by £163,000. There is a general reserve fund of £300,000 in addition to strong departmental reserves. The dividend is again at the rate of 40 per cent., free of tax, and costs £40,000, compared with interest earnings of £29,600.

London Assurance.—For the fifth successive year new life assurances of this company created a fresh record at £2,824,000 and 3,156 policies, compared with £2,764,000 and 3,608 policies in the previous year. Net rate of interest earned on the life fund was practically unaltered at £3 17s. 8d. per cent. Premium income, including that of the London's associated companies, fell from £2,094,000 to £2,042,000 in the fire branch, but accident premiums increased from £1,253,000 to £1,319,000, and marine premiums from £646,000 to £647,000. Underwriting profits, though very satisfactory, were not quite as good as in 1935. The results of the last two years are given below:—

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Fire	186,164	8.9	172,321	8.4
General Accident ..	120,043	9.6	103,389	7.9
Marine	72,011		74,928	
Life	20,000		22,500	
	398,218		373,138	
Less items debited to Profit and Loss ..	141,739		162,152	
	256,479		210,986	

Net interest earnings, after deducting £32,000 for preference dividends against £12,000 in 1935, were £183,000 compared with £216,000. The rate of dividend is again 45 per cent., and cost £230,000 with tax at 4s. 9d. in the £. Life assurance assets alone amount to £9,599,000, showing an increase in the year of £582,000, and the following were some of the main changes in the investment sub-divisions: loans of all kinds increased by £1,173,000 to £1,573,000, but British Government securities fell by £188,000 to £2,189,000; debenture stocks rose from £2,221,000 to £2,601,000, preference stocks were £226,000 greater at £656,000, and ordinary stocks expanded by £89,000 to £517,000. Total assets of the London Assurance, including its subsidiaries, now amount to £19,443,000; there is a general reserve of £1,640,000, a contingency account of £240,000 and a profit and loss balance, subject to payment of the 1936 dividend, of £823,000.

Equitable Life.—New sums assured of this Society, the oldest of all life assurance offices, rose steeply from £1,337,000 to £1,708,000, while new deferred annuities amounting to £204,000 per annum were issued—no doubt largely in connection with staff pension schemes—against £87,000 per annum in 1935. An increase from £175,000 to £233,000 in consideration for annuities completes a picture of great vitality. The net rate of interest on the funds (including reversions and investments in the Reversionary and Equitable Reversionary Interest Societies) fell by 1s. 2d. to £4 4s. 4d. per cent. As the Society does not employ agents or pay commission for the introduction of business, total expenses are small relative to the size of the funds. Expenses in connection with the considerable annuity business are not separately shown; total expenses, however, amount to only 6.8 per cent. of the premium income. During the year assets increased from £10,235,000 to £10,888,000. Mortgages on property increased by a moderate sum to £1,652,000, and loans on public rates amount to £899,000, against £706,000, but policy loans fell by £28,000 to £344,000. British Government securities at £347,000 fell by £73,000, and holdings of foreign and colonial Government securities were also smaller. On the other hand, marketable debenture, preference and ordinary stocks at £2,404,000, £501,000 and £478,000,

respectively, increased from £2,049,000, £434,000 and £448,000. The book value of stock holdings in subsidiary companies is practically unchanged at £1,608,000.

Caledonian Insurance.—The annual report of this company for 1936 contains the results of the triennial valuation of the life assurance liabilities as at December 31, 1936. For annuity contracts the basis of valuation is identical with that adopted three years ago, namely a(f) and a(m) tables, assuming each life to be "select" at the rate of valuation with interest at 3 per cent. For assurance contracts the rate of interest used was reduced from 3 per cent. to 2½ per cent. and the O^(M) table was replaced by the A^{1924/9} table. The cost of moving to the more stringent basis is not given and has operated to reduce the trading surplus shown below:—

	1931-1933	1933-1936
Trading Surplus	384,214	381,312
Brought forward	100,398	103,174
	484,612	484,486
Allocations:—		
To Bonuses to policyholders	334,294	347,524
Shareholders	37,144	38,614
Strengthening of actuarial reserves ..	10,000	...
Carried forward	103,174	98,348
	484,612	484,486

The rates of bonus declared are the same as on the previous occasion, whole life policies receiving a reversionary bonus of 42s. per cent. on the sum assured and endowment assurances receiving 40s. per cent. on the sum assured. Under the company's present double endowment plan the bonus is at the rate of £2 per cent. per annum on the initial sum assured. New life assurances in 1936 increased from £1,686,000 to £2,039,000, and annuity consideration moneys from £122,000 to £139,000. The net rate of interest on the life assurance fund was 1s. 4d. per cent. higher at £4 0s. 2d. per cent. In the miscellaneous branches fire premiums fell from £733,000 to £715,000, while marine premium income was unchanged at £86,000. On this occasion the somewhat retrograde step is taken of combining the figures of accident, employers' liability, general and motor accounts; under the combined account premium income is £521,000 against the total of £484,000 in the previous year. The underwriting results are shown below:—

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Fire	82,499	11.3	70,289	9.8
Accident	731	7.8		
Employers' liability ..	638	1.6		
General	2,549	2.2	16,415	3.1
Motor	13,396	4.2		
Marine	9,086	10.5	10,000	11.6
Life	...		12,871	
	108,899		109,575	
Less items debited to Profit and Loss (including transfer in both years of £25,000 to general reserve) ..	81,853		69,987	
Net Trading Surplus ..	27,046		39,588	

Total assets in the life balance sheet increased from £7,861,000 to £8,071,000. Policy loans fell by £60,000, but loans on personal security and medical practices increased by £124,000; there was a net increase of £43,000 in the aggregate loans. The assets of the miscellaneous branches amount to £3,311,000, while there is a general reserve of £575,000. Interest income was £76,000, and the cost of the dividend, which is again at the rate of 75 per cent., is £89,000.

London and Lancashire.—Total premium income, excluding premiums of the life department, which is administered by the Law Union and Rock, increased

from £6,042,000 to £6,225,000, a decrease of £66,000 in the fire premiums being more than offset by increases in accident and marine premium income. The underwriting results are given below:—

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Fire	443,789	15.8	357,202	13.0
Accident and General ..	72,716	3.3	107,025	4.6
Marine	185,508	17.8	129,520	11.5
Life	17,078		17,078	
Capital Redemption ..	1,467		1,379	
	720,558		612,204	
Less items debited to Profit and Loss	183,106		198,699	
Net Trading Surplus ..	537,452		413,505	

In addition to the reserves in each account of 40 per cent. of premium income for unexpired risk, reserves are held equal to 87 per cent., 43 per cent. and 89 per cent. respectively of premium income in the fire, accident and marine accounts. Total assets, exclusive of the life assets of the Law Union and Rock, which are incorporated in the consolidated balance sheet, amount to £17,438,000. There is a general reserve of £2,000,000 and a profit and loss balance, after payment of the 1936 dividend, of £2,461,000. The dividend is again at the rate of 50 per cent., costing £573,000, contrasted with interest earnings of £482,000.

Alliance Assurance.—New sums assured in the life department amounted in 1936 to £3,526,000, compared with £3,580,000 in the previous year, but annuity consideration moneys rose from £268,000 to £314,000. The net rate of interest on the combined life assurance and annuity funds was 2s. 9d. per cent. lower at £3 15s. 6d. per cent. Fire insurance premiums were £2,149,000 against £2,103,000, but underwriting results, although still very satisfactory, were not quite up to the usual excellent standard of the company. Accident and miscellaneous premiums expanded by £60,000 to £1,305,000 and marine premiums from £333,000 to £344,000. The 1934 marine account has been closed; £25,000 is set aside for future claims, and £45,000, against £24,000 in 1935, has been transferred to profit and loss. The results of the last two years are shown in the following table:—

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Fire	404,531	19.2	354,652	16.5
Miscellaneous	143,067	11.5	163,430	12.5
Marine	24,179	7.3	45,070	13.1
Life	55,961		51,061	
Transfer fees	18,539		17,844	
	646,277		632,057	
To reserve	150,000		150,000	
	496,277		482,057	
Less items debited to profit and loss ..	274,504		258,468	
Net trading surplus ..	221,773		223,589	

Strong departmental reserves are held; thus in the fire account, in addition to the usual 40 per cent. of premium income for unexpired risk, a reserve of £2,400,000 is held, equal to 112 per cent. of the premium income. In the accident account total reserves amount to 97 per cent. of the premium income, while the marine fund is in excess of three times the premium income. Total assets amount to almost £40 millions, of which £26 millions refer to the life and annuity funds of the Alliance and its subsidiaries. There is a general reserve of £1,650,000 and a profit and loss balance, after payment of the 1936 dividend, of £710,000. No pronounced movement took place during the year in the classification of securities, but an increase is noted in debenture stocks from £6,047,000 to £6,625,000, and a fall of £222,000 in policy loans. The dividend for the tenth successive year is 18s. per share. It costs £482,000, against interest earnings of £350,000.

THE STOCK EXCHANGE

Major Reaction or Turning Point?

A FORTNIGHT ago, the security markets were clearing up—not without success—the weak technical legacy of certain large positions in mining shares and internationals. To-day, their state verges on the pathological. The first fruits of the National Defence Contribution have been bitter in the extreme. Investors have made rough calculations of the effects of the new tax upon their holdings; but such crude estimates are wholly inadequate as investment pointers while the larger uncertainties regarding the new basis of N.D.C. still remain. The Chancellor of the Exchequer's promised concessions regarding the datum period and the rates of interest to be employed for the capital standard have, of course, been welcomed. But the prospect of further uncertainty pending the elaboration of these amendments in the Finance Bill left the remainder of the latest Stock Exchange Account and the whole of the next exposed to shock.

Mr Chamberlain is undoubtedly right in his view that the effects of the National Defence Contribution itself have been exaggerated by the market. Many operators argue that the yield of the new tax may vastly exceed the Chancellor's estimate, and even his reiteration of the £20-£25 millions yield for 1938-39 has not wholly reassured the pessimists. Hence, what may be called the "negative uncertainties" arising from the N.D.C. have been fully—in some cases more than fully—discounted. And while buyers have been non-existent there has been little, if any, panic selling by the public; this week's slump has occurred with a sub-normal volume of actual business. In such circumstances, a technical recovery in the markets would normally follow. Buyers of cheap stock would reappear; jobbers would take stock on their books more freely; and the liquidation of strained positions could be carried out in an orderly fashion.

On this occasion, however, investment sentiment has received a serious shock, following a succession of glancing blows during the earlier weeks of the year. During the latter part of January, it will be recalled, the gilt-edged market began to anticipate the possibility of the Defence Loans, which culminated in the publication of the Government's White Paper on February 16th. The satellites of the gilt-edged market—fixed-interest securities and the sound industrial issues (whose prices include an appreciable interest element)—immediately fell in sympathy. A considerable period of irregularity in industrial shares followed. Increased dividends were no longer seized as a pretext for marking prices higher; anticipations of the adverse effects of rising prices on industrial costs were magnified by the commodity boom which followed the White Paper; and many investors began to examine their portfolios with a view to reducing their holdings of stable equities, and of shares which appeared especially vulnerable to rising costs.

In every period of prosperity, such adjustments are ultimately called for. On this occasion, however, their effects were supplemented by the effects of the "shake-out" in commodities which followed President Roosevelt's declaration early in April, and by the gold scare which followed immediately after. The latter revealed a certain amount of weakness in Johannesburg, which had its repercussions in the London market, while the determination of the authorities on both sides of the Atlantic to bring the bull position in international stocks under control necessitated further adjustments.

Thus, N.D.C. fell upon a market which was already nursing its bruises, and its effects have, therefore, been the more serious. At times this week markets have seemed on the verge of panic, and although forced liquidation has been stemmed—at least for the time being—

the uneasy poise of the market pyramid would be upset by any shifting of the sands. It appears that the majority of vulnerable positions are now safeguarded, provided that no further disturbance occurs. But since these accounts cannot finally be cleared up until market conditions permit their orderly liquidation, the prospect of an immediate recovery is not very bright. It may, indeed, take several weeks to repair the violent movements of the last few days, and the Stock Exchange must remain a prey to rumour while weak bull positions remain.

Under present conditions, quotations for many sound shares are more the result of fear than of the careful weighing of investment factors. Indeed, N.D.C. for the time being has denied the market one of its essential functions—that of estimating the prospects of earnings and dividends in the future. Precise calculations of the incidence of N.D.C., indeed, will be impossible until the Finance Bill is finally enacted and, if a Board of Referees is instituted, perhaps even longer. In the meantime, abnormally wide quotations are being made in leading industrials, normally called with a "turn" of a few pence. The table which follows, indeed, exhibits all the signs of disorder. It depicts the course of selected gilt-edged stocks (chosen for their variations in life) and of leading industrial and commodity shares, since the end of last year. The dates have been selected to show the market reactions to the White Paper, to the gold scare, and to the Budget. In the two right-hand columns the corresponding yield figures are given for December 31st and April 29th—the latter taking account of increases in dividends which have been declared since the end of last year:—

	Quotations					Yields (%)

(n) Based on a dividend of 60 per cent.

Examining these falls, the investor may well ask himself whether the time has come for a wholesale revision

of investment policy. The cynic might observe that, under present conditions, the best investment policy is to have no policy at all. But certain broad considerations may be laid down, even amid the prevailing uncertainty. The first is that the effects of N.D.C., by themselves, have now been carried far enough. Some alleviation is promised, and that has already assisted market confidence, to a moderate extent. Any scare selling of sound industrials at this moment, therefore, is likely to be singularly ill-advised. Undue exaggeration of the extent of technical weakness may also be discounted, subject to the strict proviso that no further blows are experienced by the market. Is there any reason why the investor's confidence in the future of equity investments as a whole should be shaken? The suggestion that the Chancellor devised N.D.C. as an alternative to other forms of taxation, in order to preserve the existing level of gilt-edged securities, is very far-fetched. Yet the feeling that the authorities might not be averse to checking any undue symptoms of prosperity, including a rapid advance in equities, is undoubtedly obtaining currency. This view may have but small basis in fact; but, if it becomes widespread, the recovery of the industrial markets must be delayed the longer.

Our table, however, suggests another feature of recent security movements which is brought out even more clearly in the figures of the Actuaries' Investment Index, which appear on page 290. Whereas, four months ago, the investor was still content with a yield of 3½ per cent. on first-class industrial shares, the current figure is now well over 4 per cent., despite the increased dividends which have been paid since the turn of the year. Prospective dividend increases, if this trend continues, will need to be greater than in recent years if the general level of industrial equities is to be raised or even maintained. And it is inescapable that the scope for a further all-round advance in earnings, on the scale to which investors have become accustomed during the last four years, is becoming narrower. Costs are rising; in many industries a restive labour situation is disclosed; while in others operations are now close to physical capacity. Undoubtedly, industry as a whole can count on the maintenance of highly satisfactory total profits for some time to come. But the advance of industrial equities during the past four years has been based upon expectations of continued progress, rather than the attainment of any given level of absolute earnings. In some developing industries opportunities for increasing profits are still to be found, yet it would not be surprising if the major rise in equity prices, based on anticipations of increased earnings, has now been seen.

The investor is left, therefore, with rather negative conclusions regarding the present state and future trend of the markets. It is too early to say that the major reaction marks a turning point. Until the dust has settled on the N.D.C. controversy, and until current technical difficulties are appeased, the most careful prediction may easily be falsified. Yet of one thing the investor may be quite certain. It will take some time before the Stock Exchange is able to report "Business as usual." The present may not be a sensible time for selling; but rational investors will probably prefer to wait until the present uncertainty has subsided before tackling the long-range problems associated with the continuance of industrial recovery, which N.D.C. has thrown into such high relief.

Investment Notes

Course of Share Values.—Our monthly chart of British and American equity share movements substantiates, in part, Mr Chamberlain's contention that the prevailing condition of the markets is not solely due to the impact of N.D.C. For the past two months the trend, both in London and New York, has been downward. The process of technical correction which commenced in the London market in January has been continued almost without interruption since, and the shock administered by N.D.C. has laid bare rather considerable weaknesses in the market position. As these

words are written it seems probable that the façade will be repaired temporarily, until the prevailing abnormality has been overcome. Our chart, however, shows that, at the end of Budget week, London was retreating faster

BRITISH AND AMERICAN INDUSTRIAL SHARE VALUES OVER THE PAST TWO YEARS (1928 = 100)

American: "Standard Statistics" Index of 50 Common Stocks

than New York. The latter centre has difficulties of its own; the labour situation is far from clear; and the Administration pursues its anti-boom propaganda. Lately, Wall Street has shown itself vulnerable to London's influence, although the scale of this week's falls suggests speculative selling on exaggerated ideas of

London's difficulties. April, indeed, has produced more showers than sunshine in the markets. It began with President Roosevelt's bearish declaration on commodity prices, proceeded with the gold scare, and ended with acute technical strain after the Budget. And at this moment, the prospect of immediate recovery cannot be ranked very high.

Meanwhile, the Actuaries' Index of equity shares shows the effect of the gold scare and Budget blows by a fall from 86.5 to 84.2 during the past month (December 31, 1928 = 100). Details of certain fixed and variable dividend security indices are given below:—

Group (and No. of securities)	Price (Dec. 31, 1928 = 100)			Yield (%)		
	Year ago (Apr. 28, 1936)	Month ago (Mar. 30, 1937)	This week (Apr. 27, 1937)	Year ago (Apr. 28, 1936)	Month ago (Mar. 30, 1937)	This week (Apr. 27, 1937)
Fixed Interest:						
2½% Consols	151.7	136.3	136.6	29.4	3.27	3.27
4% Victory Bonds	122.4	115.8	116.6	...	...	...
4% Consols and 3½% Conversion Loan	134.3	128.4	127.4	...	...	...
Misc. Industrial Debts (20)	125.8	120.5	120.8	3.92	4.12	4.11
Misc. Indust. Prefcs. (47)	120.7	114.2	115.8	4.27	4.55	4.48
Ordinary:

Electric Supplies (10) ...	137.9	150.7	142.0	3.59	4.04	4.11

The general industrial index, it will be seen, conceals some striking falls in certain groups. The process of adjusting equities to a higher yield basis continues for the 177 industrials included in the Index show an overall return of 4.20 per cent. compared with 4.09 per cent.

TO-NIGHT, PERHAPS—

Who knows when and where fire will strike next? Perhaps your premises will be involved . . . perhaps to-night.

Are the priceless records of your business guarded against the ever present danger of fire? As Chairman, ask for a report.

Write for full details of The Chatwood Fire-proof Safe Cabinets, Filing Cabinets, and other fireproof equipment.

The Chatwood Products can be seen at The Building Centre, Bond Street, W.1.

a month ago and 3.64 per cent. a year ago. Conversely, the past month's events have diverted attention to gilt-edged and stable dividend securities. It is now somewhat difficult to obtain free supplies of sound industrial preference shares to yield 4½ per cent.

National Defence Bonds.—On Monday, Mr Chamberlain announced the terms of the first re-armament loan—£100 millions of 2½ per cent. National Defence Bonds, issued on Thursday at 99½, and repayable from September 15, 1944 to 1948, by annual drawings of not less than 20 per cent. of the nominal amount of bonds created. On the day of the announcement, 2½ per cent. Conversion Loan, redeemable 1944-49, stood fully one point lower than the issue price of the new bonds. Although sensational notions of a City "boycott" of the new bonds owing to N.D.C. can be dismissed, it cannot be said that the reception of the terms was auspicious. In principle, a short-life issue with a heavy sinking fund is desirable for financing re-armament, and the terms arranged in this instance completely refute the idea that, because the charge for re-armament loans on the Defence Votes is to run for thirty years at 3 per cent., identical terms must be slavishly adopted in floating the issues in the market. The former, indeed, is merely a matter of budget book keeping, while the latter is scarcely practicable. For all their desirability in principle, however, institutional investors have not taken kindly to the issue terms of the Defence Bonds, as we show on page 283. For the private investor they offer a slender yield, which largely offsets their comparative immunity from serious capital depreciation. The anticipation that the Public Departments would be called upon to take a substantial part of the Bonds was coupled, on Thursday, with the suggestion that dealings might commence at, say, two points discount. The market recalls, moreover, that the 2½ per cent. Funding Loan issued in December, 1935, at 96½, now stands 9 points lower than the issue price, while the 2½ per cent. Funding issue of last November, made at 98½, is now 93½. The technique of pitching the terms of new Treasury issues slightly above the market, in fact, bears some signs of a bluff which has now been called.

N.D.C. Revision.—The market's relief at Mr Chamberlain's promise to revise the basis of the National Defence Contribution has been tempered by the fact that substantial damage to the market had already been done, and that uncertainty will remain until the revised terms are published in the Finance Bill and approved by Parliament. As the market interprets the Chancellor's intentions, the base period will be drastically revised; the definition of "capital" is to be re-examined; and the datum rate of profit of 6 per cent. for companies is to be replaced by variable rates for different industries. During the next few weeks, therefore, investors must content themselves with the general assurance that anomalies and inequities will be alleviated. They find it difficult, however, to understand the Chancellor's reference to a "premature conception of what the proposals were," for their reaction has been based solely on the Chancellor's Budget speech, the examples set out in the White Paper, and upon subsequent explanations by Government spokesmen. The revival of market confidence which greeted the Chancellor's statement has quickly evaporated, under the pressure of renewed technical weakness. The revision of N.D.C. clearly promises to be so considerable that a firm investment policy in the interim will remain out of the question. If re-armament profits only are to be subject to the new impost, and the datum year is shifted to, say, 1936, the growth of profits will accordingly be smaller. The consequence, the market infers, is that the Chancellor's problem of raising revenue will be increased, and that the rate of levy upon the growth of profits will need to be revised or a

fresh source of revenue unearthed. Meanwhile, the adoption of the main feature of the Corporation Profits Duty is found further advocates. The maximum rate of impost contemplated under C.P.T. for any company as 10 per cent. on its ordinary capital. A similar provision incorporated in N.D.C. would reduce the arbitrary incidence of the new tax which must otherwise rise from geared capital structures, and, in addition, the relatively stable profit-earning companies would so make their contribution.

Statutory Percentages under E.P.D.—The Chancellor's suggestion of variable percentages for the N.D.C. capital standard in different industries recalls the problem which arose under the Excess Profits Duty. The Board of Referees, which was set up under the second Finance Act of 1915, was given power to fix rates for the percentage standard for different industries, provided that the maximum tax liability imposed by the act upon any subject was not thereby increased. The Board gave 176 decisions, of which 66 referred to asses of business carried on in the United Kingdom, and as many as 110 classes carried on abroad but conducted from this country. The average percentage granted was slightly below 10 per cent. for home companies (compared with the original statutory rate of 6 per cent.), and 11.3 per cent. for concerns operating overseas. In the table which follows we set out a selection of percentage rates awarded for calculating the capital standard under E.P.D. for certain industries:—

Trade or Industry	Percentages for Companies	Trade or Industry	Percentages for Companies
Aeronautical Instruments.....	6	Gold Mining (Rhodesia and W. Africa).....	22½
Aircraft Engines.....	15	Lead Mining (W. Australia).....	14
Aircraft Manufacture.....	19	Manganese Mining (Gt. Brit.).....	16
Artificial Tin Mining (Nigeria).....	13	Manganese Mining (India).....	10
Asbestos Mining (Mexico).....	17	Metals and Alloys (for high-speed steel).....	12
Asbestos Smelting.....	16	Motor Manufacture.....	7
Asbestos Mining (Rhodesia).....	16	Oil (Persia).....	11
Capt. Manufacture.....	6	Oil (Trinidad).....	14
Cane Sugar (Brit. W. Indies).....	7	Oil (Burmah).....	8½
Chemical.....	6½	Omibuses.....	8
Copper Ore Mining (New Caledonia).....	22½	Paint and Varnish.....	6
Colemanograph Industry.....	11	Pig Iron.....	7
Coal Mining.....	9	Road Materials.....	8½
Coke Manufacture.....	8	Rubber Manufacture.....	6
Copper Mining (Chile).....	10	Rubber Growing.....	10
Copper Mining (Rhodesia).....	12	Ships.....	8
Dates (Sudan).....	8	Steel Manufacture.....	9
Electric Cables.....	7	Synthetic Dyes.....	8
Electric Supply (London).....	7½	Tea Growing.....	8
Electric Supply (Provinces).....	7	Theatres (West End).....	15
Electric Supply (Hankow).....	9	Theatres (other).....	11
Explosives.....	8	Tin Dredging (Malay).....	13
Glass Preparation.....	10	Tramways.....	7½
Gold Mining (Brazil).....	13	Tungsten and Molybdenum.....	12
Gold Mining (Columbia).....	15	Wire.....	9
Gold Mining (India).....	27½	Typewriters.....	9

These rates applied to companies, and an additional 1 per cent. was allowed for firms and sole proprietors. For accounting periods after 1916 an additional 1 per cent. allowance was made to firms and sole proprietors, and for all concerns an additional 3 per cent. was allowed for increased capital. The table discloses a considerable degree of differentiation between home industry and mining and other speculative concerns, whose claims the Chancellor was at pains to stress in Tuesday's debate.

Wall Street in Retreat.—Apart from Tuesday's partial recovery, prices on Wall Street have been falling rapidly throughout the past week. The causes of this setback include the familiar fear of inflation in America as a result of unbalanced budgets; but this hardly seems adequate since the administration is apparently more economically minded at the present than at any time previously. Mr Eccles' opinions on the subject are not being ignored in Washington. A second argument seeks to explain the reverse as due to the recent regulations on in-and-out trading which have operated to make the market react more violently to small impulses than previously. But by far the most important influence has been the collapse of prices in London, as a result of the widespread fears of investors over the effects of Mr Chamberlain's new tax. The tax proposed to collect

a relatively moderate revenue, and the precipitate fall in many prices here suggests that there was a very heavy speculative position in London. The weakness of Wall Street may have been due to some extent directly to sales by London holders wishing to cover their London losses. But a larger part must have been the result of sympathetic nervousness, which found the ground well prepared by the President's recent attacks on high commodity and security prices. It seems clear that in recent days speculators in New York and in London have been made to realise that profits are not to be made so easily. But there seems little reason to anticipate a long continuation of Wall Street's state of nerves. American economic recovery has a long way to go, and business reports continue to justify good expectations. The labour situation, undoubtedly, will remain a bearish influence, and the usual seasonal recession during the summer may be expected. But these factors do not justify gloomy pictures of a return to 1929 conditions; a reasoned but discriminating optimism still appears justified for the investor.

Insurance Share Index.—After rising continuously during each quarter of 1936, our insurance share index (1913=1,000) fell somewhat sharply from 5,111 for December, 1936, to 4,800 at the end of March last. The index was thus actually a little below the level of 4,952 for the same date in 1936. The following table shows the 24 component indices, and also the general average for the last three years and for each of the last four quarters:

	1934	1935	1936	June 30, 1936	Sept. 30, 1936	Dec. 31, 1936	Mar. 31, 1937

Scottish Union and National.....	4,732	4,996	5,490	5,620	5,620	5,768	5,176
Sun Fire.....	3,088	3,271	3,316	3,333	3,333	3,289	3,067
Sun Life.....	2,632	2,972	3,375	3,426	3,325	3,577	3,022
Yorkshire.....	3,401	3,575	4,091	4,020	4,071	4,020	3,762
Average	4,025	4,497	5,031	4,965	5,080	5,111	4,800

Whereas the movements during the last three months of 1936 were irregular in tendency (the movements of two shares being mainly responsible for the net increase), the most recent indices show a decline almost throughout. Two shares only, those of Equity and Law and General Accident, have risen, while the index for Life Association of Scotland was unchanged.

Company Notes

Imperial Chemical Industries Meeting.—Lord McGowan's speech at the I.C.I. meeting on Thursday agreeably balanced retrospect against prospect. Imperial Chemical Industries has reached its tenth anniversary, having passed through the greatest depression of modern times, and can rightly claim to have consolidated its position in a manner worthy of the greatest British industrial undertaking. If the original hopes of the founders have not been realised to the full—they formed the basis of the issue of the deferred shares which have now disappeared—the company's record as a fusion of diverse industrial interests into an administrative entity is none the less satisfactory. Lord McGowan's speech endorsed at many points the view which has been consistently taken in these columns of the merits of I.C.I. ordinary stock. Responsibilities to workers, stockholders and customers were recognised. Research and installation of the most up-to-date equipment must continue if the future progress of the undertaking is to be assured. The consistent results which the company has shown during the last decade substantiate these viewpoints. During that period, in fact, some £9,000,000 have been expended upon research and some £7,000,000 upon reorganisation and concentration of the group's factories. The review of the past year's results again emphasises that I.C.I. is an industrial equity which itself provides an important element of diversification, through the wide range of industries which the company serves. But the board justifies its conservative dividend policy on the double ground that the course of industrial activity is not for ever upwards, and that, in the present context of rising costs, it does not follow that the course of profits will necessarily match the curve of economic activity. Indeed, the company may shortly be forced to review its existing selling prices—a reversal of the policy of reduction which has been pursued in recent years. Nor despite a fairly favourable review of overseas conditions last year, did the chairman contemplate the export markets with equal confidence, and his conclusion regarding the current year's prospects was in decidedly cautious vein. As a relatively stable earnings stock, I.C.I. ordinary has not been unduly affected by N.D.C. At 37s. 3d., it yields £4 6s. in keeping with its stable return.

Ford Motor Results.—Since its prosperity was re-established in 1934 the Ford Motor Company has introduced several new models into its Dagenham-manufactured range; has brought into operation its iron and steel plant; and has made a bold reduction in the price of the 8 h.p. model. The trend of profits testifies to the board's sound judgment in achieving these changes. Before the special charges for works adaptation in 1934 and 1935, trading profits were £1,440,908 and £1,513,450 respectively; in 1936 they amounted to £1,558,990. These figures include no credit for dividends paid to the wholly-owned Luxembourg holding company in respect of the company's 60 per cent. interest in most of the European Ford concerns (outside France and Germany). In total, these dividends would represent a substantial additional revenue. Of the profits actually brought in, the directors set aside nearly half (£749,571) for depreciation and obsolescence, and provide a much larger sum (£174,209, against £59,903) for tax. The employees' benefit contribution of £108,500 is also materially larger than in any previous year. The follow-

ing table shows that the 6 per cent. dividend requires £495,000 out of earnings, which, after deducting the substantial tax reserve of £174,209, amount to £511,767:

	1934	1935	1936
Gross profits, less fees	1,407,256	1,392,787	1,549,524
Employees' and boys' school	5,771	75,517	116,212
Depreciation, etc.	619,301	714,370	749,571
Tax	25,000	59,903	174,209
Earnings for Ordinary	636,118	597,153	511,767
Paid	348,750	348,750	405,000
Earnings %	9.1	8.6	7.6
Dividend %	5	5	6
Carry forward	523,083*	771,486	864,179*

* After adjustments.

The balance sheet shows that generous depreciation provisions have not been allowed to accumulate as idle cash. Surplus liquid assets are down from £1,737,000 to £1,140,000, while land and buildings are up from £3,762,000 to £3,972,000, and plant is up from £4,453,000 to £4,603,000. In the report the directors refer to new models which are expected to widen demand. The latest of these (the new 10 h.p.) will have to encounter a special form of competition from the corresponding German-made Opel, whose introduction appears to be designed, in part at least, for the provision of free sterling exchange for General Motors, who must otherwise forgo revenue from their German investment. At 27s. 6d. cum dividend, Ford shares yield £4 11s. 6d. per cent.

Morris Motors Report.—The first report to be issued since the marketing of Morris Motors ordinary shares last October would, under normal market conditions, be well received by the new holders of the equity. It shows an increase in trading profits from £1,650,636 to no less than £2,372,082, while net profits, after providing for maintenance, depreciation, and taxation, and crediting other income, have increased from £1,167,736 to £1,703,306. The 45 per cent. dividend, therefore, is covered by earnings of as much as 74.4 per cent., so that, for 1936, the company has set aside almost the same sums to internal reserves as in the previous year. The following table analyses these impressive results:—

	1934	1935	1936
Gross profit	1,044,595	1,650,636	2,372,082
Maintenance	336,929	271,832	311,030
Depreciation	156,698	176,154	182,017
Net profits*	552,858	1,167,736	1,703,306
Preference dividend	225,000	225,000	225,000
Ordinary shares:—			
Earnings	327,858	942,736	1,478,306
Paid	200,000	340,350	894,375
Earnings (%)	16.4†	41.5†	74.4
Paid (%)	10†	15†	45
Reserves	150,000	600,000	550,000†
Carried forward	236,145	238,531	272,462

Ordinary capital..... 2,000,000 2,269,000 2,650,000
 * Including other income, after charging taxation and staff funds.
 † £500,000 reserve fund and £50,000 for staff pensions reserve.
 ‡ Tax Free.

The latest profits must, in the directors' words, be considered eminently satisfactory. They are accompanied, moreover, by a consolidated balance sheet which exhibits massive strength. Out of total assets amounting to £14,109,430, current assets represent no less than £9,947,193, and of the latter sum cash stands at over £2,500,000, and Government and other securities at nearly £4,250,000. Against these totals, such amounts as £1,296,327 for trade creditors, £362,187 for income tax and the final dividend of £894,375 are almost trivial. The consolidated and legal balance sheets and the profit and loss account adopt the sensible practice of showing the effect of the directors' proposed appropriation of profits. On the prospect for the current year the report is silent. The recent feeling in the motor industry

reveals some concern at the rise in costs of materials and labour, reflected in the case of some manufacturers by a slight upward revision of prices for their new models. It seems at least reasonable to suppose that even the Morris undertaking may find it more difficult to match the past year's increase of profits under prevailing conditions, and on this assumption the present price of 39s. 1½d. and the yield of £6 2s. for the 5s. ordinary stock units appears justified.

Union Castle Report.—Although Union Castle ordinary stock is not at present publicly dealt in, the accounts are, of course, of peculiar interest to the shareholders in both R.M. and E.D. Realisation, who between them hold nearly all the ordinary stock. It so happens that each 100 shares of the Realisation companies represent roughly £127 ordinary stock in Union Castle. Under the 1936 settlement of the dispute on the question of voting rights between Union Castle ordinary and preference shareholders, the former undertook to secure a wide distribution of the ordinary stock among the general public, i.e. not to sell existing blocks held by the Realisation companies in such a way as to transfer control to any other group. It is generally assumed that the method for carrying this undertaking into effect will be the ultimate distribution in specie of the Union Castle stock now held by the Realisation companies among their shareholders. The process of realising the respective R.M. and E.D. positions has now achieved an advanced stage and it may well be that the present Union Castle report will be the last before the actual split-up occurs. It shows an increased profit on voyages of £473,450—an advance of £122,331 or nearly 35 per cent. over 1935. The net profit, after provision for tax amounts to £435,828 (an increase of £105,913 on the year) which represents earnings of 14.7 per cent. on the ordinary capital after allowing for a normal year's preference dividend.

The Board hopes that the final stage of clearing up the preference arrears will be accomplished out of profits for the current year. The balance sheet has also been put into thoroughly sound shape by utilising £1,290,323 of available reserves to write down investments. A special depreciation provision of £200,000 is made out of income in respect of vessels being re-engined, in addition to the provision of normal depreciation, calculated at the customary rate of 5 per cent. The decks are thus almost cleared for resumption of ordinary dividends, but the Board, evidently desiring to check undue optimism, warn shareholders of the heavy commitments in respect of the shipbuilding and re-engining programme. This will involve annual payments in future years which may have to be dealt with on a more permanent basis. Having regard to the conservative financial policy, the strong balance sheet position and upward secular trend of earnings, the units are likely to be a popular market when introduced on the Stock Exchange.

American Railroads' Recovery.—The New York Central Railroad in 1936 made the biggest advance in gross revenue since the period of recovery began, receipts being within hailing distance of those earned in the 'twenties. Total revenue of \$361 millions compared with \$310 millions for 1935, and despite the inevitable rise in expenses, a net profit of \$8,933,000 resulted, against a mere \$115,000. Thus although no dividends are being paid, \$1.79 per share has been earned. Considerable attention has been given to the improvement of equipment. Over half the increase in operating expenses is due to maintenance, while the profit and loss account has been debited with no less than \$14 millions for the writing-off of properties and equipment—this for the writing-off of properties and equipment—this sum considerably exceeding the largest amount so applied in any of the last ten years. The Pennsylvania Railroad is another undertaking which has enjoyed substantial recovery. Its total operating revenue of \$441 millions is 20 per cent. higher, though compared with

pre-depression years results are still considered sub-normal. The distribution of \$1 per share in respect of 1936 is unchanged, but the available earnings have risen from \$1.81 to \$2.94 per share. On this system also large sums have been spent on the retirement of property, though the \$25 millions debited includes expenses arising from flood damage. Traffics for both railway systems for the early months of 1937 shows marked improvement over those of 1936.

Babcock and Wilcox Recovery.—This company's efforts to restore normal profit levels are meeting with success, although the earnings of ten years ago are not yet restored. The improvement of 18 per cent. in trading profits for the latest year, however, is a very satisfactory achievement, and it results from a growing volume of trade at home and abroad. Ordinary shareholders at once benefit by an addition of 2 per cent. to their dividend, but almost the whole excess of earnings over the higher distribution is again retained for their future benefit in the dividend equalisation fund.

	1934	1935	1936

† After bringing in from Income Tax Account, £29,561 in 1934, and £3,406 in 1935.

The company's fame as boiler and marine engineering specialists is world-wide. Yet its wide interests justify the directors' reference to the need for a conservative distribution policy in view of the prevailing international trade situation. Despite the recovery in profits since 1933, the company has not been treated by the market as an obvious target for N.D.C., for the shares have fallen only from 49s. to 47s. The balance sheet shows its customary financial strength. Securities represent nearly 30 per cent. of the total assets, but their level of £2,316,308 is appreciably higher than the 1935 figure of £1,606,264. On the other hand, cash and shares in other companies have fallen. Though under the present trend of prices stock valuations provide only a rough indication of the volume of trade, the rise in stock from £915,266 to £1,203,029 is of some importance. At the present price the ordinary shares yield £4 5s. 3d.

Boomlet in Tea.—With most commodities temporarily in eclipse and some still undergoing the ordeal of the speculative "shake-out," tea has come more prominently to the fore in the past few weeks. Although tea shares have been unable to withstand this week's panic in the markets, losses have by no means wiped out all recent gains. A minor boomlet at the Mincing Lane auctions has carried average prices up by fully 2d. a lb. since the beginning of March, while, even more significantly, quotations for all grades are now 2½d. a lb. higher than the corresponding figure last year. Genuine trade demand is entirely responsible for the advance; there has been no incursion of outside speculators in search of untapped opportunities. This demand has been accompanied by an exceptionally big reduction in London warehouse stocks of tea. Between February

and March alone, stocks fell by over 28,000,000 lbs. to a total of 161,065,000 lbs., compared with 231,978,000 lbs. a year ago. This reduction can only be due either to an increase in consumers' demand or to a substantial accumulation of hidden reserves in the hands of distributors. In this country, part of the increased buying was almost certainly carried out in anticipation of the Budget. Merchants abroad may also have safeguarded their supplies of a commodity which, almost alone, has so far shown little disposition to follow the general trend.

* * *

If this explanation serves for the rise in prices, the future must be viewed with considerable caution. Some setback, of possibly substantial dimensions, may conceivably occur as soon as distributors' requirements have been satisfied. Though it seems fair to assume that a moderate increase in consumers' demand is taking place and that some part of the advance will be held, investors should be slow to base their valuation of tea company prospects on current tea prices alone. Any advance in demand for tea is likely to be extremely gradual. More significant from the long-term standpoint is the readiness with which higher prices evoke larger supplies. The potent forces of Japan, China and Formosa still remain outside the restriction scheme. In general, therefore, though the outlook for tea companies has undoubtedly improved, an advance in profits comparable with that of some other commodity groups appears improbable. Moreover, the prospective gains are likely to be somewhat unevenly distributed. In periods of rising prices the gap between common and high-grade teas tends to narrow. On the current showing, low-grade producers will probably enjoy a larger relative improvement in profits than producers of finer quality teas. Companies in the low and low-medium categories, such as Chubwa, Chulsa, Deundi, Brahmapootra in India, and Sumatra Tea and Tjiwangie in the Dutch East Indies appear, on this reckoning, to offer the more attractive possibilities.

* * *

Rand Leases.—The Rand Leases report for 1936, writes our mining correspondent, is of special interest, since it covers the first period of productive operations. Milling commenced in the middle of April, apparently without any difficulty. The output expanded progressively until in December it reached 71,000 tons. Costs, naturally, were somewhat high at 23s. although this figure includes 5s. 4d. per ton on account of development expenditure. After allowing for debenture interest and expenses, and taking into account sundry revenue, a balance of £107,200 remained. Of this sum, £75,000 was absorbed in payment of a maiden dividend of 5 per cent. The Union Government's share of the profits amounted to £8,000 leaving £24,200 to be carried forward. The fully-developed ore reserves amount to 3,041,000 tons—an increase of 581,000 tons on the year—averaging 4.8 dwts. over a stoping width of 43 inches. The quotation of the ros. shares at 37s. 6d., although well below the recent best seems to discount the prospect of increased profits.

* * *

Selection Trust.—Although the greater part of the increase in profits from £119,050 to £434,400 was due to realisation of investments, the Selection Trust holdings in Consolidated African Selection Trust, Roan Antelope and Trepeca yielded a larger revenue. The past year, of course, was favourable for market transactions in base metal and diamond shares. Quoted investments appear at £2,733,170, compared with £2,867,660 on December 31, 1935, and their market valuation considerably exceeded the balance sheet figure. In addition to its holdings in the above concerns already named, the Trust has a substantial interest in the American Metal Company, through which it obtains an indirect interest in several Northern Rhodesian copper concerns, as well as in numerous base metal mines, treatment and

marketing undertakings in North America. This concern has now overtaken its preference dividend arrears and should make distributions on its ordinary capital in the fairly near future. On the basis of last year's dividend of 1s. 6d., Selection Trust 5s. shares at 31s. yield approximately 4½ per cent.

* * *

Other Company Results.—Our usual analysis of profit and loss accounts appears on page 316, while on page 314 the results are discussed under the heading "Shorter Company Comments." The reports, which continue to be numerous, again include a large number of industrial and rubber companies.

* * *

Company Meetings of the Week.—On later pages of this issue will be found the reports of the following company meetings:—San Paulo (Brazilian) Railway, Imperial Chemical Industries, Barry and Staines Linoleum, Army and Navy Stores, Bignells, Oxendale and Company (Proprietors), General Accident Fire and Life Assurance, London Assurance, Royal London Mutual Insurance, Scottish Union and National Insurance, Anglo-American Debenture Corporation, Rio Tinto Company, Oriental Telephone and Electric Company, and Nirmala (Java) Plantations and Lands. At the San Paulo (Brazilian) Railway meeting the chairman pointed out that gross receipts, goods tonnage, and the number of passengers carried, all created a record in the company's history. Lord McGowan's address to Imperial Chemical Industries stockholders is discussed in a Note on page 292. It was explained by Brigadier-General Sir Frederick Gascoigne at the Army and Navy Stores meeting that the increased profit was due not only to a greater turnover, but also largely to economies. At the statutory meeting of Bignells, Limited, Mr Arthur J. Bignell expressed satisfaction, in view of rising commodity prices, that forward contracts covered raw material requirements up to August, 1938. Contracts had been received to keep the business fully occupied until that time. The chairman of Oxendale and Company (Proprietors), Ltd., disclosed to shareholders that a deferred dividend might be declared shortly. Sir Francis Norie-Miller, addressing General Accident Fire and Life Assurance Corporation shareholders, was able to report that, in spite of the fall in money values, interest earnings had once more increased substantially. At the London Assurance meeting the Governor referred to underwriting problems in the accident department, due to increasing claims and legislation in connection with motor insurance and workmen's compensation. Mr J. K. Wiseman told his hearers at the Royal London Mutual Insurance Society meeting that new business in the ordinary life branch had been a record, exceeding £6,000,000 for the first time. At the Scottish Union and National Insurance Company meeting Mr James L. Mounsey drew attention to the satisfactory fire account statement. Premiums were less than in 1935, but claims had likewise fallen in amount. Sir A. Henry MacMahon explained to Oriental Telephone and Electric Company shareholders the obstacle to development that existed in present methods of charging in Singapore. The chairman of Nirmala (Java) Plantations and Lands Company pointed out at the annual meeting that the average selling price for tea was 10½d. London equivalent, and for rubber 8d.—this being better than the average in London for the year. Sir Auckland Geddes, reviewing for Rio Tinto stockholders the company's manifold difficulties, estimated that the war in Spain had cost them a quarter of a million pounds and perhaps more. Mr Richard Guinness pointed out to Anglo-American Debenture Corporation shareholders, that the usual estimates made for the coming year suggested that the 12 per cent. dividend could be maintained. Speaking of rising costs, Mr William Sutton, at the Barry and Staines Linoleum meeting mentioned that apart from higher raw material prices, a wage increase had been given in the last 12 months, and another was being asked for.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: MAY 4

ACCOUNT: MAY 6

THE market collapse of the past week almost suggests that the Chancellor proposed to tax away all profits for evermore. That the Stock Exchange should have reacted so violently to a proposal to collect some £2 millions in the present year and £20 millions in a full year indicates that the technical condition of the market was already dangerously weak. To talk of a parallel with 1929 conditions, and of the danger of general depression, indicates hysteria rather than reason. But the violent movements of the past week reflect an extremely weak speculative position which will take a considerable time to mend.

Gilt-edged securities were steady early in the week and held their own immediately after announcement of the new defence loan, but prices became weaker later, particularly for undated issues. Greater stability returned on the Chancellor's willingness to consider modifications to N.D.C. India stocks and Dominion issues were steady, except for further speculative selling of New Zealand issues. Foreign bonds, including European, Japanese and South American issues, were generally lower throughout the week. Talk of higher freight and passenger rates stimulated home rails early in the week, but dullness developed later, despite satisfactory traffics. Argentine rails were depressed throughout.

The break in the markets, therefore, has been largely concentrated on the industrial and speculative mining sections. Equity prices have crumbled under the pressure of forced liquidation, and although the markets found a rallying point in Mr Chamberlain's promise to revise the basis of N.D.C., the widening circle of selling has since produced extreme conditions. Dealing conditions have at times been almost impossible, and in leading industrials it has not been uncommon to find shares quoted with a half-crown turn, or "sellers only." Rumours of further market difficulty both in London and Paris have added to the extreme uncertainty, and there has been little sign of the supporting orders which normally accompany a setback of more modest dimensions. Heavy selling of leading international counters has added to London's

discomfiture, and the prevailing condition of the markets is one of extreme depression and no inconsiderable fear of what next week's settlement may bring.

Steel shares opened weak, and falls of 2s. 6d. in Dorman Long and 1s. 6d. in Vickers were immediately recorded. Prices moved uncertainly on Tuesday, closing with a small recovery, but renewed weakness developed on Wednesday and for a time on Thursday. The appearance of small bargain hunting orders, however, gave a slightly firmer impression at the close. Sharp falls were recorded in the motor group. Standard again proved vulnerable to selling, and after considerable fluctuations closed as low as 6½ in mid-week. Among the many nominal quotations, that of Rolls-Royce showed a fall of 6s. 3d. on Monday to 106s. 3d., although the volume of business was extremely small. Wide movements were reported in Bristol Aeroplane, but the remaining shares did not enjoy much attention.

An erratic feature in the brewery market was Distillers, which rose and fell by shillings at a time, and closed on Thursday at 111s., after being as low as 107s. An attempt to support brewery shares met with little success, and as the general market situation deteriorated, the leading tobacco shares met with selling. The stores group, however, enjoyed some support after the first impact of Monday's selling. Marks and Spencer and Woolworth leading a moderate mid-week rally. Shipping shares met with the full brunt of liquidation, and the absence of a P. and O. interim dividend proved the signal for further selling.

Among the miscellaneous leaders, Murex, British Oxygen and Turner and Newall have at times rivalled the erratic movements of mining counters. Even Imperial Chemical Industries, which had hitherto resisted the worst effects of the weakness, closed with an altogether unusual loss of 1s. 6d. on Wednesday. Conversely, Salt Union provided one of the few bright features of the week on the terms of acquisition by I.C.I.

Prices moved erratically downward in the oil share market, a temporary improvement succeeding the rise in petrol prices and the higher mid-week prices for leading American stocks, but heavy selling on Continental account increased London's depression. Rubber shares suffered with the rest of the markets, and the fall was emphasised by the weak commodity price. Tea shares were dull without any large amount of business.

The Kaffir market was most gloomy, for it has its own

GOLDEN MOMENTS

The Cup Final

Just on time he takes the ball in his stride and slams it into the net—the winning goal. What a Golden Moment for him as he receives the coveted Cup. But even he cannot buy a better tobacco than "Cut Golden Bar" at a shilling an ounce. But it must be Wills's.

WILLS'S

CUT GOLDEN BAR

READY RUBBED

In 2 oz. Pocket Vacuum Tins and 1 oz. Airtight Tins

FLAKE FORM

In 2 oz. Vacuum Tins and 1 oz. Packets

1½ AN OUNCE

Issued by the Imperial Tobacco Co. (of Great Britain and Ireland), Ltd.

special difficulties which, it is feared, may develop at the settlement. The latter, in any event, will involve some very wide differences. Shares which were most affected were those in which a heavy speculative position had been built up; West Witwatersrand in particular broke badly. Finance, development and operating shares were none of them spared. West Africans attracted a little support after opened weakness, but they were not able to withstand for long the general trend. Rhodesian copper issues were subjected to wide fluctuations and remained dull, although not so badly depressed as the other mining markets. Tin shares were weaker in limited trading.

OVERSEAS STOCK EXCHANGES NEW YORK

VERY nervous conditions have prevailed during the past week, and the general level of share prices has slumped badly. The fall of last week-end was continued when business opened on Monday, with all groups affected. Steel, railroad and copper issues were particularly weak. Away from Wall Street business reports were all favourable, but in the Street there were exaggerated fears of a business recession during the summer. The condition of the London market was a major influence in depressing prices, and there was renewed talk of action by the Washington administration to lower the price of gold. This has been steadily denied officially and unofficially,

but Wall Street does not easily give up its fears. Tuesday saw a sizable recovery, and many who had sold short were reported to be pinched. Steel shares were in the lead, followed by oils and rails. In mid-week there was renewed slump of considerable dimensions, with U.S. Steel particularly heavy. Additional cause for nervousness was found in the desire of the Attorney-General to revive the anti-trust laws. Later in the week prices recovered from their worst levels. Business reports are good; floods have affected steel mills in the Pittsburgh area, but *Iron Age* estimates activity at 90.5 per cent. of capacity against 92 per cent. for last week. Electricity output for the week of April 24th was 14.3 per cent. up on last year.

PARIS

THE Bourse has passed an agitated month which saw—as was the case on other Exchanges—a substantial decline over the whole period. It was preoccupied, in turn, with a deteriorating political situation at home, a sharp break in the franc, a difficult technical position and the depressing influences of both Wall Street and London. April opened with some uneasiness concerning domestic politics, and rumours about a change in the price of gold, but apart from this, and largely for technical reasons, prices crumbled in a steady stream of selling. The second week was dull or irregular, but improvement in the franc exchange was a cheering influence later on. A marked rise in Rentes just before the reassembly of the Chamber immediately following a difficult account caused some comment, but only a few days later a setback in Wall Street and deep gloom in London adversely affected Paris, which ended the month under the shadow of a market failure.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields on fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

PUBLIC OFFERS

2½ per cent. National Defence Bonds.—Issue of £100,000,000 at 99½. A trustee stock. Bearer or registered bonds. Redeemable at par by annual drawings of 20 per cent. commencing September 15, 1944. Commission of 1s. 3d. per £100. Separate prospectus for further bonds (multiples of £5 or over) to be issued through savings banks, etc.

Tyne Improvement Commission.—Issue at 99½ of £500,000 Tyne Improvement 3½ per cent. stock, 1957. Redeemable at par 1957. Ranks *pari passu* with other loans. Net revenue after charges and loan debt management: 1934, £102,530; 1935, £92,746; 1936, £96,877. Proceeds to purchase Tyne Dock from L.N.E.R.

Fison, Packard and Prentice, Ltd.—Issue of 500,000 5 per cent. 2nd cumulative £1 preference shares at 20s. 6d. Chemical manufacturers. Owns fertiliser factories and has interests in subsidiaries and associated companies. Profits, after interest and depreciation, years to June 30: 1934, £93,941; 1935, £99,023; 1936, £113,282. Net assets, after deducting debentures, £1,035,009. Company and Imperial Smelting Corporation guarantee capital and dividend of 500,000 4½ per cent. £1 preference shares in National Fertilisers, Ltd. Company purchases interests in Anglo-Continental Guano Works for £580,976.

Dufay-Chromex, Ltd.—Issue at par of 180,000 6 per cent. cum. participating first £1 preference shares and 360,000 5s. ordinary shares. Acquires share capitals of Dufaycolor, Ltd., Chromex, Ltd. (incorporated in Canada), Dufaycolor Corporation, and Spicer-Dufay (British), Ltd., and \$1,465,180 Chromex, Ltd., debentures. Purchase consideration £676,993, payable by 75,000 6 per cent. second preference and 2,407,972 ordinary shares. 312 patents; development assisted in Great Britain by Ilford, Ltd. Assets, excluding stock, patents, etc., valued at £248,680.

Oddenino's Hotel and Restaurant.—Issue of 50,000 5½ per cent. cum. £1 preference shares at par and 50,000 5s. ordinary shares at 6s. Premises valued at £247,460 under 80-year Crown lease from 1926; subject to £160,000 mortgage at 4½ per cent., with collateral of floating charge debenture. Net assets (after deducting mortgage, etc.), £116,673, purchased for £94,500, payable by 149,600 ordinary shares and £57,100 unsecured loan stock repayable from proceeds. Profits, after depreciation and repairs before interest or s.f. premium: 1934, £14,289; 1935, £17,687; 1936, £17,283. Manager receives 5 per cent. or 6 per cent. of net profits. Lists closed 9.5 a.m., April 29th. Oversubscribed.

BY OFFER FOR SALE

Wm. Timpson, Ltd.—Offer for sale of 400,000 5s. ordinary shares at 15s. Bootmakers and retailers; founded 1865. Net assets, £959,141 (stock, £488,908). Profits, after depreciation:

1934, £116,166; 1935, £128,217; 1936, £152,879. Rossall Investment Company pay expenses for 3½d. commission. (Manchester Stock Exchange.)

BY STOCK EXCHANGE INTRODUCTION

Shelvoke and Drewry, Ltd.—Issued capital 500,000 5s. ordinary shares. Acquires from July 31, 1936, business of manufacturing municipal refuse collection vehicles, etc. Total assets, £135,808, purchased for £86,250 (payable by 345,000 shares) and discharge of £45,819 liabilities. Profits, before depreciation, years to July 31, 1934: £10,651; 1935, £16,626; 1936, £17,875. Messrs. Dolphin, Son and Fisher take 154,993 5s. shares at 5s. 3-84d. net.

Cockburn Trust, Ltd.—Issued capital 175,000 £1 ordinary shares and 1,000 £1 management shares. Investment and Trust Company. Total assets, £235,833. (Investments, £189,879). Profit and loss account: £14,206 from general reserve, £13,353 from revenue account; to balance sheet, £13,946. Ordinary dividends: 1936, 8 per cent. Application of profits: 6 per cent. to ordinary, 10 per cent. of balance to management shares, rest to ordinary shares or as company may determine.

Ramsgate Olympia, Ltd.—Issued capital 500,000 2s. ordinary shares. Amusement caterers since 1933. Acquires certain assets from Thanet Amusements, Ltd. Net assets £35,243; combined profits after depreciation, years to September 30: 1935, £7,524; 1936, £9,020. Purchase price for "Arcadia," £15,000, Leasehold property at Ramsgate charged.

BONUS ISSUES

Mufulira Copper Mines.—It is proposed to capitalise £2,134,910, part of credit on shares premium account, and to issue 2,134,910 £1 shares in proportion of five shares for two held.

ISSUES TO SHAREHOLDERS ONLY

Van Dyk Consolidated Mines, Ltd.—Issue of 290,998 10s. shares at par. (Seven new shares for one hundred held.)

Cow and Gate, Ltd.—Issue of a further 1,980,000 1s. ordinary shares at par to holders on April 5th (one new for every three held.)

Gopeng (Perak) Rubber.—Issue of 396,000 2s. shares at 2s. 4½d., to holders on April 14th (one new for every five held.)

Mill Close Mines.—Issue of 73,640 10s. shares at 15s. to holders, April 15th (two for every nine held.)

Murcheson Gold Development.—Issue of £145,000 10 per cent. 5 year notes at par. Redeemable at par on June 30, 1942, or at 110 after June 30, 1939, at three months' notice. Also convertible into shares at par at noteholders' option, to June 30, 1942.

East Kent Road Car.—Issue of 100,000 £1 ordinary shares at par.

A. Reyrolle and Company.—Issue of 195,000 £1 ordinary shares at 25s. to holders on April 12th (one for every three held.)

Joshua Hoyle and Sons.—Issue of 4,000,000 2s. shares at 3s. each, in proportion of four for every one 7 per cent. preference share held, and 1,000,000 2s. shares at 3s. each at the rate of one for every ordinary held.

OIL OUTPUTS

ANGLO-IRANIAN OIL COMPANY, LTD.—Production in Iran for the month of December, 1936, amounted to 709,000 tons. The total production for the year ending December 31, 1936, is 8,198,119 tons. Production in Iran for the month of January amounted to 750,000 tons; for the month of February 631,000 tons, making a total of 1,381,000 tons for the first two months of 1937.

ATTOCK OIL COMPANY, LTD.—Production for March, 8,935 barrels.

THE BRITISH BURMAH PETROLEUM COMPANY, LTD.—A cablegram has been received from Burma reporting the production of crude oil by this company as 43,729 barrels for the month of March, 1937.

BRITISH CONTROLLED OILFIELDS, LTD.—Production for the week ended March 20, 1937: 15,741 barrels. March 27, 1937: 15,363 barrels. April 3, 1937: 15,655 barrels. Production for March, 69,487 barrels; deliveries for March, 54,158 barrels. Production for week ended April 10th, 16,107 barrels; April 17th, 15,427 barrels.

COMPANY MEETINGS

IMPERIAL CHEMICAL INDUSTRIES, LIMITED

EXPANSION OF PROFITS AND ACTIVITIES

LORD MCGOWAN ON THE OUTLOOK

The tenth annual general meeting of Imperial Chemical Industries, Limited, was held, on the 29th ultimo, at the Queen's Hall, Langham Place, London.

The Rt. Hon. Lord McGowan, K.B.E., D.C.L., LL.D. (chairman and managing director), in the course of his speech, said:—

The 7th December, 1936, marked the tenth anniversary of the formation of Imperial Chemical Industries Limited, and the completion of our first decade appears to me an appropriate moment for reflecting on what we set out to do and what we have accomplished.

There is little need to remind you that your company was formed by merging the interests of the British Dyestuffs Corporation Limited, Messrs Brunner Mond and Company Limited, Nobel Industries Limited and the United Alkali Company Limited, each of them companies with an established reputation running back, through their subsidiaries, for nearly a century. Since that time we have gathered to ourselves some forty other companies of varying magnitude and interest, engaged in cognate industries.

Perhaps the most difficult task which faced us in the beginning was that of welding into one harmonious whole the variegated structures and organisations of these companies, and that of reconciling interests of a very large number of individuals of all ranks. In this task, not only I, as your chairman, but, I honestly believe, every member in the organisation, can say that we have fully achieved our aims. To-day, I.C.I., at home and abroad, in every aspect of its many-sided activities, is not a collection of different units, but one organised whole.

RETURN TO REASONABLE PROSPERITY

We have passed in this ten years through the depths of the greatest industrial and agricultural depression known in modern economic history, but have now, in common with the general industries of the country, returned to the level of reasonable prosperity at which we began. At no time did we fail to pay dividends out of profits. The average rate paid on the ordinary stock amounts to 7.2 per cent. per annum, and even at the lowest depth of the depression we were able to pay not less than 4½ per cent.

We have consistently maintained a policy of intensive research, directed to the improvement of existing processes, the discovery of fresh uses for existing products, and the development of new processes and products. Our total expenditure for this purpose has been no less than £6,000,000. We have continuously studied and pursued the policy of rationalisation and concentration which we originally set before us. During the ten years we have closed 38 factories and spent some £7,000,000 on concentration schemes.

LABOUR POLICY FOUNDED ON FRIENDSHIP

We have steadily followed a labour policy founded on friendship, and our appreciation of the valuable part played by our workers through every section of our organisation. Our general relations with the various trade unions have been excellent, and a number of your directors meet their leaders from time to time on our Trade Union Advisory Council.

Annual and statutory holidays with pay, Territorial leave on a generous basis, awards for long service, payment for valuable works suggestions and the establishment of a staff grade of workers are clear evidence of our policy. We have provided medical and dental services as well as recreation facilities at our principal works, where sports and games and social functions are encouraged. The cost of these provisions may, indeed, be measured in money, but the return received in loyal service, in health and zeal, to say nothing of less absence from work, is ample reward. I may add that in this country alone the total number of our workers has grown from 32,000 to 43,000, and our staff from 10,000 to nearly 13,000.

THE BILLINGHAM PETROL PLANT

Of the general progress of our ten manufacturing groups there is ample evidence in the annual report, and there is little for me to add. I want, however, to say something more in regard to the petrol plant at Billingham.

When we started this enterprise and planned an annual production of 100,000 tons of petrol from the hydrogenation of coal and 50,000 tons from tar oils, we knew that, particularly with regard to coal, we were pioneering a new technical field and that we were therefore incurring all the attendant risks of such a step.

It was for this reason that we were not willing to invest some £3,000,000 of new money until we had the assurance provided by the British Hydrocarbon Oils Production Act, 1934, of a continuance, within stated limits, of the protection afforded to home production by a Customs Duty on imported oil with no inland Excise Duty. It seems to be thought in some quarters that this Act of Parliament provides the company with a subsidy of £1½ million per annum, that amount being calculated by applying the Customs Duty of £10 a ton to our planned production of 150,000 tons per annum. I need hardly assure you that our petrol production is more subsidised by the existence of an Import Duty on petrol than the steel industry is subsidised by the existence of an Import Duty on steel ingots and castings. In other words, if we are to regard this enterprise as subsidised to the extent of £1½ million a year, then I calculate that steel production was subsidised in 1935 to the extent of some £30 millions. This carries its own conclusion.

Questions are also continually put in the House of Commons asking whether this enterprise has been a commercial success and implying that the company is under some obligation to the Government to supply detailed particulars of the financial results to date. There is no more warrant for this expectation than there would be for a similar demand on any manufacturer of any other product in this country which has the protection of a Customs Duty.

STEADY IMPROVEMENT IN OPERATION

For general commercial reasons it is not the practice of the company to disclose the financial results of any particular activity. All that I can say, therefore, in regard to the hydrogenation plant is that up to date it has not shown results which would justify its description as a good commercial proposition even with the advantage of the existing Customs Duty, and without that protection, of course, the enterprise would be uneconomic. These results are explained by the fact that we are in the early stage of a new industry, the first of its kind, not only in this country but in the world, in which we have met with more difficulties than we anticipated. That was one of the risks we knew we ran. Nevertheless, we have overcome first one trouble and then another, so that throughout last year there was a steady improvement in the working of the plant, while the personnel has become thoroughly familiar with the intricacies of the process.

We are still convinced that we took a right decision when we embarked on this enterprise and, notwithstanding the great publicity recently given to alternative methods, we are satisfied that the hydrogenation system is the best technical and commercial process for the conversion, without creating by-products, of coal into motor spirit. Moreover, it is developing an entirely new field of the chemical industry from which we are already deriving ancillary benefits of considerable value.

Visits abroad by your directors have been more extensive than usual. As you may know, I believe greatly in the exchange of visits on the part of business men and industrial leaders. It is only by such personal contacts that we can appreciate each other's point of view, and perceive the trends of rapidly changing economic conditions. Our staff abroad is also stimulated by discussions on the spot.

Correspondence is not always as convincing as it is intended to be, and while the Press does its best to keep us *au fait* with what is going on in our respective countries, its efforts need to be supplemented. Unfortunately we are a long distance from each other, but with the development of flying the time taken over these visits will become less as the years pass. Closer contacts are all to the good of our great Empire.

VISIT TO AUSTRALIA AND NEW ZEALAND

I have only just returned from an extended visit to Australia and New Zealand. Our subsidiary company, Imperial Chemical

Industries of Australia and New Zealand, is making excellent progress. Australia is one of the few countries which handled the difficulties of the depression in an ordered manner. The last few years have shown a striking recovery, in which our company there has shared.

It has a wide range of interests, in explosives, alkali, leather-cloth, ammonia, fertilisers, metals and ammunition. Our policy there, as elsewhere, is to co-operate with other large industrial interests. Recently we were asked by the Commonwealth Government to help in Australian defence, which we felt bound to do in view of our large interests there. Imperial Chemical Industries of Australia and New Zealand has accordingly participated in a new company, called the Commonwealth Aircraft Corporation Proprietary, Limited. With a capital of £600,000 it intends to carry out the complete design and production of aircraft at a factory in Melbourne where the employment of some 600 skilled workers is expected. The other partners in this enterprise are Broken Hill Proprietary, Broken Hill Associated Smelters and General Motors-Holdens, Limited. A preliminary order for forty aeroplanes has already been placed with the corporation by the Federal Government. There is also a keen interest in the production of oil from coal.

PROFITS AND ALLOCATIONS

I am glad to say that the company's net profits show a further moderate increase of £497,000, or 7 per cent., after providing £1,000,000 for the central obsolescence and depreciation fund and the necessary amount for the company's income tax. The board have appropriated £1,500,000 to the general reserve, and have also this year put aside another £150,000 for the workers' pension fund. This leaves £5,553,000 which, with the £639,000 brought forward from last year, makes a total of £6,192,000 available for dividend and carry-forward. The preference dividend of £1,591,000 was paid on the due dates, leaving a balance of £4,601,000.

Following the reorganisation of the company's capital, which now consists of preference and ordinary stock only, the dividend policy of the company has become simplified. Out of the balance stated above the board recommend a final dividend of 5½ per cent. on the ordinary stock, which, with the 2½ per cent. interim dividend already paid, makes a total dividend for the year of 8 per cent. on that stock. The ordinary dividend requires a sum of £3,936,000, which will leave £665,000 to be carried forward to 1937.

The increase in the year's net income corresponds almost exactly to the additional appropriation to the general reserve. In taking this course, the board are continuing their conservative financial policy. The present time of prosperity cannot be permanent, and we shall in time face a diminishing volume of business. Therefore it is essential that industrial corporations should take advantage of existing good conditions to put their house in order; that they should, out of to-day's surplus earnings, equip themselves with the most up-to-date plant procurable, so that they shall have the lowest operating cost possible. They will then continue to be competitive with the rest of the world.

BALANCE SHEET

As stated in the annual report, the litigation in regard to the company's capital reorganisation scheme came to an end in the middle of November last by the decision of the House of Lords to dismiss the final appeal of the committee representing certain deferred stockholders. The scheme was formally brought into effect as stated in the annual report, by the withdrawal of the Stock Exchange quotation of deferred stock, and by the payment to the former deferred stockholders of the suspended dividends on the new ordinary stock issued in exchange for the former deferred stock.

At December 31, 1935, the board carried the amount of £5,434,000 by which the company's capital was reduced to the capital reserve, in accordance with the resolutions passed at the extraordinary general meeting on May 1, 1935, pending the subsequent decision of the board in regard to this sum when the final result of the company's petition was known. During the hearing in the House of Lords and in the Lower Courts, apprehension was expressed by counsel for the opposing deferred stockholders in regard to the possible distribution of this sum by way of a bonus issue of shares, the major part of which would inure to the benefit of the ordinary stockholders.

WRITING DOWN OF ASSETS AND INVESTMENTS

While the board have always disclaimed any intention to use this sum in such a manner, the resolutions passed at the extraordinary general meeting referred to were wide enough to permit

of that course. To put this issue beyond further dispute, the board have decided, after making their usual annual review of the values of the company's plants and other assets held through the wholly-owned subsidiary companies, to apply it, together with further sums drawn from the company's reserves, to writing down fixed assets and investments as represented by shares and debentures in and advances to subsidiary companies. The total amount to be so written off is £6,934,000, of which £5,434,000 has been provided by the reduction in capital, £500,000 by the free reserve, and £1,000,000 by the Central Obsolescence and depreciation fund.

These heavy writings off have been applied in the main to the value of works at home concerned with the production of nitrogen, petrol, etc., and abroad to dealing with the present decline of our business in Spain and Palestine, and our foreign merchanting companies as a whole, as a result of currency depreciation and competition.

STAFF AND LABOUR RELATIONS

The new pension scheme was explained to the workers by their representatives on the Works Councils, and each was asked to indicate if he or she were willing to become a member if such a scheme were inaugurated. Your board were, of course, already aware that a large number of the workers desired the establishment of a contributory fund, and I am pleased to tell you that 99 per cent. of the eligible male workers, 86 per cent. of the eligible female workers, or overall 98 per cent. of the total made application to join the Fund. With this knowledge in their possession, the board inaugurated the fund on January 4, 1937, on a basis of joint contributions payable by the employer and the employee.

This whole-hearted acceptance demonstrates clearly that our workers share our view that an adequate scheme of pensions fittingly supplements a positive and generous labour policy. It gives a sense of security against the time when retirement from active service comes along, security which a loyal body of workers such as ours so richly deserves.

PROSPECTS FOR 1937

With the world-wide tendency to rising commodity prices upon which I have already remarked, with a policy of rearmament, and with no likelihood of any serious setback in general building activity, there seems to be no reason to anticipate any decline in 1937 in the general level of the country's activity. It does not, of course, follow that profits will show the same tendency. We have to face notable rises in the prices of our raw materials, and the increases in wages will add substantially to our costs.

The policy which I outlined to you last year was a policy of price reduction, of keeping our prices as low as possible in the belief that it would help our customers and so extend our business. In this way we have endeavoured to stand shoulder to shoulder with the industries which depend upon us for supplies, but the rising trend in the price of raw materials and the cost of wages may shortly make it necessary for us to review our present range of selling prices. While we have little doubt of the volume of home trade, we find it difficult to contemplate the situation in export markets with equal confidence. However, much as we may disapprove of economic nationalism, it is a tide we cannot stem.

These facts lead me to a cautious view of the outcome of the year 1937, but you may rest assured that as in the past the efforts of the whole organisation will lie behind the desire to meet you next year with a balance sheet and report which you will regard as satisfactory in the conditions which have appertained.

OFFER TO SALT UNION LTD.

Before I proceed to move the resolution, I must add a few words in regard to negotiations which have taken place for an offer by your company to the stockholders in the Salt Union, Limited, to acquire their stock. The formal offer was placed before the stockholders of the Salt Union in a circular letter from their board on Tuesday.

There has been a close alliance between the Salt Union and your company for a great many years, originating from agreements entered into by Brunner, Mond and Company, Limited, before the I.C.I. merger took place. This association has latterly brought the interests into closer relation, and the time has now come when, in the opinion of both boards, it would be to the interest of their stockholders to make that association permanent.

We have every hope that the Salt Union stockholders will accept the terms of exchange offered to them and that in due course this new activity will increase the strength and prosperity of your own company.

The report and accounts were unanimously adopted.

SAN PAULO (BRAZILIAN) RAILWAY COMPANY, LIMITED

RECORD FIGURES

The ordinary general meeting of The San Paulo (Brazilian) Railway Company, Limited, was held on the 28th ultimo, at Southern House, London. Mr Oliver R. H. Bury, M.I.C.E. (the chairman), presiding.

The chairman, during the course of his speech, said that the net profit was £427,000 against £287,000. The directors proposed the payment of a final dividend on the ordinary stock of 3 per cent., free of income tax, which, with the interim dividend made 5 per cent. for the year. The carry forward was £33,827, against £20,869 brought in. These results revealed a state of sustained activity for the whole period under review, receipts having also been assisted by the increase in rates which came into force on January 1, 1936. The gross receipts and the tonnage of goods, and the number of passengers carried, constituted a record in the history of the company. In passengers the increase in numbers was equal to 3.5 per cent., but the value was assisted by increased rates and a satisfactory increase in first-class passenger traffic. The goods traffic indicated the activity which had prevailed. Results of the Road Motor Company during the year had been encouraging. They had dealt with 199,000 tons of goods and carried 341,000 passengers.

They had placed orders in July last for six passenger locomotives, 12 shunting engines of a powerful type, and 300 wagons for the most part of high tonnage capacity. With the exception of five shunting engines, all had been shipped or were in course of shipment. These orders had been placed before the recent rise in prices.

With regard to the prospects for the current year, their traffic receipts to date were 39,490 contos compared with 36,508 contos for the same period last year, or in sterling £476,348, compared with £434,579. The coffee crop was estimated at 15,000,000 bags. Cotton bade fair to surpass the record year which had just closed. In short, the commercial indications led them to look for bigger movement in most of the various traffics, and it was likely that passenger traffic would continue to grow, while there was an improvement in the rate of remittances, which were coming over without any restrictions.

The report was unanimously adopted.

ANGLO-AMERICAN DEBENTURE CORPORATION, LIMITED

DIVIDEND INCREASED TO 12 PER CENT.

The forty-seventh ordinary general meeting of the Anglo-American Debenture Corporation, Limited, was held, on the 29th ultimo, at Winchester House, Old Broad Street, London.

Mr Richard S. Guinness (chairman of the company), in the course of his speech, said:—For the third successive year the gross revenue of our company has increased substantially and I am happy to say that the improvement enables your directors to recommend, for the second year, an increase of 1 per cent. in the dividend upon the issued £450,000 of ordinary stock. Over the past three years our revenue has improved in the aggregate by £17,162, and we have increased our dividend during that period from 10 per cent. to the proposed current rate of 12 per cent. I think you will agree that these results, taken in conjunction with the strength of our capital position, are very satisfactory.

The value of our investments calculated on the usual basis as at March 31st amounts to £3,036,283 and shows a surplus on the book cost of £571,731.

For the coming year we have made our usual estimates and are hopeful of maintaining the dividend at the rate of 12 per cent. to which it is now being raised. Our estimates as to revenue receipts for the current year were completed before the announcement of the proposed new taxation. Until the text of the Bill is before us in black and white and one can make reasonable calculations as to how the burden will fall, it seems unnecessary to say more than that our estimates were based on current rates of dividend on our ordinary shareholdings in British companies, and therefore it seems unreasonable to assume that our present rate of dividend should not be continued as the basis of the tax appears to be future and not existing profits.

The report was unanimously adopted.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Bouverie Street, Fleet Street, London, E.C.4.

GENERAL ACCIDENT FIRE AND LIFE ASSURANCE CORPORATION, LIMITED

FRESH RECORDS ESTABLISHED

The fifty-first annual general meeting of the General Accident Fire and Life Assurance Corporation, Limited, was held, on the 28th ultimo, at the head office, General Buildings, Perth.

Sir Francis Norie-Miller, Bt. (the chairman) paid tribute to the great work done by the late Dr William Low, of Blebo, for the corporation. Continuing, he said that the year just closed was the fiftieth year of his management of the corporation, and under those circumstances it was to him a great happiness to be able to submit for the shareholders' adoption the best statement of accounts that they had yet issued. The results had been outstandingly good in every department; the principal factor in producing those results was the work of every official of the corporation, not merely in the current year, but work that had been done during the whole of the company's fifty years' history, which had resulted in the business being so firmly established that continuing and increasing profits would undoubtedly result.

In all accounts other than life, after providing over £3,500,000 for unexpired risks and making full estimates for every outstanding claim—the amount so provided being over £3,600,000—they had a general reserve fund of £2,000,000; additional reserves in the accident and fire accounts of £450,000, and a carry forward of £643,833. In addition, the market value of their investments was in excess of the amounts entered in the books, and the reserve for depreciation of investments and adjustment of exchange, although not fully required, they thought well to maintain.

FIRE ACCOUNT

The fire account showed a very satisfactory increase in premium income at £1,049,000, and they had re-insured a large proportion of their risks following the careful lines upon which they had always worked, and their income was therefore reduced to £674,700. That account again provided a very handsome profit, namely, £135,753, or 20.12 per cent. of the premiums. Every year that account had shown exceptionally good profits.

In the accident and general account, which included all departments of business except fire, life and marine, they were beginning to reap the profits which he had more than once told the shareholders were bound to come in view of the careful underwriting of their officials in charge of those departments, both at home and abroad, especially in America.

Their marine account was beginning to make progress in income; therefore they had placed £20,000 to the credit of that account so as to build up the fund to meet unexpired risks.

Notwithstanding the fall in money values, their interest earnings had again shown a substantial increase and would, he was sure, continue to do so; they were nearly £15,000 in excess of the dividend they were paying. The increase of interest combined with the increased profits on the trading would in future be available for increasing dividends if desirable.

Their life business was transacted by the General Life Assurance Company, which company was affiliated to themselves. Last year, its hundredth year of working, had been really the best in its history.

The shareholders were, indeed, fortunate in being proprietors in a magnificent business, with an income that exceeded £10,000,000 and assets of over £18,000,000, their corporation being thus placed in the front rank of the great insurance companies of the world.

PROGRESS WELL MAINTAINED

Mr William C. Hunter, W.S., in seconding, said that he was sure that all would join with him in congratulating the chairman on being able, when celebrating his jubilee of management, to put before them so fine a report and statement of accounts.

There was one matter of hard business which, whether they liked it or not, seemed bound to obtrude itself on the attention of those who, like themselves, were largely interested in motor insurance. It was a matter of common knowledge how marked was the tendency of judges and juries greatly to increase the scale of compensation for accidents, fatal and otherwise. They were all united in deploring the dreadful frequency of road casualties, and it was right that the sufferers should be adequately compensated, but there was an undoubted tendency to assess the compensation not as between the individual held liable and the sufferer or his representative, but as between the sufferer or his representative, as an object of sympathy and the great and wealthy corporation who could well afford to pay.

The report and accounts were unanimously adopted and the dividend recommendation was approved.

THE LONDON ASSURANCE

A YEAR OF FURTHER PROGRESS

The annual general court of the London Assurance was held, on the 28th ultimo, at the offices of the corporation, 1 King William Street, London, Mr R. Olaf Hambro, the governor of the corporation presiding.

The governor, in moving the adoption of the report and accounts, said that the new life business of the corporation had amounted to £2,823,869, the new yearly premium income involved being £73,657. The premium income for the department during the year was £837,456, showing a net increase over the previous year of £73,026. The mortality experience was again favourable, the amount of actual claims to expected claims representing 89 per cent. Annuity business shows a purchase price received in excess of the previous year, and in this section also our actual experience exhibits a sound selectivity. The life fund had increased during the year by £561,164, and now stood at £9,462,193.

FIRE ACCOUNT

The fire account, with an income of £2,041,663, permitted them to transfer to profit and loss account, including interest, £229,317. In this connection he would say that the corporation and its associated companies had no direct commitments on the Spanish mainland, but a relatively substantial business in the Canary Islands, where no untoward event had taken place, and with which they need not concern themselves. It was to be hoped that the agreement among the whole body of insurers whereby war risk insurance, so far as land risk was concerned, had been entirely eliminated would form a precedent as a foundation stone for other agreements, in many matters where the body of British insurers could and should stand as one invisible entity.

ACCIDENT AND MARINE ACCOUNTS

The accident account showed a relatively substantial increase in the premium income, the total for the year being £1,318,661. The total transfer to profit and loss account, including interest, was £127,127. The underwriting problems in the accident department continued, however, to increase. Legislation either in connection with motor insurance or workmen's compensation business, coupled with increased claims experience, rendered that department one of the most difficult sections in the whole portfolio of insurance business.

The marine insurance account offered a pleasing prospect; the premium income was slightly increased by just under £1,000, the total being £647,188, and they had again been able to transfer £100,000 to the profit and loss account, including the interest item of £25,072.

PROFIT AND LOSS ACCOUNT

The profit and loss account showed a combined underwriting profit, fire, marine and accident—ignoring dividends and interest credited to the respective underwriting accounts amounting to £350,640. To that was added the total interest receipts, including the contribution of £22,500 from the life department, of £237,793. There was a small amount of £201 in respect of transfer fees, and the total including the balance forward amounted to £1,246,576. Dividends paid to the ordinary and preference shareholders showed an increase in the aggregate of £18,884, due to the recently issued 4 per cent. preference capital having ranked during the year for a full dividend. Sundry expenses not otherwise charged showed, at £62,353, a decline of approximately £7,000, and the board had made a provision of £100,000 in respect of taxation. The net result was that the balance of the profit and loss account brought in at the beginning of the year at £657,944 showed an increase in the carry forward as at the end of the year of £164,779 at £822,723.

The total assets of the corporation now stood at £19,443,038, which was an increase of £82,853 over the previous year.

From that survey members would have deduced that the corporation had experienced a successful year, and he was sure they would wish him to express to the various officials both at head office and in the branches at home and abroad, and to the directors and managements of the associated companies, and their agents, appreciation of the combined efforts which had made that excellent showing possible. It would be idle to pretend that the business of insurance was without difficulties, but in their organisation they might be confident that the energy and constant attention with which the general manager supervised every detail ensured that every possible precaution was taken to avoid the pitfalls and secure the advantages.

The report and accounts were unanimously approved, as was the recommendation of a final dividend of 5s. 6d. per share.

SCOTTISH UNION AND NATIONAL
INSURANCE COMPANY

RECORD LIFE BUSINESS

The 112th annual general meeting of this company was held, on the 28th ultimo, at Edinburgh.

Mr James L. Mounsey, W.S. (the chairman), in moving the adoption of the report and accounts for the year 1936, said:—The life premiums of nearly £822,000 are higher than ever before. In these days of rising prices and low investment rates it is important that everyone should reconsider the amount of his life assurances. Probably in the majority of cases the conclusion will be reached that enough has not been done to ensure the comfort of dependents in the event of the premature death of the breadwinner. The great advantage of life assurance over other methods of investment is that it secures at once a capital sum that could perhaps only be obtained otherwise by years of striving and saving—years that cannot be counted upon with certainty.

The net rate of interest earned on the funds in the various revenue accounts was £3 19s. 4d.

THE FIRE ACCOUNT

Turning now to the fire account, I am pleased to be able to submit to you a very satisfactory statement. It is true that the premiums are less than those of 1935 by some £13,000, but the claims, which were only 40.7 per cent. of the premiums in 1935, are lighter by nearly £10,000 in 1936, being equivalent to 40.3 per cent. of the premiums. The profit transferred to the profit and loss account is £193,667—an increase of £400 over last year's excellent profit, and the fire insurance fund of £1,399,000, being 140 per cent. of the year's premiums, provides a very comforting figure with which to close the account. The experience in connection with our business transacted by our branch in the United States has again been satisfactory.

ACCIDENT AND MARINE RESULTS

It is usual for the chairman to group the accident, employers' liability and miscellaneous accounts when submitting the results to you, but, on this occasion, I propose to deal with each account separately. The personal accident insurance account, although small—the premium income being £24,400—is of good quality, and a profit of £4,670 was transferred to the profit and loss account. The premiums received in the employers' liability insurance account amount to £56,000 and the profit transferred to the profit and loss account is £1,174. This makes a better showing than the previous year, when there was a loss of £3,300. In view of the tendency to minimise the rates obtainable from this class of business, it becomes increasingly difficult for any company to show a large margin of profit in this account.

The marine account shows an increase in the premiums of over £17,000, but the profit transferred to the profit and loss account, viz. £25,000, is less by £5,000 than the profit last year.

PROFIT AND LOSS ACCOUNT

I now turn to the profit and loss account. Interest, dividends and rents at £77,000 are approximately £2,000 less than the previous year. The profits realised total £224,500, but against this must be set the transfer of £67,000 to the miscellaneous assurance account. The net profits realised are, therefore, £157,500. It is proposed to pay the same rate of dividend as was paid last year. This will absorb £148,687, leaving a carry forward of £512,000, against £514,000 last year. The total net interest appearing in the accounts (other than life and annuity and sinking fund interest) is £143,000, which is short of the sum required to pay the dividend by only £5,700. Since the report was issued the rate of income tax has been increased to 5s. in the £, and the figures I have just referred to will require to be adjusted.

I now ask you to look at the balance sheet. The total assets of the company at £16,909,000 are nearly £104,000 greater than a year ago. I am sure that the shareholders will consider this a very satisfactory result, especially in view of the abnormally high claims paid during the year in both life and miscellaneous departments. The market value of the Stock Exchange securities as at December 31, 1936, is in the aggregate very substantially in excess of the balance sheet figures.

In conclusion, I would wish to express the directors' appreciation of the services rendered to the company by our general manager, Mr J. G. Nicoll, without whose wise control, wholehearted devotion to the interests of the company and able and energetic guidance such excellent results could not have been attained. We also highly value the good work and the loyalty of all our staff, agents and other representatives at home and abroad.

ROYAL LONDON MUTUAL
INSURANCE SOCIETY, LIMITED

ANOTHER YEAR OF SUBSTANTIAL PROGRESS

The seventy-sixth annual general meeting of this Society was held, on the 27th ultimo, in London.

Mr J. K. Wiseman, F.C.I.I., joint managing director, who presided, said: It will be seen from the society's accounts that once again the directors have the satisfaction of reporting substantial progress. The total income for the year amounted to £8,224,212—an increase of £302,326 over the previous year—and the total funds amount to £38,046,924—an increase of £2,663,205. The combined premium income of all branches amounted to £6,638,073, an increase of £259,597.

ORDINARY LIFE BRANCH

The premium income in the ordinary life branch for the year (including consideration for annuities granted) amounted to £1,733,262, representing an increase of £113,609. The new business written in this branch is a record in the history of the society. For the first time we have exceeded the £6,000,000 figure.

We regard the success in this branch with much satisfaction, and we attribute it to a large extent to the fact that we endeavour to offer to prospective assurers the form of policy best suited to their needs and circumstances.

The rate of interest earned on the ordinary branch fund has shown a fall year by year since the era of cheap money began in 1931, the net rate for last year (excluding the auxiliary life fund) being £4 3s. 8d. per cent.

Interim bonuses will continue during the current year at £2 per cent. per annum.

INDUSTRIAL LIFE BRANCH

In the industrial life branch the premium income for the year amounted to £4,833,050, which is an increase of £135,841 over the previous year. The funds of this branch at the end of the year amounted to £24,894,832, an increase of £1,610,020. Claims and surrenders paid amounted to £2,182,769.

The amount added to the fund is money put aside as a provision for future liabilities. Adding this item to the actual disbursement to policy-holders the total is £3,792,789. Thus, the actual amount paid to policy-holders during the year, plus the amount added to the fund, which provides for future payments to policy-holders—the latter amount being arrived at after taking account of interest on investments—together make up a sum equal to 78.5 per cent. of the premiums received.

The system of industrial assurance has played a great part in developing habits of thrift amongst classes which at one time saved very little. In recent years there has been a welcome tendency to effect larger assurances on the life of the breadwinner, as distinct from policies taken out with the more limited object of meeting expenses arising out of a funeral. In this way industrial assurance is becoming more and more the means of helping the family to tide over the difficult time following the loss of the weekly wage on which the maintenance of the home has depended.

BALANCE SHEET

The balance sheet shows that the assets total £38,211,169, an increase of £2,610,377 over the previous year. Stock Exchange securities represent 72.5 per cent. of the total, the remainder consisting mainly of mortgages, loans on public rates, freehold and leasehold properties, and ground rents.

The report and accounts were unanimously adopted.

OFFER TO NEW READERS

Any reader who makes his first acquaintance with this journal with this week's issue is invited to fill up the attached:

To Publisher, "The Economist Newspaper Ltd.,"
8 Boulevard Street, E.C.4.

In order to test the value of your publication I should like you to forward this to me by post for the next four weeks. If I then decide to become a subscriber, it is understood that there will be no charge for the copies thus received, but otherwise I shall be willing to pay 4s. to cover their cost.

ARMY AND NAVY STORES, LIMITED

INCREASE IN PROFITS

The annual general meeting of the Army and Navy Stores, Limited, was held, on the 28th ultimo, on the company's premises, Howick Place, Westminster, London, Brig.-Gen. Sir Frederick Gascoigne, K.C.V.O., C.M.G., D.S.O., the chairman and managing director, presiding.

The Chairman, in the course of his speech, said that the hopes he had expressed last year of a still further improvement in the results for 1936 had not been disappointed. For the third year in succession the accounts showed an improvement on the preceding year, the profit being £40,960 more than in 1935, which, in turn, had shown an increase of £19,090 over the previous year.

It was fair to remark that they had had an extra week's trading in the past year, owing to the incidence of the calendar, which naturally had had a bearing on the results, but apart from that extra week, there had been an increase in the total sales with a consequent increase in profits. He was glad to say that India had made a good contribution to those results.

The increased profit was not wholly due to increased turnover, but largely to economies in working which were now beginning to bear full fruit. During the year they had had the usual ups and downs in trade, and the extra 3d. unexpectedly imposed on the income tax last year had not helped matters.

HIGHER TAXATION

The extra 3d. added this year, bringing it to 5s. in the £, was very distressful, but, what they had not expected, was the further tax on industry which had been given the descriptive title of National Defence Contribution. It was a considerable discouragement to feel, just as they were beginning to go ahead again, that they should be faced with such a setback to the hoped-for complete recovery, but after what he would venture to describe as the illuminating speech of the Chancellor of the Exchequer in the House of Commons the day before, they might now feel no doubt that certain hoped-for concessions and modifications would receive the fullest consideration, which must be, he thought, a very comforting thought to them all.

INCREASED DISTRIBUTION

With regard to the profit available, there remained for distribution a sum of £278,909. In view of the maintenance in the improvement of trade last year, the board felt that the turn of the shareholders had now come for some recognition. What the future held one could not say, but the board felt the actual results justified their recommendation of the payment of a bonus of 3d. per share in addition to a final dividend of 10d. per share, bringing up the total for the year to 1s. 6d. per share, or 15 per cent.

With regard to India the sales showed a substantial and rather surprising improvement. Native competition was very keen, but the matter was watched very closely and steps had been taken to meet such competition, and last year's results had certainly been encouraging. After very careful consideration, the board had decided that the time had now come to extend the society's activities to New Delhi, and an establishment had been opened there to run in conjunction with the Calcutta branch.

As regarded London, last year he had told shareholders of the plans they had in hand for the opening out and regrouping of many of the departments. Some of the work was still in progress, and some of it had been completed, notably the new bridge from Victoria Street to Howick Place. They had now started their programme of improvements to the Francis Street building. The result of much of that work shareholders would be able to see for themselves when completed, but other work going on behind the scenes to improve their services was the assembling, packing and despatching of goods.

Efficiency in those services was absolutely essential. They had always been good, but they could not sit still in these days if they were to meet satisfactorily the ever-increasing and exacting demands of the modern shopper.

THE CURRENT YEAR

With regard to the current year, he would repeat the three factors which they must take into consideration, namely (1) last year contained fifty-three weeks' trading, whereas this year they would only have fifty-two weeks; (2) the effect of the further increase in income tax; and (3) the additional burden of the new tax on profits. On the other hand, trade continued good; they had the economies and the improved shopping facilities to which he had referred, and their continued and, he hoped, ever-increasing support. The report was unanimously adopted.

BARRY AND STAINES LINOLEUM, LIMITED

SATISFACTORY TRADE DEMAND

The ordinary general meeting of Barry and Staines Linoleum, Limited, was held on the 29th ultimo, at Winchester House, Old Broad Street.

Mr William Sutton, J.P. (the chairman), said:—Ladies and gentlemen,—When we met a year ago I referred to the state of unrest in Europe—which, I am sorry to say, has since become more acute—and also to the increasing cost of raw materials and the reduction in the selling prices of certain lines in which we are largely interested. I expressed the fear that the returns of our companies would be adversely affected, and not only has this happened but our own national crisis which the Empire faced in such an admirable way had undoubtedly some temporary effect on business. The cost of raw materials is still rising. Although we gave an increase in wages during the last 12 months, we are now faced with a demand for another. We have been able to obtain an increase in our selling prices, but it is very doubtful that this will be sufficient to cover the growing manufacturing costs.

In France the return of the present Government and their legislative policy caused a seriously unsettled state of affairs in industry generally, entailing large increases in wages and in the general costs of production, in addition to which working hours are now restricted by law to 40 hours a week in the linoleum and many other industries. As was inevitable, an increase in selling prices of practically every commodity followed. I am glad to be able to say that, notwithstanding the grave difficulties with which the management at the French factory were faced, both the yardage turnover and the franc value show a satisfactory increase over last year's figures. Owing, however, to the depreciation of the franc, the sterling value of the dividends received during the year is down.

The steady progress of our rubber flooring department continues and the turnover for the year again shows an increase.

DIVIDEND MAINTAINED

Notwithstanding the difficulties with which our trading has been faced during the past year, we are enabled to pay the same dividend (12½ per cent.) as we did for 1935-36. The amount received from subsidiary companies by way of dividend and for management expenses is £1,130 up, but the balance of £209,553 carried to the balance-sheet is £2,785 less than last year, due to the fact that last year there was an income tax credit of £3,156, whereas this year there is a debit of £113. After paying the preference dividend and the interim and final dividends on the ordinary stock the amount to be carried forward to next account is increased by £1,743.

There is again this year a transfer to special reserve of £25,000, making the amount now £75,000. The only other item in the balance-sheet which calls for explanation is the substantial reduction in the item "To subsidiary companies—current accounts," which this year is £91,833 less than last year. Of this sum £66,000 is accounted for by certain adjustments as between this company, and the subsidiary companies in respect of their U.S.A. trading and an adjustment of a corresponding amount appears in the contra item "By subsidiary companies—current accounts."

EXPORT TRADE DIFFICULTIES

I have already referred to the increased cost of raw materials and the demand for higher wages. While trade at the moment is very good there exist so many elements of uncertainty both at home and abroad that it is hazardous to prophesy how long this demand may continue. In the export trade, where there is room for expansion, difficulties caused by tariffs, quotas, and exchanges still remain and seriously hamper business. We are seizing every opportunity and supporting all efforts to press for an improvement of these conditions. With our efficient organisation, and producing as we do goods of the highest quality, we hope to be able to place before you next year's figures which again you will regard as satisfactory.

The board's policy, referred to at previous meetings, of obtaining the utmost efficiency in production, continues to be one of the principal matters to which their energies are devoted, and year after year substantial progress is being made in this direction with very satisfactory results.

There are some other matters to which reference may be made. In common with a large number of other companies we have joined in the guarantee fund in support of the Empire Exhibition, Scotland, to be held in Glasgow next year. The exhibition promises to be a most successful one.

The report and accounts were adopted.

ORIENTAL TELEPHONE AND ELECTRIC COMPANY, LIMITED

ANOTHER YEAR OF PROGRESS

The forty-third ordinary general meeting of this company was held, on the 26th ultimo, in London.

Sir A. Henry McMahon, G.C.M.G., G.C.V.O., K.C.I.E., C.S.I. (chairman of the company), in the course of his speech, said: After deducting £26,959 for depreciation and renewals, the net revenue of the company amounts to £103,842. Adding £51,569, brought forward from 1935, and deducting the interim dividends paid in November last, there remains a balance for disposal of £125,997, which your directors recommend should be dealt with as follows: In payment of a final dividend for the year of 3½ per cent., less tax, on the preference shares issued, £6,607; in payment of a final dividend of 8 per cent. for the year, free of tax, on the ordinary shares issued, £45,615; to place to general reserve £10,000; to contingencies reserve, £10,000; and to carry forward the balance of £53,773.

I am pleased to be able to report another year of good progress, both as regards our subsidiary and associated companies, as well as our own branches at Singapore and Mauritius.

SINGAPORE AND MAURITIUS

The Singapore branch continues to make good progress with an addition of 183 exchange lines during the year, and there is no doubt but that these additions would be greatly augmented were the company free to put into force a more modern and rational system of charging. Further proposals have been placed before the Singapore Government for an optional system of measured and message rates, but so far no decision has been arrived at. Unfortunately an impression seems to persist in some quarters that the object the company has in view in advocating a change in the present system of charging is to increase its revenue at the expense of existing subscribers. This, of course, is not the case. Naturally the company wishes to increase the number of its subscribers, but the only way to do this is to decrease and not to increase its charges. It is to be hoped that this elementary truth will soon be borne in on those with whom the decision rests, as the present methods constitute a very formidable barrier in the way of progress and development.

At Mauritius, also, there is some slight improvement, the number of exchange lines having increased from 673 to 677. No great change has occurred in the fortunes of the island since I last addressed you, though it is hoped that the committee of inquiry into the world prices of sugar which has recently commenced its investigations may have some beneficial effect on the situation there.

THE INDIAN COMPANIES

The Bombay Telephone Company, Limited, has increased the number of its exchange lines by 1,487 during the year, and the proportionate rate of increase for this year, so far as we have gone, is even higher. Considerable capital expenditure will have to be incurred to cope with these demands, and, as I have indicated elsewhere, the Bombay company is making an issue of debentures for that purpose. Meanwhile we have been able to assist them in meeting their more urgent requirements. The same dividend as last year, namely 8 per cent., has been paid, and the prospects for the future in Bombay are very encouraging.

The Bengal Telephone Corporation, Limited, has added 774 lines to its system, and the prospects of further expansion during the current year are also good. The same dividend as last year, namely 8 per cent., has been paid. The Madras Telephone Company, Limited, again pays a dividend of 8 per cent., plus a bonus of 1 per cent., and has added a further 233 lines to its system.

The Rangoon Telephone Company, Limited, has increased the number of exchange lines by 29 and also pays a dividend of 6 per cent. as before. During the year proposals were submitted to Government by the Rangoon Company for revising and modernising the method of charging for telephone service, the existing method forming a serious hindrance to development. But though we are in hopes that the equity of these proposals will be recognised, and that they will eventually be adopted, no final decision has yet been reached.

The Hong Kong Telephone Company, Limited, is recovering from the slight setback which it experienced last year, and now shows an increase of 334 in the number of exchange lines working. The same dividend as for last year, namely 12 per cent., has been paid, and this in turn has enabled the China and Japan Company to maintain its dividend of 6 per cent. in spite of the reduction in the sterling amount receivable by reason of the adverse rate of exchange.

The report and accounts were unanimously adopted.

BIGNELLS, LIMITED

GOOD PROGRESS—BIG FORWARD CONTRACTS

The statutory meeting of Bignells, Limited, was held, on the 27th ultimo, at Winchester House, London.

Mr Arthur J. Bignell, the chairman, who presided, said: Trading receipts at £24,686 3s. 5d. and trading payments at £36,304 5s. 1d. show an excess of payments due to purchases of raw materials and accumulation of stocks both customary at this time of the year.

You are probably all aware that commodity prices have risen, and are rising rapidly—you will therefore be pleased to hear that your board have entered into forward contracts for raw materials sufficient for their anticipated requirements up to August, 1938. These contracts have been made at prices less than those now ruling. You no doubt appreciate that, with our vast output of boots and shoes, this is a very important factor in the success of your company.

I will now deal with the sales position, which I think you will find just as satisfactory. The board anticipate that the company's sales for the current financial year will be well in excess of our prospectus estimate. We have arranged for the sale of the whole of the present output of the factories for 1937 and, with a view to taking further orders, are directing our attention to increasing the company's output capacity. We have several forward contracts in hand for 1938 made with well-known firms and at prices satisfactory to your company. The contracts already in hand will keep your company fully occupied until at least August, 1938, and we have further inquiries for 1938 which your directors are considering.

It may interest you at this stage to have a comparison of output since the incorporation of your company with the corresponding period of last year. This is the quiet period in our trade; nevertheless, our output has been steadily increasing from month to month, and compared with last year has increased more than threefold.

We have also completed the purchase of a further factory, as foreshadowed in the prospectus, on terms which are highly satisfactory to your company.

In conclusion, ladies and gentlemen, I think we can congratulate ourselves on being in a very strong position, and can look forward to satisfactory dividends.

OXENDALE AND COMPANY (PROPRIETORS) LIMITED

INCREASED PROFITS

The tenth annual general meeting of Oxendale and Company (Proprietors), Limited, was held, on the 27th ultimo, at Winchester House, London.

Mr A. Stanley Smith (the chairman) said that a gratifying increase in profits of the operating company was shown. It was the invariable practice of the board to transfer the whole of the balance of the profit and loss account of the operating company each year to the proprietary company as dividend. For the year under review that amount was £27,677, as compared with £25,395 a year ago and £11,749 in the accounts of 1932.

Whilst it had been a matter of gratification to the board to report increased progress, they were not a little disappointed that the increase of profits was still not sufficient to justify a dividend on the deferred shares. It was clear, however, given a continuance of present progress and no undue burden under the proposed new taxes, a deferred dividend should shortly be attained. As to the new business profits tax, it would be unwise at present to express any definite opinion as so little was known of the basis of computation. If a tax on profits were imposed it should be fair and borne in equal measure by all business concerns. The Chancellor, in his speech, had noted "The almost monotonous story of increased business, record turnover and larger profits," but had not pointed out a fact of which he was fully aware, that in the main those improved results merely indicated a recovery from the low points of depression. Very few of them would object to a tax on "increased" profits—profits above what, in those far-off days before the depression, were regarded as normal.

As to its fairness, all depended on the basis adopted. Would it not be more equitable, the chairman asked, if an alternative standard based on 1927-28-29, with suitable allowances for increased capital, were permissible? However, there was little doubt in his mind that consideration would be given to companies like their own which were deprived of a major portion of their trade by the loss of overseas markets and which by enterprise and good management had retrieved their fortunes in the home trade.

The report was unanimously adopted.

NIRMALA (JAVA) PLANTATIONS AND LANDS COMPANY, LIMITED

BOARD'S FORWARD SALES POLICY

The annual general meeting of the Nirmala (Java) Plantations and Lands Company, Limited, was held, on the 27th ultimo, at 19 Fenchurch Street, London.

Mr Walter Hilliers, the chairman, said in the course of his address:—We can again give a satisfactory account of the condition of the estates, and we were thus enabled to take full advantage of the improved position both for tea and rubber.

The average selling price of our tea was 10½d. London equivalent and for rubber 8d., which is rather better than the average price for the year in London.

A certain amount of replanting is allowed under the restriction scheme for rubber, and we expect to have nearly 400 acres thus replanted with the very best up-to-date material.

We have given you particulars of our forward sales of rubber, and since the report certain other sales have been made. There is no change as regards 1937, against which we have sold 408 tons at an average price of 10½d. London equivalent; against 1938 420 tons have been sold at an average of 11½d. London equivalent, and for 1939 300 tons at 11½d. London equivalent. Especially considering the prevailing conditions and the violent market fluctuations, these prices are fully satisfactory.

When considering these matters the importance of the substantial margin of profit should be given due weight, and, further, for a company like this, it is wiser to exchange fine prospects for tangible results by securing actual profits and in this way accelerate the payment of dividends, while building up working capital, of which the company is in need. We have about 30 per cent. of each year's prospective quota still unsold and more for 1939.

It will be plain to you that the results for the current year will show a welcome and rather marked improvement upon those which unfortunately we had to contend with far too long.

The report and accounts were unanimously adopted.

An extraordinary general meeting of the company was then held, followed by a separate meeting of the preference shareholders, and at each unanimous approval was given to the proposed capital reorganisation.

RIO TINTO COMPANY, LIMITED

COMPLICATED BUSINESS CONDITIONS

The sixty-fourth ordinary general meeting of the Rio Tinto Company, Limited, was held, on the 29th ultimo, in London.

The Rt. Hon. Sir Auckland Geddes, G.C.M.G. (the chairman), presided, and said that they were meeting as a company in circumstances of difficulty, especially in connection with that part of their business which was based on Spain. Since August 28th the conditions under which the business had been carried on had been extremely complicated. Copper, pyrites and sulphur had been requisitioned in substantial amounts and despatched to points in Spain, to Germany and Italy. Against those requisitions some pesetas had been received; some were owing. The rate of conversion for the sterling value of the goods requisitioned was fixed by General Franco's Administration at 40 to 42 pesetas to the £1. In that way the *de facto* Government had been able to secure foreign credits. In addition, in order to obtain the export permits which were necessary to permit the company to fulfil its long-standing contracts with its established customers in the United Kingdom, Europe and the United States, it had to make sterling payments equivalent to the value of the products exported, recovering in return pesetas at fixed rates of exchange.

That system of control over the company's business and sterling income had made it impossible to make profits out of the operations in Spain.

Trade was being made impossible by currency chaos. Delays were inevitable when it was necessary to get permits for this, that or the other commodity movement. Payment was necessarily slow; in some cases apparently might never come. Every delay cost money. He estimated that the political turmoil and civil war in Spain had cost the company perhaps a quarter of a million, perhaps £350,000, in the year under review.

With regard to the Budget proposals for levying a National Defence Contribution, it was quite plain that no Government would wish to damage the prosperity of the great undertakings known as Rhokana Corporation, Roan Antelope Copper Mines, Mufulira Copper Mines and Nchanga Consolidated Copper Mines, and he was confident that the case of the Rhodesian copper producers would be justly, fairly and intelligently met.

The report was adopted.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the week ended April 24, 1937, amounted to £48,344,000, against ordinary expenditure of £50,281,000. After allowing for an increase in Exchequer Balances of £149,097, the operations for the week, as shown below, decreased the gross National Debt by £3,909,000, to approximately £7,912 millions.†

(000's omitted)	
Treasury Bills	£ 5,091
Public Department Advances	8,000
National Savings Certificates	100
	£ 5,091
	£ 9,090

† Including £375 millions on Account of Exchange Equalisation Fund.

An analysis of the approximate position of the National Debt as at March 31, 1937, appeared on page 47 of *The Economist*, of April 3, 1937.

are related to the United States dollar, and the approximate sterling rates may be obtained by applying the dollar-sterling exchange rate:—

Bolivia.*	Commercial Bank's "free" selling rate was 155 bolivianos per £ on February 19th.
Colombia.*	Sight selling rate 175.10 pesos per 100 United States dollars on February 25th. This rate applies to holders of permits buying in the "open" market.
Ecuador.*	Official sight selling rate on New York was maintained up to February 15th at 10.50 sucres per United States dollar.
Guatemala.	Sight rate on New York is maintained at 1 quetzal per United States dollar, but a commission of 1 per cent. is charged by the Banco Central for the sale of drafts.
Salvador.	Sight rate on February 26th was 2.49 colones per United States dollar.
Venezuela.	Sight rate on New York was 3.93 bolivares per United States dollar on February 25th.

* Exchange controls are operative in these countries.

GOLD MARKET

Messrs Samuel Montagu and Company write on April 28, 1937:—
 The Bank of England gold reserve against notes amounted to £313,661,924 on April 21st, showing no change as compared with April 14th.

Business in the open market has been active and about £2,400,000 of bar gold was disposed of at the daily fixing. There have been further sales of gold holdings, but following last week's official denial of any intention on the part of the American Government to lower its buying price for gold, purchases for shipment to New York have been made more freely. Prices, however, have again ruled considerably below dollar parity. The s.s. "Strathmore," which sailed from Bombay on April 24th, carries gold to the value of about £197,000.

SILVER MARKET

Prices have been subject to fluctuations but have ruled at a lower level as compared with last week. Buying by the Indian bazaars has been met by China sales and speculative re-sales, but conditions have been quiet and the market therefore the more responsive to small pressure either way. The easier tendency seen during the week was due largely to poor demand, as sales were not pressed and there was no general movement towards liquidation of bull commitments; the technical position of the market is therefore unchanged and until it shows some improvement the present level would appear sufficiently high.

Quotations for gold and silver are shown below:—

1937	Price of Gold per Fine Ounce	Equivalent Value of £ sterling	Price of Bar Silver in London per ounce standard		Price of Silver New York per ounce 1000 fine
			Cash	Two Months	
April 22	140 7 1/2	12 0 9/9	20 1/2	20 1/2	45

OTHER OVERSEAS

Name	Weeks	Ending	Present Mileage	Gross Receipts for Week	
------	-------	--------	-----------------	-------------------------	--

CANADIAN EAGLE OIL.—Dividend on first preference of 4s. 2-4d. for each ten shares payable April 30th.

MEXICAN EAGLE OIL.—Dividend on first preference of 2s. 9-6d. for each ten shares of 4 pesos each payable April 30th.

UNITED STATES STEEL.—There has been declared a dividend of \$5-75 on the 7 per cent. cumulative preferred, of which \$4 is for arrears, reducing them to \$5-25.

CHARRINGTON AND COMPANY.—Ordinary final dividend 11 per cent. against 10 per cent., making 14 per cent. against 13 per cent.

DALGETY AND COMPANY.—Ordinary interim dividend 3½ per cent. less tax compared with 2½ per cent. tax free.

EVER READY COMPANY (GREAT BRITAIN).—Final ordinary dividend 20 per cent. plus 10 per cent. bonus, making 45 per cent. compared with 35 per cent. Net profit £527,333 against £482,780.

MARCONI'S WIRELESS TELEGRAPH.—Ordinary dividend 7 per cent. for 1936, compared with 4½ per cent.

FORESTAL LAND, TIMBER AND RAILWAYS.—After £50,000 to general reserve, credit balance for year 1936 amounting to £48,381. Adding balance brought forward of £120,585, makes £578,966 against £403,355. Preference dividend £111,951. To dividend equalisation £100,000. Final ordinary dividend of 2½ per cent. and 2½ per cent. bonus, making 8½ per cent. (all less tax), against 6 per cent. £128,937 carried forward.

MORRIS MOTORS, LTD.—Ordinary dividend 45 per cent. less tax for 1936 against 15 per cent. tax free. Capital £2,650,000 against £2,000,000.

ENGLISH SEWING COTTON.—Final ordinary dividend 7½ per cent. making 10 per cent. as before. Net profit for 1936 £282,643 compared with £240,728. To pension fund £10,000 against nil. Carry forward increased from £114,838 to £137,500.

RANKS, LTD.—Interim dividend unchanged at 3 per cent.

CENTRAL MINING AND INVESTMENT.—Total dividend for 1936, 15 per cent. against 12½ per cent. Highest dividend in the company's history.

HORDEN COLLIERIES.—Interim dividend maintained at 2½ per cent.

ENO PROPRIETARIES.—Final ordinary dividend, 8 per cent., making 13 per cent. as before.

FIELD BROTHERS.—Ordinary dividend maintained at 22½ per cent. on increased capital. To income tax reserve, £20,000 against £15,000. To dividend equalisation reserve, £20,000 against nil.

MASON AND BARRY.—Ordinary dividend, 5 per cent. for 1936, against nil.

VENO DRUG COMPANY.—Deferred ordinary dividend, 300 per cent. for 1936 against 196 per cent.

PENINSULAR AND ORIENTAL STEAM NAVIGATION.—No interim on deferred stock as before.

RUBBER PLANTATIONS INVESTMENT TRUST.—Ordinary dividend, 7½ per cent. for 1936, against 5 per cent.

TUBE INVESTMENTS.—Interim dividend raised from 5 per cent. to 7½ per cent.

THE WALL PAPER MANUFACTURERS, LTD.—Interim dividend of 5 per cent. on the ordinary stock and an interim dividend of 5 per cent. on the deferred stock will be paid in respect of the current financial year. The warrants for dividend on the ordinary stock will be posted on May 31, 1937, and for dividend on the deferred stock on June 15, 1937.

J. BROCKHOUSE AND COMPANY.—Interim ordinary dividend 7½ per cent. against 6 per cent. This and future interim dividends will be paid in July.

SHORTER COMPANY COMMENTS

SOUTH-EASTERN GAS CORPORATION.—The gas holding company, interests, have made profits of £110,730, an improvement of 19 per cent., although the 6 per cent. dividend is unchanged. In the current financial year steps have been taken to reduce the bank loan, by placing £27,339 4½ per cent. preference shares privately. The increased loss of RICHARDSON'S WESTGARTH AND COMPANY caused some surprise, but it is pointed out that although the volume of work was larger, the orders had been booked at a time when severe competition and therefore unremunerative prices prevailed. Likewise, much of the trading loss of £26,909 was due to development work. The progress of J. STONE AND COMPANY enables the company to double its dividend at 20 per cent. Profits have risen from £125,650 to no less than £198,812. Over twenty rubber reports are available this week. All show the sharp improvement to which investors are now accustomed, and they include the results of important companies such as CHERSONESE (F.M.S.), MENDARIS (SUMATRA), STRAITS RUBBER and TEOGOREDDJO. Tea companies again make a mixed showing, RAGALLA, RAGALLA CONSOLIDATED, and PANTIYA have recovered appreciably, the latter returning to the dividend list with a 5 per cent. payment. Investment Trust results show modest improvement. ANGLO-AMERICAN DEBENTURE raised the dividend from 11 per cent. to 12 per cent. The report contains an interesting analysis of investments. By transferring £48,941 from dividend equalisation reserve, MARCONI'S WIRELESS TELEGRAPH COMPANY are able to pay 7 per cent., against 4½ per cent. Net profits of £233,452 are about £26,000 lower, although they include £22,000 more profit on sale of investments, and earnings from contracts and sales, etc. are £74,000 higher. The difference is due to the reduction in the dividend from Cable and Wireless by £37,000 and the absence of the special dividend of £94,000 from that same company. AULT AND WIHORG are raising their distribution by 5 per cent. to 17 per cent.; profits of £61,011 show an increase of 16 per cent. Net earnings of IDEAL BUILDING AND LAND have been almost halved, owing largely to reduced trading profits by subsidiaries. JOHNSON AND PHILLIPS, after expending £15,138 on maintenance, have earned £21,000 more at £136,093. After a further increase in turnover, LONDON ELECTRIC WIRE are raising their dividend to 7½ per cent. from 6 per cent. SPILLERS, LTD., have experienced a small decline in their net earnings of £451,639, but are paying 15 per cent. as before. The first report of MEESONS, LTD., adjusted to give a proper comparison, shows profits of £34,703 against prospectus earnings of £39,647. The expected improvement did not materialise as a considerable rise in raw material costs occurred last year.

APPOINTMENTS AND PERSONAL

Mr T. Askew Newham has been appointed managing director of British General Fixed Trust.

Sir Harold Edgar Yarrow, Bart., C.B.E., has been elected to a seat at the Midland Bank board. He has also been elected chairman of the Clydesdale Bank in succession to the late Mr Henry Allan.

Mr E. W. Hives has been appointed to fill the vacancy on the board of Rolls-Royce created by the death of Mr Arthur Wormald.

RAILWAYS

ATCHISON, TOPEKA AND SANTA FE RAILWAY.—Total net income for 1936 \$9,998,125 against \$9,554,315. Preferred dividends absorb \$6,208,640, and the 2 per cent. on the common stock took \$4,854,120. After these dividends and various adjustments, surplus carried forward is reduced from \$298,291,160 to \$296,584,685.

BANKS

CHASE NATIONAL BANK.—The Chase National Bank of the City of New York has opened this week a new branch at 51 Berkeley Square W.1, for the convenience of those of its clients who require facilities in the West-end of London.

MISCELLANEOUS

BRITISH EMPIRE FIXED TRUST, Series A.—Managers (Fixed Trust Investments, Ltd.) announce that, as a result of the referendum, a substantial number of holders have agreed in principle to exchange sub-units for shares in a managed investment trust. A detailed scheme is therefore in preparation to be submitted shortly to sub-unit holders.

METAL AGENCIES, LTD.—Profit £54,544 against £46,605 for previous year. Final ordinary dividends make 27½ per cent. for year against 22½ per cent. To income tax account £14,929 against £12,481. To staff superannuation fund £500 as before. To general reserve £12,500 against £10,000. Carry forward increased from £13,861 to £14,670.

SOUTH EASTERN GAS CORPORATION.—Report for year to March 31, 1937, shows net revenue £110,730, an increase of £17,679. Ordinary dividend 6 per cent. Carry forward increased from £16,631 to £28,613.

GARRARD ENGINEERING AND MANUFACTURING.—Profit £37,601 against £31,615. Ordinary dividend 16½ per cent. as before. Development account of £2,352 written off. To a plant and machinery reserve £12,500. To reserve against amount due by subsidiary £5,000. Carry forward £20,921.

MEESONS, LTD.—First report for year to January 30, 1937, shows a profit of £42,315. After salaries, fees, debenture interest, £5,262 depreciation, and £7,121 tax, net profit is £24,590. Proportion before incorporation £8,140, applied in reduction of preliminary, etc., expenses. To occupational leases reserve £722. After preference dividend there remains £9,234 to carry forward. No dividend on ordinary shares (privately held).

JOHNSON AND PHILLIPS, LTD.—Profit for 1936 £105,458 (£25,680 increase), after £15,138 for maintenance, £26,455 for depreciation, and writing off £4,984 loss on realisation of Australian investments. £5,000 again to research and development and £10,000 against nil to dividend equalisation. Ordinary dividend maintained at 10 per cent. Carry forward increased from £101,165 to £111,623.

UNITED STATES STEEL CORPORATION.—For the first quarter of 1937 net earnings were \$28,561,533, or \$2-55 per share, against \$3,376,304, or 94c. on preferred for the corresponding period of last year. Surplus for quarter, \$7,845,000. Total earnings, after expenses, including reserve, \$43,260,000. Shipments of finished products for quarter were 3,698,000 tons.

BEECHAM'S PILLS.—Final deferred dividend, 32½ per cent. against 25 per cent., making 60 per cent. against 50 per cent. Also capital bonus of 12½ per cent. (one fully-paid deferred 5s. share for eight held).

MITCHELLS AND BUTLERS, LTD.—Ordinary interim dividend, 8 per cent. less tax against 6 per cent. tax free. The directors have decided to declare dividends less tax instead of free of tax.

I.C.I. OFFER TO THE SALT UNION.—An offer has been received whereby for each £1 Salt Union preference there is offered in exchange £1 13s. 4d. preference stock of Imperial Chemical Industries, and for each £1 ordinary stock of the Salt Union £1 10s. ordinary stock of Imperial Chemical Industries.

AULT AND WIHORG.—Net profit for year to March 31, 1937, £61,011, against £52,801. Ordinary dividend raised from 12 per cent. to 17 per cent. To reserves, £27,506. Carry forward, £7,112.

SPILLERS, LIMITED.—Net profit for year to January 31, 1937, £451,639, against £471,943. Preference dividend, £52,293. Ordinary and deferred dividends 15 per cent. as before. To reserve, £100,000. Carry forward, £167,505.

BIGNELLS, LTD.—Mr Arthur J. Bignell, presiding at the statutory meeting on April 27th, said that trading receipts at £24,686 and trading payments at £36,304 showed an excess of payments due to purchases of raw materials and accumulation of stocks, both customary at this time of the year. It is expected that sales for current financial year will be well in excess of prospectus estimate. A further factory has been purchased. Contracts already in hand will keep the company busy until at least August, 1938.

ROAN ANTELOPE COPPER MINES, LTD.—Estimated profit subject to taxation for three months to March 31, 1937, £615,000. Estimated profit, nine months to March 31, 1937, £1,096,500.

IDEAL BUILDING AND LAND DEVELOPMENT.—Net profit for 1936, £89,067 against £142,967. Provision for tax, £28,219 against £36,459. Preference dividend, £27,500 as before. Ordinary dividend reduced from 10 per cent. to 5 per cent. To special reserve, £5,000 against nil. Carried forward, £3,348. Last year £21,313 placed to preference dividend reserve.

MARCONI'S WIRELESS TELEGRAPH COMPANY.—Total profits for 1936, £495,418 against £529,326, which included £21,788 from contingencies. To depreciation, £33,184 against £28,209; from dividend equalisation reserve, £48,941. Ordinary dividend raised from 4½ per cent. to 7 per cent. To contingency reserve, £90,000. Carried forward, £7,783.

CLAN LINE STEAMERS.—An increase in profits of £22,453 to £666,964 is shown for 1936. This is before depreciation of £253,012, against £251,484. To reserve, £250,000, making total reserve £550,000. Ordinary dividend maintained at 20 per cent on larger capital.

LONDON ELECTRIC WIRE COMPANY AND SMITHS, LTD.—Net profit for 1936, £135,460 against £107,318. To general reserve, £20,000 against nil. To special reserve, £20,000 against £25,000. Ordinary dividend raised from 6½ per cent. to 7½ per cent. Carry-forward, increased from £40,391 to £54,546.

BULGARIAN EXTERNAL LOANS.—The League Loans Committee and others announce concerning the settlement of partly-paid coupons matured between December 1, 1934, and January 1, 1937, of the Bulgarian League of Nations Loans, 7 per cent., 1926, and 7½ per cent., 1928, and the pre-war loans (6 per cent., 1892; 5 per cent., 1896; 5 per cent., 1902; 5 per cent., 1904; 4½ per cent., 1907, and 4½ per cent., 1909), that although most coupons have already been surrendered, the payments offered will remain available for a further three months to July 31, 1937.

MARKS & SPENCER.—Net profits £1,433,250 against £1,264,406. Final dividend, 25 per cent., making 40 per cent. for year. Capital bonus of 10 per cent.

The New York Central Railroad Company

Extracts from the Report of the Board of Directors for the year ended December 31st, 1936

The Year's Business

Operating revenues amounted to \$361,063,871-95, an increase of \$51,033,100-83, resulting from a continuing improvement in business. Revenue freight handled amounted to 125,948,268 tons, an increase of 21,465,800 tons (20-54 per cent.). Freight revenue amounted to \$257,714,419-37, an increase of \$39,501,590-79 (18-10 per cent.). The company carried 48,269,076 revenue passengers, an increase of 3,887,617 (8-76 per cent.). Passenger revenue amounted to \$62,575,824-21, an increase of \$7,284,954 (13-18 per cent.). Net railway operating income was \$45,278,625-64, an increase of \$9,313,915-11. Net income for the year which amounted to \$8,933,174-98 was carried to the credit of profit and loss.

Profit and Loss Account

	\$	\$
Balance to Credit of Profit and Loss, December 31, 1935...		195,968,343-44
Additions:		
Net income for the year 1936	8,933,174-98	
Net income from retired road and equipment	353,448-55	
Delayed income credits	9,061-84	
Donations	17,537-66	
Miscellaneous credits	1,819,517-74	
		11,123,740-77
		207,092,084-21
Deductions:		
Surplus appropriated for investment in physical property	153,565-79	
Debt discount extinguished through surplus	1,676,929-52	
Debits from retired road and equipment	14,406,946-27*	
Miscellaneous debits	1,726,280-98	
		17,963,702-56
Balance to credit of Profit and Loss, December 31, 1936...		189,128,381-65

* Represents ledger value, less net salvage recovered, of roadway property not required for transportation service retired during the year and charged directly to Profit and Loss Account.

Operating Expenses

A more extensive programme of maintenance of structures and equipment, the increased volume of traffic handled, an increase in the cost of fuel and other materials, together with an increase in pay rolls resulting from restored rates of pay which had not been effective throughout the entire preceding year, were the major factors contributing to an increase of \$31,632,981-51 in operating expenses. In this connection attention is called to the fact that early in 1937, the several labour organisations representing railroad employees notified the company and other carriers of their demands for increase in wages amounting in the case of engine and train service employees to twenty per cent. and in the case of other classes of employees to twenty cents per hour.

By groups operating expenses for 1936 were as follows:—

Group	Amount	Increase
Maintenance of way and structures	36,741,913-90	5,263,329-46
Maintenance of equipment	76,537,117-77	11,239,451-56
Traffic expenses	6,566,989-93	169,552-30
Transportation expenses	131,318,812-25	13,938,739-19
Miscellaneous operations	5,232,784-51	864,345-31
General expenses	12,499,925-27	195,191-30
Transportation for investment—credit	67,107-36	37,627-61*
	268,830,436-27	31,632,981-51

* Decrease.

Railway Tax Accruals

Railway tax accruals were \$30,812,037-47, an increase of \$10,192,605-90 (49-43 per cent.). Accruals for Federal and State Unemployment Insurance, the rates for which will increase in later years, amounted to \$1,687,493-98, and for Federal Excise taxes in connection with the Railroad Retirement Act of 1935 amounted to \$4,812,294-64. Accruals for taxes on real and personal property increased \$1,553,161-39 and for State and Federal capital stock taxes increased \$277,632-80, as compared with the previous year in which there were larger credit adjustments. Accruals for taxes on gross earnings and for special franchise taxes increased \$1,540,917-26. Canadian taxes increased \$228,922-35, due to increased net income and sundry adjustments and for Federal income taxes increased \$90,348-77, mainly due to the adjustment of taxes for former years, while there were net increases aggregating \$1,835-03 in sundry items of taxation.

Equipment Rents

The net debit to equipment rents amounted to \$12,424,247-54. Rents received for the use of the Company's equipment on foreign roads increased \$1,354,716-17, while rentals paid to others for use of equipment increased only \$1,318,648-75, resulting in a net decrease in debits for equipment rents of \$36,067-42.

Joint Facility Rents

There was a net debit to joint facility rents of \$3,718,525-03, a decrease of \$70,334-27. Joint facility rental credits increased \$137,124-92 due to increased use of the Company's facilities by foreign roads and adjustments of accruals of the previous year, while rentals paid for the use of facilities of others increased \$66,790-65.

Non-operating Income

Non-operating income amounted to \$21,809,848-10, a decrease of \$1,824,607-74. The more important items contributing to this result were as follows: Income from lease of road and equipment decreased \$520,867-91, due mainly to the adjustment of accounts for prior years.

Miscellaneous rent income and income from miscellaneous physical property increased \$472,763-87, mainly due to an increase of \$184,863-32 in profit from operation of the New York Central Building and an increase in rentals received from properties in the Grand Central Terminal Area.

Dividend income decreased \$1,606,977-90. There were aggregate decreases amounting to \$3,312,309, due mainly to a reduction in dividends received from the Chicago River and Indiana Railroad Company, Jefferson Coal Company, the Pittsburgh and Lake Erie Railroad Company, the Reading Company and the Toledo and Ohio Central Railway Company, while there were aggregate increases amounting to \$1,705,331-10, due mainly to an increase in dividends received from the Detroit Terminal Railroad Company, Indiana Harbour Belt Railroad Company, the Mahoning Coal Railroad Company, Merchants Dispatch Transportation Company, the Toronto, Hamilton and Buffalo Railway Company and from sundry other holdings.

Deductions from Gross Income

Deductions from gross income were \$58,251,675-05, a decrease of \$1,286,261-88.

Rent for leased roads and equipment increased \$129,522-13. Payments for lease of road where rentals are based upon revenues increased \$483,613-89, as a result of increased revenues of such lines. There was an increase of \$28,305-31 in Federal taxes paid for account of lessors, and a net increase of \$56,747-72 in sundry items. These increases are offset by a decrease of \$439,144-79 in interest upon obligations of lessor companies, due to the retirement of maturing obligations and to lower interest rates resulting from refinancing certain other obligations.

Interest on funded debt amounted to \$28,777,854-14, an increase of \$228,752-10. Interest amounting to \$1,455,081-55 upon the company's Ten-Year Secured Sinking Fund Bonds and its serial and other secured notes, together with an increase of \$3,498-11, due to the exchange of 4 per cent. Consolidation Mortgage Bonds for 3½ per cent. N. Y. C. & H. R. R. R. Lake Shore Collateral Bonds, is substantially offset by decreases as follows: \$636,513-54, due to repayment of loans from Reconstruction Finance Corporation; \$239,252-66 less interest on the company's debentures of 1915 which were retired during 1935; \$353,540-06 in interest upon equipment obligations, due to the payment of maturing instalments, and \$521-30, due to the exchange of Ten-Year Convertible Secured Bonds for capital stock.

Interest on unfunded debt decreased \$1,799,869-32, due to the repayment of bank loans amounting to \$53,900,000, reduction in indebtedness to the Railroad Credit Corporation and to the reduction and refinancing of loans from the Securities Corporation of the New York Central Railroad.

Other deductions were \$1,110,124-81, an increase of \$155,333-21, due mainly to a large credit adjustment of Pennsylvania corporate loan taxes included in accounts for the previous year.

Net Income and Surplus for the Year

The net income of the company for the year amounting to \$8,933,174-98 was carried to the credit of profit and loss.

After sundry adjustments, the profit and loss account at the end of the year amounted to \$189,128,381-65 and total corporate surplus \$198,229,557-32.

Capital Stock Issued in Conversion of Bonds

During the year, the company issued 1,187 shares of capital stock, together with scrip representing half share, in conversion of and in exchange for \$47,500 principal account of its Ten-Year 6 per cent. Convertible Secured Bonds, such exchange having been at the rate of 25 shares of stock per \$1,000 principal amount of bonds. The total number of shares outstanding on December 31, 1936, was 4,993,784½.

Issue and Retirement of 4 per cent. Serial Collateral Notes

During the year the company obtained from the Federal Emergency Administration of Public Works additional loans aggregating \$3,019,000, principal amount, to provide for the purchase and installation of 42,400 tons of rail and the necessary fastenings, issuing therefor its 4 per cent. Serial Collateral Notes, due June 1, 1937-1944. Such notes, together with notes for \$3,950,000 previously issued for similar loans, made a total of \$6,969,000. All of these notes were transferred by the Federal Emergency Administration of Public Works to Reconstruction Finance Corporation and on November 27, 1936, the company discharged this indebtedness.

Reconstruction Finance Corporation Loans Repaid

The company at various times borrowed from Reconstruction Finance Corporation a total of \$27,499,000, of which \$15,600,000 was repaid in 1935, leaving a balance of \$11,899,000, due in 1936 and 1937. Early in 1936 the company applied for extension of the time of payment of this balance of \$11,899,000 of the loans to July 1, 1941, and obtained such extension as to \$9,478,737-45 thereof which was originally due in 1936. Action in regard to extension of the remainder of \$2,420,262-55 due in 1937 was deferred. Improvement in the company's cash position in the latter part of 1936 enabled it to repay these loans in full, \$2,420,262-55 having been repaid on September 18, and \$9,478,737-45 on November 27, 1936.

Loans from The Railroad Credit Corporation

As shown in the annual report of 1935, the loans obtained by the company from the Railroad Credit Corporation originally amounting to \$5,700,000, had been reduced at the end of 1935 to \$2,400,762-38. Credits and repayments on the loan during 1936 totalled \$2,202,322-78, reducing the principal amount thereof to \$198,439-80 at the close of the year.

Hotels and other Properties in the Grand Central Terminal Area

The earnings of the hotels and apartment houses located in the Grand Central Terminal Area, New York City, showed further improvement as compared with the previous year's earnings, with consequent increase in their rental payments. Two lessee companies are still undergoing reorganisation, but the conclusion of such proceedings is expected at an early date. Another of the Park Avenue apartment house properties formerly under lease was taken over in the interest of this company and the New York, New Haven and Hartford Railroad Company during the year.

Pensions

During the year 144 employees were retired and pensioned, 50 at the age of seventy, 89 for disability, and 5 special service pensions.

There were 5,087 pensioners at the close of the year. The total amount paid in pensions for the year was \$3,480,838-36.

Responsive to suggestion of the President of the United States, made under date of December 28, 1936, committees representing the managements and employees of rail carriers entered into negotiations, which, early in 1937, culminated in an agreement as to the form of legislation relating to pensions for railroad employees to be submitted at the pending session of Congress. The enactment of such legislation in the form so agreed upon would repeal the Tax Act of August 29, 1935, that accompanied the Railroad Retirement Act of 1935 and substitute in its place a new Tax Act to be effective as of January 1, 1937. The arrangement contemplates the absorption by the proposed statutory plan, subject to certain limitations, of the existing voluntary pension systems of the carriers.

The Board wishes to express its appreciation of the loyal and efficient service of the officers and employees of the company during the year.

For the Board of Directors,

F. E. WILLIAMSON,
President.

SUMMARY OF COMPANY PROFIT AND LOSS ACCOUNTS

Company	Year Ending	Balance from Last Account	Net Profit After Payment of Deben- ture Interest	Amount Available for Distri- bution	Appropriation					Corresponding Period Last Year

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

BROADLY speaking the collapse of commodity prices which started at the beginning of April appears to have come to an end. The whole fluctuation was of a largely speculative nature, and its violence has been out of all proportion to the underlying trading position.

Despite the disappearance of the speculators, copper prices have been firm, and for some grades have risen. Production continues to expand. Consumers' buying of tin is still abnormally low, and prices have sagged once again; but most countries are seriously behindhand with their shipments under the quota scheme. Lead and spelter prices have ended the week with little change. Rubber prices have been weak, partly under the influence of N.D.C. which, as at present constituted, bears very heavily upon this industry. The market in vegetable oils was quiet, with substantial declines in coconut and palm oil prices.

Wheat prices have declined once more, and reached the lowest level since early March. The market is much affected by the continually increasing American crop estimates. Business in maize and flour also continues very quiet, with prices still tending downwards. Sugar and tea prices have been more or less unaltered, with, if anything, an upward trend. Much the same applies to other food prices. In particular fruit prices have shown a few rises.

Moody's daily index of staple commodity prices in the United States (December 31, 1931 = 100) shows a further decline from 214.9 on April 21st to 210.4 on April 28th, against 224.2 a month ago and 169.7 a year ago.

COAL

SHEFFIELD.—On the export coal market there is a sharp demand for prompt and forward delivery and the shortage of large coal is causing some difficulty. Best South Yorkshire hards and steam coal are in good request, and the former are taken up for the next two months. Bunker coal is scarce and prices remain firm. Furnace and foundry coke is a strong feature of the inland market. Collieries are working full time and the pressure of home demand is having its effect upon the export market. Small coal is in very short supply, and best qualities are not easy to obtain in the open market. Household requirements declined during the past week; this will release additional quantities for industrial consumers.

WORKINGTON.—The stringency of supplies has been only slightly relieved by the Whitehaven coal which is again coming on the market. Demand for house coal is as keen as during the winter, and the shortage of industrial fuel is as acute as ever. Especially inadequate are the supplies of smalls for the coking plants, which, in turn, are hard pressed by the iron smelters of the district. As a result, the Irish market, which requires 6,000 to 8,000 tons per week, has to be content with weekly shipments of 2,000 to 3,000 tons from this district. Prices are firm.

NEWCASTLE-ON-TYNE.—Trade in every class of coal produced in this area is brisk, with loading turns filled for several weeks ahead. North-umbrian steam coals keep to late figures in the export market, although foreign coal is offered at lower prices. The scarcity of Durham manufacturing coal remains acute, ordinary grades of coking coal being nominally 23s. per ton, f.o.b. Under a brisk demand from foreign stations, bunker coal of all descriptions is firm and difficult to obtain for early shipment. Patent oven coke remains firm under a good home and export demand.

CARDIFF.—Business on the Cardiff coal market continued active and the rise in prices was firmly maintained. The Executive Board is determined to keep prices firmly under control, and in this policy it is supported by the principal companies. Contracts are being renewed at prices substantially lower than the current market quotations for day-to-day sales, and there is a readiness to deal collectively with the railways, public utility undertakings, and large industrial consumers. Output and exports are expanding, and shipments in the foreign and coastwise trades for the seventeen weeks ended April 24th show an increase of 1,070,000 tons, or practically 20 per cent. over those for the corresponding period of last year. There is a brisk demand for coke up to 50s. per ton for best foundry grades, and from 30s. to 35s. per ton for furnace qualities. Patent fuel is a little more active at steady prices. Ex-ship pitwood quotations are unchanged.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates that business in the iron and steel markets has been limited largely to the renewal of contracts and consumers' urgent requirements. Practically all sections of the industry have sufficient work in hand to keep them employed for months and producers are disinclined to accept fresh business until the publication of the new price schedule which is expected shortly.

Stringent conditions continue to rule in the pig-iron market, and although steps have been taken to increase production, developments are handicapped by the difficulty of obtaining adequate supplies of scrap, coke and ore. Large purchases of scrap have been made abroad and home production of coke is being increased; but the heavy foreign demand for the latter at high prices tends to restrict the supplies available in this country.

Some improvement is noticeable in the semi-finished steel department, and re-rolling works which recently were obliged to close down from lack of supplies have been able to restart operations.

