance Companies abroad, and to-day it not only had representation in every Continent, but it transacted in this country, almost every class of insurance business, and many of them beyond the seas also. Neither age, nor its provincial status, of which it was proud, had caused it to fall out of the ranks of leading insurance institutions, and to-day they offered up-to-date contracts with security and facilities of all kinds to the insuring public wherever they were established.

The report was unanimously adopted.

THE SOUTHERN LIFE ASSOCIATION OF SOUTH AFRICA

SATISFACTORY YEAR'S WORKING

INTEREST PROBLEMS

Presiding at the forty-sixth annual meeting of the Southern Life Association of Africa, held at the head offices of the company in Cape Town on March 16th, Mr Walter Marshall (chairman), in moving the adoption of the report and accounts, said the net amount of new life business for the year amounted to £3,303,311, as compared with £3,277,535 for the previous twelve months, while the premium income at £687,647 showed an increase of £37,283. Claims by death amounted to £179,752, showing an increase of £8,484, whilst the claims that matured on the survivance of lives totalled £198,906, as against £197,850 a year ago.

He was pleased to be able to report that under the heading of surrenders there was a further reduction of £11,000 as compared with the previous period. That department of their business was receiving special consideration at the hands of the board, and a new branch of their organisation, entitled the Conservation Department, had been set up at the head office, the object of which was to try and obviate the termination of policies by existing holders.

NEW CONSERVATION DEPARTMENT

The increased attention given to conservation had led to the realisation that reinstatement could never be more than a minor factor in a good conservation programme. The real problem was not to reinstate business but to prevent lapses from occurring. Experience had shown that the success of efforts in that direction depended probably more on the attitude of mind of the outside staff than on any other single factor. Accordingly, the department would make it its primary function to continue the education of their agents, so that they might have a fuller realisation of the value of the proper presentation of the varied life assurance contracts at their disposal.

In the matter of management expenses, like other commercial institutions, life offices were experiencing a tendency to increased costs. It was therefore very satisfactory to be able to state that the ratio to expenses of management for the past year, including commission on new business, remained practically the same as a year ago, the actual variation being 0.13 per cent.

INVESTMENT REVENUE PROBLEMS

The question of investment revenue was one which called for special note. All who were interested in life office management were hoping there would be an improvement in interest yields in the near future. At the same time, he would state that the activities of economists as well as of politicians were in the direction of maintaining interest at the present low level, because they feared unfavourable consequences should a sudden rise take place. All the same, he felt from their own experience that the downward movement in interest rates had been interrupted, and possibly, he thought, during the current year the upward trend would be established, not suddenly but at a pace which would enable their economists and politicians to adapt changing conditions to the requirements of the country. Their interest revenue amounted to £312,561, indicating a decrease in the yield on the invested and uninvested funds at £4 13s. 9d. per cent. gross and £4 12s. 10d. per cent. net.

TRIENNIAL VALUATION ON 2½ PER CENT. BASIS

The life funds of the association now exceeded seven millions pounds at £7,022,548, having increased by £362,192 during the period under review. At the last triennial investigation the rate of interest was assumed at 2½ per cent. in the case of participating contracts, so that when they considered a reduction in the rate of interest earned on their funds it must be borne in mind that on the whole there was now a greater margin, having regard to the fact that their previous valuation was at the rate of 3 per cent.

Having reviewed the results in the accident, fire and other insurance departments transacted in South Africa, he wished on behalf of the board to thank the members of the field staff

for their zealous work in the interests of the association, and at the same time to extend a welcome to the new men who had joined their ranks during the past year. He also wished to thank the management and staff at the head office and branches for their loyal and enthusiastic support in the work of the association. In particular, he wished to put on record his appreciation of the work done by the London board of directors. The skill and careful scrutiny exercised by them in the discharge of their difficult duties was worthy of much praise.

The report and accounts were unanimously adopted. The retiring directors (Messrs A. B. McDonald and A. F. Stephen) having been re-elected, and the auditors (Messrs Deloitte, Plender, Griffiths, Annan and Company) being re-appointed, the proceedings closed with a vote of thanks to the chairman, directors, the general manager (Mr J. M. Macfarlane, O.B.E., F.F.A.) and the officials and staff of the association.

BRITISH ENKA ARTIFICIAL SILK COMPANY, LIMITED

EFFECT OF LOW SELLING PRICES

The twelfth ordinary general meeting of the British Enka Artificial Silk Company, Limited, was held, on the 12th instant, in London, E.C., Mr C. T. Pott presiding.

The Chairman, in the course of his remarks, said: The working profit for the year as shown by the profit and loss account is £43,575, as compared with £101,297. After charging depreciation, debenture interest and other overheads, there is a net loss of £12,896. This result is disappointing after the progress we had made in the last three years.

The main reason for the reduction of our profits is the fall in the selling prices of rayon, but we are not without hope that we shall succeed in reducing our production costs, thus countering the fall in selling prices to some extent. As I have explained in past years, the price in this country is quite beyond our control. We do not believe that the fall in price has in any way stimulated consumption.

We hold the view that if there could be some stability in prices consumption would be greater. However true it may have been in the past that a fall in prices assisted consumption, the low and fluctuating prices we have now reached make it unlikely that any reduction may be passed on to the ultimate consumer. We notice that in America, where there has been a large increase in the consumption of rayon, the price has remained stable, and has even slightly increased, over the past two years. In other countries prices are hardening and even rising.

It is to be hoped that some improvement in selling price will materialise in this country, if only to meet the increasing cost of raw materials. In some directions at least we are safeguarded for a time ahead by our forward contracts, but sooner or later we, with other rayon yarn manufacturers, will have to face higher costs of the materials used in production.

Unfortunately we still have the Excise Duty with us, and this amounts to 25 per cent. tax upon our products. It is obvious that a tax of this dimension is an injustice when it is imposed on a single textile while all other textiles remain exempt, and it is our opinion that it should be removed at the earliest possible moment.

We have again maintained the high quality of our product. It has been our aim to supply rayon which is second to none, and we believe we have largely attained this position. So far as the general condition of the rayon trade is concerned, there is still expansion, although not at the same rate which we have seen in the past few years. The chief increases were in Japan and the United States. World demand rose only 9 per cent. as against 19 per cent. for the year before, and British demand 4.1 per cent. as against 26.3 per cent. for the previous year. Unfortunately our own company has lost the whole of its export trade, and, while at one time 30 per cent. of our production was sent overseas, in the year which has just closed our exports were less than ½ per cent. Exports have become almost impossible for this country owing to tariff barriers and exchange restrictions. We are not, however, troubled very much with the import of yarn, although there is a growing but not as yet menacing increase in the import of fabrics and hosiery made from rayon yarn. The British market is, however, largely in the hands of the British producers, and it does not appear that anything like saturation point has yet been reached. With the greater prosperity of the country we may look for an increased use of rayon products, as their popularity continues unabated.

The report and accounts were adopted.

SUNDAY PICTORIAL NEWSPAPERS (1920), LIMITED

INCREASED PROFIT — STRONG POSITION

The seventeenth ordinary general meeting of Sunday Pictorial Newspapers (1920), Limited, was held, on the 12th instant, at the Memorial Hall, London.

Mr John Cowley, who presided, said: The profit for the year ended February 28, 1937, after providing for income tax, working office, and other expenses, contingencies, etc., amounted to £247,573 8s. 4d., nearly £31,000 more than the profit of the previous year. The sum of £20,000 has been placed to reserve account, £5,000 has been applied as a provision for pensions, and £25,000 has been set aside as reserve for taxation.

We have paid interim dividends totalling 12½ per cent. on the ordinary shares, and after providing for the dividend on the preference capital there remains £117,538 15s. 9d. to carry forward, against a figure of £91,215 7s. 5d. brought in from last year.

Investments at cost or under total £2,522,093 7s. 4d. and show on balance an increase of nearly £57,000. During our year Albert E. Reed and Company, Limited, a company in which we already had a very considerable holding, made an issue of shares, and we took up the number to which we were entitled.

REVENUE WELL MAINTAINED

It is very gratifying to know that your company has begun its new year in a strong financial position. The four chief matters which influence the profit and loss account of the newspaper company are sales, advertisements, wages and contributions costs, and the price of newsprint paper. Taking these in the order mentioned, sales and advertisement revenue of the *Sunday Pictorial* have been satisfactorily maintained. Wages and editorial contributions show a modest increase, and last year the cost of our newsprint was not greatly different from that of the previous year. We also made certain economies, and dividends received on our investments were somewhat higher.

At our last meeting I made reference to the price we would be paying for newsprint during the year just ended. The price of this commodity is a matter of paramount importance to us, as indeed it is to every newspaper company. I am pleased to be able to say that during our financial year, which will end on February 28th next, we shall be paying very little more—only a few shillings per ton—than we paid last year, but it is in regard to the following year that your company may be faced with a fairly big increase in the price of newsprint. Your directors, however, have little fear on this score. I would remind shareholders of the excellent position your company is in through its close connection with pulp and paper businesses in which we are interested. Therefore, although the coming rise in the cost of newsprint, and, in fact, in the cost of every article manufactured from wood pulp, will mean a larger charge to your company for this very necessary article, it is satisfactory to know that among the investments owned by the Sunday Pictorial Company are four from which, in due course, we should derive benefit as a result of this better price and unabating demand. In Albert E. Reed and Company the *Sunday Pictorial* has a very considerable holding. That company now produces per year 200,000 tons of paper of various kinds, and that output will be increased to 250,000 tons in 1938. A large percentage of the company's production is of high-grade quality, and your directors look forward to improved earnings.

QUESTION OF PAPER SUPPLIES

The other kindred concerns in which we have interests are Anglo-Canadian Pulp and Paper Mills, Limited, Gulf Pulp and Paper Company, and Anglo-Newfoundland Development Company, Limited. You will appreciate, therefore, your company is in as safe a position in regard to paper supplies as any newspaper can be, and although the cost of the article will in due course be greater, there is the compensating advantage which we should derive from our holdings in the companies mentioned.

In concluding my remarks I think I can fairly say that we may look forward to the future with considerable hopefulness. We have, in the *Sunday Pictorial*, an attractive paper, a good and energetic staff, and our investment holdings should be of improving value to your business.

The report and accounts were unanimously adopted, and Messrs Deloitte, Plender, Griffiths and Company were re-appointed auditors.

The meeting closed with a very hearty vote of thanks to the management and staff.

DAILY MIRROR NEWSPAPERS, LIMITED

ANOTHER SUCCESSFUL YEAR

The seventeenth ordinary general meeting of The Daily Mirror Newspapers, Limited was held, on the 14th instant, at the Memorial Hall, Farringdon Street, London. Mr John Cowley (chairman of the company) presided.

The Chairman, in moving the adoption of the report and accounts, said: The profit of your company for the year ended February 28th last, after making provision for depreciation of plant and machinery, etc., and interest on debenture stock, amounted to £344,465 5s. 8d., an increase of nearly £30,000 over last year. (Hear, hear.) We have placed £20,000 to reserve account, allocated £10,000 as a provision for pensions, and an amount of £25,000 has been set aside as a reserve for taxation. After payment of interim dividends on the ordinary shares totalling 15 per cent. and providing for the dividend on the preference shares as set out in the appropriation account there remains £98,930 16s. 3d. to be carried forward, against a figure of £83,465 brought in from last year. Investments at cost or under, standing at £4,976,569 os. 10d., show an increase on balance of nearly £156,000. In this connection I mention that an issue of shares was made during the year by Albert E. Reed and Company, Limited (a company in which we already had a large holding), and we took up the number to which we were entitled.

SALES PROGRESS

Last year I made reference to the big circulation figures achieved by the *Daily Mirror* during the year which had then just concluded. I cannot refrain from referring again to this subject, for you will be gratified to know that generally the progress in our sales continues to be highly satisfactory. I would mention that the sound position of its sales has been achieved not by gift schemes nor by extravagant house-to-house canvassing, but by spending money in securing the best and most interesting news and picture services from every part of the world. This policy your directors will continue to follow.

I would draw shareholders' attention to a fact which is very little realised—if realised at all—that the morning newspaper which costs the reader a penny a day is without question the very cheapest article that can be obtained anywhere in the world at that price. (Hear, hear.) It has never been drawn sufficiently to the attention of newspaper readers, that the article which is supplied to them every day is without question the most remarkable and interesting pennyworth in the wide world. The average daily newspaper will provide its reader with enjoyment for 15 minutes or an hour or two hours, or even three hours, according to the time at his or her disposal. There is no other entertainment, and there is no other article of its value that I know of which can be bought for one penny.

It is possible that the growing popularity of the newspaper of the size and character of the *Daily Mirror* is a distinct sign that the time is coming when the smaller page newspaper will achieve as great, or even greater, sales than the so-called standard size newspaper. For handling, for obtaining all the news and pictures at a glance, for a quick survey of all the news in a concise and abbreviated form, papers of the size of the *Daily Mirror* and *Sunday Pictorial* have been increasing their appeal to the public in recent years. Their popularity, in my opinion, will continue to grow rapidly provided always that the news service and pictorial display are of the highest standard. This has been the aim of the directors and editor of your paper, and I am satisfied that a continuance of this policy will be reflected in a constantly increasing number of readers.

In the U.S.A., our type of paper has for years been by far the most popular size, and I see no reason why the *Daily Mirror*, as well as its sister paper the *Sunday Pictorial*, should not in due course achieve the same measure of popularity with the public here as papers of similar dimensions have secured in the U.S.A.

NEWSPRINT POSITION

The Chairman, in reviewing the Newsprint Industry, said:—For several years past, you will remember, I have referred to your company's investment in the Anglo-Canadian Pulp and Paper Mills, Limited, and mentioned briefly the position of the newsprint industry in the U.S.A. Last year I gave an indication that the prospect of this investment was somewhat brighter than it has been for six years. It is very gratifying to me now to say that during the past 12 months the newsprint industry in America and in this country has shown improvement even more rapid than was then anticipated.

The report and accounts were unanimously adopted.

HUDSON'S BAY COMPANY

GOOD PROGRESS DURING THE YEAR

A General Court of the Governor and Company of Adventurers of England trading into Hudson's Bay was held, on the 14th instant, in London. Mr Patrick Ashley Cooper (the Governor) presiding.

The Governor, in the course of his speech, said: I am sure it is a matter of great satisfaction to you, as it is to us, that to day we are able to recommend the payment of six years' arrears of dividend upon your preference shares, thus completely clearing up the heavy arrears that had accumulated. This may be considered another milestone in the long career of our company.

In 1936 Canada enjoyed a year of steady progress. The most important developments of the year were: A large expansion in export trade, an improvement in agricultural prices, great activity in mining and an upswing in industry generally. In spite of this recovery, however, there is still a great number of persons on relief.

Taking the provinces in which we mainly operate, British Columbia has enjoyed a year of prosperity: lumber, mining, fishing and shipping have all been good. On the other hand, in the three Prairie Provinces large areas were again affected by drought, some districts suffering complete loss. Fortunately, this was somewhat offset by higher grades and higher prices, so that in total the value of agricultural production showed an increase over the previous year. With the exception of Alberta all the Provinces in Canada have succeeded in meeting their obligations.

RETAIL STORES AND WHOLESALE DEPARTMENT

Turning first to our retail stores department, it is most gratifying to record continued success. Our Canadian Committee report that the profit earned in this department is the largest which it has ever made, and that for the first time every one of these stores is operating at a profit. We feel that these results reflect great credit on the department and all concerned in its management.

In previous years I have referred to the wholesale department and to the difficulties in operating it. I am therefore glad to be able to report to you that this department, which has received a great deal of consideration by the management, is making progress and profits. All the products which the department handles, as well as our wines and spirits, are selling well in Canada. In the United States also we are making progress with the products we market there.

LAND DEPARTMENT AND FUR TRADE

As I have pointed out to you, agricultural income in the three prairie provinces increased during the year, and this has enabled the land department to show some further improved results. The increase in our income last year is directly attributable to the improved prices obtained for the field crops and the higher grades of cereals. While this resulted in better collections from districts which enjoyed a crop, collections are still irregular and far below what we should like to see. Many areas enjoyed a crop for the first time for some years, but, taking it all in all, about half the crop area failed through drought. In spite of these misfortunes and the ever-growing temptation to default on payments, it is gratifying to record that so many farmers continue to make real efforts to meet their contractual obligations.

With regard to the fur trade, it is world conditions, particularly the buying power of consuming countries in which our furs are distributed, that make or mar the success of this department. Exchange and import restrictions continue to hamper us in many ways, but in spite of this we have experienced considerable demand from various countries, particularly the United States, with the result that fur prices advanced throughout the last 12 months, especially towards the end of the year. Our figures have benefited accordingly.

The fur catch in Canada during the last outfit showed a substantial decrease in volume as compared with the previous outfit, the most marked decline being in white fox. But the advance in fur prices more than offset the shortage in pelts.

As regards the future, while a great deal must depend on the conditions prevailing in Canada and in the other countries in which we operate, I feel we are justified in saying that, although 1937 will have its problems in plenty, there is good reason to hope we shall succeed in maintaining results comparable with those now before you. A great effort is needed from each one of us, but we are fully prepared and we have the necessary personnel, who year by year are proving their ability to meet with increasing confidence the demands made upon them.

The report and accounts were adopted.

OLYMPIC PORTLAND CEMENT COMPANY, LIMITED

IMPROVED RESULTS

The twenty-sixth annual ordinary general meeting of the Olympic Portland Cement Company, Limited, was held, on the 15th instant, in London.

Mr John Lawson (the chairman) said that the profit for the year showed an increase of about £20,000 over the preceding year. After providing for the interim dividend paid in November last, there was a balance available in profit and loss account of £43,300. The directors recommended the payment of a final dividend of 5 per cent., which would leave £31,025 to be carried forward, as compared with £27,973 brought in from the preceding account.

Prices for ordinary business were well maintained and the increased output effected a satisfactory reduction in production costs, but, as he warned shareholders last year, the profit margin on the Coulee Dam contract was comparatively small and the percentage of profit per barrel was thereby considerably less than in the preceding year.

During the year the factory maintained a 42-hour maximum week and an eight-hour maximum working day. An increase of wages of 5 cents per hour was agreed upon in May, in line with what was being paid in other industries, and in the latter part of the year their employees organised their own union, having obtained a charter from the American Federation of Labour. This involved a further advance in wages of from 5 to 10 cents per hour. Having regard to the prolonged strikes in some of the United States industries, it was satisfactory to report that the relationship with their employees had been most harmonious, and the manager reported that he had received assurances from the men that under the new union organisation they hoped to continue the same loyal service. The plant had responded well to the demands made upon it for increased output in the last nine months of the year; the quality of cement was of a high grade of fineness and no difficulty was experienced in complying with the requirements of the Coulee Dam specification. No construction work was undertaken during the year, but in the beginning of the current season coal grinding units of the Babcock and Wilcox type were being installed—one for each kiln—which would effect an economy in fuel and improve the kiln conditions. The old coal grinding equipment was to be transferred to the Finish Mill in order to increase the capacity of the latter in view of the expected larger deliveries of fine cement this year against the Coulee Dam contract.

POSITION IN THE UNITED STATES

The cement trade in the United States generally showed a distinct improvement. In this company's territory the improvement was even more marked than in some of the other States. In Washington and Oregon the increase in production was about 116 per cent. compared with 1935. Market prospects at the opening of the current year were reasonably good, and the agents reported that there was every indication that the plant would be kept busy in 1937.

State and county road work compared favourably with last year, while house and small building construction was more promising in their particular territory than for some time past. There was a hitch, however, in connection with the appropriation by Congress of funds required to complete the present contract for the Coulee Dam, deliveries against which had now been resumed. This might perhaps have been due to the Bonneville Power Bill now before Congress. In the interests of the company it was to be hoped the work on the Coulee Dam would be carried to completion, so much money having already been spent on the project.

RIISING PRICES AND GOVERNMENT EXPENDITURE

It was to be observed, however, that there was an increasing tendency on the part of State Governments to apply a greater share of the tax on gasoline to objects other than the extension or improvement of public highways. This tendency might have its effect on the public highways programme, and the recent remarks of the President that the rapid rise in prices of durable goods—amongst which he included cement—was unwelcome, and might lead to a reduction of Government expenditure, should not be overlooked.

In view of the unsettled conditions in the United States the directors preferred to pursue a conservative policy in regard to the disposal of the balance in profit and loss account, even although the accounts might appear to justify a larger final dividend than 5 per cent.

The report and accounts were unanimously adopted.

THE KING LINE LIMITED

IMPROVED FREIGHT MARKETS

SIR VERNON THOMSON ON THE OUTLOOK

The forty-eighth annual general meeting of The King Line, Limited, was held, on the 14th instant, at Winchester House, Old Broad Street, London, E.C.

Sir F. Vernon Thomson, K.B.E. (the chairman), presided. The Secretary (Mr F. W. Matthews) having read the notice convening the meeting and the auditors' report, The Chairman said:—Gentlemen, The directors' report and accounts for the year 1936—the forty-eighth year of the company's trading—having been duly circulated among the shareholders, you will, I hope, as customary, take them as read. (Agreed.)

The net profit of the company for the year 1936, inclusive of subsidy and after providing for interest, amounted to £83,147. To this has been added £22,545 brought forward from last year. After providing for the cost of Lloyd's surveys, the directors recommend that the sum of £73,000 be applied towards making good the arrears of depreciation of the company's fleet which have accrued owing to the recent world trade depression, and that the balance of £22,660 be carried forward.

UPWARD TREND OF OVERSEAS TRADE

The volume of the world's seaborne trade showed some expansion during 1936 and since the autumn freight markets have shown a marked improvement, but in the circumstances little of this can be reflected in our voyages completed in 1936. Overseas trade is undoubtedly trending upwards. Much may depend upon the coming European grain harvests.

The company's 17 vessels, of which nine are motor and eight steam ships, are of an average age of 13 years, and after deducting the reserve stand in our books at an average price of £4 18s. 10d. per ton deadweight. They have all been well kept up.

Since the end of the year the s.s. King Bledyn, built in 1918, has been sold, as has also the s.s. King Howel, built in 1919, at satisfactory prices well in excess of their book value.

BOARD'S DEPRECIATION POLICY

The directors are not unmindful that owing to the world trade depression, now happily receding, shareholders of this old-established company have received no dividend for the last seven years, but the provision of adequate depreciation necessarily comes first in soundly managed shipping companies. The available balance of profit for the year (£73,000) was accordingly utilised in writing down the book value of the fleet. The directors deemed this the prudent policy, and the more especially as the profit for 1936 included £47,519 subsidy, which is a non-recurring item.

The total amount received by way of subsidy without deduction of any kind has thus been used for depreciation. Ships have, of course, a limited period of service, normal depreciation being calculated upon a 20 years' life basis. Our shareholders will understand that it has been quite impossible during recent years for British tramp shipping companies to earn even the depreciation necessary for the vessels' replacement in due course.

THE OUTLOOK

The outlook now, however, is distinctly encouraging—notwithstanding increased costs—and given a continuance of the present state of affairs the directors hope to resume dividend distribution within 12 months.

The subsidy given by the Government to British tramp ship-owners during the last two years has definitely achieved its object by helping to bridge the gap between the period of abnormal depression and improved world trade. I am glad to say it now seems unlikely that any payment under the Act will be required in respect of the year 1937 owing to the return of prosperity to shipping, no subsidy being payable if the average freight rate for 1937 attains the average level for the year 1929.

TRANSPORT OF PRIMARY COMMODITIES

The present improvement in the freight markets is largely due to the demand for cargo shipping to carry primary commodities such as wheat and maize from Australia and Argentina to Europe to make good the poor harvest last year, and to the unusual demand for tonnage for maize from Argentina to the United States of America in consequence of the recent maize crop failure there. In addition, the disturbed international situation has accentuated the demand for tonnage.

These, however, are passing phases, and whilst of course utilising the opportunities of better trade, it is well to keep in mind that

permanent improvement in shipping is dependent upon a revival of international trade. It is generally recognised that this revival could best be promoted by two things involving action by Governments—viz. (1) a reduction of trade barriers, and (2) currency stabilisation.

THE VALUE OF CO-OPERATION

If, as one intimately associated with the administration of the British Shipping Assistance Act, it may be permitted me to do so, I would like to express the hope that the possibilities and value of co-operation amongst tramp shipowners demonstrated by the experience of the last two years and the institution of minimum freight rates will not be disregarded but that steps will be taken by the British shipping industry to establish permanently some measure of co-operation against the inevitable return of less prosperous times.

I shall be glad to try to answer any questions, and now have pleasure in proposing:—"That the report and accounts for the year ended December 31, 1936, as submitted, be received and adopted."

Mr Percy Cross seconded the resolution, which, after some congratulatory remarks by Mr A. Hunt, a shareholder, was carried unanimously.

The retiring directors (Mr Percy Cross and Sir Vernon Thomson) were re-elected, and the auditors (Messrs James Brown and Sandeman) were reappointed.

The meeting then terminated.

OOREGUM GOLD MINING COMPANY OF INDIA, LIMITED

SATISFACTORY CASH RESOURCES

The ordinary general meeting of the Ooregum Gold Mining Company of India was held, on the 15th instant, at Southern House, London, E.C.

The Hon. A. T. J. Fraser, D.S.O. (the chairman), said that the tonnage crushed for the year amounted to 147,282, which had produced 38,917 ozs. of gold. In addition to that, some 250,000 tons of old tailings were retreated and gave 12,243 ozs., a total of 51,160 ozs. of fine gold, valued at £357,290. After adjustments for royalty and interest, etc., the net income amounted to £351,166. The working costs, including additional royalty, amounted to £293,574. The profit for the year was £57,591, or £3.245 less than the year before. A preference dividend of 1s. per share had been paid in October, and the directors now recommended a final dividend for the year of 9d. per share on both classes of shares. Those dividends were a decrease of 2½ per cent., or 3d. per share, compared with last year.

Development during the year under review had been pushed ahead as fast as possible. Work had been concentrated on three main points, the West Reef, the Main Lode in Auxiliary Shaft Section at the south end of the mine, and Bullen's Section in the north. In the Main Reef Auxiliary area results had been quite satisfactory. The West Reef, a much more important body, was opening up very well at the 82nd and 83rd levels during the period under review, and that improvement had continued since the end of the financial year. Unfortunately the same could not be said of Bullen's Section. That area had for a great many years been the main producer of the mine, but from the 82nd level downwards the course of the reef had been almost completely blotted out by intrusions of pegmatite. Those who by experience were best able to judge both on the field and in this country were convinced that perseverance in depth would lead to opening up further good ore bodies below the pegmatite.

The problem before the directors and managers had been to lengthen out as much as possible the period that the mine could carry on while awaiting that much hoped for eventuality. It was with that end in view that the grade of current ore crushed had been lowered to a point that would just pay the cost of running the mine and pushing on the development. Owing to that conservative exploitation it had been possible during the year not only to maintain their ore reserves, but to increase them by over 43,000 tons and raise the average grade by nearly 0.4 of a dwt., so that at December 31st they stood at 220,000 tons, averaging the merest fraction under 10 dwts. In addition to that, there was an amount not far short of 100,000 tons of low grade ore payable at the present price of gold which must be taken into account.

Their liquid cash resources were quite satisfactory and at December 31st, after allowing for current liabilities, stood at £175,800. That was especially satisfactory in view of the fact that they might have in the near future to spend a considerable sum in capital expenditure to improve the ventilation at the bottom of the mine.

The report was unanimously adopted.

CHAMPION REEF GOLD MINES OF INDIA, LIMITED

DIVIDEND RAISED TO 45 PER CENT.

The ordinary general meeting of the Champion Reef Gold Mines of India, Limited, was held, on the 14th instant, in London, the Hon. A. T. J. Fraser, D.S.O. (Chairman), presiding.

The Chairman, in moving the adoption of the report, said: You will agree with me, I am sure, that the accounts show that the company has once more had a most satisfactory year.

The mill has crushed 143,000 tons for a return of 69,470 oz., which realised £485,000; after deducting royalty and adding interest received the total income was £467,243.

The total expenditure, including £24,000 odd additional royalty, amounted to £270,013. This leaves a profit of £197,230, an increase of more than £27,000 over the previous year. An interim dividend of 1s. 9d. was paid in October, and a final dividend of 2s. 6d. in March. The dividend for the year under review of 4s. 6d., or 45 per cent., is 3d., or 2½ per cent., greater than the previous year.

As you will probably remember, the retreatment of old tailings came to an end some 18 months ago. It is therefore all the more satisfactory that during the past year such good results have been obtained without this source of income; the loss of revenue has more than been made up by an increased tonnage of current ore treated.

BIG REDUCTION IN WORKING COSTS

Partly in consequence of the closing down of retreatment the total working costs show a big reduction, amounting to £29,600; other causes were curtailment of development and the fact that a proportion of overhead charges were taken over by the big scheme of capital expenditure now in progress.

As you very well know, the capital of the company was increased just a year ago by the issue of 130,000 10s. shares at a premium of 25s. The total cash received from the issue amounted to £229,375.

The object for which this money was raised—viz., the carrying out of a scheme of shaft sinking and equipment for mining at depth—has been prosecuted with vigour during the year.

A total of 1,061 ft. of sinking had been done on Gifford's Shaft by December 31 out of a total of 2,695. The plans and specifications for the new hoist at this shaft, which has to haul from nearly 6,600 ft., have been completed, tenders have been put out and accepted and work is in progress.

Heathcote's Shaft has been sunk a total of 232 ft. for the year, and at December 31 was down 31 ft. below the 82nd or 7,851 ft. vertically below surface. It will interest you to know that the next level, the 83rd, will be exactly 1½ miles vertically from the surface.

The estimates for the cost of this large scheme were made a year ago. Meanwhile the cost of all engineering work has risen very considerably. It is only natural, therefore, that the actual cost of the plant will be in excess of the original estimate, in spite of that estimate having been a very liberal one when it was made. On the other hand, there is, I think, no doubt that the cost of the shaft sinking and other underground work is likely to come out considerably lower than the estimate. Although this will not compensate the higher cost of the machinery, it seems probable that the sum raised will be sufficient to carry out the work originally estimated for.

I have said already that the development for the year was on a somewhat reduced scale. In view of the extremely sound position of our ore reserves this was considered politic. It is therefore all the more satisfactory that our ore reserves have increased by practically 23,000 to 471,000 tons of an average grade of 11.36dw. The grade, it is true, is lower by ½dw., but this is principally due to the fact that only a small amount of driving has been done on the rich Glen's Shoot during the year.

Mr Sydney E. Taylor, D.S.C., in seconding the resolution, said that the programme for the current year was similar to that of the last year. The sinking of Gifford's Shaft would be continued and development footage upon the actual lode channel would again have to be on a lower scale while the new construction work was in progress.

The report was unanimously adopted.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Bouverie Street, Fleet Street, London, E.C.4.

BUKIT IJOK (SELANGOR) RUBBER COMPANY, LIMITED

VALUE OF RESTRICTION

The twenty-sixth ordinary general meeting of this company was held, on the 9th instant, in London.

Mr H. B. Yuille (the chairman), after referring with regret to the retirement of Mr G. Kingsley, who had been chairman of the company for 21 years, said that the profit for the year was £6,022, or £1,842 higher than the previous year. It was proposed to pay a final dividend of 7½ per cent., less tax, making 12½ per cent. for the year.

It was their intention to cut out and replant their oldest rubber, of which some 700 acres were planted as long ago as 1907-08, and 150 acres were to be dealt with during the current year.

Their standard production for the current year had been raised to 730,200 lbs., and since releases for 1937 as at present notified would average 83½ per cent., they would be allowed to export some 611,000 lbs. of rubber, representing an increase of 184,000 lbs., or more than 30 per cent. over last year's crop. A small quantity, amounting to 134,400 lbs., had been sold forward for shipment throughout the year at 8d. per lb. c.i.f., and the balance of their crop should realise a higher price. Those facts indicated that the immediate prospects were more favourable than they had been for some years past.

In the main the Rubber Regulation Scheme was responsible for the satisfactory price reached, and its renewal when the present term expired next year was of paramount importance to the industry. It did not require very much experience of the history of the industry to visualise how rapidly the desirable state of affairs which had at last been achieved would revert to chaos if the control exercised by the Regulation Committee were removed.

The report and accounts were unanimously adopted. A resolution was passed authorising a bonus issue of one fully-paid 2s. share for every two shares at present held, and the proceedings terminated with a cordial vote of thanks to the chairman, directors and staff, a special tribute being paid to the services rendered by Mr G. Kingsley.

THE RIVER PLATE TRUST LOAN AND AGENCY COMPANY, LIMITED

IMPROVED RESULTS AND PROSPECTS

The meeting of the River Plate Trust Loan and Agency Company, Limited, was held, on the 12th instant, in London.

Mr Walter Woodbine Parish (the chairman) said that the record of 1936 bore evidence of that extraordinary recuperation which, not for the first time, Argentina had given evidence that she possessed. The figures for 1936 showed an increase in gross revenue at £345,700 of £39,000 and in net earnings at £199,000 of £23,600. After payment of 5 per cent. interest on the preference stock and the interim dividends on the "A" shares and the "B" shares, the directors recommended a further distribution of 8 per cent. on the "A" shares, making 13 per cent. for the year as against 12 per cent. in 1935, and 2½ per cent. on the "B" shares, making 3½ per cent. as against 3 per cent. For the six years from 1928 to 1934 the company's gross revenue had shown a yearly falling off; in 1935 there had been a slight improvement of £1,500, and he thought they could now say that with a further advance of £39,000 the pendulum of their fortune was once more slowly moving upwards, but he begged shareholders not to turn up their old reports and warm themselves in the hope of a return to the dividends paid before the disasters of the past few years. Conditions then and now bore no comparison.

The improvement in gross earnings arose from adjustments in respect of mortgage moratorium interest. Improved conditions in Argentina had led to greater punctuality in payment of interest and better collections. The Mortgage Moratorium Act, which had come into being in October, 1933, was framed to cover a period of three years, but it had been extended for a further two years, to October, 1938. The improvement in the financial position of the agriculturist, however, should enable a further reduction to be made in outstanding interest, although he could not hold out hopes of an increase in receipts arising from an extended demand for new loans. So far as the directors could see into the future, the dividend which they recommended for the past year they would be in a position to propose again a year hence.

The report and accounts were unanimously adopted.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the 10 days ended April 10, 1937, amounted to £21,671,000, against ordinary expenditure of £32,530,000. After allowing for an increase in Exchequer Balances of £238,134, the operations for the period, as shown below, increased the gross National Debt by £11,328,000, to approximately £7,921 millions.†

(000's omitted)			
Treasury Bills	+ 11,909	National Savings Certificates	— 100
Public Department Advances	+ 2,450	Other debt (War Loan Acts)	— 32
Land Settlement (Fac.) Acts	+ 8	Tithe Act, 1936	— 2,907
	+ 14,367		— 3,039

† Including £375 millions on Account of Exchange Equalisation Fund.

An analysis of the approximate position of the National Debt as at March 31, 1937, appeared on page 47 of *The Economist*, of April 3, 1937.

No gold movements were reported at the Bank of England between April 9th and 15th. Details of previous movements appeared in the issue of April 3rd.

GOLD MARKET

Messrs. Samuel Montagu and Company write on April 14, 1937:—
The Bank of England gold reserve against notes amounted to £313,661,924 on April 7, 1937, showing no change as compared with March 31st. In spite of authoritative denials of any intention to reduce the American Treasury's buying price for gold, nervousness persisted and the week has seen heavy liquidations of gold holdings. The open market, therefore, has been very active with dealings on a large scale, about £5,000,000 having been disposed of at the daily fixing during the week. In the circumstances buyers were reluctant and prices ruled considerably below dollar parity; however, a good proportion of the offerings were taken for New York, and purchases for an undisclosed destination were also reported. The effect of reassuring statements by Mr Morgenthau were apparent during the last two days and conditions became calmer; demand has been more general and offerings in consequence absorbed with less difficulty. The s.s. "Strathnaver" which sailed from Bombay on April 10 carries gold to the value of about £536,000.

SILVER MARKET

Quiet conditions have prevailed in the market during the past week and movements in prices have been smaller. Sales on China account continued on a moderate scale and there was further re-selling by speculators, whilst a little buying by the latter was also in evidence. The Indian Bazaars, however, were the principal buyers and the maintenance of the present level still depends upon a continuation of support from this quarter.

Quotations for gold and silver are shown below:—

1937	Price of Gold per Fine Ounce	Equivalent Value of £ sterling	Price of Bar Silver in London per ounce standard	Price of Silver New York per ounce fine
			Cash	Two Months
April 8	141 11 1/2	11 11 1/2	21 1/2	21 1/2
" 9	141 9 1/2	11 11 1/2	21 1/2	21 1/2
" 10	141 8 1/2	11 11 1/2	21 1/2	21 1/2
" 12	141 8 1/2	11 11 1/2	21 1/2	21 1/2
" 13	141 6 1/2	12 0 0	21 1/2	21 1/2
" 14	141 6 1/2	12 0 0	21 1/2	21 1/2
Average	141 8 25	11 11 0	21 0 21	21 0 21
April 15	141 6 1/2	12 0 0	20 1/2	20 1/2

The highest rate of exchange on New York recorded during the period from April 8th to the 14th was \$4.91 and the lowest \$4.88 1/2.

Messrs E. Woodall and Yardley have taken Mr G. C. Golding into partnership.

Messrs Fifteen Moorgate Unit Trusts, Ltd., opened on April 12th a branch office at Birmingham, under the direction of Mr Robert Lyall.

The Earl of Dudley has been appointed a director of the Westminster Bank.

MISCELLANEOUS

SUNGEI WAY (SELANGOR) RUBBER.—Trading profit for 1936 £19,993, against £13,325 for 1935. Ordinary dividend raised from 5½ per cent. to 9 per cent. To replanting reserve £5,000. Carry forward reduced from £16,362 to £11,537. Standard production for 1937 1,170,000 lb., an increase of 96,488 lb.

VEREENIGING ESTATES.—Profit, £252,039, against £221,902. Final dividend 7½ per cent., making 10 per cent., against 8½ per cent.; Union and Provincial taxation, £20,000, against £10,000; to debenture redemption reserve £7,280, against £6,890; to general reserve £50,000, against £43,000; forward, £71,082, against £55,658. Company has sold to new company, Amalgamated Collieries of South Africa, Cornelia Colliery, interests in the Largo Schoongezicht (Witbank), and Springfield Collieries.

BRYANT AND MAY.—Final ordinary dividend of 15 per cent., making 25 per cent., tax free, for year to March 31 (same). Employees proportion of profit, £42,159, against £43,263. Also bonus dividend of £250,000 from general reserve to holders of all the ordinary shares, the British Match Corporation, who will place that amount to reserve.

AFRICAN AND EUROPEAN INVESTMENT COMPANY.—Preliminary statement shows an increase in profits of £207,882 in 1936. Profits, £807,888. To reserves: Debenture redemption, £553; tax, £150,000, against £75,000; general, £150,000. Dividend maintained at 15 per cent. Carry-forward raised from £93,952 to £89,162.

R. W. CRABTREE AND SONS.—A first dividend is declared for 1936 of 20 per cent. Profit on trading, £54,093, against £33,011. Net profit, £13,108 higher at £34,774. To general reserve, £20,000, against £2,250. Proposed also to write down an investment by £10,000.

LEWIS AND PEAT.—Profit for 1936, £23,889, against £2,682. Preference dividends for one and a half years, £18,872. To reserve, £5,000. Carry-forward, £7,255.

CALCUTTA ELECTRIC SUPPLY CORPORATION.—Gross revenue for 1936, £1,278,589, against £1,223,763. Net revenue, £10,554 higher at £483,069. To reserve, £25,000, against £50,000. Dividend maintained on a larger capital at 12 per cent., tax free. Carry-forward increased from £36,962 to £40,545. Number of units sold, 311,412,003, against 262,913,080.

UNION MINIERE DU HAUT KATANGA.—All the outstanding 6 per cent. sterling bonds, 1928, will be redeemed on July 15, 1937, at 103, plus four months' accrued interest.

BRITISH DRUG HOUSES.—Trading profits rose by £11,530 to £71,296 in 1936. Ordinary dividend raised from 5 per cent. to 6 per cent. To writing off balance of leasehold expenditure, £8,930. To reserve, £7,500, against £10,000. Carry-forward, £11,068.

TOYO TIN.—Report for year to November 30, 1936, states that the profits of the Japanese company did not permit of a dividend payment. The credit balance of £1,024 brought forward reduced to £122, against which £230 is reserved for cash, leaving debit balance forward £108.

R. HOVENDEN AND SONS.—Net profit for year to January 8, 1937, £24,031, against £27,359. Ordinary dividend, 8 per cent., against 11½ per cent. Carry-forward, £32,664.

TUBE INVESTMENTS-RENOULD DEAL.—Negotiations have been completed between the Renould and Coventry Chain Company, Ltd., and the cycle fittings companies associated with Tube Investments, Ltd., for a plan under which Renould will discontinue manufacture and sale of cycle accessories.

TRUST OF BANK AND INSURANCE SHARES.—Distribution payable on April 30th will be at rate of 3.1149d. per unit, tax free. For year to September 30, 1937, the managers estimate a gross yield of 3¼ per cent. per annum on current price.

BARROW HEMATITE STEEL COMPANY.—Net profit for 1936, £32,321, against a net loss of £12,812 for 1935. Debit balance of £27,758 removed and a credit balance of £4,562 carried forward.

DONCASTER AMALGAMATED COLLIERIES.—Final allocation of shares in recent merger: Brodsworth, 38.2 preference and 78.2 £1 ordinary shares for every existing £100 share. Bullockton: 11 £1 preference for every ten 6 per cent. £1 preference; and 5.8 preference and 11.7 £1 ordinary shares for every £1 ordinary held. Hickleton: 26.7 preference and 185.6 ordinary shares for every £100 £1 ordinary shares. Yorkshire Main: To the sole beneficial owner (the Staveley Coal and Iron Company) of the share capital, 457,868 preference and 1,397,733 ordinary shares in the merger company.

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

LAST week's slump of the prices of primary products represented the first serious interruption of the upward trend since May last year. In April, 1936, a similar reaction, though much less severe, took place.

This week the tendency of prices on the leading commodity markets was rather indeterminate. Wheat, which rose in price a week ago, contrary to the general trend, was marked down on favourable reports concerning the winter crops of the United States, indications that Australia's export surplus had been under-estimated, and a decline of Continental buying pressure. Raw sugar prices, after rising steeply before the inception of the International Sugar Conference, have since fallen back sharply, though the outcome of the deliberations in London is not yet known. Cocoa changed hands appreciably cheaper than a week ago. Among provisions, butter was dearer and eggs cheaper, while beef was practically unchanged in price.

The principal non-ferrous metals show little change in price on the week. Spelter was quoted slightly lower and copper, lead and tin slightly higher. Linseed and linseed oil failed to maintain last week's prices, and rubber dropped below the shilling per lb. level. Among textile raw materials, wool was distinctly firmer, but raw cotton continued to decline in price.

In the United States the tendency of quotations for primary products was again downwards. Thus, Moody's index of the prices of staple commodities (December 31, 1931 = 100) declined from 223.9 on April 7th to 217.3 on April 14th, against 218.5 a month ago and 170.6 last year.

COAL

SHEFFIELD.—Export demand is expanding steadily, and supplies are readily taken up. Enquiries are numerous for graded steams for forward and prompt shipment, singles and doubles being most in demand. Prices for all grades are high owing to the shortage of available supplies. It is almost impossible to obtain coal for prompt shipment outside contract. The demand for bunker coal remains normal. On the inland market industrial fuels are in good request and coke ovens are working at high pressure. Steam coal is in strong demand, and as buying of hards for the domestic market lessens, more will become available for steam purposes. The labour difficulties in some collieries render the outlook for supplies of industrial and domestic fuel somewhat uncertain.

NEWCASTLE-ON-TYNE.—Conditions in the North-East coalfield are much the same as during the past few weeks. There is no indication of any ease on the market; prices in all sections are strong and supplies limited. Northumberland steam coals of all grades are heavily booked for the year, and a considerable amount of business has been done over 1938. Durham manufacturing coal is as firm as ever, and it seems that prices will continue to advance. Patent oven coke is just as strong.

GLASGOW.—Conditions show little change. Output remains on a full scale, and is almost entirely taken up against contract, the export position as regards new orders being now almost nominal. This position seems likely to last for some little time yet, as the collieries already hold large orders. There is a fair forward enquiry circulating from overseas sources. The market generally remains strong, with prices showing an upward trend.

CARDIFF.—The coal market remains firm. Most classes of coal are scarce for prompt positions and, although there has been no further upward movement in prices, collieries are experiencing little or no difficulty in arranging contracts for forward supplies on terms substantially better than those of expiring contracts. There are persistent complaints, however, of delays in deliveries to both inland and foreign consumers, and a meeting of coalowners is to be held next Monday to consider an amendment of the district scheme providing for the temporary suspension of the trade-sharing regulations. Apparently this step is being taken with the consent of the Government. Coke and patent fuel prices are being maintained; on the other hand the ex-ship quotations for Portuguese pitwood are a shade easier at from 25s. to 26s. Foreign and coastwise shipments at the South Wales ports last week totalled 398,000 tons, compared with 331,945 tons in the corresponding week last year, and for the current year to date the increase amounts to 760,000 tons, or about 13½ per cent. The Italian State Railways are reported to have placed a contract for an additional 100,000 tons, and the Portuguese Railways and Norwegian Naval Authorities are also inquiring for supplies.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates that the markets have been quiet, not owing to any decrease in demand, but because producers are so heavily booked for the next few months that they are reluctant to accept further orders. At the same time some consumers are disinclined to place contracts until the price position during the latter half of the year has become more clearly defined. All departments of the iron and steel industry are making great efforts to maintain deliveries, but although the works are operating at capacity so far as supplies of raw materials will permit, they are unable to meet fully the insistent demand.

In the pig iron department new business has been reduced to small proportions, since most makers are no longer in a position to accept orders for delivery in the first six months of this year. Most consumers

have covered their needs over this period and in some cases beyond; but delays in delivery are frequent and many users are operating on a hand-to-mouth basis.

The scarcity of supplies in the semi-finished steel department is unrelieved. A number of the re-rolling works have had to restrict their operations, and in some instances have had to close down temporarily.

Little new business is reported in finished steel owing to the congested state of the manufacturers' order books. The demand from all sections of the consuming industry shows no signs of relaxing and makers are concentrating upon meeting consumers' more urgent needs.

MIDDLESBROUGH.—The demand for pig iron continues unabated, and, as stocks have been practically cleared, makers can only give deliveries on a rationed basis after covering their own requirements in the steelworks and foundries. No business is being transacted for early delivery. The official quotations for home business remain at 81s. per ton for No. 3 Cleveland foundry pig iron and 97s. 6d. per ton, less 5s. per ton rebate, for East Coast Hematite Mixed Numbers, all for delivery locally. The price of basic iron is 82s. 6d. per ton less 5s. per ton rebate, but practically the entire output of this quality is used by the steelmakers themselves.

Shipments of pig iron from the Tees from April 1st to April 13th amounted to 3,077 tons, against 6,667 tons during the corresponding period in March. Local shipbuilders have recently received orders for some large cargo liners, and, generally, there is no easing in the demand for finished and semi-finished steel. It is reported that some increased supplies of semi-finished steel will be available from the Continent, which should ease the position for re-rollers. Good Durham blast furnace coke is in exceptional demand at advancing prices. New business in iron ore from North Spain is at a standstill and shipments are suspended for the time being. Heavy steel scrap is in strong demand, and the price is understood to be approximately 67s. per ton delivered works.

SHEFFIELD.—The pronounced shortage of raw materials is causing difficulties in the iron and steel market. Very little new business is being transacted, and producers have to turn down fresh orders, contracts accepted relating mainly to replacements. Consumers are eager buyers of little towards users' requirements. Makers of West Coast hematite have nothing to offer at present, but the pending increase in production is expected to ease the situation. Some limited supplies of East Coast mixed numbers are available. In common and marked bars the increase of business is maintained, and Crown bars are coming into fuller demand. It is felt that a general increase of steel prices in the near future is certain.

Owing to the rise in costs the increase is expected to be substantial. The output of basic steel billets, though heavy, is still far behind demand, and deliveries are falling into arrears. The shortage of acid steel billets is also considerable. Wire rods, strip and bars are in heavy demand, and requirements of stainless steel sheets and bright drawn steel show a further increase. Structural steel demand continues at a high level. Steel production generally in this area is at a record level.

GLASGOW.—It is understood that work will be resumed at the Flemington Works of the Lanarkshire Iron and Steel Company early next week, after a stoppage of several weeks. At the same time there has been little improvement in raw material supplies for the steelmakers. Plants are still working to capacity, but supplies of raw materials are unsatisfactory and it is feared that it will be some months before regular supplies for the requirements of the re-rollers, who in turn are quite unable to meet demand for iron and steel materials and orders on books will absorb the total possible output for some months ahead. All the local manufacturing industries are busy and are calling for heavy tonnages of steel.

CARDIFF.—Business in the South Wales tinplate trade continues very active, but prices are a shade easier and are ruling at from 24s. to 25s. per basis box f.o.b. Galvanised steel sheets are unchanged at £18 15s. per ton for export and £17 for inland delivery, and steel bars stand at £6 2s. 6d. per ton. Shipments of tinplates at Swansea last week totalled 4,885 tons, compared with 9,104 tons the previous week, and 6,255 tons in the corresponding week last year. As a result of the temporary lull in exports, stocks in warehouses and vans at Swansea increased from 6,019 tons to 10,288 tons.

OTHER METALS

COPPER.—Heavy liquidation was responsible for a further decline in prices during most of the period under review, but the market staged a recovery on Wednesday. The cessation of selling pressure suggests that consumer's demand; but the repetition of the boom conditions which have recently characterised the metal markets appears unlikely.

The unofficial statistics for March disclose a fairly favourable picture. World stocks fell from 328,170 to 308,430 short tons last month, although production rose by 18,099 to 191,010 short tons. The movement was due to the high level of "apparent consumption" which attained a new record at 210,740 short tons, or 29,910 short tons more than in February. There is no doubt that actual consumption last month was substantially smaller than those figures appear to indicate, and that stocks in the hands of consumers were considerably augmented. Meanwhile, the United States market has recently had an easy tone, but the domestic price showed some recovery this week.

Sales on the London Metal Exchange: 4,500 tons on Monday, against 4,600 tons last week; 5,100 tons on Tuesday, against 6,500 tons last week; 3,150 tons on Wednesday, against 9,000 tons last week. Domestic spot was quoted at 15-12½ cents per lb. in New York on Wednesday, against 14-6½ cents a week ago and 16-77½ cents a month ago. Wednesday's official closing price for standard cash in London was £64 2s. 6d. to £64 1s. refined copper, compared with £63 15s. to £63 17s. 6d. a week ago. Stocks at 23,021 tons, showed a decrease of 1,618 tons, while stocks of rough copper, at 707 tons, were 100 tons smaller.

LEAD AND SPELTER.—Both markets have again been weak, large scale liquidation being the most prominent feature. Lead prices reached the year's lowest level on Tuesday, but showed some recovery on Wednesday and closed showing no net change on the week. Spelter registered a slight improvement compared with a week ago. Despite the heavy liquidation of the past fortnight, the speculative bull position in both metals is still believed to be considerable and the markets therefore remain vulnerable to psychological factors.

During March, stocks of spelter in the United States fell by a further 6,379 short tons to 18,183 short tons. Stocks are thus lower than for many years and cover only about ten days' requirements. Nevertheless, the U.S. market has lately been easier; for consumers are well covered and production is rising sharply. In March, the United States produced no less than 53,202 short tons of spelter, against 38,010 and 40,025 short tons, respectively, in the two previous months. According to the "Metallgesellschaft," world smelter output of lead fell from 131,752 metric tons in January to 121,107 metric tons in February. This decline, however, was due merely to the shorter month. The daily output, which has been satisfactory of late, rose further from 4,250 tons in January to 4,325 tons in February.

Sales of lead on the London Metal Exchange: 4,000 tons on Monday, against 2,100 tons last week; 2,750 tons on Tuesday, against 3,500 tons last week; 1,250 tons on Wednesday, against 5,500 tons last week. The New York quotation on Wednesday was 6-00 cents per lb., against 6-00 cents a week ago and 7-25 cents a month ago. The official closing quotation in London for soft foreign for shipment during the current month was £25 13s. 9d. per ton, compared with £25 13s. 9d. a week ago.

Sales of spelter on the London Metal Exchange: 2,500 tons on Monday, against 3,300 tons last week; 3,250 tons on Tuesday, against 3,500 tons last week; 1,500 tons on Wednesday, against 9,500 tons last week. Wednesday's quotation in East St. Louis was 7-00 cents per lb., against 7-00 cents the week before and 7-50 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £26 2s. 6d. per ton, against £26 last week.

TIN.—After remaining relatively steady, tin prices closed the week on Wednesday showing a net gain of £3 15s. per ton. Since speculation in this metal is fairly small, there has been little selling pressure. On the other hand, buying has not yet regained large dimensions. An important development was the rise in home warehouse stocks from 1,846 tons on April 3rd to 2,048 tons on April 10th. Four weeks earlier stocks in this country were no more than 1,172 tons. Although shipments from Bolivia and Nigeria—our leading suppliers—have not been too satisfactory lately, a further gradual expansion of home warehouse stocks is looked for in the near future.

Sales of tin on the London Metal Exchange: 425 tons on Monday, against 200 tons last week; 750 tons on Tuesday, against 675 tons last week; 300 tons on Wednesday, against 1,000 tons last week. The New York quotation on Wednesday was 60-87½ cents per lb., against 60-12½ cents a week ago and 65-25 cents a month ago. Wednesday's official closing quotation in London for standard cash was £275 15s. to £276 5s. per ton, compared with £272 to £273 a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 2,048 tons, an increase of 202 tons on the week.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted on Wednesday at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was quoted at £14 7s. to £14 7s. 6d. per flask of 76 lb. the same as last week. Chinese antimony was quoted at £79 to £80 per ton ex warehouse, the same as last week. Chinese wolfram for "April-May" shipment was quoted at 61s. to 64s. per unit, c.i.f., compared with 65s. to 67s. last week. Refined platinum was steady on Wednesday at £11 15s. an ounce.

TEXTILES

COTTON.—Manchester.—Demand continued encouraging and some spinners and manufacturers have been able to extend their order lists during the week. Numerous producers appear to have oversold their output and deliveries under contract have fallen into arrears. An easier tendency has shown itself in raw cotton prices in Liverpool, partly owing to rumours concerning a change in the gold policy of the United States Government. There are persistent reports of preparations being made in America to produce a much larger crop next season, and fertiliser sales are much bigger than a year ago.

Demand for yarn has been healthy. In the American section prices for ring beams have been raised, despite the lower rates for raw cotton. There continues much pressure for deliveries. In some quarters there has been freer buying of Egyptian yarns.

In the piece-goods section the feature of interest has been the larger inquiry for the several outlets of India. Leading shippers have placed substantial orders and in certain directions the turnover has been more extensive than for a long time back. The bulk of the buying has been in bleaching and printing qualities. The trade has been of considerable benefit to manufacturers in Blackburn, Preston and Burnley. Fair miscellaneous transactions have been put through for Java and Singapore. Heavy shirtings and coloured cloths have moved off fairly well for West Africa. Rather irregular operations have occurred for Egypt, many offers being unworkable. Steady buying has taken place in printers and satens for South America and in heavy materials for Scandinavia and the Dominions. Home trade purchases have covered a wide range of goods.

WOOL.—Bradford.—In general, raw wool prices have advanced by about 5 per cent. at the auctions held in the Southern Hemisphere during the past fortnight. The selling season is thus ending on a firm note. By the end of April there will only be clearing-up sales in Australia, with limited offerings of short clothing wools at the different selling centres in South Africa. No sales are advised during the month of May at any selling centre in Australia.

The next series of London sales will again be a testing time for wool prices. Offerings look like being on the small side and should be absorbed without difficulty by the various sections of the trade. The market is very firm at centres like Bradford, but cannot be called very active. It appears that a quiet and steady but limited business is passing, most spinners having covered their requirements for the next three or four months. Total turnover seems much larger than appears on the surface. Most mills continue to run full time, but deliveries are not so large as they were six months ago. Prices for tops and yarns remain firm, with most topmakers asking 40d. for warp 64's, though it is difficult to make this price. Cross-breds are also on the firm side, with prices against the buyers; in fact, the trade is now facing higher prices. It looks as if there is going to be a very firm series in London on April 27th, but offerings will be very limited in both merinos and crossbreds. The best selection will probably be in Punta Arenas wool, most of the offerings being new clip.

GRAIN MARKETS

WHEAT.—Prices have not recovered from the decline initiated by last week's gold scare in the United States and, after a period of erratic fluctuations, closed on Wednesday showing a net decline on the week. Buying pressure has abated, and the market has been affected by indications of a larger Australian surplus, by favourable reports of the American winter wheat crop and by an increase in American offers of No. 2 hard winter wheat for August shipment from Gulf ports.

On Wednesday last, "May" futures were quoted in Chicago at 137½ cents per bushel, against 141½ cents the week before and 138½ cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba, ex ship, 55s. 9d. to 57s. 9d. per 496 lbs., as against 58s. 9d. a week ago, No. 2 Northern Manitoba, ex ship, not quoted, as against 57s. 9d. to 59s. 6d. a week ago. According to the Corn Trade News, total shipments of wheat and flour last week amounted to 1,677,000 quarters, against 1,506,000 quarters in the previous week and 981,000 quarters in the corresponding week a year ago.

FLOUR.—The market has shown no important development, and prices are rather easier. Wednesday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 45s. 6d. per 280 lbs., as against 45s. 6d. a week ago; delivered inner London, 45s., as against 45s. a week ago. Manitoba patents, ex store, 42s. 9d. to 44s. 3d., as against 44s. to 45s. 6d. a week ago. Australian, ex store, 35s. to 35s. 6d., as against 35s. to 36s. a week ago.

BARLEY.—Imported feeding barley has been in quiet request, but has nevertheless been a steady market this week. "May" futures were quoted at 72½ cents per bushel in Winnipeg on Wednesday, against 82½ cents a week ago. Quotations per 448 lbs. in London on Wednesday were: "English feed," at farm, 36s. to 38s., as against 36s. to 38s. a week ago; "English malting," at farm, 38s. to 45s., against 38s. to 45s. last week. Californian (new), ex ship 49s. to 55s., as against 49s. to 55s. a week ago. Chilean, brewing (new), ex ship, 44s. 9d. to 50s., against 44s. 9d. to 50s. a week ago.

OATS.—On Wednesday, "May" futures were quoted at 50½ cents a bushel in Chicago, against 50½ cents a week ago and 47½ cents last month, quotations in London, Wednesday: "English black," at farm, 24s. 6d.

THE FINANCIAL NEWS

Special articles due to appear next week on the Leader Page of THE FINANCIAL NEWS are as follows:

MONDAY, APRIL 19.—COMPANIES AND THEIR PROFIT-EARNING CAPACITY, No. 42.—TRINIDAD LEASEHOLDS. Oil shares tended to go worse last week, along with the rest of the markets. But interest is still strong, particularly as rumour insists that there will be a further increase in the U.K. price of petrol once the Budget is out of the way. Accordingly, we continue our analyses of leading Oil Companies this week with a concern which is interested *par excellence* in the U.K. market.

TUESDAY, APRIL 20.—WHO IS RIGHT ABOUT NEWSPRINT PRICES? The differences of opinion between Lords Rothmere and Beaverbrook over the future of newsprint has reached the proportions of a battle royal. The one predicts famine prices, the other prefers to believe that the industry is one that has always had, and still has, a comfortable excess of capacity at any reasonable price. This article seeks to establish which way the truth lies, and how much substance underlies the boom in newsprint shares.

WEDNESDAY, APRIL 21.—BASE METALS IN AMERICA. The recent spectacular boom and almost equally spectacular collapse in the Base Metal Markets have had a strong American angle. With Copper, Lead, and Zinc, the U.S.A. has been largely an isolated market in the past: there was, therefore, plenty of scope for the Bulls and Bears prophesying respectively that the U.S. would be a big exporter, or a big importer, of metals. This article gives the facts about the American Metal Industry—facts which may be important to remember in case there is any recurrence of recent mania on the Metal Exchange.

THURSDAY, APRIL 22.—COMPANIES AND THEIR PROFIT-EARNING CAPACITY, No. 43.—IMPERIAL SMELTING. The smelting and refining of metals in this Country has been—for strategic reasons—becoming a live subject. Imperial Smelting, as the biggest smelter in this Country and one of the biggest zinc smelters in the world, thus presents a particularly interesting problem at the present time. British smelting has suffered from certain handicaps in the past. It is possible that these may be alleviated, and in any case, the boom in base metals has made the Company's trading conditions much more favourable than they were.

FRIDAY, APRIL 23.—TRENDS IN THE OIL INDUSTRY. The fact that conditions in the Oil Industry are becoming more no repetition. The separate trends and tendencies within that boom are, however, interesting and important. It is, therefore, an appropriate time for one of our periodical surveys of developments in the industry.

to 25s. 6d. per 336 lbs. a week ago, as against 24s. 6d. to 26s. 6d. a week ago; "English White," at farm, 24s. 6d. to 26s. 6d., as against 24s. 6d. to 26s. 6d. a week ago; mixed Canadian feed (Vancouver), landed, 25s. 6d. per 320 lbs., as against 25s. 6d. a week ago.

MAIZE.—Maize prices have fluctuated to lower levels in the period under review. "May" futures were quoted on Wednesday at 126½ cents per bushel in Chicago, against 125½ cents a week ago and 108 cents last month. Quotations in London, Wednesday: "Plate," landed, 29s. 6d. against 29s. 3d. a week ago; "Plate," ex ship, 28s. 6d., as against 28s. 3d. a week ago; "Plate," ex wharf, was quoted at £7 10s. to £7 12s. 6d. per ton, as against £7 15s. a week ago.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1935-37:—

NEAREST FUTURE	Jan. 2, 1935	Dec. 31, 1935	April 15, 1936	Dec. 30, 1936	April 7, 1937	Apr. 14, 1937
Winnipeg (No. 1, Manitoba) —Cents per 60 lb.	82½	84½	81½	129	147½	141½
Chicago (No. 2, Winter) —Cents per 60 lb.	98½	101½	98	185½	141½	137½

The visible supply of wheat in Canada amounts to 80,927,000 bushels, against 82,568,000 bushels last week, and 110,611,000 bushels in the corresponding week last year.

April 10, 1937	240,329	45,453	38,728	10 0	10 1	8 8

OTHER FOODS

BACON.—Under the influence of an active demand, Danish was marked up last week-end. The market has since had a steady tone. The official quotations (per cwt. for No. 1 Sizable) which formed the basis for dealings on the London Provision Exchange this week were: English, 92s. to 96s.; Canadian, 88s.; Danish, 95s., against 92s. to 96s., 85s., and 92s. last week. Arrivals in London last week included: Danish, 14,077 bales; Canadian, 6,485; Dutch, 2,407; Lithuanian, 1,180; and Polish, 3,209; as against 13,435, 6,790, 2,303, 1,209 and 2,867 bales, respectively, in the previous week.

BUTTER.—A firmer tone ruled this week and prices show little alteration. Quotations (per cwt.) on the London Provision Exchange on Wednesday were: New Zealand, finest salted, 105s.; Australian, choicest salted, 105s.; Danish, 115s.; compared with 100s., 100s., and 114s. to 116s., respectively, a week ago.

CHEESE.—English and Colonial makes were a firm market, prices being generally higher. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: English, finest farmers, 89s. to 96s.; Canadian, finest coloured, 74s. to 75s.; and New Zealand, finest coloured, 68s., against 86s. to 92s., 74s. to 75s. and 65s. 6d. to 66s., respectively, a week ago.

COCOA.—The reaction in prices has continued. The spot quotation in New York on Wednesday was 9½ cents per lb., as against 10½ cents per lb. last week. In London, on Wednesday last, good fermented new crop, Accra, "April-May," was quoted at 45s. per 50 kilos, c.i.f. Continent, against 48s. 3d. a week ago. Last week's movements of cocoa in London were as follows: Landed, 10,888 bags; delivered, for home consumption, 7,901 bags; exported, 200 bags; stocks, 260,390 bags, against 149,296 bags a year ago.

COFFEE.—The London spot market was steady. In New York quiet conditions ruled, with prices mainly unchanged. On Wednesday, Rio No. 7 (cash) was quoted at 9 cents per lb. in New York, as compared with 9 cents per lb. last week and 9½ cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, nil; delivered, for home consumption, 82 cwt.; exports, 12 cwt.; stocks, 2,482 cwt., against 11,657 a year ago. Central and other South American: Landed, 9,462 cwt.; delivered for home consumption, 4,279 cwt.; exported, 634 cwt.; stocks, 103,628 cwt., against 112,480 last year. Other kinds: Landed, 3,365 cwt.; delivered for home consumption, 6,733 cwt.; exported, 1,245 cwt.; stocks, 128,648 cwt., against 163,228 last year.

EGGS.—On the Tooley Street market prices were again easier this week. A better demand was, however, encountered at the lower level. At Smithfield, on Wednesday, English (ordinary packing, Grade 1, about 15-15½ lb.) realised 9s. 3d. to 9s. 6d. per 120, as against 10s. to 10s. 3d. last week; while Danish (15½ lb.) made 8s. 3d. to 8s. 6d., as against 8s. 6d. to 8s. 9d. last week.