Works producing finished steel are operating at capacity; but they are finding it difficult to overtake arrears in deliveries. There is no sign of any shrinking in the requirements of the home market, and overseas demand appears to be increasing.

SHEFFIELD.—There is no indication of any early easing of the present difficult conditions in the iron and steel market. Supplies are well below demand and rationing is becoming more general. Makers of forge, foundry and basic pig iron have nothing to offer. The tonnage of imported iron is not at present as large as was expected. Derbyshire makers have reached the limit of their capacity. There is still a complete absence of Lincolnshire iron in the market here. The cost of pig-iron production is rising and an advance of as much as £1 per ton may be looked for at the next revision of quotations. In hematite the position remains much the same. Business in East Coast mixed numbers is more freely transacted than in West Coast

qualities, which are in restricted supply. New business accepted is subject to any price change which may occur. In finished iron, makers are fully booked for some time. Demand for common and marked bars is especially active. Crown iron makers are busier than for years. Producers of basic steel billets are still inundated with orders and there is considerable delay in deliveries. Some makers refuse to accept new business until their present commitments are less onerous. In acid billets the position is less difficult than in basic qualities. Transactions in wire rods, strip and bars show a further increase. Stainless steel sheets are in good request. There are more buyers than sellers of iron and steel scrap and prices are rising.

MIDDLESBROUGH.—General conditions in the iron and steel market remain unchanged. Deliveries of all classes of material are in arrears. Output of pig iron is much below requirements. Foundry pig iron is particularly scarce, only one furnace in this area now producing this class of material. East Coast hematite is in such demand that makers are only able to allocate small quantities for shipment abroad.

Efforts are now being made to increase the output of steel. So far, however, production has failed to overtake the demand and re-rollers continue to have difficulty in keeping their plant employed. New business is restricted pending the issue of a new price list, which is imminent.

Heavy melting steel scrap is in short supply, with makers offering 67s. per ton, delivered works. The coke market is steady, with prices strong, and good Durham qualities are firm at 35s. per ton, delivered. Imports of foreign ore into the Tees between April 1st and April 27th amounted to 212,000 tons, compared with 172,000 tons during the same period in March. It is expected that some of the steamers which have entered Bilbao will be able to bring cargoes of ore back to this country.

was quoted at 13-92½ cents per lb. in New York on Wednesday, against 14-02½ cents a week ago and 17-02½ cents a month ago. Wednesday's official closing price for standard cash in London was £60 10s. to £60 15s. per ton, compared with £60 10s. to £61 10s. a week ago. Stocks of refined copper in British official warehouses at the end of last week, at 19,822 tons, showed a decrease of 1,012 tons, while stocks of rough copper, at 1,087 tons, were 390 tons larger.

LEAD AND SPECTER.—After heavy fluctuations, prices closed on Wednesday slightly firmer on the week. Forced sales have now practically ceased, and there has been a fair amount of buying. In view of the fact that many speculative positions have not yet been liquidated, a substantial advance in prices is improbable; but a firmer tendency may be looked for if consumer buying is maintained.

Sales of lead on the London Metal Exchange: 1,500 tons on Monday, against 2,000 tons last week; 1,250 tons on Tuesday, against 2,500 tons last week; 750 tons on Wednesday, against 3,000 tons last week. The New York quotation on Wednesday was 6-00 cents per lb., against 6-00 cents a week ago and 6-95 cents a month ago. The official closing quotation in London for soft foreign for shipment during the current month was £25 1s. 3d. per ton, compared with £24 11s. 3d. a week ago.

Sales of spelter on the London Metal Exchange: 2,250 tons on Monday against 4,500 tons last week; 2,500 tons on Tuesday, against 5,500 tons last week; 1,900 tons on Wednesday, against 3,250 tons last week. Wednesday's quotation in East St. Louis was 6-75 cents per lb., against 6-75 cents the week before and 7-50 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £24 10s. per ton, against £23 13s. 9d. last week.

TIN.—Although offerings have not been heavy, the market has been generally easier. Nevertheless, the supply position remains rather tight and a resumption of consumers' buying on a normal scale would be likely to cause a sharp appreciation of prices.

At the end of March, according to the Statistical Bulletin of the International Tin Research and Development Council, published this week, the aggregate export arrears of the seven restricting countries amounted to 14,217 tons, an increase of 1,288 tons on the month. All countries except Malaya are now heavily in arrears with their shipments. It is true that the world's tin mines, according to the *Metallgesellschaft*, rose from 13,989 metric tons in February to 17,613 metric tons in March; but the latter figure is only 366 tons above January's level. Daily production was 568 metric tons in March, against 500 tons in February. It must be pointed out, however, that the daily rate of production in March was only 16 tons higher than in October, though the export quotas have been increased by 10 per cent. during this period.

Sales of tin on the London Metal Exchange: 675 tons on Monday, against 975 tons last week; 450 tons on Tuesday, against 925 tons last week; 525 tons on Wednesday, against 575 tons last week. The New York quotation on Wednesday was 55-75 cents per lb., against 58-00 cents a week ago and 64-75 cents a month ago. Wednesday's official closing quotation in London for standard cash was £256 to £256 10s. per ton, compared with £261 to £262 a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 1,761 tons, a decrease of 264 tons on the week.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted on Wednesday at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was quoted at £13 17s. to £13 17s. 6d. per flask of 76 lb., as against £14 7s. to £14 7s. 6d. last week. Chinese antimony was quoted at £64 to £65 per ton ex warehouse, as against £79 to £80 last week. Chinese wolfram for "April-May" shipment was quoted at 53s. to 56s. per unit, c.i.f., compared with 60s. to 63s. last week. Refined platinum was steady on Wednesday at £11 15s. an ounce.

TEXTILES

COTTON.—Manchester.—A quieter feeling has prevailed in the market than for several weeks past. Traders have been disturbed by the wide fluctuations in raw cotton prices and by the new taxation proposals. Numerous buyers have been in the mood to adopt a waiting attitude until the outlook is clearer. In some quarters a little more attention has been paid to the peace talks, as it is realised that any move towards disarmament would have a vital effect upon commodity prices. World demand for raw cotton continues on a large scale, but there is a possibility of a bigger crop next season, not only in the United States, but also in several other producing centres.

The yarn market has been firm with demand slower. Spinners remain very busy on old contracts. Fair transactions have been put through in coarse and medium American counts. Irregular buying has occurred in Egyptian qualities.

There has been less activity in the cloth market. Many buyers have satisfied their requirements for some time ahead and fresh contracts have not been important. Meanwhile manufacturers remain very firm in quotation. It is quite common for producers to be booked up for six months ahead, while in some instances cloth has been sold for delivery in the early months of next year. Demand for India has been on a smaller scale and only scattered transactions have taken place, chiefly in light bleaching cloths, prints and fancies. There has been a moderate turnover for Egypt and South America. Some makers have done fairly well for the Continent. A steady demand has been reported for the Dominions and the Crown Colonies. Home trade buyers have been rather cautious and clearances in certain quarters are all that could be desired.

WOOL. **Bradford.**—The third series of Colonial wool sales opened last Tuesday, Coleman Street Wool Exchange being filled with the usual crowd of buyers representing all sections of the home and Continental trades. Offerings of merinos are small and on the poor side, but the crossbreds and Punta wools should turn in an average selection. There are indications that the last of the season's clip from overseas has arrived, and the offerings both this and next series will consist largely of second-hand parcels. The tone of the sale room is firm. Prices show an advance of 4d. to 1d. per lb. according to the quality and character of the raw material. Crossbreds are in active demand, with more bidding than usual on Continental account. In fact, all sections are prepared to operate on a very liberal scale.

The improvement in manufacturing districts, both at home and abroad, is reflected at the Coleman Street Wool Exchange. Wool is sharing the improvement that has taken place in world commerce, and consumption is higher than for several years past. Practically the whole of this season's clip are already in the hands of users. Although the home trade is not now as active as during the past twelve months, consumption is still big enough to absorb all available supplies until the next Australian clip becomes available. The firm opening of the sales this week has had a strengthening influence upon tops in Bradford.

GRAIN MARKETS

WHEAT. In sympathy with the stock markets, wheat has displayed an easier tendency and prices show a substantial loss on the week. Demand has fallen off and attention is now concentrated on crop prospects in North America, which are at present quite favourable.

On Wednesday last, "May" futures were quoted in Chicago at 129 cents per bushel, against 131½ cents the week before and 142½ cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba, ex ship, 51s. 6d. to 53s. 6d. per 496 lbs., as against 54s. 3d. to 56s. 3d. a week ago, No. 2 Northern Manitoba, ex ship, 51s. to 53s., as against 53s. 6d. to 55s. a week ago. According to the *Corn Trade News* total shipments of wheat and flour last week amounted to 1,651,000 quarters, against 1,579,000 quarters in the previous week and 896,000 quarters in the corresponding week a year ago.

FLOUR.—Flour has declined in sympathy with wheat. Wednesday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 42s. 6d. per 280 lbs., as against 43s. 6d. a week ago; delivered inner London, 42s., as against 43s. a week ago. Manitoba patents, ex store, 39s. to 40s. 6d., as against 40s. 6d. to 42s. a week ago. Australian, ex store, 34s. to 35s., as against 34s. 9d. to 35s. 6d. a week ago.

BARLEY.—"May" futures were quoted at 70½ cents per bushel in Winnipeg on Wednesday, against 69 cents a week ago. Quotations per 448 lbs. in London on Wednesday were: "English feed," at farm, 36s. to 38s., as against 36s. to 38s. a week ago; "English malting," at farm, 38s. to 45s., as against 38s. to 45s. last week. Californian (new), ex ship, 49s. to 55s., as against 53s. 6d. a week ago. Chilean, brewing (new), ex ship, 44s. 9d. to 50s., against 44s. 9d. to 50s. a week ago.

OATS.—On Wednesday, "May" futures were quoted at 50 cents a bushel in Chicago, against 49½ cents a week ago and 49½ cents last month, quotations in London, Wednesday: "English black," at farm, 24s. to 26s. per 336 lbs. a week ago, as against 24s. to 26s. a week ago; "English White," at farm, 24s. to 26s., as against 24s. to 26s. a week ago; mixed Canadian feed (Vancouver), landed, 25s. 3d. per 320 lbs., as against 25s. 6d. a week ago.

MAIZE.—Despite a rally in the United States, prices in this country are lower on the week. Buying interest has subsided and the warmer weather has reduced requirements. "May" futures were quoted on Wednesday at 129½ cents per bushel in Chicago, against 128½ cents a week ago and 118½ cents last month. Quotations in London, Wednesday: "Plate," landed, 27s. 6d. per 480 lbs., as against 28s. 9d. a week ago; "Plate," ex ship, 26s. 6d., as against 27s. 9d. a week ago; "Plate," April (new), 26s. 9d., as against 27s. 6d. a week ago; yellow maize meal, ex wharf, was quoted at £7 to £7 5s. per ton, as against £7 7s. 6d. to £7 10s. a week ago.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1935-37:—

NEAREST FUTURE	Jan. 2, 1935	Dec. 31, 1935	April 29, 1936	Dec. 30, 1936	Apr. 21, 1937	Apr. 28, 1937
Winnipeg (No. 1, Manitoba) —Cents per 60 lb.	82½	84½	79½	129	136½	129½
Chicago (No. 2, Winter) —Cents per 60 lb.	88½	101½	97½	135½	134½	129

The visible supply of wheat in Canada amounts to 75,675,000 bushels, against 77,934,000 bushels last week, and 108,871,000 bushels in the corresponding week last year.

SALES AND PRICES OF BRITISH CEREALS.—The following table gives the estimated sale of home-grown wheat during the harvest years 1933-34 to 1936-37:—

	1933-1934	1934-1935	1935-1936	1936-1937
Estimated sales of home-grown wheat—	Cwts.	Cwts.	Cwts.	Cwts.
1 week to April 24.....	182,288	170,539	156,188	252,553
34 weeks to April 24.....	9,858,258	11,703,324	11,651,860	9,284,287
Average price of English wheat per cwt.	s. d. 4 5	s. d. 5 1	s. d. 6 7	s. d. 10 3

The following is a statement showing the quantities sold and the average price of British cereals in the past two weeks, and for the corresponding weeks in each of the years from 1933 to 1936:—

Week ended	QUANTITIES SOLD			AVERAGE PRICE PER CWT.		
	Wheat	Barley	Oats	Wheat	Barley	Oats
April 22, 1933.....	Cwts. 107,014	Cwts. 30,729	Cwts. 33,031	s. d. 4 5	s. d. 6 1	s. d. 5 8
April 22, 1934.....	182,288	24,446	26,132	4 5	7 8	6 0
April 27, 1935.....	170,539	55,578	23,402	5 1	7 2	7 0
April 22, 1936.....	156,188	28,878	22,415	6 7	7 4	6 11
April 17, 1937.....	252,807	35,231	40,653	10 2	10 2	8 6
April 24, 1937.....	252,553	34,709	40,164	10 3	10 3	8 8

OTHER FOODS

BACON.—The market ruled generally steady on a sustained demand. The official quotations (per cwt. for No. 1 Sizeable) which formed the basis for dealings on the London Provision Exchange this week were: English, 92s. to 96s.; Canadian, 87s.; Danish, 95s.; against 92s. to 96s.; 87s., and 95s. last week. Arrivals in London last week included: Danish, 15,009 hales; Canadian, 6,598; Dutch, 2,340; Lithuanian, 986; and Polish, 2,609; as against 13,872, 6,659, 2,571, 1,106 and 2,687 hales, respectively, in the previous week.

BUTTER.—Colonial butters hardened slightly under a firm demand, but Danish was rather easier. Quotations (per cwt.) on the London Provision Exchange on Wednesday were: New Zealand, finest salted, 108s.; Australian, choicest salted, 107s. to 108s.; Danish, 112s. to 113s.; compared with 108s., 107s. and 114s., respectively, a week ago.

CHEESE.—The market was firmer for New Zealand, with other makes about unchanged on the week. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: English, finest farmers, 89s. to 96s.; Canadian finest coloured, 75s. to 76s.; and New Zealand, finest coloured, 70s., against 89s. to 96s., 75s. to 76s. and 68s. to 69s., respectively, a week ago.

COCOA.—The spot quotation in New York on Wednesday was 9½ cents per lb., against 9½ cents per lb. last week. In London, on Wednesday last, good fermented new crop, Acera, "April-May," was quoted at 43s. per 50 kilos, c.i.f. Continent, against 44s. 6d. a week ago. Last week's movements of cocoa in London were as follows: landed, 10,839 bags; delivered, for home consumption, 15,860 bags; exported, 225 bags; stocks, 275,277 bags, against 166,387 bags a year ago.

COFFEE.—On Wednesday, Rio No. 7 (cash) was quoted at 9 cents per lb. in New York, as compared with 9 cents per lb. last week and 9½ cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, 95 cwt.; delivered, for home consumption, 38 cwt.; exports, 8 cwt.; stocks, 2,416 cwt., against 11,460 a year ago. Central and other South American: Landed, 9,638 cwt.; delivered for home consumption, 4,825 cwt.; exported, 1,028 cwt.; stocks, 109,035 cwt., against 120,945 last year. Other kinds: Landed, 4,118 cwt.; delivered, for home consumption, 3,828 cwt.; exported, 632 cwt.; stocks, 125,288 cwt., against 178,985 last year.

EGGS.—The market has been quietly steady, despite heavier Continental arrivals. At Smithfield, on Wednesday, English (ordinary packing, Grade I, about 15-15½ lb.) realised 9s. 6d. to 10s. per 120, against 9s. 6d. to 10s. last week; while Danish (15½ lb.) made 8s. 9d. to 9s., as against 8s. 6d. to 8s. 9d. last week.

FRUIT.—Business at Covent Garden remains moderately good, with prices at a satisfactory level, states *The Fruitgrower*. Buoyant conditions seem likely to continue until the end of the London season. Apples of all kinds continue in active demand, while pears are also selling well at firm rates. South African grapes are steady and other varieties show little change. Forced strawberries, in increasing supply, encounter an active demand and sell at 6s. to 10s. per lb. Peaches are also receiving attention. Good parcels of oranges are firm in price, but the bulk of the arrivals of Jaffa and Spanish are in poor condition. Grape fruit are a rather more active item and lemons are steady.

MEAT.—At Smithfield, demand for fresh beef, mutton and pork was quiet. There was a steady trade for chilled beef and best small frozen lambs, with veal in fair request. On Wednesday last, Argentine chilled hindquarters were quoted at 3s. 8d. to 4s. per 8 lbs., as compared with 3s. 8d. to 4s. a week ago. New Zealand frozen mutton was 3s. 4d. to 4s. per 8 lbs., against 3s. 4d. to 4s. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 10,061 tons, an increase of 613 tons on the corresponding week last year. Beef and veal accounted for 5,226 tons, mutton and lamb, 3,320, and pork and bacon 959, as compared with 5,057, 2,733 and 1,194 tons, respectively, in the same week of 1936.

PEPPER.—On Wednesday, Singapore white Muntok, spot, was quoted at 6d. per lb. in bond, against 6d. per lb. a week earlier. Black Lampong, spot, in bond, was quoted at 3d. per lb. sellers, compared with 3d. per lb. last week. Movements of pepper in London last week were as follows: Black, landed, 43 tons; delivered, 11 tons; stocks, 1,831, against 1,717 last year. White, landed, 237 tons; delivered, 42 tons; stocks, 11,880, compared with 12,457 a year ago.

RICE.—The spot price of Burma No. 2, cleaned, was 10s. per cwt. ex warehouse, on Wednesday, as compared with 10s. per cwt. a week ago. "May-June," in singles to Continent and U.K., was quoted at 9s. per cwt., against 9s. 1½d. for "April-May" last week. Movements in London last week were as follows: Landed, 20 tons; delivered, 16 tons; stocks, 1,051 tons, against 939 a year ago.

SUGAR.—The London market in raw sugar has had a steadier tone, but in New York prices have receded. The New York spot quotation was 3-45 cents on Wednesday, as compared with 3-50 cents per lb. last week and 3-55 cents per lb. a month ago. Wednesday's sales of raw sugar in London included "May" delivery at 6s. 4½d. to 6s. 4½d., against 6s. 2d. to 6s. 3d. a week ago. Movements of raw sugar in public warehouses in London and Liverpool last week were as follows: Imports, 24,751 tons, against 5,082 in the previous week and 1,841 in the same week of 1936; deliveries, 20,344 tons, against 18,994 and 17,367 tons, respectively; stocks, 189,144 tons, against 184,737 and 215,050 tons, respectively.

TEA.—The following table shows the average prices (compiled by the Tea Brokers' Association) of tea sold in Mincing Lane on Garden Account in recent weeks:—

Week ended	Northern India	Southern India	Ceylon	Java	Sumatra	Africa	Total
Apr. 23, 1936.....	d. 12-67	d. 14-00	d. 15-99	d. 11-00	d. 10-47	d. 11-95	d. 13-41
Mar. 18, 1937.....	14-37	15-05	17-03	14-13	12-56	13-61	15-02
Mar. 25, ".....	14-97	15-81	17-07	NH	NH	15-81	15-81
Apr. 8, ".....	14-99	16-03	17-27	NH	NH	15-81	15-81
Apr. 15, ".....	14-82	15-83	17-66	15-64	13-26	14-22	15-68
Apr. 22, ".....	14-79	16-38	17-36	14-81	13-08	13-98	15-68

At this week's public auctions in Mincing Lane, 42,361 packages of Indian and 18,930 packages of Ceylon tea came up for disposal. Competition for the Indian grades was again keen and prices for ordinary and medium kinds were firmer. The Ceylon market was firm generally.

VEGETABLES.—Supplies of English and Guernsey tomatoes are steadily increasing and prices are consequently easier, says *The Fruitgrower's* Covent Garden report. Reliable parcels of Canary Islands tomatoes are, however, dearer. Cucumbers are about unchanged in price, while lettuce, radishes and spring onions sell well. House-grown beans are firm and green peas show a similar tendency. Mushrooms are easier; some forced marrows

are now to hand. Spring greens are abundant, but cauliflower is doing a little better. Meanwhile, new potatoes are a more active item at Covent Garden, with Mataro down to 21s. to 22s. per cwt., against 27s. to 28s. last week. At the Borough on Tuesday, best siltland King Edward, in active request, again made from 10s. to 11s. per cwt., ex market.

MISCELLANEOUS COMMODITIES

VEGETABLE OILS AND OILSEEDS.—The market is quiet, and little business is passing. Linseed in particular has been affected by the weakness in wheat, and is in poor demand. Prices have eased somewhat, but on the whole are steady. Plate seed is in some request from Continental crushers. The quantity shipped from Argentina last week was 50,000 tons, bringing shipments to date up to 900,000 tons. A feature is the continued heavy export to the United States and Canada, which, so far, amounted to 342,000 tons (exclusive of about 40,000 tons diverted), against only 104,000 tons during the same period last year. At present, there is afloat for North America the unusually heavy total of 154,000 tons—all from the River Plate. Demand from this quarter seems likely to moderate soon. An increase in the acreage under linseed for next season is indicated. The new Indian linseed crop is still moving off slowly, and prices are stiffening on account of high freight rates. The quantity now afloat for Europe is 156,100 tons, or 8,300 tons more than last week, and includes 12,500 tons from India.

Cottonseed is lower and in some demand in near positions, business in black Egyptian on passage to Hull having been done at £9. New crop Egyptian is quoted nominally at £8 5s., August loading. Trade in vegetable oils is desultory. In sympathy with seed, linseed oil has declined about 15s. per ton, and is still slow. Cotton oil ex Hull has been marked down 10s. per ton, and demand on home account and for export is small. With the advent of open weather the trade in oilseeds is falling off.

FURS.—No major change in the tendency of the London Spring Fur Sales occurred during the past few days. We therefore propose to publish a detailed concluding report after the end of the sale and give in the meantime the chief prices paid at the recent Hudson's Bay Company's sale compared with those of the preceding sale (Winter Sale, 1937) and the corresponding Sale of last year (Spring Sale, 1936). All quotations are given in shillings and pence per skin:—

	Spring Sale, 1936	Winter Sale, 1937	Spring Sale, 1937
Beaver, Mackenzie River (Canada) Ex Ex Large ...	73/- to 77/-	136/-	Unsold
Ermine, York Fort (Canada) Ex Ex Large	5/7 to 6/1	7/- to 8/3	7/6
Scandinavian Ex Ex Large	4/8 to 5/-	6/8	7/2

Wolf, York Fort, Ex Large 1	40/- to 65/-	51/6 to 70/-	50/- to 64/-

RUBBER.—The factors which have unsettled the stock markets have also had a disturbing influence on rubber. After substantial fluctuations, prices both in London and New York have fallen to lower levels. Speculative commitments have been heavily liquidated and some recovery is possible if active buying is resumed. But it is likely that the restoration of confidence will be achieved only gradually. The spot price in New York on Wednesday was 20½ cents per lb., compared with 23½ cents per lb. a week ago and 26½ cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 10½d. per lb., as against 11½d. on the corresponding day last week. In forward positions, business has been done at 10½d. for "June" shipment, as against 11½d. to 11½d. a week ago. Stocks in London and Liverpool at the end of last week totalled 48,828 tons, against 50,362 tons a week earlier. A year ago stocks amounted to 141,354 tons.

THE ECONOMIST

Vol. CXXXVII

MAY 8, 1937

No. 4889

CONTENTS

thronged with Londoners, with British citizens of every colour and creed from over the seven seas, and with thousands of strangers come to witness a spectacle already rare in the modern world. London will not be—indeed, already is not—the staid old London with which so many millions of people are familiar. Yet London itself, that “flower of cities all,” as the fifteenth-century Scottish poet called it, has a life and a being of its own. With its eight and a half million inhabitants it is almost a nation by itself. But it is not an exclusive community. On the contrary, by its history, occupations and situation it is one of the cosmopolitan capitals of the world.

Thus, Coronation time, when London wears its unaccustomed but becoming cloak of festivity, is a fitting occasion on which to record something of the life of the world's greatest city. In the articles, the illustrations, and the figures of the Special Supplement on London,

which accompanies this issue of *The Economist*, our readers will find both facts and information, both knowledge and diversion. It is no mean city, indeed, which has for centuries been the place of coronation of our monarchs; and its history, its changing nature, and the way of life of its millions of inhabitants are worthy of permanent record on an occasion like the present.

In London, as in the countries of the British Commonwealth, popular attachment to constitutional monarchy blends with equally strong attachment to those democratic institutions of which that monarchy is the head. Seldom, if ever, before has the feeling for constitutional monarchy and for democracy been so strong, so unanimous, as it is in these countries to-day. It would be a disaster for the world if those institutions were to totter in their very birthplace. But next week's rejoicings will be convincing evidence of their strength and of their stability.

Spain and Europe

ON its own scale and in its own way, the European War of 1936-37 in Spain is showing a tendency to follow the same course as the European War of 1914-18. Once again the aggressor is encamped on his victim's ground. Once again he is trying to break his victim's spirit and to force him to capitulate. And once again he is finding that it is more difficult to finish a war off than to set it going. It begins to look as though the Spaniards could adopt the famous French watchword: “*Nous les aurons.*”

For the second time within a life-time—and this is surely unprecedented—Germany has involved herself in an aggressive war, hand-in-glove with a broken-backed ally. Indeed, in German military eyes, the Italy of 1937 must seem a poor exchange for the Austria-Hungary of 1914. HERR HITLER'S first use of Germany's recovered military power has been to black out the picture of an ill-used yet patient Germany, which had been impressed on foreign minds by the statesmanship of DR STRESEMANN and DR BRÜNING, and to replace it, in a rapid series of lurid strokes, with the latterly forgotten but once familiar portrait of “the Hun.” The Germany whom her FÜHRER is deliberately displaying to us is no longer the Germany of the Ruhr and the Palatinate in 1923. It is the Germany of Louvain in 1914. Are the Nazis determined to force upon us the conviction that their country is incorrigible?

The main event of the past few days in the Spanish theatre of Italo-German warfare has been the check which the Basques have given to the enemy offensive against Bilbao. We cannot yet tell whether this reverse to Italo-German arms in Vizcaya is temporary or permanent. We do not know whether Bilbao, like Madrid, is going to show herself able to hold out for months with the enemy at her gates, or whether she is going to fall, as Irun and San Sebastian fell earlier in the war. It is already evident, however, that the reverse has been severe, and that the arm which has broken down is the ground force which consists partly of Italians and partly of Castilian *requetes* under Italian officers. Moreover, this second Italian reverse has been due to the same combination of causes that produced the *débâcle* at Brihuega. First, there was an error of tactics—the Italian command sent a clumsy column, cluttered up with mechanised transport, into an ambush. Then, as before, the morale of the Italian troops gave way at the critical moment.

This second Italian reverse in Spain is likely to have an important effect on the eventual outcome of the war—whichever way the local operations in Vizcaya may go—by encouraging the Government forces and bring-

ing the Italians into further disrepute in the sight of their Spanish confederates. The most momentous consequence, however, will be the effect on the judgment of the German General Staff about Italy's value, or lack of value, as a potential ally in some future conflict that might be much more formidable than the Spanish side-show.

The German judgment on this set-back to Italian arms is likely to be all the more severe, because the German air-arm did its best to smooth the way for an Italian advance on the ground by razing the Basque country town of Guernica. The means by which Guernica was destroyed last week would appear to be established beyond all question by the concordant testimony of the Bilbao correspondent of *The Times*, the mayor and priest of Guernica itself, and the Dean of Valladolid. It was destroyed by a scientific combination of bombing and machine-gunning in rhythmic alternation. General Franco first protested that no Spanish insurgent aeroplanes had been in the air that day; but a report on Wednesday from *The Times* special correspondent with the insurgents contained the significant admission that Guernica had been bombed by the insurgents' machines. That the Basques slyly destroyed their own town themselves in order to bring discredit on the insurgent cause is incredible. There is material evidence that the work was done by German planes; and this fits in with the observation of planes flying over France within the last week or two at an enormous height from the direction of Germany in the direction of Spain. Are we to assume that the reinforcement of the German air-arm on the Basque front is part of the *quid pro quo* which HERR HITLER has paid for SIGNOR MUSSOLINI'S playing of Germany's game at his recent meeting in Venice with CHANCELLOR VON SCHUSCHNIGG?

Far from being cowed by this wantonness, the Basques have redoubled their efforts to fling back a barbarous invader. They have also been heartened by the sinking, on Friday of last week, of GENERAL FRANCO'S biggest warship, the “*España*,” which had been attempting to blockade the Basque coast. Whether she was sunk by Government bombing planes from Santander, or whether she struck a mine laid by her own side, is a question not yet cleared up. But while her fate may not throw any light on the bomb *versus* battleship controversy, there is no doubt that she has gone to the bottom; and her loss is a blow which the insurgents will feel.

They will feel it all the more because our own Government has markedly, though not avowedly, changed its policy about the “blockade” which the insurgents

claim to have established along the Basque coast. The advice to British ships to keep clear of Bilbao seems to have been dropped; and the captains who have made the venture of running GENERAL FRANCO'S unrecognised blockade must have felt it as good as a convoy when a British warship took to turning up conveniently on the fringe of the three-mile limit whenever a British merchantman was threatened by a rebel man-o'-war. More than that, the British Government have now acceded to the Basque Government's request for British naval protection, outside territorial waters, of ships carrying refugees out of the Vizcayan war-zone. This British decision has been maintained in spite of GENERAL FRANCO'S refusal to fall in with the scheme.

In making this salutary change of policy, the British Government have recognised, and bowed to, a public opinion which is by no means confined to the ranks of their political opponents. The destruction of Guernica may have had something to do with this change of policy also—though the wave of feeling in this country in favour of giving naval protection to lawfully employed British merchant ships had been mounting for several

weeks before the perpetration of the Guernica atrocity. The account of the facts about Guernica that has appeared in the British press has drawn violent recriminations from Berlin as well as from Burgos; and the inference is that the British version of what happened is true. Guernica may make a mark in European history.

Even if Bilbao were to fall, and even if this week's internal dissensions in the Government at Barcelona extend or continue, there is no indication that this would bring the end of the war in sight; and if the offensive dies away before reaching its objective, the aggressor Powers will again be faced with the choice between cutting their losses or staking a larger part of their fortunes on the issue of the Spanish adventure. Either course becomes more difficult, the more deeply they involve themselves. Though the rest of the world is ready to keep open a golden, or at least a gilded, bridge in their rear in case they may be minded to retreat, the gulf which they are digging may finally become so wide that no bridge will any longer be able to span it. The dictators should take the path of wisdom before it is too late.

The Right to Strike

THE recrudescence of labour troubles since the New Year, after a prolonged period of peace in industry, is beginning to culminate in strikes of growing national importance. During the last few weeks an unofficial, but none the less effective, strike among omnibus drivers and conductors has been spreading through the south-eastern counties. On Saturday last, the busmen of the central London district stopped work, with the full support of their union, after the month's notice specified in their agreement. The disappearance of the familiar red buses from the streets of London has occasioned considerable inconvenience, though it has not been paralysing in its effects. Of far greater importance is the fact that the coal miners have handed in their notices for a national strike to begin on May 22nd.

The state of affairs in the London bus strike may be changing as we go to press, although the Report of the Court of Inquiry (summarised on page 328) disappointed the hope that a decisive opinion would be expressed on the main issue in dispute. The men's demand is for a reduction of the working day from eight to seven-and-a-half hours. They claim that since the standard was fixed the growing congestion in the streets and the gradual acceleration of time tables have greatly increased the strain on them. As evidence, they allege an increased incidence of ill-health, especially of gastric disorders.

The London Passenger Transport Board's rejoinder is that to speak of an eight-hour day is misleading, since the actual time spent in driving or conducting is, on the average, only a few minutes over six hours. They further maintain that the men are well paid and well treated in such matters as paid holidays. But the Board's most forceful argument is financial. By the terms of the London Passenger Transport Act of 1933, which are fully discussed on another page, the Board are compelled, under pain of having a receiver appointed, to pay at least 5½ per cent. on their “C” stock (which is the junior security) for the year beginning on July 1st next. Last year they earned only a fraction over 4 per cent., and it is unlikely that they are doing any better in the current year. If they are to meet the obligations placed upon them by Parliament they have no margin at all for any increased wage payments.

This is one of those unfortunate disputes in which both sides' arguments are correct, without ever

meeting on the same ground. If the Board are right on financial grounds, the majority of people would probably side with the men on human grounds. Every owner-driver knows the strain of driving in traffic, and to do so for even six hours a day must inevitably impose a very heavy strain on the nerves. The drivers have been, to some extent, compensated for the “speed-up” by the provision of more modern buses, less arduous to drive. But for the conductors there has been no such compensation, and they deserve fully as much sympathy as the drivers. MR BALDWIN has appealed to employers to shorten hours of work to offset the growing strain of speed, and there could not be a more appropriate case for making a beginning.

The Board, on the other hand, cannot be blamed for the predicament in which the Act places them. The clause which threatens the Board with receivership unless they pay a 5½ per cent. dividend, once every three years, on what corresponds to the ordinary stock in their capitalisation, was no part of the original bargain on which the Act is mainly based. It is a highly dubious policy that public utility undertakings like London Transport should be saddled with fixed rates of interest, not merely on part but on the whole of their capital; and fundamentally dangerous that the junior stockholders should be entitled to a receivership in any circumstances. The men would have a very definite grievance if this were the only thing that stood between them and a shortening of their hours. But unless and until the Act is amended the Board must regard it as mandatory.

The striking drivers and conductors therefore have a strong case. It is doubtful, however, whether they have not substantially reduced the sympathy to which they are entitled by striking at this time and in this way. When the convenience of the public is so directly concerned, there is a special obligation on the workers not to strike until every other means of obtaining satisfaction has been tried and has failed. The Board offered to submit the dispute to an independent tribunal, and, if the award went in favour of the men, to make it retrospective to the beginning of February. This offer was refused by the men. MR ERNEST BEVIN has hotly denied the suggestion that May 1st was chosen for the beginning of the strike because of the imminence of the Coronation. But there seems to have been more than a little eagerness in some quarters to have a strike. Indeed, it has

been suggested that the caution of the officials of the union was overruled by the impetuosity of some of the subordinate representatives of the men.

Recrimination, however, is less important than the search for a solution. The obligation to pay 5½ per cent. should never have been inserted in the Act. But since investors have bought the "C" stock in reliance upon it, repeal would savour of confiscation. Nor is the suggestion that the Board should be relieved of some of their burden of taxation much more practicable, since it would not be possible to grant such a concession to the Board and withhold it from all other transport undertakings.

The Board maintain that there is no salvation in increased fares and that their present average charge of 1d. a mile brings in the maximum revenue. But it would be a remarkable coincidence if the optimum fare happened to be this convenient round figure. The raising of fares would be a most unwelcome proceeding to the travelling public, but it is hard to believe that the Board could not find some additional revenue in this way if it became necessary.

In the coalmining dispute, the issues are harder to disentangle. The quarrel goes back to the great coal strike of 1926. In that year, the miners of Nottinghamshire were among the first to abandon the stubborn and (as events proved) mistaken policy pursued by the Miners' Federation under the leadership of the late A. J. COOK. Led by MR G. A. SPENCER, at that time a miners' M.P., the Nottinghamshire Miners' Industrial Union was formed, side by side with the Nottinghamshire branch of the Miners' Federation. Though dedicated to moderation, this new union was, in its origin, a perfectly genuine trade union. However, it has remained independent of the national Federation and has naturally been preferred by the employers to the rival Association which maintains the national affiliation.

This already delicate position has been complicated by a particular dispute at Harworth, where the employers have been making a very ill-advised attempt to dictate which of the two unions their employees shall belong to. With the settlement of the obstinate question of "victimisation," however, this dispute has now been composed. On the wider issue, an agreement was reached in March for the amalgamation of the two unions. To judge by the terms of amalgamation, the independent union is conceded to have a strength in this particular coalfield at least equal to that of its rival. On April 2nd, however, the executive committee of the National Mineworkers' Federation refused to ratify the agreement negotiated by its own officers. What is more, it was decided to take a ballot throughout the country on the

proposal to strike in order to enforce the recognition of the Nottinghamshire Miners' Association (the affiliated union) by the employers. The ballot has since returned an affirmative answer; and that is where the matter now stands.

THE PRIME MINISTER has given it as his opinion that there is nothing in the circumstances that need prevent a settlement, and it is to be hoped that his appeal to the principals to avoid the national disaster of a strike will have its effect. What MR BALDWIN had to say about the desirability of trade union organisation, and the inevitability of collective bargaining, will be generally accepted in this country. It is a natural corollary that any pressure by employers to influence the choice by the workers of their representatives is illegitimate. Employers may prefer one union to another, but it is none of their business.

If this were all that the miners meant when they demanded "recognition," public sympathy would be entirely on their side. But there is some doubt whether, in fact, there is not further significance in the word. "Recognition" is sometimes spoken of as if it meant "exclusive recognition." If this is so, the Mineworkers' Federation are, in effect, asking to have the Industrial Union banned. If this is their intention (and the matter has never been clarified), it changes the whole aspect of the matter. It is, of course, desirable that there should be only one national body to represent the coalminers. But this desirability cannot be allowed to override the wish of a majority, or even of a substantial minority, of the Nottinghamshire miners to support an independent union. In any case, the first task is surely to take an independent ballot of the whole coalfield to ascertain which union is the choice of the majority. Willingness to abide by such a ballot might well be made a test of the real motives of the present skirmishings.

The right to strike as a last resort in industrial disputes has long been conceded in this country, and accepted as an inevitable part of the democratic order. But precisely because it is so accepted, the right to strike carries with it the obligation not to strike unreasonably. In neither of the two cases now before the public is there enough information available to say whether strike action is legitimate or not. Mr Bevin has shown a sense of responsibility in dissuading the tramwaymen from coming out in sympathy with the busmen. But there is a suspicion that the miners' officials have been overruled by the more militant attitude of the Federation's Executive Committee. If so, it is a doubtful augury for the beginning of a period in which many difficult problems of wages, hours and working conditions will have to be solved.

The British Steel Industry—II

THE main difficulties which face the steel industry in the matter of organisation are the wide range of products produced and the complexity of the relationships existing between the various firms. The industry embraces both the buyer and the seller of iron and steel in its many stages from the ore to the highly finished product. For very many years past the firms in most branches and in each market area have formed associations to fix minimum prices and sales conditions, and in a few cases to control output. Some of these associations have been strong enough to maintain some control over prices even during depression; others have collapsed, from time to time, under pressure; none of them has taken powers to rationalise production. One of the objects of the British Iron and Steel Federation, which was reconstituted in 1934, is to strengthen the associations, to make them fully representative of the various branches of production, and to co-ordinate

their activities to conform to the common responsibilities of the industry.

In addition, however, to the affiliation of the various associations to the Federation, the individual firms in the industry are themselves also full members. The Federation, consequently, is able to take decisions affecting the policy of the industry in many spheres besides those of prices and commercial policy. Negotiation of international agreements, discussions with consuming industries and suppliers of raw materials, examination and initiation of expansion schemes—on these and other aspects of policy the industry is able to express its views and reach general decisions whose implementation may involve action by individual firms, by the affiliated associations, or by the British Iron and Steel Corporation. The last-named body was formed about a year ago to carry out the agreed policy of the industry, whenever centralised action was called for.

Of all these various activities, that relating to price control is of special interest in view of the substantial advance in prices recently announced. Its importance is crucial, since many aspects of development are inevitably bound up with the determination of prices. The granting of protection to the industry in 1932 marks the beginning of a co-ordinated and comprehensive steel price policy. The industry subsequently undertook not to raise prices as a result of protection, but it accepted no responsibility for variations in the cost of ore, coke or scrap. Actually, the price level in existence when protection was introduced was broadly maintained until May of last year. By then a rise in raw material costs had occurred, and the economies of running existing plant at its full capacity had been attained. It therefore fell to the Import Duties Advisory Committee to determine, on the basis of audited costs, whether a rise in steel prices was justified. The advance sanctioned by the Committee in May, 1936, was rather less than 10 per cent. on the main finished steel products. This level was in force until a week ago, when a further increase of 20 per cent. was sanctioned. The prices of pig iron, semi-finished steel and almost the entire range of finished steel products are now subject to this form of regulation on a cost basis. The new prices approved by the Committee apply to deliveries up to the end of 1937; they are standard prices applicable to all consumers on the home market, and are to be regarded as both maximum and minimum prices. The increase of some 30 per cent. in the prices of plates, hoops, rails, joists and sectional material since 1932 contrasts with a rise during the same period of 46 per cent. in the cost of ore, 105 per cent. in that of coke and 86 per cent. in scrap—an average of 81 per cent. if the prices of the various items be weighted according to the quantity consumed in producing a ton of finished steel.

Apart from the desire to maintain stability of prices over as long a period as possible the price policy of the industry appears to be based on four main considerations. The first of these aims is to fix a level of prices which will afford labour and capital a return, over a period, sufficient to ensure an adequate volume of efficient production. In the second place, by providing an appropriate price margin between each stage of production, the industry desires to ensure an equitable return as between its various sections, and to maintain a balanced flow of production. A third objective is to keep raw material and other costs at the lowest possible level, so as to stimulate maximum demand at minimum prices. Finally, the policy provides for such price adjustments as will ensure that the required production is obtained from all plants, not excluding, where necessary, those whose costs are relatively high.

The first two objectives are self-explanatory. The extent to which reductions of costs are bound up with the location and the modernisation of plant was discussed in *The Economist* last week. The control of raw material prices is, however, a more immediate consideration, which has become particularly urgent in view of the rapid rise of the last few months. So far as domestic iron ore supplies are concerned, the position is safeguarded by the fact that two-thirds of the consumption is directly under the control of the pig iron makers. The remaining third, which is bought largely on long-term contracts, is not subject to sharp changes in price. As a result, the price of home ore has risen by barely 10 per cent. since 1932, while imported ores have advanced in the same period by over 70 per cent. Much the greater part of this increase has occurred within the past six months, and reflects the important part played by freight costs in the landed price of ore. Ore freights from the West Mediterranean and Spanish ports have advanced from 110 per cent. of their 1932 level a year ago to 235 per cent. to-day. The total cost to the industry of imported ore now substantially exceeds that of the much greater quantity produced at home.

In terms of value scrap is a more important raw material of the steel industry than ore. Here the position is more complicated, since the greater part of the scrap consumed comes from sources outside the direct control of the steel maker. In 1936 over a million tons

were imported and three million tons were bought in this country. Recently the price of imported scrap has tended to advance much more rapidly than home prices, so that while the increase in British scrap prices has been 11 per cent. in the past year, the price of imports is up by 65 per cent. and forward contracts can only be placed at a considerable further advance. The risk that the home price would rise parallel with this sharp advance in world prices has been countered by an agreement, negotiated between the steel industry and the scrap merchants, whereby the price is stabilised and the export of scrap supplies required by the home industry is avoided. As the scrap price in the world market is between £1 and £2 a ton in excess of the domestic price, and as it is desirable to import this year, if possible, as much scrap as was obtained from abroad in 1936, the policy has been adopted of buying the imported scrap centrally and spreading the cost.

The price of home-produced coke cannot be kept in check in the same way as that of ore and scrap. This is partly because pig iron makers themselves produce rather less than half the coke they use (a proportion which will be increased when a number of plants under construction are completed); but still more because 1½ million tons a year is sold for export, and an even larger quantity is used for non-industrial purposes. These two latter sources of consumption are exerting a vigorous and expanding demand. Through their competition with the pig iron makers for supplies—which are limited by the comparatively moderate rate at which coal output is increasing—the price has been forced up from 50 per cent. over the 1932 figure in May last year to 105 per cent. to-day. So far, no effective means has been found of exercising any control over the level of coke prices.

The remaining objective of the industry's price policy is clearly the provision of a price margin sufficient at least temporarily to secure an abnormally high volume of output from existing plant. There has been considerable danger in the past few months that the prices fixed a year ago would, as a result of the subsequent rise in raw material costs and the rapidly narrowing margin of even the most efficient producers, provide no incentive to expand production. They might even have led to curtailment of output at plants less favourably placed, and particularly at those dependent mainly on imported materials. This danger has been eliminated for the time being by fixing prices which provide adequate compensation for the costs of pushing production to a rate which for many firms exceeds a normally economic level. The marginal increment of output thus obtained must not be conceived simply as coming from plant which is less efficient or less favourably situated than that already in production. It also includes that additional output of even the most efficient works which can be made available by carrying production beyond the technical optimum, through the use of stand-by equipment, the payment of overtime, the excessive wear of plant, etc.

So far as the course of steel prices has been examined here, it would appear that within the framework of a level of prices approved by the Import Duties Advisory Committee, two main considerations have been kept in mind—the one to meet the present conditions of demand by ensuring the maximum of employment of plant and by drawing available raw materials from as wide an area as possible; the other to achieve this output economically by preventing, wherever possible, the forcing up of raw material prices in this country to the inflated levels of the international market.

In short, it would appear that the armaments race, superimposed on a rapid expansion of general trade, has brought the steel industry face to face with something like famine conditions. Technical improvement, modernisation of plant and the complete rationalisation of the industry, the necessity for which should have been foreseen, have been unduly delayed. But it is useless to cry over spilt milk. The justification of the price policy adopted in the present emergency is that while it does not deny to the industry the benefit of the long-awaited prosperity, it seeks in collaboration with the Government to moderate those elements of rising costs which lie within British control.

Millions for the Coronation

NAPOLÉON once described the English as a nation of shopkeepers. Mr Bonar Law, a Scotsman, called them a generous race. The Coronation of George VI has provided the occasion for an unprecedented display of both these interesting characteristics. Kings are rare in modern times, and the constitutional and Imperial monarchy of Britain is unique. It is, therefore, natural that the world at large is deeply interested in the traditional ritual and splendour which will grace the Coronation and in the tribute of loyalty which the whole Empire is about to pay to its royal head. Many people have come to England and they will spend millions of pounds in the space of a few short weeks.

When, on May 12th, the historic procession winds its way down the Mall and Whitehall to Westminster Abbey and back again along the Embankment, up Northumberland Avenue, Pall Mall and St. James's Street into Piccadilly, up Regent Street, along Oxford Street, and home through the Park to the Palace, there will be approximately a million patient and excited watchers on the route of six miles; and they will have paid more than a million pounds for their places.

As to the number of overseas visitors, it is probably not far from the facts to say that over 200,000 tourists will have come from the Empire and foreign countries when May 12th dawns; and that they will spend in the course of their stay in Great Britain more than £25 millions. This is one of many careful estimates made by a well-known firm on the London Stock Exchange in an admirably detailed bulletin, from which we have extracted some of the figures which follow. The total is about half that of all the visitors who came to this country in 1936, and the expenditure per visitor is likely to be considerably greater than in that year.

From the Continent, perhaps 100,000 people will come for the Coronation, which is about one-third of the total number of European visitors during the whole of last year; and they may spend some £3,000,000. In 1936, over 80,000 citizens of the United States visited this country; perhaps a quarter of that number will come this spring for the Coronation, to spend over £1½ millions. But the most notable (though not the most numerous) influx of visitors, however, will be from the far-flung parts of the Empire. More than 80,000 Imperial visitors are expected, i.e. some 15,000 more than in the whole of last year: they are likely to spend in this country and on passage fares on British liners the enormous sum of £21 millions, an average of over £260 per head; and they will stay for periods ranging from five weeks to three months. In the first half of 1936, only 8,000 Canadians visited this country; for the Coronation nearly 20,000 will come. In the whole of last year only 7,500 Australians made the long journey to Britain; this year 20,000 are expected for the Coronation alone. Shops, hotels, places of entertainment and transport services will benefit accordingly. Economic recovery will be given a fillip, and our surplus of imports will be more easily be paid for.

Nevertheless, these 200,000 visitors are no more than birds of passage. How many people will come to London from the provinces? And how many people will wait for hours on May 12th to see the State coach go by?

The number of visitors to Central London for Coronation Day is not easy to estimate. We know that over 200 long distance excursion trains will be run from all parts of the country on the night of May 11th, carrying perhaps 150,000 people. We know that between 12.30 a.m. and 7 a.m. on May 12 about 130,000 people in 179 trains will arrive at Liverpool Street, King's Cross and Marylebone; that between 3.0 a.m. and 7.0 a.m. over 300 trains will arrive at Waterloo, Victoria and Charing Cross, carrying over 200,000 passengers—more than the total number of visitors for the Coronation from overseas; that 25 special trains carrying more than 17,000 people will arrive at Paddington on the morning

of May 12; and that nearly 40,000 visitors will be similarly brought to Euston and St. Pancras. Over half-a-million people will come to the London termini in the small hours of Coronation morning, from the distant north, south, east and west, from the suburbs and from the Home Counties. And they will meet in Central London perhaps an equal number of Londoners and visitors from home and abroad, who will have made their way by 'bus, tram and underground or on foot to the six miles of streets which on that day will be the focus of the Empire's attention.

We have already suggested that a million people may witness the procession. The number will almost certainly not be larger than this because there will not be room for more—and it may even be less. A conservative estimate would be three-quarters of a million: with 85,000 in official stands, over 150,000 in windows and private stands, and about half-a-million standing on the pavements. Not even the most expert, however, can state a precise figure. Three agencies, controlling just over 50 buildings on the route, have sold nearly 25,000 seats. Three shops in Oxford Street can accommodate perhaps 6,000 people and one alone has sold over 2,000 seats.

The prices charged for places in shops and offices and institutions do not vary very much, differences being accounted for by the comparative prominence of the seats provided, and by the cost of meals which may be supplied. One shop in Piccadilly has seats varying from 2 guineas to 10 guineas in price; and another large establishment in Oxford Street has carefully graded the cost of places on the roof and six floors between half-a-guinea and 15 guineas, and has sold 2,400 seats for £11,500. Generally speaking, prices have ranged in Oxford Street and Regent Street from 2 guineas to 20 guineas; at Marble Arch and Hyde Park Corner from 12 guineas to 20 guineas; in Pall Mall and Northumberland Avenue from 4 guineas to 25 guineas; and in Park Lane and on the Victoria Embankment from 6 guineas to 20 guineas. Two of the largest agencies have estimated the average cost of seats under their control to be about 10 guineas. And two large private establishments have computed their average prices at 10 guineas and 5 guineas, respectively.

Probably a reasonably accurate average price per place, excluding the official stands under the jurisdiction of the Office of Works, would be less than 10 guineas and more than 5 guineas—say 7½ guineas. Before we can arrive at an estimate of the total sum paid for places, however, we must make allowances for a number of free places allotted to the staffs of shops and offices, to hotel guests, and to the students and staffs of hospitals. Two Oxford Street stores, for instance, are reserving their accommodation for their staff and their families. From the estimated 150,000 places we can probably deduct 15,000 for these and similar reasons. If we deduct a further 15,000 to cover possible exaggeration of the number of available places, we have a residual total of 120,000 places to be sold at an average cost of 7½ guineas. The total cost is therefore approximately £945,000. To this total must be added the money paid for places in the official stands—some 76,500 at 15s. each, and 8,500 at 22s. 6d. each, making a total of about £70,000. In all, therefore, those who pay to see the Coronation procession will probably spend just over £1 million.

Our inquiry thus suggests that to think in millions may be precisely relevant this Coronation-time. About one million people from overseas, the provinces, the Suburbs and the Home Counties will be in Central London on May 12; between three-quarters of a million and one million will see the procession; and those who have seats on the Royal route will pay about one million pounds for the privilege. To adopt the terminology of transport statistics, gross receipts will be nearly £170,000 per procession-mile.

Notes of the Week

A Valedictory Appeal.—Time and again Mr Baldwin has steered his party past troubled shoals by the finished simplicity, the firm conviction, and the subtle tact of his speeches to the House of Commons. When he rose on Wednesday evening, to speak there, probably for the last time, on strife in the coalfields, he was at his best. He made no attempt to analyse, to criticise, or to debate; nor did he speak as a party leader with a case to advocate. He spoke as a democrat, "believing that democracy at least can still practise the arts of peace in a world of strife"; and because "my time is short here now." He stated yet again his belief in freedom and personal responsibility, and pictured industrial relations in the context of democratic behaviour. Industrial democracy must be based on collective bargaining, to which the only alternative was anarchy. But collective bargaining imposed a grave responsibility on leaders and masters; they were responsible for the welfare of men and women, not only in their own trades, but without, and we must pray for their wisdom. "The whole world has its eyes on London. . . . I am going to make my last appeal in this House to the little handful who can decide whether it is going to be peace or strife." The House responded to this moving appeal by adjourning after a short further debate from which all acrimony had departed.

Industry and Arms.—Six months ago the Royal Commission on the Private Manufacture of and Trading in Arms issued a Report in which it admitted that circumstances had for the time being ruled out of court any hopes of limiting arms by international agreement, and rejected the possibility of a national monopoly of armament production in this country. It made, however, three positive suggestions: namely that the Government should assume complete responsibility for the armament industry by organising collaboration between the Government and the private manufacturers through a Ministry of Supply; that plans should be devised for limiting the profits of armament firms in peace time; and that control of exports should be tightened up by limiting licences to orders from foreign Governments and by requiring specific licences in all cases where open licences are now granted for certain classes of armaments. The Government have now published a statement of their views on this Report. As their chief energies are at the moment devoted to pushing forward their armament programme and bringing to its aid as much of private industry as they safely can, they not unnaturally accept the view that no fundamental change of system is possible or desirable at this moment. For reasons which are now familiar, they have rejected the proposal for a Ministry of Supply, and claim that the appointment of Sir Thomas Inskip adequately meets the need for greater co-ordination. So far as profits are concerned, they claim that the procedure now adopted by the service departments of the Treasury effectively prevent profiteering at the taxpayers' expense—though it is agreed that the position will need constant vigilance and that the Estimates Committee of a future year may usefully examine methods of control.

The Government are still surprisingly unrepentant about their attitude towards the American proposal of 1934 for controlling the international traffic in arms, and except for expressing general support for a convention on the publication of expenditure on arms, the Government's statement is entirely negative on the minor proposals of the Commission. There is nothing in all this that could not have been foretold; but the fact

that Mr Neville Chamberlain proposed his much-debated N.D.C. shows that the Government realise they have by no means allayed public preoccupation about the possibility of profiteering in arms. The many debates in the House show that informed opinion is far from being satisfied that the Government has achieved all that is necessary in co-ordinating the arms programme. It was not to be expected that a Royal Commission would change the Government's attitude on so central a part of their policy, or persuade them to change horses while crossing a stream. But though on paper they have given a complete negative, in practice circumstances are compelling them to take more complete control of an industry with which their relations are of so exceptional a character.

The Civil List.—The Report* from the Select Committee on the Civil List, published this week, is accompanied by an account of the proceedings of the Committee, which records a discussion on the style of living of the Monarchy and the Royal family. A motion by Mr Attlee called for greater simplicity in the state and ceremonial of the Court, and alleged that a right understanding between the King and his subjects throughout the Empire was impaired by his remote and ostentatious life, and by the fact that he was too much surrounded by persons from a single class. One may sympathise with Mr Attlee's reference to "the tedious and irksome ceremonial" which hedges round a King, to "the burden of Kingship" and to the importance of widening the personal contacts of Royalty, but it was inevitable that the Committee should have accepted the amendment of Mr Churchill that "we do not desire to see any changes in the style and establishment of the Sovereign and his family, other than those which His Majesty may himself see fit to make from time to time." Moreover, there can have been little dissent in the Committee from Mr Churchill's contention that the Crown has become "a bulwark against dictatorship"; or from the conclusion that the provision made for the Crown is "adequate, but not more than adequate." Simplicity is a virtue in a modern monarchy, but our constitutional King and his family do a great deal of very hard work for

a remuneration which probably represents a good bargain for the taxpayer.

* * *

The recommendations of the Report itself largely renew the provisions of the Civil List Act of 1936, advising only three changes, and making no mention of the Duke of Windsor. The Committee propose that the Civil List shall remain at the figure fixed for a married king in 1936, namely £410,000, for the Privy Purse, Household salaries and expenses, bounty and alms; and that the provisions made for other members of the Royal family shall remain as laid down in earlier statutes, thus in fact reducing the annual charge under this head from £194,000 to £169,000, since the former payment of £25,000 to His present Majesty when Duke of York has ceased. The only changes, excluding a hypothetical provision for the maintenance, education, marriage and demise of a possible Duke of Cornwall, concern Princess Elizabeth, the Duke of Gloucester and the so-called Civil List pensions. In the absence of a Duke of Cornwall, the Princess will receive £6,000 annually until she is 21, and thenceforward £15,000. The Duke of Gloucester, already in receipt of £25,000 a year under an Act of 1910, as a younger son of George V, will receive in addition an annuity of £10,000, in view of his additional duties during the minority of the Heir Presumptive. This total extra annual charge of £16,000 or £25,000 will be met out of the revenues of the Duchy of Cornwall, as was the additional £25,000 paid to the Duke of York during the reign of Edward VIII. The balance of the net revenues of the Duchy, estimated at £106,000, will, as formerly, be applied to reduce the amount of the Civil List.

* * *

The total annual provision for the King and the Royal Family will thus be £595,000, or £604,000 when Princess Elizabeth comes of age; but the Exchequer will only have to find £489,000, or £498,000. The "Civil List pensions" paid to persons of public, scientific, literary or artistic renown or their surviving dependents are in fact charged separately on the Consolidated Fund, but new authority must be obtained in each new Civil List Act. Since 1837, the amount of new pensions each year has been limited to £1,200; and the total charge has averaged £23,000 during the last 25 years. A change is long overdue in this material recognition of merit which is often ill rewarded financially. The welcome effect of the Committee's proposals will be to raise the annual limit to £2,500 and the total annual payment ultimately to £50,000.

Bus Strike Inquiry.—On Monday, May 3rd, a Court of Inquiry, appointed by the Ministry of Labour, met at Middlesex Guildhall to inquire into and report upon the hours and working conditions of London busmen and the matters in issue between the London Passenger Transport Board and the Transport and General Workers' Union. The Court, consisting of Sir John Forster, Sir Arthur Pugh, and Mr Basil Sanderson, first heard Mr Ernest Bevin, Secretary of the T.G.W.U., put the case of the men. Mr Bevin stated that the point at issue was "the intensification of the busman's job," which led to nervous and gastric troubles. The speeding-up of services, the growing congestion of London streets, and the lack of "a human interpretation" of the rules of the Board, had made the busman's life intolerable. Traffic density had risen 126 per cent. in sixteen years, and simultaneously the average speed of buses had been increased. There was no way of overcoming the disabilities of the work under these conditions other than reducing hours, from 8 hours a day to 7½. The case of the London Transport Board, put before the Court on Wednesday and Thursday, was that the total effect of applying a seven-and-a-half hour day would cost £650,000; that the financial position, stated

by Lord Ashfield, was unsatisfactory in view of statutory commitments; that no substantial extra revenue could be derived from an increase of fares; and that the Board was jealous of its reputation as a good employer. An interim report issued on Thursday night recommends that negotiations on matters other than the reduced working day should proceed at once; that although the evidence on ill-health had been inconclusive a *prima facie* case had been made out for immediate investigation by a properly qualified body; and that if the investigation elicits that the men's complaints are justified, hours should be reduced or other appropriate measures taken. Such measures would place an extra charge on the Board; but the Court feel that the Board would be assured of public support in finding the extra revenue.

The New Free State Constitution.—The newly published Constitution of the Irish Free State contains no mention of the King, the Governor-General or the British Commonwealth. These omissions were expected, since the occasion of the abdication was seized by Mr de Valera to register the distinction between the internal and external position of the Free State. Internally, no trace of the British connection has been permitted to survive, but externally the association with the other nations of the Commonwealth has been tacitly maintained. These developments do no more than regularise the *de facto* situation. Mr de Valera has to reduce to the minimum the volume of republican discontent at home without finally cutting the Commonwealth painter. The name of the new State is to be *Eire*, which is defined as a "sovereign independent democratic State," coterminous with the whole of Ireland; but the fact of partition is recognised "pending the reintegration of the national territory." There will be a President directly elected by the people, who will hold office for seven years and be eligible for re-election, but may be removed from office if impeached by the Dail on the initiative of the Senate. The President will possess fairly wide powers, including the former functions of the Governor-General. The Senate will reappear in a new form, consisting of sixty members, of whom eleven will be nominated and forty-nine elected by panels chosen on a vocational basis. The Senate will have power to delay legislation for three months, and in certain cases to demand a referendum.

* * *

The Rights of Irishmen.—The later sections of the Irish Free State Constitution are devoted to guarantees of certain fundamental rights and to the enunciation of general principles of social policy for the guidance of the legislature. These sections are interesting in that they are obviously an attempt to translate into practice some of the principles laid down in recent years by Catholic sociologists and in the famous Papal Encyclicals on the social problem. The fundamental rights guaranteed are equality before the law, the free expression of conviction and opinion, peaceful assembly without arms, the formation of unions and associations, the inviolability of marital and family relations, private property, freedom of conscience and the free practice of religion. Express provision is made for setting up special courts when, for any reason, the ordinary courts fail to function, so that the position of the present military tribunals will be regularised. It is doubtful if the new Constitution will make any difference to the average citizen, since much of what it states explicitly is already implicit in Irish life. The most that can be hoped from it is that its adoption will give the country a breathing space from the incessant preoccupation with political forms which has wasted so much energy in the last twenty years. One thing at least is certain. The adoption of the Constitution will do nothing to solve the great underlying problems of the Free State. The solution of these problems demands a higher degree of statesmanship than the drafting of new declarations of the rights of Irishmen.

Hitler's May Day Speech.—This year Labour Day has been celebrated in Germany as a Festival of Youth. As the Führer himself describes it, it is just the kind of festival that the children of the Canaanites were privileged to enjoy when they were dedicated to Moloch. For Herr Hitler's Leviathan is also to be honoured with human sacrifices. The Nazis, he explained, are not worrying about the few old block-heads left in Germany who are impervious to the Nazi appeal, because "we are taking their children away from them"—and this at ten years of age. These ten-year-olds, who are to be torn out of the family circle and segregated from the family atmosphere, are to be passed through the successive rolling-mills of the Hitler Youth, the Party, the S.A., the S.S., the Labour Front, the Labour Corps, the Army—and "if that won't make a nation out of such people, nothing will." "Nothing will," echoes the answer from the forbidding ruins of the history of other tyrannies which have tried this expedient. Herr Hitler is setting out to make a German breed of Spartans or Janissaries. But the Janissaries and the Spartans were not nations. They were gangs of slave-drivers holding down by terrorism a vast and hostile subject population. The system was so inhuman that the seeds of decay which it carried within itself were quick to ripen. Not content with thus declaring war to the knife on the family, Herr Hitler reiterated his defiance of religion as well. While the individual must "bend or break," the Churches—if they publish encyclicals—are to be "forced back into the spiritual sphere of the care of souls which is proper to them," while Nazidom occupies itself with really important things like production. If Herr Hitler meant what he said, the Churches could make certain of victory by taking him at his word. The pastor of souls, not the plantation overseer, has the last word when these two rival claimants for Man's allegiance come into competition.

Tremors in Middle Europe.—General Goering's visit to Rome, where he saw Signor Mussolini and Count Ciano for the second time this year, ended last week; and the General left for Berlin via Bled, in Yugoslavia, where he has been received by the Prince Regent, Paul. Hard on his heels, Baron Neurath posted to Rome last week-end. A communiqué was then published, after the usual meetings with the Duce and his Foreign Minister, which emphasised the interdependence and identity of policy of the two Fascist Great Powers in Europe, Germany and Italy; but it also, for the first time, emphasised

their definite will to continue to make in the future every effort that is susceptible of leading to a wider collaboration with the other Powers, and that may result in assuring to Europe the essential conditions of a greater and more secure political and economic stability.

Meanwhile, Count Ciano went to Tirana last week to reassure King Zog of Italy's determination to defend the integrity of Albania, despite the new Italian-Yugoslav pact; and Albania is to receive a new *douceur* from Italy of 10 million gold francs. Colonel Beck, Poland's Foreign Minister, has returned from Bucharest, where, it is said, he has been disappointed with King Carol's and the Roumanian Government's reaction to his proposed Rumano-Polish cordon of "neutrality." He is reported to have urged upon the Roumanians the advantages of cutting free from the obligations binding them to France and Czechoslovakia; but unsuccessfully. Finally, the President of Austria, Herr Miklas, accompanied by Chancellor von Schuschnigg (fresh from his meeting with the Duce at Venice) and Dr. Guido Schmidt, Assistant Foreign Minister, have been in Budapest this week. While Admiral Horthy emphasised the importance for Hungary of friendship with Italy and "the mighty German Reich," President Miklas, in replying, expressed Austria's hope that the desirable co-operation between all countries of the Danubian basin might be realised.

What has led to this diplomatic tourism? And where is it leading? The Venice meeting between Dr. von Schuschnigg and the Duce, the Italo-Yugoslav pact six weeks ago, and General Goering's visit to Prince Paul at Bled this week show that Germany and Italy have now a common policy about Austria and for the destruction of the Little Entente. Colonel Beck has seen Signor Mussolini's success in detaching Yugoslavia from solidarity with Roumania and Czechoslovakia, and this confirms him in his desire to keep on good terms with both Germany and Italy and to keep out of any co-operation with Czechoslovakia. German and Italian diplomacy thus seems to have succeeded in reducing the Little Entente to a mere alliance between Roumania and Czechoslovakia; to have completely isolated Poland from Czechoslovakia and France, and Czechoslovakia from France and Yugoslavia; and to have prevented Austria and Hungary from pursuing their inclinations and entering into closer economic collaboration with Czechoslovakia and Roumania. This success is, however, more apparent than real. Germany's and Italy's economic systems have nothing new to offer Austria, Hungary, the other States of the Danubian basin and Poland; whereas the outside world, and these States, among themselves, can now, with rising prices, greatly increase their trade. Yugoslavia's preference for blocked lire to blocked marks may yet prove unprofitable; whereas it is reported that commercial treaties are almost concluded between Hungary and Bulgaria on the one hand and Czechoslovakia on the other. Finally, the feeling is growing in Vienna, Budapest, Bucharest, Prague and Sofia that all the Danubian countries are now seriously threatened with a joint Fascist hegemony for Fascist ends. Their immediate reaction has been to sink their own petty differences before so great a danger to their independence.

* * *

Italy Looks Beyond the Mediterranean.—Sponsoring the naval estimates in the Italian Chamber on Wednesday, Admiral Cavagnari announced that any European conflict in future would soon become a world war; wars could no longer be confined to single frontiers; that "the State which already possesses the strongest navy in the world" had launched a naval armaments race; and that, accordingly, Italy must now have an "oceanic navy." He announced proximate increases in Italy's battle-cruiser strength and, proportionately therefore, in other naval categories, on the ground that the navy in war had to inflict the greatest damage on an enemy fleet; and he characterised the decision as "the most important change that must now characterise our naval programmes in the near future." He made the significant observation that Italy's success in the Abyssinian adventure had been due, in no small part, to the power of the Italian Navy. Thus, after Germany's obtaining the right in London last week to

build more 10,000-ton battle-cruisers and Japan's recent refusal to be bound by last year's agreement in London to limit naval gun calibres to 14 in., Italy, though still prepared to keep to that limitation, is now to increase the battleship "mass" of her navy and give the naval armaments race a push forward. But she has now only two modern first-class battleships; and when her current programmes are finished she will have only six. This is not a big "mass" for an "oceanic navy," even if all of it emerged beyond the Pillars of Hercules or the Red Sea; though Italy is tending more and more to defend her Mediterranean communications and possessions by aircraft. This week's news from Italy gives point to the conclusions of the article "War at Sea" in *The Economist* of April 24th, page 194. The arms race is now rollicking ahead in all branches of so-called defence services. Who will best stand the strain of peace—and of war?

American Neutrality.—The conflict in Congress between partisans of different conceptions of neutrality ended, as had been expected, in a compromise. The new Bill was passed on April 29, and flown for signature to the Caribbean, where the President is on vacation. The new measure embodies the main provisions of the expired statute; that is to say, the President is placed under obligation to declare that a state of war exists when hostilities, civil or international, have broken out, and thereafter it is illegal to export any commodities which are defined as munitions of war. But there is an additional provision that, if the President, by further proclamation, declares that the peace and neutrality of the United States are seriously endangered, it becomes illegal to sell any goods to the contending parties, save on the "cash and carry" principle, i.e. in return for immediate payment, the goods being taken away in foreign ships. The virtue of this provision is that it enables the United States to escape as far as possible from embroilment, while not completely abandoning her foreign trade. The fact that a "cash and carry" provision would favour the democratic countries as against others (since only they have the cash and the ships) is an accident, though an accident which is regarded as fortunate by an increasing section of American opinion. There have been some indications that the campaign for complete neutrality and insulation has passed its height. But it would be a grave mistake for any European to imagine that the United States is even approaching a willingness

to play any part in European affairs other than purely verbal criticism or approval of what European nations do or leave undone.

The Japanese Election and After.—The General Election held in Japan on Friday of last week was described as dull. This was because of a decrease in bribery and anti-Army talk, and because the two traditional parties—now in coalition—were returned in much the same strength as before the dissolution. Yet there are other features of this Japanese election which are full of interest. It is interesting that the Seiyukai and the Minseitō should not have been decimated by an election which the Government "made" for the express purpose of thinning their ranks. It is still more interesting that Labour should have doubled its previous poll. It is also significant that, on the morrow of this election, a rumour should have been put into circulation about an alleged design, on the Japanese Government's part, to approach the British Government with a view to a peaceful liquidation of the awkward situation created in the Far East by half a decade of Japanese aggression. In the recent past, the history of Japanese foreign policy has taken the form of a series of explosions of militarism, successively followed by anti-militarist recoils at the point where the use of force has begun to bring in diminishing returns. Has the explosion of 1931 now spent its force? This is a question which concerns not only the Far East but the whole world.

Road and Rail Traffic.—The decision of the four major railway companies to apply to the Railway Rates Tribunal next month for permission to increase freight rates by five per cent. raises an interesting economic problem. A uniform marking up of railway rates, unaccompanied by a corresponding advance in road charges, might well influence the proportions of goods carried by rail and by road. The diagram below shows the trend of rail and road traffic since 1929, as well as the course of general business activity, in terms of our own index, of which the others are component series. The figure of merchandise carried by the railways is based on the actual volume of goods carried, exclusive of coal and coke. In the absence of data about the volume of goods carried by road, the index indicating the trend of road traffic has been based on changes in the number of commercial vehicles in use. The two indices thus do

not indicate the actual proportions of the total volume of goods carried by road and rail respectively, but only changes in the relative share carried by each form of transport.

Despite its limitations, the implications of the diagram are fairly clear. Road traffic increased throughout the depression, largely at the expense of the railways, for the decline in the index of merchandise on railways between 1929 and 1932 was much more marked than the fall in general business activity. From 1932 onwards the number of commercial vehicles in use rose more rapidly, though the rate of increase, except in 1935, was not much greater than the rate of expansion of general business activity. The volume of railway traffic increased almost proportionately to the expansion of general business activity during 1932-34. It remained stationary in 1935, but has since advanced at practically the same rate as general economic activity. The bulk of the transfer from rail to road thus took place between 1929 and 1932. There was a further, though minor, change-over in 1935, but since then the railways have retained their reduced share of goods traffic. Three factors have contributed to the recent check to the transfer from rail to road. First, the railways benefited from the rapid expansion of the capital equipment industries since 1935, which involved an increase in the movement of heavy goods less suitable for transport by road. Secondly, it appears that the full effect of the restrictions on road transport was not felt until 1936. Thirdly, the railways have been able to stem the transfer from rail to road to some extent by reductions in freight rates for certain classes of goods. Although the first two tendencies still favour the railways, a general increase in freight rates of five per cent., unaccompanied by a corresponding rise in road charges, might well involve the railways in a further loss in their share of the country's transport. Indeed, there is no evidence that a uniform increase in rates is contemplated.

Employment Forges Ahead.—Partly in consequence of pre-Coronation activity, employment showed a further marked improvement last month. The Ministry of Labour estimates that on April 19th there were 11,394,000 insured persons (aged 16-64) in employment in Great Britain—152,000 more than in the preceding month and no less than 609,000 more than a year ago. Meanwhile, the numbers of unemployed persons fell from 1,601,201 on March 15th to 1,454,443 on April 19th. The total of unemployed workpeople is now 376,787 smaller than at this time last year, but this figure underestimates the improvement which has actually occurred; for the present total includes some 20,000 persons who have applied for assistance to the Unemployment Assistance Board, but were not registered earlier as seeking employment, and is also swollen by the inclusion of some agricultural workers. Changes in particular industries may be traced in the following table:—

UNEMPLOYMENT BY INDUSTRIES

Industrial Group	April 27, 1936	March 15, 1937	April 19, 1937
Coal-mining	218,477	130,888	124,051
Iron and steel	32,745	21,868	21,544
Engineering	65,908	44,160	41,316
Metal goods manufacture	43,667	31,109	28,495
Shipbuilding and repairing	49,742	38,690	36,591
Dock, harbour, etc., service	51,914	45,827	44,039
Shipping service	39,145	30,080	29,521
Building	119,511	157,299	113,997
Public works constructing	116,501	117,839	107,759
Stone quarrying	6,715	8,094	4,997
Cotton	74,073	44,322	43,380
Tailoring	14,271	14,445	12,349
Hotel, boarding-house, etc., service	65,261	69,578	63,566
Distributive trades	209,662	194,182	179,229
All persons registered (including other trades)	1,831,230	1,801,201	1,454,443

In no important industry was there a marked decline in employment last month, nor did any of the geographical divisions fail to share in the improvement. Reductions in the numbers unemployed ranged from 9,951 in the South-western area to 21,339 in London and 22,051 in Scotland. Of the persons on the registers at April 19th last, about 45 per cent. were applicants for insurance benefit and about 44 per cent. for unemployment allowances; the remaining 11 per cent. had no application for benefit or allowances. Twenty-five per cent. of the total, namely 321,000 persons, had been unemployed for twelve months or more, while 37 per cent. (480,000) had been on the registers for less than six weeks.

Industrial Progress.—This week brings news of several important readjustments in industry. The revised schedule of steel prices, published a month before the date originally intended, and showing rises of about 20 per cent., is discussed in a leading article on p. 324. The shortage in certain sections of the iron and steel markets remains acute. Producers are still booked up for months ahead, and imports continue to be well below the quota, though increased imports of ore have afforded some slight relief. The suspension of the tinplate restriction scheme in South Wales has led to the reopening of mills which had been idle for years. In the cotton trade the recovery in raw material prices, which has followed the liquidation of a good deal of undesirable speculation, has not yet restored the spirits of buyers of yarn and cloth. In the weaving section lively discussions are going on over three alternative proposals for securing better margins. One provides for an output quota of the familiar type, one for a compulsory scheme of insurance against the future stoppage of looms, and a third a legally binding agreement determining margins. However, the prospects for the adoption of any of these are not encouraging, and it seems that the spinners will remain the most prosperous of the two branches. The coal industry has seen an improvement in the chances of avoiding a national strike, which would be especially disastrous at a time when the shortage of particular grades of industrial coal is increasingly acute. Exports continue at a high level, and though some quotas have been raised, employers are still finding it difficult, especially in South Wales, to secure enough skilled men. It is not likely that the fundamental difficulties will diminish in the remaining months of the year.

Further Advance in Shipping Rates.—Shipping freight rates again sharply advanced in April, when our index was no less than 67 per cent. above the figure for April, 1936. Practically all the remaining idle mercantile tonnage has now been eliminated. The improvement in freight rates has been accompanied by a spectacular rise in the price of vessels. For example, a certain standard type of steamer, which changed hands

(1929=100)

THE
COMMERCIAL BANK OF SCOTLAND
LIMITED

Incorporated by Royal Charter and Act of Parliament

PAID-UP CAPITAL - - - £2,250,000

RESERVE FUND - - - £3,050,000

ESTABLISHED 1810

at £6,000 to £7,000 in 1932, was sold at about £32,000 last January and at £56,000 last month:—

(1898-1913 = 100)

	Average, 1913	April, 1936	February, 1937	March, 1937	April, 1937
European waters	110.0	86.1	114.0	150.4	157.9
North America	113.1	99.9	116.6	117.1	121.0
South America	123.4	87.4	124.0	119.3	145.6
India	106.3	95.0	148.9	151.4	147.7
Far East and Pacific	117.4	87.3	132.2	143.3	162.0
Australia	127.9	92.6	140.5	145.1	167.7
Total	116.3	89.9	134.3	137.8	150.3
1913 = 100	100.0	77.3	115.5	118.4	129.1

As will be seen from the more detailed analysis of changes in freight rates between March and April, advances were substantial on most trade routes:—

	Index No.	Inc. or dec. Points		Index No.	Inc. or dec. Points
Home trade	127.8	+ 4.5	South America: ..		
Bay—outwards	168.8	+ 3.7	Outwards	93.3	+19.1
Bay—homewards	232.3	+ 14.6	Homewards	197.9	+33.5
Mediterranean: ..			India—outwards ..	126.3	+12.6
Outwards	134.3	+24.0	India—homewards ..	169.1	+20.0
Homewards	156.8	+12.3	Far East, etc.	162.0	+18.7
North America	121.0	+ 3.9	Australia	167.7	+22.6

The increasing movement of primary products at higher prices has contributed, in large measure, to the strengthening of the freight markets. The tendency has been a little easier during the past fortnight; but as the tonnage disposable during May and June is limited, rates may be expected to remain firm.

Reorganising Electricity Distribution.—At the beginning of March the Minister of Transport announced that, with certain modifications in the details, the Government would accept the McGowan Committee's recommendations for the reorganisation of electricity distribution. Their proposals have now been sent to the industry and it is possible to see the changes which have been made. Amalgamation schemes are to be prepared not by special and temporary commissioners as the Committee had proposed, but by the Electricity Commissioners themselves. The Committee further had suggested that schemes which were not agreed to by small undertakings with output of less than 10,000,000 units, could nevertheless be put into force when approved by the Electricity Commissioners. Under the Government proposals such recalcitrants can only be brought to heel in the same way as large undertakings—namely, by the scheme being approved both by the Ministry of Transport and by Parliament. Since such small producers account for 431 out of the 597 producers of electricity, the Government's amendment appears to have added considerably to the difficulty of accomplishing an already formidable task. It is understood that finally the existing producers are to be grouped into 76 large units, some of which, however, will be further subdivided. Meanwhile it is hoped that these modified proposals will be carried into effect without undue delay.

The Sugar Conference.—A five-year agreement, concluded by the International Sugar Conference, was signed in London on Thursday. The agreement, according to Mr Ramsay MacDonald, provides for the regulation of quantities to be exported from the principal producing countries. It is the intention of the Government in the United Kingdom to invite Parliament to stabilise existing rates and general Imperial preferences during the period of the agreement. Colonial preferences will also be included. In short, the outcome of the International Sugar Conference has justified the limited expectations envisaged in an article in *The Economist* of April 10th (page 70). We then urged that even if a comprehensive scheme designed to restore freedom in the

world's sugar market was to remain a pious hope, importing countries might at least refrain from an intensification of their present restrictive policies. As we feared, however, exports are to be controlled by a system of quotas. Control of supplies may compensate exporting countries for the expansion of trade which would have resulted from a reversal of the restrictionist policies pursued by importing countries, but at the expense of consumers. Regarded as a test case of the willingness of nations to begin the task of freeing the channels of international trade, the results of the Conference are meagre. It is also open to grave doubt whether the expedient of placing the world's probable future consumption of sugar at an unexpectedly high level in order to secure any kind of any agreement among exporters will be proved beneficial. If prices are kept high, the potential increase of consumption will be discouraged.

Volume of Overseas Trade.—In these days of rapidly changing prices the returns of the value of our imports and exports no longer provide an indication of changes in the volume of trade. For a number of years the Board of Trade has calculated quarterly index numbers of the volume of trade by the elimination of changes in prices. Hitherto the Board's price indices have been based on average import and export prices in 1930. A remote base year, however, tends to lead to distortion in the indices for more recent periods, partly owing to changes in the distribution of foreign trade, and partly because of changes in the quality of goods. Consequently the Board of Trade has decided to recalculate its indices, taking 1935 as a basis. The year 1935 has presumably been chosen because a Census of Production was taken in respect of that year which will therefore, probably form the basis of the Board's revised index of industrial production. Details of the method of calculation of the new price indices are given in *The Board of Trade Journal* for March 4, 1937.

Comparable figures for 1930, 1935, and 1936, and for the first quarters of 1935-1937, are given in the table below:—

VOLUME AND VALUE OF IMPORTS AND EXPORTS

Period	Retained Imports				Exports of Domestic Produce			
	Declared Values	Index of Average Values	Values in terms of 1935 Values	Index of Volume	Declared Values	Index of Average Values	Values in terms of 1935 Values	Index of Volume
	£ Million	1935 = 100	£ Million	1935 = 100	£ Million	1935 = 100	£ Million	1935 = 100
Years								
1930	957.1	128.4	745.2	106.3	570.8	116.6	489.6	115.0
1935	700.7	100.0	700.7	100.0	425.8	100.0	425.8	100.0
1936	788.5	105.0	751.2	107.2	440.7	101.9	432.4	101.5
First q.tr.								
1935	164.4	99.2	165.7	94.6	105.5	100.1	105.4	99.0
1936	184.5	102.7	179.6	102.6	106.1	101.2	104.8	98.4
1937	210.8	113.5	185.7	106.0	121.1	105.2	115.2	108.2

The figures of retained imports show that the marked increase in the value of purchases abroad between the first quarters of 1936 and 1937 was largely due to a rise in prices. Owing mainly to the rise in the prices of primary products, the average value of our retained imports showed an increase of 10.5 per cent. during this period, while the volume of imports rose by only 3.3 per cent. Average export prices, after remaining almost unchanged for a prolonged period, tended to advance in recent months owing to the rise in the cost of raw materials and wages. Nevertheless, the advance in average export prices between the first quarters of 1936 and 1937, at 4 per cent., was much smaller than the rise in average import prices. On the other hand, the volume of exports rose by no less than 10 per cent. during this period, thus revealing the strong upward trend in international trade.

Revising the Budget

NEW YORK, April 27.—Herodotus states that there are certain mysteries of which it is not fitting that a layman should speak. One of these is the American Budget; but in the absence of the usual crop of gold and hot-money rumours, the financial community in the past week has given its attention to the fourth and latest presentation of the Budget for the current fiscal year (ending in June), and for the coming year. As the current fiscal year is all but completed the final results will be close to the present estimates of \$5,224 millions received and \$7,781 millions expended (less debt retirement), with a deficit of approximately \$2,500 millions. The 1938 Budget is already materially different from that presented in January; receipts of \$6,906 millions are now expected and an expenditure of \$7,324 millions is anticipated, with a deficit of \$400 millions. The principal change is the expected increase in revenue, to be achieved without additional taxation.

The fiscal year 1937 (June 30, 1936-June 30, 1937) has been one of the most prosperous years in American history. The index of production of the Federal Reserve Board will show an average for the twelve months comparable to that of 1928 and only a little lower than in the boom year 1929. The Federal revenues for the fiscal year 1937 are estimated at \$5,224 millions, a figure about \$600 millions below the original estimates, but \$1,100 millions greater than the actual receipts of the previous fiscal year, and about the same amount greater than the revenues of 1929. Expenditure on recovery and relief (\$2,630 millions) will be approximately as high as in any previous year, and the total expenditure in 1937 (\$7,781 millions) will be smaller than in 1936 by an amount which is less than the Veterans' Bonus. The deficit of 1937 (now estimated at \$2,557 millions) is less than the \$4,631 millions deficit realised in 1936; but half the difference is attributable to the bonus.

On January 6, 1936, the 1937 Budget was announced as anticipating \$5,654 millions of revenue, and in January, 1937, this estimate was raised to \$5,828 millions; the current estimate is \$5,224 millions. In January, 1936, the 1937 Budget placed expenditure at \$6,753 millions; in January, 1937, this estimate was lifted to \$8,076 millions (including \$563 millions of the unanticipated bonus); and it is currently revised downward to \$7,781 millions. In the uncertain days of early recovery it was expected that estimates of revenue and expenditure would be hardly more than well-informed guesses; but the continuance of such wide disparities between estimates and realisations in a highly prosperous economy is disquieting.

It is for this reason that the revised estimates for the fiscal year 1938 have not provoked detailed analysis in the press. In January the 1938 Budget anticipated receipts of \$7,293 millions; the figure is now revised to \$6,906 millions; and the anticipated expenditure of \$5,756 millions is now revised to \$7,234 millions. It should be explained that this revision of expenditure is the consequence of including \$1,500 millions of relief, omitted from the preliminary estimate. The result is that the 1938 Budget, which in January showed a surplus of \$1,500 millions ex-relief, now shows a deficit of \$400 millions. But even this relatively happy equation rests upon the forecast of an increase in revenue from \$5,224 millions realised in the current fiscal year to \$6,906 millions in the coming fiscal year, without any increase in taxation. The undistributed profits tax has

been effective only in the last half of the current fiscal year; nevertheless, the anticipated increase in revenue seems large, unless one assumes a further substantial increase in prices, the volume of trade, and corporate profits. The realised revenue of 1936 was \$4,116 millions; and this was not far from the receipts of the fiscal year 1929, which is generally rated as the most prosperous twelve months in American history. It will be noted that the anticipated receipts of the fiscal year 1938 are approximately 75 per cent. greater than the revenues of 1929 or of 1936. Taken with increases in local taxation, it is not unlikely that in many areas of our economy, taxation is now somewhere between 50 and 100 per cent. higher than before the depression.

Business Bullish while Wall Street Doubts

Statements for the first quarter of 1937 show corporate profits even larger than were expected. The reports so far issued are probably among the best, but these would suggest that the general level of corporate earnings may have risen perhaps twice as much as the level of production. It seems clear that these earnings have included the consequences of the rise in prices in the form of inventories, or of the unusually favourable price spread in the case of companies which have speculated successfully in their primary materials. Allowing for this factor, it is questionable if the profit margin is as wide in most industries as it was a decade ago, when production was at comparable levels. Attention is often drawn to the fact that profits have risen in percentage since 1932 or 1933 more rapidly than wages, employment, payrolls, etc. Such statements are statistically accurate, as there were no profits whatever in our economy in the depth of the depression. Wall Street is acutely puzzled. Commodity prices are 10 per cent. higher than a year ago; production is 20-25 per cent. higher; corporate earnings have apparently risen more than production; and the long-term interest rate is virtually unchanged. Yet equity prices are barely higher than in April, 1936. This is perhaps more a reflection of the rationalising processes of the human mind than an economic opinion. In general, the sentiment of business men is unanimously confident in the extreme—confident that present levels will change only for higher levels, and that profit margins will remain as satisfactory as they are now or will improve. In a word, the business community is uniformly bullish.

One could not say that the financial community was bearish; indeed, it attributes the recent and current weakness in securities to "foreign selling." But Wall Street is decidedly more temperate in its opinion than the business community. It is true that Wall Street's present mood is sobered by market action; but for some time minority opinion at least has doubted whether the consumer could pay the higher prices current and in prospect; and the schism between this section of financial opinion and the antithetical unanimity of the business community derives from the differences of opinion on that particular point.

France

May Day Calm

PARIS, May 5.—May Day, which was both Labour Day and the anniversary of the formation of the Popular Front Government, was very calm. The Internationale was broadcast by the national stations. The speech made by the Socialist Minister of State, M. Faure, was, however, conciliatory, and he admitted that the "pause" was a necessary period of economic adjustment. M. Jouhaux, leader of the Trade Unions, similarly accepted the "pause" in public expenditure, and the national unemployment fund, old age pensions, and the programme of public works must wait. Nevertheless this attitude, even after favourable statements by the Minister of Finance about the Budget, the Treasury and the franc, would not have been sufficient to provoke a recovery in the markets if it had not been assisted by economic and social troubles in other countries.

The French situation is actually dominated by two main factors: (1) the Government's want of authority; and (2) the effect of the social laws on prices. The threat to the Government's authority increases every time the masses take the offensive. But at the same time the general wish for calm in the country is always apparent; and public opinion, even if it is favourable to social reforms, is equally opposed to dictatorship of the right or the left, and there is no question of abandoning the field to the Communists. Every time that new financial difficulties occur, public opinion considers the time ripe for a change in government, and the fear of riots reappears. But when foreign markets are themselves disturbed, when Great Britain must issue a Rearmament Loan, when strikes break out in London and America, and when costs abroad are raised, then new hopes are aroused in France; and the franc with the Blum Cabinet is once more saved. Yet the remedy for the want of political authority and of economic and financial equilibrium has still to be found.

Government's Brighter Prospects

The reaffirmation of the "pause," and the improvement of the franc against the pound and the dollar which followed, will perhaps assist the money market and make easier the double operation of issuing a foreign loan and a sequel of short or middle term internal loans for the Treasury and local authorities. The total to be borrowed up to the end of 1937 is between 20,000 million and 25,000 million francs. After the 900 million francs of the Ville de Paris of last week, the veteran Pension Fund is issuing 2,000 million francs in 4 per cent. Treasury bonds; the extent to which this issue is covered will show the actual state of confidence on the market.

At the next meeting of the Chamber, on May 7, moreover, there will be an important debate on the policy of the Government. If, as is expected, this ends with an appeal by M. Blum for a truce to the conflict between parties and classes on the eve of the Paris Exhibition, it will refute the false rumours about French disorder which come from foreign sources. It is not impossible that a new lease of life will be accorded to the Cabinet, which may then remain in power until the autumn.

The production of steel in March was 675,000 tons, against 624,000 tons in February; and of iron 649,000 tons, an increase of 75,000 tons. The decline in wholesale prices has continued this week, as the following table shows:

	Mar. 27th	Apr. 3rd	Apr. 10th	Apr. 17th	Apr. 24th	May 1st
General index.....	536	540	542	539	537	533
National products	553	559	561	562	559	559
Imported products	507	505	507	498	497	487
Foodstuffs	518	527	533	532	526	522
Industrial products	552	551	550	546	547	543

Unemployment was further reduced last week to 371,413, compared with 377,677 on April 24.

Germany

Millions of Marks Seek a Borrower

BERLIN, May, 5.—The abundance of money has led to the flotation of a new Reich consolidation loan in the customary form of Reich 4½ per cent. Treasury certificates. The amount is Rm. 600 millions, of which Rm. 100 millions have already been placed, while Rm. 500 millions will be offered for public subscription at 98½ per cent. between May 13th and 29th. The average term of this loan to redemption is twelve years, against the nine years of previous loans.

Loans and industrial debentures on the Bourse again rose last week. The best barometer of money market conditions is the Gold Discount Bank, which has brought its circulation of promissory notes to a new high level of some Rm. 1,300 millions. The decline in deposits in the commercial banks, which has gone on for a year and is due, apart from Standstill withdrawals, to the practice of withholding industrial cash reserves from the banks and investing them directly in Reich "special bills" and other Reich short-term securities, has apparently ceased.

Cash is so plentiful that the Reich is actually presented as a benefactor for "sucking it up" (a financial journal's term). Referring to new sales in April of Reich non-interest-bearing Treasury certificates, the *Deutsche Allgemeine Zeitung* remarks that the Reich in shooting these certificates out "on a conveyor belt" was making a sacrifice in the interest of holders of cash who could not find enough investments; for the Reich did not need money. Some new Pirandello of the Dismal Science might launch a play entitled "Millions of Marks Seek a Borrower"—a condition pleasanter than the normal "Millions of Borrowers Seek a Mark."

Germany's Capital

It has generally been considered that Germany is a country poor in capital; and on that assumption, until the last few months, an embargo on new public (other than Reich) loans, and on all private issues, was maintained. The embargo has in part been removed. But official and private utterances about the new capital market are confused and contradictory. The confused imply, without committing themselves, that the large circulation of Reich credit instruments and the abundance of cash (which are the same thing) have in some mysterious way improved the capital market; thus the *Berliner Tageblatt* says that "the abundance of money is not merely accidental, but that it also involves capital seeking investment, is shown by the sharp rise in the Bourse quotations of fixed-interest securities"; and adds a comparison, in Germany's favour, with Great Britain, supposedly rich in capital, where "a Re-armament Loan was issued with a rather negative success, in that only 25 per cent. was subscribed." Dr Schacht, who is always clear, recently spoke of "newly created capital," with express reference to the present borrowing policy.

The ordinary Budget of Prussia for the financial year ended March 31st closed with a deficit of Rm. 14.3 millions; and the extraordinary Budget with a deficit of Rm. 900,000. Ordinary net revenue was Rm. 1,679.5 millions, and expenditure was Rm. 1,693.8 millions. The floating debt at the end of the financial year was Rm. 345 millions. Of the gross tax revenue of the Reich amounting to Rm. 11,500 millions in the same financial year, it appears that the net sum remaining to the Reich after paying the subventions to States and municipalities will be nearly Rm. 9,500 millions. In consequence of the decreed reduction of prices to farmers by 25 per cent., potash shares last week fell heavily on the Bourse, with a slight recovery towards the end. The three companies of the Salzdettfurth group have been obliged by the price cut to reduce dividends, despite good earnings in their last business year.

In order to facilitate the import of American cotton a new form of Aski account has been instituted. Contradictory statements have been made about German policy in freeing international trade. Dr Gravel, a

director in the Reich Bureau of Statistics, informed the Rhenish-Westphalian manufacturers that "Germany will not be able to follow up the aspirations towards a new introduction of free economy and free trade which are again in evidence abroad. Decisive for Germany is the political will to make herself and her economy as far as possible independent of abroad."

Ensuring Skilled Labour

The President of the Reich Board for Labour Exchanges and Unemployment Insurance has announced new measures to compel employers to accept an increased number of apprentices. A compulsory minimum will be fixed for each concern, and non-compliance will be punished by a fine of Rm. 50 marks a month for each apprentice short of the decreed number. The aim is to ensure a sufficient supply of skilled labour. The shortage of skilled labour, which is in general confined to building, steel and other investment trades, varies very much in different districts: in East Prussia last summer the number of building jobs open was thirteen times the number of locally unemployed in the same trade. Owing to the steel shortage the standards of construction stresses have been reduced; and the consumption of tinplates for certain industrial purposes has been forbidden. Manufactured consumers' goods have again risen in price. The retail supply of meat has improved. The official cereal returns for March show a satisfactory decline in consumption for the feeding of livestock. It is believed that the import of cereals in April increased very considerably. The Reich railways report for March an increase in goods traffic of nearly 13 per cent. compared with March, 1936.

Belgium

Fascism on the Ebb

LOUVAIN, April 27.—Belgium is now freed from the election excitement into which the challenge of the Rexists, whose leader is M. Degrelle, plunged the country. M. van Zeeland's success was so striking as to have even been acknowledged by his opponents. People are more surprised by the number of votes which were cast in favour of the Prime Minister than by the defeat of the Rexists. Political observers were already of the opinion that M. Degrelle's methods and his tendency towards dictatorship were becoming more and more repugnant to the Belgian people. It has also been said that M. Degrelle came two or three years too late, and that such movements can only be successful in times of weakness and depression, when they seek to catch up all the current discontent. The public is ready in periods of economic crisis to undertake all kinds of adventures, because they have so little to lose thereby. Discontent is, however, less effective in times of expanding business.

Belgium was pleased with the mission which the English and French Governments entrusted to M. van Zeeland and with the invitation of President Roosevelt. The country desires normal international relations, and everybody hopes that the effort of M. van Zeeland will prove to be successful. In spite of certain deviations from the principles of free trade, Belgium remains its advocate and would like to restore as far as possible the free functioning of world commerce.

Reducing Taxation

The recent election campaign accelerated a little the drafting of a programme for reducing taxation, which the Budget surplus has made possible. The fiscal year 1936 will probably leave a surplus of 120 million francs on the ordinary Budget; there still exists, however, an extraordinary Budget which serves to finance public works (such as new main roads) and, on a minor scale, armaments. More than 2,500 million francs have been voted on this Budget. But it happens that some of the voted credits have not been used; for 1936, extra-

ordinary expenditure will probably only amount to 1,850 million francs. This is a large sum, but not disproportionate in view of the present financial position of Belgium.

In the first three months of 1937 there was a surplus of revenue amounting to 90 millions. Consequently the Government abolished the crisis-tax, a supplement to the income tax instituted in 1931. For the public this additional tax was a sign of the bad times now over, and its abolition was popular. Actually, however, there are a number of taxes more injurious to business than the crisis-tax, and it might have been better to have discarded them first. The Government has this year lightened the tax burden by 1,000 million francs, about 10 per cent. of the total.

The National Income and Recovery

The Bulletin for Economic Sciences of Louvain printed recently a study of the national income of Belgium for a number of recent years:—

NATIONAL INCOME OF BELGIUM
(in millions of francs)

	Earned Income	Unearned Income	Total
1927	37,760	10,850	48,610
1930	50,700	17,790	68,490
1932	39,000	11,000	50,000
1934	38,700	11,010	49,710
1936	47,100	12,920	60,020

The same source states that the amount of wages paid out rose from 21,000 million francs in 1934 to 24,000 millions in 1936. Wages reached their lowest point in the first quarter of 1935; and since then there has been an advance of 30 per cent. in wages, while the cost of living has only increased by 15 per cent.

The effect of the introduction of a 45-hour week in the coal mines cannot yet be gauged, since the men have not yet begun to work additional hours for increased wage rates as they were invited to. The average reduction in the productivity of the labour because of the reduction of the working week from 48 to 45 hours is probably about 4 per cent. It is largest in the best organised coal-mines; it is less in the mines where there is still a considerable amount of short time. There is still a shortage of coal. The first contingent of Polish miners (2,000) have arrived, but so far the effects of a more numerous army of workers have not been perceptible in the production figures.

In the metallurgical industry there is widespread activity and optimism. In general, employment figures suggest that improvement has continued. The number of working days lost through unemployment, which was about 280,000 daily at the beginning of 1935, has declined to 113,000 to-day. There are probably only 80,000 entirely unemployed, and most of these are unemployable in the present industrial conditions.

Speculation Rebuked

The Brussels Stock Exchange experienced the world tendency which produced everywhere a set-back from the middle of March onwards. The previous advance, which began in the autumn of 1936, was due to the flowing of the savings of large classes of the public towards the Stock Exchange. Large quantities of gold coins returned to the National Bank; people, who had

saved them until then, were anxious to engage in stock operations, on which the Belgians as a race are very keen. People speculated in futures on the produce markets of London and New York. These operations added to the wave of speculation which caused an advance of quotations at first and afterwards a regression. Losses were heavy, but did not cause any important collapses in Belgium. They were, however, a useful lesson to check speculation, which was becoming too wild.

Japan

Defence Expenditure

Tokyo, April 9.—The Diet was dissolved on March 31st. The dilatory tactics of the major parties against Government measures were one of the avowed reasons for the Government's decision to go to the country, and the record of the session was relatively poor. In addition to the Finance Bills, however, the Bills for the stabilisation of raw silk prices, the State monopoly of alcohol, the control and regimentation of the carrying trade (other than by railway and shipping), and the establishment of health centres obtained Parliamentary approval. In the Budget estimates for 1937-38, approved by the Diet, expenditure totalled 2,872 million yen, including supplementary estimates of 58 million yen mainly for increased Exchequer contributions to local authorities. These estimates show an increase of 544.4 million yen on the Budget for the fiscal year just closed. The growth is accounted for almost entirely by the Defence Estimates.

The gross operating receipts of the Imperial Government Railway for the fiscal year ended on March 31st show that passenger receipts were 325 million yen and goods receipts were 246.7 million yen, making a total of 571.9 million yen. This was the largest total ever recorded, and is 50.6 million yen larger than the receipts of the preceding year. The increase is larger in freight than in passenger receipts.

According to Mitsui Gomei Kaisha's half-yearly analysis of the profit and loss accounts of Japanese joint-stock banks and industrial undertakings, the aggregate net profits of 250 banks for the second half of 1936 were 78,892,000 yen, a decrease of 397,000 yen compared with the first half of the year. The total net earnings of 1,000 industrial companies for the December half-year amounted to 459,273,000 yen, an increase of 35,263,000 yen on those earned by the same concerns in the preceding half-year. Except for breweries, tanneries, kilns, and stock and produce exchanges, all groups, and particularly textiles, paper, mining, trading companies and stores, and electricity and gas, showed a considerable increase in profits. The ratio of net profits to capital was 11.7 per cent., and that of amounts put to reserve was 3.1 per cent. In the preceding half-year the profit percentage was 11.2 per cent., and the reserve percentage was 2.9 per cent.

Increased Imports and Rising Prices

Raw material imports still continue high, and imports during March showed a considerable increase on last year's. The total value of imports, 400,568,000 yen, compares with 275,983,000 yen in March, 1936, an increase of 124,585,000 yen, or 45 per cent. Exports, at 276,005,000 yen, rose by 60,530,000 yen, or 28 per cent. The major advance in exports has taken place in manufactures; shipments of textiles are particularly on the up-grade. For the first three months imports showed an increase of 234,207,000 yen, or 30.3 per cent., rising over the corresponding quarter of 1936 to 1,006,986,000 yen; and exports rose by 116,721,000 yen to 701,133,000 yen, a gain of 19.9 per cent. Thus the import surplus amounted to the impressive sum of 305,835,000 yen against 188,349,000 yen in the same period of 1936.

Wholesale price movements, which suffered a setback in February, resumed their upward tendency last month. The Bank of Japan's wholesale index number for March registered a rise of 4.1 per cent on the month and reached

the highest point since March, 1926. The major advance was in metals, building materials, and chemicals.

Industrial activity is generally well maintained. The iron and steel industry is working to capacity, but output is failing to keep pace with current demand, and makers are forced to ration their customers. The engineering industry is also experiencing some difficulty in obtaining sufficient raw materials and skilled labour. The coal-owners' association has halved the penalty upon excess production above the quotas allotted to its members.

South Africa

Record Trade Figures

JOHANNESBURG, April 23.—The review of the Union Department of Customs and Excise for the year 1936 shows that exports reached a value of £114,168,233 and imports £86,299,361; total trade thus amounted to £200,467,594, an increase of nearly £23,000,000 compared with the previous year, and the highest total ever recorded. Another record was broken in the tonnage of goods landed at South African harbours last year, which totalled 4,491,971 tons, and represented an increase of over 20 per cent. in the volume of import trade. Of the hundred countries which supplied South Africa's import requirements 16 accounted for just under 92 per cent. of the total imports, representing a value of £74,529,287. South Africa continued to purchase the great bulk of its requirements in the United Kingdom, its British purchases representing a value of £36,635,000, equal to 45.2 per cent. The United States was second in the list with supplies to the value of just under £16,000,000, nearly 20 per cent. of the Union's total imports; Germany was third with goods to the value of £4,301,909. Japan's share of South African imports was valued at £3,065,329, while Canada took fifth place with £2,882,089. Foodstuffs figured higher in the list of South Africa's imports than in 1935, when this item was £3,791,946, compared with £4,089,145 in 1936.

Of South African produce exported to the value of £108 millions, nearly £82 millions represented gold, and about £2,500,000 diamonds, base metals, coal and other minerals and industrial materials. The balance of £19,500,000 represented the value of agricultural produce exported; and wool alone accounted for half this total. Japan was second in the list of South Africa's customers because of wool purchases to the value of £2,335,990, compared with £428,387 in 1935. France has become the Union's best foreign customer, and following Japan are Germany and Belgium and the United States. Mining and industrial machinery and supplies remain the principal class of imports.

Building Boom

In March a remarkable new record in the number and value of building plans passed by the Johannesburg Municipality was set up. Some 1,025 plans represented a value of £979,954. In the first three months of the year 2,922 plans have been passed with a total value of £3,320,400. In addition to 1,000 new houses and 100 blocks of flats, the plans are for 50 warehouses, six hotels, a theatre, a hospital, and an ice rink. The last item is valued at £29,500; one factory is valued at £45,000, and there are blocks of flats valued at £40,000, £32,250, £32,000 and £21,000. In nine months of the financial year the Municipality has passed plans to an aggregate value of £8,433,837, which is equal to the total building activity for the whole of last year in the other nine big urban centres of the Union. Johannesburg is growing at the rate of about 6,000 new buildings a year.

The annual report of the Union's Public Works Department shows that for the year 1935-36 the Department's "major works programme" amounted to £5,282,980, compared with £4,129,500 and £2,437,187 in the two preceding years. This expenditure is exclusive of the extensive national roads programme now in pro-

gress, while irrigation schemes are also under the control of another department. The report of the Director of Irrigation for the year 1935-36 deals with an expenditure of nearly £1,529,000, with commitments which will involve even a greater expenditure next year when construction on several big new schemes is at its peak. Total expenditure on irrigation works up to date exceeds £12,000,000.

Family Statistics

The Union office of Census and Statistics has just published a report on the expenditure of European families in urban areas which discloses how large a proportion of moderate incomes in South Africa is spent on necessities such as food, rent, rates and clothing. The percentages spent on these items falls as the income rises:—

	Percentage Expenditure Annual Income under		
	£175	£400	£600
Food	38.89	28.56	26.81
Rent and rates	25.21	21.37	19.57
Clothing	9.81	9.01	9.25

The report comments that the amount spent on amusement and sport by those in the lowest income groups is very small, being a little over one penny per month. In the highest groups the monthly expenditure under this heading averages 16s. 9d. Expenditure on holidays, though rising steeply as income rises, is also small. It is explained that "rent is in all cases high in the Union." The average monthly rent, including rates paid by the tenant, amounts to £6 7s. 7d., and the average size of a house is rather less than four rooms, apart from kitchen, bathroom and pantry. An average of over 27s. is spent in hire-purchase payments, half of the total being

paid for furniture, radio and refrigerator apparatus. The average spent on alcoholic liquor in the four lowest income groups is one penny per month; from this stage it rises by slow stages, but irregularly, to 5s. 9d. in the highest income group. The report shows that 17 per cent. of persons with an income of under £200 own or are acquiring houses; of an income between £200 and £300, 23 per cent.; of an income between £300 and £400, 36 per cent.; between £400 and £500, 46 per cent.; and between £500 and £600, 55 per cent. "It is clear that for married persons with a family, acquiring houses is the chief means of saving," comments the report.

Some illuminating figures about the comparatively small share of the selling prices of South African wines and brandy, paid by the consumer, which finds its way to the actual producer, are given in a report just issued by the Union Board of Trade and Industries on "Restraint of trade in the distribution of liquor." The general effect of the inquiry is summed up in the disclosure that of the 36s. per gallon paid by the consumer for South African brandy, the producer gets only 4s. 8d.; in the case of natural wines the producer's share is 1s. 3d. per gallon, for which the consumer pays 7s. 6d.; and in the case of fortified wines, the producer's 2s. per gallon compares with 9s. paid by the consumer. Duty and retailers' costs absorb over 50 per cent. of the consumer's 36s. per gallon of brandy, while the retailer's profits are about 7.6 per cent., the merchant's cost of preparation and selling about 1.2 per cent., and the merchant's profit 9.5 per cent. of the final price. The report comments: "On the whole, these figures confirm the general experience that the raw material cost plays a minor part in the total costs involved in placing a commodity at the disposal of the consumer."

Letters to the Editor

International Capital Movements

TO THE EDITOR OF THE 'ECONOMIST

SIR,—Several months have elapsed since the equalisation fund of the United States began to sterilize gold. But it is clear this policy has not led to the desired goal, for the upward trend of prices on the Stock Exchange and of the most important commodities has developed into an inflationary boom. Thus the policy of sterilizing gold has been an entire failure in the United States. The question arises if it was really the sterilizing policy of the equalisation fund in Great Britain which protected that country against the undue influence of foreign capital some time ago.

Capital flowing to a foreign country may merely seek protection against political and economic dangers at home. Then it will be kept as credit balances with a foreign bank, or it may be changed into foreign currencies. If money is transferred abroad, not for political reasons, but to divide the normally existing risks, or because foreign countries offer better opportunities for investment and appreciation, then it will generally be invested in long-term issues or in stocks. Sometimes there may even be investments in the form of direct participations in industrial enterprises or in real estate. As long as general economic conditions remain normal in a country to which foreign capital flows, i.e. where there is no danger of either deflation or inflation, the foreign capital will most probably be divided fairly evenly among the chief forms of investment.

Such investment will become a definite factor in the economy of a capital-receiving country, provided the sums involved reach a certain magnitude in proportion to the national capital resources. In this case, the action of an equalisation fund will be limited to the evening out of vehement short-term movements. Notwithstanding the most active working of the British fund, foreign capital has played its part in the recovery of British economy. On the other hand, the equalisation fund has effectively succeeded in protecting the home market against the short-term fluctuations of foreign capital.

About a year ago French money in enormous amounts took refuge in Great Britain and was mostly hoarded in pound sterling notes. This very particular form of investment was the more felt as for internal reasons the circulation of bank notes was at the same time expanding rapidly. Then, sterilizing gold alone proved to be ineffective and an

entirely new policy had to be adopted. The stabilisation fund was forced to sell gold to the Bank of England, in order to offset the actual pressure on the cash position of the London clearing banks.

We may assume that of the capital which recently flew to the United States only a small part went into bank balances or sought investment in long-term issues. The bulk was immediately invested in shares on the Stock Exchange or in commodities. There the purchases could be made only with rising prices, and their influence was the more perceptible as the market had already developed in a one-way road, material becoming scarce and demand growing rapidly. Thus it seems clear why the sterilizing policy of the American equalisation fund was bound to become a failure, its action being limited to the short-term money market. Even there, the hardening of interest rates which occurred at this time cannot be ascribed to the sale of Treasury bonds through the fund, but was evidently due partly to the new reserve requirements for the reporting member banks and partly to the growing

fear of inflation. In any case, the slump in the bond market had no influence on the conditions of the Stock Exchange.

What can be concluded from these developments? Sterilizing gold is clearly no panacea to prevent undesired investments of foreign capital in the domestic market of a country. This has been demonstrated whenever foreign money has been employed one-sidedly for a certain kind of investment, viz., the hoarding of bank notes by French capital in England and the share-buying of foreign capital on the New York Stock Exchange.

It may be that the revaluing of the dollar will prove the only practicable way to curb the rise in prices; in fact, revaluation of the currency may become a generally adopted policy as recovery advances. The forces which in a world of free trade would balance the levels of purchasing power and would dampen the trends of national price movements cannot now work. The manipulation of the currency may become the ultimate outcome of managed economy.

Believe me to be, Sir,

Yours faithfully,

Zurich.

WERNER BÄR.

[This letter is discussed in a Financial Note on page 341.—*Ed. Econ.*]

An Alternative to N.D.C.

TO THE EDITOR OF THE ECONOMIST

SIR,—“The increasing burden should be on increasing income.” Thus you have written in the current number; and this is the real alternative to Mr Chamberlain's hastily-designed National Defence Contribution. Taxes are paid by taxpayers, not by firms and companies; and the taxpayer's ability to pay depends on the amount of his income. If my own income went up by 9.4 per cent. last year, as it did, that is the measure of my increased ability to pay; and I should have no objection to paying an extra shilling in the £ on the “growth of income.” It would be necessary, of course, to make Stock Exchange profits liable to tax during the period of the special impost, with no allowance for losses.

Mr McKenna ought to have proposed an “Excess Income Tax” in 1915 instead of his E.P.D. I know, of course, that this would have been politically very difficult, since it would have meant taxing his new colleagues in the Ministry as well as large numbers of influential people whose incomes had increased owing to the War.

Yours, etc.,

J. E. ALLEN.

Cambridge.

Books and Publications

On Irish Conciliation

In view of the dangerous situation in Europe, and of the approaching Imperial Conference, it is deplorable that the relations between Great Britain and Ireland should be so unfriendly. This conflict between the two mother-countries of the Commonwealth is fraught with peril, inasmuch as it weakens Great Britain's power in both diplomatic and military fields, and thus injures the cause of world peace. The British public regards the Anglo-Irish quarrel with a complacency which is largely based on ignorance of the important part played by Ireland as a friend in the last war and of the dangerous part which she might play as an enemy in the next. It is with the object of ending this complacency that Captain Harrison has published this “brief study of the present position of the Anglo-Irish dispute from an independent Irish standpoint.”* This is not the first occasion when this very gallant gentleman has taken up the pen or the sword—both of which he uses with equal courage and effect—in the cause of his country, and

* “Ireland and the British Empire, 1937. Conflict or Collaboration?” By Henry Harrison, O.B.E., M.C. Robert Hale and Co. 320 pp. 10s. 6d.

National Finance

TO THE EDITOR OF THE ECONOMIST

SIR, Mr Paul Einzig accuses me of irrelevancy in giving what he describes as “a glowing but delightfully irrelevant testimonial to the friendly and pacific intentions of Germany and Herr Hitler.” But Mr Einzig himself brought Germany into the controversy about our national finance. He is certainly right in thinking that I regard Germany as potentially weaker than this country for defence, in that the proportion she is spending upon armament is much higher (I imagine) than this country's. During the Great War I believe most people were convinced that it was not so much the lack of armament which led to Germany's defeat, but the lack of a financial and economic reserve.

I am, Sir,

Your obedient servant,

London, S.W.1

D. M. MASON.

[This correspondence must now cease.—*Ed. Econ.*]

Labour's Share

TO THE EDITOR OF THE ECONOMIST

SIR,—In the leading article, “Labour's Share,” in your issue of April 17th, you refer to the difficulty of relating wages to the increasing prosperity of industry; and there will be general agreement with your view that if the necessary concessions to labour take the form of flat-rate additions to standard wage rates that a good deal of subsequent difficulty may arise if contraction should take the place of expansion at the end of a boom stimulated by armaments expenditure. May I suggest that those responsible for the conduct of industry should investigate co-partnership as a means of overcoming this difficulty? It has been shown in the Ministry of Labour Report on Co-partnership and Profit-sharing for 1920 that such schemes are most freely introduced when a period of rising prosperity coincides with industrial unrest.

Co-partnership and profit-sharing schemes provide a method by which a measure of social justice can be secured without the unsettlement involved in other methods of increasing remuneration. Plans might usefully be worked out for industries as a whole rather than separate firms; and in this connection one may mention the important agreement recently concluded for wages and security by the Joint Industrial Council of the Flour Milling Industry. This method of increasing the real income of wage earners in times of prosperity is one which is to be commended.

Yours faithfully,

JOHN RAMAGE,
Secretary, Industrial
Co-Partnership Association.

London, S.W.1.

advantage to the utmost. The whole gain secured by the Treaty was the attainment of Dominion status. How then can the Free State be accused of breaking the Treaty if she takes advantage of any developments that occur in the powers of Dominions? The English spokesmen are driven into a dilemma, escape from which is possible only by arguing that the Free State is different from all the other Dominions. But why should this be so? Has not the full Dominion status of the Free State been acknowledged by the Privy Council? It is a pity that Captain Harrison's book was apparently written before the abdication last December, since the events which took place at that time in the Dail, without arousing any official protest from Great Britain, suggest that the position which he maintains has come to be silently accepted.

In addition to this very able advocacy on constitutional issues, the book contains a valuable account of the relations between Great Britain, the Free State and Northern Ireland since the Treaty, fully supported by abundant documentation and statistics. The history of the dispute about the Ulster boundary, the land annuities and the financial settlement makes interesting reading, but the author is, perhaps, less convincing on financial than on constitutional issues. His general thesis is that the British authorities have interpreted the Treaty ungenerously and implemented it grudgingly, and have employed economic pressure to force the Free State to make political concessions. If Great Britain is the greater offender, as well as the stronger party in the dispute, it is proper that she should make the first overtures for a final settlement. Such is her duty, and such is her interest.

It may be well to remind the reader that Captain Harrison has written his book, not as the enemy but as the friend of England, for whose cause he fought in the Great War. It is because he realises that England is weakened internationally by the continued quarrel with Ireland that he has issued this appeal to the English public. To understand all enables men to forgive much, and this volume should aid the understanding of the Anglo-Irish dispute and thus pave the path to the great goal of Anglo-Irish appeasement.

Shorter Notices

“Survey of British Commonwealth Affairs. Volume 1 Problems of Nationality (1918-1936).” By W. K. Hancock, with a legal chapter by R. T. E. Latham 673 pages. 25s.

This exhaustive essay examines the various implications of the formal equality of nations which has been established within the British Commonwealth. Professor Hancock avoids the easier ground of Canada, South Africa and Australia, and seeks the real test of the new notions of national independence and freedom of commerce in the more thorny fields of Ireland, Newfoundland, India, Ceylon and Malta. He visualises the British league of free nations as a great experiment of vital importance to the whole world; and squarely faces the question whether real equality can actually be found in this untidy aggregation of peoples united only by the Crown. In particular he answers the allegations of German and Russian critics that force or capitalist exploitation is in fact the bond of Empire. The “right to secede” is dealt with ably and with notable common sense. The vigorous erudition and intelligent convictions of the author give this book a unity which its separate selection of territorial topics at first sight belies. The conclusions have a world significance; the minorities problem of the Commonwealth, and the contrast between British, German and Soviet conceptions of Empire, comprehend most of the issues by which the greater League of Nations has been torn to pieces.

“The British Empire.” Report by a Study Group of the Royal Institute of International Affairs. Oxford University Press. 336 pages. 15s.

This admirably lucid and objective study surveys the present position of the Empire and the problems which will be considered at the forthcoming Imperial Conference. Each part of the Empire is succinctly described; and the short descriptions, particularly of economic development, are excellent. The institutions, laws and conventions of the

Empire as a unit are clearly set out; and there are interesting discussions of relations with foreign powers, imperial defence and colonial administration. The problems of economic policy, population and migration are particularly well examined.

“The Menace of British Depopulation.” By G. F. McCleary, M.D. Allen and Unwin. 148 pages. 4s. 6d.

There is a rapidly-growing literature on the new aspect that the population problem has taken on in recent years, Dr McCleary's little book is a particularly welcome addition. Most of the recent books have been of a scientific nature, or at least designed for the reader who is prepared to tackle the mathematics of demography. But Dr McCleary is one of the first (if not the first) to explain simply, and in a most attractive literary style, the conclusions which have been arrived at by the specialists. The book has the further merit of discussing the position in the overseas Dominions, and demonstrating that the problem is not peculiar to these islands. The book is popularisation at its very best.

“Industrial Employment and Unemployment in West, Yorkshire. A Statistical Review of Recent Trends.” By J. Henry Richardson, M.A., Ph.D. Allen and Unwin. 142 pages. 6s.

This little book arose out of the preliminary investigations for a full-scale industrial survey (since abandoned) of the West Yorkshire district. The region is one of peculiar interest, for it is neither as specialised as some of the large industrial regions of the country nor as diversified as others, and during recent years it has been hard hit without being a depressed area. The book claims to be an introduction to the industrial structure of West Yorkshire, and answers the purpose excellently. But, especially since the intended survey is not to appear, it is to be regretted that the bare statistical bones were not a little better covered with descriptive flesh.

“An Atlas of Empire.” By J. F. Horrabin. Gollancz. 160 pages. 3s. 6d.

This is a complete survey of the Empire in clear, incisive and informative maps and ranks with Mr Horrabin's best work. Some people may question the emphasis of his verbal comments, but no one can do less than praise the skill and intelligence of his drawing.

“A Text-book of Marxist Philosophy.” Edited by J. Lewis. Gollancz. 400 pages. 5s.

The Leningrad Institute of Philosophy have prepared in this text-book of Dialectical Materialism a symposium which, in this excellent translation, will serve as a valuable addendum to the “Handbook of Marxism” issued recently by the same publishers at a similarly cheap price. To the unconverted the subject will remain largely unintelligible, but the faithful will find in this book an ample store of ammunition and the honestly curious much enlightenment. There is a gallant introduction by Dr Lewis which surveys the Marxian field from the standpoint of Western philosophical orthodoxy.

TRADING ABROAD

The existence of restrictions in a given country may temporarily prohibit dealings in forward exchange, but up-to-date information on this and on all points bearing on Forward Exchange generally may be obtained through any branch of the Westminster Bank. For any who may be unfamiliar with the facility, a very brief outline entitled *Forward Exchange* is always available at its counters

WESTMINSTER BANK LIMITED

Head Office: 41 Lothbury, London, E.C.2

MONEY AND BANKING

Our New Financial Machinery

TO-DAY perhaps is hardly the moment to talk of dearer money. Markets have lately received a series of shocks, and some of the speculative positions which undoubtedly existed have been wholly or partially corrected. Markets are now beginning to recover, and so far the evidence suggests that the underlying substratum of trade remains sound. Yet a period of tranquillity is now needed to allay men's fears, and while the growth of new speculative activity ought to be checked, it is essential not to disturb the even tenor of genuine trade.

Nevertheless, we have now had a very low Bank rate of 2 per cent. for the unprecedented period of nearly five years. Moreover, even the low Bank rate has been largely ineffective, for short loan and discount rates have stood consistently at less than one per cent. This state of affairs cannot last for ever. Again, while cheap money has been a powerful force behind the trade revival, it was not the only lever, and it would be harmful for people to gain the impression that trade can only prosper under conditions of ultra-cheap money. Some day this era of very low interest rates and abundant credit must come to an end, if only because the demand for credit will eventually grow to the point where it outstrips all reasonable supplies. Those who take the long view can argue that a modest stiffening of interest rates would be preferable to an attempt to maintain artificial cheap money conditions by means of an inflationary enlargement of the credit base.

The time may therefore be opportune to examine the instruments now at the disposal of the authorities for the regulation of the supply and cost of credit. It may be said at once that our present-day monetary and credit machine bears as much resemblance to the mechanism available in the days of the gold standard as locomotive No. 10,000 bears to the *Lord of the Isles*. In the old days of the gold standard, the authorities had two main levers and one simple test. The test was the rise and fall in the gold stocks of the Bank of England. In the light of modern knowledge this test was very crude, for we now realise that gold can enter or leave the country for reasons quite unconnected with our internal economic position. The two levers then in use were variations in Bank rate and open-market operations by the Bank of England. The former of these directly and arbitrarily altered the whole level of short-term interest rates, and by inducing the banks and other financial institutions to reconsider the division of their assets between bills and securities, also reacted indirectly upon the long-term rate of interest. Open-market operations by the Bank affected the supply of credit. The cost of credit was also affected indirectly by this alteration in the relative supply and demand, and if open-market operations were carried far enough, in time a change in Bank rate became necessary.

This was the traditional and simple machinery of former days. Since then there have been many developments. The first came in 1928 when the principles of a variable fiduciary note issue were established. This in theory enabled the authorities to alter at will the size of the banking department's Reserve, thereby providing an obvious justification for subsequent open-market operations by the Bank. In practice the fiduciary note issue has only been varied to prevent extraneous influences from acting upon the credit base. Thus it was raised in 1931 to protect the credit base from the gold drain, and lowered in 1936 to compensate for the Exchange Equalisation Account's sale of gold to the Bank.

The suspension of the gold standard in 1931 imparted a new degree of elasticity to our monetary machine. The Bank's gold reserves were no longer subject to pressure from all parts of the world, and in effect the Bank has since been only an absorber of gold. Nor were the authorities forced to maintain an arbitrary rate of exchange for sterling, regardless of whether or not that rate bore any relation to the proper value of the pound *vis-à-vis* foreign currencies. Quite reasonably efforts have been made to maintain moderate stability of the exchanges, but if any major readjustment was called for it has been possible to bring it about either unilaterally or by international agreement, without any disturbance to the internal banking system or the creation of an atmosphere of cataclysm.

The suspension of the gold standard was also the fundamental cause of the invention of new methods of control. Prior to 1931, the authorities were only concerned with regulating the cost of credit and the supply of joint-stock bank cash. No direct attempt was made to determine the composition of joint-stock bank assets, or the way in which they employed their funds. Our departure from gold, however, and also the depression and strangulation of international trade, brought joint-stock bank assets and indeed the whole means of employment of the savings of the nation very much more into the picture. The first change was that the Government came to be the main suppliant for available funds in both the long-term and short-term markets. The discount market came mainly to deal in Treasury bills and so automatically placed itself at the mercy of the authorities. In the long-term capital market the authorities had to adopt more direct methods. By enlarging the credit base and simultaneously restricting the supply of Treasury bills, they could force the banks into the long-term market as new competitors for Government securities. Equally they could limit the supply of other securities, both by the new control over investment overseas and also by the regulation of municipal borrowing. Finally, the Government, quite apart from its budgetary needs, was able to turn itself at will into either one of the largest lenders or largest borrowers in both the short-term and long-term capital markets. It could become a lender through the judicious use of the huge funds held by such Government institutions as the Savings Bank, the Unemployment and Health Insurance Funds, the Public Trustee and the National Debt Commissioners. It could become a borrower through the new Exchange Equalisation Account, for as we have pointed out before, every time the Account buys gold it has to borrow at short-term from the banking system in order to obtain the sterling required to pay for its gold.

Thus the Government is to-day one of the biggest borrowers and lenders in the market. Equally it is in a position to determine how much gold shall lie behind our credit base, for it is free to switch our total supplies of gold about between the Bank of England and the Exchange Equalisation Account. It imposes an unofficial but very real control over all foreign long-term borrowing and certain kinds of home borrowing. It has relieved the Bank from any drain upon its gold reserves, unless the Government itself decides to initiate such a drain not abroad but into the Exchange Equalisation Account. The practical import of these changes is threefold. First we have a much more delicate and elastic monetary machine, and it is not certain that the authorities have entirely learned how to use it. Next we have largely

insulated the internal supply and cost of credit from the former shocks which used to come from the outside world. Finally the control over the machine has passed mainly into the hands of the Government and its advisers.

This places the monetary outlook in a new perspective. If the Government of the day desires cheap money, there will be cheap money, even if like the late Lord Milner the Government decides to damn the consequences. Alternatively, if the Government thinks that dearer money is necessary, there are many new levers in the machine which it can use to-day. For example, the Exchange Equalisation Account could buy gold from the Bank without increasing the fiduciary note issue, at the same time paying for it by sales of Treasury bills to the joint-stock banks. In that event the latter would surrender cash for bills, which would at once tighten up the position again. Government departments could cease to lend, and instead hoard their funds. Here Professor Robbins, in *Lloyds Bank Monthly Review*, has made the interesting suggestion that in times of good trade when the Unemployment Insurance Fund is building up its reserves, it should deliberately hoard part of these reserves so as to smooth out the top of the trade cycle. One risk of all these new ideas is found in their secondary reactions, for so far we have little experience of the modern monetary machine. Used properly, the new mechanism now provides the authorities with a very delicate and complete means of control, and the old instruments of Bank rate and open-market operations in comparison resemble the traditional bull's onslaught on the gate. The real question of the future is whether the Government of the day, whatever its complexion, can be relied on to use its new instruments wisely, guided by economic rather than political considerations.

Financial Notes

The Bank for International Settlements.—At the conclusion of the seventh annual general meeting, held on May 3rd, an extraordinary general meeting was held to decide upon certain amendments to the statutes. The original constitution of the B.I.S. laid down that the chairman of the board of directors should be the president of the bank, and that subject to the authority of the board the president should carry out the policy and control the administration of the bank. The general manager is appointed by the Board. He is responsible to the president for the operations of the bank and is the chief of its operating staff. The extraordinary general meeting has now carried an amendment to the statutes separating the offices of president and chairman, and following this Sir Otto Niemeyer has been elected chairman of the Board, while Dr J. W. Beyen, hitherto alternate to Dr Trip the retiring president and chairman, becomes the new president. The advantage of this change is that the chairman of the board is no longer kept continuously in residence at Basle in order to perform his duties as president. This was largely why Dr Trip could only accept office on the condition that Dr Beyen could act as his alternate; for Dr Trip remained governor of the Netherlands Bank. Sir Otto Niemeyer also has important interests elsewhere than at Basle, and the same difficulty was likely to arise in the case of future chairmen. It is therefore a distinct advantage to create a separate office of president, especially as Dr Beyen is now available to accept the position. Dr Beyen and M. Pierre Quesnay, the general manager, will form a strong and experienced team. The seventh annual report of the B.I.S. has now been issued. It is an illuminating document, upon which we hope to comment in future weeks.

South Africa and Gold.—The present prosperity of South Africa is so intimately bound up with gold-mining that any fear of an impending reduction in the

world price of gold is bound to cause anxiety. The recent American gold rumours, the fall in the sterling price of gold, and the establishment in the London bullion market of a discount below the dollar parity price for gold, have all had their effect upon share prices both in London and Johannesburg, and it is hardly surprising that recent events have been the subject of animated discussion in the South African House of Assembly. As usual, pessimism has been carried much too far. The fall in the sterling price of gold has been very limited, for from a London price of 142s. per fine ounce on April 3rd, gold fell to a low point of 140s. 5½d. on April 27th, and has subsequently recovered to 140s. 9½d. At the time of the first gold scare in early April there was a discount of 4d. per ounce below the dollar parity price, because for a few days no one dared buy gold for shipment to the United States. Still, the British authorities supported the market both then and during the last few days, and the discount has now almost disappeared. The real explanation of the fall in the sterling price of gold lies not in this discount but in the appreciation of sterling against the dollar, and so long as America remains the chief buyer, fluctuations of this kind are unavoidable. In any case there is no reason to suppose that they are other than temporary, because there are several reasons for regarding the present level of sterling as too high. As regards share price movements, between April 3rd and 29th, *The Financial Times* index number of South African gold-mining shares fell from 223.5 to 191.5, or by 14.3 per cent., subsequently recovering by 9.7 per cent. to 205.0. A fall of this kind is out of all proportion to the very limited decline in the price of gold and any consequent effect upon mining profits, and so can only be ascribed to the general weakness of the London market, due to other causes besides gold rumours.

International Capital Movements.—Exchange Equalisation Accounts are still a comparatively new invention, and their technique of operation is perhaps not yet fully appreciated. For example, it is less than a year ago that the British authorities discovered that the Exchange Account had to sell gold to the Bank in order to offset French hoarding of British currency; while only last December did the American authorities realise that their Stabilisation Fund had to carry a stock of dollars as well as gold. A further point that has hardly yet received sufficient attention is that it is not enough to offset international movements of funds. Some regard must also be had to the cause and purpose of their movement and the use to which their owners put them on arrival in the foreign centre. These points are brought out in a letter on page 337, in which the writer calls attention to the influence of foreign investment on the economy of a capital-receiving country. The reactions of an import of foreign funds clearly vary, according to whether such funds are hoarded in currency, lodged on deposit at a bank, or invested in Government or industrial securities. For these reasons the writer is a little sceptical of the values of Exchange Funds. Our own view is that the part played by an Exchange Fund in the internal monetary mechanism of a country is still imperfectly appreciated. We, as the originators of Exchange Funds, may fairly claim the greatest wealth of experience, but even we have done no more than realise the reactions of foreign hoarding. Our correspondent's letter shows the need for yet a closer examination of the uses to which foreign funds are put on their arrival in London, and the result of that examination may influence the conduct of the Exchange Equalisation Account, and more precisely the extent to which it ought to share the gold with the Bank of England. Our correspondent's letter, in fact, is not an argument for the abolition of Exchange Funds, but on the contrary a plea for their development and more skilful use. They should be a part of our internal, as well as our external, monetary mechanism.

The Money Market.—There has been a fair demand for loans this week, while in spite of the expansion in bankers' deposits several of the banks have found it necessary to call from the market on their making-up days. In consequence those banks who were not making-up lent a fair amount of money. Rates are mainly unchanged from last week, but outside money is a shade easier.

	Apr. 15, 1937	Apr. 22, 1937	Apr. 29, 1937	May 6, 1937
Bank rate	2	2	2	2
Clearing banks' deposit rate	1	1	1	1
Short loan rate:—				
Clearing banks	1-1/2	1-1/2	1-1/2	1-1/2
Others	1-1/2	1-1/2	1-1/2	1-1/2
Discount rates:—				
Treasury bills	1	1	1	1
Three months' bank bills	1-1/2	1-1/2	1-1/2	1-1/2

• Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

Last week the syndicate only obtained 17 per cent. of the Treasury bill allotment of £40 millions, and so there remains a scarcity of bills. The market is beginning to discuss who is taking the bulk of the bills, but this is a question which it is impossible to answer. It is generally agreed that practically all the new Defence Bonds were taken "inside."

The Bank Return.—Coronation and Whitsun currency demands have raised the note circulation to a new high record of £475.2 millions. Usually Christmas provides the year's peak, so that the upward trend of spending this year, coupled with the Coronation, has overcome the normal seasonal fluctuation.

	May 6, 1936	Apr. 14, 1937	Apr. 21, 1937	Apr. 28, 1937	May 6, 1937
	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Issue Department:—					
Gold	203.7	313.7	313.7	313.7	313.7
Note circulation	422.6	465.7	464.0	468.8	475.2
Banking Department:—					
Reserve	41.8	48.9	50.7	45.8	39.4
Public deposits	9.2	22.4	25.6	26.2	18.4
Bankers' deposits	88.3	96.9	91.2	87.6	97.2
Other deposits	36.7	37.9	38.9	39.6	37.7
Government securities	88.8	96.9	94.1	97.7	103.1
Discounts and advances	9.4	6.9	4.6	5.5	5.4
Other securities	11.9	22.1	24.0	22.0	21.0
Proportion	31.1%	31.0%	32.6%	29.9%	26.0%

Normally, the expansion in the note circulation would have caused a drop in bankers' deposits as well as in the Reserve, but bank cash has been replenished by Government dividend payments, which have transferred £10 millions from public to bankers' deposits. Also Government securities have risen by £5.4 millions. This again swells bank cash, which has actually risen by nearly £10 millions during the past week. It is suggested in the market that there may have been special buying of bills to keep money easy in face of the increase in the note circulation.

The Foreign Exchanges.—Sterling developed a certain amount of general weakness on Monday and Tuesday. The London bus strike was one of the causes, for the Continent erroneously expects a British labour dispute to give rise to the same disturbances as on the Continent. Also there are a fair number of losses to be carried on most Continental bourses, and these necessitated a general repatriation of funds. At one time the Paris spot rate came down from Frs. 110½ to Frs. 109½, but since Tuesday it has returned to Frs. 110. Three months' francs have narrowed from Frs. 2½ to Frs. 1½ discount. The New York rate similarly came down from \$4.92 to \$4.93½, rising later in the week to \$4.94. Guilders, belgas, and Swiss francs moved with the dollar, and there is now a semblance of a "dollar area" in some ways comparable to the sterling area. The Stockholm rate against sterling has now come back from over Kr. 19.40 to Kr. 19.39½, or nearly to the

normal pegged rate of Kr. 19.39½. It looks as if the squeeze against the bulls of kroner may be nearly over.

The Union Bank of Scotland.—Sir A. Steven Bilsland, in his annual address to the shareholders, alluded this week to Scotland's share in the general trade recovery and in the rearmament programme. Scotland's difficulty lay in the fact that most of her industries were of a type to which recovery came late in the trade cycle. Another disadvantage was the narrow basis of Scotland's economic structure. He therefore urged that before the next period of depression they should attempt to achieve an increase in the variety of Scottish industries, and more particularly should attempt to develop the lighter engineering trades. This point he had previously illustrated by an allusion to the March unemployment returns of 87,603 for Glasgow, contrasted with only 16,000 for Birmingham. His warning that, unless this better diversification of industry could be achieved, Scotland would be worse hit by the next depression than other parts of Great Britain, is very timely, and points to the need of a closer investigation of Scottish industrial problems. His desire for the development of fresh enterprise in Scotland perhaps explains his criticism of the Budget in the concluding passage of his address. He felt bound to call attention to the discriminatory character of N.D.C. and its probable effect on those areas where recovery had been delayed. The bank's own accounts gave evidence of improved trade and turnover, but the chairman is rightly not content to leave the industrial future of Scotland to chance.

Insurance Notes

General Accident Fire and Life.—All new life business is transacted by the General Life Assurance Company, not by the Corporation itself, and in spite of the low rates of bonus declared by that company at its quinquennial valuation at December 31, 1935, new business last year fell by £31,000 only to £2,854,000. The net rate of interest earned on the life and annuity fund, which includes the existing business of the Corporation, fell by 3s. 10d. per cent. to £3 19s. 3d. per cent. Death claims at £322,000 were £82,000 smaller than in the previous year. In the other branches there was a satisfactory all-round expansion in premium income. Fire premiums increased by £32,000 to £675,000, accident and general premiums by £526,000 to £8,022,000, and marine premiums by £27,000 to £191,000. While fire branch results were, as usual, very good, the improvement in the accident profits, both absolute and in relation to the premium income, is specially gratifying. The difficulty in extracting a net profit from the miscellaneous branches of insurance, other than fire, are well-known, and the 1936 ratio, 5.4 per cent. of premium income, must be regarded as very satisfactory.

	1935	1936
	Amount of Profit	Amount of Profit
Fire	139,396	135,754
Accident and general	285,090	430,245
Marine	1,911	22,231
Life	8,229	—
Capital redemption	1,350	—
Profit on sale of investments	—	30,054
	432,154	573,822
Less items debited to profit and loss	286,910	321,986
	145,244	251,836
To reserve	125,000	100,000
Net trading surplus	20,244	151,836

Total assets, including subsidiaries, amount to £18,123,000, against £16,780,000; there is a general reserve of £2,000,000 and a free profit and loss balance of £643,000. There is no marked change in the classifica-

tion of investments, but an increase is noted in holdings of foreign government securities from £1,668,000 to £2,218,000. The rate of dividend is increased from 64 per cent. to 68 per cent. and costs £262,000, contrasted with available net interest earnings of £277,000. Since the close of last year the 400,000 ordinary shares of £5 each with 25s. paid have been sub-divided into 2,000,000 shares of £1 each with 5s. paid.

North British and Mercantile Insurance.—In the life department new sums assured increased further from £5,507,000 to £5,635,000, but annuity consideration moneys fell last year from £701,000 to £659,000. The net rate of interest was 2s. 2d. per cent. lower at £3 12s. 10d. per cent. Death claims amounted to £1,103,000 compared with £1,007,000 in 1935 and £1,218,000 in 1934, while annuity payments increased by £26,000 to £482,000. In the fire department premiums were £3,402,000, against £3,383,000, while claims increased from £1,262,000 to £1,399,000. The 1935 losses were, however, the lowest in proportion to premium income in the history of the Company; and the Chairman at the last annual meeting pointed out that the ratio, which was due to exceptional results in U.S.A., could not be regarded as at all normal or, indeed, reasonable. The premium income of the "Railway Passengers"—the accident department of the Company—increased by £43,000 to the new record figure of £1,255,000. In the marine branch—represented by the "Ocean Marine"—premium income increased from £217,000 to £236,000, while the "Fine Art and General" premium was £14,000 greater at £348,000.

	1935	1936
	Amount of Profit	Amount of Profit
Fire	461,648	369,286
Railway Passengers	148,209	138,019
Fine Art and General	42,646	51,193
Ocean Marine	40,000	40,000
Life	67,460	67,460
	759,963	665,958
Less Items debited to Profit and Loss Account	59,958	158,848
Net Trading Surplus	819,921	507,110

The negative amount shown in 1935 as debited to profit and loss arose from a transfer of £200,000 no longer required from income tax reserve. In the fire department there is an additional reserve of £2,000,000.

Separate balance sheets are presented for the Life, Annuity, and Sinking Fund branches, and show assets of £31,556,000, £7,797,000, and £513,000 respectively. There is a general balance sheet, including these items, in which assets aggregate almost £54 millions. The separate and additional balance sheets of the "Railway Passengers," "Ocean Marine," and "Fine Art and General" gave assets of £3,301,000, £1,797,000, and £1,552,000. In the life balance sheet there is a large decrease in policy loans from £2,594,000 to £2,216,000. Little change has occurred in British Government and Municipal Securities or in Indian and Colonial Government Securities, but Foreign Government Securities increased from £448,000 to £545,000. Debenture stocks increased by a trifle in percentage to £5,016,000, but Preference and Ordinary Stocks rose by £144,000 and £452,000 to £1,211,000 and £842,000 respectively. The dividend is at the rate of 6s. 3d. per cent. (whether partly or fully paid), equivalent to 25 per cent. on the nominal amount of each share. It cost £520,000, compared with available interest earnings of £536,000.

Commercial Union Assurance.—New sums assured in the Life Department amounted to £5,533,000, compared with the previous record of £5,120,000 in 1935

and £4,631,000 in 1934; annuity considerations were smaller by £16,000 at £461,000. Claims by death aggregated £565,000 against £417,000 in 1935, but the experience in the latter year is known to have been particularly favourable. The net rate of interest earned on the life and annuity fund dropped by 3s. 9d. per cent. to £3 19s. 3d. per cent. The new business of the British General, the shares of which were purchased by the Commercial Union in 1926, increased by £111,000 to £871,000. Fire premium income of the Commercial Union, including its subsidiaries, increased from £5,266,000 to £5,308,000; as in the case of other composite offices doing a large proportion of fire business in the U.S.A. the underwriting results attained the same high level as in 1935. Accident premiums rose by £32,000 to £7,642,000, while underwriting profits increased by 64 per cent. to £425,000. The marine premium income of £610,000 also showed some increase, and £100,000 was again transferred to profit and loss.

	1935	1936
	Amount of Profit	Amount of Profit
Fire	602,063	487,680
Accident	258,630	425,023
Marine	100,000	100,000
Life—		
Commercial Union	35,449	35,449
Union Life Fund	5,000	5,000
Hand-in-hand	45,000	45,000
Fund	3,463	3,463
British General	4,800	4,800
Sinking Fund	1,054,405	1,106,415
Less Items debited to Profit and Loss	217,682	345,513
To General Reserve	300,000	250,000
	536,723	510,902

In addition to 40 per cent. of the premium income for unexpired risks, additional reserves are held in the fire and accident branches amounting to 91 per cent. and 34 per cent. of the 1936 premiums. The total assets of the Commercial Union and its subsidiaries, but excluding the life department and the various subsidiary life funds, are in excess of £31,400,000, while there is a general reserve of just over £4,000,000. The life department balance-sheet shows assets of £25,422,000, and the various subsidiary life funds balance-sheets give assets aggregating nearly £8,000,000. The dividend is again at the rate of 40 per cent. and costs £1,100,000 (on the basis of tax at 4s. 9d. in the £) compared with available interest earnings of £709,000.

Gresham Life Assurance Society.—This Society, which is now controlled by the Legal and General, has always been particularly identified with life assurance overseas. In the rapid expansion in the new business of the "Gresham" in recent years, the proportion of foreign business has been fully maintained:—

Year	New sums assured (foreign)	Percentage of total new sums assured
1932	1,078	58
1933	1,406	65
1934	1,641	63
1935	2,141	64
1936	2,540	68

The net rate of interest fell last year by 2s. 2d. per cent. to £4 7s. 8d. per cent. Total assets increased from £10,187,000 to £10,661,000. Mortgages on property and British Government securities were somewhat smaller, but British Municipal Securities increased from £147,000 to £240,000. Foreign Government Securities, for obvious reasons, an unusually large proportion of the assets, and last year the amount so invested increased from £1,788,000 to £1,954,000. Debenture stocks were £135,000 greater at £1,698,000 and Preference and Ordinary stocks each increased.

THE STOCK EXCHANGE

London Transport Finance

THE absence of London's 6,000 buses from the streets is an unwelcome portent for the holder of London Transport "C" stock. The stoppage involves an immediate loss of revenue to the Board, but owing to the operation of the traffic pool in the London area the Board's net revenue does not suffer the full burden. The major consideration for the investor is the Board's statutory obligation to pay the full standard dividend of 5½ per cent., either this year or next, on its "C" stock on pain of receivership. The suggestion at this week's proceedings that the bus workers' claim may be inimical to the "C" stockholders' interests—and might even challenge their statutory rights—needs careful examination.

For some months the market has been revising its estimates of Transport "C" stock prospects. At one time last year the stock touched 112½; after the issue of the accounts for 1935-36 the price was two points below par; now, after nearly a week of the strike, it stands no higher than 86, having been as low as 83 earlier. To measure the immediate loss of net revenue arising from the strike itself is not easy. Like all calculations affecting the Board's net revenue position, it is complicated by the operation of the London Passenger Pooling Scheme, under which the Board's revenues and those of the suburban services of the main-line railways are pooled and re-distributed. From the total, London Transport takes 62.1 per cent. and the four railway companies take 37.9 per cent. The total receipts of the pool for the year to June 30th last were £40,606,339. London Transport's traffic receipts (including its share in the pool) totalled £29,724,723, compared with 52 weeks' traffics (before pooling) of £28,477,300.

To the extent, therefore, that the would-be bus passenger transfers to the other services in the pool, the latter's total revenue will not suffer. Some loss of revenue is, of course, inevitable, but even so, the other undertakings in the pool will shoulder nearly 38 per cent. of it. So far as the Board's own figures are concerned, a rough analysis of operating costs for buses last year (£12,910,822), suggests that some £10,179,234 can be attributed to charges which vary with the traffic, while £2,731,588 can be regarded as constant for the purpose of estimate. The Board's bus receipts before pooling averaged £305,500 weekly, while expenses were £248,200, some £195,700 representing current expenses and the remaining £52,500 more or less fixed items each week. So far as the Board is concerned, the variable costs will be temporarily saved while London remains busless. Thus the Board will be losing its share of 62 per cent. of pool receipts of approximately £300,000 a week, and saving current expenses of about £200,000. This, however, is merely an ephemeral paradox which serves to emphasise the point that the cost of the strike itself is a secondary consideration in any question of the long-term investment rating of the "C" stock. The cost of the men's claim is a very different matter. It has been variously put between £400,000 and £650,000 a year—equivalent to between 1½ and 2½ per cent. on the "C" stock. Judging from the Board's past operating record, an award of this order could only be implemented from one of three sources—a rise in net revenue; an alteration of renewals policy; or non-fulfilment of the "C" stockholders' existing rights.

The first two alternatives involve somewhat technical considerations, but it is highly important that the "C" stockholders should understand them. Net revenue can be increased only if gross receipts rise or other operating

expenses fall. The Board's own receipts have increased by £735,500 (or by 3 per cent.) for the 44 weeks of the current year before pooling. Lord Ashfield has stated at this week's inquiry that the whole of this increase, and more, has already been absorbed by increased costs. On the present basis of costs, moreover, the Board's expenses for the year to June, 1938, already show a prospective increase of £273,000. Already in 1937 petrol prices have been increased by 1½d. per gallon, at a cost to the Board of £285,000 in a full year. Apart from the natural increase in traffic expenses and stores, therefore, advancing costs will take a severe toll of the prospective increase in the Board's own traffics for next year. Nor, in the Board's view, would an increase in fares produce an increased gross revenue. This statement may appear somewhat surprising to the layman, and it would be desirable if the Board could amplify it. But it suggests at least that there is no easy and certain solution of the problem to be found on the operating side.

During the first two years of the Board's operation, the standard dividend provision for the "C" stock was not in operation. The Board made renewals provisions in 1933-34 to a total of £2,020,500; and in 1934-35 of £2,526,000. It was commonly assumed that these provisions contained an appreciable surplus over actual requirements, and that the renewals provisions could be used as a buffer between operating receipts and distributable earnings. On this assumption, some investment authorities inferred that the Board would take an austere view of its responsibilities towards the "C" stockholder by distributing a 5½ per cent. dividend for 1935-36, the first year under which the standard dividend provisions were operative. Instead, the Board maintained its 4 per cent. dividend, and transferred £2,300,000 to renewals. But so far as the lay investor can judge, this sum does not appear excessive, having regard, for example, to the Board's present problems of rolling-stock standardisation. If this view were correct, and if the Board were to raid its future renewals provisions in order to pay a standard dividend, the consequences might not be consonant with the Board's duty to provide an adequate transport system in its area. And they would certainly not be an argument for the purchase of the "C" stock.

What, in fact, is the statutory position of the "C" stock? If the Board fails, in each of three consecutive years (beginning with the year ended June 30, 1936), to pay interest on the "C" stock at the standard rate of 5½ per cent., holders of 5 per cent. or more of the "C" stock may apply to the Court for the appointment of a receiver. For two years out of three, therefore, the "C" stock is a pure equity stock; in the third it assumes the dignity and legal rights which have hitherto been characteristic of the most zealously protected fixed-interest security—though holders may wonder what would be the precise effect of a receivership in such an undertaking and in such circumstances. Would it in practice do more than encourage efforts to secure a revision of the legal powers of the "C" stock? But these powers were an integral part of the terms under which the original allottees of the "C" stock (who were mainly ordinary shareholders in the constituent undertakings) were induced to make the transfer. The principle of a 5½ per cent. standard dividend and the receivership provision appeared in the amended London Passenger Transport Bill as early as July, 1931 (though not in the original version), and the amended provisions were subsequently modified in the Act of 1933. Subse-

quently to alter the provisions relating to the "C" stock, therefore, without some form of acceptable compensation, might savour of interference with contractual, no less than statutory, rights.

Yet, in the existing context of rising costs, if the Board's contention that increased fares will not produce increased revenue is valid, and if existing scales of renewals provisions are, broadly, no more than adequate, what escape is there from the present dilemma? The standard dividend was short-earned last year by some £384,000, and if the present demand is conceded it is quite certain that the next two reports will show a far larger short-fall below the standard. The original hopes of more or less regular standard dividends of 5½ per cent. (with an increase to 6 per cent. under certain conditions) have now largely evaporated. Apparently, the Board might fulfil the letter of its obligation by paying 5½ per cent. every third year (at the expense of renewals if necessary) and making small token payments (or passing the dividend completely) in the intervening years. But under these circumstances the investment status of the "C" stock would be undignified and wholly unsatisfactory. The Act would become a matter of ridicule, and the efficiency of the whole undertaking might well be unfavourably affected.

From this dilemma there appears, at present, to be no visible escape. The "C" stock is bound to remain a highly disturbed market after the present strike situation has been appeased. Until some settlement is reached, it will remain impossible to measure the Board's revenue problem over the next fourteen months. During this period the Board must not merely maintain last year's revenue; it must also supplement it to the extent of 1½ per cent. on the "C" stock. That increased sum, in turn, is a relatively small proportion of traffic receipts and operating expenses—1.3 per cent. and 1.6 per cent., respectively, on last year's figures—but it represents as much as one-sixth of last year's renewals provisions. Even assuming that net operating revenues could be maintained in 1937-38 at last year's level, the full standard dividend could only be found at the expense of renewals. Short of plunging the undertaking into receivership, this seems the only method open to the Board. Yet this is a solution which is no solution. The Board's first duty is of public service, and the history of transport is littered with the wreckage of undertakings which neglected their renewals in order to placate their stockholders. That is an abiding economic fact which no statute can over-ride.

Investment Notes

The Markets Recover.—After hovering precariously near to panic on several days last week, the Stock Exchange has found some measure of confidence during the first week of the Coronation account. Although the recovery has been assisted by a certain amount of bargain hunting by the private investor, it has mainly reflected the assumption that this week's Pay Day would, after all, produce no dragon's crop of failures. The volume of business has not been large, but whereas last week it was difficult and sometimes even impossible to obtain dealing prices, this week jobbers have not hesitated to raise their prices, even if no great amount of business was passing. Steel shares have been helped, to some extent, by the announcement of higher selling prices. In the speculative markets the rise in Rhodesian copper shares and in the developing Rand counters should facilitate the clearing-up of positions now being carried on sufferance. The "House," indeed, has come largely to its own rescue, by pooling a very substantial fund in case of need. Figures putting this fund at £80 millions to £160 millions owe something to the imagination, but its proportions are undoubtedly impressive. Altogether, one firm of brokers has closed down, and a highly-respected and old-established firm of jobbers, Messrs Higham Brothers, who were running a book of Kaffirs and American securities, have discon-

tinued business. The market was stunned by this latter decision last Friday, but quickly recovered on the assurance that no train of financial losses would ensue.

* * *

For the moment, therefore, the market has found new confidence. But why did its pistons threaten to seize last week? Even in times of crisis it was, formerly, always possible to obtain some sort of dealing prices. The jobber whose mouth remains closed is an essentially recent phenomenon. Perhaps the dependence of the market on outside finance is greater than in days when substantial Stock Exchange firms were akin to investment bankers. If the financial leading strings can be suddenly shortened from outside under present conditions, therefore, market movements may tend to be more exaggerated than under the old dispensation. Despite this week's relief, technical conditions still have less than adamant strength. A selection of typical share movements is given below:—

	High 1937	April 20, 1937	April 30, 1937	May 3, 1937	May 6, 1937
Industrials					
Assoc. P. Cement (£1)	110/3	95/-	92/6	95/-	97/6
Bristol Aeroplane (10/-)	64/6	53/9	48/9	52/6	51/3
British Oxygen (£1)	138/9	116/10½	105/-	111/3	108/1½
Courtaulds (£1)	58/4	55/-	51/-	52/6	54/3
Distillers (£1)	124/9	115/6	111/6	113/6	115/6
Imperial Tobacco (£1)	183/1½	153/9	150/-	152/6	155/7½
Standard Motors (£1)	178/3	154/4½	132/6	133/1½	140/-
Turner and Newall (£1)	112/6	103/6	96/3	96/3	98/1½
Vickers (10/-)	39/1½	32/1½	29/-	30/1½	31/-
Woolworth (5/-)	96/3	79/-	77/6	78/9	80/4½
Mines and Commodities					
Anglo-American Corp. (10/-)	117/6	71/3	66/3	68/9	77/6
West Wits. (10/-)	398/3	265/-	190/-	207/6	217/6

United Siam Betong (£1)	90/-	78/6	68/9	72/6	75/-

She used to be comfortably off . . .

WIDOW. 82, requires situation urgently. Where child of 3 not objected to. Capable, good cook, write F. Box 208, Daily.

EVERY year illness or accident leaves thousands of families to face the world alone. In most cases they are not well provided for. Few men are in a position to put aside money enough to maintain their dependants at a satisfactory standard of living in the event of death. It is only fair to your family and to yourself that you place this burden on broader shoulders.

Consider the

'SAFEGUARD' PLAN

which provides a guaranteed income of £3, £6 or £9 per week tax free for a period of years after your death and a cash sum, if desired, when the income commences. When the annual income ceases a cash payment of £1,000, £2,000 or £3,000 is made. If you survive the period of your family responsibilities it can be arranged for the cash sum to be payable to you.

An enquiry for full details and for an illustration suited to your own circumstances will cost you nothing; rest assured you will incur no obligation by doing so.

LEGAL & GENERAL ASSURANCE SOCIETY LTD.
10 FLEET STREET, LONDON, E.C.4

General Manager: W. A. WORKMAN, F.I.A.
Established 1836. Assets exceed £36,000,000

There is still too little steam in the markets to make this week's recovery a reliable indicator of what may be in store for the next account or two.

The Gold Scare and After.—Out of the lion came forth sweetness, and out of the gold scare has come increased willingness to discuss the future of gold. Two authoritative statements have been made in South Africa during the past week. Sir Ernest Oppenheimer, after reviewing the position of the Anglo-American Corporation's interests, declared that a moderate fall in the sterling price presented the mines with no serious problem in maintaining their dividends. The incidence of the fall, indeed, is halved by the present basis of taxation, and the adjustment of grade to compensate for a small reduction in price is not usually difficult. Sir Ernest remained convinced of the importance of gold as a means of settling differences on international account, and suggested that the tripartite monetary agreement might pave the way to a general return to an international gold standard. These thoughts may have been in the mind of General Smuts in Wednesday's debate in the House of Assembly, when he declared: "People feel that unless there is stabilization on a gold basis—and the sooner the better—the position is not safe." And General Smuts added that Mr. Havenga, the Minister of Finance, had gone to London in order to discuss the question "and to see what could be done to make the position safer." But at present there are bulls and bears of gold. The former number the producers, and the Governments dependent upon gold production and the revaluation of their present stocks; the latter number those monetary authorities who fear that the supplies of gold forthcoming at the present price will inevitably expand the basis of credit to inflationary dimensions. While these two views vie with each other, the policy of the long-term mining investor may well be cautious. Stabilisation may be in the air, but its terms are being carefully avoided in public discussion.

★ ★ ★

Bond Movements in April.—Compared with the general movement in the security markets last month, foreign bonds remained comparatively steady. The index of 110 bonds calculated by Municipal and General Securities shows a fall of about one quarter of one per cent., from 115.7 to 115.4. The component indices follow:—

AVERAGE January-June 1934=100

	Europe	Near & Far East	Egypt	South and Central America			Complete Index	Unde-faulted Bonds	De-faulted Bonds

It will be seen that no group records a fall of more than $\frac{1}{4}$ per cent. and the European and South American Provinces indices actually record a rise. Most movements have been small, but at least three items of news have favourably affected the bondholder: the Hukuang Railway Loan Settlement; the reported acceleration of the Province of Buenos Aires debt arrangement; and the favourable reports regarding the Hungarian debt position.

Steel Price Increases.—Steel shares have been among the first groups to recover from the shock of N.D.C. At first the incidence of N.D.C. upon the steel companies was thought to be heavy, for profits have advanced more rapidly than in any other industry. But to a modified N.D.C. they might be much less vulnerable. If 1936 were chosen as a base year, for example, their position would be satisfactory, for increases in profits since then may to a large extent be due to extra capacity rather than increased profit margins per ton. And if the industry is allowed an 8 per cent. "capital standard"—as under E.P.D.—and could include, in its "capital," war-time acquisitions of plant at cost price less depreciation, the general liability would probably be small. The market, therefore, has been inclined to discount the possible dangers of N.D.C., and has preferred to register its satisfaction with the increases in prices which were announced at the end of last week. These increases are of the order of 20 per cent. for finished products—advances which lift the price to the levels of the post-war inflationary boom. The price increases will restore profit margins, which in the last few months have in some cases been depleted by the rise in raw material prices and by the high cost of working the plants to capacity. Companies which make only steel—such as the re-rollers—will be able to maintain their 1936 profitability. The great integrated concerns, however, are in a much stronger position. To the extent that they control their own supplies of iron ore, coal, coke, and scrap, these concerns are independent of the movements of the free market price of raw materials. Their costs have undoubtedly risen, both for wages and for equipment. But these increases are certainly smaller than the raw material price index. Companies like United Steel, Stewarts and Lloyds, Dorman Long, and Baldwin's must necessarily be in a stronger position than simple undertakings like Whitehead Iron, although this company is probably safeguarded to some extent by long-term agreements.

★ ★ ★

Steel-producers' shares, therefore, are favourably affected, and the rise may well be maintained. The position of steel-consuming companies, on the other hand, is less auspicious. At a time when costs of production are rising, a sudden increase of 20 per cent. in steel prices (a month before it was originally expected) is a heavy burden. Its repercussions upon the motor trade, for example, seem wholly unfavourable. Conditions of demand for motor cars preclude the industry from passing on the whole increase in costs to the consumer. Nor is the advance in steel prices the only rising cost factor with which the industry now contends. Considerations of profit margins apply relatively little to the makers of luxury cars, but the makers of the popular car, and particularly Austin Motor, must be regarded as being vulnerable. In the engineering and shipbuilding trades, too, the advance in steel prices is serious. Both industries are working at or near effective capacity at the present time (as measured by skilled labour supplies rather than by plant), and their order-books are fairly well filled. But apart from their work in the rearmament programme they may be unable to pass the whole increases on to the consumer. In this industrial group the market is not very directly interested—most of the well-known public concerns are already largely occupied with armament work. But there is a good case for regarding the prospects of a share like Ruston and Hornsby with caution, and structural engineering companies are in a decidedly vulnerable position. The danger of a serious check to demand resulting from the advance in steel and other costs is not imminent, but it might suddenly emerge at some time in the future. It is possible that a fall in commercial demand at home could to some extent be offset by an improvement in export demand. But among the shares of steel-consuming companies investors should exercise a certain caution. The latest rise in steel prices is one more link in the chain of increasing costs which might shackle current profits.

Short Particulars

THE STEEL CORPORATION OF BENGAL LIMITED

(Incorporated under the Indian Companies Act, 1913-30)

SHARE CAPITAL—

Authorized Rs. 10,00,00,000—DIVIDED into

200,000 5% (free of Indian Income Tax) Cumulative Preference Shares of Rs. 100 each £1,500,000
and 8,000,000 Ordinary Shares of Rs. 10 each £6,000,000

Being issued in India—

120,000 5% (free of Indian Income Tax) Cumulative Preference Shares of Rs. 100 = £7 10s. each £900,000
and 2,500,000 Ordinary Shares of Rs. 10 each = 15s. each £1,875,000

AUTHORISED LOAN CAPITAL—£1,000,000 $4\frac{1}{2}\%$ Guaranteed Convertible Mortgage Debentures

The Subscription List will open and close in England on Monday, 10th day of May, 1937,

FOR AN ISSUE AT PAR OF

£1,000,000 $4\frac{1}{2}\%$

Guaranteed Convertible Mortgage Debentures

To be unconditionally guaranteed as to principal and interest by The Indian Iron & Steel Co., Limited

Firm applications for £500,000 of the above Debentures having been received from the Underwriters, this amount will be allotted in full in the terms of the Prospectus, and of the balance shareholders of The Indian Iron and Steel Co., Ltd., will be given preferential allotment.

The following points are of interest:

- Holders of fully paid Convertible Debentures may convert into fully paid Ordinary Shares at the rate of 40 Ordinary Shares of Rs. 10 each for each £50 Debenture (that is to say, one Ordinary Share of Rs. 10 for each 25s. of Debenture) for a period of ten years.
- The Corporation has been formed for the purpose of constructing and working a modern steel works alongside and in close association with The Indian Iron and Steel Company, Limited, which works are expected to be in operation in about three years. The Company will supply the Corporation with the necessary hot iron for the manufacture of steel by the Corporation, and also will supply water, gases and electric power and light.
- It is considered that there is ample room in India for a new steel works. Excluding the special products of steel which are not now rolled, the average consumption of steel in India for several years past has been on the increase and has been largely in excess of the quantity of steel at present being produced in India. The Industrial development of the country indicates that these requirements will further increase and that there will be ample demand for all the products of the Corporation. The initial production aimed at is 200,000 tons of finished steel products per annum. The costs of production of iron by the Company are probably lower than those of any other iron-producing company in the world, and the Corporation will get the benefit of these low costs.
- With regard to prospective earnings, figures have been prepared based on estimated present-day costs of steel manufacture in India as compiled by the promoters, on the certified cost sheets of the Company for the manufacture of hot iron, on a two-furnace production basis, and on the lowest weighted average import prices of British and Continental steel for the past fifteen years, but without taking into consideration the special measure of protection enjoyed by the industry over and above the revenue duties which form part of the fiscal system of India. On the basis of these figures, after making allowance for Head Office expenses, Managing Agents' commission, depreciation and Directors' remuneration, but before making any provision for Indian taxation, the Directors estimate that the Corporation's profits should be at a rate of not less than £465,000 per annum. On this basis, the interest on the Convertible Debentures is covered over 10 times, and on the surplus earnings alone of the guaranteeing Company is covered four times. This makes a total cover of 14 times.
- The principal is covered more than $3\frac{1}{2}$ times without taking into account the net assets of the guaranteeing Company which net assets would represent further cover of almost 2 times. This makes a total cover of 5 times.

DIRECTORS:

B. N. MOOKERJEE (Chairman)
CARL BENDIX
SIR PADAMJI P. GINWALA

STEPHEN LYTTTELTON
KAILASH C. MAHINDRA
EDWIN L. WATTS

Copies of the full Prospectus upon the terms of which alone applications will be considered, and Forms of Application can be obtained from:

BANKERS:

MIDLAND BANK LTD., Poultry, London, E.C.2, and Branches.

Company Notes

Unscrambling Unilever.—The abandonment of international conceptions is common in modern economic life, but in few cases does it affect the *ratio vivendi* of existing companies. The Unilever grouping of 1927, however, was essentially a "gold-standard-free-trade" conception, and since 1931, the twin legs of the colossus have had no fixed relationship, owing to the departure of sterling from gold, which the guildler followed last September. Mr D'Arcy Cooper's speech to Unilever Limited shareholders, on Wednesday, was largely concerned with this problem, and with the associated question of simplifying the structure of the British group. The arrangement between the two companies, whereby each must make equal distributions, prevents the British company, under present circumstances, from distributing a substantially increased dividend. The British company would necessarily have to pool sufficient profits to enable Unilever N.V. to pay the same dividend on the same nominal capital. In 1936, indeed, the British company earned 67 per cent. of the whole group's profits, and Unilever N.V. no more than 33 per cent. The comparative freedom of business within the sterling area, and the difficulties of the Dutch company in making and transferring profits in Central Europe, account largely for this divergence, which seems likely to continue. Moreover, if direct transfers were made from Unilever Limited to Unilever N.V. to balance the difference in profits, serious double taxation would be involved.

The directors are therefore considering plans to amalgamate the British companies, Unilever and Lever Brothers, into one company, and to redistribute the existing shareholdings so that the new amalgamated company holds all the interests in the British Empire, while the Dutch company holds all other interests. The British amalgamated company will become an Empire holding company. The plans have yet to reach a detailed stage, but the chairman hopes that the accounts for 1937 will be published under the new conditions. It is out of the question to attempt to assess the importance of the new plan, except on the broadest lines. Lever Brothers, for example, has extensive connections in foreign countries, and the group's interests in the United States are highly important. The scheme at least presages a more liberal dividend policy by the British company. But when its main outlines have been decided, there will still remain the problem of absorbing the Lever Brothers' undertaking. And it is a peculiarity of this concern that, out of a capital of £61,691,000, no more than £8,500,000 consists of ordinary stock, while the remainder is divided into £30½ millions of 7 per cent. preference stock, £15,655,000 of 8 per cent. preference stock, and £6½ millions of 20 per cent. preferred ordinary stocks. This type of structure will invite the most careful and equitable consideration of any amalgamation terms.

Eno Proprietaries and Odhams Press.—These two companies have little in common technically, but their accounts make a good text for a sermon on disclosure of information to shareholders. Eno Proprietaries' accounts, for instance, while technically complete regarding the parent company itself, contain no consolidated profit and loss account or balance sheet. The Eno's shareholder is told, it is true, that the operating profits of subsidiaries before tax are £233,922 against £219,879, but when all save £229,700 out of total assets of £3,264,600 consists of interests in subsidiaries or trade investments, such information is meagre. Apart from the deduction of £153,000 capital reserve, moreover, these interests stand at cost, and no clue is available regarding the real assets position. Again the operating profit in this type of business needs elucidation. To what charges is it subject? In particular, how does advertising expenditure, which forms an appreciable element of cost in proprietary

goods business, vary from year to year? The extreme difficulty of assessing the operating company's position from the accounts of the holding company goes far to explain the fact that the ordinary shares yield as much as £7 13s. per cent. at the present price of 8s. 6d. Odhams Press, which controls at least 24 publications, apart from other businesses, also present accounts which would be appreciably more helpful if supplemented by a consolidated statement or by the revenue accounts of certain constituent undertakings. The report shows a considerable degree of stability in total profits, but contents itself with rather general statements and some figures of net sales. Nearly half the assets, in fact, consist of interests in or debts due from subsidiaries. The precise financial position of the Daily Herald Limited, as usual, is not disclosed. The capital structure of the whole undertaking makes the fullest information unusually relevant. The parent company and some of the subsidiaries have high geared capitalisations. Odhams Press, itself, shows the proportion of loan and preference to equity capital of 3.4 to 1. The group's recent expansion has been accompanied by a greater pull of its fixed charges. But, like physicists, investors might remember that the effect of a given movement in the subsidiaries' total profits on the parent company varies with the square of the distance from its source.

Marks and Spencer Results.—The profits momentum of Marks and Spencer continues undiminished. The results for the year to March 31st last are, indeed, highly satisfactory. Net profits before depreciation and tax are 14 per cent. higher, while the 40 per cent. dividend and 10 per cent. capital bonus are repeated on a larger capital. The following table analyses the results:—

	Years ended March 31		
	1935	1936	1937
Net profit	1,289,350	1,507,527	1,723,488
Depreciation, etc.	202,752	243,121	290,238
Tax reserve	160,206	167,165	238,544
Deb. redemption and staff funds	10,000	10,544	36,166
Preference dividend	105,000	105,000	105,000
Ordinary Shares:—			
Earned	811,392	981,697	1,053,540
Paid	434,838	537,986	633,884
Earned per cent.	74.1	77.3	75.3
Paid per cent.	35	40	40
Capital bonus: per cent. ...	10	10	10
Reserves	356,969	393,496	370,302
Carry forward	73,469	87,684	82,584†

†After £54,454 discount, etc., expenses written off.

The percentage rise in profits has again covered the regular 10 per cent. increase in the ordinary capital, with something to spare. It is possible that the fast pace of recent years cannot be kept up indefinitely, and if that should happen, the economic *raison d'être* of the regular capital bonuses will be weakened and disappear. In the latest period equity earnings have risen by about 7½ per cent., so that the rate of earnings on the larger capital is slightly reduced, owing entirely to heavier charges. Depreciation and the new staff funds require between them £72,000 more, and the 42 per cent. increase in the amount put to income tax reserve appears generous. Marks and Spencer can hardly escape rising costs or N.D.C. The former difficulty, however, can be allowed for without pressing upon the company's upper price limit in most cases. Expanding turnover, moreover, should be assisting the company to offset any effects of higher costs. At the present price of 8s. 3d. the ordinary shares yield £2 14s. 3d. per cent.

Further Rubber Results.—Rubber reports are still appearing in undiminished volume, and in general they tell the same tale. Conditions in 1936 were substantially better than the year previously, but in few

cases was real prosperity enjoyed. To this extent, the report of the *Rubber Plantations Investment Trust* is typical. But here the analogy ends. As the accounts for 1936 include only dividends earned in 1935, they do not fully reflect the industry's improvement last year. Thus income from investments increased from £86,694 to only £90,601, a not unsatisfactory result in view of the real difficulties experienced by the rubber industry in 1935. On the other hand, net income from the Trust's own tea plantations in Sumatra showed an advance from £77,324 to £89,396 before allowing for differences on exchange. A substantial relief was enjoyed under the latter heading—only £42,814 being deducted, against £55,373. This saving alone accounts for approximately half of the total increase in earnings available for distribution, amounting in all to £101,526 compared with £76,701, or 6 per cent. on the capital, against 4.4 per cent. The dividend of 7½ per cent. was thus short-earned by a substantial margin, though the company's financial position is in no way weakened. The most striking feature of last year's accounts is an increase of about £1,000,000 in the market value of investments held. This, of course, reflects the vast improvement in rubber prospects during recent months. In the current year the Trust should enjoy larger returns both from its investments and its estates. Many rubber companies have doubled their 1935 dividend payments in 1936, while prices of common teas have advanced strikingly in recent weeks. A distribution up to 12½ per cent. would not be altogether surprising, especially as the company's dividend policy is normally generous.

The smaller producing companies make a rather mixed showing. *Klabang* almost trebled its profits in 1936 and increased its dividends from 3 per cent. to 6 per cent. Revenue per pound of rubber rose by over 1½d. and costs were moderately reduced. The company has placed the substantial sum of £3,000 to replanting reserve—a wise provision in view of its poor supply of young rubber. Its standard production quota in the present year is almost unchanged. *Remfield*, on the other hand, which also trebled its earnings and paid a first dividend of 3½ per cent., claims that it now has no old rubber. A programme of replanting is thus regarded as unnecessary, and the company's large supply of immature rubber on its Sumatra estates should permit a considerable increase in standard quotas in the next few years. *Strathmore* is a further example of a marginal company whose earnings have benefited strikingly from the advance in rubber prices. The dividend is increased from 2½ per cent. to only 3½ per cent., however, as more than £1,000 has been carried to reserve. More rubber was produced than could be exported last year, so that the company should easily meet the larger quotas required during the current year. The earnings of *Dusun Durian* rose from 3.1 per cent. to 5.9 per cent. as a consequence of increased revenue and lower costs per pound of rubber. Copra production also contributed to the better results. Here, too, a large sum (£2,767) has been placed to reserve and dividends have been raised by no more than 1 per cent. to 4 per cent. *Malakoff*, on the other hand, has doubled its distribution—from 4 per cent. to 8 per cent. Output was larger despite the lower quota, for the company received a large addition to its standard assessment in 1936. It is well supplied with young rubber and profits should show very satisfactory increase this year, subject to the final incidence of N.D.C.

General Mining Report.—A measure of disappointment was occasioned by the moderate increase in this company's final dividend for 1936; the final payment of 3s. per share made a total of 5s., as against 4s. for 1935. The accounts show that a larger rate could have been paid, for profits amounted to £541,500 against £361,400. Of the surplus, £200,000 (in place of £100,000) was added to general reserve, increasing that fund to £600,000. After meeting the dividend, the increased balance of £316,150 remains to be carried

forward. The great bulk of the transfer to reserve is represented by additions to the portfolio, which is £184,000 higher at £1,894,700, the margin between the latter and the current value being very considerable. The previous report mentioned that in addition to holdings in its subsidiary and associated concerns, General Mining held important interests in other Rand gold-mining companies, including Crown Mines, West Wits., and Vogelstruisbult. Nothing is said on this point in the latest report; but it is intimated that the increase in the portfolio is chiefly represented by shares in which the Corporation is directly interested. On the basis of last year's dividend the shares yield 4½ per cent.

Other Company Results.—The reports of over 60 other companies are analysed on page 379, and are discussed on page 380, under the heading "Shorter Company Comments." Preliminary results are also published for 1936 by *Wiggins, Teape and Company*. They show record profits of £454,090, before tax and debenture interest. An estimate of profits for the quarter to March 31, 1937, indicates that the 1936 increase has been maintained. As we go to press, *Stewarts and Lloyds* announce their trading profits, amounting to £1,391,308, against £963,824. The net profit is £872,795, against £492,016. The sum of £100,000 is provided for special depreciation, while tax reserve receives £225,000 and contingencies £150,000. *Boots Pure Drug* net profits amount to £799,898, against £770,889. The dividend is maintained at 24 per cent., together with a tax-free payment of 3d. per share.

Company Meetings of the Week.—The reports of some thirty company meetings commence on page 355 of this issue. Reviewing the chief events of 1936 to *Union*

One expects to pay a little more for a cigarette of such excellent Quality

Bank of Scotland shareholders, Sir Steven Bilsland stressed the inevitably late recovery of certain Scottish industries. The chairman of *Caledonian Insurance Company* was able to report that new life assurance set up a fresh record in 1936. Sir Frederick Rutter, at the *London and Lancashire Insurance* meeting, examined the need for higher invisible exports. Mr F. A. Johnston showed that the *Atlas Assurance* life department had achieved new records in new business, premium income and interest revenue. At the *Alliance Assurance* meeting, Mr Lionel de Rothschild showed that fire business had been affected by foreign events, but that home business had developed. The president of the *Equitable Life Assurance Society* informed the proprietors that the net rate of interest, after tax, was still well over 4 per cent. At the *Ford Motor* meeting, Sir Percival Perry reported that sales of the £100 popular model had almost doubled during the past year. Difficult conditions in the wheat market were stressed by Sir Malcolm Robertson at the *Spillers* meeting, but the company had bought only for milling requirements. The improvement in the revenue of *English and Caledonian Investment Company* was attributed by the chairman chiefly to an increase in the average invested funds. Sir David Milne-Watson alluded at the *South-Eastern Gas Corporation* meeting to the unsatisfactory working of the marketing scheme under the Coal Mines Act. Lord Meston referred to the Calcutta Corporation's expressed intention of buying the part of the *Calcutta Electric Supply* undertaking within its area. *London Asiatic Rubber* shareholders were informed at the meeting that estate management had secured lower production costs. At the *Gresham Fire and Accident Insurance* meeting the Hon. W. B. L. Barrington said that the claims ratio of 47.4 was very satisfactory for the large proportion of motor insurance. To *Gresham Life Assurance* members he reported the entire re-organisation of the business in India. Addressing *North British and Mercantile Insurance* shareholders, Viscount Wakefield of Hythe declared that the new valuation period had made a good start. At the *British and Chinese Corporation* meeting the chairman referred to the large railway construction programme confronting the Chinese Minister of Railways. *New Kleinfontein* shareholders were informed by Mr George Mackenzie that the grade of ore to the mill had increased to 3.99 dwt. despite the greater milling tonnage. At the *Morris Motors* meeting, Lord Nuffield declared that the company's products continued in vigorous demand, orders reaching new high records. Mr Robertson Gibb, addressing *Union Castle* proprietors, stressed that the final step in rectifying the general investment position had been taken. The chairman of *Johnson and Phillips* disclosed that the increase in output had been spread uniformly over most departments. Mr W. J. Terry, at the *London Electric Wire* meeting, mentioned that export sales had increased proportionately to home sales. The chairman of *Ideal Building and Land Development* told shareholders that an estate had been acquired in Birmingham. At the *Gold Corporation* meeting, the chairman disclosed that the Quartz Block continued to show good values. Mr D. Errol Sinclair, addressing *General Ceylon Rubber and Tea* shareholders, emphasised that the export regulation scheme was steadily improving the statistical position. At the *Crown Mines* meeting, Mr John Martin referred to the company's organisation for the welfare of native labour. The chairman of *City Deep* reported that working costs had been reduced by 2d. per ton, and discussed the progress made with the new shaft. Mr Eric Miller, at the *Pataling Rubber Estates* meeting, remarked that the crop accounted for was higher, despite a lower international release. *Ionian Bank* proprietors were informed by Sir John Stavridi that the tendency towards deterioration of public and private economy in Greece had been checked. The chairman of *Licenses and General Insurance* reported that the results of the newly established life department exceeded expectations. Mr Harold Morland, at the *Friends' Provident and Century Life Office* meeting, said that the fire and accident premium from Great Britain and Ireland was steadily rising.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: MAY 25

ACCOUNT: MAY 27

A MORE confident tone has spread through the markets this week. Panic anticipations of what the settlement might bring forth have been alleviated by the news of supporting measures; a certain amount of bargain buying has been seen; and jobbers have shown considerable willingness to adjust their prices to suit the better spirits in the "House," after being rather unwilling to deal in many shares a week earlier. Business has not been brisk, and it cannot be claimed that the market has regained any great momentum. But, undoubtedly, a greater impression of confidence is now abroad, particularly in the industrial and commodity share markets.

The greater interest in equities has produced its reverse among gilt-edged, which opened firm on Monday, but have closed each day since rather below the best. Wednesday was a particularly poor day for the irredeemable stocks, although the National Defence Bonds were quoted at par for the first time. In the foreign market, Japanese bonds were consistently good, but some initial support for Brazilian issues was succeeded by profit-taking in mid-week.

Home rails were at first affected by the transport strikes, but good buying soon produced a rally. L.M.S. ordinary and Great Western were the principal features, but Southern deferred failed to hold all its gains. The week's traffics stimulated further buying on Thursday. Argentine rails were also in good demand, and all-round advances were registered on the traffics.

Nervousness gave way to cheerfulness in industrial markets this week, and the settlement of the old account was negotiated without the difficulties which were feared earlier. There was a general and well sustained rise in prices in every section of the market. American issues moved quietly in sympathy with Wall Street. Iron and steel shares advanced on the rise in steel prices. In mid-week one or two issues failed to share the general improvement. Coal shares were better, with Wm. Cory leading; Ocean Coal fell off slightly on the anticipated resumption of dividends.

Electrical equipment issues made rapid headway, although British Insulated were a little sluggish. Electrical supply shares joined the general trend after an irregular start. There was good support for motor shares, both on general reasons and on the sentiments expressed at several meetings. Prices rose in the aircraft section, with Hawker-Siddeley active in mid-week on dividend expectations.

Renewed support was evident for brewery issues on the increased beer output for March. Booth's Distilleries rose sharply at first on the announcement of a pending merger. There was an improvement, in keeping with general sentiment, among textiles, stores, catering and tobacco shares. Shipping issues were firm although dealings became less active as the week advanced. A good improvement was registered among miscellaneous industrials, including the building materials and engineering sections. The British Oxygen bonus announcement, however, was followed by a reaction in the shares.

Oil shares enjoyed cheerful conditions this week, and prices went ahead in active dealings. The statistical position of the industry is considered sound, and this week's improvement was helped substantially by the increased interim dividend of Trinidad Leaseholds. Anglo-Iranian were prominent on talk of a bonus. Continental support for the leaders was evident. Rubber shares made rapid progress, and a good demand found a limited supply of shares in the market. Some profit taking was evident, but it was offset by new purchases. Tea shares were slow to join the market trend, but prices went ahead later on a moderate business.

Speculators were able to look forward to a new lease of life in the Kaffir markets, thanks to the arrangements made to help some of the weaker positions over the settlement. Prices improved substantially this week as it became evident that the settlement would bring no extreme terrors, and naturally those issues improved most rapidly which had previously fallen furthest, such as the Far West Rand development counters. The West African section was well supported. Rhodesian copper shares were in good form at first, but became somewhat dull in mid-week. Tin shares improved despite the lower metal price.

NEW YORK STOCK EXCHANGE

TOWARDS the end of last week prices recovered rapidly on Wall Street, on the marked improvement in sentiment in London, which stimulated buying of American securities through foreign centres both on foreign and American account. This week prices have largely held their ground, but the volume of business has been small, pending the settlement of the London account. This week's early improvement was shared by many groups. Among the leaders, American T. and T. were prominent. Film issues were affected by the labour troubles. Rails, oils and copper issues were higher at first, but reacted slightly in mid-week. Quiet conditions prevailed in the bond market, where government issues were firm. The market was encouraged by the success of the Southern Bell Telephone and the Home Loan Bank issues. Business news maintains its accustomed tone; *Iron Age* estimates steel mill activity this week at 92 per cent. of capacity and anticipates a level of at least 90 per cent. throughout May. Electricity output in the week ending May 1st was 13.5 per cent. higher than for the corresponding week of last year. Scrap steel prices are lower, and exports of iron and scrap are at record levels. Brokers' loans at the end of April were reported at 2.05 per cent. of all stocks listed, against 1.85 per cent. a month ago.

HAVE YOU TRIED RE-FORMED SHELL

All Shell is now made by the 're-forming' process which rearranges the molecular structure of the petrol. The result is even smoother running, better pick-up, and an absence of 'pinking'.

YOU CAN BE SURE
OF SHELL

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields on fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

BY STOCK EXCHANGE INTRODUCTION

Ensign Lamps, Ltd.—Issued capital, 300,000 5s. ordinary shares. Electric lamp manufacturers, established 1924. Net assets, £76,020 (stocks, £37,076). Profits, after depreciation, years to June 30: 1934, £15,096; 1935, £17,845; 1936, £16,262. Six months to December 31, 1936, £12,260. Provincial Stockbrokers Trust, Ltd., take 166,666 ordinary shares at 11s. 11d. average.

Associated Clay Industries, Limited.—Particulars of £150,000 4½ per cent. first mortgage debenture stock, purchased by Equity and Law Life Assurance Society at par, less 1 per cent. commission. Redeemable at par March 31, 1962, or from 1944, at 102½ on notice.

BY TENDER

Bilston Gas Light and Coke Company.—Offer for sale by tender at £8 minimum of £5 "B" shares to realise £35,000. Ranking for 7 per cent. standard subject to sliding scale; similar shares receive 9 per cent. Serves 8 square miles. Population, 50,000; consumers, 12,861. Sales 1936, 1,660,500 therms. Profits, after maintenance and interest, years to September 30: 1934, £14,463; 1935, £16,884; 1936, £17,047.

BONUS ISSUES

Calcutta Electric Supply.—Issue of 400,000 new £1 ordinary shares at par, to existing ordinary shareholders.

Tilling and British Automobile Traction.—Meeting, May 13th, to sanction creation of 650,000 £1 ordinary shares; 666,667 shares are to be issued in proportion of one for five held.

Central Provinces Manganese Ore.—An extraordinary meeting will be held to consider capitalising £150,000 of the reserve fund and paying as capital bonus. Each stockholder to receive three new shares of 10s. for £5 10s. stock held.

ISSUES TO SHAREHOLDERS ONLY

Kennedy's (Bournemouth) Ltd.—Issue of 27,058 6 per cent. "B" cumulative £1 preference shares at 22s. and 27,062 £1 ordinary shares at 26s.

Savory and Moore.—Issue of £36,550 5 per cent. debenture stock at 101.

Joshua Hoyle and Sons.—Offer of £1,200,000 4½ per cent. first mortgage debenture stock to holders of 7 per cent. first mortgage debenture stock, in conversion in proportion of £100 new stock and £11 12s. 3d. cash for each £100 converted. The issue of 5,000,000 new ordinary 2s. shares in proportion of four new shares for each preference and one new share for each ordinary share held on April 19th is at par, and not at 3s. as previously stated.

FORTHCOMING ISSUES

Steel Corporation of Bengal.—Lists will open on Monday next, May 10th, for an issue at par of £1,000,000 4½ per cent. guaranteed convertible mortgage debentures. The prospectus will show that the Corporation has been formed to build a modern steel works in close association with the Indian Iron and Steel Company, who unconditionally guarantee the debentures as to principal and interest. Debentures are convertible for 10 years into ordinary shares at rate of one Rs.10 ordinary share per 25s. of debenture. Initial production aimed at, 200,000 tons of finished steel products. Estimated profits, not less than £465,000 per annum.

OIL OUTPUTS

PHENIX OIL AND TRANSPORT COMPANY, LTD.—The gross production of crude oil of the Phoenix group for March was 61,062 tons.

TAMPICO OIL, LTD.—The total production from the company's properties in Mexico during March was 14,053 barrels, in respect of which the royalty due to Tampico Oil, Ltd., amounted to 1,054 barrels.

TRINIDAD CONSOLIDATED OILFIELDS, LTD.—Production for March was 66,000 barrels, against 57,500 barrels for February. Well No. 28 was brought into production on March 26th, the output for the first 24 hours being 250 barrels. Well No. 29 came into production April 1st, the production for the first 24 hours being 420 barrels. Drilling was commenced on March 31st on Well No. 1 on Siparia Area. Well No. 28 brought into production on March 26th. Production for the first 24 hours was 250 barrels.

TRINIDAD LEASEHOLDS, LTD.—Oil produced during March, 51,659 tons. Oil purchased during March from other companies, 83,173 tons.

TRINIDAD PETROLEUM DEVELOPMENT COMPANY, LTD.—Production for March, 117,852 barrels; deliveries for March, including purchased oil, 119,206 barrels. Production for week ended April 3rd, 28,240 barrels; April 10th, 29,399 barrels; April 17th, 28,895 barrels. Production for the week ended April 24th: 29,092 barrels.

COMPANY MEETINGS

UNION-CASTLE MAIL STEAMSHIP COMPANY, LIMITED

INCREASED PROFIT ON VOYAGES

BALANCE SHEET NOW REVEALS THOROUGHLY SOUND POSITION

FLEET OF FIRST-CLASS AND UP-TO-DATE MAIL VESSELS

ACCELERATION OF SERVICES

MR ROBERTSON GIBB ON FUTURE OF SOUTH AFRICA

The annual ordinary general meeting of the Union-Castle Mail Steamship Company, Limited, was held on Thursday, May 6th, at Southern House, Cannon Street, London E.C.

Mr Robertson F. Gibb, Chairman and Joint Managing Director, presided.

Mr A. H. Milbourne (Joint Secretary), having read the notice convening the meeting and the report of the auditors,

The Chairman said: Ladies and Gentlemen,—Before dealing with the business of the meeting, I must refer, with profound regret, to the fact that since our report was issued we have suffered the loss of one of the directors, Mr R. A. Murray, who died on April 29th. Mr Murray joined the board in 1933 and proved himself a highly valued and much-respected colleague, whose wise advice, great experience and keen interest in the well-being of the company will be greatly missed. (Hear, hear.)

The report of the directors and the audited accounts of the company for the year ended December 31, 1936, were despatched to you about a fortnight ago, and I conclude that, as customary, you will agree to take them as read. (Agreed.)

VOTING RIGHTS

Before turning to the accounts, I wish to refer briefly to the settlement which was arrived at last year of the question of the preference shareholders' voting rights.

You will recollect that, at the class meeting of the six per cent. "A" preference shareholders and at the extraordinary general meeting of the company which were held on July 30th last, I was able to announce that agreement had been reached between your directors and the representatives of the ordinary stockholders in regard to this matter.

As part of the terms of settlement, the latter undertook to arrange for the company's ordinary stock to be widely distributed among the general public and agreed that every holder of preference shares or ordinary stock in the company should henceforth have one vote for every £1 of nominal capital. It was also agreed that four new directors suggested by the ordinary stockholders and acceptable to your board as then constituted should be added to the board.

NEW DIRECTORS

These terms of settlement received approval at the meetings to which I have referred, and the alterations in the voting rights came into operation forthwith, being embodied in the new articles of association which were adopted on that day.

In September last, Lord Catto, Mr C. L. Dalziel, Sir Ernest Harvey and Sir Campbell Stuart—the four directors nominated by the ordinary stockholders—were co-opted on the board. At this, the first general meeting of the company held since that date, I should like, on your behalf, to extend to them a very cordial welcome. (Hear, hear.) We have already found their experience and advice helpful, especially in connection with financial matters, and personally I think that we, as a company, may consider ourselves fortunate in having at our disposal the services of such able and prominent men of affairs. These gentlemen will shortly come up for re-election, and I do not doubt that you will readily assent to their continuance in office.

PLANS FOR DEALING WITH ORDINARY STOCK

The major portion of the company's ordinary stock is still held by the R.M. and E.D. Realisation Companies, and circumstances

have not yet permitted its distribution in accordance with the terms of settlement. I am given to understand by the boards of the Realisation Companies, however, that it is not likely to be long before effect is given to this. As soon as that is done, the efforts of your directors to ensure, so far as practicable, that the control of the company shall not once again pass into the hands of one individual or group will have reached their successful conclusion.

Incidentally, as the changes in our articles of association necessitated by the terms of settlement were somewhat extensive, we took the opportunity to bring the articles fully up to date in conformity with modern legislation and practice. At the same time we thought it well to add clauses to the memorandum of association empowering the company to establish and maintain air services. We have no immediate intention of building or operating aircraft, but, having regard to developments in this connection, we felt it prudent that our memorandum should embrace the power to run air services in the event of it being in the interests of the company at any time that our services should be extended in this direction. These new clauses in the memorandum were sanctioned by the Court on November 10th last.

INVESTMENT POSITION

As you are aware, the efforts of your board during the last few years have also been directed to bringing about the rehabilitation of the company's financial position, which had been so adversely affected by its association with the old Royal Mail Group of Companies, and here again we have very nearly reached our goal.

From time to time during the past three or four years, we have allocated sums to a reserve which we had created to provide for the losses we sustained through the depreciation of the investments in the Royal Mail Group, but, even when this reserve had been taken into account, the book values continued to be greatly in excess of actual values, to which fact the auditors drew attention each year in their report.

At our last annual general meeting I mentioned that the time was rapidly approaching when it would be necessary to write off some of our largest investments completely, and, as the accounts before you to-day reveal, it has been possible this year to take the final step in rectifying the investment position as a whole.

By utilising £642,521 of the insurance reserves and by transferring the reserve account of £450,000 and taxation and other reserves no longer required amounting to £197,802—a total of £1,290,323—we have been able to reduce the total book value of our investments to £892,863, which your directors and the auditors consider makes full provision for the depreciation of these assets.

Having thus been able to clear up the balance sheet satisfactorily, the board hope, if present conditions continue, to be able to deal with the arrears of dividend on the 6 per cent. preference shares out of the profits for the current year.

There are various other points in the accounts to which I think I ought to make special reference, and I propose now to deal with them.

IMPROVED EARNINGS

Turning first to the profit and loss account, it is gratifying for me to be able to draw your attention to the fact that the profit on voyages last year, after providing for depreciation on ships on the customary five per cent. basis and on property and plant and

after deducting taxation, administration and other expenses, amounted to £473,450, which is a satisfactory advance on the corresponding figure for 1935. Much of this increase can be attributed to the success of our new tonnage, thus fully justifying your directors in embarking upon the considerable shipbuilding programme commenced in 1934.

The income from investments and properties is also somewhat higher at £120,278, and it may perhaps be appropriate for me to mention here that all our subsidiary companies showed a net profit last year.

From our total net revenue from these two sources amounting to £593,728 have to be deducted interest charges and directors' fees, with the result that the net profit for the year is £435,828.

ALLOCATION OF PROFIT

After payment of the dividends on the 4½ per cent. preference shares for the past year and on the 6 per cent. "A" preference shares for twelve months to June 30, 1935, there remains a balance of £349,355.

As you know, we are at present spending a large sum of money in re-engining five of our existing mail vessels in connection with the acceleration of our mail service. This entails disposing of the engines originally installed in these ships at considerably lower figures than their book values. We have therefore considered it prudent to allocate the sum of £200,000 as special depreciation on the five vessels being re-engined, thus leaving a balance of £149,355, which it is proposed to carry forward.

There are one or two other points in the profit and loss account of which you may require me to give an explanation. The general interest charge for 1936 is nearly twice that for the preceding year. This, of course, is due to the fact that in the course of the year we have borrowed further sums for shipbuilding purposes, and the amount of interest which we shall have to pay during the current year will be greater still.

Furthermore, you may have observed that the sums shown in respect of preference dividends are in excess of those included in our 1935 accounts. This results from the fact that during the year the Inland Revenue Authorities agreed to our claims for Dominion income-tax relief in respect of two past years, and the proportionate amount of this was passed on to our preference shareholders on the occasion of the last payment of dividend.

BALANCE SHEET

I have already alluded, in connection with the investment position, to various changes in the balance sheet, but there are certain other features about which I ought, perhaps, to say a word or two.

You may have observed that the item "Advance under Loans Guarantee Act (Northern Ireland) secured by mortgage on one of the company's vessels," which stood at £160,000 in the balance sheet for 1935, has disappeared. This represented a loan, originally amounting to £1,000,000, in respect of the construction of the "Carnarvon Castle," which has been reduced periodically and has now been completely paid off, thereby finally disposing of all commitments in respect of past shipbuilding. Our existing shipbuilding liabilities are wholly in respect of new ships either under construction or recently delivered.

The amount of advances made to the company in respect of new tonnage is naturally considerably higher than the comparative figure at the end of 1935. Five new vessels were delivered to the company last year, and on their completion further sums became payable to the builders, part of which was borrowed under our loan facilities. Other vessels are at present under construction for the company, and further advances will require to be obtained from time to time towards their cost. Whilst these loans have been secured on favourable terms, they are repayable over a comparatively short period of years and, as foreshadowed in the directors' report, it may become necessary later on for us to deal with these liabilities on a more permanent basis.

Of the twelve vessels which we have ordered since the beginning of 1934, ten were contracted for before the recent increase in shipbuilding prices commenced, and the actual value to-day of our new vessels now in service is probably substantially in excess of their cost.

FINANCES ABSOLUTELY SOUND

Since our investments have now been written down to a fair book value and our properties, which in many cases have increased in value during recent years, appear in our books at moderate figures, it will be seen that our assets as a whole are now valued at a conservative figure, and therefore, whilst it may seem a little disturbing that so considerable a proportion of the company's

reserves has been utilised for depreciation, the financial position of the company may be regarded as absolutely sound.

Naturally, we are somewhat apprehensive regarding the effect, so far as this company is concerned, of the proposed new National Defence Contribution. As you know, the past few years have been difficult ones for shipping generally, and it would be regrettable if the incidence of this new tax should fall harshly upon industries just emerging from the effects of a long period of depression. Sufficient information is not yet available to enable any exact computation to be made as to the effect of the tax upon individual companies, but the shipping industry, as a whole, is making representations on the subject to the Chancellor of the Exchequer and I trust that the proposals may ultimately be so modified as not to prove injurious to an industry like ours, which is so vital to the preservation and well-being of the British Commonwealth.

NEW MAIL VESSELS

In accordance with the policy which this company has always adopted, the fleet has been maintained at a high standard of efficiency during the past year.

Our two oldest mail vessels, "Armada Castle" and "Kenilworth Castle," which had given us long and useful service, were disposed of in 1936, as was also the "Eider," which had been engaged in our Continental service, whilst the "Iansa," which was also employed in this service, has been recently sold.

Our fine new mail vessels, "Stirling Castle" and "Athlone Castle," each of over 25,500 tons, together with the "Dunnottar Castle" and "Dunvegan Castle," were put into commission in the course of the year. The latter vessels were constructed for our intermediate service, but they are being temporarily employed in the mail service to relieve the mail vessels withdrawn for re-engining. All these four new vessels have come fully up to our expectations and are proving very popular with the travelling public.

The "Walmer Castle," which we ordered for our Continental cargo feeder service between Southampton and Hamburg and Bremen, was also delivered before the end of the year and is satisfactorily fulfilling our requirements in this respect.

REFRIGERATED CARGO MOTORSHIPS

The "Roslin Castle" and "Rothesay Castle," which have now been in service for two years, continue to prove very useful in conveying fruit from South Africa to this country, and the further two fully-refrigerated cargo motorships, "Rochester Castle" and "Roxburgh Castle," will shortly be put into service.

In the spring of next year we expect our third new mail vessel, the "Capetown Castle," to be ready.

Since the commencement of the present year we have ordered two further intermediate vessels, one of which should be available by November of next year and the other some four months later.

RE-POWERING PROGRAMME

Our re-powering programme is proceeding satisfactorily, and although, on account of the unfortunate mishap to the "Llandovery Castle," which struck a mine off the Spanish coast some two and a half months ago, we were obliged to retain the "Windsor Castle" in service for another voyage before withdrawing her temporarily, I am glad to say that this will not cause any delay in the completion of the programme.

We are taking the opportunity of embodying certain improvements in these vessels while they are laid up, and when they are in service again, with the three new ships, we shall have one of the finest and most up-to-date fleets of mail vessels in the world, of which we may well be proud.

Our various services were regularly maintained throughout the year.

In August the "Stirling Castle" performed the first accelerated voyage of 13½ days from Southampton to Capetown. She and the "Athlone Castle" have continued to make the run in the shorter time ever since, and during the course of the next eighteen months they will be joined in turn by the re-powered vessels and the "Capetown Castle," so that by the end of next year the accelerated service should be in full operation.

PASSENGER TRAFFIC

I am pleased to be able to report that our passenger business generally showed an appreciable advance during the past year, both the number of passengers carried and the earnings exceed-

ing those of the previous year in our outward and homeward mail and intermediate services.

Unfortunately our East African service did not disclose the same tendency, as there was a slight falling off in passengers and earnings on this route. This was doubtless due partly to the fact that, unlike South Africa, East Africa during the earlier part of last year at any rate was still suffering from the effects of the depression, but, now that primary producers in the East African colonies, in common with others throughout the world, are receiving higher prices for their commodities, it is probable that more will be paying visits to the home country during this and succeeding years.

We have continued to receive good support for our special "holiday tours" and "round Africa tours," whilst an increasing number have taken advantage of the short Continental trips which we run during the summer months in connection with our intermediate service. Our special facilities for trips to Madeira, the Canary Islands and the Mediterranean were also well patronised.

CARGO TRAFFIC

As regards our cargo traffic, I am glad to say that the total volume and the revenue derived therefrom showed an improvement last year, as compared with 1935, although here, too, our East African service, both out and home, suffered a slight setback in earnings, whilst our service between the United States and South Africa continued to operate at a loss owing to the competition of various American lines, which has necessitated the reduction of the rates of freight below the economic level.

On each occasion that I have presided at an annual meeting of this company I have paid a tribute to the value of the work of our staff, and I trust that the regularity with which I make these remarks will not appear in any way to detract from their sincerity. The success of any company must depend in large measure upon the loyalty and efficiency of its personnel, and again I wish on your behalf, and on behalf of my colleagues on the board and myself, to express our appreciation of the faithful and diligent service of the company's staffs at home, abroad and afloat during the past year.

I have not long returned from a fairly extensive tour of East Africa, Southern Rhodesia, Portuguese East Africa and the Union of South Africa. This afforded me the opportunity of personal contact on the spot with the administrators, Ministers and responsible officials, as well as the leaders of the business communities, of those territories, and of discussing with them at first hand many matters of mutual interest. On all hands I was received with the utmost cordiality, and once again gathered the impression that such visits on behalf of our company are greatly appreciated in those far-off lands as assisting on both sides to a greater understanding of the problems associated with their development, which to so large an extent are interwoven with those of transit by sea.

DISTINGUISHED VISITORS

Many distinguished visitors from the countries we serve, including General Hertzog, the Prime Minister of the Union of South Africa, with other South African Cabinet Ministers, the Prime Minister of Southern Rhodesia, and representatives of the East African territories, are now arriving on our shores for the Coronation and forthcoming Imperial Conference, which will, I hope, give us further opportunities for renewing personal contacts and talking over various questions affecting the services we render.

In East Africa, Southern Rhodesia and Portuguese East Africa I found in the course of my travels a spirit of cautious optimism engendered by the recent substantial improvement in the prices of almost all primary products. One beneficial effect of the depression has been that producers were obliged to reduce their expenses to an absolute minimum, with the result that they are now able to make satisfactory profits when their products realise prices which formerly would have been considered uneconomic. Thus it is that prosperity is gradually returning to these countries, which should bring about an increase in the volume of cargo and passenger traffic.

PROSPERITY OF SOUTH AFRICA

As far as South Africa is concerned, the Union is still enjoying a period of prosperity resulting almost entirely from the present high premium on gold, a factor which is by no means as certain of continuance as some would like to believe. In the circumstances, there is a feeling of uncertainty in some quarters about the future, but the Government of the country, by its conservative financial policy—evidenced, for example, in its utilisation of

Budget surpluses for the reduction of debt rather than of taxation, and its efforts to encourage the development of as many primary and secondary industries as possible—is doing everything in its power to provide against untoward contingencies. Therefore, it may be that if and when the Union's income from gold diminishes, her other sources of revenue will be found sufficient to maintain a reasonably high level of prosperity.

This company of ours has been associated with the overseas trade of South Africa for over eighty years, during which time there have been many alternating periods of prosperity and depression. On the whole, the progress and development of the Union have been remarkable, and this company has endeavoured continuously to keep pace with developments by providing up-to-date facilities for the sea-borne trade of the Union.

In recent years we have provided a number of fine new vessels, the best of their type that can be built, and several others are under construction. These have involved a costly shipbuilding programme, and although, as I have mentioned, cargo and passenger business has been satisfactory on the whole, I may point out that, by the terms of the Freight Agreement with the Union Government, our rates are restricted, whereas in many trades freights generally have undergone a rapid change in an upward direction. On the other hand, operating expenses have risen considerably, advances having taken place in the cost of fuel, victualling, stores, wages and repairs, as well as for new ships.

CONFIDENCE IN FUTURE

Personally, I have great confidence in the future of South Africa, with which great country this company's fortunes are so closely bound up. Given the continuance of general progress and prosperity, we, with our new and up-to-date tonnage, are well placed to participate in the further development of the overseas trade of the Union. (Applause.)

I now have pleasure in proposing "That the report of the directors and the statement of accounts for the year ended December 31, 1936, now submitted, be and they are hereby received and adopted."

Sir F. Vernon Thomson, K.B.E. (deputy-chairman and joint managing director), seconded the resolution which, in the absence of questions or comments, was carried unanimously.

The Chairman moved the re-election of the four new directors whose names he had mentioned in his speech. They were:—Lord Catto of Cairncatto, Mr C. L. Dalziel, Sir Ernest Harvey, Bt., K.B.E., and Sir Campbell Stuart, K.B.E.

The Duke of Abercorn, K.G., K.P., seconded the resolution, which was carried unanimously.

On the motion of Sir F. Vernon Thomson, seconded by Sir Ernest Harvey, the Duke of Abercorn and Mr R. A. Murray, who retired by rotation, were re-elected.

The auditors (Messrs Deloitte, Plender, Griffiths and Company) were re-elected on the proposition of Mr F. Coward, seconded by Mr F. E. Stafford.

VOTE OF THANKS

Mr Alex Holm, C.M.G., C.B.E., proposed a hearty vote of thanks to the chairman and directors. In evaluating a company of this kind, one naturally considered the efficiency of its fleet which, in the case of their company, was of a high order. When one realised the production, trade, and commerce of the countries it served, it was clear that the fleet was very favourably placed. Apart from the enormous development of the gold mining and cognate industries, great strides had been made in which their company had taken a leading part, and had been ever ready to carry out its great responsibilities.

He submitted that it was the example, the sagacity, the capacity and the patience, in difficult situations, of their chairman and his colleagues that had enabled so satisfying a report to be made that day. The motion which he submitted to the meeting was a genuine expression of the shareholders' appreciation of the success which the company had attained. (Applause.)

Mr W. Starling seconded the resolution, which was carried with acclamation, and the chairman, having briefly responded, the proceedings terminated.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Bouverie Street, Fleet Street, London, E.C.4.

IONIAN BANK, LIMITED

A SUCCESSFUL YEAR

SIR JOHN STAVRIDIS ADDRESS

The ninety-eighth annual general meeting of the Ionian Bank, Limited, was held, on the 30th ultimo, at the offices of the company, 25-31 Moorgate, London. Sir John Stavridis, the chairman of the company, presiding.

The Chairman, in moving the adoption of the report and accounts, said he would like to convey to shareholders an impression very forcibly brought to his notice during his last visit to the Near East. For some years past he had found that the influence and prestige of England had become impaired, and with every fresh political development on the Continent of Europe it appeared to dwindle. This year, however, he had found a remarkable change; the masterly way in which the Constitutional crisis had been surmounted had come as a surprise to their friends, and when the proposed re-armament programme was made public an air of relief had become manifest in those nations who had been endeavouring to strengthen their alliances and to re-arm themselves. The prestige of England appeared to have been completely restored and the benefit thereof to the world at large should not be long in showing itself.

During the period under review in Greece the task of the new Government there had been heavy and difficult. It had had to put an end to class disputes, to rehabilitate the finances, balance the State budget, reorganise the defences of the country, complete the productive works, and above all to carry out the final establishment of the refugees and solve the difficult problem of social services.

It was impossible for the moment to pass judgment on the Government, but it was certain that the tendency towards deterioration of both public and private economy had been checked. One of the most stringent measures taken was that concerning the flight of capital, which had imposed severe restrictions on the movement of exchange. That some such measure was necessary was perfectly clear; a complete system of illegal export of capital had been organised and resulted in a serious depletion of the gold reserves of the Bank of Greece. That the steps taken had been successful was proved by the fact that the flight of capital had practically ceased. Whereas in August last the gold reserve of the Bank of Greece amounted to £2,573,000, it had reached the figure of £3,173,000 at the end of December.

DEVELOPMENT OF NATIONAL INDUSTRIES

The agricultural production last year on account of bad weather conditions had not been satisfactory. As to industrial production, 124 new factories were established last year, mostly for the manufacture of foodstuffs. Owing to the difficulty in obtaining permits for the import of foreign goods the national industries were rapidly developing and should prove a source of strength to the country, particularly when, as was the case now, international trade was at such a low ebb. Another source of strength, and one which substantially helped in reducing the adverse balance of trade, was the Greek mercantile marine.

The development of the bank's business in Greece had proceeded upon well-ordered lines, but they were still severely handicapped by the moratoria granted to debtors and the leniency of the Greek Courts.

EGYPT AND CYPRUS

The outstanding event in Egypt had been the signing of the Anglo-Egyptian Treaty, which had raised Egypt to the status of an ally of Great Britain. It was sincerely to be hoped that the anti-British propaganda that had been rife for so many years would now die down. The bank had also to record an improvement in that sphere of its operations.

Their operations in Cyprus were small as compared with those in Greece and Egypt, and the opportunities did not exist for any spectacular increase, but the attention of the world had in a small measure been focussed on that island, and he thought that they might look forward to a period of development.

Dealing with the accounts, the Chairman said that the net profit for the sixteen months' period amounted to £21,177, which compared favourably with the profit of £12,079 shown for the twelve months to August 31, 1935, and in the circumstances the directors were able to recommend the payment of a dividend of 3 per cent. for the period. Since the end of 1936 there had been no falling off in the bank's activities, and, provided there were no serious disturbances in the Near East, they should be able to show further progress in their undertaking during the present year.

The report and accounts were unanimously adopted.

THE UNION BANK OF SCOTLAND, LIMITED

IMPROVED TRADING CONDITIONS

The annual meeting of shareholders of the Union Bank of Scotland, Limited, was held, on the 5th instant, Sir A. Steven Bilsland, Bt., M.C., chairman of the bank, in the chair.

The Chairman, in submitting the directors' report, said that one of the most important events of the past year had been the break up of the gold bloc in Europe, which had removed an important obstacle to the stabilisation of currencies. While this obstacle had been removed, he did not mean to suggest that the time for stabilisation had arrived, but a position had been reached in which the main barriers had gone.

Another important event had been the rise in commodity prices since the autumn of last year, which had become particularly marked within recent months. This rise was due partly to the break up of the gold bloc, partly to the expansion of world trade and particularly as regards Great Britain to the re-armament programme. In the case of wheat it was due to short crops, both in importing and exporting countries. The increase from the abnormally low price levels was an important feature, because it brought the world economy into better balance. It was to be hoped that the higher price level would be sustained by a further healthy expansion of world trade, and that, on the other hand, it would not go too far and become inflationary.

The expansion of world trade, under the lead of Great Britain and the Empire, to which reference was made last year, had continued and had spread to the United States and to certain parts of the South American Continent. The volume of world trade was now about 85 per cent. of the 1929 figure. Further expansion towards that figure must depend largely on improvement in the political atmosphere of Europe.

The general recovery in trade and the re-armament programme were not yet being felt in Scotland to anything like the extent that they had been felt in England. For example, their figure of unemployment in Glasgow stood in March at 87,603 against a figure of just over 16,000 in Birmingham. For the most part, their industries were of a type to which recovery came late in the economic cycle. One of Scotland's great disadvantages was the narrow basis of its economic structure. The Government re-armament programme offered a special opportunity to assist the Special Areas by giving them preference not only as regards contracts but as regards sub-contracts. It was the stated policy of the Government to give this preference as regards contracts, and they hoped it might be the practice. If before the next period of depression they could not achieve an increase in the variety of their industries and particularly in the development of lighter engineering trades, they should, when such depression came, be relatively in a worse position than at the time of the last slump compared with other areas in Britain.

In introducing what was presumably his last Budget, Mr Chamberlain had caused great anxiety on account of the indefinite nature of the provision for raising a contribution from industry for national defence. They all agreed that Mr Chamberlain had performed outstanding services as Chancellor in restoring the credit of Great Britain, in maintaining cheap money over a period of six years, and in protecting trade and industry against abnormal competition. The country supported the policy of rearmament, and it was salutary to recognise that large Government expenditure, for whatever purpose, must be paid for. They accepted both the necessity to pay and the principle that those who benefit by the expenditure should pay at least their full share of the cost. But it was clearly our duty to call immediate attention both to the discriminatory character of the national defence contribution and to the effect which it seemed bound to have on those areas in which recovery came late in the economic cycle.

If they turned to the bank's balance sheet they would see, on the liabilities side, that deposits were higher by £880,000 at just under £33,000,000, and that notes in circulation showed a further increase of £104,000—a sign of improved trade and turnover.

Profits of £318,000 were very much the same as last year, and the dividend of 18 per cent. was the same as for a considerable period. This represented only 7 per cent. on their combined capital and reserves and, of course, less than that on the whole of our own resources. Ordinary banking business was still far from remunerative, and it was only because of the conservative policy pursued in the past in not distributing too much that they were able to make such a good showing.

The report was unanimously adopted and a dividend at the rate of 18 per cent. per annum declared.

CALEDONIAN INSURANCE COMPANY

SATISFACTORY RESULTS—RECORD NEW LIFE BUSINESS

MAJOR-GENERAL SIR WALTER MAXWELL SCOTT'S ADDRESS

The one hundred and thirty-second annual general meeting of the Caledonian Insurance Company was held, within the company's office, Edinburgh, on May 6, 1937.

The chairman, Major-General Sir Walter Maxwell Scott, Bt., C.B., D.S.O., in moving the adoption of the report, said:—Ladies and gentlemen,—The annual report and accounts for the year 1936 have been before you for some time. I presume, therefore, that I may take them as read.

LIFE DEPARTMENT

The net new life assurances granted during 1936 amounted to £2,039,320, the premiums thereon being £68,300, including £19,064 by single payments. The new sums assured of £2,039,320 constitute a fresh record and compare with £1,685,886 for 1935, which in itself was a record for the company.

The death claims for the year 1936 were £236,764 as compared with £207,284 in the previous year, but were within the expectation of the new mortality table, to which I shall refer later. The surrenders amounted to £65,151 as compared with £62,674 for 1935.

The expenses for the year 1936, excluding those applicable to annuities, showed a slightly lower ratio to premium income, the figure being 15.8 per cent. as compared with 15.9 per cent. for 1935.

The average rate of interest on the combined life assurance and annuity fund (excluding reversions purchased) was £4 os. 4d. per cent. after deduction of income tax, as compared with £3 19s. 3d. per cent. for the previous year.

In comparison with the figures of a year ago the valuation of our Stock Exchange securities, as at December 31st last, shows a further substantial appreciation over the values at which the securities stand in the life balance sheet. In accordance with our usual practice, in arriving at the market value in the case of all securities quoted in currencies other than sterling the rates of exchange on London as at December 31st last have been used.

The results of the triennial valuation of the life fund are set out in the report, and you will see therefrom that the rates of bonus declared for the three years ended December 31, 1936, were £2 2s. per cent. per annum in the sum assured for whole life assurances, and £2 per cent. per annum for endowment assurances. In arriving at these results, the recently published mortality table of the Faculty and Institute of Actuaries, known as the A 1924-29 Table, was used on this occasion for valuing the liabilities under the life assurance contracts, and the rate of interest assumed was 2½ per cent. instead of 3 per cent. as on previous occasions. The additional reserve for contingencies has been maintained at £30,000, and the carry-forward, after providing for the bonus distribution, is £98,348 as compared with £103,174 brought forward from the 1933 valuation.

I think you will agree that these results are satisfactory, especially as they have been arrived at without taking into account any part of the appreciation in value of the Stock Exchange securities.

The directors have resolved that the same rates of bonus as have been declared for the past triennium shall be paid as interim bonus in the case of policies becoming claims during the year 1937, and that the rates for policies becoming claims in 1938 and 1939 shall be determined at the beginning of each of these years, having regard to the conditions prevailing at the time.

FIRE, ACCIDENT AND MARINE INSURANCE ACCOUNTS

There are two innovations in these accounts to which special attention has been drawn in the annual report. The first is the combination of the various accident accounts into one account, as foreshadowed in my predecessor's speech a year ago. The second innovation is the discontinuance of our former practice of allocating interest to the fire, accident and marine revenue accounts—all such interest having been carried direct to the profit and loss account for 1936. These changes have been made with a view to simplifying our accounts.

FIRE DEPARTMENT

As you will see from the report, the premium income for the year was £714,938 compared with £733,294 in the previous year, and the profit (excluding interest) was £70,289 compared with

£82,499 for the year 1935. The fire fund on December 31, 1936, amounted to 110 per cent. of the premium income for the year.

ACCIDENT DEPARTMENT

The combined account shows that the total premium income for 1936 was £521,323 as compared with £483,674 for the previous year, and that the profit (excluding interest) was £16,415 compared with £17,313 for the year 1935. The total accident fund on December 31, 1936, amounted to 78 per cent. of the premium income for the year.

MARINE DEPARTMENT

The premium income for 1936 was £86,208 as compared with £86,218 for 1935. The first year's claims in 1936 were £16,336, being 19 per cent. of the premium income.

After a transfer of £10,000 to the profit and loss account, the marine fund at December 31st last amounted to £173,728, representing 201 per cent. of the premium income for the year.

GENERAL RESERVE FUND

This fund, which is additional to the departmental funds previously mentioned, has been increased as at December 31st last to £575,000 by a transfer of £25,000 from the trading profits of the year.

STAFF PENSION FUND

The balance of this fund as at December 31st last, after crediting interest received and charging pensions paid during the year, was £115,807. This amount appears in the general balance sheet as a loan from the trustees of the staff pension fund, in security of which specific Stock Exchange investments are now held.

PROFIT AND LOSS ACCOUNT

You will observe that on this occasion only one-third, namely £12,871, of the shareholders' portion of the life profits for the triennium has been transferred to profit and loss account, instead of the whole portion of £38,614. The balance of £25,743 appears in the general balance sheet, and will be transferred to profit and loss account in 1937 and 1938 by two equal instalments.

The balance at credit of profit and loss account at December 31, 1936, including the sum brought forward from the previous year, amounted to £271,798. Out of this sum, the directors recommend that £15,000 be carried to the staff pension fund as at January 1, 1937, and that a dividend be declared at the rate of 15s. per share, subject to deduction of income tax, to be paid by equal half-yearly instalments on May 15th and November 11th next.

It was stated in the annual report that the dividend recommended would cost £88,641 (after deduction of tax at the then current rate of 4s. 9d. per £), and, together with the allocation of £15,000, would absorb £103,641, leaving a balance of £168,157 to be carried forward, compared with £154,726 brought in from the previous year.

Since the report was issued, the rate of income tax has been increased to 5s. per £, but provisional relief in respect of Dominion income tax has now been agreed with the Revenue authorities at 3d. per £, so that on this basis the cost of the net dividend for the year would remain unaltered at £88,641. Before payment, however, of the instalment of dividend due in November, 1937, an adjustment in respect of Dominion income tax may be found necessary. Any such adjustment would alter the cost of the net dividend paid and the balance on profit and loss account to be carried forward to the 1937 account.

GENERAL BALANCE SHEET

From the directors' certificate appended to the general balance sheet you will observe that the Stock Exchange securities stand in the aggregate at less than the value at middle market prices at December 31, 1936. As in the case of the life department, in arriving at the market value of all securities quoted in currencies other than sterling, the rates of exchange on London as at December 31st last have been used.

UNITED STATES BRANCH

In the course of his speech a year ago my predecessor mentioned that plans had been approved by the directors for the construc-

tion of a modern building in Hartford, Connecticut, for our United States branch. I am glad to be able to inform you that the building has now been completed, and that, from the photographs and general information we have obtained from our United States manager, we feel sure that the building, designed by Mr Carl J. Malmfeldt, of Hartford, will be worthy of the standing of the company. Amongst special features of the building will be a reproduction in bronze of the company's coat of arms. This has been modelled and cast by Mr Charles Henshaw, of Edinburgh, for the pediment over the portico. The formal opening ceremony is to take place on June 2nd, and, to mark the occasion, it has been decided by the board that my successor as chairman Mr Wallace Cowan, and I, together with the general manager, should be present at the function. It is also our intention to visit some of our principal connections in New York and Montreal and in certain other centres in the United States and in Canada.

LONDON BRANCH

During the past year Sir Walter St. David Jenkins, C.B., C.B.E., accepted a seat on our London board on his retirement from the important position of Director of Navy Contracts at the Admiralty. We consider that we have been fortunate in securing his services.

OFFICIALS, STAFF AND AGENTS

Our annual general meetings are the only occasions on which the shareholders and the board of directors can join in giving recognition to all the good work done by the general manager, officials and staff at the head office and branches, and by the company's agents and representatives, including the marine managers and the underwriter. The progress made by the company is due to their loyalty and efficiency. You will, I know, join with me in offering them our appreciation and thanks for their services during the past year.

I now beg to move, ladies and gentlemen, that the report be adopted, that the allocation of £15,000 to the staff pension fund be approved, and that a dividend of 15s. per share, subject to a deduction of income tax, be declared for the year 1936, payable in equal half-yearly instalments on May 15th and November 11th next.

The report and accounts were adopted.

EQUITABLE LIFE ASSURANCE SOCIETY

RECORD NEW BUSINESS

The one hundred and seventy-fifth annual general meeting of the Equitable Life Assurance Society was held on the 5th instant, in London.

Mr H. L. M. Tritton (the president) said that the new life business for 1936 amounted to over £1,700,000—the largest amount of new sums assured ever obtained by the society. During the year 1936 every £1,000 whole life with profits policy which became a claim had, on the average, brought in £2,290. He had always maintained, and should continue to do so, that this fact was the finest advertisement that any insurance office could have, and he did not believe any other office in the world could approach the old Equitable's record in this respect.

The funds had grown by about £650,000, and, broadly speaking, it might be said that for some years now the annual rate of increase in the funds had been about £500,000. In arriving at the total funds the assets were taken at or under middle market prices as at 31st December, 1936, and there was a substantial margin not only in the Stock Exchange securities, but also in the society's interest in its three subsidiary companies and its freehold and leasehold properties. Opportunity had been taken to increase the loans on parochial and other public rates by about £200,000 in comparatively short-term investments. The amount invested in debenture stocks had increased by about £350,000, while freehold property had increased by about £80,000. This was partly due to the purchase of income-producing property and partly to the purchase of two buildings adjoining the office, one of which was now being rebuilt and amalgamated with the present office of the society in Coleman Street.

In spite of the difficulty of finding remunerative investments at the present time, it was satisfactory to record that the net rate of interest, after deduction of tax, was still well over 4 per cent.

Looking to the future and bearing in mind the increase in the rate of income tax, some further reduction in this rate was to be expected, and this would be accentuated if there were a continuance of the low rate of interest on which new investments could be obtained.

The report and accounts were unanimously adopted.

ALLIANCE ASSURANCE COMPANY, LIMITED

A SATISFACTORY YEAR

The annual general court of the Alliance Assurance Company, Limited, was held on the 5th instant at the head office, Bartholomew Lane, London.

Mr Lionel N. de Rothschild, O.B.E., the chairman, said that they had been operating in Spain for some ten years. The bulk of their business there was ordinary fire insurance and they did not anticipate any serious claims. In a number of cases they had granted cover against risk of damage from riot and civil commotion, but that did not give protection against civil war. In various other countries they had suffered from an extension of restrictive legislation and discrimination in favour of national companies and, in view of that and of the unstable exchanges, he was afraid that the outlook in the foreign field was not too brilliant.

They had not been altogether unprepared for developments abroad and had endeavoured during the last few years to extend their home business in order to compensate, as far as possible, for the probable loss of foreign business. The results of the home business during the past year had been very favourable and he was sure that the accounts and balance sheet would be regarded as quite satisfactory.

DEPARTMENTAL RESULTS

The new Life business was a few thousand pounds less than in the previous year. Ordinary life business had increased, but there had been a falling off in business transacted under special schemes for building societies. They had every reason to anticipate that at the close of the quinquennium on 31st December, 1938, the surplus for distribution would be satisfactory.

The fire business was that which had been most affected by foreign events. Nevertheless, owing to the development in home business, they could congratulate themselves on the results of their trading operations in the fire department during the past year. The fire fund was now about 150 per cent. of the fire premium income, so that the position of the account was one of exceptional strength. In the accident department there was a further substantial increase of nearly £60,000 in premium income. To that increase practically all the many sections of the business comprised in the term "Accident" had contributed.

MOTOR BUSINESS

The results of the motor business showed an improvement which was particularly gratifying in view of the conditions which prevailed with regard to underwriting and the settlement of claims. An increasingly important section of the company's activities in the accident department included the issue of administration and other forms of Court Bonds as well as indemnities relating to various types of contingency arising out of legal and financial transactions. An equally important section dealt with public liability indemnities.

In the marine account their net premium income for the year was about £10,000 higher, no doubt due to the greater activity in trade. Both at home and abroad their cargo business had improved. The account for 1934 had been closed, and the balance in respect of that year was £70,070. They had placed £25,000 to suspense account and the balance of £45,070 had been transferred to profit and loss account.

THE TRUSTEE DEPARTMENT

The trustee department continued to develop satisfactorily and the total funds which were now administered in that section amounted to £17,000,000. Those, of course, were entirely independent of the company's assets and were not included in the accounts.

Turning to the profit and loss account, they had again transferred £150,000 to the general reserve, which now stood at £1,650,000, and £50,000 to the staff pension fund. Including the £100,000 additional reserve in the fire account, and allowing for a reduction of about £13,000 in the carry-forward, the final result was that after paying their dividend and all expenses their reserves had been increased during the year by nearly £287,000.

With regard to their assets, the excess of market values over book values at the date of the balance sheet was actually greater than on any previous December 31st. Since the close of the year there had been a sharp fall in price, which had been greatly accentuated since the introduction of the Budget. He thought it no exaggeration to say that the proposed National Defence Contribution Tax had been a severe shock to the City. It was to be hoped that the modifications which the Chancellor had promised to make in the original proposals would achieve the objects which he had in view.

The report was adopted.

ATLAS ASSURANCE COMPANY, LIMITED

SATISFACTORY RESULTS IN ALL DEPARTMENTS

NEW LIFE BUSINESS RECORDS

MR F. A. JOHNSTON ON CONDITIONS ABROAD

The annual general court of proprietors of the Atlas Assurance Company Limited was held, on the 30th ultimo, at the Chartered Insurance Institute, 20 Aldermanbury, London, E.C.

Mr F. A. Johnston (chairman of the company), in the course of his speech, said:—In view of the continued difficulties in carrying on our foreign business to which I have had to allude on previous occasions, the account we submit to you to-day may be considered very satisfactory.

FIRE DEPARTMENT

In our fire department the premium income was almost identical with that of 1935, and it would have been larger by some £30,000 had it not been for loss on exchange caused by devaluation of certain Continental currencies. This particular account calls for no further comment by me except to point out to you that the ratio of profit of 10 per cent. is distinctly good.

ACCIDENT DEPARTMENT

In our accident department the account shows a steady increase in the premium income. Both home and foreign business have contributed to this development. The ratio of profit at 6.1 per cent. is somewhat lower than that of last year, but a substantial contribution is nevertheless made by this particular department to profit and loss account. We have in the past been very fortunate in our accident results, but restrictive legislation in certain areas leaves us almost in the position of rendering social service with little, if any, profit to the company. It is possible for that reason, therefore, that we may as time goes on have to be content with a more modest return from this department unless the volume of our accident business increases sufficiently to offset to some extent the effects of what I have mentioned.

PROGRESS OF MARINE DEPARTMENT

In our marine department we had in 1936 a very satisfactory year. Claims were below normal. The increasing cost of repairs, owing to the rise in prices and to other causes, are, however, likely to be reflected in the claims of the current year. After the transfer of £200,000 to our general reserve fund, to which I shall presently refer, the fund of £240,108 remaining in this account is sufficient to run off the entire account and to still leave a substantial margin of profit.

RECORD NEW LIFE BUSINESS

The life department is able to record once more an increased business. Premium income and interest revenue both show larger figures, in each case constituting a fresh record. The new business in 1936 of £4,315,147 was £750,990 larger than that in the previous year, and also constituted a record in progress. Interest on the life funds yielded on the average fund for 1936 a return of £4 8s. 6d., after deduction of income-tax, against £4 10s. 4d. in the previous year.

The life profit for the past year was £281,573, to which has to be added £307,516 brought forward, making a total of £589,089. Of this sum £60,000 has been used to increase the additional reserve in our valuation from £550,000 to £610,000, £40,000 has been applied to strengthening the reserve held against future bonuses under limited payment policies, and £43,144 to interim bonuses and to the usual payment to the proprietors, leaving a balance of £445,945 to be carried forward. Ignoring interim bonuses it seems probable that our bonus at the end of 1937 at the current rate of 42s. will cost approximately £525,000. You will see, therefore, in what a very strong position the life department finds itself with a carry-forward of £445,945 at the end of the second year of the current triennium.

STRONG FINANCIAL POSITION

You will have noticed in the annual report a readjustment of the company's reserves, a reform which we have for some time wished to introduce and which has now been carried out. It will give a clearer picture of the company's financial position.

The fire fund has, as you are aware, up till now contained two reserve funds, 40 per cent. being a reserve for unexpired risks and 60 per cent. a free reserve, and I may here incidentally remark that from a long experience 40 per cent. is a more than ample provision for unexpired risks. The free 60 per cent. in

the fire fund, amounting to £1,311,403, has now been transferred to the general reserve fund, and we have dealt in a somewhat similar manner with our accident and marine reserves, transferring to the general reserve from those free funds £100,000 and £200,000 respectively.

These particular transfers, with a contribution of £138,597 from profit and loss account, create, with the amount of £250,000 already in the general reserve, our new general reserve fund of £2,000,000. You will appreciate, I am sure, our objects in making this alteration, not the least benefit of which is the facility with which people at home, and especially abroad, will now be able to appreciate at a glance the strong financial position of the company.

PROFIT AND LOSS AND DIVIDEND

If you will look at our profit and loss account you will, I think, see a satisfactory picture; the comparison with the previous year is rather confused and obscured by the transfer of £138,597 to our general reserve fund from "profit and loss," but as this transfer is made from past profits the true surplus for the year 1936 after payment of income tax and expenses, making a transfer of £25,000 to our staff pension fund, and providing for the dividend, is £101,589, against £102,203 in 1935. That amount goes to strengthen the company's reserves. It may interest you to know that since the year 1931, the year in which this country went off the gold standard, the surplus income left in the profit and loss account or added to reserves has amounted to £622,000, in addition to which £95,000 has been added to the company's staff pension fund.

Owing to the transfer to the general reserve, to which I have already referred, the carry-forward to 1937 has been reduced from £348,682 to £311,674, but remains nevertheless at a substantial and satisfactory figure. We pay to you on 1936 account the dividend which shareholders have now received for some years—namely, 8s. per share, free of income tax.

OVERSEAS BUSINESS DIFFICULTIES

The rise in the wholesale prices of commodities which has taken place during the past six months is, of course, of immediate advantage to the business of insurance companies, whose revenue is benefited in many directions by the consequent increase in the value of insurable goods. Such an advantage, however, when the gold standard was practically universal and allowed to function in a healthy manner, was more distinct than it is to-day, when trade is liable to be harassed by currencies of uncertain value.

It was recently pointed out by a distinguished financial authority that a *de facto* stability of currencies is not enough and that until currencies had been fixed *de jure* it was idle to look for any recovery in world trade, and he was certain that whatever currency system was finally adopted it would be incomplete if it lacked a physical backing of gold. That is an opinion which, rightly or wrongly, appeals, I think, to the ordinary man of business far more than idealistic conceptions which often seem to lack the possibility of practical application. I refer particularly to this subject as it has assuredly an important bearing upon our interests and upon those of other insurance companies carrying on a foreign business.

TRADE AND NATIONALISM

It is evident, I think, that the currency regulations which are in force in certain countries and the quotas and the restrictions against which traders have now rather wearily to contend almost force nations to impose tariffs not, as the authority I have quoted remarked, for revenue purposes, but in order to bolster up a policy of economic self-sufficiency.

I need not point out to you how prejudicial to the interests of insurance companies with foreign connections a continuous policy abroad of economic self-sufficiency may in the long run be. Nationalism may sound a fine word to the unreflecting, but it does not make for world prosperity in trade. I think one may claim, however, that the world is slowly moving on to a healthier plane in financial matters, and insurance men, whose outlook is world-wide, will greatly welcome the advent of happier conditions.

The report and accounts were unanimously adopted.

LONDON AND LANCASHIRE INSURANCE COMPANY, LIMITED

INCREASED PREMIUMS AND INTEREST EARNINGS

BALANCE OF WORLD TRADE

The seventy-fifth ordinary general meeting of this company was held, on the 5th instant, in London.

Sir Frederick Pascoe Rutter (governor and chairman), in proposing the adoption of the reports and accounts, said: For generations we have been dependent upon our world-wide commerce, built up on a Free Trade policy, the open door. That open door had to be slightly closed in self defence, but our power, our position, would obviously be of little account unless we had our close association with so many great countries throughout the world—that association producing so much of the business upon which we live.

Now, let me illustrate what I have been endeavouring to say by a few figures, from which you can easily draw your own conclusions, and I think you will then realise that these are still much to be desired. You are all aware of the simple statement, which is axiomatic, that, if there is an excess of imports over exports, this can only be practically, truly, offset by what are called invisible exports—the income from our operations overseas, interest on foreign investments, shipping, banking and insurance.

You are also aware that, in theory, if it could be attained, it would be preferable if our exports could be made to balance our imports. But this, from the nature of our world-wide commerce, and of our position as a large creditor, is impossible; and when you get an exceptional and considerable incident—such as this re-armament programme—disturbing the equilibrium, it has had the natural effect of further increasing our imports to a much greater extent than our exports. The importance of this factor has been accentuated by the figures which have been published for the first three months of this year, which show that the visible adverse balance is much greater than it was in 1936, and still more so than 1935. Hence, there is so much more leeway to be made up by the invisible exports if the account is to be balanced at all.

Comparing then our position with that of 1929, and taking that at 100 per cent., in 1933 it was only 70 per cent.—a drop of 30 per cent.—but, in 1936, it had recovered 10 per cent. of that drop, and at the present moment you can assume our world trade to be about 80 per cent. of what it was seven years ago.

Then take the invisible exports. In 1929, they were 460 millions; by 1932 they had fallen to 260 millions; but, by 1936, they had recovered to 330 millions. That recovery came from income from foreign investments, to a less extent from shipping, and, I am sorry to say, there has been no apparent recovery in the other sections, particularly banking and insurance. This, I think, will be explicable to you because of the nationalism, restrictions to trade, and other embarrassments which have hampered both the banks and insurance companies during the past decade.

GRATIFYING RESULTS

To deal now briefly, but, I hope, clearly, with our operations in 1936, I believe you will have concluded that, considering everything, it was again another good year. For it was rife with problems and difficulties, and as regards that important section America, it had to bear the consequences of the reduction in rates promulgated in 1935.

In any case, I am sure you will be struck with the soundness of the account, in that each department contributed so fairly and well to the profit.

The premiums amounted to £6,225,193—an increase of £183,098, of which £163,006 came from the accident department, £85,771 from marine and there was a decrease of £65,679 in the fire. This decrease was only to a small extent due to the United States, and was chiefly caused by disturbances on the Continent and depreciated currencies. And, if Continental countries are so myopic as to go on sabre rattling, quarrelling amongst themselves and taking sides, there is of course no likelihood of any early improvement.

FIRE BUSINESS

Our home business was quite steadily satisfactory and produced the usual handsome result.

Generally speaking, our foreign business proved quite lucrative with the exception of America, where the profit from the United

States produced only a little over three per cent. against almost ten per cent. in the previous year. Canada is often a reflex of the United States, and there also the premiums were less and the profit only half of what it was in 1935. Notwithstanding these drawbacks, the total fire profit amounted, after the usual 40 per cent. correction, to £357,202, or 13 per cent. against £443,789, or 15.8 per cent., in 1935.

The accident department is now the one from which, without pressing, we expect and receive a gradual accretion of income. Indeed, as in the United States, casualty business seems to be gradually outstripping in volume the business of the fire departments.

I am glad to say that each of the accident sections, to a greater or lesser degree, contributed to the total profit of £107,025, or 4.5 per cent., against £72,717, or 3.3 per cent. in the previous year.

The marine business, whilst not up to the high water mark of 1935, yielded the substantial profit of £129,520, or 11.5 per cent., against £185,508, or 17.8 per cent., in 1935.

We therefore have a total profit, before deducting British income tax, of £593,747, or 9.5 per cent., against £702,014, or 11.6 per cent. And, if you could count upon as good a result in every year, I am sure you would be more than satisfied.

LIFE DEPARTMENT

The life business I do not propose to refer to in any detail, because, as you are aware, it is transacted entirely through the medium of The Law Union and Rock. You will be glad to have found that the conduct of this life business and its healthy progress during the past year gave ground for general satisfaction, and I hope you will kindly remember to give this life department your individual support.

INTEREST EARNINGS

Our interest last year showed some improvement, which, to me, was very welcome, because, on your account, I had watched with regret the yearly diminution which had been taking place, due to the causes of which you are all well aware. It was therefore satisfactory for us to find at the end of the year that there was an advance in income from the yield both on actual investments and property, the result being that, apart from the life surplus, there was a total of £481,952, as against £474,099 in 1935. I am hopeful that this means at last a real turn in the tide and that a steady recovery may take place.

The appreciation in the actual market value of our investments, which I have referred to annually, continued, as you would naturally expect, during the financially prosperous year with which I am now dealing. And, if we could only be certain of it, and secure it, we should have a very handsome sum to place to our credit.

Summarising, then, you will find from the profit and loss account that, after including the surplus from the fire, accident and marine accounts, the interest, and, on the other hand, the debits for pension funds and for the dividend of £573,000 for the year, there remains a credit in the profit and loss account to be carried forward of £2,461,006, as against £2,134,191 for last year.

SEVENTY-FIVE YEARS PROGRESS

You will have noticed from the report that we have now completed seventy-five years of our existence and, having in remembrance the serious difficulties which the company encountered at its inception, it must be a source of considerable gratification to many of you who have—in some cases to my knowledge for forty or fifty years—continued your allegiance, to know that we have reached this stage in our career, robust, and with an organisation and a name which time has established so indisputably.

The one important convincing fact which each succeeding year has shown you, is that, whatever may happen to British insurance; whatever disconcerting and troublesome incidents may arise, this company, by its record and by its prestige, remains firm upon the solid foundation which has earned for it its exceptional reputation, not only in this country, but in every other country, as I have had so many vivid opportunities of learning and appreciating.

The report and accounts were unanimously adopted.

GRESHAM FIRE AND ACCIDENT INSURANCE SOCIETY, LIMITED

SATISFACTORY RESULTS

FINANCIAL POSITION STRENGTHENED

The twenty-seventh annual general meeting of Gresham Fire and Accident Insurance Society, Limited, was held on the 6th instant, at the head office of the society, 188/190 Fleet Street, London. The Hon. W. B. L. Barrington (the chairman) presiding.

The Chairman said:—In the fire account, the premium income of £125,495 is less than in the preceding year by £7,231, but I am glad to be able to tell you that this is not due to any loss of business or connections but to the substantial fall in the value of certain foreign currencies. On the other hand, the claims are lower by £7,529, and the ratio at 50.5 per cent. has improved by nearly 3 per cent.

The amount of commission and expenses has fallen but not quite proportionately to the decrease in income, so that the ratio is higher at 45 per cent., against 43.6 per cent. in the previous year. The profit in the account amounts to £6,897, which represents 5½ per cent. of the net premiums, and this sum has been transferred to the credit of the profit and loss account. You will notice that the additional reserve of £10,000 which has been built up during the last few years, has now been transferred to the general reserve in accordance with the decision of your board to consolidate the society's free reserves, as far as possible, under one heading.

In the accident account the premiums amounted to £212,385, an increase of £15,903, while the ratio of claims has fallen from 49 per cent. to 47.4 per cent. Having regard to the fact that this account contains a large proportion of motor insurance, this ratio may be considered very satisfactory.

The commission and expenses are somewhat higher at 44.8 per cent., against 44.1 per cent. in 1935, but the profit ratio is 2 per cent. better at 5.1 per cent. The profit of £10,951 has been transferred to the credit of the profit and loss account and the additional reserve of £10,000, as in the case of the fire account, has been transferred to the general reserve.

The valuation of the society's investments as at the 31st December last discloses a further improvement in the position, the excess of the market value over the book value having increased materially during the year. I need hardly remind you that the reserve constituted by such a surplus provides a margin of security on any reversal of the trend of investment values experienced during the last few years. The investment reserve fund of £50,000 affords us in its entirety an important additional protection against fluctuation contingencies.

The profit and loss account, after crediting the underwriting profits, the interest income and other items and debiting taxation and directors' fees, shows an available balance of £38,592 against £31,022 in the preceding year. Out of this balance your directors have allocated £10,000 to the general reserve and £5,000 to staff pension reserve and recommend the payment of a dividend at the rate of 6 per cent. less income tax, absorbing £13,500. This will leave to be carried forward in the account the sum of £10,092 as against £8,079 brought forward from 1935.

During the past year progress has been made with the scheme for closer co-operation with our parent company, the Gresham Life Assurance Society, and for unity of working with the Legal and General Assurance Society which I mentioned a year ago. Although it is too early yet to expect to see material results from these efforts, much preliminary work has been done and the prospects in this direction are encouraging.

Once more may I remind you that in our opinion it must be our primary consideration for many years to build up reserves so that the Society's financial position may be unassailable. The importance of this can hardly be exaggerated and it goes without saying that the necessary provision can only be made out of the profits earned by the society. The process is necessarily slow if combined with due underwriting caution, but shareholders must be patient and will I know approve the conservative policy which first of all aims at strengthening reserves and providing the absolute security which the society must offer to its policyholders, and adopt as a secondary consideration an increase of dividends. In due course the latter should naturally follow the former.

On the whole, I think the operations of the year may be considered satisfactory, and I now beg to move: "That the directors' report and accounts be approved and adopted, and that a dividend for the year 1936 at the rate of 6 per cent., less income tax, be paid upon the paid-up capital of the society."

The report and accounts were unanimously adopted.

GRESHAM LIFE ASSURANCE SOCIETY LIMITED

CONTINUOUS PROGRESS

PREMIUM INCOME PASSES MILLION MARK

The eighty-eighth ordinary general meeting of the Gresham Life Assurance Society Limited was held, on the 6th instant, at the chief office of the society, 188-190 Fleet Street, London.

The Hon. W. B. L. Barrington, the chairman, presided, and in the course of his speech said:—The figures which are submitted to you to-day are, I think, satisfactory evidence of the continued progress of the society notwithstanding the fact that during the year we were compelled to cease our activities in Spain, where, as you know, the Society has transacted a large and progressive life business for many years. During the twelve months under review the society issued 8,308 life and endowment policies assuring the sum of £3,758,931, this being a net figure after deduction of re-assurances.

The total net premium income shows an increase over the previous year's figure of no less than £98,887. It has now passed the million mark, the actual amount received being £1,096,723. The total income of the society from premium, interest, dividends and rents was £1,544,491 and the total assets of the society increased by the sum of £474,164 and now amount to £10,661,326. The average net rate of interest realised on the society's funds was £4 6s. 3d. per cent. compared with £4 8s. 9d. per cent. in the previous year. It is a matter of regret that I should have to record this further fall in our rate of interest, but having regard to the trend of yields over the past few years, the reduction will not be unexpected. In the circumstances, I think that the rate earned can be considered as satisfactory.

The usual valuation of assets has been made as at December 31st last, and this showed again a value in excess of the book values appearing in the balance sheet.

Whereas it is impossible to anticipate the result of the terrible conflict in Spain so far as it will affect our business in that country, I would like to emphasise the fact that as the society's assets and liabilities are in the same currency, we have no reason to fear any loss which need give us cause for concern.

As foreshadowed in my speech last year, our business in India has now been entirely reorganised, and in lieu of our previous representation we have established a branch office in Bombay under the management of British officials. A valuable site has been acquired in the best part of the city, where a building is now in process of erection which will become our new chief office for India, Burma and Ceylon. We look forward to a satisfactory expansion of our business in that part of the world.

I should now like to offer our congratulations to Mr Stebbing, our manager and secretary, on the results of the year and to express to him, to our chief officials and to all members of our staff both at home and abroad, our thanks for the valuable services they have rendered. In this expression I desire, as usual, to include all our branch managers, agency representatives and connections to whose loyal co-operation we are indebted and whose support has contributed so largely to the satisfactory results attained.

With regard to our managing director, Mr Workman, I will content myself with saying, as before, that his qualities and experience make him invaluable to the society, and that he never spares himself in his efforts towards progress and efficiency. I am sorry to say that Mr Stebbing has expressed a wish to retire owing to ill-health and advancing years, and in deference to this wish the directors have reluctantly agreed to release him from the responsibilities and cares of office on June 30th next.

Mr Stebbing joined the society on August 2, 1888, and for more than 20 years of his 49 years' service occupied positions of responsibility abroad. He became assistant manager in July, 1930, and was appointed chief officer on January 1, 1934. He has served the society faithfully and well during all these years, and we all trust that he may be restored to health and be able to enjoy a well-earned leisure for many years to come.

To succeed Mr Stebbing the directors have appointed Mr David McAfee, F.C.I.I., as manager and secretary of the society as from July 1st next. Mr McAfee has been assistant manager since April 1, 1935, and we feel confident that in him the society will have an able and conscientious leader. As from the same date the directors have appointed Mr H. C. H. Highton, who has been our superintendent of foreign branches since March, 1935, to be assistant manager, and Mr N. P. Mogensen, who has been in our service since January, 1900, to be assistant secretary. To all these new officials we tender our good wishes.

The report and accounts were unanimously adopted.

FRIENDS' PROVIDENT AND CENTURY LIFE OFFICE

AGGREGATE FUNDS NOW OVER £18,000,000
MR HAROLD J. MORLAND'S ADDRESS

The annual general meeting of the Friends' Provident and Century Life Office was held, on the 5th instant, in Edinburgh.

Mr. Harold J. Morland, M.A., J.P., F.C.A. (the chairman), in the course of his speech, said: You will have seen from the report that the new life assurances have once more made a considerable advance, reaching the new record of £2,502,110, which, together with the Century's contribution of £215,861, gives a total of £2,717,971.

The annuity premiums received amounted to £1,291,188. We now provide facilities whereby persons of, say, 60 or over may invest their capital with the office, receiving either 5 per cent. or 6 per cent. income thereon for their lives, with the guaranteed return at death of an agreed substantial proportion of the capital. Thus not only is an adequate income secured, but the trouble and responsibility of investment supervision is avoided.

The sinking fund new business of the Friends' Provident and the Century together amounted to £1,282,592.

The life premium income advanced by £29,133. This trend was even better than it appears, because single premiums were £4,441 less than for 1935. The relative expenses were moderate at 15.14 per cent. The mortality experience was very favourable. The amount of the claims by death was only £190,098, which was £8,777 less than for 1935, and £89,848 below the figure for 1934, notwithstanding the larger business on the books. The proportion of actual to expected claims under the British offices A 1924-29 table was 65 per cent.

INTEREST RATE

The interest rate earned on the life and annuity assurance fund was £4 16s. before, and £4 1s. 11d. per cent. after, deduction of income-tax. It will be seen that, although the current rate of income-tax averaged over 4s. 8d. in the pound for 1936, the net effective rate suffered was about 2s. 11d. The reason for this reduction is that a rebate of income tax is allowed in respect of commission and expenses of management, and it is only the net cost of the income tax which is finally deducted from the gross interest. There is also available a credit for income-tax in respect of the amounts applicable to annuity payments. Some life offices, as in our case, deduct this from the annuity payments: others apply the credit to improve the net rate of interest earned on the combined life and annuity fund. This difference of method in some instances at least will result in a large variation in net interest rate. If we had adopted the alternative method the net interest rate would have been £4 8s. 9d. per cent. for 1936, an apparent improvement of 6s. 10d. per cent.

CENTURY REVENUE ACCOUNTS

The fire and accident premium income from Great Britain and Ireland, which derives much support from the holders of life policies, is steadily rising. We are looking forward to further progress, especially in this home field, for our well-established and completely equipped fire and accident departments.

The year's results shown by the Century were generally satisfactory. The profits transferred from underwriting accounts, excluding interest, amounted to £53,328; interest, after deduction of income tax, came to £48,635.

The investments of the Friends' Provident, the Century, and of their associated companies are under centralised control. In the case of the largest funds, those of the Friends' Provident, endeavour has been made to hold at least half the investments in secured loans, mortgages, ground rents, and office properties, which, subject to the underlying security being adequate, are little subject to fluctuations in capital value. At the end of 1936 the proportion in these less variable categories was just over 50 per cent.

The aggregate funds during 1936 were increased by over £2,000,000, and now exceed £18,000,000, of which nearly £13,500,000 relates to the Friends' Provident.

Our annual survey of the staffs at our head offices and branches has impressed your directors afresh with the quality of the service rendered by those upon whom the responsibility rests of maintaining and enhancing the reputation of our combined offices.

Mr. Robert H. Marsh, F.C.A., seconded the adoption of the report, which was carried unanimously.

The elections of directors and appointment of auditors were made.

NORTH BRITISH AND MERCANTILE INSURANCE COMPANY, LIMITED

CONTRIBUTION OF ALL DEPARTMENTS TO
GOOD RESULTS

The 127th annual general meeting of the North British and Mercantile Insurance Company Limited was held, on the 5th instant, in Edinburgh.

The Rt. Hon. The Viscount Wakefield of Hythe, G.C.V.O., C.B.E., L.L.D. (the chairman), in the course of his speech, said: I should first like to refer to certain changes in the directorate and management of the company. To our great regret Mr Robert Cross resigned at the end of the year for reasons of health. He had held office as a director for upwards of 35 years. During the whole of that time he took a keen interest in the affairs of the company and we wish to record our high appreciation of the valuable services which he rendered for such a long period.

I am also extremely sorry to say that Sir Arthur Worley decided to retire from active management at the end of the year and tendered his resignation of the position of managing director. Sir Arthur has always given to its business his unremitting care and attention and has assiduously applied his outstanding abilities to its advancement. I am glad to say that he will be willing to retain the office of deputy chairman. The Hon. Robert H. Brand has been elected a deputy chairman of the General Court of directors and his added help in this capacity will be of great value to us. Following Sir Arthur Worley's retirement, Mr H. S. Milligan was appointed general manager; Mr Thomas Frazer deputy general manager and secretary; and Mr A. E. Ridoutt joint secretary.

DEPARTMENTAL RESULT

The year was the first of a new valuation period for the life department and a very good start has been made. Policies were written for the record amount of sums assured exceeding £5,800,000, the bulk of which was retained at the company's own risk. The mortality was favourable. The total claims under our life assurance contracts exceeded £2,400,000, a sum nearly equal to the total premiums received in the year.

The results of our fire department fall somewhat short of the high profit level attained in 1935 but they are still good. The fire loss ratio was 41.11 per cent. of our premium income as compared with 37.32 per cent. for 1935. The fire surplus of £369,286 represents a profit ratio of nearly 11 per cent.—a result which we are very pleased to achieve. The premium income for the year was £3,401,993, which showed a small increase over the 1935 figure.

The results of our casualty business, which is transacted by the Railway Passengers Assurance Company, again show a healthy position. The combined interest and profit amounts to £242,834. The marine premium income for 1936 amounted to £236,216, showing an increase of nearly £20,000 on that for 1935, but, owing to the reduction of rates, these premiums represent an increased liability in respect of Hull risks on which claims will have to be met. We are satisfied that the reserves which we are carrying for the winding-up of 1935 and previous years are adequate, and we have again transferred to profit and loss account £40,000 from the profits of closed years. Another very good account has been produced by the Fine Art and General.

RESULT OF YEAR'S WORKING

Turning to the summary of the figures of our various accounts you will see that we commenced the year with an aggregate balance brought forward of £6,578,173. Our combined underwriting profits totalled £598,498 and our combined net interest totalled £590,187. One-fifth of the profits from the life branch amounted to £67,460, and sundry items amounted to £9,123. Turning to the other side of the accounts, we paid away in "North British" ordinary and preference dividends £583,980 and income tax on profits accounted for £115,971. We added to our superannuation fund £50,000, and "Railway Passengers" wrote off premises £2,000, leaving a combined balance carried forward of £7,091,490.

In other words, after payment of dividends and making provision for the various other transfers mentioned above, our profit and loss balance has been increased during the year by £513,317. Altogether I think we have every reason to be pleased with the results of the year's work, and with the fact that each section of our business has contributed handsomely to the figures presented. We propose to pay the same dividend as last year—namely, 6s. 3d. per share, less tax.

The report was unanimously adopted.

SPILLERS LIMITED

RECORD ANIMAL FOOD DELIVERIES

SIR MALCOLM ROBERTSON ON MARKET
CONDITIONS

The Rt. Hon. Sir Malcolm A. Robertson, chairman of Spillers Limited, presided at the annual general meeting of the company, on the 1st instant, at Cardiff.

In moving the adoption of the report and accounts, he said that the amount due to depositors under the head of creditors had been reduced largely as the result of the board's decision to cease to accept money on deposit at three months' notice, while the total of the reserves had been increased by £100,000 as the result of an addition of that amount to the general reserve. On the assets side, the value of stocks had increased by some £540,000, which was due to the increase in the price of wheat and grain, which necessitated the use of additional capital. It was also mainly due to that factor that investments had decreased by about £800,000.

The board had seriously considered the advisability of paying a jubilee bonus, but the directors had thought it best, in present-day circumstances, to conserve the resources of the company. They had been fully aware of the probability of increased taxation in order to finance the heavy cost of the re-armament programme, and, further, the rise in the price of wheat during the year had been so severe that it had led to a considerable increase in the amount of money required for daily use.

DIFFICULT CONDITIONS IN WHEAT MARKET

The wheat market during the year had been extremely difficult. For the first half of the year it stood at about 30s. per quarter, but during the latter half there was, for various reasons, a rise of about 10s. per quarter. A further rise to well over 50s. per quarter took place after the end of the company's financial year. Press publicity added momentum to the upward trend and caused widespread participation by outside speculators, who, by subsequently liquidating their holdings, caused a severe break in prices of about 8s. per quarter. In those very difficult conditions the board have unwaveringly maintained their policy of buying only for milling requirements. There was an unavoidable element of risk in the nature of the industry, but all speculation had been rigidly avoided. High prices of raw materials led to high prices for the finished article, which was of no advantage whatever to the company. While profit margins remained about the same, it was obvious that sales tended to diminish in quantity as prices rose.

When considering the recent rise in wheat prices it was well that the Government and those clamouring for storage of six months' or a year's supply of wheat should reflect what might happen if Great Britain went into the market and endeavoured to purchase that amount. If bad harvests and heavy purchases by Germany and Italy were responsible for increasing the price from 30s. to over 50s. per quarter in a few months, what would be the effect of Great Britain suddenly deciding to purchase six months' or a year's supplies in competition with other nations seeking to do the same?

ANIMAL AND POULTRY FOOD TRADE

The company's animal and poultry foods trade continued to grow in volume and importance in relation to the business as a whole. Deliveries during the year created a new record, which was all the more gratifying as the period had been one of great difficulty and trial for all those engaged in agricultural pursuits. The geographic position of the company's mills and depots, however, enabled the company to give unique delivery service, and with the maintenance of the high standard of quality at economic prices, the company's connection with agriculture was rapidly expanding. The company's dog foods trade also continued to make good progress, and an expansion in deliveries had again to be reported.

With regard to the company's new mill at Newcastle-on-Tyne, the silos which were now complete had been designed to store over 150,000 quarters of grain, and ships' cargoes could be discharged into those silos at the rate of 150 tons an hour. The flour mill and provender mill were situated above the warehouse, so that manufactured goods could be placed in store by force of gravity only. It was the first building of its type in Europe, and the highest mill building in the world. It was confidently expected that the mill would be in production at the date of the next annual meeting.

GOOD WORKING CONDITIONS

It was a source of much gratification to the board that the satisfactory dividends declared for the past year had not been

earned through a policy of low wages to the company's employees. Wages in the flour milling industry were generally at a higher level than in any comparable industry, and there was no reduction during the recent depression. Since March last, moreover, a reduction of approximately two hours per week in working time had been introduced without any diminution in the rate of wage. A further great advance had been pioneered by the milling industry by guaranteeing its employees in England and Wales a system of security whereby they would not suffer by reason of unemployment due to short time running.

The industry was also very proud of the fact that, for the past eighteen years, employees had enjoyed on full pay a week's annual holiday in addition to all statutory holidays, in total amounting to a fortnight in each year.

The labour conditions on the provender side of the industry had not been quite so satisfactory in the past; but, as a result of lengthy negotiations, a Provender Milling Employers' Federation had been formed. The company had joined the employers' side of the Whitley Council, which had, in the past, operated for the seed-crushing and compound cake trades only, but would now be extended to include the provender millers. It was hoped as a result that there would be a general raising of wages for men in the provender industry throughout the country which would bring many of them into line with the wages paid to the company's employees.

The report and accounts were adopted.

LICENSES AND GENERAL INSURANCE COMPANY, LIMITED

GRATIFYING RESULTS

The forty-seventh ordinary general meeting of the Licenses and General Insurance Company, Limited, was held, on the 5th instant, in London.

Lord Ernest Hamilton (Chairman of the Company), who presided, said that the tremendous improvement which had been registered in commerce and industry generally throughout the country during a further twelve months found a definite reflection in the figures submitted to the meeting.

It would indeed appear that the industrial barometer was standing at a very satisfactory "set fair," and that there did not seem anything at hand to warrant real apprehension for the immediate future. But it was not for him to embark on an exploration of the industrial outlook—that was for each one to see and judge for himself.

Since they last met in general meeting the shareholders had acceded to the necessary formalities for the creation of a new department. That addition—in the practice of life assurance—made their Company in all respects a composite office.

The result of the Company's newly established life department for its first eight months' working had frankly exceeded anticipations, and the Board were quite convinced that the step taken was wise.

The public realised more and more fully the merit of life assurance which, for the great mass of the population, was a very fine form of investment, while the life offices of this country in their quiet endeavour as trustees of part of the nation's savings, were, in themselves, a bulwark for the stability of the State.

Their fire department showed an increased income by nearly £3,500, and while the personal accident department had not been so fortunate, the steady improvement in the motor account had enabled them to transfer therefrom to profit and loss £11,042 as against £6,000.

In the general account there was an improvement in income and likewise in profit. The account was representative of quiet and steady advance—a matter of between £9,000 and £10,000 in the present year.

The total premiums in all departments showed the satisfactory increase of £52,448, and in the profit and loss account the balance available showed an additional £7,168. The Board recommended the payment of a final dividend of 14 per cent., making 20 per cent. for the year, the same as since 1927, the carry-forward being increased to £27,129. The increase in the assets of the Company was £51,980, bringing the total to just over three-quarters of a million pounds.

As to the future, the Board looked forward to 1937 for further evidence of advancement. Income showed a steady upward tendency: expenditure for the moment was on a reducing scale, and, if general conditions over which they had no control remained peaceful and prosperous, the Board looked forward with steady confidence in the affairs of the Company.

The report and accounts were unanimously adopted.

BRITISH AND CHINESE CORPORATION, LIMITED

IMPROVED CONDITIONS IN CHINA

MR D. G. M. BERNARD'S SURVEY

The thirty-ninth ordinary general meeting of the British and Chinese Corporation, Limited, was held, on the 5th instant, at the registered office of the Corporation, 3 Lombard Street, London, Mr D. G. M. Bernard (chairman of the corporation) presiding.

The Secretary (Mr E. R. Morris), having read the notice convening the meeting and the report of the auditors.

The Chairman said:—Gentlemen, the past year has been the most useful and most hopeful for the industries and trade of China since the check due to the Great War. Chinese public men, not only statesmen, but merchants and bankers as well, taught by sad experience the virtue and the necessity of self-reliance, have at long last addressed themselves to the task of setting their house in order with praiseworthy energy, and with a measure of success which affords grounds for encouragement.

CHINESE RAILWAYS LOAN CREDIT

In the sphere which is of most interest to our corporation—railway development and finance—we have had the satisfaction of seeing a general clearing up of loans in default. The terms of composition are undoubtedly very favourable to China, but the bondholders were probably well advised to accept them in view of the unanimous recommendations of committees representing holders in the capitals of Europe and America, including, I believe, also those of Japan. The resumption of service payments on Chinese railway loans generally may be regarded as a satisfactory result of the various loan settlements to which I have referred. A further effect of these settlements has been to re-establish the credit of China at a point where she may once again hope to borrow on reasonable terms, and Dr Kung, Minister of Finance, who gave his invaluable support, and Mr Chang Kia-ngau are to be congratulated on the satisfactory issues of the negotiations.

The Minister of Railways is faced with a large programme of railway construction, and it seems his principal difficulty is to know where he can best make a start. He has before him plans, not perhaps as far-reaching as those laid down by Sun Yat-sen in 1912, but upon a more practical and, it may be hoped, more profitable basis. We ourselves are in touch with him at many points, and I think you may rest assured that when railway work starts in China in earnest our Corporation will play its appropriate part.

I referred last year to the confidence we felt in the new Minister of Railways, Mr Chang Kai-ngau, and our sanguine expectations have been amply fulfilled by the results of his energetic and business-like control of his Ministry and the personal attention he has given to the financial condition of the National railways.

THE FUTURE

The finance of overseas enterprise is confronted with many difficulties, and railway development in China has more than its share. There is, in the first place, what is known as the "Treasury Ban," which prohibits free lending on pre-war lines. Secondly, we have our international obligations to consider, by which I mean the obligations imposed upon us by the Washington Treaty and the Consortium Agreement of 1921. Thirdly, we have the cloud of political unrest, which is not confined to Central Europe, but has a focus of its own in the Far East.

These formidable obstacles stand in the way, but no one of them is insuperable. We do not propose to rush our fences, but we believe that by patient negotiation we shall shortly be able to overcome them.

Not even the most cursory survey of affairs and prospects in China is possible without reference to her relations with foreign countries, for in no place in the world are business and politics so closely interwoven. Great Powers and lesser Powers all see in China a free market for their goods and services, and a vast field from which to obtain the raw materials of which they stand so much in need. All therefore are candidates for China's good will, not excepting Japan.

During the past year there have been various moves in the direction of a better understanding between these two great Asiatic Powers, China and Japan. Only last month I read in a reliable semi-official periodical, under the heading "China," that the Japanese Trade Mission in Shanghai was told by the Chinese authorities that there was no prospect of economic co-operation until the Japanese policy in North China was changed, and, under the heading of "Japan," that the Japanese Foreign Minister

had said that his policy towards China aimed at economic and cultural co-operation before taking up political negotiations.

The world at large, anxious only for peace, may almost be said to be indifferent whether a political agreement is reached before an economic or after. If I may venture to give a lead in this matter, I should say: Stand not upon the order of your settling, but settle!

EFFECT OF DEPRESSION

The effects of the general trade depression, which were acutely felt in China towards the close of 1935, have been reflected in the official revenue returns of the railways for the fiscal year ended June 30, 1936, which showed a general decrease in gross earnings, with increases in operating ratio. An exception is the Tientsin-Pukow Railway, whose earnings continue to increase and whose revenues for the calendar year 1936 constitute a record, together with a very considerable reduction in operating ratio. In the second half of 1936 there has been an encouraging increase of gross revenue in the traffic returns of all the railways financed by the Corporation, with the exception of the Canton-Kowloon Railway, where a small decrease was recorded. This improvement has been continued and increased in the early months of the present year, together with reductions in the operating ratio. Generally speaking, there is now a growing confidence in business and financial circles regarding China's prospects, and the general spirit of progress and modernisation noticeable in all Government Departments is reflected in the management and control of the railways.

REVENUE AND TRADE

Since the enforcement of the currency decrees of November, 1935, exchange stability has been maintained, and the interest of our Government in the future prospects of trade is indicated by the appointment of Mr Kirkpatrick as resident representative of the Export Credits Guarantee Department in China. I have no doubt that the facilities afforded by this action will stimulate the trade with China in the export of British capital goods.

Unification of the country has made satisfactory progress, and the settlement of the crisis in the south under the firm yet patient diplomacy of General Chiang Kai-Shek has contributed greatly to this end. The Customs Revenue collection for 1936, notwithstanding the serious loss of revenue due to the great extent of smuggling in North China, showed an increase of about \$9,000,000. The salt revenue also increased by over \$21,000,000 as compared with 1935, and this revenue has shown remarkable expansion in recent years, the total for 1936 being more than three times that of 1929, the year in which the Chief Inspectorate of Salt Revenue was re-organised. In agriculture, too, China had a prosperous year, with bumper crops in many provinces. The crops harvested during the year were estimated to be worth \$3,000,000,000 more than the crops of 1935.

ACCOUNTS

The accounts show that the net profits received during the financial year ended December 31, 1936, were £19,046 19s. 5d., as compared with £17,449 11s. 6d. in the previous year, and that in the profit and loss account of the balance sheet there is a credit balance for appropriation of £43,957 6s. 8d. As stated in the directors' report, it is proposed to pay a dividend of 15 per cent. on the paid-up capital, subject to deduction of income tax at 5s. in the pound, to increase the general reserve to £325,000 by the addition of £5,000, and to carry forward £20,207 6s. 8d. You will notice on the assets side of the balance sheet that the sterling advance, which stood last year at £235,362, has been cleared, and there only remains the currency advance, the equivalent of which at the exchange rate of 1s. 2½d. is £537,915, as compared with £499,448 a year before, the difference being the interest which has accrued during that period. Our investments, which stand in our books at below market quotations, have increased from £150,000 to £391,750.

After the negotiations now pending for the settlement of the Nanking-Hunan advances, amounting to £537,915, have been brought to a successful conclusion the board will take into consideration the suggestion which has been put forward to obtain power to increase the amount paid up on our shares by capitalising part of our reserves.

I beg to move: "That the directors' report and accounts now presented be, and they are hereby, received and adopted, and that a dividend of 15 per cent. be, and the same is hereby declared payable, subject to income tax, on the 6th instant."

The report and accounts were unanimously adopted and the recommendations of the directors approved, and the proceedings terminated with a vote of thanks to the chairman and directors.

NEW KLEINFONTEIN COMPANY LIMITED

(INCORPORATED IN THE UNION OF SOUTH AFRICA)

INCREASED TONNAGE MINED AND MILLED

ENCOURAGING DEVELOPMENTS

MR GEORGE MACKENZIE'S ADDRESS

The forty-first ordinary general meeting of shareholders of the New Kleinfontein Company, Limited (incorporated in the Union of South Africa) was held in the Board Room, Consolidated Building, Fox Street, Johannesburg, on Wednesday, the 21st ultimo.

Mr George Mackenzie presided.

In moving the adoption of the report and accounts, the chairman said:—

Gentlemen,—I have now to submit for your adoption the reports and accounts for the year ended December 31, 1936, which have been in your hands for some time.

No change has taken place in your company's claim holding which remains at 2,597 claims. Notice of the Government's intention to proclaim approximately 148 claims on farm Reitfontein, to which I made reference last year, appeared in the Union Government Gazette in the early part of this year and the matter is now proceeding. When these 148 claims have been transferred, your company will have a total holding of 2,745 claims.

BALANCE SHEET

In the balance sheet you will observe that the item "property development and equipment" has been increased by £93,404 10s. 8d. made up as follows:—South shaft sinking and equipment, £63,051 17s. 2d.; Apex No. 7 shaft new hoist, £11,901 5s.; and additions to reduction plant, £18,451 8s. 6d.

The revenue from gold for the year amounted to £1,038,064 7s. 9d., and the result of the year's operations was a working profit of £272,758 8s. 5d., as compared with £166,408 19s. 2d. for the previous year.

The balance carried to the appropriation account, including £3,794 18s. 2d. being excess provision for taxation for 1935, and £92,022 4s. 8d. unappropriated at December 31, 1935, amounted to £382,283 7s. 2d., which was dealt with as follows:—Dividends, £218,480 5s. 11d.; Miners' Phthisis Compensation Fund, £7,778 11s. 11d.; funds transferred in respect of expenditure on capital account, £83,599 15s. 2d.; and balance carried forward, £72,424 14s. 2d.

MINE OPERATIONS

I will now deal briefly with the operations at the mine. The tonnage mined was 905,982 tons, and the tonnage milled 801,700 tons, being an increase on the previous year of 100,622 tons in the tonnage mined and 116,300 tons in the tonnage milled. Working costs at 19s. 1½d., show a reduction of 1s. 4½d. per ton milled. The total footage developed was 53,840 feet, of which 37,155 feet were sampled and 14,080 feet were payable, equivalent to 37.9 per cent. of a value of 5.65 dwts. over 57 inches.

In the Kleinfontein section of the mine, development during the year has been confined to the opening up of isolated blocks of ground on the Main Reef previously considered unpayable, and to the exploitation of the 200-foot reef. Although the payable ore disclosed in this section has been somewhat limited, it has continued to contribute substantially to the tonnage of ore sent to the mill.

In the area to the east of the Apex shaft, development has been practically completed above the strike fault met with on the 14th level, and the reef disclosures have been encouraging. In order to expedite the development on the lower side of the strike fault where shoots of high grade ore are likely to be met, the main shaft is being sunk to the 16th level which should be completed within the next few months.

ENCOURAGING DISCLOSURES

On the western side of the Apex section, development disclosures have been encouraging in the No. 1 leased area on the 1st and 3rd levels where pay reef has been exposed. The 3rd level west has now reached the No. 2 leased area and recently has shown encouraging values. The 6th level west has also penetrated the No. 2 leased area, but so far the values have been somewhat disappointing.

In order to serve the east winze area where ore bodies of exceptional width are available for stoping, it is proposed to instal equip a new haulage between the 1st and 4th levels. The ore

reserves were again calculated on the basis of a pay limit of 3 dwts. and on that basis it was estimated that at the end of the year there were 2,569,318 tons of ore reserves of an average value of 4.96 dwts. over 54 inches.

I do not think it is necessary for me to go into details of the development footages and values for last year. These are given in the manager's report and from the plan which accompanied the annual report you will be able to see the progress made. The reduction plant will be increased during the current year by the addition of another tube mill and rotary filter, which when installed, a larger tonnage can be crushed and will permit of finer grinding of the ore and a reduction in the average value of the residues.

NEW SOUTH SHAFT

The chairman referred to the difficulties caused by encountering water in the New South Shaft, and said that the permanent pump station had been completed in January and that it was anticipated that the shaft would be down to the required depth about the end of the year.

GRADE OF ORE

There is one question I should like to deal with, and that is the grade of ore sent to the mill during the last three years. In this connection I think it is better to link the grade with the tonnage.

I give the following comparative figures:—

For the year 1934: The tonnage milled was 649,000 tons; average grade, 3.75 dwts.; profit, £65,062; ore reserves, 1,028,191 tons.

For the year 1935: The tonnage milled was 685,400 tons; average grade, 3.90 dwts.; profit, £166,409; ore reserves, 1,945,079 tons.

For the year 1936: The tonnage milled was 801,700 tons; average grade, 3.99 dwts.; profit, £272,758; ore reserves, 2,569,318 tons.

Shareholders will see that notwithstanding the increase in the milling tonnage during 1936—an increase of 116,300 tons over the previous year—the grade of ore to the mill has been increased from 3.90 dwts. to 3.99 dwts. When we take into consideration that the Kleinfontein Mine is a producing mine and at the same time a developing one, the first essential is to establish a strong ore reserve position, and I think we can claim that this is being done.

PRESENT POSITION

When the company was taken over in 1931 there were only available some 286,000 tons, whereas at the end of 1936, although the pay limit had been lowered to 3 dwts., we have two and a half million tons. The grade of ore milled can only be increased by removing a larger percentage from payable reserves, but your board feels that in view of the fact that the mill is now crushing a larger tonnage, it is in the interest of the company to maintain and possibly improve the present ore reserve position.

At present development in the lower levels of the Apex is being pushed ahead where high grade blocks of ore exist. The lay-out in the bottom levels, however, is such that development and stoping cannot be conveniently carried on together, but as soon as the south shaft has reached the reef horizon, probably about the end of the year, and the ore bins completed, it will be possible to increase the grade of ore milled, and the monthly profits.

The programme which has been set down by your board is as follows:—

In September of this year, when another tube mill and the second Oliver filter have been installed, the monthly tonnage crushed will be increased from 71,000 tons to about 75,000 tons, which will result in an increase in the monthly profits without any increase in the grade of ore milled.

Since our last meeting, Mr Geo. D. Stephan, B.Sc. (Mining), has been appointed consulting engineer to the company, and I have to express our appreciation to him and to Mr Calderwood, your manager, for the work accomplished.

I now move that the directors' report, balance sheet and accounts for the year ended December 31, 1936, laid before the meeting, be adopted.

The resolution was carried.

CROWN MINES, LIMITED

MR JOHN MARTIN'S REPORT

Mr John Martin, presiding at the annual meeting held in Johannesburg, on the 5th instant, in moving the adoption of the report and accounts, said that the company had had another successful year. The tonnage milled and the working revenue had been the highest in the history of the company, and dividend declarations, totalling 190 per cent., had been 20 per cent. more than the previous record of 170 per cent.