FRUIT.—Business at Covent Garden shows steady improvement, states *The Fruitgrower*, and certain special lines are receiving more attention. The influx of visitors for the Coronation is expected to have a favourable effect on the level of demand during the next month. Meanwhile, the apple trade continues active and prices good. Pears also remain in steady demand, prices for this fruit being well maintained. English forced strawberries, of good size and colour, sell well at prices ranging from 10s. to 20s. per lb. A few peaches have put in an appearance, and some French cherries have arrived. The good supplies of South African grapes clear satisfactorily, and melons are receiving attention. Plums from South Africa have now about finished, but those from Australia and Argentina are steady. Demand for grape-fruit has improved, and reliable parcels of oranges find a ready sale. All lemons are firm.

MEAT.—Business has again been on a somewhat quiet scale at Smithfield market this week. On Wednesday last, Argentine chilled hindquarters were quoted at 3s. 8d. to 4s. per 8 lbs., as compared with 3s. 8d. to 4s. a week ago. New Zealand frozen mutton was 3s. 4d. to 4s. per 8 lbs., against 3s. 2d. to 4s. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 9,616 tons, an increase of 335 tons on the corresponding week last year. Beef and veal accounted for 4,954 tons, mutton and lamb 2,906 and pork and bacon 1,095, as compared with 4,972, 2,656 and 1,131 tons, respectively, in the same week of 1936.

MILK.—Information relative to the operation of the Milk Marketing Scheme during March as issued by the Milk Marketing Board is given in the following table, together with comparable statistics for earlier months:—

	March, 1936	Dec., 1936	Jan., 1937	Feb., 1937	March, 1937

				Nutmeg, 65's							

at a very high level or a very low one—will escape the new tax altogether. The tax is only payable on expanding profits; it is designed as a tax on prosperity.

There will be wide agreement that in the circumstances in which the country finds itself at present, it is sounder in principle to place the burden of the new taxation on profits, than to increase the Income Tax still further (which would directly hit the consuming power of the population) or to impose a miscellaneous collection of indirect taxes. In a period of expanding national income, profits always increase more rapidly than other varieties of incomes. Moreover, in the present incipient boom, profits are being swollen by the Government's heavy expenditure on armaments, which is precisely the occasion of the need for new taxation. The increasing burden should be on increasing incomes.

It cannot be denied, however, that the scheme, as briefly outlined by the Chancellor, is open to certain powerful objections which call for modification. Pending the issue of the Finance Bill itself, it is, perhaps inevitably, very obscure on a number of essential points and has caused uneasiness and hesitation in business circles.

Some of the obscurities were cleared up by Colonel Colville in Wednesday's debate. For example, it is made clear that both the assessment of profits and the assessment of the capital upon which the scale of taxation will depend, are to follow the precedent of the Excess Profits Duty; that is to say, debentures, loans and debts of a company will not be included in capital, while the profits subject to tax will be arrived at after deducting debenture and other charges. Profit will also exclude revenue derived from investments outside the business, which will also presumably be excluded from the assessment of capital. Broadly speaking, the method of assessing profits will follow the assessment for Income Tax, but, in order to avoid double taxation, the payment of the levy will be deducted before assessing Income Tax.

In one important particular, however, the new tax differs from the old E.P.D.; for the capital of every company will have to be assessed, whereas in the case of the war-time impost, this assessment was only needed in exceptional cases, notably where capital changes had taken place since the basic period. The accountants do not regard the assessment of capital as an insoluble problem, but to assess the capital of all the important concerns in the country on standard principles is a tremendous undertaking and full of pitfalls and anomalies. Is it or is it not to include goodwill? Clearly it would be difficult to exclude it, if it has been paid for. But what is to happen if goodwill has been built up over a period of years and is represented by disclosed or undisclosed reserves? Are the assets in the business to be reckoned at cost? If so, is there not the possibility of grave inequalities between Company A, which has bought its plant at top prices, and Company B, which has been capitalised when prices were low? The valuation problem is clearly one of the gravest difficulties which this proposal encounters, and may even prove to be a rock on which it will founder.

But assuming this difficulty overcome, there remains

the question whether in its present form the tax is or is not equitable. It is agreed that armament profits, which clearly cannot be fully controlled, even by the best conceived accounting devices in the purchasing departments of the fighting services, should contribute something to the Exchequer in time of special need. Other boom profits, which in some measure may also be the indirect result of the armament programme, may in equity also be asked for a special contribution. But, if it be granted that the new tax should fall on profits generally, there are two possible ways of levying it. One would be to place a graduated tax on profits which, whether rising or falling, are high relative to the capital employed. The other would be to tax any increase in profits, whether, after the increase, they are high or low. The new tax, though it contains elements of both principles, substantially follows the latter. And, in doing so, there is a real danger that it may press unfairly on firms which are struggling out of the depression, or on businesses which have made headway in recent years by special enterprise. For example, shipping, the cotton trade, the trades of the Depressed Areas, the new industries of this country which have been absorbing the employable population, will all be hard hit. In all these cases it is important that the flow of resources into development should not be too sharply checked, or the firms in question be prevented from reconstituting their proper reserves, by a tax rising to the very heavy figure of 33½ per cent.

These difficulties cannot be brushed aside by reference to the experience of the war-time E.P.D. That tax was itself full of thorny problems which became immensely more complicated when we passed from war to peace. In the Great War it was almost true to say that all profits were directly or indirectly due to war expenditure. Normal economic influences were suspended and the competitive fixing of prices and profits almost ceased. In peace time this is not the case; and to-day the rearmament programme is far from being the single dominating influence in the profits situation of this country.

If, therefore, the present tax is to become an instrument adapted to the present situation it needs to be much more supple and elastic than the old E.P.D. The suggestion that it should be confined to armament profits has been rejected by the Chancellor, and the decision would seem to be the right one, partly because it is so difficult to draw the line between what is and what is not armament profit, and partly because some profits which would be excluded by any definition might properly be asked for a Defence Contribution in the present circumstances.

If this larger view is accepted and it is sought to design the tax as an emergency profits tax, the exemption limit should not be based on years which for many firms are the bottom of the depression and make the tax a burden, not on prosperity, but on normal recovery. It is, for example, suggested that the two best years of the period 1933 to 1936 should be the chosen base. On the other hand, it would seem desirable to modify the exemption granted to all firms, however big or however prosperous, whose current profits do not happen to exceed those of a given period in the recent past. In other words, the exemption limit should be below the figure of the standard period in cases where the return to capital was already high in that period. There is also a strong case to be made for a modification of the rates proposed which will grade the burden more smoothly.

These and many similar problems must be dealt with if the tax is to be forged into the instrument Mr Chamberlain is seeking; and it is clear, therefore, that Parliament has a severe and responsible task ahead of it. But if amendments are made on the lines suggested, we may succeed in devising a workable compromise between a pure tax on growing profits and a tax on high business profits, which would be a valuable complement to the standardised graduations of the present tax system.

Dove and Olive Branch

THE waters of tribulation which overwhelmed the world are at last subsiding. The ark of peace is slowly settling down. Mr LANSBURY has flown to Berlin and come home with an olive branch. The importance of his trophy does not lie in its size or substance, but in the evidence that the waters really are abating from off the earth. It is a tiny branch; yet we like it a good deal better than the leaf which SIGNOR MUSSOLINI rather aggressively poked at us the other day from off the points of eight million bayonets. MR LANSBURY was able, on Monday, to make the following statement with HERR HITLER'S approval:—

Germany will be very willing to attend a conference and take part in a united effort to establish economic co-operation and mutual understanding between the nations of the world if President Roosevelt, or the head of another great country, will take the lead in calling such a conference.

A sceptic will point out that on the morrow of the German military reoccupation of the Rhineland on March 7th last year, HERR HITLER positively threw at our heads the offer of a general European settlement, without waiting for MR LANSBURY or anyone else to coax it out of him. Then, when this lure had served its immediate purpose of tiding us over the shock, it was almost impudently withdrawn from under our noses. Last year's offer turned out to exclude Russia and to be limited, in effect, to the western corner of the continent. MR LANSBURY confessed on Monday, when tackled on the point, that "we didn't discuss the question whether Germany would refuse to participate in such a conference if Russia were to come in." Now it is just as true this year as it was last year that, unless Germany is willing to come to terms with Russia, Europe cannot have peace. But it is by no means certain that the intransigence towards Russia which was HERR HITLER'S mood then is still his mood to-day. DR SCHACHT, at Brussels last week, said he would certainly collaborate with Russia in an international economic agreement for expanding trade.

In the past twelve months a great deal has happened to change HERR HITLER'S outlook. The progress of German rearmament has been beset with increasing financial and economic difficulties—by a formidable rise in world prices, last but not least. Great Britain has thrown herself into an armaments race in which she threatens to outstay the runners who have already loped three times round the dust-and-ashes track. Intervention in Spain has proved a disappointment. The policy of divide and conquer in Eastern Europe has begun to drive the threatened countries into presenting something like a united front against impending aggressors. In short, the dictatorial technique in its application to international affairs has begun—as we have been steadily pointing out—to bring in diminishing returns.

On this showing, the HITLER-LANSBURY statement ought to be taken seriously and followed up on our side with vigour and sincerity. The worst that can befall us is another disappointment, while the best that we have a chance of gaining is the supreme good: a stable peace. Nor need HERR HITLER (and this is also for SIGNOR MUSSOLINI'S ear) have any fear that a peaceward move on his part will be interpreted on our side as a sign of weakness, or maliciously taken advantage of in the hope of getting him on the run and making him cut a poor figure in his own people's eyes. As MR BALDWIN told

the House of Commons on Thursday, at any moment we are ready to build a golden bridge if there is a reasonable prospect that the dictators will join us in walking arm-in-arm across it.

It is a happy coincidence that at this moment HERR ROSENBERG'S (we will not now say HERR HITLER'S) eastern prospects are less bright than they were a few months ago—and this notwithstanding DR STOYADINOVITCH'S recent deviation from the straight line of the Little Entente. The policy of the PRIME MINISTER of JUGOSLAVIA is not the policy of his countrymen, as they showed demonstratively in the reception they accorded PRESIDENT BENEŠ when he visited Belgrade for the Little Entente Conference three weeks ago. Moreover, the *rapprochements* of Vienna, Budapest and Bucarest towards Prague count for much more, taken together, than the falterings of Belgrade. Austria's determination to be a thing-in-herself grows daily more evident; and DR VON SCHUSCHNIGG was undoubtedly speaking the mind of a majority of his countrymen when he declared on April 15th at Eisenstadt that an *Anschluss* with Germany and a restoration of the Habsburgs were not the only two alternatives that Austria had before her. He will probably tell the DUCE at Venice this week-end that Austria must settle her own destiny.

As for Hungary and Roumania, the Reichsdeutsch Nazi fomentation of local native Nazi movements has overreached itself in both countries almost simultaneously. Last week we recorded KING CAROL'S and M. TATARESCU'S forced counter-stroke against PRINCE NICHOLAS and the Iron Guard. Now comes corresponding news from Hungary. On Friday of last week the so-called "National Will" Party was dropped upon by the Government. In both countries Nazism has evoked a national reaction against it when it has been found to stand for subservience to Germany and not, after all, for a Hungarian or Roumanian super-patriotism. M. DARANYI has already drawn the moral and is steering a course that leads towards collaboration with the succession States. These will surely have the sense to acquiesce in the re-armament of Hungary now that she is shelving her claims to treaty-revision, and now that Germany and Austria have unilaterally rearmed. In Roumania, M. TATARESCU—or will it once more be M. TITULESCU?—will probably come to terms with Russia by entering into a pact with her in exchange for a Russian recognition of Roumania's title to Bessarabia. And Poland, already Roumania's friend and ally, may be led to look at the world still more nearly with the eyes of the Little Entente by her concern over the reign of Nazidom in Danzig and over the approaching demise of the Upper Silesia Convention.

In these subsiding European waters the political fishing is already much less promising for Germany and Italy than it was a short while ago. If Germany is still thinking of making herself mistress of Danubia, she must face the fact that she cannot now hope to achieve this by DR SCHACHT'S economic acts alone. Arms are needed to do the trick to-day; and that is an adventure for which, we believe, the German people has no stomach.

In a time of transition it is sometimes prudent to change one's prophet. We again should like to suggest to HERR HITLER, with all respect and sincerity, that if he did now drop HERR ROSENBERG and take up MR LANSBURY, he would be making a very good bargain for his country and for himself.

THE BUDGET

Housing in Britain

THERE are two aspects of Britain's housing problem. The first is the existence of bad houses; the second, the existence of overcrowding. The problem is now executive and financial, not legislative. Since the passing of the 1935 Housing Act, the primary responsibility for its solution, in the interests of national health and decent standards of living, has passed from Parliament to the Government and the local authorities. What are the main features of the Government's policy? How much has been done, and what still remains to do?

The Government's policy has three principal lines of attack. The most spectacular is the slum-clearance programme, inaugurated in 1933. Under this programme approximately 300,000 houses were to be cleared and replaced in the ensuing five years. According to the latest returns, orders for the demolition of 120,000 houses have been confirmed by the Minister of Health, and 109,000 new houses have actually been completed. The rate of "ex-slum" building is nearly 60,000 a year, and seems to be increasing. The process of slum-clearance, from the original resolution to demolish a given area to the completion of the replacement houses, usually takes anything up to two years to accomplish. There is therefore a reasonable possibility that the 300,000 new houses stipulated in the Government's programme may be finished and occupied by 1939 or 1940.

This, so far as it goes, is gratifying. There is a tendency, however, on the part of some Government supporters, to treat the completion of this programme as being synonymous with the end of the slum problem in Great Britain. This suggestion requires to be refuted as strongly as possible. It might, perhaps, be near the truth in the case of certain of the smaller towns and in rural areas; but anyone who is acquainted with housing conditions in the large industrial cities knows that only a fraction of their slums have been included in their programmes. In their case, the programme figures have as a rule contained merely as many of the worst houses as were capable of being demolished and replaced in the course of five years. Although no decisive figures are available at the moment, one informed estimate has put the total number of houses which could be condemned without any raising of the current standards at as many as 1,000,000.

The second part of the Government's policy is concerned with the building of houses to relieve overcrowding. Before the 1935 Act was passed, the Government had been severely criticised for bringing to an end the earlier Wheatley legislation (passed during the first Labour administration), under which local authorities could build working-class houses for letting. It was urged that, so long as a widespread shortage of houses remained, the Government had deprived working-class tenants of the only source from which their housing needs could be satisfied. Meanwhile, building by private enterprise was practically confined to the erection of houses for sale at prices beyond the means of working-class tenants. The 1935 Act has partially met this criticism, since local authorities will now be able to build at any rate a certain number of houses to let. The subsidy which this Act provides should enable the large, poor families, who constitute the most difficult part of the overcrowding problem, to be rehoused. But as yet building under the 1935 Act has hardly begun. The preliminary stage in its application was the holding of a nation-wide overcrowding survey, as a result of which 340,000 dwellings were declared to be overcrowded. Unfortunately, however, this figure is largely vitiated in the eyes of housing reformers by the fact that the standard utilised to test overcrowding was very low,

and allowed living-rooms to be used for sleeping purposes. A very different result would have been produced by the adoption of a standard more in accordance with the needs and habits of the people. Such a standard might well have raised the total of overcrowded dwellings to 800,000 or 900,000, or even more. The Minister of Health has already admitted that the standard of the 1935 Act is not to be taken as an ultimate one. The fact remains, however, that its use has led once again to a tendency to underestimate the size and gravity of the housing problem. Finally, the Government's housing policy has a third item—building by private enterprise. Private building has been phenomenally active during the last three years, and the total number of new houses erected has averaged over 250,000 annually. To-day the saturation point is probably not far off. Though most of these houses are not of a large type, only a small proportion—during 1936 about 33,000—were built for letting, and the majority are not suitable for working-class tenants, except, possibly, for a relatively small number of the better-paid workers. The middle-class demand for houses is not sufficient to maintain a rate of building at this level indefinitely. There is reason to believe, therefore, that private building forms an unstable element in the present situation, and a fall of considerable dimensions may soon occur.

If such a fall is actually experienced, there are three possible alternatives for the future. Private builders may turn to the production of working-class houses. Alternatively, there may be a slump in the building trade, with heavy unemployment; or, finally, increased local authority building, either for the relief of overcrowding or for slum clearance, may take the place of private building. But the present overcrowding programme is estimated to require the building of only 200,000 to 250,000 houses altogether; and such a number would hardly provide an adequate offset to a serious decline in private building for any length of time. The number of workers in the building trade has grown from 884,000 to 1,020,000 in the last three years, and the capacity of the building trade is now greater than it has ever been. A good deal of building of a non-residential character is being undertaken, and it may be expected to increase still further, given the continuance of industrial activity. But it can hardly be expected to take up all the slack from a decline in residential building.

Until the 1935 Act is in full operation, it will probably be premature to attempt to pass a final judgment on the Government's housing policy. The slum-clearance scheme seems to be on the way to achieving a fair measure of success, within the limits marked out for it; but the results of the Government's policy under other heads appear more doubtful. There is still a regrettable tendency to underestimate the amount of work to be done. Courageous measures are conspicuously absent. For example, nothing has been heard recently of the possibilities of decentralisation by the creation of self-contained garden cities, a step which many experts regard as the true solution of many of the most formidable problems brought about by excessive urban growth. Nor has anything been done to cheapen the cost of building by central purchasing or through increased standardisation. No serious steps appear to be contemplated to control the location of industry, or to regulate the growth of Greater London. For the present, then, the conclusion must be that while a degree of progress is being made towards a solution of the housing problem, this progress is being achieved in a rather haphazard way; and it is adding considerably to the enormous built-over and semi-urbanised areas of Great Britain.

The Budget Accounts

BUDGET speeches follow a classical pattern, aptly described by Mr Attlee on Tuesday as "financial strip-tease," in which the House of Commons is kept "in tantalising expectation of what is to come." The Chancellor first surveys the experience of the past year, then estimates in turn expenditure and revenue for the year to come; only finally does he distribute the potential surplus or impose taxation to cover the prospective deficit. In the first of our tables we amalgamate two of these stages, considering together the actual expenditure of the past year and the estimated expenditure of the current year 1937-38:—

EXPENDITURE (£'000's omitted)				
	Budget Estimate 1936-37 (1)	Actual Issues 1936-37 (2)	Budget Estimate 1937-38 (3)	Col. (3) compared with Col. (2) (4)
Consol. Fund Services:—				
Interest and Management of Debt	224,000	210,873	224,000	+ 13,127
Payments to N. Ireland	7,500	7,996	8,000	+ 4

Total Supply Services*	562,597	567,230	627,348†	+ 60,118
Total Ordinary Expenditure	797,897	789,759	862,848†	+ 73,089
New Sinking Fund	...	13,127	...	— 13,127
Total	797,897	802,886	862,848†	+ 59,962
Self-Balancing Expenditure:—				
Post Office	69,344	71,880	75,198§	+ 3,318
Road Fund	26,500	27,427	†	— 27,427
Total	95,844	99,307	75,198	— 24,109
Total Expenditure ...	893,741	902,193	938,046†	+ 35,853

* Excluding Post Office. † Excluding sums, aggregating £80,000,000 for all the Defence services, to be met out of Defence Loan. ‡ Now included in Supply Services. § Expenditure on Broadcasting, amounting to £2,870,000, is omitted from Civil Votes and included in Self-Balancing Expenditure.

The Chancellor's comments on expenditure, past and prospective, contained nothing of particular moment. The Fixed Debt Charge is to be put once more at £224 millions. As the Chancellor remarked, there would be something illogical in instituting a sinking fund in a year when £80 millions is to be borrowed. Power is to be taken to borrow for the statutory sinking funds, and also to omit the provision, mandatory under the existing law, for debt redemption equal to last year's deficit. Following his own recent precedents, Mr Chamberlain made provision for Supplementary Estimates expected in the course of the year. But this provision is confined to the Civil Estimates, and amounts to no more than £10 millions, which is less than was expected. The Defence Estimates are apparently considered to be ample. When the sums to be borrowed are included, the increase amounts to almost exactly 50 per cent, and the depen-

ments may have difficulty in attaining this rate of expenditure unless they are confronted by heavy increases in prices.

There has been a re-organisation of the self-balancing chapter, as the result of the decision to end the autonomy of the Road Fund. Road expenditure is brought into the Supply Services. It is estimated at £28,500,000, but the balance in the Road Fund on March 31st last of £5,000,000 is to be appropriated against the expenditure (the final "raid on the Road Fund"), as also is £1,000,000 expected to be gathered during this year in fees and fines, leaving a net figure of £22,500,000. On the other hand, the expenditure on Broadcasting, amounting to £2,870,000, is to be counted as self-balancing, although it also appears in Class 4 of the Civil Estimates.

The next stage is to estimate the yield of revenue on the existing basis of taxation:—

REVENUE (£'000's omitted)				
	Budget Estimate 1936-37 (1)	Actual Receipts 1936-37 (2)	Estimate for 1937-38 on existing basis of taxation (3)	Col. (3) compared with Col. (2) (4)
Inland Revenue:—				
Income Tax	259,000	257,237	275,000	+ 17,763
Surtax	56,500	53,540	58,000	+ 4,460
Estate, etc., Duties	89,000	87,990	89,000	+ 1,010
Stamps	27,000	29,140	29,000	— 140
Other Revenue	1,500	1,730	1,500	— 230
Total Inland Revenue	433,000	429,637	452,500	+ 22,863
Customs	207,525	211,282	219,850	+ 8,568
Excise	110,000	109,500	113,150	+ 3,650
Total Customs and Excise	317,525	320,782	333,000	+ 12,218
Motor Vehicle Duty (Exchequer share) ...	5,000	5,300	34,000*	+ 28,700
Total Tax Revenue ...	755,525	755,719	819,500	+ 53,781
Post Office (net receipt)	11,256	10,970	11,800	+ 830
Post Office Fund	...	100	...	— 100
Crown Lands	1,350	1,350	1,350	...
Sundry Loans	5,000	4,550	4,300	— 250
Miscellaneous Receipts	25,250	24,600	11,000	— 13,600
Total Ordinary Revenue	798,381	797,289	847,950	+ 50,661
Self-Balancing Revenue:—				
Post Office	69,344	71,880	75,198	+ 3,318
Road Fund	26,500	27,427	†	— 27,427
Total	95,844	99,307	75,198	— 24,109
Total Revenue	894,225	896,596	923,148	+ 26,552

* Whole proceeds of Motor Vehicle Duty now go to Exchequer.

Mr Chamberlain's estimates of the yield of revenue are liberal, without being precisely optimistic. Thus Income Tax is expected to show an increase of over £18 millions. Surtax, in spite of (or possibly because of) the disappointing yield of 1936-37, is to produce nearly £4½ millions more. The estimate for Death Duties is put back to last year's Budget figure. Customs and Excise are both expected to show substantial increases. Of the total expected increase under this head of £12,218,000, beer is expected to provide £2.4 millions, tobacco £2.4 millions, oil £2.5 millions, the Import Duties Act £2.1 millions, and the recently-imposed beef and veal duties £2.5 millions. The only other feature of interest in the table is the estimated decline in Miscellaneous Receipts from £24.6 millions to £11.0 millions. The Chancellor

remarked that this item had been swollen in recent years by non-recurrent receipts, and that it was always subject to considerable fluctuation. As already explained, however, the annual "raid" on the Road Fund is now included as a set-off against expenditure, although in 1936-37 it figured as a Miscellaneous Receipt.

These estimates of revenue and expenditure left the Chancellor with a prospective deficit of £14,898,000 to be met by fresh taxation. Before proceeding to his major proposals, he announced a few minor adjustments. The most important of these was a new provision directed against "bondwashing," or the sale of bonds cum dividend and their immediate repurchase ex dividend. The difference between the two prices has hitherto been considered as capital, and, for many recipients, has not been subject to income tax. There is also to be further tightening-up of the law in regard to one-man companies. The import duty on hops is to be continued, and minor changes are to be made in the Customs duties to implement the Anglo-Canadian Trade Agreement. Finally, as previously foreshadowed, the Male Servants' Licence Duty is to be abolished.

None of these small changes is expected to have any perceptible influence on the revenue, and the Chancellor turned for the major part of the needed revenue to the Income Tax, "the one source of revenue to which all Chancellors look in time of trouble and which has never yet failed them." The standard rate is to be raised by 3d. to 5s. in the £. This will produce £13 millions this year and £15 millions in a full year. There were no changes in the allowances.

The gap was now reduced to the "trifling figure" of £1,748,000, and probably most members of the House thought that the Budget of 1937 was virtually finished. But Mr Chamberlain's biggest surprise—and that a sensational one—was still to come. Explaining that defence expenditure was likely to be "very much heavier" in the next two or three years than in the present year, although borrowing on the maximum scale was already contemplated, the Chancellor described his search for "some device capable of growth in itself, but easily adjustable." He claimed to have found it in the National Defence Contribution, to be levied on the growth of business profits in the present upward phase of the trade cycle. This new tax, which bears a very strong resemblance to the war-time Excess Profits Duty, is fully explained and discussed elsewhere in this issue, and it is necessary here only to mention that it is expected to bring in no more than £2,000,000 this year, but "a yield of the important order of £20 millions to £25 millions next year."

War at Sea

WARS have been fought on land and sea almost since the dawn of history; but the conquest of the air has within one generation added a new sphere to warfare. This has produced three striking changes. First, it has added 50 per cent. to the total expenditure of the fighting services; for a third arm has to be provided; and 40 first-line planes, if we allow for their rapid obsolescence, are equivalent in cost of construction, upkeep and the personnel to one battleship. Secondly, it robbed maritime, island Powers, like Japan and Britain, of their inviolability, and engendered a nervousness unknown to them for many centuries. No insular Great Power can now reckon itself safe with a big navy, as it did before 1914. Lastly, the aeroplane may profoundly change the character of war at sea.

It is scarcely surprising, therefore, that Western nations have tried to cover themselves against all risks in the bomber versus battleship controversy by building up increased supplies of both. At a time when the bombing aeroplane has increased in size and performance warships have become larger, more powerful and more costly. A modern navy imposes a heavy economic burden on countries whose possessions, communications, trade and material welfare demand the maintenance of

The Budget was thus balanced, as shown in the final table:—

I.—ORDINARY REVENUE AND EXPENDITURE, 1937-38	
ESTIMATED REVENUE	ESTIMATED EXPENDITURE
£ Mn.	£ Mn.
<i>Inland Revenue</i> —	<i>Interest and Management of National Debt</i> 224.0
Income Tax 288.1	<i>Payments to Northern Ireland Exchequer (including net share of reserved taxes)</i> 8.0
Sur-tax 58.0	<i>Miscellaneous Consolidated Fund Services</i> 3.2
Estate Duties 89.0	<i>Post Office Fund</i> 0.3
Stamps 29.0	
Other Inland Revenue	
Duties 1.5	
National Defence Contribution 2.0	
Total Inland Revenue 467.6	Total 235.5
<i>Customs and Excise</i> —	<i>Supply Services</i> —
Customs 219.8	<i>Defence</i> —
Excise 113.1	
Total Customs and Excise 333.0	Army 63.7

II.—SELF-BALANCING REVENUE AND EXPENDITURE

Post Office—Revenue to meet Post Office expenditure (£72,328,000) and Broadcasting (£2,870,000) £75,198,000

The small surplus of £252,000 is, of course, a purely formal figure. It should also be borne in mind that the sum of £80 millions to be raised by borrowing has been omitted from the figures of expenditure throughout this article.

sea power. The following table gives some idea of its growth in the last half-century:—

NAVAL ESTIMATES (£ millions)§								
Year	Great Britain	France	Germany	Italy	Japan	U.S.A.	Russia	Total
1886	13½	7½	2½	3½	...	3½	4	34½
1900	27½	12½	7½	4½	...	10	9	71
1912	44	17	22	8½	9½	26	17½	144½
1934	55½	22	...	15	41½	57½	...	191½
1937	105½	42½	30*	30*	42	105	...	354

§ Converted at rates current in each year. * Estimated; Budgets are not published. † Negligible. ‡ Including expenditure from loans. || Unknown.

Great Britain is spending eight times, and the world's seven largest Powers more than ten times, as much to-day as in 1886. The mass of a navy—the ships of the line, which give battle—has gradually become composed of fewer, but bigger, ships. A larger proportion of total sea-power is represented by cruisers for raiding merchantmen and bases, and by flotillas of smaller offensive and defensive craft—torpedo-boats, destroyers, submarines and motorcraft. After the last war two innovations appeared. The first were giant battle-cruisers of 45,000 tons, cost-

ing more than £7,000,000 each, with very high speeds and armaments. The second were aircraft carriers, costing almost as much apiece, whose duty was to act both as antennae carrying the eyes of the fleet, and as long-distance aerial weapons. The lapse, last year, of the system of limitation on the naval armaments of the naval Powers, fashioned at Washington in 1921 and extended at London in 1930, has started another naval arms race at a juncture when the rôles of capital ships, battle-cruisers, naval aircraft, submarines, and modern light surface-craft are still largely competitive and, in any case, indeterminate.

Moreover, another factor in the increasing cost of navies is the growing complexity of ships and their armament. So far, the heaviest guns have remained at 16 in. calibre, and in the latest capital ships laid down by the French, Italian, German, Japanese and British Governments they are no bigger than 15 in. calibre. Negotiations have been proceeding between the chief naval Powers to make 14 in. the biggest calibre for the future, but Japan's unwillingness to agree has just condemned these discussions to sterility. Meanwhile, modern armour-plating, munitions, anti-aircraft guns and shells, wireless, electrical and range-finding apparatus, fuel and firing equipment, motors and turbines all render the cost of the finished product many times more than that of its pre-war prototype. Finally, this factor has greatly multiplied the cost of maintaining the necessary equipment in those naval bases abroad on which battle fleets must depend now that so many maritime nations are potential disputants of sea power.

At sea, the last war provided few revolutionary lessons in strategy or tactics—apart, perhaps, from the use of submarines for blockade. There was at the outset a good deal of raiding by German cruisers; but the mass of the German navy emerged only for the inconclusive Jutland engagement, which provided no data for estimating the effect of large-scale intervention by aircraft. Accordingly, no Admiralty—and no Air Ministry—yet knows how vulnerable the mass of a navy may prove to aerial attack. Clearly, a battle fleet, or a merchant convoy, in confined waters within reach of an enemy air base—and that zone is to-day, for heavy bombers, a circle of 600 miles' radius from the base—is far more vulnerable than a cruiser squadron; whereas cruisers proceeding out of formation, or a battle fleet on the high seas, will be safer from aerial attack. The English Channel, the Mediterranean highway, and narrows like those at Gibraltar, Suez, the Red Sea, Dardanelles, Sea of Marmora, the two Baltic Belts, the China Sea and Straits of Korea—all these are commercial highways; and both merchantmen and warships using them will be vulnerable to aerial attack, unless they operate in such narrows only at night. On the other hand, it is difficult to identify ships from anything like a safe height. A direct hit on a neutral ship might prove as costly in a future war as the sinking of the "Lusitania" in the last; and the aerial bombardment of ships in the recent Greek and Spanish rebellions affords no experience on which major decisions of naval strategy or tactics can usefully be based, owing to the absence of modern artillery defences and of supporting fleets.

But the threat of aerial bombardment has raised a most important question on the future of war at sea. Each naval Power favours those categories of ships which best serve its geographical and strategical situation. Minelayers are mainly employable for defence of coasts near home or near bases abroad; submarines for blockade in the same zones of operation; cruisers and destroyers for conveying and for curtaining a battle fleet. But the battle fleet itself—to-day the vestigial mass of former navies—is reserved for major decisions, e.g. the destruction of the mass of the enemy's navy if battle is offered. This mass has become very costly; and since the Russo-Japanese war of 1905 no opposing battle fleets have fought a wholly decisive action. The stronger naval Powers, with their eyes on their commerce and their heavy battle fleets, are fast seeking and equipping new naval and aircraft bases in strategical positions: Britain at Alexandria, Cyprus, Singapore and Simonstown; and the United States at Guam,

still retaining the Philippines; Japan has fortified her mandated Pacific islands north of the Equator, and seeks to extend her influence in the Dutch East Indies. The greater naval Powers are also increasing their cruiser strength; for example, the British Navy will soon possess the seventy cruisers demanded by the Admiralty in the Preparatory Disarmament Commission at Geneva ten years ago.

These signs of the times are vague portents of revolutions in strategy which will probably only be consummated if the world is scourged by future wars at sea. For the moment we may note that the heavy central mass of navies still remains, with a capacity of gunfire which can still force decisions in major sea battles provided an engagement is allowed to take place. After victory in such an engagement, a battle fleet would have its enemy's remaining naval forces at its mercy—and therefore the control of the seas, however many miles away from the enemy's coasts and air bases it then instituted its blockade. At present, however, it seems more likely that a future naval war will—at least for some time—be confined to naval and aerial raids on, and defence of, communications; by warships no heavier than cruisers, and aircraft operating from land bases. From such engagements, capital ships and battle-cruisers will be excluded—save as "mother-ships"—because of their value as the outer defences of strategic bases. They will be moved as floating fortresses from one land base to another as tactical considerations demand—the battle-cruisers being the most mobile, and therefore quickly disposable for emergency reinforcements. Aircraft, submarines, and the new light surface-craft will for some time need to operate mainly within a given radius of their bases; and if battle fleets never offer or accept battle, their accompanying protective craft, both aerial and surface, will only be able to skirmish.

Thus, in future warfare at sea, no decisive advantage for either side can as yet be prophesied on the basis of the kinds of naval armament they possess. The construction of new "tall ships," coupled with the development of more numerous naval and air bases abroad, seems likely to keep vital communications open on the high seas for adequate supplies. In narrow European waters (including the Mediterranean) British, German, Italian or French communications would be seriously threatened in a war in which any of these Powers were opposed. In the Mediterranean a major engagement between battle fleets would necessarily have to lead to a naval decision; after which, blockade or evacuation would follow.

In essentials, naval strategy has not altered very much since 1900. The size of the ships, and guns themselves, is still decided by mutual tacit agreement. One naval Power cannot steal a march on another. Blockade is still pre-eminently a task for the main fleet, since the main fleet can impose a blockade beyond range of enemy bases. Only in the case of virtually contiguous countries—e.g. France and Germany, Germany and Britain, France and Italy—can submarine blockade again attempt to smash the convoy system; and to-day, as we pointed out in an article on February 27th (page 455), the new aerial arm will effect much more damage on an enemy's docks, railways and commissariat system than submarine blockade, with its attendant risks, could accomplish against his shipping. The main brunt of a future war would fall from the skies at the start, on every participant. The function of navies remains the safeguarding of vital communications with overseas sources of supply. To a great extent, air forces can now protect a maritime country against invasion from the sea; and navies will probably remain relatively immune from the air arm in safeguarding overseas communications—immune, at least, by comparison with towns, docks and railways at home. But navies may find that the greatest threat of the aeroplane is not against the warship, but against its function. If air forces can lay the docks and harbours of Britain, France, Germany, Italy and Japan in ruins, they may render the function of their navies supererogatory.

Notes of the Week

The Move for Freer Trade.—So far, the sum total of the British Government's contribution to the rapidly spreading movement for freer trade has been their lame concurrence in the French proposal that M. van Zeeland, Prime Minister of Belgium, should be charged to investigate the necessary preliminary steps towards it. The Government's policy, in brief, is to explore avenues and leave no stones unturned. Meanwhile, M. van Zeeland, an economist of high standing, whose perception of the political importance of reducing the hindrances to international commerce has long been known, has charged M. Maurice Frère, former adviser to the Austrian National Bank, with the task of sounding other Governments on the possible measures. M. Frère, himself a distinguished economist from the Belgian Foreign Office, has been in Paris this week; and M. van Zeeland has been invited by President Roosevelt to Washington in a few weeks' time. President Roosevelt, Mr. Secretary Cordell Hull, M. Blum in France, M. van Zeeland in Belgium, Dr. Colijn in the Netherlands, Hr. Sandler in Sweden, Hr. Stauning in Denmark, their colleagues in Norway and Finland, and President Benes and M. Hodza in Czechoslovakia, are all of one mind: that the critical moment has arrived to ease political tension in Europe by relieving economic tension, and by expanding both the trade and the economic collaboration of like-minded nations. The prospects of its achievement depend absolutely on the attitude of the British Government. If they adopt, in the boom conditions of 1937, the same narrow conception of British interests as they adopted at Ottawa in the trough of depression five years ago, the blow will be worse, and more costly in the long run, than the Ottawa blow in 1932. And the political implications of that have been disturbing enough, in all conscience, in the last five terrible years.

"Shells—without Profits."—The alleged rejection by the War Office of an offer by Messrs Ransomes and Rapier to make shells for the Government without profit was again raised this week by the letter of Sir Thomas Inskip, Minister for Co-ordination of Defence, to Mr T. Johnston, M.P. The latter had been through the correspondence with Sir Thomas since the matter was first raised in the Commons on March 24th. Last July the company were invited to tender. On July 17th they wrote to the Secretary for War stating that they would fulfil contracts "without profit at all to ourselves, assuming that full depreciation and oncost charges will be allowed." This certainly meant that rises in costs should be covered, as well as costs involved if capacity should be improved or extended; and it equally meant that the firm would forgo what anyone, including the Army Contracts officials, would understand as their profit. "In other words," said the company, "we shall work neither at a profit nor at a loss." This would not have been as beneficial a basis to them as that on which all other Government contractors work for armaments: namely, a guaranteed profit margin over and above all costs. The story then becomes complicated; for, although the Government authorities agreed to the proffered financial basis for any tender, the company themselves had to allow for necessary new buildings and for plant to the cost of £30,514 8s., which the Government would have to supply. (Incidentally, Sir Thomas Inskip's letter shows that the company could not have secured the necessary machine tools for 10-12 months; and delivery of shells could not have begun before 14-16 months after receipt of instructions to proceed!) After this, they

duly sent in their tender, and added a 10 per cent. profit margin; but this was to defray the cost of new factory premises, available to the company in time of peace, and to the Government in time of war.

Meanwhile, however, experts visited the factory and decided that it was more fitted—as, indeed, is the case—to produce tanks and caterpillar vehicles. The company appear to have pressed the Director of Army Contracts, on two occasions at least, to allow a notice to appear in the Press to the effect that a contract was *in course of preparation* on a basis of "no profit, no loss." But, after the company had expressed a natural preference for the caterpillar work, and after their tender for shells (with its complicated provisions for new buildings and plant) had been received, it was declined on the ground that these shells would in effect cost much more than was stated. Consequently, under the "no profit, no loss" basis, the tender price would be scaled up. The Contracts authorities were perfectly justified in taking this view; for they had to compare the *probable* cost, on this unprecedented basis, with the costs of other firms. What the public does not, and cannot, know is: How did the costs really compare? Clearly, it is possible that the "cost plus necessary capital expenditure" basis of one firm may exceed the "cost plus profits" basis of another. But there can obviously be no objection to a "no profits" contract; and it is well that the War Office should have made it clear that they will welcome any such offer from any quarter.

Spain's Frontiers and the Powers.—On Monday night the first stage of international supervision of Spanish frontiers was begun. So far, only the British and French sea-patrol areas—i.e. along the north coast, round Majorca, and from Gibraltar to beyond Málaga—the French land frontier, and the Italian sea-patrol region on the east coast are being fully patrolled. The Pyrenean frontier is in the hands of an international force composed mainly of Scandinavian, Dutch, and Baltic State citizens. The Portuguese-British joint commission is slowly taking up its posts on the Portuguese frontier. But all interest has been focussed this week on the so-called blockade of Bilbao by the ephemeral warships of the insurgents. The acute public dissatisfaction with the British Government's action last week in warning British food ships, which had a right to go to Bilbao, against proceeding thither, broke out again in the Commons this week. Mr Eden admitted that General Franco's threat to stop the four British foodships at St. Jean de Luz from going to Bilbao had been received by the British Government as early as April 10th. This confession suggests that the Government on April 13th merely kow-towed to illegal threats by a rebel, to whom they declined to accord the status of a belligerent. The Government's contention that Bilbao harbour was dangerously mined, on which their decision nominally reposed, was shown this week to be as invalid as General Franco's "blockade." For one of the four British foodships cheerily put to sea at night, and entered Bilbao safely on Tuesday. It was accompanied by Spanish Government warships cavorting hither and thither to prove the absence of mines and the viability of the channel. Other British ships are now preparing to run the "blockade," which appears to have so alarmed the British Government. It seems that international maritime law must look to Welsh skippers—"Potato," "Corn-cob" and "Ham and egg" Jones, Master

Roberts, and men of that kidney—and not to the British Government for the maintenance of its canons. After much hesitation, the Government have announced that they will afford full protection up to the limit of Spanish waters to British ships whose masters ignore the Government's warnings about Bilbao. In the rest of Spain, the Spanish Government forces seem to be making some headway; while on the Basque front the rebels are massing for a big offensive.

Trade Union Ballots.—The democratic procedure of the ballot has been adopted in the two major labour disputes now outstanding, in the coalfields and on the Clyde. At the end of last week the half-million miners of Great Britain were asked to declare whether or not they were willing to cease work in support of the claim of the Nottinghamshire Miners' Association for recognition at Harworth Colliery. The poll was decisive, and the necessary two-thirds majority to authorise a strike was obtained in every coalfield: as many as 444,546 votes were given for handing in strike notices if necessary, and only 61,446 against; in Nottinghamshire itself, 21,956 of the Association's members voted for a strike against 4,810. The die has not yet, however, been finally cast. The miners have, in effect, recognised the vital importance for their Federation that its affiliated body in Nottinghamshire should be recognised by the owners in its own right, irrespective of the steps being taken to amalgamate the Association with the Industrial Union, which has hitherto had company support. The threat of a general strike, backed by an overwhelming majority of miners, may now be used by the National Executive of the Mineworkers' Federation as a bargaining weapon to secure a favourable settlement of the Harworth dispute and to prevent the victimisation of Association members at that colliery. The Executive has decided to summon a delegate conference on April 30th; and, unless a settlement has been made before that date, a general stoppage will probably be arranged to begin on May 14th—the earliest possible date in view of the necessary notices. May 14th is uncomfortably near the date of the Coronation, and a general coal strike would be a national disaster. There is, however, no cause for immediate alarm. The dispute would probably be capable of settlement if the owners at Harworth recognised the rights which have traditionally been accorded to the Federation elsewhere; and it is to be hoped that prudence and a sense of responsibility will inspire the Federation and the employers to agree upon this simple and obvious way out of the present *impasse*.

The second ballot, taken among the engineers of Messrs Beardmore's Forge at Parkhead, is an example of local autonomy in trade union procedure. The strike of these engineers, who have demanded an extra penny an hour and refused to negotiate through the Employers' Federation because Messrs Beardmore did not join it until the dispute had begun, has hitherto been repudiated by the National Executive of the Amalgamated Engineering Union. The secretary of the Union went so far as to condemn publicly "unauthorised and irresponsible strikes" in a speech at Chester. The Parkhead men have, however, been consistently supported by all the engineering bodies in Glasgow and on the Clyde. They have now qualified for Union recognition of their action and for strike pay by voting overwhelmingly in favour of continuing the strike in the recent ballot; 1,015 votes were cast in favour and only 64 against. This strike is again serious because it is symptomatic of the disputes which will inevitably arise from the furious pace of re-armament and the rising cost of living unless tactful negotiation is continuously the order of the day. Union recognition of the Parkhead strike has surely opened the way for the ending of the deadlock. Negotiations may now be resumed with a fair chance of a speedy settlement.

Transport Strikes.—On Wednesday, April 14th, a lightning strike of 1,000 busmen was declared in East Kent in support of a claim for an increase of 2d. in hourly wage-rates and for revised time schedules. The strike has not been recognised by the Transport and General Workers' Union, whose view is, like that of the Engineering Union in the Parkhead dispute, that conciliation machinery should have been employed before the resort to force was adopted. The cautious and constitutional attitude of the Union has not, however, prevented the strike from spreading into nine counties. On Monday Essex busmen at Chelmsford and Grays decided to support the Kent strike, and a similar decision was taken on Tuesday at Luton, Aylesbury, Hitchin, and in parts of Sussex. Pressure is thus being put on the Union to recognise the Kent strike and to open negotiations with the Kent employers accordingly. The Home Counties are threatened with a complete paralysis of passenger transport; and the situation bodes little good for the issue of the London bus crisis, where negotiations for shorter hours and easier time schedules have again broken down. This wave of unauthorised strikes is alarming, but it cannot be denied that the pace and pressure of modern life, which have been unfavourably commented upon recently by the Prime Minister and by the Institute of Industrial Psychology, probably affect transport workers more adversely than any others. Their conditions of work are—at least in passenger service—relatively good, but the strain on their nerves on the roads of to-day is great. The habit of striking before negotiation has been fully tried and without Union authorisation is to be deprecated—the more because there is no formal provision for conciliation after an unauthorised strike has begun. But the grievances of busmen are real, and some compromise reasonably favourable to both sides ought to be possible.

Members' Salaries.—The revelations which were made in the course of last week's debate on the salaries of Ministers about the poverty of many ordinary members of the House have been followed up by Mr Baldwin, as he promised. He has had unofficial conversations with the leaders of the Opposition parties; and has shown particular concern for the plight of workingmen members with large families and distant homes. Whether or not definite proposals will be brought forward in the near future to raise members' salaries to £500 or £600 still, however, remains uncertain. At a meeting on Monday of the rank and file members of the Prime Minister's own party strong opposition was voiced to the proposals that salaries should be raised at all. While there are clearly some valid objections to the raising of the rewards of participation in democratic politics, it is perhaps unfortunate that criticism should be so specifically expressed by that body of members which is on the whole least in need of increased

INVESTORS in Swedish

SKANDINAVISKA
KREDITAKTIEBOLAGET

remuneration. All things considered, the present salary of £400 is probably inadequate to enable a large number of our poorer representatives to do their jobs without hardship, and £600 is probably a fair figure.

* * *

Income Tax since 1914.—The income tax has long been one of the major sources of the National Revenue in this country. Its contribution to the total revenue during the year ended March, 1937, was about 28½ per cent., against 22 per cent. in 1913-14. Actually, the income tax has undergone frequent changes since the War, both in scope and in the amount levied per pound of income. In the diagram below we have traced the effect of these changes during the past twenty-two years. The effective rate of tax per pound represents the average amount levied on the income of all individuals above the exemption limit. This rate, therefore, varies directly with changes in allowances to income tax payers. The net yield of the income tax, which is the actual revenue derived by the Exchequer, varies not only with changes in the rate and scope of taxation, but also with changes in the national income. Finally the yield per penny is calculated by dividing the total revenue derived from income tax by the standard rate of taxation and varies with changes in the extent to which the full standard rate is applied, as well as in the proportion of the income of individuals subject to the standard and lower rates. Thus, if both the rate and method of taxation remain unchanged, the proportion of individual incomes subject to the full standard rate, and hence the yield per penny, may be expected to increase during periods of growing pros-

perity and to fall during depression. The standard rate of income tax itself has been changed many times during the past twenty-two years.

STANDARD RATE OF INCOME TAX PER POUND

Year ended	s. d.	Year ended	s. d.
March		March	
1914	1 2	1924-25	4 6
1915	1 8	1926-30	4 0
1916	3 0	1931	4 6
1917-18	5 0	1932-34	5 0
1919-22	6 0	1935-36	4 6
1923	5 0	1937	4 9

To the year ended March, 1937, the standard rate has been raised from 4s. 9d. to 5s. per pound without any alterations in allowances or in the manner of its application.

* * *

M. Blum in Heavy Weather.—On the international horizon, the skies are clearing for M. Blum and his colleagues of the Front Populaire Government; but domestic politics are buffeting him about. We believe that he will keep afloat and ride triumphantly into harbour; but meanwhile we shall be watching his fortunes with anxious eyes. This French ship carries on board the destinies of Europe. At the moment, M. Blum is in danger of being crushed between two icebergs: the pressure from his Radical-Socialist allies and from the French investor; and the counter-pressure from the Left Wing of his own party and from the General

Council of the Trade Unions. The two issues over which the battle is raging are public works and the forty-hour week. The C.G.T. are urging the Prime Minister to resume a policy of public works on a scale that would be incompatible with the Government's undertakings on March 4th, when the franc was unpegged. And the unions are also interpreting the forty-hours' week law in a way which may not be illegitimate, but which is producing fresh trouble between employees and employers. There is unrest in the building and victualing trades, and the workers are on strike in the Paris breweries and in the naval dockyard at St. Nazaire. Yet still, when it comes to the point, there seems to be nobody who wants to destroy the Blum Government. This became apparent once again at a meeting of the National Committee of the Socialist Party, which was held at Buteaux, in the metropolitan area, over the week-end. There was a considerable *fracas* between the Government's upholders in the Party and the revolutionary followers of M. Pivert; but the latter has a Trotskyite tinge, and this brought the sub-Stalinist followers of M. Zyrtinsky into the lists against him. On Sunday, the meeting ended in a compromise, after M. Blum had intervened in person and had put to his fellow-Socialists very forcibly the conditions under which he was holding office. Each time M. Blum avoids collapse, his prospects improve.

* * *

The Montreux Conference.—Last week saw the opening at Montreux of a Conference between the Egyptian Government and the Governments that still enjoy capitulatory privileges in Egypt, for the purpose of considering Egyptian proposals for their abolition. The Egyptian Government is making suggestions for a transitional regime and the British delegation is giving its support under the recent Anglo-Egyptian settlement. The other capitulatory Powers in Egypt are France, Italy, Greece, Belgium, Denmark, the Netherlands, Norway, Portugal, Spain, Sweden and the United States. The real strength of the Egyptian case lies not in tactical considerations, but in that the capitulations in Egypt have long since become an inequitable anachronism. The treaties on which they are based are treaties not with Egypt herself but with Turkey, since they date from times when Egypt was a Turkish province. The regime established by these Turkish treaties was abolished in Turkey itself with the consent of the interested Powers in 1923. In Egypt, too, the ranks of the capitulatory Powers were thinned by the War and its aftermath. For the "ex-enemy Powers" were forced to sign away their rights; their successor-States did not acquire corresponding rights; and the Soviet Government renounced the rights that had been possessed by the Imperial Russian Government. Thus today the capitulatory Powers in Egypt represent only an arbitrarily selected remnant of those that enjoyed capitulatory privileges in the past.

* * *

The privileges fall into two main groups: immunity from Egyptian jurisdiction, and immunity from Egyptian taxation. The latter group of privileges is perhaps less defensible than the former. On the other hand, in this field of taxation, much has been done already towards putting foreigners and Egyptians on an equal footing. In the matter of jurisdiction, there are at present three sets of Courts in Egypt; first, the Egyptian National Courts, which at present have no jurisdiction where capitulatory foreigners or foreign interests are concerned. Second come the Mixed Tribunals, which deal with civil cases in which at least one party is a capitulatory foreigner, but in which both parties are not capitulatory foreigners of the same nationality. Thirdly, there are the Consular Courts, which deal with civil cases in which both parties are their own nationals, as well as with all criminal cases in which their nationals

are concerned. Briefly, the Egyptian Government's proposal is that the present consular jurisdiction shall be transferred to the Mixed Tribunals for a transitional period, after which the Mixed Tribunals shall be merged in the Egyptian National Courts. It seems likely that an agreement will be reached on these lines.

* * *

Capitulations and the Powers.—These first two weeks of negotiation, however, have shown that the process of working out this agreement in detail is not going to be quick. Though all the capitulatory Powers have acquiesced in advance in the abolition of the capitulations in Egypt "in principle," there are a number of difficult practical problems in the negotiators' path. First there is the question of time. Is the transitional period to last for twelve years, as the Egyptians have proposed in the draft convention on which the Conference is working? Or for eighteen, as the French delegation demands? And, second, there is the question of defining a foreigner. Granted that, during a transitional period of debatable length, the nationals of certain foreign Powers are to continue to benefit from the capitulatory regime, it must be decided what classes of people are to enjoy this still valuable privilege. Is it to be confined, as the Egyptians propose, to foreigners who are full citizens of the foreign countries in question? Or is it to be extended to inferior categories of *resortissants*—a French term which is as capacious as it is generic? Perhaps a compromise may be found between these two extremes. For it would seem unreasonable to refuse a French protected person from Tunisia or a British protected person from the Malay States the enjoyment of rights which would be extended automatically to an Algerian French citizen or to an Indian British subject. On the other hand, there is one class of foreign *resortissant* whom the Egyptians have an overwhelmingly strong case for ruling out; and that is the *protégé* of a foreign Power who is not merely not a full citizen of the protecting country, but is actually not a real foreigner—being nothing more nor less than an Egyptian who has managed to obtain exemption from the laws of his own country by drawing over his shoulders the fringe of the mantle of some foreign Government. There are cases in which this privileged Egyptian has not even earned the privilege himself, but has inherited it from a grandfather who once upon a time had the job of messenger boy in a foreign consulate. This is an abuse which cannot bear examination.

* * *

The American Budget.—On the same day that Mr Neville Chamberlain was presenting his Budget to the House of Commons, President Roosevelt sent a message to Congress containing what amounted to revised estimates of revenue and expenditure for the

7, CHANCERY LANE, LONDON

current and prospective years (the American financial year ends on June 30th). In his original Budget Message in January the President estimated a deficit of \$2,248 millions for 1936-37; for 1937-38 he estimated an approximate balance after including expenditure on relief but not on the redemption of debt. Expenditure has meanwhile been kept within the estimate, but revenue, especially from income tax, has failed to come up to the optimistic estimates of last January. Accordingly, the estimated deficit for the current year is now put at \$2,557 millions, while next year's figures show an estimated deficit of \$418 millions. Such importance is attached, however, to a balanced Budget in 1937-38 that the President has ordered the Departments to economise and the revenue is to be fortified by the liquidation of the assets of certain emergency agencies. This solicitude for a balance is timely; for the American Government is rightly anxious not to do anything calculated to accelerate the already impressively rapid pace of industrial expansion, and any efforts to put the brakes on will be very difficult, if not impossible, so long as Treasury deficits are inflating the banking structure and compelling the maintenance of extreme monetary ease.

The Irish Free State Budget.—The I.F.S. Budget for the year 1937-38 bears all the marks of an election Budget. The speech of the Minister for Finance contained an elaborate *apologia* for the Government's policy since it took office six years ago; and the remissions of taxation are calculated to make a good impression on the mass of the electorate. The year 1936-37 ended with a comfortable surplus, which is being utilised to reduce indirect taxation. The duties on tea, sugar and wheat are to be reduced and the price of butter is to be lowered. Reductions will also be made in postal charges; and the tax on consolidated bank notes will be changed from 3 to 2½ per cent. The total expenditure is estimated at £31,044,000, of which £1,970,000 will be defrayed from borrowing; and total revenue is estimated at £31,051,000, so that a small surplus should be realised. While the reductions in indirect taxation are welcome, they will do little to neutralise the increase in the cost of living, which is the result of the general rise in prices and the policy of industrial protection. The fall in real wages is causing much discontent among the working classes, and Dublin is threatened with an epidemic of strikes. In the face of rising prices in all directions, the slight remissions of taxation promised by the Budget will afford but a small measure of relief to the harassed taxpayers.

The Factories Bill.—When the details of the Government's Factories Bill were published early in February it was welcomed with reservations. Particular disappointment was expressed that the overtime provisions should permit in fact the working of a 54-hour week by women; and that young persons under 16 should be allowed to work for the excessive period of 48 hours each week. Agitation has grown about these matters since February; and it has been reiterated in many quarters that "the conditions of work for young persons hardly square with official pronouncements on the subject of physical fitness" (*The Economist*, February 6th, page 293). The Physical Training and Recreation Bill has emphasised by its objects the anomaly in this respect which the Factories Bill has proposed to preserve. It is not surprising therefore, and it is certainly welcome, that the Government, whose attitude was defined on Tuesday by Sir John Simon in the Standing Committee which is examining the Bill, should now be dissatisfied with the present provisions of the Bill about the permitted hours of young persons. The Home Secretary thought that the Bill should go farther than had been proposed; he mentioned 42 and 44 hours as possible substitutes for 48; and he hoped that on the Report stage he would be able to move a reduction of

hours accordingly. This change of mind is commendable, but the Government will not satisfy even the more reasonable of their critics unless they extend their new enlightenment to cover at least the excessive working hours of women.

Industrial Progress.—Mr Chamberlain's new taxation proposals, whose implications are discussed on page 189, have been received with dismay by many industrialists. Meanwhile, industrial activity continues to expand, despite numerous and insistent complaints about shortages of materials and skilled labour, and the rise in costs. The output of coal during the week ended April 10th was 5,234,000 tons, compared with 4,079,600 tons during the corresponding week a year ago. As our Cardiff correspondent points out on page 245, exports of coal from South Wales last week reached the highest level since July, 1932, with the probability of further improvement. The suspension of the trade-sharing regulations, discussed on page 201, has freed the industry from an irksome restriction. The iron and steel industry continues to operate at capacity, but new business is now small in volume, as most producers have already sold their output for some months ahead. A feature is the rapid increase in exports of tinplates. The volume of new business booked by the cotton trade was again fairly substantial this week. The wool textile industry remains active, and the jute trade is benefiting from the rise in prices due to the curtailment of output in India through strikes. Wholesale business in textiles generally remains at an encouraging level. All the indications point to a further increase in industrial activity over the next few weeks.

Industrial Profits—An Addendum.—Mr Chamberlain's announcement of a new National Defence Contribution, falling on profits in excess of those of a datum period, lends interest to the following figures, which show actual rates of interest and dividend paid, on the average, by companies whose reports have been published in the nine months ended March 31, 1937:—

Group	Debiture Capital	Rate of Int.	Preference Capital	Rate of Int.	Ordinary Capital	Rate of Div. (c)	Rate of Div. Year Ago (d)
Breweries	£45,513,853	4.5	£36,881,649	5.7	£67,291,524	14.7	13.9
Canals and docks	3,257,123	3.9	5,886,230	3.7	7,866,894	1.4	1.2
Electric lighting and power	43,326,188	4.5	29,268,542	5.7	46,193,251	8.1	7.1
Financial land and investment	40,208,408	4.4	39,979,176	5.4	104,805,341	6.2	5.8
Gas	30,567,819	3.9	13,517,419	4.5	45,789,691	5.7	5.6
Hotels and restaurants	3,225,768	4.4	3,477,635	5.1	4,840,636	4.9	4.6
Iron, coal & steel	33,481,101	5.0	46,896,519	4.6	98,233,444	6.1	4.3
Motor cycle and aviation	3,526,579	5.6	9,321,161	5.4	20,008,702	15.4	12.4
Oil	500,000	5.5	600,007	8.0	11,380,842	6.1	4.6
Rubber	3,375,798	6.5	848,639	4.9	43,577,267	4.1	3.3
Shipping	9,255,760	4.3	10,138,995	4.7	20,917,706	2.5	1.1
Shops and stores	17,062,229	4.4	51,004,679	6.2	44,027,716	16.5	14.7
Tea	353,095	8.2	1,842,330	6.1	6,800,144	6.5	3.1
Telegraphs and telephones	275,000	5.5	399,970	7.0	2,570,010	10.4	8.8
Textiles	12,628,075	5.0	39,789,982	3.8	59,508,067	4.9	4.5
Tramway & omnibus	12,692,839	4.6	9,058,110	1.9	14,372,228	6.9	6.2
Trusts	85,884,781	4.5	67,888,478	3.9	58,584,920	4.5	4.1
Waterworks	5,132,508	4.4	5,050,545	4.8	7,508,790	6.6	6.7
Building materials	6,843,820	4.6	13,787,889	5.4	22,778,384	15.5	13.2
Food, confectionery and drink	4,019,373	4.7	23,864,541	5.9	31,633,410	11.2	11.7
Electrical equipment	3,272,290	4.6	7,256,743	8.1	13,286,214	9.5	9.1
Newspapers, printing, etc.	6,687,803	4.6	20,881,642	5.6	18,069,748	7.4	6.3
Tobacco	83,229	5.0	32,817,663	6.1	89,117,826	20.6	19.6
Warehouse and trading	1,358,990	4.2	7,571,629	4.8	10,901,821	4.5	3.9
Miscellaneous	37,384,935	4.7	115,834,339	6.5	114,866,008	10.4	7.7
Total	409,917,364	4.5	593,864,512	5.4	964,931,584	9.4	8.3

(c) 1,503 reports.

(d) 1,399 reports.

The "high dividend" groups are, on this showing, the tobacco, retail trade, building materials, motor cycle and

aviation, brewery, food and electrical equipment trades. On page 242 we show the latest net profits of the companies in each group and their allocation between ordinary and preference dividends and reserves, etc. The highest proportions of "retained" profits to total profits are shown by the shipping, electric lighting, oil, electrical equipment, motor cycle and aviation and building materials groups. Taken together, the two tables give an indirect inkling of which groups may be most vulnerable to the new tax, though our method of computing profits may differ considerably from that of the Inland Revenue. And none of the profits shown in our tables will actually be chargeable to the tax, which applies only to accounting years closing after April 5, 1937.

Trade Sharing in Coal-Mining.—The coal-mining industry continues to have difficulties in expanding its output proportionately to the increase in demand. During the fourteen weeks ended April 3rd, for example, the output of coal was just under 67 million tons, against 67½ millions a year ago. During the past few weeks the Mines Department has been in consultation with the Central Council of Coal Owners in an attempt to ascertain the causes which are impeding expansion and to devise methods for their elimination. These discussions have not definitely ascertained the real extent of the shortage of supply. The mine owners admit the temporary scarcity of certain classes of coals, but they point out that none of the districts has produced the quantity actually authorised by the original and supplementary allocations of the Central Council, and that the scarcity of certain classes of coals (principally smalls and sized) is due mainly to a comparatively still restricted demand for large coals. Agreement, however, has been reached to improve the elasticity of the existing system of regulation by amendments of the provisions of the district schemes relating to trade sharing and basic tonnages.

When the much-discussed and much-criticised centralised control of sales was introduced in August, 1936, the supply of coal was still in excess of demand, and one of the conditions of the new regime was that the available trade should be distributed equitably between the various collieries, having regard particularly to their respective basic tonnages and recent performance. Undertakings receiving less than their proportionate share of business in accounting periods were compensated in respect of the deficiencies, while undertakings producing more than their proportionate share were subject to levies ranging generally from 1s. to 2s. 6d. per ton in the inland trade, and from 6d. to 2s. 6d. per ton in the export trade. In spite of the advance in prices, these penalties, it is argued, have had a deterring effect on the sales of some colliery companies, and it has been decided that all levies on excesses of allocated tonnages shall be suspended for a period of six months from April 1st. It is good news that the Mines Department has readily consented to the statutory amendments of the district schemes which will be necessary for this purpose; but it has at the same time laid down the condition that the Executive Boards shall give their immediate attention to the revision of basic tonnages where they have become temporarily stabilised and where, therefore, they may be exercising a restraining effect on the development work of the largest and most enterprising undertakings. It is anticipated that these changes will lead to a slight increase in output, particularly for the inland trade.

Co-operative Production.—The value of the Co-operative Wholesale Society's products totalled £36,346,783 last year, approximately one-third of the turnover. The flour mills continued to supply flour to the bakeries of the retail societies, the value of the output

of the nine mills being £9,111,643, an increase of 13½ per cent., with a resultant profit of £402,204. Supplies from the five bacon factories (two in England, one in Ireland and two in Denmark) were valued at £1,174,090; and from the three butter factories at £2,478,835. This represented an increase of 9 per cent., whereas the weight of butter sent out decreased by nearly 1 per cent. Boot and shoe production realised £1,620,843; the six clothing factories had an output valued at £1,168,142; and the products of the six cabinet and bedding factories brought in £968,118. The profits on these products were £8,603, £7,020 and £17,717 respectively. For the first time for a considerable period there was a profit on farming operations. Some 17,816 acres were cultivated as pasture, arable and orchard, giving supplies valued at £282,150 and returning a profit of £6,577.

Glasshouse Crops.—That horticultural production under glass has risen considerably since the imposition of import duties at the end of 1931 is revealed in returns published in one of the recent issues of *The Agricultural Market Report*. From a sample inquiry by the Ministry of Agriculture, with the co-operation of the growers' organisations, it is estimated that the area under glass in England and Wales rose from 2,725 acres in 1925 to 3,150 acres in 1931 and to 3,360 acres in 1935. But as the figure for 1931 is declared to be probably too high, subsequent progress has been more rapid than the figures suggest. Meanwhile, the value of the crop shows striking development, as the following figures illustrate:—

	VALUE IN £'000		
	1925	1931	1935
Fruit and vegetables:—			
Tomatoes	2,350	2,190	2,520
Cucumbers	750	770	800
Grapes	130	90	145
Other fruit			45
Salads	250	230	125
Other vegetables			55
Mushrooms			70
Flowers and plants	1,350	2,290	3,205
	4,830	5,570	6,965

Output in 1935 was worth 25 per cent. more than in 1931 and over 40 per cent. more than in 1925, despite the downward trend of prices during the decade. Production of the three principal crops is estimated to have developed as follows:—

	1925	1931	1935
Tomatoes (tons)	47,000	54,000	59,000
Cucumbers (millions)	50	54	75
Grapes (thousand lb.)	1,500	1,150	2,030

The industry now employs some 40,000 persons, of whom approximately 27,000 are regularly engaged; the remainder are casual labourers or unpaid workers.

National Defence Contribution

A Compendium of Fact

It is proposed to charge upon trades and businesses making profits of more than £2,000 in accounting years ending after April 5, 1937, a tax, to be called the National Defence Contribution, on the growth of profits measured by the relation of the actual profits of the accounting year to either the average actual profits of past years or the profits corresponding to a percentage on the capital employed. The tax will be graduated, at rates not exceeding one-third of the growth, by reference to the return on capital which the profits represent.

The chargeable growth of profit will be determined by deducting from the current profit (less any abatement or deduction for losses) either the capital standard (for companies 6 per cent., and for individuals and firms 8 per cent. on the capital employed in the business) or the profits standard (the average profits of the three years 1933, 1934 and 1935).