It was indicative of the scale of operations that the tonnage crushed in 1936, at 4,277,000 tons, had been 945,000 tons more than during the gold standard year in 1932, an increase which, in itself, was approximate to the total of many an individual Witwatersrand mine. The yield in 1936 of 4.782 dwt. per ton milled had been lower by 0.12 dwt., but the greater tonnage had produced a substantial increase in the total yield of gold, which, at 1,022,625 fine ounces had been 41,521 fine ounces more than that of 1935, and had been only 20,876 fine ounces less than the peak output in 1933, when the yield per ton had been more than one dwt. higher. Development results on the Main Reef Leader had been, on the whole, satisfactory, although, in the extreme western area, exposures had continued to be disappointing. Indications had, however, been more favourable in that section during the current year. Development on the South Reef had not been as large as in the previous year, the work on that reef having been concentrated to a large extent on a more favourable central section where the percentage of the amount payable was high, but the value of the ore comparatively low. The total ore developed and classed as payable was 4,219,980 tons with an average value of 5.3 dwt. per ton. Tonnage thus developed had been 229,796 tons less than tonnage developed in 1935, but the value of ore disclosed showed an increase of 0.4 dwt., owing to the greater proportion of Main Reef Leader developed.

The total ore reserve as re-estimated at the end of the year was 25,541,900 tons of an average value of 5.30 dwt. over an estimated stoping width of 49.3 inches. That included 5,470,500 tons of an average value of 6.16 dwt. in shaft and safety pillars not at present available for stoping. The available reserve was, therefore, 20,071,400 tons, which had an average value of 5.06 dwt. Compared with the previous year, the available reserve showed an increase of 254,275 tons, the average value being 0.01 dwt. lower.

It was of interest to record that the sinking of the third shaft—No. 15B—in number 15 shaft system, which was itself a unit in four deep level shaft systems of the mine, had been completed, the bottom of the shaft, at 8,527 feet below the collar of the first shaft in the system, now being the lowest on the Rand and 2,927 feet below the sea level. The work of installing in No. 15B shaft permanent equipment for hoisting purposes had made rapid progress.

"EFFICIENT AND LOYAL" EMPLOYEES

Figures quoted revealed little of the human element that was concerned with that vast organisation. The maintenance of the present scale of operations was in a large measure dependent not only upon the efficiency and the loyalty of the large labour force of 3,266 Europeans and some 25,000 natives, but also upon the availability of adequate supplies of labour. So far as European workers were concerned there was no reason to anticipate that the requirements of new and developing mines could not be met. The native labour position was less assured. The wastage of native employees was due, for the most part, to the expiry of contracts, which was considerable. At Crown Mines the daily wastage was between 50 and 60, which meant that every month between 1,600 and 1,700 natives had to be recruited. It was therefore important for every mine on the Witwatersrand that there should be no decrease in recruitment and that requirements of new and developing mines should be met without reducing the labour quota for producing mines. It had become necessary to look outside existing sources to meet future needs. In doing so, they had to be assured of the physical ability of the natives from other areas, such as tropical areas, to adjust themselves to a variety of climatic and mining conditions on the Witwatersrand and also that their treatment satisfied the natives themselves and the Government authorities concerned. The mortality and sickness rates among tropical natives allocated to Crown Mines for experimental purposes showed that the precautions taken and the training of natives, whether tropical or other, in hygienic and sanitary methods were meeting with very encouraging results. As tropical natives had more than average susceptibility to

pneumonia they were, on arrival at the mine, given light work on the surface for a fortnight to become accustomed to variations of temperature experienced on the Rand.

ACCLIMATISATION PROCESSES

Mr Martin proceeded to describe in some detail a further process of acclimatisation of the tropical native: the constant medical supervision to which all natives were subject as a matter of routine: the training natives received in ordinary precautions against catching cold, such as using heavy coats with which they were provided: the precautions taken in the mine itself to protect natives from contact with cold ventilation currents when returning from work: and the scrutiny of all natives as they came off the shift and their immediate treatment for any cuts or injuries.

The Chairman went on to describe features of the natives' life in the mine compounds. Any visitor to the compound at Crown Mines, he said, could not but be impressed by the neat appearance of asphalted streets, the lawns and flower gardens and the clean and regularly painted buildings, with their equipment of wash houses, shower baths of hot and cold water and water-borne sewerage and electric light.

The cooking and general kitchen arrangements were organised on modern lines with electric or steam-heated boilers and appliances. Meals were based on a regulation diet specially selected for its high nutritive value from foodstuffs suited to the native palate. Recreation facilities were provided, there being four large sports grounds adjoining the bigger compounds. A free cinema performance once a week in each compound and loud speakers connected with wireless-receiving and gramophone sets gave natives entertainment in their leisure hours.

"These are some of the features of compound life on Crown Mines," said Mr Martin, "and with minor variations they are typical of the measures taken on gold mines of the Witwatersrand to care for the health and comfort of the native employees."

The report and accounts were adopted unanimously.

CITY DEEP, LIMITED

RECORD TONNAGE MINED AND MILLED

Mr C. L. Read, chairman, presiding at the annual general meeting held in Johannesburg on the 5th instant, said the company's mining property had been increased by the acquisition, under lease from the Government, of approximately five and a half claims forming an island block in the eastern section of the mine.

Compared with the previous year's figures the tonnage mined had increased by 138,836 tons, derived mainly from the comparatively low grade south reef.

Ore milled had reached the fresh record of 1,277,000 tons, of which 127,800 tons came from surface dumps, or less than half the quantity drawn from that source during 1935.

The yield per ton had been lower by .09 dwt., which, with the fall of 1s. 10d. in the average price realised for gold, had resulted in a decrease of 1s. per ton milled in working revenue.

Working costs had been lower by 2d. per ton and the working profit had been reduced by 10d. per ton to 3s. 11d. per ton milled.

After reviewing the financial results the Chairman recalled "at the capital of the company had been increased in June last year by 300,000 shares of £1 each issued at a premium of 7s. 6d. per share.

THE NEW VERTICAL SHAFT

The net yield of the new issue had been £407,882. The additional capital was to finance the major portion of the programme, which included the sinking of a new vertical shaft in the eastern area and the provision and installation of equipment incidental thereto. Preliminary work on the sinking of the new shaft (No. 5) had been undertaken. The steel headgear had been erected and the collar put in. Delays had occurred in the delivery of the hoists, but one had been ready to operate and the second had been in the course of erection at the end of December. The offices and other buildings had been completed and railway facilities had been well advanced. While this work had been proceeding, the shaft had been sunk 144 feet with light tackle, its total depth below the collar at the close of the year having been 164 feet. With the second hoist in commission about the middle of February the footage sunk had been increased and the total depth at the end of April was 1,183 feet.

Development footage, including the incline shaft-sinking but excluding the vertical shaft, totalled 78,722 feet, and was a record for the company, representing an increase of 11,590 feet or approxi-

GOLD CORPORATION LIMITED

IMPROVING PROSPECTS

The third ordinary general meeting of Gold Corporation, Limited, was held, on the 6th instant, in London.

Sir Edward A. Ruggles-Brise, Bt. (the chairman), said that the accounts for the year ended March 31, 1937, showed liquid assets at £231,537, against an issued and paid-up capital of £207,698. Since the close of the year they had been able to invest some of their cash balance at prices which ought to show substantial appreciation during the current year and which showed a highly satisfactory yield.

The Quartz Block (143 acres) had continued to show very good values and was now under option to a syndicate acting on behalf of the Dome Mining Corporation until June 4th. With regard to Monument Hill, the company had a large interest in that producing mine; unfortunately, the grade at the moment was rather low, but Mr Stuckey, the managing director, told them when he was in England recently that he felt certain that values would improve, and recent results had justified that. Shareholders would see from the accounts what steps the directors had taken towards putting the company on a sound and profitable basis. Further reductions in the running costs of the company were in hand and some had already been put into effect.

It was never intended, nor was it the object for which the company was formed, to speculate in gold-mining shares, but they were prepared to participate with the gold groups when they were financing newly-discovered projects, or to consider participations in the form of shares.

Again they must reiterate that time must be given for these things to progress, and in the usual way a developing company could not be expected to pay large dividends at first. In spite of the recent heavy setback in markets, he considered the outlook for mining enterprises of the first order to be encouraging.

Regarding permission to deal in the shares, they had been unofficially advised not to make the application whilst outstanding calls remained unpaid—a position since cleared up. It was now their intention to make application for permission to deal.

The report was adopted.

JOHNSON AND PHILLIPS, LIMITED

SUBSTANTIAL EXPANSION

The thirty-second annual general meeting of Johnson and Phillips, Limited, was held, on the 6th instant, at Winchester House, London.

Mr G. Leslie Wates, J.P. (the chairman) said that the profit for the year had substantially increased, it being £181,000 as compared with £144,000 for the previous year. Their balance sheet, succeeding as it did three years of steady improvement, reflected the increase in prosperity which had gradually been permeating the whole country after the slump of 1929 to 1932. That prosperity, having been gradual, had every prospect of being a stable condition.

Their output for 1936 showed an increase over the figures for the previous year of approximately 25 per cent. in value and their carry-forward of orders in hand into 1937 was practically 50 per cent. up on the previous year's total. To some extent that difference was, of course, due to higher prices, but it was largely an increase in volume of business as well, as the main rise in raw materials which had taken place did not begin to be felt until nearly the end of 1936. That increase in output had been spread fairly uniformly over practically all their departments.

While work for the War Service Departments was always a feature of their business, the Re-armament Programme could not be said to have affected their turnover for 1936. Its effects were undoubtedly beginning to be felt, both directly and indirectly, but even during the war the demand upon them had been largely for their own standard lines of manufacture. A matter they had particularly in mind was the maintenance of their service to their overseas customers. At a time like the present there was, perhaps, some temptation to concentrate on the active home market, but they fully realised that to do so to the neglect of their valuable connections abroad would be a very short-sighted policy. Their business with their overseas branches, agencies and customers was being maintained.

The newer departments of their business continued to make progress and their subsidiary, British Permel Enamelled Wire, Limited, had worked to capacity throughout 1936, the high quality of its products attracting as much business as their plant could cope with.

The report was unanimously adopted.

mately 17 per cent. on the footage accomplished in the previous year.

Expenditure charged to working costs upon development was £184,232, or 2s. 10.6d. per ton milled.

Payable ore development amounted to 1,300,900 tons, valued at 4.91 dwt. per ton over a stoping width of 51.5 inches.

ORE RESERVE

The total ore reserve at the end of the year was estimated at 3,993,700 tons of an average value of 5.2 dwt. over a stoping width of 51.4 inches.

The estimated available ore reserve was made up of 2,517,900 tons of the Main Reef Leader, averaging 5.31 dwt. over an estimated stoping width of 49.3 inches and 879,500 tons of the South Reef, averaging 4.03 dwt. over an estimated stoping width of 65.2 inches.

Compared with the estimated available ore reserve at the end of the previous year on the Main Reef Leader, there was an increase of 230,100 tons, with a decrease of 0.22 dwt. per ton in the average value, and on the South Reef there was an increase of 133,700 tons, with no change in the average value, but an increase of 3.2 inches in the estimated stoping width. Combined, there was an increase of 363,800 tons, with a drop in the average value of 0.18 dwt. and an increase in the average stoping width of 0.7 of an inch.

Exposures on the Main Reef Leader in the lower levels of the mine between No. 4 C incline shaft and the western boundary has been below the average value of those made in previous years. On the other hand, east of No. 4 C incline shaft, exposures had been more encouraging. On the South Reef, on the upper levels of No. 1 shaft and at No. 2 incline shaft, considerable tonnage of payable but low-grade ore had been developed and was included in the reserve.

The increase of 363,800 tons in the available ore reserve was satisfactory, but the underground position was still difficult owing to concentration of the Main Reef Leader reserve in the south-west corner and in the lower levels of the extreme east.

Richer blocks of the Main Reef Leader left above the thirty-second level in the west were approaching the remnant stage and had to be mined with great caution, and consequently output from them was restricted.

The output from the large pay blocks in the extreme east was restricted by reason of ventilation and transport difficulties which would be removed when No. 5 vertical shaft came into commission.

Development of exposures in the western section adjoining the Robinson Deep boundary had recently shown decreased values, although this had to some extent been offset by improving prospects east of No. 4 C incline.

The position had been eased by the development in the upper levels of large tonnages of the payable South Reef, but which were of low grade and showed no large margin of profit.

Another feature which prevented any material improvement in grade was that considerable tonnages of unpayable ore intervening between stretches of payable ore had to be mined over incline shafts to protect shafts from dangerous pressure.

"We are making steady progress towards better conditions," Mr Read said, "but the stage of difficulties is not yet behind us."

IMPROVED TAXATION POSITION

It had been necessary, he added, to provide only £382 in respect of sundry taxes during the year. As explained last year the new method of taxation of the profits of gold-mining companies allowed accumulated losses brought forward and amortisation of capital expenditure to be taken into account. These allowances in 1936 extinguished all the company's liability for Government taxation on profits derived from gold mining, and the same condition would apply to 1937.

The report and accounts were adopted unanimously.

SOUTH-EASTERN GAS CORPORATION, LIMITED

YEAR OF STEADY PROGRESS

The fifth ordinary general meeting of the South-Eastern Gas Corporation, Limited, was held, on the 5th instant, in London, Sir David Milne-Watson, LL.D., D.L. (the chairman) presiding.

The Chairman in the course of his speech said that the balance of profit for the year, after paying the preference dividend, was equivalent to 7 per cent., less tax, on the ordinary shares. The directors were not recommending, however, any increase in the dividend paid in previous years of 6 per cent., and a substantial sum had therefore been added to the carry-forward.

The group of companies offered very great possibilities for the expansion of gas sales. One of the greatest benefits to be derived from such geographical grouping under one control was that it permitted the adoption of a long-term policy, so that the development and extension of each member of the group formed part of a planned and co-ordinated scheme for the whole area. Omitting the very small undertakings, all the companies of the group showed increased sales of gas.

Last year he had expressed fears as to the upshot of the District Marketing Scheme under the provisions of the Coal Mines Act, 1930, and unfortunately their fears were being realised. They were finding that they could not obtain additional coal or renew expiring contracts except at considerably increased prices and, further, there had been difficulty in obtaining deliveries under contracts negotiated some time ago. The board felt that the main force of public opinion was with them in a determination, if public utility undertakings found themselves faced with any crude expression of the monopoly spirit, to resist, both on their own behalf, and that of the ultimate consumer, exploitation by sales monopoly.

He would not like to miss the opportunity now afforded of making some comments upon the report of the Joint Parliamentary Committee on Gas Charges published last week. The whole tenor of the report implied a most gratifying vote of confidence in the management and conduct of the industry and its sense of responsibility towards its consumers.

The report was unanimously adopted.

CALCUTTA ELECTRIC SUPPLY CORPORATION, LIMITED

NEW ORDINARY SHARES TO BE ISSUED

The annual meeting of the Calcutta Electric Supply Corporation, Limited, was held, on the 3rd instant, in London.

Lord Meston (chairman), in the course of his speech, said that the capital expenditure during the year was just over £400,000, which was not in excess of what they were now coming to regard as their normal requirements for the steady extension of the business. Net divisible profits came to £211,454, against £220,282 for 1935, enabling the board to recommend a repetition of last year's dividend, viz.: 12 per cent., free of income tax.

The Calcutta Corporation intimated their intention to buy in October, 1938, that part of the undertaking which lay within their area. This step was communicated in the board's circular letter of November 12, 1936; and, acting on competent legal advice both in London and in Calcutta, the directors informed the Corporation that they did not accept their intimation as a valid notice of purchase under the law. The Corporation expressed regret that they took this view, and nothing further had happened up to now. The directors then proceeded to carry out their original purpose of lowering the domestic rate, and it came down to two annas per unit from March 1st last. At the same time, the cooking and heating rate was reduced, as an experiment, from one anna to $\frac{3}{4}$ anna per unit.

The agitation against the company in Calcutta was largely a protest against so high a dividend as 12 per cent. being paid by a public utility company. On all grounds, therefore, the directors were bound to advise that 10 per cent. be regarded as the standard rate of dividend in future instead of 12 per cent.

It was intended this year to redeem at the earliest permissible date the mortgage debentures raised at a time when money was dear. In order to meet the needs immediately in sight, the board proposed to issue, early in June, 400,000 new ordinary shares, to be offered to the ordinary shareholders in the ratio of their existing holdings, at the price of £1 per share, and to rank for the dividends payable in respect of the profits of 1937 and thereafter. The offer would carry the ordinary right of renunciation.

The report and accounts were unanimously adopted.

IDEAL BUILDING AND LAND DEVELOPMENT COMPANY LIMITED

IMPROVED POSITION

The third ordinary general meeting of this company was held, on the 6th instant, in London.

Sir Thomas Keens, D.L. (the chairman) said that, whilst regretting that the profits had declined in comparison with the previous year, the directors submitted that the balance sheet was, on the whole, quite satisfactory. It showed the company to be in a sound position, and in many respects better than a year ago. With one exception, every estate the company had developed had been visited by the directors of one of the building societies with which the company did most of its business, who had expressed themselves as more than satisfied with the condition of them and of the conservative lines upon which development had been and was being carried out. They had also inspected the new estates which the company had recently acquired for their 1937 building programme, and in every case they had expressed their approval of the company's choice of area. As the question of the relationship between the building societies and the company was a matter of great importance to the company, the fact that the building societies had such confidence in the company made its negotiations with them so much easier. He wanted to impress upon shareholders the fact that the company was in the position to obtain the best possible terms for its client purchasers and thus for itself.

They had recently commenced development in the Midlands and an estate had been acquired in Birmingham where building and selling had just been commenced, and extensive developments in the area were now under consideration. For the first 11 months of the current year sales had been much lower than in the same period last year, but obviously that position had been aggravated by the continuously bad weekends. However, sales over the Easter period and up to date had been much more promising. Enquiries received in response to their advertisements were coming in at a rate which offered favourable promise for a continuance of a steady rate of selling. The quality of their sales and the enquiries showed a marked improvement over those of the past, and he thought it would be agreed that that was an encouraging sign.

The report was unanimously adopted.

LONDON ELECTRIC WIRE COMPANY AND SMITHS, LIMITED

IMPROVED RESULTS

The twenty-eighth annual general meeting of this company was held, on the 6th instant, in London.

Mr W. J. Terry, chairman and managing director, said that their current liabilities amounted to £200,417, whereas current assets appeared at £989,067, showing that the company was in a strong liquid position.

With regard to commodity prices, during last year they advanced steadily. The company did not speculate, but covered their copper requirements from day to day. In so far as the company was concerned, the only effect of the increased price in copper was the further absorption of their cash resources in the conduct of the business. It was customary to pay for copper on arrival, whilst it was the practice of the trade to make contracts with their customers which could be taken over a period of twelve months in accordance with their requirements.

The company's products had been maintained at a high standard of quality and the demands for their products increased during 1936, which resulted in the highest tonnage output as yet recorded.

Their export sales had increased in a similar proportion to their home sales, and the policy of a further development of the overseas markets would be persistently pursued.

In view of the prevailing conditions, it was not possible to make any definite forecast as to the future, but it might be said that the electrical industry—which had been referred to as the "hand-maid of other industries"—continued to make substantial progress, and existing orders on hand indicated that their company's output in the current year would equal or possibly surpass that of 1936, provided conditions remained unchanged.

It was hoped that the Government expenditure in connection with distressed areas would be made in reviving, as far as possible, the industries which were indigenous to those districts, so that their prospects might be assured on a sound economic basis.

The directors recommended that the final ordinary dividend should be raised to 5½ per cent., making 7½ per cent. for the year under review, as against 6½ per cent. for the previous year.

The report and accounts were unanimously adopted.

GENERAL CEYLON RUBBER AND TEA ESTATES, LIMITED

SATISFACTORY INCREASE IN PROFIT

The fortieth annual ordinary general meeting of General Ceylon Rubber and Tea Estates, Limited, was held, on the 6th instant, at 4 Lloyd's Avenue, London.

Mr D. Errol Sinclair, who presided, said that the balance at profit and loss was £16,853, against £9,396, which with £1,424 brought in made a total of £18,278 available. From that an appropriation of £5,000 had been made to reserve account, bringing that account up to £75,000. Out of the balance of £13,278 the directors recommended the payment of a dividend of 4 per cent., less tax, which would absorb £12,242.

Tea was the predominant partner and had provided the greater part of the revenue in recent years. The profit on tea for 1936 was £12,140 against £10,920 in 1935, and on rubber £10,480 against £300 in 1935. Tea crop exported under regulation was 1,808,000 lbs. against 1,777,000 lbs., and the gross average was 1s. 1.36d. against 1s. 1.16d. The f.o.b. costs in the past three years had been 9.86d., 9.87d., and 9.87d. respectively.

The regulation of export scheme was steadily improving the statistical position. The chairman was confident that the future of the industry would yield a reasonable return on the capital invested therein.

The rubber crop exported was 918,000 lbs. against 945,000 lbs., and the net average was 8.10d. against 5.54d. Forward sales were:—114 tons deliverable during 1937 at a gross average of 9.54d. c.i.f. No forward sales had yet been made for delivery during 1938.

It was almost useless at the present time to estimate the effects of N.D.C. upon the future profits of the company. Since the Chancellor's announcement on April 20th, that form of taxation it had been the target of a very large amount of criticism, and it appeared unlikely that that impost would become law in anything like the form as was at first understood.

In the absence of any further untoward circumstances or shocks the immediate future was bright for both their products. The properties were reported on as being in excellent condition.

The report and accounts were adopted and the dividend as recommended declared.

LONDON ASIATIC RUBBER AND PRODUCE COMPANY, LIMITED

IMPROVED OUTLOOK

At the annual general meeting of the London Asiatic Rubber and Produce Company, Limited, held on the 3rd instant, Mr H. J. Welch, the chairman, in the course of his speech, said:—We have very few areas which are not still capable of many years of useful production. We have also a very satisfactory proportion of quite young mature rubber. The development of our younger areas is reflected in our assessment for standard production, which, at about 12,788,000 lb. for 1937, is some 915,000 lb. higher than in 1936. Our issued capital is just under £32 per planted acre, but of this about £8 10s. per acre represents surplus liquid assets, so that the net capital cost per acre is only £23 10s.

Crops allowed under the working of the restriction scheme were slightly lower in 1936 than in 1935, but the estate management nevertheless secured some further reduction in the cost of production per pound. The crop was sold at an average of 8.39d. per lb. on London landed terms. This was 2d. per lb. better than in 1935 (and 6d. per lb. better than in 1932).

Our profit for the year is £120,646, from which we are recommending payment of a dividend of 10 per cent. The profit-sharing bonuses payable to staff are fully twice as large for 1936 as for 1935. We are also recommending a special additional grant of £1,500 to the estates staff retirement fund and a grant of £1,000 to inaugurate a similar fund for the estates subordinate staff.

The estates continue to be maintained in first-class order and are managed with marked efficiency and success by the company's staff. As at present arranged, the quarterly exportable percentages in for 1937 are to average 83½ per cent., against 62½ per cent. in 1936; therefore, at prices such as are now current, we may expect 1937 to be a very successful year. At 83½ per cent. our much improved trading results in 1937. Forward sales for 1937, exportable crop would be 4,780 tons. Total 1,367 tons, at made from the middle of last year onwards, total 1,367 tons, at prices averaging 9½d. per lb. London equivalent. We have also sold 756 tons for shipment in 1938 at an average of 11.3d. London equivalent.

The report and accounts were adopted, the dividend of 10 per cent. was approved, and the retiring directors were re-elected.

PATALING RUBBER ESTATES LIMITED

DIVIDEND OF 10 PER CENT

The seventeenth ordinary general meeting of this Company was held, on the 7th instant, in London.

Mr H. Eric Miller, in the course of his speech, said:—Compared with the previous year the crop accounted for was some 326,000 lbs. higher, despite a lower international release, the explanation being that our 1936 standard exceeded that for 1935 by over 695,000 lbs., and export rights in respect of 106,902 lbs. were purchased at prices which showed the company a profit on the rubber exported against them. The cost of production, as was to be expected, showed a small increase. The average net sale price was 1.93d. per lb. higher than in 1935.

All our advices from the East are to the effect that the properties are in first-class order. This statement is amply borne out by the crop figures for last year—2,850,000 lbs. of rubber were produced by tapping an average of less than 23 per cent. of our mature area on any one day. As further evidence that the standard assessment granted the company is by no means high, although for 1937 it averages 492 lbs. per assessed acre, and certain of the young areas have not yet attained their maximum figures, we are advised that the full 100 per cent. assessment can easily be produced on a conservative tapping system and without opening Katumba Estate.

The year's working resulted in a profit of £39,041, and we recommend the payment of a final dividend of 7 per cent. (making 10 per cent. for the year), from which income tax at 5s. in the £ will be deducted.

Many authoritative criticisms have already been voiced about various aspects of the proposed National Defence Contribution, and I will not enlarge on that topic to-day, because the Rubber Growers' Association is assuming the arduous responsibility of representing to the Chancellor of the Exchequer the case of the plantation rubber industry. As you know, Harrisons and Crosfield have a number of companies in their office, and we cannot see how under the N.D.C. even rough justice can be done as between the various companies engaged in this industry. How much more difficult will it therefore be to treat one industry fairly in relation to the others coming within the scope of this tax!

The report was adopted.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the week ended May 1, 1937, amounted to £11,855,000, against ordinary expenditure of £31,028,000. After allowing for an increase in Exchequer Balances of £21,656, the operations for the week, as shown below, increased the gross National Debt by £19,424,000, to approximately £7,931 millions.†

liquidation of many weak positions, the bull account in lead and spelter is still above normal. This fact may cause fresh liquidation if prices remain weak over a lengthy period. On the other hand, if they recover too rapidly, it seems likely, therefore, that both markets will remain sensitive for some time to come.

Sales of lead on the London Metal Exchange: 2,400 tons on Monday, against 1,500 tons last week; 1,000 tons on Tuesday, against 1,250 tons last week; 850 tons on Wednesday, against 750 tons last week. The New York quotation on Wednesday was 6.00 cents per lb., against 6.00 cents a week ago and 6.00 cents a month ago. The official closing quotation in London for soft foreign for shipment during the current month was £23 17s. 6d. per ton, compared with £25 1s. 3d. a week ago.

Sales of spelter on the London Metal Exchange: 2,000 tons on Monday, against 2,250 tons last week; 600 tons on Tuesday, against 2,500 tons last week; 1,300 tons on Wednesday, against 1,900 tons last week. Wednesday's quotation in East St. Louis was 6.75 cent. per lb., against 6.75 cents the week before and 7.00 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £23 per ton, against £24 10s. last week.

TIN. After heavy fluctuations, prices closed on Wednesday showing a substantial loss on the week, mainly in consequence of the absence of buying interest. Since the statistical position is strengthening, a resumption of normal buying would probably result in a marked price rise. Visible supplies increased last month, according to A. Strauss and Company, by only 92 tons to 22,348 tons. New supplies, at 10,762 tons, were 2,995 tons lower than in March, but deliveries fell by 2,068 to 10,798 tons. In view of the higher quotas, the small increase in supplies is unsatisfactory. Since deliveries are likely to recover soon, a fresh decline in stocks seems probable unless production makes a much better showing in the near future.

Sales of tin on the London Metal Exchange: 325 tons on Monday, against 675 tons last week; 325 tons on Tuesday, against 450 tons last week; 350 tons on Wednesday, against 525 tons last week. The New York quotation on Wednesday was 55.37½ cents per lb., against 55.75 cents a week ago and 60.12½ cents a month ago. Wednesday's official closing quotation in London for standard cash was £249 to £249 10s. per ton, compared with £256 to £256 10s. a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 1,781 tons, an increase of 20 tons on the week.

OTHER NON-FERROUS METALS. Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted on Wednesday at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was quoted at £15 12s. to £15 12s. 6d. per flask of 76 lb., as against £13 17s. to £13 17s. 6d. last week. Chinese antimony was quoted at £75 per ton, ex warehouse, as against £64 to £65 last week. Chinese wolfram for "May-June" shipment was quoted at 55s. to 57s. per unit, c.i.f., compared with 53s. to 56s. for "April-May" last week. Refined platinum was quoted on Wednesday at £11 5s. an ounce, as against £11 15s. last week.

TEXTILES

COTTON.—**Manchester.**—Although conditions in the Manchester market have continued rather unsettled, the recovery in raw material prices has been a feature, and quotations are now above the low point recently reached. The confidence of buyers of yarn and cloth has not yet been fully restored, but in certain directions there has been an increased inquiry. The technical position of the New York and Liverpool markets has been decidedly improved by the heavy liquidation of contracts by speculators. Serious losses have recently occurred in certain quarters. There has not been any distinct change with regard to the prospects for the new crop in the United States. Most private firms believe that there will be an increase of at least 10 per cent. in the area under cotton. The weather later on, however, will have an important influence on the size of the crop. World consumption continues on a large scale.

It has been a rather poor week for spinners and manufacturers so far as fresh business is concerned. Numerous buyers have adopted a waiting policy. All producers are centring attention on the completion of old contracts, and, owing to the decline in prices, it is very important that deliveries should not be late. Since a month ago, however, prices for yarn and cloth have not fallen proportionately to the drop in raw cotton quotations. Miscellaneous sales have been put through in piece goods for several markets and for the home trade, but there has been an absence of bulk lines. Yarns have been firm in quotation, but purchased rather sparingly.

Reorganisation of Weaving Section.—In connection with the movement in the Lancashire cotton industry towards united action to prevent price-cutting and establish profitable margins, the weaving section has lagged behind. It is being urged in some quarters that action should be taken and the Burnley and District Cotton Industry Study Group has sent a circular to over 700 manufacturing concerns asking for their opinion on certain proposals. It is pointed out that the improvement in margins, which most manufacturers have secured during the past few months, has shown that reasonable profits are possible, provided that the causes of price-cutting are removed. In 1935 the Burnley Group advocated the adoption of a scheme to eliminate or immobilise redundant plant or machinery, but the years passed by without any prospect of such a scheme being adopted. The need for some effort is most urgent, writes our Man-

chester correspondent, particularly in view of the fact that spinners have taken steps to ensure reasonable margins and that finishers are pressing forward with schemes to prevent price cutting in their section of the trade. In the circumstances, there is a danger that under present conditions manufacturers will have to bear the brunt of the pressure towards lower prices, which will result from any decline in demand. To devise a scheme for securing reasonable margins is relatively simple, but to devise a scheme which will secure the support of a sufficiently large body of manufacturers is extremely difficult. In order to assess opinion in Lancashire, the Burnley Group has drawn up three schemes, and they now ask firms affected to give their views on the proposals. Scheme 1 provides for a five years' compulsory insurance scheme, under which, for payment of a premium of 3d. per loom a week, manufacturers would be paid 2s. 6d. compensation on all looms stopped. Scheme 2 proposes that a Board be appointed to administer legally binding agreements to prohibit the sale of cloth below a fixed margin over the cost of raw materials plus wages. Scheme 3 provides for a Statutory Board to control production, under which firms would be given a percentage of a quota of production with compensation for loom activity at less than the quota. The proposals have caused a good deal of discussion in trade circles, but in the weaving section of the Lancashire industry there is great diversity of interests, and there seems to be doubt as to whether any of these schemes will obtain sufficient support at present. Manufacturers, however, realise the danger of disagreement in view of the price-fixing schemes which have recently been arranged in the spinning branch, and it is well known that during the recent revival of trade spinners have done much better than manufacturers.

JUTE. Dundee. The strike position at the Indian jute mills became very serious by the middle of last week, but some of the idle mills have since resumed work. Prices for Calcutta goods declined to some extent as the result of the improvement, while buyers were inclined to hold off and await further developments. It is understood that the workers are now being urged to return to work in all mills, so that negotiations may be entered into with the employers for increased wages and a host of other concessions demanded by the workers' leaders. Raw jute advanced in price under speculative operations, consumers showing very little interest, especially as the stocks curtailed the consumption of the fibre. In spite of the strikes, the figures of the stocks of hessians and sackings in Calcutta showed only a small decrease during April. This is due to lack of shipping accommodation, insufficient steamers being available to take away large quantities of goods awaiting despatch on the quay. During April, hessian stocks were reduced by 6,600,000 yards, and sacking stocks by 4,700,000 yards.

The weather conditions affecting the new jute crop have been very adverse this season until now, owing to lack of rain, but the latest news is that beneficial rains have fallen, and that sowings are proceeding favourably in the districts left to complete. Prices of the fibre have displayed weakness, and £21 10s. per ton is now quoted for Daisee 213 full group, and £22 2s. 6d. for Tossa 2/3, with fours at £19 12s. 6d. and £21 10s. respectively. May-June. New crop offers are absent this season, and any prices named by spinners are well below the rates ruling for old crop. Good First Marks, Lightnings and Hearts of the old crop are more or less nominal.

Spinners are all very busy, and they are very firm in their prices. Common 8 lb. cops are held for 2s. 4d. and 8 lb. spools for 2s. 5d., and offers of business at less are being refused. Twist is firm at 4½d. to 4½d. for 3 ply 8 lb., and sacking yarns are from 2½d. for 24 lb. twist and 3½d. for 8 lb. chains, while Rove is lowest at £22 for 48 lb. and £17 10s. for 200 lb. The finer yarns are quiet but firm, and carpet descriptions are being sold at 3½d. for 14 lb. warp. The cloth end of the trade is comfortably placed, and manufacturers are still entering orders at from 2½d. for 10 oz. 40 in. and 2½d. for 8 oz. A really good business has been done in 40 in. goods to replace delayed shipments from Calcutta, while meat wrappers have also been purchased. Conditions are now rather quieter. Linoleum hessians and heavy goods are firm.

GRAIN MARKETS

WHEAT. After a week of quiet trading, prices show little alteration. Although at present demand remains quiet, the tone is steadier owing to a sharp decrease in Argentine clearances and complaints of dry weather in Canada. According to the *Corn Trade News*, German buying is likely to continue for a number of weeks, but Italian demand is negligible and is unlikely to expand in the near future.

On Wednesday last, "May" futures were quoted in Chicago at 129½ cents per bushel, against 129 cents the week before and 141½ cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba, ex ship 51s. 9d. to 53s. per 496 lbs., as against 51s. 6d. to 53s. 6d. a week ago; No. 2 Northern Manitoba, ex ship, 51s. 3d. to 52s. 6d., as against 51s. to 53s. a week ago. According to the *Corn Trade News* total shipments of wheat and flour last week amounted to 1,304,000 quarters against 1,651,000 quarters in the previous week and 1,237,000 quarters in the corresponding week a year ago.

FLOUR.—Demand for both home-milled and imported flour is slow, and prices are about unchanged. Wednesday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 42s. 6d. per 280 lbs., as against 42s. 6d. a week ago; delivered inner London, 42s., as against 42s. a week ago. Manitoba patents, ex store, 39s. to 40s. 6d., as against 39s. to 40s. 6d. a week ago. Australian, ex store, 34s. to 35s., as against 34s. to 35s. a week ago.

BARLEY.—Imported feeding barley remains a quiet market. "May" futures were quoted at 72½ cents per bushel in Winnipeg on Wednesday, against 70½ cents a week ago. Quotations per 448 lbs. in London on Wednesday were: "English feed," at farm, 35s. to 36s., as against 36s. to 38s. a week ago; "English malting," at farm, 38s. to 45s., against 38s. to 45s. last week. Californian (new), ex ship, 53s. 6d., as against 49s. to 55s. a week ago. Chilean, brewing (new), ex ship, 44s. 9d. to 50s., against 44s. 9d. to 50s. a week ago.

OATS.—On Wednesday, "May" futures were quoted at 49½ cents. a bushel in Chicago, against 50 cents a week ago and 50½ cents last month. Quotations in London, Wednesday: "English black," at farm, 26s. to 27s., per 336 lbs. a week ago, as against 24s. to 26s. a week ago; "English White," at farm, 26s. to 27s., as against 24s. to 26s. a week ago; mixed Canadian feed (Vancouver), landed, 25s. 6d. per 320 lbs., as against 25s. 3d. a week ago.

MAIZE.—The market has been featureless and prices are unaltered. "May" futures were quoted on Wednesday at 132½ cents per bushel in Chicago, against 129½ cents a week ago and 125½ cents last month. Quotations in London, Wednesday: "Plate," landed, 27s. 6d. per 480 lbs., as against 27s. 6d. a week ago; "Plate," ex ship, 26s. 6d., as against 26s. 6d. a week ago; "Plate," April (new), 27s., as against 26s. 8d. a week ago; yellow maize meal, ex wharf, was quoted at £7 per ton, as against £7 to £7 5s. a week ago.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1935-37:—

NEAREST FUTURE	Jan. 2, 1935	Dec. 31, 1935	May 6, 1936	Dec. 30, 1936	Apr. 28, 1937	May 5, 1937
Winnipeg (No. 1, Manitoba) —Cents per 60 lb.	82½	84½	78½	129	129½	133½
Chicago (No. 2, Winter) —Cents per 60 lb.	98½	101½	96½	135½	129	129½

The visible supply of wheat in Canada amounts to 72,230,000 bushels, against 75,675,000 bushels last week, and 109,107,000 bushels in the corresponding week last year.

SALES AND PRICES OF BRITISH CEREALS.—The following table gives the estimated sale of home-grown wheat during the harvest years 1933-34 to 1936-37:—

	1933-1934	1934-1935	1935-1936	1936-1937
Estimated sales of home-grown wheat—	Cwts.	Cwts.	Cwts.	Cwts.
1 week to May 1.....	154,474	181,232	213,392	141,854
35 weeks to May 1.....	9,512,732	11,884,556	11,865,252	9,426,121
Average price of English wheat per cwt.	s. d. 4 5	s. d. 5 3	s. d. 6 8	s. d. 10 0

The following is a statement showing the quantities sold and the average price of British cereals in the past two weeks, and for the corresponding weeks in each of the years from 1933 to 1936:—

Week ended	QUANTITIES SOLD			AVERAGE PRICE PER CWT.		
	Wheat	Barley	Oats	Wheat	Barley	Oats
	Cwts.	Cwts.	Cwts.	s. d.	s. d.	s. d.
April 29, 1933	104,449	29,960	17,566	5 3	6 5	5 8
April 28, 1934	154,474	34,343	26,882	4 5	7 11	6 1
May 4, 1935	181,232	34,778	27,962	5 3	7 1	7 0
May 2, 1936	213,392	28,177	31,324	6 8	7 4	6 1
April 24, 1937	252,553	34,709	40,164	10 3	10 3	8 8
May 1, 1937	141,854	33,987	31,398	10 0	10 3	8 7

OTHER FOODS

BACON.—Supplies have been ample this week, but demand has shown a tendency to fall off. The official quotations (per cwt. for No. 1 Sizeable) which formed the basis for dealings on the London Provision Exchange this week were: English, 92s. to 96s.; Canadian, 87s.; Danish, 95s.; against 92s. to 96s.; 87s., and 95s. last week. Arrivals in London last week included: Danish, 15,111 bales; Canadian, 6,956; Dutch, 3,064; Lithuanian, 1,300; and Polish, 3,474; as against 15,009, 6,598, 2,340, 986 and 2,609 bales, respectively, in the previous week.

BUTTER.—Prices were marked down on a quiet demand, but business has been more active at the lower level. Quotations (per cwt.) on the London Provision Exchange on Wednesday were: New Zealand, finest salted, 104s.; Australian, choicest salted, 103s.; Danish, 110s. to 112s.; compared with 108s., 107s. to 108s., and 112s. to 113s., respectively, a week ago.

CHEESE.—The market has been firm, except for Dutch, which has been in quiet demand. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: English, finest farmers, 89s. to 96s.; Canadian finest coloured, 76s. to 78s.; and New Zealand, finest coloured, 70s.; against 89s. to 96s., 75s. to 76s., and 70s., respectively, a week ago.

COCOA.—Prices have been sharply reduced this week. The spot quotation in New York on Wednesday was 8½ cents per lb., as against 9½ cents per lb. last week. In London, on Wednesday last, good fermented new crop, Accra, "May-June," was quoted at 40s. 6d. per 50 kilos, c.i.f. Continent, against 43s. a week ago. Last week's movements of cocoa in London were as follows: landed, 18,083 bags; delivered, for home consumption, 19,939 bags; exported, 10 bags; stocks, 273,411 bags, against 164,728 bags a year ago.

COFFEE.—The London spot market was quiet. The spot market in New York was firm, but with prices showing little alteration. On Wednesday, Rio No. 7 (cash) was quoted at 9 cents per lb. in New York, as compared with 9 cents per lb. last week and 9 cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, 149 cwt.; delivered, for home consumption, 402 cwt.; exports, 109 cwt.; stocks, 2,054 cwt., against 11,509 a year ago. Central and other South American: Landed, 6,089 cwt.; delivered for home consumption, 955 cwt.; exported, 569 cwt.; stocks, 113,600 cwt., against 125,473 last year. Other kinds: Landed, 1,822 cwt.; delivered for home consumption, 1,530 cwt.; exported, 382 cwt.; stocks, 125,178 cwt., against 181,823 last year.

EGGS.—Arrivals were fairly substantial this week, but prices generally show little alteration. At Smithfield, on Wednesday, English (ordinary packing, Grade I, about 15-15½ lb.) realised 9s. 3d. to 9s. 9d. per 120, against 9s. 6d. to 10s. last week; while Danish (15½ lb.) made 8s. 9d. to 9s., as against 8s. 9d. to 9s. last week.

FRUIT.—Business at Covent Garden remains good, states *The Fruit-grower*. Supplies, although generally rather heavy, clear well and prices are accordingly maintained at a satisfactory level. Apples are a good trade, with all new season fruit clearing readily. Pears are also going out trade, with high prices are inclined easier with plentiful supplies. Grapes are an active item and are clearing very satisfactorily, while English peaches are also in request. A few Belgian nectarines have put in an appearance, while forced strawberries are coming in for a good inquiry. First arrivals of Spanish apricots fetch 10s. to 12s. per crate, but the French and Italian cherries so far to hand are rather immature. Reliable parcels of oranges are in short supply and make better prices, while lemons are scarce and dear. Grapefruit are a more active trade, but with ample supplies quotations remain easy.

MEAT.—Fresh meat was a rather dull item at Smithfield this week, but chilled beef and frozen mutton and lamb were in steady demand.

Prices are about unchanged. On Wednesday last, Argentine chilled hindquarters were quoted at 3s. 10d. to 4s. 2d. per 8 lbs., as compared with 3s. 8d. to 4s. a week ago. New Zealand frozen mutton was 3s. 4d. to 4s. per 8 lbs., against 3s. 4d. to 4s. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 9,409 tons, an increase of 681 tons on the corresponding week last year. Beef and veal accounted for 4,943 tons, mutton and lamb, 3,029, and pork and bacon 981, as compared with 4,627, 2,693, and 885 tons, respectively, in the same week of 1936.

PEPPER.—On Wednesday, Singapore white Muntok, spot, was quoted at 6d. per lb. in bond, against 6d. per lb. a week earlier. Black Lampung, spot, in bond, was quoted at 3d. per lb. sellers, compared with 3d. per lb. last week. Movements of pepper in London last week were as follows: Black, landed, 10 tons; delivered, 1 ton; stocks, 1,840, against 1,704 last year. White, landed, 53 tons; delivered, 29 tons; stocks, 11,904, compared with 12,397 a year ago.

RICE.—The spot price of Burma No. 2, cleaned, was 10s. per cwt. ex warehouse, on Wednesday, as compared with 10s. per cwt. a week ago. "May-June," in singles to Continent and U.K., was quoted at 9s. per cwt., against 9s. last week. Movements in London last week were as follows: Landed, 79 tons; delivered, 76 tons; stocks, 1,054 tons, against 1,286 a year ago.

SUGAR.—Raw sugar has been a rather quiet market in London this week. In New York prices have been steady. The New York spot quotation was 3.45 cents on Wednesday, as compared with 3.45 cents per lb. last week and 3.45 cents per lb. a month ago. Wednesday's sales of raw sugar in London included "August" delivery at 6s. 2½d. to 6s. 3d., against 6s. 4½d. to 6s. 5½d. a week ago. Movements of raw sugar in public warehouses in London and Liverpool last week were as follows: Imports, 13,431 tons, against 24,751 in the previous week and 8,701 in the same week of 1936; deliveries, 19,305 tons, against 20,344 and 19,258 tons, respectively; stocks, 183,270 tons, against 189,144 and 204,493 tons, respectively.

TEA.—The following table shows the average prices (compiled by the Tea Brokers' Association) of tea sold in Mincing Lane on Garden Account in recent weeks:—

Week ended	Northern India	Southern India	Ceylon	Java	Sumatra	Africa	Total
	d.	d.	d.	d.	d.	d.	d.
Apr. 30, 1936	12-79	13-66	16-05	10-94	10-49	11-99	13-48
Mar. 23, 1937	14-97	15-81	17-27	Nil	Nil	13-91	15-81
Apr. 8, "	14-99	16-03	17-67	15-64	13-26	14-22	15-65
Apr. 15, "	14-82	15-83	17-68	14-15	12-94	13-83	15-47
Apr. 22, "	14-79	16-38	17-38	14-81	13-08	13-98	15-68
Apr. 29, "	15-04	16-37	17-35	13-68	12-73	14-18	15-68

At this week's public auctions in Mincing Lane, 41,019 packages of Indian and 21,696 packages of Ceylon tea came up for disposal. In response to a strong and active demand, Indian teas advanced in price. For the cheaper Ceylon teas a similar tendency was evident, but fine teas were easy and sold 1d. to 2d. per lb. below valuations.

VEGETABLES.—There has been a sharp increase in supplies of asparagus, while house-grown beans are also more plentiful, according to *The Fruitgrower's* Covent Garden report. Forced marrows sell well and Guernsey green peas are an increasing item. Tomatoes are firm on a steady demand, while cucumbers are slightly easier on larger supplies. Good quality greenstuff is doing better, although cauliflowers continue abundant and cheap. New potatoes encounter a better demand and Mataro are firm at 22s. to 23s. per cwt., against 21s. to 22s. last week. Meanwhile, old potatoes remain in good supply at London markets and prices are inclined easier this week. At the Borough on Tuesday, however, best siltland King Edward were unchanged at 10s. to 11s. per cwt.

MISCELLANEOUS COMMODITIES

VEGETABLE OILS AND OIL SEEDS.—Generally there is a much better feeling and prices are steady, though business is very quiet. Demand for linseed is small. At the same time there is no pressure to sell either by Argentina or India in view of the strong statistical position of supplies and the uncertainty regarding the yield of the domestic United States crop. Already Argentina has exported 925,000 tons or approximately two-thirds of this year's crop, and of this about 400,000 tons has been destined for the United States and Canada. The question is how much more North America will have to import to supplement home production. The new Indian linseed is moving off slowly. The more optimistic estimates suggest that India may have an exportable surplus approaching 350,000 tons, on which English crushers will depend as usual to a large extent. World supplies are something over a million tons or rather less than the quantity actually shipped in the remainder of last year. Linseed oil which fluctuated considerably last month, is now steadier at a lower level, but demand is restricted. The current quotation for May delivery is around £29 to £29 16s. per ton, naked, ex Hull. After some weakness in near positions Egyptian cotton seed has been steadier and quoted at about £9, May loading. Large shipments of cotton oil continue to be made from Hull to the United States under running contracts.

RUBBER.—Despite a slight rally in the United States, prices on the London market are rather lower than a week ago. Confidence has not yet been restored and fluctuations have been heavy; but prices seem likely to show some recovery when normal buying is resumed. The spot price in New York on Wednesday was 21½ cents per lb., compared with 20½ cents per lb. a week ago and 24½ cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 10½d. per lb., as against 10½d. on the corresponding day last week. In forward positions, business has been done at 10½d. for "June" shipment, as against 10½d. a week ago. Stocks in London and Liverpool at the end of last week totalled 48,687 tons, against 48,828 tons a week earlier. A year ago stocks amounted to 139,750 tons.

FURS.—The London spring series of fur auctions closed early this week, after being very uninteresting for the past ten days. The general uncertainty and the slump in stocks and commodities resulted in great caution on the part of buyers. Hence sales, which had not been impressive before, became rather small. Prices eased slightly in the last week of the series, although there were no outstanding losses worth mentioning. Since the termination of the sale, conditions on the free market have been very quiet. The next London silver fox auctions will be held on May 31st. The general London summer sale, which, although still young, has already gained great popularity, will start on July 28th.

which the United Kingdom has entered on her own account, in defence of what she believes to be her vital interests. The attitude of the Dominions will clearly depend on the degree to which they regard their own vital interests as also involved. The Conference will further have to discuss important aspects of foreign relations in which the principle of support for the League Covenant cannot at present provide a clear index of policy: for instance, relations with the United States, and the Far Eastern problem. Obviously, economic questions are of peculiar importance in these fields.

Only when agreement has been reached on the broad lines of foreign policy can the Conference or its technical committees proceed to a consideration of co-operation in matters of defence. Here, as in issues of foreign policy, the starting-point must be recognition of the Dominions' national consciousness. In the present stage of the Commonwealth's development, there can be no dictated or centralised system of defence to which all its self-governing members contribute. The Dominions believe that their primary duty is to defend their own territories in their own way. That is also true to-day of India. Her leaders—including British soldiers in Indian Army commands—have repeatedly emphasised that her great defence burden can be tolerated only if it is made clear that it is incurred for the defence of India herself and not for an imperial reserve. Hence, over and above the technical co-operation (similar training, interchange of material and personnel) which is almost universal in the defence systems of the Commonwealth nations, their peace-time co-operation for defence is bound to lie mainly in the spheres of naval action, naval and air bases for joint use, and possible action by air forces at a distance from national territory in defence of agreed common interests. The field is nevertheless wide, and the expanding armament

programmes of the Dominions, as well as of this country, greatly increase the opportunities for sound and durable understandings.

Finally, the Conference will have before it a group of constitutional questions. Mr BALDWIN stated a couple of months ago that the particular subjects proposed under this head were certain matters relating to nationality, treaty procedure, the international status of the members of the British Commonwealth, and channels of communication between them. These heads could be made to cover, in fact, practically all the constitutional problems of the British Commonwealth that have come into controversy since the War. We have yet to see what they are to mean on this occasion. It has been repeatedly rumoured that certain of the Dominions are anxious for the abolition of the Dominions Office, which they regard as an anachronism. Vestiges of colonial rule are plainly out of date, and may be subject to dangerous misrepresentation. But to overburden the PRIME MINISTER, or to relegate communication with the Dominions to a department of the Foreign Office, would be even more inappropriate than the present system. Those who are inclined to think that the Dominions Office is functionless would do well to recall the skill and tact required during recent months in the handling of such matters as the abdication, the Coronation, and the Imperial Conference itself.

In conclusion, there is, happily, one aspect of our constitutional system which is conspicuous by its absence from Mr BALDWIN's list: namely the relationship of the self-governing nations of the Commonwealth to the Crown. The single but divisible kingship has become an established fact, founded no longer on the ancient law of these islands alone, but freely and separately accepted and acclaimed by all the King's peoples. Never was a symbol more fitting, or its recognition more sincere.

A Hundred Years Ago

BY a happy coincidence, the Coronation of King George VI on May 12, 1937, comes within six weeks of the centenary of the Accession of Queen Victoria on June 20, 1837. Amid the rejoicings of a free people and an independent Commonwealth of Nations we may pause and, looking over the crowded achievements of a hundred years, may see how much progress has been made in the building of democracy.

When the young Queen came to the throne in 1837, England was still ruled exclusively by a few, and was freshly scarred by the social and economic disorders of industrialism. William Lamb, Viscount Melbourne, was Prime Minister, and his political creed was simply expressed in the dictum that "the whole duty of government is to prevent crime and to preserve contracts." This was the authentic voice of aristocratic government. Although the Reform Bill of 1832 had begun the extension of the representative basis of Parliament which was not completed until 1918 and 1928, parliamentary reform had produced no change in policy.

It was a squalid England over which Victoria came to rule. New jerry-built industrial towns were filled with the cholera-ridden increase of population which industrial revolution had brought. Men, women and children were overworked for pittance wages in fields, factories and mines. The old Poor Law had broken down under the burden of land enclosure, the new industry and the new farming, the French wars and their long aftermath. A National Debt which in 1816 had reached the unprecedented height of £878 millions and which stood at £770 millions in 1837 lay heavy upon a people who relied upon a clumsy and regressive tariff for their revenue. The voice of democracy was heard only in the

discrepant tones of men like Owen, Cobbett, Hunt and the *flâneur* Disraeli. Administration was still mainly the degenerate heirloom of an earlier age.

There was no income tax in 1837, and there was virtually no sanitation; for the nation was neither able to afford nor ready to pay for the fruits of democracy in adequate social services, decent wages and healthy conditions of life. The reform of the Poor Law in 1834 and the ostracising or imprisonment of the poor and unemployed had aroused suspicions among the working classes which were not allayed by the prosecution of trade unionists and the tragedy of the Dorchester labourers.

Yet the basis of material progress was already laid. Exports were nearly four times what they had been fifty years before. The annual output of iron had risen almost ten-fold since 1815; and the consumption of cotton, largely spun by steam-driven machinery, had increased six-fold in a similar time. The annual output of coal had been trebled in thirty years. Stephenson's "Rocket" had travelled at 36 miles per hour in 1833; and by 1837 Acts for constructing all the railways which were the beginnings of the present main lines had been passed. In the year of Queen Victoria's coronation the "Sirius" and the "Great Western" crossed the Atlantic under steam.

Another powerful machine was also effectively at work in 1837—the engine of investment. Overseas lending, already over £100 millions, was to reach £150 millions in ten years and £350 millions in twenty. A rentier class, created in the preceding century, speculated in America in the 'twenties and in home railways in the 'thirties; and proceeded, in the next generation, to finance the Industrial Revolution throughout the world.

In 1837, however, industry had outgrown its immediate environment. Trade and employment were restrained by a coercive fiscal system. Investment was hampered by an inadequate company law which refused joint-stock organisation and limited liability to all but a favoured few. The crises and depressions of 1816 and 1826 were renewed in the very year of the new Queen's accession.

Nevertheless, evolution, once it began, was impressive by its rapidity; an Act of 1837 extended the privilege of joint stock, and heralded the Company Act of 1844. In 1838 the Manchester Anti-Corn Law Association was formed; and the march towards free trade, cheap raw materials and cheap bread (urged, among others, by a journal styled *The Economist Free Trade Newspaper*, founded in 1843), was accelerated by Cobden and Bright. In 1846, when Peel began the final assault on import duties which Gladstone was to complete, he restored the income tax. To him the tax was a means to balance the Budget; to William Pitt it had been the instrument of war; Gladstone called it the engine of free trade.

Though organised social services were almost non-existent in 1837 the first steps towards a better order had been taken by a devoted few. The eighteenth century had seen notable advances in medical science and practice, and death rates had been abated. But voluntary effort had become increasingly unable to tackle the degeneration of the industrial slums or to stay the onset of typhus and typhoid. Cholera stirred the nation from its apathy. Inquiries were instituted into sanitary conditions; and in 1837 the horrors of London were revealed in official reports.

The condition of England was being brought home to the governing classes by factory inspectors, blue books, novelists (Dickens wrote "Oliver Twist" in the year of Victoria's coronation), poets, social reformers, and organised working men. "Nothing is so expensive as a vicious and unhappy population," wrote Disraeli. Factory Acts, Public Health Acts and Poor Law Acts begot the administrative hierarchy which was the origin of

our modern Civil Service. The Chartist Movement, set on foot in 1837, and the Anti-Corn Law League, sent out from Manchester in 1838, established the pattern and habit of democratic politics.

When the appeal of the Chartists to the young Queen and her Parliament was ignored, the sequel was riot and disorder, three things saved the country: the profit and employment of the "railway enterprise"; the unshackling of commerce; and the fashioning of practical democracy by the passing of welfare laws, the building of central and local government to execute them, the raising of money by taxation to pay for them, and the extension of the franchise.

So began a century of crowded progress. The chart on this page shows how great that progress has been in commerce, industry and finance. An administrative machine has been created to administer democratic laws, made by a Parliament elected by the whole of the adult population. And the nation has learned that the price of democratic government must be paid. In 1837, government expenditure, apart from defence and ordnance, was £35 millions; in 1937 it will be about £730 millions.

To-day, when we survey the inheritance our Victorian progenitors have bequeathed us, we have room for gratitude but little for complaisance. Within our own time, the course of trade has been partially choked again by restraints and restrictions all over the world. The cost of war challenges the cost of welfare in the national accounts. There are 1½ millions unemployed this Coronation time. The slums, malnutrition, Depressed Areas and destitution remain with us, even at the peak of current prosperity.

Mr Baldwin has declared that democracy can still practise the arts of peace in a world of strife. We may say: "Amen to that"; for on peace and freer trade depends the democracy which has built an impressive edifice of social reform, political freedom and Imperial autonomy in the last hundred years.

A CENTURY'S ECONOMIC PROGRESS

	National Taxation (a)	Population (b)	Imports (c)	British Exports (d)	Railway mileage (e)	Coal output (f)	British Shipping (g)
Unit	£	Number	£	£	Miles	Tons	Gross Tons
1837 (black on chart)*	48,462,000	26,709,000	54,737,000	42,215,000	540	64,661,000	2,296,000
1936 (shaded on chart)	755,719,000	47,098,000	848,928,000	440,719,000	36,868	228,524,000	17,285,000

* The 1837 figures, in general, include the whole of Ireland, while the latest figures exclude the Irish Free State; but comparability, except where otherwise noted, is not seriously affected. (a) Twelve months to June 5, 1838, and Mar. 31, 1937, respectively. (b) 1841 and 1936 respectively. The earlier figure includes, and the later figure excludes, the population of what is now the Irish Free State, which was 6,529,000 in 1841 and 3,013,000 in 1934. (c) Official values in 1837. (d) Declared values. (e) Reduced to single-line track, excluding sidings; 1837 and 1935. (f) 1854 and 1936, respectively. (g) Tonnage on Lloyd's Register.

Second Thoughts in Japan

AFTER the recent General Election in Japan, there was a rumour that the Japanese Government was intending before long to make an overture to the British Government for the negotiation of an agreed settlement of the present Far Eastern conflict. If this move is not insincere, to use a term which the Japanese are fond of applying to their Chinese neighbours, it is assured in advance of a sympathetic response. But the Japanese cannot fail to appreciate that there will naturally be certain conditions on our side which will have to be fulfilled if any progress is to be made towards an understanding.

To begin with, there is the question who the parties to an agreement are to be. The rumours mention Japan, China and Great Britain; but no negotiations could be serious, and no settlement lasting, from which either the U.S.A. or the U.S.S.R. were excluded. And it seems hardly likely that the British Government would be willing to enter into *pourparlers* for a Far Eastern settlement except on a Five-Power basis, at the minimum. It would be still better to extend it to Six Powers by including France, who has important territorial interests at Shanghai as well as in Indo-China, and would also almost certainly be invited to participate in any international loan for the economic rehabilitation of China which might issue from the suggested peace move.

In the second place, there is China to consider. The Japanese are said not to be intending to insist upon a recognition of Manchukuo, and to be willing on the other hand to give a pledge to respect China's integrity. But Manchukuo is presumably excluded from the limits of the China whom Japan would agree not to mutilate; and there is another serious difficulty in the reported Japanese demand for a recognition, by third parties, of Japan's special strategic as well as economic interests in North China, inside the Great Wall. In our belief, Japan will have to go farther than this if she really wants to conciliate China and thereby to secure for herself the Chinese trade which she can neither coax nor extort from a China who continues to bear Japan a grudge. While Japan may be entitled to demand guarantees that no other foreign Power shall step into her place in North China if she renounces her military domination there, we fancy that nothing short of such a renunciation—and this in Manchukuo as well—will suffice to appease Chinese feelings.

For Japan to relax her hold on Manchukuo may be difficult, but such things have been done by other Powers in recent years. The British treaties with Iraq and Egypt, and the French treaty with Syria, are valuable precedents. Japan may take her time about it; she may be asked to agree that the status of Manchukuo shall be reviewed—and revised—at stated intervals in some international forum. But sooner or later the 28 million Chinese inhabitants of Manchukuo will have to be given a genuine opportunity of reuniting their country with China if they choose. It is only when this prospect has been assured that a true friendship between China and Japan will begin to become a practical possibility. And, after all, Japan has once already, since the Great War, made a politic concession to China of equal magnitude. At the Washington Conference of 1921-22, Japan gave up not only the Chinese province of Shantung, but also the ex-German leased territory of Kiao-Chao. And now, as then, the effect would be to increase, and not to diminish, the esteem in which Japan is held.

If the Japanese can persuade themselves to go this far, they have the prospect of winning an immense reward. They will obtain the lion's share of the China trade; and they will also obtain—for this new China who will be Japan's friend as well as customer—an interna-

tional loan which will set China on her feet again economically and will make it worth while to trade with her. These two things together would give Japan the outlet which she has failed to obtain by her aggressive policy.

This policy of aggression is now palpably discredited by its fruits. The Japanese colonisation of Manchuria has been negligible. The unsuitability of the climate, and the presence in the country of a Chinese population firmly rooted in the soil, have proved insurmountable obstacles even to a Japan who has seized complete economic as well as political control over the coveted territory. Economically, Manchuria has been no asset to Japan, but a heavy liability; and in order to acquire this liability Japan has been sacrificing the substantial asset of her trade with the 400 million Chinese on the other side of the Great Wall.

Nor has the conquest of Manchuria brought Japan even a strategic gain on balance. When the Russians meekly abandoned their rights and their property in Manchuria, it looked for a moment as though Japan had gained the whip-hand over Russia on the Asiatic Continent. Her installation in Manchuria gave her the interior lines, from which she could simultaneously threaten Transbaikalia and the Maritime Province and might even hope to sever all communications between Vladivostok and Moscow. This, however, was only the first chapter in the story; for while the Russians did not attempt to challenge Japan's seizure of Manchuria, they did set out to make their own military position in their own territory relatively stronger than before. To-day, the Maritime Province of the Soviet Union is linked with the rest of the country by new lines of communication which are out of Japan's reach. The Soviet army in the Far East has its own independent munitions factories and sources of supply. And Vladivostok has been developed into an air base within bombing range of Japan's congested industrial cities.

These are all reasons for a change of Japanese policy; but is Japan likely to be rational? On this point the precedents are rather reassuring. In the recent history of Japanese foreign policy, lucid intervals have alternated with bouts of homicidal mania. The first year in which modern Japan ran amok was not 1931, after all. She had done it before as recently as 1915; and by the end of the Great War it looked as if Japan were in a fair way to make herself mistress not only of the whole of China but also of Eastern Siberia right up to Lake Baikal. Yet, in the very hour of the Japanese militarists' triumph, they were found to be unable to deliver the goods for which they had been asking so high a price from the Japanese people. Public opinion in Japan turned against the militarists and won the day. Its victory was registered in the settlement at Washington; and this settlement gave half the world peace for a decade. In the light of this precedent, it seems not unlikely that the cycle of Japanese policy may be on the point of repeating itself.

One of the first outward symptoms of a reassertion of civilian over military opinion in Japan was the emphatic disfavour with which the Japano-German "anti-Communist pact" was received. The Japanese people seem to dislike the idea of being drummed into taking their place in a world-wide Fascist front. If there is to be a conflict on the lines of Fascism *contra mundum*, the Japanese prefer that Germany and Italy shall face the music alone. They do not want to be a Far Eastern out-rigger of "the Berlin-Rome axis." This is fortunate; for if Japan refuses to play the game, Germany and Italy will have less stomach for playing it by themselves.

An Economist at the Breakfast Table—III

Burnt Coffee

THE initial article of this series described the breakfast of Mr Prohack (whose zeal for economy carried terror into the Government's Spending Departments) as consisting of bacon, dry toast, coffee and marmalade. In his preference for coffee as the regular accompaniment of his morning bacon and egg, Mr Prohack differed from the majority of his compatriots; for it is proverbial that the cup which cheers the average Englishman contains tea rather than coffee. We must presume that Mr Prohack was one of the substantial minority who find in coffee a fragrant beverage which stimulates the intellect, soothes the digestion and fortifies its devotees against the daily routine of modern life. These properties, which depend upon the presence of caffeine, have been appreciated by mankind for at least five centuries. Let us consider for a few moments the economics of the coffee bean.

The berry from which the coffee bean is extracted is the fruit of an evergreen plant indigenous to Abyssinia. The plant itself grows at a considerable altitude on well-watered mountain slopes in tropical regions. In appearance and size the fruit resembles a small cherry, which takes on a dark red hue as it ripens. The berry normally contains two hard seeds, bluish or greenish in colour, which may be separated from the fleshy portion by one of several methods. When they have been extracted, the beans must be cleaned, dried and graded; and, after they have entered into international trade, they must still be roasted and ground before they are finally ready for the coffee pot.

Coffee is known to have been used in Abyssinia in the fifteenth century, and the habit apparently spread rapidly through Arabia, despite its prohibition in the Koran. In 1652 the first London coffee house was opened in St. Michael's Alley, Cornhill, and the part played by this new institution in the subsequent life of the City of London is famous. At present, however, the United Kingdom is one of the smallest consumers, on a *per capita* basis, in the world, while the United States is one of the most important. Britain, however, has developed a considerable *entrepôt* trade in this commodity. Thus, in 1930 over one-half of our gross imports of coffee were re-exported, mainly to Western Europe. The importance of this trade has, however, recently declined.

Until the end of the seventeenth century virtually the whole of the world's demand was satisfied from the Yemen Province of Southern Arabia—where the celebrated Mocha coffee is still produced. With the growth of European consumption, however, the centre of production shifted rapidly westwards to Central America, the West Indies and Brazil. The pre-eminent position of Brazil among the world's producers at the present time is shown by the following figures:—

WORLD COFFEE PRODUCTION (In thousand bags of 60 kilos.)				Brazilian Proportion of Total Production
Season ended	Brazil	Other Countries	Total	
June 30				
1930	30,186	8,273	38,459	78.4
1931	15,678	8,633	24,311	64.4
1932	27,581	8,287	35,868	76.8
1933	14,502	9,239	23,741	61.2
1934	30,383	8,935	39,318	77.3
1935	18,496	7,699	26,195	70.4
1936	21,455	10,028	31,483	68.2

Brazil produces about 70 per cent. of the world's coffee. Of her exports, about 60 per cent. go to the United States and only 30 per cent. to Europe. Brazil inevitably has been prominent in recent endeavours to raise the price of the coffee bean. The broad features of the Brazilian Government's valorisation schemes are now common knowledge in the consuming countries. What is less widely appreciated is that restriction of supplies has been intensified during the present season

and that the price of coffee has consequently risen. The London quotation for Santos, which was little more than 38s. per cwt. a year ago, rose to almost 54s. last February, and is still 51s. per cwt.

At present no less than 30 per cent. of Brazil's annual output is destroyed. For this "sacrifice quota" the grower receives from the Government a price of 5 milreis per bag, a sum which suffices only to cover the cost of the bag and the transport charges to the Government depôts. The amount thus destroyed rose from 1,793,112 bags in 1935 to 3,731,154 bags in 1936. Except in the case of the highest grades, a further 30 per cent. must be delivered by the coffee producers to the regulating warehouses, to provide a store which enables the Government to retain a substantial measure of control over the market. The storing of the beans, incidentally, has no deleterious effect; on the contrary, it improves their quality. The remaining 40 per cent. of production may be exported by the grower at will. In addition to these restrictive measures, the Brazilian Government recently entered into a price-raising agreement with other American producers. The reasons for the recent intensification of efforts to improve the financial position of the Brazilian coffee-grower may not be wholly unpolitical; for the presidential and parliamentary elections are due next January. But the levering up of prices must ultimately be damaging to the country's long-term interests, for competition will be encouraged. Already this season's deliveries of Brazilian coffee have fallen well below last year's level.

The British consumer is only indirectly interested in the level of Brazilian prices, since a very small part of our supplies come from that country. Actually, about 40 per cent. are obtained from Costa Rica, 30 per cent. from British East Africa and some 18 per cent. from British India. Foreign coffee (not kiln-dried, roasted or ground) entering this country pays an import duty of 14s. per cwt., while supplies from the Empire pay only 4s. 8d. Despite this substantial Imperial preference, however, the distribution of supplies has shown little alteration over the past decade. The trend of consumption since 1929 has been as follows:—

UNITED KINGDOM—COFFEE CONSUMPTION
(Cwts.)

	Imports	Re- exports	Net Imports	Change in Stocks	Home Con- sumption
1929	559,272	245,830	313,442	— 11,000	324,442
1930	815,427	441,070	374,357	+ 23,000	351,357
1931	752,400	400,728	351,672	— 12,000	363,672
1932	741,943	319,913	422,030	+ 97,000	325,030
1933	658,883	344,462	314,421	+ 21,000	293,421
1934	531,268	229,773	301,495	— 10,000	311,495
1935	478,407	233,153	245,254	— 65,000	310,254
1936	440,794	155,001	285,793	— 31,000	316,793

Consumption continued to gain ground until 1931, for coffee prices were falling while real wages were still rising. Imports rose sharply in 1932, but demand fell off and stocks in bonded warehouses were consequently largely augmented. The growth of general prosperity has since been reflected in a gradual expansion of demand for coffee. Although this tendency has recently been intensified, consumption is still well below the 1931 peak. Whether this leeway will be made up in the near future will depend in part upon price changes on the world market—and here Brazilian policy is clearly a relevant factor. Whether or not the demand for coffee is inelastic, as is frequently declared, a substantial recovery in consumption is more likely to come as a consequence of the continuance of general recovery than as the result of price reductions. Present indications, indeed, are that coffee will cost more in the immediate future than in the recent past.

Spain's Mineral Resources

POLITICAL and economic motives are inextricably mingled in all modern disputes. Territorial or ideological—and the present war in Spain is no exception to the rule. It began as a well organised military rebellion which, almost for the first time in the tangled history of Spain, failed to secure its immediate objective. It has become a contest in which great European nations have fed the contestants with men and material. Those who know Spain best believe most strongly that even if General Franco were eventually successful, the rank and file of Spaniards would never submit to a state of political dominance by Italy and Germany. On the economic side, however, the potentialities are very different. A Government placed (and probably maintained) in power by German and Italian bayonets and bombers would be in no position effectively to resist foreign encroachment on Spain's natural resources.

The nature of these resources, and their distribution within the territories at present controlled by the opposing forces in Spain are shown by the map on this page. The economic significance of current military operations may be readily appreciated. Valencia, the seat of the Republican Spanish Government, is clearly the objective of the Teruel offensive. The spearhead of the Cordoba thrust threatens the richest mineral area in Spain, including the ore-fields of Penarroya, Linares and Jaen. General Franco already commands Rio Tinto and Huelva, and the seizure of the Almaden mercury mines would give him the possession of the world's richest reserve for that heavy liquid metal.

The Bilbao offensive has for its objective one of the most accessible and richest iron ore deposits in Europe. General Franco is naturally anxious to deprive the Spanish Government of its access to munition metals and sources of power. More generous ore supplies, moreover, would furnish the rebel General with assets with which to purchase further external military assistance. Copper, pyrites and sulphur from the British-owned Rio Tinto mines have been requisitioned by the insurgents in substantial amounts, and despatched to other points in Spain, to Germany and to Italy.

Britain is the leading buyer of Spain's marmalade crop of bitter oranges, her sherry production and her tomato crop—which comes mostly from General Franco's territory. Under a clearing scheme, Nationalist Spain's exports to Britain would realise enough sterling to pay off the British owners of the Spanish mines and probably to settle other British "frozen" claims on Spain as well. Imports of Spanish iron ore into Germany alone increased from 37,210 tons last December to 206,707 tons in January and 91,596 tons in February.

Spain's proved iron ore reserves total 711 million tons, with an iron content of about 349 million tons, and her probable reserves are much larger. The ore reserves of Morocco are estimated at 25 million tons, the principal iron mines being situated from 15 to 20 miles from the Port of Melilla, to which they are connected by a narrow-gauge railway. Manganese ores occur in association with iron ores in the Huelva district, at Rio Tinto, at Tharsis and near San Domingo. Deposits carrying wolframite with cassiterite are found at San Finx, Galicia, Montaro and Cordoba. It has been estimated that there are 2,000 million tons of cupriforous pyrites in the Huelva Province, within a depth of 400 feet. Given a recovery of only 1 per cent., these reserves would be equivalent to 20 million tons of metallic copper. The output of cupriforous pyrites from about 50 mines in Huelva, operated by various companies between 1922 and 1931, totalled 30 million tons—equivalent to some 400,000 tons of copper. Lead ores, often argentiferous, and frequently associated with zinc ores, are found around Mazarron, Cartagena, Málaga, Linares, Jaen, Córdoba and Penarroya.

The known and probable mercury reserves make the Almaden area the biggest mercury mine in the world.

The output of quicksilver from Almaden between 1564 and 1907 totalled 169,000 tons, compared with a total from the Italian Idria mines, the next largest in the world, between 1525 and 1908, of 72,000 tons. The Spanish reserves are estimated to be sufficiently large to supply for more than 100 years the world's normal annual consumption of 100,000 flasks of mercury. The average content of the ore is 8 per cent., of which 6 per cent. is recovered. Spain and Italy together provide nearly four-fifths of the world's production of mercury.

The Spanish potash basin lies forty miles north-west of Barcelona. It is 28 miles long and 10 miles wide, and is now recognised as rivaling in importance, and probably exceeding in richness, the German Stassfurt and French Alsatian deposits.

SPAIN'S MINERALS AND THE WAR

KEY TO ABOVE MAP

Fe. Iron.	Sn. Tin.	Hg. Mercury.	C. Coal.
Cu. Copper.	W. Wolfram.	Bi. Bismuth.	P. Power Stn.
Pb. Lead.	Mn. Manganese.	S. Sulphur.	I.S. Iron & Steel Ind.
Zn. Zinc.	Ag. Silver.	K ₂ O. Potash.	M.Ind. Metal Ind.

Spain's production of leading minerals in recent years is given below:—

Iron ore	(1935)	2.7 million tons
Pyrites { Cupriforous	(1934)	0.6 "
Non-cupriforous	(1934)	1.5 "
Copper ore	(1934)	20,610 tons
Mercury	(1934)	1,227 "
Tin	(1935)	250 "
Wolfram	(1935)	350 "
Manganese ore	(1935)	693 "
Coal and lignite	(1935)	7.3 million tons
Potash salts (as K ₂ O)	(1935)	121,372 "
Sulphur	(1934)	31,130 tons

If General Franco is victorious, Italy and Germany will obviously obtain access to much-needed supplies of strategic minerals for their drive towards self-sufficiency in the face of exchange difficulties. New reserves of iron ore would greatly benefit the enlarged German and Italian iron and steel industries, which are both suffering from a serious shortage of supplies.

For Great Britain, on the other hand, the outcome would be definitely unfavourable, since she normally imports nearly a million tons of Spanish iron ore every year to supplement her comparatively low-grade domestic resources.

Notes of the Week

The Coronation.—The whole world was in attendance at the solemn and Imperial ceremony and celebration of the crowning of George VI on Wednesday, May 12th. Over a million people waited for long hours under grey skies on the route of the Royal procession; and when they had seen the trappings of centuries of history and of a great Empire go by, and had enjoyed the novel experience of listening to the broadcast of the impressive ceremony in the Abbey, their welcome voiced the rejoicings of a quarter of the earth's population. All over the British Isles and the Empire it was the same; banners flew and beacons burned. Everywhere the ritual and splendour of the Coronation service were heard and visualised. In no continent were the deeply impressive voice and words of the Archbishop of Canterbury unheard, as the ceremony passed from the Vivat and the Recognition to the Anointing and the Crowning. The swelling cheers on the processional route when the King and Queen rode home in crowns and robes of State were heard in all lands. The simple and moving words of King George which he addressed through the microphone to the whole Empire were a dignified and fitting end to an occasion which has deeply impressed the whole world.

The crowning of King George VI as head of a group of independent and democratic peoples was a peculiar symbol of British political sense. He rules, but his peoples govern themselves. Beside him there is no place for dictatorship; the sword and rod are vested in him as a trust to preserve justice and mercy from usurpers and tyrants. The King has no power; but he guarantees the power of his people. The events of Wednesday, the calm and dignity of the principal actor, and the participation of hundreds of millions of people which the British Broadcasting Corporation made possible, have confirmed the hold of the Monarchy on the loyalty of the British peoples. Monarchy and ritual strike strangely on the modern world; but transmuted to modern uses they may serve a great purpose in a troubled age.

Coronation Honours List.—The list of honours conferred at the New Year was narrowly contrived in contrast to the national significance of the Royal accession. The Coronation Honours List, published on Monday, may truly be spared this criticism. Sir Herbert Samuel is appropriately created viscount, for the Liberal principles for which he stands are finding more recognition than for many years past. One of the new barons,

Sir Walter Rea, Bart., was once a Liberal whip; and another, Dr. Addison, has ranked among Labour's ablest Ministers. Three new Privy Councillors, Mr Pethick-Lawrence, Lord Snell, and Mr Isaac Foot are also supporters of the Opposition. Although the only by-elections which the honours make necessary are in safe Conservative seats at Buckingham, Glasgow and Kingston, there has been an evident desire to do justice to all parties. There has been a similar anxiety to reward Dominion and colonial merit in view of the Imperial character of the Coronation and the Imperial Conference. The list as a whole is not, however, strikingly impressive. The Press has been recognised in the barony of Mr Elias, and industry in the peerages bestowed on Sir Robert Horne, Sir John Cadman and Sir John Davenport Siddeley. The knighthood conferred on Mr William Bradshaw, Chairman of the Co-operative Wholesale Society, is a rare and pleasing tribute to the importance of the movement with which he is associated. And skill and zeal in high positions are aptly recognised by Sir Frederick Leith-Ross's G.C.M.G. and the knighthood conferred on Mr W. V. Wood, senior vice-president of the London, Midland and Scottish Railway. But there is a certain lack of balance in the list as a whole. Education is ill-rewarded apart from the honours accorded to the leaders of divers juvenile organisations. Industry and commerce on the whole lack their usual prominent place in the list. Music, art and letters are recognised but sparingly. There is in fact a heavy weighting of the roll on the side of science and medicine and, above all, administration. It is proper that research and doctors should be recognised; and that the vast work done by civil servants all over the Empire should be rewarded. But favours might well have been distributed with even greater comprehensiveness—and this is a good honours list as honours lists go—than they have been in a list of 1,400 names, which fails only by one hundred to equal the portentous number of honours conferred in 1902 on the Coronation of Edward VII.

London Transport.—Neither the proceedings nor the report of last week's Court of Inquiry into the London bus strike, which has now lasted a fortnight, suggested any real hopes of an immediate way out of the impasse: The position when the strike was called was that, while the London Passenger Transport Board refused to consider the proposal for a 7½ hour day any further, the men would consider no alternative suggestions. On Saturday last the Board offered to negotiate on all points except the 7½ hours day. On that crucial matter they accepted the Court's recommendation

EUROPEAN REPRESENTATIVE'S OFFICE: 8 KING WILLIAM STREET, LONDON, E.C.4

Member of the Federal Reserve System, the New York Clearing House Association and of the Federal Deposit Insurance Corporation

that a medical inquiry into the health of busmen should be instituted and offered, in the last resort, to accept the decision of an impartial tribunal on what should be done to avert bad effects on health, if any were proved. They also offered to discuss speeding-up, the alteration of schedules, irregular meal-times, and even "onerous and exacting" schedules. This offer was submitted to the district branches on Sunday and Monday. By 47 votes to 3, they decided on Monday to continue the strike. Actually the outlook is not as black as might appear. Mr Bevin, Secretary of the Transport and General Workers' Union, has succeeded in persuading the provincial busmen who were on strike in thirteen counties to return to work. He has resisted a strong demand that the London dispute should be extended to the trams and trolley-buses. The trams and trolley-buses, like the tubes, have done good work in facilitating Coronation traffic; and it must be clear to Mr Bevin that if the busmen now refuse entirely to discuss the many points which the Board have submitted, public sympathy for the strikers will be largely alienated. The National Executive of the Union probably hold this view; and it is believed that in a statement to the London branches they have urged the advisability of suspending the strike, pending negotiations on the basis of the Board's offer and the Court's report.

The Coal Dispute.—Nearly a month ago deadlock was reached in the negotiations for amalgamation in Nottinghamshire of the Industrial Union, which commands the support of a substantial fraction of the men in that field, and the Nottinghamshire Miners' Association, which is affiliated to the Mineworkers' Federation of Great Britain. The management of Harworth Colliery had refused to negotiate with the Association until amalgamation was completed; and the Association, speaking for the Federation, refused to complete the amalgamation until it received recognition in its own right. The impasse remains; it has been embittered by clash and riot at Harworth; and it has been given a national character by the decision of the Federation on April 30th to call a strike in all the coalfields unless recognition was secured and victimisation at Harworth Colliery was stopped. The strike was due to begin on May 22nd, but the direct appeal of Mr Baldwin and the activities of the Secretary for the Mines Department secured a postponement for one week. Hopes of peace have, however, been short-lived. Both sides remain intransigent. The Nottinghamshire coalowners and the representatives of the Industrial Union offered last week to meet the Miners' Federation if they would first accept the principle of amalgamation and agree to submit outstanding points to arbitration. The Federation replied that they would only confer unconditionally. The owners and the Industrial Union say that recognition is implicit in amalgamation, since the fused body would be affiliated to the Federation. The Association and the Federation, however, demand recognition as the first step. No progress has been made in several weeks, and, although wage prospects are better in most fields than they have been for many years, a national coal strike on May 29th is now probable. The owners and the union they favour accuse the Federation of seeking to override the wishes of a majority in the Nottinghamshire field. The Federation, on the other hand, believe that a fundamental principle of trade unionism is at stake, and that the Association, being in their view the only independent union in Nottinghamshire, should have full, and indeed ultimately exclusive, recognition. The Federation cannot forget the defeat of 1926 which set on foot the present troubles in Nottinghamshire; and, whatever the merits of their present case, they not unnaturally refuse to compromise any discussion by accepting conditions beforehand.

The Zeppelin Disaster.—Germany's record in airship construction and operation has been so enviable that the disaster which overtook her latest airship, the

Hindenburg, at Lakehurst, N.J., on Thursday of last week seems the more terrible. Since the war, the lighter-than-air school in Germany have so perfected airships that regular commercial operation between the Americas and Europe was possible, safe, and not over-expensive. The Graf Zeppelin and Hindenburg were regular fliers above the Atlantic; and the disasters which overtook the British R.34 and R.101 and the American Macon and Akron, passed the German airships by. Now the German immunity has ended. After headwinds and a protracted thunderstorm round Lakehurst, the field of arrival, the Hindenburg had just dropped her mooring ropes and was descending to anchor at the mooring mast when, for some unexplained reason, an explosion occurred in the stern. The vast ship crashed to earth in flames; and of over 100 passengers and crew, 35 are dead, including Commander Lehmann, and many severely injured. The word "sabotage" was quickly passed round; but the airship's designer, Captain Eckener, has expressed scepticism of such an explanation. It is known that hydrogen was being released before the explosion; but this was normal, the ship had Diesel motors, and their exhaust manifolds are specially constructed not to pass a spark. It seems probable that either a charge of static electricity gathered from the thunder-clouds on the exterior and then discharged when the cables touched earth, or that, after the strain of the storm and wind, some play developed in joints or rivets, which gave out a spark in the interior of the envelope. It is fortunate that the disaster took place only a hundred or two hundred feet up, since many have escaped death. But it is a bitter disappointment for Germany after so long and distinguished a record for safe airship travel; and our sympathies are due to the constructors and operators of the Zeppelins as much as to the relatives of those who perished in the disaster. If the ship had been filled with helium, the disaster might not have occurred; and as the United States has a monopoly of helium, this latest airship disaster has stimulated many Americans, including some Senators and Congressmen, to urge the U.S. Government to permit its export.

The By-Elections.—The result of the contest at York completes an interesting series of by-elections which in recent weeks has been testing public opinion. Of the recent contests, the Government have held every seat except Central Wandsworth, which went to Labour. In every case, however, there has been a falling-off in the Government's vote and majority. The following figures show the total votes recorded in all by-elections during the life of the present Parliament, with the exception of the three University contests, in each of which there have been special circumstances which would invalidate a comparison:—

	Government			Labour		
	General Election 1935	By-Elections	Change	General Election 1935	By-Elections	Change
By-elections in 1935-6.....	258,103	204,212	-20.8%	186,590	190,422	+ 2.0%
By-elections in 1937.....	197,007	153,182	-22.2%	120,562	114,564	- 5.0%
Total.....	455,110	357,394	-21.4%	307,152	304,986	- 0.8%

These figures do not reveal any very startling reversal in public opinion. The fall in the Government vote is larger than in the Opposition vote, but this is usual in by-elections. Moreover, though the fall in the Government vote is increasing, the Labour vote is also falling behind the General Election figures. On balance, there does not seem to be much evidence that Labour is sweeping the country. This lends additional point to the fact that four constituencies where a considerable turnover of votes has led to Government defeats—Derby, Oxford University, the Combined Universities and Central Wandsworth—are also the four constituencies in which a determined

and successful attempt was made to organise what may be called the Opposition vote on non-party or inter-party lines. The Honours List and the sudden death of Sir James Blindell will lead to another series of by-elections in a few weeks' time, but all the seats in question appear to be safe Government seats.

M. Blum's Victory.—Last Saturday evening, the French Government, after facing the Chamber on a motion of confidence which provoked a lively debate, secured their greatest victory since assuming office a year ago. With the big majority of 181 votes (380 against 199) compared with 174 votes at their first meeting of the Chamber, and as few as 147 after the unfortunate Clichy fracas, the Government rallied to their support the entire Left Cartel, including even dissident Radicals. The main reason for this was M. Blum's firm reassertion, earlier last week, that a pause in the tempo of reform had become necessary and possible. At the same time, the renewal of the Matignon industrial agreements between workers and employers for another six months promised an end to the bickerings which had latterly threatened to provoke another wave of strikes. These two recent bull points for the Government coincided with steadily increasing revenue from taxes, rising exports, expansion of production and stocks, and reviving profitability of industry despite the reforms and the 40-hour week. Clearly, while the big capital holdings of the rich rentiers still remain outside France for safe custody, M. Blum's main problem must remain the cheapening of money rates so that the annual service of the National Debt, forming one half of the ordinary Budget, can be reduced by conversions. This can be achieved slowly, by steady improvement of business, as well as quickly, by sudden repatriation of the hundreds of millions of pounds sterling now standing to the credit of French firms and persons in foreign countries.

After a year of his Government, the overwhelming bulk of the population of France are ranged more firmly than ever behind M. Blum; and the position of France's national economy—as distinct from the temporary embarrassments of the money market or the franc exchange—is slowly but steadily improving. M. Blum is known to lay emphasis on the importance for France and French democracy of freer trading relations; not only to increase French exports, but also to increase imports as a check to the rise in French prices. French governments have not always been so far-sighted. If the British Government were now as far-sighted and constructive-minded as M. Blum, they could, with his Government, powerfully buttress peace and prosperity in Europe. The need and the opportunity now coincide. Have the French and British Governments the will to take the lead?

The Duce Cuts Us.—Last week-end it was officially announced in Rome that Italian newspaper correspondents were being forthwith recalled from London, and that all British newspapers—save only the *Daily Mail*, the *Evening News*, and the *Observer*, that faithful Italianophil trio—were henceforth banned in Italy. The alleged reason for this singular "cut direct" is that English newspapers have consistently calumniated "the Italian armed forces" in their exploits. This strange statement is presumably an admission about Italian armed forces in Spain; in fact, natural sensitiveness on the score of Brihuega and Bilbao; and the German State-controlled Press has faithfully echoed the tart allegations of its colleague and brother-in-arms. Doubtless the real reason is that no dictator can allow his dictatees to learn truths undictatable to himself. All dictators will hang together on this point. So the free Press from abroad, however small its circulation among those dictatees who can read a foreign language, must be banned. The truth can

make people free; and freedom is dangerous to dictators; so truth in a totalitarian State becomes merely what is dictated. The Duce must be hypersensitive to criticism just now if he is forced to ban a few English newspapers. Why? Does he seek to turn all Italy into one vast *disperata* squadron, himself the most desperate? No democratic State wants to "cut" Italy. We would all reciprocate the Duce's offer, repeated last week at the first anniversary of the conquest of Ethiopia, for truly amicable collaboration in the cause of peace and justice. But when the Duce orders foreigners to "cut" his countrymen, something must be rotten in the state of Italy.

The Week in Spain.—Insurgent activity on the Bilbao front has intensified during the past week; but the Basque forces are not even yet in their final defensive positions. Despite continuous air raids and machine-gunning from the air, to which the Basques are unable to reply in kind, their line is being held. They have given ground on the eastward heights, but retaken ground in other places. Meanwhile it was announced on the eve of the Coronation that the first Basque children are due in this country next week. The Government's decision to permit this act of humanitarianism could scarcely be refused, for the funds to support the children have been privately raised here, and what other countries can do for so laudable an object can be done by this country. Despite the British Government's consistency in adhering to humanitarian intervention in Spain, the German and Italian press still persist in dubbing it partiality for the Spanish Government—as if, in such a case, the word partiality could ever be legitimately applied to humanitarian work on behalf of old people and children in the very arena of ruthless warfare. Moreover, many of the aged and the young now being evacuated to France and other countries are from families in sympathy with General Franco. Elsewhere than Bilbao the week has been quiet, save for an intensive—indeed, hitherto the worst—bombardment of the capital city. No ensuing military action at Madrid has yet taken place.

At Barcelona the local government has been rent by dissension which ended in recourse to arms, during which more than 200 have been killed. The Anarcho-Syndicalists (C.N.T.), disgruntled because their Socialist colleagues did not agree to expropriation of land and industries, refused to bow to the will of their colleagues of the Socialist, Communist, and other persuasions. A Socialist was murdered; and when suspected Anarchists were ordered to be arrested, their colleagues proceeded to military action. They were, however, too weak to assume power on their own; and public sympathy turned from them. The dispute has been settled, aided by the dispatch of 5,000 men from Madrid and stern warnings from the Valencia Government. It is deplorable that, at this juncture, the Catalan Anarchists should give the common enemy of all the Spanish Government forces a rod wherewith to beat them. There are signs, however, that this perilous precedent has acted as a sobering influence on all extremists in the Government

camp. Meanwhile, dissensions are not confined to the Government side. General Franco has had to supersede his nominal leader of the Spanish Fascist Party; and stories are still coming through from insurgent territory that the Italians, Germans, Falangists, Requetes, and Monarchists obstinately refuse to combine in an effective unitary military command. A final clear-cut military decision in Spain seems as far off as ever.

Lord Zetland's Statement.—As a move towards ending the deadlock between the Indian provincial Governments and the Congress, Lord Zetland's statement last week was a great improvement on his initial intervention, which was widely regarded in India as frigidly formal and unconstructive. It would seem, he said, that in some quarters a great deal more had been read into that part of the Act which imposed special obligations on the Governors than it actually contained. The essence of the new Constitution was that the initiative and responsibility for the whole of the government of a province, though in form vesting in the Governor, passed to the Ministry in office. The reserve powers could only come into operation if the Governor considered that the special responsibilities laid on him by Parliament were involved. But even then it would be altogether wrong to assume that he would immediately set himself in open opposition to his Ministry. He would surely lay his difficulties before his Ministry, "and I should have thought," added the Secretary of State, "that just as the Ministers can count upon the assistance of the Governor in their difficulties, so could he in his turn rely upon receiving the sympathetic consideration of his Ministers for the difficulty of his own position." There could be no question of the Governors' interfering constantly and embarrassingly in the work of their Ministers. It seems regrettable that such a statement was not made on behalf of the Government before matters had degenerated to their present unsatisfactory position. The recent resolution of the Congress Working Committee indicated no retreat from the demand for specific assurances, and the struggle has now become almost a war of prestige. The expected defeat of the minority Ministries when their legislatures meet may, nevertheless, provide an opportunity for re-opening the discussions on a practical basis.

* * *

The War in Waziristan.—It is always a moot point when exactly a North-West Frontier skirmish becomes "one of England's little wars." But that stage certainly seems to have been passed in the present Waziristan disturbances. The original incident—the abduction of a Hindu girl by a Pathan, her conversion to Islam and the decision of the appeal court to restore her to her parents—was a trivial spark which set alight a veritable magazine of latent violence. To-day, some 30,000 British and Indian troops are engaged in fighting the Faquir of Ipi—the principal instigator of violence—and his friends. Hence the affair, whatever its outcome—and there are signs that casualties and attrition are already breaking down the morale of the tribesmen—is a grave warning for the whole future of imperial defence. Even though frontier defence is mainly the duty of Indian troops, for so small a field army as Great Britain possesses, scattered over three continents and shouldering many duties that continue through war and peace, such incidents as the Waziristan fighting and the despatch of a division to Palestine mean a serious drain on the strength available to meet other possible dangers. There may be vital lessons to learn here about the size and organisation of the army in India, both British and Indian. New and urgent experience has been acquired to guide the overdue reform of the Cardwell system of sister battalions at home and overseas. Certainly there are vital lessons for the future control of the frontier, about which some eminent correspondents of *The Times* have had sharp things to say.

Anglo-American Co-operation.—Surprisingly little notice has been taken on this side of the Atlantic of a letter written by President Roosevelt for the Coronation number of an American newspaper. "It is a simple statement of fact," wrote the President, "but one which cannot be too often affirmed, that the United States and Great Britain have one great common concern—the preservation of peace throughout the world. While national means and methods of contributing to a peace more secure and more stable may rightly vary, this common objective stands ever a common inspiration." These words may sound jejune to British ears. But their significance lies in the fact that no American President has ever before found it politically expedient to express such sentiments. There can be no doubt that Mr Roosevelt's Administration is sincerely anxious to draw closer the ties that connect the policies of the two countries, and is ready to come a good way further than halfway to meet Great Britain. By common consent, the first and easiest stage would be the conclusion of a Trade Agreement. This is still under consideration in Whitehall, but such hints as emerge do not encourage any great hopefulness. If the question is examined in a narrow departmental spirit, and strictly within the limits laid down by the policy of the last four years, deadlock will be inevitable. But it will be more than a shame if an opportunity which is not likely to recur is thrown away for the lack of a Cabinet decision, based on the broadest view of high policy, and applying the same large considerations to the paramount need, at this moment of the world's history, for the fullest practicable measure of co-operation among all the English-speaking peoples.

* * *

Seasonal Movements in Metal Prices.—It is not generally known that the break in commodity prices which began about March 12th, fell precisely at a period of the year when the base metal markets are frequently in a technically weak condition. There is in fact a seasonal tendency in the prices of copper, tin, lead, and spelter, which manifests itself in some years in a striking form. By the courtesy of Mr L. L. Whyte we are able to publish the results of an inquiry he undertook into the seasonal movement in base metal prices. The monthly averages for 1923-1931 of the London Metal Exchange prices for standard cash copper, tin, spelter, and lead, were used as a basis. All January prices for each metal

were averaged, then February prices, etc. The "average year" so obtained was corrected for the net secular trend from January 1923-December 1931, and the month in which the highest price was recorded was taken as 100. The results are shown in the curves, and a high (100) for both copper and tin in March, a low for copper (90.8) in June-July, and for tin (91.1) in June.

The other two metals show similar but somewhat less marked curves. The mean curve for the prices of all four metals gives a high in March (100), and a low in June (92.2). These results from a nine-year period indicate the existence of a seasonal tendency for copper and tin to be high in March and to fall rather sharply until June; while the lesser movements in spelter and lead are probably due partly to their well-known tendency to move in sympathy with the two more speculative metals. For both copper and tin, during the whole 1923-31 period, all the most severe falls occurred in the March-June period. In the case of tin there was a high in March in the years '23, '24, '26, '27 and '31, and the date of the highest price in these years was March 13th, 12th, 17th, 23rd and 18th, respectively. The sharp falls in the copper price in 1929, 1930, and 1931 also began in the same period in March.

* * *

What causes this weakness in the metal market from March to June? It cannot be due to a seasonal movement in physical metal, either in production or in deliveries, since metal stocks show no such seasonal fluctuations. It must therefore be due to operations in the forward markets; and as there is no reason to believe that producers hedge seasonally, we are left with the consumer's forward purchases as an explanation. This is in fact the probable explanation of the phenomenon. It is well known to the metal market that the chief metal consumers buy forward to an exceptional extent during the early spring—when estimates are being made for the year—and then buy much less for a period of two or three months in the early summer. There is thus a relative concentration of purchases in February and March, and the market knows that consumers are often somewhat overbought by the middle of March. If there happens to be a bull speculative position at that time, the market is ripe for a bear attack. Speculative activity thus reinforces an underlying technical factor which is not to be revealed by statistical analysis in years when there is little speculation. The average drop of 7.8 per cent. from March to June for all four metals from 1923-1931 is undoubtedly principally due to the repeated collapses during this quarter of an overbought or bull speculative position in either copper or tin. During the subsequent years 1932-1936 this tendency was not present to any marked extent owing probably to the absence of any large speculative activity in the metals. The break in commodity markets in the current year has been intensified by rumours that the dollar would be "revalued" when there were strong bull positions in the metal markets. A warning that there was an exceptional and possibly dangerous position was in fact given by the market on March 10th, when there was a backwardation on all four base metals. The recent reaction has resulted in the April mean prices for the four metals being down by an average of 15 per cent. from the March averages. Owing to the severity of this fall it is reasonable to expect that the low point of the movement will this year be in May rather than June.

* * *

Road Transport Wages.—It is opportune that at a moment when the problems of passenger transport are engaging public interest and anxiety, the graver questions of remuneration and conditions in the road haulage industry should be brought to notice. The Baillie (Departmental) Committee on the Regulation of Wages and Conditions of Service in the Road Transport Industry issued their Report* on Tuesday, and their view is plain and uncompromising. "In a considerable number of cases the wages paid to C licence drivers [employed by ancillary vehicle owners] are substantially low, even lower than the minimum rates of wages fixed by trade boards"; and "in nearly all cases the normal hours of work are considerably in excess of the 48-hour week." The Committee suggest, therefore, that there should be set up new machinery to deal with all matters affecting the work, wages and conditions of drivers and statutory attendants in the road motor transport industry. They

* H.M. Stationery Office. Price 1s. net.

propose a Central Board to recommend standard wages and conditions, which may be given statutory effect by Ministerial Order. The Central Board will be advised and assisted by local Area Boards in each Traffic Area, appointed by the Minister of Transport. It is proposed further that it should be made a condition of every A (public carrier's) and B (limited carrier's) licence that such standard wages and conditions should be observed. Thus the comparative failure of the National Joint Conciliation Board, set up without statutory powers of enforcement in 1934 to implement the fair wages clauses of the Road Traffic Act, is to be repaired. Unfortunately, the holders of C licences, which constitute 70 per cent. of all road haulage licensees, cannot be so simply dealt with. They have opposed regulation because their workers are ancillary to other industries, and they have, not unnaturally, been supported by the representatives of the industries they serve. Interests have, however, also been at work on the other side; competitors, such as haulage employers and railway companies, have sided with trade unions to urge that the C licences should be brought into line with the A and B licences. The Committee now propose that Trade Boards should be established in the retail distributive trades (unless negotiations at present in progress about wages and conditions in those trades result in an adequate system of regulation) which would embrace the drivers of C licensed vehicles in retail distribution; and that for all other C licence drivers and attendants it should be made a condition of the licence that they should be given either the wages and conditions prescribed for A and B licensees or those determined by collective bargaining. Conditions in road transport are often regrettably bad; and if these various proposals are implemented by statute a great deal will have been done to protect the workers in the industry and the public from the consequences of underpayment, overwork and undue fatigue.

Business in Coronation Week.—Preparations for the Coronation provided a marked stimulus for various sections of the textile, clothing, pottery and catering trades. A decline in new business this week, therefore, was to be expected. In addition, however, the cotton and wool textile trades have encountered increasing resistance from buyers who are unwilling to pay current prices. The metal industries, however, are as active as ever. Demand for iron and steel, for example, has been scarcely affected by the increase in prices, and the industry is still unable to satisfy all requirements. Arrivals of Continental semi-manufactured steel have eased the stringency a little, but there are no indications of an early change in the supply-demand position in favour of consumers. As our Cardiff correspondent points out on page 434, exports of tinplates are twice as heavy as a year ago. Shipbuilding is another metal-using industry whose requirements of steel are still expanding rapidly as a result of the rising stream of orders for new

vessels. The coal trade, too, remains very active, despite the seasonal decline in household requirements. Pressure for deliveries has been accentuated, to some extent, by the possibility of a strike. In the absence of serious labour disputes, industrial activity as a whole may be expected to continue at a high level during the next few weeks.

The Growth of Population.—The Registrar General's Quarterly Return of Births, Deaths and Marriages which has just been published adds 1936 to the years for which we have completed data. Figures for the last eight years are reproduced below:—

POPULATION IN ENGLAND AND WALES, 1929-1936

Year	Marriages	Live Births	Deaths	Excess of Births over Deaths
1929	313,316	643,637	532,492	111,145
1930	315,109	648,811	455,427	193,384
1931	311,847	632,081	491,630	140,451
1932	307,184	613,972	484,129	129,843
1933	318,191	580,413	496,465	83,948
1934	342,307	597,642	476,810	120,832
1935	349,536	598,756	477,401	121,355
1936	353,561	605,659	495,798	109,861

Annual Rates per 1,000 of Population

1929	15.8	16.3	13.4	2.9
1930	15.8	16.3	11.4	4.9
1931	15.6	15.8	12.3	3.5
1932	15.3	15.3	12.0	3.3
1933	15.8	14.4	12.3	2.1
1934	16.9	14.8	11.8	3.0
1935	17.2	14.7	11.7	3.0
1936	17.3	14.8	12.1	2.7

From these figures the decline in the birth and death rates, and the diminishing difference between the two emerge fairly clearly. But beyond that they convey little information about long-term trends. The rise in the marriage rate, to which one is tempted to attach significance, is, however, mainly due to recovery and changing age structure. Next year's figures, which will show the age of mothers at the birth of children, and the marital condition of deceased males, will be of considerably greater interest.

Cotton Industry's Recovery.—The Lancashire cotton trade was one of the last of the major industries to emerge from depression. Since last autumn, the demand for cotton goods has improved rapidly, both at home and abroad. Deliveries of raw cotton to the mills in the first quarter of this year showed an increase of about 12 per cent. over the corresponding period a year ago. The proportion of unemployed insured workers in the industry declined by 6.2 per cent. to 10.5 per cent. during the year ended last March, when the proportion unemployed in all industries fell by only 2.4 per cent. to 11.8 per cent. The improvement in home demand, due to growing prosperity and an increase in Government contracts, may be expected to continue. But a sustained period of good business depends largely on the course of export trade. The latest evidence of the trend of overseas sales points to a definite improvement, due mainly to the increasing purchasing power of primary producing countries. Thus, the trade returns for March indicate that the downward trend of exports of piece-goods has at last been arrested. Moreover, there are indications that Lancashire is now holding its own in competition with other exporting countries. Figures compiled by the Joint Committee of Cotton Trade Organisations show that Britain's share (in terms of value) of world trade in cotton piece-goods (exclusive of Italy, Spain, Portugal and the U.S.S.R.) remained unchanged at about 41 per cent. during the past two years.

The expansion of the demand for cotton goods in recent months has been accompanied by an improvement in the financial position of the industry. In the spinning

section, for example, the increase in business has alleviated the problem of excess capacity which has been responsible for the absence of reasonable profit-margins in recent years. It has been estimated that only eight per cent. of the spindles still in existence were idle at the end of March, compared with 21 per cent. a year ago. Price-cutting has been almost eliminated as a result of the increase in business and the operation of price agreements which now cover about 75 per cent. of Lancashire's spindles. In contrast to the spinning section, however, the weaving branch has made little headway against the problem of excess capacity, though it is now less serious than before the improvement in turnover. Three schemes, designed to restore reasonable profit-margins, have recently been submitted to manufacturers by the Burnley and District Cotton Industry Study Group. But whether the weaving section can agree on a scheme of co-operation remains to be seen.

Colliery Amalgamations.—Another merger has been carried through this month in the Notts. coalfield under the auspices of the Coal Mines Reorganisation Commission. The properties of the Digby Colliery Company have been merged with the Bestwood Coal and Iron Company and the Notts. pits of the Babbington Coal Company. The fusion brings under a single control six adjacent pits in the vicinity of Nottingham, which are among the most highly mechanised in the country. Bestwood Coal and Iron and Babbington Coal were transferred, in March, 1936, to a new company, the B.A. Collieries Ltd., which will now have a capital of £1.6 millions. This is the second merger during this year, the first being that of the Doncaster Amalgamated Collieries with a capital of £6.91 millions, by which seven Yorkshire companies were merged. Altogether, 61 amalgamations have so far taken place under the provisions of the Act of 1926; these, however, include extensions of earlier amalgamations. Last year seven mergers were undertaken; there were eight in 1935, six in 1934, and 38 amalgamations before 1934. The last figure (which includes the Yorkshire Amalgamated Collieries merger, which was enlarged in 1935) covered 370 pits, employing 243,000 workers. Of the subsequent amalgamations the most noteworthy were: first, the Lothians scheme, in 1934, which embraced 11 of the main companies, responsible for 95 per cent. of total production of the district; secondly, the North Staffordshire scheme, in the same year, which applied to 15 companies and 90 per cent. of the district's output; thirdly, in 1935, the amalgamation of the Powell Duffryn Steam Coal Company and Welsh Associated Collieries into the Powell Duffryn Associated Collieries, which, with 93 pits, is the largest coal producing unit in Great Britain.

A New Rubber-like Material.—An exhibition has recently been held to illustrate the industrial uses and possibilities of a new material known as Neoprene, which resembles rubber in many ways but is claimed to be superior in certain respects. It is unlike natural rubber and the rubber substitutes, of which so much has been heard in recent years, in its resistance to the action of heat and to that of oils, solvents and many kinds of chemicals. It is, in fact, put forward not as a rubber substitute but as an entirely new material of wide and varied application in the electrical, chemical and general engineering industries. It costs more than natural rubber, however, and it obviously is unlikely to replace natural rubber in these industries. Probably it will find its chief outlet in those branches of the petroleum, electrical and chemical industries where a rubber-like material resistant to heat, oils, solvents and other chemicals is required, and where natural rubber, though occasionally tried, has not been used to any large extent. It may even extend the useful applications of natural rubber by being bonded with it for certain purposes.

Fears for the Summer

NEW YORK, May 4.—The recent market reaction amounted to about 4 per cent. in long Governments, and rather more in long corporate bonds. From the March peak to the lowest prices in April, common equity averages receded about 15 per cent., Moody's index of primary commodities fell perhaps 10 per cent.; and there was no perceptible decline in the index of the Bureau of Labour Statistics. The stock market decline was of about the same magnitude as in April, 1936, but the 1936 reaction was not accompanied by any weakness in bonds or commodities. At the end of April, 1937, the usual indices of equity prices were at the same level as at the beginning of April, 1936, with commodity prices about 10 per cent. higher, industrial production 20 per cent. higher; and earnings in the first quarter had risen more than production. The common Wall Street explanation is that the decline in bonds represented adjustment to the new reserve requirements of the member banks; that the decline in stocks was partly sympathetic, partly nervousness because of official warnings and administrative hints, and largely the consequence of London selling. The decline in commodities is explained entirely in terms of the collapse of the speculative movement in London. The fact that a stock market decline of almost identical dimensions occurred just one year ago, and was followed, not by a recession in industry, but by a smart acceleration of recovery, is cited as an argument for believing that no general repercussions are to be looked for now; and as yet there are no indications of any slackening of business activity. Nevertheless, some slackening this summer is now generally expected, while a month ago this view was exceptional. Meanwhile, just as those who were boundlessly optimistic two months ago are now talking of a seasonal recession, so those who were talking two months ago of a summer recession are now even more pessimistic.

Just a year ago our economy was being "needed" by the \$2,000 million Veterans' Bonus, which has no counterpart this year. Secondly, the main hope of 1937 was building, and so far building, while maintaining the levels of recent months, is not showing its expected resilience. As the rental market continues strong, this disappointing showing is attributed to the sharp rise in costs, especially in labour costs. Thirdly, while there was little public speculation in commodities, there was during the winter a great deal of anticipatory buying in one form or another, which finally manifested itself in difficulties of delivery; in the last fortnight there has been a corresponding absence of gossip on this theme. Fourthly, the question of the ability of consumers to pay the increasing retail prices is still unanswered. In general, retail trade is reported to be very good indeed; but after allowing something for the increase in prices, the gain in physical volume is not very impressive.

No one yet feels ready to comment on the possible repercussions from abroad. It is recognised that simultaneously with the comparatively mild reaction in our market, there were setbacks in London, Paris, Amsterdam, Prague, Vienna, and Budapest of comparable or perhaps greater severity; that is, there has been a comprehensive, perhaps world-wide, reaction in speculative markets, of greater magnitude and severity than has occurred at any time since the world recovery began in 1932-33. A few go so far as to believe that the spring of 1937 marks the culmination of a cycle.

The Movement of Business

Meanwhile, the March business indices of the Federal Reserve Board rose compared with February, and it is believed that April was even more active.

BUSINESS INDICES (1923-5=100: ADJUSTED FOR SEASONAL)

	Mar., 1929	Mar., 1936	Sept., 1936	Feb., 1937	Mar., 1937*
Industrial production—					
Total	118	93	109	116	118
Manufactures	120	93	110	116	117
Minerals	107	97	101	115	127
Construction contracts—					
Total	104	47	59	62	55
Residential	...	26	47	47	45
All other	...	63	69	75	64
Factory employment	101	88	93.6	99.7	100.8
Factory payrolls	111	77.6	83.4	95.8	101.2
Freight car loadings	103	66	72	80	83
Department store sales	113	84	88	95	92

* Preliminary.

Although production is almost 10 per cent. above September, construction contracts show no increase. Factory employment has risen about 7 per cent. in 6 months, and payrolls more than 20 per cent. Over the year (March to March) most of the increase in payrolls occurred after September, although the greater increase in production occurred in the previous six months. When the index of production reached the vicinity of 110, a sellers' market appeared in labour, and the result was that spectacular increase in wages which has marked the last six months.

The increase in mineral production since the peak of the New Era in March, 1929, is of course largely petroleum. Employment is about the same as in 1929, and payrolls less, which suggests that the general increases in hourly wages have not quite offset the shorter week. It is probable, however, that the real value of these payrolls is still a little higher than in 1929. The difference in department store sales is partly due to lower prices, but it is questionable whether such an explanation is entirely adequate. The outstanding difference is, of course, in building, which is only half what it was in 1929. This focuses attention on what is the outstanding question of this year—the prospect for building. It is statistically demonstrable that building "ought" to increase; it is also statistically demonstrable that the building index stood at 68 in December, 1935, and has not reached that figure since in spite of the recovery in residential building; and that residential building, the index for which reached 44 last July, has remained at about that level since then without any perceptible upward trend.

The foreign trade figures for March showed larger imports and a larger balance than has been usual in recent months. Our silver buying is now relatively small, but the aggregate passive balance has risen to \$531 millions, compared with \$122 millions in the first quarter of 1936. This inevitably raises again the hot money question.

The State of the Popular Front

PARIS, May 13.—The last debate of the Chamber revealed for the first time in this assembly the progress in the country of certain great currents of opinion, which must be noticed because they may open the way in the future for a peaceful revolution. For a year the Trade Unions, which exercise power outside the actual Constitution, and the Communists, who are not represented in the Cabinet, have led French policy, because their claims were ratified by the country by the election of the Popular Front on the programme of the *Rassemblement Populaire*. The objectives of the "government of the masses" were the same as the aims of the majority of the Chamber. The Radicals in the Chamber had to follow; and the Senate could only voice occasional protests, which were usually uttered by M. Caillaux in speeches on the authority of the State and orderly finance.

Now, however, the programme on which the country voted has been practically accomplished; and the Trade Unions and Communists are clamouring for new reforms. Economic recovery is still in the balance, and the Radicals are in a better position in the Chamber to resist these new enterprises. They emphasise, with the support of the Government, that new reforms are impossible until the country has again been consulted. The "pause" is thus established, and the extremists must bow to it. Otherwise, they would be considered "factious" in a democratic country, where liberty and "war to the factious" are the great rallying cries.

Vested Interests Attacked

But the "pause," even when it is accompanied by slight relaxations of reform, such as the revision of the 40-hour week and the increasing of taxes and the cost of transport, satisfies neither the Right nor the Left. Such notable orators as the Conservative M. La Cour Grand' Maison, and the Left independent M. Bergery emphasise the need for the so-called Reforms of Structure to save liberty from the trusts in key industries, an echo of the old slogans indicting the "200 families" which the Blum Cabinet seem to have buried.

"An end must be made to the odious speculation and profits of the trusts," says M. Bergery, "and this step is in the spirit of the programme of the *Rassemblement Populaire* if not in the letter. In any case, the Government carried out the devaluation which was not mentioned in that programme. Trusts must be nationalised . . ." M. Bergery thus supports a materialist conception of the struggle against the trusts. "You must enter into the struggle against the trusts," M. La Cour Grand' Maison said on his side, "because men are enslaved by production and production by the money power, when money ought to serve production, production men, and men an ideal." This idealist thesis of the struggle against the trusts, the inspiration of which is to be sought in the great Christian doctrinaires, was applauded by the whole Chamber. But the speaker went on to emphasise that the struggle against the trusts did not involve the nationalisation of the trusts and the establishment of State capitalism, or the despoiling of the rich. Its object was not to pave the way for a new authoritative State, but to restore the authority of the State in order to restore liberty.

It will be interesting to see how the Radicals, who have undertaken the protection of the middle classes, will react to the demand for a struggle against vested interests which will be made by their Communist allies every time that financial difficulties occur. The Radicals hope that they will be able to avoid the difficult choice, either by an international conference freeing all countries from their acutest difficulties, or by new social and financial complications in foreign countries which will make France safe by comparison and so precipitate the long-expected and long-delayed repatriation of funds.

Production Maintained

The *Statistique Générale* has just published its monthly figures, showing industrial production in France in March, 1937:—

	March, 1936	Jan., 1937	Feb., 1937	March, 1937
General index	101	101	103	104
Engineering	100	110	113	115
Iron and steel	86	94	101	102
Textiles	70	71	70	69
Mines (adjusted figures)...	102	97	102	105
Building	71	63	67	67
Leather	97	92	95	98
Paper	146	145	143	144
Rubber	990	812	784	754
Motors	465	552	533	494

The figures for the cotton industry are as follows:—

	Dec., 1936	Jan., 1937	Feb., 1937	March, 1937
Spinning (average per spindle in kilograms) :	1,983	1,692	1,615	1,851
Production	2,163	1,592	1,649	1,864
Deliveries	1,149	1,221	1,172	1,171
Stocks	4,856	5,574	5,448	5,707
Unfulfilled orders				
Weaving (average per loom in pieces of 100 metres) :				
Production	5.46	4.90	4.63	5.13
Deliveries	5.67	4.64	4.40	5.08
Stocks	4.54	4.86	4.82	5.01
Unfulfilled orders	22.88	27.14	27.46	26.52

In the motor industry, 14,550 automobiles were put on the road in March, against 12,496 in February and 12,740 in January.

Germany

Abundant Money and Public Policy

BERLIN, May 11.—At economic conferences and in the press the discussion of advance-financing methods and of the so-called *Deutsches Finanzwunder* continues. The official view is that so long as the superfluous cash can be sucked up in Reich consolidation loans, the system is unobjectionable. The loans will certainly be subscribed. It is noteworthy that whereas a Reich middle-term issue in the summer of 1936 caused a marked tightening of the money market, which lasted for many weeks, the market was virtually unaffected by the Reich issue of March. This seems to have been one reason why the latest loan was launched after such a very short interval. In addition to the normal causes of abundant money, and also to the accelerated liquidation of stocks of materials and goods, there is the cash newly distributed as compensation to holders of the foreign currency securities, which were impounded in November, 1936, and virtually confiscated later. The effect has been to increase the publicly-held stock of foreign exchange.

As shown by the last official returns, the sum of bills (other than Treasury bills, which are separately returned) held by banks rose from Rm. 11,691 millions on November 11, 1936, to Rm. 13,452 millions on March 31, 1937. These figures cover the Reichsbank, the Gold Discount Bank, the commercial banks, savings banks, and the special banks, and they consist very largely of Reich special bills. The official comment is that, although bills corresponding to the Reich loan of March were then paid off, the total of bills held by the banks did not decline, a fact which suggests the contraction of heavy new bill liabilities. From Professor Wagemann, Director of the Trade Research Institute, comes the comment that since 1933 the process in the field of production has resembled that which took place in consumption in 1923 (the last inflation year). In 1923, public loans in the form of bank-notes were literally pushed into the pockets of consumers; to-day public credit, this time in the form of bills, flows into the portfolios of industry, trade, and the banks. Professor Wagemann maintains that the process involves no danger.

Rising Cost of Living

An official analysis of the cost-of-living index shows that the only important food product that declined in retail price between March 1933 and March 1937 was

bread; and that the greatest rises were in the prices of meat, dairy products, and vegetables. The price of bread fell 2 per cent.; the price of beef rose 18 per cent., of pork 11 per cent., of veal 40 per cent., of mutton 41 per cent., of eggs 31 per cent., of milk 7 per cent., of butter 35 per cent., of margarine 44 per cent., of potatoes 22 per cent., of peas 52 per cent., and of beans 31 per cent. The price of clothing rose 24 per cent., of linen 17 per cent., of footwear 8 per cent., and of furniture 6 per cent.

The number of unemployed fell in April by a quarter of a million to 961,000, against 1,763,000 in April, 1936. It is authoritatively announced that, since the maintenance of the standard of living requires an increase in production, the daily working time in certain trades will be allowed to exceed eight hours; and that there will be an increase of Sunday work. But the consent of the local Trustees of Labour will be required in every individual case, and will be given only if it is clear that production will really increase correspondingly.

The volume of goods traffic on the Railways Corporation system in March was 12.88 per cent. greater than in March 1936. The Corporation's report for 1936 shows that goods traffic rose 11 per cent. compared with 1935. Operating receipts were Rm. 3,985 millions in 1936 against Rm. 3,586 millions in 1935; and expenditure, including the cost of maintenance and renovation, was Rm. 3,513 millions compared with Rm. 3,434 millions. Receipts were still Rm. 1,369 millions lower than in 1929, the best year of recent times—but the fall in prices must be taken into account. In 1936 expenditure was only 88 per cent. of operating receipts, against 96 per cent. in 1935. For the first time since 1930, the operating surplus, which was Rm. 472 millions, sufficed to cover fixed charges, including Rm. 70 millions to the Reich, Rm. 47.3 millions for debt-service, and allocations to various reserves. There was a net profit of Rm. 121.4 millions, of which Rm. 75.7 millions was applied to the payment of preference dividends. According to the annual report of the Reich Motor-Roads Company, for 1936, 1,087 kilometres of road were opened by the end of the year, with 2,660 bridges.

Iron and Steel Shortage

The shortage of iron and steel has begun to affect house building; the number of permits for such work in the first quarter of this year were 18 per cent. fewer than in the same quarter of 1936; but permits for other kinds of building, mainly public and industrial, increased 24 per cent. The syndicate reports for April speak of friction and difficulties in administering the new steel rationing system. The demand has not declined. An arrangement has been made to reconstruct the Avi agreement under which manufacturers received price-rebates on steel required for the production of goods for export. This agreement was first concluded at a time when German steel prices were much higher than world prices. The disparity was the consequence of Germany's reintroduction of steel duties in 1925 and of agreements made by her with foreign countries whereby Germany's ability to import the cheaper foreign material was limited. That price-disparity no longer exists; at present, against a German price for bars of Rm. 104-110 per ton, the Brussels price is about £6½ gold. In view of the German shortage it is remarkable that the export of iron and steel and of iron and steel goods (other than machinery) increased very substantially in March, and that imports declined.

Austria

The Government's Price Policy

VIENNA, May 5.—Austria is fighting her way in the wake of the universal upward trend. Under the influence of the general economic improvement the volume of her foreign trade in the first quarter of 1937 has increased by 82.8 million schillings compared with the same period of 1936; but the higher figures are mainly due to the

higher prices of all important raw materials. The general price index, giving the average of foodstuffs and industrial materials (100 = the first half of 1914), and quoted at 107.9 for April, 1936, is rising steadily; it reached 111.7 in February, 112.3 in March, 113.4 in April, 1937; the foodstuff index stands at 100.7 compared with 97.8 in April, 1936, and the index of industrial materials at 138.2, compared with 127.6 in April, 1936. Significantly in contrast to the steep upward movement of the raw material and wholesale indices, is the stability of the retail index (138.5 in April compared with 137.8 a year ago) and of the cost of living index (104.2 in April compared with 104 a year ago). Agricultural producers, manufacturers and wholesale dealers are striving to relate retail prices to the higher prices of raw materials and semi-finished goods. Some trades like paper, cotton yarn and tissues, stockings and petrol are making concerted efforts by the forming of cartels, the limitation of production, and imposing stricter conditions of payment. But with a considerable part of the population still living on the dole, and salaries, wages and pensions very low, the restricted buying power of the public is an obstacle to all efforts adequately to augment retail prices.

The problem of maintaining the already very modest standard of life is not only of economic importance, but of the highest political consequence, and the Government has been forced to interfere. Torn between the popular resistance against any rise in the price of necessary commodities and the predicament of the agricultural producers, industrial manufacturers and wholesale dealers, the Government appointed a Price Commissary. This was preparatory to authoritative measures fixing the prices of necessities. The Commissary himself has no power to act. He is the recipient of all claims and provides an official hearing for disputes between producers, manufacturers, dealers and consumers about prices.

The Implications of Price Control

It may be doubted whether the step taken by the Government will be effective; and there are political difficulties implicit in the price problem. If prices rise, as they must, in view of the rise in costs, the Government will be blamed. It is not desirable, however, that, by the compulsory intervention of the Commissary, the natural adaptation of the Austrian price level to the upward trend of world prices should be artificially prevented. It may be possible through the trade unions, which are under Government influence, and through the Guilds to put the brake temporarily on the demand for higher wages and salaries, which will inevitably follow the rise in retail prices and in the cost of living. The Price Commissary may, by deftly temporising, prevent the tide of the universal rise in prices, wages and salaries from becoming a danger to the already difficult maintenance of Austria's political and economic balance. But nobody supposes that Austria, alone of all countries, could enjoy the advantages of better times without going through the preliminary processes of general adaptation.

Greece

Good Harvest Prospects

ATHENS, April 26.—The weather this year has so far been favourable and good harvests are expected. In view of the sudden increase of the tobacco output in 1936 measures have been taken by the authorities to prevent any extension of the areas under tobacco. According to semi-official statistics the total quantity of tobacco sold by producers in 1936 was 42,350 tons, against 44,245 tons in 1935; but the average price per kilogramme was Drs. 50.98, against Drs. 37.25, an increase of about 37 per cent. Another staple product, olive oil, showed an equal advance in price, but production has fallen off considerably in the last two years (73,000 tons in 1935 and 60,000 tons in 1936, against 110,000 tons in 1934) owing to unfavourable weather. A good crop is, however, promised this year.

A Ten Year Plan has been drawn up by the authorities to provide for reclamation and hydraulic works, the completion of the road system and the railway network, and for the construction or extension of ports. It is estimated that a sum of Drs. 4,414 millions will be required. A further amount of Drs. 2,910 millions will be spent on smaller works, for the payment of compensation to expropriated owners, and the upkeep of roads. Thus a total amount of Drs. 7,324 millions is required; and will be met partly from the ordinary revenue of the Budget, and partly by internal loans at 5½ per cent., to which various Greek institutions (Post Office savings bank, pension funds, and other similar organisations) will have to subscribe by investing a portion of their liquid funds.

Industrial activity during the first quarter of this year was maintained at the levels of last year. Those industries which carry out public orders were especially active. The metal industries were short of raw materials, particularly of iron. The export of industrial raw materials and goods, such as chemicals, turpentine, oil and cotton yarns, is more brisk this year than in 1936. In a report submitted to the Government by the Supreme Economic Council, it is stated that the home cotton yarn and textile industry is important because it finds most of its raw materials at home, employs a large number of workers, and mainly supplies home consumption. The reorganisation of the industry would render unnecessary the existence of protective tariffs, and would enable it not only to satisfy the requirements of the home market, but also to increase exports.

Sterling Loans Law

Following negotiations between the Government and the National Bank over the industrial loans granted in sterling to various Greek concerns by the Hellenic and General Trust, Limited, of London, a law has recently been promulgated providing for the manner of settlement of the outstanding balance of these loans, amounting to £435,000. The interest is reduced to 5½ per cent. from an average rate of 9 per cent. when the loans were made. Overdue interest is fixed at 8 per cent. The debtors of loans outstanding on January 1, 1936, were given the right to request, up to April 25, 1937, the capitalisation of their debts, including overdue interest. The date of repayment is prolonged for ten years from the original maturity date of each loan. The authorities will allow the transfer of £40,000 annually for the service of these loans; and the equivalent of £70,000, blocked in drachmas and arising from previous payments of capital and interest, will be transferred in ten years by half-yearly instalments of £3,500. Debtors not paying their instalments as stipulated by this law will forfeit the advantages accorded them by it.

Final Budget estimates for the financial year 1936-37 show total estimated receipts of Drs. 14,605 millions, of which Drs. 10,825 millions represent ordinary revenue, Drs. 959 millions non-recurring revenue, and Drs. 2,823 millions the proceeds of loans. Total expenditure is estimated at Drs. 15,450 millions, of which ordinary expenditure accounts for Drs. 11,041 millions, and non-recurring expenditure for Drs. 4,409 millions. The estimated net deficit is Drs. 844 millions, which may be reduced to Drs. 250 millions. Of the revenue assigned to the service of the National Debt, receipts for the first two months of 1937 totalled Drs. 665 millions, against Drs. 689 millions in the corresponding period of 1936. Negotiations with the foreign bondholders for a final settlement of the foreign debt service have not yet been concluded, and the Government instructed its fiscal agents to start paying, from April 1st, the same percentage as last year, that is, about 40 per cent. of the normal interest service.

The foreign trade returns for the first two months of the current year reveal an increase of both imports and exports in quantity and in value. A striking rise in exports considerably reduced the import surplus to Drs. 150,598,000, compared with Drs. 821,451,000 in the corresponding period of 1936. Imports of wheat were notably higher, and there was a striking rise in the value of tobacco exported.

Canada

Progress in Legislation

OTTAWA, April 23.—The Federal Parliament was prorogued on April 10th after the shortest session of recent years. Apart from the passage of the Anglo-Canadian Agreement the most important measures of the session were bills for the establishment of the Trans-Canada air service; for the control of traffic in the implements and materials of war; for the prevention of the enlistment of Canadian citizens in foreign armies; for the elimination of the gold clause from Canadian bond contracts; for the provision of pensions for the blind at the age of 40; for the recapitalisation of the Canadian National railway system; and for the transfer of the administration of the Combines Investigation Act from the Trade and Industry Commission to the Department of Labour. The powers of the Commissioner who is to administer the Combines' Bill were greatly modified in the Senate and he cannot undertake certain kinds of inquiry without a fiat from the Chairman of the Tariff Board or the President of the Exchequer Court. In the closing days of the session Ministers had to face an awkward revolt among their low-tariff supporters who strenuously objected to proposed upward changes in the tariff.

Mr Lewis alarms Canadian Business

Since Parliament adjourned, public attention has been focused on industrial troubles and particularly on the strike which broke out among the workers of the Canadian subsidiary of the General Motors Corporation at Oshawa near Toronto. These workers had been organised as a unit of the structure which Mr John Lewis is building up through the Committee for Industrial Organisation in the United States. When they submitted demands for higher wages and better working conditions and for the recognition of their union, the officials of the Corporation refused to deal with them as long as they retained a C.I.O. organiser as one of their spokesmen. The Federal Government remained neutral when a strike broke out, but Mr Hepburn, the Liberal Premier of Ontario, intervened as a vociferous partisan of the Corporation and declared his intention to keep Ontario free from the pollution of "Lewism" which he maintained was hand in glove with Communism. To the majority of intelligent Canadians it seemed strange that a Liberal politician should side with an American-controlled Corporation against Canadian workers because they had elected to join a union with American affiliations; but Mr Hepburn was strongly backed by employers who dreaded the advent of the C.I.O. in industry. Eventually the strike was settled on April 23rd; the majority of the men's demands were conceded and, while there was no outright recognition of the C.I.O., it was provided that the new agreement should run concurrently with the agreement concluded in the United States with the Automobile Workers Union of America. The C.I.O. are now busy trying to organise the steel, textile, metal mining and other industries; and their activities are alarming the leaders of the business community.

Recovery Doubts

Reports from the prairies bring cheering news of generous rains over a wide area just when they were badly needed to make good the deficiencies of soil moisture. Farmers in northern Saskatchewan assert that seeding conditions are better than in any recent year. The economic record of the first quarter of 1937 has been quite satisfactory, but lately the prospects of continued upward progress have been dimmed, firstly by the threat of labour troubles, and secondly by apprehensions that the United States Government may reduce its price for gold and dislocate the general price structure. There has been a serious stock market slump in the past week but it has now been checked and there is no evidence of any real recession in business. Although the general economic index of the Bureau of Statistics

moved down two points in the fortnight ended April 17th, its fall was mainly due to the stock market situation. Given below are data about three of the major components of the index.

Week Ended	Carloadings	Wholesale Prices	Bank Clearings	Economic Index
April 18, 1936.....	77.1	72.2	94.4	105.0
April 3, 1937	84.5	86.9	117.0	113.8
April 10, 1937.....	85.4	86.7	113.4	114.2
April 17, 1937.....	82.4	86.0	108.4	111.8

Retail merchants report that their volume of business is better than it was a year ago. The employment situation is not wholly satisfactory. The latest employment bulletin covering the month of February shows that there was shrinkage of employment in that month instead of the usual increase, and the Bureau's index on March 1st stood at 104.1 compared with 102.8 on March 1, 1936. But the "heavy" industries making durable goods are all very busy, and firms making farming implements are expecting more machinery to be replaced by farmers than in any recent years. The lumber companies are preparing to deal with the largest winter cut of logs for some years. There has been a substantial increase in the output of all the lumbering provinces except British Columbia. Preliminary estimates place the value of the cut in New Brunswick at 7 million dollars compared with 2 millions last year. The production of newsprint is being maintained at a high level; and some companies are obtaining prices for spot transactions above the figure of \$50 per ton fixed for 1938 deliveries. There has also been an encouraging advance in new building; and the value of contracts placed during March was \$16,058,100, a rise of 60 per cent. compared with March, 1936. The rise in commodity prices has been checked chiefly by the fall in the price of base metals. The depletion of Canada's stocks of wheat continues; and the visible supply on April 16th was reduced to 77,702,901 bushels compared with 197½ million bushels on the parallel date in 1936.

New Zealand

Stationary Population Threatened

CHRISTCHURCH, April 17.—It has been estimated that New Zealand's birth rate, which exceeded 25 per 1,000 on average between 1910 and 1920, has been falling since and is now 15 per 1,000. The death rate, about 8½ per 1,000, has remained almost stationary, and consequently the rate of natural increase has been halved. In addition, immigration has practically ceased, and the population, now only 15 per square mile, threatens to become stationary before long. In consequence there has recently been some revival of interest in immigration. The biennial meeting of the Australasian Association for the Advancement of Science, at Auckland in January, gave it some attention. Contributors concluded that the record of elaborate Government schemes for settling immigrants is not encouraging and that the creation of conditions likely to attract immigrants would be more likely to get good results. Since then branches of a "Five Million Club" have been formed in the centres, and the subject is likely to be further investigated.

The Prime Minister, who has left for the Coronation, announced on his departure that the Budget surplus for the year would be about £NZ100,000. The Budget does not, however, include the whole of the Government's current revenue and expenditure; it omits, for instance, any loss or gain on the marketing of dairy produce. Competent dairymen estimate that for the dairy year ending July 31st the Government's payments to farmers will exceed the net receipts for produce sold by about £NZ2 millions. Despite this prospective loss, which constitutes a subsidy to the industry, farmers are agitating for a higher guaranteed price next season. They claim that costs of production have been increased

by about 2½d. per lb. of butter by reason of the rise in wages and reduction of hours, while competent labour is hard to get because farm wages compare unfavourably with the rates paid on public works.

The Bureau of Industry, established last year, has been active in investigating marketing and gazetting regulations. The local marketing of wheat, onions, eggs, oranges, and, in Wellington, dairy produce is already regulated; while investigations are being made in the production and marketing of flax, cement, pip fruits, tobacco and bacon. An effort is also being made to rationalise retail druggists. Most of these are commodities of minor importance, and the control schemes are in the experimental stage. The Government has announced that it does not at present intend to extend its export marketing control to wool or meat, and that it will not interfere in these industries unless requested to do so.

Record Wool Prices and Trade

The wool sales in the current issue have been the best since 1928. Prices per bale of New Zealand wool averaged £NZ13 9s. for the 1935-36 season. For the 1936-37 season the average price was £NZ16 13s. in November, £NZ20 2s. in December, £NZ21 8s. in January and £NZ23 6s. in February. For four months up to and including February 314,774 bales exported were valued at £NZ901,505 (£NZ21 19s. 7d. a bale), compared with 333,193 bales valued at £NZ4,478,150 (£NZ13 8s. 9d. a bale) for the same period a year earlier. This represents a rise of 63 per cent. in prices. The latest wool prices are slightly above the £NZ21 9s. per bale received in 1928-29, and are in striking contrast the average of £NZ7 15s. for 1930-33. For nine months up to and including March, 1937, 603,933 bales were offered, 599,248 sold and 592,981 exported. Britain was much the largest buyer, with Japan and the United States next.

This improvement in wool prices has been chiefly responsible for establishing new high records in many statistical series. For the year ended February 4th exports exceeded £NZ260 millions in value. The previous highest figure was £NZ57.1 millions in 1924-25. For the financial year ended in March sales tax revenue was £NZ3.04 millions, or 23 per cent. more than in the preceding year, and the highest yet recorded. In February total bank debits exceeded £NZ22 millions, the highest figure for any month since the series began in 1928. Total bank deposits, which prior to 1934 only once reached £NZ60 millions (in 1920) and normally reach their seasonal peak about May, exceeded £NZ76 millions.

These figures indicate an abundance of money and a rapid expansion of internal trade. The expansion has been helped by the rise of 18 per cent. in wages since 1935, by increased public expenditure in public works, and by increased payments to dairy farmers under the Government's scheme of guaranteed prices. For the first two months of 1937 imports rose by £NZ2½ millions, and the demand for cargo space from Australia now exceeds the normal supply. Though costs have risen appreciably by reason of wage increases, shorter hours and higher taxation, retail price movements have lagged behind, the index having risen only 7½ per cent. since 1935. Nearly all the price groups, however, show an upward trend and further increases must be expected during 1937. It must be remembered that the recovery in Britain and elsewhere is reflected in New Zealand, that the range between high and low prices is widest in the case of her agricultural products, and that her exchange depreciation has to be allowed for. In present conditions it appears that 1937 is likely to be a year of boom.

Letters to the Editor

Fixed versus Free Exchanges

TO THE EDITOR OF THE ECONOMIST

SIR,—There has been much discussion, in your columns as elsewhere, upon the relative advantages of "fixed" versus "free" exchange rates. By "free" exchanges I understand those which are allowed and expected to alter gradually from year to year, in order to bring about adjustment in the various items of the balance of payments to changes in fundamental factors, though steadied against tendencies to shorter fluctuations. In many such discussions it has been claimed that the policy of fixed exchanges (whether or not this involves actual gold parities) has the advantage of considerably facilitating international trade and investment, because it enables importers and exporters, as well as investors, to foresee their receipts and costs more easily in planning their business. I maintain that this advantage claimed is largely spurious; and that in those few cases where it is supported by argument, such argument must be severely scrutinised.

To appreciate this contention we may consider the alternative methods by which adjustment may be made to an enduring change which requires some shift in the amount or direction of international trade. With free exchanges, the adjustment between one area and another will come about largely by a change in the exchange rate between them, which will tend to stimulate or depress various parts of their trade. Some secondary effects may undoubtedly be brought about in their incomes and cost levels, but these need not be great. With fixed exchanges, the adjustments, the essentially similar depression and stimulation of various elements in the trade, must be brought about by inflationary or deflationary changes in the several areas, affecting their incomes and cost levels (probably the volume of output and employment as well as monetary values). There may be some differences in the elements of trade affected in the two cases in response to the same original change, particularly because of the varying incidence of inflation or deflation upon costs and demands; but by and large if the mechanisms work at all smoothly we may expect the same trades to be affected. Of course in either case protectionist or other measures may be introduced to alter or to hasten the adjustment. These would seem to be more likely in the case of a country defending a fixed exchange, but are essentially separate from the point we are considering.

Either form of adjustment then will, must in fact, cause some alteration in the supply or demand conditions affecting importers and exporters. These may differ in appearance between the two cases, but they must be equally potent to achieve eventual adjustment. Whether importers are restricted by a rise in the cost of exchange or a fall in their home demand, their business must suffer. In so far as these adjustments are not foreseen they will upset the calculations of those engaged in international trade. And also they will affect that foreign investment which takes place in real goods or equities; for the volume of profit will alter in terms of the real values in the investors' country under fixed exchanges, despite their conversion at the old exchange rate. Hence both in trading and lending similar problems of foresight are involved whenever any fundamental adjustments may have to be effected under

either fixed or free exchanges. When the exchanges are free, one must estimate how they will react. With fixed exchanges one must foretell the greater effects upon incomes and cost levels at home and abroad. The data required for the first will generally be needed for the second. Only those making secure loans in money terms will be protected against uncertainty by the fixity of the exchanges, and even here the borrower may be victimised by a fall in his home receipts or the lenders by a rise in prices against them.

Possibly there appears to be more certainty with fixed exchanges because traders and investors do not, as a rule, look far beyond the exchange rate to estimate what is in fact likely to happen to incomes and costs. Perhaps this ostrich-like attitude is justified by the sheer impossibility of making sensible appraisals of future income conditions, because of the multiplicity of important causes affecting them, even aside from international trade conditions. But to adopt a policy of fixed exchanges only makes such unpredictable changes in income more probable and does not decrease the difficulty of planning trade rationally. To advocate such a policy because traders and investors in greater ignorance will be led into unwarranted optimism, would seem to be a counsel of despair appropriate only to a stage not yet reached in the decay of capitalism.

Yours truly,
R. B. BRYCE.

Cambridge,
Mass.

International Capital Movements

TO THE EDITOR OF THE ECONOMIST

SIR,—Referring to the remarks on international movements of capital in your issue of May 8th (p. 341), I am glad to see that you are taking notice of certain important but little understood and generally ignored facts in this connection, because the question of international payments is one of fundamental importance in both the national and international spheres of economics, finance, industry and trade. A good deal more will be heard about this question.

As you say, some regard must be had to the cause and purpose of capital movements and the use to which the owners put the money on its arrival in a foreign centre. This, however, is not the whole story, because every capital movement or foreign payment is a double operation, involving another capital movement or foreign payment in the opposite direction. This double operation may induce a movement of gold and/or goods either in one direction or in the other direction, not only according to the respective uses to which the respective owners put the respective foreign money they acquire, but also according to the respective sources of this foreign money. There might, for instance, be deflation in both the countries between which the capital movements are taking place, without any movements of gold and/or goods being induced; or there might be deflation in one of the countries and inflation in the other with movements of gold and/or goods from the deflationary to the inflationary country; or there might be inflation in both countries.

Yours faithfully,
A. H. ABBATI.

Eastbourne.

Books and Publications

An Economist's Manifesto

PROFESSOR EDWIN CANNAN, to whom Professor Robbins, his pupil and successor, dedicates this book,* once wrote "An Economist's Protest" against the practice of economic unreason. Professor Robbins has written an economist's manifesto on reason—and on reason in more than the economic field. After his two economic studies on "The Nature and Significance of Economic Science" and "The Great Depression,"

* "Economic Planning and the International Order." By Lionel Robbins. 330 pages. Macmillan. 8s. 6d.

the theoretician breaks away into the sphere of social policy. It is written with the same uncompromising logic, the same forceful analysis, and the same impatience of speciousness as his earlier works; but, unlike them, this book breathes an Olympian atmosphere which now and then detracts—in style of presentation only—from an otherwise masterly performance. On this occasion Mr Robbins, perhaps unconsciously, emulating the political economists of a century ago, whom he rightly admires, transposes his formidable intellectual equipment from the key of theory to that of political practice. Such a transposition necessitates a more realistic approach and treatment than if he had

remained in the realm of theory. Instead, he is more, not less, theoretical and analytical, both in style and content, than he was in "The Great Depression." To this extent, his nicely "buttoned-up" arguments are likely to be scouted by shallower minds clamouring for more factual treatment. This is a great pity; for the connections between national economic "planning" and the world's political and economic order are becoming fast and painfully evident; and Mr Robbins' latest book is indubitably the most penetrating and illuminating study of those connections we have yet seen.

The author starts with an inquiry into the nature of planning, in which he rightly ridicules the notion that *laissez faire* implies absence of an economic plan or system. He reposes his developing argument on the familiar concepts of the free market and free competition for the utilisation of all factors of production (nationally and internationally) in order to enlarge national incomes. He then attacks the facile contentions that modern technique allows of larger real incomes *with* autarky, and that "a just balance" must be preserved not only between agriculture and industry in every State, but between each separate industry as well. From economics he branches out to the social sphere. Someone must plan; the plan must not be allowed to vary; the capital sunk by the State in the planned enterprises must be "safeguarded" (the author here makes a *reductio ad absurdum* of each country's safeguarding of its railways by asking what would have happened last century if the "coaching industry" had been safeguarded); and the interests of workers and managers must be protected as much against foreign competition as against that arising at home from new inventions (he makes a hit here against the deliberate distortion of world production of agricultural produce since the war, by means of governmental refusal to allow exploitation of new methods). In planning industry and foreign trade, he not only describes the costly chaos created in national and international trade, but uncovers the grave political dangers: lobbying by vested interests, rigidification of national and world economy, intensification of the *real* economic grievances of have-not nations as contrasted with their published grievances, permeation of domestic and international political systems by State-protected monopolies, sacrifice of consumers' desires and choice, and the saddling of Government with responsibility for booms and slumps. Mr Robbins rejects both inter-governmental and inter-industrial planning, as conspiracies against the consuming public; in which he seems to protest too much, for it is clear that monopolisation need not necessarily—as he admits in a gloss—prove either "a conspiracy against the public or a contrivance to raise prices."

Having disposed of Independent National Planning and International Planning, Mr Robbins gives us by far the best part of his book: the section on Complete International Planning. It begins with thorough-going international Communism as a hypothesis; and is a *tour de force*, led up to by the preceding arguments, and leading into a peroration on the great theme: Do we want, or need, an international order? In this third Part and Conclusion, Mr Robbins leaves Olympus and presents us with the welcome and edifying spectacle of an uncompromising liberal laying about him with a flail in defence of a clear ideal. Though he runs through the fields of political creeds, monetary theory, State sovereignty, totalitarianism, private capitalism, and international order in this guise, he never becomes superfluous or irrelevant. Nationalism must be surpassed; the parochial protection of interests at the expense of the commonweal must be abandoned; or the civilisation our Western Society has built up must perish. It is a bold thesis; but Mr Robbins sustains it with ruthless logic. Nothing, he says, will serve now but throwing the lever of State economic policies into reverse. Compromise will not only be costly, it will be abortive; for the children of darkness are cannier in their generation than the children of light, and the last state of partially-planned national economies will be worse than the first. Mr Robbins labours under no delusions. He admits it looks like a lost cause. But he addresses economists, as

much as *les clercs* of M. Julien Benda, when he adjures his readers to get back to the individual as criterion, back to individual values (the source of all), and back to the unfettered reason of the individual mind. Whether one agrees with him or not, whether the world will wag his way or not, he has performed a notable service to Reason in an age of unreason. This book can evoke neither agreement nor disagreement without evoking profound thought.

Shorter Notices

"100 Flashlights on Free Trade." Compiled by Raymond Jones. Liberal Free Trade Committee. 6d.

This little pamphlet stating concisely, forcefully and typically the case for Free Trade, makes an appropriate appearance when Protectionism is losing the fervour of recent years under the pressure of acute shortages and common sense. The tide of freer trade is running in all over the world, and although it will almost surely be halted by the breakwaters of economic nationalism and warlike self-sufficiency, this pointed broadside is undoubtedly a sign of the times. Facts and figures, compiled to the minute, are used to refute the arguments for Protection. Tariffs, quotas, trade agreements and exchange restrictions, currency policy and the course and nature of world commerce are briefly and informatively discussed. A book to be praised, read and used.

"The Twentieth Century in the Far East." By P. H. B. Kent. Arnold. 390 pages. 16s.

This book is a broad survey of Far Eastern history since 1901. The situation when the century dawned, the growth of nationalism in China, the impact of Western commerce and culture on Chinese life, the Asiatic ambitions of Japan, and the present position are vividly described. The question "What of the future?" is squarely faced. Mr Kent is not an historian, but he has a close personal knowledge of China.

"Soviet Democracy." By P. Sloan. Gollancz. 288 pages. 6s.

Mr Sloan sets out to re-assess the meaning of democracy in terms of the concrete social and economic achievements of the Soviet Union. He admits the elements of dictatorship in the post-revolutionary history of Russia, but he points to the truly democratic realisation in that country of equal opportunity and genuine education for all, workers' rights, a popular press, co-operative ownership and production, and freedom for women. He contrasts this new life and the new State with its citizen soviets and citizen army with the democracy of the "old civilisation," falsely based on private property and individual control of production. Mr Sloan is an advocate, but he has written a challenging book.

"Egg Prices." By O. J. Beilby. Agricultural Economics Research Institute, Oxford. 66 pages. 2s. 6d.

In this workmanlike study, Mr Beilby shows that the recent low level of egg prices has been brought about, in the main, by the rapid expansion of home production. He therefore questions the feasibility of import restriction as a means of improving the poultry farmer's income and focuses attention on the necessity of reducing production costs.

MONEY AND BANKING

The Problem of Gold—I

GOLD had an attraction for men long before Amyas Leigh ambushed the gold train or Captain Flint's parrot shrieked "Pieces of eight." It is no accident that every new increase in the world's gold supplies has coincided with a new era of material progress. The Spanish galleons and Sir Francis Drake's ships brought more to Europe than they dreamed of; and last century's gold discoveries in California, Australia, Alaska and the Rand coincided with an unparalleled increase in the world's economic activity. Even to-day, when paper currency is in universal use, the volume of currency and credit and the power of the banking system to aid producer and consumer depends on the world supplies of monetary gold. In the last five years recovery from the depths of the depression of 1932 has occurred once again at a time when monetary gold stocks were increasing with a rapidity hardly surpassed in times of great new gold discoveries.

No important new goldfield, however, has been found during the past five years. How, then, has this rapid augmentation of the world's gold stocks come about? The answer is: by way of a general devaluation of currencies. The process began with the suspension of the gold standard, first in England and later throughout the sterling area. Next came the American devaluation of early 1934, followed by the gold *bloc* devaluation of the autumn of last year. These changes were thus spread over a period of five years. It is fair to assume that the process is now complete, in its essential features, and that a more reasonable balance between currencies has been restored. The net result of these years of travail is a devaluation of the pound, the dollar, and many other currencies, against gold, of approximately 40 per cent. Conversely, the price of gold in these currencies, and the money value of the gold stocks of these countries, has risen by 67 per cent.

The world, in fact, has learned a new lesson. The value of a country's gold stocks does not merely depend upon the physical quantity of gold lying in the vaults of the central bank or the Treasury. It depends also upon the price of each ounce of gold expressed in the national currency. If all countries, or a sufficient number of the most influential, agree to devalue their currencies and raise the price of gold, then the world's stocks of monetary gold are increased as effectively as if a new goldfield had been discovered. This, however, is certainly not the whole story. Whatever may happen in the long run, an increase in the price of gold does not immediately bring with it an equivalent increase in the price of commodities in general, or more particularly in the cost of mining gold. Gold production is consequently stimulated, additional veins become profitable to work, and lower-grade deposits, previously known to exist, can be opened up. Meanwhile, the higher price of gold encourages the dispersion of hoards of gold accumulated in the East over countless centuries, and if this encouragement coincides with a period of depression—as in the last few years—the incentive to dishoard is greatly increased.

That, in brief, has been the secret of the expansion in the world's monetary gold stocks during the past five years. In the present article we propose to examine the extent and nature of the increase, leaving its underlying lessons for a subsequent review. The latest report of the Bank for International Settlements, dated May 3, 1937, contains a wealth of information on the supply and distribution of gold. Production of new gold is shown in the following table. The values shown in the

last column represent "pre-devaluation" Swiss francs, of which approximately 15 equal £1 sterling:—

Year	S. Africa	Russia	U.S.A.	Canada	Other Countries	World Production	Millions of gold Swiss francs
	(Thousands of fine ounces)						
1915	9,096	1,546	4,888	918	6,146	22,594	2,420
1932	11,559	1,990	2,449	3,044	5,264	24,306	2,604
1933	11,014	2,067	2,537	2,949	6,336	25,503	2,732
1934	10,480	4,263	2,916	2,972	6,999	27,630	2,960
1935	10,774	5,831	3,619	3,283	7,484	30,991	3,320
1936	11,339	7,350	4,295	3,721	8,549	35,254	3,777

Measured in physical quantity, since 1915, the record year before 1932, annual gold production has risen by 57 per cent. Allowing also for an assumed increase of 67 per cent. in its price, the increase in value is 152 per cent. Between 1935 and 1936 alone there was an increase in physical production of 4.3 million ounces, or 13½ per cent., which, as the B.I.S. points out, is comparable with increases previously registered at the time of great new discoveries of gold.

The extent of dishoarding by the Far East is shown in the next table:—

	India	China	Hong Kong	Total
	(millions of gold Swiss francs)			
1931	477	54	63	594
1932	1,014	118	59	1,191
1933	653	74	100	827
1934	706	54	68	828
1935	495	43	34	572
1936	371	37	29	437
Total	3,716	380	353	4,449

The influence of general economic conditions upon Eastern dishoarding is very noticeable. In 1932, when conditions were very depressed, dishoarding was at its peak. Since then it has diminished with the improvement in economic conditions.

Taking the years 1932-36 together, new production plus Eastern dishoarding have supplied the world with an additional Sw.Frs. 19,248 millions of gold, equal to about £1,280 millions sterling. A small part of this gold has been taken by the arts, and there has also been private hoarding in the West up to 1935, followed by a dishoarding movement in Europe during 1936, estimated at Sw.Frs. 1,000 millions, or £67 millions sterling. This last movement is attributed by the B.I.S. to more profitable forms of investment, due to recovery, and also to certain penal taxation and other measures taken against the hoarding of gold.

What has happened to the bulk of this new gold? Some indication is found in the following table of central bank holdings, compiled from B.I.S. reports. It covers the four years 1933-36, inclusive:—

Central Banks and Governments*	End of 1932	End of 1936	Intervening loss (—) or gain (+)
	(millions of gold Swiss francs)		
United Kingdom.....	3,021	7,911	+ 4,890
United States	20,964	34,439	+ 13,475
France	16,857	9,168	— 7,689
Holland	2,151	1,499	— 652
Belgium	1,871	1,934	+ 63
Switzerland.....	2,471	2,008	— 463
Germany	1,083	141	— 942
Italy	1,593	638	— 955
Other countries	12,131	14,564	+ 2,433
Total	62,142	72,300	+ 10,158

* Excluding undisclosed holdings of exchange funds, etc.

The total increase of Sw.Frs. 10,158 millions accounts for little more than half the total accretion of Sw.Frs. 19,248 millions in the world's gold supplies. Central bank and governmental acquisitions during 1932 explain part of the remaining Sw.Frs. 9,090 millions, but the destination of the remainder must be sought in the needs of the arts, in private hoards, and—last but not least—in the acquisitions of Exchange Funds. In other words, only part of the world's new gold supplies has gone to swell visible and active monetary gold stocks. The rest has either disappeared elsewhere or has been deliberately segregated by different Governments, who finance their holdings out of money borrowed, in many cases, at short-term from the banking system. The central banks of England and Holland also continue to value their gold at the old parity—i.e. they deliberately undervalue their gold in comparison with its present price in their currency. Thus the expansion in the credit base throughout the world during the past five years is, for the first time in modern history, by no means commensurate with the expansion in monetary gold stocks. The extreme inequality in the distribution of gold, as shown in the last table, has also prevented the new gold from exercising anything like its normal effect upon world prices and trade.

What may happen if, at some future time, the new gold is released and more evenly distributed? Is the present price of gold too high, and is the world in danger of becoming choked with gold? Sir Henry Strakosch discussed some of these points in *The Times* of May 10th, and we ourselves will return to them at a later date. Meanwhile, although the Tripartite Agreement of last autumn established a new equilibrium, the problem of the world's monetary affairs has by no means reached its final solution.

Financial Notes

The Bank's New Gold Purchase.—On Tuesday evening of this week the Bank of England announced that it had bought £5,000,000 of gold. The presumption is that this gold was bought from the Exchange Equalisation Account. The probable motive for this purchase is the Coronation expansion in the note circulation, for as this week's Bank return shows, the circulation has risen by £15.9 millions during the past three weeks, and on Tuesday evening reached a new high record of £479.9 millions. The simplest way to prevent these large currency withdrawals by the public from contracting the credit base is for the Bank to buy gold from the Exchange Account, and for the latter to apply the cash so received to redemption of Treasury bills held by the banking system. This course may have been rendered slightly more advisable by the fact that during the past few weeks the Exchange Account has had to buy some gold in the London bullion market, in order to support the market at a time when there was a general reluctance to buy for shipment to the United States. For this reason the Exchange Account may have been glad to sell gold. Still, the absence of any change in the fiduciary note issue suggests that the Coronation circulation expansion was the main motive behind this operation. Last December, when the Bank bought £65 millions of gold, the fiduciary note issue was only reduced by £60 millions. Thus, there was then a net expansion of £5,000,000, and adding on this week's purchase, there has been during the past six months a total increase of £10 millions, available either to support an increase in the note circulation or for an expansion of the credit base. So far it has been more than absorbed by the past six months' increase of £33 millions in the note circulation. The reduction in the fiduciary note issue made last December shows that gold is not being transferred to the Bank in such a way as to inflate the credit base, but if the circulation contracts it will be interesting to see if the Exchange Account takes back any gold from the Bank.

The Exchange Account and Gold.—Another consequence of the Bank's gold purchases is that the Bank has to buy gold at the current market price and then write it down to its statutory price of approximately 85s. per ounce fine. Since March 31, 1936, the Bank has bought £118 millions of gold, valued at 85s. an ounce. This cost it at, say, 142s. an ounce, £197 millions, so that the Exchange Account has had to stand a loss of £79 millions. In these circumstances it was a little surprising to find in Mr Chamberlain's latest Budget speech "an assurance that the Account still shows a profit." Sir Arthur Salter at once put down a question asking if the Account still showed a profit after reckoning the net result of any losses and gains by purchases and sales of gold in recent years at sterling prices in excess of the fixed value (i.e. 85s. an ounce) as defined in the Finance Act, 1932. This was the Act setting up the Account and defining its obligations in respect of the Bank of England's gold operations. Mr Chamberlain has now replied that his statement that the operations of the Account showed a profit up to any particular date naturally took into account both the accounting losses and gains incurred by the Account on transfers of gold to and from the Issue Department of the Bank of England, and also the accounting profit on revaluation at the market price of amounts thus transferred. Both question and answer were couched in general terms and did not refer to the experience of any particular year. The Exchange Account must have made an initial profit upon the gold and *devisen* taken over from the Bank when the Account started business in 1932; and there was a further profit on the Bank's gold sales at the time of the last complete American debt payment in December, 1932. Next the Account has been able to write up its gold holdings as a result of the rise in the price of gold from 1932 onwards. The Account has also made good jobbing profits from its constant intervention in the exchange market. This is probably why the Account has shown a profit over the whole period from its inception to March 31, 1937, in spite of the Bank's heavy gold purchases during the past year. This gives us the main assurance that so far the Exchange Account's resources have remained intact and are still in excess of their original £375 millions.

The Foreign Exchanges.—There has been little movement during the past week, and the closure of London on Coronation Day served to restrict business. French francs rallied from Frs. 110½ to Frs. 109 on M. Blum's majority in the Chamber, but have since come back to Frs. 110½. There was a better demand for forward francs at Frs. 11½ discount for three months and Frs. ½ discount for one month. The shorter date has some attraction as a medium for investment, as it yields 5½ per cent. per annum with only one month's risk; and so it is narrower than the three months' rate. Dollars are weak at \$4.93½ and over, as a result of continued gold sales to the United States. The Netherlands Bank has now reduced its buying price for dollars from

THE ECONOMIST
includes a special

BANKING SUPPLEMENT

This detailed survey of British and Foreign Banking examines current British Banking trends. Special articles discuss the problems of bank investments and advances. These articles discuss the new Tripartite Monetary Agreement with special reference to the position of France. Other articles describe conditions in the United States, Germany and China. The Supplement gives complete statistical data of all British and foreign banks operating in London.

Fl. 1.82½ to Fl. 1.81½, so that guilders are firmer. The Swedish Minister of Finance has issued a statement expressing fears lest the tendency to rising prices in Sweden becomes excessive. He adds that in case of emergency it may be necessary to abandon the present relation between the krona and the pound by raising the value of the krona, and also to take restrictive measures as regards the credit market.

April Clearing Bank Averages.—The April returns of the ten English clearing banks show that they have been able to replenish their cash. Their aggregate cash ratio has risen from a bare 10 per cent. to 10.2 per cent., and whereas last March four of the ten banks (including Lloyds and the National Provincial among the "big four") returned ratios of less than 10 per cent., during April there was only one under 10 per cent. Cash itself has increased by £3.8 millions. This agrees roughly with the month's increase in bankers' deposits at the Bank of England, and can be traced back to an April expansion in the quantity of Government securities held in the banking department of the Bank. Thus money is being kept easy.

(In £ millions)

	April, 1936	Dec., 1936	Jan., 1937	Feb., 1937	March, 1937	April, 1937
Capital and reserves.....	131.7	131.9	132.5	132.5	132.5	132.5

Total assets.....	2,352.3	2,517.6	2,512.4	2,483.7	2,461.3	2,472.3

The clearing banks have not allowed their deposits to expand in the same proportion as their cash, and that is why their cash ratios are higher. Call and short loans have risen by £6.8 millions, while discounts have fallen by £6.7 millions. The total volume of tender Treasury bills showed little change between March and April, and so it looks as if more bills were being held by the market, and less by the banks. There has been a further increase of £11.8 millions in advances, which have risen to 42.1 per cent. of deposits. This may be why investments have been reduced by £5.9 millions, for investments and advances still equal 71.2 per cent. of deposits, a proportion which is well up to the banks' usual levels.

The Money Market.—The Payment of the Defence Loan call of £19.5 millions on Monday made money a little less plentiful, while, owing to the Coronation, some of the banks who usually make-up on Wednesday were calling on the previous day. Thus there was a fair demand for funds early in the week. Rates are unchanged:—

	Apr. 22, 1937	Apr. 29, 1937	May 6, 1937	May 13, 1937
Bank rate.....	2	2	2	2

Clearing banks.....	½-½-1*	½-½-1*	½-½-1*	½-½-1*
Others.....	½-½	½-½	½-½	½-½
Discount rates:—				
Treasury bills.....	½-½	½-½	½-½	½-½
Three months' bank bills.....	½-½	½-½	½-½	½-½

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

The market is still short of bills, for on May 7th the syndicate only secured 18 per cent. of the allotment, although the tender price was reduced to the lowest point consonant with the banks' ½ per cent. minimum buying rate. The banks are now in a position to buy early August Treasury bills.

The Bank Return.—There has been a further increase in the note circulation, raising the total Coronation expansion to £15.9 millions. It is still uncertain if the note circulation has quite reached its peak, or whether Whitsun currency withdrawals together with the Coronation aftermath will cause a further increase. Owing to the Bank's gold purchase, this week's rise in the note circulation has not caused a reduction in the Reserve:—

	May 13, 1936	Apr. 21, 1937	Apr. 28, 1937	May 5, 1937	May 12, 1937
	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Issue Department:—					
Gold.....	204.3	313.7	313.7	313.7	318.7
Note circulation.....	424.8	464.0	468.8	475.2	479.9
Banking Department:—					
Reserve.....	40.3	50.7	45.8	39.4	39.6
Public deposits.....	13.3	25.6	26.2	16.4	32.5
Bankers' deposits.....	83.2	91.2	87.6	97.2	87.7
Other deposits.....	37.0	38.9	39.6	37.7	37.2
Government securities.....	89.9	94.1	97.7	103.1	108.3
Discounts and advances.....	8.8	4.6	5.5	5.4	5.9
Other securities.....	12.3	24.0	22.0	21.0	21.3
Proportion.....	30.1%	32.5%	29.9%	26.0%	25.1%

The main change in the Banking Department is an increase of £16.1 millions in public deposits. In connection with this, a call of £19.5 millions fell due on May 10th on the new National Defence bonds. Also the sterling paid by the Bank for its new gold may for the moment have been lodged in public deposits. Government securities continue to rise, so that the policy of easy money is still being pursued. Nevertheless, the increase in public deposits has reduced bankers' deposits by £9.5 millions.

Insurance Notes

Liverpool and London and Globe Insurance.—In 1936, the first year of this company's second centenary of existence, the number of new life assurance policies showed a remarkable expansion from 4,502 to 6,815, while new sums assured increased from £2,461,000 to £3,211,000. The net rate of interest earned on the Life and Annuity funds fell by ¼d. per cent. to £3 17s. 9d. per cent. In the Fire branch premium income was some £51,000 smaller at £3,910,000; in common with most other offices the underwriting results were not quite up to the very high standard set in 1935. On the other hand, accident premiums increased substantially from £4,293,000 to £4,627,000, and underwriting profits were very much better than in 1935, a year which in itself marked a great improvement on recent preceding years. The Marine premium income was more than maintained at £294,000. The results of the last two years are given below:—

	1935	1936
	Amount of Profit	Amount of Profit
	Percentage of Premiums	Percentage of Premiums
Fire.....	482,741	410,985
Accident.....	133,809	230,177
Marine.....	21,289	21,017
Life.....	26,000	26,000
Less Items debited to Profit and Loss Account.....	663,839	688,179
Net Trading Surplus.....	216,255	215,050
	447,584	473,129

In the Fire Department, apart from the usual reserve of 40 per cent. of the premium income for unexpired risks, there is an additional reserve which remains as before at £1,775,000. In the Accident Department the process of augmenting the additional reserve has been continued by a transfer of £250,000 from Profit and Loss; this reserve now amounts to £1,250,000. The total assets in the consolidated balance sheet amount to

£32,368,000, compared with £30,783,000. Loans show some increase at £1,589,000, but British Government Securities fell further from £6,056,000 to £5,595,000. Indian and Colonial Government Securities at £1,643,000 increased by £102,000, and Foreign Government Securities expanded from £6,469,000 to £7,213,000. Debenture stocks further contracted and preference stocks were also smaller, but ordinary stocks rose sharply from £1,370,000 to £2,389,000. The dividend on the share capital, which is held by the Royal, is at the rate of 67½ per cent. for the seventh successive year, and costs £547,000, compared with the available interest earnings of £390,000.

Guardian Assurance Company.—Total premium income, apart from life assurance premiums, increased from £2,492,000 to £2,596,000. In the fire branch there was an increase of £27,000 to £1,137,000, and underwriting results were very satisfactory. In the accident branch premium income was £1,185,000 compared with £1,128,000, and a small loss in the underwriting results occurred against the moderate profit in 1935. Marine premium income was £20,000 higher at £273,000. The results in the last two years are given below:—

	1935	1936
	Amount of Profit	Amount of Profit
	Percentage of Premiums	Percentage of Premiums
Fire.....	149,743	158,483
Accident.....	49,021	6,931
Marine.....	8,560	2,454
Life.....	18,545	18,545
Less Items debited to Profit and Loss.....	99,741	117,619
Net Trading Surplus.....	126,128	54,932

Included in the debits to Profit and Loss in the above table are transfers to "Investment Reserve and Contingency Fund" of £50,000 and £25,000 in 1935 and 1936, respectively.

The departmental reserves are strong, amounting in the fire and accident branches to 150 per cent. and 81 per cent. respectively of the premium income. In the life department new sums assured increased further from £1,585,000 to £1,759,000, and the net rate of interest earned was 2s. 5d. per cent. lower at £3 17s. 5d. per cent. Death claims fell by the large sum of £70,000 to £228,000. Total assets of the company and its subsidiaries amount to £16 millions, of which more than £8½ millions belong to the life funds. The book value of the investments are considerably lower than their market values on December 31st last. British Government securities fell from £1,112,000 to £535,000. Debenture stocks amount to £1,709,000 against £1,472,000, and preference stocks to £869,000 compared with £703,000, while ordinary stocks increased from £584,000 to £776,000. The dividend is again at the rate of 100 per cent. and costs £171,000, against available net interest earnings of £152,000.

Friends' Provident and Century Life Office.—The new life assurances of the Friends' Provident increased from £2,276,000 to the record figure of £2,502,000. In addition policies were issued by the Century for £216,000, mainly in connection with a special scheme of life and disability insurance. The purchase money received for immediate annuities also constituted a record for the office at £1¼ millions, against £850,000 in 1935. Death claims fell by £9,000 to £190,000, while annuities paid, less tax, increased from £139,000 to £198,000. The net rate of interest was 2s. 7d. per cent. smaller at £4 1s. 11d. per cent. The Friends' Provident owns the whole of the share capital of the Century, which transacts all the main classes of insurance business, including Permanent Sickness Insurance, a branch in which it was the principal pioneer. The following table records the results of the last two years.

	1935	1936
	Amount of Profit	Amount of Profit
	Percentage of Premiums	Percentage of Premiums
Fire.....	24,329	28,010
Accident.....	1,555	1,171
Motor.....	3,488	4,313
General.....	7,035	17,834
Employers Liability.....	7,932	1,743
Marine.....	5,060	2,600
Less Miscellaneous profit and loss items.....	9,285	17,337
	37,004	35,992

The total assets amount to £15,378,000, against £12,560,000. Loans of all kinds advanced by £544,000 to £3,330,000, but British Government securities remained at a practically unchanged level of £1¼ million. Debenture stocks amounted to £4,030,000 against £3,452,000 and preference stocks to £1,091,000 against £754,000. The shares of the Century appear at the purchase figure of £1,000,000, while other ordinary stockholdings at £2,264,000 amount to practically double the 1935 figure. A dividend of 15 per cent. has been declared, together with a bonus of 2½ per cent. These items cost £53,000, while interest earnings were £49,000.

Northern Assurance.—New life assurances amount to £1,813,000, and the considerable expansion over the previous year's total of £1,545,000 may have been partly due to the novel centenary concession of granting a deduction of 10 per cent. from the first premium under new policies effected in 1936 by existing life policyholders. The net rate of interest earned on the life assurance and annuity fund was 2s. 2d. per cent. smaller at £4 2s. 6d. per cent. In the other branches the results were satisfactory. Fire premiums amount to £1,926,000, against £1,936,000, and although claims were some £18,000 higher at £806,000, it should be noted that the fire loss ratio in 1935 was the lowest in the history of the company. Accident premiums increased by £86,000 to the record figure of £1,757,000, while in the marine branch premium income amounted to £693,000, compared with £631,000, and for the fifth successive year £25,000 was transferred to profit and loss. In the fire and accident account 50 per cent. of the premium income is held as a reserve for unexpired risk, but in arriving at the results shown below, we have followed the more usual practice by taking 40 per cent.

	1935	1936
	Amount of Profit	Amount of Profit
	Percentage of Premiums	Percentage of Premiums
Fire.....	202,913	177,854
Accident.....	142,236	126,633
Marine.....	25,000	25,000
Life.....	115,000	...
Less Items debited to Profit and Loss.....	324,483	151,106
Net Trading Surplus.....	160,666	178,381

Included above in the debits to profit and loss are transfers to the contingency fund amounting in 1935 to £100,000 and in 1936 to £50,000; the 1935 figure also includes £100,000 applied to write off the cost of acquired companies. Total assets of the Northern—excluding the associated companies—increased from £15,972,000 to £16,638,000. The largest changes in the investments were increases of £360,000 to £576,000 in loans on public rates and £277,000 to £1,247,000 in ordinary stocks. Preference stocks increased, but debenture stocks showed some reduction. There is a general reserve of £2,000,000 and a substantial profit and loss balance. Total assets in the consolidated balance sheet amount to £24,669,000, of which £4,732,000 consists of assets in the "London and Scottish." The dividend is 75 per cent., and cost £232,000, contrasted with available interest earnings of £193,000.

THE STOCK EXCHANGE

Prospects for Rubber

In the past few weeks the rubber market has worn a disconsolate air, and rubber prices have suffered a major reaction. After a confident advance to almost 1s. 2d. a lb. at the end of March, the quotation slumped to 9½d. in the following month, and has now recovered to just under 10½d. Share prices, however, had moved well in the rear of the carefree rise in the commodity. They have, consequently, shown more resistance to speculative liquidation, but losses have been appreciable.

Even more significant than the decline in prices has been the revolutionary change in market sentiment concerning the immediate prospect for the rubber industry. Only a month ago there was serious discussion of the possibility of a major boom during the current year, on the lines of those of 1909 and 1925. These confident prognostications received some support from the apparent inability of Malaya and the Dutch East Indies to ship their allotted quotas in the first two months of the year. Most observers were thus totally unprepared for a large increase in shipments from both countries in March, when the total exports were well in excess of the month's allowance and were sufficient to wipe out almost the whole of the previous deficiency. The April figures for the Netherlands East Indies showed an appreciable decline, but it is patent, nevertheless, that the prophets of boom allowed themselves to be excessively influenced by transient difficulties. The exporting areas have been shown capable of expanding output at a much faster rate than was anticipated. But will the further expansion necessary in the future be as easily achieved? Can the industry, for example, meet the 90 per cent. quota called for in the second half of this year? What of the longer view? Though all danger of a "squeeze" is removed for 1937, will 1938 witness a repetition of 1925 or 1909? These are vital questions for investors.

Recent developments in the statistical position may first be briefly summarised. In 1936, in response to the accelerated tempo of world recovery, consumption of rubber increased from 941,600 tons to 1,013,500 tons, and achieved a new all-time peak. In the current year, the advance has continued, and demand bids fair to reach, and perhaps exceed, 1,100,000 tons—i.e. about 10 per cent. more than the 1936 total. Supplies were restricted last year to an average of only 62½ per cent. of standard production; stocks fell rapidly, and by autumn all the excess appeared to have been fully liquidated.

Since then a further decline has reduced stocks well below the level of adequacy. By March they had fallen to only 286,000 tons (in the principal countries outside the regulation areas), and were equivalent to less than three months' demand, against double that amount twelve months ago. The International Committee's tardy efforts to increase supplies by a rapid expansion in the quota have, till recently, merely succeeded in fanning the flames of speculative ardour and stimulating the rise in prices still further. For the current year, an average quota of 83½ per cent. is called for. It should be adequate (provided it be forthcoming) to satisfy prospective demand in full, and to go a considerable way to replenishing depleted reserves. In the first quarter, a production rate of 75 per cent. has almost been achieved, representing an increase in output of about 20 per cent. over the second half of 1936. This is no mean accomplishment. But for the remainder of the year, an average of about 85 per cent. will be necessary to meet all requirements. Is an equal degree of success likely?

For investors nurtured on the view that the world has been suffering from an immense superabundance of productive capacity in the primary producing industries, the idea of a positive shortage of rubber may appear fantastic. Rubber, however, is in a somewhat different position from most commodities. There are few commodities in which world consumption to-day has regained the level of the pre-depression years, but rubber passed that point as early as 1933. To-day, absorption is at a rate nearly 40 per cent. in excess of 1929. The "bulls" of rubber propound both a short- and a long-run case. In the short run, it is alleged, supplies of native labour are insufficient to meet the increased demand not only from rubber plantations, but from tin mines and elsewhere. In the longer run, more emphasis is placed on the declining yield from old rubber areas, the necessity for wholesale clearing and replanting, and the serious reduction in available capacity which will result from any such movement. Provided consumption continues to expand at the rate of recent years, demand may quickly outstrip full potential production. There are admittedly large reserves of native rubber in the Dutch East Indies, but these (it is argued) will not become fully available in the absence of a further price rise.

Labour difficulties have recently multiplied, especially in Malaya and Sumatra, but the problem is

Investment Notes

Interrupted Convalescence.—Last week's Stock Exchange Settlement was accomplished without the hammer, thanks to a good deal of hard and anxious work. The tone of the markets in Coronation week, however, forcibly suggested that some of the emergency shoring-up of weak positions, and the papering-over of cracks, were emergency measures which might not obviate the necessity for later rebuilding operations. There was a fresh outbreak of selling in the speculative markets, especially in Kaffirs, on Monday, and on Tuesday a general dullness was only arrested in the last hour. The causes of weakness were both particular and general. Some of the forced liquidation was known to be due to the clearing up of the position of a firm whose option engagements had been taken over. Many sections, including gilt-edged, rails and various industrials, were a prey to fears of a replica in Britain of the regime of labour unrest which has already swept across America and France. In particular, investors whose memories are moderately long dread the words "coal stoppage," with good reason. The speculative share markets, particularly rubber and oil, received little help from overseas centres, and the market in gold mining shares acted on its own view of what Mr Martin had left unsaid at the Rand Mines meeting (discussed in a Note on page 410).

* * *

A moderate rise in prices is obviously the most immediate desideratum if the technical legacy of the last few weeks is to be cleared up, with the least delay and at the lowest cost. The obstacles in the way of this consummation are threefold: rising prices, industrial unrest and uncertainty over the ultimate form and incidence of the Chancellor's National Defence Contribution. These are devils which come out only with prayer and fasting. For the moment, the market's internal and external problems are reacting unfavourably on each other. So long as the optimists are precluded by sheer uncertainty even from special pleading, prices can hardly recover. Bargain hunters who regard present prices, in many cases, as cheap, are deterred from coming in, so long as the possibility remains that by waiting they may buy cheaper. The omens, at least, favour a continuation of hesitation until the Whitsun holidays are over, the miners' strike notices have either expired or been withdrawn and the new Finance Bill has been introduced into Parliament. But encircling worries did not detract from the loyal fervour with which, in the "House" on the eve of the Coronation, some 5,000 members and clerks sung the National Anthem, accompanied by a detachment of the Grenadier Guards Band and drummers of the Stock Exchange Cadets Battalion.

* * *

Street Traders, London.*—Members of the London Stock Exchange, though they have in the course of history been called many things by many men, will not readily recognise themselves under this title. Nor have they worried themselves unduly over the question whether Throgmorton Street is, or is not, a thoroughfare. Some people, however, think it ought to be, and the Home Secretary has lately been asked whether "he is aware that on five days in each week the thoroughfare named Throgmorton Street is obstructed by street traders in public securities." Sir John Power wished, moreover, to know the number of prosecutions in London in 1934, 1935, and 1936 for obstruction, the amount collected in fines, the number of cases occurring in Throgmorton Street, and the steps taken to keep that street clear since 1895, when the members had the best of the famous "Battle" which secured them the tranquil enjoyment of their extra-mural activities for nearly half a century. The written reply came with full Ministerial solemnity, accompanied by a table showing, among other things, that 27 prosecutions were made for obstruction, nine

being grappled with. The Chinese immigration quota into Malaya has been raised and negotiations are proceeding with the Indian Government for accelerating the supply of coolies. The Netherlands Indies Government has also relaxed its restrictive measures on emigration from Java. It appears, therefore, more than likely that both Malaya and the Dutch East Indies will be able to produce an 80 per cent. quota, and they may perhaps achieve 85 per cent. by the end of the year. After that much will depend on the price factor. Given the prospect of reasonable stability around the current, or perhaps a somewhat higher, level, the necessary inducement will be present for more vigorous recruitment of labour forces. We have shown, however, that production, even at 85 per cent., will be adequate to meet requirements in the near future, and to remove all danger of a market squeeze. On the other hand, there would appear to be little likelihood of any further fall in prices. Consumers have large arrears of purchases to satisfy, to say nothing of reserves to be replenished. The outlook therefore is for greater price stability than in the recent past. On the longer view, the prospect is more obscure. There can be no question of the necessity for replanting on a large scale in the next few years. All new planting is prohibited under the restriction scheme, and there is thus little slack which might be taken up in order to meet any sustained expansion in demand. But no one can predict the precise point at which a real shortage may develop; for its basic condition would be a continued upward movement in the trade cycle during the next few years. This goes beyond anything which can be legitimately anticipated at the present moment, but remains as a factor, possibly of prime importance, in the background.

Meanwhile, for the current year and perhaps beyond, rubber companies should reap their first abundant harvest of profits since the boom period of 1928 and 1929. All are inevitably faced, however, with a pronounced upward movement in costs. Reference to the table at the foot of the preceding page suggests that no appreciable rise in unit costs occurred in 1936, despite the increased rate of restriction. But in the current year the rising tendency has been strongly accentuated. In most cases, moreover, additional charges will have to be met for work postponed during the depression, and provision for replanting will inevitably take a large slice out of earnings. Our calculations of probable profits in the current year for a selected number of companies, shown in the table, have been based on an average price of 10d. a lb. and an average quota of 85 per cent. No deductions for replanting, reserves, etc., have been made, but a fair margin between earnings and dividends on this account must be regarded as certain. We have allowed for income from other sources in the final profit estimates, and have assumed that costs for all companies increase by ½d. a lb. over the 1936 level. Finally, each company's response to further changes in the price of rubber has been expressed as a percentage on the share yield at current prices. Both the resulting figures and those of estimated earnings yields show remarkably few disparities, as between the different producers.

It does not follow, however, that the need for further selectivity has been eliminated. For one thing, the importance of provision for future earning power in the shape of ample supplies of young rubber is likely to increase with the passage of time. Companies, therefore, which already own young areas or possess adequate financial resources to meet the heavy cost of replanting should have a special claim on the investor's attention. For another thing, the shadow of the Chancellor's new National Defence Contribution lies heavy over the industry. Unless the tax is drastically amended, it will most affect those rubber companies which have shown the largest recovery since depression. For them, indeed, it may be equivalent to a decline of rather more than 1d. per lb in the price of rubber, while for the low dividend-payers it will be almost negligible. Some modification in share prices will no doubt occur, if the tax is passed in its present form. Nevertheless, considerations of efficiency and financial strength must continue, in the last resort, to determine the investor's choice.

guineas imposed in fines, and eleven days of imprisonment served in default of fine. But the number of cases in Throgmorton Street was *nil*. The amiable practice of congregating in the Street after 4 p.m. was soberly defended on the expected score of long-established practice and the rarity of through traffic. Members no doubt share the general appreciation of this pleasant Parliamentary conceit, but they will hope that costermongers are not addicted to reading either *Hansard* or the leading financial newspapers. If one of them happened to be fined one day and tried to push his barrow through Throgmorton Street the next, his comment might well be expressed in language less Parliamentary than the Home Secretary's.

* * *

Ordinary Share Yields.—The importance of the changing yield basis which is being applied in the valuation of ordinary shares was emphasised in our Stock Exchange leading article a fortnight ago. In order to illustrate these changes in greater detail, we have prepared the accompanying chart, which depicts the yields shown by the Actuaries' Index of 177 industrials. The bold line shows the overall yield on the index since 1935, and the remaining curves indicate the returns shown by certain component groups:—

INDUSTRIAL ORDINARY SHARE YIELDS
(Actuaries' Investment Index)

Since the last quarter of 1936, ordinary share yields have risen from a little over 3½ per cent. to nearly 4½ per cent.—a level higher than at any time since recovery began. In part this movement is due to the reaction in share prices, but its main cause is to be found in increased dividends. The rapid rise in the yield on oil shares is due largely to increased distributions, while the increased return on building materials shares, now as high as 5½ per cent., may be attributed to the markets' cautious revision of future earnings prospects. With one exception—coal shares—all the groups show an appreciably higher return than a year ago.

Mr Martin on Gold.—Mr John Martin, who is both chairman of Rand Mines and a director of the Bank of England, endeavoured to combine realism with optimism when making his contribution to current symposia on the future of gold. At the Rand Mines meeting on Friday, May 7th, Mr Martin began by pointing out that under the Tripartite Monetary Agreement there is no fixed price for gold, yet gold is still used as a monetary reserve and a means of international payments. Mr Martin described the technique of exchange control—new style—as an example of co-operation between principals who remained independent. Mr Martin then went on to pose a dilemma. At the current market price for gold, the Bank

of England's reserves were worth about £525 millions—apart from the large holding of the Exchange Equalisation Account. If these immense holdings were allowed to do the work of which they would have been capable under the old dispensation, an inflation of credit, on a scale without precedent, would almost certainly result. America's present holdings, measured in current dollar values, were capable of sustaining bank credits twice or thrice as large as those which financed the boom of 1929. In fact, the American reserves alone, in current values, exceeded the monetary gold reserves of the whole world eight years ago. But the higher prices of gold and commodities had lifted the world from depression, and suddenly to reverse the trend would be a calamity. How long would governments continue to absorb gold in excess of their requirements? Mr Martin thus clearly and cogently stated the dilemma, but he made no really determined attempt to answer it, either in the rôle of a gold producer or a central banker. He ruled out "revolutionary measures" and suggested that governments might permit a further gradual rise in prices "to a level at which existing gold holdings could be utilised for monetary purposes without their present scale of redundancy." But clearly, if gold reserves, at current values, are allowed to function as a basis of currency and credit in the same ratios as in 1929, the level of prices will need to be very much higher and/or the volume of trade much greater than in 1929, to produce the effect which Mr Martin envisages, unless other measures are taken. We discuss the background of the world's problem in an article on page 404 of this issue. Meanwhile, Mr Martin has taken occasion to warn South Africa that she ought to take a long view in meeting "such difficulties as undoubtedly lie ahead."

* * *

Steel Price Increases.—In an Investment Note under this heading on page 346 of last week's issue of *The Economist*, it was inadvertently stated that recent advances had raised the prices of finished steel products "to the levels of the post-war inflationary boom." The statement should have read: "to the highest levels since the post-war inflationary boom." We ask our readers to take note of this correction.

April, 1937 ...	99,150	12,485	11,495	123,130	

Few industrial public issues of importance have appeared, but our figures include a considerable number of bonus issues and issues to shareholders. Among the month's introductions the N'Changa Consolidated Copper issue was prominent.

Company Notes

Harland and Wolff Reconstruction.—Seven years have passed since the R.M.S.P. moratorium was agreed to by the creditors of the group, and the process of straightening out the tangle of interlocking finances of the individual concerns is now, at long last, approaching its conclusion. In the case of Harland and Wolff, the long period of careful nursing, aided by a favourable trend of trade, has made feasible a plan which rescues for the first preference shareholders a deferred equity from a position which at one time appeared beyond salvation. The present scheme is rendered possible by an agreement with the creditors, whose claims, at December 31st last, amounted to no less than £10,928,670. Under its terms they have agreed to scale down their claims to £7,281,687, and to accept in full and final satisfaction, cash and sundry assets estimated at £2,081,687 and £5,200,000 in £1 "A" ordinary shares of the new capital. The present share capital is to be reduced by £8,544,312 to £1,796,082 but only £2,400,000 of this reduction falls on the publicly held £1 first preference shares, which are to be converted into new "B" ordinary, and reduced to 8s. The balance of the reduction is attributable to the "A" or "B" preferences and the ordinary which are held within the group. The proposed new capital will embrace, first the £5,200,000 "A" ordinary shares which will be entitled to receive a 4 per cent. non-cumulative preferential dividend and to participate *pari passu* with the "B" ordinary for a further 2 per cent. The rest of the capitalisation will be represented by £1,796,082 "B" ordinary, of which £1,600,000, or 89.1 per cent., will be allocated to the present first preference shareholders.

* * *

The "B" ordinary will be, in effect, the deferred ordinary of the reconstructed undertaking. They will doubtless attract market interest as a high-g geared ship-building equity with long-term possibilities. To show distributable earnings equal to 8 per cent. on these shares, the net profits of the undertaking (after providing for depreciation) will need to reach £455,686—or, say, 7 per cent. on the net assets after writing down. By this standard, the company's earning power would not be required to reach an inordinately high level to bring the "B" ordinary capital into the dividend paying category. On the other hand, profits for 1936, before depreciation, as shown by the report accompanying the scheme—were only £86,007 and were thus far below the level which will in future be required to meet the 4 per cent. non-cumulative dividend on the new "A" ordinary, which will call for £208,000 per annum. The results for the current year, however, should show a substantial improvement, since the 1936 figures were based on orders accepted at a time when prices were barely remunerative. In due course, creditors will doubtless desire to dispose of their "B" shares for cash, and it may be presumed that in accepting the present scheme they have in mind the probability of results for the current year which will render some marketing operation feasible, at a moderate price. Since the publication of the scheme and the report, the £1 first preference shares have fallen about 30 per cent. to 7s. This price represents 17s. 6d. for the new "B" ordinary shares.

* * *

New Gaumont British Development.—A new development has occurred in the Gaumont British dispute this week. At the adjourned general meeting on December 17th last, certain gentlemen agreed to act as a

provisional committee. They have now issued a circular to shareholders in an endeavour to obtain the necessary support, by way of votes and finance, for an application for an investigation by the Board of Trade. The circular recapitulates the story of the consolidated balance sheet, the dissension on the board over the preference dividend question, and the action before Mr Justice Clauson which failed to obtain restraint of the payment of a preference dividend, but succeeded in eliciting a number of new and significant facts. The circular declares that, in addition to the company's trading losses to March 31, 1937—estimated at £623,000 but now put at nearly £800,000—the trial revealed the existence of capital losses by way of: (a) two former distributing companies, Ideal Films and W. and F. Film Services, which stand in the Corporation's books at £450,000, but have been out of existence for several years; (b) the investment in Gaumont British Distributors (practically closed down as a consequence of the deal with General Film Distributors), which stands in the books at £510,000; (c) the Shepherds Bush studios, valued in the books at £450,000, but now closed down; (d) shares in Denman Picture Houses, standing at nearly £2 millions, which were admitted to be over-valued by about £1 million; and (e) loans to and investments in Gainsborough Pictures, Baird Television and British Acoustics, all of which companies show large trading losses. Altogether, the committee put the total capital and trading losses of Gaumont British at approximately £3 millions, and conclude that serious jeopardy exists in regard to the share capital. The committee finally suggest that shareholders may care to contribute, say, 1d. per share to provide the funds necessary for further action. As the facts already elicited certainly appear to indicate a *prima facie* case for further examination, the suggested attempt to obtain a Board of Trade investigation may commend itself to outside shareholders.

Stewarts and Lloyds' Progress.—The market's satisfaction with the substantial improvement shown in this company's report was somewhat tinged with surprise. Although investors are perhaps too ready to take large increases in earnings as a matter of course, a rise of 44 per cent. is remarkable in a year when exports of tubes declined both in volume and value. The issue in October last of deferred shares, involving over one-and-a-third millions, can hardly have appreciably affected results for 1936. On the other hand, a setback was experienced in 1935, and if the latest profits are compared with 1934, the rise is of a more moderate order. In the latest period the increase in the earnings for the equity is, however, only £157,500. Staff funds and depreciation between them take about £20,000 more, £25,700 has been used to start a debenture redemption reserve, while income tax reserve, as indicated in the following table, absorbs £225,000, where no allocation was made in 1935.

	1934	1935	1936

Contingencies reserve

Carry forward

* Includes £100,000 special depreciation. † After £82,126 issue expenses. § Before staff fund contributions.

The dividend is raised by 2½ per cent. to a total of 7½ per cent. on the old capital, and the margin between earnings and distribution widened at the same time. The usual provision for contingencies reserve (shown together with taxation and maintenance reserves in the balance sheet in a single figure) is lower at £150,000, but £100,000 is set aside for special depreciation. The balance sheet reflects the changes made both by the ordinary development of business and by last autumn's new issue to finance the Corby extensions, which are expected to come into production this year. Properties and plant stand at £9,516,672, against £8,340,199, and although shares in subsidiaries are practically unchanged, loans to them, and interests in allied companies, are proportionately much higher. The current year will be of unusual interest in the company's development, with the extension of operations at Corby and the agreement with the Lancashire Steel Corporation for the manufacture of rolled products. For the deferred stockholders, however, prospects may be clouded if the N.D.C. is levied on existing principles. This stock, at 37s. 3d., yields 44 os. 4d.

Allied Newspapers.—The profits of this combine have risen £31,252, or 2.9 per cent., to a new record in its history, and the ordinary dividend has been raised by 1 per cent. to 9 per cent. The whole of the increased earnings becomes available for the ordinary shareholders, though as before well under half the earnings are distributed. Details are shown in the following table:—

	YEARS TO DECEMBER 31ST	1934	1935	1936
Profit		1,018,732	1,070,933	1,102,185

The report is not an informative document and there are no means of discovering the position of the main subsidiaries. But the year 1936 has been an eventful one for the company, and the report gives some description of the main occurrences. Reference is made to the retirement of Lord Camrose and two of his family, the sale of the various Edward Lloyd interests, and the acquisition of the outside shareholdings of Daily Sketch and Sunday Graphic, Ltd. The Edward Lloyd interests were sold at a profit of £880,483, which has been allocated to the reserves of the companies of the group. The parent company's general reserve has been increased by £630,583, while part of the proceeds has been spent in completing its purchase of its share of *The Daily Sketch*. The balance sheet reveals less change than might be expected after these changes. Investments in subsidiaries, at £3,268,000, are actually £517,000 higher, advances however showing a small decrease so that these interests still amount to about two-fifths of the total assets. After the addition of the latest allocation, the general reserve will be £2,000,000. Surplus liquid assets in the latest balance sheet are approximately £312,000, against £515,000 at the end of 1934, when total assets were £1,000,000 lower than the present level of £15½ millions. At the current price of 35s. 1½d. the ordinary shares yield 5½ per cent.

Siemens' Progress.—Recovery is shown very clearly in the 1936 accounts of this company, which manufactures a wide range of electrical apparatus. The directors report that their factories are working at capacity and that considerable extensions have been found necessary. Possibly owing to the date of making them, or even to the lack of a consolidated balance sheet, however, these extensions do not reveal themselves in the published figures for 1936. Land and buildings, for instance, have risen less than £20,000 and investments in subsidiaries have actually fallen over £55,000. Materials and work in hand are up about 18 per cent., but ordinary earnings have risen by nearly 80 per cent., much of which has been ploughed back. Recent developments are shown in the following table:—

	YEARS TO DECEMBER 31	1934	1935	1936
Profit		134,154	236,122	347,746
Pension funds		13,584	15,432	17,670

Carry forward		332,985*	339,724	344,617

* After crediting £9,995 income tax not required.

In reviewing the earnings prospects for the present year, the possible consequences of the recent fire at one of the company's factories must not be forgotten. The costs of reconstruction and extension are necessarily high at the moment, and the company is vulnerable to the rapid rise in metal prices. Apart from considerations such as these, the outlook for the company is bright, for its main interests lie in activities with good prospects for expansion, such as the manufacture of telephone apparatus, traffic control systems, batteries, and a variety of marine fittings. The ordinary stock at 32s. 7½d. cum dividend gives a yield of 4½ per cent.

London County Freehold.—Continued progress is shown by the admirably full and informative accounts of this property company, which give comparable figures for the past twelve years, a revised form of accounts, and a wealth of comment. The annual net revenue

(before interest) at £592,234, shows a rise on the year of just over £56,844, or 10 per cent.—a very satisfactory improvement for a company of this type. The ordinary dividend of 10 per cent. and the bonus of 1 per cent. is maintained for the seventh year in succession, while reserve appropriations are resumed with the sum of £35,000, making the general reserve £1,294,098, out of a balance sheet total of just under £10 millions. All this is a considerable achievement in face of rising rates and costs. How long it can last is another question. The building of flats has gone on at a portentous rate in the last year or so, and conceivably the supply is now adequate or even excessive. For the moment, however, the directors report a lower percentage of unlet premises than at any time since the beginning of the slump, and in so far as their properties are mainly in central parts of London and the company is firmly established in its particular sphere, its prospects are at least as favourable as those of any similar concern. With the combination of the natural advantages of such sites and a probable trend towards more central homes, any hypothetical fall from the present high level of rents may well be small for this type of property. A policy of modernisation is, moreover, being vigorously followed. The present price of the ordinary stock is 19s. 9d. per 10s. stock unit.

Cable and Wireless Accounts.—Since the directors had already indicated that the revenues for the current year were likely to cover a 4 per cent. dividend on the new ordinary stock (if the scheme to be considered on May 24th were approved), the accounts for 1936 lack a good deal of their usual interest. The gross revenue of the holding company, in fact, amounts to £986,276, compared with £1,120,234 for 1935. The fall is attributable to comparatively severe reductions in the amounts received from the Eastern Extension and Western Telegraph companies. The resulting gross revenue is appreciably lower than the estimate of £1,080,000 recently published with the details of the reconstruction

scheme. It becomes increasingly clear, indeed, that the earnings possibilities of the "B" ordinary are so remote that the terms of their participation in the reorganisation scheme are relatively generous. These figures are filled out in detail by the operating company's accounts, which show that message receipts are slightly lower (as the index numbers indicated) while the net profits, after providing for the various special items, has fallen from £1,001,397 to £842,945.

Central Uruguay Railway Reorganisation.—Full details were lately published of the scheme to simplify and reduce the present awkward structure of the Central Uruguay Railway and the four extension companies. Owing to loss of traffics and exchange difficulties a moratorium scheme was adopted in 1933 and extended in 1935. The latter scheme expires this year. Recovery of the system to the conditions which existed when the working arrangements were originally made is so unlikely that an entire reconstruction of the group has been decided upon. Briefly, holdings in the four extension companies are to be surrendered against stocks of the Central Company, which will absorb the other undertakings. The capital of the Central Company, however, itself consists of four classes of debenture stocks, together with preference and ordinary shares, and is therefore to be reorganised into £4,890,000 of debenture stocks and £5,860,000 in ordinary shares only, making £10,750,000 issued in all. In allocating the new Central securities among the five undertakings the debenture stocks are divided mainly in accordance with the earning capacity of the extension companies, as measured by average gross receipts for ten years, subject to adjustments for existing net assets and other special factors. Of the new ordinary shares, one-third are required to satisfy various arrears, the balance being allotted to preference and ordinary holders on the basis of existing preferential rights. In distributing the new stocks among the different existing classes, the

CAPITAL ISSUES

As might have been expected, new issue activity has subsided, and this week produced only two offers. One of these, however, made by the *Steel Corporation of Bengal*, is the most important industrial issue of recent weeks. This company will operate under the guardianship of the Indian Iron and Steel Company. It has an issued share capital of £2,775,000, the public issue comprising £1,000,000 4½ per cent. guaranteed convertible mortgage debentures at par. A modern steel works is to be erected at Hirapur, the initial production aimed at being 200,000 tons of finished steel products annually. The Indian company, who take one-fifth of net profits after charges, unconditionally guarantee principal and interest of the Bengal company, supply "utilities," such as water, power and town services, and undertake to provide with "hot iron" at cost plus a percentage. The debentures, being convertible into ordinary shares in and after 1947, contain a strong equity element which may attract investors. The issue price, in fact, would appear to contain a little option money. *British Independent Exhibitors (Distribution) Co.*, with a capital of £200,000 in all, is issuing 1,100,000 2s. ordinary shares at par. The prospectus states that, "The object underlying the inception of the company was the creation of a Federation of British Cinema Owners to develop the cinema interests on an economic basis primarily in the interests of the independent exhibitor in the United Kingdom." The arrangements for translating this general objective into specific terms appear to include, *inter alia*, an arrangement under which another company, Rock Studios, buys 350,000 shares at 4 per cent. commission, licenses sound stage facilities for five years at a rent rising from £16,250 to £32,500, and assigns rights in a certain picture for £20,000 cash and 50 per cent. of net distribution receipts. Permission to deal will be applied for only after the publication of the first trading report. For the present, therefore, the shares entirely lack marketability.

PUBLIC OFFERS

STEEL CORPORATION OF BENGAL.—Issue at par of £1,000,000 4½ per cent. guaranteed convertible mortgage debentures (£500,000 underwritten firm). Prior or *pari passu* debentures not to be issued unless considered necessary for extensions. Redeemable at par 1967, or from 1947 at 102 on notice, or from 1948 by drawings at par. Until 1947, holders may convert into Rs.10 ordinary shares at rate of 40 shares per £50 debenture. Principal and interest guaranteed by Indian Iron and Steel Company; charges rank after those securing second debenture stock. Formed to build steelworks at Hirapur: hot iron to be supplied at cost plus 5 per cent. by Indian company, who grant leases, etc., supply water, electric power, etc., and receive one-fifth of net profits. Estimated profits, after depreciation, not under £465,000, or £320,000 after interest and Indian company's share. List closed at 9.1 a.m., May 10th.

BRITISH INDEPENDENT EXHIBITORS (DISTRIBUTION) COMPANY.—Issue of 1,100,000 2s. ordinary shares at par. 400,000 2s. franchise shares (ranking with ordinary) to be issued as required to independent exhibitors, who receive preference in rent, etc., for films produced, controlled or distributed by company. Consideration for promotion, £5,000 cash and 100,000 ordinary shares. Company pay £6,500 preliminary expenses. Rock Studios, Ltd., license sound stage facilities for five years to company. List closed at end of banking hours, May 10th.

ISSUES TO SHAREHOLDERS ONLY

HILLS (R. H. O.) (BLACKPOOL).—Issue of 200,000 new ordinary 5s. shares at 7s. 6d. to holders on register April 30th (one for every two held).

BONUS SHARES

J. COMPTON, SONS AND WEBB.—The directors propose to capitalise £33,600 of the general reserve by issue as bonus to ordinary shareholders in the proportion of one new share for ten held.

PYE RADIO.—Capital bonus of 400 per cent. to be paid out of undistributed profits. Instead of being given by the issue of shares of the existing denomination the present 1/- shares will become 5/- shares fully paid.

OIL OUTPUTS

BRITISH CONTROLLED OILFIELDS, LTD.—Production for the week ended April 24th: 14,794 barrels. Production for the week ended May 1st: 14,854 barrels. Production for April, 64,822 barrels; shipments for April, 68,949 barrels; production for week ended May 8th, 13,556 barrels.

THE KERN RIVER OILFIELDS OF CALIFORNIA, LTD.—The total production during the month of March amounted to 157,614 barrels, or approximately 22,518 tons. The total production during April amounted to 158,276 barrels, or approximately 22,611 tons.

THE MEXICAN EAGLE OIL COMPANY, LTD.—Production for the week ended March 20th was 620,000 barrels; March 27th, 591,000 barrels; April 3rd; 589,000 barrels; April 10th, 592,000 barrels. Production for the week ended April 17th, was 599,000 barrels. Output for the week ended April 24th was 617,000 barrels. Production for the week ended May 1st, 1937, was 643,000 barrels.

APEX (TRINIDAD) OILFIELDS, LTD.—The results for April are: Production of oil, 48,770 tons; deliveries, 52,220 tons.

COMPANY MEETINGS

RAND MINES LIMITED

ANOTHER SUCCESSFUL YEAR

USE OF GOLD AS RESERVE

INTERNATIONAL POSITION

MR JOHN MARTIN'S ADDRESS

There has been a growing appreciation by countries which had left the old gold standard of the utility of gold as a reserve, said Mr John Martin, member of the court of directors of the Bank of England, delivering the chairman's address, in Johannesburg, on the 7th instant, at the annual meeting of the Rand Mines, Limited.

There had, he said, been a development in the practice of effecting large international payments through the medium of gold, and he referred to the Three Power Monetary Agreement of last autumn as "a sort of monetary Locarno pact."

Moving the adoption of the report and accounts, the Chairman said that the company had again had a successful year, dividends having been the highest since 1913.

The financial and investment basis of the company, exceptionally strong as it had been over a long period, had been further strengthened.

STRONG INVESTMENT POSITION

Commenting on the balance sheet, the Chairman mentioned that it had been considered expedient to reduce the book value of certain holdings both below the cost and below the market prices. The strength of the company's investment position was evident from the schedule appearing in the accounts. The market value of shareholdings, all of which appeared in the books at or under cost, but in no instance above the market price at December 31, 1936, largely exceeded the book value in the balance sheet.

The disappearance from the detailed schedule of certain smaller items which had figured there in previous years did not necessarily mean that the company had liquidated those particular interests; some of them had for the sake of convenience been included under the globular heading of sundry shares and debentures.

The market value of the company's gold-mining interests at the end of the year represented 86.7 per cent. of the market value of the company's total investments at that date; and 85.5 per cent. of the company's gold-mining interests was dividend-producing.

The gold-mining industry had enjoyed another prosperous year. Assuming other conditions remained relatively stable, native labour requirements must increase formidably in the next two or three years, and could not be met from the customary sources. The problem—a real one—had been receiving close attention. Experimental employment of tropical natives had encouraging results, and it was hoped that in the course of time a large additional supply of native labour might be obtained from areas north of latitude 22 deg. South, particularly from Nyasaland, Northern Rhodesia and adjacent territories.

CLOSED SHOP PRINCIPLE

A decision of great importance, recently announced by the Gold Producers' Committee of the Transvaal Chamber of Mines, was that at the beginning of next month the closed shop principle was to be applied.

The decision of the Chamber of Mines implied a wider recognition of trade unionism. The change of policy might not have been considered but for two reasons. The first reason had been that various recognised trade unions had proved themselves to be representative of the respective classes of employees whose interests they had never failed to urge in a responsible and effective manner. Agreements concluded with the unions had been observed; due regard had been paid to the general welfare of industry upon which the whole country was so largely dependent; harmonious relationships between employers and employees had

been maintained, and industrial peace had been preserved practically unbroken for fifteen years.

That satisfactory situation went a long way to justify the exclusive recognition now to be accorded to the trade unions.

The second reason had been the emergence of a new body whose activities, although not confined to the mines, were antagonistic to and resented by all recognised trade unions.

"It would have been unthinkable," said Mr Martin, "for the Chamber of Mines to stand aside and allow the operations of industry to be suspended—for that is what would have resulted—while a challenge to the recognised unions was being fought out with prodigious loss to all concerned. In these matters the Chamber of Mines has one concern and one only. It is to see that the industry functions as industry—as a truly national industry. The employees cannot hope to gain anything from trade union civil war."

"When, therefore, a disruptive attempt at organised sectionalism became apparent, it appeared logical and proper that the industry should advance a further stage in its recognition of the established trade unions and not only recognise and deal with them exclusively, which has been the practice hitherto, but require that employees should belong to their respective unions."

GOLD SITUATION

Dealing with the gold situation, Mr Martin said there had been a growing appreciation by countries which had left the gold standard of the utility of gold as a reserve. There had been a further development in the practice and technique of effecting large international payments and transfers of capital through the medium of gold. During the first half of 1936 the dollar had depreciated on sterling and with it the sterling price of gold had fallen. When the French authorities had severed the link between the franc and the dollar, as they had done in September, the dollar had appreciated and with it the sterling price of gold had risen again.

The most important event in the monetary sphere had been the change of policy by the French authorities. It was important for two reasons; first, because it had been the occasion of a demonstration of international co-operation by the monetary authorities of France, America and the United Kingdom; and, secondly, because it led to a further development in the technique of exchange management off the gold standard but on a basis of gold.

Three Governments had declared that they were opposed to currency depreciation as an instrument of trade policy—a sort of monetary Locarno pact—and that they aimed at exchange stability and the greatest possible freedom of commercial exchange. This declaration had only confirmed the impression to be drawn from the previous practice and statements of the British Government; but it was an advantage to have those principles formally put on record.

TECHNIQUE OF EXCHANGE CONTROL

The development in the technique of exchange control had attracted less attention and was perhaps of greater interest. It should be noted that it was an example of co-operation between principals who remained independent, pledged to no particular rate of currency agreement, but only to the general principles of co-operation and stability. In each country the market in foreign exchange was free, thus differentiating those countries from the areas of controlled currencies. In each country, again, the exchanges could move and managers of the Exchange Funds

were not required or expected to resist a prolonged and definite trend in one direction or other.

What they did set out to do was to prevent sudden and large transactions from producing the large and transient effect upon exchange rates that they would inevitably produce but for the operations of the exchange funds.

The function of the latter was simply to maintain orderly and steady markets. To facilitate their intervention they had come to an understanding among themselves to exchange with one another their currencies for gold. Each would take over, in exchange for gold, any amount of its own currency which other funds might have acquired in the course of meeting the demand for their own currencies.

Conversely, each fund would supply its currency, in exchange for gold, to one of the other funds which might need it in order to take up its own currency from its own citizens or others who were withdrawing funds. Thus a demand for dollars, for example, could be met without its affecting the dollar-sterling rate, by the American funds supplying the dollars needed in exchange for sterling, which it then converted into gold, earmarked at the Bank of England. Or the English fund could meet any movement to repatriate to France money at present in London, by supplying France, which it would obtain either by releasing from earmark its own gold in the Bank of France, or by earmarking in favour of the French fund gold in the Bank of England.

Thus, to-day, without any formal stabilisation of currencies in terms of one another or any universal linking at a fixed price with gold, very large transfers of funds could be made from one centre to another without any dislocating effect upon exchange rates. Actually movements in exchange rates between pound, dollar, and franc since October last had been negligible from day to day or week to week, and over the whole period had been so slight as to offer neither an obstacle to traders nor an inducement to speculators.

USE OF GOLD

The Chairman continued:—I have dealt in this detail with a matter of technique because its success is too often taken for granted. Actually it calls for experience, judgment, and large resources in the form of gold. The advantage it secures is that it renders unnecessary the scrutiny and authorisation by government of every international transaction, which the experience of other countries shows to be the only alternative. We may be grateful to be spared such further penetration of ordinary business by government controls.

I have referred to it also because it illustrates how gold can be used in monetary arrangements on a system which differs from the gold bullion standard in involving no fixed price for gold, but resembles it in its dependence upon, and use of, gold as a monetary reserve and means of international payment.

Whether the success with which the British monetary authorities in particular have met the difficulties arising from the collapse of the international gold standard will result in a permanent change of system or smooth the way towards a return to the international gold standard remains to be seen.

Since I have ventured on this difficult topic of monetary policy which is of such vital importance to our industry, may I go a step further and direct your attention to what appears to be a possible danger? The suspension of the gold standard by country after country was generally taken to be an inflationary measure.

Before 1930 there was commonly believed to be insufficient production of gold to maintain adequate monetary supplies and the departure from the gold standard was looked on as removing a brake upon expansion of trade and a rise in prices.

VOLUME OF CREDIT

In view of this, it is interesting to observe that the volume of credit permitted by the monetary authorities of the two countries whose action in these matters is usually regarded as decisive for the world, the United States and the United Kingdom, has been far less than would have resulted from the unimpeded operation of the old automatic gold standard.

In the United Kingdom, the Bank of England shows gold reserves which, valued at the current market price, amount to about £525,000,000, and there is to be added to this the unknown but undoubtedly large holding of the exchange equalisation account. Gold holdings of this magnitude, had they been allowed to enter the cash base of credit, instead of being so largely neutralised (by valuation in the banks' accounts at the old statutory price by reduction in the fiduciary note issue and by operations of the exchange account) might have led to inflation of credit on a scale without precedent.

Similarly in the United States, if the Federal Reserve Board had not doubled the minimum legal cash reserves of the member banks

and if the Treasury had not also adopted the same procedure as the British exchange account (of borrowing from the market the cash required to pay for incoming gold) the cash base would have sustained a volume of bank credit two or three times as large as that which sufficed to finance the boom of 1929.

Measured in current dollar values, the American gold reserves are greater than the total monetary gold reserves of the world in 1929.

FUTURE PRICE

Questions that preoccupy attention at present are questions concerning the future price of gold and the future position of gold in the monetary systems of the world. They are questions which in these unpredictable times admit of no explicit answer. We as gold producers can neither dictate nor forecast the course of events. How long, it is being asked, will Governments continue to absorb gold in excess of their requirements of gold for the purpose of monetary reserves?

Their motive is, of course, to prevent the monetary situation from getting out of hand, as would happen if they permitted an enlargement of cash reserves of commercial banks to a point at which credit would be available from any and every project at any level of prices.

There may therefore be a limit under the conditions now existing to the capacity for absorption of new gold at rising prices or even at the present level of prices. Measured in current values, world production of gold has expanded threefold since 1929. In part this is due to an increase in the physical volume, in part to the rise in the sterling or dollar price per ounce.

As I emphasised a year ago, the price of gold depends chiefly on the course of events in the United States of America. The fact that that country has latterly been the only large buyer of gold has in the main been due to the conditions that America has herself created. With the restoration of greater confidence there has in the past two years been a great influx and reflux of capital to the United States.

It would have been better for America and the world if it had been possible to effect the immense transfer of funds by the sale to America of goods and services, but this fact was insufficiently realised by America, who preferred and welcomed the incoming streams of gold, which are now claimed in some quarters there to be an embarrassment.

PERIL OF FURTHER MONETARY EXPERIMENTS

Discussion over the last few months at Washington of the problem apprehended by the influx of foreign capital culminated in the recent crop of rumours that the United States contemplated a change of policy affecting gold. Even rumours which, though officially denied in most explicit terms, still persist, have had widespread repercussions that demonstrate to the United States and the rest of the world the peril of further monetary experiments, their boomerang effect, and their threat to the progress of world recovery.

The higher price of gold and other commodities has lifted the world from depression, and suddenly to reverse the upward movement would be a calamity. A revolutionary measure should not be needed to cope with the situation.

The Government authorities could permit a further gradual rise of prices to a level at which existing gold holdings could be utilised for monetary purposes without their present scale of redundancy. The lesson also to be drawn from the difficulties of recent years is that much larger gold reserves than ever before are needed against international movements of capital. Not all influxes of foreign capital can or need be permitted to enlarge the cash base for the domestic credit system. Confidence in non-metallic currencies, currencies divorced from gold, depends on confidence in the Governments that create them or authorise their creation, and that confidence is not always forthcoming.

A WORLD PROBLEM

The problem is a world problem which is beyond determination by this country alone. It is fortunate that at this juncture there should be assembled in London Prime Ministers and other leading representatives, including the governors of the different central banks, of the Dominions and Colonies of the British Empire, which is so vitally concerned with the position of gold, both as producers and in relation to the exchange and economic interests of the whole group of nations whose currencies are based upon sterling. There is thus afforded an opportunity for the fullest consultation under conditions where all relevant facts and tendencies can be properly assessed.

It may be—let us hope it will be—that with the widest co-operation, a further effective approach may be made towards a

form of stabilisation on a gold standard, the full consummation of which would relieve and indeed solve so many acute economic problems that now beset the world.

This corporation, as shareholders are fully aware, is predominantly a gold holding company. Changes in the situation there may be, but we in South Africa must take the longer view and meet without alarm such difficulties as undoubtedly lie ahead. That is the attitude which I feel confident meets with the approval of shareholders of this company.

Reviewing the operation of mines of the group, Mr Martin said there had been a small increase in working costs which was indicative of a general tendency which was becoming more marked. But generally speaking, the experience in the matter of working costs was satisfactory and was creditable to the mine managements, particularly when account was taken of the increased expenditure necessitated by working at greater depths, which involved higher charges for hauling, pumping, ventilation, and support of workings. There had also been larger contributions to the provident fund and bigger charges for holiday leave and other privileges granted to European employees.

INCREASED MILLING CAPACITY

The process of enlarging milling capacities continued. In particular at Modderfontein East, East Rand Proprietary Mines, and Consolidated Main Reef, tonnages crushed would be gradually increased. At Durban Roodepoort Deep the present capital expenditure programme was nearing completion. The milling capacity of the latter mine would be increased as soon as possible to 140,000 tons per month, and upon completion of a new vertical shaft the milling capacity was to be further increased to 175,000 tons.

The company's capital would be increased to provide funds for this new programme.

The shareholders would probably have noted with satisfaction that, as from the beginning of May, the Central Mining and Rand Mines group had, by arrangement with other interested parties, assumed full administrative and technical control of the Welgedacht Exploration Company.

Mr Martin paid tribute to the late Sir Lionel Phillips, Bart.

The report and accounts were unanimously adopted.

BREEDON AND CLOUD HILL LIME WORKS, LIMITED

SUCCESSFUL YEAR—RECORD PROFIT

The fourth annual general meeting was held at the registered offices, 11-12 Pall Mall, S.W.1, on Thursday the 6th May, 1937. The Chairman (Mr A. Woolley Hart) presided.

The Secretary (Mr. John Jordan) having read the notice convening the meeting and the auditors' report, the Chairman said:—

The directors' report, profit and loss account, and balance sheet as at January 31st last having been in your hands for some days past, I propose, with your permission, to take them as read. (Agreed.)

I do not think there is much to add to the printed report, which tells you that we have had a very successful year and have made a record profit—over £9,000 more than last year. Trade generally has been good, and we have managed to get our fair share. I think this can be attributed to skilful and energetic management, the good quality of all our products, and our favourable situation, practically in the centre of a ring of important manufacturing towns.

Your directors have also since the company's inception adopted a progressive policy in fully maintaining the plant and machinery in first class order and condition, and adding to it whenever necessary or desirable either to meet expanding, or secure new, trade.

This year we have not only doubled the tile-making plant, but added a new gravel plant and a lime hydrating plant, and other developments are contemplated.

Your directors will shortly put before you a scheme for the reorganising of the company's capital which they believe will be for the benefit of all shareholders.

With regard to the accounts, it will be seen that during the year the share capital of the company was increased from £85,000 to £100,000 by the creation of a further 60,000 participating preferred ordinary 5s. shares, of which 40,000 were issued at 7s. 6d. each.

The bank overdraft was reduced from £14,694 to £6,447, sundry creditors are £20,130 against £20,066 last year, and sundry

debtors are £32,516 against £27,542. Stock-in-trade and work in progress are almost the same, being £11,691 this year and £11,263 last.

Preliminary expenses stood at £4,886 last year, and this item was reduced in appropriation by £1,000 to £3,886 this year. As you will see, it is now proposed to write the whole of this off, which will leave us with a perfectly clear balance sheet.

If anyone has any questions to raise, I will do my best to answer them, and in the meantime I will formally move the usual resolutions and ask one of my colleagues to second them.

The report and accounts were then proposed, seconded and carried unanimously.

Mr J. H. W. Laverick, the retiring director, was re-elected, and the auditors, Messrs Derbyshire and Company, reappointed.

SPAARWATER GOLD MINING COMPANY, LIMITED

SATISFACTORY PROGRESS

The second ordinary general meeting of this company was held on the 11th instant in Johannesburg.

The Acting Chairman, Mr G. Carleton Jones, after dealing with the receipts and expenditure, said that the unexpended balance on hand at December 31st last, was £1,999,868, of which £1,988,142 was represented by cash and balance of cash assets.

With regard to the operations during the year, the total footage to end of April, 1937, including subsidiary development, was 23,410 ft., of which 12,945 ft. had been sampled and 4,560 ft., or 35 per cent., proved payable, averaging 9.3 dwts. over a stopping width of 29.4 ins. Number 1 shaft had been completed in March last, at a final depth of 3,388 ft., and sampling over 21 sections of the main reef encountered at 3,108 ft. gave an average value of 15.2 dwts. over a reef width of 5 ins.

In conclusion, the Chairman said: I think I am justified in stating that the progress on your property to date is most satisfactory, and that development disclosures give indications of pay shoots hitherto unknown. When through connection is made with the Sub Nigel Haulages, while only minor advantages will accrue, as the ventilation facilities which the Sub Nigel can afford are very limited, the connection would allow of egress, and the system of ventilation designed for No. 1 vertical shaft, which can be used for both upcast and downcast purposes, would permit of production from No. 1 shaft area without recourse to the sinking of a second vertical shaft, provided that a sufficient percentage of payability is obtained in development disclosures within a reasonable distance to the shaft.

The report and accounts were unanimously adopted.

CALCUTTA TRAMWAYS COMPANY, LIMITED

IMPROVED PROSPECTS

The ordinary general meeting of this company was held, on the 11th instant, at 1 Queen Victoria Street, London, Sir Geoffrey R. Clarke, C.S.I., O.B.E. (chairman of the company), presiding.

The Chairman, in the course of his speech, said that the net revenue earned on the working of the undertaking for the year to December 31, 1936, amounted to £106,106, showing a reduction compared with the previous year of £12,402. This is partly due to a reduction in gross receipts of £6,266 and partly to an increase in expenditure of £5,776. The increase in expenditure is chiefly due to the additional cost of maintaining and repairing the permanent way and cars. Such expenditure will vary from year to year, and I am sure you will agree that these vital assets should be kept in first-class order. In comparing the gross receipts in 1936 with 1935, it must be remembered that in 1935, as I pointed out to you last year, we had the advantage of exceptional traffics in connection with the Silver Jubilee Celebrations and the Ardhodaya Yoga Festival, which is only held once in 25 years. Both these attractions brought many people into Calcutta.

I am glad to be able to inform those of you who do not follow our weekly published returns that our gross receipts for the current year up to date show an encouraging increase over those of 1936.

The Chairman then explained the Board's policy for replacing old rolling stock and dealt at some length with the trolley-bus question in Calcutta.

The report and accounts were unanimously adopted, and a final dividend on the ordinary shares of 5 per cent., less income tax, making with the interim dividend already paid a total dividend of 8 per cent., was approved.

INDIAN COPPER CORPORATION, LIMITED

DIVIDEND AGAIN INCREASED

The thirteenth ordinary general meeting of this company was held, on the 10th instant, in London.

Sir Godfrey B. H. Fell, K.C.I.E., C.S.I. (chairman and managing director) said that the disposable balance was £82,999, comparing with £77,564 a year ago. The final dividend proposed, at the rate of 7½ per cent., making a total dividend for the year of 12½ per cent., would absorb £61,866, and the board proposed to carry forward the balance of £21,133 to the next account. He hoped shareholders would approve a cautious policy in the matter of distribution of dividends. For 1933 they had paid a maiden dividend of 2½ per cent. For 1934 they had paid 7½ per cent., and for 1935 10 per cent. He hoped that each year might see conditions improve and thus enable them to continue the steady arithmetical progression.

Development during 1936 at Mosaboni was somewhat disappointing, especially as regarded the extent and value of the payable footage. At Dhobani development, on the other hand, was good.

Ore reserves were computed by Mr Woakes to total, at Mosaboni and Dhobani, 949,175 short tons of 2.97 per cent. grade, with a copper content of 28,225 short tons. While the estimated tonnage of ore was practically the same as a year ago, the estimated copper content was somewhat less.

Mining costs showed a reduction of over 10 per cent. as compared with the previous year. The average grade of ore milled was the same as in 1935, namely 2.45 per cent. It now paid them to lower the average grade, having regard to the higher price of copper, so that they might expect to see a rather lower figure for 1937. The mill and rolling mill had again operated with great efficiency.

He was glad to say that during the second half of the year market conditions had improved greatly, with the result that they found themselves at the end of the year with stocks of yellow metal about 430 tons lower than at the beginning. They had sold altogether 8,286 tons of yellow metal sheets and 1,910 tons of circles, in addition to 808 tons of refined copper.

FLUCTUATIONS IN PRICE

Last year he had ventured to prophesy that, if and when equilibrium was reached between production and consumption, they might safely anticipate that the resultant stabilisation of price would be at a much lower level than had prevailed up to 1930. It was, he thought, clear that equilibrium had not yet been reached. If it had, they would not see standard copper, which last year rose in price from a low of about £34 10s. to a high of about £49 8s., reaching so high a figure in the first three months of this year as £79. Latterly, in common with that of other base metals, the price had fallen considerably. Looking at the matter from the point of view of the best interests of the company, they welcomed the fall and would not be sorry to see the world price still lower. Excessive prices checked consumption and were therefore bad for their trade.

It was the usual practice at their annual general meetings to say something about the progress of operations during the current financial year. During the first three months the output had amounted to 1,835 long tons of copper and 2,379 long tons of first-class yellow metal sheets. Those figures closely approximated to those of the corresponding period in 1936, and were quite satisfactory having regard to the fact that the grade of ore had been deliberately lowered, as he had explained. Development was being actively pushed on and a new area, at Surda, some four miles north-west of the Mosaboni mine, was being prospected.

He trusted that shareholders would regard the results of the year's operations as satisfactory. Profits had increased, although sales of yellow metal sheets and circles combined were over 600 tons lower than in the previous year. That reduction in the tonnage sold was compensated for in part by reduced operating costs, for which great credit was due to the general manager and his staff, and in part by the higher prices realised for their products. Actually, the effect of the increase in the world price of copper, which had lately been so marked, had hardly made itself felt during the year under review. They had received on the average only £2 13s. a ton more for their copper ingot in 1936 than they did in 1935, and £3 2s. 7d. and £2 19s. 2d. more for their yellow metal sheets and circles respectively. The prices obtained for those products sold during the current year were, of course, higher.

The report and accounts were unanimously adopted.

SELECTION TRUST, LIMITED

LARGE INCREASE IN PROFIT

The annual meeting of Selection Trust, Limited, was held, on the 7th instant, at 20 Aldermanbury, London.

Mr A. Chester Beatty (the chairman), in the course of his speech, said: The net profit for the year of £434,000 compares with £119,000 in 1935. Our receipts from dividends and interest were higher, but the greater part of the increased revenue arose from profits on the realisation of investments.

After adding to the profit the balance from last year, and making certain reserves, including provision for income tax on profits for 1936, there is an available balance £397,511. Out of this sum the directors recommend the distribution of £234,293 by the payment of a dividend of 1s. per share and a bonus of 6d. per share, both less income tax at 4s. 5d. in the £, leaving £163,218 to be carried forward.

The balance sheet shows assets totalling about £3,927,000, of which cash and debtors represent £980,000, and investments at book valuation stand at £2,947,000. The current market valuation of the quoted investments is very largely in excess of the figure at which they appear in the balance sheet.

N.D.C. TAX

The proposals of the Chancellor of the Exchequer for the levy of a National Defence Contribution caused serious apprehension to the directors of the mining companies with which we are directly connected. We believe, however, that the Government appreciates the peculiar characteristics and inherent risks of the mining business, which call for special consideration, especially in the case of mines situated in the British colonies or elsewhere abroad.

These companies have spent very large sums and taken considerable risks in developing mines which have taken many years to bring to fruition. The imposition of a tax in the form originally proposed upon companies which happen to be domiciled in the United Kingdom, but whose operations are mainly abroad, would be, in many cases, a very great hardship.

The companies are, I am sure, prepared to bear their fair share of the cost of National Defence, but I trust, indeed I feel confident, that they will be called upon to do so only in a way which is equitable and fair, and which will not discourage enterprise or tend to divert business from this country.

Reviewing broadly the results of the companies in which we are mainly interested, we find that all those in the profit-earning stage show a marked increase in revenue and a general improvement in their financial positions.

Two of the companies, Roan Antelope Copper Mines, Limited, and Mufulira Copper Mines, Limited, have been able to arrange recently for the early redemption of the whole of their outstanding debenture issues out of the proceeds of share capital issues. We regard it as prudent policy that they should thus strengthen their financial structure by freeing themselves from fixed charges. All the operating companies continue to follow a progressive policy, and to maintain a high standard of efficiency.

THE CURRENT YEAR

In conclusion, while, of course, we cannot foresee what profits will arise from the realisation of investments for the current year, our income from dividends should show a further increase. The companies which have formed our past sources of revenue are earning increased profits, and we have now commenced to receive a return on our large investment in the American Metal Company. I consider, therefore, that we may look forward with confidence to the future course of our business.

The report and accounts were unanimously adopted.

Our Information Service

The Intelligence Branch of *The Economist* has been enlarged to meet the growing demand for economic and statistical information. The Department has been able to secure the services of a number of experts, and is prepared to supply information and reports on any branch of industry and finance as well as on international relations at a fee proportionate to the work involved.

A special feature of the Department is the preparation of regular or occasional reports, on request, for business men and industrialists anxious to keep abreast of all developments which may affect their branch of activity.

Enquiries should be addressed to the
Intelligence Branch, THE ECONOMIST
8 Bouverie Street, London, E.C.4

COMMERCIAL UNION ASSURANCE COMPANY, LIMITED

ANOTHER SUCCESSFUL YEAR

RECORD NEW LIFE BUSINESS

MR HERBERT LEWIS'S ADDRESS

The seventy-fifth annual general meeting of the Commercial Union Assurance Company, Limited, was held, on the 10th instant, at the registered office of the company, 24 Cornhill, London.

Mr Herbert Lewis, chairman of the company, in the course of his speech, said:—Before proceeding to review the accounts I would call your attention to the fact that this annual meeting is noteworthy as being the seventy-fifth of the series. We may congratulate ourselves, therefore, on having carried on our business with no inconsiderable success during three-quarters of a century. I hope that some of you will be present at the centenary meeting, although that is a pleasure which I, and I fear some of my colleagues, will hardly be able to share.

FIRE DEPARTMENT

I will now deal with the accounts, taking them in the order in which they appear in the document before you, the first being that of the fire department. You will be pleased to note that the operations of this department have again proved satisfactory.

The premium income at £5,308,412 shows some expansion both at home and abroad. The actual increase as shown in the account is £41,963 and would have been considerably larger but for the effect of the depreciation of various European currencies. We have also lost a considerable and profitable business which for many years we carried on in Mexico. Recent legislation in that country has imposed such onerous requirements upon insurance companies that we, in common with other offices, did not feel justified in complying with them, and our business there has been discontinued.

Losses amounted to 40.18 per cent. of the premium income, a ratio only slightly in excess of the record figure of 39.20 per cent. in 1935. Our experience, particularly at home and in the United States, the loss ratio has again been unusually low, although somewhat higher than in the previous year. We can hardly expect the indefinite continuance of this experience in America, particularly as the recent favourable experience has already caused substantial reductions in rates of premiums.

Once again, the fire department has not been involved in any serious disaster, but the unhappy events in Spain have resulted in considerable dislocation of our business in that country, where we have been working for over half a century. The net result is an underwriting profit of £487,681, of which £475,000 has been transferred to profit and loss and the balance added to the additional reserve of the department, thus bringing the fire fund to £6,963,934, or 131 per cent. of the premium income.

MARINE DEPARTMENT

The net premiums are £609,516, an increase on the previous year of £24,581. The claims paid and outstanding amount to £356,221 and the sum of £100,000 has been transferred to profit and loss account, leaving the marine fund at £1,203,207, or 197 per cent. of the premium income. The increase in premium income is chiefly accounted for by improved conditions in America, in-creased values of commodities and to some extent by war risk premiums.

I regret to say that the fall in rates on hulls has continued throughout most of the year owing to lack of co-operation among underwriters, and the outlook for business written during that time is not favourable. I am glad, however, to be able to report that since the turn of the year there has been an improvement in the position. The rapidly increasing values of tonnage, accompanied by considerable increases in the cost of repairs throughout the world, has brought underwriters together, with the result that an agreement to stop reductions in rates has been reached. Already increases are being obtained.

In my opinion, the market is in a healthier and firmer condition than it has been for some years past, although much remains to be done to put the business on a satisfactory footing.

There are no signs, I am sorry to say, of the cessation of reductions in cargo rates, nor does it seem likely that any satisfactory agreement can be reached.

While, as I have said, there are some hopeful signs in the marine market, I would point out that any improvement which may be brought about will take time to become apparent in our figures,

and I again emphasise our belief that marine business is not likely to show too good results in the immediate future.

ACCIDENT DEPARTMENT

The total premium income amounted to £7,641,952—an increase of £32,485. Our business increased in most parts of the world—notably at home. There was a decrease in the United States and exchange variations elsewhere brought about a reduction in our sterling figures.

Claims paid and outstanding amounted to £4,035,258, and, after providing the usual reserve for unexpired risk, there is a profit of £425,023, or 5.56 per cent. of the premium income. This is a moderate ratio of profit but may be considered satisfactory having regard to the wide range of the operations of the department—including a considerable volume of business in America.

A year ago I made reference to the unprofitable results of the American business. I said that the results for 1935 had improved considerably and expressed the hope that the account in 1936 might yield a profit. You will be pleased to hear that that hope has been fulfilled and a satisfactory profit was earned upon this important section of our accident account.

The home business shows satisfactory expansion in all classes, and this may also be said of our business in most places abroad. In some countries the prevailing conditions are distinctly unfavourable, but these are being carefully watched.

From the revenue account of this department the sum of £325,000 has been transferred to profit and loss, leaving the accident fund at £5,671,330, or 74 per cent. of the premium income.

LIFE DEPARTMENT

In 1936 conditions in this country continued to be favourable for the development of new life business and we have secured our full share of the increase. The net new sums assured in 1936 amounted to £5,533,211, an increase of £413,308 over 1935, and a record total for the third year in succession.

The premium income advanced by £53,402 from £1,796,114 to £1,849,516. This is in spite of a fall of £40,445 in single premiums, a class of business which we do not encourage under present financial conditions. We also received £461,407 as consideration for annuities, a reduction of £15,597 compared with 1935.

The interest income, after deduction of income tax, was £956,855, an increase of £4,514. The net rate earned, after deduction of tax, fell from £4 2s. 11d. per cent. in 1935 to £3 19s. 3d. per cent. in 1936. This fall is due partly to increased income tax, and partly to the low rate of interest now obtainable on new investments which we regard as suitable for the life fund.

The claims by death amounted to £564,947, an increase of £147,464 as compared with 1935, when they were exceptionally light. They represent 91 per cent. of the amount expected according to the A 1924-1929 table, which is derived from the recent experience of the English and Scottish life offices—a satisfactory result, even if not so favourable as in 1935.

There is a small increase of £8,328 in the expenses, including commission. Expressed as a percentage of the premiums, the expenses, including commission, amounted to 12.84 per cent. in 1936, compared with 12.75 per cent. in 1935. This is a moderate rate, and the increase is small in relation to the larger amount of new business transacted.

LIFE FUND EXCEEDS £25,000,000

During 1936 the amount of the life fund increased by £1,269,563, and at the end of the year exceeded £25,000,000. There has been a substantial appreciation in the market value of the assets of the fund above the value at which they stand in our books. This appreciation is not brought into account, and as at the present time it amounts to over £2,500,000, it furnishes a substantial buffer against possible future depreciation.

The next quinquennial valuation of the Commercial Union life fund will be made as at December 31, 1937. Assuming that we do not in the meantime encounter any major catastrophe, there is every prospect of a favourable distribution of profits. We are continuing to pay interim bonuses at the full rate declared at our last valuation, on all participating policies which become claims this year by death or survival, and on which no bonuses have been surrendered.

As I remarked at the outset, we have overcome the difficulties which have presented themselves during seventy-five years, and I trust that with care and prudence and by maintaining our organisation at a high pitch of efficiency we shall be able to meet successfully those which may present themselves in the future.

The report and accounts were unanimously adopted, and a final dividend of 4s. per share, making 8s. per share, less tax, was approved.

Movement, September 21, 1931 (gold standard suspended) to May 13, 1937 (inclusive) £181,973,324 in

GOLD MARKET

Messrs. Samuel Montagu and Company write on May 13, 1937:—
The Bank of England gold reserve against notes on May 5, 1937, was £313,661,924. This week's return will show a substantial increase as on May 11th the Bank announced the purchase of £4,999,886 in bar gold. This purchase, which was presumably made from the Exchange Equalisation Account, was the first of importance since the £65 millions acquired last December. In the open market the amount of gold available at the fixing during the period May 6th-11th, inclusive, was £1,800,000. Offerings were again mostly taken for shipment to New York, but prices continued to rule well below dollar parity. The s.s. "Strathaird," which sailed from Bombay on May 8th carries gold to the value of about £285,000.

SILVER MARKET

A steady tone has been maintained during the past week. Further buying by the Indian Bazaars was met by sales on China account and speculative re-sales, prices showing very little movement, the cash quotation varying only between 20½d. and 20¾d., and that for two months between 20¾d. and 20½d. Owing to the small demand for spot silver, the discount on that delivery increased to ½d. on the 10th instant, but moved back to ¼d. on the following day. The undertone of the market is steady, and no wide movements are expected in the immediate future.

Quotations for gold and silver are shown below:—

1937	Price of Gold per Fine Ounce	Equivalent Value of £ sterling	Price of Bar Silver in London per ounce standard	Price of Silver New York per ounce -699 fine
			Cash	Two Months
May 6	140 8½	12 0-90	20½	20½
" 7	140 8	12 0-95	20½	20½
" 8	140 8½	12 0-90	20½	20½
" 10	140 9	12 0-86	20½	20½
" 11	140 7	12 1-03	20½	20½
" 12			Market Closed	
Average	140 8-20	12 0-93	20-387	20-462
May 13	140 5½	12 1-16	20½	20½

The highest rate of exchange on New York recorded during the period from May 6th to 11th was \$4-94½, and the lowest \$4-93½.

SHORTER COMPANY COMMENTS

COMPANY RESULTS OF THE WEEK.—This week another business controlled by the Distillers Company reports substantial improvement, BUCHANAN-DEWAR earnings being £1,009,370 against £866,692. CHARRINGTON AND COMPANY are increasing their dividend by 1 per cent. to 14 per cent. Somewhat stationary conditions in the textile trades are implied by the net earnings of BRITISH COTTON AND WOOL, almost unchanged at £100,301, though VANTONA TEXTILES have converted a loss into a profit of £17,844. E. K. COLE, LTD., who in July last inaugurated a policy of selling direct to retailers, have earned £110,026 for 10 months, against £204,842 for a year; the number of receivers increased, but the accounts reflect the reduced profit margins. BRITISH MATCH CORPORATION earnings of £474,129 represent a small improvement, the dividend being maintained at 7½ per cent. A consolidated balance sheet is published by GOODLASS, WALL AND LEAD INDUSTRIES, who are paying 7 per cent. against 6 per cent., with profits of £195,487. The first accounts of MELLOWES AND COMPANY show a profit of £59,750, a 25 per cent. dividend being paid. Another company whose profits are affected by rising costs is SMITH'S POTATO CRISPS, with earnings of £98,980 comparing with £107,549, despite a record level of sales. EVER READY COMPANY report a satisfactory improvement in earnings from £482,780 to £527,333, and are increasing their dividend from 35 per cent. to 45 per cent. All intangible assets of both the parent and the subsidiary companies have now been written off from £533,815 share premiums and transfers from reserve of £577,553. The balance sheet and the reserve account show that the company's

† Free of income tax. (x) Nine months. (v) Ten months.

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

IN view of the Coronation festivities and the approaching Whitsun holidays, business on the commodity markets was not very active this week, while the general trend of quotations was downwards.

The market in non-ferrous metals was characterised by lack of interest among buyers, and quotations for copper, lead, spelter and tin all drifted downwards. Rumours of negotiations in New York with a view to re-introducing output restrictions on copper failed to stem the decline in the price of this metal. Linseed oil and rubber were only slightly dearer than a week ago. Among textile raw materials, American cotton suffered a decline in price. The market in coal, on the other hand, remained firm, while the recent advance in quotations for iron and steel materials failed to check the pressure of demand.

Raw sugar prices, exceptionally, rose sharply on the publication of the terms of the export regulation scheme, negotiated at the Conference in London. Wheat prices tended to sag. Beef and mutton were steady, but bacon and butter were marked down a little.

In the United States, too, the general trend of prices was downwards. Moody's index of staple commodity prices (December 31, 1931 = 100) stood at 204.5 on Wednesday, (May 12th, against 209.3 a week ago, 219.5 a month ago, and 162.7 a year ago.

COAL

SHEFFIELD.—Export demand continues strong. Inquiries from the Continent extend to the end of the year. Prices are higher than for some years. The mining dispute has revived the immediate demand for house-hold coal. Requirements of all classes of industrial fuel are very heavy. Coke ovens are working to capacity. The price of large coke for Sheffield works and graded qualities for industrial use and central heating have risen by as much as 10s. per ton on last year's price. Sized and small coal is scarce.

NEWCASTLE-ON-TYNE.—Tyne coal and coke shipments, which are always an index to the North East coal trade, are now showing an improvement compared with last year, the increase to date being 57,000 tons. During the last week there has been less inquiry from abroad, but the market retains full strength for all classes of coal. Northumberland steam collieries are fully stemmed and have little free coal for this year, whilst in Durham the insistent home trade can always absorb any surplus.

GLASGOW.—Firm conditions continue in the Scottish coal market. Demand practically all round is brisk, and while some slight change in its direction results from the advance of the season there is little question of any surplus fuel to meet new inquiry. With the Baltic season now opening, shipping prospects remain bright, and there is no falling off in coastwise or Irish business. Industrial takings remain on an active scale, and here also the outlook is good. House coal tends to lag a little, but as yet

(Continued from page 430)

goodwill, etc., of £227,721 has been entirely written off, while £883,647 has been used for similar purposes for the subsidiaries. Again remarkable progress has been made by PRESSED STEEL COMPANY, whose profits of £270,962 are almost 50 per cent. higher. The 22½ per cent. tax-free dividend is the first paid, though 35½ per cent. was earned for the equity dividend in 1935. A 6 per cent. dividend is being paid by AMALGAMATED COLLIERIES OF SOUTH AFRICA, whose first report discloses net earnings of £192,090. PHILLIPS AND POWIS AIRCRAFT have increased to appointed the market, as the 1935 loss of £20,236 has been increased to £31,586. Rubber results show no change in previous satisfactory trends: KEPPONG (MALAY), for instance, have earned £81,012 against £24,632. Tea reports in most cases indicate some improvement. STANDARD OF CEYLON profits of £32,057 are unchanged, but many of the smaller HOLDINGS and MID-EUROPEAN CORPORATION have made roughly the same profits as before, each company maintaining its 3 per cent. dividend. Some of the trust results indicate a sharper rate of recovery, INDUSTRIAL AND GENERAL and LAKE VIEW INVESTMENT being among the more important companies showing this trend.

RAILWAYS

URUGUAY RAILWAYS.—Under the Scheme described in a note on page 4

MIDDLESBROUGH.—Users of hematite pig iron and steel are prepared to follow the recent rise in prices, and, whilst they are anxious to cover their requirements for some time ahead, makers, who are having difficulty in fulfilling their current obligations, are not too keen to increase their commitments yet. There is only one furnace producing Cleveland foundry pig iron in this area, the production of which, after supplying maker's own requirements, is rationed to consumers. Business for forward delivery is held up as no official announcement has been made regarding the new price of this grade of iron. The demand for East Coast mixed numbers hematite is very strong and makers have no difficulty in securing the new price of 122s. 6d. per ton, delivered locally. Steel production continues to increase where possible, but is not yet sufficient to satisfy all demands.

Further shipbuilding orders continue to be received and one local yard has secured the contract for two big oil tankers. The increased production of blast-furnace coke is readily absorbed and producers report a good demand at 35s. per ton, delivered at the furnaces. Scrap prices are unaltered with supplies not too freely available. Imports of foreign ore into the Tees continue to be well maintained, the quantity for the first 11 days of May being 56,487 tons, against 73,000 tons during the first 10 days of April.

GLASGOW.—There is a definite improvement in the tonnage of semis available for re-rollers this week, deliveries of several shipments of Continental material having been made. There is still a marked shortage, however, for stocks have been exhausted at all works. At the steel-making plants the situation is unchanged. Plants are running to capacity, but are still unable to meet the demands made on them. In no branch of the industry has the recent rise in prices affected demand. At the Clyde shipyards employment is increasing as work advances on the recently placed contracts. Many yards are exceedingly busy. There are a large number of tenders out at the moment and further contracts are expected despite increased costs.

CARDIFF.—For purely domestic reasons a few of the tinplate mills are idle this week, but generally speaking the industry is quite active, with current production at 73.31 per cent. of capacity. Shipments at Swansea last week totalled 10,345 tons, compared with 5,457 tons in the corresponding week last year, and stocks in warehouse and in vans were at the relatively low figure of 3,687 tons, against 5,657 tons a year ago. Prices are ruling at from 24s. 6d. to 25s. 6d. per basis box f.o.b., while quotations for sheets and steel bars are also unchanged at their recently increased figures.

OTHER METALS

COPPER.—Despite the reserve of consumers and holiday influences, prices are slightly firmer this week. The market was impressed by a sharp drop in home warehouse stocks last week.

Consumption of copper in this country rose from 60,000 tons in the first quarter of 1936 to 69,000 in the same period of this year according to the British Metal Corporation. Since this improvement in consumption was probably maintained until the middle of May, British consumers are likely to be short of supplies following the recent interruption of buying. Meanwhile, in the United States the market remains dull.

Sales on the London Metal Exchange: 2,050 tons on Monday, against 2,900 tons last week; 1,800 tons on Tuesday, against 2,100 tons last week; nil tons on Wednesday, against 2,600 tons last week. Domestic spot was quoted at 13.97½ cents per lb. in New York on Wednesday, against 14.02½ cents a week ago and 15.12½ cents a month ago. Tuesday's official closing price for standard cash in London was £60 15s. to £61 per ton, compared with £59 10s. to £59 15s. a week ago. Stocks of refined copper in British official warehouses at the end of last week, at 14,188 tons, showed a decrease of 4,581 tons, while stocks of rough copper, at 2,787 tons, were 280 tons larger.

LEAD AND SELLER.—Absence of buying support and a certain amount of hedge selling were responsible for a slightly easier tone in both lead and spelter. It is anticipated in market circles that more Spanish lead will be available shortly, or at least that the Spanish Government will pay some of its creditors with lead. Meanwhile, stocks of spelter in the United States fell by 4,272 to 13,911 short tons in April. The latter figure represents only about one week's requirements; but since American Consumers are well stocked the actual position is less tight than might be supposed from the statistics alone.

Sales of lead on the London Metal Exchange: 1,100 tons on Monday, against 2,400 tons last week; 900 tons on Tuesday, against 1,000 tons last week; nil tons on Wednesday, against 850 tons last week. The New York quotation on Wednesday was 6.00 cents per lb., against 6.00 cents a week ago and 6.00 cents a month ago. The official closing quotation in London for soft foreign for shipment during the current month was £23 10s. per ton, compared with £23 17s. 6d. last week.

Sales of spelter on the London Metal Exchange: 1,450 tons on Monday, against 2,000 tons last week; 1,300 tons on Tuesday, against 600 tons last week; nil tons on Wednesday, against 1,300 tons last week. Wednesday's quotation in East St. Louis was 6.75 cents per lb., against 6.75 cents the week before and 7.00 cents a month earlier. Tuesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £22 13s. 9d. per ton, against £23s. last week.

TIN.—Prices were lower in a featureless market. Nevertheless, the outlook appears promising and a resumption of normal buying would probably be followed by a price rise. It is reported that agreement has been reached between the Bolivian Government and the country's tin producers whereby tin production will be immediately increased; this agreement would appear to relate to the question of foreign exchange. In view of the fact that Bolivian producers are handicapped by shortage of labour and water, however, the importance of this agreement from the point of view of tin supplies should not be over-emphasised.

Sales of tin on the London Metal Exchange: 275 tons on Monday, against 325 tons last week; 200 tons on Tuesday, against 325 tons last week; nil tons on Wednesday, against 350 tons last week. The New York quotation on Wednesday was 54.75 cents per lb., against 55.37½ cents a week ago and 60.87½ cents a month ago. Tuesday's official closing quotation in London for standard cash was £247 15s. to £248 per ton, compared with £249 to £249 10s. a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 1,631 tons, a decrease of 150 tons on the week.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted on Tuesday at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was quoted at £15 12s. to £15 12s. 6d. per flask of 76 lb., the same as last week. Chinese antimony was quoted at £73 to £74 per ton, ex warehouse, as against £75 last week. Chinese wolfram for "May-June" shipment was quoted at 56s. to 58s. per unit, c.i.f., compared with 55s. to 57s. last week. Refined platinum was quoted on Tuesday at £11 5s. an ounce, as against £11 15s. last week.

TEXTILES

COTTON.—Manchester.—Business has not shown expansion, and numerous buyers have again been inclined to act with caution. Owing to their good order lists, spinners and manufacturers have been in a position to resist low offers. Rather wider fluctuations have occurred in raw cotton prices. More attention is now being paid to the weather reports from the American belt. Cables indicate beneficial rains in Texas; but the extent of the increase in acreage remains uncertain. According to some authorities, the labour question in the belt may have some effect on production.

In the American yarn market, the scarcity of certain counts and qualities tends to become more acute. During the last few days prices have been paid for the quick delivery of ring beams which show a substantial increase in profit margins since a month ago. Fresh business, however, has not been important. In Egyptian yarns buying has been patchy.

Some manufacturers of piece-goods have experienced a larger inquiry and in one or two directions there have been more serious attempts at transactions, but turnover has been limited. Customers abroad are undoubtedly refusing to pay practically the same prices for Lancashire goods as when American cotton in Liverpool was around 8.1. per lb. There is some irregularity in the engagements of producers, but most makers are very well sold. Moderate scattered sales have been booked for export and the home trade, but most manufacturers have not sold current production.

LANCASHIRE AND THE BUDGET.—Since the Budget was introduced an expert Committee of the Manchester Chamber of Commerce has investigated the N.D.C. proposals. This week a letter has been sent to the Chancellor of the Exchequer conveying the Chamber's views on the National Defence Contribution proposals. Sir Edward Rhodes, the President of the Chamber, in his communication, says: "The Manchester Chamber associated itself unequivocally with the principle that part of the financial burden occasioned by the programme of re-armament which circumstances have rendered necessary for this country, should be borne by a tax on the profits of trade and industry." The letter continues: "It appears to us, however, that this principle could better be carried into effect by a tax on trading profits in general, rather than by an attempt to isolate increased profits after the precedent of the Excess Profits Duty, with all its complexities and inequities." The National Defence Contribution proposals have also been considered by the Federation of Master Cotton Spinners' Associations. In an official statement it was announced that the Federation is of opinion that the money required could have been found in some other way and it has requested the Chancellor of the Exchequer to consider alternative methods of obtaining the desired revenue which will be more equitable.

WOOL.—Bradford.—The third series of Colonial sales came to a close after only eight selling days. The home trade was credited with purchasing 29,500 bales, and the Continent 26,000 bales, while 13,000 bales were carried forward. The slight setback in prices led to more withdrawals than seemed likely, largely because of the rather high selling limits fixed by owners. The final results left merinos on about the same level of prices as at the close of the March series, while crossbreds were mostly 5 to 7½ per cent. higher. The reception of the crossbred slipes on offer was a little disappointing, largely due to the spirit of reserve that has come over the woollen end of the textile trade. Generally speaking, however, the auctions were good and a spirit of confidence prevailed.

Turning to conditions in manufacturing centres, it is significant that a spirit of hesitancy and caution has spread throughout the textile industry of the West Riding, and markets here are very slack. It would seem as if for the time being prices have touched the peak, and instead of buying their hand, preferring to work off old contracts and await further developments. The statistical position of raw wool is sound, but since the Coronation the industry has been marking time and markets have assumed a quiet and unresponsive attitude. Prices are fairly steady, though it is possible to buy both merino and crossbred tops at a fraction below the recent highest point.

GRAIN MARKETS

WHEAT.—The Coronation holiday and the approaching Whitsun recess had a restrictive effect on business. This factor, coupled with some what bearish crop reports from North America, was responsible for an easier tone this week.

On Wednesday last, "May" futures were quoted in Chicago at 122½ cents per bushel, against 129½ cents the week before and 137½ cents a month ago. Quotations in London, Monday: No. 1 Northern Manitoba, ex ship, 51s. 9d. per 496 lbs., as against 51s. 9d. to 53s. a week ago, No. 2 Northern Manitoba, ex ship, 51s., as against 51s. 3d. to 52s. 6d. a week ago.

FLOUR.—Monday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 42s. per 280 lbs., as against 42s. 6d. a week ago; delivered inner London, 41s. 6d., as against 42s. a week ago. Manitoba patents, ex store, 40s., as against 39s. to 40s. 6d. a week ago. Australian, ex store, 33s. 9d. to 34s. 9d., as against 34s. to 35s. a week ago.

BARLEY.—Quotations per 448 lbs. in London on Monday were: "English feed," at farm, 35s. to 36s., as against 35s. to 36s. a week ago; "English malting," at farm, 38s. to 40s., as against 38s. to 40s. a week ago. Californian (new), ex ship, 49s. to 55s., as against 53s. 6d. a week ago.

OATS.—On Wednesday, "May" futures were quoted at 45½ cents a bushel in Chicago, against 49½ cents a week ago and 50½ cents last month. Quotations in London, Monday: "English black," at farm, 25s. to 27s. per 336 lbs., as against 26s. to 27s. a week ago; "English White," at farm, 25s. to 27s., as against 26s. to 27s. a week ago; mixed Canadian feed (Vancouver), landed, 26s. per 320 lbs., as against 25s. 6d. a week ago.

MAIZE.—"May" futures were quoted on Wednesday at 125½ cents per bushel in Chicago, against 132½ cents a week ago and 126½ cents last month. Quotations in London, Monday: "Plate," landed 28s. 3d. per 480 lbs., as against 27s. 6d. a week ago; "Plate," ex ship, 27s. 3d., as against 26s. 6d. a week ago; "Plate," April (new), 27s., as against 27s. a week ago.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1935-37:—

NEAREST FUTURE	Jan. 2, 1935	Dec. 31, 1935	May 13, 1936	Dec. 30, 1936	May 5, 1937	May 12, 1937
Winnipeg (No. 1, Manitoba) —Cents per 60 lb.	82½	84½	78	129	133½	(a)
Chicago (No. 2, Winter) —Cents per 60 lb.	98½	101½	93	135½	129½	122½

(a) Market closed.

The visible supply of wheat in Canada amounts to 72,230,000 bushels, against 75,675,000 bushels last week, and 109,107,000 bushels in the corresponding week last year.

SALES AND PRICES OF BRITISH CEREALS.—The following table gives the estimated sale of home-grown wheat during the harvest years 1933-34 to 1936-37:—

	1933-1934	1934-1935	1935-1936	1936-1937
Estimated sales of home-grown wheat—	Cwts.	Cwts.	Cwts.	Cwts.
1 week to May 8.....	148,199	206,783	205,608	140,650
36 weeks to May 8.....	9,660,931	12,091,339	12,070,860	9,566,771
Average price of English wheat per cwt.	s. d. 4 5	s. d. 5 4	s. d. 6 9	s. d. 9 10

The following is a statement showing the quantities sold and the average price of British cereals in the past two weeks, and for the corresponding weeks in each of the years from 1933 to 1936:—

Week ended	QUANTITIES SOLD			AVERAGE PRICE PER CWT.		
	Wheat	Barley	Oats	Wheat	Barley	Oats
May 6, 1933.....	Cwts. 118,663	Cwts. 44,497	Cwts. 19,061	s. d. 5 4	s. d. 6 6	s. d. 5 9
May 5, 1934.....	148,199	22,207	23,514	5 4	7 8	6 0
May 11, 1935.....	206,783	33,172	19,933	5 4	7 1	7 1
May 9, 1936.....	205,608	26,540	28,979	6 9	7 11	6 1
May 1, 1937.....	141,854	39,987	31,398	10 0	10 3	8 7
May 8, 1937.....	140,650	17,594	29,848	9 10	10 1	8 9

OTHER FOODS

BACON.—The market has been somewhat irregular this week. The official quotations (per cwt. for No. 1 Sizable) which formed the basis for dealings on the London Provision Exchange this week were: English, 90s. to 96s.; Canadian, 87s.; Danish, 95s.; against 92s. to 96s., 87s., and 95s. last week. Arrivals in London last week included: Danish, 14,497 bales; Canadian, 7,432; Dutch, 2,886; Lithuanian, 1,503; and Polish, 3,020; as against 15,111, 6,956, 3,064, 1,300 and 3,474 bales, respectively, in the previous week.

BUTTER.—Prices again eased on a quiet demand. Quotations (per cwt.) on the London Provision Exchange on Monday were: New Zealand, finest salted, 103s.; Australian, choicest salted, 102s. to 103s.; Danish, 110s.; compared with 104s., 103s., and 110s. to 112s. respectively a week ago.

CHEESE.—The market has again had a firm tone. Quotations (per cwt.) on the London Provision Exchange on Monday were as follows: English, finest farmers, 89s. to 96s.; Canadian, finest coloured, 76s. to 78s.; and New Zealand, finest coloured, 71s.; against 89s. to 96s., 76s. to 78s., and 70s., respectively, a week ago.

COCOA.—A further drop in prices has occurred this week. The spot quotation in New York on Wednesday was 8 cents per lb., as against 8½ cents per lb. last week. In London, on Tuesday last, good fermented new crop, Accra, "May-June," was quoted at 38s. per 50 kilos, c.i.f. Continent, against 40s. 6d. a week ago. Last week's movements of cocoa in London were as follows: Landed, 34,807 bags; delivered, for home consumption, 8,891 bags; exported, 202 bags; stocks, 300,125 bags, against 163,814 bags a year ago.

COFFEE.—The London spot market was quiet, but New York prices showed a firmer tendency. On Wednesday, Rio No. 7 (cash) was quoted at 9½ cents per lb. in New York, as compared with 9 cents per lb. last week and 9 cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, 39 cwt.; delivered, for home consumption, 121 cwt.; exports, nil; stocks, 1,972 cwt., against 11,415 a year ago. Central and other South American: Landed, 5,102 cwt.; delivered, for home consumption, 1,422 cwt.; exported, 658 cwt.; stocks, 116,622 cwt., against 127,283 last year. Other kinds: Landed, 2,004 cwt.; delivered, for home consumption, 3,295 cwt.; exported, 726 cwt.; stocks, 123,161 cwt., against 180,915 last year.

EGGS.—Prices were about unchanged in a quiet market. At Smithfield, on Tuesday, English (ordinary packing, Grade I, about 15-15½ lb.) realised 9s. 3d. to 9s. 9d. per 120, against 9s. 3d. to 9s. 9d. last week; while Danish (15½ lb.) made 8s. 6d. to 8s. 9d., as against 8s. 9d. to 9s. last week.

FRUIT.—Business at Covent Garden has been active, states *The Fruitgrower*, and prices generally maintain a satisfactory level. The

demand for apples continues active, but with very heavy imports, prices are generally a point easier. Pears remain a consistent trade and quotations show little variation. Large quantities of grapes are disposed of without difficulty and peaches meet a steady sale. English forced strawberries are steady at 6s. to 12s. per lb. Large arrivals of French and Italian cherries are showing better form and meeting a fair sale at the rather lower prices now ruling. Moderate supplies of Spanish apricots sell at 6s. to 10s. per crate. Reliable parcels of oranges are inquired for, but are somewhat scarce; plentiful supplies of grape fruit meet a better sale, while lemons remain short and dear.

MEAT.—A fair business was transacted at Smithfield and prices are about unchanged. On Tuesday last, Argentine chilled hindquarters were quoted at 3s. 10d. to 4s. 3d. per 8 lbs., as compared with 3s. 10d. to 4s. 2d. a week ago. New Zealand frozen mutton was 3s. 4d. to 4s. per 8 lbs., against 3s. 4d. to 4s. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 9,318 tons, an increase of 812 tons on the corresponding week last year.

PEPPER.—On Tuesday, Singapore white Muntok, spot, was quoted at 6d. per lb. in bond, against 6d. per lb. a week earlier. Black Lampong, spot, in bond, was quoted at 3d. per lb. sellers, compared with 3d. per lb. last week. Movements of pepper in London last week were as follows: Black, landed, 29 tons; delivered, 1 ton; stocks, 1,868, against 1,717 last year. White, landed, 89 tons; delivered, 57 tons; stocks, 11,936, compared with 12,344 a year ago.

RICE.—The spot price of Burma No. 2, cleaned, was 10s. per cwt. ex warehouse, on Tuesday, as compared with 10s. per cwt. a week ago. "May-June," in singles to Continent and U.K., was quoted at 9s. per cwt., against 9s. last week. Movements in London last week were as follows: Landed, 72 tons; delivered, 56 tons; stocks, 1,070 tons, against 1,216 a year ago.

SUGAR.—Raw sugar was a rather firmer market in London, but New York quotations were unchanged. The New York spot quotation was 3.45 cents on Wednesday, as compared with 3.45 cents per lb. last week and 3.45 cents per lb. a month ago. Tuesday's sales of raw sugar in London included "August" delivery at 6s. 5½d., against 6s. 2½d. to 6s. 3d. a week ago. Movements of raw sugar in public warehouses in London and Liverpool last week were as follows: Imports, 28,393 tons, against 13,431 in the previous week and 6,591 in the same week of 1936; deliveries, 30,039 tons, against 19,305 and 17,699 tons, respectively; stocks, 181,624 tons, against 183,270 and 193,415 tons, respectively.

TEA.—The following table shows the average prices (compiled by the Tea Brokers' Association) of tea sold in Mincing Lane on Garden Account in recent weeks:—

Week ended	Northern India	Southern India	Ceylon	Java	Sumatra	Africa	Total
May 7, 1936.....	d. 12.79	d. 14.09	d. 15.67	d. 11.02	d. 10.54	d. 11.69	d. 13.55
Apr. 8, 1937.....	14.99	16.03	17.67	15.64	13.26	14.22	15.65
Apr. 15, ".....	14.82	15.89	17.36	14.15	12.94	13.83	15.47
Apr. 22, ".....	14.79	16.38	17.36	14.81	13.08	13.98	15.68
Apr. 29, ".....	15.04	16.37	17.35	13.68	12.73	14.18	15.68
May 6, ".....	15.26	16.15	17.28	14.52	13.23	14.31	15.80

At this week's public auctions in Mincing Lane, 31,963 packages of Indian and 20,721 packages of Ceylon tea came up for disposal. Prices of Indian sorts advanced on a strong demand. Ceylon teas up to 1s. 3d. per lb. were also dearer; medium and fine broken Orange Pekoes were irregular and usually easier. Leaf grades, however, were dearer.

VEGETABLES.—Increasing supplies of tomatoes are now reaching Covent Garden, according to *The Fruitgrower*, and prices are consequently declining. Cucumbers and asparagus are also more plentiful, but demand is good and prices show little variation. House-grown beans are available in fair quantities and green peas are easier. Plentiful supplies of greenstuff are offered at lower rates, but Egyptian onions are doing a little better. Rhubarb is going out fairly well, but parsnips, carrots and turnips are a slow trade. New potatoes are a more active trade and Scilly Isles supplies are now arriving. The latter have been making 2d. to 4d. per lb. while Mataro are quoted at 26s. to 27s. per cwt. Meanwhile, old potatoes remain in demand at the various London markets at steady prices. On Tuesday, best siltland King Edward made 10s. to 11s. per cwt. at the Borough, the same as a week earlier.

MISCELLANEOUS COMMODITIES

VEGETABLE OILS AND OILSEEDS.—There is little disposition to trade and quiet conditions rule in most sections. Crushers of linseed, both here and elsewhere, are well supplied and have exhibited only desultory interest. But shippers in Argentina and India, fortified by a strong statistical position, have evinced little pressure to sell and the market is fairly steady. For Calcutta May-June loading £14 12s. 6d. per ton has been paid and Plate on passage to Hull has commanded over £13 per ton, plus duty. Shipments from the River Plate last week were 21,000 tons, the lowest figure for some weeks, bringing the total since January 1st up to 946,000 tons or rather more than two thirds of this season's estimated exportable surplus. The quantity afloat for Europe has now been reduced by substantial arrivals to 104,400 tons (including 14,100 tons from India) and that for the United States and Canada to 96,600 tons. America has made heavy demands upon the Plate crop this year. The extent of future purchases depends on the size of the domestic crop, the outlook for which is regarded as favourable.

Linseed oil made a good recovery from the recent set-back, but eased off again leaving a net gain of 20s. per ton from the lowest. Easier conditions are ruling in cottonseed after £9 paid for black Egyptian May-June loading. Demand for cotton oil, however, is only moderate, and prices remain without quotable change. The trade in oilcakes has fallen off with the coming of open weather.

RUBBER.—The market has had a firmer tone this week, and prices have recovered part of their recent fall. The spot price in New York on Wednesday was 21½ cents per lb., compared with 21½ cents per lb. a week ago and 22½ cents a month ago. Tuesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 10½d. per lb., as against 10½d. on the corresponding day last week. In forward positions, business has been done at 10½d. for "June" shipment, as against 10½d. a week ago. Stocks in London and Liverpool at the end of last week totalled 47,757 tons, against 48,687 tons a week earlier. A year ago stocks amounted to 136,716 tons.

WHOLESALE COMMODITY PRICES

of labour conditions in an attempt to discover where conflict can be avoided by preventive action. Trade unionism is so thoroughly accepted in this country that it comes as a shock to realise how small a proportion of British workers are actually enrolled in trade unions. There are roughly 19 million persons covered by National Health Insurance, and some 13 millions insured against unemployment. But the membership of unions affiliated to the Trades Union Congress in 1936 was only 3,615,000. It follows that there are many unorganised industries, especially among those which have been growing most rapidly. In some of these industries wages are low and conditions of work bad. In the road haulage industry, for example, a Departmental Committee has recently reported that wages are frequently "even lower than the minimum rates of wages fixed by trade boards" and that hours are "in nearly all cases . . . considerably in excess of the 48-hour week." Some other distributive trades have conditions almost as bad. In engineering, the workers have not had a proportionate share in the recent swelling prosperity which has come to many of the lighter branches of the industry. Women's wages are almost everywhere too low.

These are all cases in which no immediate remedy can be expected from trade union activity, for organisation must precede action. It may be suggested that a more direct method would be that made possible by the Trade Boards Act of 1909, which was instrumental in the years just before and after the war in considerably improving conditions in sweated industries.

Sweated industries, however, are exceptional, though by no means non-existent, even to-day; and the Trade Board method is not applicable to industry as a whole. There the worker turns to the trade unions, and it is from them that the greater part of the pressure for improved conditions—and, incidentally, for greater effi-

ency—will come. On the whole, this pressure is to be welcomed, for its results in raising the standard of living usually outweigh the disturbance it creates. Collective bargaining is accepted in this country—indeed, it is hardly questioned in principle—and many of the most progressive industries welcome it as a factor making for order and stability. Even those employers who regard it as a necessary evil are inclined to rank the necessity above the evil. For the public at large, trade union collaboration in the settlement of working conditions accords with the growing belief that industry is fundamentally a co-operative process of partnership rather than an exclusive concern of proprietors or an anti-social exploitation.

This acceptance of trade unionism's central contention, however, carries with it certain obligations on organised labour. One is the duty to exercise a wise discrimination in using, or threatening to use, the ultimate weapon of the strike. It should remain in reserve for employment, in important cases, when all other means of settlement have been exhausted. There is also an obligation on the rank and file to observe the necessary discipline. The mechanism of the unions is rightly democratic. But it is not true democracy for the rank and file to empower leaders to make agreements and then to repudiate them.

There have been disturbing indications recently that both these truths are being forgotten. Both in the London bus strike and in the coal dispute the rank and file have overruled the leaders. In both, the strike weapon has been unsheathed with more haste than can be justified. It is important that these methods should not be further pursued. For if they are, what might be a beneficial period of labour advance may be converted into a series of unnecessarily bitter conflicts. That would be bad for the prestige of the democratic system. It would be even worse for trade unionism.

The Austrian Portent

THE comings and goings, both along and about the Rome-Berlin axis, have brought Austria's destiny once more into the forefront of European events. No one, save the chief protagonists, knows what rôle SIGNOR MUSSOLINI, HERR HITLER, GENERAL GOERING, DR VON SCHUSCHNIGG and COUNT CIANO between them during the last few weeks have reserved for that small but important country. Least of all, perhaps, have the Austrians themselves any clear idea in what political direction they wish to go, or whither they are being led. Does their destiny lie in Rome or in Berlin? Between the two, or beyond both?

This may explain the many irreconcilable opinions now being voiced in Vienna. One Austrian will assure the foreign observer that the present political regime is the old Austria come to life again, while another will warn him that it is no more than a crust on the surface of the lava in the crater of a volcano which is just getting ready to erupt. Perhaps the greatest disagreement of all is over the problem of what has happened to the former adherents of the Austrian Social-Democratic Party. Have they stayed Marxist? Have they turned Nazi? Have they drifted back into the fold of the Church? Tracking down the vanished Austrian Social-Democrat is as elusive a quest as hunting the snark, or the slipper, or the pre-war English Liberal vote. On all those questions, views are legion.

But there is one point on which these discordant voices speak in chorus. They all agree that the fate of Austria depends on the policy of England and France; and on this question there is only a difference of desire, without any difference of conviction. There is a minority of

Austrian Pan-Germans and Nazis who do not want the Western Powers to take a more active line because they wish for an *Anschluss*, or at any rate for a *Gleichschaltung*. There are other Austrians who hope to see England and France restrain the German and Italian icebergs from crushing between them the Austrian cockleshell; and these Austrians whose eyes are turned westward are probably in a majority, since they seem to include those who take no other interest in politics, as well as the politically conscious supporters of the Vaterländische Front. But the minority who set no store by Anglo-French intervention agree with the majority who place their hopes in it in believing that this Western question—and not any local play of forces—is the issue which will be decisive for Austria's destiny.

Whatever an Englishman or a Frenchman may think about this Austrian belief, he will soon find that the Austrians are not alone in holding it. If he talks to a Pole, a Hungarian or a Yugoslav, he will encounter virtually the same point of view. The truth seems to be that (perhaps with the exception of Czechoslovakia) all these lesser States that lie in the arena between Germany, Italy, and Russia have now resigned themselves to the idea that they cannot expect to be masters of their own fate. Their future will depend upon the relations between the Great Powers that overshadow them. If the Western Powers show themselves determined to prevent the Central Powers from achieving their ambition to make Central and Eastern Europe revolve round the Berlin-Rome axis, then the Central and East-European States may pluck up the courage to fight for their lives under Anglo-French leadership. But if the Western Powers

make up their minds to abandon Central and Eastern Europe to a German hegemony, then these small countries will accept the inevitable. Perhaps Czechoslovakia might put up a strong fight which would ultimately involve the whole delicate structure of Europe; but the majority of her neighbours have no stomach for self-immolation. If they are to lose their liberty, they prefer to lose it quietly rather than to lose their life as well. That is the lesson which they have learnt from the story of Abyssinia.

Undesignedly, yet not the less effectively, such an acceptance of a German hegemony would be the smaller States' revenge upon the Western Powers for having left them in the lurch. For if it be true that the destiny of Austria or Poland depends on the policy of London and Paris, is it not perhaps equally true that the destiny of France and Great Britain depends no less directly upon what happens to Central and Eastern Europe? These small countries may be right in thinking that they are nothing in themselves. But Germany might also not be wrong in thinking that, in her hands, they would be capable of making history by giving Germany a decisive superiority over her Western rivals. At present the smaller countries are all frankly temporising, and one shrewd observer from a Viennese watch tower declares that the shifts in the policy of Poland, Austria and the Little Entente States are a surer index of the state of health of England and France than any news that comes to him direct from those two Western countries.

Austria has to temporise with the rest. She cannot break away from Italy and Germany. The utmost she can do is to refuse to be drawn into an anti-Western front. With her living memories of her own rôle as a Great Power, she probably feels even more distaste than her successor-states feel for the rôle that all alike are now being compelled to play. But one cannot be guided by one's taste when one is in constant peril of one's life and when one cannot count upon any helping hand to throw a life line if one's cockle-boat is stove in.

This necessity to temporise is perhaps the hardest test of the character of the lonely man who now has the government of Austria in his hands—or, should one rather say, on his shoulders, which are manfully bearing this burden of Atlas. DR VON SCHUSCHNIGG is a man

who is convinced of his mission and is dedicated to it. He does not glory in it; he submits to it. It is not for him an intoxicating fulfilment of his personality; it is a heavy cross. And one may guess that, in the BUNDESKANZLER'S own mind, the criterion of success in his task is not an outward one. No doubt he faces the fact that the Vaterländische Front might be broken by the impact of external forces which it would be quite beyond his own power to control, and that his personal career might end in the same fashion as that of his predecessor DR DOLLFUSS. These possibilities probably do not dismay him. It is enough for him to do his duty as a good and faithful servant.

If this diagnosis of DR VON SCHUSCHNIGG comes anywhere near the mark, it means that he is one of the most formidable statesmen in Europe. A nation composed of six million Schuschniggs would be invincible. But that raises the question: Is SCHUSCHNIGG or HITLER the typical Austrian? HITLER, with his artistic temperament, bears the greater resemblance to the stage Austrian who plays his mercurial rôle in the imagination of the foreigner. But then nations have a way of making up caricatures of themselves for export. And perhaps the Austrian statesman who has stuck to his post in Vienna, instead of making a profitable Hegira to Berlin, is, after all, not so un-Austrian as he would appear to be in foreign eyes. DR VON SCHUSCHNIGG puzzles the foreigner because we are unused to finding men of this austere ascetic type in the rôle of Austrian—or, for that matter, British—politicians.

Perhaps, then, it is as a politician rather than as an Austrian that DR VON SCHUSCHNIGG is a portent. His freedom from HITLER'S shoddiness almost automatically deprives him of HITLER'S demagogic flair. Is he sufficiently in touch with the mass of his countrymen? His aloofness may be his Achilles' heel. Yet he has three very potent assets. He has behind him all the momentum of the Austrian tradition. He can console himself, if he should fail to win the hearts of the Social Democrats, with the knowledge that they greatly prefer his regime to the only now conceivable alternative. And last, but not least, he has his own character. An ascetic who is also a fighter may prove to be as much a match for the FÜHRER as for the DUCE.

A System for Saving

IN Great Britain, the cradle of the incongruous, we pride ourselves on a long and lively tradition of political thinking, and, in the same breath, on our entire emancipation from the tyranny of abstract doctrines. We work, consequently, in an environment of anomalies, and, on the whole, we thrive on it. But one disadvantage of the policy is that some of our most valuable anomalies obtain less than their meed of careful attention because they cannot readily be fitted into simple categories.

This condition certainly applies to the National Savings Movement, which is celebrating its twenty-first birthday this year. Its central organisation and part of its regional activity are financed by the State, but a great proportion of its work is done by some thousands of public-spirited private citizens. It has always enjoyed the warm support of all parties throughout its history. And it has the laudable object of encouraging, from a mainly altruistic motive, one particular virtue. The movement started in the War, as only one of many organisations called up to meet exceptional necessities in an exceptional manner. Founded on the recommendations of the Montagu Committee on War Loans for Small Investors, the National War Savings Committees (for there were two at first, which were quickly merged) set themselves

the twofold object of reducing individual spending and securing as much as possible of the money saved for the Government. To attain those ends, the National War Savings Movement enlisted an immense body of voluntary helpers, engaged upon a furious propaganda campaign and organised a host of War Savings Associations to purchase the newly instituted War Savings Certificates. It also ran special campaigns in support of the Five Per Cent. War Loan, War Bonds and Food Economy.

When the War ended, the movement, unlike most other novelties of the period, survived intact, on the recommendation of an official committee "impressed by the enormous potential increase in the number of small investors." To-day, after twenty-one years of development, its constitution is as follows. At the apex of the pyramid stands the National Savings Committee, a large body composed partly of members appointed by the Treasury, partly of representatives of various interested bodies and partly of delegates elected from the movement's voluntary workers. This Committee has a very strong Industrial Advisory Council to assist in one branch of its work. Beneath the national committee comes a voluntary organisation, composed of some 1,250

Local Savings Committees, each dealing with its own area, which in nearly all cases is the same as the local government area. These committees, whose personnel includes municipal leaders, teachers, social workers and other public spirited persons, supervise and encourage the local savings clubs (usually called National Savings Groups), the promotion of which is the *raison d'être* of the whole hierarchy. The National Savings Committee runs a London office, which has an official Civil Service staff of about 200 persons all told, and is financed directly by the Treasury. Under the office, in turn, are the twelve regions into which England and Wales are divided—Scotland has a separate organisation. Each region has a commissioner and a varying number of assistant commissioners. An annual conference is held in each region with delegates from each local committee, proportionate in number to the number of Savings Groups under its aegis. This conference elects the region's representative on the national committee. At county meetings (held in the course of the regional conferences) delegates are chosen for the National Savings Assembly, the annual parliament of the movement as a whole.