Where the current profits are less than £12,000 there is to be allowed an abatement therefrom of one-fifth of the amount by which the profits fall short of £12,000. Where the four years before the first accounting period showed a net loss the amount of the loss will be allowed as a deduction from the profits of the accounting period.

The graduation of the rate of charge is determined by reference to the percentage return on the capital employed in the business which the current profits (less any abatement or deduction for losses) represent, and the following table shows the rate of charge in the case of companies:—

Companies

	Rate of charge on chargeable growth
1. Where the current profit does not exceed 6 per cent. on capital	Nil
2. Where the current profit exceeds 6 per cent. on capital, but does not exceed 10 per cent. on capital— Upon the growth	One-fifth
3. Where the current profit exceeds 10 per cent. on capital, but does not exceed 15 per cent. on capital— (a) if the standard represents a percentage return of less than 10 per cent.— Upon the amount by which 10 per cent. exceeds the standard (b) if the standard represents a percentage return on capital of over 10 per cent.— Upon the growth	One-fifth One-quarter
4. Where the current profit exceeds 15 per cent. on capital— (a) if the standard represents a return on capital of less than 10 per cent.— Upon the amount by which 10 per cent. exceeds the standard Upon that amount of the growth equivalent to 5 per cent. on capital... Upon the remainder of the growth (b) if the standard represents a return on capital greater than 10 per cent., but less than 15 per cent.— Upon the amount by which 15 per cent. exceeds the standard Upon the remainder of the growth (c) if the standard represents a return on capital of over 15 per cent.— Upon the whole growth	One-fifth One-quarter One-third One-quarter One-third One-third

Individuals and Firms

In the case of Individuals and Firms all the percentages in the above table are to be increased by two, to reflect the fact that individuals and firms are based upon 8 per cent. return on capital as against the 6 per cent. for companies. The points of graduation are therefore 8, 12 and 17 per cent.

Examples

The following examples are selected from among those given in the Financial Statement, 1937-38, and illustrate how the charge is computed.

Cases where capital is large, and taxpayer elects to be charged on Capital Standard.

Assume capital of £1,000,000, and profits of current accounting period are £160,000. Chargeable growth of profit is therefore £100,000. Rule 4 (a) applies. The sum of £40,000, representing the difference between 10 per cent. on capital (£100,000) and the Standard (£60,000), is chargeable at one-fifth. The further amount of £50,000 of the growth is equivalent to 5 per cent. on capital, and is chargeable at one-quarter. The remainder of the growth, £10,000, is chargeable at one-third.

Total contribution payable, £23,833.

Cases where capital is large, and taxpayer elects to be charged on Profits Standard.

Assume capital of £1,000,000 in each case.

(i) Profits Standard for three years 1933-35, £80,000. Current profits, £180,000. Chargeable growth, £100,000.

Current profit exceeds 15 per cent. on capital; Standard is below 10 per cent. on capital. Rule 4 (a) applies. The first £20,000 of the growth will therefore be chargeable at one-fifth, representing the difference between the Standard (£80,000) and 10 per cent. on capital (£100,000). The further amount of £50,000 of the growth, equivalent to 5 per cent. on capital, is chargeable at one-quarter. The remainder of the growth, £30,000, is chargeable at one-third.

Total contribution payable, £26,500.

(ii) Profits Standard, £120,000. Current profits, £160,000. Chargeable growth, £40,000.

The profits standard exceeds 10 per cent. on the capital and is less than 15 per cent. No part of the growth, therefore, is chargeable at one-fifth. Current profit exceeds 15 per cent. on capital. Rule 4 (b) applies. Fifteen per cent. of the capital (£150,000) exceeds the standard (£120,000) by £30,000, which sum is chargeable at one-quarter. The remainder of the growth (£10,000) is chargeable at one-third.

Total contribution payable, £10,833.

(iii) Profits Standard, £240,000. Current profits, £360,000. Chargeable growth, £120,000.

The profits standard exceeds 15 per cent. on the capital, and no part of the growth is chargeable at one-fifth or one-quarter. Rule 4 (c) applies. The whole growth is chargeable at one-third.

Total contribution payable, £40,000.

Case where net aggregate loss for four years preceding first accounting period is deducted.

Assume capital of £1,000,000, and taxpayer elects to be charged on Capital Standard. Assume current profits £400,000 and set-off of loss for four preceding years £200,000.

Adjusted profit, £200,000. Capital Standard (6 per cent. of £1,000,000) is £60,000, and chargeable growth therefore £140,000. Rule 4 (a) applies. First £40,000 of growth (10 per cent. of capital less standard) chargeable at one-fifth; next £50,000 (5 per cent. on capital) chargeable at one-quarter; remaining £50,000 of growth chargeable at one-third.

Total contribution payable, £37,166.

THE CHANCELLOR'S EXPLANATION

The following points concerning the National Defence Contribution are summarised from Mr Chamberlain's Budget Speech:—

The contribution is to be "special and temporary." It will not apply to professions and employment. Two alternative standards will be employed, at the taxpayer's choice. For the Capital Standard, the capital will be calculated at the cost of the assets in the business. Where profits in any year fall below the Standard, the deficiency will be offset in other periods. Concerns which have made losses in the last four years may set off the amounts, in so far as they have not yet been written off, against the profit chargeable. The first assessment will be made for the accounting period of each concern which ends after April 5, 1937. For firms making up accounts to June 30th, the first accounting period will be to June 30, 1937. For firms accounting to March 31st, the first accounting period will end on March 31, 1938. Provision will be made at end of the National Defence Contribution to adjust the differences in dates.

COL. COLVILLE'S EXPLANATION

The following points from the speech of the Financial Secretary to the Treasury (Col. Colville) in the Debate on April 21st, throw further light on the manner in which the tax will be assessed.

The general basis of computing capital will be the cost of assets employed in the business, subject to special modifications in certain cases. Deduction of liabilities from costs will be allowed, such as debentures and loans. Reserves invested in assets employed in the business will be included, but reserves invested outside the business will not be included as capital.

Profits will be computed generally on same lines as for Income Tax purposes, subject to certain modifications, such as deduction of interest on debentures and loans. Preference dividends will not be deducted, nor will preference shares be deducted in computing capital. Losses will be computed on similar lines. In computing N.D.C., income tax will not rank as deduction from profits, but N.D.C. will rank as an expense for Income Tax purposes.

INCIDENCE OF NATIONAL DEFENCE CONTRIBUTION

We have compiled the following table to show the effect of the new tax (a) on capital, (b) on profit, and (c) on growth of profit, at various levels of profits in the datum period and in any accounting period.

(1)	(2)	(3)	(4)	(5)
Where Average Profits for Three Years to Nearest Date after April 5, 1935, are	And Profits in Accounting Period are	N.D.C. will absorb following percentages		
		Of Total Capital	Of Total Profit	Of Total Increase in Profit since Datum Period
(%)	(%)			
6 or under	6 or under	Nil	Nil	Nil
	10	0-80	8-0	20-0*
	15	2-05	13-7	22-8*
	20	3-72	18-6	26-6*
	30	7-25	24-2	30-2*
	40	10-38	25-9	30-6*
10	15	1-25	8-3	25-0
	20	2-92	14-6	29-2
	30	6-25	20-8	31-2
	40	9-58	23-9	31-9
15	20	1-67	8-3	33-3
	30	5-00	16-7	33-3
	40	8-33	20-8	33-3
	50	11-67	23-3	33-3
20	30	3-33	11-1	33-3
	40	6-67	16-7	33-3
	50	10-00	20-0	33-3
	60	13-33	22-2	33-3
30	40	3-33	8-3	33-3
	50	6-67	13-3	33-3
	60	10-00	16-7	33-3
	100	23-33	23-3	33-3
50	100	16-67	16-7	33-3
	150	33-33	22-2	33-3
	200	50-00	25-0	33-3

* If datum period profits were below 6 per cent., the percentages of total increase absorbed by tax will be lower than these figures.

Notes on the above table:—

(1) The figures make no allowance for any deduction for losses, or for abatement where current profits are less than £12,000.

(2) The table relates to companies. For individuals and firms, 2 per cent. should be added to figures in columns (1) and (2).

(3) As N.D.C. payments will be allowed as a charge to be deducted in computing income tax, the net cost, as shown in columns (3), (4) and (5) will be reduced by one-fourth presuming a standard income tax rate of 5s. in the £.

EFFECT ON VARIOUS GROUPS OF INDUSTRIES

To give an approximate idea of the way the tax will fall on different groups of industries, in the light of their past and present profits experience, we have prepared the following table from our records of industrial profits. The last column shows how the companies would have fared relatively, had the tax been in force in recent months.

Notes on the table.—The figures are designed only as an approximate guide. The percentages are on issued capital, at par, excluding debentures, but making no allowance for reserves, etc. The basis of our computation is the balance sheets of companies which were published during the first three months of the calendar years following those given in the table, and the composition of our sample is not identical throughout. Particulars of the number of companies were given in last week's *Economist*, page 135. The last column

of the table is, of course, an average, and does not purport to show the incidence of the tax on individual companies.

PAST AND PRESENT PROFITS (Profits shown after Debenture Interest)

Group	Profits Earned on Total Capital* in			Average of three percentages in datum years	Profit in 1936	Per £100 Capital, Duty Payable on
	1933	1934	1935			
Breweries	10-7	10-5	11-1	10-8	12-0	1-2
Electric Power	11-4	11-9	11-8	11-7	14-3	2-6
Finance	4-1	6-4	9-2	6-6	9-5	2-9
Iron, Coal and Steel	2-7	5-2	8-2	5-4	9-3	3-3
Motors, Cycle & Aviation	11-1	16-5	26-8	18-1	25-5	7-4
Shipping	5-6	5-3	6-2	5-7	12-6	6-6
Shops and Stores	14-3	15-1	15-3	14-9	16-0	1-1
Textiles	5-4	4-5	5-7	5-2	6-9	0-9

* Excluding debentures. Figures refer to actual years in which profits were earned.

THE EXCESS PROFITS DUTY

The new duty has so many points of resemblance with the Excess Profits Duty originally levied under the Finance Act of 1915 (No. 2) and finally removed by the Finance Act of 1922, that a brief summary of the latter's terms may be apposite.

E.P.D. was assessed on the excess of the actual profits of every accounting period (less certain abatements) over the "pre-war standard." The profits of the accounting year and pre-war years were adjusted as for income tax purposes, with certain modifications which included the addition of profits from land and any increase in remuneration of directors and managers, and deduction of payments (such as interest and rent) made less tax, and income from investments (except for insurance and investment businesses). Other adjustments were that "artificial transactions" to reduce profits were disallowed; wear and tear allowances were based on Income Tax rules; and an allowance was made for increased or diminished or slowly remunerative capital.

Where the business had started before August 5, 1913, the taxpayer could select either the Profits Standard or the Percentage Standard. The Profits Standard was based on the profits of certain pre-war years, to the end of the last accounting period before August 5, 1914. Where three years were available, Profits Standard was the average of any two selected by the taxpayer. Where two years were available, the taxpayer could choose average or last year. For one year only, the standard was that year. The Percentage Standard was calculated on the capital existing at the end of the last pre-war trade year. The rates applicable were: for firms and individuals, 7 per cent. (8 per cent. after 1916); and for companies 6 per cent.

In other cases the "Statutory percentage" was compulsory. It was calculated on the average capital employed during the accounting period. The rates were: for firms and individuals, 7 per cent. (increased to 11 per cent. for accounting periods after 1916 and to 13 per cent. after 1919); and for companies: 6 per cent. (increased to 9 per cent. for accounting periods after 1916 and to 11 per cent. after 1919).

For the purpose of E.P.D. "Capital" was defined as the actual cost price or value of the assets. These included: cash; purchased assets, at cost, less wear and tear; book debts (as allowed for income tax); assets not purchased, at value when acquired; and assets paid for otherwise than in cash. Deductions were allowed for borrowed cash and debts and capital (such as investments) on which income was not liable to E.P.D. Patents and secret processes were adjudged material assets, but goodwill, satisfied by shares chiefly held by former owner of goodwill, was subject to decision of Commissioners. Accumulated profits in respect of past periods ranked as capital. Fluctuating capital was adjusted by deducting from or adding to the profits of the accounting period the statutory percentages on the increase or decrease.

Various abatements were allowed, the effect of which was that E.P.D. was not payable unless profit exceeded £200 in 1915, £500 after 1916 and £832 after 1919.

The rate of duty, chargeable on the excess of profits, was originally 50 per cent. It was changed to 60 per cent. to December 31, 1916; 80 per cent. for 1917 and 1918; 40 per cent. for 1919, and 60 per cent. for 1920 and 1921.

A final adjustment was made, by virtue of which if the aggregate net duty paid throughout exceeded the net excess, the profits difference could be reclaimed. A set-off or repayment was made if the profits of the period were less than the standard, plus the abatement. E.P.D. was allowed as a deduction for income tax purposes, but Income Tax, Corporations Profits Tax and E.P.D. were not allowable deductions for E.P.D.

Alarms and Excursions

NEW YORK, April 13.—Two weeks ago there was a severe flurry in the Government bond market; last week there was a comparable flurry in the stock market, while Governments rallied moderately. Whether the rally in Governments was a spontaneous market movement or the consequence of open-market purchases by the Reserve Banks cannot be ascertained until the Bank statement appears. The flurry in the stock market was attributed to rumours that the dollar price of gold was to be lowered; and the official response to the rumour only partially dispelled the uncertainty. In fact, no sooner is one rumour disposed of than several more appear; and it cannot be said that one is more unpalatable than another. For example, the rumour that the price of gold was to be reduced was almost immediately followed by a story that a free gold market would be created in New York in the hope that hoarding would be encouraged. Rumours of this type are significant, largely because they remind the market of the ever-present but frequently forgotten problem of our gold imports. The inactive gold fund, established late in December, has risen to nearly \$400 millions; and the financing of this fund is becoming a recognisable element in our deficit.

This fund was set up to prevent incoming gold from increasing excess reserves. Its purpose was supplementary to the parallel policy of reducing existing excess reserves by increasing reserve requirements—a policy which has been modified by the decision of the Reserve System to add to reserves by open-market purchases to assist the Government market. At the same time, there were rumours that the Federal Trade Commission was to inquire into price advances which were suspected of being caused by monopolistic agreements. The Message containing the Relief Budget is expected soon. It is anticipated that it will show little reduction in the numbers adjudged still to require relief; but that it may show a considerable reorientation of relief projects.

To these uncertainties about governmental policies aimed, it would seem, primarily at boom control, labour unrest has added further disquiet by reaching a stage where violence is part of the routine of news. In a chocolate factory occupied by sit-down strikers a crowd of farmers, who had been deprived of a market for their milk, invaded the plant and ejected the strikers, without bloodshed. In another instance, some eight persons were shot in a clash between two rival unions. Several States have initiated special legislation against sit-down strikes—a matter chiefly significant because it shows the state of public opinion.

Uncertain Business Prospects

In spite of increasing perplexity about the character and devices of the Administration's new economic policies; in spite of the prevalence of labour troubles;

and in spite of the rapid increase of prices of all kinds, business activity is at its best levels. There are, however, two considerations which are influencing expectations. First, April is commonly the peak of the spring seasonal; and is not uncommonly followed by some recession to midsummer. Secondly, there is some evidence that in the recent excited movements of the commodity markets, inventories were built up to rather optimistic dimensions. As a result, opinion about the future is unusually divided. At the beginning of the year opinion was almost unanimous that the trend of production would be upward throughout the year; this is still the majority opinion. But since early March a minority opinion has been forming that is apprehensive of a recession in business activity and in corporate earnings. Washington takes the view that the recent price movement was non-monetary in character; opinion in New York generally describes it in terms of inflation, Washington takes the view that the immediate concern must be to prevent a boom; a substantial minority opinion in New York believes that a recession is more imminent than a boom.

The Shifting Balance of Trade

The February foreign trade figures showed a remarkable increase in both exports and imports; imports as usual rose more rapidly.

MERCHANDISE TRADE OF THE UNITED STATES (\$000,000)

	Imports	Exports	* Balance
February, 1934.....	133	163	+ 30
" 1935.....	152	163	+ 11
" 1936.....	193	182	- 11
" 1937.....	278	233	- 45

* — import surplus and + = export surplus.

As February, 1934, was the first month of the stabilisation of the dollar at its present level, the series is continuous for purposes of comparison. It will be noted that imports have risen by over 100 per cent. and exports by about 50 per cent. The trend from an active balance to a passive balance also appears to have been continuous.

Net gold imports in February amounted to \$120 millions, almost identical with those of January (\$121 millions). Net silver imports amounted to \$13 millions in February, but in January they were only nominal. Our visible balance for the two months is as follows:—

VISIBLE BALANCE OF THE UNITED STATES Two months of 1936 (\$000,000)

Merchandise Imports...	380	Merchandise Exports...	380
Gold Imports	53	Gold Exports	24
Silver Imports	18	Silver Exports	—
	451		404
	404		

Merchandise Imports...	518	Merchandise Exports	454
Gold Imports	242	Gold Exports	—
Silver Imports	17	Silver Exports	1
	777		455
	455		
Passive Balance	322		

The increase in merchandise trade and the shift in the trade balance are both remarkable; but hardly less so is the figure of the visible passive balance. Its increase over last year is partly misleading, as the net gold imports of February, 1936, were abnormally small. Presumably this net passive balance is a crude measure of the growth of the hot money account.

France

The Revolt of the Middle Class

PARIS, April 22.—The unexpected defeat of the candidate of the former Croix de Feu in their first electoral challenge in Mortain by a coalition of all parties, Right and Left, supporting the moderate candidate, was the best possible answer to the Communist campaign against the so-called French Fascism. Moreover, it is daily more perceptible that the Popular Front is endangered by the violent speeches of its extreme supporters. Last week, the Radicals in Carcassonne manifested their impatience; and the Socialist Council of Puteaux condemned a new group of extremists which has been created inside the Party by a former pillar of M. Blum's Cabinet, M. Pivert. It is not possible to deliver any final judgment; but the zeal of the Popular Front is being visibly exhausted by the rapid and full realisation of its programme; and many people of the middle classes, who voted for the Popular Front at the end of the deflation, are now discontented by the rigid application of the 40 hour week. Thus it has been decided that in the retail business the law will not be applied during the Paris Exhibition.

The situation will not be made any easier by the forthcoming Treasury difficulties. And the repeated appeals for order and calm by M. Jouhaux, the leader of the Trade Unions, and by other officials, including the Prime Minister himself, show that the absence of discipline in industry is not pure imagination on the part of the employers. A further sign of the evolution of public opinion as a whole is that the possibility of a successor to the present Cabinet is now anticipated with much less anxiety, although no immediate change is likely.

Slump in Rentes and Industrials

The Stock Exchange, disturbed by the heaviness of international markets and by internal political anxieties, registered a serious decline, notably in the Rentes, which are now, in Auril francs, nearly at their 1936 lowest in Poincaré francs:

	April 24, 1936	Lowest Poincaré frs.	April 20, 1937
3 p.c.	67.65	65.05	65.40
4 p.c. 1917	70.30	62.95	65.75
4 p.c. 1918	69.35	63.00	65.00
5 p.c. 1920	96.30	83.25	90.85
4½ p.c. 1932 A	74.30	67.35	69.70
4½ p.c. 1932 B	73.15	66.35	68.75

Industrials also suffered an important setback. It appears now that, after the revival of orders which was caused by the rise in prices and the fear of further rises, stocks were replenished, and now the power of consumers to buy is diminished by the rise in prices. The diminution of activity in certain industries, in textiles, in rubber and in the automobile trade, can already be seen; and only the Paris Exhibition can cause an increase in building activity. The latest figures for the textile industry, in particular, suggest that the benefits of devaluation have been wiped out.

Foreign trade in March showed some improvement with a marked diminution in imports, while exports were the highest since the devaluation of October, 1936. This improvement is, however, due to the rise in prices.

	Foreign Trade		Quantity in Tons (000 omitted)	
	Value in Francs (000,000 omitted)	Value in Francs (000,000 omitted)		
Imports:	Feb., 1937	Mar., 1937	Feb., 1937	Mar., 1937
Foodstuffs	1,001	789	628	480
Raw materials	2,186	1,898	4,553	3,909
Manufactured goods ...	494	539	177	208
Totals	3,681	3,226	5,358	4,597
Exports:	Feb., 1937	Mar., 1937	Feb., 1937	Mar., 1937
Foodstuffs	237	266	83	84
Raw materials	610	608	2,092	1,972
Manufactured goods ...	848	963	210	209
Totals	1,695	1,837	2,385	2,265
Monthly import surplus	1,986	1,389		

Inflow of Capital Needed

The import surplus is less than it was but it remains important. Even if the flight of capital and speculation against the franc have momentarily ceased, the covering of this commercial deficit will necessitate more than that; capital will have to flow in.

The tone of the franc on the exchange market is actually firmer at 110.50 to the pound, against 107 at the beginning of March, 1937, and 105.15 after the last devaluation. The margin up to 112, the maximum limit of depreciation, is now very small, and speculation has thus been stopped, just as it was stopped on the Stock Exchange by the general setback. Money is now more abundant and rates are lower, but not low enough to make it feasible for the Minister of Finance to issue any important short term loans. The new National Security Loan (with guarantee of exchange) was quoted on the Bourse on Tuesday last for the first time at 95 frs. 75.

Wholesale prices registered a small decline last week, which is principally due, however, to the decline in the price of imported products:—

	June, 1936	Sept., 1936	Apr. 10, 1937	Apr. 17, 1937
General index.....	372	407	541	539
Domestic products	415	457	561	562
Imported products	296	319	506	497
Foodstuffs	396	447	533	532
Industrial products ...	352	373	549	546

Unemployment on April 10 was 381,855, against 386,254 in the preceding week.

Germany

Dr Schacht's Apologia

BERLIN, April 21.—In Munich last week Dr Schacht declared that "the restrictions on raw materials have probably passed their highest point," and foreshadowed alleviations. He remarked that restrictions on consumption, owing to their psychological reaction, must not be pushed too far. It is not possible, he added, to attain complete independence of food imports within a calculable time. For that reason he was constrained to "attack the Colonial question" again; the possession of colonies with a mark currency would bring about an "extraordinary" improvement. So far there are no signs of relaxation in the control of either raw materials or food. In a later speech on Herr Hitler's birthday Dr Schacht stated that "in its preparatory stage the new Four Year Plan must cause the community much inconvenience, and impose on it many sacrifices; for the construction of the new factories naturally involves a temporary increase in the consumption of foreign exchange." It is not easy to reconcile these two utterances. In his second speech Dr Schacht dealt also with the responsibility of foreign countries for German and world economic troubles; and affirmed that foreign countries, "absurd as it may sound," have done their best by various measures, including incitements to boycott, to prevent Germany from paying her debts. Nevertheless Germany is "the only great country which has succeeded in maintaining the parity of its currency unchanged."

Financial Agents of the Government of the Dominion of Canada in London
The Bank undertakes banking business in all parts of the world,
and with its numerous branches offers special facilities in Canada,
Newfoundland and the United States.

Dr Schacht replied as follows to the foreign criticism that State "advance-financing" of public undertakings has been accomplished by means of mysterious conjuring tricks: "The whole mysterious conjuring trick consists simply in this, that for the advance financing of extraordinary Reich needs we take all the money-market resources that at the moment lie idle; that the Reichsbank in its legal cover replaces with special bills the currency reserves which it sacrifices to foreign creditors; and, further, that in view of the great fluidity of the money market, it allows such special bills to take the place of private discounting." Except for the omission of the fact that the currency reserves which the Reichsbank sacrificed to foreign creditors were originally sacrificed by foreign creditors to the Reichsbank, this is a good summary of the process. Nevertheless (and this has been made clear in other official statements), the extreme abundance of money, which is now even greater than in 1936, arose out of advance financing, and is preserved thereby. In the main the foreign criticisms to which Dr Schacht referred concern less the process itself than the secrecy observed about the amount of Reich bill liabilities.

Dubious Debt Statement

The monthly debt return for February (which, as usual, omits these liabilities) shows a slight decrease, due to temporary causes. In the past twelve months the debt has moved (in millions of marks) as follows:—

	Feb. 1936	Feb. 1937
Total	14,457.4	15,299.7
Including foreign currency	1,668.8	1,447.5
New internal debt	9,013.7	10,220.9
Including short term	2,971.7	2,402.0

The remainder of the total (old internal debt) consists mainly of valorised pre-stabilisation loans, and other debts incurred before April, 1924. The foreign debt is reckoned at current exchange, and therefore takes into account the gold-bloc devaluations of 1936. Further, there have been subtracted from the foreign-debt total sums which, because they could not be transferred, were paid into a special account at the Reichsbank. This calculation does not seem to be correct; for the official definition of foreign debt is debt in foreign currency, and the payments into the Reichsbank have not reduced that. The chief changes in the new internal debt during the year have been an increase of nearly Rm. 1,800 millions in the total of long and medium term liabilities, due mainly to consolidation borrowing; against this there has been a decline of nearly Rm. 600 millions in the total of short term debts.

The final crop returns for 1936 show for all the chief cereals considerable decreases compared with the estimates of September. Except for barley, the yields were below the average of the preceding years:—

	Average of 1930-35.	1936.
Millions of Metric Tons.		
Rye	7.76	7.36
Wheat and spelt	4.78	4.51
Barley	3.19	3.40
Oats	6.05	5.60

The gross import of foodstuffs and condiments in 1936 was Rm. 1,499 millions, slightly more than in 1935. In 1928 these imports totalled Rm. 5,742 millions; but the imports of 1936 at the prices of 1928 would have been worth Rm. 3,194 millions. Exports declined from Rm. 772 millions in 1928 to Rm. 88 millions (Rm. 159 millions at the prices of 1928) in 1936. The decrease in the supply of foreign foodstuffs, it will be seen, has been very much smaller than the decrease in payments for imports.

Restraint of Enterprise and Movement

Government restrictions on the mobility of labour and on enterprise have been the subjects of some interesting judicial decisions and authoritative statements. The Reichsgewerbeordnung lays down the principle of complete freedom to engage in industry and trade. This freedom has since 1932 been restricted by innumerable laws and ordinances. In dealing with individual test cases some of the Courts of Admini-

stration have therefore decided that industrial freedom in the sense of the Gewerbeordnung no longer exists in law at all. The police, for instance, could on principle and without any limitation veto any particular undertaking. The Prussian High Court of Administration has now decided, however, that the freedom of the Gewerbeordnung still exists in so far as it has not been restricted by special laws.

In regard to restrictions upon the choice of employment (recently made more stringent because of the steel shortage), it has been officially decided that the personal circumstances of workers applying for freedom to change their employers must be taken into account; but that the mere desire of a workman to improve his material condition (to get a higher wage) is not a good ground for claiming exemption from the restrictions. The Iron and Steel Supervision Board has forbidden under penalty the growing practice of giving multiple orders for iron and steel in order to ensure delivery. Pig-iron production in March was 1,300,640 tons against 1,190,800 tons in February; but output per day worked fell considerably. The quarterly figures (3,783,540 tons in 1937 against 3,703,100 tons in 1936) show plainly that the expansion has ended. The Ruhr Coal Syndicate states that the demand for fine coal cannot be met. The export surplus in foreign trade in March was Rm. 53 millions, against Rm. 24 millions in March, 1936.

Norway

Business Activity

Oslo, April 17.—Monetary conditions have not altered materially during recent weeks, except that the contraction of deposits with private and savings banks seems to have stopped, and the trend is now definitely upwards. Thus, the increase of deposits during February amounted to about 18 million kroner, while there was a decrease of about 8 million kroner during the same month last year. The weekly returns of the Norges Bank show an increase in the circulation of notes of about 13 million kroner in the course of last month, chiefly on account of increased demand for cash to meet Easter traffic requirements. Deposits decreased by a similar amount, but otherwise the fluctuations were only negligible.

In the course of last month arrangements were made for the conversion of no less than five different series of loans, two of which were 5 per cent. loans of the Norges Hypothekbank, and three were similar loans of the Smabruk and Boligbank. The conversion loans are of the 4½ per cent. type, and the Smabruk and Boligbank are offering their new issue for public subscription at par, with preferential right of allotment to holders of the old bonds.

The statistics of foreign trade during February reveal a record increase in imports, the value of which amounted to 100.2 million kroner, against 91.6 million in January and 71 million in February last year. The increase is chiefly due to heavy imports of machinery and ships. Exports also showed a slight increase from 63 million kroner to 65.6 million kroner (58 million in February, 1936).

There was a slight decline in industrial production in January, due to a set-back in certain export industries. It is a significant fact that the unemployment figures fell by about 4.5 per cent. from January to March; and the remarkable increase in imports, not only of articles of consumption, but also of various raw materials and semi-manufactured articles, is indicative of well-maintained activity in our home industries.

The Revision of Wages

These encouraging features cannot, however, conceal the seriousness of recent developments in the labour market. Wage scales were due to be revised on April 1st. Negotiations, which concern some 50,000 men in various branches of industry, have been carried on since shortly before Easter. The fact that the Labour Union has suc-

ceeded in carrying through a demand for separate negotiations for each of the groups concerned, instead of jointly as has been the custom, has added to the difficulties already existing in the rather widely differing ideas of workers and employers about wages and holidays. Fortunately, however, the prospect of an agreed settlement is now bright. Notice was given by the Labour Union to stop work on April 7th, but the Government gave orders to postpone the stoppage for another week or so.

Operations on the Bourse have been unusually brisk for several weeks, especially in whaling and shipping. Unemployed tonnage in our merchant fleet has dwindled to practically none; fresh tonnage is still being acquired; and the rates obtained, even for time charters of substantial duration, seem still to be soaring to pre-war levels.

According to the *Okonomisk Revue* the wholesale price index rose from 155.1 on March 1st to 160.1 on April 1st, the highest figures since 1927. The total rise during the first quarter of the year was 13.6 points.

Hungary

Social Reform

BUDAPEST, April 10.—When Dr Darányi became Prime Minister in October, 1936, upon the death of General Gömbös, political observers agreed that the test of his ability to govern would come in the spring of 1937. It now appears that the new Premier has stood the test better perhaps than many of his well wishers would have believed. The recent domestic troubles caused by certain irresponsible elements have been suppressed without delay. It must be added, however, that practically all the opposition parties support the Government of Dr Darányi in its effort to keep law and order in the country.

Since the death of General Gömbös, domestic affairs have undergone considerable changes. Such outstanding personalities of the Opposition as Count Bethlen and Dr Eckhardt, the leader of the Independent Farmers' Party, are wholeheartedly co-operating with Dr Darányi to bring about the constitutional reform which provides for the long delayed secret ballot in rural districts and the extension of the prerogatives of the Regent and the Upper House. Parliament is expected to discuss the Reform Bill after the Budget debate, but before the summer recess.

The improvement in the financial and economic situation enables the Government to devote its attention to social problems. A new generation has grown up since the end of the war and the Government realises that a new deal is necessary to satisfy their demands. Dr Fabinyi, the Finance Minister, by his able handling of the debts of the smallholders, won support for the Government from needy peasants. Nearly 400,000 families benefit by the provisions of the new decree just promulgated, which relieves the smallholders of their onerous burden. The original valuation of the land allotted to them is reduced by one-third and the interest rate from 4 to 3 per cent.; thus the annuity paid by the beneficiaries of the Land Reform is now only 50 per cent. of the original amount. With the improvement in agricultural prices it is reasonable to hope that the new regulations will enable the new proprietors to pay off their debts gradually in an orderly fashion.

The Terms of Trade

Trade returns were very satisfactory in the first two months of the year. Comparative figures are as follows:—

	1936	1937
First two months		
(in million pengő)		
Exports	76.1	96.5
Imports	70.8	60.4
Balance	+5.3	+36.1

The substantial increase of the export surplus is due principally to the fact that in the same period of last year

Hungary was compelled to import maize because of the failure of the 1935 harvest; whereas now maize is being exported in considerable quantities from the bumper harvest of 1936. The rising agricultural prices have greatly improved the lot of the farmers. Fortunately internal wheat prices have not followed the recent steep rise in the world market, because, since the Rome Agreement began to operate in 1934, domestic wheat has been constantly quoted above world prices. While Hungary is anxious to preserve the facilities granted to the signatories of the Rome Agreement, agricultural interests are urging the Government to alter the present method of selling wheat in fixed quantities at fixed prices, and to substitute preferential quotas at world prices. It is hoped in addition that the renewal of the Rome Agreement will remedy some of Hungary's legitimate grievances against Austria about export quotas.

Negotiations for a new commercial treaty with Germany are scheduled to take place before long. As more than half of Hungary's foreign trade is done with Austria, Germany and Italy, the new trade treaties are of paramount importance, and Hungary's price structure will now depend upon them. In less than a year the cost of living has increased by 10 per cent. Food and clothing are chiefly responsible for the rise. Wages have been increased by approximately 10-12 per cent. in the same period, so that real wages remain practically the same in spite of the industrial boom. The number of gainfully employed persons is still rising.

Jugoslavia

Pax Romana?

BELGRADE, April 13.—The Government is highly satisfied with the Italian pact. It is hoped that the conclusion of this pact, which follows so soon after that with Bulgaria, marks the achievement by Yugoslavia of a kind of *Pax Romana* on all its frontiers. Particular stress is laid by the Government on the fact that the new agreement in no way weakens, but rather complements, the existing friendship with France, Great Britain, the Little Entente and the Balkan countries. Whether this enthusiasm is shared by popular opinion, which is notably Francophile and pro-Little Entente, it is difficult to say, since discussion of foreign affairs in the Press is not encouraged. There was no doubt, however, of the popular enthusiasm about the visit of President Benes. It is certain that the concessions obtained from Italy are even more important than they appear at first sight, and that there could hardly have been a psychologically more suitable moment for obtaining them than immediately after the reversal of Italian hopes in Spain. Indirectly, too, a guaranteed peace on the western border should enable the Government to devote itself, much less hampered, to the Croatian problem.

Exports have been doubled in quantity and increased by 60 per cent. in value compared with last year in the first two months of the year. The increase of imports in February also shows that the usual lag of imports behind exports is being caught up.

The MERCANTILE BANK of INDIA LIMITED.

Head Office: 15 Gracechurch St., London, E.C.3
Branches and Agencies throughout the East

Correspondents in all parts of the World

WORLD-WIDE LETTERS OF CREDIT
AND DRAFTS ISSUED

An indication that the Government is trying to settle the rapidly growing German trade debt to Yugoslavia (which now exceeds 36 million gold marks) is the new agreement which fixes a definite proportion between exports and imports. Under this arrangement Germany is to import less from Yugoslavia than she exports thereto until a balance of trade is achieved. This should be advantageous to the exports to Yugoslavia of other countries which trade with her.

Foreign Capital in Yugoslavia

Recently published statistics of foreign capital in Yugoslavia collected by Professor Rosenberg and published in the *Privredni Pregled* show that investments amount to 2,616 million dinars and foreign credits to 3,600 million dinars, making in all 6,216 million dinars, or £25.9 millions. This represents about one-third of the total sum invested in Yugoslav business life, which is 18,370 million dinars, or £76,250,000. Foreign capital in Yugoslavia, as in all the States of South-Eastern Europe, takes the form of credits rather than of actual investment in shares. Most of this capital (77.6 per cent.) is invested in industry: 2,192 million dinars in share capital and 2,634 million dinars in credits, making in all 4,826 million dinars. Banking comes next with a total of 903 million dinars (281 millions in shares and 622 millions in credits); and then transport (66 million dinars in shares and 175 millions in credits), commercial enterprises (with 210 millions in all), and insurance (with 35 millions in all).

Since the collapse of the Credit Anstalt foreign investments in Yugoslav banking through Vienna have been declining and precedence has passed into the hands of Czech and French firms. French investments are the largest (807 million dinars in share capital and 249 millions in credit), and represent 17 per cent. of all the foreign investments in the country. British capital comes second with 873 million dinars, or 14 per cent. of the total, and Czech third with 741 millions.

Statistics suggest an incipient boom. The number of insured workers increased between November, 1935, and November, 1936, from 599,655 to 656,962. The index of mining output stood at 134 at the end of last year (1926-30 = 100). The index of foundries output, on the same basis, was 148. State receipts for the ten months April to January were 8,480 million dinars, compared with 8,173 millions for the corresponding months of 1935-36. Truck loadings reached a total of 1,514,000 for 1936, compared with 1,459,000 in 1935, and were the highest for the last six years. Even savings deposits, which have been more or less stationary for a number of years, increased in the twelve months February, 1936, to February, 1937, from 10,303 to 10,932 million dinars.

Japan

Government Regulation

TOKYO, March 30.—The Government has introduced several important measures into the Diet. The Foreign Trade Regulation Bill will empower the Government to restrict or prohibit imports or exports if it is deemed necessary to prevent unwarranted competition between traders or the concentration of sales or purchases in one market. The Foreign Trade Guilds Bill is designed to codify the Import and Export Guilds Acts and to strengthen Government control over trade. The Department Store Bill proposes to put such undertakings under a licensing system, to restrain the growth and activity of big stores in the interests of small retailers. The Agricultural Land Bill aims to secure agrarian peace by extending the small-holding scheme. Under the tariff revision the duties on mineral oil, motor vehicles and parts, ball-bearings, card clothing, iodine and cassava roots will be raised; the duty on molasses for glycerine making will be reduced; aeroplanes and parts, wood pulp and hardened soya bean oil will be put on the free

list; and the duty on pig iron and steel materials will be suspended for about two years.

The improvement in general trade conditions has at last reached the joint-stock banks. The aggregate profits of the six leading banks for the December half-year amounted to 28,191,000 yen, compared with 27,529,000 yen in the preceding half-year. There was a moderate increase in the earnings of the four Tokyo banks, but the profits of the two Osaka banks were slightly smaller. The most notable feature in the balance sheets of the Big Six is a marked rise in advances. While aggregate deposits rose by 200,333,000 yen and investment holdings fell by 139,675,000 yen, loans and advances increased by 345,785,000 yen. Cash in hand and at the Bank of Japan increased by 39,144,000 yen, but the cash ratio was still at the low level of 8.3 per cent., showing that the banks, under the cheap money regime, were forced to employ a large proportion of their resources in profit-earning directions.

Growing Trade and Production

The course of foreign trade continues to be satisfactory. The February returns show that, compared with the corresponding month of last year, imports (302,434,000 yen) increased by 50,595,000 yen, i.e. 20.1 per cent., and exports (225,654,000 yen) rose by 31,264,000 yen, i.e. 16.1 per cent. The increase in imports is mainly accounted for by raw materials, the chief increases being in raw cotton, wool, crude rubber, iron and steel, and copper. Raw wool arrived in large quantities from Australia after the cessation of the trade war. The expansion in exports was spread over the whole list, with the exception of vegetable oils, rayon yarn, etc. There were increases in the two staples, cotton piece-goods and raw silk.

Other home trade statistics show the acceleration of the recent trend. The output of cotton yarn during February totalled 131,901,000 lbs., an increase of 1,431,000 lbs. since January; and rayon production during last month established another record with 25,585,000 lbs., or 324,000 lbs. more than in the preceding month. The aggregate value of all shares listed on the Tokyo Stock Exchange on March 1st was increased by 299.1 million yen to 8,355.7 million yen. The Bank of Japan's wholesale index number for February registered a fall of 1.2 per cent. on the month; the decline is mostly accounted for by those articles which had made steep advances during the preceding month.

The official index of industrial production in 1936 shows a rise of 17.8 per cent. and 6.5 per cent., respectively, compared with 1934 and 1935. The following table gives a comparison of the index numbers (average of 1931, 1932 and 1933 = 100) for output of the principal products for the past three years:—

	1934	1935	1936
Cotton yarn	122.9	126.0	127.7
Raw silk	99.1	100.9	91.1
Rayon yarn	205.0	299.0	389.5
Cotton piece-goods	127.4	131.7	125.0
Silk piece-goods	118.3	112.2	88.1
Rayon piece-goods	143.3	203.9	294.3
Pig iron	151.5	165.2	173.6
Steel products	156.0	181.9	210.0
Machinery and tools	159.5	187.7	214.2
Cement	118.5	132.1	129.5
Sulphate of ammonia	120.3	144.1	190.4
Caustic soda	222.0	287.3	354.6
Paper	116.9	126.3	134.1
Refined sugar	100.2	112.9	97.5
Total manufacturing industries	129.1	143.3	151.9
Gold	114.7	140.7	166.6
Silver	124.3	147.5	173.8
Sulphur	160.4	192.9	225.5
Coal	121.0	127.9	139.5
Total of mineral industries	115.4	124.1	138.0
Grand total	127.4	141.0	150.2

The expansion of production continued to be conspicuous in the case of rayon, iron and steel, machinery and tools and heavy chemicals, while there were notable declines in the case of most textiles, with the possible exception of rayon yarn and fabrics.

Letters to the Editor

National Finance

TO THE EDITOR OF THE ECONOMIST

SIR,—Your admirable and exhaustive survey of the National Accounts for the year just ended, published with this week's *Economist*, emphasises certain important facts.

1. The savings in the Consolidated Fund Services by conversion operations amounted to £142 millions between 1930 and 1937, while the increase in Defence and Other Services, during the same period, was as much as £196 millions. We all know what is in store for us in the financial year just commenced. Further comment is superfluous.

2. It would appear that the estimated expenditure for the current year, including the £80 millions Defence Loan, will represent 18.1 per cent. of the estimated National Income, against 18.5 in 1924; 17.6 in 1929; and 20.8 in 1932. Those who still have some regard for the country's financial record and reputation would appear to be justified in contending that the additional burden could be shouldered without hampering legitimate enterprise unduly. In fact, it would be comparatively easy, if a halt were called to the increase in "All Other" expenditure—£434 millions estimated, against £420 millions!

May I now be permitted a word of criticism. You suggest the appointment of a Commission charged with the task of finding new sources of revenue. Would it not be more to the point and of greater benefit to the country ultimately if a Commission were appointed to explore all possible methods of effecting savings in our national expenditure?

A careful study of your figures fills one with the gravest concern as to the future. Probably we have passed the peak of the boom, and the fact is hidden only by activity in re-armament, and will emerge as the expenditure on unproductive assets gradually grows.

I am, Sir,

Your obedient Servant,

JOHN BRUNTON.

Bournemouth.

TO THE EDITOR OF THE ECONOMIST

SIR,—Mr Paul Einzig has written you an amusing letter. He thinks I ought to have addressed my letters to Herr Hitler. Why Herr Hitler? And why this anxiety to select Germany as an enemy of this country? I can see no evidence on the part of Germany of any intention to attack this country. Quite the contrary. Anyone who has recently visited Germany will confirm my statement that her whole policy is based upon a disposition to cultivate the most friendly relations with Great Britain.

Sir Robert Horne attacked the German Ambassador recently for making a speech at Leipzig in which he was reported to have stated that if Great Britain did not agree to restore the former German Colonies, Germany would take steps to obtain them by force. This was contradicted in *The Times* newspaper by a correspondent, and I have had it from Herr Von Ribbentrop himself that he never said anything of the sort. A verbatim translation of the speech confirms the Ambassador's statement.

Mr Einzig has also failed to appreciate my argument which is not to leave London defenceless, but so to arrange our defence programme as to provide for adequate armament and adequate finance.

I am, Sir,

Your obedient Servant,

D. M. MASON.

London, S.W.1.

Who Owns an Insurance Company's Assets?

TO THE EDITOR OF THE ECONOMIST

SIR,—Mr Goulding is inclined, I think, to misconceive the purpose of segregating the life assets of a composite insurance office. The object is not to ensure a higher quality of investment for the life department, but to protect it from the inroads of other departments whose liabilities mature more quickly.

A fire department will two years from now have discharged all the outstanding and potential liabilities on existing contracts. A life department forty years hence will still have to make provision for the same liabilities that are standing on its books to-day. It is to-day acquiring assets that will be wanted in forty years' time.

If one of the short-contract departments gets into difficulties and wants ready cash and knows that across the corridor in the same building the life department has assets which for payment of life claims will not be wanted these forty years—knows, too, that they can be realised and used for the immediate claims of an unsuccessful department without any breach of the law—then how easily may the temptation to use them become irresistible. If it is not resisted, the long-term life policy holders may find that the assets provided from their annual premiums have been dissipated in an attempt to keep a short-term department on its feet.

Yours, etc.,

INSURER.

London, E.C.2.

Growth of a Monopoly

TO THE EDITOR OF THE ECONOMIST

SIR,—I am far from wishing to discourage Mr H. G. Williams from protesting in Parliament against what he rightly calls "all this modern nonsense of the excessive control over the individual in industry," and I only wish I could induce him to extend his protests to the interferences with trade and the consumer's liberty of buying, which the tariffs which he advocates involve.

The "shifts and devices" to which the Government has resorted are perhaps no better than the "logical Protectionist policy" which Mr Williams wants; but it is doubtful if they are any worse, at a time when the leaders of so many countries have come to realise that logical Protectionist policies have created havoc in the world and must be reversed.

Mr Williams suggests that my business friend who has been compelled to pay 125 per cent. more for his steel under the monopoly that has grown up in Scotland must be incompetent. He has built up a fine business in the West of Scotland and is regarded as an unusually shrewd man. Since my last letter appeared, he tells me that he slightly underestimated the rise in price. For Mr Williams to say that there has been no general rise in price of this order is beside the point. The fact remains that in Scotland the iron and steel industry has become a monopoly under Protection.

Yours faithfully,

RANALD M. FINDLAY.

Edinburgh.

An Economist at the Breakfast Table

TO THE EDITOR OF THE ECONOMIST

SIR,—Your economist at the breakfast table, in reviewing the effect of the marketing scheme upon bacon, says he has no retail prices with which to make comparisons. He may be interested in the following quotations for English back (the most expensive cut) at a West End of London store (the most expensive market) as given in the grocery trade press. From January, 1925, to May, 1931, the price was, with the exception of one month, always 2s. or more, and was frequently 2s. 6d. The averages for the years were: 1925, 2s. 3½d.; 1926, 2s. 5d.; 1927, 2s. 1½d.; 1928, 2s. 2d.; 1929, 2s. 3½d.; 1930, 2s. 3¾d.; 1931, 2s. 1d.

The slump in the bacon market was first felt in June, 1931, and since then the price has never touched 2s., the averages being: 1932, 1s. 9d.; 1933, 1s. 9½d.; 1934, 1s. 11d.; 1935, 1s. 10½d.; 1936, 1s. 10½d. The present price is 1s. 10d.

The Ministry of Labour notes the rise and fall in the price of streaky bacon as bought by the middle and working classes. This shows that a shillingworth of streaky bacon from 1925-30 would have fluctuated between 9½ and 12½ ozs. During the slump of 1931-33, a shilling would have bought 16½-19½ ozs., but since the marketing scheme

began it would have bought 14 ozs. in 1934 and 1935, and 13½ ozs. in 1936 and to-day—a fluctuation of only half an ounce.

Your correspondent says that the cut in supplies of Danish bacon has produced a 25½ per cent. price advance. But this is making a comparison between 1936 and the slump year of 1933, when, as the Food Council has pointed out, all countries were producing at an uneconomic figure. If your contributor will look further back to more normal years, he will find that Danish bacon was not only subject to more violent fluctuations than to-day, but was considerably higher in price.

Thus the price of Danish No. 1 sizeable on the London Provision Exchange was 123s. in 1925; 122s. in 1926; 94s. in 1927; 98s. in 1928; 113s. in 1929, and 95s. in 1930, when, of course, there was no limitation of supplies. The highest price since the quota began, 94s., is the same as the lowest in the five normal years before the slump.

Yours, etc.,
W. GILBERT FRASER.
London, W.C.2.

[It is true that the price of Danish bacon was no higher last year than in 1927, but our correspondent overlooks the fact that the Ministry of Labour index of food prices (1914 = 100) averaged only 130 in 1936, against 160 in 1927—a drop of 19 per cent. And whereas food prices in general rose by a mere 8 per cent., from 120 in 1933 to 130 last year, the price of Danish bacon advanced by no less than 25½ per cent.—ED. *Econ.*]

Books and Publications

Price Movements and Business Cycles

THESE two volumes* represent American research at its most painstaking. Professor Mills's study of price-movements since 1929 must be one of the most minute ever made of any period, and is likely to prove a mine which will be gratefully worked by several generations of students to come. Professor Bratt's book, which "is written for use as a text for college courses in business cycles," is only less detailed because its scope is wider. He does not discuss Trade Cycle theory critically; his purpose is to show that the various attempts to trace the business cycle to single causes have been unsuccessful, and that therefore forecasts of future cyclical movements must be based on an interpretation of a changing complex of factors. He accepts, in short, Professor Wesley Mitchell's view that each cycle is a "unique historical episode." An inductive method, involving a good deal of empiricism, is the only sound basis for business cycle studies, according to this interpretation. Such an approach is best carried out statistically, and it is to the statistician that his book will most appeal.

The principal reference of both these books is to American conditions, but Professor Mills devotes some attention to the world price situation. He treats the question of decline and recovery comparatively for thirty-two countries. The inference is that the action taken, particularly in the monetary field, by their Governments accounts for the dissimilar course of events in these countries, since if that factor were not important one would expect to find countries of the same economic type experiencing the same price-movement (not necessarily simultaneously) in a given world situation. But, although Professor Mills observes that "the international pattern is not a simple one," he has little to say about purely monetary influences on the price structure. Rather he directs our attention to changes in the price-margins between different stages of production; to the changing position of primary producers; to the position of capital goods industries; and to changes in

the prices of consumers' goods due, e.g. to the increased importance of salesmanship and advertising. British readers will perhaps be struck as much by his silence about the "inflexibility" of wages as by his disregard of currency and credit policy. Indeed, part of the value of Professor Mills' study lies in its insistence on factors which have bulked large in the American situation, since it stimulates us to re-examine our ideas about the depression in this country. In particular, he brings out a point to which comparatively little attention has been paid by English economists—the fact that after the war the tendency was for the gap between the prices of finished products and those of raw materials of manufacture to widen, reversing the trend noticeable for a quarter of a century before. We are familiar with the compensatory cheapening of imports which helped us to last out the years of shrinking trade and growing unemployment with no great social distress; but we have not yet taken adequately into account the implications of the current trend. If it persists, the areas of primary production can no longer expect even to retain their former share of the world's real income; and the capital sunk in them when their prospects were better will have largely to be written off.

To follow out such possibilities would, however, take us a long way beyond the scope of Professor Mills's book. He has confined himself to an elucidation of the facts of recent price-history. The result is a model of statistical research of which the publishing bodies may justly be proud.

Shorter Notices

"Land Utilisation and Rural Economy in Korea." By Hoon K. Lee. Oxford University Press. 289 pages. 17s.

Examines the foundations of life and livelihood in Japan's largest colony. Natural resources, crops, farming, land-ownership and tenancy, capital investment, rural credit, labour problems and the standard of living are ably and fully described. Lucidly and objectively written without prejudice or bias. Allows the facts to speak.

"The Riddle of Napoleon." By Raoul Brice. Putnam. 345 pages. 15s.

This book shows Napoleon following his "star" to the "destined" end; driven to his long feud against England by a Corsican sense of vendetta; influenced at every turn by his family and various women; and dying still dignified and undaunted. M. Brice tries to interpret this historic

career in psychological terms, with a leaven of medical phrases; but his explanation amounts to no more than that "the child is father to the man." Napoleon was ambitious, audacious, prudent, ingenious and revengeful because "he felt, thought and acted as a Corsican." The book is ragged and rhetorical, but quite interesting to read.

"The Problems and Practice of Economic Planning." By R. Burrows. King. 280 pages. 10s. 6d.

Mr Burrows has attempted to sort out and to criticise the theories and the practical measures which have arisen from the contemporary vogue of economic planning. He surveys adequately what has been done in Great Britain, Australasia, the United States, Italy and Russia; and concludes that economic planning must be futile until a wider planning of human life is undertaken, and until a universal change of heart has taken place.

"Greece's Anatolian Adventure and After." By A. A. Pallis. Methuen. 238 pages. 10s. 6d.

A praiseworthy attempt to summarise simply that very complicated series of political, military and diplomatic events which led to the burning of Smyrna and the expulsion of the Greeks from Asia Minor in 1922. Sets the episode in the context of Greek history, examines the responsibility of the Great Powers, and passes judgment reluctantly against M. Venizelos.

"The Co-operative Movement and Better Nutrition." International Labour Office Studies and Reports, Series B, No. 24. P. S. King and Son. 66 pages. 1s. 6d.

This Report summarises the results of an inquiry undertaken by the International Committee for Inter-Co-operative Relations at the request of the International Labour Office. Its two chapters cover the action taken respectively by the agricultural co-operative organisations and the distributive co-operative organisations to improve, define and guarantee the quality of the products they place on the market, and to educate producers and consumers.

"Proceedings of the International Conference of Agricultural Economists, 1936." Oxford University Press. Humphrey Milford. 528 pages. 17s. 6d.

This substantial volume contains a full record of the papers and speeches delivered at St. Andrews during the week ending September 6, 1936. The majority of the papers are concerned with different aspects of certain fundamental problems of agricultural policy, viz.: the relation of agriculture to the rest of the community; land tenure, agricultural credit, commercial policy and the outlook for international trade in agricultural produce; the industrial organisation of farming; and the consumption of agricultural produce. The few remaining papers deal with more specialised subjects.

"B.B.C. Annual, 1937." The British Broadcasting Corporation. 2s. 6d.

The usual feast of information about broadcasting with sidelights on policy. Improvements in studio design, the development of television, the growth of revenue and expenditure in the last ten years, and the future of regional transmission, are all pointedly discussed. The use of programme time is analysed hour by hour; the international implications of wireless are reviewed; and every aspect of the British service is examined. Profusely illustrated and full of facts, this annual is cheap, attractive and invaluable for reference.

"Valuation of Real Property." By C. A. and N. Webb. The Technical Press. 331 pages. 21s.

The sixth edition of a well-known work first published in 1910. Covers the valuation of all types of real property; examines such matters as timber measuring, arbitration, compulsory purchase, licensing and fire insurance; states the valuation procedure for rating and taxation; and includes a survey of the Tithe Act of 1936 and the Landlord and Tenant Act of 1927. Full, authoritative and up to date.

"British Waterworks Directory (1936)." Fifth Edition. Edited by G. P. Warner Terry. British Waterworks Association. 1½ guineas (1 guinea to members).

This well-known compendium provides the essential statistical basis for the study and management of water undertakings. It is prepared with the co-operation of the Ministry of Health. Names and ages of undertakings, details of officials, statutes and sources of supply, particulars of all types of charges, and fuel consumption figures are set out in full. The statistical tables are excellent; and a novel feature of this edition is the analyses of the chemical and bacteriological character of the water of the various undertakings.

MONEY AND BANKING

Banking and Government Finance

THE reactions of Government finance upon the banking system are close and immediate. It is not the Treasury's practice to hold large cash balances at the Bank of England, and any movement of funds into or out of the Exchequer is quickly reflected in a reduction or expansion of the floating debt. Nor do the Government departments hold large cash balances, for any surplus funds are at once invested in Treasury bills or Government securities, or re-lent on Ways and Means to the Government. Thus, the Government never becomes a hoarder of liquid cash abstracted from the banking system, but it is equally true that all Government operations have their reactions not so much upon the supply of bank cash, but upon bank deposits and earning assets.

We propose, in the following article, to examine the reactions of two main trends of Government finance. The first is seasonal, and arises from the traditional British practice of collecting the bulk of the year's revenue during the last quarter (December 31st to March 31st) of the financial year. This is illustrated in the following table, covering the past financial year:—

REVENUE AND EXPENDITURE

1936-37	Revenue	Expenditure*	Surplus or Deficit
April 1-December 31 ...	443	582	- 139
January 1-March 31 ...	354	208	+ 146
Complete Year ...	797	790	+ 7

* Excluding Sinking Fund.

There is a gradual growth in the deficit from April to December in each financial year, followed by its rapid disappearance during the ensuing three months.

The second trend of Government finance is mainly of a long-term character, and results from successive steps to consolidate the National Debt position by issues of new long-term securities. Every such issue involves the payment of large amounts of money into the Exchequer, as the various calls fall due; and unless this money is required to meet maturing long-term debt, it is automatically applied to the reduction of the floating debt. The latter's amount at any given moment, therefore, depends on two distinct variables, namely the seasonal fluctuations in the excess of expenditure over revenue and the Government's debt funding operations. A complication, concerned rather with the composition of the floating debt, arises from the Exchange Equalisation Account's operations. As we have pointed out before, the more gold the Exchange Account buys and holds, the larger is that part of the floating debt held by the banking system as distinguished from the Public Departments.

The first of the charts on the opposite page illustrates these two main trends. The thick continuous curve shows the absolute size of the floating debt at any moment, as indicated by the figures (representing millions of pounds) printed in the margin. The thin dotted line shows the excess of expenditure over revenue. This is measured from the horizontal zero line. Each financial year has its independent zero line, whose position in the chart is determined by the size of the floating debt at the beginning of that year. The "dot-dash" line measures other payments into or out of the Exchequer, and is also related to the zero line for each year. If payments into the Exchequer for each financial year to date exceed payments out of the Exchequer, then this last line is shown as falling below the zero line, and vice versa.

The floating debt curve tends to follow the "net expenditure" curve, rising and falling with the cumulative deficit for each year. For reasons of convenience, the deficit (or margin of expenditure over revenue) is calculated without taking account of sinking fund payments. The recent Funding Loan issues, however, have

tended to widen the margin between the two curves during each of the years, making the floating debt smaller than it otherwise would have been. They also explain the gradual decline in the floating debt during the whole period.

The next two charts, which the reader should note are drawn on a vertical scale half that of the first chart, link up Government finance with the banking position. Chart (2) shows the floating debt divided into tender issues of Treasury bills and the floating assets of Public Departments, the latter comprising tap issues of Treasury bills plus the Departments' Ways and Means Advances. The chart has additional curves for clearing bank deposits and investments. All these curves show the absolute size of each item, and are related to the scale in the margin. Superimposed on them are the two Government finance curves, "net expenditure" and "other payments into or out of the Exchequer." These are related to the horizontal zero line for each year, which is given the same position as in the first or basic chart. Chart (3) is constructed in the same way, but gives clearing bank deposits, discounts and cash (in absolute figures), and also the two Government finance curves.

The two charts, taken together, show how the seasonal rise and fall of net expenditure reacts through the banking system. First it affects the floating debt and the total of tender issues of Treasury bills. The latter fluctuation in turn causes a parallel rise and fall in clearing discounts, while the spring revenue collection brings about a contraction in deposits. The machinery, however, is elastic, and much of the original shock is absorbed in the process of transmission. The general trend of bank deposits, again, has been upwards in recent years, as a result of causes which are not directly connected with Government revenue and expenditure. Finally, bank cash usually remains unchanged each time. The cash transferred from the banks to the Exchequer in payment of the taxes due by the banks' customers returns at once in the redemption of Treasury bills held by the banks. All these points are illustrated in the following table:—

REVENUE AND THE BANKING POSITION

1936-37 (Dec. 31st-March 31st)—	(£ millions)
Net revenue surplus	146
Reduction in—	
Floating debt	152
Tender Treasury bills	109
Clearing Bank Discounts*	71
" Cash*	19
" Deposits*	68

* December and March averages are compared.

The limited reduction in bank cash is due to causes unconnected with the ebb and flow of revenue. The table shows that a net revenue surplus of £146 millions ends in a reduction in clearing bank deposits of less than half that amount. In a sense that last reduction is deflationary, for it indicates a contraction in the amount of money in the hands of the public. This, however, is the natural consequence of the duty of citizens to pay their taxes. Also, in the absence of any reduction in bank cash, a contraction in deposits and discounts raises the banks' cash ratios and so adds to their liquidity. The contraction in the supply of Treasury bills also weakens the discount rate at this season of the year. The slightly firmer tendency of money noticeable in the spring is due not so much to a diminution in bank cash as to the fact that much of the money is continually moving backwards and forwards between the banks and the Exchequer and so is not readily available for lending to the market.

There is little evidence of the influence of the successive Funding Loan issues upon the banking system.

EXCHEQUER RECEIPTS AND PAYMENTS

THE BANKS AND THE FLOATING DEBT

THE BANKS AND THE EXCHEQUER

The curve of clearing bank investments was not disturbed by any of these recent issues. While the downward trend of departmental floating assets probably reflects internal support to the Funding Loans, the main cause of this decline must be attributed to the Exchange Equalisation Account's heavy and continuous gold purchases. Without these, there would have been a noticeable drop in tender Treasury bills and clearing bank discounts, which would have brought to light the Government's efforts to fund the floating debt. Actually, as fast as the Government funded its short-term debt to the banking system through the issue of these various loans, it had to borrow afresh at short-term from the banks in order to buy and hold its new gold. The real effect of debt refunding upon the banking system will only emerge, if and when the repatriation of French money now in London takes place.

In spite of the seasonal discrepancy between revenue and expenditure, the present system of Government finance works reasonably well. There is no Government immobilisation of cash or credit, and no serious disturbance to the banking system. Of greater moment are the operations of the Exchange Equalisation Account, which are outside the normal budget machinery. We may conclude that the banking system, for its own part, appears to have satisfactorily accommodated itself to our traditional practice of paying the bulk of our taxes during the last quarter of each financial year.

Financial Notes

Monetary Changes in Burma.—A correspondent writes that in consequence of the separation of Burma from India the weekly returns of the Reserve Bank of India now differentiate between notes which are legal tender in Burma only and those that are legal tender in both India and Burma. The Reserve Bank has the sole right to issue notes in Burma and to undertake the Government's banking business and the management of the public debt. Until the Governor of Burma determines otherwise, the standard monetary unit of Burma is the Indian rupee, and the right to demand rupee coin in exchange for legal tender notes will remain. The Reserve Bank is also bound to sell in Rangoon sterling at not less than rs. 5½d. per rupee and to buy sterling at a rate not higher than rs. 6⅞d. per rupee. These are the rates already fixed for India. Provision has been made for the apportionment of Burma's share of the Reserve Bank's future profits, this being a matter for the Application Committee charged with the duty of determining Burma's net indebtedness to India. It is also provided that during the currency of the London Silver Agreement the Governor of Burma shall not dispose of any of his silver stocks except by agreement with the Governor-General of India. It is contemplated that for a minimum period of three years from April 1, 1937, the Reserve Bank will continue to operate in Burma, subject to the right of the Governor of Burma to introduce new currency notes or coinage before that date by agreement with the Bank. The Governor-General shall also give due notice to the Governor of Burma of any proposal to introduce or move an amendment to any Bill in the Indian or Federal Legislature which affects the coinage or currency of British India or the constitution or functions of the Reserve Bank. Among other provisions, the four Burma banks formerly included in the list of Scheduled Banks in India now become Scheduled Banks in Burma, and the Reserve Bank's powers to require the maintenance with it of statutory cash balances apply to them as heretofore. At the expiration of this transitional period of three years or longer, and, should it be then decided to terminate the Reserve Bank's responsibility for the currency in Burma, the Reserve Bank will transfer to the Government of Burma from its Issue Department assets equivalent in value to the total liability in respect of Burma notes outstanding, and its responsibility therefore will then cease.

The Money Market.—Notwithstanding the week's contraction in bankers' deposits, noted below, money has remained very comfortable. A moderate amount has been lent by the clearing banks each day, while outside money has been obtainable, mainly against bonds, at rates of ½-¾ per cent. The market naturally borrows against bills mainly from the clearing banks, so as to obtain the latter's minimum loan rate of ½ per cent.

	Apr. 1, 1937	Apr. 8, 1937	Apr. 15, 1937	Apr. 22, 1937
Bank rate	2	2	2	2
Clearing banks' deposit rate	½	½	½	½
Short loan rate:—				
Clearing banks	½-1*	½-1*	½-1*	½-1*
Others	½-1	½-1	½-1	½-1
Discount rates:—				
Treasury bills	½	½	½	½
Three months' bank bills	½	½	½	½

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

Last week the market again partly missed the Treasury bill tender, the syndicate only obtaining 37 per cent. of the total allotment. Thus the scarcity of bills continues. The clearing banks are now buyers of both June and July Treasury bills, but the lack of bills is making holders reluctant to sell.

The Bank Return.—This week there has been a further small contraction in the note circulation, and it may be assumed that the currency withdrawn over Easter has now returned to the banks.

BANK OF ENGLAND					
	Apr. 22, 1936	Mar. 31, 1937	Apr. 7, 1937	Apr. 14, 1937	Apr. 21, 1937
£ mill.	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Issue Department:—					
Gold	202.1	313.7	313.7	313.7	313.7
Note circulation	415.4	473.8	469.9	465.7	464.0
Banking Department:—					
Reserve	47.4	40.8	44.6	48.9	50.7
Public deposits	13.2	52.2	24.5	22.4	25.6
Bankers' deposits	93.1	62.3	94.8	96.9	91.2
Other deposits	38.1	38.5	38.3	37.9	38.9
Government securities	93.2	100.5	101.1	96.9	94.1
Discounts and advances	7.5	7.1	7.4	6.9	4.6
Other securities	13.9	22.9	22.3	22.1	24.0
Proportion	32.8%	26.6%	28.2%	31.0%	32.5%

In the banking department the usual mid-monthly excise duty payments explain the increases in public deposits and other securities. The fall in Government securities probably marks the running-off of some more of the April bills specially purchased late in March in order to help the market over the end of the quarter. There is a small reduction in discount and advances, which probably means that some of these April bills were regarded as "discounts" rather than as "open-market purchases" by the Bank. As the classification depends upon whether the initiative came from the Bank or the discount market, the distinction is at times a fine one. As a result of these movements, bankers' deposits are reduced by five millions, in spite of the contraction in the note circulation.