Thus, in this complex of private and public activity the streams of influence flow up and down with a nice division of forces. The opposite dangers of bureaucracy and amateurism are neatly escaped, and throughout its life the movement has consistently succeeded in adapting its methods with increasing skill to changing circumstances. A glance at its statistics reveals the changes with which it has had to contend. In the War period, under the spur of exceptional needs, the number of groups which it organised rose to 41,000. In the first flush of peace, when men and women attempted to restore pre-war modes of life, many groups died outright, and more first slept and then expired. By the beginning of 1923 the total had fallen to nearly 18,000. The greatest tribute to the movement's vitality is that this crisis was safely surmounted. In the following years, even in the worst period of slump, the number rose steadily. To-day it is back at 38,000, with a membership of about 1,250,000 persons actually enrolled in its groups.

The movement is now an established and prospering part of our national life. The rough figures available suggest that a high proportion of working-class saving is performed through its mechanism. What part of this is in any sense net, it is, of course, very hard to tell, but if we look at the details of group organisation, it is not impossible to make a reasonable guess.

Of the existing groups, three-fifths are in schools, and of the remainder about two-thirds are in places of employment, and one-third in social organisations, churches, mothers' unions, clubs and the like. The national committee suggests a diversity of different schemes for these different classes of savings groups, the Post Office Savings Bank, Trustee Savings Banks and National Savings Certificates being the media through which the movement works. The most elaborate schemes are naturally designed for places of employment. Under these schemes, the savings of the employees, with assistance from the employer, can be used to provide endowment and death benefit. Many simpler types of schemes are appropriate to schools and social organisations. The secretary of a group may simply bank the members' contributions, and distribute the money at the annual meeting, or, if any member so wishes, transfer it to his private savings account or buy savings certificates for him. Alternatively, a member may have a National Savings Stamp Book and buy stamps for it from the secretary; or he may have a Penny Savings Bank book in which his payments-in and his withdrawals can be recorded. One popular and ingenious scheme makes a mild appeal to the saver's gambling instinct. Each member of the group covenants to save so many sixpences a week for thirty weeks to obtain so many savings certi-

ificates. With the weekly revenue the secretary buys certificates, and a weekly ballot is held to decide in whose name these certificates shall be put. The least fortunate subscriber obtains his certificate as soon as he has completed his thirty weeks' saving. The remainder begin to earn their interest anything from one to twenty-nine weeks earlier.

The simplicity of these schemes, the places in which they work, and the literature which recommends them, suggest two conclusive facts. The motives for saving which are fostered are very general. The new savers save for the most part, not specifically to have money for holidays or Christmas festivities and so on, but because they are taught the merits of wise spending and the utility of possessing a reserve fund. The movement has affected national life mainly by raising the economic intelligence of those to whom economic wisdom is most important. And, secondly, the people directly affected comprise a large population untouched through most of their lives by similar movements. Of the school-children (and their parents) to whom the movement appeals, many probably learn to save throughout their working lives; and others, while ceasing to exercise communal thrift, doubtless continue to be careful spenders. As this has now gone on for more than two decades, and its effects are cumulative, its net result must have been enormous.

After this review of its works, it is scarcely necessary to give the movement a formal testimonial. But two criticisms are often heard which deserve mention. In the first place, the wisdom of saving on our present scale has been energetically attacked by some economists. And, moreover, the old objection to "taking money out of circulation"—singularly inapplicable though it be to loans to Government—is always ready to be hurled at advocates of personal economy. But the movement should surely lose no sleep over such questionings. The aggregate volume of savings in the three institutions mentioned is now not less than £1,371,800,000, and the annual increment is about £70 millions. But if we measure usefulness by the addition it makes to the welfare of the people who save it, it is obviously the most useful part of the nation's savings. If it should ever be desirable that we save less, there are other streams we can dam at a less direct cost and an equal indirect gain. Secondly, some well-intentioned people accuse the movement of having, consciously or unconsciously, a political effect. By cheaply assisting the poor man to have a stake in the country's capital, it is supposed to prevent his expressing resentment at the way he is treated by Capitalism. This contention seems singularly inept. If the stake is small—as in most cases it must be—the objection posits a remarkable potentiality for complacency: and if it is large enough to stifle discontent, who could honestly object to that?

All things considered, therefore, the case for defence and congratulation is fully established. Theory may huff and puff, but the structure is thoroughly windproof. His MAJESTY THE KING has called it one of the most beneficent influences in our national life. In 1926, four Prime Ministers and six Chancellors sent anniversary congratulations; this year, twenty-first birthday messages have come from leading figures in many branches of national life, including the PRIME MINISTER, the CHANCELLOR, the PRESIDENT OF THE FEDERATION OF BRITISH INDUSTRIES, the GOVERNOR OF THE BANK OF ENGLAND and the PRESIDENT OF THE NATIONAL UNION OF TEACHERS. In the Advisory Council under the Government's Physical Fitness legislation, and in some aspects of the Special Areas policy, the authorities have offered the National Savings Movement the sincerest form of flattery. And coming years will doubtless see more experiments in the combination of voluntary and official effort.

The Trend of Overseas Trade

CONTEMPORARY developments in Britain's overseas trade have much significance. A year ago our imports, measured both by volume and value, were rising faster than our exports. Between the first quarters of 1935 and 1936 imports increased by 12.3 per cent. in value and by 8.2 per cent. in volume, while British exports rose by only 0.6 per cent. in value and decreased by 0.6 per cent. in volume. More recently, these trends have been reversed. The value and volume of British exports between January and March this year, compared with those of the first three months of 1936, showed increases of 14½ per cent. and 10 per cent. respectively, while imports rose by 14½ per cent. in value but only by 2½ per cent. in volume. And, as will be seen from an analysis of our overseas trade in April, made on page 451, the tendency of exports to increase faster than imports is continuing.

Statistics of changes in the distribution of Britain's overseas trade between the first quarters of 1936 and 1937, published in the *Accounts Relating to Trade and Navigation* for April and analysed in the tables below, can best be read in the light of these general tendencies. During the upward phase of a trade cycle there is usually a time lag between increased imports of raw materials by industrial countries and exports of finished goods to primary producing countries. Heavier shipments of primary products are not immediately reflected in increased purchasing power, and time must necessarily elapse between placing and the completion of orders for

manufactured goods. In the past year, raw material producing countries have not only benefited from increased sales but also from the marked rise in prices. Since manufactured goods have not shown a corresponding price rise, primary producers have been able to obtain a greater volume of finished commodities in exchange for their exports of raw materials and crude foodstuffs. World recovery, moreover, is normally accompanied by an increase in trade in partly finished and finished goods between countries engaged mainly in the production of manufactures. In recent months the majority of industrial countries have made economic headway. But Britain's exports to them, though higher in most cases than a year ago, have inevitably been affected by the varying degree of recovery attained by, and the economic and financial policy of, each country.

The two charts overleaf show changes in the value of imports and exports during the first quarter of every year since 1929, and the distribution of our trade between Empire and foreign countries. Between 1929 and 1933, the proportion of our total imports purchased from the Empire, mainly in the form of raw materials and crude foodstuffs, rose from 32.1 per cent. to 38.8 per cent., largely owing to the reduction of British imports of manufactures during this period and to the diversion of trade after the 1932 tariff and Ottawa. Between the first quarters of 1933 and 1936, however, when Britain's imports of raw materials and of partly-finished and finished goods rose fairly rapidly, the

proportion of our total purchases taken from the Empire rose only slightly, from 38.8 per cent. to 40.7 per cent. Finally, the growing need for partly-finished and finished goods, due to the insufficiency of home production, was, very largely, responsible for the small decline of the Empire share in Britain's import trade, from 40.7 per cent. in the first quarter of 1936 to 40.1 per cent. in January-March, 1937.

In contrast to the trend of imports between 1929 and 1933, the proportion of Britain's exports consigned to the Empire declined from 45.1 per cent. to 44.0 per

I.—U.K. IMPORTS FROM BRITISH AND FOREIGN COUNTRIES

(First Quarter of each Year)

cent. Between 1933 and 1936, however, when the Empire countries, as a whole, recovered more rapidly than many other countries, the Imperial share of our export trade rose from 44 per cent. to 48.4 per cent. But, more recently, recovery has made rapid strides in other raw material producing and industrial countries. Consequently, the proportion of total British exports to the Empire, like imports from it, showed a decline, from 48.4 per cent. in January-March, 1936, to 47.2 per cent. in the first quarter of the current year.

While the trend of our trade was upwards in the case of most countries, the tables on the preceding page reveal striking differences between individual nations. While our imports from the Empire, for example, showed an increase of 13 per cent. between the first quarters of 1936 and 1937, our purchases of commodities (exclusive of gold) from South Africa actually declined by 17 per cent. The increase of 11½ per cent. in exports to British countries was smaller than the rise in imports from them, but it was more evenly distributed. A comparison of our imports from the Dominions in

the first quarter of 1929 with our purchases in January-March this year shows substantial increases in imports from Australia and Canada. Imports from the latter country, which sends us large quantities of wheat, metals and timber, rose by no less than 62 per cent. between 1929 and 1937 and by 21 per cent. during the past year. South Africa, enriched by her gold mines, purchased more commodities from us in the first quarter of 1937 than eight years ago, but Canada and Australia are still taking less from us than in the first quarter of 1929.

II.—U.K. EXPORTS TO BRITISH AND FOREIGN COUNTRIES

(First Quarter of each Year)

Changes in our trade with individual foreign countries are equally noteworthy. Our exports to the United States, for example, rose by no less than 30 per cent. between the first quarters of 1936 and 1937, while our purchases from that country actually showed a slight decline. The figures for France reveal a similar trend, but an opposite tendency is disclosed by our trade with the U.S.S.R., Turkey, Egypt, Chile and Peru. Imports from Argentina, again, rose by 72½ per cent., partly owing to higher prices for grain, wool and hides, but British sales to that country increased by only 9½ per cent. For crop-producing countries, however, a single quarter's figures may not be fully representative. Purchases from Germany, surprisingly, increased by only 1½ per cent., while British exports to that country rose by 9½ per cent.

Present indications point to a continuance of these trends during the next few months. The increasing purchasing power of raw material producing countries and the expansion of activity in industrialised nations are likely to stimulate international trade still further.

War on Land

FROM the time when wars began, the warrior has tended steadily to become less important than his weapons. This is not to belittle the quality of the human element in warfare. Indeed, quality, in many respects, is to-day more important than ever. Nevertheless, it is true in respect of both sheer physique and numbers. The military significances of these two factors have long been and are still being constantly reduced by the destructive inventiveness of mankind, by the exploitation of scientific discovery in order to equip armies with ever deadlier weapons.

In war on land—as in war on sea and, latterly, in the air—each new weapon of offence evokes a new weapon of defence. When flint axes and pebbles in slings formed the armoury of men, earthen ramparts like those of Maiden Castle, near Dorchester, could keep an attacking

army at bay. The collapse of the Roman Empire and of the Pax Romana in Europe ushered in a period of petty warring States and of walled cities and strongholds, until gunpowder destroyed what neither arrows nor rams could reduce. A long period of warfare in open country followed, when—apart from sieges, which followed ancient usage, with fortifications and redoubts—strategy and tactics decided which army should win the victory. The campaigns of Marlborough and Napoleon show this phase at its best: forced marches, quick dispositions, surprise movements—these are all more important than sheer numbers, as long as the weapons on both sides are the same.

In the middle of last century, the pace of invention began to tell on military science: the Prussian needle-gun defeated Austria at Sadowa, and France was both

out-maneuvred and under-equipped in Lorraine five years later. From then until to-day, the striking power of rifles, field-guns, howitzers, machine-guns and (latterly) tanks has been matched on the side of defence by a new science of fortification in ferro-concrete, by anti-tank guns, concrete machine-gun emplacements, etc. Hence the widely discussed conclusion of military scientists to-day, that war on land is tending more and more towards stalemate. "It was bad enough in the Great War," they say, "when hundreds of thousands of men fought from trenches, with gas and artillery and tanks and aircraft, for the possession of a few hundred yards of what had once been woodland; what will it be like next time?" Or, again: "The armies of the future will be like the workers of the future: machine-tenders. The machines will spit and snarl at each other, over no-man's-land, from impregnable emplacements." In such a context, *ils ne passeront pas* acquires a double-edged significance; for the so-called "war of attrition" will set in from the start. This means that the decisive factors in the war will emerge in other spheres than the strictly military: e.g. the psychology, morale, or nutrition of the civil populations; blockade—which is the old siege on a national scale; and national exhaustion of resources for warfare.

But this scepticism about a purely military decision is exaggerated. It is too facile as a general truth; though it may well hold good of a particular country which pushes its military preparations for war ahead so rapidly and so comprehensively that its endurance is endangered. Two recent developments in military science modify the conclusion that armies must quickly reach a position of stalemate. The first is the rapid transformation of armies into two parts: the old "battering-ram" army (like the mass of a navy), and the new—untried—highly mobile units. The second is the preparation and eventual utilisation of all the State's resources, human and material, for the purpose of surprise attack, without preliminaries of any kind save those which may make the surprise attack crushing and complete. To this end, industry, agriculture, men, women, and children, transport, houses, schools, ships, all are scheduled, recruited, and allocated to specific uses by the State, in time of peace for time of war. A State which simultaneously organises its armed forces on that basis and equips them with the finest available weapons disposes both of a formidable military force and also of an unparalleled war-machine behind it.

On the other hand, the surprise element in attack can be overestimated. Secret services have more, not less, means at their disposal to-day; and, with the growth in a modern attacking army's needs of mechanical and transport preparations, no government intent on sudden aggression could hope to keep its intentions unsuspected. The Ethiopian Government, as well as many military experts and diplomatic correspondents, drew attention to Italy's bellicose preparations a year before the attack was launched. Only foreign governments affected to ignore them. An army big enough to ensure sudden victory cannot be assembled by even a Great Power on the frontier of a smaller neighbour without evoking complete mobilisation beyond that frontier.

The crucial question in land warfare to-day is thus: How is the defence likely to stand up to initial assault of so formidable a character? And the second question, almost as crucial, follows: If defence is adequate, how will warfare on land develop?

The able and extremely well-informed military correspondent of *The Times*, Captain Liddell Hart, has observed in his recent book, "Europe in Arms," that the mechanisation of modern armies is proceeding so rapidly that the best Maginot lines may be circumvented in a night, without declaration of war, by the mass transportation of troops by air or by other similar means. But though potential attackers are still trusting to their numbers and to their wonderful equipment, the advance of scientific technique works also for the defence. For in difficult country, thoroughly known by its defenders, every route may prove a new Thermopylae; two hundred men may hold back 20,000 by means of machine-guns, ample

ammunition, and emplacements secure from artillery and aerial bombardment. For what it is worth, some evidence to this effect is offered by the offensive on Bilbao, where, despite the Basques' total lack of aircraft and relatively poor field equipment, they have been able to hold up a much better-equipped and better-trained force. The task of a large, very numerous army attacking, say, Switzerland or Czechoslovakia may, thus, be more costly than attacking, say, Belgium or Hungary; for, in future land warfare, geography and topography may once again come to the aid of the defence.

We may, therefore, expect the disciples of mass warfare to loose the first bolt of war; but we must also expect two things to aid the defence. First, the attackers will employ great numbers (Signor Mussolini has boasted that he can now put 2,000,000 men, fully equipped, into the field, and the German and Russian armies to-day stand at 1,000,000 and more); and, as Captain Liddell Hart pertinently observes, the great increase in the fire-power of armies to-day renders "the big battalions" more vulnerable than before. Secondly, despite reliance upon the "crushing surprise blow" theory of Von Schlieffen and others, mechanisation and technical improvements are certainly as potent for defence as—if not more than—for attack. To give but one example, Belgium, France, and Czechoslovakia all conceive the possibility that Germany may one day attack them. In view of the rate and extent of German war-preparations they could not do otherwise. Their measures have been, first, to put their German frontiers in a state of semi-permanent mobilisation, with self-sufficient garrisons in their Maginot lines, wartime munitions supplies, etc.; and, secondly, to organise their military commands in such a way that the minimum of marching, communications by road or rail, etc., is necessitated, thus minimising the risk of dislocation by sudden aerial attack. For the rest, if an attack comes like a thief in the night, special plans of defensive campaigning are linked—as almost every kind of warfare is linked to-day—with the possibility of organised air-raids on the military and industrial centres of the enemy. This week, the Italian Under-Secretary for War has announced that Italy's land frontiers are to be permanently manned; and, as we describe in a Note on page 449, Italy's military, naval and aerial dispositions are to be linked to her self-sufficiency programme. Enough has been shown in Spain to prove that a better-equipped attacking force to-day needs the consilience of many other favourable factors before their leaders can count on anything like a surprise "walk-over." No European, no Western State—however small—is likely ever to prove so easy to reduce as Ethiopia proved to Italy a year ago.

In these circumstances, the very mechanisation and (if we can use the word in this context) over-capitalisation of land warfare is likely to remove decisions in such warfare from the purely military sphere to other spheres, if only the defence against sudden attack can hold. We must not forget that a sudden attack on land will doubtless be accompanied—in order to be more crushing—by aerial and possibly naval action, on a great scale; and it may be that, against a small State in isolation, a Great Power could quickly prove victorious.

Against such a possibility, however, other factors work: the solidarity of political and military interests between the various groups of European States (to say nothing of the League of Nations); the sudden imposition of the strain of war upon the aggressor's national economy; the tendency of local wars to spread, if victory is not sudden and complete. Over and above these factors, there is the inordinate material wastage of modern land warfare, however localised. The disciples of "totalitarian war" have at least this much on their side. As far as we can see to-day, a State which aims to achieve a political decision by means of war must reckon on much more than a war between professional land armies. It will need to be a war of all the talents, all the resources, of the nation. Providence is tending to march away from the big battalions; and in such unfamiliar circumstances, the risks of miscalculation and the penalty of failure are to-day far greater than they have ever been before.

Federation will only be resorted to if direct negotiations now fail. It seems a pity that gaps in conciliation procedure should permit the prolongation and embitterment of labour disputes in so critical an industry as armament engineering.

* * *

American Hesitations—American politics have reached the state which is usual in the month of May. After four months of speechmaking, the approach of summer is increasing the pressure for legislative results. It is at this stage in the session that a strong President can get what he wants by the exercise of judicious pressure. Mr Roosevelt is back from his holiday, and is doubtless preparing to exert the pressure. This year, however, his task is complicated by his proposals for reforming the Supreme Court, on which he has refused to consider any compromise. This is not the usual matter of conflicting pressure groups bearing upon the legislators; it is a subject in which the public is very interested and on which Congressmen themselves hold strong views. The opposition to the President's plan is very strong, certainly stronger in Congress than those who are completely committed to Mr Roosevelt's support. The assent of the waverers depends entirely upon whether some change in the Court can be demonstrated to be necessary. So far the Justices have refused to oblige the President by being intransigent. Their judgments in the current session have been notably liberal, although a decision on the vital Social Security Act is still withheld. Moreover, one of the oldest and most conservative Justices, Mr Van Devanter, has resigned. The effect of his resignation was to induce the Judiciary Committee to report against the President's Bill by a small majority, and the same effect has undoubtedly been produced on the floor of the Senate itself. Mr Roosevelt may still get his wish, but to do so he will have to exert himself as never before.

* * *

In industry, the ferment induced by the activities of the Committee for Industrial Organisation continues. After appearing for many months to carry all before it, the C.I.O. has now come up against resolute opposition from some of the "independents" (i.e. firms unrelated to the United States Steel Corporation) in the Ohio steel industry. These firms threaten to close their works rather than submit to Mr Lewis's demands, and though the roar of defiance is doubtless doubly loud for stage effect, it is clear that there is a severe struggle in prospect. With political uncertainty and industrial disturbance, it is not surprising that the current mood in business is one of caution. A moderate pause in recovery, or even a slight recession, seems to be anticipated. But if anything of the sort is coming, it still lies in the future, as the current indices and the first quarter's profits figures continue to make a favourable showing. At this stage in recovery, however, there is good reason to welcome some consolidation of the gains hitherto realised rather than a further rapid advance. And a psychology of circumspection may do positive good.

* * *

The Way to Anglo-American Trade Agreement—A speech made on Wednesday in New York by the British Ambassador to the United States contained what has all the appearances of being welcome news. After expressing his "earnest hope" that an agreement would be possible, Sir Ronald Lindsay said that the British Government were willing to accord American farmers "favourable treatment" for their produce in the British market if, in return, "reasonable" reductions were made in the American tariff on "certain classes of typically British goods." It is no secret that the major obstacle to the conclusion of an agreement has not been any unwillingness on the American side to make the necessary concessions, but a difficulty on the British side in finding any concessions to American agricultural produce which would not conflict with the Ottawa Agreements. It is, of course, possible that when the British

Government says "favourable treatment" it means the continuance of the present treatment; such interpretations have not been unknown in the recent history of British commercial negotiations. But it is hardly conceivable that the Government would expect the United States to conclude an Agreement in which she received nothing in return but a promise of economic non-aggression. If this possibility be ruled out, Sir Ronald Lindsay's words can only be interpreted in a most hopeful sense. The indirect benefits of an Anglo-American Trade Agreement would be so large that it is worth a very large effort to bring the negotiations to a successful conclusion.

* * *

Higher Railway Charges?—The application of the four main line railways to the Rates Tribunal for authority to increase fares and charges by approximately 5 per cent. affords the latest of many examples of the passing on of increased wages and material costs to the consumer. A letter sent on behalf of the railways to the Tribunal, this week, shows that the projected increase is to apply to all passenger fares—including season ticket rates—and all freight charges—including goods carried at exceptional rates. As none of the railways, except the Southern, is even within hailing distance of its standard revenue under the 1921 Act, the Rates Tribunal will presumably grant the application, so long as the railways are able to show that it will, in fact, produce a net increase in revenue. Of this, there can be little doubt. The change will increase the vulnerability of the railways, *pro tanto*, to road competition, but it is only a little one; and the companies are presumably satisfied that it will not prejudice their future tactical position.

* * *

Last year the aggregate gross receipts of the four railways were just under £160 millions. Given no loss of traffic, therefore, the proposed increase would produce about £8,000,000 of additional receipts in a full year. Actually, as we show in a Stock Exchange Note on page 466, gross receipts are running appreciably higher this year than last, and nineteen weeks' operations at existing rates have produced a gross gain of a little over £2½ millions. The Coronation is past, but what is normally the heaviest period of passenger traffic is still to come; and there is no sign as yet of a reversal of the upward trend of general trade activity. Past experience emphasises the hazard of estimating a year's gains by simple proportion. Nevertheless, an increase of £5 to £6 millions in the full year may be hoped for. Against this there will be a formidable growth in expenses. From 40 to 50 per cent. of the gain may be offset by the increased cost of handling a larger traffic. Coal, steel, timber and other materials will cost at least an additional £2 millions, and last year's wages concessions approximately another three-quarters of a million. Thus, the "natural" increase in railway receipts appears already fully mortgaged. Where will the fruits of the proposed addition to charges go? Costs of materials will probably be still higher next year. Railway workers are likely to ask for, and to obtain, the remission of the remaining 1½ per cent. of the wages cut of 1931, and it is doubtful whether they will be content to stop there. In fact, the railways seem to be endeavouring to avoid any threat of a strike by creating, in advance, a reserve of earnings out of which they can meet fresh demands from labour—within reason—without reducing dividends to stockholders.

* * *

N.D.C. and its Critics.—On April 27th Mr Chamberlain declared that his National Defence Contribution proposals represented merely an "outline," and he undertook to seek detailed information before presenting his scheme in detail, and to examine all proposals "in the most sympathetic manner." Potential tax payers, having learned with amazement that N.D.C. was in the inchoate state of notes on a blotting pad,

has since been awaiting its presentation in draft—in the Finance Bill expected early next week. In a leading article in Budget Week, we suggested that the inequity of the Contribution as a tax on growth would in part be met by introducing some of the characteristics of a general tax on corporation profits. In particular, we submitted three suggestions for the Chancellor's consideration; that the chosen base for the tax should be the two best years of the period 1933 to 1936; that the exemption limit should be below the figure of the standard period where that figure was already very high; and that the proposed rates of tax should be modified, so as to grade the burden more smoothly. Subsequently, numerous business organisations have generously supplied the Chancellor with information, criticism, protest, and special pleading. Most of the memoranda have stressed the importance of three factors (implicit in our own suggestions): the effect of the base period, the calculation of the capital standard, and the percentage from which the growth of profits is to be measured. On each matter, the Chancellor has already foreshadowed the prospect of major amendments. To revise the base period, however, is a simple matter compared with the complete definition of a capital standard and the full enumeration of profits percentages to be applied to different industries. For this reason the Finance Bill may conceivably lack finality on these two matters.

* * *

Suggestions to the Chancellor.—A summary of the various representations made to the Chancellor may prepare the way for examination of the Finance Bill. At the end of April, the *Association of British Chambers of Commerce* led the way by stressing the inequities created by fortuitous differences in the capital structures of otherwise similar companies. The Association criticised the base period 1933–35, suggested an optional standard to avoid injustices, and appealed for a variable profits percentage, subject to a maximum impost, in any accounting period, of 10 per cent. of the profits. The *Shipbuilders' organisation* presented a statistical illustration of the "unrelieved gloom" of the industry during the base period; stressed the unfairness of any tax which would prevent the industry from recruiting its technical and financial strength after a prolonged depression, and claimed that its circumstances warranted special reserve provisions or a higher profits standard. The *Shipowners' Parliamentary Committee* followed with the suggestion that the datum period should be any three consecutive years, at the taxpayer's option, during the ten accounting periods to April, 1937. The incidence of N.D.C. upon shipping, it was pointed out, would be severe on those companies which had financed themselves largely by loans or debentures; while the 6 per cent. datum in prosperous years was inadequate to maintain shipping enterprise in good years and bad. Spokesmen for the *textile industries* stressed their preference for a simple tax based on all profits, rather than an attempt to adopt the complex principle of taxing an increase.

* * *

The most detailed submissions were made last week by representatives of seven leading business organisations, including the *Association of British Chambers of Commerce*, the *Federation of British Industries*, the *Chamber of Shipping* and the *British Iron and Steel Federation*. Their memorandum suggested that the liability for N.D.C. should not exceed 10 per cent. of total statutory profits; that the basic period for the total statutory profits should take in the year 1936, and the profits standard should have the option to choose two or four years in the previous four- or ten-year period. The document went on to discuss the difficulty of precise computation of "capital," and suggested that this might be largely removed if the "zones of charge" were abandoned. A plea was made for special consideration of adjustments necessitated by reconstructions, development expenditure, increased capital, investments

and wear-and-tear allowances. The problem of domicile and of tax avoidance by overseas registration was stressed, and the report concluded with the suggestion that a tribunal should be set up with all the powers exercised by the Board of Referees under E.P.D., and the further power of fixing an optional period for the Profits Standard whenever the Act would work harshly. Finally, memoranda have been submitted by the *Rubber Growers' Association*, by a number of *base metal mining companies* and by the *National Union of Manufacturers* which traverse similar ground. The former document stresses the speculative nature of rubber production. Recognising that most rubber companies would elect for the capital standard, the industry declares that development cost should rank as capital employed; that a 12½ per cent. return is a reasonable minimum; and that deficiencies in the datum period below this level should be offset against assessable profits. Altogether, Mr Chamberlain should now be the most knowledgeable of men, if wisdom resides in a multitude of counsellors.

* * *

The End of the Socialist League.—Without dissent the annual conference of the Socialist League decided, on May 16th, to dissolve its organisation in the interests of working class unity. The League was founded in 1932 and has consistently afforded an asylum for the extremists within the Labour Party and a home for unrewarded zeal. It has steadily advocated a policy of militant Socialism; and, indeed, it owed its inception to dissatisfaction with the tentative programme and final disaster of the last Labour Government. Since then its members have continued to criticise the cautious empiricism of the party bureaucracy. Like so many other ginger groups of the past, the League derived its importance from the personality and standing of its leader, Sir Stafford Cripps. But it was not until last year that its anomalous position and the conflict between its principles and those of the Labour Party were revealed, when the League embarked upon the United Front campaign in co-operation with the Independent Labour Party and the Communists. The official Labour position remained unchanged; to be compromised with revolutionary groups would be electorally damaging and contrary to the evolutionary Socialism for which the party stood. The fact that the Communist was now willing to suspend his revolutionary ambitions and to play the constitutional game made no difference. In conference last year, both the Labour Party and the Trade Unions rejected in mass the Communist alliance, and the co-operation of the splinter parties in the unity campaign has not sufficed to change the attitude of the Labour leaders. Sir Stafford Cripps himself has admitted that no Popular Front can be effective unless it rests upon the main body of the organised working class. Accordingly, the Communists and their friends have turned to more direct and effective work within particular trade unions; and the League has

7, CHANCERY LANE, LONDON

been lingering uselessly in the wilderness. In March the National Executive of the Labour Party proscribed the League, and decided that from June 1st members of that body would be ineligible for membership of the Party. The inevitable sequel came at Leicester last Sunday, and a few vigorous minds and much enthusiastic youth have been saved from political exile, while Sir Stafford Cripps himself has been restored to the fold. Fundamentally, however, nothing has been changed. All that has happened is that the clash of doctrine has been brought once again inside the Labour Party; and the assault upon the citadel of Transport House will hereafter come from within.

The Trend of Population.—There has recently been much discussion of the certainty that Britain's population will soon cease to increase and the probability that, subsequently, it may begin actually to decline. The diagram at the foot of this page throws considerable light on the recent trend of population in this country. The upper and lower lines on the chart show, respectively, the births and deaths in England and Wales during each year from 1900 to 1936; and the shaded area between the two lines consequently indicates the natural increase of the population—that is, the increase exclusive of the effects of migration. Deaths due to the Great War are excluded. The annual number of deaths showed little variation between 1900-1930, the general tendency being slightly downwards. During this period the death rate fell from 18.2 per thousand of the population in 1900 to 11.4 per thousand in 1930. After remaining fairly stable during the first eight years of the present century, the annual number of live births began slowly to decline before the war. The abrupt fall during the war was compensated, to some extent, in 1920-21, but the downward trend, which had begun before the war, soon reasserted itself. Thus, the birth rate per thousand of the population fell from 28.7 per thousand of the population in 1900 to 14.4 per thousand in 1933. The natural rate of growth of the population of England and Wales has thus fallen from about 400,000 per annum to little over 100,000 per annum. More recently, a state of comparative stability has been reached. The annual number of births has risen slightly, mainly, it may be presumed, as a consequence of the increase in marriages from 307,184 in 1932 to 353,561 in 1936, which, in turn, may doubtless be attributed to improved economic conditions and the larger number of persons of marriageable age. The number of deaths, however, has tended to increase slightly since 1930, as a

reflection of the gradual increase in the average age of the population. The latter factor is likely to continue, and even to be accentuated, and in the absence of a striking rise in births, it will be only a matter of time before the natural increase of the population is reduced to zero.

The Diplomatic Roundabout.—The diplomatic merry-go-round, to which Signor Mussolini and Count Ciano imparted a surprising acceleration with the Italo-Yugoslav pact and the Italo-German and Italo-Austrian conversations, has quickened again during the last few days. Prince Paul of Yugoslavia, M. de Kánya, Foreign Minister of Hungary, Dr Hodza, Prime Minister of Czechoslovakia, and M. Litvinov, Russian Commissar for Foreign Affairs, have all been in touch with London or Paris; and it is feasible to ascribe the intense diplomatic activity of the last few days to concern about Central European security. The extremes to which Italy has recently been impelled—mainly by reason of blows to her prestige in Spain—and the degree to which Germany is supporting her, have forced the Austrian and Hungarian Governments to revise their attitude to the link with Rome. After the Italo-Yugoslav agreement, which is a blow to Austrian and Hungarian trade with Italy without being an economic advantage to Yugoslavia, Austrian and Hungarian statesmen may well have wondered whether their link with Rome was not likely to drag them into unwelcome adventures, the cost of which would first fall on Austria and Hungary. Thus, while the aim of Italy and Germany has latterly been to isolate Czechoslovakia and disrupt the Little Entente, the apparent defection of Yugoslavia has been more than offset by an increase in those earnest discussions between Prague, Vienna and Budapest which have for some months been directed towards economic and political understanding in the key-region of the whole Danubian basin. Despite the formidable pressure which Germany and Italy may jointly be prepared to exert upon Austria and Hungary, it still seems dangerous for them to go to the length of forcing Dr von Schuschnigg either to resign or to admit Nazis into his Cabinet.

A Pact for the Pacific.—In a notable opening speech at the Imperial Conference on May 14th, Mr J. A. Lyons, Prime Minister of Australia, said that the Australian Government wanted a statement to issue from

the Conference "which would demonstrate to the rest of the world that the countries composing the British Commonwealth of Nations were prepared to act together in support of the maintenance of international law and order." He then went on to say that

Australia would greatly welcome a regional understanding and pact of non-aggression by the countries of the Pacific, conceived in the spirit of the principles of the League. Towards the achievement of such a pact we are prepared to collaborate with all other peoples of the Pacific in a spirit of understanding and sympathy.

These are pregnant words; for they clearly apply to Russia as much as to Japan, the United States, the Netherlands, France, and other nations with possessions in the Pacific. Mr Lyons also emphasised Australia's will to accept full responsibility for co-operation in defence of the British Commonwealth, and for removing trade barriers in the cause of economic understanding and political appeasement. On the latter point, his country's growing trade with Japan and inability to sell all its exports to the United Kingdom may have proved conclusive. Meanwhile, in an address in Tokyo three days later, Mr Sato, Japanese Foreign Minister, reiterated his assurances that Japan harboured no aggressive designs on China, and emphasised once again Japan's desire to improve relations with Great Britain, with whose statesmen the Japanese Ambassador in London is now discussing ways and means to an understanding. As we observed in a leading article last week, there is no real reason, apart from the unhappy periodical incursions of militaristic extremists into Japanese politics, why such an understanding should not prove a prelude to a general Pacific pact. And such a pact would go far to restore that measure of stability in the Pacific which the Japanese themselves destroyed when they tore up the Nine-Power Treaty and refused to renew the eminently successful Washington agreements. It might even open up welcome vistas of an international agreement on naval limitation in the Pacific. It would, as we pointed out last week, necessarily have to include as Mr Lyons indicated; and that would face Russia, as Mr Lyons indicated; and that would face Japan with the choice of securing the real benefits of a general Pacific agreement in which Italy and Germany could not be included, or waiving them in favour of the illusory and dangerous anti-Communist pacts with Germany and Italy. Doubtless the Japanese know on which side of the bread lies the butter.

Count Ciano on Foreign Policy.—On May 13th the Foreign Minister of Italy introduced the Foreign Office Estimates with an *exposé* of Italian foreign policy. Count Ciano took pains to emphasise Italy's desire to collaborate for peace with all peoples, and scouted the notion that Italy and Germany together constituted a *bloc*. Italy would remain passive, even indifferent, over the future of the League of Nations; but if Italian foreign policy moved parallel on many points with that of Germany, it was not out of a desire to provoke scissions. The gentleman's agreement with Britain of January 2nd had provided little comfort, for some unexpected obstacle had delayed reconciliation. This obstacle, Count Ciano indicated, was not British rearmament; since Italy could not deny others what she claimed as of right for herself; nor was it the British refusal to recognise *de jure* Italy's conquest of Ethiopia. It is to be presumed that the British attitude over Spain, and over the allied subject of British naval dispositions in the Mediterranean and Red Seas, was implied; or it may have been the reports from Spain in the free British Press which Count Ciano disliked. He then disclaimed any intent to foment anti-British feelings in the Islamic world, and characterised Italy's efforts among the Moslems as dictated by her own vital interests. Perhaps the most obscure part of his speech was that in which he outlined Italian policy over West European security. Here Count Ciano seemed at great pains to trim his sails to the western wind from Britain and France, without giving offence to Germany. In his speech as a whole there was evident a sense of Italian isolation, and

of a desire to improve relations with other Powers than Germany. If that is true, Signor Mussolini should best know how to begin to realise the aims his Foreign Minister has set forth.

The Duce, however, waited until last Saturday and then made one of his more intransigent speeches. He proclaimed Italy's determination to be economically independent of the richer democracies animated by aggressive designs; and intimated that Italy would be self-sufficient in oils by the second half of next year, mainly by means of the treatment in Italy of Albanian petrol and lignite. This latter point partly explains the Italo-Yugoslav pact for control of the Adriatic, and the recent renewal of the Italian subsidy to the Albanian Government. The Italian Empire would be exploited to the full in the cause of Italian self-sufficiency; and Italy would never give up this ideal in order to enter into an economic system controlled by the "aggressive" democracies. This pronouncement was emphasised on the same day by the speeches of the Under-secretaries for Navy, Air, and Army, who all urged Italy's need to render her Empire self-sufficient and impregnable. General Valle, Under-secretary for Air, declared that the centre of gravity for the air arm had shifted from the valley of the Po towards the Mediterranean, the Red Sea and the Indian Ocean. The Navy was being organised on a basis of big battleships and cruisers; and the Army was in future to mount permanent guard on the land frontiers. From an economically strong Great Power, possessed of unmortgaged and unlimited resources, these declarations might presage ill for Europe. From the Italy of to-day, they argue a nervous hysteria—which, apparently, international goodwill cannot be allowed by the Duce to abate—rather than sheer ill-will.

The Spanish Government.—The news of the week from Spain has been the re-fashioning—much more than a mere reshuffle—of the Spanish Government. After the abortive recourse by the Catalan Anarcho-Syndicalists to civil strife (described in these Notes last week), it was evident that something had to be done to give the Spanish Government coherence and unitary direction. The new Cabinet, led by Dr Negrin, a moderate Socialist who was Finance Minister in the last Government, is remarkable first for its catholicity, and secondly for the absence of Señor Largo Caballero, the Left-wing leader of the Socialist trade unions, and also the Anarcho-Syndicalists. The Communists have two portfolios (Agriculture and Education and Health), the Socialists three (Prime Ministership, Defence and Interior), the Republicans two, the Catalan Left one, and the Basques one. The Communists absolutely refused to accede to Señor Caballero's new demand for the portfolio of the Interior as well as the Prime Ministership and Defence. They insisted that Defence should be organised by a supreme war council with a responsible chief of staff. Though, surprisingly enough, President Azaña seems to have urged them to give in to Señor Caballero, they remained adamant; Señor Caballero and the C.N.T. ministers were dropped; the Socialists rallied with the Communists for centralised administration against the

Newfoundland and the United States.

economic sectionalism of the Syndicalists; and the upshot was the victory of Señor Don Indalecio Prieto, the moderate Socialist, and his control of Defence. In the Ministries of Air and Marine he is reported to have been very successful hitherto; and there is no doubt that the new Government presents a more uniform, workmanlike appearance. If the Socialist trade unions of Señor Caballero and the Syndicalists loyally co-operate, as they have promised to do, the prospects of the Spanish Government should now improve.

The attack on Bilbao continues, but without any striking success for the insurgents. Their German aeroplanes and pilots have razed more Basque villages; and the capture and examination of a German "volunteer" pilot who bombed Guernica give an adequate idea how systematically this is organised. The German pilot in question had a diary, which showed that, though a business man and an amateur aviator in private life, he had been forwarded by commercial air liners to Rome and thence to the insurgents' base as recently as last month, i.e. after the ban on volunteers had been nominally enforced, by agreement, by Italy and Germany. This discovery has naturally incensed the Basque and Valencia authorities, who see in it another proof that the supervision of non-intervention works as supervision of a blockade on supplies to the Spanish Government. On the Madrid, Toledo and Teruel fronts the insurgents have been hard pressed. All activity is centred round Bilbao, where, as at Madrid, a decision may be so long deferred as to make the insurgents' hearts sick. The best news of the week is that, after last-minute hitches, the 4,000 Basque children from Bilbao are due in this country next week.

The Russian Riddle.—What is happening in Russia, and why, are questions defying human wits—outside Russia—to answer. Conjecture alone is possible. The recent fall of Yagoda, for long chief of the dreaded G.P.U., was followed last week-end by the effective dismissal of Marshal Tukhachevsky from his post of Deputy Commissar for War and Deputy Commander-in-Chief under Marshal Voroshilov. Tukhachevsky was an officer in the old Imperial Guard; a very clever leader of the Red Army in Poland in 1920; and became the originator of the reorganisation and mechanisation of the Red Army in 1930. In this capacity he achieved what all competent military observers describe as wonders with the reformed Red Army; but in so doing he fell foul of Yagoda, whose 200,000 State Security Police were concerned to maintain, in their pristine strength, the revolutionary military councils of politicians, whose job it had ever been to purge the Army of any "deviationist" tendencies. Tukhachevsky, who was only 40 in 1933, was able, with the aid of Marshal Voroshilov, to decrease politics and to increase discipline, national self-feeling, preferment of rank, and vocational pride in the Red Army; but Yagoda's first blows fell last summer, when a General of the Tank Corps and several officers were arrested at Kieff, on a charge of plotting against Stalin and Voroshilov. When the Trotskyist conspiracies were alleged to have been unearthed, the arrests of other high officers by the G.P.U. followed; and some of these have "disappeared." Since then, Yagoda's downfall did much to appease the Red Army leaders; but now Tukhachevsky and his successful policy have been liquidated by an even higher instance than the G.P.U. The political councils of supervision in all military districts are re-established; and Tukhachevsky, at 44, retires to a nominal post in the Volga command. What do these lightning blows to left and right portend? Is Stalin afraid that the revolutionary praetorian guard is outpacing his own march towards the bourgeois State? If so, what will Marshal Voroshilov—and what will all the other young Army leaders, bred to mechanisation and military efficiency—think of Tukhachevsky's reward?

Co-operative Economic Policy.—Nineteen hundred and thirty delegates were present at the Congress of the British Co-operative movement held at Bath this Whitsuntide. Though this was a record attendance, the mood of the delegates was more sombre than usual, for the co-operative societies are being increasingly affected by what their leaders term "the economic warfare" of the Government's fiscal policy. Throughout the report of the Co-operative Union were indications of the growing tendency of the Government to substitute commodity and foodstuffs control by independent commissions for their former policy of control by producers. This variation in the structure of marketing schemes and industrial organisation is viewed with the more disfavour because it assigns no place to the seven and a half million members of co-operative societies who are organised consumers. They and their dependents represent more than half the population and their societies had a turnover last year of £234,598,250. During the present year the cost of foodstuffs has steadily risen in every part of the country, and it is feared that wages may have to be modified if the present policy is continued. The imposition of taxation on foodstuffs, the limitation of imports, the continuance of subsidies and the marketing schemes were estimated by the Right Hon. A. V. Alexander, M.P., to cost the country £90 millions a year. As distributors the co-operative societies were deeply concerned with the Milk Marketing Scheme examined by the Government's Committee of Investigation last autumn. The societies claim to have been responsible for the reduction in wholesale prices from 15s. 6d. to 15s. 3d. per dozen gallons. The operation of the quota system in bacon have cut down by one-half the imports from the English Co-operative Wholesale Society's own bacon factory in Denmark. Simultaneously, difficulties have been experienced in securing licences for additional co-operative bacon-curing accommodation in this country. Co-operators have objected to the raising of £3,000,000 by import duties on meat as a contribution to the cost of subsidising home producers. Already the effect is being felt in the retail butchers' shops in every town.

Freer Trade and the Co-operatives.—The co-operative societies have opposed—unsuccessfully—applications for increased duties on boxboards, granite, dressed leather, typewriters and starch. The Congress at Bath adopted a resolution of its Parliamentary Committee recording its concern over the rise in the cost of living and calling upon the Government to establish a fairer incidence of taxation and to open negotiations with foreign Powers for a freer basis of trade. The proceedings showed that British co-operators approach the problem from an international viewpoint. Sir William Bradshaw, the president of the Co-operative Wholesale Society, has intimated that plans are ready for the opening in London of a centre for international trading relations between the various national co-operative organisations. Previous efforts have been hindered by tariff barriers. The co-operators of Sweden and the Co-operative Wholesale Society of Scotland are ready for reciprocal trading; but tariffs have upset calculations so far. Meanwhile efforts are being made to develop business with the growing co-operative societies in the Dominions. The presence of a Canadian representative for the first time at a British co-operative congress suggests that the desire of British co-operators for freer trade may have some response among the new co-operative movements in Canada, Australia and South Africa. This year's Congress may be the beginning of a new phase of co-operation, in which development on the Empire side may find an important place in the movement's policy.

Industrial Activity after the Coronation.—The temporary lull in new business due to the Coronation was prolonged in many branches of activity by the Whitsun holidays, while the possibility of a coal strike

at the end of this month has introduced an element of uncertainty into the outlook. While many markets were closed this week, the pressure of demand for coal and iron and steel remains as strong as ever. Coal production is now running about 9 per cent. above last year's level, and in spite of the rise in prices, consumers have difficulty in obtaining the supplies they require. The possibility of a coal strike has added to the anxiety. In the iron and steel markets consumers continue to attach more importance to the question of deliveries than to rising prices. As our Manchester correspondent points out on page 487, business in cotton yarns and piece goods was somewhat restricted this week, but prices have been maintained, and spinners and manufacturers have sufficient orders on hand to keep them busy. The jute industry, too, has experienced a lull in new business, but order books are well filled. Sales of motor-cars continue well above last year's level, but the latest figures of goods vehicle registrations, relating to March, show a decline on the year. In general, there are no indications of an early decline in business activity apart from normal seasonal movements—if a coal strike can be averted.

Overseas Trade in April.—Britain's overseas trade figures continue to increase rapidly, and, indeed, at an accelerating rate. The most welcome indication in the April returns is that, for the first time in many months, the percentage increase in exports has been greater than that in imports. The rise in the former has been large enough to make the statement true also for the whole of the first four months of the year. The full figures are shown in the following tables:—

MONTH OF APRIL (000's omitted)					
	1935	1936	1937	Change between 1936 and 1937	
Total imports	£59,872	£66,664	£82,871	+16,207	+24.2
British exports	33,009	33,427	43,027	+9,600	+28.3
Re-exports	4,203	5,922	7,274	+1,352	+22.8
Total exports	37,212	39,349	50,302	+10,952	+27.8
Excess of imports over exports	22,660	27,315	32,569	+5,254	+19.2
Transshipments under bond	2,058	1,964	3,223	+1,259	+64.1

FIRST FOUR MONTHS (000's omitted)					
	1935	1936	1937	Change between 1936 and 1937	
Total imports	£237,866	£266,517	£312,002	+45,485	+17.0
British exports	138,498	139,483	164,146	+24,663	+17.7
Re-exports	18,089	21,780	26,080	+4,249	+19.5
Total exports	156,587	161,263	190,226	+28,912	+17.9
Excess of imports over exports	81,279	105,253	121,776	+16,523	+15.7
Transshipments under bond	7,796	8,662	12,511	+3,849	+44.4

Despite the encouraging movement in exports last month, the absolute excess of imports over total exports was £5½ millions greater than in April, 1936. For the first few months this year the increase in the visible import balance is £16½ millions, but invisible items have risen appreciably with the rise in raw material prices and freight rates.

Trade by Commodities.—The quantities of the main retained imports for the month of April for the last three years are shown in the table below. No fewer than half the items show a decrease in quantity as compared with last year, though in most cases the percentage is small. Changes in their value are discussed in the next Note. Rising prices and the adequacy of the stocks already in existence account for the big fall in the volume of wheat imported. The

other chief decline, in wool, reflects the lull experienced in the last month or so in the Yorkshire industry. The effects of the armament are clear in the increased import of machinery, more than half of which comes from Germany and the United States. The other figures show only a normal expansion.

RETAINED IMPORTS—MONTH OF APRIL

Items and Measure	1935	1936	1937
Wheat ('000 cwt.s.)	8,086	8,337	7,153
Beef and veal ('000 cwt.s.)	974	1,039	1,141
Mutton and lamb ('000 cwt.s.)	599	447	554
Sugar, unrefined ('000 cwt.s.)	2,808	3,034	3,169
Iron ore and scrap ('000 tons)	429	633	655
Raw cotton ('000 cwt.s.)	833	1,229	1,226
Sheep's and lambs' wool ('000 cwt.s.)	1,217	1,088	872
Flax, hemp, and jute (tons)	24,744	21,963	28,061
Crude petroleum ('000 galls.)	40,516	38,215	44,530
Hides, wet and dry ('000 cwt.s.)	123	163	124
Wood pulp ('000 tons)	163	204	116
Rubber ('000 cwt.s.)	297	122	236
Unwrought copper (tons)	32,360	28,298	33,210
Tin: Ore and concentrates (tons)	29,844	30,633	30,515
Tin: Blocks, ingots, slabs and bars (tons)	3,282	4,760	4,702
Iron and steel manufactures ('000 tons)	787	3,033	1,284
Machinery (tons)	63	121	88
	6,171	10,211	13,151

Figures for the most important groups of exports are shown in the second table, and reveal a very different trend.

BRITISH EXPORTS—MONTH OF APRIL

Items and Measure	1935	1936	1937
Coal ('000 tons)	2,873	2,537	3,242
Iron and steel scrap (tons)	12,509	8,822	30,971
Pig iron and ferro alloys (tons)	20,175	9,810	17,664
Railway materials (tons)	7,637	18,131	10,576
Total iron and steel manufacture (tons)	204,291	177,519	239,461
Textile machinery (tons)	5,281	4,031	6,402
Total machinery (tons)	32,187	30,807	38,576
Cotton yarns ('000 lbs.)	10,463	11,936	14,772
Cotton piece goods ('000 sq. yds.)	159,452	141,194	164,785
Wool tops ('000 lbs.)	4,234	4,338	3,787
Worsted yarns ('000 lbs.)	2,269	2,302	2,230
Woollen tissues ('000 sq. yds.)	4,549	5,174	5,627
Worsted tissues ('000 sq. yds.)	2,461	2,372	2,963
Linon piece goods ('000 sq. yds.)	8,215	7,271	7,331
Leather boots and shoes (doz. pairs)	33,285	25,954	30,829
Leather (cwt.s.)	21,142	21,179	33,034
Paper and cardboard (cwt.s.)	285,822	304,467	353,760
Locomotives (complete and parts) (tons)	661	832	1,514
Motor vehicles and chassis (tons)	5,451	6,245	7,496

All but three of the commodities entered here show increases. The jump in coal and iron and steel manufactures is especially welcome. As in the March returns, the main increases (with the exception of paper and cardboard, which compensates a decline in March) are in those commodities which are capital goods or are used in heavy industry. Textile products have remained fairly stable, though there has been a recovery of cotton piece-good exports, principally to the Continent.

Import and Export Prices.—In a leading article on page 441 the course of British international trade in the first quarter of this year is discussed. It is shown that, though imports and exports have changed in value more or less in proportion, in quantity imports have risen less than exports. In illustration of these tendencies we have calculated price changes of individual commodities during the past three years from the trade returns for April. These figures are particularly

valuable in that they show the average prices at which actual transactions have taken place.

AVERAGE PRICES OF IMPORTS

Item	Unit	April, 1935	April, 1936	April, 1937	Change 1936 to 1937
Wheat	cwt.	0.286	0.343	0.518	+ 51.0
Chilled Beef	cwt.	1.60	1.50	1.63	+ 8.7
Bacon	cwt.	3.95	4.11	4.22	+ 2.7
Butter	cwt.	3.68	4.07	4.72	+ 1.6
Sugar, unrefined	cwt.	0.317	0.320	0.438	+ 36.9
Raw cotton (4 14 staple)	cental	2.71	2.52	3.14	+ 24.6
Wool, merino greasy	1,000 lbs.	3.99	5.15	6.66	+ 29.3
Cottonseed	ton	5.38	5.55	6.96	+ 25.4
Motor spirit	1,000 galls.	14.0	15.8	19.2	+ 21.6
Rubber, raw	centals	2.51	3.04	4.68	+ 53.9
Copper (electrolytic)	ton	31.5	40.3	70.8	+ 75.7
Lead (unwrought)	ton	12.2	16.6	28.6	+ 84.2
Tin (blocks, etc.)	ton	22.6	21.2	25.9	+ 17.5
Zinc	ton	13.6	16.3	27.4	+ 68.1

The table of import prices brings out very clearly the extremely rapid rise in the cost of wheat, the very modest increase in meat and dairy produce prices and the startling jump in the cost of industrial raw materials.

Export prices have also shown a general rise, though in no case does the increase exceed 20 per cent., and in the majority it is in the neighbourhood of 10 per cent.

AVERAGE PRICES OF EXPORTS

Item	Unit	April, 1935	April, 1936	April, 1937	Change 1936 to 1937
Spirits	Proof gall.	1.21	1.28	1.24	- 4.0
Tobacco	lb.	0.114	0.111	0.117	+ 5.4
Coal, large steam	ton	0.839	0.854	0.949	+ 11.3
Coal, sized steam	ton	0.698	0.772	0.886	+ 14.8
Galvanised sheet	ton	12.7	13.5	14.7	+ 8.9
Tinned plates	ton	19.8	20.7	22.6	+ 9.2
Steel tubes	ton	20.9	18.6	18.7	+ 0.5
Cotton yarn*	100 lb.	5.62	5.71	6.06	+ 6.1
Cotton piece - goods, bleached	1,000 sq. yds.	16.3	17.1	18.4	+ 7.6
Cotton piece-goods, dyed in the piece	1,000 sq. yds.	24.6	25.9	27.4	+ 5.8
Worsted yarns (combed)	100 lbs.	12.9	13.2	15.5	+ 17.4
Woolen tissue†	100 sq. yds.	15.8	18.3	20.2	+ 10.4

* Unbleached, up to No. 40 count. † All wool, 8 to 12 oz. per sq. yd.

For the most part the explanation of the rise in prices is simply the increased cost of raw materials, though many manufacturers have succeeded in increasing their profit margins as a result of the increase in world demand.

Lower Steel Output.—The latest returns of the British Iron and Steel Federation show a decline in the output of crude steel, but a further increase in the production of pig iron. On a daily basis, crude steel production declined from 44,380 tons in March to 41,554 tons in April, while the output of pig iron rose from 21,945 tons to 22,690 tons during this period. The number of furnaces in blast showed a net increase of 4 to 121 during the past month:—

PRODUCTION AND FOREIGN TRADE IN IRON AND STEEL
(In thousands of tons)

Period	Production		Foreign Trade	
	Pig Iron	Steel Ingots and Castings	Total Imports	British Exports
1913—Monthly Average	855.0	638.6	185.9	414.1
1929	632.4	803.0	235.2	364.9
1932	297.8	438.5	132.7	157.4
1936	640.5	974.8	123.6	183.8
1936—March	633.6	980.1	130.3	163.4
April	629.8	984.2	120.8	177.5
May	661.0	963.0	117.5	204.1
June	644.1	965.9	110.6	173.5
July	665.6	974.1	170.3	216.1
August	635.8	872.7	141.8	164.0
September	650.8	1,027.0	165.0	183.0
October	670.3	1,060.5	101.0	194.4
November	643.1	1,001.3	90.7	193.3
December	671.4	1,019.2	94.8	204.8
1937—January	650.7	998.9	83.1	215.0
February	603.7	995.9	82.9	200.5
March	680.3	1,109.5	94.3	231.6
April	680.7	1,080.4	88.5	239.5

Despite the decline in steel production, output was still almost 100,000 tons higher than in April, 1937, while the current rate of pig iron production is about 50,000 tons in excess of last year's level. Despite the recent increase in prices, the supply position remains

stringent, partly as a result of the marked reduction in imports and the increasing demand from overseas customers.

Sterling and International Prices.—The latest index numbers show that the recent recession in wholesale prices has now been checked. *The Economist's* complete British index number has risen during the past fortnight by 0.3 per cent. Primary products have fallen in England by 0.7 per cent., but have risen in the United States by 0.5 per cent. The Irving Fisher general index number has fallen by 0.9 per cent. These movements are both small and indeterminate, but they show that the period of recession has now been succeeded by one of hesitancy, which may be the prelude to a new recovery. Italian wholesale price index numbers are now available, for the first time for nearly two years. We reproduce from *The Financial Times* the monthly averages for most of 1936, together with the figures for recent fortnights. The net rise in Italian prices during the past year is 14.8 per cent. This is very moderate when allowance is made for the rise in world prices and also for last October's devaluation of the lira, but the total increase since July, 1935, is 31.8 per cent. Apparently the internal value of the lira depreciated in anticipation of its devaluation, presumably as the result of the Abyssinian war and sanctions:—

* These figures refer to May 12th.
† Monthly averages.

During the past fortnight increases in the cereals and meat and minerals groups were balanced by declines in the other three groups:—

The Economist INDEX (1927 = 100)				
	Sept. 18, 1931	Apr. 14, 1937	Apr. 28, 1937	May 19, 1937
Cereals and meat	64.5	95.0	92.2	94.6
Other foods	62.2	70.2	69.7	68.4
Textiles	43.7	74.6	74.3	73.8
Minerals	67.4	107.4	105.5	107.1
Miscellaneous	65.8	87.0	87.1	86.7
Complete index	60.4	86.8	85.7	86.0
1913 = 100	83.1	119.3	118.0	118.4
1924 = 100	52.2	75.0	74.1	74.3

Both grain and meat prices were firmer. Bacon was unchanged. Among other foods, there was an increase in coffee, but most of the remaining prices were lower. Cotton and wool were cheaper, but there were increases in flax and jute. In the minerals group there were advances in steel and copper and declines in lead, tin and spelter. In the miscellaneous group, rubber, tallow and leather are all cheaper, while linseed oil advanced.

The Raising of Required Reserves

NEW YORK, May 11.—Perhaps the largest single control operation ever undertaken by the Reserve System was completed on May 1st, when required reserves were raised to the legal maximum. That is, all member banks in Central Reserve Cities are now required to maintain deposits at the Reserve Banks equal to 26 per cent. of their demand deposits; in Reserve Cities, 20 per cent.; and elsewhere 14 per cent. The required reserve against time deposits is uniformly 6 per cent. The initial action of raising required reserves by 50 per cent., undertaken last August 15th, was largely neutralised by subsequent gold imports. At the end of the year, the creation of the Inactive Gold Fund, whose operation is analogous to that of the British Equalisation Fund, effectively checked the further expansion of excess reserves, but as these were in the vicinity of \$2,000 millions, the Reserve authorities were still far from control of the credit system. This state of affairs was viewed complacently as long as we were pursuing a policy of inflation, but is irreconcilable with the increasingly frequent warnings from Washington of the imminence of a dangerous boom. The announcement in February that the required reserves would be raised another 50 per cent., in two equal steps on March 1st and May 1st, was therefore the logical sequel to the measures initiated in the previous year.

That the elimination of some \$3,000 millions of bank cash, even though this left excess reserves conservatively estimated at \$500 millions, would cause some firming of money rates was expected. Indeed this movement became perceptible in the second half of last year, when came Governments advanced from practically rates on short Governments from 0.0 per cent. to about 0.40 per cent. (and in instances actually) 0.0 per cent. to about 0.40 per cent. on nine months' paper. It was apparently believed that this logical consequence would be confined to the short-money market; and up to the end of February the rate on long Governments showed no firming whatsoever. The fact that the new issue market went flat in January and the corporate bond market turned heavy in February was ascribed to special causes, for at the end of February the long Governments were in new high ground, and it was generally assumed that the banks (which had been given abundant notice) had adjusted their reserve position to the new requirements. This supposition was supported by all the statistical data publicly available. The Treasury, therefore, offered for March 15th a long-term 2½ per cent. conversion bond, which promptly went to a premium before issue.

Scarcely had the books been closed when bond, stock and commodity markets fell sharply. The consternation expressed in banking and official circles seemed rather disproportionate to the actual decline in Government securities. The 2½ per cent. issue, for example, dropped from a little over 101 to a little under 97, or from a 2½ per cent. basis to a 2½ per cent. basis. At the end of March the Reserve Board, which was apparently quite disconcerted, announced that it would undertake additional purchases to support the market, or to use the official term, to maintain an orderly market. By that time, however, the flurry had practically spent its force. The Reserve Bank has actually added about \$100 million to its total holdings of Governments, as well as increasing its proportion of longs to shorts. Certain Government agencies have also been purchasers. The Government market regained its equanimity, and the current rate on long Governments is quiet, with long 2½'s at par.

This decline was partly sympathetic at a time when all

sorts of markets at home and abroad were uneasy; it was partly a nervous response to alarming official utterances; and for these reasons it may be described as essentially a flurry. Certainly the shift in quotations on Government bonds (from 2½ per cent. to 2½ per cent.) can as yet hardly be described as a change in the long-term rate of interest, as the term is used in economic discussion. Nevertheless, the change from excess reserves of over \$3,000 millions to excess reserves of about \$800 millions, is a major operation; and operating a banking system which requires 26 per cent. of bank cash against demand deposits in its principal financial centres is more delicate than operating on a required reserve of 13 per cent. plus an equal amount of excess reserves.

Adjustment in New York City

The New York market has something of the same relation to the banking system of the United States that London has, not to Britain, but to the sterling area; that is, there is a balance-of-payments problem of considerable complexity. This balance-of-payments problem has in recent years been conditioned by two facts: the New York banks were continuously receiving reserves in the form of gold imports; and were continuously losing reserve cash to the interior by reason of an adverse balance of payments between New York and the rest of the United States. The replenishment of the cash of the New York banks by gold imports was abruptly terminated by the creation of the Inactive Gold Fund; but New York's relation to the interior of the United States has become to a large degree conditioned by financing of deficits; and the Budget outlook is anything but clear.

The following tables show how the Member Banks of New York City progressively adjusted themselves to the change in reserve requirements.

NEW YORK MEMBER BANKS
(\$000,000)

	July 1, 1936	Feb. 24, 1937	May 5, 1937
Total loans and investments	9,063	8,633	8,379
Brokers loans	1,004	1,053	1,147
Security loan to others	765	727	732
Commercial loans, etc.	1,555	1,791	1,935
U. S. and guaranteed securities	4,582	3,917	3,476
Other securities	1,157	1,145	1,089
Reserve with Fed. Res. Banks	2,004	2,648	2,430
Demand deposits	6,215	6,515	6,333
Time deposits	550	645	658
Government deposits	192	134	66
Inter-bank deposits	2,933	2,764	2,464

It does not appear that these banks were under actual pressure at any time up to the end of February. The liquidation between July 1, 1936, and the end of February, 1937, appears to have been precautionary rather than compulsory. Between the end of February and the end of April, the New York City Banks actually lost almost \$200 millions of reserves, in addition to the increase in reserve requirements, and were forced to borrow—although the group continuously had great

excess reserves. This illustrates the technical problem of distributing excess reserves, or any reserves for that matter, in a banking system that is no longer complemented with a smoothly functioning money market.

Formerly, the New York money market was composed of a large call market; a fair commercial paper and bill market; and the short Government market. The call market is now much shrunken and is limited to the New York banks; the commercial paper market is quite small; and the short Government market, now the sole money market, reduced by the funding operations of the past year, is carrying the whole load. In the 20's, the system functioned smoothly with \$25 to \$50 millions of excess reserves; at present the excess reserves probably exceed \$800 millions. While the process of adjustment from \$3,000 millions of excess reserves to the present figure has produced rather more disturbance than was statistically anticipated, the completion of the undertaking is generally believed to find the adjustment also completed. This belief, however, pre-supposes that the balance of payments between New York and the interior is in equilibrium; and on this theme it is impossible to offer any positive opinion.

France

High Hopes of the Exhibition

PARIS, May 20.—The Paris Exhibition will be opened on May 24. Foreign tourists will bring pounds, dollars, etc., which will opportunely stock the Equalisation Fund just when the import surplus has reached 6,000 million francs for the first four months of the year. This week will also be marked by new measures of the revival of business, which will include a revision of the 40-hour week in retail trade, the establishment of full powers to revise the tariff and to substitute duties for quotas, and the increase of some taxes and of railway rates and fares. The practical benefits of the Exhibition, taken with the price in social reform, should help to restore confidence and to effect a recovery in the money market, which has still to meet the needs of the Treasury for 1937.

The Treasury will officially need 18,000 million francs between April until the end of December, though 20,000 millions is a more probable figure. These forecasts assume that fiscal receipts will conform to the estimates (in April they did not), that the English Loan will be renewed, and that the first maturity of the 4½ per cent. 1934 Treasury bonds, which were issued with a term of 3, 6 and 9 years, will not have to be wholly repaid. If confidence exists, these operations will present no serious difficulties. If not, the problem will not be solved without a financial and political crisis. These considerations explain the recent speeches in which M. Blum and his Ministers emphasised the need for Socialists to respect the "pause." They also explain the desire of the French Government to collaborate with Great Britain to make peace and international co-operation effective.

Imports were in April slightly lower and exports slightly higher, as the following table shows:—

	FOREIGN TRADE			
	In Francs ('000,000 omitted)	In Tons ('000 omitted)		
	March, 1937	April, 1937	March, 1937	April, 1937
Imports:—				
Foodstuffs	790	830	480	515
Raw materials	1,898	1,986	3,910	4,215
Manufactured goods ...	539	481	208	223
Totals	3,227	3,297	4,598	4,953
Exports:—				
Foodstuffs	266	277	84	89
Raw materials	608	735	1,972	2,257
Manufactured goods ...	963	961	209	255
Totals	1,837	1,973	2,265	2,601

For the first four months of 1937, imports show an increase in value of 5,375 million francs and exports of 2,402 million francs compared with the same period of 1936. The import surplus was 6,205 million francs, against 3,273 millions in 1936. Both in imports and exports, the increase was principally in raw materials.

Steady Prices

The latest indices of prices, for April, show that wholesale prices were steady at 532, against 537 in March, and retail prices had only moved from 577 to 580. The stability of wholesale prices is explained by the decline in world prices and the seasonal heaviness of certain domestic food products, while certain other prices, notably those of metallurgical and re-armament products, registered a new rise. It is feared, however, that the cost of living, which was 581 for the first quarter of 1937, against 486, 504, and 540 for the first, third and fourth quarters of 1936, will be pushed up in the future by the general introduction of the 40-hour week, by the increase in the cost of goods transport and, next winter, by the seasonal rise in the price of coal, wheat and food products. The Government will, however, try to mitigate this by a further reduction of import duties.

Unemployment on May 8th was 363,569, a fall of 4,812 for the week and of 77,545 compared with the corresponding week of 1936. Railways receipts for the first 17 weeks of 1937 were 3,273 million francs, an increase of 9.86 per cent. compared with 1936. Loaded waggons for the same period numbered 4,928,238, against 4,788,331 in 1936, an increase of 2.92 per cent.

Fiscal receipts in April were less favourable than for the first quarter of the year. They were 131.5 million francs lower than those of the corresponding month of 1936. The decline was particularly marked in the yield of the turnover tax, which produced 397 million francs, against 540 millions in the same month of 1936.

The general heaviness of international markets added to the effects of internal political troubles and of Anglo-Italian tension reacted on French industrials. Nevertheless, quotations remain much higher than the highest of 1936.

Germany

Self-Sufficiency at all Costs

BERLIN, May 18.—The Four-Year Plan for raw materials entered a new phase last week when an import duty of over 100 per cent. *ad valorem* was imposed on rubber, hitherto free from duty. The new duty may be increased or reduced with changes in price, and embraces caoutchouc, gutta-percha and balata. The present market price of duty-free rubber, which is quoted in Hamburg in pence per English pound, works out at about Rm. 118 per 100 kilogrammes. On the basis of an import of 80,000 tons a year, the yield of the new duty would be Rm. 100 millions. It is announced that the receipts will be used to finance the new Buna synthetic rubber plants. These concerns cannot get along without Reich help. It seems, however, that Reich financial help will not be confined to the producers of the new material. In great measure these have already raised the capital necessary or have financed themselves out of their own resources. Reich financial assistance will be required by the manufacturing consumers of Buna, who must now expand and adapt their plant. The new duty involves a doubling of the price of the natural rubber whenever the new substitute is generally available.

The measure throws some light on the policy behind the Four-Year Plan. Sometimes the Plan has been justified on ideological Party grounds, because national self-sufficiency is regarded as desirable in itself. Sometimes it has been justified by the exigencies of national defence, because all the materials to be produced are more or less indispensable to war. There is no contradiction between these two motives; but a contradiction is implied by the third kind of official utterance, which is temporising, protesting and even apologetic. In these protestations the Plan appears as an urgent but disagreeable necessity. It is protested that Germany desires nothing more ardently than the emancipation of international trade; but that unluckily she cannot expect this in view of foreign trade barriers. Consequently she is short of foreign exchange to pay for imports. In a

reasonable world, they claim, she would never have dreamed of a Four-Year Plan. It accords with this view that until now the import of the necessary raw materials which Germany does not possess, but for which she might produce substitutes, has been in general duty free. That was the case with rubber. The new rubber duty, however, is an instance of a new impediment to trade, ostensibly with the incongruous aim of overcoming the undesirable consequences of old impediments. Actually Germany has experienced no difficulty in obtaining a supply of foreign rubber. While her import of many commodities has been heavily cut down, her import of rubber has risen rapidly from 50,200 tons in 1932 to 82,100 tons in 1936. The raising of a new obstacle to imports suggests that the Plan was not really an emergency measure forced on an unwilling Reich by the perverse trade and currency policy of the outside world, but that it sprang from a desire to attain self-sufficiency at all costs.

Industrial activity is increasing. Most trades which manufacture production-goods have reached the point where they would normally expand their plant. Armament orders, new raw-material undertakings, building, and export (in which the demand for capital goods predominates) are responsible for this condition. Iron production has not succeeded in maintaining the high level reached in September, 1936. The output of production-goods is estimated at between 7 and 10 per cent. higher than a year ago.

Officially, it is declared that there is now virtually no unemployment. Of approximately one million persons now registered as unemployed, some 300,000 to 500,000 are short-term unemployed who, when the return was compiled, were changing their jobs, and of the remainder some 330,000 were not fully employable. The consumption of electricity in March was 21 per cent. higher than in March, 1936. Pig-iron output in April was 1,306,200 tons, against 1,303,900 tons in March; in the first four months of 1937 it was 5,093,000 tons, against 4,913,900 tons in 1936.

Change in Direction and Terms of Trade

The geographical distribution of foreign trade continues to change in the now familiar direction. The chief feature is the decline in passive balances with overseas countries. In the first quarter of 1937 there was an export surplus with Europe of Rm. 231 millions against Rm. 169 millions in the same quarter of 1936; and an import surplus with overseas countries of only Rm. 37 millions compared with Rm. 87 millions a year ago. With Asia and America the import surpluses have entirely disappeared; with Africa the surplus has changed little, and with Australia it has slightly increased. Imports from South-East Europe increased considerably, but from the United States they heavily declined. The increase in export values was about 13.1 per cent. in all and was evenly spread over European and other trade. Brazil, Argentina, Mexico and Venezuela have greatly increased their purchases in the last quarter; and in trade with the United States exports have actually exceeded imports. American figures, which are differently compiled, do not, however, usually agree with the German. The shift in the direction of export trade is shown by the following table:—

	Jan.-March (inclusive)	
	1933	1937
Percentage share in German exports of:—		
Europe	78.5	68.3
Africa	2.3	3.8
Asia	7.2	11.9
America	11.3	15.0
Australasia	0.6	0.9

The monetary trade-balance is still unfavourably influenced by the "price scissors." Although the price of exports rose slightly in the first quarter of this year, the price of imports rose still more. It is officially reckoned that 8 to 9 per cent. more exports must be sold this year to pay for the same quantity of imports as was purchased last year. The large increase in the export of manufactured goods in 1936 was mainly due to a rise in the sale of production or capital goods, cloth being the

Switzerland

Budget Recriminations

GENEVA, May 16.—Much dissatisfaction is being expressed throughout the country about the financial policy of the Swiss Confederation in 1936. A deficit of 300,000 francs was estimated. Actually the accounts show a deficit of 27 million francs. The Federal Finance Department had pledged itself to curtail all expenses and to oppose any increase in expenditure. Parliament voted a rise in the rates of the "Crisis Tax" to increase its yield by several millions. The taxpayers supplied an extra 65 million francs to the Treasury, general receipts were 7 million francs higher than estimated, but the Finance Department, after making economies to a total of about 4 million francs, spent 34 million francs more than forecast.

In 1933, when the Federal finances were in a difficult position, a first financial programme was voted by Parliament; it included the institution of the "Crisis Tax" and the raising of several existing taxes. That programme was a failure, and in 1933 the deficit reached 72 millions; while it was 26 million francs in 1934 and 18 million francs in 1935. A second financial programme was approved last year, to yield another 130 million francs, enough to balance the accounts. The 1936 deficit shows the result.

If the present economic revival continues it may to some extent ease the position of the Federal finances, but it is nevertheless certain that some more curtailments are needed in all Federal services. State subsidies were reduced last year, but they still reached about 200 millions, against 22 millions in 1913 and 86 millions in 1929. Important savings could now be made in State grants, especially since unemployment is falling. The Socialist Party has launched a campaign for the levying of new taxes to balance the Budget and to permit the undertaking of big public works.

Business Activity

Swiss foreign trade returns for the first quarter of 1937 show that the improvement recorded since the currency was devalued is still going on. Imports reached the value of 454,911,769 francs, an increase of 69 per cent. over the corresponding period of 1936, and of 2 per cent. over the previous quarter. The rise in the imports of raw materials shows that industry is more active. Exports were valued at 264,099,456 francs, a rise of

32 per cent. compared with the first quarter of 1936. The situation has improved so much in the watch-making industry that a great number of factories cannot accept new orders for six months, while a few refuse them unless the goods may be delivered next year. The machine industry is also more active.

Imports from Great Britain reached the value of 28,887,771 francs, compared with 17,474,708 francs a year ago, while exports to her reached 30,575,756 francs, against 19,773,969 francs in 1936. The five chief exporters to Switzerland were Germany (90.2 million francs), France (61.3 million francs), Great Britain (28.5 million francs), United States (28.0 million francs), and Italy (27.8 million francs); while the five best importers from Switzerland were Germany (42.0 million francs), France (34.0 million francs), Great Britain (30.5 million francs), United States (25.2 million francs), and Italy (16.8 million francs). There has been a noticeable drop in unemployment in almost all branches of industry and commerce. The number of registered unemployed was 104,000 at the end of December, 1936, compared with 118,700 in 1935, and 89,390 at the end of March against 98,300 at the end of March, 1936.

The Future of Swiss Railways

For the first time since 1930 the Swiss Federal Railways recorded an increase both in passengers and goods traffic, and a surplus of 23 million francs, compared with 11 millions in 1936. It is feared, however, that the re-organisation plan for the railways which the Federal Council has been discussing for the past three years may now be deferred.

The economic crisis of the past five years deeply influenced the earnings of all transport undertakings. The receipts of the Federal Railways, which exceeded 420 million francs in 1930, gradually declined, but the working surplus remained comparatively high, thanks to drastic savings in all expenses. Receipts and yearly surpluses since 1931 have been as follows:—

	Receipts (In millions of francs.)	Surplus
1931	389	106
1932	342	69
1933	336	76
1934	333	86
1935	314	74
1936	290	77

The receipts of private lines dwindled in a somewhat higher proportion, and a number of them have been unable to even pay the interests on mortgages and securities. Some of them have been financially helped by the Cantons and Communes concerned, but that help has proved inadequate. The Federal Government has been called upon to undertake the same financial restoration of the private lines as of public. The network of the Swiss Federal railways is 1,781 miles, valued at about 3,000 million francs; the network of private lines is 1,875 miles, estimated to be worth 1,000 million francs. The Federal Council is prepared to spend 150 million francs to save those private lines, the existence of which is justified by economic, tourist or military reasons. It is not yet known how the Confederation will proceed: the private lines will probably be under Government control, but will retain some independence. The failure of the State purchase of private lines in 1901 is an ill omen for this new venture.

Hungary

Foreign Policy

BUDAPEST, May 12.—The visit of the Italian royal family to Budapest coincides with the tenth anniversary of the Italian-Hungarian treaty of friendship, which was the forerunner of the Rome Protocol. Though the visit was decided last November when Admiral Horthy, Regent of Hungary, went to Rome with his Ministers, the presence of the Italian monarch in Budapest, accompanied by his Foreign Minister, Count Ciano, coming as it does so soon after the visit of the Austrian President

and Chancellor von Schuschnigg, affords plenty of room for speculation about its significance. It is worth while, therefore, to quote a recent statement of the Foreign Minister, M. de Kánya, who summarised the foreign policy of Hungary as follows: "Loyalty to our friends, avoidance of any and all adventures, the establishment of satisfactory relationships with those from whom we are now separated by controversial matters; and opposition to the political blocs and military alliances."

Hungary welcomed the improvement of Italian-Jugoslav relations, and earnestly regrets that new differences have arisen between Italy and England. The Government realises that no satisfactory solution of the Danubian problem is possible without the active and benevolent co-operation of all the Great Powers concerned. The Administration is therefore concentrating every effort to bring about social improvements to diminish the danger of extreme propagandists of the Right or Left seizing power in the rural areas. This is particularly important because the new electoral law will extend the secret ballot to rural constituencies.

Cautious Finance

Business and public revenue continue to be satisfactory, but Mr Tyler's last report contains a timely reminder that the improvement arises mainly from favourable circumstances which may not last very long. The League representative points out that a poor harvest, coupled with a less advantageous price situation, might reverse the tendency; and that the present position calls for the continuation of a conservative financial policy.

The new Budget for 1937-38 discloses a deficit of 67.9 million pengő, but it is safe to say that barring unforeseen accidents current receipts will amply suffice to meet not only current expenditure, but also some of the cost of investments and social improvements which are planned to increase the productive capacity of the country.

The Budget estimates are as follows, compared with the figures for last year:—

	1936-37	1937-38
	Million pengő	
Administration:—		
Expenditure.....	788.1	821.7
Receipts.....	771.6	805.3
Deficit.....	—16.5	—16.4
Undertakings:—		
Expenditure.....	423.6	445.2
Receipts.....	364.5	393.7
Deficit.....	—59.1	—51.5
Total deficit.....	—75.6	—67.9

The full service of the State's foreign debts, calculated at the official rate, has again been included in these estimates at 92.3 million pengő, and judging from the experience of the past two years, actual disbursements will not exceed 65 million pengő. It must be pointed out, however, that the above estimates do not include the sums due to the Agricultural Relief Fund, which amounted to 51 million pengő in the current year. Because of the rise in prices and the national income the burden of taxation is somewhat lighter than it was in the depression years, but it is still very heavy.

The Break in Stocks

The Budapest Stock Exchange experienced its worst day on April 27th, when the quotations of leading shares fell by some 20 per cent. or more because of the collapse of domestic over-speculation and the break in foreign markets. Bonds were entirely unaffected and maintained a firm tendency throughout April and May; the reverse in the share market, which in spite of the repeated warnings of the authorities, showed all the signs of an inflationary boom, was long overdue. In sympathy with the rally in Vienna and Prague, stocks rallied in the first part of May, recovering about half of their losses. It is significant that the yield of the leading shares on the Budapest Exchange, even at the lower prices now quoted, is scarcely more than 2-3 per cent., whereas the best securities with fixed interest, State and mortgage bonds alike, offer a yield of more than 5½ or 6 per cent. The comparatively high rates ruling for bonds in the open market do not make attractive the flotation of an internal loan.

India

Congress Policy in Bombay

BOMBAY, April 26.—The programme put forward by the Bombay Ministry, and held up as a model for Ministries in other provinces, aims to stimulate economic activity by giving the utmost encouragement to agriculture. The programme is designed to afford the ryot profitable access to forest areas, and it also proposes to distribute waste ground to landless labourers. A general review of assessment for land revenue is also suggested. The Ministry hopes in the long run to establish free and compulsory primary education throughout the Presidency. Prohibition, which has always been of great interest to the Congress Party, is also included in the long run policy of the Ministry.

The subject is exhaustively discussed in the report of the Prohibition (Finance) Committee of the Bombay Presidency issued in 1927. The Commissioner of Excise for the Presidency reckoned that, exclusive of Sind, the recurring cost of trying to enforce prohibition would be Rs. 339 lakhs, and that the capital cost of buildings and equipment for enforcement would be another Rs. 515 lakhs. The Committee thought that these costs were exaggerated. Some thought that economies might be made by handing over preventive work to the police; but the Inspector-General argued that to hand over this task to the police would be disastrous to the morals of his force and would in fact result in no saving.

The Farmer and the Moneylender

One of the best documents about economic conditions in India issued for a very long time is the report which has been submitted to the Government of India by the Reserve Bank about rural credit. In much of the discussion preliminary to the establishment of the bank there was constant reference to the need for using it to help agriculture. The economic problem of agricultural India is only to a minor extent one of credit facilities. The farmer must first be made credit-worthy. This means that his earning capacity must be increased and that he must have a practical desire to improve his economic condition. Any economic improvement, if it is to be effective or lasting, must be accompanied, and in many cases preceded, by improvements in village sanitation and hygiene, medical facilities, roads, wells and irrigation works, and the spread of a practical form of education. Villagers must also be educated to take effective co-operative action towards the consolidation of holdings. Public opinion must be developed to prevent the undue splitting up of holdings into uneconomic patches yielding but a bare subsistence.

The Indian ryot is normally trapped in a vicious circle, since he pays interest at usurious rates on a load of indebtedness which eats up his profit and leaves no incentive for improvement. Provincial Governments are trying to break this vicious circle by setting up debt conciliation machinery which seems to be working fairly satisfactorily. They are also exploring the possibility of finding suitable and profitable bye-employments for the ryot and inducing him to follow them.

The report examines the part that commercial banks could play in helping agriculture and points out that they could do little more than finance the marketing of crops. But there are certain prerequisites before this aid can be proffered. A reasonable standardisation of marketable crops is necessary, as also are proper storage under proper supervision and properly regulated forward markets run on orthodox lines in the interest of both sellers and buyers.

The Co-operative Credit Societies might fulfil the rôle by providing the farmer with funds for growing his crops. They are not doing so adequately, states the report, because of overdue debts which are large and have in effect become long-term loans. It is necessary for these long-term debts to be placed on a business footing. It is recommended that more practical bankers should be in

control in each Province. There should be more representation of depositors on the boards of Provincial Co-operative Banks and the Central Banks. The nature of the business which the societies can finance should be much more restricted. Loans should be issued in instalments and not in lump sums. It should also be considered whether a cultivator-borrower who sells his produce without any attempt to repay the loan on it should not be liable to imprisonment.

There is scope for land mortgage banks on a joint stock basis to bring the money markets and the farmer into closer contact. Even with a revitalised co-operative movement and the greatest possible contact between finance and the farmer, he must continue for a long time to come in many places and in many ways to depend on the village moneylender. The report states that a system of compulsory licensing and registration of approved moneylenders should go a long way to restore harmony between ryot and *bania*.

Favourable Trade Agreement

The Indo-Japanese Trade Agreement does not, as some industrialists hoped, deal with the question of anything else but Japanese imports of textiles. In essentials the new agreement maintains the *status quo* allowing for the separation of Burma. India is to take 283 million yards of cotton piece-goods against purchases by Japan of one million bales of Indian cotton, with a maximum receipt of 358 million yards against an increased purchase by Japan of 1½ million bales of Indian cotton. The changes in the categories of piece-goods within the quota are to India's advantage. Finally, the new protocol, like the old, makes no mention of such extraneous imports as made-up garments, towellings, and re-exports over India's land frontiers to the neighbouring markets of Nepal and Afghanistan. The non-official advisers pressed for action against these; apparently Japan was unwilling to concede the point. On the whole, however, India's position is stronger under the revised protocol.

Letters to the Editor

State Money or Bank Money?

TO THE EDITOR OF THE ECONOMIST

SIR,—There is no doubt that Mr Mackenzie King, Prime Minister of Canada, hit the nail on the head when he said recently: "Until the control and issue of currency is restored to the State, recognised as the Government's most conspicuous and sacred responsibility, all talk of the Sovereignty of Parliament and Democracy is idle and futile."

Money and food are very much alike in one respect. We must have money, like food, in order to exist. But if we use a large proportion of non-genuine currency we are bound to suffer economic ill-health, in the same way that we suffer physical ill-health when we eat bad food. The only genuine State currency employed at the present time in England and most foreign countries, is the metal cash and postal order money, which together represent a very small fraction of the currency.

So long as the amount of State currency remains more or less stationary, crushing taxation and indebtedness will go on increasing, and the root cause of strife and war will not be removed. Surely a National debt of about £8,000 million and a local government one of £1,300 million should set the duldest mind thinking furiously. These colossal debts are due chiefly to the present method of using cheques. Nearly all our currency has no tangible existence beyond being in the form of book entries, which a certain section of the community are able to create through the medium of cheques. Banks must return to their original function of handling money in tangible form.

Cheques must cease to be temporary money; they must be an order to transfer 100 per cent. State-money notes of a special type, so that any sum, however large, can be easily and safely paid with one or a few notes. At first this may appear to be a cumbersome scheme, but it will be found to be less complicated than the present method of handling cheques, which often cost the banks about eighteen pence each to clear, as they have to pass through about a dozen hands.

The world has got into the present appalling economic and debt tangle through the departure from using tangible State currency, which it could now do in a new and modern way. This has prevented the State from exercising its prerogative over the creation and issue of the currency,

thus depriving the people of incalculable benefits and the enjoyment of a progressive civilisation. It is quite conceivable that the amount of new money that would have to be added to the existing money each year in order to keep prices at their desired level and enable the people to buy to the extent that they can produce, would make taxation unnecessary.

The British Government has a wonderful opportunity of adopting a 100 per cent. State-money system. If it did, we would rapidly become strong financially, industrially and in many other ways. Other nations would soon follow our example and there would be a chance to settle international disputes by mutually beneficial agreements. Insane destructive wars would become the follies of a bygone age.

Yours faithfully,

A. VERDON-ROE.

Hamble, Southampton.

Our New Financial Machinery

TO THE EDITOR OF THE ECONOMIST

SIR,—I notice in your issue of May 8th a comparison between our present monetary and credit machine and that of the gold standard illustrated from locomotive engineering, quoting No. 10,000 and the "Lord of the Isles." If the latter is the celebrated G.W.R. machine of last century, and No. 10,000 the recent L.N.E.R. high-pressure, water-tube boiler, compound locomotive, the analogy is, to put it mildly, unfortunate.

"Lord of the Isles" was extremely successful and did its job for many years until outclassed by increasing weights of trains. So far, so good. "No. 10,000," after ceaseless experimenting for six or seven years, has had to be abandoned, as far as its new principles are concerned, and is to be rebuilt on the old lines. Not so good.

Yours, etc.,

RAILWAY OBSERVER.

St. Albans.

Books and Publications

Central Control and Local Finance

NEITHER in Germany nor in Great Britain has it yet been possible to find one single principle by which to distinguish the spheres of local and national finance. "The choice," writes Miss Newcomen,* "between varying local tax rates on real estate and business, and the distribution of revenues from taxes levied at uniform rates throughout a country has yet to be made. The one leads to local self-government, with its local freedom, local responsibility, and individuality—all desirable ends. The other leads to uniform taxes and equal opportunity, likewise desirable ends." The conflict of principles is well stated in these few sentences, and the

prevailing tendency towards increasing central aid and control suggests the very gradual triumph of the second principle in Great Britain as well as in Germany.

Miss Newcomen does full justice to the complexity of the issue, and to the still greater complexity of the *ad hoc* methods used to solve it in this country. Even the systematising Act of 1929 was devised rather to provide an acceptable solution of current difficulties than to solve the difficulty of principle. The elaborate "weighting" of counties according to the number of children, the population per mile of road, the percentage of unemployed, etc., was designed to effect certain desired results at the time of drafting, but cannot be justified on other grounds. As the situation changes, the equalising effect of the formulas will change, and they may have to be revised.

De-rating is, as Miss Newcomen says, the most criticised feature of the 1929 Act. "What, in fact, the Government chose to do was to subsidise farmers, mine-owners, manufacturers, and shippers, at the expense of the users of light oil." In support of this de-rating, it is frequently contended that industry should not bear burdens equal to those placed on residents, since local government services benefit residents rather than industrial concerns. But rates are commonly justified on the theory of ability to pay rather than benefit; and moreover it is by no means clear that industrial establishments ought not to contribute to local government expenditure on education, housing, health, and relief.

"Highways, at least, are essential to the farm. Yet farm real estate contributes nothing at all."

Miss Newcomen asks if merchants are to be regarded as unproductive? Only industrialists and farmers are treated as producers in the allocation of the benefits of the Act, at the expense of the private resident, the shopkeepers, and the motorist. The Act has, moreover, "permanently impaired" the rate basis of local government, so that increasing dependence on the national Exchequer is to be expected in the future. This means that ordinary taxpayers, including the working and lower middle classes, will indirectly come to bear in yet another way the burden of the subsidy effected through de-rating. Moreover, the growing dependence of local authorities on the central Government both for grant-aid and for permission to raise loans imposes a grave responsibility on the central Government. It may be out of touch with the electors of a particular locality, and is not in any case directly responsible to them. The first principle of local responsibility has thus been dropped, without the second, the principle of full equalisation, being established; we are therefore at a half-way house in the relations between local and central finance.

Miss Newcomen's book is a notable contribution to English understanding of home problems, which are clarified by comparison with German organisation and by the expression of Miss Newcomen's own detached and penetrating criticisms.

Shorter Notices

"The Railway Worker." By G. M. Rountree, M.A. McGill University. Oxford University Press (Humphrey Milford). 12s. 6d.

The stability of employment in British railways before the post-war amalgamations made them a kind of industrial aristocracy. Expansion was almost continuous; the effect of the trade cycle was relatively small; technological unemployment was insignificant; and seasonal unemployment was almost equally so. Even after the grouping it was possible to reduce the labour force by employment attrition rather than dismissal, with a consequent minimum of disturbance.

British railwaymen will find a vivid contrast in the Canadian conditions described in Mr Rountree's book. Seasonal variation in traffic and employment assumes in the Dominion an importance quite unknown here. The freezing of the Eastern ports in the winter and the autumn movement of the wheat crop exercise a substantial influence on employment among the traffic staff; while employment among the permanent way men is dominated by the fact that, in Mr Rountree's words, "from November to March it is literally impossible to accomplish anything but very minor repairs to the permanent way." Superimposed upon this picture of normal variation is the huge shadow of "the railway problem"—the writing down of the assets of the Canadian National and the closing of redundant lines. This in itself makes the employment question highly complex; but when the effects of the depression and of road competition are added the threads seem almost inextricably tangled.

Nor is the organisation of collective bargaining, at any rate to an English student, either logical or strategically effective. There is nothing corresponding to the dominance of the great industrial union, the National Union of Railwaymen, in this country, which represents the railway workers as a whole while leaving scope for independent action by the Amalgamated Society of Locomotive Engineers and Firemen, the Railway Clerks' Association, and the shopmen's unions. In Canada the unions are split on the question of international or national organisation (which usually means federation with the American Federation of Labour or with the All-Canadian Congress of Labour). There is, of course, also the cleavage between craft and industrial unionism; and Mr Rountree points out that the most important national Canadian union, the Canadian Brotherhood of Railway Employees, is in conflict with the craft principle of the Trades and Labour Congress of Canada. An added complication arises from the existence of separate union federations for the Canadian Pacific Railway and the Canadian National Railway.

Mr Rountree ends with two chapters on "Short Run Problems" and "Long Run Problems," in the first of which he makes various practical suggestions for reducing the incidence of "normal" seasonal unemployment; in the second he deals with the effects on employment of railway unification.

"World Revolution (1917-1936)." By C. L. R. James. Secker and Warburg. 429 pages. 12s. 6d.

A history of the Communist International which seeks to interpret post-war history in terms of revolution and counter-revolution. Reveals the fissures within Communism, and accuses Stalin of sabotaging world revolution by falsification and physical repression. Surveys the Russian Revolution, the work of Lenin, the Socialist failures of 1923, the collapse of revolution in China, and the emergence of a bureaucratic State in Russia. Suggests that Stalin is insecure, and that only a Fourth International can salvage world Socialism. A biased and challenging book.

"Public Finance." By A. G. Buehler. McGraw Hill. 632 pages. 24s.

The traditional American text-book "for the use of college classes." Thorough, painstaking, and well-arranged, this book is lucidly written, and will be a useful work of reference for students interested in the minutiae of public finance in North America. The historical sections are good; and the theoretical background is consistently adequate.

"The Business Management Review." Vol. II. January-March, 1937. Management Journals. 5s.

This quarterly review contains the gist of the discussions of the Management Conference at Oxford, where the question how a business may be developed by plan was examined. The rôle of the economist, the practical terrain, market research, publicity, production and buying were dealt with by appropriate experts and men of experience. The result is an interesting and useful volume.

"The Russian Peasant Movement." By L. A. Owen. P. S. King. 267 pages. 12s. 6d.

An account and explanation of the agrarian facets of the Revolution of 1917 and subsequent developments; prefaced by a valuable analysis of Government policy and peasant organisation in the preceding decade. Sets the events of 1917, the history of Soviet Russia and the policy of Lenin and Stalin in a new perspective.

MONEY AND BANKING

The Problem of Gold—II

LAST week we described the growth in the world's gold supplies during the last few years. We then showed that there has been an expansion in four years of 16.5 per cent. in the gold held by the central banks, equal to an annual expansion of 4.1 per cent. This is rather greater than the 3 per cent. annual expansion often assumed to be necessary to ensure reasonable economic progress. Moreover, the aggravated maldistribution of the world's gold—i.e. its concentration in England and the United States—means that these two countries have accumulated gold at a rate far in excess of their normal needs.

Now a rapid increase in the world's monetary system tends to bring about a rise in commodity prices, and there is no doubt that the general recovery and the rise in world prices since 1932 has partly depended on the increase in the world's available gold supply. At all events if gold had not been available, the improvement could not have taken place except by a general and complete severance of the link with gold. To that extent the new gold has brought relief, and is a cause of satisfaction rather than anxiety. Yet while there is no direct mathematical relation between an increase in gold stocks and a rise in prices, it would be easy to show that if all the gold held in England and the United States were let loose in the banking system and if confidence was such that it was able to exercise its full effect upon the volume of credit, the resultant rise in commodities would carry the British and American price-levels far beyond those of 1929. In this respect the situation is quite abnormal—or at all events unprecedented. At the moment the gold is being held in check, partly by the segregation of a substantial proportion in exchange funds and partly because the Bank of England still under-values its gold. This course of action is illogical, for there seems little sense in buying new gold at a relatively high price, only to write it down arbitrarily or bury it in exchange funds. This, broadly speaking, is the problem with which we are faced to-day.

Arguments can be, and are, found both for and against a rise in world prices. The case against can be stated very simply. Trade conditions at home and abroad show that the present level of prices is already remunerative to many producers, including at least some primary producers as well as industrialists. A further increase would add to industrial costs and the cost of living, and would create a legitimate basis for demands for higher wages with all their attendant labour troubles. The *rentier*, after having his money income cut down by the fall in interest rates and debt conversions, would have his real income further reduced by a rise of prices, and though he would gain some relief from the rise in interest rates, both short-term and long-term, which would follow a rise of prices, the wider consequences of that rise would be harmful. Finally a renewed rise in commodity prices would cause new out-breaks of speculation, followed by liquidation and a general unsettlement of trade.

The arguments in favour of a slow and orderly rise in prices are equally potent. It would reduce the burden of the National Debt, which is now very heavy. This of course is the obverse to the penalisation of the holders of government debt, and in essence it implies the transference of part of the burden from the *entrepreneur* to the *rentier* and possibly to the Civil Servant and other salaried classes. Again, it is doubted if all the primary producing countries have yet regained a fair level of prices. A further increase of prices, it is argued, would enable them to buy more of our manufactured goods, it would hasten the liquidation of their outstanding debts, and would put them in a position to borrow more capital for

purposes of internal development. A further point is that a period of rising prices is the only one in which Governments can be induced to consider tariff reductions in practice instead of in principle. It would be the counterpart to the collapse of 1929-32, which was the main cause of the virulent spread of economic nationalism at that time. For these reasons it is argued that a gradual return to the 1929 level is to be desired.

On the balance of these two views it may be admitted that there is still some leeway to be made up from the bottom level of the depression. But any such recovery must be made with the very greatest caution—and the present gold supply provides an ample backing for it.

Meanwhile, is it to be assumed that England and the United States are becoming so choked with gold as to require a desperate remedy? England, it must be remembered, has become since 1931 the centre of the sterling area, and our gold reserves are in that sense the ultimate reserves of the whole sterling area as well as of ourselves. Again, a proportion of both the British and American gold reserves are in reality the product of "hot money." Gold to-day is badly distributed throughout the world, partly because capital is also badly distributed. Instead of seeking its normal employment at home, capital has fled for refuge to London and New York, and only a portion of it is properly invested there in productive enterprise, the remainder being hoarded in idle bank deposits, in currency, or even in gold itself. Now the economics of hot money have so far received imperfect study. To the extent that this fugitive money is hoarded in bank deposits, it is legitimate for the banking system to re-lend it at short-term to the Treasury, which in turn uses it to finance the exchange fund's gold holdings. This is one justification for the accumulation of gold in a Government controlled exchange fund. Equally, if hot money is hoarded in currency, it is right for the central bank to hold additional gold against that currency. These are the only ways in which the recipient countries, notably England, the United States and Holland, can preserve a liquid position. To that extent the accumulation and segregation of apparently surplus gold by those countries is the inevitable consequence of the accumulation of large floating masses of hot money. This suggests that the real problem is that owing to a deterioration of confidence the world is not making full use of its savings. If those savings could be induced to seek proper investment either at home or where they could be usefully employed, then the gold too could be better distributed, and the problem of surplus gold in London or Washington would become less obtrusive.

None of these ends would be furthered either by a reduction in the price of gold or by restriction of its purchase. Indeed, either of these possibilities would involve grave disadvantages if they were carried out by individual countries without international agreement. The Tripartite Monetary Agreement would be jettisoned and the exchanges thrown into fresh chaos. Again, neither the British Empire nor the United States would agree to a step which would plunge gold producers into sudden ruin, nor would it be right for them to do so. The inevitable reaction on world trade would make this course of action unjustifiable. France, too, could not agree to a step which would write down the value of the Banque de France's gold stocks, for unlike Great Britain and the United States, she has no reserve of segregated gold upon which to draw. We have also witnessed during recent weeks the psychological consequences of even a rumour of a movement in this

direction. Finally, the less sophisticated section of world opinion still regards gold as the one standard of value immune from Government interference. It is because the public believes in gold that bankers are able to use it as the ultimate basis of bank cash, credit, and indeed of money in the most general sense of the term. Governments have already caused a violent upheaval in the value of gold once, when they either deliberately devalued their currencies or allowed them to depreciate. If they now interfere with it again in the opposite direction, they will seriously shake belief in the yellow metal. So long as our knowledge of the price structure remains incomplete, and our methods of monetary management embryonic, no source of stability is to be neglected. There is nothing to be gained from a conspicuous display of arbitrary fluctuations in the value of gold.

But if there is to be no drastic action affecting the price of gold, the authorities must do their best to curb speculation, to minimise labour troubles, and to make any rise in prices that may occur as slow and orderly as possible. In short, they must see to it that the consequences of an abundant gold supply do not get out of hand. This requires a reversal of the banking measures taken eight years ago to "economise" gold; the segregation of gold and the raising of banking reserve requirements are among the practicable ways of doing this. For the rest, we may look to continued trade expansion to prevent the gold surplus from growing to unmanageable proportions. With a more remunerative price level throughout the world, confidence should return, and fresh opportunities should be sought for reducing tariffs, for removing trade and exchange restrictions, and for reviving home and international investment. Meanwhile, as recovery progresses, India should become once more an absorber of gold, while now that China has abandoned silver as a monetary standard, she too may begin to build up a gold reserve. All this is looking rather far ahead; but it suggests that with care it may be possible to achieve a better distribution of gold. It would be foolish to deny that the present gold surplus carries with it certain dangers, or to refrain from taking all possible action to minimise them—though it is legitimate to add that the dangers of a surfeit of gold are less than those of a shortage. But when stability is beginning to emerge from the chaos of the exchanges, it is hardly the time to inject the new disturbing factor which any drastic alteration in the price of gold, or arbitrary restriction of the market for gold, would assuredly be. When world trade has recovered its freedom and regained fresh life, the time will have come to take stock of our gold supplies and to devise a long-term remedy for any permanent maladjustment or general gold excess which may then still persist.

Financial Notes

Defence Loan Reactions.—For the current financial year from April 1st to May 15th, there is a seasonal deficit of £24 millions, which in the absence of other operations by the Government should cause a parallel increase in the floating debt. On this occasion, however, the floating debt has only risen by £4 millions, mainly because of the receipt to date by the Treasury of £24.5 millions, representing the two first calls on the new National Defence Bonds. The change in the position of the floating debt during these six weeks is illuminating. Tender issues of Treasury bills have risen by £30 millions, while there has been a reduction of £26 millions in the floating assets of public departments. This last movement points very strongly to two main deductions. The first is that the Exchange Equalisation Account has been buying gold, and so has had to reduce its holdings of Treasury bills. The second deduction is that the departments have taken up the bulk of the new Defence Loan issue, reducing their floating assets in order to make room for it. Last week, when a call of £19.5 millions was paid, the floating assets of the

departments were reduced by £18 millions, and there is a fairly close resemblance between these two figures. All this confirms the view widely expressed at the time the loan was issued. The net result is that the effective portion of the floating debt, consisting of money borrowed by means of tender issues of Treasury bills, has risen commensurately with the revenue deficit. Unless the departments can dispose of their holdings it looks as if re-armament expenditure will cause an increase in the effective floating debt.

* * *

Swedish Monetary Policy.—Last week we called attention to a statement by the Swedish Minister of Finance to the effect that in order to offset the tendency towards rising prices in Sweden it might be necessary to raise the value of the krona against the pound and also to restrict credit at home. The full statement, which was not available when we went to press, was that the general rise in wholesale prices must soon cause a considerable increase in the cost of living. If Swedish monetary policy was to maintain a stable price standard efforts must be made to stop the inflationary development of prices in the world markets. In these circumstances the external value of the krona was a secondary consideration. The Minister suggested an appreciation in the value of the krona against sterling, and more stringent control of domestic credit. Both measures, he added, were most undesirable and only applicable in the greatest necessity. He concluded by asking for authority to use up to Kr.100 millions of the Riksbank's exchange reserves for State purchases abroad. This warning was rather abrupt, and the following day the Finance Minister apparently realised that fact. Reverting to an earlier statement of his, made last March, he said on May 14th that an alteration in the value of the krona was no more necessary to-day than it was earlier in the year. On the contrary, the recent fall in international prices had made it less essential to consider such a measure. In common with other countries, Sweden is obviously a little anxious about the rise in world prices, but the Government realises how easy it is to upset the whole course of trade by the application of sudden remedies. The dividing line between boom and slump can be very narrow. Hence it is reassuring to learn that the Finance Minister was thinking aloud about the distant future, and that he realises the danger of any fresh disturbance to world exchange, trade and prices.

* * *

The Money Market.—Three months ago, Treasury bill allotments to the market were confined mainly to bills maturing on the days following Coronation Day and Whit-Monday. These bills had an extra day to run, which was to the advantage of the Government. As a result there were very heavy maturities on these two days, namely Thursday, May 13th, and Tuesday, May 18th. This explains the transfer of funds from public to bankers' deposits, shown in this week's Bank return, and has also made money quite easy:—

	Apr. 29, 1937	May 6, 1937	May 13, 1937	May 20, 1937
Bank rate	2	2	2	2
Clearing banks' deposit rate	1	1	1	1
Short loan rate:—				
Clearing banks	1-1*	1-1*	1-1*	1-1*
Others	1-1	1-1	1-1	1-1
Discount rates:—				
Treasury bills	1	1	1	1
Three months' bank bills	1-1	1-1	1-1	1-1

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

Discount rates are unchanged, but the market fared rather better at last week's tender, for the syndicate secured 54 per cent. of the allotment against only 18 per cent. the previous week. The market was therefore more willing to sell Treasury bills to the banks, though it was only selling July maturities. The banks were on the

whole reader to buy August bills, as they were well supplied with July bills, but some of the banks were quite ready to take what they could get. The supply of commercial bills continues to increase, but the operative rate for three months' bank bills is little better than $\frac{1}{2}$ per cent. Six months' bills are quoted at $\frac{3}{4}$ per cent., but the market regards these rates as a little low for so long a period.

The Bank Return.—Whitsun has brought with it a further small increase in the note circulation. This week's figure of £481.4 millions represents a high record for all time, for it just surpasses the previous record of £480.6 millions in 1920 for the combined note issues. The Bank has bought another £2.5 millions of gold, so that the Reserve is slightly higher in spite of the expansion in the circulation. Incidentally, if the Bank's gold were revalued at the current market price, even this record note circulation would be more than covered in gold; in fact, the notes in the Reserve would be covered as well. It is difficult to forecast the future trend of the note circulation, but after dropping slightly during the next two months it may rise to a new record during the August holidays:—

	BANK OF ENGLAND				
	May 20, 1936	Apr. 28, 1937	May 5, 1937	May 12, 1937	May 19, 1937
	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Issue Department:—					
Gold	205.4	313.7	313.7	318.7	321.3
Note circulation	423.1	468.8	475.2	479.9	481.4
Banking Department:—					
Reserve	43.1	45.8	39.4	39.6	40.7
Public deposits	21.0	26.2	16.4	32.5	19.2
Bankers' deposits	80.1	87.6	97.2	87.7	97.4
Other deposits	36.8	39.6	37.7	37.2	37.6
Government securities	91.2	97.7	103.1	108.3	103.3
Discounts and advances	7.1	5.5	5.4	5.9	6.6
Other securities	14.3	22.0	21.0	21.3	21.4
Proportion	31.2%	29.9%	26.0%	25.1%	26.4%

The main movement in the banking department is a transfer of funds from public to bankers' deposits. This is due to the heavy Treasury bill maturities referred to in a previous note. Government securities are reduced by £5 millions, possibly because the gold cover of the note circulation has been increased.

The Foreign Exchanges.—The spot Paris rate is a shade weaker at Frs. 110 $\frac{1}{2}$, while the discount on three months' francs has also widened fractionally to Frs. 1 $\frac{1}{8}$ discount. During the last day or two sterling has weakened a shade against the dollar and its allied currencies, such as guilders, belgas and Swiss francs. There has been some demand for forward belgas. Spot dollars were quoted on Thursday at \$4.9420. There was some evidence of a commercial demand for all dates up to the end of the year, and the opinion was expressed that without this the rate would have been driven up to \$4.95 by sales of dollars against gold purchases. A large quantity of gold was disposed of in the London bullion market during the past week, at prices giving consistently a discount of 2d. per ounce below the dollar parity price. The American banks are still nervous about shipping gold freely to the United States, and are reluctant to hold gold on the water beyond a certain limit. The demand has thus come mainly from arbitrageurs, who are able to secure a good profit while only incurring the very slight risk of a change in the American Treasury's buying policy while their gold is in transit. In spite of the somewhat contradictory declarations concerning Swedish monetary policy, the krona has remained unaltered during the past week at Kr. 19.39 $\frac{1}{2}$, which is the normal pegged rate.

Union Bank of Scotland.—We regret that the 1937 entries in the table published on page 44 of the Banking Supplement of May 15th contained certain

errors. The number of branches of the Union Bank was given as 181 instead of the correct figure of 212. The true figure for "Cash in hand and at bank" is £3,051,401, and "discounts and advances, including short loans on stock," should read £10,721,123. The proportion of profits to resources is 0.78 per cent. We take this opportunity of making these corrections.

Insurance Notes

London and Manchester Assurance Company.—New business in the ordinary branch for the year ended March 31st last consisted of 30,300 policies, assuring £4,316,000, against 33,600 for £4,690,000, in the preceding year. The interest credited to the ordinary and industrial branches results in net rates of interest on the respective funds of £4 6s. 5d. per cent. and £4 5s. 7d. per cent., against £4 9s. per cent. and £4 6s. 10d. per cent., respectively, for the year ended March 31, 1936. The net rate of interest earned in the ordinary branch of this office is consistently greater than in the industrial branch, a result (as we have been in the habit of pointing out each year) not easy to understand, particularly as there is only one balance sheet. The expense ratio in the industrial branch showed further reduction from 39.6 per cent. to 38.8 per cent. of the premium income. This ratio is not altogether comparable with the ratio of some other industrial offices, as the whole of the premiums are payable weekly; all monthly premium policies—which of course involve smaller collection expenses—are included in the ordinary branch. The usual annual valuation of liabilities has been made, and the results are given below:—

	ORDINARY BRANCH		Year to March 24th	
	1936	1937	1936	1937
Surplus earned in year	394,954	421,287		
Brought forward from preceding year ..	230,580	262,994		
	625,534	684,281		
Allocations:—				
To Bonuses to policyholders	327,540	319,760		
„ Shareholders' account	15,000	15,000		
„ Staff pension fund	20,000	20,000		
„ Carried forward to next year	262,994	329,521		
	625,534	684,281		
INDUSTRIAL BRANCH				
Surplus earned in year	272,574	294,815		
Brought forward from preceding year ..	130,023	131,119		
	402,597	425,934		
Allocations:—				
To Bonuses to policyholders	112,950	110,172		
„ Staff pension fund	30,000	30,000		
„ Staff benefit fund	20,000	20,000		
„ Shareholders' account	108,528	108,498		
„ Common contingency fund	25,000	25,000		
„ Carried forward to next year	131,119	132,264		
	402,597	425,934		

The rate of bonus in the ordinary branch is 40s. per cent. calculated on the sum assured and the cost is amply covered by the trading profits. For many years the rate of bonus has been 44s. per cent. The present reduction reflects a cautious view of the future, as it will be seen from the above table that the previous rate of bonus could have been maintained out of trading profits. In the industrial branch the basis of allocation is unaltered. The total assets have increased from £16,657,000 to £17,852,000 and considerable movement has taken place in the various classes of investments. Mortgages on property showed an increase of 30 per cent. to £1,540,000, but British Government securities and Indian and Colonial government securities were smaller by £186,000 and £247,000 respectively. On the other hand debenture stocks increased from £2,004,000 to £2,521,000, preference stocks from £1,500,000 to

£1,746,000 and ordinary stocks from £1,379,000 to £1,947,000. The dividend is again at the rate of 50 per cent., free of tax.

Royal Insurance Company.—New life assurances were slightly larger at £4,924,000. The net rate of interest earned on the life assurances and annuity funds fell by 1s. 7d. per cent. to £3 17s. 11d. per cent. Fire premiums were £5,526,000 against £5,558,000 in the previous year. Underwriting profits were satisfactory, but there was a considerable reduction from the exceptionally good results of 1935. Accident premiums rose from £5,160,000 to £5,494,000 and underwriting results expanded by £43,000. Marine premium income was practically unaltered at £807,000. Reserves are strong at 103 per cent., 104 per cent. and 186 per cent. of the premium income in the fire, accident and marine branches.

	1935		1936	
	Profit	Per cent. of Premiums	Profit	Per cent. of Premiums
Fire	720,631	13.0	559,695	10.1
Personal accident, employers' liability and general	297,108	5.8	340,708	6.2
Marine	60,914		52,756	
Life	50,000		50,000	
	1,128,653		1,003,159	
Less items debited to profit and loss ..	382,224		417,155	
To general reserve ..	250,000		250,000	
	496,429		336,004	

Total assets in the consolidated balance sheet amount to £57,773,000; there is a reserve fund of £1,500,000 and a profit and loss balance of £1,878,000. Mortgages on a property, after increasing by nearly £1 million in 1935 to £2,919,000, showed some reduction at £2,844,000; to £2,919,000, showed some reduction at £1,332,000. British policy loans were also smaller at £14,162,000, while government securities amount to £9,072,000 are equal to foreign government securities at £8,193,000 16 per cent. of the total assets, compared with £8,193,000 in 1935, and £6,533,000 in 1934. Debenture stocks increased by £264,000 to £8,753,000 and preference stocks by £92,000 to £4,050,000 for the seventh successive year. The dividend is 65 per cent. and costs £1,390,000, against interest earnings of £1,223,000.

Yorkshire Insurance Company.—In the fire branch premium income in 1936 was £16,000 smaller at £897,000, but underwriting profits were the best for many years. The accident department resulted in an increase of £77,000 in premium income, but profits were lower. New life assurances increased by 14 per cent. to £2,780,000. The net rate of interest earned on life assurance funds fell by 2s. 1d. per cent. to £4 4s. per cent. Marine premium income was somewhat smaller at £339,000.

	1935		1936	
	Profit	Per cent. of Premiums	Profit	Per cent. of Premiums
Fire	103,585	11.3	117,923	13.2
Accident and general	36,633	2.9	28,885	2.1
Marine	9,985		13,570	
Life	13,570		8,000	
Profits from reversions	8,000		178,507	
	171,773		30,000	
To general reserve ..	30,000		148,507	
	141,773		112,798	
Less items debited to profit and loss	105,475		35,709	
	36,298			

The total assets of the Yorkshire increased from £15,091,000 to £15,848,000; the investment reserve remains at £100,000 and the general reserve increased by £30,000 to £1,165,000. In addition to the usual reserves for unexpired risks, additional reserves in the fire and accident departments amount to £320,000 and £220,000 equal to 35 per cent. and 16 per cent. of the

premium income. The marine fund amounts to 176 per cent. of the 1936 premiums. The dividend is unchanged at 47 $\frac{1}{2}$ per cent. and costs £139,000, compared with interest earnings of £104,000.

Marine Insurance Company.—The premium income of this Company (which is a subsidiary of the London and Lancashire) reversed the trend of recent years by increasing in 1936 from £521,000 to £592,000. First year's claims and expenses accounted for 32 per cent. of this premium income, compared with 29 per cent. in each of the previous two years. Claims in the 1935 underwriting account at £218,000, although quite satisfactory in amount, were somewhat greater than the comparative experience of recent years. The 1934 underwriting account has been closed by a transfer to Profit and Loss of £107,000, which is equal to 20.1 per cent. of the 1934 premium income; the profit transferred in the two preceding years amounted to 23.2 per cent. and 22.5 per cent. Total assets are £2,633,000, against which there is a Reserve Fund of £700,000 and a Profit and Loss balance, after providing for the 1936 dividend, of £457,000. Interest earnings are £90,000 and the dividend, unchanged at 40 per cent., costs £183,000.

Motor Union Insurance.—The accident department is much the most important branch of this company's business. The total premiums in this branch in 1936 amounted to £1,615,000, compared with £1,606,000 in 1935. Although the report unfortunately does not show the figures relating to the various sections which comprise this branch, motor insurance premiums probably accounted for about 90 per cent. of the total. In the circumstances, the large increase in the underwriting profit is especially gratifying. Fire premiums were slightly lower at £185,000, but marine premiums increased by £3,000 to £54,000.

	1935		1936	
	Profit	Per cent. of Premiums	Profit	Per cent. of Premiums
Fire	26,480	14.1	24,504	13.2
General	94,898	5.9	146,265	9.1
	121,378		170,769	
Less Items Debited to Profit and Loss ..	52,464		89,845	
	68,914		80,924	
To general reserve	69,000		93,000	

Total assets amount to £2,823,000, and the market values of the assets on December 31, 1936, exceeded the book values by £153,000. In addition, there is an investment reserve fund of £243,000. There is also a general reserve of £586,000. The dividend on the share capital—which is held by the Royal Exchange—has been increased from 32 per cent. to 37 per cent. The cost is £56,000, against interest earnings of £79,000.

Sea Insurance Company.—The total premium income increased slightly from £705,000 to £707,000; the marine branch alone accounts for £465,000 against £452,000 for 1935, and as usual underwriting results were good.

	1935		1936	
	Profit	Per cent. of Premiums	Profit	Per cent. of Premiums
Fire	4,804	3.3	7,456	5.4
Accident	3,158	3.0	3,105	3.0
Marine	38,464		57,875	
	40,110		62,226	
Less Items Debited to Profit and Loss ..	20,666		22,524	
Account ..	19,444		39,702	

Total assets amount to £2,292,000, compared with general and investment reserves aggregating £750,000 and a free profit and loss balance of £199,000. The dividend is at the usual rate of 17 $\frac{1}{2}$ per cent., and its cost is covered by interest earnings.

Corporation Borrowing Again.—After an interval of six months, the voice of the corporation borrower is again heard in the new issue market. A deputation from the City Council of Leeds has visited London, and obtained permission to issue £4,000,000 of new stock. The "life" of this stock is the conventional span of twenty to twenty-three years, but the rate of interest is new and portentous. For the first time since cheap money became well established, a first-class home corporation is issuing—not a 2½ per cent. or a 3 per cent., but a 3½ per cent. stock. The price, at 101, is as near par as makes no odds. As a clue to official intentions this curtain-raising operation appears to have a twofold significance. First, it suggests that the Treasury is not prepared to insist on a monopoly of the market until its National Defence Bonds are digested. Secondly, the authorities would appear to have decided to take the cash and let the credit go—in other words, they are meeting the market in fixing the terms of all new issue operations except their own. Only the Government are in the happy position of having Public Departments which can take in their own washing. For other borrowers it is wise not to run the risk of creating a mass of undigested new corporation securities in order to maintain a fictitiously low interest level.

Home Rail Rates and Traffics.—Since the Chancellor wrought havoc in the speculative share markets, "marginal" Home Rail stocks have received more attention. Home rails are entirely immune from N.D.C., and they have improved their status since the 1936 reports were issued and chairmen's speeches heard. This week, further particulars of the companies' application for increased charges have been published. Apparently the companies propose to increase all charges—passenger and goods, "standard" and "exceptional"—by a flat rate of 5 per cent. The increases in the costs of road transport and the "boom" demand for transport of all kinds support the companies' contention that increased net revenue will be obtained, although it will probably be much less than the "theoretical" figure of £8,000,000 which represents 5 per cent. of gross railway receipts last year—for reasons discussed at length in a Note on page 446. Moreover, any increase of net revenue will necessarily be shared with the workmen—claims involving an annual cost of some £2,250,000 are already due for consideration. The main market significance of the companies' proposal lies in the fact that it releases railway stocks from the stable revenue *cum* increasing costs position which they seemed to occupy three months ago.

The trend of traffics, accordingly, again assumes considerable interest for investors. The current week's figures are somewhat indecisive. They refer to a pre-Whitsun week which also included Coronation Day—a bank holiday. In comparison with the pre-Whitsun week of 1936 they show a decline of £65,000—gains of £84,000 in passengers and £33,500 in coal being offset by a merchandise decline of £182,500. There is no doubt, however, that lately the trend has been improving. Whereas in the first ten weeks of the year, the average weekly gain was only £51,000, in the third five-week period, which included Easter, the weekly gain was £155,000, and in the three post-Easter weeks (not including Coronation week), the average gain was £221,000. The main advance lately has been in passengers, and is largely due to the Coronation, but goods and coal traffics have been very well maintained, and, barring a national coal strike, should continue favourable. The medium-term prospects of Home Rail stocks, in short, look more promising than they have been for some time.

Increased Tea Quota.—The International Tea Committee sprang a complete surprise with its decision to increase export quotas by 5 per cent. during the current regulation year. This is the first occasion on which an established quota has been altered, and the

measure is the more unexpected in that the season is already nearly two months old. The substantial rise in tea prices, which has recently provided the one cheerful note in the commodity markets, has undoubtedly impressed the Committee with a sense of urgency. Since the beginning of the year Ceylon and Javanese teas have sold at about 2½d. a lb. above the average for 1936, and common Indian teas have now risen to about 1s. 3d. a lb., against approximately 1s. a lb. last year. At the same time, stocks of tea in London have declined by 81 million lbs. in the first four months against only 28 million lbs. last year. Definite indications are still lacking whether this exceptional reduction is due to larger consumption or to an accumulation of invisible reserves in the hands of dealers. The prospect of some increase in tea duties undoubtedly stimulated purchases by distributors. But demand has shown no falling off since the Budget was announced, though it is conceivable that the expectation of higher prices itself encouraged purchases during the past few weeks. The forthcoming auctions will thus provide an acid test of the strength of the recent advance in prices. Some decline—possibly of appreciable dimensions—may be expected to follow upon the new quota announcement. But unless actual consumption has shown no improvement whatever, part at least of the gains should be held. The trend of prices in the more distant future is somewhat obscure. Larger supplies may be expected to correct the tendency for the margin between common and fine teas to close, which had become so noticeable in recent months. It is even possible that producers of finer grades such as the Darjeeling and some of the Assam companies, together with the leading Ceylon estates, will enjoy higher prices if demand tends to increase somewhat, even though common teas become more plentiful. This new move of the Tea Committee has thus enhanced the perplexities of the prospective investor in tea shares. Previously it appeared likely that common-grade producers would reap the more substantial gains this year. The better-class companies now stand in a more attractive light. In general, investors would be well advised to await the course of auction prices in the next few weeks before entering into new commitments.

A Threat to Rubber?—Rubber has recently been meeting with more than a normal share of adversity. After showing distinct signs of recovery, with prices climbing once more to the level of 11d. a lb., the market experienced a precipitate drop on the report that a new duty, amounting to 125 marks per 100 kilograms, had been imposed on imports of rubber into Germany. The avowed object of the tax is to provide funds for the erection of plant to produce the variety of synthetic rubber known as "Buna," with which German chemists have long been experimenting. Though reports from Germany of the progress of this material have not been lacking during the past year or so, the market in general has tended to treat these and similar accounts from other centres with some scepticism. The realisation that the drastic measure now announced would hardly have been adopted if commercial production of synthetic rubber were not close to the stage of practical possibility, has come as a considerable shock. Second thoughts, however, have produced rather more reassuring views about the near-term prospect. Germany's demand for raw rubber is still extremely heavy, and some years must elapse before home-made substitutes can replace the 70,000 tons which she annually requires, though a steady reduction in imports as the Four-year self-sufficiency plan progresses may be inevitable. But even the total loss of the German market, amounting to about 7 per cent. of world demand, would hardly be a major tragedy, and might normally be made good by expansion in other markets—provided that the costs of production of synthetic rubber are not reduced from their present extravagant levels to a figure more competitive with the natural product. This seems a remote contingency and "Buna" and its fellows will probably long remain the expensive luxury of totalitarian governments.

Building Society Co-operation.—Sir Harold Belman's presidential address to the first conference of the new Building Societies Association this week necessarily dwelt mainly on the importance and progress of the policy of co-operation, which unfortunately produced last year's cleavage within the movement. The Code was never intended to be a rigid formulation, and although less than a year has passed since its inception, revision has been found necessary in the light of experience. Some provisional amendments are in operation, and it is the task of the Conference to arrange for further revision. Sir Harold found it advisable, in view of certain misconceptions, to reiterate that the Association's object was to safeguard and not to penalise. On the future of building activity, his remarks were cautious, but he threw out the interesting suggestion that qualitative improvements in housing accommodation might provide a new outlet for building society finance.

Industrial Profits in April.—The increase of 23.36 per cent. in the profits of companies whose reports were published in April is the largest since October. Rubber companies, showing a rise of 112 per cent., account for 75 out of the 245 reports, but their influence on the total increase of £6,004,776 is not large. The record of recent months is shown below:—

Reports published in	No. of Companies	Rise in Profits*	Reports published in	No. of Companies	Rise in Profits*
1935—			1936—		
December ...	159	12.27	August	47	14.21
1936—			September ..	107	12.32
January	128	13.66	October	146	18.09
February ...	205	9.00	November...	177	13.49
March	236	17.39	December ..	175	15.49
April	254	9.66	1937—		
May	269	9.41	January ...	110	15.92
June	214	13.50	February ...	208	8.95
July	228	15.69	March	307	12.52
			April	245	23.36

* After payment of debenture interest.

The total net profits covered by the April reports amounted to £31,712,217, compared with £25,707,441 for the preceding year. The greatest absolute improvement is shown by the miscellaneous group, which includes the Imperial Chemical and the Unilever results, though these two reports together reduce—rather than increase—the average percentage increase. Shipping companies alone account for nearly 25 per cent. of the total rise in profits.

Company Notes

British Oxygen Progress.—The report of British Oxygen, embellished with a consolidated profits statement, is distinctly impressive. The profits attributable to the parent company have increased by one-third—from £451,928 to £602,379—and although the grouped earnings statement is presented without a comparison for 1935, it is evident that the consolidated profit of £995,781, before depreciation, represents a striking advance over 1935. As much as £301,409 has been provided by the company and its subsidiaries for depreciation, and special appropriations and other undistributed profits total £94,093, leaving £600,279 available for British Oxygen, whose recent revenue achievement is analysed below:—

	1934	1935	1936
Profit, after depreciation	359,979	451,928	602,379
Fees, taxes and pensions	27,100	9,827	81,427
Preference dividend	32,500	32,500	32,500
Ordinary stock—			
Earned	300,379	409,601	488,452
Paid	248,567	334,185	401,297
Paid (%)	15	15	15
Additional and general reserve	75,000	75,000	75,000
Carried forward	21,983	22,399	34,554
Ordinary capital	1,657,116	1,933,302	2,655,674

The latest earnings, apart from the undistributed amounts retained by subsidiaries, are equivalent to 18.2 per cent. on the ordinary capital after including the 6½ per cent. scrip bonus announced a fortnight ago. Trade at home and abroad continues to expand, and the dynamic technical nature of the company's business has been enhanced by the acquisition of the Quasi-Arc and Ferro-Arc interests, from which no profits have been included in the accounts. These acquisitions and the further extension of plants are responsible for the main balance-sheet changes. The company's position is strong and progressive—qualities for which investors must pay the price, for the ordinary stock stands at 5½ cum bonus, and yields but 3 per cent. It is, in short, likely to make its main appeal to the long-term investor.

Edmundsons Electricity Report.—The profits of this electric supply undertaking—the largest in the country—show an increase which closely corresponds to the raising of the ordinary dividend from 8 to 9 per cent. A substantial proportion of the earnings, however, comes from contracting and other services to subsidiary companies on capital account. The parent company treats these as revenue profit, although canons of accountancy might suggest special treatment. Furthermore, if the Government introduces legislation on the lines recommended by the McGowan Committee, this revenue (obtained, presumably, under non-competitive conditions) is hardly likely to be maintained. The table below shows the effect if revenue from this source is excluded, in a final calculation:—

	Years to March 31st		
	1935	1936	1937
Gross trading profit	143,387	196,693	208,587
Administrative expenses, etc. ...	34,017	32,403	32,086
Net direct profit	109,370	164,290	176,501
Interest and dividend receivable, etc.	502,533	527,778	589,564
Total income	611,903	692,068	766,065
Interest on debentures, etc.	132,839	144,570	202,568
Income tax	20,381	37,245	43,130
Preference dividends	111,760	111,760	111,760
Available for ordinary	346,922	398,493	408,607
Ordinary dividend	299,200	299,200	336,600
Earnings (%)	9.6	11.5	11.6
Rate (%)	8	8	9
Reserve	45,000	50,000	30,000
Written off	...	44,150	41,250
Carried forward	44,577	49,720	50,477
Earnings available for ordinary, excluding net direct profit	237,552	234,203	232,106
Equivalent to	6.3%	6.3%	6.2%

The proportion of subsidiaries' profits distributed in dividends to the parent company cannot easily be ascertained. The consolidated balance sheet shows an increase in depreciation reserves of £380,000, after deducting

The Distinctive System

of
The Scottish Provident Institution

Under The Distinctive System the premiums are so moderate that, at early and middle ages, the annual sum charged elsewhere for a Whole Life Assurance of £1,000, with profits, will here secure from the first as much as £1,300 or thereby with right to share in the Surplus.

Write for an explanatory booklet

The Scottish Provident Institution

London (City) Office 5 Lombard Street, E.C.3
HEAD OFFICE 6 St. Andrew Square, EDINBURGH
FUNDS EXCEED £24,000,000

capital expenditure written off in the year. Unless these amounts written off are of the order of £250,000, the year's allocation to depreciation reserves appears rather lean, for fixed assets total over £20 millions. On the other hand, there is an increase in the consolidated surplus of some £415,000. Part of this sum may represent transfers to general reserves by subsidiary companies which make provision for depreciation without specifically allocating it as such. It seems fair to estimate consolidated earnings, after depreciation, but excluding the direct trading profit from capital services to the subsidiaries, as approximately equal to the ordinary dividend. A consolidated profit and loss account would make this matter plainer. The £1 ordinary shares stand at 42s. and yield £4 8s. per cent. Perhaps the appointment of Sir Thomas Royden and Mr F. H. James, of the Imperial Continental Gas Association, which has acquired a substantial holding of the ordinary capital, may be followed by a further clarification of the accounts, which are already more explicit than those of many large electricity undertakings.

* * *

Disappointing "Kruschen" Profits.—The steady fall in Griffiths Hughes Proprietaries £1 shares from 59s. 6d. early last year to the present figure of 37s. 6d. has correctly anticipated the unfavourable dividend and results published this week, on which the shares fell abruptly to 32s. 6d. on Thursday. The operating company's profits have fallen sharply from £456,678 to £234,401, and the holding company's dividend is reduced from 17½ per cent. to 11 per cent. Proprietary medicine finance is full of incalculables. Investors have no knowledge of the value of their chief asset—goodwill—until the results are published. The holding company's capitalisation is based on a purchase of profits rather than fixed assets, and the profits record, in turn, is dependent upon advertising expenditure. The latter item forms the clue both to current profits (being far and away the greatest element of cost) and to their future maintenance. The fall in the Griffiths Hughes profits is so sharp that shareholders deserve the fullest information on this particular aspect of the company's finance since 1930. The company has apparently passed beyond the "aggressive" stage in its market; is it possible that it is now paying the cost in reduced profits?

* * *

"Spinners" and Ocean Coal.—These two concerns, with apparently little more in common than the proverbial chalk and cheese, have published highly interesting reports this week. Coal and cotton, until last year, have both been laggards in recovery. In neither case is full prosperity yet restored (although Ocean Coal profits permit the resumption of dividends) but recovery, even for Fine Cotton Spinners, is at least well on the way. The Association's profits have improved from £233,123 to £304,420, covering the usual depreciation provision (£100,000) and debenture interest (£110,000) with the highest margin since the year to March, 1930. The amount earned for preference dividend is £88,580, compared with £380,568 for 1929-30. At this stage recovery is quite obviously a tender plant, which must first cover the accumulated losses of £346,299 before holders of the 5 per cent. preference stock (in arrears since March, 1931) can look towards a return. The fact that the Association has continued to provide depreciation (though not at the pre-depression rate) will undoubtedly assist it to turn the better trading conditions in the spinning industry to full advantage. The industry now enjoys a price control scheme, and if it can fight rayon at home and disorder in the export markets with success, the Association's prospects over the next year or so should improve considerably. The Ocean Coal figures are complicated by the transfer of £207,175 (net) from the accumulated profits of the subsidiaries, but the dividends received by the parent company in respect of 1936 trading amounted to £178,808 compared with £78,770 for 1935. The 2 per cent. dividend is almost

exactly covered by earnings which, for the first three quarters of 1936, were derived from a lower output than in the preceding year. Some improvement is now reported and the South American business is enjoying increased turnover. Ocean Coal ordinary stock stands at 15s., yielding £2 15s. per cent., and should have fair recovery prospects, provided that peace is preserved in the coal industry and N.D.C. is merciful.

* * *

Rolls Royce Prospects.—Although the rate of advance in profits of Rolls Royce has slackened in recent years, an increase of over £40,000 (11 per cent.) is shown in the latest profits of £393,498. Trading profits, in fact, reached the record figure of £347,784. Yet the market's readiness to exaggerate the prospects of "re-armament companies" is itself responsible for any disappointment with the results. For, as the following table shows, earnings for the share capital are only £20,500 higher, and owing to the bonus issue of January last, the percentage earned is slightly lower.

	1934	1935	1936
Trading profit	262,307	299,602	347,784
Other income	33,209	53,700	45,714
Tax reserve	60,000	70,000	90,000
Pension fund and fees	33,905	33,500	33,261
Ordinary and Workers' Stock—			
Earned	201,611	249,802	270,237
Paid	169,295	191,146	223,296
Earned %	24.9	31.6	27.2
Paid %	20	22½	22½
Dividend equalisation	45,000	50,000	35,000†
Carry forward	73,316	81,972	93,913
Capital	847,138	850,090	1,064,730*

* Includes free 25 per cent. bonus created in 1937. † Includes £30,000 to consolidated reserve funds.

The balance sheet shows and the report explains some changes in the presentation of certain accounts. Out of the special contingencies reserve of £112,350 in the 1935 balance sheet, £100,000 was transferred to the consolidated reserve funds, shown at £730,000 at the end of 1936, but since reduced by £212,266 in respect of the bonus issue. The balance of the special contingencies account was transferred to provision for contingencies which, hitherto included in the single total for creditors, is now disclosed separately at £240,537. The assets side of the balance sheet likewise shows an improvement in an already satisfactory position. Debtors and stock between them amount to £1,035,752, against £758,958, while depreciation in the year took £115,094 against £70,515. The profitability of the company is largely dependent on the R.A.F. expansion programme, which cannot last indefinitely, but provides the company with a secure income while it lasts. Investors may reasonably expect the maintenance of the 22½ per cent. dividend on the increased capital, and there is room for more. But the shares provide limited speculative attraction at 5½, and the yield of £4 per cent. indicates that their solid worth requires its price.

* * *

Yorkshire Amalgamated Collieries.—In the worst year experienced by this colliery holding company in its present form, its income was £14,153. For the past year it was twenty times that amount. The latest income of £282,161 compares with £151,828 for the previous period, though allowance should be made for the sum of £41,877, by which dividends paid by subsidiaries exceeded their profits in the latest financial year. A payment of 5 per cent. tax free on the ordinary shares, against 4 per cent. less tax, understates the earnings position, for some £227,800 is earned for the equity, equivalent to about 10.4 per cent. gross, against 4.9 per cent. The sum of £50,000 inaugurates a general reserve fund, while the carry-forward is now £29,679, against £6,191. During 1936-37 important structural changes were introduced by the group. The colliery assets of the

four subsidiaries were transferred to a new company by an exchange of shares. The consolidated balance sheet, therefore, includes this new undertaking, Amalgamated Denaby Collieries, and also the Donnington Coking Company, whose plant, it is expected, will be finished by the autumn. Additions to property amounted to £90,300 during 1936, while depreciation was £99,309 against £87,384. At present, labour difficulties are threatening the coal industry's further recovery, which was late in starting, but should still have some way to go if peace is preserved. Meanwhile the old problem of royalties is being settled, while output may be assisted by the present suspension of the levies on tonnage in excess of the basic quantities. Yorkshire Amalgamated Collieries is well placed to take advantage of the favourable factors if they are allowed to operate. The ordinary shares stand at 23s., and yield £5 16s. per cent. gross.

* * *

Wiggins Teape Report.—The shares of this company have most of the merits of a first-class industrial investment, and they are justifiably well esteemed by the market. Profits show no spectacular advances, but they now progress regularly. The company follows the commendable practice of issuing quarterly reports, and its full accounts are rightly regarded as a model. The 1936 report is very satisfactory. Group profits have increased by 7 per cent.—a result which is not spectacular, but accords with the company's tradition. The following table shows the division of group profits between subsidiaries' expenses and the parent company:—

	1934	1935	1936
CONSOLIDATED FIGURES	£	£	£

† Includes £5,407 expenses, etc., written off.

The increase in the balance available for the parent company is about £40,300, against a rise of £66,000 in the consolidated profits. Ordinary shareholders of the parent company again receive a 9 per cent. dividend, covered by a further 7 per cent. in earnings, which is put to reserve. The consolidated balance sheet reflects the process of steady expansion shown in the most of whose shares have been acquired during the past year. Plant and machinery, before deducting the depreciation reserves, stand at £2,673,359 against £2,525,406, while stocks are £78,335 higher at £1,259,257. Debtors also show an increase, and a rise of 13 per cent. in cash holdings is satisfactory. The usual quarterly progress report to March 31st is issued with the 1936 report, though its contents have already been announced. Net profits before debenture interest show an increase of 3 per cent., and though a single quarter's results are insufficient for drawing firm con-

clusions, there is no reason to expect a marked change in previous trends. The present price of the ordinary shares is £2, giving £4 10s. on the 9 per cent. dividend.