The Foreign Exchanges.—This has been another week of fairly wide movements. The outflow of gold, both Russian and hoarded, to the United States continues; and as a result there has been a definite weakening of the spot New York rate from \$4.90½ to over \$4.94. Three months' dollars have appreciated slightly to 1½ cents premium, as some sellers of spot dollars are taking a long view and buying them back forward on the chance of an improvement in the rate. Francs have been pronouncedly weak. The market is once more taking a pessimistic view of the French financial outlook, especially as rentes have now fallen again to a new record, while the efflux of capital is thought to have begun again. The spot Paris rate therefore depreciated to Frs. 111½. The French Control then intervened in Paris and drove the rate sharply back to Frs. 110½. This move, however,

did not carry conviction and the rate has since returned to Frs. 111. Three months' francs have widened to Frs. 2½ discount, and this is rather ominous, as it means a forward rate of Frs. 113½, which is very near, if not outside, the sterling rate corresponding to the lower statutory limit for the franc of 43 milligrammes of gold. Dutch guilders, Swiss francs and belgas have depreciated against sterling in sympathy with the dollar to rates of Fl. 9.02½, Frs. 21.59 and Bel. 29.24, respectively.

A Swedish Comedy.—This week there has been a sudden depreciation of the Swedish krona. Three months ago there were heavy purchases of forward krona, based on rumours that the Swedish authorities were going to bring about an appreciation of the krona, to offset the rise in sterling commodity prices. These rumours proved baseless, and the forward positions are now falling due. Unfortunately for the speculators, the Riksbank has cornered all the supplies of foreign exchange, and is only letting the speculators out at its own price. From the normal spot rate of Kr. 19.39½ per pound sterling, the Riksbank has so far raised the rate by successive steps to Kr. 19.41½, and as the liquidation of these positions is not yet complete, the rate may go higher. It is generally believed that the Swedish authorities intend to take care that the speculators on no account earn a profit.

Insurance Notes

Eagle Star and British Dominions.—The accounts of this company include the figures relating to the closed funds of the "Eagle," "English and Scottish," "Sceptre" and "Star," whose periodical valuations take place at various dates. The figures given below refer to the quinquennial valuation of the current series only, and for comparative purposes the corresponding results of the 1931 valuation are added.

	1927-1931	1932-1936
Trading Surplus	438,923	373,522
Profits from Investments	155,922	34,961
Brought forward	82,673	59,648
	365,674	468,131
Allocations:—		
To with-profits policyholders	200,724	287,060
" Shareholders	105,302	142,895
" Carried forward	59,648	38,176
	365,674	468,131

Considerable strengthening in the basis of valuation has been made and the cost is hidden in the trading surplus shown. For non-participating policies no alteration in the basis was made, but in the participating section the A. 1924/29 table has replaced the OM table. The valuation rate in the case of annuities has been reduced from 3½ per cent. to 3 per cent., except that for deferred annuities and group pensions 3½ per cent. is used during the period of deferment, with an allowance for future expenses. For the quinquennium ended December 31, 1931, bonus rates were 28s. per cent. per annum of the sum assured in the ordinary section, 29s. per cent. per annum in the abstainers section and 15s. per cent. per annum in the low premium section. On the present occasion the corresponding rates are 40s. per cent., 41s. per cent. (42s. per cent. for whole life policies) and 27s. per cent. (28s. per cent. for whole life policies). During 1936 net new sums assured increased by nearly £3,000,000 to £5,734,000, but as the number of new policies increased only by 236 to 2,690 it may be assumed that much of this extraordinary increase in sums assured arose from group life assurance contracts in which the company specialises. The net rate of interest on life assurance and annuity funds fell by 5d. per cent. to 44 3s. per cent., while death claims amounted to £662,000 against £806,000.

In the other branches of insurance, a slight reduction took place in fire premium income from £808,000 to £796,000, but increases of £8,000, £29,000, £37,000 and £19,000 occurred in the accident, employers' liability, general and marine accounts, respectively. The rapidly expanding motor insurance premium income is now greatly in excess even of fire premiums, and last year increased from £1,465,000 to £1,633,000; underwriting results, however, are less favourable than usual.

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Fire	70,139	8.7	74,073	9.3
Accident	8,809	10.2	9,749	10.3
Employers Liability	3,671	2.2	4,027	2.0
General	110,677	26.1	98,544	21.3
Motor	17,662	1.2	5,683	.3
Marine	25,000		20,000	
Life	72,275		110,447	
	308,233		311,157	
Less items debited to Profit and Loss Account	265,453		260,483	
	42,780		50,674	

In 1936 there was a further issue of ordinary shares of £3 each at £20 and the premium received after deducting expenses amounted to £1,116,000. This sum, together with a further £34,000 from profit and loss account, was transferred to the general reserve, which now amounts to £2,500,000. Total assets include those of the closed funds, and subsidiaries increased from £23,691,000 to £25,502,000. There was some increase in mortgages, but a reduction of £229,000 in British Government securities, and contrary to general experience a fall of £389,000 in debenture stocks. On the other hand, preference stocks increased from £2,826,000 to £3,229,000, while ordinary stock holdings increased sharply from £2,134,000 to £3,590,000. The dividend has been increased by a further 2½ per cent. to 27½ per cent., and costs £186,000 compared with aggregate interest earnings of £190,000.

Scottish Union and National Insurance.—In the life branch, new sums assured rose further from £3,604,000 to £3,761,000, and the net rate of interest was 4d. per cent. higher at £3 19s. 4d. per cent. Death claims increased from £358,000 to £522,000. Fire premium income fell slightly from £1,012,000 to £998,000, and the underwriting profit was again very satisfactory.

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Fire	133,348	13.2	134,008	13.4
Accident	1,715	6.1	3,623	14.9
Employers Liability	4,472	8.0	762	1.4
Miscellaneous	6,270	2.8	71,876	31.2
Marine	30,000		25,000	
	166,861		89,993	
Less Items Debited to Profit and Loss	84,031		89,492	
	82,830		501	

Most of the loss shown in the miscellaneous branch probably arose in the motor insurance section. Marine premium income increased by £17,000 to £326,000, but the transfer to profit and loss account was reduced from £30,000 to £25,000. Total assets amounted to £16,909,000 against £16,805,000. Loans of all kinds fell by £326,000 to £1,740,000, the reduction in policy loans alone being £145,000. British Government securities increased by nearly £350,000, and some small increase took place also in Indian, Colonial and foreign government securities. Debenture stocks fell from £3,831,000 to £3,601,000 and preference stocks increased from £2,385,000 to £2,756,000, while ordinary stocks showed little change. There is a general reserve fund of £500,000, a contingency fund of £100,000, and a profit and loss balance of £512,000. As is the custom of the company, 50 per cent.—instead of the more general 40 per cent.—of the premium income is reserved in the departmental

accounts for unexpired risks. In addition special reserves are held in the fire and miscellaneous departments of £900,000 and £50,000 respectively. The dividend is again at the rate of 65 per cent. and costs £150,000, contrasted with interest earnings of £143,000. The trading surplus on this occasion is negligible, but the experience in the miscellaneous branch may be assumed to have been quite exceptional in 1936.

* * *

Wesleyan and General Assurance.—In the Ordinary Branch new sums assured were £1,714,000, compared with the record figure of £1,799,000 in the previous year, and the net rate of interest fell from £4 5s. 4d. per cent. to £4 2s. 4d. per cent. In the Industrial Branch new sums assured fell by £30,000 to £3,815,000, but the total premium income increased from £1,311,000 to £1,365,000; the expense ratio in this branch was further reduced from 38.2 per cent. to 36.6 per cent. The same basis of valuation of liabilities was adopted as in the previous year, namely, OM 3 per cent. for Ordinary Branch policies, a(m) and a(f) 3½ per cent. for annuities, and E.L. No. 6 (Males) 3½ per cent. for Industrial Branch policies, but in the last mentioned case additional valuation strength has been attained, at the expense of the carry forward, by increasing a special reserve by £50,000. The results of the annual valuation of liabilities are shown below:—

ORDINARY BRANCH.

	1935	1936
Surplus earned during the year	140,931	124,692
Investment Profits realised	6,586	7,423
Transferred from Industrial Branch	14,077	14,997
Brought forward from previous year	89,406	55,064
	250,100	202,176
To Bonuses to Policyholders	135,936	142,475
Staff Pension Fund	15,100	14,050
Strengthening of Reserves	44,000	—
Carried forward to next year	55,064	45,651
	250,100	202,176

INDUSTRIAL BRANCH.

Surplus earned during the year	175,811	181,768
Investment Profits realised	8,075	3,450
Brought forward from previous year	99,311	102,477
	283,197	287,695
To Bonuses to Policyholders	54,492	56,056
Staff Pension Fund	59,900	55,950
Bonuses to Outdoor Staff	18,164	17,702
Ordinary Branch (gross of tax)	18,164	19,669
Strengthening of Reserves	30,000	50,000
Investment Reserve Fund	—	50,000
Carried forward to next year	102,477	38,318
	283,197	287,695

The rate of bonus in the Ordinary Branch for both whole life and endowment assurance policies is 38s. per cent. calculated on the sum assured, contrasted with 44s. per cent. for whole life and 38s. per cent. for endowment assurances in 1935, and with 46s. per cent. and 40s. per cent. in 1934. In the Industrial Branch the form of distribution follows the same lines as in the previous year. Policies becoming claims by death or maturity between April 6, 1937 and April 3, 1939, will be entitled to an addition of 2½ per cent. of the sum assured for policies of ten years' duration, increasing by ½ per cent. for each subsequent year's duration up to a maximum of 10 per cent. for policies of forty years' duration and over. Total assets increased from £13,869,000 to £14,734,000. Loans of all kinds amount to £5,025,000 against £4,170,000; mortgages on property alone account for an increase of £311,000, due, no doubt, in large part to the popularity of the Society's house purchase scheme, while loans on public rates are almost doubled at £1,099,000. British Government Securities fell by £623,000 to £3,245,000, but Debenture and Preference Stocks each showed increases. The Society has no Ordinary Stock holdings.

Atlas Assurance Company.—New life assurances in 1936 were £4,315,000 compared with £3,564,000, but annuity consideration moneys fell from £596,000 to £419,000. The net rate of interest was 1s. 10d. per cent. smaller at £4 8s. 6d. per cent., while death claims were considerably greater at £354,000 against £245,000. Surplus is distributed to policy-holders at triennial intervals, the last occasion being as at December 31, 1934, but an annual valuation of liabilities is made and the results published in the Report. In 1935 the trading surplus shown for the year was £411,000, from which £90,000 was applied to strengthen reserves; last year the corresponding surplus was £282,000, from which £100,000 has been applied to a further strengthening of reserves. In the Miscellaneous Branches Fire premiums were practically unchanged at £1,759,000, but Accident premiums increased from £546,000 to £588,000, and Marine premiums from £111,000 to £127,000. With a view to showing more clearly the Company's surplus funds, the Directors have transferred to General Reserve Fund the Additional Fire and Accident Reserves of £1,311,000 and £100,000 respectively, and also £200,000 from the Marine Fund and £139,000 from Profit and Loss. These transfers bring the General Reserve Fund up to £2,000,000.

* * *

The underwriting results of the past two years are shown below:—

	1935	1936
	Amount of Profit	Amount of Profit
	Percent- age of Premiums	Percent- age of Premiums
Fire	181,564	175,465
	10.3	10.0
Accident	39,375	36,175
	7.2	6.2
Life	27,154	28,720
	248,093	240,360
Less items debited to Profit and Loss	88,207	86,581
Net Trading Surplus	159,886	153,779

Total assets of the Atlas and subsidiaries increased from £18,315,000 to £19,319,000, the life assets alone being £13,250,000 against £12,392,000. The most striking movement took place in the life assets under the title "House and Landed Property," which increased from £489,000 to £998,000. Apart from the General Reserve of £2,000,000 above mentioned, there are other free reserves of nearly £500,000. The dividend for the tenth successive year costs £176,000, and is at the rate of 32 per cent. free of tax; aggregate net interest earnings are £124,000, against £118,000 in 1935.

* * *

British and Foreign Marine Insurance.—This marine company, which is a subsidiary of the Royal, has always earned satisfactory underwriting profits. The figures of the last five closed years are given below:—

	Premium Income	Transferred to Profit and Loss
1931	482,000	38,000
1932	431,000	33,000
1933	372,000	6,000
1934	389,000	28,000
1935	398,000	19,000

In 1936, premium income was almost exactly the same as in 1935; first-year claims were £106,000 against £101,000, but this increase is more than counterbalanced by a fall of £9,000 in expenses. There is a small fire account, in which premium income last year amounted to £23,000, resulting in a profit of £4,000, which, as usual, is retained in the departmental account. Some £50,000 has been transferred from the fire account to superannuation fund, leaving the fire fund at £19,000 compared with £65,000 at the beginning of the year. The superannuation fund appears as a new item in the balance sheet. Total assets amount to £3,463,000, compared with a reserve fund of £1,000,000 and a general contingency fund of £233,000. The dividend for the seventh successive year is 13½ per cent., and costs £142,000 contrasted with interest earnings of £132,000.

THE STOCK EXCHANGE

The New Tax and the Investor

THERE is a subtle irony for the investor in the reflection that Mr Neville Chamberlain was within approximately £2 millions of a balanced Budget for 1937-38, when he decided to impose a new tax which will completely alter the existing scale of values for ordinary shares, and will involve a thorough-going re-orientation of investment criteria in most markets. The new National Defence Contribution will, primarily, be made by the ordinary shareholder, for the income of the debenture and preference shareholder is a fixed amount, for which the recipient is personally liable to tax, whereas the new impost will be a liability of the company concerned.

During the period of recovery, so far, the aim of investors has been to estimate the probable effect of the growth in earnings and dividends on individual shares, having regard not only to the over-all increase in profits, but also to its incidence on ordinary share payments; for a given rise in total earnings means more to the holder of a high-g geared than of a low-g geared share. Now, it appears, a significant part of this increase will be taken by the Exchequer. But the Exchequer will base its computation not on equity profits, but on total profits after debenture interest. Thus the market, in making its downward readjustment of existing ordinary share values, will have three different factors to consider: first, the extent to which the new National Defence Contribution will affect total profits; secondly, the manner in which this will be translated into total and percentage earnings and dividends on individual ordinary shares, having regard to "gearing"; and, thirdly, the ability of individual companies to meet the additional impost out of profits hitherto ploughed back.

With the general effect of the tax from a fiscal viewpoint we deal in a leading article elsewhere in this issue. In Notes on pages 218 to 220 we discuss the initial reaction of the market to Mr Chamberlain's announcement and, by way of illustration, we examine certain companies to illustrate the differing incidence, and some of the anomalies, of the impost in particular cases. The present article is concerned with the detailed implications for investors of the tax itself. Investors may find it convenient first to consider the general effects of the tax before examining its somewhat complex details.

The National Defence Contribution inevitably recalls the Excess Profits Duty enforced from 1914 to 1921, with the difference that the present tax is a peace-time tax, whereas E.P.D. had its origin in special war-time conditions. Companies which make profits directly attributable to the re-armament programme will, of course, pay N.D.C. (National Defence Contribution) on them, but the tax is a levy not on re-armament profits, but on the growth of all profits, whatever their cause. And it is indubitable that the "re-armament element" will be responsible for a much smaller part of the total growth of profits in the next few years than was the "war element" in the E.P.D. period. In other words, the incidence of the tax will fall first on the growth of profits resulting from cyclical and other factors which have made for increased earnings in industry in general and, secondly, on any supernormal increase, which may represent the fruits of special enterprise, or good fortune, on the part of individual companies. And it will be borne by the special class of shareholders—i.e. the ordinary shareholders—who are the risk-takers of industry.

In last week's issue of *The Economist* we analysed the profits of some 628 companies whose reports had been published in the first quarter of this year. On the basis of similar figures for preceding years, we constructed a

chain index of earnings. Our basis of computation is not the same as Mr Chamberlain's, but it may serve as a rough guide to the relative position of the basic years 1933-34-35 in the profits cycle:—

INDUSTRIAL PROFITS INDEX

(Based on Company Reports published in first three months of Years following those named)

Profits earned during year	Chain Index, 1929 = 100
1929	100.0
1930	89.3
1931	76.5
1932	69.7
1933	73.4
1934	84.1
1935	95.3
1936	106.7

The average of the index of the three datum years is 84.3. This is approximately 14½ points above the index figure for the worst year of depression, 1932, and 15½ points below the figure for 1929 and 22½ points below the figure for 1936. Thus, the datum line chosen by the Chancellor appears to lie nearer to the low point of depression than to the level reached in the present stage of recovery.

To that extent, it is not unfair to regard it as being, in part, not wholly a tax on prosperity, but in part a tax on the trade cycle. In some respects, N.D.C. is comparable with C.P.T. (Corporation Profits Tax), imposed by Sir Austen Chamberlain in his Budget of April, 1920, and abolished by Mr Snowden in 1924. C.P.T. was charged at the rate of 1s. in the pound on profits accruing on and after January 1, 1920, above £500 (the rate was reduced to 6d. by Mr Baldwin in 1923) and it produced revenue much of the order of that forecast by Mr Chamberlain. In 1922-23, for example, it netted £22½ millions. It had, however, two important differences from N.D.C. In the first place, Sir Austen Chamberlain made some attempt to temper the wind to the ordinary shareholder, for it was provided that in no case was the duty to exceed 2s. in the £ on the profit remaining after payment of debenture interest and preference dividends. In the second place, C.P.T. was payable only by limited liability companies engaged in trade, whereas N.D.C. is payable by companies, firms and individuals, and its method of assessment is far more complicated.

Under N.D.C., the taxpayer will not pay on the basis of a flat rate, but on that of a ratio and a difference. The only way by which the investor can discover his approximate position under the new tax is to take pencil and paper, and, leaving the unknown factors on one side for the moment, work out the incidence of those which are already clear. It is obvious that companies which earned less than 6 per cent. in the datum period will opt for the capital standard, while those which earned more than 6 per cent. will opt for the profits standard. On this assumption, it becomes possible to construct a form of frequency table, showing, for given datum period earnings and present earnings, etc., the proportion of total capital, total profit and total increase which will be represented by N.D.C. payments. A table on these lines will be found on page 203 under the heading "Incidence of National Defence Contribution."

A study of this table reveals a number of obvious anomalies. Industrialists and investors will find it difficult to appreciate the reason for a system under which a dozen companies, all earning identical profits, may be

liable to widely varying amounts of tax. Two companies, for example, may have profits of £100,000, and both may have earned, say, 10 per cent. in their datum period. But if one has a capital of £500,000, while another has a capital of £250,000, one will pay £14,600 and the other £23,900. Again, suppose that two companies with the same capital of £1,000,000 are now earning £300,000, but one earned 20 per cent. in the datum period while the other earned little or nothing. Neither company may have had any connection with the re-armament programme. But the consistently prosperous firm will pay £33,300 and the formerly depressed company £72,500. Here, indeed, is the strongest ground for criticism. Those companies which suffered most during the depression pay most now; those which suffered least, pay least.

The principles for assessment explained by Col. Colville on Wednesday evening afford only an approximate indication of the way the measurement of capital and profits will work out, though the Treasury will have its E.P.D. experience to guide it. A rough idea of *relative* burdens can be obtained, however, from the table given, for a number of groups—breweries, electric power, steel, motors, shipping, etc.—on page 203—under the heading "Past and Present Profits." The figures are based on company reports published in the first three months of 1937 and earlier years, taking published profits (after debenture interest) and existing ordinary and preference capital. Obviously, the results are very approximate, but they show, for example, that on their latest results groups like the motor, cycle and aviation companies (some of whom are benefiting from re-armament) would have been liable to N.D.C. on profits bearing six times as large a relationship to their paid-up capital, and shipping companies (which have no direct interest in re-armament) a relationship 5½ times as large as in the case, say, of the breweries and the retail trading companies.

The investor has still two further points to consider. How far can the effect of the tax be "cushioned" by a reduction in the proportion of earned profits put to reserves? The following table gives some idea of the margin shown by the latest company reports in a number of important industrial groups. The companies in question all published their reports during the three months ended March 31st last:—

EARNINGS AND DIVIDENDS ON ORDINARY CAPITAL (YEAR 1936)

Group	No. of Companies	Average on Ordinary Shares	
		Profits	Dividends
		%	%
Breweries.....	15	15.6	10.3
Electric Power	24	19.6	8.5
Finance	47	9.8	6.9
Iron, Coal and Steel	34	12.4	5.9
Motors, Cycles and Aviation...	7	37.0	22.3
Shipping	6	13.0	3.2
Shops and Stores	42	26.2	19.9
Textiles	30	8.3	6.6

There is a margin in every case, which is least in the textile group and widest in the motors, cycles and aviation, electric power, shipping and iron, coal and steel groups. The figures, however, need qualification, to the extent, e.g. that the electric power companies' reserves include an element of depreciation, while the shipping and steel companies, whose dividends are still low, have in certain cases arrears of depreciation still to make up. On the whole, the table leaves an impression that the groups on which the new tax will fall heaviest have the best reason for a conservative dividend policy in present circumstances.

Finally, the investor must consider the effect of "gearing," i.e. the proportion of total profits already absorbed by fixed charges. The new tax, in fact, is equivalent to the placing of a varying income debenture in front of a company's existing capital, with a set-off of one-fourth of its amount by way of saving in income tax. We show below two imaginary cases to illustrate the incidence of the new tax on a stable, prosperous and low-gear company and a high-gear "recovery" company, respectively. The examples have purposely

been made extreme, and the income tax factor, for the sake of simplicity, has been disregarded.

EFFECT OF GEARING

Case I

A Company has been stable and relatively prosperous, with a moderate subsequent increase of profits, and a low gearing.

Capital: 6 per cent. Preference	250,000
Ordinary	750,000
Total	1,000,000
Standard Profits	150,000
Profits in Accounting Period	200,000

Absorbed as follows:—

(a) Presuming no N.D.C.—	
Preference Dividend	15,000
Earned for Ordinary	185,000 (24.7%)
(b) Presuming N.D.C. Payable—	
N.D.C.	16,700
Preference Dividend	15,000
Earned for Ordinary	168,300 (22.4%)

Case II

A Company has recovered after depression, and has a high gearing.

Capital: 6 per cent. Preference	750,000
Ordinary	250,000
Total	1,000,000
Standard Profits	60,000
Profits in Accounting Period	200,000

Absorbed as follows:—

(a) Presuming no N.D.C.—	
Preference Dividend	45,000
Earned for Ordinary	155,000 (62.0%)
(b) Presuming N.D.C. Payable—	
N.D.C.	37,200
Preference Dividend	45,000
Earned for Ordinary	117,800 (47.1%)

In the first case, it will be seen, the earnings for ordinary shareholders remain relatively stable at 22.4 per cent., against 24.7 per cent. In the second case, however, they fall steeply from 62.0 per cent. to 47.1 per cent. Investors must decide whether their holdings come nearer to Company I or Company II. The facts appear to suggest that the tax, so long as it remains in its present form, is likely to produce, from the investor's viewpoint, an amount of confusion and uncertainty which appears high in proportion to its prospective financial yield to the Exchequer. Some of the reasons for uneasiness may be set at rest by the fuller information which will be revealed in the Finance Bill itself. But these cases are sufficient to show grounds for important modifications on the lines suggested in our first leading article.

Investment Notes

N.D.C. and the Markets.—Mr Chamberlain's National Defence Contribution proposals have wrought consternation on the Stock Exchange, and the volume of criticism which they have evoked must be unparalleled in the history of Conservative Budgets. The Stock Exchange immediately seized the main inference from the tax proposals—that ordinary shares would bear the whole burden, and that those shares on which earnings were low during the base period and have since recovered considerably would be most severely hit. Dealers, however, were quite unable to assess the effects of the tax with any degree of precision upon individual companies, for, as we point out on page 219, until the concepts of capital and profits are fully clarified, an attempt at detailed calculation of the effects is hardly worth while. While the extent of the fall in such groups as iron and steel shares, shipping, and general recovery industrials may, therefore, call for subsequent adjustment (up or down), in principle these movements were fully justified. By contrast, the shares in prosperous but sheltered industries, such as tobacco and brewing, were affected least of

all, for they escape the worst incidence of the Contribution owing to their relatively smaller growth of profits in recent years.

For some time on Wednesday, however, dealings were completely nominal, and dealers marked down prices in self-defence. Apart from a certain amount of speculative selling (some of it associated with the recent technical weakness), the volume of public selling appears to have been small. The following table shows the extent of the fall on Wednesday and Thursday in some leading groups:—

	Friday, Apr. 16	Monday, Apr. 19	Tuesday, Apr. 20	Wed., Apr. 21	Thurs., Apr. 22	Change Budget news
Old Consols	76½	76½	76½	77	77½	+1½
War Loan	103	103½	103½	103½	103½	+½
John Brown (10/-)	35/6	36/6	36/9	33/6	33/6	-3/3
Dorman Long (£1)	54/-	55/3	56/3	51/3	50/-	-6
Vickers (10/-)	31/1½	31/9	32/6	30/9	30/4½	-2½
Imperial Tobacco (£1) ...	151/3	151/3	154/4½	154/4½	153/9	-½
B.A. Tobacco (£1)	127/-	127/6	128/9	128/1½	127/6	-1/3
Ind. Coope (£1)	122/-	123/-	125/-	125/-	124/6	-6d.
Distillers (£1)	115/-	115/-	117/-	114/-	112/6	-4/6
Associated Cement (£1) ...	95/6	94/9	95/-	90/-	90/7½	-4/4½
British Oxygen (£1)	115/-	116/10½	116/10½	111/3	110/7½	-6/3
Crompton Parkinson (5/-) ..	68/6	68/9	69/6	64/-	64/9	-4/9
General Electric (£1) ...	87/3	87/-	87/3	83/6	83/3	-4/-
Turner and Newall (£1) ...	103/-	103/-	104/6	98/9	95/-	-9/6
Standard Motors (£1) ...	150/-	153/9	154/4½	145/-	146/3	-8/1½

Commodity shares, where recovery has also been late, were likewise demoralised. Rubber shares were regarded as particularly vulnerable, and dealing was arranged with the utmost difficulty. Oil shares, spared from any increase in taxation, felt the blow of the new tax with equal severity. And by a paradox, Kaffir shares, which on Tuesday were again shaken by speculative weakness, were one of the few groups to recover on Wednesday, on the reasoning that South African domicile would enable them to escape the new tax.

Future Effects.—Brokers who recalled the operation of E.P.D. (which incidentally fell upon brokers and jobbers, though not on other occupations within the Square Mile) suggested that the new tax would have a profound effect on the future of individual markets which could not be finally assessed until fuller details of the Chancellor's proposals are made known. The fact that relief is promised for certain depressed groups has, perhaps, been overlooked in the market's consternation, but the relative attractions of fixed-interest securities and equities with an overseas domicile have certainly been enhanced. The new issue market will presumably stand still for some time, for the essence of new offers is a firm calculation of the prospective earnings available for the ordinary share subscriber. On the same argument, capital reconstruction schemes may be delayed, while the position of those companies which have effected sweeping reconstructions and have since achieved a striking increase in profits (such, for instance, as Dorman Long) looks hardly enviable. Again, the high-gear equity share is penalised relatively to the low-gear share, and changes in capitalisation, therefore, cannot be ruled out. There is, moreover, some likelihood that companies operating abroad and registered in this country may elect to change their domicile. If, again, a company includes an item for, say, patents on its books at cost price (irrespective of its real value) while another, comparable in all other respects, places no valuation on patents in its books, will their treatment differ in computing "capital employed in the business"? If the former receives better consideration, openings for abuse are clearly likely to arise. Finally, home rail stockholders will note with relief that the companies will not be liable, for they are well below the 6 per cent. datum level, though not immune from other claims for costs and wages, which will be considered next Thursday.

Some Companies Considered.—Part of the market's resentment regarding the new tax arises from its inability, at this stage, to compute the actual

FOR SECURITY: STABILITY:
STRENGTH:

SECURITY
FIRST
TRUST

This popular unit trust spreads your investment over 23 first-class British companies embracing railways; iron, coal and steel; land and building; stores; foodstuffs; textiles; breweries; tobacco; gold mines; light, fuel and chemicals; newspapers. All are sound dividend payers and notable for their very strong financial and trading positions.

YIELD: Based on the cash distributions from the investments during the past year, the gross yield at the present price is approximately 5½ per cent. Proceeds of the sale of bonus shares and of new issue rights are not taken into account. Large capital bonuses are added to the capital of the Trust; fractions of bonus shares and of new issue rights are sold and the proceeds are distributed as capital. All management charges have been allowed for. With a few exceptions, the underlying securities consist of ordinary shares, distributions on which are subject to fluctuation.

LLOYDS BANK LIMITED
are Custodian Trustees of the underlying securities.

Security First Trust is one of the eight unit trusts managed by Fifteen Moorgate Unit Trusts Ltd. In the trusts of this Group, which is associated with Dawney Day & Co., Ltd., Merchant Bankers, the public has invested over £10,000,000.

For full particulars write for Booklet EC2, the basis of all transactions, to the Managers:

Members of the Unit Trusts Association.

consequences which are likely to follow for individual companies. The broad effects have been discounted, as we show in a preceding note. The precise effects will be unknown for some time to come. We may, however, attempt to show the rough incidence of tax upon a handful of companies, choosing the examples to show stable and recovery profits trends. For new companies, such as Rhokana, which are now making large profits on their capital, the incidence of the tax based on a "capital" standard will obviously be severe, and the full 33½ per cent. rate would presumably apply. For more stable concerns, such as Imperial Tobacco, the growth in profits compared with the base years has not been unduly large. On the basis of the 1936 profits, indeed, the additional tax would probably not exceed 1.3 per cent. on the ordinary capital. But in this instance—as for other companies whose assets consist largely of interests in subsidiaries like "Shell" Transport—the problem of assessing "capital" and "profits" opens up innumerable difficulties. Even in the case of the industrial concern which is largely an operating company, it may be unwise to argue from published capital and profits figures at this stage. To give two examples, however, on a tentative basis, it would seem that Turner and Newall might have to pay an amount equivalent to 8.7 per cent. on the ordinary stock in respect of the current year, assuming that profits increase by 10 per cent., while for Courtaulds the percentage appears to be negligible on the same basis. And for the concerns which have reorganised their capital, such as Dorman Long, Cammell Laird *et hoc genus omne*, and are now within the zone of high profits, even guesswork is dangerous.

"Bondwashing"—The remaining sections of the Budget have been dwarfed by the consternation aroused by the National Defence Contribution. But two further points call for comment. The first is that the Chancellor proposes to abolish "bondwashing"—a term used to describe operations by which the owner of securities sells them at a price which covers accrued dividend, and repurchases them ex dividend. These transactions are technically of a capital nature, but in effect they enable the operator to "strip" the dividend from the security and to deprive the Exchequer of tax upon the coupons. Bondwashing, of course, is not limited to operations in gilt-edged securities alone, for the same technique is open to the operator in ordinary shares sold cum dividend and purchased ex dividend. Since the Chancellor hopes to obtain £1 million from the abolition of the practice in a full year it appears that the gross dividends involved would be of the order of £4 millions, and the value of the securities used for such operations as high as £100 millions. The figure, of course, is a fraction of the outstanding £1,900 millions of War Loan, quite apart from other securities. The procedure for checking the practice, however, has not been divulged, but it may be presumed that the declarations now required by the revenue authorities regarding tax exemptions on coupons will need to be accompanied by a declaration showing the period for which such securities have been held, if the market is to be spared detailed examination of each and every transaction. The Chancellor, it will be noted, thanked the representative bodies in the financial world for their "co-operation" in the proposed measure. In theory, of course, every transaction in dividend-paying securities involves a distinction between capital and revenue, and some element of tax evasion therefore arises. But the danger of interim market fluctuations between the sale of a security cum a large part of the dividend and its repurchase ex dividend some weeks later is obviously a deterrent, whereas the "straddle" by which "bondwashing" is usually effected carries no appreciable risk.

—And Tax Calculations.—Investors will nurse their Budget bruises for many days to come, and they will not find great solace in the one proposal which gives

them some slight incidental relief. A 5s. rate of income tax, while not pleasant in itself, is much simpler to operate for investment calculation than the previous rate of 4s. 9d. in the £. For converting gross dividends or profits to a net basis, and *vice versa*, the rules which now apply are arithmetically simple. Conversion from gross to net, either for dividend or profits, is simply achieved by taking three-quarters of the gross rates; conversely, net dividends and profits may be raised to a gross basis by adding one-third to the net figures.

The War Against Share-Pushing.—The appointment of the Committee on Share-pushing revealed the Government's intention to attempt to stop the flow of money from the pockets of the gullible to those of the glib. This week has brought a useful public warning, in advance of the Committee's conclusions. A leaflet is to be distributed in millions through the medium of savings banks and similar organisations. The readers are told of the formation of Sir Archibald Bodkin's Committee, on whose suggestion the public is now being warned. Some description is given of the usual share-pushing methods, in particular the invitation accompanied often by "Market Reports" to exchange safe for high-yielding securities, and Mr. Justice Finlay's commendation of the waste-paper basket for such documents is reproduced. It is difficult always to distinguish between the true and the false, but this public warning and recent Press publicity should now be protecting at least some of the credulous from folly.

Industrial Profits in March.—Reports published in March reached a record number owing to the spate of accounts issued in advance of Easter. They show that the percentage increase in the profit has recovered to 12½ per cent., compared with an improvement of 17.39 for the March companies last year, which were fewer in number. The record of recent months is shown below:—

Reports published in	No. of Companies	Rise in Profits*	Reports published in	No. of Companies	Rise in Profits*
1935—			1936—		
November ..	160	17.47	July.....	228	15.69
December ...	159	12.27	August	47	14.21
			September ...	107	12.32
1936—			October	146	18.09
January.....	128	13.66	November ...	177	13.49
February ..	205	9.00	December ...	175	15.49
March	236	17.39	1937—		
April	254	9.66	January	110	15.92
May.....	269	9.41	February	208	8.95
June	214	13.50	March.....	307	12.52

* After payment of debenture interest.

The total net profits covered by the March reports amounted to £53,554,168, compared with £47,594,666 for the preceding year. To this £6,000,000 increase iron, steel and coal companies contributed about £1,600,000, and land and investment companies (including the United Africa Company and the Niger Company) just over £1,000,000. Other large profit increases were made by electric lighting and equipment companies.

Company Notes

Imperial Chemical Industries Progress.—The full report of I.C.I. is an impressive document. It begins with a cheerful reference to the growth in sales of practically every product, which in some cases established new records. This forms the basis of an advance in profits to a new record of £9,049,422, which was analysed in detail on page 26 of *The Economist* of April 3rd. Re-armament has made its contribution to increased activity, and the improvement in the export markets receives due welcome. The broad base of the group's progress can only adequately be estimated from the detailed report itself, for there is hardly an industry which does not draw, to some extent, on the products

of the I.C.I. undertaking. Alkali, dyestuffs, explosives, fertilisers, general chemicals, building materials, metal products, paints and plastics—this is an impressive range of products which shares in the general recovery in industry at almost every point. On the financial side, the main change of the year was the confirmation, by the House of Lords, of the capital reorganisation scheme last November. The issued capital, therefore, now amounts to £71,927,679, of which £49,198,900 is in ordinary stock and the balance in 7 per cent. cumulative preference stock.

The potentialities of the group for further expansion are backed by an impressive balance sheet. Net current assets are of the order of £12,050,000. The reserve position reveals £4,160,000 for capital reserve, £7,000,000 general reserve and £3,365,000 outstanding on the Central Obsolescence reserve. There is, in addition, £665,142 carried forward. Even for a company whose balance sheet total exceeds £95 millions, these are impressive figures. And a further measure of financial conservatism is to be found in the writing-down of interests in subsidiary companies by no less than £6,934,141, in which the capital reserve of £5,434,141 arising from the reduction of the deferred capital is included. It is customary, and not unreasonable, to regard I.C.I. ordinary as a security with long-term possibilities rather than imminent dividend attractions. Its progress is apportioned between three beneficiaries—the customers, the workpeople and the shareholders. The ultimate potentialities of the group may therefore appear gradually, but so many of the component sections serve expanding industries that they may well be impressive, if political and economic conditions permit. The ordinary stock units stand at 38s. 10½d., to yield £4 2s. 3d. per cent.

Unilever Group Progress.—The favourable dividends declared by Unilever and Unilever N.V. as we went to press last week have been followed by impressive reports. The consolidated profits of Unilever, Ltd., have increased from £2,432,156 to £3,463,038—a matter of 42 per cent. The consolidated profits of Unilever N.V. have increased by the considerably smaller proportion of 14 per cent. from Fl. 13,568,879 to Fl. 15,459,791. These profits include, in each case, the proportion of profits less losses of all companies in the organisation, after providing for outside interests. The distribution of the profits between the internal reserves of subsidiaries and the shareholders and reserves of the parent companies are shown below:—

(Years to Dec. 31)	Unilever, Ltd.		Unilever, N.V.	
	1935	1936	1935	1936
Consolidated net profit	£ 2,432,156	£ 3,463,038	Fl. 13,568,879	Fl. 15,459,791
Retained by subsid. & assoc. cos.	960,192	1,313,540	918,326	1,225,909
Balance	1,471,964	2,149,498	12,650,553	14,233,882
Preferred dividends	232,067	377,988	2,205,735	2,035,000
Ordinary—				
Earned	1,239,897	1,771,510	10,445,118	12,198,882
Paid	754,584	890,042	6,810,540	9,364,493
Earned (%)	10.9	15.6	6.1	7.2
Paid (%)	6½*	7½*	4	5½
General and contingent reserves	417,547	600,000	3,309,437	2,500,000
Carry forward§	367,363	714,727	4,127,761	4,462,150

* At exchange of Fl. 7.20 in 1935, and Fl. 9 in 1936. § Before adjustment for exchange on ordinary dividends.

The group—and in particular the British section of it—has vindicated its inclusion in a commodity recovery category. Two points stand out, however, in the distribution. The amounts set aside to reserves are markedly conservative in the first place—some £2½ millions for Unilever and Fl. 4 millions for Unilever N.V. Secondly, the British company, under the dividend arrangement, is compelled to adopt the leaner distribution policy. The devaluation of the gold *bloc*, which has enabled the Unilever group to reduce the covering costs charged in earlier years, and to increase the reserves against restricted currencies, has worked to the disadvantage of

Unilever, Ltd. But the devaluations were a contributory factor to the rise in commodity prices, from which the West African and plantation interests (mainly the concern of Unilever, Ltd.) are deriving full benefit. The rising tendency of prices cannot be escaped by some of the manufacturing interests, but it is probable that its effect on the group as a whole will continue favourable. Additional interest is lent to the forthcoming speech of the chairman of Unilever, Ltd., since it will disclose the details of a scheme (if it has proved practicable) for simplifying the interests of the group. A certain amount of detailed information regarding the group is given in the report—it includes, for example, the usual statement of working capital, showing that the group's combined net current assets at £41,053,000 consist largely of stocks—but simplification, if it can be achieved, will be even more serviceable to the investor.

Cable and Wireless Reconstruction.—The full scheme of reconstruction which the directors of Cable and Wireless (Holding) have issued this week puts the market's recent guessing at rest in two important particulars. It confirms, of course, the outline of the scheme, on which we commented on page 94 of *The Economist* of April 10th. But it also adds an estimate of the group's earnings for 1936, and suggests, subject to suitable reservations, the possibility of a 4 per cent. dividend on the new ordinary stock, if the scheme is passed. On the basis of the estimated earnings given in the statement—the group's profits are put at £1,080,000 gross—our earlier estimates appear to be somewhat optimistic. The amount earned for the existing ordinary stock, assuming normal preference dividend, was approximately three-quarters of 1 per cent. last year, and on the reconstructed capital (after allowance for interest and sinking fund on the new income stock) this level of profits would be equivalent to about 1½ per cent.

On the directors' suggestion that a 4 per cent. dividend may be paid on the new ordinary stock for 1937, however, investors may spare themselves any further guesswork about earnings. Last year's results are hardly good enough to encourage the "B" ordinary stockholders to ask for more under the scheme. It may reasonably be inferred, however, that the board would not have suggested the possibility of 4 per cent. dividend unless they felt reasonably assured that earnings were likely to cover it with a satisfactory margin. The rise in the March traffic index to 90.6 (compared with 76.0 for March last year) brings the average for the first quarter up to 87.0, compared with 73.5 a year ago, and the earnings outlook, therefore, seems propitious. In assessing the three stocks, allowance must be made for the inclusion of £7 6s. 9d. of the new 4 per cent. income stock in the price of the preference stock (assuming that

The Distinctive System

of

The Scottish Provident Institution

Under *The Distinctive System* the premiums are so moderate that, at early and middle ages, the annual sum charged elsewhere for a Whole Life Assurance of £1,000, with profits, will here secure from the first as much as £1,300 or thereby with right to share in the Surplus.

Write for an explanatory booklet

The Scottish Provident Institution

London (City) Office 3 Lombard Street, E.C.3
HEAD OFFICE 6 St. Andrew Square, EDINBURGH
FUNDS EXCEED £24,000,000

the scheme is approved). If the new income stock is taken at par, the net price of the preference at 109½ ex dividend would be 101½, and the yield as high as 5½ per cent., with prospects of improving cover. The market has now adjusted the "A" and "B" ordinary quotations to a broadly comparable basis, although the "A" ordinary is still fractionally cheaper. On the terms of the exchange, the present "A" stock quotation is equivalent to 91 for the new ordinary, which offer the prospects of a 4.4 per cent. yield and a recovery equity, provided that the directors' present suggestions are fulfilled.

* * *

Cunard Group Results.—The improvement in the North Atlantic passenger traffic and the inaugural services of the "Queen Mary" have provided more cheerful operating results for Cunard White Star for 1936. Total income, at £6,881,319, is 15 per cent. higher than for 1935, and a working profit of £588,422 has been earned against a small operating loss in 1935. We show the recent course of receipts and profits below:—

	1934†	1935	1936
Total income	£ 3,306,756	£ 5,956,929	£ 6,881,319
Net profit	Dr. 408,090	Dr. 61,769	£ 546,659

† Period June 20th–December 31st

Net earnings have thus been sufficient to wipe out the deficits of the previous 18 months, and to provide £76,800 to be carried forward. Again, however, no fleet depreciation is provided. The directors point out that the ultimate urgency of replacing certain express tonnage has led them to build the "No. 552." In addition, Cammell Laird are now building an intermediate passenger and cargo vessel of 32,000 tons for delivery in 1939. The accounts do not disclose the expenditure on the sister ship to the "Queen Mary," but steamship assets at £18,717,400 have increased by more than £600,000, and include payments on account of the new ship, which was ordered last October. The balance sheet discloses no debenture issues to secure advances for the vessel, since the agreement with the Treasury was signed only last February. The Government hold the existing £2,950,000 debenture stocks outstanding, and though there are advances of £550,000 still to come in respect of the "Queen Mary," the company spent £250,000 over and above the loans authorised.

* * *

Cunard White Star reported little change in the carriage of freight, but the recent improvement in the freight markets is of considerable importance to Cunard Steam Ship through its interests in Commonwealth and Dominion and in Thomas and Jno. Brocklebank. The upward tendency in rates began fairly late in 1936, but the absence of any effect in the latest accounts is somewhat disappointing. Total income amounted to £361,719, showing a decline of some £16,500, which, however, is largely offset by reduced expenses. The net profit of £22,740 is therefore slightly lower. The report offers no comment on the outlook for 1937, which, however, can hardly fail to be brighter. With preference dividends in arrear since 1931, and an asset of uncertain value consisting of 62 per cent. of the share capital of Cunard White Star, the Cunard Steam Ship position is still uncertain. The time for a reconstruction may be approaching, however, if shipping recovery continues, but the first preference stock at 77½ and the ordinary shares at 7s. 1½d., are speculative.

* * *

Henley's Telegraph Progress.—The expectation of life of a business has rarely been estimated, but no actuarial calculation is needed to prove that it is unusual for a firm to enter, as Henley's Telegraph now enters, its 101st year with a vigour which would be creditable at any age. The latest trading profits of the company have increased more than 25 per cent., allowing for the change in the accounting period. They are, moreover,

the highest for ten years by a considerable margin. The occasion of the company's centenary was marked last November by 100 per cent. share bonus, which was afforded very comfortably, without special centenary effort, from reserves. The following table shows the trend of profits in the last three financial periods, though comparison is affected by the change in the accounting year and by the bonus issue:—

	Year 1934-35	9 Months 1935	Year 1936
Trading profit	246,448	237,576	402,491
Depreciation	56,375	44,042	61,170
Fees, interest, etc.	14,095	14,362	33,098
Preference dividend	9,000	9,000†	9,000
Ordinary shares			
Earned	166,978	170,172	299,223
Paid	195,000	146,250	243,750
Earned %	25.7	29.2	28.4
Paid %	30	22½	22½

Reserve 18,564** 492,936 120,000**
Carry forward* 459,867 492,936 428,408

* After transfers to and from reserves. † For year. § Includes special staff bonus. || Ordinary capital doubled by bonus issue ranking for final dividend. ** Including trustee security depreciation.

Depreciation has been provided at about the same level as before, but expenses are somewhat changed, owing to the redemption of debentures in 1935 and the payment of the staff bonus in 1936. Although the rate of dividend at 22½ per cent. is the same as for the previous period, the final of 15 per cent. was paid on the doubled capital. Steps have been taken to build up the reserve again by allocating £100,000, while the past practice of adjusting the book values of trustee securities is followed by setting aside £20,000 for depreciation arising since the end of the year. While cost factors affect the outlook for cable companies to some extent, there is still scope for expansion of electrical services. The present balance-sheet, in fact, shows all the usual signs of increasing activity. At the current price of 18s. 9d., the ordinary shares yield 6½ per cent., assuming the maintenance of the 22½ per cent. dividend.

* * *

"Sofina" Survey.—The "Sofina" shareholder is well served by the annual reports which give, in addition to the parent company's accounts, a short report upon each of the principal subsidiaries. Under present international conditions, a widely-spread undertaking of this kind has its own problems, among which the report cites the difficulty of transferring funds, uncertainty regarding events in Spain, burdens placed on electricity companies in some countries, and the unencouraging attitude towards privately-managed utility companies in others. The directors, however, are largely reassured by the steady growth in output—Argentina, in particular, being mentioned—and the 1936 accounts show reasonably satisfactory earnings and a very satisfactory assets position. Net profits are lower by Fr. 7 millions, the total income of Fr. 115 millions comparing with Fr. 123 millions, but no change is made in the Fr. 440 per share dividend. The cash position is remarkable; the figure of Fr. 953 millions is Fr. 83 millions above 1935, and amounts to no less than 41 per cent. of the total assets. The report, however, will interest a far wider public than its own shareholders. It includes a wealth of statistical information, and a reasoned discussion upon the need for legal stability if economic progress is to be won. The investor with international interests will agree, regretfully, that "the economic value of property and other rights exists only in proportion to the protection granted them by the law." It is a heavy burden and harmful to initiative if, in addition to essential trade risks, there is a superimposed risk of confiscation by some new law, or the risk of breach of contract. Monetary instability, and a growing tendency to consider that unforeseen events excuse the non-fulfilment of contracts, have certainly not made things easier for those who have to look ahead.

Recovery in Shipping.—The sharp recovery shown by recent shipping results is the more significant since freights did not gather momentum till the last quarter of 1936, and did not exceed pre-war levels until December. The accompanying table shows that ordinary shareholders have at last been rewarded, after long years of waiting, by measurable earnings. It has been possible, moreover, to make increased provision for depreciation. *Court Line*, for instance, have provided £35,000, the first allocation since 1929, and have also paid off debenture interest arrears. Even after depreciation, some 16 per cent. has been earned for the equity, assuming one year's debenture interest. *King Line* have also made good depreciation arrears, by setting aside £73,000—twice the previous

Company (and denomination.)	Total Profit		Earned for Ord.		1936 Div.	Current Price	Yield on Earnings
	1935	1936	1935	1936			
Cairn Line (10s.)	£ 6,171	£ 22,587	Nil	2.0	Nil	9½	2.2
Court Line (6/8)	98,837	134,705	Nil	3.5	Nil	20/10½	1.1

Lampart and Holt (6/8)	41,208	62,547	0.5	2.1	Nil	12/10½	1.1
Royal Mail Lines (£1)	936,414	1,031,246	6.2	10.0	4†	28/4†	7.0†

* Includes subsidy. † Tax free. ‡ Yield on dividend, 3.4 per cent. § No quotation

sum. A similar step has been taken by *Lampart and Holt*, who have allocated £30,000 in their last accounts, against £15,000. This company benefited by the sharp rise in South American freights towards the end of 1936. The recovery shown by *Cairn Line* is very satisfactory, especially since the improvement in North Atlantic freight has lagged behind other routes. Among other companies, *Royal Mail Lines* paid 4½ per cent. dividend for 1936, and the profits recovery is satisfactory in view of the adverse factors which Lord Essendon outlined in March. As we go to press, the *Union Castle* results are issued, showing a profit on voyages of £473,450, against £351,119. The directors have taken special measures regarding depreciation, and hope to deal with the arrears on the 6 per cent. preference shares out of this year's profits.

* * *

Rio Tinto.—The directors describe the past year (so far as Spain is concerned) as one of "political turmoil, strikes, increased expenses." Temporary suspension of operations was followed by the imposition of various decrees by General Franco, including the requisitioning of copper and pyrites against ultimate peseta payments. Although the position has since eased slightly, the strain on the company's sterling resources continues. Last year the average price of copper was above that of 1935, which in turn showed recovery from the 1934 level; but the quantity of ore shipped declined from 1,243,920 tons in 1935 to 1,061,180 tons. Sundry income, however, amounted to £108,260, against £91,070 for 1935, thanks to the receipt of larger dividends upon the company's Rhodesian interests; but by special appropriations for pensions, etc., were swollen by £56,700 extra payments to workmen. The preference dividend, by absorbing more than the year's actual net earnings, therefore entailed a draft upon the carry-forward. No ordinary dividend has been paid since 1930. The results of the past four years are summarised below:—

	1933	1934	1935	1936
Trading profit	501,600	453,550	527,980	445,560
Net profit	103,540	55,110	174,280	63,270
Dividends (pref.)	81,250	81,250	81,250	81,250
Carried forward	402,860	376,720	469,750	451,770
Property and plant	3,255,540	3,305,950	3,296,250	3,286,870
Investments	3,168,000	2,918,920	2,784,220	2,894,200

In connection with the Rhodesian interests (holdings in such companies representing 87 per cent. of the book value of quoted investments), the directors mention that not less than 425,000 shares are being taken up in

the recently formed N'Changa Consolidated Copper Mines. Tharsis, which also operates in Spain, last year made a profit of £36,000, against £76,420; but no dividend was declared.

* * *

Other Company Results.—Our usual analysis of profit and loss accounts on page 244 comprises about 70 companies, though there are few results of outstanding importance apart from those already discussed. The results are discussed on page 228, under the heading "Shorter Company Comments."

* * *

Company Meetings of the Week.—On later pages of this issue will be found the reports of the following company meetings:—Société Financière de Transports et D'Entreprises Industrielles (Sofina), Bank of Athens, Amalgamated Metal, Southern Areas Electric Corporation, Agricultural Mortgage Corporation, Alliance Trust, Legal and General Assurance, Royal Exchange Assurance, World Auxiliary Insurance, Camp Bird, Lanadron Rubber Estates, and Ledbury Rubber Estates. A discussion of the Sofina report appears in a Note on page 222. The directors' report of the Bank of Athens, presented at the meeting on April 3rd, referred to the increased purchasing power of the farming community. Viscount Elibank pointed out to Southern Areas Electric Corporation proprietors that the increase in the number of units sold was 18.3 per cent., against an average for the country of about 15 per cent. At the Agricultural Mortgage Corporation meeting, Sir Harry Goschen referred to the difficult farming conditions caused in 1936 by the weather, lower yields helping to offset the rising prices for agricultural produce. Mr David Pirie, addressing Alliance Trust stockholders, examined the justification for looking upon the present time as comparable with the year 1929. He believed on the whole that present business and stock market activity was healthier. The chief points of contrast were, at the present time, cheap money, lower interest rates in the U.S.A. than here, stronger financial resources, and a better quality of new issues. At the Royal Exchange Assurance meeting, the sub-governor drew attention to the very good results in the accident department. The chairman told shareholders at the World Auxiliary Insurance Corporation meeting that in the fire department premium income showed an increase despite the currency devaluation on certain foreign premiums. Mr Eric Macfadyen, at the Lanadron Rubber meeting, pointed out that after allowing for a windfall in 1935, the net profit on the working of the estates had in fact trebled in 1936. At the Ledbury Rubber Estates meeting, he declared that they could look for a continued rise in the average price of rubber. Mr F. W. Baker, addressing Camp Bird shareholders, discussed the flotation of the Lake George Mining Corporation. The profit on the Lake George mine had been estimated at £400,000, but, of course, at current prices the profit would exceed that figure. Mr C. V. Sale's address to the Amalgamated Metal meeting discussed the outlook for the consumption of base metals in 1937. Among the points mentioned by Mr Ernest E. Bird at the Legal and General meeting, the total life business in force at the end of 1936 was disclosed at £118,214,087.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: MAY 4

ACCOUNT: MAY 6

MR CHAMBERLAIN'S surprise has given many sections of the market a shock from which they have not yet recovered, and sentiment appears likely to continue unsettled until the implications of the new tax on growth of profits are much clearer. For the present, the general tendency is for gilt-edged to rise in company with foreign bonds, and for industrials to fall in an irregular fashion in accordance with the roughly estimated incidence of the new tax. Conditions were also determined by the heavy settlement for an account which saw large falls in Kafir prices.

Gilt-edged got off easily with only 3d. on the income tax, and prices gained substantially, continuing a trend which set in late last week. Indian stocks moved in sympathy, but Dominion issues, under the lead of New Zealand issues, were dull. Foreign bonds were supported on their immunity from the new taxation, and on Germany's willingness to attend a Peace Conference. German issues lead among Europeans, Japanese among Far Eastern and Brazilians among South American issues.

Home rails were supported before the Budget, and continued in favour because the profits-growth tax will leave them unaffected. The week's traffic results, again, were very encouraging. Transport "C" stock fell further in fear of increased petrol taxation, but subsequently recovered slightly. Argentine rails were firm at one time, but became dull later.

The industrial markets took the whole shock of the N.D.C. proposals. Dealers were dismayed in the "Street" on Tuesday evening, and when they assembled on Wednesday they made purely defensive quotations for some time. The chief falls (which are shown in our table of Active Security prices on pages 226 and 227) occurred in the high-gear recovery industries, and the smallest in the stable profit-earning groups. The shipping and armament and steel groups were thus the principal sufferers, and while the volume of public selling was not substantial, the artificial conditions were responsible for abnormally wide quotations.

In the steel group, John Brown and Dorman Long (with a fall of 5s.) and Whitehead Iron were particularly weak features. The re-armament group—Vickers, Hadfields and Cammell Laird—also registered considerable falls.

Electrical equipment issues were affected by the new tax proposal, with Crompton Parkinson the outstanding victim (owing to its expanding profits record) with a fall of 5s. 6d. to 64s. The cable companies showed losses of 2s. 6d. in most cases, but the supply companies were little affected, owing to their comparatively stable profits. Aircraft shares were marked down on the same scale as the re-armament issues, Bristol being among the weaker features with a 4s. fall, while Handley Page were 5s. lower. In the motor section, Standard, which has also made rapid progress during recent years, was regarded as particularly vulnerable, and the shares fell by nearly 10s. to 145s.

The sections which resisted the general decline were almost confined to brewery and tobacco issues. Imperial Tobacco, indeed, finished unchanged on Wednesday, while the brewery section, relieved at the absence of any new impost on beer, made several positive improvements. Distillers, however, were rather severely affected, with a fall of 3s.

Among textile shares, losses were general, Courtaulds in particular being a weak market at first, but recovering sufficiently in later dealings to close only 1s. lower. The fixed price stores group—Woolworth, Marks and Spencer, and British Home Stores—was severely affected. Shipping shares were among the worst victims, and Clan Lines, which lost 17s. 6d. at 9½, showed one of the largest falls in the market. Other falls were more moderate, but the two Realisation issues fell by more than 2s. 6d.

Weak features in the general industrial markets included Turner and Newall, British Oxygen and Murex—all between 3s. 9d. and 5s. lower. By contrast, Imperial Chemical Industries were only a few pence lower. The building issues, and particularly Associated Portland Cement, were heavily marked down, and among the engineering companies, J. Brockhouse registered a fall of 4s. 3d. to 63s. 9d.

In the oil share market Mexican Eagles opened firm, but dull conditions prevailed later. The absence of any increase in petrol taxation was completely offset by the new profits tax and even the Eagle issues were marked down. The Rubber share market turned very weak after the Budget, on the expectation that rubber company shares would be among the most heavily hit of all shares, but later in the week there was an improvement on the higher commodity price. Similar conditions developed in the tea share market, but on a much smaller scale since tea earnings have made no spectacular recovery from the base years.

The Kafir market opened the week well, but became duller later on a pre-budget gold scare, coincident with the weak technical position. Fairly large selling was again reported from the Cape. The budget proposals encouraged the Kafir market, however, since the companies are registered outside England. West Africans were depressed, and Rhodesian Copper issues even more so. There were signs of a slight improvement later. Tin shares fell severely on the new tax, but became a little firmer subsequently.

NEW YORK STOCK EXCHANGE

PRICES have risen steadily but quietly on Wall Street. Early this week railroad issues improved on the I.C.C. decision to increase miscellaneous freight rates. The President's message on Tuesday disclosed no unexpected relief expenditure and proposed no new taxes, both of which were to the liking of the market. On the message most prices went ahead, with the outstanding exception of the copper group which declined in sympathy with the commodity price. In mid-week steel shares were in the lead, with steel mill activity for the week estimated by *Iron Age* at a new high level of 92 per cent. of capacity against 91 per cent. for last week. The markets welcomed Carnegie-Illinois Steel's decision not to raise prices for the third quarter. In the bond market there was evidence of some firmness early in the week, but government bonds are not able to find their feet as yet. They showed signs of improvement on the President's message but turned irregular later. Business reports continue to be excellent.

GOLDEN MOMENTS

The Cup Final

Just on time he takes the ball in his stride and slams it into the net—the winning goal. What a Golden Moment for him as he receives the coveted Cup. But even he cannot buy a better tobacco than "Cut Golden Bar" at a shilling an ounce. But it must be Wills's.

2 oz. Vacuum Tin

WILLS'S

CUT GOLDEN BAR

READY RUBBED
In 2 oz. Pocket Vacuum Tins and 1 oz. Airtight Tins
FLAKE FORM
In 2 oz. Vacuum Tins and 1 oz. Packets

1/2 AN OUNCE

Investment For Appreciation

by L. L. B. ANGAS

Author of *Coming Rise in Gold Shares* (Feb. 1931); *Coming English Boom* (Sept. 1931); *Coming Rise in Wall Street* (Apr. 1933); *Coming American Boom* (Aug. 1934), etc., etc.

A method of forecasting and exploiting industrial cycles. Do not wait for a crisis to read this best seller. Descriptive folder available from Macmillan & Co., Ltd., St. Martin's St., London. Price 1/6 net

Issued by the Imperial Tobacco Co. (of Great Britain and Ireland), Ltd.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields on fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

BY STOCK EXCHANGE INTRODUCTION

Arusha Plantations, Ltd.—Issue of 550,000 2s. ordinary shares at 2s. 3d.; and £55,000 6 per cent. convertible first mortgage debenture stock at 102½, redeemable at 105, 1951, or from 1941 on notice. Holder can convert into ordinary stock from 1938 at rate of £10 stock for 65 shares. Acquires the sisal and coffee Themli Estate and Farm No. 67/1 in Tanganyika. Total purchase consideration £106,500, payable by £96,500 cash £5,000 debenture stock and 50,000 shares. Estimated production 1937: sisal, 1,000 tons; coffee, 200 tons. Estimates of profits given.

BONUS ISSUES

Tilling and British Automobile Traction.—It is proposed to capitalise part of reserves by issuing bonus shares in the proportion of one new for five ordinary shares held.

ISSUES TO SHAREHOLDERS ONLY

Anglo Johore Rubber.—Issue of £45,000 6 per cent. convertible debenture stock at 105 and £45,000 in 1s. shares at par.

Anti-Attrition Metal.—Issue of 200,000 new 2s. shares at 3s. to shareholders on April 23rd.

Barrow Barnsley Main Collieries.—Issue of 250,000 5½ per cent. cumulative first £1 preference shares at par.

Blount and Company.—Issue of 750,000 1s. ordinary shares at par.

The British Northrop Loom Company, Ltd.—Issue of 100,000 10s. ordinary shares each at 12s., to shareholders on April 9th, in proportion of one new for five held.

Central London Property Trust.—Issue at par of 80,000 1s. ordinary shares, 120,000 6 per cent. 10s. preference shares, and £100,000 5 per cent. debentures.

Durban Roodepoort Deep.—Issue of 250,000 10s. shares at 55s. in proportion of one new for eight held on June 30th.

Gopeng (Perak) Rubber.—Issue of 396,000 2s. shares at 2s. 4½d., in proportion of one for every five held on April 14th. Required or acquisition of 486 acres and a further 350 acres.

Imperial Cold Storage and Supply.—Issue of 54,666 £1 ordinary shares at par to Anglo-American Corporation of South Africa, Ltd.

Kelvin Investment Trust, Ltd.—Issue of 117,200 £1 ordinary shares at 20s. 9d.

Lawas (Sarawak) Estates.—Issue of 127,492 £1 ordinary shares at 21s. in proportion of four for every five held. Required to purchase another property and for development.

R. A. Lister and Company, Ltd.—Issue of 150,000 £1 ordinary shares at 62s. (to finance factory extension and expanding turnover).

London Labourers' Dwellings.—Issue of 55,000 £1 shares at 23s. to shareholders on April 13th, on basis of five new shares for twenty held.

Nanwa Gold Mines.—Issue of 988,431 1s. ordinary shares at par to shareholders on April 13th on basis of one new for five held.

Rhodesia Broken Hill.—Issue of 1,476,118 new 5s. shares at par.

Scottish Eastern Investment Trust.—Issue of 40,000 deferred £1 shares and 60,000 4½ per cent. cumulative £1 preferred shares both at 21s., to holders on April 5th, on basis of one deferred share per £7 deferred stock and three preferred shares for every £14 deferred stock.

Triumph Company.—Issue of 2,000,000 2s. ordinary shares at par in proportion of two new shares for every share held.

United City Property Trust.—Issue of 100,000 5½ per cent. cumulative £1 preference shares at 21s. 6d. and 100,000 £1 ordinary shares at 23s. 6d.

SHORTER COMPANY COMMENTS

COMPANY RESULTS OF THE WEEK.—An exception to a general improvement in land companies is shown by ARGENTINE ESTATES OF BOVRIL, whose profits of £18,063 are £9,000 lower, owing to poor crops. A further large number of rubber company reports indicate the trend of sharp increases that by now has become typical. GRAND CENTRAL (CEYLON), for instance, record trebled earnings, other important results being CHANGKAT SALAK, CEYLON (PARA), ROSEHAUGH (CEYLON) RUBBER, and REMFIELD. The past week has also produced the first large batch of tea company reports; they make a mixed showing, though the largest plantations, those of CEYLON TEA, and NUWARA ELIYA, with profits of £58,444 and £69,245 respectively, have made satisfactory progress. Four of the seven companies have undergone a setback, but ROSEHAUGH (CEYLON) TEA, with earnings of £10,898 have actually trebled their profits. Four of the five stores publishing their accounts recently show very good improvement. The ARMY AND NAVY STORES profits of £189,903 are £41,000 higher, CHARLES BAKER AND COMPANY have converted an £8,818 loss into a £5,744 profit, CIVIL SERVICE SUPPLY earnings are some 25 per cent. higher, while LILLEY AND SKINNER, though earning £17,000 more with £67,075, are placing the full increase to general reserve. Among motor and aircraft companies, the market was a little disappointed with the BOUTON PAUL AIRCRAFT report, though a loss of £8,935 has been converted into a profit. SCAMMELL LORRIES have earned £10,923 against a loss of £5,890, while ALBION MOTORS are raising their dividend from 10 per cent. to 15 per cent. Household goods are well represented among the week's results: the BRYANT AND MAY earnings of £636,700 are a trifle higher, CEREBOS have earned £406,567, against £353,723 for 13 months, while improvement is shown also by J. & J. COLMAN and by RECKITT AND SONS, the latter's profits of £1,020,010 comparing with £1,015,653. PHILCO RADIO have presented their first accounts, earning £82,416 for a period of about 29 weeks, and paying a dividend of 25 per cent. actual. WARNERS RADIO AND ELECTRIC report total profits of £44,510 for the half-year to March last, against £37,177 for the previous full year.

APPOINTMENTS AND PERSONAL

Mr Charles Adams and Mr George A. Woodruff have been appointed directors of Anti-Attrition Metal Company, Ltd.

Tate and Lyle announces that Mr Ian Archibald de Hoghton Lyle has been elected a director.

Mr Robert Lawrence Angus, of Ladykirk, Monkton, Ayrshire, has joined the board of the Clydesdale Bank.

Mr Edmund Godward, the London manager of the Bank of Australasia, retired on April 10th. To fill the vacancy the directors have appointed Mr George Cloughton Cowan, manager, and Mr James Nevin Desmond Paine, secretary.

Raphael Tuck & Sons, Ltd., announce that Sir Edgar Waterlow, Bt., Mr V. E. Goodman, and Mr A. E. Owen Jones, will become directors. Sir Edgar Waterlow has consented to be chairman of the Board. Mr Gustave Tuck and Mr Desmond Tuck will be appointed joint managing directors.

Sir Harold Bellman, M.B.E., J.P., managing director of the Abbey Road Building Society, has been unanimously elected chairman of the Board of management in succession to the late Mr J. Broughton Knight, C.B.E., and Mr Alexander C. Hutchins, F.C.A., has been appointed deputy-chairman.

Mr J. O. Murgatroyd has joined the board of Singer Motors, Ltd.

The registered office of the Trinidad Consolidated Oilfields, Ltd., is now at 4 Cleveland Square, St. James's, S.W. Telephone number: Whitehall 1773.

Mr T. Walton, F.C.A., has resigned from the board of Barrow, Hepburn & Gale, Ltd., and Mr G. W. Odey has been appointed chairman in his place. Mr W. R. Box has joined the Board.

Mr T. A. W. Allen, a director of London Industrial Finance Trust, Ltd., has joined the board of D. M. Gilbert and Company, Ltd.

Colonel S. E. Monkhouse, M.I.E.E., general manager, has been elected a director of North-Eastern Electric Supply Company, Ltd.

GOVERNMENT &c.

ARGENTINE GOVERNMENT.—United Kingdom holders of External S.F. (U.S.) Gold Bonds, 1960, and 1961 (issued 1926 and 1927) may convert into Argentine Republic S.F. External Conversion 4 per cent. (U.S.) Bonds of which \$35,000,000 is being issued in the U.S.A. Basis of \$1,000 4 per cent. Bonds plus \$132 cash for each \$1,000 6 per cent. Bonds surrendered with coupons. New bonds issued at 89½, redeemable at par by half-yearly drawings, on any interest date on notice, or due 1972.

SOCIÉTÉ FINANCIÈRE DE TRANSPORTS ET D'ENTREPRISES INDUSTRIELLES (SOFINA)

DIRECTORS' REPORT TO THE SHAREHOLDERS FOR PRESENTATION TO THE ORDINARY GENERAL MEETING OF APRIL 22, 1937 (ABRIDGED)

Copies of the complete translation of the Report and Balance Sheet can be obtained from:—

The Electric & Railway Finance Corp., Ltd.,

10 Mayfair Place, London, W.1,

and

The Midland Bank Limited, Poultry, London, E.C.2.

The annual report which Sofina's board of directors present this year to the shareholders considers in its preamble the economic consequences of arbitrary or excessive legislations and disregard for contractual rights. The argument runs as follows:—

Business recovery is impeded by lack of confidence, which springs from two sources—the menace of war and the insecurity of individual rights. Every provision against risks burdens the cost of production, and when risks are such as to raise prices to a level at which there would be no buyers, the output of goods is arrested. Civilisation tends to reduce the risks that humanity cannot escape, but to some extent risks remain unavoidable. It is the economic function of the entrepreneur to assume these risks, and it is to the general interest that experiments in which the chances of profit are greater than the danger of loss shall be attempted; the community benefits from the balance of successful ventures. Coming on top of the risks inherent in every enterprise, insecurity of rights involves additional danger, and it can thus deter private initiative.

Legal stability and the respect of contracts are factors of security. No doubt the law cannot be immutable, and it may become necessary to restrict the liberty of contracting and to moderate agreed obligations. Yet there are principles of law that may not be overridden. If the law-maker disregards this principle the law becomes a factor of economic disturbance, and if he is not firmly resolved to confine his intervention to a clearly delimited field, the proliferation of enactments invades every phase in the life of the nation. Thus, again, private initiative is stifled.

These observations, which are set out in length in the first three chapters of the preamble, lead up to the following conclusions:—

"THE CHOICE BETWEEN RIGHTS OR COMPULSION"

"The economic value of property and other rights exists only in proportion to the protection granted them by the law. The legislator has the power—this is a question of fact—to modify the value of a given right, either by burdening it with obligations or by restricting its use. The restriction is often indirect: an undertaking may find itself unable to supply at a profit as a result of favours granted to competitors.

"Wealth is thus created and destroyed by the law; and, in accordance with the rule whereby the community suffers more harm from individual losses than it benefits from corresponding gains, the aggregate wealth is usually diminished when Peter is robbed to enrich Paul.

"No doubt some laws bring better order into the affairs of the nation and help to support or co-ordinate fruitful activities. But, apart from such adjustments and rearrangements, legislative instability throws the economic machine out of gear; it destroys wealth or prevents its formation.

"Alteration of the law has always created a risk that the capitalist and the entrepreneur have had to take into account. But in days gone by the changes were few and far between; even in countries where political practices were somewhat uncertain, this risk was considered almost negligible. But how many countries are there to-day in which investors and producers are not obliged to ask themselves what new law may shortly make an inroad into their incomes?

"Amplifying the effect of actual risk, uncertainty forces up interest rates, prices and rents, or even creates a preference for hoarding rather than investment, inaction rather than enterprise. The moment business is regarded as a gamble it becomes the preserve of inexperienced and unscrupulous men; the *chevalier d'industrie* takes the place of the captain of industry, and the workers are not the last to suffer from this change in command. The responsible entrepreneur will no longer risk his assets, still less those entrusted to his care, except against a Government guarantee—and even then the Government's signature must inspire sufficient confidence. But guarantees of this sort are not only a danger to the public finances; they undermine the ingenuity and tenacity shown by private initiative when it can expect to reap only according to what it has sown.

"Doubtless, by resorting to inflation, as also indeed by discouraging enterprise, any Government has the power to create an abundance of funds on the home market; it may even be able to borrow cheaply, since the small investor is like the bee, quick to forget that the hive has been raided and ever willing to go on gathering honey. But no wonder there is a shortage of houses and apartments when building to let becomes a highly speculative proposition; no wonder that industry should cease to extend its plant when its output is liable to be burdened with unexpected costs, and inadequate maximum prices may be fixed for its products.

"Uncertainty as to the future purchasing power of a currency is a well-known obstacle to long-term lending; it causes investors who would otherwise be content with a moderate return to refuse their aid to undertakings that require fixed capital at a low rate of interest. Uncertainty as to the future value of currencies in relation to one another is one of the main causes of the decline in international trade and the slowness of its revival. By an irony of fate, the very confidence inspired by a few currencies to-day is a source of commercial and financial disequilibrium, because the countries in which foreign capital seeks refuge will take measures to protect themselves against inopportune inflation, while the others, in vain attempts to stop the flight of capital, will place further restrictions on imports of goods and transfers of money. A Government that is unable to restore faith in its currency may go so far as to threaten its citizens with confiscation of their property if they decline to subscribe to its loans, or even with death if they seek to protect their savings by investing them in a safer currency.

"There is no field in which stability is a more pressing need than in the matter of currencies. Fixed rates of exchange can be the outcome only of national laws based on international agreement.

"But international agreements are precisely those that have suffered the most flagrant breaches in the course of the past few years. Speaking in Buenos Aires last December, Mr Cordell Hull appealed to the civilised world to re-establish international understandings and strengthen the regard for international law. If this appeal remains unheeded the world will be plunged into greater confusion.

"In order that mankind may be able to engage methodically in enterprise and persevere in its undertakings, call a halt in the race towards self-sufficiency, and establish a rational division of labour

and distribution of resources between nations, it must be freed from the nightmare of impending war. The sanctity of treaties must be assured. It does not follow that treaties should not be revisable; indeed, it is best that the covenant itself should provide for revision. In order that economic co-operation may be practicable between nations, not only must sound relations be established between governments, but also private international law should be clearly defined and scrupulously observed.

"Nations who imagine they can with impunity break the promises given explicitly or tacitly to other nations, or to foreign nationals who have built up undertakings at their invitation or with their permission, can expect no further help from abroad. At most, goods will be supplied to them only against cash on delivery or payment in advance, no credit being granted. Obligated to live almost exclusively on their own resources, they will perforce lead a miserable existence. They will learn that the following maxim of La Rochefoucauld holds true for nations as well as for individuals: 'He who thinks he can find in himself the wherewithal to do without others is greatly mistaken; but he who thinks others cannot do without him makes an even greater mistake.'

"When a people can no longer order its activities on the assumption of the stability of the law and the faithful accomplishment of the contracts that would provide it with goods and services, it must seek another course for the pursuit of its economic life. It has only one alternative: to commit itself to the care of an all-powerful State whose Government will dictate what each citizen's activities shall be, and who will minister to his needs. Instead of seeking security in contractual stipulations, each member of the community must be content with whatever place in the sun is assigned to him by the institutions in force at a given moment.

"It was in other troublous times that Rousseau conceived his ideal of the 'despotic state,' master of all its members' possessions, including their capacity to work. To-day this old ideal has again come into favour. Many capitalists, traders and manufacturers, from the multitude of small shop-keepers to the managers of the largest works, are becoming convinced that they can no longer build upon the foundation of law and contracts. Disconcerted and weary, they resign themselves to the hope that the Government will plan and undertake business in their stead. As the rule of law has ceased to exist, they are prepared to accept a dictatorship. The man who has possessions will leave the State to dispose of them; and he who bore the responsibilities of management will accept instructions upon how to conduct his business: trusting that in return for their obedience the State will leave them some enjoyment of their property, or a small share of authority. And, rather than submit to the changing moods and biased will of parliamentary majorities, they call for a leader, from whom they may at least expect some method in control.

"In truth, the choice of every nation is not so much between the parliamentary system and dictatorship as between two economic systems—a regime of freedom under which citizens settle their mutual relations through inviolable contracts within the setting of a code of laws that derives permanence from well-established principles; or a regime under which the State allocates tasks and fixes rewards, regulates production, distribution and consumption, in short, manages the national economy.

"This power of the State can be exercised by a body of officials as well as by one man or an oligarchy; and history tells of enlightened despots, guardians of a lawful order, as well as of parliaments that have disregarded the principles of law. Great public works can be successfully carried out by coercion. But a system of dictation can bring neither prosperity nor security to a nation. Granted that it may be able to co-ordinate activities better than a regime of liberty, nevertheless it forgoes the stimulus and ingenuity of private initiative.

"A nation under arbitrary rule no less surely renounces the benefits of private enterprise, and it condemns itself to isolation, which spells certain misery. If every agreement implies risk as well as assurances for each of the parties, it is a fool's bargain to assume an obligation when the other party can repudiate or be released from his commitments under a judicial practice inspired by the doctrine that the State knows no other law than that of its immediate convenience.

"An economic system based on voluntary exchanges of goods and services, a happy co-operation between independent nations—in other words, concerted action towards greater welfare in the bracing atmosphere of liberty—pre-supposes as an essential condition the sanctity of contracts."

Before giving the usual information regarding the undertakings in which Sofina is particularly interested, the report com-

ments briefly on some recent developments in the supply of electricity. The following passages are extracted from this section of the report:—

"The output of electricity attained further record figures in 1936. There has been a substantial increase in the industrial demand for electricity, together with a continued rise in domestic requirements, except in countries where an over-valued currency has retarded business recovery. In Switzerland a fresh fall in consumption for general industrial purposes was offset by increased sales to electro-chemical and electro-metallurgical undertakings. In the United States the demand increased by 18.4 per cent. (7,500 million kWh) for large power requirements, and by 12.3 per cent. (3,300 million kWh) for household, commercial, and handicraft appliances.

"In highly developed countries it is becoming difficult to open up new areas for the services of electricity. There remains little scope for extending the networks, except in rural districts where the progress of electrification can be furthered by electrifying the railways running through these districts. Consequently, electricity distributors are concentrating largely on 'intensive' rather than 'extensive' development of their outlets, and are endeavouring to bring customers to a better realisation of the advantages that can be derived from the many possible uses to which electric energy can be applied. 'Sales promotion' has thus taken a prominent rank amongst the preoccupations of every distributor.

"Electricity supply undertakings that have adopted modern methods have organised courses at which those of their agents who are in touch with customers can learn how to give explanations and advice. Handbooks provide them with a summary of these courses; other manuals, written for the benefit of the senior staff, indicate the lines along which research work and canvassing should be conducted, and examine what interest the undertaking may have in promoting the expansion of sales for a given use, or what facilities it can offer its customers for the purchase, upkeep, or renewal of each kind of appliance.

"It is hardly necessary to recall that the surest way to reduce the average cost of the kWh is to obtain a more continuous utilisation of plant. One of the larger French companies was able within six years to increase night consumption by 125 million kWh, and to raise from 2,100 to 2,600 per annum the number of hours during which peak power is utilised. In the United States, sales of electric household appliances reached nearly 1,200 million dollars in 1936. It is chiefly due to the more widespread use of appliances of this kind that the residential consumption of electric energy has increased in that country by more than 9,000 million kWh since 1925, and that in the course of a decade it has been possible to reduce tariffs by an average of 30 per cent., while the distributors' receipts have increased by about 13.5 per cent. per customer.

"The price charged for electric appliances can be reduced according to the degree in which increased demand permits mass production; and the prices charged for electric energy according to the improvement in the load factor. But a rational organisation is an equally sure means of lowering the price of electricity, because it avoids duplication in the generating or distributing plants.

"Co-ordination of power-stations and networks is steadily progressing in all countries. Inefficient units are being put out of commission; new plant is not being built unless its usefulness is assured. Rationalisation of this kind is usually brought about by voluntary agreement between undertakings. In Belgium, for instance, an understanding in this respect was negotiated last year between distributors and industrial concerns generating electric energy for their own requirements; in England, out-of-date power stations are being gradually eliminated without the authorities being obliged to use the power of coercion vested in them by law.

"At the Third World Power Conference which met at Washington last September, the delegates of the participating nations were unanimous in stressing the only two methods whereby the cost of the kWh can be reduced, namely by technical improvement and co-ordination, and by more flexible tariffs so adjusted as to promote those uses which improve the load chart. (Moreover, the undertaking should be assured of a sufficiently long lease of life, so that adequate provision for amortisation may be consistent with a moderate price of supplies, nor should it be otherwise burdened with excessive charges.)

"Except in two or three instances the spokesmen of the governments represented at the Conference declared themselves opposed to the nationalisation of electricity production or distribution."

COMPANY MEETINGS

THE ALLIANCE TRUST COMPANY, LIMITED

SATISFACTORY YEAR'S RESULTS

SUBSTANTIAL ADVANCE IN REVENUE—INCREASED DIVIDEND

MR DAVID PIRIE'S REVIEW OF BUSINESS CONDITIONS AND OUTLOOK

The annual ordinary general meeting of The Alliance Trust Company, Limited, was held, on the 18th instant, in the company's registered office, Meadow House, 64 Reform Street, Dundee.

Mr David Pirie presided, and after formal evidence of the proper calling of the meeting had been submitted, the secretary, Mr John P. Bruce, read the auditors' report to the shareholders.

The Chairman, in moving the adoption of the annual report, said:—It is now my duty to submit for your approval the directors' report and accounts for the past year. The revenue figures reflect a substantial advance on last year, and I think you will regard the results shown as entirely satisfactory. The increase in net revenue is quite considerable. After paying all expenses of management and administration we have left £523,554, and after deducting interest on borrowed money of £160,213, there remains for the credit of our shareholders a sum of £363,341, an advance on last year's figure of £56,209.

As mentioned in the report, revenue has this year had the benefit of arrears of interest and dividends to the extent of £21,000, but as the previous year received nearly £20,000 under that head, that scarcely affects the comparison. There are reasons connected with the uncertainties of taxation both here and in the United States which make the transfer to special taxation reserve account desirable, and the strengthening of contingent fund needs no defence. These allocations are in accordance with the sound policy of prudent reservations from revenue to which must be attributed the remarkable strength of the company's position, and we are glad that it enables us not only to make them but to recommend an increase in the dividend and still add something to our carry forward.

VALUATION OF INVESTMENT

The valuation of our bond and stock investments also makes a satisfactory showing. We have in the past commented on the essentially fleeting character of Stock Exchange values, and we should never suggest that the position of the company should be estimated solely or even mainly by the valuation of its bonds and stocks at any given date.

The essential factor is the real earning power of the company, present and prospective. Still I should not feel happy if I saw our high revenue accompanied by a valuation which in the circumstances of the time was a low one for such securities as we hold, because I should then fear that our revenue though high was unstable. I am glad, therefore, to state that our good revenue position is buttressed by a valuation of our securities which shows a very substantial appreciation over book cost. That is a fact which entitles us to regard the situation as sound and healthy from every point of view.

GENERAL PROSPERITY

These facts and results are, of course, merely the reflection of a picture of general prosperity brighter than any we have seen for many years. This general prosperity has manifested itself in many ways, and perhaps the aspect which gives us all most satisfaction is the growing increase in employment. Between 1929 and 1932 the number of insured employed persons fell by 872,000. During the next four years it rose by 1,548,000, and more of our people are in employment to-day than ever before. But what more particularly concerns our business here is the effect on our investments and on the stock markets. It is not surprising that those markets which reflect every side of our economic life should show strength and activity.

The direct causes of that strength and activity are many, but the cause which bulked most largely was the rise in price of primary commodities. Indeed, the year may well be called a commodity year and, broadly speaking, the tendency was for those shares and securities to rise which have benefited by the demand for commodities. In fact, while the 365 securities taken as representative by the *Bankers' Magazine* showed an apprecia-

tion for 1936 of over 5 per cent., British Government stocks and kindred securities showed an actual depreciation for the year.

COMPARISON WITH 1929

The rise came from the variable-dividend securities and it was intimately connected with the rise in commodities. It has reached the dimensions of a boom and we must ask ourselves how long and how far this position may extend. We are inevitably led to compare the position with 1929. That was also a year of high business activity, but it was followed by one of the severest depressions in economic history.

We shall be wise, therefore, to consider whether the conditions now are similar and, if not, how far the difference affects our outlook. Undoubtedly there are many differences. The pound sterling has been divorced from the gold standard. A system of tariffs has replaced the system of free trade. Our business activity has become largely domestic. According to the Board of Trade's estimates, while the total volume of British industrial production was 15 per cent. higher than in 1929, the volume of British exports was no less than 23½ per cent. lower. This position will be increased by the fact that so much of our productive energy is to be turned to the purposes of national defence, although one is interested to notice that cautious efforts have just been initiated by our own and other Governments for a revival of international commerce.

HEALTHIER AND MORE STABLE POSITION

The consequence of all this is extremely difficult to gauge, but I think on the whole we must consider that the present business activity and stock market position are much healthier and more stable than they were in 1929. In the first place, we have cheap and abundant money. In 1929 the Bank rate started at 4½ per cent. and was raised to a maximum of 6½ per cent. This year it has been a steady 2 per cent. The market rate of discount on three months' bank bills has been not much more than ½ per cent. In 1929 it averaged 5½ per cent.

One of the most dangerous factors in 1929 was the financing of the unprecedented stock exchange boom in America at fantastic rates of interest. To-day money is cheaper in the United States than it is here. The powers of our Treasury to control the rate of interest have largely increased, and it is to their interest to continue the era of cheap money indefinitely. This factor then of interest rates, which is probably the most potent single influence in security markets, is definitely operating and likely to continue operating in favour of the stability of the position.

Again, the financial resources available to strengthen the position are very much greater. Our Government has now for some years placed an embargo on foreign borrowings, and the huge surpluses and savings of British industry have been retained in the country. Out of total prospectus borrowings of £256,000,000 in 1936 less than £1,000,000 went to foreign countries. Then, our industrial concerns are very much stronger financially than they were in 1929. They are able to finance themselves to an extent which was quite impossible in past years.

BETTER QUALITY OF NEW ISSUES

It is pointed out in an article in *Lloyds Bank Monthly Review* for March, to which I am indebted for many of the facts and figures I am quoting, that the total new issues in the London capital market during the last three years have been appreciably less than those of 1929 and earlier years, when the cost of new capital was very much dearer. This position is also emphasised by amalgamations and the drawing of the smaller industrial companies under the wing of the large organisations whose financial strength enables them to meet their long-term needs out of their own surpluses. All this not only decreases the quantity of new issues—it ensures an improvement in their quality.

Then, while it is true that a number of issues are still made on the results of a single prosperous year, the provisions of the

Companies Act of 1929, whose intention has been backed up by the attitude of the Stock Exchange Committee for General Purposes, have all tended to restrict the making of new issues without solid foundation.

Finally, the whole position is healthier because while in 1929 prices were falling steeply and the trend of business affairs was, therefore, definitely deflationary, in 1937 prices are rising and the tendency is expansive—a bull point for equity shares.

DANGER OF VIOLENT RISE IN PRICES

We must not, of course, be blind to the dangers of such a violent rise in prices as has taken place. As Mr Keynes pointed out in *The Times* recently, if increasing demand fails to elicit a sufficient increase in output and the efforts of purchasers spend themselves in merely raising prices, a very dangerous form of inflation results, and in this connection it is interesting to note that the President of the United States is credited with the intention of taking measures to reduce the rapidly advancing prices of certain commodities, and that the mere rumour of such action has had a healthy effect.

Then, as usual in boom times, labour troubles are looming before us and rising costs are threatening profits. On the whole, then, a comparison between 1929 and 1937 leads us to the conclusion that, on the one hand, the position of the present year is much more healthy and stable but that, on the other hand, we shall be wise to regard the new conditions with caution and adhere to our traditional policy of prudent reservation from profits against the contingencies of an unknown future.

RECOVERY IN THE UNITED STATES

In the United States also recovery is the prevailing note, and it is impossible not to be impressed by the reasons given for the continuation of that recovery. We have in all 23.76 per cent. of our invested funds in that great country, of which, however, only 15.96 per cent. represents bond and stock investments, the balance of 7.80 being in mortgages and real estate. With regard to the latter, the measures for the relief of the American farmer adopted by the Roosevelt Government showed signs of assisting us in a slow and difficult task until, by the action of the Supreme Court, these measures were substantially interfered with. The President is, however, a singularly resourceful person, and, as indicated in the report, we find that he has been able to continue by other methods, to a certain extent at least, the aid which he planned for agriculture.

There is no doubt in our view that in future, in one way or another, the American farmer is bound to receive more consideration than he has in the past. Politically, his numbers make him powerful, and now that he has become conscious of that power and active in his own interests the authorities will find it necessary to give him the consideration to which he is entitled.

CONFIDENCE IN THE FUTURE

On the whole, therefore, while we have many problems and difficulties with which it is quite impossible for me to deal in detail, I think that we can not only congratulate ourselves on the results of the past year but we can feel that the position of our company and its business is sound enough and strong enough to enable us to look to the future with confidence.

I should like before sitting down to pay a tribute to the able and conscientious work of our staff here and our representatives in America, and I conclude by moving that the directors' report and accounts be adopted and that final dividends be declared as therein recommended, viz. on £700,000 preference stock at the preferential rate of 4½ per cent. per annum; on £650,000 preference stock at the preferential rate of 4 per cent. per annum; on £750,000 preference stock at the preferential rate of 5 per cent. per annum; on £100,000 "A" preference stock at the preferential rate of 4 per cent. per annum; and on £1,050,000 ordinary stock at the rate of 12 per cent. actual, making 23 per cent. for the year, all subject to deduction of income tax.

The report and accounts were adopted, and resolutions declaring dividends, re-electing the retiring director, and appointing auditors were unanimously passed.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Bouverie Street, Fleet Street, London, E.C.4.

AGRICULTURAL MORTGAGE CORPORATION, LIMITED

FARMING CONDITIONS AND OUTLOOK

The eighth ordinary general meeting of this company was held, on the 19th instant, at Stone House, Bishopgate, E.C., Sir Harry Goschen, Bt., K.B.E. (the chairman), presiding.

The Chairman, in the course of his speech, said: During the past year we have granted further long-term loans of £377,496, bringing the total amount advanced up to £11,968,400, secured on first mortgage of 820,749 acres of agricultural land, together with the necessary farmhouses and buildings valued in all at £18,876,582. In addition, loans for a further £204,816 have been approved by the directors and will be completed as soon as the necessary formalities have been complied with.

The total of loans granted under the Improvement of Land Acts has increased to £83,598, and these are secured by rent charges on the land under the absolute order of the Minister of Agriculture and Fisheries, ranking as first charges on properties of an estimated annual rental value of £49,774.

I am pleased to be able to report that the payments of interest and repayments of principal continue, as a whole, to be promptly met, and it is satisfactory to note that over 93 per cent. of the total falling during the year had been received within seven days of the close of the period.

Farming conditions during 1936 were, in the main, disappointing. The wet winter damaged the autumn sown corn and poor yields were obtained over practically the whole country. Adverse weather made lambing conditions difficult and many flock masters experienced serious losses. Work on the land was delayed and only those farmers with entirely adequate manual and team labour as well as the necessary machinery were able to get their essential spring cultivations up to date. Unseasonable weather persisted through hay time and harvest, and much unprofitable money was spent in getting in damaged and sometimes worthless crops.

IMPROVING PRICES

Prices for agricultural produce generally showed some improvement, but dearer foodstuffs, increased labour difficulties, and lower yields more than offset the advantage so gained. The price of wheat has risen to a figure which almost rules out the provisions of the Wheat Act, but the result of the threshing was so disappointing that few farmers found the crop a profitable one. There was an increase of more than 27,000 acres in the area under barley in 1936, but the yield was somewhat lower and the total production showed an increase of only 7,000 tons. The counties of Cambridge, Hertford and Glamorgan were noteworthy as giving yields above the average. Sugar-beet growers generally showed good results and the fine weather during October was reflected in a welcome increase in the sugar content. Potato prices were well maintained and, in spite of blight damage, growers had a satisfactory year. Dairy farmers did reasonably well. More milk was sold through the Milk Marketing Board, and the cheese market showed a better tone. The depression in the livestock industry continues, and, even with the subsidy, beef producers have found it difficult to make a living. The trade for sheep and lambs has been well maintained throughout the year and steady prices have been recorded. Root crops have been good and the pastures and clover leys have provided all the necessary keep.

There are definite signs that the values of agricultural holdings generally are rising, and sound dairy farms with good homesteads are in demand, while medium-sized holdings well placed for markets, and for obtaining labour, are showing a steady upward tendency.

There are many indications, too, that although farmers may not in the near future see all their hopes realised, their confidence may be better justified than for some years past. The spending power of consumers is increasing, and if farmers will produce what the consumer requires and supply it in a standardised form they should be in a position to reap their share of the benefits accruing from the increasing prosperity of the country as a whole.

We have thought it wise to transfer the sum of £35,000 to contingencies account this year to provide against the possible fall in our income due to the increasing difficulty we are experiencing in finding employment for our surplus funds.

The balance of the profit and loss account, after bringing in £7,350 os. 4d. from last year, is £32,796 ros. 3d., and it is proposed to transfer to special reserve £2,664 and to general reserve £15,000, as well as to write off expenses of and discount on issues of debenture stock, amounting together to £8,333, leaving £6,799 to carry forward.

The report and accounts were unanimously adopted.

BANK OF ATHENS

INCREASED PROFIT AND DIVIDEND

The directors' report for 1936 was presented at the annual shareholders' meeting, held on April 3rd, in Athens.

The following were among the salient points:—During the past year the International situation showed several disturbing factors, unfavourable to the maintenance of peace, which appeared to retard the normal development of economic life. At the same time armaments have further expanded, and certain countries have extended the system of restrictions, thus furthering the policy of economic autarky.

Nevertheless, world conditions, which since 1933 had commenced to shake off the effects of the Great Crisis, have continued to show unmistakable signs of recovery. These have shown themselves first in the sterling bloc countries, then the United States, and extended afterwards to other countries.

The year 1936 has been marked by an increase in prices. Industrial activity has been stimulated by the increased purchasing power of the farming community and by lower interest rates, and, aided by the impetus of expenditure on armaments, further increased and so contributed to the decrease of unemployment.

In Greece itself, the attention of the Government has been absorbed by its own large domestic problems, which have for a long time caused social unrest. The new political regime, which came into power in August last, has striven to improve living conditions whilst at the same time pursuing the policy of developing the country's resources and improving its financial status.

Owing to unfavourable climatic conditions, which have affected the majority of products with the exception of tobacco, the agricultural year has not been entirely satisfactory. Nevertheless exports have benefited from the higher level of prices.

There has been a satisfactory activity in industry and a marked increase in the building trade, whilst merchant shipping has had an active year.

The results for the year 1936, after the usual provisions and amortisations, show an increase to Drs. 21,116,509, as compared with Drs. 18,790,541 for the preceding year. This allows us to propose a distribution of a dividend of Drs. 12 per share and to carry forward Drs. 5,195,366 to the new account.

SOUTHERN AREAS ELECTRIC CORPORATION, LIMITED

EXPANSION OF BUSINESS

The fourth ordinary general meeting of this company was held, on the 6th instant, in London, the Rt. Hon. Viscount Elibank (chairman of the company) presiding.

In the course of his speech the Chairman said: We are glad to present the improved accounts now before you. The dividends receivable from all our subsidiary companies during the past three years have been as follows:—1934, £9,788; 1935, £23,850; 1936, £33,038. Before arriving at the amounts available for dividends for the year our subsidiaries had set aside in the aggregate the sum of £18,514 for depreciation, as compared with £16,503 for the previous year. The reserves of all the companies total £145,572.

During the year we have increased by 10.4 per cent. the number of consumers connected, and by 18.3 per cent. the number of units sold, the latter comparing with an average for the country of about 15 per cent. The average price received per unit was 2.23d., or just under 2½d., a reduction of ⅓ of a penny compared with the previous year, an advantage to our consumers of about £6,360, and resulting from various reductions made in our tariffs during the year. Nevertheless our receipts from the sale of current increased by just under 11 per cent.

The gross profits for the year were £33,384 17s. 7d., compared with £21,604 12s. 4d. last year. We paid to the holders of the old ordinary shares during the year the sum of £3,814 4s. 6d. as an interim dividend of 1½ per cent. We now propose to declare a final dividend of 3 per cent. for the year, less tax, on both old and new shares, which will absorb £17,922 3s. 11d., and to carry forward to the next account the balance of £7,457 12s. 2d., as compared with £2,692 4s. 7d. brought in. The dividend on the old ordinary shares will thus be increased from 4 per cent. to 4½ per cent., and the new ordinary shares will share in the larger final dividend of 3 per cent. in accordance with the terms of the prospectus under which they were issued. If steady progress is maintained we may be justified in recommending a moderate increase in next year's dividend.

The report and accounts were unanimously adopted.

CAMP BIRD, LIMITED

ENCOURAGING OUTLOOK

The thirty-fifth ordinary general meeting of Camp Bird, Limited (of 49 Moorgate, E.C.), was held, on the 16th instant, in London, Mr F. W. Baker (the chairman) presiding.

The Chairman, in the course of his speech, said: After deduction of the items dealt with in the profit and loss appropriation account, including the amount of £156,366 written off investments and advances out of profits, and the balance of the underwriting commission and capital reorganisation expenses amounting to £16,147, which will thus not appear in subsequent profit and loss accounts, £63,892 is carried to the balance sheet, out of which, subject to confirmation, the directors have declared a dividend, No. 45, of 6 per cent., absorbing £49,860, leaving a balance of £14,031 to be carried forward to the current year.

I would like to make a reference to the profit of £166,253 made on the realisation of investments, as I feel there is some misconception in the minds of shareholders as to how this profit was made. It was not made in operating on the market but by realisation of participations which showed us a substantial profit which we felt should be secured.

Our quoted investments now stand at a book cost of £767,315, as against £503,234 at December 31. Our unquoted investments and ventures now stand at £293,736, as against £655,308 at December 31, while cash at bank in London now stands at £234,580, as against £78,034.

These several items under the headings of quoted and unquoted securities, properties and miscellaneous, at book cost, to which must be added advances, debtors and cash, represent a total at this date of approximately £1,333,000, having a value ten days ago and before the recent abnormal shakeout of £1,862,000, since reduced in the last ten days by £160,000.

The Mexican Corporation, as you know, owns practically half the share capital of the Fresnillo Company. The result of development work at the Fresnillo property and at the outlying Plateros and Zacatecas properties has been throughout the year of a very encouraging nature, so that the management is now proposing to enlarge certain sections of the plant to meet increased tonnage available. Earnings again influenced by the higher range of metal prices have been substantially increased.

LAKE GEORGE MINING CORPORATION

We have been successful in floating the Lake George Mining Corporation, with an issued capital of £1,110,000, divided into 2,220,000 shares of 10s. each, to acquire the Lake George Mine; £600,000 has been provided by the issue of shares at par for equipment and further mine development, and for working capital. Plans are now in hand so that a plant will be erected to treat the large developed reserves of ore in the mine.

On the basis of a price of £18 for lead and zinc, and based upon the treatment of 1,000 tons of ore a day, an estimated profit of £400,000 (Australian) should be earned. At to-day's metal prices the profit would be in excess of this figure.

It is very satisfactory to me to be able to report that, at last, this company's valuable holding in Lake George has been put into a position where in due course, based upon estimates of earnings as given, substantial revenue should accrue to us through a holding which approximates a third of the total issued capital of the company provided with sufficient capital to complete its construction programme.

WEST WITWATERSRAND AREAS

In West Witwatersrand Areas, Limited, we hold 20,000 shares at the written-up cost of £10. West Witwatersrand Areas, Limited, has continued the exploration of its properties by diamond drilling, the most important feature of which has been the proving, in the western section, of the reef now known as the Carbon Leader. All three boreholes which intersected this reef have shown high values. Two subsidiary companies have been floated, of which Venterspost Gold Mining Company, Limited, has practically completed its No. 1 shaft and has started active development underground. Libanon Gold Mining Company, Limited, has started shaft sinking, a favourable feature being the depth reached, approximately 400 ft., without encountering water in the dolomite. A third subsidiary is expected to be floated at an early date. The right to subscribe the initial working capital in subsidiaries belongs to the shareholders of West Witwatersrand Areas, Limited.

In conclusion, I feel justified in saying that, provided we have no serious economic, international or political disturbances during the current year, the outlook for earnings is definitely encouraging. The report and accounts were unanimously adopted.

AMALGAMATED METAL CORPORATION, LIMITED

POSITION AND PROSPECTS OF NON-FERROUS METALS

MR C. V. SALE'S ADDRESS

The eighth annual general meeting of the Amalgamated Metal Corporation, Limited, was held, on the 21st instant, in London, Mr Charles V. Sale (the chairman) presiding.

The Chairman, in the course of his speech, said:—The profits of your corporation, including interest and a refund of income tax, amount to £365,081, to which must be added £28,206 brought forward from last year, a total of £393,377. From this sum, half-yearly dividends at the rate of 6 per cent. per annum were paid on the Cumulative Preference shares, and the directors now recommend a dividend of 7 per cent. upon the Ordinary shares payable on May 5th, less income tax at the rate then ruling. These dividends will absorb £364,505 and leave a balance of £28,872 to be carried forward.

Price movements in the first three quarters of 1936 were irregular. Copper and lead slowly improved under the influence of dwindling stocks; conversely, spelter declined with expanding stocks; tin fell in the second quarter owing to restriction uncertainties. All four metals rose sharply in the last quarter. Here, I would remind you that the first nine months witnessed an activity little greater than that obtaining in the corresponding period of 1935. The great increase in tonnage and value mentioned in the report was not recorded until the last quarter of the year, and it was only in 1937 that the upward movement was greatly accelerated.

Speaking broadly, the devaluation of the gold *bloc* currencies in September was the first cause of increasing commodity prices. The fabricator and the consumer in every country, impelled by rising demand, smitten by fears of inflation and, in the metal trade, alarmed by the huge armament programmes announced by many Governments, and by our own in particular, rushed in to replenish stocks for current requirements, and make provision for forward needs. In face of such a mass buying movement, supplies were, and would nearly always be, insufficient to stem a rise in prices. For the time being, these have fallen considerably, so that their disparity from the general level of commodity prices is now much less than in early March.

BUILDING TRADE ACTIVITIES

In considering the future and prospects of the coming year, it is well to remember that the building trade is one of the principal outlets for non-ferrous metals. To-day the building of private residential houses in this country shows signs of diminishing, but increased commercial building, and building under slum clearance schemes will probably be enough to compensate for this for some time to come. Armaments do not seem to have added much to the country's total demand in 1936, but they must inevitably become a more important influence in 1937. The revival of shipbuilding also brings with it a considerably larger demand for metals, especially for brass. In short, while smaller tonnages may be used in some of the peace industries, it seems probable that the total consumption in this country will not be less than in 1936.

THE U.S.A.

In the United States, so far as foreign observers can judge of the trend of consumption, there is more room for expansion and for a quicker rate of increase than here, and, indeed, this is borne out by the table to which I have just referred. The building trade in that country, for instance, suffered very severely in the years of depression; new residential buildings fell from a value of over £400,000,000 per annum to less than £80,000,000, and the recovery, which began only in 1935, is still very modest. Non-residential contracts suffered in like degree, but show a marked increase during recent months. In both classes there is a large accumulation of arrears to be overtaken, and overtaken they will be. Prosperity will impel it. A great demand for metals will be caused. I need not dwell on the fact that, quite apart from building, the increased activity in other industries in the United States will lead to the consumption of much larger tonnages of copper in the electrical trades and of the other metals in their respective spheres.

If this is a correct forecast in the United States, it seems reasonable to expect a similar revival of prosperity in the countries of primary production, which will benefit by the rise in price of the primary commodities.

Again, the continental countries which, taken together, consume more copper, lead, and spelter than the United States, may be expected to maintain and even slightly increase their requirements; the improving trend of industry in France, and the still growing demand from Russia, are factors of importance.

PROSPECTS OF INCREASED CONSUMPTION

With these conditions it is probable that consumption will keep up and even grow in 1937, but the course of prices will depend on how quickly the output of each metal can be increased. It appears certain that the output of copper will be considerably higher by the end of the year, and the recession in price recently witnessed was not unexpected; the peak levels of March are not likely to be regained. The same forecast may apply to tin; prospects, however, of quick increases in the output of lead and spelter are more remote, and, therefore, their prices do not appear to be as vulnerable as those of the other two metals. To gain a balanced view we must, however, place on the other side of the scale the unsolved political problems which still beset the world, and the rising menace of labour difficulties, strikes, and demands for much shorter hours.

Having said so much, I must leave you to form your own opinion of the future. All I can say with certainty is that the results of our trading since January 1st are substantially better than for any corresponding period of 1936.

RUBBER

The rubber department of Henry Gardner and Company completed a satisfactory year. Both the consumption and the price of rubber advanced hand in hand with those of metals and other commodities. At the beginning of 1936 the price was approximately 6½d. and at the end of the year 10½d. per pound, rising still further to 1s. 1½d. in March, 1937, and falling back within the last few days to the current price of approximately 11d. per pound, which, in view of world demand, seems to be reasonable.

For the first time, consumption during the twelve months slightly exceeded 1,000,000 tons, of which more than one-half was absorbed by the United States, while world stocks diminished by 160,000 tons. Taking these prospects into consideration, the control committee has increased the quota of export releases from 65 per cent. for the last half of the year to 75 per cent., 80 per cent., 90 per cent., and 90 per cent. respectively for each quarter of 1937. Since the end of December there has been a further reduction of over 40,000 tons and, on the basis of current consumption, even with the larger quotas, it is estimated that stocks at the end of 1937 will not amount to more than six or seven months' supply. Of the present stocks, estimated at 460,000 tons, approximately 25 per cent. are held in the East and, therefore, not immediately available in the countries of consumption.

MINING IN THE U.K.

Finally, I must say something about mining in the United Kingdom. It is our belief that there are several mining operations to be carried on profitably in the United Kingdom, particularly the mining of lead with the zinc which is associated with it. As you are doubtless aware, there is an important and successful mine known as Mill Close, in Derbyshire, which has attained its present importance since the war under the skilled auspices of the New Consolidated Gold Fields. We in our turn also have been largely responsible for draining and developing the old Halkyn district to which I have referred on several previous occasions. The mining difficulties in this area are great, and, in spite of the sea level tunnel, production is at times hampered by an excessive flow of water in the workings. Nevertheless, we think this venture has a profitable future, even at much lower prices for lead and spelter. These two mines to-day win almost the whole tonnage of lead production in this country, and direct employment is given to about a thousand men in areas where other work is scarce.

During the past year we also undertook, in conjunction with other lead interests, the exploration of the Greenside Mine in the Lake District, which appears a promising prospect. At this property mining is a simpler matter and, although it is too early to forecast the extent of the orebody, it would appear to justify development, and we are not unhopful that it will prove a profitable producer with a considerable life.

The report and accounts were unanimously adopted.

ROYAL EXCHANGE ASSURANCE

SUCCESSFUL YEAR

The two hundred and seventeenth annual general court of the Royal Exchange Assurance was held, on the 21st instant, at the Head Office of the Corporation in the Royal Exchange, London, E.C.

Mr Charles L. Dalziel (the sub-governor), after expressing regret at the absence through indisposition of the governor, Mr Vivian Smith, said that in the life department new business had amounted to £4,652,000, showing a slight increase on that for 1935. The net sum assured was £4,322,000, a rather smaller figure than that of last year. The total premium income of the life department was £1,253,000, which again recorded an increase over the year 1935, while the claims paid and outstanding amounted to £698,000, against a total of £676,000 for the year 1935. The gross rate of interest earned on the life fund for the year was £4 19s. 2d. per cent., against £4 19s. 9d. per cent. for 1935. The life assurance fund now stood at £12,505,000.

FIRE, MARINE AND ACCIDENT DEPARTMENT

The fire department had had another good year, and, although the underwriting profit of nearly £171,000 was not quite so high a figure as in 1935—a record year—it was eminently satisfactory. A total of £212,837 had been transferred to general profit and loss.

The fire fund at the commencement of last year had stood at £1,193,000, of which £600,000 was represented by additional reserve, and the directors had considered this an appropriate time to make a transfer from general profit and loss of £200,000 to the additional reserve, making that reserve up to a figure of £800,000. Their fire business in this country continued to keep at a steady and satisfactory level.

In the marine department the net premiums received amounted to approximately £660,000, while the marine fund now stood at £830,000. To the growth of competition could now be added very definitely the increased cost of repairs, and the directors had decided to make no transfer this year from that department to the general profit and loss account.

The year's results of the accident department were most satisfactory. The net premiums had amounted to £1,124,000, and the underwriting profit of £62,000 showed a marked increase on that obtained in 1935. The department had transferred to general profit and loss account a sum of £101,000, the highest amount since 1922. With the exception of foreign employers' liability insurance, every section of the business had produced a higher ratio of profit. Motor-car insurance had been somewhat more profitable, but the outlook was still rather uncertain. They were awaiting with interest the findings of the Departmental Committee appointed by the Board of Trade to consider and report on the question of compulsory insurance. They had decided to transfer from general profit and loss account the sum of £100,000 to the additional reserve for accident business, making that £300,000.

DIVIDEND

As to the general profit and loss account, net interest, dividends and rents not carried to other accounts amounted to £122,099, an increase of £3,649. An increase of 5 per cent. in the dividend for 1936 from the "Motor Union" was included. Transfers from the fire, accident and trustee departments totalled £330,753. To those figures had to be added £42,907, being one-fifth of the proprietors' valuation surplus for the years 1931-1935, and, with transfer fees, there was a total figure of £495,907.

The directors recommended a final dividend of 19 per cent. which, with the interim dividend of 11 per cent. paid in November, would make a total dividend of 30 per cent., less tax, on the capital stock. He thought it would be agreed that they had again had a successful year.

With regard to the associated companies, the Car and General Insurance Corporation had received a net premium income for the year of £1,472,000, and had made an underwriting profit of £36,665; the Motor Union Insurance Company had experienced a most satisfactory 12 months' business; the State Assurance Company had been rather less fortunate and the National Provincial Insurance Company had again presented satisfactory figures.

In conclusion, he said that as one looked round the world to-day one was apt to grow rather apprehensive of theories that ran counter to individual enterprise. It seemed to him that the strength and vitality of British insurance lay in the fact that it had been built up and was still conducted by organisations reasonably free from well-intentioned but hampering control.

The report was unanimously adopted.

In its 100th Year A RECORD AMOUNT OF NEW BUSINESS was transacted by the

"Legal & General"

At the Annual General Meeting, held on the 20th April, the Chairman, Mr. Ernest E. Bird said that during the year 1936:

21,926 new Life Policies were issued.

The net new Life Sums assured amounted to £16,897,582.

The Total net new Sums assured inclusive of Sinking Fund amounted to £18,252,837.

The net new Life Premium Income was £1,170,687.

The net Fire and Accident Premium Income was £535,522.

Total Life business in force at the end of 1936, 171,337 policies assuring £118,214,087 and Deferred Annuities of £2,659,399 per annum.

The Total Assets of the Society exceed £39,500,000.

A copy of the Annual Report and Accounts together with the Quinquennial Valuation Report for the period ending 31st December, 1936, will be sent on request.

WORLD AUXILIARY INSURANCE CORPORATION, LIMITED

DIVIDEND OF 7½ PER CENT.

The eighteenth ordinary general meeting of this Corporation was held, on the 20th instant, in London, Capt. the Rt. Hon. C. C. Craig, D.L., the chairman, presiding.

The Chairman, in the course of his speech, said that with reference to the fire account the fund brought forward from last year amounted to £45,027 and interest to £2,316, to which was added premiums of £93,370, making £140,714. After paying all claims, etc., and transferring £2,750 to profit and loss account, there remained a balance of £46,693, equal to 50 per cent. of the premiums received during the year. The premium income showed a small increase notwithstanding currency devaluation on certain foreign premiums. While results in the foreign field had been satisfactory, losses in the home market had exceeded those of the last few years.

In the general accident and miscellaneous account the total was £213,250 and the remaining balance was £128,495. The favourable results referred to last year had continued, and the settlements on the 1935 account up to the end of 1936 were favourable. In the marine account, premiums for 1936 amounted to £102,082; £20,000 had been transferred to profit and loss and £158,333 was carried forward to 1937, and represented a fund equal to 155 per cent. of the premium income for the year. The premium income showed a slight reduction, and they might hope that the contraction in income, to which he had referred previously, had been arrested, and that their next account might show a premium figure not lower than the one presented for the year under review. He did not wish to be too definite as conditions to-day were not favourable to underwriters.

The available balance in the profit and loss account was £179,391. After paying sundry charges and reserving for taxation, there remained a balance of £166,861, from which they recommended the payment of a dividend of 7½ per cent., free of income tax, on the paid-up capital of the company. Investments taken at cost amounted to £1,012,441, and their value at December 31, 1936, was £1,085,470.

The report was unanimously adopted.

LANADRON RUBBER ESTATES, LIMITED

NET PROFIT TREBLED

The twenty-ninth ordinary general meeting of the Lanadron Rubber Estates, Limited, was held, on the 21st instant, at 1-4 Great Tower Street, London, Mr Eric Macfadyen (the chairman) presiding.

The Chairman, in the course of his speech, said that crop expenses had gone up from £18,764 to £20,941, but output had increased rather more than proportionately from 1,099,503 lbs. to 1,114,403 lbs., while the gross sum realised for the crop accounted for was more than half as large again. Thus the balance transferred to the balance sheet was greater by over £6,000 than a year ago, and inasmuch as last year's figure included a windfall of about £4,000 from taxation reserve, the net profit on the year's working of the estates in 1936 was, in fact, treble that of 1935.

The appropriations, including a dividend of 5 per cent. recommended, would leave them with a somewhat reduced carry-forward, but, in view of the current year's prospects, they considered that might be justified. Costs were a shade under the 1935 figures, while the sale price showed an improvement of over 1½d. per pound net.

The immediate outlook, for the time being, appeared to be "set fair." They were not short of labour and could expect consequently to produce about 1,725,000 lbs. of rubber this year—in accordance with the releases intimated by the International Regulation Committee—including the company's share of Sungei Sabaling production rights. They would further, by arrangement with their partner company, produce the remaining 75,000 lbs. of the Sabaling rights, bringing their total crop up to 1,800,000 lbs. approximately.

They had to meet forward contracts during 1937 totalling 672,000 lbs. at an average price (London equivalent) of 10d. per pound. That was about 1½d. higher than the price obtained last year and present indications were that the balance of their output should fetch higher prices. The per pound cost should be at pretty much last year's level.

The report was unanimously adopted.

LEDBURY RUBBER ESTATES, LIMITED

IMPROVED RESULTS AND PROSPECTS

The twenty-eighth ordinary general meeting of the Ledbury Rubber Estates, Limited, was held, on the 21st instant, at 1-4 Great Tower Street, London, Mr Eric Macfadyen (the chairman) presiding.

The Chairman, in the course of his speech, said that the profit and loss account showed a credit balance of £9,400, against £4,732 a year ago, when £1,000 withdrawn from taxation reserve was included. They had accounted for 649,603 lbs. in 1936, and, allowing for the releases announced by the authorities, they should account for about 670,000 lbs. of rubber in 1937.

The company's share of the Sungei Sabaling Estate might be regarded as the equivalent of 272 acres of modern and very promising rubber on which they could start tapping at any time. Sione Estate, as reduced in area by mining operations, had a planted area of 472 acres. Kinrara and Ledbury remained at 1,915 acres planted. On the two latter estates obsolescence was a factor, and they had replanted 52 acres in 1936 and had arranged to replant about as much in 1937.

The wages of estate labour had naturally been rising in the last year or two. In the case of their company the consequential rise in cost of production of the crop in 1936 over 1935 had been a little more than the small increase in accountable crop. He could not promise that that tendency might not go somewhat further, but in the current year they could look for a continuance in the rise in average price. As against a price equivalent to 6.32d. per lb. landed in London for 1935, they had the equivalent of 8.24d. per lb. in 1936. In 1937 they had 329,000 lbs. sold forward at average prices equivalent to about 10d. London landed terms, and 134,000 lbs. in 1938 at a little over 11d. London landed terms.

In the absence of some adverse development such as could not now be foreseen, the company should make further progress in 1937.

The report was unanimously adopted, and a dividend of 7½ per cent. approved.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the week ended April 17, 1937, amounted to £15,509,000, against ordinary expenditure of £10,645,000. After allowing for a decrease in Exchequer Balances of £477,855, the operations for the week, as shown below, decreased the gross National Debt by £5,277,000, to approximately £7,916 millions.†

No gold movements were reported at the Bank of England between April 16th and 22nd. Details of previous movements appeared in the issue of April 3rd.

GOLD MARKET

Messrs Samuel Montagu and Company write on April 21, 1937:—
The Bank of England gold reserve against notes amounted to £313,661,924 on April 14th, showing no change as compared with April 7th.
In the open market about £2,500,000 of bar gold changed hands at the daily fixing. Conditions have been quieter, but there have been further liquidations of holdings and prices have continued to rule well below dollar parity. Most of the offerings have been taken for shipment to New York. Further rumours from Washington were received on April 20th to the effect that measures for checking the inflow of gold into the United

States of America continued to be the subject of deliberations, but later it was again categorically denied in official quarters that a tax on gold imports, an increase in handling charges, or any other device which would lower the price, is being considered. The denial stated that it is felt that, under existing conditions, the United States has much more to gain in the long run by absorbing the gold and maintaining the existing price than by changing it and thus upsetting international stability.

The S.S. "Ranchi," which sailed from Bombay on April 17th, carries gold to the value of about £373,000.

SILVER MARKET

Quiet conditions continued, but with buyers disposed to hold back, the tendency of the market was easier and prices showed a decline on the week, to day's quotations of 20½d. for cash and 20¾d. for two months' delivery comparing with 20½d. for both deliveries a week ago. There have been no new features, offerings again consisting mainly of sales on China account and speculative resales, and although the Indian bazaars bought, demand was less keen and proved insufficient to maintain prices. Sellers may hesitate should prices go lower, but any marked recovery appears unlikely unless Indian demand improves.

Quotations for gold and silver are shown below:—

1937	Price of Gold per Fine Ounce	Equivalent Value of £ sterling	Price of Bar Silver in London per ounce standard		Price of Silver New York per ounce fine
			Cash	Two Months	
April 15.....	141 6	12 0-09	20½	20½	April 14 48
" 16.....	141 5½	12 0-13	20½	20½	" 15 45½

KLEINFONTEIN ESTATES AND TOWNSHIP.—Interim dividend, 20 per cent., compared with 10 per cent.

GOODE, DURRANT AND MURRAY.—Dividend to be paid for full year on the 7 per cent. preference shares.

NEW TRANSVAAL GOLD FARMS.—Dividend of 12½ per cent., equal to 3d. per share.

BRITISH CELANESE.—Half year's dividend due April 30th, on the 7 per cent. first cumulative preference shares will be paid. A decision on the payment of a dividend on the 7½ per cent. second preference shares will be made at the close of the financial year in June.

MUREX, LTD.—Interim dividend, 7½ per cent. on 1,000,000 £1 shares, against 10 per cent. on 553,500 £1 shares a year ago.

CEREHOS, LTD.—Final dividend, 30 per cent., making 40 per cent. as before, but is paid on a capital of £1,000,000 compared with £750,000 a year ago.

CENTRAL ARGENTINE RAILWAY.—Interim dividend of 2½ per cent. on the 4½ per cent. preference stock. Dividends were resumed last year with a payment of 3½ per cent. in November.

CABLE AND WIRELESS (HOLDING), LTD.—Directors recommend a dividend of 5½ per cent. on the preference stock out of profits for 1936.

CLAN LINE STEAMERS.—Final dividend, 15 per cent., making 20 per cent. for 1936. Same as for 1935, but paid on £150,000 extra capital.

MAWCHI MINES, LTD.—Final dividend, 60 per cent., against 45 per cent., making 82½ per cent. for year, against 65 per cent.

ANGLO-AMERICAN DEBENTURE CORPORATION.—Final dividend of 8½ per cent., against 7½ per cent., making 12 per cent. for year, against 11 per cent.

SELECTION TRUST, LTD.—Dividend of 1s. per share, against 6d. per share, also bonus of 6d. per share, against nil.

TOBACCO SECURITIES TRUST.—Interim dividend maintained at 5 per cent.

BABCOCK AND WILCOX.—Final dividend, 6 per cent., against 4 per cent., making 10 per cent. for year, against 8 per cent. for 1935.

PHILIP HILL AND PARTNERS.—First interim dividend, 12½ per cent.

TELEPHONE MANUFACTURING.—Final dividend, 6½ per cent., against 5 per cent., making 9 per cent. for 1936, against 7½ per cent. for 1935.

KLEINFONTEIN ESTATES AND TOWNSHIP.—Interim dividend 20 per cent., against 10 per cent.

AULT AND WIBORG.—Final ordinary dividend, 13½ per cent., making 17 per cent. for year to March 31st., compared with 12 per cent.

SAN PAUL (BRAZILIAN) RAILWAY.—Tax free ordinary dividends; 3 per cent. final, making 5 per cent., against a single payment of 2½ per cent. for 1935.

FORD MOTOR COMPANY.—Ordinary dividend 6 per cent. for 1936, compared with 5 per cent. for 1935.

(s) The reduction in profit is due to the suspension of operations from 19th March to 22nd March inclusive resulting from the underground fire.

(t) The tonnage milled includes 15,000 tons from low grade surface dumps accumulated during the development period.

TRANSVAAL OUTPUT, EMPLOYMENT AND WORKING PROFIT.—Gold output, March, 1937: Witwatersrand, 959,718 fine ounces; outside districts, 22,586 fine ounces; total, 982,304 fine ounces. Value for purposes of declaration, £7 2s. 0d. Total output, February, 1937: 922,941 fine ounces. The number of natives employed at end of March was: Gold mines, 309,634, coal mines, 15,248; total, 324,882. Total estimated working profit for March, 1937: Witwatersrand, £2,708,056; outside districts, £9,254; total £2,717,310. Comparable figures for February, 1937: Witwatersrand, £2,567,261; outside districts, £8,844; total £2,576,105.

SHORTER COMPANY COMMENTS

(Continued from page 228)

MISCELLANEOUS

KREUGER AND TOLL.—The administrators propose to pay the non-privileged creditors a dividend on account of 26 per cent. Dividend on the secured debentures brought into the reconstruction scheme will be Kr.919-52 per \$1,000 and Kr.459\$78 per \$500 nominal. Dividends on the debentures not brought into the plan will be Kr.932-18 per \$1,000 and Kr.466-11 per \$500 debenture.

CABLE AND WIRELESS, LTD. (Index Numbers).—Monthly figures reduced to working day average. Working day average of comparable receipts, year 1929 = 100. Index number, March, 1937, 90-6 compared with 84-6 for February, 1937, and 76-0 for March, 1936. The March total is the highest for that month since 1930, when the index number was 94-5. It has only been exceeded twice since—on April, 1930, 94-9, and in December, 1936, when it was 96-4. For table showing monthly index since beginning of 1930 see *The Economist*, January 23, 1937, page 214.

SHELL UNION OIL CORPORATION.—Net profit for the first quarter of 1937 amounted to \$3,674,479 (about £734,900), against \$1,681,984 (£336,400).

BOWATER'S PAPER MILLS, LTD.—Negotiations have been concluded with the Swedish woodpulp firm of Scharins Soner. The present productive capacity of these mills is over 130,000 tons of ground-wood pulp per annum, but they are designed to be readily capable of expansion.

J. & J. COLMAN, LTD.—Net profit for 1936 £518,809, against £500,239. Ordinary dividend maintained at 16 per cent. To general reserve £82,742, against £100,000, and £40,000 to contingency and development reserve, against nil. Carry forward £85,347, compared with £85,183 brought in.

DARWIN'S CAPITAL SCHEME.—It is proposed that all preference dividend arrears be cancelled and that others be issued. For every £1 "A" preference share 10s. 5 per cent. convertible debenture stock and 1½ 10s. ordinary shares, for every five £1 "B" preference shares four 10s. ordinary shares, and for every five £1 ordinary shares one 10s. ordinary share.

HENRY BERRY CAPITAL SCHEME.—Proposed to reduce the capital from £120,000 to £110,000 divided into 12,000 £5 preference share. Ordinary shares of 16s. 8d. to be divided into five ordinary shares of 3s. 4d. each. Preference shareholders will receive 60,000 of these shares in satisfaction of dividend arrears down to December 31, 1935.

ARMY AND NAVY STORES.—Gross profits for year to January 30, 1937, amounted to £703,940, compared with £660,296 for previous year. Ordinary dividend and bonus 15 per cent., compared with 12½ per cent. To pensions redemption fund and £2,000 to Indian good service fund. Carry forward, £124,871.

BRITISH MARINE AIRCRAFT.—At a meeting of the committee of shareholders held April 19th, it was decided to apply for a stay of liquidation and the discharge of the liquidator. At a meeting of shareholders, on April 16th, a resolution was passed to this effect.

MASSON SCOTT AND COMPANY, LTD.—The statutory report shows a cash balance of £24,459. The chairman pointed out at the meeting on April 22nd that in addition to extensions to plant and factory to cope with ever increasing work, they had practically concluded negotiations for the absorption, on favourable terms, of an engineering firm manufacturing some of their most essential components. This should substantially benefit future profits. After paying for this business and the new buildings and plant, their liquid resources would remain sufficient for requirements. As regards the future, he pointed out that there is a great demand for paper in all forms, newsprint, wrapping materials, etc.

THE PENNSYLVANIA RAILROAD

SUMMARY OF ANNUAL REPORT FOR 1936

THE 90th Annual Report of the Pennsylvania Railroad Company covering operations for 1936 will be presented to the stockholders at the annual meeting on April 13, 1937. The report shows that total operating revenues increased over 1935 by \$73,613,003 or 20%, but continued subnormal, being 35% below the annual average for 1925-1929. Operating expenses increased \$50,987,517 (due principally to increased business and larger expenditures for necessary current maintenance and to improve the general condition of the road and equipment). Net income was \$38,742,091, as compared with \$23,962,586 in 1935. Surplus for 1936 was equal to 4.8% upon the outstanding Capital Stock as compared with 2.8% in 1935. Surplus per share (par \$50) was \$2.38 as compared with \$1.38 in 1935.

OPERATING RESULTS

	1936	Comparison with 1935 Increase or Decrease
TOTAL OPERATING REVENUES were.....	\$441,425,189	I \$73,613,003
TOTAL OPERATING EXPENSES were.....	314,087,701	I 50,987,517
LEAVING NET REVENUE FROM RAILWAY OPERATIONS OF.....	127,337,488	I 22,625,486
Taxes amounted to.....	34,714,149	I 9,479,724
HIRE OF EQUIPMENT, JOINT FACILITY RENTS, etc., were.....	8,442,746	D 640,190
LEAVING NET RAILWAY OPERATING INCOME OF.....	84,180,593	I 13,785,952
INCOME FROM INVESTMENTS AND OTHER SOURCES amounted to.....	36,119,533	D 406,678
MAKING GROSS INCOME OF.....	120,300,126	I 13,379,274
RENTAL FOR LEASED LINES, INTEREST ON THE COMPANY'S DEBT AND OTHER CHARGES amounted to.....	81,558,035	D 1,400,231
LEAVING NET INCOME OF.....	38,742,091	I 14,779,505
APPROPRIATIONS TO SINKING AND OTHER FUNDS, etc.,	7,342,740	I 1,508,550
SURPLUS (Equal to 4.8% on Capital Stock).....	31,399,351	I 13,270,955

Dividends aggregating 4% (\$2.00 per share) were paid during the year. The dividend of 2% paid on December 21, 1936, was charged against 1936 income. Expenses incurred on account of floods and for retirement of property during the year aggregating \$24,794,575 were charged to Profit and Loss.

The Pennsylvania Railroad cordially invites the active interest of its stockholders and bondholders in getting people to travel and ship via The Pennsylvania Railroad.

M. W. CLEMENT, President

THE PENNSYLVANIA RAILROAD

SHIP AND TRAVEL VIA PENNSYLVANIA

Stockholders can obtain copies of the Annual Report from

J. Taney Willcox, Secretary, Broad Street Station Building, Philadelphia, Pa.

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

RATHER irregular conditions were the feature of the commodity markets this week. The decline in prices initiated a fortnight ago continued, though with diminished force.

The wheat market remained rather depressed, and there is no immediate prospect of much recovery. Meat prices showed little change, while butter and cheese rose slightly. The sugar market appears to be taking an increasingly gloomy view of the prospects of the conference for the price was once again marked down.

Tea prices continued to rise after some tendency last week to share the decline in rubber, but in the equally speculative cocoa market prices fell, and there is no sign that rubber prices will shortly renew the increases of a few weeks ago. Speculators seem to have learnt caution in the last few days, but there is the unwelcome possibility, which seems to have been realised to a small extent on Wednesday, that the Chancellor's new tax will shift speculative funds out of the stock market into commodity markets, and more especially into non-ferrous metals. These quotations have continued to slump very rapidly, but in the last day or so the collapse appears to have been arrested. Wool remained firm, but cotton and jute prices were once again weak.

In the United States, primary product prices have followed the same trend. Moody's Index of staple commodity prices (December 31, 1931 = 100) fell to 214.9 on April 21st, against 217.3 on April 14th, 221.4 a month ago, and 171.3 a year ago.

COAL

NEWCASTLE-ON-TYNE.—Demand for all classes of fuel in this area is as heavy as ever, and little change in the general position is likely to take place this year. Northumberland screened coals are heavily sold for delivery this year, the only free coal being in the hands of a few contractors, who can obtain 22s. per ton f.o.b. for Prime Blyth screened classes. Durham collieries are now about fully booked for this year, and prices continue to rise. Coking coal is extremely difficult to obtain for the export market, owing to the increasing home requirements.

SHEFFIELD.—Conditions on the export coal market show little change. Coal for prompt shipment is in good demand, but there is difficulty in obtaining supplies, especially of bunkers. Enquiries for forward delivery are good, and prices remain firm. On the inland market the demand for industrial fuel is brisk. The scarcity of coke, due to the shortage of coking slacks, is causing some difficulty and prices continue to rise. Household coal is still active, but requirements are likely to lessen shortly, thus releasing additional tonnages for the growing industrial demand.

GLASGOW.—Owing to the lack of supplies and the reticence of the collieries in committing themselves very far ahead, new business is now declining. This is particularly the case in the shipping trade, where there have been enquiries circulating for business into next year. Most of the collieries are booked up for a good many weeks to come, and they are loth to take on new business which may involve delivery delays. Home trade remains active, with industrial demands continuing on a large scale. There is a good deal of buying to replenish stocks. The market tone remains strong, and prices continue to rise.

CARDIFF.—Active conditions continue in the South Wales coal trade, and there has been a further advance in current market quotations, particularly for Monmouthshire semi-bituminous coals. These grades had been lagging behind the movement in best steam qualities, but Black Veins are now quoted up to 25s. 6d. and Western Valleys up to 24s. 6d. Bunker smals and all classes of washed coals are also firmer. During March the average declared f.o.b. value of all coals exported from South Wales was approximately 1s. per ton higher than in February, and in view of the terms on which contracts have been renewed recently, April is practically certain to show a further increase. Exports in the foreign and coastwise trades last week totalled 455,300 tons, the largest weekly figure since July, 1932, and the aggregate trade up to April 18th shows an increase of just under a million tons compared with the corresponding period last year. Output is steadily expanding, and indications point to a further expansion in exports. Furnace coke prices have increased further, and are quoted at 30s. to 35s. Patent fuel is unchanged at 23s. 6d.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates that whilst most of the steelworks are operating practically at capacity new business has been on a restricted scale. Transactions are limited as the majority of consumers have covered their requirements so far as possible, whilst the steelworks are generally booked as far ahead as is considered prudent under existing conditions. The world scarcity of steel is still acute and arrivals of steel from Cartel countries are considerably in arrears.

In the pig-iron department heavy quantities are passing into consumption, but the volume of business has been comparatively light. The producing works are making great efforts to meet the needs of the consuming industries; but are handicapped by the difficulty of obtaining adequate supplies of ore and fuel. Attempts are being made to secure material from abroad, so far with only partial success owing to the stringency which prevails in the world's markets.

The position in the semi-finished steel department does not materially change, and pressure to obtain supplies is unrelaxed. The British works are operating at capacity, but abnormally low imports of Continental steel are affecting operations at the consuming works. Later, however, a slight improvement has been noticeable in the position. The demand for finished steel is still insistent on home and overseas account and shows no signs of declining.