* * *

Mexican Eagle.—The 1936 report of Mexican Eagle covers a period of disturbed labour conditions (which did not, however, prevent the company from increasing its sales from 26.3 million barrels to 28.5 million barrels), and appears when the outcome of labour negotiations is still uncertain. Discussions with the Mexican Government are also proceeding slowly. The market, which was not enthusiastic about the dividend, finds the report interesting, but devoid of bullish features. The trading profit amounts to £1,026,850, compared with a disclosed figure of £895,891 for 1935, which was struck after providing for the Amatlan settlement, and crediting £300,000 from non-recurring reserves. The past year, moreover, saw increased wage costs and depreciation charges. After providing for Mexican taxation (£254,004 against £207,184), the sum of £792,615 is available for dividends, compared with £705,097. Profits for the past three years are analysed below:—

	1934	1935	1936
Trading profit (after depreciation and reserves).....	781,571	895,891*	1,026,850
Other income	21,707	16,390	19,769
Total income.....	803,278	912,281	1,046,619
Mexican income tax.....	139,625	207,184	254,004
Available for dividends	663,653	705,097	792,615
First preference dividend.....	84,698	83,113	77,787
Participating preference dividend	Nil	35,417†	38,959†
Ordinary dividend	Nil	586,782†	645,460†
Tax payable for previous years	145,240	Nil	Nil
Provision for duties payable on cancellation of 1906 concession.....	422,535	Nil	Nil
Carried forward	11,180	10,965	41,374

* After crediting reserves not required, and providing for disposition of Amatlan lawsuit. † 10d. per share.

The report notes that increased profits are attributable to the sale of some 2,800,000 barrels more than in 1935, for export sale prices were little changed. Recent production figures, coupled with the firm condition of the export oil market, would suggest a renewal of speculative interest in Mexican Eagle, but for the over-riding factor of the difficulties of its domicile. The \$4 shares are now 19s. 9d. (compared with a high level last year of 34s. 4½d.) and yield 4.6 per cent. They seem fated to remain an uncertain market until the Mexican situation is finally settled on satisfactory terms.

* * *

Canadian Eagle.—The Canadian Eagle accounts are rather more impressive. The company's business is almost entirely confined to oil marketing and shipping, and the report points out that profits depend upon the margin between selling and wholesale prices. Total income rose last year by £176,000, and the actual trading results are actually better than this bald figure suggests.

* Includes, in 1934, £222,975 dividends relating to 1933, and in 1935, £68,229 relating to 1933-34. † After credit of £222,884 in 1934 and £10,565 in 1935 from investment reserve no longer required. ‡ Less interest. § Paid and/or accrued; arrears paid to date on May 7, 1936. || General reserve. In 1934 includes £200,000 special exploration reserve.

Canadian Eagle is predominantly an oil shipping concern and freight rates are therefore of prime importance to its earnings position. Since the end of September last year Gulf rates have advanced from 8s. 6d. per ton to 35s. The report points out that the increase in freights affects the company only to the extent to which it is passed on in selling prices. It is generally considered that the increase in freights is fully equivalent to the increase of 1½d. per gallon in British petrol prices. This calculation does not go far to assist the market's anticipation of a further rise in petrol prices. But it suggests that *Canadian Eagle* has somewhat better prospects than Mexican Eagle, from which it purchases its principal supplies. Yet *Canadian Eagle* could not wholly escape the incidence of any labour trouble in Mexico, and the ordinary shares have fallen to 18s. 10½d. They are still solely of interest to the speculator.

Mr Welch on Rubber. — Recently the leaders of the plantation industry have been more preoccupied with the possible ravages of the National Defence Contribution on company profits than with any hypothetical challenge to the supremacy of rubber, such as we examine in a Note on page 466. In his exhaustive address at the annual meeting of the *Rubber Plantations Investment Trust*, Mr H. J. Welch elaborated the objections to the proposed new tax which have by now become familiar, and appealed to the Chancellor to adopt alternative methods of assessing the “standard” rate of profits for rubber and tea companies. Mr Welch regards even 10 per cent. as an onerous basis for any “Increase of Profits Tax” as he termed the new levy, and suggests instead a minimum profit allowance of £7 to £8 per mature acre, or the taxation of profits from an increase in prices above an agreed figure. For tea areas the adoption of a standard is somewhat more difficult, though the solution favoured by Mr Welch is an average of the three best consecutive years between 1925 and 1936. Among the most important recommendations made in the speech is the suggestion that the ban on new planting of rubber should now be rescinded. Mr Welch looks upon the present replanting provisions as quite inadequate. He anticipates a very considerable increase in rubber consumption over the next decade and regards the opening up of new areas as essential if future requirements are to be satisfactorily met. This is a matter which is likely to acquire greater prominence in the near future.

Recent Rubber Reports.—Among recent rubber results the report of the *Malacca Rubber Plantations* is the most important. Output, though substantially lower than in 1935, brought in over £20,000 additional revenue and as estate costs were practically unchanged, distributable profits were almost doubled. The gearing of the ordinary stock is increased by the £115,000 preference capital, so that the dividend is raised from 2½ per

cent. to $7\frac{1}{2}$ per cent. For the current year the company has received a moderate increase in its standard assessment, and its prospects are excellent. Since no profits were earned in the five years prior to 1935, however it will be particularly vulnerable to N.D.C. deductions unless Mr Welch's suggestions are accepted by the Chancellor. *Kirby Rubber Estates* is to this extent fortunate, as its relatively high capitalisation (£78½ per planted acre) precludes any rapid increase in profits. In 1936, however, earnings showed a large improvement on the unfavourable results for 1935, and the dividend (at 5 per cent.) was doubled. The standard assessment this year is unchanged, though a start has been made with some experimental new planting. *Emerald Rubber*, on the other hand, has received an increased assessment of over 10 per cent. on last year's figure, and its supply of young rubber would appear to be extremely good. Profits were more than doubled in 1936 and dividends rose from 5 per cent. to 10 per cent. Here, too, costs were practically unchanged and the bulk of increased receipts were retained as net profits.

Other Company Results.— Company reports continue to appear in large numbers, and our usual analysis of profit and loss accounts on page 486 again includes over 65 other companies. The reports of the *E. D.* and *R. M. Realisation* companies are now available, showing the steady progress of the liquidation of the two groups. The results are discussed on page 487 under the heading “ Shorter Company Comments.”

Company Meetings of the Week.—In this issue the reports of company meetings commence on page 476. The world-wide nature of the company's interests was illustrated by Mr A. E. Pattinson at the *Liverpool and London and Globe Insurance* meeting, when he disclosed that business had been transacted in one hundred different countries and forty-six different currencies. Lord Middleton, addressing the *Yorkshire Insurance Company* meeting, reported that the net new sums assured amounted to £2,779,772 against £2,430,353 for 1935. A substantial increase in premium income and a fall in the sum paid in surrenders was reported by Mr Walter H. Brown at the *London and Manchester Assurance* meeting. Reference was also made to an interesting new departure in appointing agents on a salary instead of commission basis, while there had been a reduction in the expense ratio. At the *Smith's Potato Crisps* meeting, Sir Herbert Morgan remarked that an advance in the price of certain materials had been partly offset by economies in production. Industrial recovery in some of the depressed areas was helping sales, though profits had probably been affected by the bad summer. Addressing *British Match Corporation* members, Mr Clarence E. Bartholomew discussed the position of certain overseas interests: conditions in Brazil were improving, Dominion investments had again proved remunerative and holdings in the Argentine were being increased. An expansion of both lighterage and road transport business was reported by the chairman at the *James W. Cook and Company* meeting. Sir William Burton, at the *London County Freehold and Leasehold Properties* meeting, informed his hearers of the progress made with the modernisation programme. The chairman pointed out to *Mining Trust* proprietors that the increase in the debit balance on income and expenditure account was not due to any new losses, and he reviewed the latest year's working of the various subsidiaries. Mr H. S. Hersov, at the *West Spaarwater* meeting, outlined the progress made in drilling operations. Mr R. Olaf Hambro was able to tell *Hambros Bank* shareholders that certain customers in Italy were again using the bank's services. The chairman, at the *Odhams Press* meeting, said it was proposed to consolidate part of the balance due by *The Daily Herald* into debenture stock. At the *Telephone Manufacturing* meeting, Mr Fred T. Jackson informed his hearers that the company was protected against rising costs in its long-term contracts, by a "costs variation" clause and covered itself on raw materials in other contracts.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: MAY 25

ACCOUNT: MAY 27

THE last week of the Coronation *cum* Whitsun account has provided no new factors of investment importance, unless the better tone in the industrial market towards the end of the week presages more hopeful things for the "Finance Bill Account." It was, at least, remarked that this was the first account for some time which promised to end firmly, and while it would be easy to exaggerate the improvement in buying, there was at least no liquidation of the recent disorderly character.

By contrast, the gilt-edged market has turned downhill, after some weeks of comparative firmness. The woes which fell upon industrials after N.D.C. helped the gilt-edged market; but now the latter appears to be affected by the imminence of new corporation borrowing (on markedly more favourable terms to the borrower than those of six months ago) and by the prevailing discussion of stabilisation which might well involve some qualification to the free monetary management of the past five years.

The decline in the funds was marked by a fall of half a point in Old Consols on Wednesday. On the imminence of corporation borrowing, the market immediately adjusted other corporation issues to the new terms. Some foreign bonds tended to improve. Brazilians, which opened nervously, advanced in mid-week, on all-round support both for the Fundings and for the lower grade groups. Japanese issues opened firm, but German bonds failed to maintain their prices.

The home rail market was convicted of extravagance in its estimate of Coronation and holiday traffics. The actual traffics proved disappointing, compared with the corresponding holiday week of 1936, but the railways' detailed proposals for a 5 per cent. increase in freight and passenger rates stimulated the market on Thursday. Tuesday, scarcely

The tone in the industrial market on Tuesday scarcely suggested that the account would finish somewhat stronger and when improvement did come it was a matter of pence rather than shillings. Iron and steel shares opened dull, but improved on Wednesday, and in many instances again on Thursday. Motor shares improved on the registration figures. There were few features in the electrical equipment group, apart from the sharp fall in Telegraph Condenser on the halving of the dividend. Edmundsons Electricity improved on the report (discussed on page 467). "Cottons" with a good

Distillers were a feature among "wet stocks," with a good rise on Wednesday, but many of the brewery shares were a few pence lower. Tobacco shares responded to a little late investment interest, and the Unilevers also advanced. In the textile market, the new Joshua Hoyle debentures opened at a two-point discount, while Spinners fluctuated considerably on the results. Courtaulds improved by a few pence from mid-week onwards, and moderate interest was shown in shipping shares, P. and O. and Furness Withy both showing improvement.

Few changes of importance occurred in the miscellaneous leaders, although even where shares showed no quotable alteration, the general tendency was appreciably firmer. Issues like Murex, British Oxygen (whose report, analysed on page 467, was well received), Turner and Newall, and Imperial Chemical showed moderate improvements. Engineering and building issues were steady or lower. Griffiths Hughes fell sharply from 37s. 6d. to 32s. 6d. on the reduced profits (see page 468). Preference shares remained small. Some

Business in the plantation shares remained small. Some falls occurred among rubber shares at the opening, although there was no selling pressure, but the absence of any considerable support on the improvement in the commodity merely put the market steadier without inducing a new advance. Tea shares, similarly, were slightly lower at first, but maintained their new levels.

The mining markets opened with a steady tone, but after mid-week they produced distinctly better form than of late. The rise was mainly of a professional character, assisted by the stabilisation discussion and an appeasement of the recent fears for the future of gold. The rise was widespread, finance house issues, established mines and developing mines sharing agreeably in the unwonted sunshine. The better spirit produced a sharp rally among Rhodesian copper issues, and diamond shares were appreciably better, assisted by Sir Ernest Oppenheimer's remarks at the De Beers meeting. Base metal shares improved somewhat, but tin shares were deserted.

NEW YORK STOCK EXCHANGE

PRICES as a whole have been a little irregular, without any important changes in trend taking place. On either side of the Whitsun week-end the volume of business was small, such activity as there was being mainly due to professional operations, with interest centred round steel and mining companies, and rails. An upward trend on Monday's opening was reversed during the session, utilities being affected by the proposal to set up a number of power authorities similar to the T.V.A. A favourable influence on Tuesday was the news that the Judiciary Committee of the Senate had decided against the proposal to reform the Supreme Court, though the next day there was some profit-taking. A new aggressive note in the labour position has been struck by the Republic Steel Corporation's announcement that if anything arose to provoke a strike, the works would be shut down until the men could return to work peacefully and without intimidation. Steel consumption continues to be heavy, but a slight easing of the situation is implied by a cut in the price of Pittsburg scrap. Steel mill activity is estimated by *Iron Age* at 92 per cent.—the same as for the previous week.

COMPANY MEETINGS

LONDON AND MANCHESTER
ASSURANCE COMPANY, LIMITED

ANOTHER SUCCESSFUL YEAR

STRONG POSITION

The sixty-eighth annual general meeting of the London and Manchester Assurance Company, Limited, was held, on the 19th instant, at the chief offices, Finsbury Square, London, Mr Walter H. Brown (the chairman) presiding.

The Chairman, in moving the adoption of the report and accounts, said:—Turning to the results for the past financial year, the principal features were: Ordinary branch—The premium income was £1,382,195, and again showed a substantial increase, this being £72,742. Consideration money for annuities was lower, and single premiums a little higher. Death claims were more by about £10,000, and maturities by survivorship were less by about £11,000. On the whole the progress was encouraging. The ratio of expenses to office premiums (adjusting as usual for single premiums) was, roughly, one-half of 1 per cent. less, compared with the year before.

Having regard to the obscurity of the financial outlook, the directors consider it advisable as a precautionary measure that the bonus distribution in this branch be restricted to £2 per cent., although the surplus at £329,521 to be carried forward in the life fund is greater than a year ago and sufficient to provide a further bonus of £2 1s. 4d. per cent.

The net yield on this fund was £4 6s. 5d. per cent.

INDUSTRIAL BRANCH

A substantial increase in premium income of £53,984 is also to be recorded in this branch, bringing up that income for the year to £1,803,530. The sum paid in surrenders was 25 per cent. less than in the previous year. As regards claims, those paid on account of survivorship of the endowment period were less than in the year before, but death claims show an increase of over £30,000, this office having felt the full effect of the influenza epidemic.

During the year a commencement has been made in the direction of appointing agents on a salary instead of a commission basis. This has involved a considerable amount of re-distribution of calls so that a salaried agent has less distance to walk each week, and can collect a larger amount of premiums in a day's work without any greater degree of effort. The process of introducing these new terms and concentrating the areas has of necessity to be somewhat slow, but it is already to be seen from the accounts before you that there is a reduction of about three-quarters of 1 per cent. in the expense ratio when measured against the premium income. We do not, however, assert that such a method of measuring the expense ratio is the one and only correct one, for this must be a matter of opinion and can be misleading in an office like the London and Manchester, where there is no monthly premium transacted in the industrial branch.

The net yield on the industrial life fund was £4 5s. 7d. per cent., which is 1s. 3d. less than in the previous year, but 9d. more than two years ago.

Although none of the policies issued in this branch has any contractual right to participate in any of the profits of the company, we have provided for the repetition of our past performance in allocating the same rates of bonuses. The rates are described in the directors' report.

I may mention that there is now no such thing in this office as forfeiture of benefits paid for. If, owing to unemployment or other cause, an industrial policyholder discontinues payment of premiums after two years he is granted, after an extended period of free and full insurance cover, an automatically created free paid-up policy of a value calculated in accordance with certain rules laid down by Act of Parliament. On March 24th last this company had in force no fewer than 217,294 of these free policies.

It will have been observed that the premium income in the fire and general branch for the year was not far short of £80,000. Greater activity has been displayed in this branch during the past year, and from the steps that have been taken even more promising results should be in evidence in the present year.

ASSETS

As you will have seen from the accounts, the funds on March 24th last reached the impressive total of £17,738,925, having been increased in the course of the year by the very material sum of £1,191,202. As I have mentioned to you before, the security for the assurance funds is a prime consideration, and, as usual, our assets have been cautiously valued. The sum of £27,500 has again been taken from profit and loss balance and

applied to writing down property values. A new fund, called the "Common Contingency Fund," has been set up out of free surplus, the £125,000 appearing under that heading in the balance sheet being made up as to £25,000 from the industrial branch account and £100,000 from the profit and loss account. In the aggregate the balance sheet values of the Stock Exchange securities considerably exceed the middle market prices quoted on March 24, 1937, less accrued interest, though of course the appreciation is not as much as it was a year ago.

Of Stock Exchange securities no less than 80.8 per cent. is invested in the United Kingdom, and a further 14.6 per cent. in the rest of the Empire, thus leaving only 4.6 per cent. in foreign countries. As much as 49 per cent. of the amount of our Stock Exchange securities carry a definite date of redemption. The remaining assets are all in the United Kingdom.

Perhaps a few words upon the part played by the company in that great and important social development—National Health Insurance, which enters so largely into the life of the nation, may not be inappropriate. In the course of the past year, the company, acting in association with the National Amalgamated Approved Society, was responsible through our representatives for the payment to "London and Manchester" members of 279,981 sickness and disablement benefits totalling £139,892, and 9,332 maternity payments amounting to £20,429. And, further, £17,350 approximately was represented by non-cash treatment benefits.

COMPANY'S GROWTH DURING FIFTY YEARS

I may be pardoned for making a personal reference. This is my fiftieth year of service with the company, practically a life-time of endeavour containing many difficulties but an abundance of pleasure in the many and variable duties that have fallen to my lot. The following figures covering that period, and illustrating the growth of the company, may be interesting to you, as, you can realise, they are to me:—

Year ending	Premium Income	Funds
March 24, 1887	£ 56,206	£ 23,464
" 1907	423,542	452,691
" 1927	1,979,515	7,180,926
" 1937	3,267,919	17,738,925

The report and accounts were unanimously adopted.

HAMBROS BANK LIMITED

IMPROVED EUROPEAN CONDITIONS

The twenty-fifth annual meeting of Hambros Bank Limited, was held, on the 20th instant, at 41 Bishopsgate, London.

Mr R. Olaf Hambro (the chairman), said:—In addressing you last year I touched on various points in the situation in Europe and ventured to predict an improvement in the situation generally, both commercially and politically. I think I can say without fear of contradiction that my forecast has been justified. In spite of the revolting spectacle of the Civil War in Spain, conditions in the rest of Europe have improved and are daily improving. I told you last year that our relations with our friends of long standing in Italy had almost ceased to exist. I am glad to be able to say that is not now the case, and various of our customers in that country are again using our services.

One of the most outstanding events of the past year was the very important arrangement made by our country with the United States and France on the question of the stabilisation of the three currencies by Equalisation Fund Control. This is the first step—basis of world currency stabilisation without which foreign trade cannot truly expand.

In my opinion the general improvement in the industrial position of this country is not primarily due to the armament programme, but to a general restoration of confidence, which makes it all the more unfortunate that the Budget Speech should have been interpreted in the way it was.

In order to meet the requirements of our various customers, we have decided to create a Trustee and Executor Company with a capital of £250,000, of which £100,000 will be paid up.

Our liquidity is again in the strong position which it is our custom to maintain, in spite of the fact that this is bound to react in a slightly adverse way on the profit and loss account. Taking the account, however, as a whole, I am sure you will agree with me that it is eminently satisfactory, the slight decrease from last year being unimportant, and over a period of years the profit shows steady expansion.

The report was unanimously adopted.

THE LIVERPOOL AND LONDON AND
GLOBE INSURANCE COMPANY,
LIMITED

101st ANNUAL REPORT

NEW RECORDS IN 1936

The 101st annual general meeting of the Liverpool and London and Globe Insurance Company, Limited, was held, on the 19th instant, in Liverpool.

Mr A. E. Pattinson, the chairman, said that, after provision for taxation, total underwriting profits and investment earnings (including life interest) in 1936, had been greater than in any preceding year in the company's history. Underwriting results—to which every department contributed—were amongst the best it had experienced; total premium income had risen; new life business figures constituted a record; and the total expense ratio had been lowered.

WORLD-WIDE SERVICE

A vision of world-wide service, which the name "The Liverpool and London and Globe" connotes, was given by the chairman when he indicated that the company last year transacted business and settled losses in 100 different countries and in 46 differing currencies.

At the root of disturbed international affairs lay lack of confidence. It was one of the primary functions of an insurance company to provide security, the basis of confidence and the antidote to fear. For this reason insurance companies must be financially strong.

FIRE LOSSES AND MOTOR CLAIMS

The direct fire loss in Britain last year, amounting to nearly £11,000,000, would have paid for the erection of some 27,000 dwellings at £400 each, capable of housing 80,000 to 100,000 persons. The same money could have paid the wages of 70,000 men for a year at £3 a week each.

In the light of never-ending third-party claims, one of the greatest achievements of British underwriters had been to keep motor insurance premium rates in this country on an equitable basis. In the past five years British companies had paid practically

£100,000,000 in motor claims alone, a figure which took no account of the indirect and consequential losses resulting from such accidents.

1936 RESULTS

Net Premiums.—Fire, £3,909,518 (against £3,960,629 for 1935); accident and miscellaneous, £4,627,128 (against £4,293,399); marine, £294,163 (against £290,393).

Profits, exclusive of interest, were: Fire, £410,985; accident, £230,177; marine, £21,017; and life, £26,000. Total interest to profit and loss account was £417,248.

At the new record figure of £3,211,028, net new life sums assured were £750,427 greater than in 1935.

Profit and loss account, after providing for dividend, income tax, etc., showed a balance carried forward of £620,017.

The report and accounts were adopted, and a final dividend of 13s. 6d. per share was declared, making 27s. per share, less tax, for 1936.

YORKSHIRE INSURANCE COMPANY,
LIMITED

RECORD IN NEW LIFE BUSINESS

The annual general meeting of the Yorkshire Insurance Company, Limited, was held, on the 19th instant, at York, the Right Hon. Lord Middleton, M.C. (chairman of the company), presiding.

The Chairman, in the course of his speech, said:—Looking at the year's working, the aggregate results are very similar to those of 1935. The gross and net rates of interest earned on our total funds are £4 11s. 6d. per cent. and £3 15s. 10d. per cent. respectively, as compared with £4 12s. 2d. per cent. and £3 17s. 2d. per cent. last year.

In the life account the volume of new business was a record in the history of the company. The net new sums assured total £2,779,772, as compared with £2,430,353 for 1935.

The home fire income has shown a small increase, but the foreign premiums are, on the other hand, rather lower, in common with the experience of the majority of companies.

In the accident and general account the premiums again show a substantial increase, the 1936 total being £1,335,804, compared with £1,258,718 last year. The increasingly high awards by the Courts in respect of third party personal injury claims and the high cost of claims generally is a matter of moment not only to the companies, but even more perhaps to the insuring public, as these factors directly affect the premiums which have to be charged.

Marine account premiums are slightly less at £338,975. £27,500 has been transferred to profit and loss, the same as last year, and the fund at the end of the year, viz. £597,782, represents 176 per cent. of the premium income, as against 172 per cent. last year.

The total transfers to profit and loss account, including the allocation from profit on reversions and the contribution from life account, amount to £245,622, being higher than the previous year's transfers by over £5,500. This, I think you will agree, is not unsatisfactory. We are able to carry forward a balance of £150,681—a figure which differs only slightly from that carried forward last year. The transfer of £30,000 increases the general reserve to £1,164,553.

The report and accounts were unanimously adopted.

LONDON COUNTY FREEHOLD AND
LEASEHOLD PROPERTIES,
LIMITED

INCREASED EARNINGS

The annual ordinary general meeting of the London County Freehold and Leasehold Properties, Limited, was held, on the 19th instant, at 114-116 Park Street, London, W.

Sir William J. M. Burton (the chairman) presided and moved the adoption of the directors' report, which stated that the year's results were in accordance with their estimates and fulfilled their anticipations. The prospectus dated June, 1935, on the occasion of the last issue of shares, showed estimated profits of £391,829 for the year now closed, and the net revenue was actually £392,470. The directors recommended payment of a final dividend of 4 per cent. and a bonus of 1 per cent., which would make a total ordinary dividend and bonus of 11 per cent. for the year.

EXCELLENT CONDITION OF COMPANY'S PROPERTIES

The year's work had been satisfactory in every way and showed continued and steady progress. It was very gratifying to be able to record those improved results. Their properties were in excellent and attractive condition; the work of internal modernisation was being carried out according to programme and the balance of repairs and maintenance reserve (£100,000) should be sufficient to complete that type of work throughout the whole of their properties in due course.

At the moment the Chancellor of the Exchequer's intentions regarding the much-debated National Defence Contribution had not been clarified. It would seem, however, that his primary intention was to obtain an additional tax from those industries benefiting directly or indirectly from the huge expansion of armament expenditure and not unduly to tax a company of their nature.

The Chairman announced that Mr Thos. J. Callen (managing director), had been appointed vice-chairman of the company.

The report was unanimously adopted.

BRITISH MATCH CORPORATION, LIMITED

ASSETS IN EXCESS OF £7,800,000

CONDITIONS IN BRAZIL AND AT HOME

The tenth ordinary general meeting of this Company was held, on the 18th instant, in London, Mr Clarence E. Bartholomew, O.B.E. (chairman and managing director), presiding.

The Chairman, in the course of his speech, said:—In the accounts for 1928 the total value of all our assets appeared as £6,238,136. In the following year the Brazilian business was added with an addition of just over £700,000 to our capital, and the assets came to £7,955,443. To-day they are £7,800,000, although we have written off £360,000 from the goodwill item. It is our intention to write off that item altogether by allocations from profits each year.

Thanks mainly to special bonus dividends from Bryant and May, Limited—our principal operating company—we have amassed a reserve account of £700,000. This is all invested in fixed-dated British Government securities, whose cost is just below their redemption price. We have, nevertheless, thought it prudent to recommend a reserve of £15,000 to cover any loss which we might have to make in the event of realising some of these securities for the purpose of acquiring further trade investments when opportunities arise. The holdings in subsidiary and associated companies have yielded a very satisfactory return.

As you will remember, the Brazilian investment has been a cause of some anxiety to your directors, but there has been a substantial improvement in the conditions of that country, and, if these improved conditions continue, that anxiety will be removed.

We have been glad to increase our interests in the Argentine, where exchange conditions have improved, for we have confidence not only in that wonderful country but also in the management of our associates there.

In the home trade we have held our own, in spite of a continuance of the abnormal competition from Soviet Russia to which I referred last year. This has been carried on with no regard to profit, but the business has not grown in volume, owing to competition from other imported matches. Our Dominion investments have all been remunerative once more.

The revenue account shows the second highest net revenue which we have yet achieved, and there is an increase in all the items on the right side of that account, except in transfer and registration fees. This figure shows that the shares are well held, for we have passed only just under 2,000 transfers in the year, although there are more than 10,000 shareholders. This stable shareholding seems to us to justify our policy of endeavouring to fortify reserves and to eliminate unsubstantial assets from our balance sheet, with a view to a gradual increase in the real value of your investment, regardless of market fluctuations.

NATIONAL DEFENCE CONTRIBUTION

Chairmen of industrial concerns are expected just now to offer their views on the quaintly named National Defence Contribution. My considered opinion must be reserved until we can see the details of this new and milder form of the crude excess profits duty, which did so much mischief in its hasty wartime guise.

If it is to apply to all industry, the new tax discriminates between investors of different classes, and adds an additional burden to those concerns which, when their profits increase, will, in any case, pay increased income tax. That is no light matter with income tax at 5s. in the pound. Additional profits are not all derived from re-armament nor from trade recovery, and I may fitly quote our Brazilian subsidiary as an instance of this. Its profits are derived solely from manufacture and sale within a foreign country, and cannot be affected for good or ill by the state of trade in the United Kingdom. There are many more important investments of similar nature—for example, foreign railways. Surely all these should be exempt from such a tax.

I doubt whether any tax on the lines indicated by the Chancellor of the Exchequer can be so devised as to prevent hardship and inequality, and without causing very heavy expense to the Treasury and the taxpayers. It is, in my view, most unfortunate that such a disturbing factor should have been introduced at all, when the relatively small amount required could have been collected at no expense, and much more equitably, by a temporary "contribution"—to use Mr Chamberlain's quaint word again—of a small percentage on the amount of everybody's income as assessed for income tax. I believe 3 per cent. all round would be ample.

The report and accounts were unanimously adopted.

MINING TRUST, LIMITED

VALUE OF ASSETS INCREASED

PROMISE OF NEW INTERESTS

The eighth ordinary annual general meeting of the Mining Trust, Limited, was held, on the 18th instant, in London.

Earl Castle Stewart, M.C. (chairman), who presided, in the course of his speech said:—Whilst the debit balance in the income and expenditure account has been increased, it must be realised that this is not due to any new losses arising during the last year. What is involved is simply the writing off of a portion of the losses which have been known to shareholders to exist for some years. Actually, during the year the financial position of the company has considerably improved. Last year the market value of the quoted securities was £1,603,910, and this year their value is £2,625,992. Last year the value of the unquoted securities and advances was placed at £510,502; this year, even after writing off £217,709 loss upon the Villemagne property, the figure is £431,062. Cash and debtors last year amounted to £256,156, and this year £214,661, making a total valuation of the assets last year of £2,670,688, and this year £3,271,115. The improvement in the value of the assets then during the past year amounts to £600,427.

OPERATIONS OF THE SUBSIDIARIES

Mount Isa Mines, Limited, have made a small loss for the year under review, but is now earning a profit which will go in due course to meet the redemption of the 4½ per cent. debentures which were guaranteed by the Queensland Government.

In regard to New Guinea Goldfields, although this company made a profit for the year, your directors feel that the board acted very wisely in not distributing a dividend, since it is quite evident that considerable uncertainty still exists as to the probable life of the ore bodies which are now being worked. Moreover, until the report upon the Wau Alluvials has been received, it will not be known whether it would be profitable to treat those alluvials, and if so how much capital expenditure would be required.

The Britannia Lead Company has operated successfully throughout the year. The total amount of Mount Isa bullion charged was 34,738 tons, from which 34,355 tons of refined lead was produced. Production of silver for the year was 3,065,980 oz. As by-products there were sold 494 tons of zinc chloride and 1,064 tons of antimonial lead. The silver content of the bullion charged from Mount Isa was 81.3 ozs. silver per ton as compared with 63.8 ozs. for the previous year. This company paid to the Mining Trust £15,733 in fees and commissions and now carries forward a total profit since operations commenced of £33,069.

You were told at the meeting last year that we had acquired an interest in the Big Bell Mine in Western Australia. This mine is situated 20 miles from Cue. The proved ore occurs as a lens 900 ft. long, varying in width from 120 ft. at the centre to 70 ft. at the ends, which has been proved to a depth of 700 ft. by diamond drilling and by systematic driving and cross-cutting on the 120 ft. and 250 ft. levels. The tonnage has been estimated at 2,932,000 tons assaying 3.7 dwts. A cyanide plant to treat 1,000 tons of ore per day is in course of construction, and it is hoped that milling will commence some time in July of this year.

SAUDI ARABIAN MINING SYNDICATE

We have also purchased some additional shares in the Saudi Arabian Mining Syndicate, which has been examining a property at Mahad Dahab, some 200 miles from the coast of Jeddah. At this property 14 diamond drill holes have been drilled, and with two exceptions have cut ore of satisfactory width and values at vertical depths varying from 200 ft. to 600 ft. A further nine holes have been drilled through the pillars between the ancient stopes at no great depth from the surface, and have disclosed considerable quantities of ore which could be cheaply worked by open cast quarries. In addition to the ore disclosed by drilling there is, lying upon the surface close to the mine, a dump of tailings estimated at about 400,000 tons of an average value of 8 dwts.

The Anglo-Queensland Mining Proprietary, Limited, in which the Mining Trust has a 25 per cent. participation, is engaged in the examination of a promising goldmining area at Howley in the northern territory about 100 miles from the Port of Darwin. Preliminary sampling by trenches has already been conducted upon the surface, and the results have been such as to warrant a further and much more detailed examination.

In conclusion, during the past year there has been a very considerable increase in the value of our assets, and we have been able to take up participations in new properties which give every promise of developing well.

The report and accounts were unanimously adopted.

JAMES W. COOK AND COMPANY, LIMITED

REVIVAL IN FREIGHTS

The fortieth annual general meeting of James W. Cook and Company, Limited, was held, on the 14th instant, in London.

Mr W. J. Clarke (chairman and managing director), in the course of his speech, said he was glad to be able to report that the profit this year was not less than last year and they had maintained their trading satisfactorily.

Their lighterage business had been on an expanding scale, and in respect of tonnage they had carried a bigger quantity of goods in 1936 than for many years past.

The welcome revival in freights was certainly apparent this year in the greatly increased cargoes arriving in London, and prospects on the river on the whole were satisfactory.

Regarding the activities of the subsidiary companies, he said the goal in front of the board was, and had been, to establish those ventures so that in due course profits would be secured from businesses not materially affected by the conditions of the old original branches. It had been a happy coincidence that in the year under review the subsidiaries had made such profit, and it was possible for them to contribute to the general welfare out of the year's trading.

In the case of the Bulk Oil Steamship Company, Limited, the ships had been kept very well employed. He was glad to report that prospects were good.

With regard to the company's road transport interests, the same tale of success was to be told. All through the year they had enjoyed consistent increase in trade. That was the result of excellent service which their scheme of haulage had given to clients, and at the end of the year they were more established in favour than at the beginning.

Shareholders should all be thankful that the year's accounts were presented with the item of "goodwill" entirely eliminated, and a review of the accounts should give them a measure of satisfaction at the results of the trading for 1936.

The report and accounts were unanimously adopted and a final dividend on the ordinary shares of 7½ per cent. per annum, making 10 per cent. for the year, was declared.

WEST SPAARWATER, LIMITED

PROGRESS OF OPERATIONS

The second ordinary general meeting of West Spaarwater, Limited, was held in Johannesburg, on Tuesday, May 18th.

Mr A. S. Hersov presided in the absence of the chairman of the company, Mr H. G. Latilla.

The Chairman, in the course of his speech, intimated that the expenditure during the year on shaft sinking, equipment for shaft and drilling amounted to £64,000, and that liquid resources at the date of the balance sheet were £622,000.

The drilling programme in connection with the first vertical shaft had been completed and the company was also contributing to the cost of deepening the existing borehole on Eendracht No. 267.

At the end of April, 1937, No. 1 shaft had been sunk to a depth of 555 ft. It was not anticipated that the shaft would intersect the Nigel reef at a shallower depth than 4,700 ft.

The erection of machinery and plant, as well as buildings, had proceeded satisfactorily. Permanent 115-ft. steel headgear had been completed. Present hoisting equipment would serve the shaft for initial 1,500 ft. of sinking, but erection of permanent Ward Leonard hoist was proceeding.

The directors' report and accounts were adopted unanimously. The retiring directors and auditors were re-elected.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to:—

THE BANK OF LONDON AND SOUTH AMERICA LTD. has received telegraphic advice from Valencia that the gold surcharge for the payment of Spanish customs duties has been fixed for the period May 11th to 20th at 141-23 per cent. The previous rate was fixed as from May 1st at 141-60 per cent.

CENTRAL AND SOUTH AMERICAN EXCHANGE RATES

The following rates apply to the centres shown below. Rates for other centres were given in the issue of May 1st.

Bolivia.*	Commercial Banks' "free" selling rate was 120 bolivianos per £ on April 23rd.
Colombia.*	Sight selling rate on New York was 175-80 pesos per 100 United States dollars on May 7th. This rate applies to holders of permits buying in the "open" market.
Nicaragua.*	Sight selling rate on New York was fixed at 2 cordobas per United States dollar on March 19th.
Salvador.	Sight selling rate on New York was 2-51 colones per United States dollar on May 8th.
Venezuela.	Sight selling rate on New York was reduced to 3-19 bolivares per United States dollar on April 27th.

* Exchange controls are operative in these countries. Overseas bank rates and exchange rates for South Africa and Australasia appeared in the issue of May 1st.

BURMAH OIL COMPANY, LTD.—Profit for 1936 £2,955,448 compared with a profit of £2,276,913 for 1935. Ordinary final dividend 17½ per cent. also a cash bonus of 5 per cent., making a total dividend of 22½ per cent. for the year. This compares with 20 per cent. for 1935 and 15 per cent. for 1934. To general reserve £500,000 against £200,000. Carry forward increased from £634,994 to £847,155.

J. AND P. COATS.—Net profits for year of £1,794,744, against £2,006,340. Interim dividend of 6d., less tax, for quarter ended March 31st.

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

IN view of the Coronation and Whitsun holidays, business has been on a small scale, though quotations for the most part have moved slightly upwards for the first time in some weeks.

Base metals without exception have risen, in no case very much, with the final liquidation of the worst speculative positions. But rubber and most of the vegetable oils, particularly coconut, have declined, again not very much. In the coal and iron and steel industries nothing of any importance has occurred. Prices remain very firm, and, though output has expanded, the pressure on supplies remains equally strong.

Quotations for wheat and grain have again moved upwards, as the seriousness of the German and Italian positions are becoming better realised. There has also been a general increase in beef, coffee and fruit prices, but sugar prices were slightly marked down, following the rise last week. So also were the prices of American and Egyptian cotton.

The same general trend is visible in the United States, where Moody's daily index of staple commodity prices (December 31, 1931 = 100) was 211.1 on May 19th, against 204.5 the week before, 215.5 a month ago, and 163.7 on the same date last year.

COAL

SHEFFIELD.—The possibility of a coal strike is bringing pressure for supplies for stocking purposes, but the holidays at the pits have restricted output this week. Inland demand for industrial fuel is strong and prices are very firm. Consumption of best locomotive hards is increasing, while manufacturing fuel is in heavy request. Household fuels are holding up well for the time of year. Furnace and foundry coke, as well as large patent oven and graded coke, are in short supply, with a heavy demand. Furnace coke is quoted at 35s. to 36s. and gas coke 37s. to 38s. per ton. For shipment, furnace coke is quoted at 37s. 6d. per ton, to 38s. per ton. Export inquiry is expanding. Some qualities are a little more plentiful, but orders for hards, singles and smalls are not

easily placed. A few inquiries for forward delivery are about, but at the existing high prices business is limited.

NEWCASTLE-ON-TYNE.—Very little coal is available from the North-East coalfields for some time ahead. Northumberland steam collieries are heavily booked for all grades and odd contractors have odd parcels of free coal. Best Blyth for export is 23s. 6d. per ton, with doubles and trebles 23s. per ton, singles 22s. 6d. per ton and smalls 17s. 6d. per ton f.o.b. Durham manufacturing coal is in keen demand, prime brands of coking being 24s. per ton whereas prime bunkers are 22s. per ton f.o.b. Patent oven coke is a steady market at 40s. to 45s. per ton f.o.b. according to quality.

GLASGOW.—The main features of the market are unchanged. In general, outputs are fully booked for some time ahead, and in the export branch, especially, collieries are not seeking new business. Coastwise and industrial takings remain brisk, with prices firm. The house coal section is the only one in which there is any disposition to eases. Demand is showing a seasonal contraction, but this movement is offset, to some extent, by precautionary buying as a result of the labour position, and also by the fact that Irish buying has not yet fallen off to the usual extent.

CARDIFF.—Business has been restricted this week by the three days' holidays at the collieries and the closing of the Exchange on Monday and Tuesday. Market conditions showed little change. Exports were exceptionally heavy towards the end of the past week, when shipments in the coasting and foreign trades totalled 392,400 tons, compared with 354,419 tons in the corresponding week last year. Prices are firm but unaltered. A local firm has tendered the lowest British tender for the supply of 275,000 tons to the Egyptian State Railways, but at 24s. 6d. per ton, f.o.b., it represents an increase of 6s. 3d. per ton over a contract for 233,000 tons in June, 1936. Lower offers have been received from Poland and Germany, but this is usual in the case of these contracts. The allocation of the order is expected in the course of the next few weeks.

IRON AND STEEL

SHEFFIELD.—Holiday influences have dominated the iron and steel market this week, and the volume of business has been small. So far as pig-iron is concerned, makers are virtually off the market, having little or nothing to offer beyond a few occasional parcels. Some contract renewals have been arranged, with deliveries on a rationed basis. There is no foundry iron available at present, and forge iron is not easily to be had. One or two reconditioned furnaces will come into operation shortly, and although the output from these will be welcome it will go only a short way to relieve the prevailing scarcity. The pending revision of forge and

(Continued on page 488)

SHORTER COMPANY COMMENTS

OTHER COMPANY RESULTS.—Rising costs combined with the reconstruction are responsible for the small decline in PARK GATE IRON AND STEEL profits, since the increase in selling prices produced no effect till the latter part of the year. The larger rubber company results, including such concerns as MALACCA, REMBAU JELEI and HONG KONG (SELANGOR) show satisfactory improvements, reaching up to 125 per cent. in some cases. Tea company results are mixed, and increases in profits are not

OTHER FOODS

BACON.—Despite a rather slow demand, prices remained unaltered. The official quotations (per cwt. for No. 1 Sizable) which formed the basis for dealings on the London Provision Exchange this week were: English, 90s. to 96s.; Canadian, 87s.; Danish, 95s.; against 90s. to 96s., 87s. and 95s. last week. Arrivals in London last week included: Danish, 14,062 bales; Canadian, 7,660; Dutch, 2,490; Lithuanian, 1,510; and Polish, in the previous week.

BUTTER.—The market in Colonial sorts firmed up on shorter supplies. Quotations (per cwt.) on the London Provision Exchange on Monday were: New Zealand, finest salted, 108s. 6d. to 109s.; Australian, choicest salted, 108s.; Danish, 108s. to 109s.; compared with 103s., 102s. to 103s., respectively, a week ago.

CHEESE.—Stocks of English Cheddar cheese are now almost cleared and no quotations are available. The market in other sorts was about steady. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: Canadian, finest coloured, 76s. to 78s.; and New Zealand, finest coloured, 72s. 6d.; against 76s. to 78s., respectively, a week ago.

COCOA.—The spot quotation in New York on Wednesday was 7½ cents per lb., as against 8 cents per lb. last week. In London, on Wednesday at 36s.-36s. 6d. per 50 kilos., c.i.f. Continent, against 36s. 3d. a week ago. Last week's movements of cocoa in London were as follows: Landed,

9,083 bags; delivered, for home consumption, 5,041 bags; exported, nil; stocks, 304,167 bags, against 158,663 bags a year ago.

COFFEE.—On Wednesday, Rio No. 7 (cash) was quoted at 9½ cents per lb. in New York, as compared with 9½ cents per lb. last week and 9 cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, 196 cwt.; delivered, for home consumption, 7 cwt.; exports, nil; stocks, 2,161 cwt., against 11,267 a year ago. Central and other South American: Landed, 950 cwt.; delivered, for home consumption, 1,303 cwt.; exported, 168 cwt.; stocks, 116,101 cwt., against 126,536 last year. Other kinds: Landed, 1,007 cwt.; delivered, for home consumption, 2,932 cwt.; exported, 188 cwt.; stocks, 121,048 cwt., against 181,299 last year.

EGGS.—The market was firm for English and Irish, with other descriptions steady. At Smithfield, on Wednesday, English (ordinary packing, Grade I, about 15-15½ lb.) realised 9s. 9d. to 10s. per 120, against 9s. 3d. to 9s. 9d. last week; while Danish (15½ lb.) made 8s. 6d. to 8s. 9d., as against 8s. 6d. to 8s. 9d. last week.

FRUIT.—Trade at Covent Garden was active all last week, says *The Fruitgrower*, and although quieter conditions have ruled since the holiday, the fall in business has been less than usual. Despite heavier arrivals, apples sold well and were only a shade cheaper. Pears remained a steady selling line while hothouse grapes, restricted to Belgian, cleared well at steady prices. Guernsey green figs, now on the market, made from 6s. to 18s. per dozen, English peaches made up to 36s. per dozen for finest samples, while forced strawberries cleared well at from 4s. to 10s. per lb. Spanish apricots were a point easier on larger supplies, while French cherries were also lower. Reliable parcels of oranges were dearer, grapefruit sold rather better and lemons remained short and dear.

MILK.—Information relative to the operation of the Milk Marketing Scheme during April as issued by the Milk Marketing Board is given in the following table, together with comparable statistics for earlier months:—

	April, 1936	Jan., 1937	Feb., 1937	March, 1937	April, 1937
Regional pool prices* (per gallon):

Manufacturing price (per gallon, average)	4.885	6.249	6.26	5.824	5.293
Total sales under contract	77.03	64.15	60.00	69.45	72.81
For liquid consumption	45.44	48.14	45.02	49.17	47.77
For manufacturing	31.59	16.01	14.98	20.28	25.04

* On account to the nearest farthing.

Accredited producers receive 1d. per gallon in addition to the above prices. Premiums for level deliveries and for Grade "A" or special services are paid to the producers concerned in addition to the pool price. Transport charges are payable by individual producers and are deducted from accounts.

MEAT.—At Smithfield market on Wednesday last, Argentine chilled hindquarters were quoted at 4s. 6d. to 4s. 10d. per 8 lbs., as compared with 3s. 10d. to 4s. 3d. a week ago. New Zealand frozen mutton was 3s. 4d. to 4s. 8 lbs., against 3s. 4d. to 4s. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 8,206 tons, a decrease of 8,208 tons on the corresponding week last year. Beef and mutton accounted for 4,602 tons, mutton and lamb 2,520, and pork and bacon 700, as compared with 4,852, 2,957 and 806 tons, respectively, in the same week of 1936.

PEPPER.—On Tuesday, Singapore white Muntok, spot, was quoted at 6d. per lb. in bond, against 6d. per lb. a week earlier. Black Lampung, spot, in bond, was quoted at 3d. per lb. sellers, compared with 3d. per lb. last week. Movements of pepper in London last week were as follows: Black, landed, nil; delivered, 1 ton; stocks, 1,867, against 1,729 last year. White, landed, 59 tons; delivered, 26 tons; stocks, 11,969, compared with 12,301 a year ago.

RICE.—The spot price of Burma No. 2, cleaned, was 10s. per cwt. ex warehouse, on Wednesday, as compared with 10s. per cwt. a week ago. "May-June," in singles to Continent and U.K., was quoted at 9s. per cwt., against 9s. last week. Movements in London last week were as follows: Landed, 41 tons; delivered, 70 tons; stocks, 1,041 tons, against 1,230 a year ago.

SUGAR.—Prices have relapsed this week. The New York spot quotation was 3-35 cents on Wednesday, as compared with 3-45 cents per lb. last week and 3-50 cents per lb. a month ago. Wednesday's sales of raw sugar in London included "August" delivery at 6s. 2½d. to 6s. 3½d., against 6s. 5½d. a week ago. Movements of raw sugar in public warehouses in London and Liverpool last week were as follows: Imports, 13,309 tons, against 28,393 in the previous week and 12,012 in the same week of 1936; deliveries, 13,090 tons, against 30,039 and 17,686 tons, respectively; stocks, 181,843 tons, against 181,624 and 187,741 tons, respectively.

TEA.—The following table shows the average prices (compiled by the Tea Brokers' Association) of tea sold in Mincing Lane on Garden Account in recent weeks:—

Week ended	Northern India	Southern India	Ceylon	Java	Sumatra	Africa	Total
May 14, 1936	d.	d.	d.	d.	d.	d.	d.
Apr. 15, 1937	12.59	13.66	15.08	10.89	10.36	11.86	13.19
Apr. 15, 1937	14.82	15.83	17.66	14.15	12.94	13.83	15.47
Apr. 22, "	14.79	16.38	17.36	14.81	13.08	13.98	15.68
Apr. 29, "	15.04	16.37	17.35	13.68	12.73	14.18	15.68
May 6, "	15.26	16.15	17.28	14.52	13.23	14.31	15.80
May 11, "	15.58	16.58	17.15	Nil	Nil	14.83	16.23

The London market was closed this week.

VEGETABLES.—Supplies of tomatoes are increasing daily and prices at Covent Garden have consequently been declining, says *The Fruitgrower*. Cucumbers rose in price this week on shorter supplies and good quality asparagus has been a prominent item. Salads of all kinds sold well, house-grown

WHOLESALE COMMODITY PRICES

UNITED KINGDOM: LONDON, May 19th.

The prices in the following are revised with the assistance of an eminent firm in each department

CEREALS AND MEAT				POTATOES—				WOOL—			
GRAIN, Etc.—				English King Edward				English Southdown, greasy, per lb.			
Wheat—				per cwt.				" Lincoln hog, washed

MR BALDWIN is primarily responsible for all this. But taking these fourteen years as a whole, he is the Prime Minister of the period of post-war recovery.

His personal contribution to this end has been his part in sweetening the relations between Capital and Labour—particularly after the General Strike. Industrial peace is a matter in which psychology is of great importance; and MR BALDWIN's liberalism, which enabled MR CHURCHILL to add to our pre-war social reforms, which held in check the Diehard tendencies of the Conservative Party, which made it easy for him to collaborate with representatives of Labour, and finally to fuse with the leaders of the National Labour group, undoubtedly contributed to create the right kind of atmosphere. It has been pointed out that England is almost the only country in the world that is not hopelessly split by a conflict between the "haves" and the "have nots" or between Fascism and Communism. This, again, is not MR BALDWIN's doing for—in so far as political action has brought it about—it is the result of the social legislation of the period 1906 to 1914, of the taxation of inheritance which dates back to the HARCOURT Budget of 1894 and of the forging of our system of progressive taxation by MR LLOYD GEORGE. The growth of the British middle class and the increase in the number of small capitalists have provided a fusing material which has prevented national disintegration. MR BALDWIN has sought to use these opportunities to the best advantage, and under him England has remained essentially a Liberal country.

Abroad, unhappily, the picture is very different. In 1923 Germany was a democracy. There was good reason to hope that if France's post-war nervousness could be calmed, the world would be able to realise the dream of 1919 and enjoy the benefit of a steadily strengthening international civilisation. But with all his qualities, MR BALDWIN has never known how to grapple

with the international situation or to seize its opportunities. His decade and a half ends with the League of Nations discredited, with the arms race in full flight and the economic future of this country saddled with the colossal burden of a £1,500 millions armament programme. During that period, when so many great opportunities have presented themselves, our foreign policy has suffered from a lack of definition, from failure to seize the leadership which the world was anxious to thrust upon Great Britain, from an absence of understanding of foreign psychology and an inability to convert high ideals into realities.

MR BALDWIN has been a Prime Minister in full sympathy with the post-war evolution of British democracy. Personally free from any leaning towards any kind of personal dictatorship, he has completed the edifice of universal adult suffrage in this country. He has taken the responsibility for creating a new constitution of the Empire in the Statute of Westminster, and by overcoming opposition in his own party he has enabled the new Constitution of India to reach the statute book. If example alone could suffice to lead other nations along the path of sanity, MR BALDWIN's England would have created a new and peaceful world.

But amid warring ideals and conflicting interests, where quick action, constant watchfulness and imagination are needed, MR BALDWIN's Governments have shown all the weaknesses of democracy. During a period when international policy has been the determining factor in the economic and political progress of the world, he needs more than fair-weather qualities who "rides in the whirlwind and directs the storm." If history records that MR BALDWIN was a typical Premier of a twentieth-century democracy it will not fail to note also the stupendous task which he hands over to his successor.

America Looks to England

COMMENT has frequently been made in these columns on the gathering insistence of the demand in all democratic States—save, apparently, Great Britain—for a decisive initiative to free international trade from some of its fetters. Both the demand for freer trade and the difficulties which stand in the way are finding their crucial expression in the proposal for a bilateral Trade Agreement between the United Kingdom and the United States. By tacit consent it is being made a test case.

From the narrowly commercial aspect, an agreement would be far from negligible, for each of the two countries is among the other's very best customers. Even if, as is likely, an Anglo-American Trade Agreement covered only a small fraction of Anglo-American trade, the demonstration that barriers could be reduced by mutual consent between the world's two greatest trading nations could not fail to have a profound effect upon the whole movement for relaxing restrictions.

The commercial argument, however, is neither the last nor the most weighty that can be urged in favour of an Anglo-American Agreement. The more apparent it has become that the political road to international appeasement has reached, at least for the time being, a dead end, the more hopes have been attached to the possibility of progress by means of "economic disarmament." It is not far from the grim truth to say that this is the only hope of immediate improvement. An agreement between the United Kingdom and the United States is as clearly and as unquestionably an essential preliminary for disarmament in the economic sphere as it is in the naval.

For these reasons, even if both countries were seeking

to evade their responsibilities, the necessity of an agreement would have to be urged upon them. But the fact which converts a necessity into a golden opportunity is that the American Government is not merely willing, but anxious, to conclude such an agreement. MR CORDELL HULL, Secretary of State in PRESIDENT ROOSEVELT's Administration, has made the conclusion of such agreements the fulcrum of his whole policy. Limited by the doctrine of isolationism, MR ROOSEVELT sees in economic disarmament the most powerful contribution that he can make towards the pacification of the world. And the PRESIDENT and the SECRETARY OF STATE have proved their sincerity by the conclusion of no less than sixteen agreements, each one of which has involved reductions in the American tariff (a fact which MR RUNCIMAN forgets when he too claims to have concluded a large number of pacts). Ever since the War British opinion has urged the United States to play its appointed rôle in world affairs. For an even longer period Americans have been invited from this side of the Atlantic to benefit the world—and, incidentally, themselves—by reducing their excessive tariffs. Now, when an opportunity occurs to secure not only a reduction in American duties but an approach towards political co-operation of the only kind which it is open to an American President to propose—and to secure these not as a grudging favour but as the result of an American proposal, assiduously pressed—it is hard to believe one's eyes when one sees the British Government hesitating.

Hopes have been raised in the last week or two by two events. The first was the speech made by the British Ambassador to Washington reported in *The Economist*

last week. SIR RONALD LINDSAY was reported as saying that Great Britain offered American agriculture "favourable treatment" in return for counter-concessions. True, the phrase could be variously interpreted. Or, again, SIR RONALD might have exceeded his instructions. But nevertheless, there was a sudden burst of hope. It was encouraged by the discovery that the British Dominions, far from obstructing an Anglo-American Agreement by standing on the strict letter of their Ottawa advantages, were actually urging such an agreement on the Government of the United Kingdom.

In this atmosphere of suddenly renewed hope, the subject was debated by the House of Commons on Tuesday. The debate was given its tone by a most impressively expert and moderate speech by SIR ARTHUR SALTER. Among a number of practical and specific suggestions, SIR ARTHUR proposed that, without abandoning the principle of Imperial Preference, its form should be changed. The major obstacle to the granting of a concession to, say, American wheat is that Canada is guaranteed a minimum preference equal to the whole of the present British duty on foreign wheat. With the evident goodwill of the Dominions it should be easily possible to evolve some more flexible method which would safeguard the preferences of the Dominions while leaving a margin for concessions to other countries.

To this and other suggestions, however, MR RUNCIMAN returned a most discouraging reply. One by one they were discarded, ignored or rejected. As was once said of another Cabinet Minister, he seemed to appear in the rôle of an inverted Micawber, waiting for things to turn down. He praised the principle of an Anglo-American Trade Agreement, but the emphasis was all on the difficulties of detail.

Americans are becoming impatient and annoyed—as well they may when a virtual gift horse is examined so minutely in the mouth. MR RUNCIMAN admits that the question is being examined in a context of minutiae—"a most laborious business." But the precise details of the duties to be affected by the Agreement are almost the least important element in the situation. What is of vastly greater moment is that we are on the threshold of administering a snub to MR CORDELL

HULL similar to that which SIR JOHN SIMON gave MR STIMSON when the United States wanted to co-operate in settling the Manchurian affair in 1932.

If we rebuff American goodwill once again, we shall deserve all we get. It is true that the British tariff is not high and that our imports have been maintained in volume through the depression years. But SIR ARTHUR SALTER may be quoted on the first point: "I believe it is true that, if we take into account the place which Great Britain occupies in the trade of the world, the size and importance of the British market, and the novelty of the new commercial policies that have been introduced, and then consider the cumulative effects of Imperial preference with the Dominions, the new protective system here, the abandonment of the open door, and the establishment of agricultural quotas, it is literally and absolutely true to say that in the last five or six years, since the depression, the commercial policy of no single country in the world has had so great an effect as has that of our country in restricting and deflecting the trade of the world." The same indictment can be found, in terms of studious moderation, in a valuable Report just issued by the organisation known as P.E.P.*

True or false, however, justification of the past is irrelevant. Our commercial policy may have been perfect or it may have been misconceived. Neither fact is material. When a house is on fire it is not enough for one of the occupants to prove that he is innocent of arson. The only urgent question is what help will now be forthcoming. What assistance is Great Britain prepared to give at this juncture, when the need is greater and the opportunity more pressing than ever before? With our larger stake in trade, our larger interest in peace and our larger gain from Anglo-American co-operation, we are offering less than MR ROOSEVELT. By putting a very little into the common pool, we could draw out almost infinitely much. Perhaps it is not too much to hope that even at the eleventh hour the Government may decide to risk a small investment of faith in the certainty of ample reward.

* "International Trade." Published by P.E.P., 16, Queen Anne's Gate, S.W.1. 8s. 6d. net.

N.D.C.: Revised Version

MR CHAMBERLAIN has stuck to his guns and belied the prophets who forecast the transformation of his graduated National Defence Contribution into a straightforward Corporation Profits Tax. For a month since Budget week he has kept open house at the Treasury and has listened to influential spokesmen for nearly every important trade and industry. Now it is his turn to speak again; and it is clear from this week's published text of the Finance Bill that he has been willing to make important concessions of detail, at the cost of an appreciable reduction in probable yield. But the tax, which his successor at the Exchequer will pilot through the House of Commons, will, after all, remain a steeply-graded impost on the growth of British profits.

Compared with the outline sketched in the House and the Budget White Paper a month ago (summarised on page 202 of *The Economist* of April 24th), the revised draft of N.D.C. embodies three major and a large number of minor changes.

First, companies on the profits standard, which were originally to have been assessed on earnings in excess of the average for the three accounting years 1933 to 1935, may now eliminate a bad year and/or may bring an additional good year into computation by choosing the three best calendar years of the four between 1933 and 1936, or the two best of the three between 1933 and 1935. This is the most important concession and it will reduce the

assessable profits for practically all concerns liable to the duty which adopt this standard.

Secondly, in the case of companies which adopt the alternative of a capital standard, the exemption limit of 6 per cent. on capital, which applies to all companies who are assessed on this standard, may be raised for particular industries, on application by persons "substantially representing any class of trade or business" to the Commissioners of Inland Revenue (with appeal to a special Board of Referees) to a figure which will take due account of exceptional risk, wastage or deferment of yield. Similar application may be made for upward adjustment of the total capital figure, on which the percentage is based, where the original total appears small in comparison with the stake involved. Meanwhile, the percentages allowed to different trades under the Excess Profits Duty may be applied, with any modifications which seem desirable.

Thirdly, the rate of contribution is revised so that company profits under 12 per cent. (instead of 10 per cent.) pay at the minimum rate of one-fifth on their growth, and the maximum of one-third is levied only on profits exceeding 16 per cent. (in place of 15 per cent.)—with an extra 2 per cent., as before, for individuals' profits at each stage.

For the rest, "capital" is to be computed on the basis of the actual cost of assets, less a deduction for wear and tear, even though it may subsequently have been heavily written down. Capital introduced since the standard period will be allowed a maximum of 6 per cent. Investments are to be excluded from capital, and income thereon from profits; borrowed money is to be deducted from assets and interest from earnings; but borrowed money may be set off against trade investments. New companies will be

allowed an increase of 2 per cent. for three years in their statutory percentage, and small businesses may claim either an abatement of one-fifth of the difference between their profits and £12,000, or elect to pay on the profits standard on the assumption that their capital is £25,000. Whenever current profits fall below the standard, the deficiency may be set off against past or future taxable earnings, at the highest rate actually paid or payable. A net loss in the standard period may be deducted from profits subsequently chargeable, but no relief is obtainable for any deficiency between zero and the 6 per cent. minimum standard. Liability will begin, in all cases, from January 1, 1937, and profits will be taken as accruing evenly throughout any accounting period. Holding companies will be deemed to be the owners of all subsidiary companies of which they hold not less than nine-tenths of the ordinary share capital.

Such, in brief, are the N.D.C. provisions of the Finance Bill. To what extent have they removed the anomalies inherent in its first draft and how far will the Exchequer's concessions reduce the burden—and the yield—of the new tax?

1. We may obtain a rough idea of the effect of the change in the standard period by taking the figures of approximately 600 industrial companies whose reports have been analysed in *The Economist* during the first quarter of each of the last seven years. Our sample has varied somewhat from year to year, but a chain index based on the figure 100 for profits, after deducting debenture interest earned in 1929 (and recorded in 1930), gives the following results (cf. *The Economist*, April 17, 1937, page 139):—

INDEX OF PROFITS			
Profits earned in—		Profits earned in—	
1929	100.0	1933	73.4
1930	89.3	1934	84.1
1931	76.5	1935	95.3
1932	69.7	1936	106.7

The mean figure for the three years 1933 to 1935 is 84.3; for the three best of 1933 to 1936, 95.4; for the two best of 1933 to 1935, 89.7. The most favourable of the new averages is still $4\frac{1}{2}$ per cent. below that of 1929, when no abnormal armament profits were being made; and it is $11\frac{1}{2}$ per cent. below the index for 1936, when such profits were still relatively small. It is, however, 11 points higher than the basis laid down in the Budget speech. What this means can be illustrated by assuming that the profits index for 1937 will be, say, 110. Under the Budget scheme duty would be paid on the difference between 84.3 and 110, i.e. on 25.7. Under the new scheme it will be paid on the difference between 95.4 and 110, i.e. on 14.6. On this assumption the change would reduce the amount of the tax by nearly one-half. If profits were to rise to 120 the loss of revenue would be about one-third. In either case, of course, the actual loss would be more than this owing to other concessions.

2. To measure even the approximate effect of the granting of special exemption percentages to individual industries is obviously impracticable at the moment; but it is relevant to recall that the Board of Referees, set up under E.P.D. in 1915, awarded an average percentage slightly below 10 on sixty-six applications from home companies and 11.3 on 110 applications from companies operating abroad—compared with an original statutory rate, as at present, of 6 per cent. in both categories. The annexed figures for a number of separate trades are particularly interesting under current conditions:—

E.P.D. PERCENTAGES

Oil (Burma)	8	Pig iron	7
Coke manufacture	8	Cement	6

If these figures are representative of the concessions that will in fact be given, it is fairly clear that the possibility of obtaining special percentages will be of smaller practical importance for many industries than the choice of the datum period for profits. Taking the three best years between 1933 and 1936, our analysis of "first quarter" company earnings, referred to in the preceding section, shows a profits average of 22.9 per cent. for representative concerns in the composite motor, cycle and aviation group, or 15.5 per cent. for shops and stores, 12.7 per cent. for electric power concerns, and 11.3 per cent. for breweries. All of these are well above the exemptions conceded under E.P.D. Among typical recovery industries, on the other hand, the averages are lower. For example, the profits of shipping companies were only 8.1 per cent., for iron, coal and steel 7.6 per cent. and for textiles 6.0 per cent. These percentages are based on preference and ordinary share capital, and not on capital under the Finance Bill. But, broadly, the figures suggest that, in the case of the recovery trades, the E.P.D. exemptions are about equal to the average standard earnings, and that companies below the average will benefit under E.P.D. percentages.

3. Finally, an approximate idea both of the effect of the new basis of graduation (6 per cent., 12 per cent. and 16 per cent., instead of 6 per cent., 10 per cent. and 15 per cent.), and the extent to which the tax continues to hit growing concerns as compared with companies that have been prosperous throughout may be seen from the table below. This shows the percentage of profits that will be paid as N.D.C. by companies which are earning the same rate of profit to-day but earned differing rates in their standard periods:—

Companies Earning (%)	Whose Standard Profits are (%)	Will pay following N.D.C. Percentages		Corresponding Percentages under Original Budget Proposals	
		Of Total Capital	Of Total Current Profit	Of Total Capital	Of Total Current Profit
6 or under	6 or under	Nil	Nil	Nil	Nil
12	6 or under	1.2	10.0	1.3	10.8
	12	Nil	Nil	Nil	Nil
16	6 or under	2.2	13.7	2.4	14.9
	12	1.0	6.2	1.1	6.8
	16	Nil	Nil	Nil	Nil
20	6 or under	3.5	17.6	3.7	18.6
	12	2.3	11.7	2.4	12.1
	16	1.3	6.7	1.3	6.7
	20	Nil	Nil	Nil	Nil
30	6 or under	6.2	20.7	7.2	23.5
	12	5.7	18.9	5.75	19.2
	16	4.7	15.6	4.7	15.6
	20	3.3	11.0	3.3	11.0
	30	Nil	Nil	Nil	Nil
40	6 or under	9.5	23.8	10.4	25.9
	12	9.0	22.5	9.1	22.7
	16	8.0	20.0	8.0	20.0
	20	6.7	16.7	6.7	16.7
	30	3.3	8.3	3.3	8.3
	40	Nil	Nil	Nil	Nil

Note.—These figures refer to companies, and exclude reliefs to small businesses. For individuals, 2 per cent. should be added to all figures in the first two columns.

Companies which have recovered after depression, and consequently have low standard profits, come off slightly—but only slightly—better under the new arrangements than under the old, while the stable but prosperous companies, with high standard profits, continue to be mulcted more lightly than their fellows, or not at all. The net contribution made by the new grading to the reduction of anomalies is, in fact, inconsiderable.

In general, it may be said that the concessions embodied in this week's Finance Bill will tend to increase the number of individuals and companies who secure complete exemption, while leaving the remainder still subject to a burden which, though modified, will fall heavily on those which have been most enterprising and progressive. Which companies and industries will fall wholly or mainly into the one group and which into the other, we discuss at greater length in a Stock Exchange article on page 518. When the proposals were first presented, we suggested that Mr

CHAMBERLAIN should remedy the most serious defects of his scheme (a) by amending the basic period so as to make the tax more a burden on prosperity and less on normal recovery; (b) by reducing the exemption limit in cases where the return to capital was already high in the standard period, so that the scheme would acquire some of the characteristics of a graduated corporation tax instead of being a tax mainly on growth; and (c) by grading the burden more smoothly.

The change in the standard date has gone some considerable way to meet the first point; but the CHANCELLOR has done nothing to meet the second and little to meet the third. Indeed, the increase in the exemptions may even make the burden seem more inequitable on growing concerns which still bear it.

MR CHAMBERLAIN started from the entirely laudable principle that exceptional prosperity should be privileged to make an exceptional contribution to the Exchequer in a time of national emergency. We must credit him, moreover, with a sincere desire to meet his

critics by removing, wherever possible, the injustices and anomalies inherent in his original proposals. But at a time like the present, when increasing profits may be the resultant of many factors—including the trade cycle, severe early depression or late recovery, exceptional risk, youth, initiative and enterprise, as well as the adventitious consequences of national re-armament—a tax on mere growth involves the insuperable difficulty that to eliminate all its inevitable anomalies may be to reduce its yield practically to zero. But the objection against a special tax on the most enterprising units in British industry is fundamental. We believe that the Government would be well advised in the interests of industry to make a more fundamental change—even at this hour—and to redraft its scheme in the form of a simpler graduated tax on corporation profits as a whole. It would certainly be of far greater benefit to the Exchequer than a tax the yield of which, in the process of removing individual inequities and anomalies, will tend more and more to disappear.

Scotland's Industrial Expansion

SCOTLAND provides an interesting study in industrial development. More than 50 per cent. of her population are dependent, directly or indirectly, on the so-called "heavy" industries, which have scarcely had time to emerge from the severest trade depression in living memory before being called upon to cope with the largest volume of work assigned to them in a period of peace. In the industrial belt of Scotland trade recovery is now definitely established, and the Government's re-armament programme assures the continuity of employment for at least four years ahead to iron and steel, shipbuilding, engineering and their allied industries.

In mid-summer, 1932, over 68 per cent. of the Scottish shipbuilding industry's personnel was unemployed. For engineering in its various branches—marine, general mechanical, structural, electrical, etc.—the unemployed percentage was about 40. Shipyards, steelworks and engineering shops were being closed down, not merely for lack of orders, but because facilities for production appeared far in excess of any predictable demand. The shipbuilding industry of the Clyde, for example, had an annual productive capacity of over 1,000,000 gross tons of shipping, but during the winter of 1932 the tonnage actually under construction was barely 50,000. Shipbuilders were compelled to begin an active policy of rationalisation, designed to eliminate uneconomic competition within the industry. Similar efforts were made by the iron and steel trades. Recovery rapidly followed, and full-time working conditions were restored in the steel trade long before any material improvement developed in shipbuilding. Activity in building and the motor industry gave a further stimulus to the steel trades.

Revival in the shipyards was slower, but the outlook changed materially in the spring of 1934, when work was resumed on the 80,000-ton liner "Queen Mary," which had been lying unfinished on the stocks at Clydebank for 2½ years. About 4,000 men were re-employed between the resumption and the launching, and subsequently some 7,000 workers were engaged in fitting out and supplying equipment for the liner.

This development coincided with the placing of a series of other orders for mercantile tonnage—particularly oil tankers, small cargo vessels and coasters—and the Admiralty slightly advanced their building programmes. Admiralty orders, indeed, did much to keep

a nucleus of men in employment in 1933 and the early part of 1934, when mercantile orders were lacking. Since the ships of the 1931 programme were ordered, late in 1932, contracts have been given out in steady succession, and in the past year they have been rapidly accelerated. To-day Scottish shipyards have some fifty ships, with a total cost of £35 millions, on order for the Admiralty. Normally increased warship construction leads to larger orders for mercantile tonnage from owners anxious to avoid being embarrassed by the resulting rise in prices. During the last few months this tendency has been accentuated by the fact that many owners had completely suspended the rebuilding of their fleets during the depression, and replacements have become urgently necessary. Thus, a sudden acceleration of Government requirements has been almost contemporaneous with revived demand for commercial tonnage, mainly cargo-carrying ships and oil tankers. At present Scottish shipbuilders have on order some 140 merchant ships, costing about £21 millions, as well as fifty warships, costing (as already mentioned) about £35 millions. The bulk of the work—equivalent to about 700,000 gross tons of shipping—is still in a preliminary stage of construction. In the shipyards, the engineering and the iron and steel industries, the unemployed total has been reduced almost to the "unemployable" level. In coal mining, however, though activity has increased, mechanisation has effected substantial economy in the labour force. The number of colliery workers employed to-day is about 89,000, against about 85,000 in 1932. In the steel industry, however, the present figure of about 11,500 compares with 7,400, and in shipbuilding and repairing a total of 40,000 contrasts with a mere 12,000 in 1932. In engineering, the number employed is approximately 90,000 men—an increase of about 50 per cent. compared with the figures for 1932.

Changes in methods of production and improved shipbuilding and engineering technique make it difficult to estimate accurately the number of persons likely to be employed when work on present contracts reaches a more advanced stage. At least, there will be few unemployed craftsmen for the next four or five years. The present scarcity of trained men, however, is gradually being overcome, with the increasing recruitment of young people to industry.

A few details of the larger orders now in hand may be of interest. The construction of the "Queen Mary's"

sister ship, No. 552, will provide three years' work for 5,000 persons in the Clydebank establishment of John Brown and Company; and almost every industrial town in the United Kingdom will make some contribution to this ship. The Admiralty work includes two 35,000-ton battleships, each costing about £7,500,000. These will be built, respectively, by John Brown and Company, of Clydebank, and the Fairfield Shipbuilding and Engineering Company, of Govan. Each will entail at least as much employment as the construction of the 80,000-ton liner No. 552. For the steel works, however, battleship orders provide less demand than is popularly supposed. Each ship will require approximately 13,000 tons of steel for its hull, whereas about 40,000 tons of steelwork will be required for No. 552.

The machinery for the warships, on the other hand, is a particularly large item; and it is mainly for this reason that a single 10,000-ton cruiser has been estimated to provide more employment to the shipbuilding industry than a dozen high-class cargo boats.

At least 60 per cent. of the cost of a modern ship, whether naval or mercantile, is spent in wages. About two-thirds of the cost of a ship is outside the control of the builders, being represented in sub-contracts to suppliers of materials and equipment. These contracts, however, are largely given, in Scotland, to local firms. One Glasgow firm, for example, supplies all the high-

grade bolts and nuts used in British warships, no matter where they are built.

Although a shortage of materials is increasing the costs of ship construction, none of the more important contracts has so far been seriously delayed. Economies made possible by the recent technical advances are proving helpful. Electric welding, for example, permits a marked saving in materials as compared with riveting.

To meet the present emergency conditions many works in Scotland are being extended and new factories are being opened up. In many cases these developments are designed to have a permanent rather than a temporary effect—a case in point being the £2,500,000 scheme undertaken by Colvilles, Ltd. (which was discussed in a leading article in the Stock Exchange section of *The Economist* last week). If these extensions are to find profitable employment when the more abnormal features in the present position have been eliminated, an expansion of international trade will be indispensable. Scotland is no stranger to the unhappy consequences of alternate over-expansion and under-employment of her highly specialised resources of men and machinery. If history is not to repeat itself, the world must be allowed to recover its sanity and, having satisfied its taste for swords, to remember that a good ploughshare is cheaper than a bad one.

What is a Trading Estate?

THE disorganisation of modern society is nowhere so clearly shown as in the obstinately persisting unemployment which disfigures contemporary prosperity. The Depressed Areas mark our failure to make the best of the world we live in. Many panaceas have been launched on the sea of general criticism and official caution. In the columns of the Press, in parliamentary debates, in expert reports, in the lucubrations of eminent economists and politicians, and in a million conversations, the ways to end unemployment and to revive the Depressed Areas have been variously canvassed.

Not least important among the contributions to this troubled symposium has been the experience of the Trading Estates at Treforest and in the Team Valley. Indeed, the limelight shed on trading estates as part of the solution of the problem of unemployment has given them a central place in discussions about industrial development.

The modern conception of a trading estate follows the lines of thought of the best of our economists and planners. Its purpose, whether it is situated within or outside the Special Areas, is to enable industry to produce with the highest degree of efficiency. The broad needs of production are factory buildings, low rents and rates, power, the handling of goods, and operating capital; markets and transport communications; and the availability of suitable labour, with amenities whereby that labour may give of its best.

A clear idea of the aims of the trading estate may be obtained if we analyse how it sets out to conform with each of these requirements. The factories are built to give the smoothest flow of production possible; they are well ventilated and lighted, and in outward appearance a pride to the owner. The tenants are fortunately placed because a Government trading estate does not operate for profit; and the rents are therefore based on contractors' cost of construction plus the interest on the developed cost of the land covered by each factory and a small annual charge for ground rent and administrative services. Owing to the magnitude of the contracts, building costs are naturally lower than would be the case with a single factory. Low rating assessments are granted because the Estate Company does much of the work, such as road construction and maintenance, which normally would be carried out by the local authority. Similarly, because the trading estate bears the cost of the

installation and equipment of mains and plant, the Estate Company can buy electricity, gas and water on terms enabling it to make concessions to the tenants. The ability of the Estate Company to negotiate with the railway for adequate sidings and single-handling loading, combined with its own network of roads and light railways, ensures the cheap and convenient handling of goods at the factory door and railhead.

Moreover, the economies which are possible on capital outlay set free money for operational development. Apart from his plant, the occupant of a trading estate site need bear no constructional costs whatever, for his fully equipped factory is built for him from foundation stone to interior decoration. Even architectural advice is free. Canteens, garages, refuse destructors, yards, and wash places, are all provided on a communal system; and the tenant is thereby saved a great deal in outlay and maintenance charges.

The second element of successful production is location. No trading estate in the world can guarantee markets. It can only assure that it is so placed that markets are within easy reach. Most industries in the early stages of development prefer to have a "bread-and-butter" market at their door by which to live before they step up to the stage of national distribution. The vicinity of a large urban population is therefore a necessity. Adequate road and rail communications are important equally for local or national distribution.

That suitable labour should be available is clearly necessary. A trading estate company, with power to induce the transport companies to provide cheap fares, can increase the supply of workers by facilitating their mobility. Modern labour rightly demands that its welfare shall receive attention. By the provision of canteens serving hot meals, of open spaces adjacent to the factory for the dinner hour in summer months, and of communal playing fields, and even, if necessary, of planned housing, the trading estate confers a benefit on employee and employer alike.

A practical example of these principles in operation can be found on the western outskirts of Gateshead. The Team Valley trading estate covers 700 acres easily accessible to the main railway from King's Cross to London, the Great North Road and the River Tyne. It was begun last October, and is now taking shape in the hands of over 1,000 excavators, roadmakers and

builders. Three large factories and nine smaller ones in pleasing brick are almost completed to occupy 1,200 workers. Contracts to the value of £366,500 are under way; and altogether sites have been taken for thirty-one factories to employ over 3,000 people. By the end of 1937 the number planned may be eighty, with work for 8,000 men and women. A twenty-year plan envisages 400 factories on 400 acres, employing about 40,000 workers, with 300 acres of open spaces, approaches, offices, canteens and clubs.

The object of the estate is to rebalance the top-heavy industrial life of Tyneside by planting a variety of light industries. There is an adjacent and newly prosperous market of over 2½ million people in the North-East. But the goods of the sausage, glass, furniture, clothing and confectionery enterprises in the Team Valley will ultimately be distributed over the national market.

The demand of these industries for unskilled labour, largely female and juvenile, does not compete with the revived needs of the export and armament trades. There is an untapped pool of female labour on Tyneside where only 13.8 per cent. of the insured workers are women against a national average of 27.8 per cent.; and many males have unhappily been unable to acquire skill during the depression years. Thus the inducements offered to light industries in Gateshead are considerable and typical of the trading estate method. Communal light and power, planned transport, handsome and effective designing of factories and approaches, and the commercially strategic site promise economies of technique, organisation and distribution. The factories will mainly belong to the estate, and rents to cover land, structure, access and service will work out (at present

costing) at 8d. per square foot; although small factories of 1,500 feet will be let at £1 a week. The only danger is that rising construction costs (covered so far by forward contracts) or dearer money may enhance rents.

The project is ambitious and admirably executed. It would be easy, however, to magnify its quantitative importance. Even 8,000 employees (largely women) would compare but slightly with 1½ million insured workers and 148,741 unemployed (over 90 per cent. men) in the N.E. area. The 40,000 workers of the ultimate plan may compare little better with the unemployed of the next recession.

The specific problem of special unemployment which still underlies armament's feverish activity will hardly be touched; South-West Durham, for instance, will still stand stark and alone. Moreover, the estate may be in some instances competitive with existing industries without its amenities. The authorities can discourage, but cannot forbid, the growth of sheltered and subsidised competition.

There are labour problems to be carefully handled, the cost of transport for low-paid female and juvenile labour; the difficulty of planning now for a possible housing policy in the future; and the hours and wages of women and young persons.

When all is said, however, this very young venture has made striking progress. Alone, it will not solve the industrial problems of the North-East or the recurrent unemployment of Tyneside. But it is soundly conceived, and will make a definite contribution to the mitigation of these difficulties. In conjunction with an effective national policy of freer trade, this and similar schemes may ultimately acquire great importance.

Notes of the Week

The Week in Parliament.—Mr Baldwin presided over his last Cabinet on Wednesday, and two events have appropriately marked his departure from the House of Commons. The Cabinet has espoused a cause which he recently made peculiarly his own by approving the increase of members' salaries from £400 to £600 per annum. And due tributes have been paid by his colleagues to Mr Ramsay MacDonald, who will remain in the heat of representative politics, but has finally laid down the burden of office. Mr Runciman spoke his last ministerial words in the Commons on Tuesday; Sir John Simon is going to the Treasury, and Sir Samuel Hoare to the Home Office; and other Cabinet changes may have been announced by the time this issue of *The Economist* is in the hands of its readers. Apart from Tuesday's debate (which we discuss elsewhere), only the complications of N.D.C. stirred the placidly valedictory atmosphere of Parliament this week. On Monday, Mr Attlee's appeal for greater simplicity in the monarchy fell on stony ground. On Wednesday Sir Thomas Inskip showed no great facility in answering Mr Noel Baker's indictment of the Government's failure to carry out long ago the proposals of the Royal Commission on the Private Manufacture of Arms. He was supported by Mr Duff Cooper, who argued, in belligerently desperate fashion, that this was a wicked world, and we must accept it as such. Mr W. S. Morrison, however, announced on Thursday the Government's decision not to put British agriculture on a war footing in peace-time. Instead, the limit of anticipated supplies under the Wheat Act, 1932, would be raised from six million to eight million quarters; and special schemes would be introduced for oats and barley.

Imperial Conference at Work.—The Imperial Conference, after a fortnight of spasmodic meetings punctuated by public and semi-public functions, is finishing the expository part of its work. No news of its progress has been allowed to reach the public save brief official communiqués which reveal that both the Dominions and the United Kingdom have explained at some length to each other their respective

policies, especially in matters of defence. In this field the most important decision so far has been the setting up of a committee to study industrial and economic co-ordination from the defence point of view. This is a subject of immense scope, involving important questions of commercial as well as military policy. The haphazard development of strategically "key" industries in the Dominions has been the cause of anxiety among many of their own citizens as well as in Whitehall, a striking example being the Government-aided establishment of an aircraft factory in Australia to manufacture American types of aeroplanes. The question of accumulating reserves of food or raw materials is obviously part of the same general theme. Nothing further has emerged with regard to Mr Lyons' proposal for a Pacific pact, nor have other major issues of foreign policy yet passed beyond the preliminary stages of discussion. The coming week should see more positive progress, especially in the field of economic policy, where the determination of two at least of the Dominions to force the British Government's hand over the question of an Anglo-American trade treaty remains the outstanding feature of the whole Conference.

* * *

Buses in London Again.—A notable week of labour settlements has ended with the welcome reappearance of London's buses. The determination of Mr Bevin and the Executive Council of the Transport and General Workers' Union to bring about a resumption of work pending further negotiations with the London Transport Board has been in evidence since the Court of Inquiry issued their report on May 6th. The attempt to bring out the tram and trolley-bus men in sympathy was firmly resisted despite considerable pressure from a certain section of the busmen. On Tuesday Mr Bevin and his colleagues decided to take the matter into their own hands, and to conduct negotiations over the head of the Central Bus Committee. The publication of the final report of the Court of Inquiry, which actually added nothing to the interim report of three weeks ago, provided, with the Board's offer of May 8th, a basis of

discussion. On Wednesday, after a joint conference between representatives of the Board and the Union executive, the 25,000 busmen were officially called upon to resume work. Both parties agreed to accept the Court's findings; to negotiate and settle a new agreement accordingly; and to set up joint machinery to examine schedules and conditions of employment. It is agreed, on the result of these steps, to take action—which may even involve the reduction of hours—to remedy agreed grievances. The Union executive has taken an unusual course—to say the least—in settling an official strike over the head of the busmen's Committee on which it had conferred responsibility and with which it found itself, lately, completely at variance. In the last resort, however, union machinery exists to prevent rather than to provoke strikes, and the real question at stake is the busmen's health, not their militant prestige. If their conditions of work are now to be improved, Mr Bevin's bold stroke will be justified by the event.

* * *

Coal Settlement.—After the sudden turn of events last week when the Secretary for Mines brought together representatives of the Mineworkers' Federation, the Nottinghamshire coalowners, and the Industrial Union, the outlook for peace in the coalfields sensibly improved. At a joint conference of the three parties the principle of amalgamation between the Nottinghamshire Miners' Association, affiliated to the Federation, and the Industrial Union was mutually accepted. Further meetings reached agreement about details regarding the amalgamation and re-employment at Harworth Colliery, and it then remained to submit the agreed terms for ratification to delegate conferences of the Federation and the Industrial Union. The national delegate conference of the Federation had recently vetoed an amalgamation agreement on similar lines, but it seems likely that the threat of a national coal strike on May 29th has been quite averted. Common sense has achieved a result which might well have been secured weeks ago. The energy and tact of Captain Crookshank, at the Ministry of Mines, have contributed materially to this welcome end.

* * *

America's Newest Deal.—The Supreme Court has set the seal upon its new-found mood of liberalism by declaring the Social Security Act to be legal. The direct importance of this decision is very great, for the Act is the first attempt, however imperfect in technique, to construct a system of social services for the working population of the United States. Its indirect importance is perhaps even greater, since the method adopted for unemployment insurance was that of imposing a tax on all industry, and then remitting nine-tenths of it in States which established satisfactory unemployment insurance systems. If this use of the Federal taxing power to coerce the States into doing something outside the powers of the Federal Government itself is legal, it opens up a vast field for further legislation. The immediate effect of this surprising decision, as of the preceding liberal decisions, has been to weaken the support for the President's Court reform proposals. But it is a legitimate retort from the President's side that the judgment, like so many other crucial decisions, was taken by a majority of five to four, and that it is an impossible position for the powers of the Federal Government to be at the mercy of one man's opinion.

* * *

Whether by a reform of the Court or by voluntary "liberalisation" on the part of the existing Court, however, it is now obvious that the limitations on the New Deal are not to be so tightly drawn as appeared likely after the decisions which invalidated the N.R.A. and the A.A.A. In anticipation of this change, the President is already moving towards a restoration of both these Acts in slightly modified form. The new agricultural plan calls for the most direct compulsion upon farmers to limit their production whenever restrictions of

supply is considered advisable. Grants are to be paid to them, but not in the form of bribes for not raising unwanted crops (which the Court declared to be unconstitutional), but as rewards for growing "conservation" crops. With all the change of details, however, the main purpose of these various agricultural schemes remains, namely, an artificial adjustment of supply to demand. The new N.R.A., on the other hand, reproduces only a portion of the old, for all the former provisions for the cartelisation of industry, the fixation of minimum prices, etc., have been dropped, and only the labour provisions remain. A Labour Standards Board is to be set up, charged with the duty of specifying minimum rates of wages and maximum hours of work for each industry. The original intention was to specify universal rates of 40 cents an hour and 40 hours a week, but the actual proposal leaves room for greater elasticity. Child labour (i.e. under the age of 16) is to be entirely abolished. These prohibitions are to be implemented by forbidding the movement in inter-State trade of goods made in defiance of them, so that the scope of the new legislation may, in practice, be limited to manufacturing industry and transport. But the proposal is nevertheless a bold attempt to advance further in the direction of guaranteeing to the "underprivileged" at least a certain minimum standard of living. It also serves the clearest notice on all that the New Deal is not over. Indeed, the Newest Deal is only just beginning.

* * *

New Hopes for Spain.—This week the tale of Spanish events and discussions over Spain has been extremely full. The campaigning for Bilbao is still going on, and General Franco has treated the city to a "surrender or no quarter" ultimatum of the same kind as those frequently addressed to Madrid. It may be equally effective. Meanwhile the German bombers and their German pilots are still devastating the villages round Bilbao as well as parts of the city itself; and on Wednesday they went to the extreme of shooting down a French air-liner with passengers aboard. The pilot, though severely wounded, contrived to land his (British) machine, but could not lower his retractable undercarriage. Happily, none was killed; but we imagine that stiff compensation will be demanded; or else air-liners bound for Bilbao, as cargo ships, will in future have to be convoyed by fighting craft. Then General Franco's German air force may receive unpleasant shocks. It is clear that General Franco's aim in his campaign of terrorism from air and sea is to prevent foreign shipping or aircraft from taking anyone or anything to Bilbao. The British Government were forced—more by a combination of "Potato Jones" and Company with public opinion than by any convictions of their own—to call General Franco's naval bluff; and the French may soon call his aerial bluff. At Madrid, nothing of note has occurred; but on the Toledo and Guadalajara fronts, perhaps owing to the inroads on his forces there which General Franco has had to make in order to stiffen the attack on Bilbao, the Government forces have advanced again. The new Spanish Government seems to be settling down to work with great vigour; and there have been protestations of solidarity and loyalty from all the elements, Catalan and other, on the Government side.

* * *

Meanwhile, the moves towards a truce in the conflict, which we noted last week, have this week gathered considerable momentum. The Technical Advisory Subcommittee appointed by the London Non-intervention Committee to draft a plan for the withdrawal of all foreign "volunteers" from Spain, handed their report to the parent Committee on Wednesday, and it has gone to the twenty-seven Governments represented. It now applies, as a result of insistence from certain Governments (notably the German and Italian) to all foreign participants, directly or indirectly, in the conflict. So wide a definition makes it more difficult of application than one covering only actual foreign fighting men. More interesting is the news that the twenty-seven Governments

are being asked to state, with their views on the plan, if they will give force to its proposals. The discussions over the feasibility of a truce—which, in any case, will be necessary to evacuate the foreign "volunteers"—are not in sight of the goal, since the Italian and Russian Governments have not yet replied to the initiative taken last week by the British Government. Both the plans for withdrawal of volunteers and for a truce will have finally to be agreed by both sides in Spain; so optimism would be out of place. The parent Committee is also putting the finishing touches to its appeal to both sides to stop all bombing from the air and to humanise the conflict. In this context, the Basque Government have postponed, probably *sine die*, the execution of three of the captured German pilots duly tried and sentenced to death, and General Franco has released his foreign prisoners of war. Perhaps the most important and most influential event of the week has been the landing of 4,000 Basque children from Bilbao at Southampton, and their distribution to the institutions of all kinds and creeds which are to care for them here. Those, including the Home Secretary, who welcomed them on their arrival in camp were deeply moved by the sight of so many children, from families sympathising with both sides in Spain, in whose features and gestures the signs of suffering were writ large. This humanitarian action, at any rate, is one over which those British people who have made it possible by their generosity need have no misgivings.

* * *

The Paris Exhibition.—With the burning of the Crystal Palace, in which the first great international exhibition was housed in Hyde Park in 1851, fresh in our memory, the Paris International Exhibition was opened by President Lebrun on Monday. Paris quickly followed London in staging a great exhibition eighty years ago; and the present exhibition there—a vast public works achievement—bids fair to surpass any exhibition held since the last war, including that at Wembley in 1925. The Paris exhibition around the site of the old Trocadero, in the shadow of the Eiffel Tower, is certainly the most ambitious in architecture, amenities, and impressiveness; but it is not yet complete. Its construction has been dogged by persistent labour troubles; and the task of preparing an area along both banks of the Seine from the Place de la Concorde to the Trocadero and over the Champ de Mars almost to the Chamber of Deputies has been *kolossal* enough to impress even the accomplished Nazi stage-managers of massed impressiveness. Forty-two of the world's nations are represented among the 280 pavilions and palaces; and it is reported that among the most impressive exhibits are those by Germany and Soviet Russia. Is it too much to hope that the aim of the "onlie begetter" of the Great Exhibition of 1851 and of all such exhibitions—Albert of Saxe-Coburg, Prince Consort of Queen Victoria—may be

realised at Paris in 1937? He believed that in an age of technical and productive achievements, men of all nations, by being convoked to perceive their interests in the arts of peace, might be led to forsake war. The Great Exhibition and its successor at Paris helped Cobden to conclude the commercial treaty with France which laid the basis for freer international trade. In our age of even more miraculous achievements, the Paris Exhibition may serve to remind men of many nations that peace and freer trade are now, more than ever, the linked essentials of our civilisation.

The League Council.—The proceedings of the Council at Geneva, which opened this week, have been important without being exciting. The most important events were the intimation from the Emperor of Ethiopia that he could see no useful purpose in his being represented at the forthcoming Assembly, and the ceremonious admission of a fully-sovereign Egypt to membership of the League on Wednesday. The recent success at the Montreux Conference over the Capitulations, and the speech of Nahas Pasha at Geneva on Wednesday, testify to the greatness of the rôle which Egypt will in future be called upon to play in the Near and Middle East. As a full, loyal, and enthusiastic League Member, beside this country, with which she has just concluded a statesmanlike treaty of alliance, Egypt is capable of playing a decisive rôle, both at Geneva and farther to the East. The status of the delegation representing the Emperor of Ethiopia is not yet definitely settled, for his absence at the next Assembly does not technically invalidate his rights to be represented in future; nor, indeed, can the League decently and legally deprive him of rights which even the victorious aggressor on his territory cannot legally arrogate to himself. But the Emperor's decision this week probably indicates that he himself does not intend to pursue ineffective demands for justice in a forum patently impotent to satisfy them. Happily for the League, his decision this week absolves the Credentials Committee from examining and pronouncing upon his credentials; and though the Polish representative on the Council tried to secure an official record to the effect that the Council regarded the question as "settled," the Mexican delegate promptly vetoed, in his country's name, any action which might deprive the Emperor of his rights, and Ethiopia of League representation. The question of the autonomy of the Sanjak of Alexandretta under the now independent Syrian Republic will soon be resolved by the presentation to the Council of a report by the rapporteur of the special Committee, Herr Sandler, under the good offices of the French, Turkish and British Foreign Ministers. Over Spain, the Council is drawing up a resolution for a truce, and the Spanish Govern-

ment's representative, despite General Franco's provocative challenge to his credentials, has presented a White Book which contains full evidence of intervention against the Spanish Government on a large scale by the Italian Government and Army.

Another Setback for Fascism.—"The Fascist tide is still on the ebb; and it may so continue as long as democracies, too, can produce real leaders." With those words we ended our comment on M. van Zeeland's crushing defeat of M. Degrelle, the Belgian Rexist leader, at the Brussels bye-election on April 11th last. Now this week M. van Zeeland's opposite number in the Netherlands, Dr Colijn, has utterly routed the Dutch Fascist Party, and added over 40 per cent. more votes to his own Anti-revolutionary Party, in a general election which was even more excitedly contested than the last, in 1933. Indeed, the Dutch Fascists have lost 40 per cent. of their former voters, and will have only four instead of their expected eight seats. Thus, as in Belgium and in Czechoslovakia, the other two democracies where Nazi-inspired Fascist Parties have been recently losing ground, the people of the Netherlands have turned from Right-wing extremism at the same time as from that of the Left-wing variety. In Holland, this week's results would have been unthinkable a year ago, when the long pressure of Dr Colijn's deflationary programme had ground out a large measure of discontent. But, though late, devaluation came at last; and, as has frequently been pointed out in these columns during the last nine months, the combination of rising world prices with the general re-alignment of currencies through the devaluations last September has steadily worked against Fascism and the Fascist States. After the latest Belgian and Netherlands victories of democracy, it behoves the two remaining Great democratic Powers in Europe, France and Britain, to do all in their joint power to strengthen and extend this patent revival of democracy. The best way they can do that is to join wholeheartedly in the drive for freeing trade. The U.S.A., France, Belgium, Holland, Switzerland, Czechoslovakia, and the Scandinavian and Baltic countries are all prepared to do their utmost to achieve this aim. What are the the new British Government prepared to do?

Lord Plymouth flies to the Baltic.—The flying visit Lord Plymouth is paying to Helsingfors, Tallinn, Riga and Kaunas is a most welcome, if somewhat belated, gesture of courtesy and recognition on the part of this country to four very friendly—indeed, very important—young States. It is the first time since their inception

that an official representative of the British Government has visited the three Baltic republics, though Finland had the opportunity of welcoming the head of the Department of Overseas Trade during the memorable "British Week" in Helsingfors in September, 1933. Not only do trade relations between England and both the Scandinavian and Baltic States date back to the very beginning of our history; not only is the whole of that region one of the best markets in the world for Britain, and an essential source of supply; but from the political and cultural standpoints they are closer to us than almost any other nation. The prosperity achieved by Finland—the only country in the world now paying its war debt—deserves study; and the commercial expansion and political consolidation of the three Baltic republics is also remarkable. It curiously contradicts the gloomy prognostications that, without the vast Russian hinterland, these countries would be unable to survive. To-day their trade with Russia is negligible, while England is their commercial—and in many ways their political—metropolis. That position affords this country unique chances, and obvious responsibilities. These States have no political claims on us. There are no special issues for Lord Plymouth to settle. But it is only natural that, cabined as they are between Russia and Germany, they should feel a certain apprehension about two formidable neighbours—whether these happen to be allies as they were before 1933, or enemies as they appear to be now. They wish to live on terms of friendship and peace with both Russia and Germany. Neutrality is with them an article of faith. Lord Plymouth ought to convince them that England appreciates their position, and sees in them not only her very old commercial friends but also collaborators in the cause of peace.

The Trend of Prices.—The implications of the sharp rise in wholesale commodity prices since the middle of last year have been widely discussed of late. In particular anxiety has been expressed over its probable repercussions on the cost of living. The relationship between changes in wholesale prices and the cost of living is illustrated by the diagram below, based on *The Economist* index of wholesale prices of primary products and partly-finished goods and the Ministry of Labour's index of the cost of living. While the official cost of living index suffers from many imperfections, the diagram clearly shows the comparative stability of the prices of consumption goods, including rent. While the two indices show the same general trend, the amplitude of the variations of *The Economist* index during the past ten years has been more than double that of

WHOLESALE PRICES AND THE COST OF LIVING

(Sources: Wholesale Prices, *The Economist*; Cost of Living, Ministry of Labour)

the official cost of living index. Incidentally, the diagram shows that both wholesale prices and the cost of living continued, on the whole, to fall for eighteen months after the suspension of the gold standard in September, 1931. Between the spring of 1933 and the middle of 1936 both wholesale and retail prices rose fairly gently, but since then wholesale prices have increased more rapidly as world recovery has gained momentum. So far the advance in wholesale prices has not been proportionately reflected in the official cost of living index, but the latter may move rapidly in future if wholesale prices continue to increase.

Airways to the Empire.—On Tuesday night the White Paper (Cmd. 5414) was issued giving the chief provisions in the agreement, to be concluded later, between Imperial Airways, the Postmaster-General, and the Secretary of State for Air, for improved passenger services and carriage of all Empire first-class mail by Imperial Airways along the Empire routes. Such mail for Empire and certain foreign countries on the routes will be taken at 1½d. per ½ oz. for letters and 1d. for postcards. The Egypt-South Africa service is to begin shortly; that to India, Burma and Malaya at the end of this year; and the extension to Australia early in 1938. The agreement is to run for fifteen years from next January 1st; and in each of the first three years Imperial Airways are to receive £750,000 subsidy; in each of the next three, £675,000; in each of the next three, £600,000; in each of the next three £525,000, and in each of the last three £450,000—though it is stated that these total subsidies of £9,000,000 are all "subject to adjustment," presumably both upwards and downwards. The various participating countries will, however, together pay not less than £185,000 in each of the fifteen years, "normally" to the United Kingdom Government, as appropriations-in-aid of Air Votes. During the fifteen years Imperial Airways will also receive a sum of £900,000 per annum as payment for carriage of mails alone from the United Kingdom and other Governments, to be made by the Postmaster-General from the Post Office Vote; of which sum £315,000 per annum is expected to come from Governments other than our own. Qantas Airways and other such services on the Empire routes are associated, and will sometimes receive portions of subsidy and payment direct. At the outset, Sydney will be ten days from London, Capetown and Singapore six to seven days, and Karachi or Kisumu three to four days; but when the organisation and equipment for night flying are perfected, these times are to be reduced to seven days, one hundred hours, and sixty hours respectively. By the agreement, nine services a week are to and from Egypt, five to and from India, three to and from East Africa and the Straits Settlements, and two a week to and from Australia and South Africa. On these heads of the future agreement, our Empire air-mail services will be the cheapest, most frequent, and most extensive in the world. Imperial Airways seem to have done remarkably well for themselves in the agreement; but air-mail is one of those rare developments for which subsidies can be justified by the service which can only thus be provided.

Scrap and Build.—Part II of the British Shipping (Assistance) Act of 1935 empowered the Board of Trade, on the advice of the Ships Replacement Committee and with the consent of the Treasury, to make advances at a rate not exceeding 3 per cent. per annum to assist the building and modernisation of vessels for the carriage of commercial cargoes. It was laid down that scrapping must go hand-in-hand with building and renovation to obviate redundant tonnage; that two tons of shipping must be scrapped for every ton built with assistance, and one ton for every ton modernised. On the expiry of this section of the 1935 Act, on February 25th, the Ships Replacement Committee has recorded the working of the scheme; and their report* describes the inevitable

* "Report of the Ships Replacement Committee." His Majesty's Stationery Office. 2d.

fate of depression devices in a period of advancing activity. The technical and financial standards laid upon applicants by the Committee showed a keen desire to advance the interests of British shipping by bringing the tramp fleet into line with the most modern criteria of efficiency. Of the fifty ships built or sanctioned under the scheme, some 55 per cent. of the tonnage was steam and 45 per cent. diesel. Good crew accommodation was insisted upon. And of seventy-four applications for the building of ninety-five ships at an estimated loan cost of £6,228,353, thirty-seven were granted and the total approved advances amounted to £3,548,124 7s. 9d. Counter-scrapping involved the approved demolition of ninety-seven vessels of 386,625 tons gross, consisting of forty-nine British and forty-eight foreign vessels. Of the foreign vessels, amounting to 148,158 tons gross, as many as fifteen with a gross tonnage of 55,156 were Greek. No figures are given of the ages of the condemned ships. At the outset of the scheme freights were still low and tonnage redundant. But even from the beginning improvement rapidly set in; and, indeed, the scarcity of scrap tonnage was a growing difficulty throughout. By 1936 much of the scrap bought for demolition in the open market was already out of commission, and its selection was contrary to the intention of the Act, which had not, however, envisaged a shortage of suitable competitive ships. The recovery of freights in the autumn of 1936 rendered the scrap position impossible and the Act largely unworkable. The only possible conclusion from this report is that the Act was introduced too late. The scheme would have been much more useful had it been introduced a year or two earlier. It is true that a step towards the modernisation of the mercantile marine has been taken; and that a fillip was given to shipbuilding. But such a scheme belongs properly to the trough of depression, not belatedly to the rising curve of prosperity.

German Trade in South-East Europe.—During 1936, Germany's foreign trade with the Central and South-East European countries again increased. Compared with 1935 and 1932 Germany's share of trade with the countries below developed as follows:—

IN PER CENT. OF THE VALUE OF EACH COUNTRY'S FOREIGN TRADE

Country	1932		1935		1936	
	Imports from Germany	Exports to Germany	Imports from Germany	Exports to Germany	Imports from Germany	Exports to Germany
Austria	20.0	16.5	16.7	16.0	16.8	16.1
Czechoslovakia	26.3	16.2	17.3	14.9	17.5	14.4
Hungary	22.5	15.1	22.6	23.8	25.3	23.0
Roumania	24.5	12.4	24.4	16.8	39.0	20.7
Yugoslavia	17.9	11.3	16.2	18.7	26.7	23.7
Greece	9.7	15.1	18.7	29.0	22.3	35.1
Bulgaria	25.9	26.0	53.6	48.0	61.0	47.7

Family provision scheme

A scheme to secure a Capital Sum payable at death and a regular income over a period of years for dependants in the event of early death, at a cost which is little more than that of ordinary life assurance. It is readily adaptable, and rates will be quoted on application for policies to suit the needs of each individual.

Established 1844 Funds exceed £25,000,000

The figures show that trade relations between Germany, Austria, Czechoslovakia and, to a certain extent, Hungary remained virtually at the same level. This was partly the result of the competitive power of Austria and Czechoslovakia, and partly due to the working of the Rome Protocols. This has favoured non-German countries. Roumania, Yugoslavia, Bulgaria and Greece together accounted mainly for the total increase. Countries without exchange restrictions and complicated barter methods have slowly gained lost ground. For example, Great Britain's share of the foreign trade of some of these countries developed as follows:—

	1935		1936	
	Imports from Great Britain	Exports to Great Britain	Imports from Great Britain	Exports to Great Britain
Roumania	9.6	8.8	6.9	12.5
Bulgaria	4.6	4.3	4.6	11.6
Yugoslavia	10.1	5.3	8.5	9.9

Great Britain's share in their imports was still declining, but that in their exports increased remarkably. Italy's share in their trade, owing to sanctions, declined enormously.

Germany's possibilities in penetrating South-Eastern Europe seem to decline during trade recovery. The following table makes it appear doubtful if Germany will be able to keep pace with other countries.

Country	Imports: 1929 = 100			Exports: 1929 = 100		
	1932	1935	1936	1932	1935	1936
Germany.....	34.8	31.0	31.4	42.6	31.4	35.4
Austria.....	42.5	36.6	37.9	35.7	40.5	43.1
Czechoslovakia.....	37.1	33.8	39.8	35.9	39.0	39.6
Hungary.....	32.1	36.8	39.8	33.0	43.4	48.6
Roumania.....	40.4	36.4	38.8	58.0	58.1	68.2
Yugoslavia.....	37.7	48.7	53.8	38.6	50.8	55.2
Bulgaria.....	41.9	36.3	38.4	53.0	51.2	61.0

Under Dr Schacht's New Plan policy, all these countries are still compelled to buy heavily from Germany. Germany will now have to increase her exports to countries other than those in Central and South-East Europe in order to be able to buy more from that region than she sells there. These difficulties partly explain why Dr Schacht has been trying to come to an understanding with the larger world-trading countries in matters of foreign trade.

Sugar Agreement Details.—The full text of the agreement concluded at the London conference at the beginning of this month is now available. It does nothing to increase the distinctly restrained satisfaction with which its outlines were greeted. The contracting governments agree, roughly speaking, not to increase their already grossly excessive measures of protection during the five years, from September next, for which the agreement is to run. Great Britain, however, reserves the right to increase domestic production and imports from the Empire in proportion to any increase in consumption. This appears to be the only contribution the conference had to make to the reconstruction of the industry. The remainder of the agreement provides for the detailed apportionment of export quotas to the free market and for the setting up of the International Sugar Council.

The basic export quotas are allocated as follows:—

Country	Quota (Metric tons)	Country	Quota (Metric tons)
Netherlands (including overseas)	1,050,000	Germany	120,000
Cuba	910,000	Poland	120,000
Dominican Republic	400,000	Brazil	60,000
Peru	330,000	Smaller producers (Belgium, Haiti, Hungary and Portugal) in all	122,500
Czechoslovakia	250,000		
U.S.S.R.	230,000	Total	3,022,500

* Czechoslovakia is to receive also additional quotas of 90,000 in 1937-8, 60,000 in 1938-9, and 25,000 in 1939-40.

In addition, a reserve of 47,500 tons is held at the disposal jointly of France and Yugoslavia. These basic quotas may be increased or decreased proportionately when demand warrants the change, and various maximum stocks expressed as percentages of the quotas are allotted to each country. The whole scheme is to be administered by the Council, and by its executive committee, which is to be composed of three representatives each of importing, cane sugar producing and beet sugar producing countries. The prohibition of imports from a country infringing the agreement is not to be considered contrary to any most-favoured-nation rights that the offender may enjoy. The elaborate constitution of which this is a brief summary may possibly work efficiently, but it seems unlikely that it will bring with it any relief to the consumer. Nor will exporters secure any advantage, except, perhaps, a slightly higher price, that they would not have obtained in the ordinary course of trade.

Industrial News.—The news that the impending national coal strike has been averted has been greeted with heartfelt relief by industrialists who are now again able to plan ahead. The meagre revisions of N.D.C., however, set out in the Finance Bill, have disappointed industry, especially as the precise liability of individual concerns is still uncertain. Nevertheless the majority of the latest reports from industrial centres on pages 549-552, point to increasing activity, especially in the coal and metal trades. The decline in the demand for house coal has been offset by a further expansion of industrial requirements, and supplementary increases in output allocations have been demanded and conceded for the current quarter. The demand for iron and steel remains as strong as ever and producers, though gradually extending their capacity, are still unable to meet all requirements, a situation which has its counterparts in other countries. A feature is the marked expansion of international trade in iron and steel specialities between industrialised countries. New business in cotton and wool textiles has not yet recovered to pre-holiday dimensions. Demand for rayon, on the other hand, remains exceptionally good. Apart from certain consumption goods trades, there are as yet no indications of the seasonal lull in industrial activity which usually sets in at this time of the year. The outlook for industry and trade is discussed at length in the *Monthly Trade Supplement* published with this issue of *The Economist*.

Electricity Reorganisation.—The Government's dratt plans for the reorganisation of the electric supply industry have been in the hands of those concerned for some weeks, and their broad outlines have been described, unofficially, in the Press. The 600-odd existing undertakings have been divided into 76 groups, which are, for the most part, of homogeneous character and consist wholly of either company-owned undertakings or municipally-owned undertakings. The undertakings in each group are to be combined into one unit, preferably through the acquisition by one member of all the others; failing that, by the establishment of a Distribution Authority as a body corporate appointed by the Minister of Transport; or, as a last resort, by the formation of Joint Boards where the undertakings to be merged are at present owned by local authorities. Schemes for this purpose are to be prepared by the Electricity Commissioners and to have effect compulsorily on confirmation by the Minister. Meanwhile, every encouragement is given to the preparation of schemes to the same end on a voluntary basis, and it is understood that a considerable response has already been secured. Compensation for the dispossessed owners of undertakings is apparently to be on the basis of depreciated assets in the case of local authorities; while, for companies, a further payment will be made for goodwill. This will be equivalent to the purchase, for the unexpired period of each company's franchise, of the profits in excess of a return, at an investment rate, on the depreciated assets. Surviving companies will have a consolidated franchise

for a limited term of years of their whole undertaking. In addition to strict regulation and supervision by the Electricity Commission, their earnings will be regulated by a sliding scale of Draconian severity. On the whole, the scheme seems to provide a workmanlike solution of a knotty and difficult complex of interests. It may be open to criticism, however, on the two grounds: that while it decries the logical basis, it prolongs the form of private enterprise; and that—presumably in deference to interests which are politically strong—it does not divide the country into sufficiently large areas to ensure that each dense area carries something like its due proportion of thinly populated country.

Employment in the Retail Trades.—In *The Economist* of September 19, 1936, we drew attention to the serious problems of employment in retail distribution; to casual labour, long hours, low wages and juvenile unemployment. An analysis of the most recent Ministry of Labour figures, made by the Shop Assistants' Union, serves to underline the urgency of the difficulties which the Ministry in conjunction with the more progressive employers and the Union is at present trying to solve. The fact that the number of insured distributive workers rose between July, 1935, and July, 1936, from 2,213,620 to 2,248,630 shows the magnitude of the problem. More than 25 per cent. of these workers are employed in London alone; and 838,930, or over 37 per cent., are women and girls. Perhaps the most striking feature of the analysis, however, is the revelation that one in every three of the insured workers in distributive trades is under 21—a total of 769,820 young persons, often working long hours, not unusually between 50 and 60 per week, for weekly wages sometimes considerably below 15s. Moreover, these juveniles are more liable to unemployment than those in any other trade. In mid-1936 over 24 per cent. of all the insured unemployed youths in the country between 18 and 20 years of age were in retail trades; and 28 per cent. of all the unemployed girls of the same age had been similarly employed. In Wales as many as one-fifth of the insured males between 18 and 20 in retail distribution were out of work. Faced with these figures and by the facts about the conditions of work and remuneration revealed by a Select Committee on Shop Assistants in 1931, we cannot but feel that the present negotiations ought to result in far-reaching ameliorations in a group of trades upon which we all lean heavily and in which the effort of organising collective bargaining is necessarily an uphill task.

The Scottish Herring Industry.—Almost two years have elapsed since the scheme for the rehabilitation of the depressed herring industry, drafted by the newly-created Herring Industry Board, came into force after securing the approval of Parliament; and some gratifying progress has been achieved in the interim. Following a period of acute depression—reflected in abnormally low profits, declining employment and the existence of obsolete equipment and surplus capacity—the fortunes of the industry have recently taken a turn for the better. The season has as yet hardly begun, but the value of British takings of herring in the first four months of 1937, according to the official returns, averaged 11s. 4d. per cwt., against 9s. 2d. in the same period of last year. Since the primary cause of the depression was the loss of export markets, due to political changes on the Continent, world depression and currency difficulties, particular interest attaches to an agreement between the German klondyking importers and the Shetland herring fishermen, which came into force last week. The German importers have agreed to satisfy all their requirements during the coming season from the Shetland fisheries. Germany is already by far the most important overseas purchaser of British herring and it is hoped that she will absorb still larger quantities under this new arrangement.

Although the industry apparently stands on the threshold of a more profitable season, prosperity still eludes the "small men" in the industry. In Scotland, where individual ownership is far more common than in England, much of the existing equipment is obsolete and many of the drifters barely conform to Board of Trade standards of seaworthiness. The Herring Board, it is true, has launched a loan scheme to facilitate the rebuilding of obsolete tonnage; but it is doubtful whether the bulk of the small Scottish owners are in a position to take advantage of it. A new herring drifter may cost as much as £6,000 to build and the owner must himself find one-third of this sum. A much wider measure of prosperity than has yet been achieved will be necessary before arrears of depreciation and replacement can be made good. But, at a time when so much attention is being devoted to war-time needs, it seems unlikely that the Government will acquiesce in the indefinite contraction of the fishing fleets. The salvation of the herring industry is contingent upon the recovery of markets overseas, and this is one more reason for a new effort by the British Government to loosen the shackles of world trade.

Road Passenger Transport Developments.—A company was formed last week called Red and White United Transport Limited. Its establishment marks a further stage in the consolidation of passenger road transport interests, and emphasises the marked difference in structure between the passenger and goods sides of the road transport industry. The new concern, which is a merger of some eight different companies and their subsidiaries in Wales and the Border Counties, will control over 370 buses and coaches. It will, indeed, be the largest of the remaining companies in England and Wales outside the Tilling and B.A.T. group. There is still a considerable number of small operators of passenger road services; for the latest reports of the Traffic Commissioners record the existence of 4,896 operators each owning fewer than ten vehicles. Nevertheless, the operating units of the Tilling and B.A.T. and the Scottish Motor Traction Groups, together with the municipalities and London Transport, account for nearly 60 per cent. of all passenger vehicles on the roads. There is nothing like this concentration of ownership on the goods vehicle side. Apart from Carter Paterson, Pickfords and other railway-controlled companies, there are not more than a score of haulage firms owning over 100 vehicles each, out of a total of 91,567 "A" (Public Carriers') licensed vehicles on the roads. In the main, the only large goods haulage concerns are those supplying regular trunk services where competition is a bone of contention with the railways.

Motor Insurance in India.—The Committee appointed by the Government of India to examine the "question of enforcing compulsory insurance of motor vehicles against passenger and third party risks" has recently submitted its report. The report brings out the appalling fact that the incidence of motor accidents in India in relation to the number of motor vehicles on the road is far in excess of that in any other country in the world. Fatal accidents number 93 per 10,000 in India; comparable figures for the U.K., Italy and New Zealand are 30.6, 59.4, and 7.4. The total number of all kinds of motor vehicles on the roads is only 125,000, according to figures submitted by the various Provinces, or 143,000 including vehicles not in use. Of these only 20 per cent.

are buses carrying passengers and many of these do not directly compete with the railways. In other words competition from road transport complained of by the Indian railways has been greatly over-rated. The main recommendations of the Committee include compulsory third party insurance, separation of motor insurance from other accident insurance in returns of companies, compulsory reporting of all accidents and more rigorous punishment for negligent driving. The Committee recognises that the co-operation of the insurers is dependent on adequate measures for the proper regulation and control of motor transport. The Committee holds that the "one-man-one-bus" system is a frequent source of accidents and advocates its replacement by a system of vehicles operating on definite routes to a regular time schedule. It favours a system of co-operative insurance, if practicable, and the setting up of Provincial Boards for road licensing purposes.

* * *

Census of Production: Metal Trades.—Volumes IV and V of the preliminary returns of the Fifth Census of Production, 1935, cover the Iron and Steel Trades. General details about the Census reports were given in *The Economist* of February 27th, page 463. The table below reproduces part of the general summary from the latest reports and gives the gross value of production, as well as the net output (gross value minus costs of fuel, materials and work given out), the number of persons employed, and net output per employee:—

IRON AND STEEL

Trade (and year)	Gross output	Net output	Av. No. of persons employed	Net output per employee
	Thous. £	Thous. £		£
Iron and steel:—				
Blast furnaces	1935 21,047	4,083	15,815	258
	1934 18,540	3,591	14,873	241
	1930 28,820	3,948	19,362	204
Smelting and rolling	1935 101,542	33,356	135,011	247
	1934 90,844	29,569	126,837	233

* Excludes N. Ireland.

† Includes items excluded above for N. Ireland.

The figures show clearly the violence of the recession even from the none too prosperous year of 1930, and the equal rapidity of recovery in 1935. In all the large branches of the industry employment rose substantially, and net output per head easily surpassed the figure for 1930. The increase in the value of the net output per employee in most branches of the industry between 1930 and 1935 reflects the improvement in efficiency resulting from reorganisation.

Volume of British Production.—The official index of industrial production for the first quarter of 1937, published in this week's *Board of Trade Journal*, shows an increase of 7.1 per cent. over the corresponding quarter last year. This confirms once again the movement of *The Economist* index of business activity which showed almost precisely the same rise during this period. Changes in the output of the principal branches of activity are shown below:—

BOARD OF TRADE INDEX OF PRODUCTION (1930=100)

Group	Year 1935	Year 1936	1936		1937
			Mar. Quarter	Dec. Quarter	Mar. Quarter
1. Mines and quarries	91.7	94.4	100.6	99.1	99.5
2. Iron and steel	125.6	150.1	146.2	155.6	158.0
3. Non-ferrous metals	137.3	143.9	134.8	154.0	154.2
4. Engineering and shipbuilding	104.8	123.1	116.3	132.3	136.1
5. Building materials and building	147.0	157.1	148.8	157.3	147.7
6. Textiles	119.1	126.4	127.3	130.3	130.5
7. Chemicals, oils, etc.	110.6	114.0	115.1	119.1	120.5
8. Leather and boots and shoes	116.0	120.7	126.1	119.6	120.6
9. Food, drink and tobacco	107.6	114.5	106.9	121.2	113.3
10. Gas and electricity	132.6	148.2	(a)	(a)	(a)
Total of manufacturing industries (2-10)*	117.0	129.4	126.9	137.6	137.3
Total of all groups (1-10)*	113.5	124.6	123.2	132.1	131.9

* Includes also various industries not specified above.

(a) Quarterly particulars of gas production are not available and complete information in respect of the year 1936 cannot yet be given; a provisional estimate of the quantity made has been used for the calculation of the group index for last year. The available data for electricity have been included in the general index numbers.

In contrast to its movement a year ago, however, the official index showed a slight decline in industrial activity between the last quarter of 1936 and the first three months of the current year. This decline is due to the fall in the indices for building and building materials, and for food, drink and tobacco, for the figures for all the other industries registered an increase between October–December, 1936, and the first quarter of 1937.

* * *

Immigration in South Africa.—The first Act of the present parliamentary session in South Africa was the Aliens Act, 1937, which repealed the 1930 Quota Act and tightened up the restriction of immigration by introducing a more comprehensive control. The Quota Act had exempted most of the large countries of the world from its provisions. From the countries not so exempted it allowed fifty immigrants per annum from each, plus an additional thousand subject to selection. The new Act replaces this regulation by a discretionary power given to an Immigrants Selection Board to restrict and regulate the individual entry of aliens into the Union for permanent or temporary residence. To be acceptable, an applicant for permanent residence must be readily assimilable with European inhabitants and not likely to pursue an occupation in which, in the opinion of the Board, there is already a sufficient number of persons engaged in the Union. There is now a further immigration measure before Parliament, the Immigration Amendment Bill, relating to the recruitment of native labour to meet the increasing demand of the gold mines. Its main purpose is to allow the import of tropical natives (i.e. natives from the north of latitude 22 degrees south of the equator) under approved schemes of recruitment and repatriation. Hitherto (since the Immigrants Regulation Act of 1913) the native labour supply to the mines has come from the Union itself, from the Protectorates of Basutoland, Swaziland and Bechuanaland, and, under a convention, from the Province of Mozambique. The recruiting of tropical natives was not permitted on account of the high death rate (especially from pneumonia) which prevailed in the early days when tropical natives were admitted to the Union. Whether this disability has been removed remains to be seen.

Labour Since the War

NEW YORK, May 18.—The outstanding phenomenon in the spring of 1937 has been the expansion of the labour movement. So recent is this activity that it is not readily analysed in terms of numbers, ideology or general characteristics. Any survey at this stage is necessarily sketchy and tentative.

Between the war period and the passage of the National Industrial Recovery Act, American unionism became dormant. The great Brotherhoods were firmly entrenched in the railroads; the craft unions of the American Federation of Labour had complete or almost complete control of certain skilled trades, like building in its various forms, the printing trades, etc. Coal mining was unionised only in certain regions. But, generally speaking, the newer mass production industries were either unorganised or loosely organised in company unions. Their personnel had neither the cohesion of occupation that characterised the railroad brotherhoods nor the bonds of individual skill of the Federation craftsmen. The result was that total union membership showed little change in numbers from year to year; and the whole movement pursued the even tenor of its way in routine tranquillity. There were exceptional incidents of extreme violence, notably in the coal industry, and occasionally there was local degeneration into downright racketeering.

The N.I.R.A. gave a considerable, but only a brief, impetus to organisation, especially in the areas which did not lend themselves readily to craft unionism. The new organisations fell mainly into the broad category of company unions, in the sense that they were not affiliated to the national or international unions of the Federation; but the movement was somewhat factitious. The year 1934 was, however, marked by two great strikes: a marine strike on the Pacific Coast in the summer and a cotton textile strike in the early autumn. While textile strikes were no novelty, this was the first great attempt to organise the whole industry on a national basis. In spite, or because, of the prompt appearance of violence, the textile strike failed, and for about two years the American labour situation resumed its former tranquillity. This could hardly be attributed to the abandonment of the N.I.R.A., for the sections involving collective bargaining were not questioned before the Court. Nevertheless, the passage of the Wagner Act in the spring of 1936 gave another impulse to the movement, while the example of the stay-in strikes in France suggested a new technique well adapted to industries and plants in which only a small, but resolute and aggressive minority had been organised.

The Rise of Mr Lewis

While the Federation of Labour was by no means slow to undertake campaigns, it was the Committee for Industrial Organisation under Mr John Lewis that made most energetic use of the opportunity. The great unorganised areas were the mass-production industries, with numerous well-paid employees as much above the average skill level of common labour as below the skill level of the craftsmen. The field was ripe for the harvest, the sit-down strike was a sickle at hand, and in Mr Lewis, the C.I.O. had an energetic, not to say, militant, harvester. Six months ago, the C.I.O. was hardly more than a faction of the Federation, representing the United Mine Workers, a rather battered textile union and the garment trades. It concentrated on what might have

seemed the hardest industry in the country—automobiles—and opened with a flank attack on the glass industry. It then proceeded to a sit-down strike in a great motor corporation in which it represented only a handful of the workers, and forced a settlement. On the strength of that victory, it struck at another great motor company in which its position was somewhat stronger, and forced another settlement. After this impressive demonstration, the largest unit in the steel industry capitulated without a struggle.

The result is that the C.I.O. which six months ago represented no more than a minority of organised labour, has now a membership which compares in numbers with either the Federation or the railway Brotherhoods, and is still growing far more rapidly than either. Curiously enough, its whole rise and progress has been in open contradiction of the Wagner Act, which insists that a majority must be the sole bargaining agency, but does not define majority—i.e. whether a majority of all workers in the industry, a majority in a given plant, a majority in a particular department or type of work, or a majority of those participating in some election of representatives. The last of these definitions seems to be gaining acceptance. So far the C.I.O. unions have won their outstanding victories in contests in which they were a minority by any measurement. These unions are, however, growing so rapidly that they may soon become majorities, although in instances it seems clear there will be a collision between the Federation and the C.I.O. unions under the Wagner Act. The important fact is that while the C.I.O. and the Federation are decidedly rivals in certain fields, the C.I.O. has been making its gains not at the expense of existing trade unionism, but in industries that had been only quasi-organised in company unions, partly because the area had not lent itself well to the horizontal organisations of the Federation.

The change in the past six months is astonishing. While six months ago the great mass of American industry was unorganised or only nominally organised, it is now in process of being completely organised either under the Federation or under the C.I.O. It is not unlikely that at the present time American industry is as completely organised as British industry, and it would appear that in a few months, if the present trends continue, it will be more completely organised.

The Prospects of Labour

The first comment is obvious. The C.I.O. unions have expanded with mushroom speed; but they possess neither experienced local leaders nor a tradition of organisation among their hastily recruited membership. Hence the continuance of fitful local strikes in the General Motors plants after the strike settlement of

INQUIRIES SOLICITED

February—an example of amateur leadership and undisciplined membership. Such episodes are evidence of adolescence rather than of maturity in labour organisation.

It is one thing to note this sudden organisation of the personnel of American industry; it is another thing to formulate its ideology and define its programme. One can say with some positiveness that the current American labour movement is not Marxian in its ideology; but one can also say that it bears little resemblance to the trade union movement as developed in England. It has not yet developed articulate spokesmen or a programme. Nevertheless, the various settlements negotiated—differing widely in substance—are beginning to take shape and a piecemeal pattern is appearing, something like a partly assembled jigsaw puzzle. These settlements go far beyond the simple hours-and-wages arrangements of conventional trade union negotiation, and include wide areas of industrial relationship, considerably more involved than the master-and-servant relation of tradition and of common law. Broadly speaking, they envisage the investment of a job with certain nebulous concepts of property. These were invoked in the sit-down strikes in which it was asserted that while the factory was the property of the owner-employer, the job in the factory was the property of the employee; but the concept finds a number of other applications no more clearly defined. So rapidly has the movement developed that it is not surprising that its outlines should be indistinct. The important fact to remember is that in six months American industry has passed from a relatively unorganised state to one of unusually complete organisation; and that out of a number of detached settlements, a novel pattern of industrial relationship is gradually emerging.

France

No Immediate Financial Difficulties

PARIS, May 27.—The franc seems to be sufficiently bid on the market to be easily maintained. The dollars and pounds brought by tourists and visitors to the Exhibition will consolidate its position. But the return of capital is still too slow to cover the huge needs of the Treasury; and the Rentés are below their lowest points of February, 1934. The sentiment is growing that new financial difficulties will occur, because, as the Prime Minister declared, the State cannot keep on spending so much more than it receives. An estimated deficit for 1938 of 50,000 million francs; the attraction of foreign prosperity; the incoherence of Parliament; the technical errors of the Trade Unions; and the want of authority of the Government are evoking alarm in the country. The fears are probably exaggerated, but they tend to paralyse investment and business.

The opening of the Exhibition will be rapidly followed by the liquidation of the "Soviets of the Exhibition," the new "Ateliers Nationaux." On the other hand, the truce during the Exhibition and the general feeling that the Exhibition should succeed for the sake of national prestige will enable the Government to obtain further financial help from Parliament. The internal difficulties, on the other hand, explain the interest which prevails in the country in the progress of Franco-British efforts to alleviate conflict in Europe and notably in Spain.

The Error of the Forty-Hour Week

The latest mistake of the trade unions is the opposition to any revision of the forty-hour week, which was originally intended to diminish unemployment and is now causing a lamentable paralysis of production and business. The Communists, many of whom were elected by business people, have been forced to take a stand against their allies in the Popular Front. This stubborn and doctrinaire determination to apply the 40-hour week rigidly is a repetition in the field of industry of the rigid insistence on the gold tax in the financial field. It is, however, more lamentable, since the workers are now accustomed to their new Saturday holidays, and

their abolition would provoke grave discontent. If statistics are examined, it appears that unemployment has been diminished by re-armament orders, great public works, by the forty-hour week and by the longer period of military service, but on a much smaller scale by the revival of business. The Government is not unaware of these issues, and the Minister of Economy, M. Spinasse, has declared that the "forty-hour week cannot last unless France produces as much as in the forty-eight-hour week."

Tariff Changes

The diminution of production and the burden of the new social laws evoked a rise in prices which still hampers exports and renders easier the importation of foreign products. The Government have presented again to Parliament a bill for plenary powers to deal with tariffs and quotas by decree. This Bill has already been thrown out by the Senate, which fears that it will be used to lower the protective duties on farm products in order to compensate for the rise in prices. It is emphasised, on the other hand, that the raising of tariffs is contradictory to international collaboration for the lowering of tariffs, which the Government has always proclaimed to be the supreme goal of its policy.

The movement of wholesale prices is shown in the following table:—

	May 1st	May 8th	May 15th	May 22nd
General index	533	536	532	532
Home products	559	560	559	555
Imported products.....	487	492	483	490
Foodstuffs	522	524	524	516
Industrial products ...	543	546	540	546

Prices have remained steady for some weeks and seem to have been temporarily stabilised.

Germany

Central and Local Finance

BERLIN, May 25.—Reich revenue from taxation in April, the first month of the financial year 1937-38, totalled Rm. 911 millions, against Rm. 780 millions in the same month of last year. Revenue from direct taxes and taxes on business rose from Rm. 456 millions to Rm. 561 millions; and from Customs and Excise rose from Rm. 324 millions to Rm. 350 millions. The yield of the turnover tax, which showed the biggest absolute increase, rose from Rm. 201 millions to Rm. 245 millions. The greater relative increase in the yield from Corporation Income Tax, from Rm. 13 millions to Rm. 33 millions, was due to an increase in the rate of tax.

The total indebtedness of municipalities with over 10,000 inhabitants, excluding the Hanse cities, was Rm. 9,491 millions on September 30, 1936, against Rm. 9,653 millions on March 31st. The foreign share in the debt declined from Rm. 379 millions to Rm. 366 millions. Interest paid in the first half of 1936-37 amounted to Rm. 199 millions, and amortisation to Rm. 230 millions. The expenditure of municipalities and municipal unions is declining slightly. This is due to decreased outlay on unemployment relief, while other important expenditure items actually show increases. In 1935-36 municipal expenditure (excluding the Saar and Hanse cities) was Rm. 5,964 millions, against Rm. 6,064 millions in 1934-35.

The structure of municipal finance has undergone a considerable change since the depression. In 1932-33 63.9 per cent. of expenditure was covered by taxation or by administration receipts; in 1935-36 the percentage was 83.2. In the same time, subventions from the Reich and States fell from 12.3 per cent. of expenditure to 5.4 per cent. The total revenue under social insurance schemes, excluding unemployment insurance, was Rm. 4,390 millions in 1936, against Rm. 4,060 millions in 1935; total expenditure was Rm. 3,730 millions, compared with Rm. 3,580 millions. The receipts of the Unemployment Insurance Board totalled Rm. 1,512 millions, against Rm. 1,376 millions in 1935; and the

Board's expenditure rose to Rm. 1,505 millions from Rm. 1,374 millions. The increase in expenditure was due to the repayment of debt. The actual expenditure on unemployment benefit and emergency relief was only Rm. 622 millions in 1936, against Rm. 737 millions in 1935.

The Four Year Plan at Work

Eggs have again disappeared from the market, in spite of an official price 12 per cent. higher than a year ago. There have been numerous new statements about the Four Year Plan. The Chief of the Office for German Raw and Works Materials, Colonel Loeb, promises that the Reich will be independent of foreign liquid fuel within three years. Everything possible will be done to increase the home output of iron ore. Coal and peat will replace firewood, and the wood so saved will be used as raw material for the production of sugar, spirit, benzine and textiles. According to Colonel Loeb, the Four Year Plan is inimical to imports only up to a point which is fixed by considerations of defence and ethics, and it is not inimical to exports; artificial wool is already being exported, and the new Buna synthetic rubber, although it costs about double the price of natural rubber, will shortly be exported. It is stated that artificial silk and synthetic wool provided 19.2 per cent. of textile materials in 1936, against 11.3 per cent. in 1935. The value of all textile raw materials consumed (including yarns) remained virtually unchanged in 1936, being Rm. 906 millions, against Rm. 894 millions in 1935; but the net cost to Germany in foreign currency fell from Rm. 647 millions to Rm. 521 millions.

Industry is generally active. Coal production in the first four months of the year was 59,960,000 tons, against 51,050,000 tons in 1936; and 58,200,000 tons of lignite were produced, against 50,040,000 tons. The Ruhr coal industry is fully occupied. Although some derelict pits are being reopened and some new pits are being sunk, no increase in output worth mentioning is likely in the present year. The present shortage of fine coal and slacks is due in part to deliberate adaptation of industrial plant. After the war the Syndicate had trouble in marketing these sorts, of which to-day there is a shortage. In consequence, it resorted to certain price differentiations, which encouraged plant adaptations. The demand for fine sorts duly increased; and it was fostered by the rapid expansion of cement output, and by other industrial changes. Of late there has been a tendency on the part of the Syndicate to reverse the post-war price differentiation.

The consumption of electricity in March was 21 per cent. higher than that of March, 1936. The Ministry of Economy has forbidden the establishment or expansion of mail order businesses in a great many foodstuffs and other consumers' goods. Owing to favourable Press reports, shipping shares rose sharply on the Bourse last week. The Norddeutsche Lloyd Company reports a net loss of Rm. 1,278,200 in 1936, after writing off nearly Rm. 18 millions. An official report puts the sum invested for reconstruction of shipping between the currency stabilisation and the end of 1935 at Rm. 2,340 millions. Until 1930 investment in sea-going shipping more than covered depreciation and losses, and the value of the commercial fleet increased. But in the years 1931-35 (inclusive), when investment was small and scrapping very active, there was a deficit.

Trade with the British Empire

The foreign trade return for April shows an active balance of Rm. 15 millions, against Rm. 53 millions in March, and Rm. 5 millions in April, 1936. There was a very large increase in imports, and a moderate increase in exports. Nearly half of the increase in imports came from South America, the British Empire, and South East Europe. The increase in exports appears satisfactory if seasonal influences are taken into account; in nearly all post-war years April actually witnessed a setback in exports. The increase in exports went largely to Scandinavia, the British Empire, and South East Europe. Imports from the British Empire in the first four months of the year were valued at Rm. 331 millions, and exports

to the British Empire at Rm. 280 millions. The colonies ceded by the Versailles Treaty have begun to appear in the trade returns as German Colonies.

Millions of marks

	March	April	January-April
Imports			
I. Foodstuffs	154.6	181.3	576.3
(a) Livestock.....	7.8	7.1	33.5
(b) Animal foodstuffs.....	38.1	41.1	151.6
(c) Vegetable foodstuffs	82.1	105.0	288.5
II. Industrial goods	250.0	291.2	976.4

Total	462.1	491.8	1,774.7

Imports of gold and silver in the first four months amounted to Rm. 130,300,000, and exports to Rm. 11,400,000. As only a small part could have been silver, these figures indicate a substantial net gold import. No increase of the gold reserve is shown in the Reichsbank's returns.

Holland

Economic Recovery Continues

AMSTERDAM, May 20.—The signs of further improvement in the economic situation of the Netherlands have continued to manifest themselves during the past few weeks. Exports in the month of April rose by more than 77 per cent. compared with the corresponding month of last year, while imports increased by 75 per cent. Some details of the balance of trade, compiled by the Central Statistical Bureau, will be seen in the following table:—

	In millions of guilders, gold and silver omitted		April, Jan.-April,	
	1936	1937	1936	1937
Imports	81	142	314	479
Exports	57	101	213	347

Exports of industrial products progressed particularly well in April, especially of artificial silk yarn, wireless apparatus and electric lamps.

State revenue is also still making a very satisfactory showing. The yield of 34.5 million guilders in April was 5.7 millions higher than in April, 1936; the first four months of the year yielded 19 millions more than the corresponding period of 1936. The revenue accruing from the turnover or sales tax was again satisfactory in April, which is a clear indication of the revival of trade.

Increasing exports make more employment available, and unemployment is declining month by month. At the end of March the number of registered unemployed was 26,000 less than a year ago. It should be noted, however, that in the Netherlands all the unemployed are not registered at the Labour Exchanges as persons

CONTEMPORARY RUSSIA

"Of value to all serious students of Soviet Affairs."—*The Times*.
No. 3 Just Out! A new and complete survey of collectivised agriculture by Dr. C. G. Hillier, formerly agricultural expert to the Government in Moscow, and other articles.

seeking employment. The unemployment returns for February and March of this year are summarised below:—

In Places of	Unemployed at the end of		
	February, 1937	March, 1937	Decline
100,000 and more inhabitants	161,853	153,693	8,160
50,000 to 100,000	51,310	48,570	2,740
20,000 to 50,000	55,969	50,228	4,841
Less than 20,000	171,321	150,874	20,447
Total	439,553	403,365	36,188

Apparently as the result of the London sugar agreement about 100,000 tons of Java sugar have been disposed of within a few days. The price has been raised by 0.10 guilders per quintal in the export market and by 0.25 guilders in the domestic market. In the most important export markets, Singapore, Japan, Hong-kong, and British India, the average export price is now about 6.00 guilders per quintal, compared with 3.90 on September 20, 1936, a rise of over 50 per cent.