MIDDLESBROUGH.—There is no change in the stringent position of iron and steel in this area. Owing to the substantial advance in the price of raw materials over the last few weeks, it is anticipated that a new price schedule will soon be issued for all classes of material. Current output of both Cleveland foundry pig iron and East Coast Hematite Mixed Numbers

is going into consumption, either at makers' own works or to their regular customers. Every effort is being made to increase outputs. Steel makers are experiencing an abnormal demand for all classes of material, and, in the absence of increased supplies of Continental semi-manufactured steel, re-rollers are having difficulty in carrying out their programmes. Foreign ore is subject to special bargaining, owing

February witnessed a further increase in the daily output of zinc, according to the *Metalgesellschaft* figures. The daily rate of production was up from 3,987 metric tons in January to 4,058 metric tons in February. In view of the fact that ample quantities of zinc are available, the increase in the output was surprisingly small. It appears that the refineries are encountering difficulty in bringing idle plant into production after so long a spell of inactivity.

Sales of lead on the London Metal Exchange: 2,000 tons on Monday, against 4,000 tons last week; 2,500 tons on Tuesday, against 2,750 tons last week; 3,000 tons on Wednesday, against 1,250 tons last week. The New York quotation on Wednesday was 6-90 cents per lb., against 6-00 cents a week ago and 6-95 cents a month ago. The official closing quotation in London for soft foreign for shipment during the current month was £24 11s. 3d. per ton, compared with £25 13s. 9d. a week ago.

Sales of spelter on the London Metal Exchange: 4,500 tons on Monday, against 2,500 tons last week; 5,500 tons on Tuesday, against 3,250 tons last week; 3,250 tons on Wednesday, against 1,500 tons last week. Wednesday's quotation in East St. Louis was 6-75 cents per lb., against 7-00 cents the week before and 7-50 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £23 13s. 9d. per ton, against £26 2s. 6d. last week.

TIN.—After slumping heavily from £275 15s. to £249 per ton, the cash price recovered to £261 per ton on Wednesday. Heavy liquidation in the early part of the week had its full effect on prices, since American consumers remained out of the market. United States deliveries exceeded consumption by at least 5,000 tons in the first quarter of the year, so that requirements are not large at the moment. Turnovers may therefore continue on a small scale for some time. But, in the absence of a substantial surplus of supplies, the tin market is likely to be at least as strong as the metal markets in general.

Sales of tin on the London Metal Exchange: 975 tons on Monday, against 425 tons last week; 925 tons on Tuesday, against 750 tons last week; 575 tons on Wednesday, against 300 tons last week. The New York quotation on Wednesday was 58-00 cents per lb., against 60-87½ cents a week ago and 64-00 cents a month ago. Wednesday's official closing quotation in London for standard cash was £261 to £262 per ton, compared with £275 15s. to £276 5s. a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 2,025 tons, a decrease of 23 tons on the week.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted on Wednesday at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was quoted at £14 7s. 6d. per flask of 76 lb., the same as last week. Chinese antimony was quoted at £79 to £80 per ton ex warehouse, the same as last week. Chinese wolfram for "April-May" shipment was quoted at 60s. to 63s. per unit, c.i.f., compared with 61s. to 64s. last week. Refined platinum was steady on Wednesday at £11 15s. an ounce.

TEXTILES

COTTON.—Manchester.—The Budget proposals regarding the new form of taxation have caused some considerable alarm, for it is held that the cotton industry, which is recovering slowly from the ten years' depression, will be severely penalised. The fall in raw cotton prices in Liverpool has been rather severe. The decline in American qualities is around ½d. a lb. from the high level registered at the beginning of the month. The rumour that President Roosevelt intended to reduce the buying price of gold was the immediate cause of the slump, but although this rumour was denied there continues an easy feeling, despite the rising trend of world consumption.

Business in yarns has not been at a standstill, but the turnover has been smaller than recently. The mills, however, remain busy, completing old contracts.

Business in cloth has not been much affected by the decline in raw cotton prices. Even when prices were falling, buyers continued to place orders, with the result that a considerable business has been done for many of the outlets abroad, but chiefly for India. It is reported that some of the leading merchant houses have now secured their requirements up to the end of the year. A fair miscellaneous trade has also been done for many of the smaller markets, including Java, South America, the Continent, and the Dominions. There has been less activity in the home trade section, for many buyers have satisfied their requirements.

JUTE.—Dundee.—Raw jute prices have not maintained their recent advance, and they have declined by about 20s. per ton. The fibre market is influenced by weather reports, and the effect it is having on the progress of sowings of the new crop. Lack of rain was in a large measure responsible for the higher prices for raw jute, but, though some beneficial showers have fallen in most districts, more rain is urgently required if sowings in the low lands are to be completed in time. A good crop is required for next season owing to the increase in consumption. The present crop is likely to yield about 10,500,000 bales, but the total consumption of the world has increased to 11,000,000 bales per annum. The deficiency will have to be met from stocks in the hands of consumers, most likely the Indian Mills, as the quantity being exported from India this season shows an increase and is probably sufficient to meet the needs of other producing countries. Since the first week of February, a number of the Indian Mills have been idle through strikes, and production is being curtailed by about 30 per cent. The average monthly consumption of hessian cloth in America during the first three months of this year was 79 million yards, compared with 64 million yards during the whole of 1936.

The full group Daisee 2/3 is now obtainable at £21 10s. per ton, and

fours at £19 2s. 6d.; Tossa 2/3 at £21 5s., and fours at £20 10s., April/May. Good First Marks are nominal, and Lightnings are offered at £22 17s. 6d., while Hedges have been sold at £21 6s. 3d., April/May. Dundee spinners are buying little meantime, as they are already well bought for this season. They are now awaiting offers of the new crop, which sellers are very reluctant to make this year.

Jute yarns are firmly held, as spinners are very busy and well sold ahead. Common 8 lb. cops are not under 2s. 3d., and 8 lb. spools 2s. 4d. Twist is selling at 4½d. for 3 ply 8 lb., and sacking yarns at 2½d. for 24 lb. web and 3½d. for 8 lb. chains. Rove is firm at £21 10s. for 48 lbs. and £17 5s. for 200 lb., while the finer yarns are in quite a strong position at 2s. 11d. for second quality 8 lb. warp, 2s. 8d. for third and 2s. 6d. for fourth. Carpet yarns are firm at 3½d. lowest for 14 lb. warp.

Buyers are trying to purchase at less than 2½d. for 10 oz. 40 in. and 2½d. for 8 oz., but manufacturers are satisfied with their sales for the present and refuse to make concessions. A good inquiry prevails, but business is only moderate.

Calcutta goods have fluctuated in sympathy with the variations in the strike position in Calcutta, but they continue to rule well above the lowest points recently touched.

GRAIN MARKETS

WHEAT.—On Wednesday last, "May" futures were quoted in Chicago at 134½ cents per bushel, against 137½ cents the week before and 139½ cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba, ex ship, 54s. 3d. to 56s. 3d., per 496 lbs., as against 55s. 9d. to 57s. 9d. a week ago, No. 2 Northern Manitoba, ex ship, 53s. 6d. to 55s., as against not quoted a week ago. According to the Corn Trade News, total shipments of wheat and flour last week amounted to 1,579,000 quarters, against 1,677,000 quarters in the previous week and 811,000 quarters in the corresponding week a year ago.

Prices continued to decline sharply for the greater part of the week, though later some recovery showed itself. The futures market appears to have been technically weak enough for the gold scare of a fortnight ago to have had persistent effects. At the same time the rising crop estimates and the practical completion of Continental buying have had a depressing effect. The volume of wheat on transit to Europe is declining.

FLOUR.—Wednesday's London quotations (excluding quota pay, ments) were: Straight run, delivered Home Counties, 43s. 6d. per 280 lbs., as against 45s. 6d. a week ago; delivered inner London, 43s., as against 45s. a week ago. Manitoba patents, ex store, 40s. 6d. to 42s. 0d., as against 42s. 9d. to 44s. 3d. a week ago. Australian, ex store, 43s. 9d. to 35s. 6d., as against 35s. to 35s. 6d. a week ago.

A parallel decline took place in the flour market, and bakers have been buying very little.

BARLEY.—"May" futures were quoted at 69 cents per bushel in Winnipeg on Wednesday, against 72½ cents a week ago. Quotations per 448 lbs. in London on Wednesday were: English "feed," at farm, 36s. to 38s., as against 36s. to 38s. a week ago; "English malting," at farm, 38s. to 45s., against 38s. to 45s. last week. Californian (new), ex ship, 53s. 6d., as against 49s. to 55s. a week ago. Chilean, brewing (new), ex ship, 44s. 9d. to 50s., against 44s. 9d. to 50s. a week ago.

Conditions were dull, though there is no prospect of substantial falls.

OATS.—On Wednesday, "May" futures were quoted at 49½ cents a bushel in Chicago, against 50½ cents a week ago and 47 cents last month. Quotations in London, Wednesday: "Plate," landed, 28s. 9d., as against 29s. 6d. a week ago; "Plate," ex ship, 27s. 9d., as against 28s. 6d. a week ago; "Plate," April (new), 27s. 6d., as against 28s. a week ago; yellow maize meal, ex wharf, was quoted at £7 7s. 6d. to £7 10s. per ton, as against £7 10s. to £7 12s. 6d. a week ago.

MAIZE.—"May" futures were quoted on Wednesday at 128½ cents per bushel in Chicago, against 126½ cents a week ago and 110 cents last month. Quotations in London, Wednesday: "Plate," landed, 28s. 9d., as against 29s. 6d. a week ago; "Plate," ex ship, 27s. 9d., as against 28s. 6d. a week ago; "Plate," April (new), 27s. 6d., as against 28s. a week ago; yellow maize meal, ex wharf, was quoted at £7 7s. 6d. to £7 10s. per ton, as against £7 10s. to £7 12s. 6d. a week ago.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1935-37:—

Nearest Future	Jan. 2, 1935	Dec. 31, 1935	April 22, 1936	Dec. 30, 1936	Apr. 14, 1937	Apr. 21, 1937
Winnipeg (No. 1, Manitoba) —Cents per 60 lb.	82½	84½	82½	129	141½	136½
Chicago (No. 2, Winter) —Cents per 60 lb.	98½	101½	101½	135½	137½	134½

The visible supply of wheat in Canada amounts to 77,934,000 bushels, against 80,927,000 bushels last week, and 111,378,000 bushels in the corresponding week last year.

SALES AND PRICES OF BRITISH CEREALS.—The following table gives the estimated sale of home-grown wheat during the harvest years 1933-34 to 1936-37:—

	1933-1934	1934-1935	1935-1936	1936-1937
Estimated sales of home-grown wheat—	Cwts.	Cwts.	Cwts.	Cwts.
1 week to April 17.....	160,232	145,394	154,083	252,807
33 weeks to April 17.....	9,675,972	11,532,785	11,495,692	9,031,714
Average price of English wheat per cwt.	s. d. 4 4	s. d. 4 10	s. d. 6 6	s. d. 10 2

The following is a statement showing the quantities sold and the average price of British cereals in the past two weeks, and for the corresponding weeks in each of the years from 1933 to 1936:—

Week ended	QUANTITIES SOLD			AVERAGE PRICE PER CWT.		
	Wheat	Barley	Oats	Wheat	Barley	Oats
April 15, 1933.....	Cwts. 85,580	Cwts. 30,850	Cwts. 14,944	s. d. 5 2	s. d. 6 4	s. d. 5 10
April 14, 1934.....	160,232	20,158	24,154	4 4	7 11	5 11
April 20, 1935.....	145,394	39,281	13,484	4 10	7 2	7 0
April 18, 1936.....	154,083	28,964	25,206	6 6	6 11	6 11
April 10, 1937.....	240,329	45,453	38,728	10 0	10 1	8 4
April 17, 1937.....	252,807	35,231	40,653	10 2	10 2	8 6

OTHER FOODS

BACON.—Demand remains moderately active and the market has a steady tone. The official quotations (per cwt. for No. 1 Sizable) which formed the basis for dealings on the London Provision Exchange this week were: English, 92s. to 96s.; Canadian, 87s.; Danish, 95s.; against 92s. to 96s., 85s., and 95s. last week. Arrivals in London last week included: Danish, 13,872 bales; Canadian, 6,659; Dutch, 2,571; Lithuanian, 1,106; and Polish, 2,687; as against 14,077, 6,485, 2,407, 1,180 and 3,209 bales, respectively, in the previous week.

BUTTER.—Colonial makes have again been a firm market, with Danish slightly easier. Quotations (per cwt.) on the London Provision Exchange on Wednesday were: New Zealand, finest salted, 108s.; Australian, choicest salted, 107s.; Danish, 114s.; compared with 105s., 105s. and 115s., respectively, a week ago.

CHEESE.—The market has had a steady tone, with prices a shade higher on the week. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: English, finest farmers, 89s. to 96s.; Canadian, finest coloured, 75s. to 76s.; and New Zealand, finest coloured, 68s. to 69s., against 89s. to 96s., 74s. to 75s. and 68s., respectively, a week ago.

COCOA.—Prices are again slightly lower on the week. The spot quotation in New York on Wednesday was 9½ cents per lb., as against 9½ cents per lb. last week. In London, on Wednesday last, good fermented new crop, Accra, "April-May," was quoted at 44s. 6d. per 50 kilos, c.i.f. Continent, against 45s. a week ago. Last week's movements of cocoa in London were as follows: Landed, 23,895 bags; delivered, for home consumption, 3,762 bags; exported, nil; stocks, 280,523 bags, against 156,792 bags a year ago.

COFFEE.—The spot markets in London and New York have been quietly steady. On Wednesday, Rio No. 7 (cash) was quoted at 9 cents per lb. in New York, as compared with 9 cents per lb. last week and 9½ cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, 3 cwt.; delivered, for home consumption, 118 cwt.; exports, nil; stocks, 2,367 cwt., against 11,519 a year ago. Central and other South American: Landed, 7,739 cwt.; delivered for home consumption, 4,859 cwt.; exported, 1,258 cwt.; stocks, 105,250 cwt., against 117,552 last year. Other kinds: Landed, 5,015 cwt.; delivered, for home consumption, 6,911 cwt.; exported, 1,122 cwt.; stocks, 125,630 cwt., against 171,016 last year.

EGGS.—In consequence of rather smaller arrivals, prices were occasionally firmer this week. At Smithfield, on Wednesday, English (ordinary packing, Grade 1, about 15-15½ lb.) realised 9s. 6d. to 10s. per 120, as against 9s. 3d. to 9s. 6d. last week; while Danish (15½ lb.) made 8s. 6d. to 8s. 9d., as against 8s. 3d. to 8s. 6d. last week.

FRUIT.—Business at Covent Garden has continued steady, says *The Fruitgrower*, most of the regular seasonal lines moving well. For apples a consistent demand is maintained at satisfactory rates. Pears also continue in steady request. Supplies are generally on the short side, and prices are consequently inclined firmer for both South African and Australian. The season for South African plums has now practically finished. The slowly increasing supplies of forced strawberries meet a fairly steady sale at from 6s. to 10s. per lb., and up to 12s. for the finest samples. A few English peaches have put in an appearance. South African grapes are firmer on an active demand, but melons from the same source are rather easier. Limited supplies of French box cherries are on the market. Grapefruit and oranges are frequently of poor quality. Quotations for lemons show little change.

MEAT.—Demand at Smithfield has been quiet for fresh and chilled beef and for fresh mutton and lamb; but frozen meat has been a rather more active item. On Wednesday last, Argentine chilled hindquarters were quoted at 3s. 8d. to 4s. per 8 lbs., as compared with 3s. 8d. to 4s. a week ago. New Zealand frozen mutton was 3s. 4d. to 4s. per 8 lbs., against 3s. 4d. to 4s. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 9,149 tons, an increase of 950 tons on the corresponding week last year. Beef and veal accounted for 4,937 tons, mutton and lamb 2,790, and pork and bacon 929, as compared with 4,303, 2,327 and 1,059 tons, respectively, in the same week of 1936.

PEPPER.—On Wednesday, Singapore white Muntok, spot, was quoted at 6d. per lb. in bond, against 6d. per lb. a week earlier. Black Lampung, spot, in bond, was quoted at 3d. per lb. sellers, compared with 3½d. per lb. last week. Movements of pepper in London last week were as follows: Black, landed, nil; delivered, 12 tons; stocks, 1,799, against 1,700 last year. White, landed, 53 tons; delivered, 51 tons; stocks, 11,685, compared with 12,492 a year ago.

RICE.—The spot price of Burma No. 2, cleaned, was 10s. per cwt. ex warehouse, on Wednesday, as compared with 10s. per cwt. a week ago. "April-May," in singles to Continent and U.K., was quoted at 9s. 1½d. per cwt., against 9s. 3d. last week. Movements in London last week were as follows: Landed, 4 tons; delivered, 43 tons; stocks, 1,047 tons, against 977 a year ago.

SUGAR.—The spot markets have been fairly steady this week. The New York spot quotation was 3-50 cents on Wednesday, as compared with 3-45 cents per lb. last week and 3-45 cents per lb. a month ago. Wednesday's sales of raw sugar in London included "May" delivery at 6s. 2d. to 6s. 3d., against 6s. 4d. to 6s. 4½d. a week ago. Movements of raw sugar in public warehouses in London and Liverpool last week were as follows: Imports, 5,082 tons, against 15,100 in the previous week and 23,357 in the same week of 1936; deliveries, 18,994 tons, against 18,776 and 14,370 tons, respectively; stocks, 184,737 tons, against 198,649 and 230,576 tons, respectively.

TEA.—The following table shows the average prices (compiled by the Tea Brokers' Association) of tea sold in Mincing Lane on Garden Account in recent weeks:—

Week ended	Northern India	Southern India	Ceylon	Java	Sumatra	Africa	Total
Apr. 7, 1936.....	d. 12-73	d. 14-74	d. 15-95	d. Nil	d. Nil	d. 11-78	d. 14-30
Mar. 11, 1937.....	14-29	15-01	16-82	14-18	12-38	13-34	14-92
Mar. 18, ".....	14-37	15-05	17-03	14-13	12-56	13-61	15-02
Mar. 28, ".....	14-97	15-81	17-27	Nil	Nil	13-91	15-81
Apr. 8, ".....	14-99	16-03	17-67	15-64	13-26	14-22	15-65
Apr. 15, ".....	14-82	15-83	17-66	14-15	12-94	13-83	15-47

At this week's public auctions in Mincing Lane, 44,239 packages of Indian and 19,342 packages of Ceylon tea came up for disposal. After last week's lull, the market in Indian grades had a stronger tone, and prices for ordinary and medium kinds advanced under keen bidding. There was a very firm market for the plainest Ceylon teas, but mediums showed an irregular decline. High grown teas also sold at lower prices.

VEGETABLES.—At the rather lower prices now ruling, the increasing supplies of English and Guernsey tomatoes are meeting a steady sale, says *The Fruitgrower's* Covent Garden report. Cucumbers, although more abundant, are in good demand and hold their price. Lettuce and radishes sell well, while asparagus is in fair demand. House-grown beans are firmer, and Guernsey new peas are quoted at 1s. 9d. to 2s. 6d. per lb. Kitchen vegetables in general are rather easy in price on plentiful supplies. Meanwhile, old potatoes remain in moderate demand at the various London markets, prices showing little change on the week. Thus, at the Borough on Tuesday, best siltland King Edward again made from 10s. to 11s. per cwt. New potatoes are now receiving more attention, Spanish Mataro being quoted at 27s. to 28s. per cwt. at Covent Garden.

MISCELLANEOUS COMMODITIES

VEGETABLE OILS AND OLSEEDS.—Markets have recovered fairly well from the recent setback, and more trade is in evidence. Linseed is in improved demand, more particularly the Indian varieties, and up to £14 13s. 9d. per ton has been paid for Calcutta, April shipment to Hull. Enquiry for Plate seed, however, is negligible, the main support coming from the Continent. The Argentine Government has notified that the exportable surplus on April 17th was 760,000 tons. To date, over 850,000 tons have been exported, and of this 328,000 tons have been for the United States and Canada, against only 103,000 tons during the same period last year. Shipments to Europe (including small quantities from India) have been 56,000 tons more than a year ago. The attention of English crushers is now turned to the new Indian crop, the shipment of which so far has been very tardy, mainly owing to the difficulty in obtaining freight space. Private estimates suggest the probability of 350,000 tons being available for export, but this is considered too optimistic. Even should India export freely, which may depend on the level of prices, world supplies of linseed are likely to be rather less than was actually shipped in the remainder of last year. The quantity on passage to Europe has further diminished, and is 147,800 tons (including 13,200 tons from India) or 27,000 tons less on the week. Linseed oil, which declined sharply last week, has recovered about 20s. per ton, and is in improved demand. There is some demand for Egyptian cotton seed in near positions, and up to £9 5s. has been conceded for "afloat." Forward positions are neglected. Meanwhile, cotton oil prices are maintained at recent levels with a fair demand on home account and for export.

RUBBER.—Liquidation of speculative commitments has again been heavy, and prices have fluctuated to lower levels. Meanwhile, home trade deliveries remain good, and United Kingdom stocks continue their gradual decline. The spot price in New York on Wednesday was 23½ cents per lb., compared with 22½ cents per lb. a week ago and 24½ cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 11½d. per lb., as against 11½d. on the corresponding day last week. In forward positions, business has been done at 11½d. to 11½d. for "May" shipment, as against 11½d. to 11½d. a week ago. Stocks in London and Liverpool at the end of last week totalled 50,362 tons, against 50,802 tons a week earlier. A year ago stocks amounted to 143,337 tons.

FURS.—Last week's sale of Australian furs was followed this week by the Hudson's Bay auction of Canadian skins. For the second time in the history of the company the Hudson's Bay catalogue included also a small collection of South-West African Persian lamb skins. Neither the offerings nor the sales were representative. Owing to the smaller catches the number of skins offered was comparatively small and the quality not always good. Nevertheless, demand was keen and prices firm. In practically all cases prices realised were practically the same as during the winter sale, but as the quality was frequently inferior, the quotations indicated a further slight rise in prices. Demand came mainly from London and Paris dealers. In addition, the United States and Eastern Europe (Poland, Czechoslovakia, Roumania) absorbed a substantial proportion of the offerings.

BANK OF LONDON & SOUTH AMERICA LIMITED

Affords a complete international banking service through its branches in

ARGENTINA, URUGUAY, PARAGUAY
CHILE, COLOMBIA, ECUADOR
GUATEMALA, NICARAGUA, PERU
SALVADOR, VENEZUELA, BRAZIL

impossible to reduce tariffs to other countries. In certain cases they actually involved the raising of tariffs against third parties. In no single respect did Ottawa diminish the barriers against the trade of foreign countries; and in fact—as the figures show—it definitely hampered them. Though the British tariff is not high, the trade involved is so large that Ottawa and the British tariff together have constituted the greatest obstacle erected against the trade of foreign countries since the crisis of 1929.

The importance of this consideration is urged this week in a notable document issued by the Economic Committee of the League of Nations Union. In their opinion "there is a grave danger that intra-imperial commercial arrangements which are exclusive in form may constitute not merely an impediment to the restoration of trade outside the area they cover, but also an impediment to a restoration of stable international relations." The Economic Committee go on to emphasise the necessity for the British Government, if they desire to effect such a restoration, to make "certain important changes in policy in this respect."

At the same time, we have set our face against anyone following the example of the Empire. In present conditions few, probably no, nations are prepared to throw their doors wide open. But, in order to break the vicious circle, attempts have been made to set up low tariff regions or groups which, though falling short of complete customs unions, would involve reduced tariffs on a preferential basis to the members of the group. This means a departure from most-favoured-nation treatment; but the schemes meet this objection by offering the advantage of the preferential terms to any country that will reciprocate. Up to this day, this country has blocked these schemes by insisting on its treaty rights and demanding the advantages without making any of the concessions. It is, however, significant that two years ago the United States departed from its traditional attitude so far as to bless the principle of agreements of this kind in the Monte Video resolutions of the Pan-American Congress.

Even our individual commercial treaties are the subject of criticism; for it is claimed that, though in them we have ourselves adhered to the most-favoured-nation principle of no discrimination in our relations with foreign countries, the great bargaining strength conferred on us by the importance of the British market has put us in a position to compel the other parties to the treaties to impose quotas in our favour. This has introduced an element of discrimination and has tended to undermine the most-favoured-nation principle in the world at large.

To-day the need of economic disarmament is realised on all sides. The United States—though still secretly annoyed at our chronic evasion of the war debt problem and distrustful of the Ottawa Agreements—realises that a commercial agreement which would increase trade between England and America would be economically a gesture and an example and politically a great step towards world peace. M. BLUM is anxious to move further in the direction of lower tariffs, but needs some reciprocal concessions to enable him to do so. The Oslo Powers have been sitting in conference to find a way of reducing the barriers between them, and MR VAN ZEELAND has been commissioned to take a more general view of the European field. Last but not least, DR SCHACHT has said that Germany is willing to co-operate in efforts to reduce the barriers to trade, and his remarks have been confirmed by the still more important statement of HERR HITLER to MR LANSBURY that Germany would attend an economic conference if one were summoned by the President of the United States.

For this it is as yet early days; but the policy of this country and the Empire must be defined this month. It is in our power to prepare the way in four directions.

The first is to decide in principle with the Dominions that imperial policy shall henceforth follow the line adopted by Canada in her new agreement with this country rather than that of the 1932 agreements; that is to say, that it will be based *not* on the principle of a fixed amount of preference—which makes it impossible to reduce duties against foreign goods—but on maximum duties on Empire goods. There are signs that Empire opinion generally is beginning to move in this direction.

Secondly, we should be prepared to follow the example of Canada and establish an intermediate tariff which would enable us to give some, but not all, of the benefits of preference to foreign countries pursuing a genuinely liberal commercial policy. This would enable us to withdraw opposition to the formation of low tariff groups and to obtain for ourselves the advantages of membership of such groups by the concessions in rates which this intermediate tariff would embody. Such a step would at once bring the plans of MR VAN ZEELAND within the bounds of practical politics.

Thirdly, we should consider the relations of the United States with the Empire as a whole. American tradition is opposed to differential tariffs. If, in return for reductions in duties which specially interest Great Britain, we in this country made concessions to America or admitted her trade on the intermediate tariff, it would certainly mean keener competition with some forms of Dominion produce. But the United States might well consider it worth while to compensate the Dominions for any such benefit by offering reductions on tariff schedules that would give the Dominions greater access to the American market.

Finally, there is the problem of Germany's re-entry into the world economic system. We have no space to discuss this important question here in its European aspect. All that need be said from the point of view of imperial policy is that it is vital to avoid the closing of the door to foreign trade in the dependent Empire or to give colour to Germany's plea that she can only secure the materials and markets that are vital to her from a colonial empire of her own. If we pursue that road it must inevitably end in a clash.

These are all matters of far-reaching principle. But the fact that the Empire exists throws upon its members the duty of facing them. Before the war civilisation, and the international trade which is its natural accompaniment, grew apace, with the help of free trade in Britain and low tariffs in most of the world outside Europe.

Britain and the Empire have to-day radically departed from this state of affairs. But a group of nations which includes one-quarter of the world's population and covers over one-quarter of its surface cannot live to themselves alone. Nor can their economic policy be considered in watertight compartments, but must be treated as a whole. Unless and until we are prepared to return to the pre-war state of things a heavy responsibility rests upon the Empire to seek some other means of making its contribution to the general well being. The preceding suggestions seem to us the most practical way of approaching the problem at this critical stage.

On pages 262 to 271 of this issue appears

containing an analysis of the
Ottawa Agreements, their
effects on Imperial trade,
and the problems involved
in their renewal

Belgium's New Status

MR ANTHONY EDEN arrived in Brussels last Sunday for his pre-arranged visit to the Belgian Government. On the eve of his arrival the text of the new Anglo-French declaration on the status of Belgium was presented to the Belgian Minister for Foreign Affairs, M. SPAAK.

The essence of this declaration is that the French and British Governments consider Belgium to be now released from all obligations towards them resulting either from the Treaty of Locarno or from the provisional Anglo-Franco-Belgian arrangement of March 19, 1936, under which the three parties temporarily re-affirmed, among themselves, the undertakings to assist each other against aggression. This agreement had been contained in the Locarno Treaty; but the two vital changes were that Germany had ceased, in consequence of her Rhineland act on March 7th, to be one of the beneficiaries; while the United Kingdom had become a beneficiary as well as a guarantor.

Under the new arrangement of April 24th, Belgium is discharged from the obligation of giving a guarantee without forfeiting the privilege of being the recipient of one. The new declaration goes on to state that the United Kingdom and France maintain in respect of Belgium their existing undertakings towards her. It is added that the existing reciprocal undertakings between Belgium's two present guarantors—undertakings which constitute a provisional Anglo-French defensive alliance—are in no way affected by the waiving of the corresponding obligations that have hitherto been binding upon Belgium as well.

To continue to receive a guarantee, without any longer being asked to give one in return, is unquestionably a status of privilege. The Belgians themselves have been the first to acknowledge that this privilege which they have now obtained has its price. The Belgian Government publicly declares its determination to defend the frontiers of Belgium with all its forces against any aggression or invasion; to prevent Belgian territory from being used, for purposes of aggression against another State, as a passage or as a base of operations by land, by sea or in the air; and to organise the defence of Belgium in an efficient manner for this purpose. The two other Powers take note of the renewed assurances of the fidelity of Belgium to the Covenant of the League of Nations and its obligations.

When all these terms of the new Anglo-French declarations are read together, two salient features emerge. First, the new status which Belgium has acquired, through her release from her Locarno and post-Locarno obligations, to assist her neighbours if they are the victims of aggression, is something very different from a status of isolation. Secondly, the new arrangement still leaves open a number of knotty questions which may be crucial.

Belgium, then, has eschewed isolation in three several ways. She is continuing to accept a guarantee from France and Great Britain; she is undertaking, *vis-à-vis* these two guarantors, to re-arm herself efficiently; and she is re-affirming her own obligations under the Covenant, not excluding Article XVI. Under modern technical conditions of warfare, each of these three Belgian undertakings probably involves the making of technical arrangements in advance between the Belgian staff on the one hand and the French and British staffs on the other. If Great Britain and France are to resist a violation of Belgium's integrity by a fourth Power, they can only do this by carrying out operations of

war, in Belgium's defence, on Belgian soil and waters and in Belgian air. They cannot do that effectively without knowing in advance what Belgian facilities they will have at their disposal. Again, if France and Great Britain are to be satisfied that Belgium is doing her best, by effective Belgian re-armament, to deter a fourth party from attacking either England or France, or both, through Belgian air or across Belgian ground, then Belgium must take these two neighbours into her confidence to some extent about her own military arrangements.

Then there is Article XVI of the Covenant. This Article may not oblige a State-member of the League to take military action in defence of a fellow-member who is the victim of aggression. Indeed, if this obligation were implicit in Article XVI, the release of Belgium from her late obligations towards France and Great Britain would be meaningless. Yet, short of that, Article XVI may still involve obligations which may be very serious from the aggressor's standpoint. For instance, it may involve giving free passage across one's territory to the armed forces of other States-members when these are either themselves the victims of aggression or else are exercising their unquestionable right to take up arms on a victim's behalf.

The cordiality with which MR EDEN has been received by his Belgian hosts shows that the British and French Governments' readiness to accommodate their own policy to Belgian desires is a matter that is of vital importance for them, as well as for Belgium. It has been much appreciated in Brussels. The moral solidarity between these three West European democratic countries is likely to become all the closer for being relieved of its hitherto rather ponderous juridical trappings. The new arrangement evidently does answer to the wishes of that substantial majority which voted for M. VAN ZEELAND against M. DEGRELLE in the Brussels by-election the other day. This majority of the Bruxellois—and of the Belgian people as a whole—do not want to be pawns, not even in the hands of friendly neighbours, in a European power-game. But they also do not want to smooth Germany's way towards an ascendancy over Europe.

This is the meaning of the Belgian Government's steadfastness in clinging to the Covenant. That brings us to the question of Germany's reaction. The German Government knows that Belgium would like a new guarantee from Germany to supplement those which she already has from Great Britain and France. Will Germany now try to sell Belgium this guarantee at a price? And will Germany's price be that Belgium shall denounce her own obligations under Articles XV and XVI of the Covenant? The Germans are already pointing out that Switzerland obtained at least a partial exemption from these Articles in 1920, and Germany herself in 1925. Why should not Belgium follow suit by refusing in advance to give France and Great Britain any Belgian facilities for defending themselves if Germany were to attack them? If Germany does propose some such deal as this, the Belgians may reply that, for the article offered, the price is high. What value should Belgium set on a German scrap of paper which has been torn up twice over within living memory? Belgian independence would not be worth much if Belgian neutrality solely worked in favour of an aggressor. That is the lesson, for Belgium and the rest of us, of last week's declaration.

The British Steel Industry—I

THERE are three main stages in the production of finished steel products—the blast furnace, the steel furnace and the rolling mill. In the blast furnace iron ore is reduced from its oxide form to metallic pig iron. The steel furnace burns away the metallic impurities in the pig iron by separating them out from the metallic iron in the form of oxides. This process may be carried out in either a Bessemer converter or an open-hearth furnace. In the former, the oxidation is effected by blowing air through the molten metal. In the open-hearth furnace external heat is available, and steel scrap may be charged into the furnace. To the extent that scrap is used, the process becomes little more than one of remelting. In addition to the advantage of being able to use up to some 80 per cent. of scrap in the charge (an element of flexibility of considerable advantage in view of the wide fluctuations in the price relationship between pig iron and scrap) the open-hearth process makes possible a more accurate control of the composition of the finished steel. The exact chemical properties of the steel are determined by the addition of carbon and other elements as the metal is poured from the furnace. The open-hearth process predominates in the United Kingdom. On the Continent a much larger proportion of Bessemer steel is made.

There is a second distinction that must be drawn between two ways of making steel—known as the "acid" and "basic" processes respectively. The acid process will not eliminate phosphorus from the pig iron and, therefore, can only be employed on iron initially free from phosphorus. The basic process, so called because the furnace is lined with a basic material such as dolomite, will extract phosphorus, and can thus be used in purifying pig iron obtained from the large supplies of phosphoric ore available in this country, Lorraine and other parts of the world. Both acid and basic steel can be made in either of the types of furnace referred to above. As the presence of phosphorus in more than small traces is most deleterious to steel, it is considered preferable to use acid steel for the highest class of work. Open-hearth steel is generally used for structural and similar purposes. Basic Bessemer steel is used largely for tubes, and where rolling properties are more important than tensile strength.

In the next stage of production the steel ingots are rolled first into semi-finished products, billets or sheet bars, and then rolled further (if in the same works, while still hot) into finished sections, sheets, strip or other products. In producing a ton of steel ingots in this country in 1935 an average of 0.6 tons of scrap and 0.4 tons of pig iron were used. Of the 0.6 tons of scrap roughly half arises in the course of production of the steel products, and the other half mainly from the demolition and scrapping of steel structures, including ships and machinery. In making a ton of pig iron upwards of one ton of coke is required, and from two tons to 3½ tons of ore, depending on its iron content. Less than a third of the ore used in this country during the last decade has been imported (mainly from Spain, North Africa and Scandinavia), while there has been a net export of both scrap and coke.

Thus, it pays to locate steelworks close to the sources of raw material and, where all necessary materials are not found together, at the source of the predominating raw material, and adapt the technique of production so as to involve the minimum import of further materials into the district. Since, however, the

main loss in weight occurs in the early stages of production, it is sometimes economical to transport the steel in semi-finished forms and finish it near the market: this practice, and the multifarious forms in which finished steel is required, account for the existence of re-rolling works in the Birmingham area.

The ubiquity of the raw materials in this country enables steelworks to be located in all the main industrial regions. They are all either on or within easy reach of coalfields, while it is possible to select in each case the steel process which takes the fullest advantage of the particular iron-bearing materials which are most readily available. Thus:—

In *Scotland and South Wales*, highly industrialised regions with negligible ore supplies, an open-hearth process using over two-thirds scrap is generally adopted.

In *Cumberland*, with rich non-phosphoric ore deposits but lacking the industrial hinterland to provide much scrap, acid Bessemer with some acid open-hearth steel is made.

In *Northamptonshire*, with abundant phosphoric ore, negligible industrial scrap and little internal works scrap, the basic Bessemer process is employed exclusively.

In *Lincolnshire*, where there are similar ample supplies of native phosphoric ore, the basic open-hearth process is used with a charge of 80 per cent. pig iron and 20 per cent. scrap.

On the *North-East Coast*, the still substantial though declining supplies of home ore are supplemented by both imported ore and local shipbreaking and other scrap; the district uses an open-hearth process with an average charge of 70 per cent. pig iron and 30 per cent. scrap.

In *Sheffield*, where there are no ore supplies but substantial quantities of scrap, and a traditional demand for products of the highest quality, a large proportion of acid open-hearth and electric furnace steel is made; and the furnace charge averages fully 65 per cent. scrap.

While each of these districts has an economic (as well as an historic) justification, it is inevitable that as the richer but partially worked-out deposits become progressively more expensive to mine, there should be a trend toward the use of more accessible lower-grade ores. This tendency leads to a more rapid expansion of production in some districts and to a relative (if not absolute) decline in others. Thus, in the past decade, steel output in the Lincolnshire and Northamptonshire districts has quadrupled and now stands at nearly 2,000,000 tons a year. This tendency for production to expand in the two districts dependent entirely on the use of home raw materials, relatively to districts which are now partially dependent on imports, has been dictated solely by economic considerations.

The current rate of British steel production is practically 13 million tons a year. This rate compares with 11.7 million tons produced in 1936, 5.2 million in 1932, and is over 30 per cent. in excess of that achieved in 1929 or at any time during the last war. The agreement with the Continental industry has fixed an import quota at a level of just over 500,000 tons—a tonnage which the Cartel now have difficulty in supplying—compared with imports from the Continent of over 2,000,000 tons in 1930 and 1931. The export position is secured by a quota which will do much to ensure that Great Britain has at least as large a share of world exports as she had in 1929 or in any subsequent year.

The output of over 9 million tons per annum reached in the comparatively stable period 1927-29 can be regarded as a minimum rather than a normal figure.

Home consumption was seriously curtailed by the restrictive effect of the high interest rate required to maintain our over-valued currency; exporting industries were handicapped and imports encouraged by the disparity of cost levels arising from the same over-valuation; while the steel industry was in no position to protect itself from the periodic attacks on this market by Continental producers. These adverse factors have now been largely corrected. The average home production of steel ingots during the last decade has been 8.3 million tons. The long-term upward trend in domestic steel consumption should increase this figure during the next decade to an average of 10.3 million tons; lower interest rates and capital construction may well add 0.5 million tons to the average demand; while it is anticipated that, as a result of the agreement with Continental producers, there will be an improvement in the net balance of exports over imports of 1.5 million tons of ingots. This rough calculation gives an average anticipated demand over the next decade of almost 12½ million tons; and when allowance is made for the rearmament demand which will fall largely in the new decade, it seems not unlikely that the average for the period will be of the order of 12½ million to 13 million tons.

The actual volume of production in the near future is not likely to be limited by any shortage of capacity, but rather by difficulties of ensuring a correspondingly rapid increase in raw material supplies. The sharp advance in prices of iron ore, coke, and scrap during the past year is the chief reason for the imminent rise in prices of finished steel. The adjustment of steel prices, however, which is now being considered, will doubtless take

account of the probability that ore prices will rise still further.

But whatever the precise output may be in the next year or so, we are likely to see in the future, as in the past, wide fluctuations of demand. On two occasions since the war the production of steel in this country has been reduced by half in the space of two years, and a few years later has more than recovered the lost ground. The American level of steel production fell by 75 per cent. in the years of depression which followed the collapse in 1929. Expenditure on capital development schemes, and on replacement of plant and buildings is so easy to curtail whenever the industrial outlook becomes unfavourable, that a stable demand for steel cannot be anticipated. It may be that, at the onset of the next recession, more vigorous and immediate action will be taken to prevent the spread of depression; but, even so, it is reasonable to anticipate that while a peak demand of over 14 million tons is likely to be reached in the next year or so, it is equally probable that this will be followed by a reaction to a level fully 3 million to 4 million tons lower.

The various works extension schemes at present approaching completion are expected to make possible in this country a yearly rate of steel production during 1938 substantially in excess of the present rate of 13 million tons. Further expansion will mature in 1939, so that it should be possible over the next two years to meet a very large peak demand. Subsequently, should a reaction set in, the industry will have extensively modernised its plant and will be in a position to face a recession with highly efficient productive equipment.

Great Cities—X

The Difficulties of Liverpool

LIVERPOOL is by far the largest of the compact group of densely-populated and economically close-knit administrative areas which line the banks of the Mersey estuary and are known collectively as Merseyside. A century ago the population of the city was 213,000, and of the area 224,000; in 1911, the two figures were 753,000 and 1,102,000; at the last census they were 856,000 and 1,272,000. To-day, the city covers an area of 27,000 acres.

First and foremost, Liverpool is, of course, a seaport. As such, it is second only to London and far ahead of the third. It is as an exporter that Liverpool ranks closest to the capital. If one examines the trade figures for 1935, it will be seen that of exports and re-exports totalling £481,000,000, Liverpool sent £132,000,000 and London £145,000,000. But of total imports of £757,000,000, only £140,000,000 came in by Liverpool as against London's £321,000,000. But though it is always comforting to read of such imposing sums, further inquiry shows some rather depressing facts. If we compare the fortunes of the two cities' trade over the last ten years, we find that London's imports by volume have recovered to 89 per cent. of the 1927-1929 average, while Liverpool has only gone up to 80 per cent. And the figures for exports are no more encouraging: for they are 84 per cent. and 69 per cent. respectively.

Such facts as these should induce one to treat with

care prophecies such as recently have been made by some of the leaders of Liverpool's trade and commerce of the early passing of depression and the advent of boom conditions on the Merseyside. The industry and trade of that great hinterland which stretches north and east to beyond the Pennines and southwards into the Midlands, with whose economic welfare that of Liverpool and Merseyside are inextricably linked, will have to improve considerably if Merseyside is to experience the degree of recovery which the more prosperous parts of the country have enjoyed.

The truth appears to be that the prolonged commercial development of Merseyside during the nineteenth century, which continued up to 1914, has not been renewed since the war. Though the tonnage of shipping using the port in post-war as compared with pre-war years has increased, trade in commodities has ceased to grow. The post-war situation has in the main been determined by two familiar forces. In the first place, the rise of manufacturing industry in countries previously supplied by our exporters, and secondly, the depressing and increasing popularity of autarky. The industrial hinterland of the port of Liverpool has experienced, since the post-war boom, the keenest depression, and the export of manufactures from this area has conspicuously declined. And economic nationalism, whatever its origins and possible justification, has, with its tariffs, quotas, and restrictions, diminished the volume

of international commerce and the trade of Merseyside. A policy of self-sufficient nationalism in any part of the world, in so far as it is successful, must, in one way or another, be detrimental to the port of Liverpool.

Some statistics of unemployment on Merseyside in recent years throw some light on the position as it really is. In 1936 more than 28 per cent. of insured adult males on Merseyside were unemployed. In 1932 and 1933 one out of every three was without work. Between 1927-29 and 1936, the number of insured persons on Merseyside rose from just over 360,000 to nearly 400,000, while the number of unemployed fell from 100,000 (in 1930-32) to 92,000. Mr Caradog Jones, author of a survey of the problem entitled "Trade Revival in a Depressed Area," just published by the Liverpool University Press, estimates that of these 92,000 men, about 40,000 are unemployed as a result of conditions peculiar to Merseyside. But even if these people could be absorbed in industry, and if, at the same time, the effects on employment of the Great Depression disappeared, there would still in this area remain no fewer than 34,000 unemployed. The "abnormal place" unemployment (which is closely analogous to the "special unemployment" discussed in *The Economist* of March 20th) of 40,000 persons, is actually slightly greater now than it was in 1934. Nor must it be forgotten that in an area like Merseyside there is always, under present conditions, much unemployment among "black-coated" workers, which does not appear in any published returns. Of this large amount of "abnormal place" unemployment, it is not surprising to find that well over one-half is attached to shipping, shipbuilding, transport, and the distributive trades. Special measures are clearly called for in order to deal with a problem of this magnitude.

According to the survey of Mr Caradog Jones, transport, distribution, shipping and shipbuilding are still the predominating trades on Merseyside, to which some 44 per cent. of the occupied population are attached, but their importance has been diminished since 1932 when they accounted for fully 50 per cent. of the occupied population. There has been a considerable rise in the importance of building, furnishing, and "general services," and some increase in that of the metal, clothing, and textile trades. It seems that economic forces in Liverpool as in other depressed areas are slowly tending to assimilate the distribution of workers by industries to that of the country as a whole.

Between 1924 and 1931 some 70 firms, each employing 20 or more insured workers, started operations on Merseyside. Of these, about 60 firms, employing altogether 7,000 workers, are engaged in some kind of manufacture, the most noteworthy being artificial silk, clothing, electrical appliances, oil, paint and chemicals, paper and printing. Since 1931 a few new factories have been erected in Liverpool, but almost an equal number have been closed. Work has already commenced on the large new Government aircraft factory adjoining the airport. Then there is the rise and rapid growth of the betting pool "industry," giving employment to thousands of women and girls, of which Liverpool has the questionable reputation of being a centre. Liverpool has also lost a good deal of the North Atlantic passenger traffic to Southampton, while the stream of European emigrant traffic which used to be a picturesque feature of the port has long since dried up.

A native of Liverpool revisiting the City after an absence of twenty years would find it hard to believe that any industrial depression had existed in the interval. He would be at once struck by the disappearance of old landmarks and by the imposing new buildings that have taken their places. He would be astonished at the progress made in the construction of two great cathedrals. He would travel through "Queensway," the New Mersey Tunnel, a triumph of modern engineering. He would

marvel at the new main roads leading into the city and at the suburbs to the east, north, and south, now grown into what are virtually new satellite towns. Liverpool has spread far out into the countryside and encroached upon what used to be rural solitudes.

Travelling inwards from one of the new housing estates, if he chanced to board one of the latest tramcars, the visitor would rejoice at the superiority of these luxurious vehicles over the old ramshackle "tail-waggers." But if he made the journey during the morning rush hours, he would suffer like a great many other citizens from the congestion and delay as he approached the business and shopping centres, and he would find the return journey in the evening still more trying. The huge development of motor traffic and the greatly increased spread of the city have between them created a well-nigh insoluble problem of passenger transport. When the main arteries leading outwards from the centre of the town were constructed, the needs they were planned to serve were very different from those which exist to-day. Liverpool, with the neighbouring townships on the east bank of the Mersey, takes, roughly, the form of a huge semi-circle with its chord stretching some twelve miles along the riverside, a shape that adds materially to the difficulties of providing efficient transport. Nor are the outlets from Liverpool to the dormitory towns on the west bank of the river, provided by the Mersey Underground Railway and by ferry steamers, satisfactory at all hours. Though much could be done to ease congestion in this direction by allowing buses to use the new tunnel, unfortunately this policy, at the moment, appears to be impracticable on financial grounds. It would seem, however, that this mode of egress from the city must be adopted sooner or later.

But no one, sympathetic visitor or citizen, could prophesy confidently about the near or distant future of this huge conurbation. There surely can be no doubt that the economic life of Liverpool itself must continue to depend largely on her import and export trade. Many of her industries and much of her commercial activity are inseparably linked with it. Such old-established industries as flour and oil milling, sugar refining, the manufacture of tobacco, matches, lard and soap, grew out of the nature of her imports. It was in connection with her import trade that her great markets and exchanges arose, dealing in cotton, corn, fruit, meat and provisions. For her exports she depends predominantly on her extensive hinterland, whose factories and workshops, in their turn, depend on raw materials and partly manufactured goods which figure among her imports. Her large banking and insurance businesses, her warehousing, her forwarding agencies, as well as her shipping, are to a very great extent part and parcel of her port activities. But the extent of her trade unfortunately is and will be determined by factors beyond her control.

To be sure, some improvement has recently been experienced on Merseyside. But in so far as this has been the direct and indirect result of rearmament in our own and other countries it cannot be expected, or hoped, to last indefinitely.

Taking everything into account, it is difficult to avoid the conclusion that for the next decade, and possibly for a much longer period, Liverpool will have to face an awkward and trying situation brought about by the interplay on the world stage of economic and political forces which, though they must inevitably work against her progress, she will be unable to influence or moderate. For the rest, one can only hope that statesmen, soon rather than late, will pursue a policy more in keeping with Liverpool's interests, that international economic co-operation will eventually be restored, and that trade will again flow freely between the nations. But such a happy consummation is not likely to be reached for many years to come.

An Economist at the Breakfast Table—II

Eggs for Englishmen

THE most familiar of English breakfast-table partnerships is that between bacon and eggs. Our examination, a fortnight ago, of the bacon industry may, therefore, be appropriately supplemented by a discussion of those of its familiar plate-fellow. The number of eggs consumed by the average member of the population of the United Kingdom falls far short of the comparable figure for countries like Canada and the United States. Nevertheless, almost 160 "eggs in shell" (i.e. before cooking) are consumed each year. A further substantial quantity is eaten in the less familiar guise of liquid, frozen or dried eggs; but our present survey is confined to the more important "shell" variety.

Egg prices have an almost perfect seasonal pattern, varying inversely with the level of home supplies. They are normally lowest in the spring and highest in October or November. The poultry keeper has learned to accept these monthly variations as a normal occurrence, and his complaint is rather that the long-term trend has been downwards. His contention may be examined in the light of the following table, which shows annual averages of prices for four representative grades on the London Egg Exchange. The figures have been calculated by the Imperial Economic Committee:—

AVERAGE WHOLESALE PRICES PER 120 EGGS

	English		Danish	
	N.M.	18 lb.	N.M.	15½ lb.
	Specials		Standards	
	s. d.	s. d.	s. d.	s. d.
1931	17 5	14 1	15 9	12 3
1932	16 4	13 10	14 11	12 1
1933	16 2	13 0	14 11	11 8
1934	15 8	12 8	14 5	11 1
1935	15 10	12 8	14 9	10 11
1936	16 9	...	15 6	11 3

Wholesale prices actually fell by about one-third between 1929 and 1934, but this was a much smaller decline than that, for example, in the prices of butter and cheese. English eggs were a little dearer in 1935 than in 1934, and all descriptions enjoyed a further price advance during the greater part of last year. In the closing months of 1936, however, the seasonal decline was of more than normal dimensions, and this factor has chiefly been responsible for the British producers' demand for special assistance.

Recent changes on the supply side are well brought out by the following figures, compiled by the Imperial Economic Committee:—

UNITED KINGDOM SUPPLIES OF SHELL EGGS

Year	Home	Net	Total	Consumption
	Production	Imports	Supplies	per Head
	Millions	Millions	Millions	Number
1929	3,632	2,950	6,582	144
1930	3,840	3,163	7,003	153
1931	4,170	3,102	7,272	158
1932	4,499	2,390	6,889	149
1933	4,742	2,201	6,943	149
1934	4,815	2,243	7,058	151
1935	4,862	2,366	7,028	150
1936	4,524	2,958	7,482	159

Production made rapid strides in this country during the post-war years. In view of the 75 per cent. increase in output between 1925 and 1934, it is difficult to believe that in this period egg production was unremunerative. But costs have undoubtedly risen more recently, and output contracted appreciably in 1935 and 1936, despite an improvement in prices. How far are imports responsible for this?

In the egg, as in the bacon trade, Denmark is by far the most important source of our overseas supplies. Last year she provided about one-third of our total imports, the next most important suppliers being the Netherlands, the Irish Free State, Poland, Australia, Roumania and China. Substantial shipments are made

from Northern Ireland to Great Britain, but these, of course, do not appear in the British Trade Returns. Supplies from the Empire comprised, in all, about 20 per cent. of Britain's total imports last year. There is now no marked seasonal movement in the import trade. Supplies from Europe naturally reach a peak in the spring, but the deficiency in the autumn and winter is made good by shipments from Southern Hemisphere producers and by the importation of preserved eggs.

Thus, though the United Kingdom is the world's largest importer of eggs, supplies from abroad accounted for only two-fifths of her total consumption last year. The competitive power of these imports is affected, among other things, by the tariff. Shell eggs from foreign countries bear specific duties ranging from 1s. to 1s. 9d. per 120; and imports from the Irish Free State are taxed to the tune of 30 per cent. *ad valorem*. The imposition of these duties, together with the depreciation of sterling and the fall in prices, caused imports to decline very considerably between 1930 and 1933. An increase occurred in the early months of 1934, but the Government took speedy steps to check it. Though they had no statutory powers to limit imports, they succeeded in negotiating an agreement, on a "voluntary" basis, with the Governments of the principal exporting countries, providing for the progressive reduction of imported supplies during 1934 and 1935. Despite a fall in Dominion supplies, however, imports were actually higher in 1935 than in 1934, and a further 25 per cent. increase occurred last year. But this expansion was largely due to exceptionally favourable weather conditions in certain overseas producing areas, and it does not follow that the increase will be maintained this season.

Nevertheless, in spite of last year's increase, imports were only slightly in excess of those of 1929 and were substantially smaller than in 1930 or 1931. The home output, on the other hand, even after its recent setback, remained 25 per cent. above that of the pre-depression year. On this showing, the British producer cannot justly blame the foreigner for his difficulties. On the contrary, his inability to hold his own in competition, e.g. with Danish producers, despite the assistance given him by the tariff, prompts the question whether his own efficiency is as great as that of his competitors. That all British producers are not equally efficient is widely admitted. The industry's marketing arrangements, again, have been frequently and rightly criticised. The producer, in very many cases, is concerned primarily with the satisfaction of local needs, and sends only his surplus to the large markets. The latter's supplies of home-produced eggs, in consequence, are erratic, and the frequency of delay in reaching the markets tends to reduce the average level of quality.

Two years ago, the Reorganisation Commission for England and Wales rejected price-raising expedients on the ground that these would merely damage the industry by reducing demand. Both this Commission, however, and that for Great Britain, drew attention to the absolute necessity of rationalising distribution. The establishment of packing stations, for testing and grading, was recommended by the Commission for England and Wales; while the Commission for Great Britain suggested the setting up of marketing schemes for England and Scotland. Last June, however, the National Farmers' Union rejected these proposals and decided instead to press the Government to raise the import duties.

The consumer, in the light of the foregoing objective survey of undisputed fact, is surely right in resenting such an endeavour to increase the price of an important article of his daily food. He has right on his side in suggesting that the home industry should put its house in order before seeking Government assistance in the shape of import restriction.

Notes of the Week

The Budget Debate.—The debates on the Budget Resolutions have not been entirely monopolised by the National Defence Contribution. Mr Dingle Foot made an attempt on Tuesday to have excised from the Canadian Trade Agreement those clauses which, by guaranteeing margins of preference, effectively prevent, for the duration of the Agreement, any reduction in the rates of duty on such imported foreign foodstuffs as wheat, cheese, eggs, apples, pears, condensed milk, etc. The attempt, of course, failed, being voted down by the Government's majority. What was remarkable was that it excited almost no discussion at all, although the clauses in question, apart from imposing a potential burden on the British consumer, patently tie the hands of Great Britain in the imminent negotiations for the economic rehabilitation of the world.

* * *

When the resolution dealing with the N.D.C. was reached, Mr Neville Chamberlain decided, if not to bow to the storm, at least to make quite an appreciable obeisance to it. He confessed to surprise at the violence of the opposition to his new tax, and suggested that the critics had entirely lost sight of the very moderate yield that is expected of it. Moreover, he still maintained, as he was both bound and entitled to, that the principle of the tax is just and generally accepted. The detailed concessions related in the main to the base period from which the growth of profits is to be calculated, and to the standard percentage of profits which is to be exempt from taxation. On the former point, the Chancellor said that he was quite prepared to reconsider it "either by way of some choice being given to the taxpayer to choose between different years, or by adding other years to the years already taken, or possibly by a combination of both." He also promised some elasticity in fixing the standard rate of profits as between different classes of industry. These concessions have been welcomed by the critics of the tax, and they do go a long way towards the removal of some of the more glaring technical defects of the scheme as first outlined. But the exact incidence of the new tax will not be ascertainable for a long time yet, and a considerable measure of uncertainty is inevitable. At the same time, the Chancellor of the Exchequer was undoubtedly right in thinking that financial circles have greatly exaggerated the importance of the new tax and have allowed themselves to be driven into an almost hysterical mood for which there is very little justification.

* * *

Labour on the Move.—The present situation in Nottinghamshire, on the Clyde, and in London renders specially interesting the Annual Report of the Ministry of Labour for 1936. Although Industrial improvement last year led to increased trade union activity and to demands for higher wages, the number of working days lost through disputes last year was actually lower than in 1935. For the most part adjustments were made smoothly, thanks to the effectiveness of the established machinery for negotiation between employers and employees. Even in the more troubled early months of 1937 the efficacy of conciliation has been demonstrated in South Wales, Lancashire and Scotland. On the other side, however, tendencies were already evident in 1936 which are now threatening to dominate the labour scene: the increasing number of unofficial strikes; the disputes arising from the refusal of employers to recognise independent unions; and the disputes caused by the reluctance of employees to work by the side of non-unionists. The acceleration of recovery, speeding-up

of production and transport, extension of overtime, and sharply rising cost of living have given a new stimulus to these movements. On the other hand, employers, faced with an upward spiral of costs, are becoming less willing to accede to the demands of labour, now it is on the move. The trade unions are undoubtedly eager to regain the power and prestige which were lost in 1926 and have been dimmed in recent years by the rise of large unorganised trades and by the onset of depression. The employers are anxious lest the exigent demands of the unions should sap the healthy flow of recovery profits, already threatened by the Chancellor of the Exchequer. The situation is critical. The ultimate decision will, we trust, reflect the public's manifest desire that justice should be done to both sides.

* * *

Coalfield Problems.—The desire of the unions to reinforce their traditional rights is most evident in the coalfields. A national coal strike is threatened at a time when a satisfactory five years' agreement for wages has been made in South Wales; when the normal process of recovery has raised wages in Northumberland, Scotland and Nottinghamshire; when the public conscience is being stirred about mining dangers by the prosecution at Wrexham of the owners and management of Gresford Colliery for breaches of the Mines Act at that tragic pit; and when it is at last proposed to remove the burden of mining royalties at a satisfactory low cost for compensation of some £66 millions. Moreover, in Bircotes, the model colliery village in Nottinghamshire where the miners of Harworth Colliery live, there was rioting on April 23rd and April 24th; and 31 men have been arrested. The threatened strike and the Bircotes disorders spring from the same causes. Some 1,000 men normally employed at Harworth withdrew their labour 26 weeks ago because the Nottinghamshire Miners' Association, affiliated to the Miners' Federation of Great Britain, was not recognised by the owners. Instead, they recognised the Industrial or "Spencer" Union. An attempt to reconcile the two unions by amalgamation broke down some weeks ago; and a fortnight ago the half-million miners of Great Britain decided to go on strike in May unless the Association were recognised in Nottinghamshire and the Harworth strikers were fairly reinstated. Meanwhile, the Spencer Union men have been working at Harworth under police protection; and the disorders which devastated Bircotes a week ago and the disorders which the strikers picketing the pit at the were the result of the strikers picketing the pit at the night shift. The issue is one of principle and prestige; and it is to be hoped that the series of meetings now being held between the Mines Department, the coalowners and the Federation will lead to a settlement which will avert the national strike and restore peace and order to the prosperous Nottinghamshire field.

* * *

London Transport.—The danger of a strike of London busmen is more immediate than the possibility of a coal strike, while the Clydeside engineering strikes still remain at a deadlock. Unless the negotiations which are now vigorously being conducted by the Ministry of Labour between the London Transport Board and the representatives of the busmen's union are successful, May Day—which is also Labour Day and Cup-Final Day—will see London without buses. Coronation transport, too, will be gravely threatened. The decision of the busmen to strike at midnight on April 30th was announced last Saturday. It followed the Board's rejection of the men's demand for a 7½-hour day instead of the present 8-hour day. The Board claims that the change would cost £650,000, which it cannot possibly afford. In reply to the wider charge of the busmen that

the new time schedules involve an intolerable nervous and gastric strain on drivers, the Board has replied that the more up-to-date buses which have been introduced more than compensate for the 10 per cent. speeding-up which has been made since 1933. The situation is indirectly complicated by the series of unauthorised bus strikes which have broken out in 10 south-eastern counties and are spreading daily.

* * *

Nevertheless, three points are clear. The Union has recognised the London strike notice on the ground that long and patient negotiations have been fruitless; but it has repudiated the other bus strikes because conciliation has not been properly tried. To lump all these strikes in a common indictment is unjust and incorrect. The second point is underlined by the rumour that the four railway companies intend to apply in June for higher rates and fares. Transport costs are rising rapidly; and it may be that the demand of the London busmen, like that of the railway unions for the restoration of the last quarter of the wage-cut made in 1931, could only be met by the raising of charges to the public. (The L.P.T. Board assert that to raise charges in London would not increase revenue.) Finally, the Board have offered to submit the dispute to independent arbitration, and to make any awards retrospective to February 1st, if only the men will agree to postpone the whole matter until June 1st. The men have so far refused. They say that they have negotiated for several months; that they have reduced their claim from a 7-hour to a 7½-hour day; that their work under the new schedules is patently dangerous; that an unfair attempt is being made to rouse public opinion against them; and that postponement would only weaken their position. On Thursday night it was announced at a conference of the extra-London strikers that they, too, would cease work at midnight on Friday unless their demands were granted; and that they would in that event request the Transport Union to recognise the district strikes and to call a national stoppage. The Union, however, has still not recognised the strikes in the Eastern Counties, or given any sanction to action outside London. Nevertheless, a national busmen's strike, with its grave implications, is demanded; and Mr Bevin, Secretary of the T.G.W.U., will have great difficulty in holding his Union back in the country, while urging it on in London.

* * *

The Basques at Bay.—It is now quite certain despite the various direct and indirect protests from insurgent headquarters in Spain, that General Franco's naval forces are incapable of blockading Bilbao. During the last week, British foodships have been leaving St. Jean de Luz, keeping in touch with British warships

throughout the passage to Bilbao, and entering the three-mile limit under the protection both of the warships and of the shore batteries. General Franco's protests, faithfully echoed by the German and Italian press, are based on the insurgents' pretension that they have the right to the traditional Spanish Government's six-mile limit. If this pretension were accorded, their warships could fairly safely stop foodships beyond the effective range of Bilbao's shore batteries. But only Germany and Italy have recognised the insurgents as the Government of Spain. The other Powers have not even accorded them belligerents' rights; nor, in fact, have Germany and Italy. Consequently, the French, British, and other Governments—having secured from the Spanish Government, which they all still recognise, a *de facto* agreement to a three-mile limit last autumn—have the right to protect their shipping on the high seas, up to this limit, against the depredations of unrecognised marauders. The British Government, until their inexplicable lapse before General Franco's unwarranted threats a fortnight ago, had been consistent in their intention to stand by the rights of British shippers; and now that Bilbao harbour has been shown to be comparatively free of mines and incapable of closure by General Franco's warships, the British Government have, commendably, resumed their consistency.

* * *

Meanwhile, on land, the insurgents' offensive in Vizcaya has rolled the Basques back from their lines around Durango; and the defenders of Bilbao have taken to reserve lines. The city is now almost completely invested; but the temper of its defenders has been raised to the level of desperate zeal by the shockingly wanton annihilation of the ancient town of Guernica, the traditional mother-town of all the Basques. On Tuesday, a force of some 70 German bombers and pursuit planes systematically wiped the town out, together with the majority of its inhabitants, by intensive incendiary bombing and machine-gunning, which lasted for hours. General Franco's headquarters are reported to have disclaimed all knowledge of the affair; and it is said that the German headquarters at Deva, 20 miles west of San Sebastian, ordered the attack in an effort to shake Basque morale. It has had precisely the opposite effect; for there are some Basques on the insurgent side; and all Basques feel the destruction of their ancient cultural centre as a personal insult. The Nationalists lamely allege that the Basques themselves fired the town before withdrawing from it; but it was not in the front line of the campaign; and the accounts of this outrage upon a civil town furnished by the correspondents of *The Times* and other British newspapers leave no doubt that all the aeroplanes were German, manned by Germans. On Wednesday, the House of Commons showed itself dissatisfied with Mr Eden's earnest, but unconvincing, protests against such barbarities by the side which, in

Spain, claims to represent culture, civilisation, and religion. The Germans seem to have chosen this way of rejoinder to the British Government's insistence upon their maritime rights to supply Bilbao with food. It has scarcely, however, increased their chances of becoming endeared to the Spanish people. And it has further injured Germany's reputation in the world.

* * *

Venice and After.—On Friday, April 23rd, Dr von Schuschnigg interviewed Signor Mussolini at Venice. As is by now a commonplace, the official *communiqué* was rosily uninformative—except for an eloquent silence on the two subjects of the independence of Austria and restoration of the Habsburgs. From the comments of the spokesman of the Austrian delegation, it became apparent that some kind of compromise had been reached on the question of Austria's alignment. Dr von Schuschnigg had maintained his refusal to join an Italo-German pact, but in return he had undertaken not to join a Franco-Czecho-Russian pact either; and this concession had involved at least a pause in the process of the recent Austro-Czechoslovakian understanding. The real flash of enlightenment, however, came from an article which was published, on the evening of the meeting of the statesmen at Venice, by Signor Gayda in the *Giornale d'Italia*. In this article Signor Mussolini's usually well-inspired interpreter stated that it was Dr von Schuschnigg's intention shortly to admit a Nazi into his cabinet with the function of serving as an intermediary between Nazidom and the Vaterländische Front. This *ballon d'essai* was immediately slashed to bits by the Austrians. The offending issue of the *Giornale d'Italia* was stopped at the frontier; and an emphatic denial was given by Dr von Schuschnigg to Signor Gayda's allegation. The statement was, indeed, calculated to sow confusion in the ranks of the Vaterländische Front, and to make the rank and file ask themselves, in consternation, whether they had been betrayed by their leader. It is easy to see why Dr von Schuschnigg is incensed; it is more difficult to understand why Italy is now playing Germany's game.

* * *

Signor Gayda's article is the last link in a chain of evidence. Italy seeks to keep Austria away from Czechoslovakia; she deprecates references to the Habsburgs and to Austrian independence; and finally she tries to open a breach in the Vaterländische Front for the thin end of a Nazi wedge to nose its way in. There is only one possible interpretation. Italy has not only ceased to place obstacles in the way of Germany's penetration of the Danubian countries; she is now actually smoothing Germany's path by helping her ally to tear the obstacles down. The ascendancy of the Reich over the Danubian countries means that Germany's frontier will soon be not only on the Brenner but also on the Julian Alps; and this means in turn that not only the South Tyrol, but also the Adriatic and whole of Italy, would eventually be at Germany's mercy. This must be perfectly plain to Mussolini; for his determination to keep the German peril at arm's length has been the mainspring of his foreign policy in Europe in recent years. We are bound to infer that the pressure of some dire extremity is driving him into supplicating Hitler to enrol the maker of Fascism as his junior partner in the Nazi firm. These junior partnerships are arduous and humiliating to the Reich, as the whole world knows from the awful example of the Habsburg Monarchy's experience in the last war. For what German service is Signor Mussolini now offering to pay this very stiff price? Whatever it may be that Mussolini is now trying to purchase from Hitler, it must be something so big that even Hitler may flinch from entering into the suggested bargain.

* * *

Two New Naval Treaties.—Apparently two new naval treaties are now almost ready for signature—one between Great Britain and Germany and the other

between Great Britain and Russia. The principle underlying both treaties is the acceptance, by Germany and by Russia respectively, of the qualitative limitations which have been agreed upon, between Great Britain, the United States and France, in the London Naval Treaty of 1936. Both Germany and Russia, however, are being conceded certain advantages. Germany will have the right to build two more 10,000-ton 8-inch-gun cruisers in virtue of the Anglo-German Naval Agreement of 1935, which authorises her to build up to 35 per cent. of the British tonnage in this class. And this is a departure from the terms of the Treaty of 1936, which provides for a naval holiday from cruisers of this class. Russia, for her part, is to be given some specific concessions in regard to gun calibres, as well as a general permission to exceed the London Treaty limits in the Far East if Japan does so first. Any Russian warships of a supra-treaty scale must, however, be kept in Far Eastern waters by the terms of the new Anglo-Russian agreement. It is impossible not to speculate on the alignment of these diverse naval forces in the event of another war. The German and the Japanese fleets will presumably both be on the opposite side to the Russian. It is less easy to guess whether the Russian and the British fleets will be allies.

* * *

Advance and Setback at Montreux.—After moving rather slowly in the first stages, the Capitulations Conference suddenly gathered speed in the earlier part of last week. The Egyptians seemed to have convinced the representatives of the Capitulatory Powers that they were prepared to give and take, and were genuinely anxious to make the new regime for foreigners in Egypt work satisfactorily for all parties. By the middle of the week there was even talk of the General Convention and its annexes being ready for signature in time for the delegates to come to London for the Coronation. Last Saturday, however, this good progress was checked by the action of the French delegation, who made an attempt to capture, on the margin of the Conference, the positions which they had so far failed to take by storm at the Conference table. They presented the Egyptian delegation with a memorandum containing concrete proposals for a bilateral Franco-Egyptian agreement on the future of a number of French institutions and interests in Egypt. When the Egyptians made it clear that they were not prepared to enter into separate agreements with particular Powers at this stage, but were resolved, first of all, to carry out the purpose of the Montreux Conference by negotiating a general convention on the Capitulations, the French delegation left Montreux for Paris to consult their Government and to obtain further instructions. In consequence, the work of the Conference has been held up, pending the French delegates' return. In more serious international affairs than this business of liquidating the Capitulations in Egypt, the French have all too often over-reached themselves, and inflicted grave damage on their neighbours, by trying to drive too hard a bargain. Their new offer indicates that they will not repeat a mistake which is not only old but also proved disastrous by the irrefutable evidence of the facts of post-war history.

* * *

Railway Rates.—It is understood that the four major railway companies intend to apply to the Railway Rates Tribunal in June to increase railway freights and passenger fares by 5 per cent. The occasion of this application is said to be the rise in operating costs. Coal, steel and other materials have recently risen rapidly in price, and the companies are morally bound to accede in August to the demand of the unions for the restoration of the last quarter of the 1931 cut in wages. Under the Railways Act of 1921, the companies can apply to the Tribunal for an increase in rates so long as their revenues fall below the standard revenues defined in the Act. It has never been possible since 1921 for the rail-

ways to earn these standard revenues because of the depression and road competition; but they have refrained from exercising their rights under the Act, believing that to raise rates would be to lose traffic. Indeed, exceptional rates, which under the Act may be sanctioned so long as they are no more than 40 per cent. below the standard charges, have been multiplied; and passenger fares have been considerably reduced by various devices, such as the monthly ticket at 1d. a mile. Two factors have altered this position. A notable recovery in trade has occurred; and road competition has probably come very near to the limit of its immediate effectiveness under the new conditions of statutory restriction. The net railway revenues of the G.W.R., the L.N.E.R., the L.M.S. and the Southern for 1936 were £35,730,560, against total standard revenues under the Act of £51,312,579. It seems possible that an increase of 5 per cent. might be made in rates and fares, in the present circumstances, without loss of traffic. It is interesting to notice, however, that the London Passenger Transport Board, which can modify rates without application to the Tribunal, has no immediate intention of increasing rates, presumably because to do so might cause a decline in traffic. The railways' application is understandable, particularly when taken in conjunction with the restoration of the railway workers' wage cuts, which ought not to be denied. It still remains true, as Mr Wedgwood pointed out in 1922, that a procedure is wanted for linking the decisions of the Railway Rates Tribunal with the findings of the National Wages Board. They are both based on two aspects of the same situation.

* * *

Mining Royalties.—The long-standing controversy surrounding the nationalisation of coal-mining royalties has at last been finally settled this week by Mr Baldwin's announcement that the Government had accepted the award of the special tribunal set up in March to determine the capital value of the royalties. The tribunal, consisting of Lord Justice Greene (the chairman), Mr Justice Clauson and Lord Plender, decided, without much delay, that the appropriate number of years' purchase to be applied to the agreed royalty income of £4,430,000 per annum was fifteen years. The total amount payable as compensation to the royalty owners thus amounts to £66,450,000, which is substantially below the figure which the owners hoped to receive or the Government expected to have to pay. Mr R. F. Pawsey, secretary of the Mineral Owners' Joint Committee, has indicated the Committee's acceptance of the award, though they had hoped to receive £110 millions. So far, so good. But the establishment of a single landlord is not sufficient, in itself, to bring about the speedy reorganisation of the industry. As we pointed out in a survey of the coal industry in *The Economist* of January 9th on page 54, the Government should reinforce its Bill for the unification of royalties with provisions designed to bring about compulsory reorganisation after only a short period of grace. Moreover, there is much to be said for vesting the administration of royalties in the same body which is charged with the reorganisation of the industry. To shelve reorganisation now, simply because demand is good and business profitable, would be inexcusable.

* * *

The Activity of Industry.—Despite unabated apprehension about the proposed profits tax, shown in a number of speeches at company meetings this week, industry with few exceptions continues its upward progress. The main disturbances, none of which has been substantial, have been felt in the textile trades. Both cotton and woollen cloth manufacturers appear to have taken up a cautious attitude until the position becomes clearer, despite the continued expansion of exports. Our Cardiff correspondent comments on page 317 on the coal industry's determination to keep contract prices under control in the face of the continued increase in demand. A marked shortage of some grades consumed by heavy

industry, and particularly of large coal and bunker coal, is being experienced. South Wales exports have risen nearly 20 per cent. this year from the corresponding period last year. The pressure on iron and steel supplies is becoming increasingly acute, firms are booked up for many months ahead, further furnaces are being put into blast, and others are held up through lack of raw materials. The new price list may be published earlier than was originally intended, and is expected to show some large increases. As a result of the improvement in demand, tinplate manufacturers have suspended their restriction on production, while retaining other parts of the pooling scheme. Prices are very firm, and exports continue much above the figures for 1936. There are so far no indications whatsoever of an early decline in industrial activity.

* * *

World Trade in Raw Materials.—The League's Economic Intelligence Service has recently published a volume* giving some valuable information about international trade in 1935. It presents, as a result of special enquiries from the countries concerned, tables giving with more detail and more accuracy than any other source, the exact imports and exports of 35 raw materials for 42 countries. From these we have extracted data, shown in the following table, about important commodities which throw some light on the problem of raw materials. Where possible, an estimate giving the percentage of world production which enters international trade has been added:—

RAW MATERIALS TRADE IN 1935

Commodity	Total Imports of 42 Countries '000 metric tons	As a percentage of World Production	Percentage taken by United Kingdom	Percentage taken by Germany	Percentage taken by Japan	Largest Importer or next largest after U.K., Germany or Japan	
						Country	Percentage
Butter	584	...	82.5	1.2	0	U.S.A.	7.6
Wheat	12,474	10.1	41.0	1.3	3.6	Belgium	8.5
Sugar, unrefined	5,453	31.1	35.6	.02	0	U.S.A.	42.4
Tobacco, unmanufactured	378	18.9	28.8	2.3	0	France	8.9
Nitrates	1,938	(100)	2.0	4.3	3.3	Egypt	23.8
Rubber	1,136	(100)	11.4	5.8	5.4	U.S.A.	42.5
Wood, sawn or squared	10,161	...	34.1	9.5	0	Holland	8.7
Wood pulp	6,078	33.9	37.0	2.3	4.5	U.S.A.	32.2
Sheep's and lambs' wool	1,035	21.8	24.3	11.9	10.6	France	16.9
Raw cotton	2,783	14.7	20.6	7.6	26.5	France	8.4
Motor spirit	11,259	5.0	35.5	10.9	4.7	Australia	6.3
Pig iron, etc.	2,219	3.0	5.8	4.4	43.4	Belgium	9.2
Iron and steel	1,059	...	25.6	5.5	21.2	Egypt	12.2
Copper	1,323	...	21.9	17.0	5.4	U.S.A.	16.5

If any clear conclusion is possible from these statistics it is that the problem is complex. Comparable data are lacking for other years, but it would seem that, with few exceptions, and after making full allowance for the fact that the figures refer to a year of depressed trade, the two "dissatisfied powers" play only a very small part in the world's import trade. The main exceptions only reveal the dependence of Japan upon imported cotton and metals. In no case does Germany take as much as a fifth of the world trade in any commodity. But in eleven of the fourteen materials, Great Britain's trade is the

largest or a close second to the largest; in ten we take more than a fifth; and in five more than a third. The facts bring out very clearly the importance of British policy in the whole problem, for in at least five of these markets we are almost in a position to dictate prices. The remaining Powers, apart from the United States in the case of sugar and rubber, compete in markets in which each is individually unimportant.

★ ★ ★

Further Decline in Prices.—The reaction in wholesale prices continued during the past fortnight. *The Economist's* complete British index number has fallen by 1.1 per cent., and the British primary products index by 2.9 per cent. Parallel declines have occurred in the United States, where primary products have fallen by 3.3 per cent., and the complete Irving Fisher index by 0.7 per cent. A downward trend is also noticeable in France and Germany. The total fall is still very limited in comparison with the year's previous increase.

* These figures refer to April 21st.

The decline in the fortnight has been general, for the miscellaneous group index has been the only one to resist the downward trend. The fall was heaviest in the case of the cereals and meat and minerals groups.

The Economist INDEX
(1927 = 100)

	Sept. 18, 1931	Mar. 31, 1937	Apr. 14, 1937	Apr. 28, 1937
Cereals and meat	64.5	93.0	95.0	92.2
Other foods	62.2	70.4	70.2	69.7
Textiles	43.7	74.2	74.6	74.3
Minerals	67.4	113.2	107.4	105.5
Miscellaneous	65.8	87.0	87.0	87.1
Complete index	60.4	87.2	86.8	85.7
1913 = 100	83.1	119.9	119.3	118.0
1924 = 100	52.2	75.3	75.0	74.1

There has been a sharp drop in wheat, which restores the prices of early March. Maize and rice are also cheaper. Meat prices were irregular, and bacon was unchanged. Among other foods there were increases in tea and cheese, and reductions in butter and coco-oil. In the textiles group wool and flax were firmer, but there was a reaction in jute and a fresh drop in cotton. Non-ferrous metals are again lower, but the fall was less than in the previous fortnight. In the miscellaneous groups there were advances in Swedish timber, hides, petrol, petroleum, and linseed oil, and a further reduction in rubber.

An Important World Survey.—Yet again the Director of the International Labour Office, Mr Harold Butler, has provided the world with grounds for both thought and action in his Annual Report.* He states the facts of recovery: the revival of production, employment, and trade all over the world. But he points out that large pools of unemployment still persist, and that the restoration of world trade has been unsatisfactory. Recovery is still unevenly based on narrowly national policies and on the uneconomic activity of armament—on large-scale outlay on public works without return, competing with real recovery and popular needs, sacrificing the standard of living to the standard of arms, and laying up deep depression or war for the not far distant future. "It is hardly the kind of recovery for which most people have been watching and waiting." Nevertheless he finds three hopeful signs. The agreement of September, 1936, between Britain, France, and the United States showed a realisation that peace and prosperity can only be based on sound economics; that progress can only be achieved by international co-operation; and that constant co-operation between countries to manage their monetary systems is vitally necessary. Secondly, he points to the improved purchasing power of the great agricultural countries. Thirdly, he suggests that the experience of the recent slump has given us enough data to frame a policy to control our economic destiny. The traditional view of unemployment has been revolutionised; and the *conditio sine qua non* of depression policy is no longer the reduction of wages or the lengthening of hours. "The depression has led to increasing recognition of the value of the minimum wage"; and a new standard has been set for the future by the introduction in many countries of the forty-hour week.

Mr Butler observes that the outstanding lesson of the slump has been in monetary policy. Governments have learned that traditional deflation cannot arrest depression; the revitalising effects of monetary expansion have been experienced the world over—here Mr Butler is perhaps dangerously laudatory of monetary devices which might be unsound as permanent practices. It is thus "an ill wind that blows nobody any good." Mr Butler is not, however, very optimistic. The world and prosperity are distorted by the drive for greater self-sufficiency. The future is doubtful: the dangers of a slump are seen as never before; but the beginnings of freer trade, the basic need, are tenuous and all but stifled. The plan of the future has been drafted. But "the clearance of the paths of trade will be a slow and laborious process." To judge from the British Government's attitude the last observation is the surest.

Marketing in South Africa.—A group of professors and lecturers in the University of Cape Town has publicly denounced the Marketing Bill now before the South African Parliament. In a statement to the Press they claim that the Bill is against the interests of the community; that it provides no safeguard against a serious increase in the cost of living; and that the alleged protection of consumers' interests will prove completely ineffective. The Marketing Bill is designed to regulate the production and sale of agricultural products and will set up a National Marketing Council, a Producers' Advisory Committee, and a Consumers' Advisory Committee. The Council will draft schemes, investigate marketing conditions, and recommend the regulation of imports and exports. The two Committees will be advisory to the Minister of Agriculture and the Council. Each approved scheme will be administered by a board on which producers' representatives must be in a majority. The boards will be empowered to register producers and dealers; to limit the amounts of

* Report of the Director. International Labour Conference at Geneva. International Labour Office, 82 pages, 1s. 6d.

products moved and sold; to impose levies for export subsidy; to advise on the control of exports and imports; to conduct pooling operations; to inspect producers' premises and books; and to buy and sell outright. Schemes approved by the Minister must be accepted by the Governor-General, or voted upon by the producers concerned; opportunity will be given for any class of producers or consumers to lodge objections, and the final decision in deadlock will rest with both Houses of Parliament, although boards will normally come into being without Parliamentary approval. The boards will be able to borrow from the Land Bank, and will be assisted also by loans from an Agricultural Marketing Fund. The critics of the measure argue that it will place the power of monopoly in the hands of agricultural producers, and destroy the free market to the detriment of consumers. The rival contentions will be tested in the further developments of the controversy.

★ ★ ★

Sustained Recovery in Shipping.—The latest returns of idle mercantile tonnage, prepared by the Chamber of Shipping, reveal the marked recovery in shipping during the first quarter of this year. The tonnage of vessels laid up at British and Irish ports declined from 473,900 net tons on April 1, 1936, to 212,400 tons at the end of last year and 90,300 tons at the beginning of last month. As these figures include eight foreign vessels of 15,300 net tons, the British tonnage laid up on April 1st was only 75,000 net tons, comprising 69 vessels. The tonnage on the United Kingdom Shipping Register declined by 98,000 gross tons during the first quarter of this year. And, since idle capacity decreased by 197,000 gross tons during this period, the tonnage of vessels in commission increased by about 99,000 gross tons. The problem of unemployed shipping capacity has thus been solved. Moreover, in view of the elimination of almost the whole of the idle tonnage still in existence at the end of last year, the 8 per cent. rise in *The Economist* index of freight rates is scarcely surprising. This quick reversal of the shipping industry's position is one of the most remarkable evidences of world recovery.

Expanding Retail Trade.—Retail turnover is expanding steadily with the increase in employment, wage rates and profits. During March, business was exceptionally brisk, for the returns published in this week's *Board of Trade Journal* show a 15.2 per cent. increase in the value of sales between March, 1936 and March, 1937. The improvement was fairly well spread geographically, the increase during the year being most marked in Suburban London (+ 17.8 per cent.) and least in Central and West End London (+ 9.8 per cent.). In Scotland, the value of sales rose by 13.2 per cent. and all other districts showed increases of more than 15 per cent. over the figures for March, 1936. This latter movement is a particularly welcome sign of recovery in earnings and purchasing power in the provinces which include the Distressed Areas. With the exception of piece goods, sales of all the items shown separately in the returns were higher than a year ago. Sales of women's wear in March, for example, were 14.8 per cent. higher than last year. The marked increase in the value of sales last March over the figures for the corresponding month in 1936 was due, to some extent, to the early date of Easter, while preparations for the Coronation may also have influenced business. In the absence of information about changes in prices, it is impossible to estimate how far the growth of sales represents an increase in the volume of turnover. Meanwhile, the indications point to a further improvement in retail trade.

Fifth Census of Production.—More of the results of the Fifth Census of Production relating to 1935 are now available. Details of the Census and of the other sources

of statistical information used in the reports were given in *The Economist* of February 27th, page 463; but the following table, giving the general summary of the textile trades, shows the gross value of production, the net output (gross value minus costs of materials and work given out), the number of employees, and net output per employee for 1930 and 1935 (Census years) and 1934 (from the Import Duties Act Inquiry):—

TEXTILES				
Industry (and Year)	Gross Output	Net Output	Average number of persons employed	Net output per person employed
Cotton (spinning and doubling) { 1935 1934 1930*	Thous. £ 74,073 71,371 78,624	Thous. £ 20,147 20,554 19,828	182,153 183,750 190,736	£ 111 112 104

Total { 1935 1934 1930	443,656 401,822 433,085	156,362 147,893 147,682	1,050,220 1,025,926 1,061,699	149 144 139

* Excludes N. Ireland.

† No figures for flock, rag, or packing.

‡ Excludes excise duty.

It will be noticed that in these years the only large branches of the industry which recorded significant progress were woollen and worsted, and artificial silk. Cotton, linen and hosiery were practically stationary, while perhaps improving slightly in average efficiency. Some of the minor trades directly dependent upon the state of industry made some headway.

Family provision scheme

A scheme to secure a Capital Sum payable at death and a regular income over a period of years for dependants in the event of early death, at a cost which is little more than that of ordinary life assurance. It is readily adaptable, and rates will be quoted on application for policies to suit the needs of each individual.

OTTAWA SECTION

In view of the forthcoming Imperial Conference and the expiration of the Ottawa Agreements this year, we have summarised the Agreements of 1932, the development of Imperial preference since that date and the course of trade within and without the Empire, and have briefly indicated the problems that present themselves in considering the renewal or revision of the Agreements. Their relation to trade policy in general and to the political situation is discussed more fully in the first article of this issue.

I—The Agreements of 1932

THE normal term of the trade agreements concluded at Ottawa in 1932, between Great Britain and the Dominions, expires this year. Hence their renewal or amendment forms an obvious topic of negotiation among the statesmen assembling for the Coronation and the Imperial Conference. According to Mr Baldwin's announcement, however, such questions are not to be discussed by the Conference as a whole, but in bilateral conversations. This procedure had been foreshadowed by the actual conclusion of a new Anglo-Canadian trade agreement and by other recent developments. Its advisability was suggested by experience at Ottawa in 1932, when inadequately detailed preparation occasionally involved the whole Conference in stagnation while bilateral bargains were being driven. It may be taken for granted, nevertheless, that the British Government will preserve its policy of allowing the same tariff and preferential terms to all the overseas Empire. This was the main unifying factor in the series of separate agreements concluded at Ottawa. In this Section an attempt is made to trace the working of the agreements, and to draw from our experience since 1932 the lessons it has to teach for the future of Empire trade relations. This task must necessarily be preceded by a recapitulation of the main terms of the agreements themselves.

COMMITMENTS OF THE UNITED KINGDOM

The main undertaking given by the United Kingdom was the stabilisation of the preferential position created by the Import Duties Act, 1932. That Act exempted Empire products both from the 10 per cent. duty and from any additional duties under the Act until November, 1932; this exemption was prolonged for five years by the Ottawa Agreements, save for eggs, poultry and dairy produce, on which the British Government reserved the right after three years either to impose a preferential duty (without reducing the margin of preference) or to apply a quota system. On the foundation of this main undertaking, supplementary concessions to the overseas Empire were erected. These took two forms: the imposition of new or revised duties on certain imports from foreign countries, and the promise to maintain at least the existing margins of preference on a further list of commodities—thus effectively banning any reduction of the general rate of duty. Under the first head, three commodities—wheat, copper and linseed—were removed from the free list, and duties were raised, or made more onerous by a change from an *ad valorem* to a specific basis, on butter and cheese, eggs, preserved milk, fresh, canned and dried fruits, and a few less important articles. The categories affected (excluding wheat and copper) accounted for £118 millions of United Kingdom imports in 1930, of which £68 millions came from foreign countries. Under the second head, the 10 per cent. *ad valorem* duty and preference were stabilised on a long list of commodities that included barley, wheat flour, tinned meat, potatoes, fish, many varieties of timber, leather, lead and zinc. This group of undertakings affected £101 millions of 1930 imports, of which nearly three-quarters came from

foreign countries. Other concessions included the maintenance of the existing preference on tobacco and the widening of the preference on coffee. The general effect of the United Kingdom's Ottawa undertakings is shown by the following table:—

Protective Duties before Ottawa			Protective Duties after Ottawa		
Percentage of Foreign Imports taxed at			Percentage of Foreign Imports taxed at		
10%	11–20%	over 20%	10%	11–20%	over 20%
32.9	15.3	4.6	28.3	21.8	7.7

In addition, a start was made with the system of raising the price of meat and other products by the restriction of supply, under agreement between the United Kingdom and the exporting countries.

DOMINION COMMITMENTS

The undertakings given by the Dominions (except the Irish Free State, with which the British Government declined to make a trade agreement) and India are not easily summarised. Three Dominions—Canada, Australia and New Zealand—signed general clauses promising to protect by tariffs only those industries which were reasonably assured of sound opportunities of success, and to keep protective duties at a level that would allow United Kingdom producers "full opportunity of reasonable competition on the basis of the relative cost of economical and efficient production." Special consideration, it was agreed, might nevertheless be given to infant industries. The formula was to be applied by impartial boards, before whom British manufacturers would have the right to make representations. We shall return to the question of these general clauses later. All the Dominions also undertook to remove as soon as possible the various "crisis" restrictions they had placed upon imports from the United Kingdom; this aspect is also dealt with in a later paragraph. For the rest, the undertakings were widely different as between the several Dominions and India, according to their varying tariff history, the industries that they had chiefly protected, and the different goods for which the United Kingdom was specially anxious to increase the market in each case. It may be noted, however, that generally speaking the Dominions' tariffs on British goods had been rising even faster than foreign tariffs, and that for some years the trend of their share in total British exports had been downward (see Table on page 265).

The Australian Government was handicapped in regard to reducing duties on British goods by a pledge it had given not to reduce the level of protection except on the recommendation of the Tariff Board. Hence its major undertakings (apart from those already referred to) took the form of guaranteeing the maintenance of existing preferences, with certain exceptions, and applying a sliding scale of minimum margins of preference, according to the height of the *ad valorem* tariff. Thus, where the duty on United Kingdom goods was less than 20 per cent., the margin of preference would be 15

per cent.; and so on for higher ranges of duty and preference. At least to begin with, these undertakings necessarily implied a certain raising of general tariffs. Canada's concessions were largely in the form of specific changes in tariff schedules of great length and complexity. It was semi-officially estimated that the preferential tariff was thereby reduced to zero on categories of which the United Kingdom had supplied \$8.3 million in 1931–32, and was lowered on categories of which she had supplied \$37.4 millions, and that the foreign tariff was raised on categories of which she had supplied \$8.8 millions. Roughly half of her total exports to Canada were affected. *The Economist* pointed out at the time, however, that even on some of these items (notably textiles), as well as on many that were untouched, Canada's preferential tariff remained extremely high.

New Zealand undertook at Ottawa to remove the existing surcharge of nine-fortieths of the Customs duty on British goods, to maintain existing margins of preference (except where the margin was over 20 per cent., in which case it might be reduced), and to lower the preferential duty on four classes of goods covering £2.4 millions of British trade in 1930. South Africa undertook to create new or increased preferences on a short list of goods, partly by raising the general tariff; to impose new duties on certain foreign textiles; and to maintain at least existing margins of preference on a long list of manufactured articles. India's main undertaking was to give a 7½ per cent. preference on motor-cars and a 10 per cent. preference on a long series of manufactures. The volume of Indian imports

affected was estimated at £32 millions, of which £12.7 millions came from the United Kingdom. The Indian Government also promised a 10 per cent. preference on a shorter list of imports, including certain cotton and rayon piece-goods, subject to advice from the Tariff Board as to the degree of protection necessary. The low level of their tariffs, and the large proportion of their imports already coming from the Empire, prevented Newfoundland and Southern Rhodesia from granting any big or far-reaching preferential concessions.

SUMMARY

While it is impossible to summarise the Ottawa Agreements precisely, it will be seen that they had the following main features: (a) a pledge of continued freedom of entry for most Empire goods into the United Kingdom; (b) a certain lowering of preferential tariffs by the Dominions; (c) a certain raising of general tariffs, both by the United Kingdom and by the other signatories; (d) pledges on both sides to maintain margins of preference, which were bound to prevent downward movements of general tariffs in the future; (e) pledges to remove crisis restrictions and surcharges; (f) pledges by three Dominions to apply a "scientific" formula to their preferential tariffs; and (g) the thin end of the wedge of restriction of trade in primary products, with the aim of raising their price. They also confirmed the closing of the colonial Open Door by linking it with Dominion preferences for products of the dependent Empire.

II—Imperial Preference Since Ottawa

BEFORE considering the apparent effect of the Ottawa Agreements on the course of imperial and foreign trade, it is necessary to review the changes made since 1932 in United Kingdom and Dominion tariffs and quotas within the framework of the Ottawa Agreements and partly as a consequence of their terms.

CRISIS RESTRICTIONS

First of all, there were the Dominion undertakings to remove crisis restrictions as soon as financial conditions allowed. The Canadian sales tax has actually been raised since Ottawa from 6 to 8 per cent., but there are a large number of exemptions and the tax is not protective, being balanced by an equal Excise. A so-called Special Excise Tax, in fact a tariff surcharge, of 3 per cent. was payable on Canadian imports at the time of Ottawa; as far as British goods are concerned it was halved in 1934 and abolished in 1935. In 1932, Canada's anti-dumping duty was being used as a cloak for extra protection against goods from countries like Great Britain with depreciated currencies; an artificial exchange rate for sterling was fixed for the purpose of calculating "fair market value," with the result that British exporters had to pay the difference—at one time amounting to 58 cents in the pound—between the actual and the theoretical selling prices of their goods. This was set right in March, 1933, but of course the subsequent fall of the dollar has automatically done away with the alleged "exchange dumping" of British goods.

Australia's crisis barriers to imports took the form of primage duty and surtaxes. At the time of Ottawa, primage duty stood at 10 per cent., but most goods used by Australian industries had been exempted. In 1933 the principle of imperial preference was introduced into the primage system. The present position is that most imports under the preferential tariff, and those from countries with which Australia has trade agreements, are exempt from primage, or are subject to a primage duty of only 5 per cent. The general rate of 10 per cent. is still in force, though there are a good many exceptions. A surtax of one-half the duty ordinarily payable was imposed on certain imports,

mostly luxury goods, in 1930, but since 1932 it has gradually been abolished. New Zealand also imposed primage duties and surtaxes, though on a lower scale. Primage duty of 3 per cent. was levied on all imports otherwise free of duty, and this general rate remains in force, though many important articles have been freed from it since 1932. The duty obviously operates more against British than against foreign goods, since fewer of the latter are on the free list. The surtax of nine-fortieths of the total duty payable was abolished on United Kingdom goods under the Ottawa Agreement; the same concession has since been made, under the New Zealand-Belgian trade agreement, to all countries trading on most-favoured-nation terms with the Dominion. In South Africa, the 5 per cent. primage duty and the 7½ per cent. surtax previously imposed were abolished when the Union left the gold standard in January, 1933.

THE GENERAL CLAUSES

The next point to be considered is the working out of the general formula, embodied in the Ottawa Agreements between the United Kingdom and Canada, Australia and New Zealand, determining the maximum height of their preferential tariffs. The results have been disappointing to those who put their faith in the idea of a "scientific tariff" and who believed that Empire trade relations should be governed rather by comprehensive and permanent principles than by limited and temporary bargains. The greatest gain was expected in Canada, but there a judicial Tariff Board has not found itself able to recommend many substantial reductions in the British preferential tariff. Part of the reason has been its inability, in important cases, to ascertain relative national costs of production. More fortunate results, from the point of view of British manufacturers, have emerged in Australia and New Zealand, where no attempt was made at fine judicial interpretation. The Australian Tariff Board, in particular, has made it clear that its estimation of relative costs of production has been based on little more than rule-of-thumb or—perhaps the same thing—common sense, backed by long experience of tariff making.

DOMINION TARIFFS

Dominion tariff schedules are so complicated and dissimilar that there is no compact way of assessing the changes in them as a result of Ottawa and since. The best method appears to be to select certain important items, for each Dominion separately, and to tabulate the rates in force (a) just before the Ottawa Agreements went into operation, (b) just afterwards, and (c) at the latest date for which figures can be obtained. In the tables that follow, P stands for the British preferential tariff, G for the general tariff, and I for the intermediate or most-favoured-nation tariff:—

CANADIAN TARIFF RATES

Article	August, 1932		November, 1932		April, 1937	
	P.	I.	P.	I.	P.	I.
Tableware	Free	27½%	Free	35%	Free	35%
Steel plates (wide)	Free	\$3	Free	\$6	Free	\$6
Tin-coated sheets	7½%	12½%	Free	20%	Free	20%
Cotton fabrics*	17½ to 22½	20 to 27½	17½ to 22½	20 to 27½	15 to 20	20 to 27½
plus per lb.	3c.	3½c.	2c.	3½c.	Nil	3½c.
Cotton clothing	25%	30%	25%	30%	25%	30%
plus per lb.	3c.	3½c.	2c.	3½c.	Nil	3½c.
Woven fabrics of wool, n.o.p.	27½%	35%	27½%	35%	27½%	35%
plus per lb.	25c.	30c.	18½c.	30c.	12c.	30c.
Anthracite coal	Free	40c.	Free	50c.	Free	50c.

* Three categories: Unbleached, bleached or mercerised, and printed or coloured.

The above rates, like those in the tables below for other Dominions, are quoted clear of sales tax, surtax, dumping duty or other special charges. With certain exceptions, the Canadian preferential tariff is subject to a discount of 10 per cent. where the stated rates exceed 15 per cent. *ad valorem*. It should be noted, in connection with the margins of preference over foreign imports, that before the Canadian-American trade agreement of November, 1935, United States goods were subject to the general tariff and after the agreement to the intermediate tariff. The general tariff is substantially higher than the intermediate on the textile group of the items in the table. The lowering of the preferential tariff rates shown in the last column was chiefly the result of the recent Anglo-Canadian agreement replacing Ottawa, not of the operation of the general Ottawa clauses. The new agreement was fully reviewed in *The Economist* for March 6, 1937.

AUSTRALIAN TARIFF RATES

Article	August, 1932		November, 1932		April, 1937	
	P.	G.	P.	G.	P.	G.
Woollen piece-goods, n.e.i.	45%	60%	35%	55%	35%	55%
Apparel	60%	75%	45%	65%	45%	65%
Steel plates and sheets, galvanised and/or corrugated	110s.	150s.	90s.	130s.	90s.	130s.
Machinery, n.e.i.	55%	75%	45%	65%	45%	65%
Rayon piece-goods	25%	35%	20%	40%	1½d.	9d.
Assembled motor chassis	5%	45%	5%	45%	1½d. sq. yd.	7½d. lb.

Most of the reductions in tariff rates shown between August and November, 1932, were the product, not of Ottawa undertakings, but of the adoption of a report of the Tariff Board with effect from September 2, 1932. The sliding-scale formula for preferences enforced an increase in the general rate of duty on machinery from 60 to 65 per cent. The table brings out the enormously high rates still ruling in Australia, even under the preferential tariff.

SOUTH AFRICAN TARIFF RATES

Article	July, 1932		May, 1933		July, 1936	
	P.	G.	P.	G.	P.	I.
Cotton piece-goods	5%	10%	5%	10%	5%	10%
Woollen piece-goods	5%	5%	5%	5%	5%	5%
Socks and stockings	10%	15%	10%	15%	10%	15%
Iron and steel plates and sheets	Free	3%	Free	3%	Free	3%
Motor cars (under 400 value)	20%	20%	20%	20%	20%	20%
Mining machinery	Free	3%	Free	5%	Free	5%
Radio sets	20%	20%	15%	25%	5%	15%

The table demonstrates the relative smallness of the preferential margins accorded by the Union and of the changes made by the Ottawa Agreements. Neither high industrial protection nor big preferences have been part of South Africa's fiscal policy. In 1936 her tariff was reorganised on a triple-decker basis; but the highest level of duties applies only when imposed by proclamation (e.g. on cotton and woollen piece-goods), and then not to goods from the United Kingdom or from a long list of foreign and Empire countries.

NEW ZEALAND TARIFF RATES

Article	August, 1932		April, 1933		April, 1937	
	P.	G.	P.	G.	P.	G.
Motor cars	10%	40%	10%	55%	15%	80%
plus body duty	11½%	16½%	11½%	16½%	Nil	Nil
Woollen piece-goods, n.e.i.	20%	45%	20%	45%	20%	45%
Rayon piece-goods	10%	25%	10%	15%	Free	15%
Clothing and hosiery, n.e.i.	32½%	55%	27½%	50%	25%	50%
Shirts, pyjamas, etc.	32½%	55%	27½%	50%	20%	50%

The reduction of general rates of duty is seen to have been a valuable feature of some of New Zealand's post-Ottawa tariff changes.

INDIAN TARIFF RATES

Article	August, 1932		January, 1933		January, 1937	
	P.	G.	P.	G.	P.	G.
Motor cars	37½%	37½%	30%	37½%	30%	37½%
Galvanised iron or steel sheets:—	Rs. ton	Rs. ton	Rs. ton	Rs. ton	Rs. ton	Rs. ton
(a) If made from Indian sheet bar	83½	83½	30	83	15½ or 10%	45½
(b) Not made from Indian sheet bar	83½	83½	53	83	15½ or 10%	45½
Cotton piece-goods, plain grey	25%	31½%	25%	50%	25%	50%
or per lb.	4½ as.	4½ as.	4½ as.	5½ as.	4½ as.	5½ as.
Rayon piece-goods	50%	50%	50%	50%	30%	50%
or per sq. yd.	...	...	...	...	2½ as.	4 as.

The higher of the alternative duties is applicable. India denounced her Ottawa Agreement last year, and negotiations are still in progress for a new trade treaty.

SUMMARY

This review, incomplete as it has inevitably been, has brought out the significant features of Dominion and Indian tariff changes since Ottawa. They have been a product largely of two factors: changing general economic conditions, and political events such as the substitution of Mr Mackenzie King's Government for that of Mr Bennett in Canada. Up till then, *Canada's* main contribution had been the reduction of crisis imposts. Since 1935, unilaterally and under the recent agreement, she has reduced duties on a number of fairly important United Kingdom exports. Finally, to certain foreign countries whose trade was formerly subject to the general tariff—notably her great southern neighbour—she has conceded the lower duties of her intermediate tariff. *Australia* has also removed certain crisis surcharges, and has generally called a halt to the process of ever higher protection which she was previously pursuing. *South Africa* was enabled by the abandonment of the gold standard to abolish her extraordinary defences against imports. She has otherwise made little change in her system of moderate protection and preference. *New Zealand* has shown a steady tendency towards a somewhat lower tariff, and the present Labour Government is not at present inclined to reverse the tendency. *India's* tariff changes have been mainly related to her textile pacts with Japan and the United Kingdom, and to her long-standing policy of giving special protection to infant industries, like iron, and reducing it once they are established. In brief, the broad tendency in oversea Empire tariffs since Ottawa has been one of stabilisation, with a distinct, though moderate, movement downward as economic conditions have improved.

UNITED KINGDOM POLICY

In the *United Kingdom*, the most important modifications of protectionist and preferential policy have not been in the field of tariffs but in that of quantitative regulation of the trade in primary foodstuffs. This

policy was advanced by the British Government as a means of raising world prices to a profitable level in the interests of producers everywhere. But its purpose as a means of protection for home agriculture could hardly be disguised; and from the first it was regarded by the Dominions with suspicion or even with frank hostility. Their antagonism has been a steady handicap to its enforcement. Soon after the Ottawa Conference (which reached agreement only on the regulation of trade in meat), negotiations were opened for applying a similar system to imports of dairy products into the United Kingdom. Although these efforts came to nothing, British policy towards the home dairying industry was based for a long time on the assumption that some such system would eventually be applied. That this has now apparently been abandoned is mainly due to the strenuous opposition of the Dominions, who see in restriction the frustration of their hopes of continued expansion of their primary industry.

As far as meat was concerned, the Ottawa agreements precluded the British Government from imposing duties on Dominion meat during their currency, and from imposing any quantitative restriction on meat from

Australia or New Zealand until June, 1934. A few months later a pact was reached with Argentina, whereby she cut down her exports of beef to this country by 10 per cent., and of mutton and lamb by 20 per cent. The two Dominions concerned were then prevailed upon to reduce their mutton and lamb exports by 10 per cent., but they refused to agree to any curtailment of their sales of beef. The expiry in 1934 of the British undertaking against such curtailment, and the approaching expiry of the Anglo-Argentine pact and of the Ottawa agreements themselves, led to further discussions in 1935 and 1936. The Dominions steadfastly maintained their opposition of principle, and reinforced it by hard, bargaining arguments. The outcome has been that their meat exports are to be subject neither to compulsory restriction nor to a tariff or levy in the British market. This struggle over restriction has been the most remarkable post-Ottawa development in Empire trade relations. It seems to foreshadow further intense conflict, behind the scenes of the Imperial Conference, between the protagonists of British agricultural protectionism and those who are convinced of the imperative need for wider markets for British manufactures.

III—Empire Trade since 1930

ANYONE who tries to estimate the practical effect of the Ottawa trade agreements must engage the *post hoc ergo propter hoc* fallacy as his mortal enemy. The statistics show plainly enough what has happened since Ottawa, in comparison with what happened before; but a dozen other influences intervened, each as powerful or even more powerful than the Empire commercial treaties. Among such influences were the relative stability of exchanges in an area including most of the British Empire, while other currencies were either overvalued or unstable in relation to sterling, or both; the high price of gold and the consequent prosperity of gold-mining industry, especially in South Africa, but also in Canada, Australia and other parts of the Empire; the internal recovery of the United Kingdom, based on the housing boom and other local capital expenditures; and the rise in commodity prices, which affected raw produce more rapidly than manufactures, and therefore affected United Kingdom imports from the Empire more rapidly than her exports to them or her imports from industrial countries like herself. Other influences of almost equal importance might be added. Hence we must beware of assuming that what happened to Empire trade after Ottawa happened because of Ottawa, and it is in this light that the statistics tabulated below and on other pages of this Section (see pages 269-71) must be examined.

BRITISH TRADE FIGURES

The most general picture is given by the following figures of British imports and exports from the Empire and from foreign countries over a series of years:—

BRITISH IMPORTS

Year	Total	From Foreign Countries		From Whole Empire		Dominions (excluding I.F.S.), India and Southern Rhodesia	
		Amount	%	Amount	%	Amount	%
1925	£'000	£'000	67.5	£'000	32.5	£'000	22.9
1927	1,320,715	881,879	70.0	438,836	30.0	302,591	20.2
1929	1,218,341	851,680	70.0	366,661	29.0	245,888	19.7
1930	1,220,765	861,823	70.6	358,842	29.2	240,590	19.6
1931	1,043,975	736,945	70.6	304,030	28.7	204,576	18.4
1932	861,253	613,836	71.3	247,417	28.7	167,122	19.4
1933	701,670	453,533	64.7	248,137	35.3	175,053	24.9
1934	675,016	425,879	63.0	249,137	36.0	184,826	27.4
1935	781,414	480,129	61.5	271,285	34.5	196,217	25.1
1936	756,041	471,483	62.4	284,558	37.6	205,185	27.1
1937	848,936	516,356	60.9	332,580	39.1	247,900	29.2

BRITISH EXPORTS

Year	Total	To Foreign Countries		To Whole Empire		Dominions (excluding I.F.S.), India and Southern Rhodesia	
		Amount	%	Amount	%	Amount	%
1925	£'000	£'000	58.6	£'000	41.4	£'000	28.8
1927	773,380	438,266	56.7	335,114	43.3	230,055	32.2
1929	709,981	382,431	53.9	327,550	46.1	228,040	32.1
1930	729,349	404,888	55.6	324,461	44.4	224,741	30.9
1931	570,755	322,410	56.5	248,345	43.5	162,228	28.4
1932	390,622	219,949	56.3	170,673	43.7	101,898	26.1
1933	365,024	199,512	54.6	165,512	45.4	100,191	27.2
1934	367,909	204,392	55.6	163,517	44.4	100,540	29.0
1935	395,986	210,413	53.2	185,573	46.8	125,987	31.8
1936	425,813	221,468	52.0	204,345	48.0	137,535	32.3
1937	440,719	223,792	50.8	216,927	49.2	146,544	33.3

Perhaps the most striking feature here is the continuous and rapid advance in United Kingdom imports from the oversea Empire. The big rise in their ratio to imports from foreign countries happened between 1931 and 1932, whereas the big rise in their actual value did not begin until two years later, when home prosperity was getting under way. This is a pretty clear indication of the extent to which the policy of tariffs-cum-preference, adopted at the end of 1931 and the beginning of 1932, restricted trade with foreign countries rather than merely diverted it to the Empire. Leaving out the Irish Free State, the effect of that policy, in round figures, was to raise the proportion of Empire imports to total imports from one-quarter to one-third. In some ways even more remarkable than that proportionate rise was the fact that imports from the overseas Empire were 20 per cent. higher in sterling value in 1936 than they were in 1930—nearly 10 per cent. higher even if the Irish Free State be included. The tables incidentally show up the price we have paid for the luxury of a "tariff war" with our neighbour.

The more violent depression of the purchasing power of the Dominions, in comparison with that of Great Britain, is shown in the relatively slow recovery of their imports of Empire goods to pre-1931 levels. One of them, however, was already buying more British goods in 1934 than in 1930, such was the revivifying effect of gold prosperity in South Africa. In her case, on the other hand, there has been no apparent trend towards a higher proportion of imports from the Empire than before Ottawa, and the proportion of her exports going to the United Kingdom and other parts of the

Empire has definitely declined. The Union has never adopted either high all-round protectionism or wide preferential margins, and the Ottawa arrangements made comparatively little difference to her commercial system. Not only in South Africa, but also in other Dominions, there is an evident slowing-down of the post-1931 rise in the ratio of Empire imports to total imports. This suggests that the major effect of Ottawa and the currency factor on the direction of their purchases has now worked itself out. Furthermore, in no case was the rise in that ratio as great for any of the Dominions, India or the dependent Empire as it has been for the United Kingdom.

This fact has been commonly taken as indicating that the United Kingdom got the worst of the bargain at Ottawa. That is the obvious comment on the far more substantial rise in our imports from the Empire than in our exports to the Empire. Apart, however, from the mercantilist error of regarding imports as inherently an evil, the comment ignores the other influences that have intervened, including those aspects of British protectionism which are quite independent of Imperial preference. From their own point of view the Dominions argue that there was much more room for expansion in United Kingdom imports from the Empire than in their own imports from the United Kingdom.

Specially significant, perhaps, is the trend of United

Kingdom re-exports to the overseas Empire shown in the detailed table given on page 269. Ottawa evidently had little or no improving effect in this field. The sacrifice of entrepôt trade, which is usually symptomatic of a protectionist regime, has been one of the more depressing results of the British tariff system. It is noteworthy that not only the absolute value of re-exports to the Empire but also their proportion to total re-exports has declined—a tribute to the choking effect of protection within the Empire as well as beyond it.

DIVERSION OF TRADE

The most important question about the Ottawa system is not which party got the best bargain, but how far that system succeeded in its ostensible aim of clearing out the channels of Empire trade. How far did it promote trade in the Empire, how far did it dam trade between the Empire and the rest of the world, how far did it simply divert trade from one channel to the other? These are questions that can be answered only by the most intricate and detailed examination of the statistics, item by item, taking all other influences into account. Some clue, however, may perhaps be found in the tables on the next page, showing the changes in the Dominions' imports of textiles and of iron and steel and in the United Kingdom's imports of meat and dairy produce.

Notes.—(a) From United Kingdom. (b) From U.S.A. (c) British currency values. (d) Excluding canvas and duck. (e) Including Government stores and imports from South-West Africa. (f) Excluding Govt. stores. (g) Including mixed fabrics.

An outstanding feature of the above figures is the diversion that took place in the trade in cotton goods. Thus Canada spent \$4,207,000 on British cotton piece-goods and yarns in 1931-32, and \$7,068,000 in 1935-36, while her imports of American goods in the same groups fell from \$4,870,000 to \$1,997,000—an almost exact balance. In similar categories, South Africa increased her purchases from the Empire by £1,359,000 between 1931 and 1935, while diminishing her purchases from foreign countries by £764,000. India kept the quantity of her imports of foreign cotton piece-goods at a constant level, but their value fell; whereas she so far increased the quantity she bought from Empire countries that the value rose by nearly 40 per cent. Apart from cottons, no very distinct general trends are visible in the Dominion figures. In some cases, increased purchasing power benefited both British and foreign countries; in others, national protectionism cut down purchases from both alike.

Similar figures for certain agricultural imports into the United Kingdom are shown in the following table, and are the basis for the chart at the foot of this page:—

IMPORTS OF MEAT AND DAIRY PRODUCTS INTO UNITED KINGDOM, 1931 AND 1935

	From British Countries		From Foreign Countries	
	1931	1935	1931	1935
Meat other than pig meat.....	£17,695	£20,305	£35,508	£22,622

Cheese.....	£7,513	£5,811	£1,550	£838
cwts.	2,525	2,398	361	316

IMPORTS OF FOODSTUFFS INTO U.K. FOR 1931 AND 1935

* Excluding pig meat.

These figures tell a much plainer story. In all the categories listed, except butter and cheese, a rise in the quantity purchased from the Empire was offset by a much greater fall in the quantity purchased from foreign countries. The slight increase in the *quantity* of foreign butter imported did not prevent the same proposition from being true of the *values* of imports of butter. Both the quantity and the value of cheese imported fell, from the Empire as well as from foreign countries. If all the items are added together, an increase of less than £6,000,000 in imports from the Empire is seen to be out-

IV—Revising Ottawa

A SURVEY of Imperial trade relations reveals two important trends: in the Dominions a determination to protect manufacturing industry; and in the United Kingdom protection for agriculture—especially by quantitative restriction. In both these respects the Ottawa pacts have been a limiting rather than the determining factor. Time and again the need to attune British policy to the interests of the overseas Empire has checked or prevented the quota limitation of imports of foodstuffs. On the other hand, the Ottawa undertakings have been a not very rigid "ceiling" for the protection given by the Dominions to their secondary industries. But while British protectionist policy seems to have chafed against imperial restraints, Dominion protectionist policy has, on the whole, kept comfortably within them since Ottawa.

THE POLITICAL BACKGROUND

This is, in part, due to the fact that some of the Dominion tariffs were already high, whereas that which the United Kingdom introduced in 1932 was moderate. It is, however, also partly the result of political developments in the various countries of the Empire. For example, the British Government seems to be more solidly protectionist now than it was five years ago. Having discarded its free-trade Liberal support, survived a general election, and founded a powerful set of vested interests behind the tariff regime, it has been able to dispense with such compromises as its former pledge against taxes on food. By contrast, the Dominion Governments have, generally speaking, swung in the opposite direction. The United Australia Party has had to take the anti-protectionist Country Party into coalition. The fusion of the parties of General Hertzog and General Smuts diluted the more extreme nationalism of the Union Government. The Labour Party in New Zealand, though as determined as its predecessors to maintain the standard of life in the Dominion's secondary industries, bases its policy on reciprocal trade agreements rather than on tariff protectionism.

The most decisive political change, however, has happened in Canada, where Mr Mackenzie King has replaced Mr Bennett. The practical effect of this upon Empire trade relations was seen in the new Anglo-Canadian commercial pact. A large number of Canadian tariff items were lowered. Moreover, a definite move was made away from guarantees of minimum margins of preference (which prevent the reduction of tariffs on foreign goods) towards guarantees of maximum preferential rates of duty, which leave the path open to a more liberal regime in the future. If this is to be a feature of the revised agreements with other Dominions, it will be a distinct though passive contribution towards freer world trade.

There are signs that this may, indeed, be the outcome of the London discussions. The Dominions, notably Australia, are tending towards the view that they must seek expanding markets outside as well as inside the Empire. It is not inconceivable that the same truth may be driven home upon the British Government in the light of events since Ottawa. The general effect of the Ottawa Agreements, it is now clear, was to stimulate protectionism abroad, and a prime objective of the present negotiations should be to help in reversing that trend.

balanced by a drop of £34 millions in imports from foreign countries.

Thus, in these all-important items of Empire trade, the Empire producer has gained far less than the foreign producer has lost by the new British commercial policy. The exporter who has lost foreign markets, as well as the consumer, has paid for the protection of home agriculture, and Imperial preference has only very partially succeeded in its professed aim of mitigating the barriers to world trade. The real problem has still to be tackled.

The decisive factor in the whole complex is British protective policy, especially towards agriculture. For the purposes of the present conference some degree of protection in Great Britain must be accepted as a postulate in the situation. But not all forms of protection are equally harmful to world trade and prosperity. Even within the framework of the existing system, it would be possible for the Government, in collaboration with the Dominions, India and the colonies, to set its face against a number of dangerous aspects of its previous policy: against the closed door in the dependent Empire, which is compatible neither with economic sanity, nor with imperial trusteeship, nor with international appeasement; against quota restrictions, which penalise the poor consumer and the progressive producer, while encouraging stagnation and inefficiency; against such pledges to the rest of the Empire as inhibit the granting of freer trade to foreign goods; against a pedantic and obstructive insistence upon the most-favoured-nation principle in cases where its own purpose—freer international trade—would be better served by the establishment of low-tariff groups open to all.

EMPIRE AND FOREIGN TRADE

The greatest defect of the Ottawa Agreements was that—except for pious generalisations—they impeded rather than assisted trade between the Empire and the outside world. There were undoubtedly excuses for this defect. The world depression was almost at its greatest severity. British and foreign countries alike, in fear for their financial stability, were preoccupied with the problem of preventing, at almost any price, an adverse balance of trade rather than with the task of expanding their business relations in pursuit of a higher standard of life. It was to the credit of Ottawa that, at least in principle, it renounced "crisis" restrictions on Empire trade.

Now, however, the circumstances of the day provide no such excuse for a restrictive instead of an expansive policy towards trade with foreign countries. A high degree of monetary co-operation has replaced competitive disorder over a wide area. Governments are concerned rather with controlling the boom than with finding bottom in a slump. Many countries, notably the United States, France and the Oslo Powers, have given practical evidence of their anxiety to contribute towards freer conditions of world trade. The time is ripe for a bold gesture by the British Commonwealth nations towards the same end.

The Imperial Conference itself will not discuss detailed questions of tariffs and quotas and bilateral agreements. It can, however, be made the occasion for co-ordinating different branches of Imperial economic policy. The division of official ideas into separate compartments was well illustrated by the contrast between the restrictive trade policy and the expansive monetary policy accepted by the Ottawa Conference at the instance of the United Kingdom Government.

The Imperial Conference of 1937 with its attendant economic difficulties offers an excellent opportunity for co-ordinating the different aspects of Empire co-operation. It can do still greater service, not only to the Empire itself but to the whole world, if it can enlist its members in a common effort to enlarge the trade of the Empire with the nations outside it.

The Problem of Prices

NEW YORK, April 20.—In the past two months organised markets have experienced recessions of sufficient magnitude to require some consideration of their significance. High-grade corporate bonds began to decline about the middle of February; long-term Government bonds began to decline early in March; common stocks began to decline about the middle of March; and primary commodities about the end of March. In the past week or so, bonds, both corporate and Government, have shown steadiness, with some tendency to recover. The result is that the $2\frac{3}{4}$ per cent. long Governments are back to par, while just before the decline the $2\frac{1}{2}$ per cents. commanded a small premium. The increase in reserve requirements may have been a factor in unsettling the rate, and the buying of about \$55 millions by the Reserve Banks, plus some Treasury purchases, perhaps helped to check the decline and to stimulate the rally. But taking things as they are, it would appear that the long-term rate of interest has risen by perhaps $\frac{1}{4}$ per cent.; and that the rather wider movement in yields on corporate bonds represented a re-alignment on the Government market, rather than an increase in the interest rate.

The decline in commodities, like the previous rise, has been most extreme in the items in which London speculation had been active—copper, lead, zinc, rubber and, to a lesser degree, cereal grains and cotton.

Moody's index of primary commodities rose from about 160 in June, 1936, to about 230 nine months later—almost 50 per cent. This remarkable move occurred in three distinct phases—one in the early summer, featuring agricultural crops, and clearly associated with drought; the second towards the end of the year, and including metals. The third came from about mid-February, and ran raggedly into April. Most commodities, except perhaps cotton, had figured in the movement up to the end of the year. Although the highest point of the index was reached in early April, the markets had lost their unity by the end of the year. Lard, cotton oil, sugar, and cocoa receded after reaching peak prices in late December or early January; the non-ferrous metals reached their best prices in early March; rubber, grains, hides and cotton continued to rise in April. Of the three reactions—bonds, commodities and shares—that in shares has been relatively the

smallest; the decline in the average from early March has been about 10 per cent.—about the same as that which occurred at this time last year; it has been most marked, as would be expected, in shares affected by commodity prices.

This succession of market declines—moderate though they are—has rather dampened the inflation-mindedness that was emphatically the mood of Wall Street early in the year. The weakness in the corporate bond market has limited new financing; and the decline in commodity prices, combined with the fact that inventories are pretty high, and dealers have liberally bought forward, has apparently terminated the heterogeneous sellers' market of mid-winter. In short, the boom psychology has been considerably abated; but the two questions which were raised by the sellers' market are still unanswered. The increase in basic costs, whether of primary commodities or labour, is gradually reaching the public in the form of retail prices. It is a matter of controversy whether or not incomes have been increased as much as costs, especially since an appreciable fraction of the increased costs is the consequence of the shortened week. Secondly, in the sellers' market there was a good deal of stocking up in one form or another; which may or may not have created inventories to be worked off. Few persons are ready to predict a readjustment of sufficient magnitude to be termed a recession; but an increasing number are persuaded that there are a price question and an inventory question to be answered.

The Future of Gold

Although the official statements were accepted as reassuring, the gold question remains one of the most lively themes of New York conversation. The inactive gold fund has reached \$472 millions in approximately four months, and the rate of inflow has been accelerated in the past month. Not a day passes without a rumour or a proposal; the rumour that the price of gold would be reduced to \$30 an ounce was followed by a rumour that a free gold market would be established to encourage hoarding by individuals; and this in turn was followed by suggestions for a complete embargo, for a quota system for imports, for an import tariff, for the return of gold to the Reserve System (combined with flexible reserve requirements to sterilise the gold in the System); and for putting gold coin into circulation. So numerous and so varied is this stream of suggestions that it is impossible to give more credence to one than to another; they are significant because they show that the gold question has assumed major importance and is pressing for an answer that has not yet been found.

This gold question is, of course, both a monetary and a fiscal problem. The purchase of \$472 millions of gold in four months has increased the Budget deficit by that amount; and there can be no doubt that the country is becoming more deficit-conscious and more debt-conscious than it has been. If the increase of the inactive gold fund is continued into the future at the rate of the past four months, it would perhaps become the major element in the deficit. The President's Budget Message, expected last week, is awaited with keener interest because it has been postponed. It is realised that the expectations of January have been disappointed, both in expenditure and in revenue; it is still persistently rumoured, however, that new taxes are not immediately contemplated.

The familiar controversy about the number of unemployed was revived by an estimate of Senator Vandenberg, who computes the number of industrially employed at 38 millions, exclusive of persons in agriculture or on relief work, against an official estimate by the Bureau of Labour for last December of 32 millions. Senator

Vandenberg derives his figure from the 26 millions registered by the Social Security Board, plus 12 millions (estimated by the National Industrial Conference Board) gainfully employed but not eligible for registration. As the estimated number of employables, exclusive of agriculture, is put at about 41 millions, this calculation would leave a figure of about 3 millions for the unemployed, against estimates ranging from 6 millions to 10 millions.

After the Wagner Ruling

WASHINGTON, April 20.—The Supreme Court, in sustaining the Wagner Labour Relations Act, put the seal of law upon the profound change in the status of organised labour expressed in the General Motors and Chrysler settlements and the steel agreement. Collective bargaining is not only here to stay, but it is here with the full compulsion of executive government behind it. When steel made its voluntary peace with John L. Lewis, industrialism in the United States entered a new phase, and the ultimate acceptance of labour organisation was assured. But no one thought it would follow within a few weeks, or that opposition to it would be outlawed. Even the subtlest case of discrimination against unions appears hopeless in an American court, since even the plea of freedom of the press did not win the appeal of the Associated Press. The South, where prejudice against unions is almost as strong as against negroes, will find it hard to adjust itself to the new legislation. Harlan County, Kentucky, where a union organiser's life was never safe, will have to put up its shot-guns. Even California's vegetable and fruit industry will have to forego the protection of vigilantes.

But the Wagner decision did not solve America's labour problems. The sit-down strike must be appraised, and either legalised or rejected as standard practice. It brought industrial regions into a dangerous humour. In Michigan a powerful movement was under way to organise vigilantes to deal independently with sit-down strikers. Governor Murphy's insistence on settling the General Motors strike, without executing a court order to oust sit-downers, created bitterness among both employers and non-union workers. One saw here the first symptoms, east of California's Imperial Valley, of the growth of an unofficial army with a wide popular support, one of the pre-requisites of Fascism. John L. Lewis sensed the danger and withdrew sit-downers in the Chrysler plants before proceeding to negotiations. His action was probably the turning point in a labour crisis which might have been quickly out of hand with serious consequences. Mr Lewis undoubtedly recognised that the morality of the sit-down strike in the General Motors plants was on a higher plane than in the Chrysler plants. General Motors had kept unions out; Chrysler in a feeble but real way had been sympathetic with them. And the steel agreement had brought the unions into the industrial stronghold as equals, so that blasting tactics no longer were called for.

But the effect of the sit-down epidemic is still here. Employers now demand protection against it, with an insistence sharpened by their amazement at the Supreme Court's Wagner ruling. They wish to require of labour the strict observance of the law of trespass, and to balance the Court's finding with new legislation to impose responsibilities on unions commensurate with their new power. Employers look longingly at the legislation passed in Great Britain after the General Strike. They are asking for the incorporation of unions, supervision of union finances, and union liability for damages if contracts are violated. The United States Supreme Court, in a unanimous decision in 1922 in the Coronado coal cases involving the United Mine Workers, ruled that unions are suable in the Federal courts both for injunctions and money damages; and in the Coronado case damages of over £5,500 were paid. In many States unions are suable for damages under codes relating to voluntary unincorporated associations. Since in a damage suit the employer must be able to prove his case or foot the bill, injunction suits against unions have been more popular.

Amendment of the Wagner Act is also being pressed by the American Federation of Labour, to permit representation in collective bargaining by crafts as well as by industries. As the Act stands it favours the Lewis unions to an extent which makes any great growth by the A.F. of L. difficult, if not impossible. The Administration, however, is not inclined to favour amendment either on behalf of employers or the Federation, on the plausible ground that the Wagner law is entitled to a period of experience before it is rewritten.

Unionism at the Cross Roads

It is noteworthy that the cause of unionism should have made historic gains in a period when the labour movement is split wide open, beyond possible healing. Embarked on its course of ejecting the Lewis unions, the A.F. of L. cannot draw back, and this year is almost certain to make irrevocable the suspensions imposed on the Lewis organisations at the last annual convention. The personal bitterness between John L. Lewis and William Green has grown worse as Lewis has swept to further successes. It reached its climax in Green's public attack on his rival as one aspiring to a political dictatorship. Lewis did not answer, but his friends know that he will not compromise with the Federation so long as Green is its chairman.

But it would be a mistake to expect the Lewis movement to maintain the velocity of this year's successes. While Lewis has been absorbed with major negotiations, almost nothing has been done to consolidate the gains made. The Labour movement needs a corps of officers comparable to a government's civil service, men who are versed in labour practices, the law, and routine strategy. It was a fatal weakness of the American Federation of Labour that it did not train such a corps, and so was not able to take over the task of organising

THE CHASE NATIONAL BANK

OF THE CITY OF NEW YORK

CHANGE OF ADDRESS

As from May 3rd, 1937, the main
London branch of the Bank will be
transferred from 10 Moorgate, E.C.2,
to

**6 LOMBARD STREET
EC3**

Telephone: MANsion House 3240
Cables: Chasebank London

industrial unions in the mass production industries. Now Mr Lewis must issue charters. He must recruit officers on a national scale, install them and try as best he may to teach them overnight how to run their formidable affairs. It may be, as Mr Lewis predicts, that he will have a larger membership by the end of the year than the Federation itself. But it will be a callow organisation, likely at any time to get out of hand, and injure itself seriously. The real influence of the Wagner decision will not be felt much before next year, and only then if the Lewis unions can satisfy their rank and file while getting down to the serious task of perfecting organisation. Membership drives will be continued, particularly in the textile mills of the South, and the oil fields and refineries of the Rockefeller empire. They will be prosecuted in the plants of Mr Ford, despite any ingenuity he can show in bribing his workers to remain unorganised.

The day when espionage can bore into the unions so as to permit wholesale discharges of new members is over. The great "detective" corporations, with their industrial spies and their professional strike-breakers, must either dissolve or find new fields for their employees. Their doings have been adequately aired for the first time in the hearing before the Senate Committee on Civil Liberties under Senator La Follette. It has been a belated chapter to unfold to the public, but now that these practices have been exposed, the satisfaction of the public over the Wagner decision is all the greater. It puts an end to them.

France

Extremists Resisted

PARIS, April 29.—The Popular Front Government, which enjoys a comfortable majority in the Chamber, has been for three or four weeks pressed by the extremist elements of the Trade Unions and the Communists to issue a new 10,000 million franc loan for public works, and to charge the Budget with several billions of new expenditure for pensions for aged workers and for a national unemployment fund. All these claims are, however, contradictory to the promises which were made by M. Auriol, the Minister of Finance, at the eve of the last Security Loan; and their first effect was to provoke a new fall in the franc and the Rentes. The end of the Parliamentary recess was, however, marked by two significant events: (1) the success at Sète of the Socialist Jules Moch, the Blum candidate, against a coalition of moderates; and (2) an open letter by M. Campinchi, the President of the Radical-Socialist group in the Chamber, addressed to the moderates, in which the writer not only denounced social disorder, but also the want of a spirit of social justice which the governing classes have shown during the last century.

M. Blum, who had conducted lengthy negotiations with the leaders of the republican parties and with the Socialists, then declared in a Cabinet Council that the "breathing space" would be continued; and that there was no question of a new loan or any new expenditure for the time being. These concessions to Capital seem to have been endorsed by the Trade Unions and by the Communists; and the Cabinet has once more gained time. But it is by no means certain that Parliament has asserted its authority against "the dictatorship of the masses" without offering some compensation. It is believed that the new programme which is being prepared by M. Blum will entail basic reforms, which the Government will present, not as inspired by the wish "to take money where it is," but by a sense of social justice. M. Blum may define his project further when answering his critics on May 7th.

On the other hand, it is not certain that the Prime Minister intends to embark immediately on this new policy. His next aim is to ensure that the Exhibition will be opened at the time arranged, on May 27; to increase meanwhile the purchasing power of the masses by a rise in wheat prices; and to reabsorb the unem-

ployed by such measures as compelling landowners to make certain repairs to keep the workers employed after the Exhibition has been constructed and opened.

Prices and Business Fears

Such a policy will undoubtedly help to maintain the social equilibrium—at least, if this equilibrium is not again menaced by new economic difficulties. Business reports show that there has been a slowing down of activity in many industries after the revival. The rise in prices which followed the social laws, the devaluation and the rise in the price of imported raw materials, have lifted prices above the purchasing power of the public. The resistance of consumers has brought about some stability, and even a slight decline in wholesale prices, as the following table shows:—

	MARCH			APRIL		
	20th	27th	3rd	10th	17th	24th
General index	533	536	540	542	539	537
National products	549	553	559	561	562	559
Imported products.....	504	507	505	507	498	497
Foodstuffs	518	518	527	533	532	526
Industrial products	547	552	551	550	546	547

It remains to be seen whether or not industry and business men will be squeezed between the rise in cost prices and the decline in purchasing power. M. Simon, the President of the Société Générale, declared at the annual meeting of this bank that the "outlook is not encouraging."

After the decision to maintain the "pause" had been taken, the Government and the banks agreed to issue a 2,000 million or 3,000 million franc loan for the new War Pension Fund, in one-year 4 per cent. bills, similar to the National Defence Bonds. Fiscal receipts in March were 3,065 millions, of which 2,493 million francs were ordinary receipts. The total for the first quarter of 1937 is thus 8,184 million francs, against 7,400 million francs in the first quarter of 1936.

Germany

Creating Capital

BERLIN, April 28.—The Bourse was influenced last week by reports of further public borrowing. One measure mentioned was a possible Reich motor roads loan of Rm. 350 millions. At the opening of the recent Automobile Exhibition, Herr Hitler intimated that the Motor Roads Company from 1937 onwards would finance itself, which means that it must borrow in the capital market on its own security, but possibly with a Reich guarantee. It also seems certain that other flotations of Reich consolidation loans are impending. The *Deutscher Volkswirt*, which is certainly an official mouthpiece in this matter, declares that in the present condition of the capital market the Reich could easily borrow for consolidation Rm. 2,000 millions or 3,000 millions in the coming financial year.

The money market has of late been extraordinarily liquid. There are numerous indications of this: an increased demand for short-term investments; heavy sales of G.D. Bank promissory notes; and a decline in the rate for day loans during last week to below 2 per cent., a depth not reached since the war. The circulation of credit instruments has greatly increased, though, according to official returns, the familiar story of the astronomical circulation of Reich work-creation and armaments bills is untrue. It is nevertheless necessary, the *Deutscher Volkswirt* points out, that this should not lead to an increase in the currency circulation "above the quantity necessary for coping with the increased turnover of goods," an increase naturally threatened if the longish-term Reich special bills should be rediscounted. The liquidity of the money market is itself due to Reich short-term advance financing. The *Deutscher Volkswirt* continues: "The money resources with which the Reich, for the covering of its expenditure, supplied itself, not by taxation but by contracting short-term debts, and which it pumped into private

business, must be sucked up again if an inflationary effect is to be avoided."

It is officially affirmed on all sides that the shortage of capital has ceased; to prove this the easy flotations in the past two years of Reich loans and of Four-Year Plan company debentures are cited. But, according to the passage quoted, which is identical with earlier official utterances, the Reich has created capital, and can continue to create it, by contracting short-term debts and pumping the yield into industry. Then it can borrow back the capital and pay off an equivalent sum of short-term debt already contracted for capital investment. Obviously, there is no limit to this process.

The economic meaning and the consequences of this system are not quite clear. It seems that no distinction is made between capital and credit. The Reich creates capital by pumping bill-raised money into private business; and anyone, public or private, who wants capital can get the same money. He can get it, as in the case of the proposed motor roads loan, for genuine capital investment. But, also, a private concern which does not want capital at all for investment in its own works, can sell bonds or shares in the capital market in order that it may have cash for the purchase of Reich bills; and it is under-capitalised if it has not cash for such purposes.

Farming, Manufacture—and High Prices

The cultivation of vegetables has been subjected to a rigid system of registration and permits. To increase the cultivated area of certain vegetables without permission is made a penal offence. The ordinance recently issued to prevent inefficient farming has been amplified. It is made a penal offence to farm inefficiently; alternatively, badly run farm land may be transferred to a trustee, or compulsorily leased to an experienced farmer. Farmers may be required to cultivate waste land, or again to lease it to an experienced person.

Herr Wagner has recently delivered a long address on price-regulation and foreign trade. He denied that absolute autarky is aimed at, but he emphasised the need for increasing exports. He remarked that whereas Germany had freed herself from the so-called economic law of Supply and Demand, that was not so abroad; and from foreign customers such prices must be demanded as they were willing to pay. He implied that the heavy iron and steel export (which has been stable of late) ought not to be increased merely because prices have risen considerably while the prices of finished goods based on steel have not advanced correspondingly. The main object must be to export articles into which a great deal of labour has gone. Herr Wagner announced that new price regulations would be issued. The interests of exporters would be taken into account, but traders' profit margins on imported goods would not be allowed to increase merely because of the rise in world prices.

The industrial employment index (1936 = 100) stood at 103.7 in March, against 100.7 in February. This increase is mainly due to the seasonal recovery of building, the index number of which rose from 65.7 to 84.1, but the other recorded trades also improved, except foodstuffs. Production goods (probably also because of the building revival) improved much more than consumption goods. The average daily time worked in all industry rose from 7.56 to 7.70 hours. Coal output in the first quarter of 1937 was 44,240,000 tons against 39,180,000 tons in the same period of 1936. The production of ingot steel in March was 1,581,800 tons, the daily output being practically the same as in February. The first quarter of the year shows a slight decline, output being 4,635,200 tons, against 4,638,200 tons in 1936. Taken with the quarterly return of pig iron, this shows that the great expansion of iron and steel output has ceased, after lasting since the late summer of 1932. The steel syndicate reports speak of an unchanged heavy demand; and Herr Wagner has spoken of the substitution of stone and brick for steel in building. The export of motor cars in the first quarter of the year was 5,639 against 2,988 and 1,181 in the same quarters of 1936 and 1933 respectively. A detailed return of machinery exports (which reached a total of 336,000 tons in 1936 against 255,000 tons in

1935) shows an increase in machine tools for the working of metals from 43,547 to 73,217 tons; deliveries to Russia rose from 3,775 to 21,573 tons, and to Great Britain from 6,168 to 10,461 tons. A great deal has been heard of late about British purchases of German machine tools.

Austria

Slight Recovery

VIENNA, April 19.—While the economic situation in most countries appears to be considerably improving, conditions in Austria are but slightly altered. Even here, however, the upward trend is unmistakable. The recently floated internal loan, amounting to 180 million schilling, has been offered at the comparatively low percentage of 4½ per cent. without any of the usual inducements. It has been fully subscribed, and private investors have participated as well as the banks, saving institutions and insurance companies. Money was withdrawn from the Stock Exchange to pay for the loan, which caused the general Stock Exchange index for shares to rise by only 2.7 per cent. compared with February. Nevertheless, foreign shares and all shares connected with the armament industries maintained their upward movement during March, rising on the average by 8.3 per cent. and 10.4 per cent. respectively compared with the February figure. Industrial materials profited from higher metal prices, and in March the index improved from 134.9 to 136.7, while retail prices and the cost of living remained unaltered. Employment was slightly improved. The production of iron and steel increased considerably. Foreign trade is steadily improving; imports of foodstuffs and raw materials, and exports of timber, pig iron, paper pulp, finished goods and livestock are the most important items. Tourist traffic in February exceeded the figures for February 1936 by 5.4 per cent. Austrian winters sports centres were visited by 23.4 per cent. more tourists from abroad than in February 1936. Austrian tourists apparently travelled less: their numbers fell by 4.3 per cent.

Thus, Austria in 1937 is continuing the return to economic normality which began in 1936. The general index of industrial production (1929 = 100) at the end of 1936 stood at 82; it was as low as 60 in 1932 and 77 in 1935, according to the League of Nations index. Thus a recent survey of the economic situation of the world, which classified the present condition of each country, quite rightly placed Austria amongst those countries where the economic situation shows only a slight improvement.

Iron in Politics

Iron and steel are the key products of Austrian industry; and the Alpine Montan Steel Corporation has always been the most powerful unit. This body not only monopolises the production of iron ore and steel, and the trade in these commodities, but also exercises an influence on internal and international politics. Immediately after the war the Austrian Government acquired a considerable share in the company (1919). Shortly afterwards these shares were sold to an Italian group. Very unexpectedly, however, Italian control was short-lived. In 1921 the shares became the property of the German Stinnes group, who (in co-operation with Austrian and—to a small extent—Italian partners) exercised control until 1926. After the collapse of Stinnes, the Vereinigte Stahlwerke of Düsseldorf acquired the majority of the shares in the Corporation, and thus the

greatest and most important Austrian industry was brought under direct German influence.

Always the centre of resistance against all advanced social reforms, the iron lords strenuously opposed the post-war Governments, which more or less were under the influence of the Left parties. Styria and the Montan Company became the stronghold of "yellow" trade unionism, preparing the ground for the militant Heimwehr, who finally in 1934 overthrew the democratic constitution of Austria. The Nazi putsch of July, 1934, showed that the political reliability of the management and of the employees of the company was very doubtful. The Government therefore placed the company under the control of their own nominee. Since then the board of administration has been newly elected by arrangement between the Government and the German shareholders. Most of the complaints about the political activities of the Montan Company then ceased. But public discussion about the political attitude of the Montan Company has been lately revived. It was rumoured that the company had refused orders from Jugoslavia, Roumania and England.

The Alpine Corporation's Explanation

The company, bitterly criticised, published an interesting memorandum, which they presented to the Government. They do not deny having declined to export iron to Jugoslavia, Roumania and England, but they protest against the allegation that they did so for political reasons. The Vereinigte Stahlwerke do not (they state) exert any influence on decisions about the accepting of commercial orders. The orders were refused for purely industrial and commercial reasons. They say that it is technically impossible to meet all the demands made upon it, because the production of half-finished and rolled products is limited by the capacity of their steel works.

The highest annual production of pig iron from their furnaces amounts to 430,000 tons, and the capacity of the works being limited and at present fully used by the incoming orders, the management has been forced to weigh carefully the commercial and financial advantages of each order. The memorandum is most explicit about the possible export to England. It denies that any serious negotiations have taken place. The subsequent conditions of the market abroad and in Austria did not leave any pig iron over for export to England.

Holland

Recovery and Labour Troubles

AMSTERDAM, April 22.—The company reports for 1936 are being published, and it is evident that the devaluation of the guilder in September, 1936, heralded a new era for the Netherlands. All the annual reports announce higher profits in 1936, some of them very much higher, and in most instances the distribution of dividends can be resumed or raised to a higher percentage. Most of the reports show that already some improvement had set in prior to September, 1936, or at least that the retrograde movement had been brought to a halt; but the effective stimulus to recovery was the depreciation of the guilder, which enabled production, turnover and exports to increase. Holland thereby recovered her power of competing against other countries in the world's markets. In most instances the fourth quarter of 1936 was the decisive period, and the big profits were registered during the three months subsequent to the devaluation. This applies not only to the plantation companies, such as the rubber, fibre and sugar enterprises, but also to the shipping companies and banks, which made their big profits in the fourth quarter. Prospects for 1937 are, on the whole, viewed optimistically.

The situation in the labour market has undergone a considerable change; the number of unemployed at the end of February, 1937, was 439,553, compared with 466,242 at the end of January, 1937, showing a drop of 26,689 persons. At the end of February, 1936, the number of unemployed was 465,463, or nearly 26,000

more than now. Increased employment, especially in the Netherlands shipbuilding yards, has given rise to some labour troubles, and even to a strike in one of the big Amsterdam yards. Demands for enhanced wages are not, however, general, because the rise in the cost of living since the depreciation of the guilder has been only slight in extent, as the Government have counteracted an advance in retail prices as far as possible by reducing their emergency levies on many articles. It is being advocated in many quarters that the emergency levies, the cumbersome bureaucracy of the emergency organisations, and the other obstacles hampering trade and industry should be abolished. Actually, the Government have already made a start by reducing the emergency levy on imported grain, in view of increased world prices. It is only in this way that a decided advance in the prices of the primary necessities of life can be averted.

The course of wholesale prices in the Netherlands since the depreciation of the guilder last autumn can be clearly seen from the following table:—

	Food	Raw materials	Manufactured goods	Total
1926-30	100	100	100	100
1936—September	65.8	48.4	66.1	62.6
October	69.5	58.5	71.0	68.2
November	70.4	60.4	72.3	69.5
December	71.3	65.3	72.9	71.0
1937—January	73.3	69.3	74.2	73.0
February	73.6	69.5	75.7	74.0
March	74.8	73.5	77.4	76.0

The improved situation is also reflected in the increased yield of taxation. State revenue is not only coming in more freely than in 1936, but it even exceeds the estimates for 1937. The financial situation of the country is accordingly improving. On the other hand, however, it is certain that the expenditure on defence will have to be on a larger scale in future.

Improved Banking and Trade

The annual reports so far published of the big Netherlands' banking establishments show that our private banking institutions are thoroughly sound and that their strength has not been impaired by the years of depression. The Minister of Finance has now officially inaugurated the Royal Commission on Banking. On this occasion the Minister stated that the Government were satisfied that direct governmental supervision of the affairs of the private banks was not necessary, because the system of consultation now existing between the private banks and the Central Bank had had the desired result in practice. The Minister admitted that the existing method had come into being during a period of depression, when the private banks were particularly dependent upon co-operation with the Netherlands Bank. Things might become different in times of prosperity.

Satisfactory Balance of Trade

There is every reason for satisfaction at the development of our foreign trade in the first quarter of the current year. January and February showed a decided advance compared with the corresponding months of 1936, while the rise in the value of our exports was relatively higher than that of our imports. In March, this improvement was not only maintained but was even surpassed.

In the first three months of 1937 the value of our exports compared with 1936 advanced by 90.5 million guilders to 246.2 million guilders, and our imports by 103.8 million guilders to 336.5 million guilders.

	Imports (In million guilders)				Exports (In million guilders)			
	1934	1935	1936	1937	1934	1935	1936	1937
1st quarter	276	226	233	336	168	160	156	246
2nd "	261	229	234	...	171	159	163	...
3rd "	251	228	243	...	196	174	194	...
4th "	250	253	307	...	177	182	232	...
Year	1,038	936	1,017	...	712	675	745	...

	Imports (In thousand tons)			Exports		
	1935	1936	1937	1935	1936	1937
1st quarter ...	4,652	5,608	4,858	2,948	3,137	3,789
2nd "	5,068	4,841	...	3,023	3,093	...
3rd "	5,401	5,407	...	3,118	3,347	...
4th "	5,316	5,602	...	3,360	3,961	...
Year	20,437	20,358	...	12,499	13,538	...

Not only the value but also the volume of our imports and exports advanced, and the improvement is not attributable solely to higher prices. One has to go back to 1931 to find a higher figure for the value of exports for the first quarter of the year, and to 1932 for a higher value for imports.

Czechoslovakia

Political Calm

PRAGUE, April 20.—The external situation has improved. The collaboration of the Little Entente States has been strengthened by the visit of the Roumanian Prime Minister, M. Tatarescu, to Czechoslovakia and by the visit of President Benes to Jugoslavia. This collaboration has not been affected in any way by the Italo-Jugoslav agreement. On the contrary, co-operation between the Danubian countries is only possible with the concurrence of Germany and Italy.

The negotiations with the German minorities have greatly eased the tension in internal politics. Municipal elections will shortly take place. The Government's extraordinary powers to cope with the crisis will terminate this year. It is now being discussed whether they should be prolonged or curtailed. New sources of revenue are being investigated to find the Cz.K. 150 millions required to effect the promised abolition of cuts in Civil Service salaries. The agrarian demand for the establishment of an animal produce monopoly is meeting with considerable opposition in many quarters. Other agrarian demands for the removal of the indebtedness of the agricultural classes and for the introduction of a managed economy in other branches of production will be the subject of difficult negotiations. The current prices of corn under the monopoly scheme are to be revised.

The Government has announced that elections will be held this year in the Social Insurance Institutions, Chambers of Commerce and Chambers of Agriculture, where nomination by the Government substituted election during the unsettled post-war period. Frequent discussions are taking place about the duration of the present prosperity, which is bound up with armaments to an exceptional degree in this country.

Revival in Business and Industry

On the money market a spring revival has been apparent, and is reflected in the increased demand for money, the rising prices of raw materials, and the growth of building activity. The Stock Exchange has shown a steadily rising tendency, especially on the share market. At the end of March the Stock Exchange index stood at 163.3, compared with 100 in 1927 and 145.5 at the beginning of January. The index of industrial and transport shares reached 183.1 at the end of March. The wholesale price index (in gold) rose in March to 754, against 691 in August of last year; the index of agricultural prices stood at 696, and that of manufactured goods at 818. Thus the rise in world prices is clearly reflected; and the difference between agricultural prices and those of industrial products is moving against agriculture. There is, therefore, an outcry for the revision of corn prices and for an adjustment of animal production.

The number of unemployed persons declined again at the end of March to 627,333, against 677,947 in February. Compared with March, 1936, there has been a fall of 170,439. Industrial activity is on the increase. The index of industrial production stood in January at 92.1 (1929=100). The production of pig iron in March amounted to 142,144 tons, against 89,732 a year ago,

and that of raw steel 179,130 tons, compared with 120,838 a year ago. Consumption of iron and steel is increasing all the time, not only as the result of armaments, but also because of better employment and increased investment in other industries. There has been a demand that because of the scarcity of iron the export of pig iron should be limited. Engineering is also satisfactorily employed, primarily because various plants are supplementing or replacing their equipment of machinery. The glass and pottery trades have improved and are now exporting more than in past years. Some difficulties are being encountered in the textile industry, where the rising prices of raw materials are increasing costs.

Foreign trade for the first quarter of 1937 (in thousands of Cz.K.) amounted to:—

	1936	1937
Imports	1,662,551	2,332,032
Exports	1,730,265	2,508,705
Export Surplus	67,714	176,673

Railway traffic in the first quarter was 1,173,000 trucks against 1,063,000 a year ago, and 964,000 in 1935. A supplementary commercial agreement has been concluded with Finland. With Italy, negotiations about a new adjustment of trade have also been brought to a satisfactory conclusion. Negotiations are being carried on with Bulgaria, Denmark and Argentina; and preparations are being made for negotiations with Hungary, the Netherlands, the United States, and some South American countries.

Sweden

Baltic Co-operation

STOCKHOLM, April 24.—The Foreign Minister, Mr Sandler, delivered a speech to the Swedish Exporters' Association in which he outlined the programme for intensifying trade relations between countries forming the Oslo group. It is expected, Mr Sandler said, that Holland and Belgium will abolish certain restrictions against the other Oslo countries; that Denmark will grant certain concessions within the frame of her actual currency regulations; and that the three other countries which have so far adopted a liberal trade policy, namely Norway, Sweden and Finland, will pledge themselves not to increase duties on certain goods. Modest as this programme may appear, it may give an impulse to the great trade powers to follow the example of the Oslo states.

A meeting of the Foreign Secretaries of the four Northern countries took place in Helsingfors on April 20th. The main points in the discussion were navigation in Spanish waters, economic co-operation between the Northern states in case of war, and a project providing for mutual information about armaments among the four Northern states. The Foreign Secretaries seemed anxious to point out that the ever-increasing co-operation among the Northern countries was simply the result of community of interests and of traditional friendship and was by no means based upon any kind of alliance or diplomatic instrument limiting their political independence. This affirmation was provoked by the suggestion in foreign papers that the Northern countries intended to form some kind of military bloc to play an active rôle in the Baltic.

The Progress of the Boom

The Swedish boom forges ahead; and the general index of industrial production rose during February by one point to 114, compared with 104 in February, 1936 (100 = the average of 1935). The rise was particularly marked in the production of iron and steel, which jumped from 115 to 120. Market reports are extremely favourable for all the important staple articles. Timber sales were particularly brisk in January and February, but were somewhat slowed down in March. Total sales of timber goods during the first quarter of the year

amounted to about 610,000 standards. Pulp sales were also lively; and at the end of March practically the entire 1937 production of bleached sulphite and sulphate was sold. Of the 1938 production, about three-fifths of the sulphite and three-quarters of the sulphate pulps have already been sold, which is a sales record for Sweden. Of mechanical pulp, practically the entire production of 1937 and half of the production of 1938 were placed at the beginning of April. The iron market continues to be exceptionally lively, and Swedish ironworks are unable to satisfy the continually growing demands on account of the shortage of raw material.

Prices continue to move upward, and the wholesale price index of Professor Silverstolpe (1913 = 100) recorded in March a jump from 134 to 140. The rise was particularly noticeable in metals, from 156 to 184, and in pulp, from 142 to 166. This rise of wholesale prices is now beginning to affect the cost of living. The Swedish cost-of-living index, which had remained almost unchanged in 1936 at 158, rose between January and April from 158 to 161 (100 = July, 1914).

Foreign trade is gradually progressing, particularly in imports, as can be seen from the following table:—

	(In million kronor)	
	1936	1937
	January—	January—
	March	March
Imports	374.5	435.7
Exports	290.7	351.6
Import surplus	83.8	84.1

Unemployment stood at 31,500 on February 28th, which is an exceptionally low February figure, compared with 58,000 a year ago and 90,000 in February, 1935. There is an increasing demand, not only for skilled labour, but also for agricultural workers and for labour in the timber industry.

The money market remained easy, and the cash holdings of the joint-stock banks reached new records. As a result of the general rise in prices, bank advances, particularly home bills, showed a noticeable growth in March. Profiting by the exceptional cheapness of money, industrial concerns continue to convert their funded liabilities into loans at lower rates. In fact, the more accentuated the boom becomes, the more apparent are fears of a forthcoming break in the present position; and the more anxious company directors are beginning to strengthen the position of their concerns.

U.S.S.R.

Moscow and Spain

Moscow, April 12.—Moscow has naturally been pleased with the course of events in Spain, but official newspapers have been careful not to picture Madrid's victories as a triumph for Communism. No Soviet official or newspaper has ever admitted that Russian armaments or soldiers have played any part in the Spanish conflict. Popular sympathy in this country has been with the Madrid Government from the beginning, but Moscow has consistently described the conflict to its own people as one between Fascists and a democratic Government. It remains to be seen whether this policy would be maintained in event of a final victory for Madrid.

Impartial observers here are generally agreed that Moscow has moved with commendable caution in Spain. Geography may partly account for this, but the Soviets naturally desire, if possible, to prevent General Franco from conquering Spain, because they believe a German-Italian foothold in Spain would tend to confine French and British attention to Western Europe and thus give Germany a free hand in the East. The part the Soviets have thus far played in Spain could be justified entirely on the grounds of national self-interest.

Economic Disorganisation

The demoralisation of Soviet industry caused by the elimination of hundreds of executives alleged to be Trotskyists is reflected in the first quarter's production figures. Official statistics show that production fell below the State plan in the first three months of 1937 by the following amounts:—Coal, 4,188,000 tons; pig iron, 479,500 tons; steel ingots, 452,400 tons; rolled steel, 395,900 tons; and car-loadings, 758,626. The most severe slump occurred in the coal mines of the Don Basin; while car-loadings dropped about 8,000 daily below the estimates. Weakness in transport, combined with shortage of coal, held up production in hundreds of factories, which were unable to get raw materials and fuel. Spring sowing also was delayed in southern European Russia by the non-delivery of agricultural machinery and spare parts for tractors. Collectivised peasants, having become dependent upon machinery, were slow in making good the shortage by hand labour.

The authorities are making vigorous efforts to recover lost ground, but it is difficult to find seasoned managers to replace those arrested or dismissed. It has been announced that the standard wages will be increased again in May, and that piece-rates below these norms will be reduced. This action is intended to stimulate more intensive work. It is now apparent that Trotskyism has been more costly to Soviet economy through the disorganisation of industry than through actual sabotage. The prospects were not improved by Mr Stalin's warning that many Trotskyists have escaped detection, and that competent executives are not immune from suspicion, since they may be awaiting a more favourable opportunity, such as war, to undermine the present regime.

Communist Control to End

The Communists, who have for years closely supervised industry and agriculture, have been bewildered by contradictory orders from the party's higher command. In February the Communists were told that they had spent too much time on economic questions, neglecting political leadership, thus permitting Trotskyists to penetrate the party. This reprimand apparently was interpreted too literally, and official newspapers later blamed the Communists for the delay in spring sowing. The peasants, accustomed to await orders from local Communists, hesitated to take the initiative in sowing. Now the Communists have been ordered to resume leadership in industry and agriculture, but meanwhile to relinquish their authority gradually to technicians, to the non-party bureaucracy.

The higher party organs apparently believe that centralised Communist control has been carried too far, and are preparing to turn over the direction of industry and agriculture to non-Communists. It is explained that the new electoral system will compel Communists to devote much of their time to the political education of the masses, to make sure that enemy elements are not elected to office.

While official newspapers admit widespread confusion in industry and agriculture, it is possible that their reports are exaggerated. The Kremlin often overstates defects in its system in order to stimulate activity among its officials and workers. Inexperienced observers, reading the Soviet Press, might well conclude that conditions are worse than they actually are.

China

The Island of Hainan

HONGKONG, March 31.—The enthusiastic reception accorded to Mr Lin, Prime Minister of the Nanking Government, when he visited South China, suggests that the unification of the South with the Central Government has the approval of the populace. It is, however, apparent that business interests are far from pleased. The currency situation is yet to be solved, and there is an unfortunate deadlock between traders and the local

administration about taxation. The present officials have, in most cases, come from Government offices in Nanking and are influenced by Western theories about the raising of revenue. The Canton business man strongly resents any prying into his affairs and has revolted against a turnover tax. Through his Chamber of Commerce he has offered to bargain in time-honoured oriental fashion, and a total contribution of \$2,000,000 has been tendered in lieu of the business tax. The Revenue Department appears to have abandoned the idea of collecting the tax from individual firms and is reported to have replied to the Chamber's offer by demanding \$4,000,000. Presumably the difference will be eventually narrowed down until an agreed figure is arrived at.

Attention has recently become focused on the island of Hainan, which lies off the south-west coast of Kwangtung, about 250 miles from Hongkong. The island, although wild and sparsely populated in the interior, supports a fair population, and supplies a constant stream of emigrants to Malaya. For some years past various schemes for the economic development of Hainan have been put forward without going beyond the preliminary steps, but since the suppression of the revolt of the southern provinces last autumn, the Nanking Government has begun to take an interest in the island. Various visits have been paid by investigators and one party of industrialists from Shanghai has examined the possibilities of growing cotton for their textile mills. The American Commercial Attaché has visited the island to inquire into the sugar production, and a British mining concern is said to be carrying out an exploratory survey. When some few months ago a Japanese subject was murdered at the port of Pakhoi on the mainland nearby, Japanese vessels visited Hainan and, for the moment, there was some fear that the island might be occupied. If it had been, political complications would have ensued, for the French Government some forty years ago extracted a promise from China that the island should not be alienated, in view of the proximity of French Indo-China; while Great Britain would regard the presence of Japanese in Hainan as a menace to Malaya on one hand and to Hongkong on the other. Fortunately, the excuse for Japan to seize the island passed, but the Japanese Press is watching Hainan closely.

Boom Optimism and Rising Prices

The Hongkong Government has been fortunate in ending 1936 with a surplus of over \$500,000 instead of an anticipated deficit of \$3,000,000. Economic recovery is evident in the returns of revenue of every kind and the total collected amounts to over \$30,000,000. The surplus of assets over liabilities on December 31, 1936, was just under \$13,000,000. Since the end of the year trade has shown steady expansion. For the first two months imports showed an increase of over 20 per cent., and exports a rise of 34 per cent. compared with the corresponding period of 1936. Commercial travellers who have been here during the past six or eight weeks in large numbers report better business than for many years past. While the recent rapid rise in manufacturing costs has brought in orders which might normally have been deferred till later in the year, there is a much more hopeful feeling among retailers and dealers who appear confident that demand is steadily expanding. With the tremendous rise in world prices it is feared that business in metals here will be affected unfavourably before long. The demand for scrap metal is leading to a considerable amount of pilfering, and every day the police courts are occupied with cases about the theft of water meter covers, iron railings, door and window fasteners, telephone cables, and in one instance a short section of the Kowloon-Canton railway.

It is many a long day since the Stock Exchange was in such a cheerful mood as it is at present. Shares which have been neglected for years past are in demand at rising prices, and the various company meetings held at this time of year reveal good results for 1936 and a promising outlook for the current year. The Hongkong and Whampoa Dock Company, whose shares were

under their par value of \$10 less than three months ago, astonished the public by declaring a dividend of 60 cents, the first since 1924. The shares now stand at \$32 despite a warning note from the chairman in his annual speech. Other shares such as Hongkong Hotels, Green Island Cements, Hongkong Trams and Hongkong Telephones, have improved in value at a very rapid rate during the past few weeks, while the shares of the Hongkong Bank and the Insurance Companies, which do not normally attract the attention of the speculator, have also advanced.

Canada

Tariff Controversies

OTTAWA, April 9.—The most controversial measure of the present session of Parliament, the Government's Transportation Bill, which sought to replace the present Railway Commission by a Transport Board, armed with much wider powers, was rejected by the Conservative majority in the Senate, assisted by two Liberals. The Budget, with the tariff changes necessitated by the revision of the Anglo-Canadian trade agreement, has now been passed. Conservative criticism was largely confined to details like the arrangements about vegetable oils and the provision whereby, if the British Government complains that certain Canadian firms are dumping their products on the British market, the Canadian Government undertakes to deprive these interests of their local dumping protection.

During the debate the operations of the International Glass Cartel, in which a well-known Lancashire firm is reputed to be the controlling force, were severely criticised by both Mr Bennett and Mr Dunning; and they are also the subject of unfavourable comment in a report of the Canadian Tariff Board which has recently been published. This report finds that there has been exacted by this British firm an inordinately high price for plate and safety glass from the Canadian interests which need it; and that, through the Cartel's control of the Belgian output of glass, the cheaper Belgian glass cannot be profitably imported. The intermediate tariff rate on glass has been reduced by 5 per cent.; but a preferential margin of 15 per cent. in favour of British glass has still to be maintained, and the alteration seems to offer no prospect of relief for the Canadian consumers.

Further troubles have arisen from certain tariff changes announced after the Budget was passed. These changes provide for a certain reduction in the duties on some parts of motors but for increases in the duties on furniture and hats. The latter have aroused the wrath of the Liberal Party, who contend that these increases represent a capitulation to protectionist interests wholly inconsistent with the Liberal programme, and are threatening to hold up business unless the Government drops its proposals. Mr Dunning defended the changes on the ground that the furniture and hat industries were suffering from unfair foreign competition.

The House of Commons has passed a Bill amending the Customs Act, and some of its provisions arm the Government with broad powers to control the export, import and transportation of implements and materials of war, foodstuffs being included within the scope of the regulation proposed. The Government has also secured endorsement of its new trade arrangements with Germany. As a corollary it has taken authority to set the value for Custom duty purposes of all goods imported into Canada from countries with depreciated currencies, a power which has hitherto only been applicable to countries with depreciated currencies. The measure eliminates the "gold clause" from existing trade agreements and has also passed the Commons in face of strong objections on the part of Mr Bennett.

The Government recently introduced its Bill to establish a Trans-Canada air service. For its operation a semi-public corporation will be set up in which the Canadian National Railways will hold 51 per cent. of the capital of \$5,000,000, and the balance will be allocated between different aviation interests, who will be allowed

to pay for their stock with equipment in lieu of cash. The Canadian Pacific Railway was apparently dissatisfied with the proposed arrangements, and has withdrawn from participation.

Mr Lewis Acts in Canada

Serious labour troubles have developed as a result of a well-planned campaign by Mr John Lewis's Committee of Industrial Organisation to extend its sway into Canada. Its agents have been busy organising unions in the motor, steel and textile industries of Canada, and Canadian employers dislike the prospect of the Trades and Labour Congress of Canada (which has been closely linked with the American Federation of Labour and proved an equally tame organisation) being supplanted by the C.I.O. as the bargaining agency of the Canadian working classes. When a dispute about wages arose between the Canadian branch of the General Motors Corporation and its workers at Oshawa, Ontario, who have joined the Automobile Workers' Union of America, an affiliate of the C.I.O., the officials of the Corporation refused to negotiate with these employees as long as they kept Hugh Thompson, a C.I.O. agent, as their spokesman. As a result, 3,700 of the workers in the G.M. plants at Oshawa walked out on strike on April 8th; and the company has closed down its other plant at Windsor. There was no attempt at a sit-down strike because Mr Lapointe, the Minister of Justice, had declared that such action was illegal in Canada and would not be tolerated. The Liberal Government of Ontario has

ranged itself on the side of the Corporation; and at its request a detachment of mounted police has been sent to Ottawa. But the Federal Government is taking a neutral stand. The strikers are behaving in orderly fashion, and their leaders assert that they will be backed by the C.I.O. in the United States until the Corporation agrees to recognition of their union.

The King Government has now available the report of the Bank of Canada upon the financial affairs of Alberta, which it investigated with the consent of Mr Aberhart. The gist of the findings is that, as a result of the halving of the interest on the province's bonds in 1936 Alberta is in a substantially better financial position than either of the adjacent prairie provinces of Manitoba and Saskatchewan; that there is a prospect of a balanced Budget for the next fiscal year; that the appropriations made by the Budget will provide for administrative expenses and necessary services on a scale as high as those prevailing in the adjacent provinces; and that, therefore, there is no need for the Federal Treasury to give Alberta the special financial assistance which is now being arranged for Manitoba and Saskatchewan. The report, however, characterises as regrettable the repudiatory measures which have enabled Alberta to reach this comparatively happy financial position; and holds that the ultimate effects of the impairing of provincial credit in frightening away capital and retarding economic development are bound in the long run to outweigh any temporary pecuniary gain which has been secured.

Letters to the Editor

Marketing and Food Prices

TO THE EDITOR OF THE ECONOMIST

SIR,—The Food Council, in its Report, finds that far from reducing prices by "orderly marketing," the result of the agricultural marketing schemes has been to raise food prices. It is not necessary to reiterate the view that the schemes were designed not so much to ensure more "orderly marketing" as to subsidise certain agricultural interests, and, indeed, that "orderly marketing" was merely a euphemism for agricultural protectionism. It is difficult, on this view, to sympathise with the theory implicit in the recommendation that the marketing schemes be reorganised under a more independent and impartial control than at present. Is not the very *raison d'être* of the schemes their ability to squeeze the consumer?

Having satisfied itself that the consumer is being squeezed, the Food Council suggests that the remedy is to have dealers' margins fixed by an independent body, presumably at a level which is more favourable to the consumer. You add: "The consumer must be protected against the ungrateful abuse by producers of a power given to them only to safeguard their livelihood." Agreed: but is this the best, or even a sure, way of protection? Laying aside for the moment the difficulties—statistical and otherwise—involved in investigating middlemen's costs, is such an investigation necessary? Will not the free market ensure that middlemen cover their costs? It seems that there is a logical contradiction in your note of last week. Either it is agreed that middlemen should cover their costs and no more, and go out of business if they cannot (on the doctrine that industry exists for the consumer, and not the consumer for industry), so that margin-fixing bodies are superfluous, or else it is agreed that for a political or aesthetic reason middlemen (and producers) should more than cover costs, in which case it seems to me idle to complain that the marketing schemes have been operated in the interests of the producers.

There remains the broader and more vital problem: How best is the consumer to protect himself? Where competition persists, and to the extent that it persists, the remedy of the consumer is simple: he merely buys elsewhere. But with the growth of State-fostered and "natural" monopolies, the consumer has had to resort to a number of indirect devices—including "Letters to the Editor"—in order at least to make it known that he feels a grievance, even if he cannot obtain a remedy. For these, and more, the absence of a free market is responsible. The protection

of the consumer lies not in independent tribunals; these may be useful in fooling the consumer into believing that his interests are being protected once a monopoly has been created. The protection of the consumer lies in the impersonality of the free market. For some products there are by nature no close substitutes, and here a perfectly free market is a technical impossibility. But it is not necessary to hold that the free market can be restored over the whole field of economic activity to believe that measures designed to increase the freedom of the market and the abstention from measures designed or having the tendency to promote concentration and centralisation of supply will do something to ensure that consumer interests have their appropriate place in the scheme of industry. Certainly in agriculture monopoly has not the sanction of technical necessity.

Yours faithfully,

A. SLABERDAIN.

Stroud Green, N.4.

National Finance

TO THE EDITOR OF THE ECONOMIST

SIR,—Mr D. M. Mason takes the opportunity of his reply to my letter, published in your issue of April 17th, to give a glowing but delightfully irrelevant testimonial to the friendly and pacific intentions of Germany and Herr Hitler. I thought the reason why I suggested that he ought to have addressed his two letters to Herr Hitler instead of to you was fairly obvious. If Mr Mason's conclusions—that "we are spending too high a proportion of our national income on defence expenditure," that we are thereby "unduly reducing our financial resources and therefore dissipating our reserves," and that consequently "it is our bounden duty to reduce the burden of our defence expenditure so as to increase our strength and security"—are correct of this country, how much more true must they be of Germany!

After all, during the last few years Germany has been spending a much larger proportion of her national income on defence expenditure than this country. On the basis of Mr Mason's theory, Germany is becoming weaker and weaker, in spite of the increase—or, to be correct, because of the increase—in the number of her guns and aeroplanes. But somehow I doubt whether he would be able to convince Herr Hitler that this is so. In fact, somehow I doubt whether he would even try to convince him.

Yours faithfully,

S.W.5.

PAUL EINZIG.

Books and Publications

An American Minority Problem

It is generally recognised that most of the twelve million Negroes in the United States live under grave economic and social disabilities; and as the principal political parties have not since the Civil War been able or willing to do much to solve the resulting problems, it is not altogether a matter for surprise that many Negroes are now listening to the Communists. This book* is a statement of the Communist programme for ending the Negro question; and although it contains the usual extravagances of orthodox Marxist dogma, reliance on the dialectical approach has by no means excluded the presentation of some genuine research.

This research is devoted mainly to showing that the present position of the Negro in the Southern States is a residue of feudalism left over from chattel slavery, and in some respects little superior to slavery. Very many Southern Negroes are share-croppers—that is to say, they are nominally tenants, but their actual status is that of labourers for a deferred wage. And it is a deferred wage which by various expedients, such as falsifying the tenant's account or charging him twenty per cent. interest on supplies, is kept down to the level of a bare subsistence. Nor has the tenant much opportunity to resist these terms or move elsewhere.

Roughly this is a correct statement of the position as visitors to the Southern States usually see it, especially in the plantation districts; but it might have been fairer to admit that the monopoly profits yielded by this system of "nigger farming" are seldom commensurate with its apparent rapacity, since the plantations usually lie in a high-cost cotton area. On the other hand, these high costs are partly accounted for by the bad farming and the backwardness of the Negro, which are more or less inseparable from the system.

Mr Allen attributes the origins of the system to the fact that the bourgeois revolution of the Civil War (Northern bourgeoisie versus Southern aristocrats) was not completed by the war: the Negro was left landless and without effective civil rights. Consequently the plantation owner was able to climb back into the saddle by regaining feudal control over the Negroes. This control has always been challenged by Liberals, but in recent years the growth of severe unemployment among the industrial Negroes in the Northern States has made it easier for the Communists to obtain a foothold in the struggle. Perhaps their appeal has also been strengthened by the A.A.A. crop restriction scheme for cotton, in the benefits of which Negro tenants have not shared equally with white landlords.

What the Communists are now proposing, to judge from this book, is that they shall complete the bourgeois revolution of 1860 and secure for the Negro political freedom amounting even to the right of racial self-determination. There would then be established a Negro Republic in the Black Belt, an area in which the Negro population is in a majority. True, such a revolution, if successful, would also produce a Communist United States, but the Negro's special gain would be the creation within the Federal State of an autonomous republic like the Tartar Republic within the Soviet Union.

Such a long-run objective is, of course, hardly worth considering unless a promising strategy can be developed. The strategy at present favoured is collaboration between the white and Negro proletariat, including the Negro peasantry with the latter. Some small successes along these lines have already been achieved, such as the collaboration of whites and Negroes in the Share Croppers' Union. Race prejudice, however, remains a formidable barrier to close collaboration; and in any case

* "The Negro Question in the United States." By James S. Allen. London, Lawrence and Wishart, Ltd. 224 pages. 5s. net.

the allegiance of even the industrial Negro is far from being given to the Communists alone. Much influence is still exercised by the Tuskegee school of opinion, which concentrates on the self-improvement of the Negro; and by Dr Dubois' group, which stands for Negro nationalism irrespective of class differences. But probably the future political affiliation of the Negro worker will be largely decided by the success or failure of Mr John Lewis. The craft unions of the American Federation of Labour had little place for the Negro; but he is welcome in most of the new industrial unions. If, on the basis of these, a Labour Party is created, it may well draw the Negro away from the Communists. It would promise the Negro less, perhaps, but the promise might be worth more.

Shorter Notices

"I Found No Peace." By Webb Miller. Victor Gollancz. 352 pages. 12s. 6d.

"I found no peace," says Mr Miller. He looked for none. "From early boyhood," says Mr Miller, "I steeped myself in the gentle philosophy of Henry D. Thoreau." Yet in no way do Mr Miller's life, thoughts and writings resemble Thoreau's. It is better to take this book on its own merits. Mr Miller's work as foreign correspondent for the United Press news agency carried him to "six wars on four continents, and to numberless riots, rebellions and revolutions in a dozen lands." He is a master of his profession; it is his just pride that more often than not he can beat his competitors at getting the all important facts, on whatever war he is reporting, past the censor and over the cables. The kind of news which is so transmitted is purely factual news, unbiassed by the personality of the news gatherer.

A Book of Immediate Importance

IRELAND AND THE BRITISH EMPIRE 1937

*Conflict or
Collaboration?*

By HENRY HARRISON

Manchester Guardian: "Deserves the fullest consideration by all those who wish to form a sound judgment on a serious issue."

10s. 6d. net.

LONDON: ROBERT HALE & COMPANY

How Landru went to the guillotine, how the police cracked the skulls of Hindus in a civil-disobedience campaign; how the Italians opened their Abyssinia war; wherever the vultures are gathered to the carcass Mr Miller is there, and we are told the facts. Carcasses are important, and Mr Miller makes dead men tell their tales. In modest and attractive style he writes his story. Roy Howard adds the first published account of his reporting of the False Armistice, and its celebration in America four days before November 11, 1918.

Mr Miller gives us the conclusions he draws from his experience. The most important event of his generation is the advance of scientific invention; the people of the world must pay in restriction of personal liberty to secure a beneficent use of scientific powers. Two separate governments, economic and political, cannot continue to exist. The forces that should build up peace in Europe are rushing it to destruction. The one thing about which he is certain is that Europe cannot avoid another Great War. America, he hopes, may succeed in making the necessary economic and political adjustments without conflict.

These conclusions might have been reached without Mr Miller's experience; the evidence upon which he bases them is not to be found in his book. He has reported the appearance of war; he has not examined peace. He shows a surprising lack of curiosity about the meaning of the events he reports. Or is the superficiality of his book the unfortunate result of a self-imposed discipline? The reporter must be certain of his accuracy, and Mr Miller says he has learned that the only way to retain a firm, clear-cut opinion about anything is to know little or nothing about it.

"Studies in the Theory of Economic Expansion." By Erik Lundberg. (Stockholm Economic Studies No. 6.) King. 265 pages.

Mr Lundberg's chief object is to analyse economic development through time, and to examine what modifications must be made in the traditional static economic theory to explain dynamic changes. He argues convincingly that only by examining sequences of economic events can dynamic development be understood, and that these events in their turn depend partly on the events of the past and partly on plans for the future. A large part of the book is taken up by a discussion of problems such as monetary circulation, savings and investment. Mr Lundberg shows the shortcomings for the purpose of dynamic analysis of such concepts as the velocity of circulation and the identity of savings and investment, and of such distinctions as that usually made between saving and hoarding. English readers will be particularly interested in his very acute criticisms of Mr Keynes' recent theories. One of the most admirable features of Mr Lundberg's work is his ability to recognise the good points in the theories of others and to develop them.

In the last two chapters Mr Lundberg works out various "model sequences," and shows how incomes, saving and investment change under various assumptions. It is interesting to notice that small changes in the constants, e.g. the rate of depreciation of capital, may alter the whole character of the sequence. Mr Lundberg indicates that sequences may lead to cyclical variations or to continuous expansion or contraction, but he does not rigorously work out the general conditions which make sequences cyclical in the real world. But he does prove that the causes of contraction after an expansion are many and varied, and that given certain rates of saving, depreciation, etc., cycles are inevitable.

This is undoubtedly one of the most valuable books on monetary and trade cycle theory which has appeared in English in recent years.

"Man's Worldly Goods." By Leo Huberman. Gollancz. 357 pages. 10s. 6d.

An exciting blend of economic history and economic theory. Covers the methods whereby men have sought their living from the twelfth century until to-day, their ideas and ideals, their institutions, and their class conflicts. Gives economics an historical context which is rather arbitrarily put together. Brilliantly and lucidly written with a wealth of scholarly reference and a strong leaven of partiality.

"The Magic of Monarchy." By Kingsley Martin. Nelson. 104 pages. 2s. 6d.

Mr Martin sets out to break, in a decent and orderly way, the taboo against discussion of the Monarchy. The result is not perhaps so bold a departure from modern practice as the author suggests; but the book is vividly written, full of concise arguments and excellent portraits.

Mr Martin discusses the abdication, the bankruptcy of Republicanism, the proper rôle of the sovereign, and the need for common sense to replace "magic" in our view of the throne. An interesting footnote to contemporary history and politics.

MONEY AND BANKING

The First Defence Loan

IN his recent treatment of the City the Chancellor has been nothing if not thorough. Having last week shaken markets by his bombshell in the shape of the National Defence Contribution, he has this week invited the investor to provide him with £100 millions for his first Defence Loan. On the whole there is something to be said for getting all these shocks over and done with. The market knew that a Defence Loan was coming some time this year, and, as Mr Chamberlain himself admitted, this uncertainty was retarding the raising of new capital by local authorities and other borrowers. There was much to be said for launching this loan at a time when private capital issues were already being deferred through the immediate reactions of the Budget.

The new loan takes the form of £100 millions of 2½ per cent. National Defence Bonds, issued at 99½ and redeemable at par by means of annual drawings of not less than 20 per cent. of the nominal amount of the bonds. The first drawings will take place on September 15, 1944, so that if 20 per cent. is redeemed each year, the repayment of the loan is dated 1944-48. As regards initial calls, 5 per cent. is payable on application, 19½ per cent. on May 10th, 25 per cent. on June 1st, and 50 per cent. on July 5th. Interest is payable on March 15th and September 15th. There is also a separate Post Office issue to small investors, additional to the main issue of £100 millions, which is made as usual through the Bank of England.

A loan redeemable seven to eleven years ahead is neither "short" nor "long." Theoretically there is a strong argument against long-term borrowing for re-armament, because battleships, aeroplanes and munitions of war have notoriously short lives. From the practical point of view other considerations are of greater importance. Foremost among these are the questions, what class of investors will be attracted by the loan; and will it prove an adequate instrument with which to tap the savings of the nation?

Judged in this way Mr Chamberlain is inflicting a severe test upon the investor. To a certain extent he will respond, partly from patriotic motives, but the new issue in itself possesses limited attractions. It is of too long a date for the discount market, which is rightly unwilling to lock up much of its funds for a minimum of seven years. It appears a little more attractive to the banks, but here the plain truth is that the upward trend of advances—its partial consequence of re-armament—has brought the banks near to the point where in the absence of a further expansion of the credit base they will have to turn sellers rather than buyers of securities. In any case, it is not the proper function of either the banks or the discount market to act as purveyors of medium-term finance to the Government, and the revival in both home and world trade and the rise in commodity prices is restoring to both bankers and bill-brokers their normal function of providing short-term finance for commerce. There remain other institutional investors, such as insurance companies and investment trusts. Here it is only necessary to point out that last Tuesday 2½ per cent. Conversion Loan, 1944-49, a practically identical stock, was quoted at 98½, or over a point cheaper than the issue price of the new bonds.

This suggests that the new loan will follow a familiar course. In accordance with the Government's new technique, the bulk of it will be taken up "inside" by various public departments and in due course peddled out to the market at such prices as, to use a well-known term, bring together a willing buyer and a willing seller. For buyers to be willing that price implies a discount, and the size of that discount will depend upon the authorities' eagerness to clear the decks and also upon the loss they are willing to accept, having regard to the

trend of the gilt-edged market during the remainder of the year. This fact alone raises several important questions. The loss will have to be borne immediately by the various departments which find themselves, *volens volens*, underwriting the new loan. It seems hardly fair to place them in a position where virtually they have to subsidise re-armament to an extent measured by their loss, and it is open to question whether public funds should be diverted in this manner. Perhaps the only case where this procedure is really justifiable is that of the Issue Department of the Bank of England, for as the net profits of the note issue accrue to the revenue, any loss falling upon the Issue Department is automatically transferred to the Exchequer and brought into the year's national accounts.

It is not easy to gauge the effect of this new loan upon the banking system and the money market. Superficially the Government is raising £100 millions against estimated defence requirements during 1937-38 of £80 millions, to be financed out of loans. This implies a margin of £20 millions this year to be applied to the reduction of the floating debt, but there is nothing to prevent the Government from presenting later in the year supplementary defence estimates to be financed out of borrowing. It all depends upon the future trend of the cost of re-armament and upon the degree to which the programme can be accelerated, and no doubt these possibilities lie behind the decision to borrow a margin of £20 millions to-day. Initially there will be a big reduction in the floating debt, because it will be impossible to have spent as much as £80 millions by next September when the final call on the new loan falls due.

Another imponderable is the extent to which the new bonds are taken up and held "inside," for this will determine the extent to which the reduction in the floating debt falls either upon the departments' floating assets or upon the tender issue of Treasury bills. If there are substantial subscriptions by the general public (or alternatively if the departments can re-sell their holdings without undue delay) then there will be a reduction in tender issues of Treasury bills, or rather the seasonal increase due to take place between now and the end of December will be minimised. If, on the other hand, the departments have to hold the bulk of the new loan, then tap Treasury bills will be reduced while tender Treasury bills will be unaffected. In either event we must envisage an appreciable drop in the total floating debt between now and next September, followed by an increase, supplementary to the year's seasonal increase, during subsequent months. This latter movement will be because the money will continue to be spent upon re-armament after the final call on the new bonds has been collected.

Assuming that a substantial part but not all of the new bonds have to be held "inside," it is reasonable to envisage a retardation of the seasonal increase in tender issues of Treasury bills between now and September 15th, followed by an acceleration from then onwards to the end of the calendar year. The seasonal contraction during the following three months may in turn be retarded by the continued expenditure of the proceeds of the Defence Loan. Thus, discount rates may be weak during the summer, firm during the late autumn and early winter, and not quite so weak as usual in the late winter and early spring. Throughout the whole of this period, however, much can happen to upset these very tentative calculations. Meanwhile the new loan will be an additional factor tending to raise the long-term rate of interest and increasingly divorce it from the short-term rate.

Finally, it is necessary to look ahead. We have already pointed out that the date of redemption of the

new loan coincides very closely with that of the 2½ per cent. Conversion Loan. Of the latter, £206 millions is outstanding, so that during the five years 1944-49 the authorities will have to deal with over £300 millions of maturing debt. Moreover, by that date the remainder of the authorised £400 millions of defence borrowing will be outstanding. Thus the whole perspective of future Government financing is being changed, and if the intention is to redeem the various defence loans out of revenue the outlook for the taxpayer seven years hence is indeed bleak. A cynic will reply that whoever is Chancellor of the Exchequer during those years will no doubt find good reason for re-borrowing or converting instead of repaying out of revenue, and no doubt the cynic will prove right. This does not alter the fact that the problem of our maturing debt is now undergoing drastic modification.

As we foresaw from the start, the issue of the Defence Loans is not proving too easy a job. Probably the Government is making the best of it, and it is certainly to the advantage of the financial world to have the first Defence Loan out of the way. Yet the basic truth remains. Granted that re-armament is a necessity, the country has to pay for it, whether by taxation or by subscriptions to loans. Both last week's Budget and this week's Defence Loan show that payment is a process which may or may not be salutary, but is certainly far from pleasant.

Financial Notes

The French Financial Outlook.—M. Vincent-Auriol's statement this week to the Finance Committee of the Chamber was very opportune, in view of the renewed feelings of uncertainty and the fall of rentes to a new record low level. In general terms he gave the assurance that the promise of a "pause" made last March, when the Defence Loan was launched, was being kept, and he pointed out that the original estimate of Frs. 17,715 millions for the Extraordinary Budget had been considerably reduced by the decisions taken on March 5. The ordinary budget deficit, originally estimated at Frs. 4,600 millions, is now placed by him at not more than Frs. 5,000 millions, this new estimate being based on the results for the first quarter of the year. Total "loan expenditure" for the year, including the ordinary budget deficit and loans of Frs. 2,792 millions made to local authorities and repayable in due course, was estimated by him at Frs. 10,117 millions. He stressed the need for stopping these automatic Treasury advances to local authorities, and hoped to introduce a Bill to enable the Departments and municipalities to obtain money without recourse to the Treasury. On the cash outlook for the Government he was much less reassuring. For the remaining three-quarters of the current year he has to find Frs. 1,400 millions for the ordinary budget deficit, Frs. 7,900 millions for extraordinary expenditure, and about Frs. 3,000 millions for the Post Office, Pensions Fund, and advances to Poland. His total need is thus Frs. 12,300 millions. To meet this he has Frs. 3,600 millions, representing the Government's balance at the Banque de France on April 15, the authority to issue the remaining Frs. 2,500 millions of the National Defence Loan, the right to borrow a further Frs. 2,200 millions from the Banque de France, and the option to call for repayments of Frs. 700 millions from the town of Paris. These last sums only add up to Frs. 9,000 millions, so that he is apparently Frs. 3,300 millions short. M. Vincent-Auriol gave no indication of how he proposed to fill this gap, but he admitted that current market conditions were too unfavourable to permit of the early issue of the remainder of the Defence Loan, and he also ruled out another long-term loan this year. Thus, by April 15th the Government had spent the major part of the proceeds of the March Defence Loans which yielded Frs. 8,011 millions. It is now faced with a prospective cash deficit of Frs. 3,300 millions.

M. Vincent-Auriol attributed the recent weakness of the franc largely to technical reasons, but he called attention to the growth in France's passive trade balance. The French trade returns for the first quarter of this year show an import surplus of Frs. 4,022 millions against one of only Frs. 2,344 millions for the first quarter of 1936. The main cause of this increase is the expansion from Frs. 3,357 millions to Frs. 6,043 millions in French imports of raw materials. M. Vincent-Auriol said that abnormally large quantities of raw materials were being imported, but he did not make any attempt to link this up with French rearmament. He admitted that a certain efflux of capital might be in progress for purely psychological reasons. He said that the Exchange Equalisation Fund had restored its holdings of foreign exchange, and that with the gold reserve of the Banque de France they had all the resources necessary to protect the franc. These resources would not be wasted on counteracting day-to-day movements, but would be used when effective resistance seemed necessary. The Government were also calling a conference to discuss the growth in the passive trade balance. On the whole M. Vincent-Auriol made the best of a very difficult job, but his explanation is far from reassuring. The Government's whole outlook is dubious, and the reactions of French re-armament and social legislation upon her trade balance and the stability of the franc are still very difficult to assess.

The Foreign Exchanges.—The main influence this week has been the break in the London and New York stock markets. In contrast to the recent trend, the general tendency on the continent is for the moment to get out of foreign securities and into home currencies, regardless of the degree of confidence normally felt in the latter. In consequence of this movement, the French franc has strengthened against sterling from Frs. 111½ last week to Frs. 110½ on Tuesday, and later to Frs. 110½. For the same reason the dollar has weakened not only against Continental currencies, but also against sterling. At one time the spot New York rate rose to \$4.94½. It later came back to \$4.93, and then rose again to \$4.94½. The influx of funds into Holland has now become so great that the Netherlands Bank has lowered its buying rate for dollars from Fl. 1.82½, where it had stood for several months, to Fl. 1.82½. In consequence the pound sterling also fell from Fl. 9.03 to Fl. 9.01. Forward rates have been very steady, but there has been rather more demand for forward guilders. The Stockholm rate remains as high as Kr. 19.40½, against a normal pegged rate of Kr. 19.39½. The reason is that there are still many forward purchases of krona to be covered both this week and in early May, and the Riksbank remains determined to exact a salutary toll from those speculators who sold foreign currencies forward earlier in the year.

The Money Market.—In spite of the beginning of the Coronation currency withdrawals, money has remained comfortable, but there was a fair demand for loans last Monday. This was explained in some quarters by clearing bank calling. Otherwise conditions are unchanged.

	Apr. 8, 1937	Apr. 15, 1937	Apr. 22, 1937	Apr. 29, 1937
Bank rate	2	2	2	2
Clearing banks' deposit rate	2	2	2	2
Short loan rate :—				
Clearing banks	1½-1*	1½-1*	1½-1*	1½-1*
Others	1½	1½	1½	1½
Discount rates :—				
Treasury bills	1½	1½	1½	1½
Three months' bank bills	1½-1	1½-1	1½-1	1½-1
* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.				
The clearing banks remain buyers of June and July Treasury bills at ½ per cent., but last week the syndicate secured no more than 18 per cent. of the week's allot-				

ment of Treasury bills, and so the market has not had many bills to sell. The immediate reception of the new Defence Loan, on Thursday, confirms the views expressed on a previous page. The bulk of the issue was almost certainly taken up "inside."

The Bank Return.—This week there has been an increase of £4.8 millions in the note circulation. A small part of the expansion is due to the normal requirements at the end of each month, but the bulk of it is probably currency withdrawals in connection with the approaching Coronation. It is difficult to tell how much additional currency will be withdrawn over the Coronation and Whitsun.

BANK OF ENGLAND					
	Apr. 29, 1936	Apr. 7, 1937	Apr. 14, 1937	Apr. 21, 1937	Apr. 28, 1937
	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Issue Department :—					
Gold	202.7	313.7	313.7	313.7	313.7
Note circulation	416.9	469.9	465.7	464.0	468.8
Banking Department :—					
Reserve	46.6	44.6	48.9	50.7	45.8
Public deposits	7.5	24.5	22.4	25.6	26.2
Bankers' deposits	104.7	94.8	96.9	91.2	87.6
Other deposits	39.0	38.3	37.9	38.9	39.6
Government securities	101.3	101.1	96.9	94.1	97.7
Discounts and advances	8.3	7.4	6.9	4.6	5.5
Other securities	12.6	22.3	22.1	24.0	22.0
Proportion	30.8%	28.2%	31.0%	32.5%	29.9%

In the banking department there is an increase of £3.6 millions in Government securities. The expansion in the note circulation has reduced the Reserve by £4.9 millions, and is also responsible for the drop of £3.6 millions in bankers' deposits. It will be interesting to see how the supply of bank cash is affected during the next few weeks by Coronation currency withdrawals.

Insurance Notes

Legal and General Assurance.—Another quinquennial valuation of the assets and liabilities of this Society has been made as at December 31, 1936. Since 1919 the issue of participating policies has been discontinued, and existing with-profit policies are entitled to a maximum compound bonus of 38s. per cent. per annum. For these policies the bonus reserve method of valuation is used, and future bonus at the above rate is treated as a liability, although in no sense guaranteed. For assurances the A1924/29 table is adopted, and for annuities (including deferred annuities under group pension schemes) the a(f) and a(m) table. The interest bases adopted are 3½ per cent. for participating policies and 3½ per cent. for non-participating policies and annuities. Suitable deductions are made from the value of future premiums to allow for expenses. Five years ago the rate of interest used was 4 per cent. in obtaining the liability under both assurance and annuity contracts. The results brought out in the last two valuations are shown below. The amount shown as distributed to policy-holders does not include interim bonuses paid during the quinquennium on death claims and maturities, as the published accounts give no figure for this item :—

	1927-31	1932-36
Trading surplus	1,912,460	1,612,994
Profit on reversions	394,975	485,766
Brought forward	46,157	119,882
	2,353,592	2,218,642
To Bonuses to policyholders	968,850	735,858
" Transfer to profit and loss	800,000	350,000
" Strengthening of reserves	464,860	1,039,690
" Carry forward	119,882	93,094
	2,353,592	2,218,642

New ordinary sums assured—all non-participating in form—increased from £6,381,000 to £7,113,000, and sinking fund assurances from £1,176,000 to £1,355,000. In addition to ordinary assurances, the society transacts a very large amount of decreasing term, group assurance and group pensions business.

Last year decreasing term assurances (largely issued in connection with building society mortgages repayable by instalments) and group assurances were £9,784,000, against £9,383,000, and deferred annuities (under pension schemes) increased from £1,149,000 per annum to £1,601,000 per annum. The net rate of interest earned on the life assurance fund, omitting reversions, fell from 4 2s. 11d. per cent. to 4 0s. 9d. per cent. Annuities paid increased from £369,000 to £401,000. Fire premium income was £315,000 against £323,000 in 1935, and accident premium income £221,000, against £235,000.

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Fire	33,265	10.3	46,549	14.8
Accident	13,320	5.7	4,000	.2
Life			350,000	
Sickness			15,000	
Sinking fund			85,000	
	19,945		500,549	
Less items debited to profit and loss	10,000		130,000	
Net trading surplus ..	9,945		370,549	

Profit on investments realised during 1936 amounts to £370,000, which has been applied to write down investment values. Credit is taken for £290,000, being appreciation in the re-valuation of reversions, and the sum of £150,000 has been transferred to both the general and investment reserves. Total assets increased from £36,690,000 to £39,725,000, of which mortgages on property and loans accounted for over £13½ millions, and reversions and life interests for £4½ millions. British Government securities are smaller by more than £300,000 at £5½ millions, while debenture, preference and ordinary stocks all show marked increases. The aggregate market value as at December 31 1936 "largely exceeded" the aggregate book value. Investment reserve now amounts to £1,000,000 and the general reserve to £500,000. The ordinary dividend is increased from 42½ per cent. to 45 per cent., both free of tax. The usual 10 per cent. bonus, free of tax, is repeated, together with a centenary distribution this year of 25 per cent., free of tax. The total cost of these distributions is £160,000, against £105,000 in the previous year. It is proposed to apply £50,000 from profit-and-loss balance to pay off 5s. per share, making the shares £5 each, with 25s. paid; it is further proposed thereafter to sub-divide each share into five shares of £1 each, with 5s. paid.

World Auxiliary Insurance.—Although established in 1919 under the aegis of the World Marine, which was shortly afterwards transferred to the Northern, the World Auxiliary remains an independent concern. In 1936 premium income increased slightly from £273,000 to £277,000. The underwriting results are shown below:

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Fire	5,350	6.0	£349	—
Accident and general ..	7,338	9.2	7,888	9.7
Marine	15,048		15,356	
	27,736		23,593	
Less items debited to profit and loss account	10,461		10,783	
Net trading surplus ..	17,275		12,810	

Total assets amount to £1,186,000, of which the book value of the Stock Exchange securities accounts for £1,012,000. The market value on December 31, 1936, was £1,085,000. Specific reserve funds amount to £250,000, while profit and loss balance, after deducting the cost of the 1936 dividend, is £144,000. The dividend is at the usual rate of 7½ per cent., free of tax, and costs £22,500 against net interest earnings of £28,000.

The State (including the British Equitable) Assurance.—This company, which was absorbed by the Royal Exchange in 1924, transacts fire, accident and marine insurance, but has not yet commenced the transaction of life business in its own name. The accounts, however, include the figures of its subsidiary, the British Equitable, new life assurances of which amounted to £829,000 in 1936, compared with £806,000 in the previous year. Total fire premium income of the State and its subsidiaries, including the British Equitable, at £836,000 was £7,000 down, but underwriting profit showed a considerable reduction.

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Fire	36,167	6.6	18,537	3.5
Accident	20,326	9.5	12,148	5.3
Marine	9,175	11.0	3,347	4.0
Life	1,814		1,814	
	67,482		35,846	
Less items debited to profit and loss account	40,891		41,080	
Net trading surplus ..	26,591		— 5,234	

The dividend is again at the rate of 25 per cent. and costs £19,000, against net interest earnings of £33,000.

Law Union and Rock.—New sums showed considerable expansion at £2,746,000, compared with £2,455,000 in the previous year, and net interest earnings on the life assurance fund increased by 1s. 7d. per cent. to £3 15s. 11d. per cent. Total fire and accident premiums were £12,000 higher at £703,000; but underwriting results were less favourable:—

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Life	17,078	—	17,078	—
Fire	94,245	21.0	69,669	15.9
Accident and General ..	31,343	13.0	16,073	6.0
	142,666		102,820	
Less items debited to Profit and Loss ..	30,775		40,964	
	111,891		61,856	

Net interest earnings in the miscellaneous branches amounted to £48,000. The dividend is again at the rate of 16s. per cent. per share, and costs £138,000. This sum is considerably in excess of the combined net trading surplus and interest earnings.

World Marine and General Insurance.—This company was transferred to the "Northern" shortly after the war, and was originally founded to transact marine insurance, in which it has a very successful record. The continued fall of recent years in marine premium income has been arrested; last year's total at £110,000 shows an increase on the year of £3,000. Fire and general premium income also increased from £113,000 to £124,000. The results of the last two years are given in the following table:—

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Fire and accident	4,216	3.7	— 691	— 0.5
Marine	15,000	14.0	15,000	13.6
	19,216		14,309	
Less items debited to profit and loss account	7,500		3,392	
Net trading surplus	11,716		10,917	

Total assets amounted to £982,000 and the market investments on December 31st last exceeded book values