Revaluation Rumours

Despite the signs of economic recovery the Amsterdam stock market has remained depressed, and local securities failed to continue their upward trend. The cause of this is financial, or rather monetary. The problem of the price of gold is attracting much interest in the Netherlands, especially in view of the flow of gold towards this country. The weekly return of the Netherlands Bank reveals that the stock of gold has grown from 697 million guilders on May 11, 1936, to 1,055 millions on May 12, 1937, and the entire bank note circulation is covered by more than 100 per cent.

This influx of gold has continued in full force during the last few weeks, with the result that the Netherlands Equalisation Fund has resorted to reducing its purchase price for dollars. Because of this policy of gradually reducing the purchasing price of gold by lowering the rate at which the Equalisation Fund is prepared to take dollars off the market, some talk of a gradual revaluation of the guilder has naturally been induced. Notwithstanding the fact that the Equalisation Fund has reduced its price for dollars six times within a short period, and by one-eighth of a Dutch cent on each occasion, gold dollars continue to flow to this country. The more the belief in a slow, and possibly only a modest, revaluation of the guilder gains ground, the more inclination there will be to transfer gold or dollars to this country now, with the object of withdrawing from the country more gold or more dollars than have been brought in when, later on, the guilder rate is regarded as approaching its apex. If dollars, that is to say gold to all intents and purposes, continue to flow in, and the influx seems to be increasing rather than decreasing, this may very well be attributed to the prevailing uncertainty about a gradual revaluation of the guilder. It is difficult to see that this can be of any benefit to this country.

Embargo on Foreign Issues

As far as the flow of gold to this country is due to our balance of trade, the question of this country providing credits and capital abroad becomes increasingly urgent. Actually, there is still an embargo on foreign issues. The Board of the Amsterdam Bourse openly expressed disapproval of the embargo in their last annual report. They pointed out that foreign countries might possibly provide attractive investments for the abundance of capital which is seeking suitable investment here. The so-called embargo on foreign issues, or rather the impossibility of getting these securities officially quoted on the Amsterdam Stock Exchange, is a considerable obstacle.

"It ought not to be imagined," the Board of the Bourse stated, "that to prevent the quoting of foreign securities makes more funds available for domestic purposes, for capital will always seek a reasonable distribution between domestic and foreign investments. The so-called embargo only *hampers* the acquisition of foreign securities for Netherlands account, but by no means prevents it; and in the case of securities which are bought abroad and may not be quoted on the Amsterdam Exchange, the only thing the embargo

achieves is that the Amsterdam market loses this important business, and the revenue authorities fail to get the benefit of the stamp duties. We consider the maintenance of the Government's embargo on foreign securities exceeds by far its original object of reserving the capital market for domestic requirements. And it involves the risk that Amsterdam will thereby become too much a local money market, and will gradually forfeit its significance as a prominent international financial centre."

Spain

Fuel Self-Sufficiency

BARCELONA, May 12.—In a recent interview, Señor Diego de Santillan, who until a short time ago was Minister of Economy in the Catalan Government, gave some details about various industrial improvements in autonomous Catalonia.

The utilisation of the huge reserve of "white coal" in Catalonia is still in its beginnings. All the plans are, however, laid down, and by means of electrification of the railways the country will save large sums which hitherto have gone abroad for coal, for the most part from England. Catalonia produces very little coal, and the Spanish mines are situated in districts from which the cost of transport to Barcelona is very high.

About the scarcity of petrol, Señor Santillan affirmed that in parts of Catalonia soundings were being effected at spots pointed out by geologists as likely to contain oil. If, however, the results of these soundings show that the working of the mines will be too expensive, the distillation of lignite coal, of which there are large reserves in Catalonia, which up to now have hardly been worked on account of the poor quality of this material, is going to be undertaken. This should yield large quantities of fuel for driving trucks and stationary motors, and the importation of petrol may be reduced considerably.

Substitution Policy

Señor Santillan deplored the fact that by far the largest part of the ores produced in Catalonia is being exported instead of being smelted and used at home. Lead has always been imported, although there are considerable reserves in Catalonia. Accordingly, a big concern has just been founded, to mine, smelt and manufacture. There is not very much copper in Catalonia, although if the work were intensified at the few small mines on the southern slopes of the Pyrenees the output would be sufficient for immediate needs. There is an abundance of zinc ore of excellent quality; and a plant for the manufacture of zinc articles is being built.

Catalonia has also important bauxite mines, and the results of tests have been so satisfactory that a plant for the manufacture of aluminium is planned. Catalonia is not rich in iron ores, but there is enough to avert in emergency the necessity of importing iron from abroad or from northern Spain, where, at the present time, there are considerable transport difficulties. One of the principal products of the Catalan subsoil is potash, produced in yearly increasing quantities at Suria. The output is already sufficient to meet all the demands of Spanish agriculture and leave a surplus for shipping to foreign countries, and especially to France. Potash is only found in a very limited number of countries, amongst which Germany still occupies the first place, but she has lost the world monopoly she possessed before the war, chiefly on account of the discovery of the Suria mines.

By far the most important industry in Catalonia is the textile industry, which gives employment to nearly 50 per cent. of the working population. The greater part of the raw material used is cotton, which at present is not produced in Catalonia and very little in other Spanish provinces. Señor Santillan explained that the possibility of making abundant certain other fibres similar to cotton in order to restrict imports has been studied. A plant will soon be set up to transform hemp and flax into a sort of cotton. An attempt is also being made to substitute temporarily some domestic material for the jute imported from India.

According to a decree issued by the Ministry of Industry, the lead mines of Carthagena and La Union, as well as those at Linares, La Carolina and other places, and the smelting and manufacturing plants connected with these mines, have been put under the provisional control of the State. This measure is due to the attitude of the owners of these establishments who did not support the Government in its endeavour to increase production.

As the control applies to properties owned totally or in part by foreign citizens (Peñarroya, for instance, is a French company) foreign interests will be respected and should expropriation ever be contemplated, the full value of the investments would be refunded to them. The total output of lead ore in Spain in the year 1934 amounted to 72,151 tons, the greater part of which came from the mines falling under the decree.

Spain and the Catalan Trade

A decree issued for the Government of Spain by the Minister of Commerce is published, according to which a special Regulating Committee for the foreign trade of Catalonia is created. According to the decree, the Committee is composed of an equal number of delegates of the Ministry of Commerce and of the Trade Department of the Government of Catalonia, the President to be chosen by the Minister of Commerce from these delegates. All exporters and importers established in Barcelona and in the other provinces of Catalonia will have to be provided with a special authorisation issued by the said Committee for each transaction with a foreign country, including those on a compensation basis. Every application will be examined and answered on the day of receipt. In case of acceptance, a document to this effect will be delivered by the Committee to the applicant which will be indispensable for exporting or importing goods, and must be presented at the custom house when the goods are being shipped or discharged. In the case of compensation transactions, the Committee will carefully examine the prices stated and compare them with the actual market prices before granting the permission. The shipping documents for the goods the export or import of which has been permitted, will be handed over to the Banco Exterior de España; in the case of exports with a draft on the foreign buyers, to enable the bank to take care of the financial part of the transaction in accordance with the regulations issued by the Ministry of Finance of the Spanish Republic. The Committee will adjust its decisions to the instructions it will regularly receive from the Ministry of Commerce about the desirability of importing or exporting certain goods, or about the value of the principal articles. The Committee for the Regulation of Catalan trade has been set up chiefly to extend the activities of the Central Government to the Catalan trade, in order to control and regulate the whole volume of Spanish foreign business. The new regulation will help to increase the international trade of Catalonia, the volume of which has always been vastly superior to that of any other province of Spain.

Turkey

The Syrian Frontier

ISTANBUL, April 20.—To place a frontier division on a war footing is always a serious step. Three factors appear to have brought this about on the Syrian frontier. One is the allegation that subalterns in Syria, whether backed by Paris or not, are endeavouring to deprive the Turks of the benefit of the settlement of the Sandjak dispute; another is the report that cruel treatment has been inflicted upon Turks in Syria; and the third is the fact that incursions have been made into Turkish territory from over the frontier.

When the Minister of the Interior spoke before the Grand National Assembly at Ankara in the name of the Government, he pointed to the gradual and successful removal of banditry, which for centuries had checked the development of the country. Nevertheless, in the

course of the past few month acts of banditry along the Syrian frontier had increased to an extent hardly known before. On March 19th a large-scale act of banditry was committed between Mardin and Diyarbakir, and news was received that the spoils had been sold on the other side of the frontier amidst public rejoicings. A similar incident occurred at Gerçük, but there the Turkish forces arrived in time to disperse the band, killing a number of brigands. Material obtained on these and other occasions suggested that the formation of bands of brigands was facilitated in Syrian territory, where such bands have found an easy refuge after each incursion.

Under the circumstances the Turkish Government felt compelled to act. In addition to several administrative measures it was decided to mobilise the reservists belonging to one division, a step which probably is simply an intimation that Turkish patience is at an end. The Minister declared that should these measures prove insufficient the Government would not fail to take further steps. Turkey was ready to have the frontier situation and the problem of banditry investigated by some international body.

Several members of Parliament and a part of the Turkish Press allege the Arabs are instruments in the hands of the French. There is a tendency to distinguish between the Blum Cabinet, which has the sympathy of the public, and the French colonial administration. The Prime Minister and the Foreign Minister, on the other hand, have their attention fixed on Balkan affairs; and their departure for Belgrade at this juncture seems to justify the belief that, however important the Turco-Syrian issue may be, European affairs are still more important.

Australia

Farmers and the Referendum

MELBOURNE, April 23.—The result of the referendum on the proposal to amend the Commonwealth Constitution to give the Commonwealth Parliament power to deal with marketing has been to leave in the air the schemes for establishing local prices higher than export values. The principal schemes of this sort were those for dried fruits and butter. The rejection of the amendment followed precedent; and the only important exceptions in the past have been the Financial Agreement and the Loan Council. The popular attitude was reinforced by a rather widespread feeling that the Commonwealth Government is in many ways attempting to do too much; and that the country already suffers from excessive interference by both Commonwealth and State Governments.

Although not confined to the cities, the adverse vote was specially pronounced in metropolitan districts, where the voters were opposed to the maintenance of high prices for local consumption. If the existing arrangements for dried fruits and butter break down, and the producers have to accept low prices for the whole of their output, their margin of profit will be reduced and may even disappear. The question of assisting producers by other methods has been raised, but the Government is unlikely to adopt this course in face of the result of the

An invaluable reference book for bankers, business men, journalists and all concerned with International Finance and Affairs.

referendum. Politically, the effect of the referendum has been to tell the country producers that although they have to carry the burden of high protection, it is not intended that they should benefit from it.

Improved Monetary Position

The Australian monetary position has been altered by the higher prices for wool and other leading exports. Banking figures show an unusually large increase in deposits and a reduction in advances in the country districts. The quarterly average returns of the ten trading banks (exclusive of the Commonwealth Bank) up to March 31st showed deposits within Australia of £307,191,272, an increase of £13,790,080 compared with the same period a year ago; and advances (country and town business) of £261,461,261, an increase of £2,897,374. Government and municipal securities to the value of £43,937,468 showed a net decrease of £1,870,026, after allowing for an increase of £975,001 in Treasury bills held, which amount now to £26 millions. Comparing the movements, it appears that the external funds of the banks, principally in London, have improved by over £8 millions compared with the first quarter of last year. The Commonwealth Bank shows a similar improvement of approximately £5 millions.

At the same time, business continues active, and the building trade is still busy in the capital cities. Stock Exchange quotations for shares in industrial companies are at a high level, after some recent fluctuations, but the probable effect upon profits of the tendency to higher costs is now engaging attention.

The Commonwealth Government is offering on behalf of itself and the States a 3½ per cent. loan of £7,500,000, redeemable in 1948, at £99 5s. per cent. In deciding on the amount of £7,500,000 the Loan Council has not met the full expectations of some of the State Governments. Business opinion, however, continues critical of the steady increase in public debts in view of the state of unemployment, which is now only little worse than at the pre-depression level.

Letters to the Editor

The Problem of Gold

TO THE EDITOR OF THE ECONOMIST

SIR,—May I be allowed to make a suggestion which, if well founded, will be of assistance in solving the problem of the alleged gold surplus referred to in your last issue.

To my mind the cause of the difficulty is the mistaken assumption that gold has a price. It is the measure of value and a given quantity can only be "bought" with currency which, either by reason of its being on gold or by reason of the international valuation of that currency, has a gold value which equals the quantity of gold acquired. Currencies rise and fall for various reasons; *gold never varies*.

When the U.S.A. was on gold, at par \$20·67 bought an

ounce; to-day it requires \$35. This does not mean that gold has risen but that the dollar has fallen; the "price" of gold expressed in sterling was the same after the U.S.A. devaloured as it was before. If gold were subject to fluctuations it would rise or fall in value like any other commodity throughout the world.

Hence there is no foundation for the "gold scare." Whatever manipulations of currency any of the nations may indulge in they cannot affect the value of that which is the measure of value of all currencies. The prosperity of the gold mining and other Empire industries is due to the fact that the depreciation of Empire currencies has not appreciably affected their domestic purchasing power. There is no surplus and no cause for fear as to the future of gold so long as we in the Empire allow this favourable state of affairs to continue.

Yours faithfully,

JOSEPH RICARDO.

Temple, E.C.

[We entirely dissent from the propositions which Mr Ricardo regards as axiomatic. But we print this letter because it serves as a reminder that there are still many who take it for granted that there is something inherent in gold that makes it the measure of value and that therefore "gold never varies." Gold is only a measure of value so long as we care to use it as such; its value is not always stable in relation to other commodities and if any other unit of account is adopted the price of gold varies like that of any other commodity.—ED. *Econ.*]

Excessive Saving

TO THE EDITOR OF THE ECONOMIST

SIR,—Few will dissent from the view expressed in last week's article on the National Savings Movement that "... if we measure usefulness by the addition it makes to the welfare of the people who save it is obviously the most useful part of the nation's savings." Few will dissent except as they consider it an under-statement of the immense benefit of small savings to the individual and to the State.

The article proceeds "If it should ever be desirable that we save less. . . ." But in every slump it is desirable that we save less—or rather that we spend more. If I save in a slump, I put my neighbour out of work. The benefit of saving to the individual must not be allowed to obscure the vital fact that every act of saving reduces the general income unless offset by the spending of others either on consumption or investment goods or services. Net saving, since it reduces the national income, is fatal to saving. On the one hand the advantages of saving to the individual are manifest: on the other hand, net saving reduces trade and the general income. There need however be no dilemma. We must encourage individual saving to the full, and at the same time take prompt action to offset net national saving.

It is not essential for the State itself to spend more as the community spends less: it will suffice if citizens are provided with the means to spend more, e.g. by reduced taxation. Unfortunately, less taxation at one time suggests more taxation at another, although lower rates do not necessarily mean lower receipts, and we have perhaps disposed of the intellectual dilemma only to find ourselves faced with a practical one—or at least with formidable difficulties none the less real for being largely psychological.

Yours faithfully,

Reigate, Surrey.

P. E. BUDGEN.

Books and Publications

An American Economist

PROFESSOR MITCHELL has so high a reputation in this country for his studies of the Trade Cycle that even a volume of republished essays and addresses with an odd title is sure of many attentive readers. One always approaches such a book with forebodings. There is a large element of duty among the motives that make one read the minor works on various subjects of an accepted authority on one particular topic. And when, as in this case,* they are edited and selected by a pupil, one expects to find a good deal of ephemeral matter.

* "The Backward Art of Spending Money, and other Essays." By Wesley C. Mitchell. 415 pages. McGraw-Hill. 18s.

is because he regards our pet ideals and theories as mere by-products of the kind of work we do, mere excrescences on minds devoted mainly to getting a living.

A little of this attitude—and a satiric wit not unlike Veblen's—remains in Professor Mitchell's work. He, too, cultivates an innocent eye when dealing with other economists. His critical method is very largely to attempt to see not only what economists have said but what they have not said. Or, as he puts it, postulates are not as interesting to him as preconceptions. The method is very definitely a success in the critical essays, and particularly so in the excellent studies of Bentham, Ricardo and Wieser, which add to our comprehension rather than to our knowledge. It works well, too, in the title essay, which analyses very simply and solemnly the reasons why we are so much cleverer at making than at spending money.

The essays on the duties of contemporary economics show the author in the rôle of a director of statistical research rather than as a psychologist. But the background is the same. The urgent plea for the continued collection and improvement of statistics, and for their impartial analysis by institutes of economic research, is based upon the same sense of the fallibility of theorising and of the transience of the mere theorist's advice. But it is based also upon an additional conviction, that of the immense complexity and uncertainty of economic affairs as they are revealed by the multitudinous data accessible to the American student.

This conviction is not of course peculiar to America; but in this country the dominance of theory has left the concoction of policy largely to politicians and officials, for only a few economists have had time, opportunity or inclination to rush into affairs. In America, on the other hand, economists have always been more ready to improvise policy. Government has been far more anxious to employ them, and public opinion has been more patient of their pronouncements. This situation is clearly reflected in Professor Mitchell's essays and adds much to their interest for English readers. He has a very experimental attitude towards social questions, and is moreover a very influential person. The National Bureau of Economic Research, of which he is director, is well known to possess the confidence both of the public in general and of business men in particular. And it is significant that he can consider changes which, even in this country and certainly in most parts of the Continent, would be thought rather Bolshevik.

It is therefore not only to economists that these essays can be recommended. They reveal some distinguishing characteristics of American democracy. In their massive simplicity—rather reminiscent of Marshall, in their extreme open-mindedness, and in their willingness to consider very drastic public policies without political preconceptions, they illustrate a different outlook from ours. It is important that we should understand this attitude; and we may have a lot to learn from it.

Shorter Notices

"Economic Thought and Language." By L. M. Fraser. Black. 411 pages. 12s. 6d.

Professor Fraser has here attempted to apply the logical technique of his training as a philosopher to the terms and processes of economic thought. He shows a wide and lively knowledge of contemporary writings and controversies, and covers the whole field of economic theory in his search for meaning and definition. No more useful contribution could be brought to the science of economics at this stage of its development than the gift of precise statement. And Professor Fraser brings the experience of some years of successful teaching to the task. Unfortunately, however, he has probably attempted to do too much in the compass of a single book. A shorter and simpler analysis of economic meaning might well have been more effective. Nor do his terms of reference permit him to resolve the host of real and verbal difficulties which he culls from current discussion to illustrate his method of approach. There is consequently an inconclusive air about this book; it tends to sprawl and lose perspective; and it is necessarily repetitive. Nevertheless, it is a notable book, and a token of the energetic erudition and incisive curiosity of the younger generation of economists.

"World Finance (1935-37)." By Paul Einzig. Kegan Paul. 342 pages. 12s. 6d.

Mr Einzig has now extended his serial epic of post-war finance from the fall of the gold *bloc* to the current throes of re-armament policy. He shows how the traditional policy of deflation in the face of depression failed in a welter of crises; and how a grim battle around the franc saw the devaluations of the gold *bloc*, and ended with the Tripartite Agreement of last September and the seeming dawn of an era of financial common sense. But then, in Mr. Einzig's view, tragedy intervened in the cost of re-armament, just when prosperity was bounding forward under the new stimulus. The book leaves Europe under the brooding menace of war. The story is told in a lively and interesting style. The author deals in his own individual way with currency stabilisation, the financial implications of French social policy, the problem of sterling overvaluation, and the American position. The account is perhaps least impressive where underlying and long-run problems of policy emerge.

MONEY AND BANKING

France and the Franc

The last three months have witnessed a sharp decline in the exchange value of the franc, from Frs. 105 to the £1 immediately after the devaluation and until the first week of March, to Frs. 110-111 during the last few days. This decline, which a month ago went as far as Frs. 112 to the £1, represents a lapse from the middle to the lowest ratio of the franc's possible gold content to the dollar's gold content, as provided in the decrees establishing the new gold franc. The Exchange Committee, established at the same time, tried to hold the franc at its middle exchange value, while every indication showed that it should be at the lower level. Accordingly, the bears were betting on a certainty. This bear position, at great cost to the French Exchange Fund (in gold), has now been cleared away.

The bear attacks were due to the confused political scene in France; the spasmodic resurgence of stay-in strikes by labour zealots; the vacillating attitude of the Government, ever since their advent to power, to the penal taxation of repatriated private capital; the swift rise in costs of production produced by the unexpectedly rapid social reforms; the grudging *méchanceté* of the "men of the Right" and the rentiers towards the Blum Government. But the bears have now little reason to renew their attacks.

Here are but a few evidences of real recovery. Wagon loadings and returns on the railways—the branch of the French economy in which deficits have ruled longest—reflect a quick rise in business turnover. Tax revenue in the first quarter of this year exceeded that in the first quarter of 1936 by more than Frs. 750 millions, as well as the already optimistically calculated revenue estimates. Industrial production, especially in the building, metal and machinery industries, has spurted upwards, largely owing to the consilience of devaluation with the expenditure of many milliards of francs on armaments out of the extra-ordinary Budget, on "crisis-public-works" out of the special fund for that purpose set up last year, and on the Paris Exhibition. Re-stocking, which began last winter, has extended; and the rate of compulsory liquidations and bankruptcies has rapidly fallen. Big concerns have begun to increase their capital; private issues, which in the first quarter of last year were only Frs. 238 millions, reached Frs. 607 millions in the first quarter of this year. Bank deposits have been steadily rising. The official figures of unemployment at 378,000 odd are about 75,000 less than at the corresponding period of last year; but of these 378,000, about 100,000 are over the age of fifty, and 100,000 are women in irregular employment; and about 1,000,000 foreign workers in France (many of them Poles) have been compelled by unemployment during the depression to return home. Consequently, the galvanic effect of devaluation, rising wholesale prices and expanding trade has been exerted upon one of the few European labour markets where little labour reserve for all branches of industry exists. The result of this, as of the social reforms in the sphere of wages, hours and conditions, has been greatly to improve the lot of the worker. But, simultaneously, it has intensified that tendency—to be noted in the industrial recoveries of Great Britain and the United States—of industrial concerns to instal the latest types of labour-saving machinery and methods. In sum, the profitability of French industry to-day has not only been restored over the bulk of industry; it has been restored to a higher *real* extent that a comparison of indices for, say, 1931 and 1937, would suggest.

For example, there is a shortage of labour, especially of skilled labour, in many branches of industry; and the

rise in costs of production during the last twelve months—which is, according to the most reliable estimates, of the order of 30-40 per cent.—has led not only to the improvement of plant, noted above, but also to industrial amalgamations on a large scale. This has worked against the typical small French manufacturing concern, which cannot so well afford the still high rates of interest (6½-7 per cent. on industrial debentures); and the narrowing of the capital market by the necessarily frequent incursions of the Government has reinforced the already existing tightness, due to the "stay-out" strike of the French capitalists. Only the larger, more profitable concerns can still profit from the exceptional situation which drives them to re-equip their factories. Thus, in the last twelve months such concerns—which are also those who must first benefit from re-armament and public works—have achieved a remarkably high degree of productive efficiency, comparable with that of corresponding undertakings in, say, Britain or the United States, and higher than before 1931.

Devaluation, the social reforms and the rise in prices outside France have combined to raise the French price-level to such a degree that M. Blum's Government have had to decree a "pause" in the progress of reform and to force the more pretentious Socialist and Communist workers' leaders to prolong the Matignon agreement for collective regulation of industrial questions. Between April, 1936, and April, 1937, French wholesale prices rose by 47 per cent.—industrial wholesale prices by 53 per cent. and agricultural wholesale prices by 29 per cent. Retail prices went up by about 27 per cent. In the same period, however, British wholesale prices rose by 13 per cent., retail prices by nearly 5 per cent., and American wholesale prices by 7 per cent., retail prices by 5 per cent. As the French devaluation was in effect about 40 per cent., there is still a margin in favour of French prices—for what such superficial calculations are worth. More important is the movement of French production costs, which the higher wage rates, shorter hours, and still very high rate of interest decide. That the pace of social reform has been hot, and that devaluation occurred at so late a date as to coincide (unfavourably for France) with a steep rise in world prices of necessary raw materials, appears from the latest French trade returns. For the first four months of this year, compared with those of last, imports are up by Frs. 5,375 millions, but exports by only Frs. 2,402 millions, so that the import surplus has risen during the twelve months in which devaluation occurred to Frs. 6,205 millions, i.e. virtually Frs. 3,000 millions more than, or double what it was, in the first third of last year. These considerations alone give point to M. Blum's demand for a "pause" and to his urgent desire to expand international trade.

The ordinary Budget for 1937 shows a deficit of Frs. 4,600 millions which, as noted above, is being reduced by an excess of tax revenue over estimates. On the other hand, the extra-Budgetary needs for defence and public works are now Frs. 9,000 millions, for pensions fund Frs. 2,200 millions, and for the railways and other undertakings' deficits Frs. 16,000 millions. Frs. 8,000 millions have already been raised in cash by the *tranches* of the new 4½ per cent. Defence Loan and Frs. 6,000 millions of extraordinary expenditure has been abandoned, but there was an irreducible real deficit of about Frs. 25,000 millions for the current year.

This deficit can only be covered by borrowing. M. Auriol has said that Frs. 16,000 millions must come from the medium- and long-term market; another Frs. 4,000 millions is needed to repay the British credit. The long-term public debt, which stood at Frs. 261,441 millions in 1930 and at Frs. 356,842 millions in 1936, is thus still rising, and the rate of interest remains high; consequently the burden of debt on the ordinary Budget increases. On the other hand, the short-term debt in Treasury bills was reduced from Frs. 13,939 millions in December, 1935, to Frs. 6,322 millions last September; but since then the Treasury has borrowed a fresh Frs. 11,500 millions out of the Frs. 20,000 millions newly authorised, Frs. 2-3,000 millions for pensions in one-year bonds, plus the Frs. 8,000 millions of long-term Defence Loan. The probable needs of the Treasury in the last nine months of 1937 was placed on May 22nd at Frs. 20,000 millions. The Government had to pay 4½ per cent. at 98 for its recent Defence Loan, still quoted at 95½. Thus, the Government has been able to borrow, on costly terms; but, as in the case of the dog that walked on its hind legs, the wonder is not that it did it badly, but that it was able to do it at all.

The French economy, the franc, and the Government are alike still suffering under that *crise de confiance* which has devastated France—and French politics—ever since the policy of unremitting deflation was first inaugurated five years ago. M. Blum's Government has behind it a more solid mass of public goodwill than any French Government during those five years. But that Government cannot blink the fact that the golden horse has bolted. It must be fetched back; or it must return voluntarily. It cannot be fetched back; and unless measures are taken to induce it to return, M. Blum's only alternative is that kind of nationalistic economy, that autarky, which some of his extremist supporters have urged on him, and in which no French capitalist or industrialist could comfortably breathe. Such an alternative M. Blum has decisively rejected, and has demanded the famous "pause." The first faint signs that the capital efflux has ceased are now apparent, and with the need for funds in a rapidly recovering field of French industry capital is trickling back. As this process develops, the Government will be able to reduce the rate of interest, lower the burden of the service of the National Debt on the Budget, and reap the overdue first-fruits of devaluation. Though the outlook is still clouded with anxieties, French finances and the franc seem now to enjoy greater expectations than they could a few months ago.

Financial Notes

Institute of Bankers.—Mr R. A. Wilson, a joint general manager of Lloyds Bank, has been elected President of the Institute of Bankers in succession to Sir John Caulcutt. Mr Wilson, who became deputy chairman of the Institute two years ago, passed the earlier part of his banking life in Yorkshire. He entered Brown's Bank in Leeds in 1898, two years before its absorption by Lloyds Bank, and eventually became the Lloyds Bank manager for Leeds. In 1924 he came to London as assistant general manager, and in 1929 was appointed one of the joint general managers. His election as President of the Institute is to be welcomed both on personal grounds and because of Mr Wilson's long experience of north-country banking.

Foreign Exchange Dealings.—The normal practice in London is for all foreign exchange transactions between bank dealers to be made through a broker. The broker does not buy or sell on his own account, but his function is to keep in touch with all the dealers, judge the general trend of rates, and to suggest and determine rates which are satisfactory to both buyer

and seller. In return for his work he is paid a commission, and without his services an individual dealer would never ascertain quickly exactly when business was offering, or make certain at any moment of securing the most favourable rate. Recently there has been a suspicion, to put it no higher, that one or two dealers were inquiring of the brokers the rates of the moment and then dealing with each other direct. The brokers naturally objected to being short-circuited in this manner. Negotiations have recently been taking place between the Bankers' Foreign Exchange Committee and the committees representing the foreign exchange brokers, and in consequence it has been agreed that direct dealing shall cease as from June 1st. This means that all banks in direct telephonic connection with brokers shall make full use of the latter's services, but certain affiliated or subsidiary banks which have insufficient foreign exchange business to justify telephonic connection will still deal direct with their parent or affiliated bank. This is a thoroughly equitable solution of what was becoming a vexed question.

Italian Finances.—Isolated details of Italy's economic position are once more beginning to emerge. Last week we were able to secure publication of Italian wholesale price index numbers, showing that there had been a net rise since July, 1935, of 31.8 per cent. The Finance Minister has now brought the Bank of Italy's return partially up to date. Between December 31, 1936, and April 30, 1937, the Bank's gold reserves had fallen from 5,892 to 4,023 million lire (the previous statement gave a figure of 4,021 million for February 20, 1937). The note circulation has risen from 13,145 millions at the end of 1934, to 15,678 millions last February, and 15,645 millions on April 30th, but the previous explanation that these later figures include 1,480 million of notes in circulation in Abyssinia is repeated. The Bank's gold reserves exclude the reserves of gold and devisen held by the Institute of Exchange, and it still appears that apart from these last holdings Italy has lost the whole of the profit on the revaluation of the Bank's gold last October. The Finance Minister also gave some budget details. Estimated revenue for 1937-38 at 20,597 million lire showed an increase of 285 millions over 1936-37, but a deficit of 3,173 millions was expected, largely due to the expenditure of 1,021 millions in Abyssinia. To fill this deficit the Government was largely relying upon the improvement in the economic situation, the buoyancy of the revenue and the prevention of tax evasion. The cost of "the conquest and exploitation of the Empire" during the years 1934-35 and 1935-36 was 12,111 million lire, and the financial year 1935-36 showed an "effective" deficit of 12,686 millions. There would be a deficit for 1936-37, but this would be met by the profits on the revaluation of the Bank of Italy's gold and on the realisation of the gold and devisen surrendered to the State by the Italian people. These are non-recurrent sources of revenue, as the Government may realise more clearly by the end of the current financial year. As the Finance Minister virtually admits, Italy can only achieve a balance by applying totalitarian standards of measurement.

The Foreign Exchanges and Gold.—Spot francs strengthened from Frs. 110½ to Frs. 110¾ early in the week, mainly because the French authorities were squeezing certain bears of francs with positions maturing at the end of the month. The rate has since slipped back to Frs. 110½, with three months' francs hovering between Frs. 1½ and Frs. 2 discount. Dollars have been very steady at just over \$4.94, but they were more bid towards the end of the week, this being a reflection of the easier tendency of the franc. There is a fair demand, probably of a commercial character, for dollars for delivery towards the end of the year. The six months' rate is 2½-2¾ cents premium, or an absolute rate of about \$4.91½. The view is expressed that while some

appreciation of the dollar is probable, sterling is not likely to fall below that rate. If so, there is little gain in covering ahead. London dealings in gold have been active, for dishoarded gold continues to come forward, and the British authorities have been buying more freely. The discount below the dollar parity price has narrowed. British purchases of gold serve to check sales to the United States, and so give support to the dollar. In this connection the current rate of \$4.94 for sterling is on the high side, and the recent weakness of the dollar is in part attributable to heavy gold shipments to the United States. It has also been suggested that some of the British official gold purchases have been on Dutch account. An interesting position has developed in Amsterdam. A heavy influx of funds into Holland has forced the Dutch authorities to make heavy gold purchases and also to reduce their buying rate for dollars, but one consequence is that there are now few dollars held privately in Amsterdam. Hence if there is a demand for dollars, there may be a temporary reaction in the rate, pending sales by the Dutch authorities, who are now operating the other way. There has been a temporary demand for belgas, and the rate for sterling has fallen from 29.32 belgas to 29.27 belgas. This demand is ascribed to some repayment of money due to Belgium. Swedish kronor have returned to the normal pegged rate of Kr. 19.39½, and have been very steady. After a period of weakness during April, the free rate for Argentine pesos has strengthened nearly to the official import rate of 16 pesos to the pound, and there are rumours of a reduction in the latter. So far there is no indication of any such change.

The Money Market.—Easier conditions have prevailed this week, especially on Tuesday, when the supply of funds exceeded the demand. There were, indeed, reports of offerings of bond money at ½ per cent. by outside lenders, in place of the usual rate of ¾ per cent. Discount rates are unchanged, but ¾ per cent. is now the effective rate for three months' bank bills. The banks have bought moderate amounts of July and August Treasury bills, but some of the banks already have plenty of July bills.

	May 6, 1937	May 13, 1937	May 20, 1937	May 27, 1937
Bank rate	2	2	2	2
Clearing banks' deposit rate	2	2	2	2
Short loan rate:—				
Clearing banks	1-1-1*	1-1-1*	1-1-1*	1-1-1*
Others	1-1-1	1-1-1	1-1-1	1-1-1
Discount rates:—				
Treasury bills	1	1	1	1
Three months' bank bills	1-1-1	1-1-1	1-1-1	1-1-1

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

At the Treasury bill tender on May 21st, the syndicate succeeded in securing 60 per cent. of the allotment in place of 54 per cent. the week before, but they only did so by tendering at one penny below the price corresponding to the agreed minimum rate of ½ per cent., and so the bills yield practically no profit. It has been suggested that the market should take the risk of tendering at a lower price on the ground that it might still obtain an adequate allotment. The danger is lest the market should be out-bid by other applicants, and if the market missed the tender altogether it would find itself faced with the awkward alternative of either having to reduce its loans from the banks or else having unemployed funds on its hands.

The Bank Return.—This week the return of currency after the Coronation and Whitsun has reduced the circulation by £6.2 millions. In the absence of further gold purchases by the Bank, the Reserve is increased by the same amount..

BANK OF ENGLAND					
	May 27, 1936	May 5, 1937	May 12, 1937	May 19, 1937	May 26, 1937
	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Issue Department:—					
Gold	206.4	313.7	318.7	321.3	321.3
Note circulation	426.1	475.2	479.9	481.4	475.2
Banking Department:—					
Reserve	41.2	39.4	39.6	40.7	46.9
Public deposits	19.8	16.4	32.5	19.2	24.9
Bankers' deposits	78.3	97.2	87.7	97.4	91.4
Other deposits	36.7	37.7	37.2	37.6	37.5
Government securities	91.8	103.1	108.3	103.3	99.5
Discounts and advances	6.7	5.4	5.9	6.6	4.9
Other securities	12.9	21.0	21.3	21.4	20.3
Proportion	30.5%	26.0%	25.1%	26.4%	30.5%

In the banking department Government securities are reduced by £3.8 millions. They thus continue to move on lines parallel to the rise and fall in the note circulation, with the result that the total assets and liabilities of the banking department are kept nearly unchanged. While the Bank's total deposits are unaltered, there has been this week a transfer of funds from bankers' to public deposits. This is the back-wash of last week's increase in bankers' deposits. Both are due to the same cause, namely, the concentration of last week's Treasury bill maturities on Tuesday, May 18th, the opening day of the week.

Irish Banks' Returns.—The returns of the banks operating in the Free State for the March quarter, published by the Currency Commission, are as follows:—

	£000's omitted				
	March quarter, 1936	Dec. quarter, 1936	March quarter, 1937		
			In I.F.S.	Elsewhere	Total
Liabilities:—					
Capital, reserves, etc.	17,218	17,371	10,392	7,136	17,338
Notes in circulation	8,698	8,789	5,105	3,664	8,789
Current, deposit and other accounts	163,384	164,735	120,289	44,843	165,132
Other liabilities	4,924	5,577	2,843	2,389	5,232
Total	194,224	196,473	138,440	58,031	196,471
Assets:—					
Cash and balances with banks	12,786	14,968	4,921	7,549	12,470
Money at call and short notice	10,574	10,709	5	10,225	10,230
Bills	6,462	6,313	4,879	1,467	6,346
Loans and advances	67,759	67,825	44,858	24,189	69,047
Investments:—					
(a) Government	79,316	78,543	3,579	76,507	80,086
(b) Other	9,529	10,188	3,580	7,042	10,622
Other assets	7,799	7,924	3,187	4,180	7,667
Total	194,225	196,473	65,009	131,459	196,471
Excess of assets outside I.F.S. over liabilities outside I.F.S.	72,056	72,642	...	73,428	...

These figures must be regarded as very satisfactory. Compared with a year ago there has been an increase in deposits, loans and advances and investments, which reflects the improvement in agricultural prices and in general business conditions. During the same period the total monetary circulation in the Free State has increased from £15,212,460 to £16,054,759, and the average daily bank debits (exclusive of government accounts) from £1,579,000 to £1,720,000. The increase in the net external assets, shown in the last line of the above table, suggests that the balance of payments during the last twelve months has been favourable, in spite of the large passive visible trade balance.

Anglo-Palestine Bank.—The report of the directors for the year to December 31, 1936, states that the accounts of the bank reflect in some measure the effect of the year's political events upon the economic life of the country. It also states that the year's citrus season was unsatisfactory, as although exports were much larger in volume, prices were lower than at any time since the War. For these reasons the increase in deposits was not so rapid as in previous years, while advances, etc., have recorded a slight decline from £2,786,000 to £2,627,000. On the other hand, the

General Mortgage Bank of Palestine, in which the Anglo-Palestine Bank holds a controlling interest, has been able to extend its activities in some degree. The net profits of the Anglo-Palestine Bank have fallen from £130,196 for 1935 to £95,963 for 1936, and in the latter year the directors thought it prudent to make a disclosed appropriation of £20,000 for contingencies. On the other hand, last year's appropriation from net profits of £100,284 to the reserve fund has not been repeated. Instead the reserve fund has been reduced from £240,000 to £219,000 as the result of the changes in the bank's capital structure and the fresh issue of shares made a year ago. Nevertheless the ratio of capital plus reserves to deposits remains adequate, while the bank's general position is sufficiently liquid. It is clear, however, that its future earnings are governed to some extent by the course of events in Palestine.

The Nordiska Föreningsbanken.—One of Finland's three leading banks has just celebrated its 75th jubilee. It is not generally realised to what extent Finland was independent of Russia even in the days of the union. It had its own monetary system from 1860, and the Bank of Finland was actually established in 1811. The desirability of creating joint stock banks became apparent during the Crimean War, and on May 21, 1862, the Föreningsbanken i Finland came into being. In 1919 it amalgamated with the Nordiska Aktiebanken, which was ten years its junior, and assumed its present name. To-day the bank enjoys a unique and well deserved prestige in its own country; indeed, throughout the business world. It has played a leading part in developing and consolidating Finland's recent and remarkable prosperity. It merits warm congratulations on its able, vigorous and sound administration.

Insurance Notes

Car and General Insurance.—The total premiums of this company, which is controlled by the Royal Exchange, were £1,472,000 in 1936, compared with £1,267,000 in the previous year. An increase from £1,117,000 to £1,317,000 took place in the accident branch; the greater part of these premiums refer to motor insurance, in which the company occupies an important place in the market. Fire premiums at £97,000 and marine premiums at £58,000, both showed some expansion. The results of the last two years are given below.

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Fire	14,025	14.7	13,628	14.1
General Accident	73,391	6.6	55,378	4.2
Marine	4,655	8.5	616	1.1
	92,071		69,622	
Less items debited to Profit and Loss Account	65,271		52,898	
	26,800		16,724	
To General Reserve ...	45,000		32,000	

Total assets amount to £2,090,000, of which Stock Exchange securities account for £1,474,000, against an aggregate market value on December 31st last of £1,690,000. Not included in the above debits to profit and loss was the transfer of £45,000 in 1935 and £32,000 in 1936 to general reserve, which now amounts to £509,000. The dividend is again at the rate of 50 per cent., and is more than covered by available interest earnings.

London and Provincial Marine and General.—This company was acquired by the Yorkshire Insurance Company in 1913 and was originally engaged

in marine insurance only, but since the War it has transacted fire and accident business, the premium income from which now exceeds the marine premium income. The company's marine experience has been consistently good, and last year first year's claims and expenses amounted to 30.5 per cent. of the premium income, compared with 33.6 per cent. in 1935. As in that year, £20,000 has been transferred to profit and loss, leaving the marine fund at £188,000, equal to 186 per cent. of last year's premium income. The results of the last two years are shown below.

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Fire and Accident	8,125	7.4	3,798	3.4
Marine	20,000	20.3	20,000	19.8
	28,125		23,798	
Less items debited to Profit and Loss	18,831		15,034	
Net Trading Surplus ...	9,294		8,764	

Total assets amount to £1,529,000, and the aggregate market value of the Stock Exchange securities on December 31, 1936, was in excess of the corresponding book value of £1,336,000. Investment and other reserve funds amount to £690,000, and the profit and loss balance, after payment of the year's dividend, is £138,000. The cost of the usual 10 per cent. free of tax dividend is £30,000, and compares with interest earnings of £46,000.

Phoenix Assurance Company.—In the life department new sums assured in 1936, the first year of a new quinquennial period, were £4,859,000, compared with the previous year's record figure of £3,806,000. The net rate of interest on the life assurance fund was 4½ is. per cent.—a fall of 1s. 8d. per cent. compared with the 1935 figure. Fire premium income was £26,000 higher at £2,601,000, but underwriting profits fell from £311,000 to £224,000. The latter figure is, however, much higher than for many years before 1935. Accident premium income increased from £3,444,000 to £3,737,000 and there was also an increase in the underwriting profits. In the marine department premium income was slightly smaller at £548,000, and for the third successive year £30,000 has been transferred to profit and loss:—

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Fire	311,071	11.7	224,089	8.3
Personal Accident, Em- ployers' Liability and General	139,247	4.0	162,393	4.3
Marine	30,000	5.4	30,000	5.5
Life	20,000		20,000	
Sinking fund	30,000		20,000	
	530,318		456,482	
Less items debited to profit and loss account	343,131		336,674	
Net trading surplus ...	187,187		119,808	

Among the items debited to profit and loss in the above table is a transfer of £100,000 in 1935 to investment and contingency reserve. The consolidated balance sheet shows total life assurance assets of £18,753,000, compared with £18,195,000 in 1935. Total fall from £3,732,000 to £3,442,000, while British Government securities increased by £399,000 to £3,995,000. There was also a substantial increase in ordinary stocks from £158,000 to £351,000. The assets of the other branches totalled £17,254,000, and the general and investment reserves are unaltered at £2,500,000 and £1,960,000 respectively. After providing for the dividend, which is again at the rate of 60 per cent. and costs £460,000, compared with available interest earnings of £378,000, there is a profit and loss balance of £1,486,000.

THE STOCK EXCHANGE

The Incidence of N.D.C.

THE City is dissatisfied with the revised version of Mr Chamberlain's National Defence Contribution. Mr Chamberlain has listened to criticism and suggestion, but his response leaves the main outlines of the Contribution intact. The nature and effect of the changes embodied in the Finance Bill are discussed in a Leading Article on page 495 of this issue. Investors, at least, can no longer postpone the ungrateful task of estimating the consequences of Mr Chamberlain's firm determination.

Even at this stage, however, accuracy in any calculation of the incidence of the tax is quite unattainable. In the first place, N.D.C. will be based, not on published profits, but on Schedule D profits. Secondly, "capital" under N.D.C. may differ materially from any figure in a company's published balance sheet. Thirdly, all estimates of the incidence of N.D.C. must be based on purely arbitrary assumptions of prospective profit increases in 1937 and after. Precise analysis must needs await the publication, next autumn, of the first batch of company results covering a substantial part of 1937.

The main features of the new tax are by now only too familiar to the investor. Stable profits—no matter how high—elude the tax; recovery profits (particularly those of companies with a substantial debenture capital), are taxed in proportion to the extent of earlier depression. The effect of this basic anomaly may be traced, in broad outline, by reference to the profits analyses which are regularly published in *The Economist*. The table at the head of the next column shows the average rates earned on share capital (excluding debentures) in eight industries during recent years. Two final columns show the original profits standard and the best percentage for the taxpayer under the revised N.D.C.

The inclusion of 1936 in the base period clearly helps all the groups. Recovery industries like steel and shipping benefit appreciably from the new standard. The figures suggest, subject to their inherent limitations, that many textile companies will still be unable to show the statutory percentage of 6 per cent., and will presumably elect to go on the capital standard.

The task of estimating the potential position of individual companies is complicated by the voluminous administrative detail which E.P.D. has bequeathed to N.D.C. Neither profits nor capital standards can be calculated by the outside investor with any degree of

Group	Profits earned on capital (excluding debentures)				Original standard, 1933-1935	Optimum average
	1933	1934	1935	1936		
Breweries.....	10.7	10.5	11.1	12.0	10.8	11.3
Electric power.....	11.4	11.9	11.8	14.3	11.7	12.7
Finance.....	4.1	6.4	9.2	9.5	6.6	8.4
Iron, coal and steel.....	2.7	5.2	8.2	9.3	5.4	7.6
Motors, cycle and aviation.....	11.1	16.5	26.8	25.5	18.1	22.9
Shipping.....	5.6	5.3	6.2	12.6	5.7	8.1
Shops and stores.....	14.3	15.1	15.3	16.0	14.9	15.5
Textiles.....	5.4	4.5	5.7	6.9	5.2	6.0

accuracy. Further, the revised basis of assessment, under which all liabilities to N.D.C. begin from January 1, 1937, involves a re-apportionment of profits for accounting periods made up to other dates—apparently on a simple arithmetical basis. Encompassed about by such difficulties, we have nevertheless endeavoured to ascertain, within broad limits, the prospective liability to N.D.C. of certain companies, each of which is representative of a large number of others. In reaching the results shown in the accompanying table, we have used two alternative assumptions of the growth of profits during the current year: first, an increase at the rate recorded during the latest year; secondly, the effect of a flat increase of 10 per cent.

The position of the first three companies on our list—Imperial Chemical Industries, Turner and Newall and Crompton Parkinson—is relatively straightforward within the limits of the complications introduced by N.D.C. Imperial Chemical Industries, with moderately progressive profits during the base period, would have to pay under N.D.C. only one-half of one per cent. on its equity capital under both assumptions. On Assumption 1, the relative burden of N.D.C. on the equity earnings of Turner and Newall will be ten times and on those of Crompton Parkinson thirty times as heavy as that imposed on the ordinary capital of I.C.I. The effect of gearing is evident from a comparison between Turner and Newall and Crompton Parkinson, though neither company has any debentures. The proportion of total profits absorbed by N.D.C. is not widely different in the two instances, but the impost falls on a much narrower ordinary capital structure in the case of Crompton Parkinson than of Turner and Newall. The arbitrary incidence of the tax could not be more clearly illustrated.

ESTIMATED INCIDENCE OF N.D.C.

Company and Group	Selected Profits standard	Standard as percentage of capital	Abated Profits (see note below)	Profits as percentage of capital	Growth of profits	Total absorbed by N.D.C.	N.D.C. as percentage of total profit	N.D.C. as percentage of equity capital
<i>Stable profits—</i>	(£'000)	%	(£'000)	%	(£'000)	(£'000)	%	%
Imperial Chem. Ind.	7,020	9	{ 1. 8,150 2. 8,300	{ 10 10	{ 1,130 1,280	{ 226 256	{ 3 3	{ 0.5 0.5

Investment Notes

A Tale of Two Markets.—The behaviour of the stock markets of London and New York this week bears eloquent testimony to their technical make-up. After Mr Chamberlain introduced his National Defence Contribution on April 20th, the *Financial News* Ordinary Share Index fell 7 points in a week. The concessions made in this week's Finance Bill undoubtedly disappointed the market, for they took only a pound or two off the millstone and proceeded to tie it round the market's neck with distressing finality. But there was no evidence whatever of a renewal of large-scale selling. The *Financial News* Index, which had recovered four points, lost only one. Investors were prepared to give due weight to more favourable news items—such as the satisfactory turn in the coal trade and the London bus stoppage, and the excellent holiday railway traffics—which a month ago had been unnoticed in the general *malaise*. In due course re-alignment will be effected of the prices of securities which are deemed especially vulnerable to N.D.C.; but the process will be approximately arithmetical rather than wholly emotional. The market, in short, is now becalmed but not beslumped.

* * *

Wall Street also seems to have lost its sense of direction, and on the whole its nerves are a little less steady than London's. On Tuesday, for example, a stagnant market suddenly took a downward turn in the last hour, when many prices fell two dollars or more. The market does not like the President, and occasionally its dislike overclouds its judgment. Rightly or wrongly, Wall Street credits the Administration at Washington with complacency as Mr Lewis goes from victory to victory in the field of labour. And happenings in and around the Supreme Court—the validation of the Social Security Act and the retirement, actual or rumoured, of aged members of the Court—have a scale of Wall Street values based less on their social and constitutional importance than on their supposed effect in facilitating or hampering the President's plans for reform of the Court—to which Wall Street as a whole remains implacably hostile. *Prima facie*, these conditions seem unfavourable to an early resumption of activity; but past experience suggests that frequently revival has emerged from an even less promising background.

* * *

E.P.D. Special Allowances.—The text of the Finance Bill leaves the definite impression that N.D.C. will be largely administered on the lines of E.P.D. Powers are given for orders under E.P.D. which were in force at the commencement of the Finance Act of 1926 to have effect, subject to any necessary adaptations. And application may be made (as under E.P.D.) by "persons substantially representing any class of trade or business" for increased statutory percentages on the grounds of exceptional risk, exceptional wastage of capital, or exceptional deferment of yield. Special interest, therefore, attaches to the following table, in which we have grouped the percentages awarded by the Board of Referees for E.P.D., for the most important industries, in ascending order:—

Six per cent.—Aero. instruments; boots and shoes; hosiery; jute merchants; paint, colour and varnish; rubber manufacture; ships.

Six-and-a-half per cent.—Cement manufacture.

Seven per cent.—Electrical cable; electricity supply (London); electrical machinery; fireclay mining and manufacture; motors; pig iron.

Seven-and-a-half per cent.—Cold storage proprietors; electricity supply (Provinces); salt.

Eight per cent.—Coke; daily newspapers; explosives; omnibuses (London); steel; tea-growing (India and Ceylon).

Eight-and-a-half per cent.—Road materials.

Nine per cent.—Aircraft engines; coal mining; coffee growing (E. Indies); nitrate extracting (Chile); synthetic dyes; type-writers.

Ten per cent.—Flax preparation; iron and steel industry (Bengal); manganese ore mining (India); rubber growers; sisal (W. Africa).

A final comparison is given between Marks and Spencer and Woolworth under N.D.C. Both companies' shares are at present valued on a similar earnings basis. But Marks and Spencer, with a slightly more progressive record during the base period, together with an appreciable amount of debenture capital, attracts a higher rate of levy than Woolworth. Under our first assumption, indeed, Marks and Spencer's estimated liability would be seven per cent.—one-tenth of equity earnings, one-sixth of the equity dividend, and two-thirds of the regular scrip bonus rate.

Recovery companies, *ex hypothesi*, are vulnerable to the new tax. But when such companies have, in addition, raised large amounts of fresh capital recently for new developments—then, indeed, will Pelion be piled on Ossa. As an example, we may cite Stewarts and Lloyds, whose profits rose from £620,000 in 1933 to £1,334,000 last year. The company's capital consists of £2½ millions of debentures, £1.7 millions of preference stocks, and £5.7 millions of deferred capital (apart from certain "liaison shares" resulting from an agreement with another company, Tube Investments). At the end of 1933, its properties and plant stood in the balance-sheet at £5½ millions; at the end of 1936, the total was £9½ millions. According to Section 17 of the Finance Bill, however, if the capital employed by any company during any chargeable accounting period exceeds the average employed in the standard years, the average profits of the standard years will be increased to the extent of 6 per cent. of the excess. Is such a rate at all adequate for a company which, like Stewarts and Lloyds, has taken the risk of transferring production, on a grand scale, to an entirely new works in an hitherto undeveloped area? The same point applies to all companies which plough back an appreciable proportion of their earnings.

An example of a different character is afforded by John Brown, which has an appreciable stake in the re-armament programme. The company reconstructed its capital in 1930, and its fixed assets, which formerly appeared at £3½ millions at cost less depreciation, now stand at little more than £1½ millions. The former figures *plus* all other assets, *less* the appropriate deductions, will form the basis of the company's computation, which will presumably be calculated on the capital standard. On this basis the company's liability for N.D.C. would appear to be small, in relation to what it would have been on a capital standard assessment based on present book values. Yet, if the company, on reconstruction, had transferred its assets to a new concern, the latter standards would have applied.

Finally, the position of mining and plantation companies demands special consideration. They will doubtless apply for an increased statutory percentage, on the ground of exceptional risk, exceptional wastage of capital or exceptional deferment of yield. It is clear that for such concerns as the Rhodesian copper producers, a special rate of even 15 per cent. (which was allowed under E.P.D.) would remove only a comparatively small part of the potential burden. On current earnings (at a very rough estimate) of 125 per cent. for Rhokana and 150 per cent. for Roan Antelope, an allowance of 15 per cent. would be a very minor affair. For rubber companies, again, if the figures of estimated profits in 1937, given in an article on page 408 of *The Economist* of May 15th, are taken as a guide, there will still be an appreciable growth over a 10 per cent. capital standard.

Such are the limited conclusions which the investor can alone reach under existing circumstances. Stable profit earning companies will come off best, together with industries like the railways and some public utilities, which have a low arithmetical rate of earnings on a high fixed capital. The companies most vulnerable to the tax will be recovery concerns, companies with heavy debentures, companies in speculative industries, commodity and mining companies with a British domicile, and companies in industries where earnings bear a high proportion to their fixed capital. A tax on the growth of accountancy profits for the duration of N.D.C., measured by a pre-N.D.C. standard, would obviously be remunerative.

Eleven per cent.—Cinematograph; oil production (Persia); sugar (W. Indies).

Twelve per cent.—Cotton (Sudan); metals and alloys for high-speed steel; tungsten and molybdenum wire.

Twelve-and-a-half per cent.—Metalliferous ores (Burma).

Thirteen per cent.—Alluvial tin (Nigeria); tin dredging (Malay and Siam).

Fourteen per cent.—Lead mining (W. Australia); oil production (Trinidad).

Fifteen per cent.—Aircraft manufacture; copper mining (Rhodesia).

Sixteen per cent.—Asbestos mining (Rhodesia).

Twenty-two-and-a-half per cent.—Gold-mining (Rhodesia); gold-mining in W. Africa.

Twenty-seven-and-a-half per cent.—Gold-mining (India).

On these concessions, commodity and mining companies must, apparently, chiefly rely. They are, if precedent serves, unlikely to produce much relief for such concerns as the Rhodesian copper mines; nor would rubber plantations obtain any striking adjustment of their burden with a 10 per cent. standard. For industry generally, the concessions allowed were clearly modest. It is difficult to perceive any decisive economic reason for a statutory percentage of $7\frac{1}{2}$ per cent. for provincial electricity companies as compared with, say, 8 per cent. for steel. The former is a steadily expanding industry; the latter is highly responsive to the trade cycle. But unless the Commissioners are prepared to acknowledge this factor as a form of "exceptional risk," the recovery industries, as such, will have no claim to a higher datum standard than the statutory six per cent.

* * *

Holding Companies and N.D.C.—Not the least of the difficulties of N.D.C. are the rules prescribed for profits of holding companies. The Companies Act defines a subsidiary, in effect, as one whose parent holds more than 50 per cent. of its capital, controls a majority of its votes, or appoints a majority of its directors. The Finance Bill goes a step farther than the Companies Act, for it recognises the existence of sub-subsidiaries, but it defines the point of control at 90 per cent. or over. For N.D.C. assessments, shares in subsidiaries in which the parent company holds between 50 and 90 per cent. of the equity will presumably be treated as investments; only above this latter figure will earnings be consolidated for N.D.C.—as though the parent company were the ultimate owner of the subsidiary's business. But for the purposes of the Companies Act—and in particular Section 126, under which members are told how the income of subsidiaries has been dealt with—the existing legal standards still apply. It is obvious that this distinction greatly complicates the investor's task of assessing the effect of N.D.C. upon a parent company. In cases where subsidiaries are mainly 100 per cent. controlled by the parent concern (Imperial Chemical Industries is an example) it now becomes essential for the shareholder to know the consolidated profits of the group for the base years and all future years. But this information is available to him in comparatively few cases.

* * *

The procedure to be followed for a chain of subsidiaries and sub-subsidiaries which are joined by 90 per cent. ownership except for one link, is nowhere defined. Search at the Companies Registry to ascertain such capital relationships will avail the investor nothing, however, while he remains ignorant of group profits or of the amounts received in dividends from subsidiaries. For chains consisting of normal subsidiaries which are less than 90 per cent. owned, it appears that the principles laid down for investments will apply. Such interests, appearing in the books as subsidiaries, will be treated for N.D.C. as investments, and will not be computed as capital. In the same way, the income derived therefrom by the parent company will not, apparently, be included in the parent's profits, unless the latter is a bank or assurance undertaking, or a business "wholly or mainly" concerned in "making or holding investments." And in these cases appropriate set-offs will be allowed, to avoid double

taxation. But, to take only one example, it will be a highly complex task to assess the position of Thomas Tilling under N.D.C. Apart from its direct operating interests, the company, together with British Electric Traction, has a minority interest (*de jure*) in Tilling and British Automobile Traction. The latter company, in turn, has equal interests with the main line railways in the transport operating subsidiaries, which obviously cannot normally exceed 50 per cent. No investor, and probably few accountants, are capable, on the information at present available, of tracing the effect of N.D.C. on such a chain of companies.

* * *

Income Tax and "Bond-washing."—The simplest clause in the Finance Bill states:—"Income tax for the year 1937-38 shall be charged at the standard rate of 5s. in the pound." The increase has been overshadowed by the effects of N.D.C. and has excited little or no comment. It has at least the negative virtue of enabling investors to convert tax-free dividends to a gross basis by mental arithmetic instead of by slide-rule. "Bond-washing" or "the avoidance of tax by certain transactions in securities" is met by Section 10 of the Finance Bill. If, under any collateral arrangement to repurchase securities, the interest is receivable by a person other than the beneficial owner, the latter will nevertheless be charged, for income tax purposes, with the interest which was received by the temporary holder. Conversely, any person carrying on the business of dealing in securities who enters into an arrangement to re-sell securities bought, under which he receives interest on the securities, will not be liable to tax on such profits. The Commissioners will be given powers to demand particulars of all securities held by any person during the period specified in their notice, to ascertain whether tax has been borne on the securities concerned. Bond-washing has been largely reserved to the professional rather than the private investor, and these fairly simple rules are likely to be sufficient to stop the loss of tax, which has been costing the Exchequer up to a million pounds a year.

* * *

S.E. Committee Report.—The report of the Committee for General Purposes for the year ending March 24, 1937, is more comprehensive than its predecessors. Developments in recent years have thrown ever increasing obligations on the Stock Exchange as a public institution, and it is entirely appropriate that the proceedings of the committee and of the important sub-committees should be formally reported. Even now the report largely consists of a record of the numbers of committee and sub-committee meetings held, but possibilities of future expansion are suggested by the appearance of comments on such matters as dealing for outside brokers and the reasons for the establishment of the Register of County Brokers. A sidelight on the magnitude of the tasks undertaken is provided by the statistics of the New Issues and Official Quotation sub-committee. Some 112 meetings were held, 585 applications for official quotations were recommended and 1,920 applications for Permission to Deal were considered, of which 1,912 representing an aggregate nominal value of £697,174,206 were granted. When it is realised that each one of these applications involves a thorough-going examination of the statement or offer itself and all material legal and general documents, apart from any questions of principle involved, the enormous amount of work handled by the committee and its officials in this department alone can be readily appreciated.

* * *

South African Views on Gold.—The considered views of the South African finance houses on matters which closely concern the gold mining industry are always followed with keen interest by investors. This

year more than usual importance attaches to them in view of the large part played in contemporary economic discussion by questions of the future value of gold. On May 7th, Mr John Martin, chairman of Rand Mines, declared that higher prices for gold in terms of currencies, and for commodities in terms of gold, had lifted the world from depression; but that if the immense gold holdings of certain nations were allowed full scope, an inflation of credit might result. On May 21st, Mr P. M. Anderson, at the annual meeting of the Union Corporation at Johannesburg, dwelt rather on the consequences of any appreciable reduction of the price of gold. Expressing complete concurrence with the view strongly urged by Sir Henry Strakosch, the Corporation's chairman, in a recent letter to *The Times*, Mr Anderson declared that such a reduction would produce deflationary conditions drastically affecting all prices, whether of securities, raw materials, manufactured goods or services. Last Tuesday, Mr F. R. Phillips, chairman of the Central Mining and Investment Corporation, endorsed the view that drastic deflationary action was wholly undesirable. Mr Phillips diagnosed the present gold position as being characteristic of a period of transition in the course of which some countries had been glutted with gold, while the great majority were still starved of it. He concluded that a redistribution of gold stocks was necessary and inevitable, and that the corner-stone of this process must be the resumption of freer international trading relations. The first move lay with the creditor nations, who must live up to their position, import more freely and, following America's tentative but welcome example, begin to lend abroad again. Investors will say "Amen to That"; and will suggest that a copy of these statements might possibly be sent to the Board of Trade, the Treasury and the Foreign Transactions Advisory Committee.

Company Notes

R.M. Realisation Prospects.—The 1936 reports of the Realisation Companies show that their tasks are now progressing toward final accomplishment. The first debentures of both companies have been discharged completely, and also the whole of the E.D. income debentures and 45 per cent. of the R.M. income debentures. Of the latter issue there remains outstanding £1,402,500, the repayment of which, including 10 per cent. premium, will require £1,542,750 before the £1,000,000 share capital ranks for distribution. Against this, the company had £186,530 in the General Account at December 31, 1936, and has since realised approximately £714,000 (including the proceeds of £500,000 Royal Mail Lines Ordinary). Further, a sum of the order of £250,000 should accrue from the voluntary liquidation of the Nelson Steam Navigation Company, which is rapidly nearing completion. Moreover, under present market conditions, it may be assumed that the remaining direct holding of £380,000 Royal Mail Lines ordinary and the David MacIver block of £160,000 will be realised in the course of the next few months. These items represent a total of, say, £1,800,000—sufficient, broadly, to pay off the balance of the income debentures and to leave a surplus equal to some 5s. cash per R.M. Realisation Share.

* * *

There are, however, sundry other interests of which the £314,000 shares holding in Anglo-Foreign Properties—formed earlier this year to acquire certain R.M. and E.D. properties—constitutes the most substantial item, leaving a dozen lots mostly of small account. These are difficult to value, but £375,000-£500,000 would be a good price at the moment, but with careful nursing something more might be secured in time. The Pacific Steam Navigation interest, in particular, is singularly difficult to value. A sum between 7s. 6d. and 10s. per R.M. share, probably, fairly represents the prospects of these interests, making with the 5s. cash already calculated, 12s. 6d.-15s. per

share. The present price of R.M. Realisation is 53s., which, by these estimates, puts a value of £1,775,000-£1,900,000 on the feature asset—the holding of £1,369,990 Union Castle Ordinary, which is equivalent to 27s. 9d.-29s. 6d. per £1 of the latter stock. By the terms of the settlement of the voting dispute, distribution of the Union Castle Ordinary will be in specie and will be carried out in the comparatively near future.

* * *

E.D. Realisation.—All claims preceding E.D.'s £1,000,000 share capital have now been extinguished. The E.D. Company had cash in hand on the General Account of £428,904 at December 31st last, and has since realised a further £259,000. However, £402,121 has since been paid in discharge of a bank liability. The remaining assets consist largely of a number of small items, some of which may take some while to clear up. Hence, although the E.D. position holds out the prospect of a substantial cash payment to the shareholders in the near future—of the order of 5s. per share—the final clearing up of the miscellaneous pieces may take some time. Including the £130,000 in Anglo-Foreign Properties, there may be eventually another 10s. to 12s. 6d. of assets per share. The present price of E.D. is 51s. 6d.—so, again by our counting, its holding of £1,369,990 Union Castle is valued at between £1,700,000 and £1,825,000, or 24s. 9d. to 26s. 9d. per £ of Union Castle stock. Thus, although the realisation process has proceeded rather more favourably for both R.M. and E.D. Realisation than at first seemed likely, the general lines of our previous analyses are confirmed. In particular, we continue to maintain the thesis that no justification ever existed for the substantial premium of R.M. over E.D. which for so long amounted to 10s., and remained a persistent feature of the market.

COMMERCIAL SERVICE

The Bank has over 370 Branches in Africa, and Agents and Correspondents throughout the World. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

THE STANDARD BANK MONTHLY REVIEW is sent post free on application. It gives the latest information on all South, East and Central African matters of Trade and Commercial Interest.

J. & P. Coats' Disappointing Results.—Another marked recession in the net profits of J. & P. Coats, comes as a surprise. A fall from £2,006,340 earned for dividend in 1935 to £1,794,744 is of significant, though not serious dimensions, but the latter figure compares unfavourably with £2,463,327 for 1934. Nor is the explanation of the decline at once obvious. It is true that the chairman last year emphasised that large-scale improvement would not come until world recovery was on a wider basis—the greater part of the change in profits between 1934 and 1935 being attributed to exchange difficulties. The problem of export trade is vitally relevant to J. & P. Coats, of whose sales only about one-fifth are made to British countries. The company's experience, moreover, proves once again that widespread interests may sometimes multiply rather than divide trading risks. Last autumn's devaluations, for example, must have played their part in the year's results, though they affected only three months' trading. Meanwhile, the 10 per cent. dividend is maintained, but it appears to be short-earned by about £10,250, which is obtained by a corresponding reduction in the carry-forward. Investors will be wise to await the full report before framing final conclusions regarding these figures. The outlook for the current year, considered on general grounds, should be favourable, judging from the trade figures for the first four months of 1937. But investors will probably prefer to await the full report and the chairman's speech before deciding upon their policy.

Boots Pure Drug.—There are some shares which seem to suffer from perennial over-valuation, and it is now becoming relevant whether Boots Pure Drug 5s. shares, at 51s. 9d., are not in danger of falling into this category. The shares are supported at over 50s. on the assumption that one day the company will distribute a massive capital bonus. The latest accounts confirm, for the *n*th time, that the company could well afford to do so, but meanwhile, holders of the shares have to content themselves with a dividend yield of under 3 per cent. and an earnings yield of less than 5 per cent. The accounts, to the end of March, show that net profits amounted to £799,899, compared with £770,890 for the preceding year. The distribution, of course, has been maintained at that curious amalgam of 24 per cent. gross dividend and a 5 per cent. tax free bonus. The company's earnings are as consistent as those of any large undertaking, and not only does the parent concern retain nearly half of the profits which it discloses, but in addition the subsidiaries also adopt a highly conservative distribution policy. The financial strength of the undertaking, therefore, is even greater than the parent company's balance sheet—with a general reserve of £2,000,000, against an ordinary capital of £1,600,000—indicates. Presumably the company will be liable for N.D.C. on the basis of the consolidated earnings of the group, for the operating subsidiaries are 100 per cent. controlled. The burden does not appear to be unduly heavy, but the company will not escape so lightly as its own profit and loss account suggests.

British Oxygen Progress.—The impressive profits record of British Oxygen (which was analysed on page 467 of *The Economist* last week) was discussed with proper satisfaction by Dr Pollock at Wednesday's general meeting. This progress is the result of firm technical and financial foundations during a period of general economic recovery. Depreciation provisions, for instance, have been generous to the point of meeting all ordinary expansion. But of the recent developments in which the company is concerned, two may be singled out for special mention. The first is the strong tactical position which the company has now acquired in the welding industry. Before the acquisition of the Quasi-Arc and Ferro-Arc interests, of course, the company was the leader in the gas welding industry. These new interests, however, are complementary, and the chair-

man evidently envisages a progressive expansion of the welding industry, in which the company will be able to play its part in supplying the most comprehensive technical service, unhampered by any danger of competitive over-expansion of capacity. These quasi-monopolistic powers, however, should yield benefits to the consumer, as well as economies to the company. The second development is more remote—the establishment of a domestic calcium carbide industry, for which the company's bill has twice failed in Parliament. The company, however, will submit its plans to the committee which the Government has set up. British Oxygen is one of the progressive companies which, having increased its profits substantially during recent years, and having spent substantial sums on extending its capacity, is now faced with the demands of N.D.C. The ordinary stock remains a sound long-term holding, but it is too high, in view of the surrounding market uncertainty, to interest the seeker for quick profits.

Cable and Wireless Reconstruction.—The necessary but unpleasant medicine that the holders of Cable and Wireless "A" and "B" stocks consented to take last Monday was made as palatable as possible by Mr Denison-Pender's address. Yet one of his first points was a warning against too optimistic interpretations of the recent rise in traffic receipts. Part of the increase in profits will in future be required for special allocations which were impossible while earnings were low. But the prospects of a secure income appear reasonably assured by rising receipts and internal reorganisation. The time is therefore appropriate for adapting to actual conditions a capitalisation which seemed justifiable when the merger was formed but has been proved wholly excessive since. The undertaking was expected to enjoy the benefit of unified control. But wireless and airmail services have increased, and the depression reduced international trade to a fraction of its former proportions. Mr Denison-Pender's claim that the scheme was fair is broadly true. The "B" ordinary stockholders get a little more than their deserts, but the scheme was obviously necessary and well-founded.

Allied Sumatra Plantations.—Although sharp increases in the profits of rubber companies have recently been common, the Allied Sumatra report is impressive. The company, which works through two Dutch subsidiaries, is paying 5 per cent. against 2½ per cent., but the operating results are even better than this increase suggests. The harvested crop in 1936 was about 5,500,000 lbs., or 220,000 lbs. less than in 1935, but owing to differences in stocks carried forward, the crop accounted for rose by 756,000 lbs. But as the average net sale price rose from 5.68d. to 7.9d. per lb., the larger subsidiary, Si Boelan, nearly trebled previous profits by earning Fls. 734,439. It could, therefore, well afford Fls. 168,844 (of which Fls. 125,000 was used for writing down mature areas) compared with Fls. 30,724, for various provisions shown in the accounts. The Soeka Radja Cultuur company earned Fls. 53,454 against Fls. 14,270, and used nearly half of these profits for writing down mature areas. These subsidiaries paid no dividend, but owing to the good results the parent company has been enabled to transfer £76,000 against £36,000 from its reserve for losses of subsidiaries—or only about £10,000 more than the earned surplus of the estate companies, after allowing for the various appropriations. This transfer, added to a balance of £2,393 from interest, etc., makes £78,393, or 5.8 per cent. available for the shareholders. At a current price of 23s. 3d., Allied Sumatra stock yields 4 6s. per cent.

Other Company Results.—Although our usual analysis of profit and loss accounts on page 548 again comprises about sixty-five further companies, about twenty of these are tea companies, and the number of

important miscellaneous industrial results is lower. The larger results include those of *Imperial Continental Gas*, *City of London Real Property*, *Pease and Partners* and *Whitehall Electric Investments*, and are discussed on page 547 under the heading "Shorter Company Comments."

Company Meetings of the Week.—The reports of 20 company meetings commence on page 529 of this issue. The chairmen's remarks at the *British Oxygen*, *Cable and Wireless*, and *Central Mining* meetings are discussed in Notes on earlier pages. Mr H. E. Pattinson, addressing *Royal Insurance* members, referred with satisfaction to signs of some expansion in international trade and the possibility of currency stabilisation. Improvement so far, however, had been most marked in the home markets of the countries in which the company was interested. In reminding his hearers at the *Sun Insurance Office* meeting that King George VI was the eleventh monarch under whose rule the Office had done its work, Sir William Goschen commented upon its ability to adjust itself to changing conditions. Mr R. Wilson Bartlett spoke to *Incorporated Accountants* of the importance of N.D.C., and drew attention to its complications, even when contrasted with E.P.D. At the *Edmundsons Electricity* meeting, Sir T. Royden discussed at length the McGowan report, and in pointing out that the Corporation was fully British owned, he drew attention to signs of the Corporation's progress. The number of consumers served had risen by 13 per cent.; there had been an increase of 19 per cent. in units sold and 15 per cent. in the load. Results for the current year had so far been equally favourable. Mr James Gray, at the *Madras Electric Supply* meeting, estimated that concessions made to consumers would be offset in 1938 by a higher demand for current. Addressing *Wiggins Teape* shareholders, Lord Portal referred to improved results by the

company's new ventures, and commented in particular on the acquisition of Ford Paper Mills. At the *Mid-European Corporation* meeting the chairman reported the progress made in pursuing the company's policy of reducing its interests on the Continent of Europe. Mr E. F. Slade assured *Batang Consolidated Rubber Estates* members that their directors were fully alive to the necessity of acquiring new planted areas. The chairman, at the *Malacca Rubber Plantations* meeting, said that estimates for the current year made some time ago anticipated a slight reduction in costs. Sir Francis Voules told his hearers at the *Kepong (Malay) Rubber* meeting that their f.o.b. cost of 4.19d. per lb. in 1935 had been reduced to 3.93d. Mr Eric Macfadyen pointed out to *Kasintoe Rubber* shareholders that their standard output had been increased. The chairman, at the *Sungei Batu (Malaya)* meeting said that 123,200 lbs. of the 1938 crop had been sold at the equivalent of 1s. 0½d. per lb. Members of the *British-Borneo Petroleum Syndicate* were reminded by the chairman that the previous year's results had included a large non-recurring profit from the sale of interests in Orinoco Oilfields, Limited. *Anglo-Palestine Bank* shareholders were told of the obstacles to revival that existed during the period of political uncertainty, and the report of the Royal Commission was being anxiously awaited. At the Class and General meetings of *Illustrated Newspapers* the implications of the scheme for preference shareholders was fully explained by Sir William Graham, who drew attention to the approval of the scheme given by the Association of Investment Trusts. It was suggested, with regard to N.D.C., by Mr W. Sandford Poole at the *Industrial and General Trust* meeting that the measure should be deferred until next year's Finance Bill, to give time for modification, and that in particular it should not require a basis of assessment distinct from that of income tax. At the *W. J. Bush and Company* meeting the chairman drew attention to the fact that in fifteen years over £400,000 of undivided profits had been retained in the business.

GOLDEN MOMENTS

The Derby

Here they come! They're in the Straight. He's moving up. He's winning. By Jove—he's done it. The Favourite wins!

What a Golden Moment for the owner as he leads in the Winner of the Derby. But even he cannot buy a better Tobacco than 'Cut Golden Bar' at a shilling an ounce—but it must be Wills's.

WILLS'S CUT GOLDEN BAR

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: JUNE 8

ACCOUNT: JUNE 10

It is only slightly wide of the truth to say that there have been no markets this week. The revised version of N.D.C. has indeed robbed the industrial and commodity markets of every shred of interest and hopefulness. The concessions have had a bad reception, and if the technical situation in the markets had not been so greatly strengthened by the recent liquidation, a period of adversity rather than mere sloth would certainly be the result. For the moment, industrials cannot be valued on any precise basis; investors may attempt to console themselves with the thought that the expected yield of £25 millions from N.D.C. is not extreme. But even if this estimate proves accurate, the blow to enterprise and the uncertainty of the precise burden for individual companies renders rational equity investment almost impossible.

Even the gilt-edged market made only one day's capital out of the Finance Bill, for it was very firm on Tuesday, but sagged with the rest of the market on Wednesday onwards. The prospect of further borrowing, coupled with the slight interest in the Leeds issue, was accompanied by almost negligible business. In the foreign market, Japanese stocks were again active, but fluctuated with intermittent profit-taking. High-grade Brazilian issues improved further, but German Dawes and Young loans reacted in mid-week.

Home rails remained consistently good throughout the week on expectations of a coal settlement, the favourable effect of the increased rates application, and good traffics. L.M.S. were a feature among the ordinary stocks, and recovered sharply after Tuesday's setback, which was due to profit-taking and the announcement of wage demands. The preference stocks also improved, and the market continued to attract support until the end of the week. London Transport "C" stock improved to 88½ on the strike settlement. The Argentine rail market opened firmly, interest still being aroused by the reported application for higher rates, but the market gradually receded—ignoring the debenture interest announcements—as interest declined and wheat fell.

In the industrial markets, business commenced in promising style, but operators counted their blessings before they were bestowed. The publication of the Finance Bill was highly disappointing to the market's hopes, and business immediately fell to the lowest ebb. Iron and steel shares were appreciably affected, Dorman Long falling on Tuesday by 1s. 10½d., and other shares by smaller amounts. The tone became steadier in mid-week, but there was complete paucity of business. The colliery list, however, showed some improvement on the recent results and dividends, while the prospect of settlement of the dispute encouraged some small buying. Motor shares were dull, aircraft issues flat, and electrical equipment issues a few pence lower.

The Government's proposals for the reorganisation of the electrical distribution industry were adduced as a reason for the selling of supply shares, several of which fell by small amounts during the week. Brewery and tobacco shares were quiet and fractionally lower, store shares were mainly unchanged, and the only firm sections in the market appeared to be among bank and insurance shares. The progressive industrials in the miscellaneous market greeted the news of N.D.C. with disappointment, but were not seriously marked down. British Oxygen, indeed, recovered on the chairman's remarks at the meeting (discussed on page 522). Building shares were generally lower.

The oil market opened with a general advance in prices, and after the N.D.C. check further progress was recorded. Anglo-Iranian was an active feature, in anticipation of a good dividend and a capital bonus. The other leaders made more modest advances, although some of the Trinidad issues moved against the trend. Rubber shares opened slightly firmer, but registered disappointment with the N.D.C. proposals, even on the assumption that the industry will qualify for a special capital percentage. Tea shares were easier, the opening weakness at the Mincing Lane auctions disappointing some speculators.

Kaffir shares led an improvement in the mining markets on Monday, but the general reaction to the modified N.D.C. proposals was felt later, although the South African companies escape. The confidence expressed at the Union Corporation and Central Minings meetings (on which we comment on page 521) assisted the market to some extent, and a certain amount of speculative buying followed in mid-week. The rally, however, remained of moderate dimensions. West African issues were affected, together with the Rhodesian copper issues,

by the N.D.C. setback, but closed firmer in mid-week. Diamond issues lost part of a strong rise. There were few conspicuous movements among base metal shares, and tin shares were easier.

NEW YORK STOCK EXCHANGE

THE close of last week was marked by a brighter tendency, oil shares in particular being stimulated by the announcement that the price of East Texas crude was being raised by 8 cts. to \$1.35 per barrel. This week, however, has been characterised by a creeping paralysis which allowed the minimum of response to the small crop of news. Monday's trading was uninteresting, with very small changes and no particular trend. The Supreme Court judgment on the Social Security Act was received with indifference, and there was nothing to measure its significance for the stock markets. A similar lack of interest was displayed the next day, when small losses were general, with weakness in rails in particular (due to unfavourable crop reports) spreading to steel and motor shares. Payment of \$2 per share arrears on U.S. Steel Preferred was announced after hours, but though the Common were marked up, response was poor in a session said to be the most inactive for two years. A little selling of steel issues occurred after the appearance of the *Iron Age* figures reporting steel ingot production at 91 per cent. of capacity against 92 per cent. It is stated that seasonal influences are becoming noticeable, orders being equal to about 75 per cent. of current deliveries.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926=100):—

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are debentures redeemable at a certain date the yield includes a profit or loss on redemption, where the stocks are redeemable at or before the date the final date of payment is taken when the stock stands at a discount and the capital date when the quotation is above par. The ordinary dividend rate and shares are calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

Rate % per Annum, except where marked % or Stated in Cash

In the general foreign field we are able to report profitable results, but conditions have been more than ever difficult.

Workmen's compensation business at home has, for reasons known to you, made only a small contribution to our profits, whilst abroad, though showing some improvement on recent years, results are still far from satisfactory. This class of business the world over continues to be more costly, and it is very difficult to transact it on a basis productive of profit. Long experience of workmen's compensation insurance in this country leads us to the conclusion that even yet the claims cost has not reached its peak, and since the operation of the Workmen's Compensation

Act, 1925, our records show that the average cost per claim has increased by practically 40 per cent.

Our funds in this department now amount to £5,697,000, which is slightly in excess of our premium income.

MARINE DEPARTMENT

In the marine department, the 1935 underwriting account has been closed with a profit of £52,000, or 6.5 per cent. of the premiums for that year, a result which I think we may regard as moderately good, having regard to existing conditions.

During 1936 our marine premiums amounted to £806,000, and first year settlements and expenses have absorbed £495,000, the balance of £401,000 being carried forward. This figure represents 49.7 per cent., which, curiously enough, is exactly the same percentage as was carried forward last year.

PROFIT AND LOSS ACCOUNT

On the income side of the profit and loss account, interest and dividends (less income tax) amounted to £1,241,000, which is less by £12,000 net than for 1935. The fall is attributable to the increase last year in the standard rate of tax from 4s. 6d. to 4s. 9d. in the £, the gross figure being, in fact, higher than for the previous year.

The profits transferred from the fire, marine, and accident underwriting accounts, together with one-fifth of the shareholders' proportion of the life profits for the past quinquennium, aggregate £1,003,000, ranking among the best achievements in the company's history. (Applause.)

In addition to the usual allocations appearing on the other side of the account, and which include £50,000 written off freehold house property, and £148,000 to superannuation funds, you will observe that we have again transferred £250,000 to reserve fund in order further to augment our free central reserves, whilst £250,000 has been placed to the additional reserve in the accident and general insurances account.

As already announced, the directors recommend a similar dividend to last year, namely, a final payment of 3s. 3d. per share, which, with the interim payment of that amount in November last, makes the total of 6s. 6d. for the year.

BALANCE SHEET

There would not appear to be any features of the balance sheet necessitating special mention, apart from a reference to the total funds of the company, which, at £48,989,000, show an increase of £1,550,000 on the year. Of this, £896,000 is represented by the growth in the various life funds, and there is consequently an increase in the other departmental and free funds of £654,000.

OUTLOOK

This concludes my review of the results disclosed in the accounts before you, and it is satisfactory to be able to report a condition of progress. Insurance is so closely linked with commerce that the growth in our business cannot but reflect in some way that expansion in trade of which we see so many evidences in other directions. It is true that, so far, the improvement has been most marked in the home markets of the various countries where we operate, but signs are not lacking of an expansion in international trade and a move towards a period when effective stabilisation of the major currencies may become practicable. Progress in that direction has been made during the last twelve months, as evidenced by the tripartite declaration on exchange by the United States, France and this country, and the discussions that are now on foot to secure greater freedom of trade between the various countries taking part in them. I trust that no efforts will be spared to develop and extend this movement, as there is no doubt whatever that the cause of world peace is most effectively advanced by improvement in the economic conditions of the people, by the greater freedom of international trade, and the confidence engendered by a condition of stability in the major currencies of the world.

The history of the present year will be marked by a number of events of outstanding interest, and the Rearmament Programme is a landmark of special prominence. So far as we are concerned, its direct effects are perhaps most marked on the financial side, through the incidence of taxation. It is difficult, however, to resist the claim that the programme is essential for the security of Great Britain and the European nations generally. There may be some temporary disadvantages in the mobilisation of men and materials for rearmament work, but I hope that this dislocation will be temporary only in its effects, and will not affect our capacity to develop our export markets.

The Imperial Conference, too, is another feature worthy of note. The opportunity afforded for the leaders of our various Dominions and Colonies to make this close personal contact with each other and with the Government of this country, and to de-

liberate on matters of common concern, will, we hope, fructify in the interest of Imperial commerce and even extend universally.

WAR RISKS AGREEMENT

In our own business, last year has been noteworthy for an agreement which was reached between insurance companies and underwriters in this country to exclude war risk on land from the scope of their covers, an agreement to which some publicity has been given. Insurance to be effective must be confined to events which permit a company, by selection and distribution, to limit liability and protect itself against catastrophe. The exercise of these fundamental precautions is obviously impossible in the case of war risk, and the agreement to exclude this cover is, in my opinion, in the best interests both of the companies and the insuring public. So far as we are concerned, it affects our practice very slightly. On account of those very factors which prevent the exercise of prudent underwriting precautions, our liabilities were very limited.

So far as this year has gone, nothing exceptional has happened to which I ought to refer. The difficulties and problems inherent in our business are still with us. We are dependent on general world conditions for the results that we report to you but more particularly on the support we receive from shareholders and policyholders and, given a continuance of active trade, I think we can look forward with reasonable optimism. I am satisfied that our organisation, agents, officials and staff, to whose loyal services the company owes so much, are well-fitted to take advantage of whatever opportunities the future may hold. (Applause.)

The report and accounts were adopted, and a final dividend of 3s. 3d. per share was declared, making 6s. 6d. per share, less income tax, for 1936.

BRITISH-BORNEO PETROLEUM SYNDICATE LIMITED

MAINTENANCE OF SATISFACTORY PROFITS

The twenty-third ordinary general meeting of this company was held, on the 27th instant, in London.

Mr Walter MacLachlan (chairman and managing director), in the course of his speech, said:—The total revenue amounted to £73,544, which comprises dividends and interest upon our investments and loans, royalty upon the production of oil from the Seria oilfield in Brunei, and the net profit derived from realisation of investments during the year. The administrative, management and other London expenditure amounted to £4,955, leaving a net profit for the year of £68,589. Adding this amount to the £12,106 of undistributed profit from last year, we have a total credit balance of £110,696. The directors have transferred £20,000 to general reserve and £13,125 has been paid in respect of interim dividend No. 23; the balance at the credit of the profit and loss account therefore now stands at £77,571.

The directors recommend the payment, in respect of the year which ended on March 31st last, of a final dividend, No. 24, of 5 per cent. and a bonus of 7½ per cent., both less tax, making a total distribution of 17½ per cent. for the year. It is proposed that the final dividend and bonus will be payable on June 12th. The income tax deducted will be at the rate of 3s. 6.26d. in the £, the reduction from the standard rate of 5s. resulting from Dominion income tax relief. These appropriations, with the directors' additional remuneration of £1,562, will amount to £32,813, leaving a balance at the credit of the profit and loss account of £44,758.

We are pleased to be able to report the maintenance of satisfactory profits for the year under review, and in comparing these with previous results we would remind you that the accounts for the previous year included a substantial non-recurring profit from the sale of our interest in Orinoco Oilfields, Limited. The general result is that the rate of distribution is maintained at 17½ per cent., and we have also been able to utilise £20,000 of our profits to raise our general reserve to the substantial sum of £70,000, and, at the same time, slightly increase the balance of undistributed profit.

With regard to the general reserve, I wish to point out that the business of a company such as this must fluctuate from year to year, and while for some years past we have experienced steadily rising prices and favourable conditions which have been reflected in the consistent increase in the dividends we have paid, it must be recognised that these conditions cannot continue indefinitely. You will appreciate that, after three years of almost constantly rising prices, the opportunities for favourable market operations are increasingly restricted, and indeed the downward trend of gilt-edged securities indicates the probability of dearer money and higher yields, with a consequent revision downwards of the high prices which have recently prevailed.

The report was adopted.

BRITISH OXYGEN COMPANY, LIMITED

CONTINUED EXPANSION AT HOME AND OVERSEAS

DEVELOPMENT OF WELDING PROCESSES

ISSUE OF BONUS SHARES

DR J. D. POLLOCK'S ADDRESS

The fifty-first ordinary annual general meeting of the British Oxygen Company, Limited, was held, on the 26th instant, at the Grosvenor Hotel, London, S.W.

Dr J. Donald Pollock, chairman of the company, presided. The Secretary (Mr Frank Leeds) having read the report of the auditors,

The Chairman said: Ladies and gentlemen,—I regret to say that on this occasion we meet without the genial presence of one of our managing directors, Mr P. B. Liversidge, who has been temporarily laid aside. I am sure you will all agree with me that we deplore his absence and send him our sincerest sympathy and best wishes for a speedy recovery.

ISSUED ORDINARY CAPITAL

Including the free bonus issued to shareholders at the beginning of last year, the ordinary capital amounted to £2,485,674, and, in accordance with the report, there was an issue of 170,000 ordinary shares in payment of the purchase price of the Quasi-Arc Company, Limited, bringing the ordinary capital of the company at December 31, 1936, up to £2,655,674. Since that date there has been an issue of 8,000 ordinary shares of the company, in payment of the purchase price of the Ferro-Arc Welding Company, Limited, thus bringing the total issued ordinary stock up to £2,663,674.

The free bonus issue, to be distributed amongst ordinary shareholders in the proportion of one share for every £15 ordinary stock held, amounts to £177,578, bringing the ordinary capital, on which the final dividend of 8 per cent. is payable, up to £2,841,252.

The statement of accounts includes for the first time a statement of consolidated profits of the organisation, including the company's share of the profits of its various subsidiary companies.

The statement is indicative of the progress of the company, and I am sure it will be appreciated by the shareholders.

THE CONSOLIDATED PROFITS OF THE ORGANISATION

The consolidated profits of the organisation, including the company's share of the profits of the various subsidiary companies, amount to £995,781, but as the figures for 1935 were not prepared in the same manner, there is no comparative corresponding figure, but the balance of profits, which includes the profits of the subsidiary companies to the extent to which dividends have been declared, amounts to £600,279, which compares with the figure for 1935 of £449,828.

The consolidated profits of the organisation, after deduction of depreciation and of the contribution to the staff and works pension funds, amount to £665,045, from which there falls to be deducted a preference dividend distribution for the year amounting to £32,500, a preference dividend dividend paid of £173,997, and the provision for the ordinary interim dividend of £227,300, giving a total of £433,797, and leaving a balance of £231,248, which represents the balance of the profits of this company and of its subsidiaries retained for special appropriations and allocation to reserves and undistributed profit balances.

Whilst we have paid a final dividend on the 178,000 ordinary shares issued in payment for the purchase price of the Quasi-Arc Company, Limited, and the Ferro-Arc Welding Company, Limited, no profits of these businesses have been brought into the statements shown in the combined profits of the company and of its subsidiaries for this year.

LIBERAL DEPRECIATION POLICY

The same liberal policy with regard to depreciation has been pursued throughout the organisation as for the year 1935, and whilst the amount written off represents a large percentage of the book value of the assets, the directors, in view of our development policy, deem it prudent to add a further £50,000 to the reserve against buildings and plant.

The value of our fixed assets shows an increase from £1,260,869 to £1,438,027, after taking into account depreciation written off. It is the aim of your directors to meet all ordinary improvements and expansions out of depreciation and obsolescence provision.

The company's interest in shares in subsidiary companies has increased from £817,229 to £1,018,299. Our interests will tend to increase owing to the expansion of our overseas subsidiaries, but this year the increase is mainly due to the acquisition of the Quasi-Arc Company, Limited.

The balance at bankers and in British and Colonial Government securities at cost amounts to £462,764.

CAPITAL BONUS

It will be appreciated that, with the continued expansion of the ordinary business of the company both at home and overseas, it is necessary to retain in a business such as ours a larger sum than would be ordinarily retained. The directors therefore recommend that a sum of £177,578 standing at the credit of the general reserve account be capitalised and distributed to the ordinary shareholders as a free bonus in the proportion of one share for every £15 ordinary stock held.

After providing for the dividend on the preference stock for the year, and the interim dividend of 7 per cent. paid in November last on £2,485,574 ordinary stock, and contributions to the staff and works pension funds, and the reserve provision of £125,000, there remains a balance of £261,854, out of which the directors recommend the distribution of £227,300 for the payment of a final dividend of 8 per cent. on the ordinary stock, including the new issue, less tax, carrying forward to the next account the sum of £34,554.

Owing to the Dominions income tax relief to which the company is entitled, amounting to 3.937d. in the pound, the rate at which income tax will be deducted from the final dividend will be 4s. 8.063d. in the pound.

NATIONAL DEFENCE CONTRIBUTION

I think I may rightly express the view of the shareholders of this company by saying that we shall be ready and willing to pay our fair share towards the cost of properly establishing and maintaining our various Defence Services, and we are only anxious that the necessary taxation should be on an equitable basis.

Uncertainty is not conducive to enterprise, and the proposed new tax unfortunately will leave all undertakings in that position during the whole period of this taxation.

RESEARCH AND DEVELOPMENT

The business of this company in practically all of its products is of such a nature that it gives extensive scope for research and development in the methods of production and distribution, in new uses for the products and in new products themselves.

Large sums have been spent by us in building and equipping up-to-date research laboratories in London, and the year 1936 may be considered as another year of intensive research and development.

The extension and modernisation of our plant and equipment works at Edmonton was completed during the year, and we are now enjoying the benefit of these extensions, which enable us to cope with the increasing demands for plant and equipment of all kinds for use in the application of our products.

The company's programme, which was commenced in 1930, of laying down large capacity oxygen-producing plants in the chief industrial centres throughout the country, made further progress during the year, and our main chain of these large plants now operates from London to Glasgow.

EXPANDING DEMAND FOR ACETYLENE

The demand for acetylene equally showed a continuous expansion. Acetylene is manufactured from calcium carbide, and the supplies of carbide for this country are wholly imported. We are the largest importers and the largest users of carbide in this country, and in order to ensure our supplies, in peace or war, the company promoted the Caledonian Power Bill, to enable the company to obtain low-cost power for the production of carbide which, however, was rejected by Parliament.

The Government have now set up a Calcium Carbide Committee which is prepared to consider schemes which may be submitted to it for the production of calcium carbide, and this company proposes to submit a scheme to the committee.

The expansion of the welding business continued during the year in both the oxy-acetylene and electric systems. Electric welding is developing rapidly, and its applications are largely in a field not competitive with oxy-acetylene welding, in addition to which, electric welding, in many of its applications, necessitates cutting and bevelling of plates and other sections, and for such cutting and bevelling oxygen is used to a large extent. The two systems tend to be more closely allied and the board of directors were of the opinion that, rather than still further extend the electric welding department of the company, it would be better to ally ourselves with an old-established company engaged in electric welding development.

I have already referred to the purchase of the share capital of the Quasi-Arc Company, Limited, who are the pioneers of electric welding, and to the purchase of the share capital of the Ferro-Arc Welding Company, with which company we had co-operated for some considerable period.

The amalgamation of these interests allows us to group the technical resources of oxy-acetylene and electric welding and to place our organisation in a position to give unbiased information on welding and welding problems.

PENSION FUNDS

As I told you in my speech last year, a staff pension fund was started on January 1, 1936, and has been most highly appreciated by most of our staff. I would like to give you the percentage of members. Out of the total male staff 99.5 per cent. are members of the fund, and 85 per cent. of the female staff.

The success of this staff pension fund encouraged us to proceed with greater confidence in the establishment of a pension fund for the works people, which was brought into operation on September 1, 1936. The scheme has been a great success, which is proved by the following percentage of members who have joined:—Males, 99 per cent.; females, 82.5 per cent.

The foregoing figures relate to the company and its subsidiaries in this country participating in the funds. It is hoped in the course of the present year to bring into operation similar funds in our overseas companies.

HOLIDAYS WITH PAY

For some years the company has given workmen certain holidays with either half-pay or full-pay according to length of service. Commencing this year, all workmen with not less than six months' service will have a holiday of one week with full pay. (Hear, hear.) Nearly all the workmen employed by the company will participate in that arrangement. In addition an extra holiday with pay is to be granted to both staff and workmen who are members of the Territorial Forces and who attend the annual training camps. (Hear, hear.)

I would like again to refer to the XIIth International Acetylene Congress which was held in June of last year.

The opening ceremony took place at the Guildhall on June 8th, and during the week of the congress 74 papers were considered at the different meetings held. Representatives from 25 foreign countries attended, and, in addition, representatives from all the Dominions. The total number of members registered was 785.

COLLABORATION WITH OVERSEAS COMPANIES

The policy of our company of having close collaboration with our overseas associated companies is proving very valuable, and during last year this was exemplified by the visits of seven of our overseas directors. We took this opportunity of holding an "Empire" conference, at which all of our overseas companies were represented by the directors visiting this country, thus affording an opportunity for useful interchange of technical and commercial information.

During the year our director, Mr R. W. McCrone, accompanied by our overseas director, Major Raikes, paid a visit to India, Ceylon, and Burmah, where they made a complete survey of the works of our new Indian company.

This year we have with us Mr Bird, the secretary of our South African company, and Sir Alexander Stewart, K.B.E., the chairman of our Australian company. Sir Alexander Stewart has been associated with the British Oxygen company for 25 years, and was responsible, along with his then partner, Mr Fyvie, for the formation and development of the Commonwealth Oxygen Company in Australia. He has taken a great part in the development and expansion of industry in Australia, and our association with him has been

invaluable. We are indeed fortunate in having the benefit of Sir Alexander's wise counsel and experience as chairman in guiding the destinies of our Australian company. We, as a company, congratulate him on the high honour conferred on him in the New Year Honours by his Majesty the King. After the report has been proposed and seconded, I will ask Sir Alexander to say a few words to you.

PROSPECTS FOR CURRENT YEAR

I am very glad to be able to inform you that, since the commencement of this year, the trade of our home and overseas companies still continues to show expansion as compared with 1936, and we have every reason to be satisfied with the results to date.

In conclusion, I am sure you will appreciate from our report and from my remarks that the year 1936 must have been a very strenuous year for our managing directors, their staffs and employees, and we must congratulate them all on coming through such a year as 1936 with flying colours. (Hear, hear.)

I have already referred to our close collaboration and co-operation with our overseas companies, and I wish also to congratulate our overseas chairman, directors, and managing directors, and their staffs and employees, on the successful efforts they have made during the past year, and we send them our thanks and good wishes. (Applause.)

The chairman concluded by moving the adoption of the report and accounts, which was seconded by Mr. S. J. L. Hardie (vice-chairman).

SIR ALEXANDER STEWART'S STATEMENT

Sir Alexander Stewart, K.B.E.—Mr Chairman, ladies and gentlemen,—I would like to express the pleasure that I have in being present to-day. I would also like to express to you the thanks of my colleagues and myself for the very kindly references that have been made to our activities in Australia. Further, I would like to congratulate the shareholders of this company on the statement that has been made to-day from the chair. (Hear, hear.) I think that the congratulations to the executive directors of this company are well merited. (Hear, hear.) I have been present, like yourselves, only as a listener, but I have been impressed. I have spent a little time in going over the organisation and the team work you have here is very wonderful. The spirit of "pull together" and the success and the development that have taken place in this organisation since I saw it last, 10 years ago, are very pleasing. I have been very surprised at the chairman's comments with regard to the carbide industry in this country, and I would only say that the safety of the country warrants its establishment in Great Britain. (Hear, hear.) That, I think, is a most important thing.

DEVELOPMENT OF CARBIDE INDUSTRIES

The fact that so many of your industries depend upon the production of carbide and the many by-products that come from it warrants immediate attention. We have in our own little way developed our own carbide industry from water power from the Great Lake in Tasmania, and it has been of the utmost advantage and benefit in developing many of our indigenous industries. I would like to see everyone who has any pull in bringing this thing to a successful conclusion to do so. When we in Australia get a large meeting like this we know the board is in for a bad time. On the other hand, when we have a good story such as we have heard this morning we generally get a small attendance. I think that each one of you should become an ambassador to see that this business is put straight and thus help to create new employment. It is necessary to keep this great Empire self-contained. Defence has been referred to by the chairman. That, of course, touches us very closely, and we are 100 per cent. with the Mother Country. (Hear, hear.)

EFFICIENCY AND SERVICE TO THE PUBLIC

I do not think I have anything more to say other than to tell you that in a big expanding industry like this there is, of course, always heavy expenditure, and the only way to keep abreast of the times and bring success is to have efficiency and service to the public, with a good technical background and research laboratories. That is the motto of our company in Australia. We are very proud of our progress, and we are proud of our association with the British Oxygen Company. We lean on them in much of our research work, and I think the interchange of technical information between Britain and the Dominions is wonderful. If any of you care to come out to Australia we shall be very glad to see you and to give you a good welcome and at the same time show you the interests embracing what is known in Australia as the Commonwealth Industrial Gases. We are, of course, very far flung; your distances to us are nothing—it is only about a crow's flight from one of your works to another. We have between one of our works in one State and another some

3,000 miles to travel, but our efficiency and organisation are very good. It is a great pleasure to me to know that we are a contributor to the fine results reviewed by the chairman this morning. (Applause.)

The report and accounts were unanimously adopted, and, the formal business having been transacted, resolutions were passed increasing the capital and authorising the distribution of bonus shares.

A hearty vote of thanks having been accorded to the chairman, directors, and staff, the proceedings terminated.

WIGGINS, TEAPE AND COMPANY (1919) LIMITED

INCREASED VOLUME OF TRADE

LORD PORTAL'S STATEMENT

The eighteenth annual general meeting of Wiggins, Teape and Company (1919), Limited, was held, on the 24th instant, at Winchester House, Old Broad Street, London, E.C.

Lord Portal, D.S.O., M.V.O. (chairman of the company). said:—Ladies and gentlemen,—The report and accounts have been in your hands for the requisite period, and I propose, with your permission, to take them as read. For the fourth year in succession your directors in their report have been able to report a larger volume of trade done by your company and its subsidiary companies during the year under review. The year 1936 witnessed improved trading conditions in almost all industries which have undoubtedly led to an increased demand for paper. I am confident that the Wiggins, Teape Group of companies has secured its fair share of that increased demand. An increased export trade derived mainly from the British Empire has again been enjoyed.

I am glad to report that your company's new ventures showed some improvement during the year 1936, but in the case of Greaseproof Paper Mills a loss was again incurred, though on a much reduced scale.

FORD PAPER MILLS

For some time past the demand for our cheaper grades of banks and bonds has been growing and we arrived at a point when our machines capable of making those papers could not cope with the increasing sales. We were faced with the alternative of either putting down new plant or acquiring a suitable mill. As you are already aware, we were able to acquire the Ford Paper Mills, situate at Hylton, near Sunderland. I am pleased to inform you that we are already turning out those papers at the Ford Paper Mills.

ISSUE OF ORDINARY SHARES

The company, as stated in my speech of December 23rd last, are now issuing an additional 81,194 ordinary shares which we are offering to our stockholders at a figure which is approximately half a crown a share below to-day's market price. The board have not issued the shares before this date as they were anxious that the stockholders should have not only seen last year's accounts but should have also received the progress report for the first quarter of 1937.

DIVIDEND AND BONUS

You will see that we recommend a payment of a final dividend on the ordinary stock of 5 per cent., less income tax, which brings the dividend for the year 1936 up to 8 per cent. In addition, we are recommending the payment of a bonus on the ordinary stock of 1 per cent., less income tax. Then we propose that £10,000 be transferred to income tax equalisation reserve and £15,000 to special obsolescence reserve. We also propose the transfer of £85,000 to general reserve, bringing that account up to £491,780. The total allocation to these reserves of £110,000 compares with £75,000 for 1935, an increase of £35,000.

PROSPECT FOR 1937

Before I close my remarks, you will doubtless expect me to say something with regard to the trading operations for the current year. You have already been made aware of the profits for the first three months. These show an increase of £3,380 compared with those for the similar period of last year. We are still very busy at our mills, but are faced with rising costs of manufacture. I think, however, that we can look forward to being able to report on an equally good balance sheet this time next year.

The report and accounts were duly adopted; the dividend and bonus, as proposed, were approved; the retiring director was re-elected, and the auditors were reappointed.

SUN INSURANCE OFFICE, LIMITED

INCREASED UNDERWRITING PROFIT AND INVESTMENT INCOME

IMPROVED ACCIDENT ACCOUNT

The annual general meeting of the Sun Insurance Office, Limited, was held, on the 25th instant, at its head office in London.

The Chairman, Sir William H. Goschen, K.B.E., who presided, offered congratulations to two gentlemen connected with the office who received the honour of knighthood in the Coronation Honours List, viz. Sir George F. Huggins, K.B.E., of Trinidad, whose firm had represented the "Sun" in Grenada for many years, and Sir James Wallace Sandford, a local director, in Adelaide.

He felt that it was not inappropriate to recall that King George VI was the eleventh Monarch under whose rule the "Sun" had carried on its work. During that long period many fundamental changes—political, social and economic—had taken place at home and abroad. It was, he thought, somewhat remarkable that the office had been able so to adapt itself to the varying circumstances of the past 228 years as to have remained throughout one of the leaders of the business of insurance. Never in its history had it been more necessary than to-day that those entrusted with the guidance of the company's affairs should be constantly alert and ready to adjust their minds and policy to the ever changing conditions of the eventful times through which they were passing.

THE ACCOUNTS

As regards the accounts, he explained that in 1936 there was a reduction in premium income. This reduction was confined to the foreign field and was the result either of deliberate policy or of causes beyond the company's control.

In the fire account, notwithstanding a satisfactory increase of premium at home, there was in the aggregate a fall of some £79,000 in comparison with 1935, due in part to retirement from business in Mexico in company with all other British offices operating in that country, in consequence of legislation affecting foreign companies which was generally considered unacceptable.

In respect of Spain, since the outbreak of the civil war the company had thought it prudent to adopt a very conservative underwriting policy.

The income from fire business in the United States showed a decline, but in 1935 the premium income from this source was considerably above the normal.

Another factor which had affected premiums was the devaluation of the gold currencies of certain European countries.

The underwriting profit in the fire account was £231,049 exclusive of interest, the percentage of profit to earned premiums being 10.27.

In the accident account, as intimated last year, the volume of the company's casualty business in the United States had been substantially reduced. The effect of that policy was shown in the aggregate premiums, which, as compared with 1935, showed a fall of £106,824. It was not anticipated that the business in the United States casualty section would call for any further reduction.

The percentage of profit on the accident account taken as a whole was 6.41 per cent. on an earned premium basis, as compared with 1.32 per cent. in the previous year, the total underwriting profit carried to profit and loss account being £114,189, exclusive of interest. The marked improvement in this account was most gratifying.

In the marine account the premium income had fallen from £553,000 to £528,000.

They had again been able to transfer to profit and loss account £50,000 in addition to the interest of £30,609 earned on the marine funds, now standing at £950,592 or 180 per cent. of the year's premium income.

The total net income from investments for the year was £255,903, compared with £251,783 in 1935.

The sum of £100,000 had been transferred to an investment exchange and contingency reserve fund.

The board were again recommending a final dividend of 1s. 5d. per share, making, with the interim dividend paid in January, 2s. 8d. per share for the year. This was well covered by the income from investments.

The total funds of the office had increased during the year from £7,977,533 to £8,118,427, the book value of the investments being in the aggregate very substantially less than their market value even at to-day's prices.

The report was adopted.

ANGLO-PALESTINE BANK, LIMITED

REVIEW OF PAST YEAR'S OPERATIONS

RESULTS NOT MATERIALLY AFFECTED BY
UNREST

DIVIDEND MAINTAINED

MR L. ISTORIK'S ADDRESS

The thirty-fifth annual general meeting of the Anglo-Palestine Bank, Limited, was held, on the 27th instant, at the Bank's offices, Brook House, Wallbrook, London, E.C.

In the absence of the acting chairman, who resides in Palestine, Mr L. Istoric (one of the directors) presided.

The Joint Secretary (Mr S. Costa), having read the notice convening the meeting and also the auditors' report,

The Chairman said:—Ladies and gentlemen,—Since we last met, your board has experienced the loss of one of its members, Mr Joseph Ahronowitz, who joined us only a few years ago. During those few years his wide knowledge of the country and his sound advice have been of the utmost value to us, and his untimely death, after a short illness, has been a great loss to his colleagues and to the bank.

In last year's meeting, held on April 21, I still felt justified in opening my remarks by stating that conditions in Palestine continued to be favourable. I said so although two days before certain disturbances had broken out at Jaffa which at that moment one was reasonably entitled to regard as being merely local in character and significance. Unfortunately, as you are aware, those disturbances were allowed to spread, and for more than half a year the country was in a state of continuous disorder, which, in its later stages, became serious enough to justify the sending out to Palestine of a strong military force. The period of more serious disorder came to an end in October last, but it was followed by another period of isolated incidents which continues until this day.

NEED FOR POLITICAL SETTLEMENT

The Report of the Royal Commission which was sent out to Palestine to investigate the position and to make recommendations is being anxiously awaited. So long as no definite and more or less satisfactory policy has been evolved the country is bound to remain in a state of uncertainty which weighs heavily on the minds of investors and of the business community generally. It is this uncertainty and the consequent stagnation which dominate the picture, and there is little hope of any revival until a satisfactory political settlement has been achieved. Your directors are quite convinced that the problem with which the Mandatory Government has to contend is less formidable than it is generally represented to be. If only there existed a firm resolution to carry through loyally and without wavering the obligations of the Mandate, most of the difficulties which now appear to loom so large would melt away or be found to be non-existent. It would then be seen that the country is able to absorb a very large immigrant population which will, in the future, as it has done in the past, be the main contributing factor towards its development and prosperity.

I am very happy to be able to tell you that the bank has in no material way suffered from the year's events. Of course, we could not expect in a year of considerable disturbances to transact as much and as profitable business as we had done before. You will have seen from the annual report and from the accounts that our credit business has gone down by some small amount, and our net balance of profit, which amounted to £130,000 last year, stands this time at £96,000 only. Considering all the circumstances, you will, perhaps, be prepared to agree with me that we have not done badly.

THE DIVIDEND

We have carefully considered whether, under present circumstances, we are justified in proposing the same dividend on the ordinary shares as last year, and we have arrived at the conclusion that there is no adequate reason for doing otherwise. The only difference which this year's dividend shows as compared with last year's is that it is made payable subject to income tax, and has been increased to such an extent as to pro-

vide, after deduction of a tax, a net yield of 8 per cent. It is our present intention to propose in future the payment of dividends subject to income tax.

You will, I hope, commend the action of your directors in proposing that, in view of the uncertain outlook, the available balance of profit should be transferred to the contingency fund.

You will be interested to hear that the Statistical Department recently created under Government auspices has commenced to publish monthly banking returns. A comparison of those returns with our own figures shows that well over 40 per cent. of the country's deposit business is concentrated with us. The balance is with five foreign banks operating in the country and a large number of smaller local institutions.

THE ORANGE INDUSTRY

The orange industry has had a bad season, and is faced with considerable difficulties. Superabundant rains during the shipping season seriously impaired the quality of the fruit, and prices were, in consequence, lower than at any time since the War. Many planters will, therefore, find it difficult to work their groves during the coming summer months in an adequate way, and there exists as yet no certainty that, with new areas reaching the fruit-bearing stage and a consequent increase in the volume of our citrus export, prices will be materially better than those of the last season. The large banks who work together in financing the orange industry retain their full confidence in its future, and their own seasonal advances which are carefully adapted to the market prospects present no risk, but naturally the country will for its ultimate prosperity depend in no small degree on the orange industry being placed on a secure footing.

Towards this end there now appears to exist the beginning of co-operation between the Government, the orange growers and the banks, and one must hope that their joint efforts will be successful.

I now beg to move that the report and accounts for the year ended December 31, 1936, as circulated among the shareholders, be approved and adopted, and that the payment of interim and final dividends both on the ordinary and "A" ordinary shares amounting to 10.6 per cent., less tax, equal to 8 per cent., free of tax, for the year ended December 31, 1936, be and the same is hereby sanctioned.

After passing a vote of thanks to the General Manager, the officials and the staff, the report and accounts, together with the dividends and appropriations therein recommended were approved and adopted. The co-operation of new directors and the re-election of the retiring director were confirmed, and the auditors were reappointed.

The proceedings then terminated with a vote of thanks to the chairman.

MADRAS ELECTRIC SUPPLY
CORPORATION, LIMITED

EXPANSION MAINTAINED

The ordinary general meeting of the Madras Electric Supply Corporation, Limited, was held, on the 26th instant, in London. Mr James Gray (the chairman), in the course of his speech, said: As stated in the directors' report the normal expansion of the business of the corporation was maintained during 1936, the number of consumers connected having increased by 8.8 per cent. and the units sold by 7.8 per cent.

The balance of net revenue for 1936 is £75,598. The directors recommend: (1) Provision for three months' preference dividend accrued to December 31, 1936, £6,212; (2) payment of a final dividend of 5½ per cent. (actual) on the ordinary shares, making 8 per cent. for the year free of income-tax, £32,901, together £39,113, leaving £38,665 to be carried forward, as against £35,771 brought in.

On the whole the directors regard the results as satisfactory, and subject to unforeseen circumstances they are sanguine that the liberal concessions made to consumers (the full effect whereof will be felt this year) will during 1938 be balanced by the increased demand for current. In any event the substantial amount carried forward safeguards the immediate future.

I regret that the position of the tramways did not improve during 1936, and the directors of that company considered it prudent to pass the ordinary share dividend. Competition of motor omnibuses was unrelaxed, but I am able to report an improvement in traffic receipts for the first four months of this year. We are satisfied that everything possible is being done to meet the competition.

The report was unanimously adopted.

CENTRAL MINING AND INVESTMENT
CORPORATION, LIMITED

SUCCESSFUL RESULTS—INCREASED PROFITS

FURTHER EXPANSION IN SOUTH AFRICAN GOLD MINING INDUSTRY

MR F. R. PHILLIPS' ADDRESS

The thirty-second ordinary general meeting of the Central Mining and Investment Corporation, Limited, was held on the 25th instant, at 1 London Wall Buildings, London, Mr F. R. Phillips, M.C., the chairman of the corporation, presiding.

The Secretary (Mr R. A. Macqueen) having read the notice convening the meeting and also the auditors' report,

The Chairman, in the course of his speech, said:—Before proceeding with the business of the meeting I feel it is fitting that I should refer to the death last year of my father, Sir Lionel Phillips. He was one of the pioneers of the Witwatersrand gold mining industry, and from its early days I think it is true to say that he played a notable part in its development. (Hear, hear.) He was a partner in the firm of Messrs Wernher, Beit and Company, which brought into being this corporation. He was a director of the corporation for a period of nearly 19 years, and was its chairman during the difficult war and post-war years, retiring from active business at the end of 1924.

All those associated with him in business, both in London and in South Africa, were ever aware that the welfare of the corporation was his constant ambition and an object for which he never spared himself, and I am proud to think that he has left behind him as an inspiration to those of us now associated with the affairs of your corporation a name for devoted service, probity, and courage.

HIGHER PROFITS

We are glad to be able to present to you accounts which we are sure you will consider satisfactory. The net profit of £822,357 2s. 1d. is £84,720 higher than that for 1935. I am glad to say that our income from dividends and interest again shows an increase. General expenses were slightly higher, as is to be expected in times of expansion. The amount brought forward from last year is £177,564 7s. 10d., which, with the net profit for the current year, gives a total for disposal of £999,921 9s. 11d. The dividend on the 5 per cent. cumulative preference shares absorbs £50,000. The interim dividend of 8s. per share paid on the ordinary capital in November last called for £170,000, and we now propose the payment of a final dividend of 12s. per share and a bonus of 4s. per share, together 16s. per share, absorbing a further £340,000, making a total distribution on both classes of shares of £560,000.

We propose that £150,000 should be transferred to reserve fund, increasing the fund to a total of £1,550,000. The appropriation for the income tax at £75,000 is slightly higher. After allowing for the amount due to the directors under the articles of association the balance carried forward is practically unchanged at £176,119 14s. 3d.

BALANCE SHEET CHANGES

There are certain important changes in the balance sheet. In the first place our investments, including those in subsidiary companies, show a net increase of £920,195. The larger part of the increase of £819,799 under the heading of gold mining is in respect of additions to our holdings of dividend-paying shares, mainly of companies of our own group. We have also subscribed for our proportion of the additional capital required during the year by the developing gold mining companies in which we are interested, and have acquired a substantial holding in Welgedacht Exploration Company, Limited, of which company we have taken over the administrative and technical control. This company's property lies to the east of Modderfontein East, Limited, and we regard it as an attractive mining speculation. An increase of £320,290 is shown under the heading oil, coal, and base metals, which is accounted for in the main by our larger holding of Trinidad Leaseholds, Limited, which company made a new issue of capital towards the end of last year, and by further purchases of base metal shares.

PROVISION FOR SPANISH COMMITMENTS

Secondly, debtors show a decrease of £1,482,734, which reflects the writing down of the loan to the Anglo-Spanish Construction Company, Limited, as mentioned in the directors' report. In view of the active prosecution of hostilities in Spain since the outbreak

of the civil war last July, it has become apparent that negotiations for a settlement of the debt due by the Spanish Government to the Santander-Mediterranean Cia. must inevitably be further postponed. In these circumstances, we have felt that it would be wise to make complete provision in this year's accounts for the corporation's commitment in the Anglo-Spanish Construction Company, Limited. Reserves have fortunately been built up in the past towards meeting such a contingency, and by applying these together with an appropriation from realised profits the loan has now been written down to a nominal figure and the debentures to 5 per cent. of their nominal value.

Our holding of shares has already been written off. The valuation of the debentures is based on the approximate value of the Anglo-Spanish Construction Company's assets in this country, disregarding all assets and claims in Spain. We have taken the figure of 5 per cent. as a conservative valuation for our accounts, but it is not to be regarded as expressing our view as to the ultimate value of the debentures, as the claim of the Santander-Mediterranean Cia. against the Spanish Government remains undisputed and will be pressed at a suitable opportunity. I need hardly say that we regret that it has been necessary to take this step, but it seems prudent in the circumstances existing to-day, and the writing off of an investment the ultimate value of which is in doubt contributes to the strength of our balance sheet.

LARGE LIQUID RESOURCES

As you will see, we maintain very large liquid resources against our deposit and other liabilities. You will observe that the reduction in the amount of cash held at the end of the year is compensated for by an almost corresponding increase under the heading of Government securities and Union of South Africa Treasury Bills, and represents the employment in South African Treasury Bills of funds previously on deposit. Loans at call show an increase. Loans to brokers and others also have increased with expanding business during the year. The lower valuation of debentures of subsidiary companies is explained by further repayment of debentures of London Wall Estate, Limited, and amounts written off our holding of Anglo-Spanish debentures, to which I have already referred.

Our shares, investments, and interests total £6,537,009. Where quotations are available they are taken into our accounts at or under market prices ruling at December 31st last, and on the basis of these quotations their value is very considerably in excess of the balance sheet figure. Unquoted securities are entered at directors' valuation. On the other side of the balance sheet creditors show an increase of £1,553,417, which is accounted for mainly by the larger deposits placed with us by our associated companies.

CONTINUED WIDESPREAD ACTIVITY IN THE INDUSTRY

That the widespread activity and increased scale of operations referred to last year throughout the South African gold mining industry still continues is evidenced by the following figures. The ore milled by the gold mines of the Witwatersrand, including Heidelberg, amounted to 48,221,120 tons, which was 3,986,470 tons in excess of the quantity treated in the previous year, thus establishing a new record in the history of the industry. Once again the average grade of ore milled was reduced, being 4.569 dwt. per ton, against 4.729 dwt. Working costs were lowered by 2d. per ton milled to 18s. 9d., but as the average price realised for the gold produced fell by 1s. 9-6d. per fine ounce, the profit earned at £32,049,125 was £591,138 lower than in 1935. The currency value of the gold production for the year was £77,367,036, which was the highest ever recorded. The footage of development accomplished at 2,137,084 ft. was 173,569 ft. more than in 1935. As was natural the increased activity in all branches of the mining industry necessitated the employment of a greater number of both white and native employees, and comparing the labour force in December, 1936, with that employed in December, 1935, we find that the figures for white employees were 36,675, as compared with 33,479, while native workers totalled 304,243, against 282,917.

NEW RECORDS SET UP BY GROUP

The Witwatersrand mines of our own group again established new records in the tonnage milled—namely, 18,131,500, an increase of 1,222,800 tons; fathoms broken 1,274,029, an increase of 55,161; development footage 745,889, an increase of 42,001.

Although the working revenue increased by £703,013 to £20,958,728, the yield per ton milled decreased by 0.11 dwt. to 4.19 dwt., a percentage reduction for the mines of the group of 29.67 compared with 1932. Working costs increased during the year by 1.5d., an increase which is largely accounted for by contributions to the provident fund, additional leave, and other privileges.

The cost of development again shows a decrease compared with the previous year of 4d. per foot, and cost of stoping a decrease of 3d. per fathom. Against these decreases, the shovelling and tramming costs per ton mined remained unchanged, whilst support of workings showed a slight increase of 0.2d. per ton mined. This latter rise in cost is one that can only be expected in view of the increasing depth of the workings which must inevitably entail greater expense in keeping them open. Steady progress is being made with the elimination of dust underground, and the results so far obtained give definite encouragement. Amongst the employees of the group the death rate from disease during 1936 was 7.00 per thousand, as compared with 7.91 in the previous year, and was the lowest in the group's history.

NEW CONDITIONS OF EMPLOYMENT

An important change in industrial policy on the Witwatersrand is involved in the recent decision by the Gold Producers' Committee of the Transvaal Chamber of Mines to apply the principle of the closed shop to the mines under its control. As from the beginning of next month, all employees, with a few minor exceptions, will, as a condition of their employment, be required to belong to their respective trade unions recognised by the Chamber of Mines. The change in policy will bring the relationship between mine employees and their employers into conformity with the principle inherent in the Industrial Conciliation Act of the Union of South Africa—a principle which has been successfully applied in maintaining harmony in most of the other industries in the Union.

ATTITUDE OF CHAMBER OF MINES

In the past the mining industry has maintained the open-shop principle. The departure from that policy has been largely influenced by the disruptive and unsettling activities of a body antagonistic to the existing trade unions. The only concern of the Chamber of Mines in this matter is to endeavour to preserve industrial peace and effective collective bargaining. Accordingly, in order to avert wasteful and unnecessary strife amongst mine employees, the Chamber of Mines decided to give wider recognition to the established unions by undertaking to deal with them exclusively and by adopting the closed-shop principle. This decision was facilitated by recognition of the fact that, in their dealings with the employers, the trade unions had shown a sense of responsibility, a readiness to observe negotiated agreements, and a willingness to exhaust all opportunities of conciliation and compromise before resorting to other measures. The trade unions will now receive a great accession of strength, but experience during the past 15 years justifies the hope that this power will be used by them with a full sense of responsibility.

It is to be regretted that the Government of the Union of South Africa in the last Budget did not relieve the mining industry of some part of the onerous burden of taxation which it is now carrying, and it is to be hoped that, with the growing Budget surpluses of the Union, this important aspect will not be overlooked.

CONFIDENCE IN GOLD

During the past few weeks there has been much discussion in the press and elsewhere on the subject of gold, and I feel it is right that I should say a few words on this question. I will preface my remarks by saying that, notwithstanding what has recently occurred, the confidence in the value of gold which we have expressed at previous meetings remains unaltered, as is evidenced by the fact that our major holdings are in gold mining companies, and that during the past few years the policy of the board has been steadily and judiciously to increase its gold mining holdings.

In dealing with this very complex question, it is well to bear in mind that recovery from the intense world depression of 1929-1931 coincided with the revaluation of gold, and from that time commodity prices increased, business activity was stimulated, profitability was restored to industries previously working at a loss, unemployment declined—in fact, the machinery of recovery so greatly desired was effectively set in motion. The suggestion recently made that a reduction in the price of gold was contemplated

in the United States, which was at once denied by the authorities, would imply a reversal of this process, since, meanwhile, the economic system has been adjusting itself to the higher price of gold.

A PERIOD OF TRANSITION

The effect even of this rumour was immediate and world-wide, and a sharp fall took place in the price of commodities. The implication of such a step is, of course, deflationary. Prices would have to be adjusted to lower levels, and the process of recovery reversed. Is it to be supposed that such a development is desired? There is no denying that there are difficulties inherent in the situation to-day which arise from the fact that we are in a period of transition. Having abandoned the gold standard at the old parities, currency systems have either been rigidly controlled, or have been subject to management by Central Banking Authorities and Governments, and stability of exchange, within certain limits, has recently been maintained through the successful operation of the tripartite agreement between the United States, France, and this country.

It is important to note that the operation of this agreement depends fundamentally on the transfer of gold between the three countries as and when exchange of currencies is required. Even at a time when currencies are under official management, therefore, and divorced from a direct tie with gold, the utility and necessity of gold is demonstrated. A feature of recent years has been the movement of large amounts of capital from one country to another—sometimes as a flight from currencies which appeared to be unstable, and sometimes for purposes of more or less temporary investments in attractive securities. Large gold reserves are needed against the movements of capital involved.

MONETARY STANDARD BASIS OF THE FUTURE

In regard to the use of gold in the future, I would like to recall to you the remarks made by the Chancellor of the Exchequer last October. He said it had been suggested that we were about to enter on a new monetary era, in which there would be a permanent system of managed currencies; this he regarded as very unlikely. He said he saw no reason to depart from the view he had previously expressed that in the end the world would return to an international monetary standard on the only basis which appeared to give general confidence, that is, gold, and he added that, provided that violent fluctuations in the price of gold as expressed in commodities could be eliminated, he saw no insuperable difficulty in our ultimately arriving again at a currency based on free exchange of gold. The investment policy of the corporation has been based on our belief that after a transition period, of longer or shorter duration, gold, because of its recognised qualities, would once again resume its position as the basis of currencies.

UNITED STATES' TRADE POLICY

Despite setbacks, the industrial progress of the principal countries of the world has continued and has every appearance of continuing. It is true that international trade has not increased to the extent that might be wished, but it is, I think, significant that the United States is beginning to buy foreign goods much more freely, and it is stated that for the first quarter of the present year that country had an adverse visible trade balance amounting to \$114,000,000, imports for that period being \$246,000,000 greater than those of the corresponding period of 1936.

It has been a basis of criticism of the United States that that country has not sufficiently altered its trade policy to accord with the fact that since the Great War it has become a creditor nation, instead of being, as previously, a debtor nation. How far the result quoted is fortuitous and how far it represents a settled and continuous tendency, it is perhaps early to say, but if it can be taken as an indication of a definite trend, it should, in time, lead to some modification of the maldistribution of gold, which it is so desirable to remedy.

Another important factor in the monetary situation is that there has been some evidence recently of a revival of American lending abroad. This development, as it gains momentum, will be of the utmost significance in helping to solve the problems with which the world is to-day faced.

Summarising our views on gold, we believe in its fundamental necessity and also that the currencies of most countries of the world will be ultimately stabilised upon it. In the meantime we are passing through a transition period, in the course of which some countries have been glutted with and the great majority starved of gold, and we consider a redistribution of gold stocks is necessary and inevitable. In our opinion the process of redistribution will begin as soon as the creditor nations act as such and import goods more freely from their debtors. Finally, while it is impossible to predict the exact price at which gold will be stabilised, we hold the view that it is not in the interests of any nation, politically or

economically, to take drastic deflationary action, involving a check to the present trend of trade expansion.

EXPANSION OF OPERATIONS IN AUSTRALIA

The Chairman, having dealt with the Corporation's companies in South Africa, said: Turning to our gold-mining interests in Australia, there has been a steady improvement and expansion of operations in the various ventures and mines controlled by or associated with the Gold Exploration and Finance Company of Australia, Limited. During the past year the new 30-stamp battery of Bendigo Mines, Limited, was brought into commission. Seven properties in which the Gold Exploration Company is interested have now reached the producing stage, of which three are paying dividends. Their total production to date exceeds 100,000 ozs., and, with the new mill of Gold Mines of Kalgoorlie, Limited, coming into commission towards the end of this year and the start of operations by the Victoria Gold Dredging Company N.L. early next year, combined with forthcoming milling expansion at both Triton and Central Norseman, increasing production can be looked for in the ensuing year.

In regard to oil, the industry to-day is in a more satisfactory position than it has been for a long time past. In the year 1936 consumption eclipsed all previous records, and the same is also true of production. Throughout the year prices of oil products showed a rising tendency, and in the current year have improved still further. Owing to the better State control of oil production in the United States, the main producing country of the world, the risk of large quantities of oil being produced in excess of current requirements has been mitigated. Increasing world prosperity is resulting in a larger demand for all oil products, particularly motor spirit, and statistics for the current year to date indicate that in the absence of unforeseen contingencies 1937 will bring further prosperity to the oil industry.

NEW PROFITS RECORD OF TRINIDAD LEASEHOLDS

During its last financial year, ended June 30, 1936, Trinidad Leaseholds, Limited, established new high records in profits earned, production and purchases of crude oil, refinery throughput and footage drilled. The total dividends paid for that year amounted to 25 per cent., as compared with 17½ per cent. for the previous twelve months. An interim dividend of 10 per cent. for the current year was recently announced. In order to meet the further expansion of the company's business the authorised capital was increased by £200,000 to £1,700,000 in October last, and an issue of 327,890 shares at £3 15s. per share was made in November, raising the issued capital from £1,311,562 to £1,639,452. The outlook for this company is satisfactory.

ANGLO-SPANISH CONSTRUCTION COMPANY

I have already referred to the changes in our balance sheet in respect of the items representing our interest in Spain. The affairs of the Anglo-Spanish Construction Company, Limited, have naturally been dominated during the past 10 months by the Civil War which broke out in July last. The whole of the Santander-Mediterranean Company's railway system lies within the territory which has been from the beginning of hostilities under the control of General Franco. Negligible damage has been suffered by the company's property and normal train services have been running almost without interruption. Traffic receipts declined in the early months of the war, but are now exceeding those of the corresponding months of last year. The military authorities have made frequent use of the line and paid promptly for the services required.

Until the outbreak of the Civil War the Anglo-Spanish Construction Company, Limited, was receiving regularly weekly remittances of sterling against the gradual sale of its holding of 4 per cent. Gold Treasury Bonds. These remittances ceased after hostilities commenced, and the Anglo-Spanish Construction Company, Limited, has now a balance of £85,000 of these bonds still unrealised. In the terms of its contract with the Official Currency Bureau in Madrid the company has the right to claim and export physical gold if and when the weekly allowance of foreign exchange is not forthcoming. The company is now pressing for the fulfilment of its rights under this contract.

CURRENT YEAR'S PROSPECTS

It is usual for me to conclude my remarks by making some reference to the prospects for the current year. This year it is perhaps more difficult than usual to make a forecast, but, so far as the year has gone, the gold mining companies and the other companies in which we have our major dividend-earning investments have done well, and there is good reason to anticipate that they will continue to earn good profits.

The report and accounts were unanimously adopted.

ILLUSTRATED NEWSPAPERS LIMITED

SCHEME OF ARRANGEMENT APPROVED

Meetings of the holders of the preference and ordinary shares and also an extraordinary general meeting of Illustrated Newspapers, Limited, were held on the 26th instant at Southern House, E.C., to consider a scheme of arrangement.

Sir William Graham (chairman of the company), addressing the meeting of preference shareholders, said: The first important feature to be considered by you is the payment to each shareholder of the sum of 1s. per share in satisfaction of the arrears of preference dividend. The amount to be paid is within quite a small fraction of the full amount of the arrears that you should receive as preference shareholders, less income tax, and that sum will not be paid in any way out of the assets of the company, but will come out of the pockets of the purchasers of the shares, who have entered into a provisional contract for purchase of the greater part of the shareholding of ordinary shares of the Inveresk Paper Company, Limited, which is held in their name or nominees' names or by the trustees for their debenture holders. The payment of the sum does not in any way reduce the amount that has been accumulated at the credit of the profit and loss account, and which affords a fund for general safeguarding of the company's interests and also securing a continuity of payment of preference dividend.

Against the advantage accruing from the payment of the 1s. per share, the preference shareholders are asked to reduce their cumulative preferential dividend from 7 per cent. to 5½ per cent. as from the 30th April last. You will be paid preference dividend for the six months up to 30th April at the rate of 7 per cent. per annum, and that payment will be made quite shortly. As against the reduction of your cumulative preferential dividend, you will be accorded the right to an extra ½ per cent. on the payment of the first 1 per cent. and another ½ per cent. on payment of the second 1 per cent. distributed amongst the holders of the ordinary shares, and you also will be given at the expense of the ordinary shareholders an allotment of two 5s. ordinary shares against every five £1 preference shares which you hold. This will provide for a distribution amongst the holders of the preference shares proportionate to their holding of approximately 12.85 per cent. of the total amount available for dividend amongst the ordinary shareholders.

It follows, of course, that upon release of the arrears of dividend owing to the preference shareholders their right to receive notice of and vote at general meetings of the company will cease until the dividend on the preference shares at the rate of 5½ per cent. per annum has been in arrear for a period of six months. As you know, the preference dividend has for some time past been payable on the 1st January and 1st July in each year in respect of the period up to 31st October and 30th April, respectively. The six months' period of arrear will commence from the 1st January or the 1st July, as the case may be.

AN EQUITABLE SCHEME

As stated in the circular, the meeting has been called at the request of The Inveresk Paper Company, Limited, for the purpose of considering the scheme in consequence of an agreement entered into between them and Mr Elias as is set out in the circular. The directors, after careful consideration of the effect resulting to the preference and the ordinary shareholders of the company, have formed the opinion that it is of such an equitable character as to justify them in recommending it to the shareholders, and the opinion formed by them has been confirmed by the Association of Investment Trusts. That body consists of the principal investment trust companies carrying on business in England and Scotland, and the purpose of the Association is to consider the fairness or otherwise of schemes which are put before debenture holders and preference shareholders of joint stock companies for the purpose of effecting a variation in their rights *inter se*.

A special committee of that body consisting of experienced directors of trust companies, having considered your scheme, have reported that in their opinion it is equitable and have recommended members of the Association, who are shareholders in the company, to support the proposals made. A large majority of proxies which have been received are in favour of the resolution. The number of proxies received up to this morning from preference shareholders is 2,969, of which 2,867 are in favour of the resolution and 102 are in opposition. The number of shares voted upon by those in favour of the resolution is 787,985, and the number of shares voted against the resolution is 26,118.

At the meetings of preference and ordinary shareholders a card vote was taken for submission to the court and the scheme was approved by overwhelming majorities; at the extraordinary general meeting it was carried by a show of hands.

EDMUNDSONS ELECTRICITY CORPORATION LIMITED

A YEAR OF SUSTAINED PROGRESS

EFFICIENT SERVICE

SIR THOMAS ROYDEN ON MCGOWAN REPORT

The annual general meeting of Edmundsons Electricity Corporation, Limited, was held, on the 27th instant, at Thames House, Millbank, London.

Sir Thomas Royden, Bart., C.H. (the chairman), in the course of his speech, said:—During the year under review important changes have taken place in the shareholding of the corporation. Out of a total of 3,740,000 shares 2,737,025 were formerly held by the Greater London and Counties Trust, which in its turn was owned by the Utilities Power and Light Company of Chicago. Last July this block of shares was acquired by a British syndicate, with the result that with a few, and those very small, exceptions, Edmundsons is now 100 per cent. British-owned and 100 per cent. British controlled. I wish to emphasise most strongly this point, as I find that there is still a large section of the public which is unaware of the change which has taken place. In its outlook, in its constitution and in its control our corporation is entirely British.

The past year has been one of sustained progress. Our associated undertakings obtained 30,100 new consumers, an increase of 13 per cent., making a total of 338,100 at the end of 1936. Over 116,900 kw., or 15 per cent., of new load were added to our mains, making a total of 901,800 kw. at the end of 1936. The units sold increased by 99,500,000, or 19 per cent., the total sales during the year being 634,550,000. In addition, we sold 56 million units to the Central Electricity Board. The results of the current year are so far equally encouraging.

CO-ORDINATED CONTROL

Brigadier-General Hayes, in his speech at our last annual meeting, recalled the fact that three years previously there was initiated the policy of co-ordinated control of all the companies in the Edmundsons group, and in that connection he drew attention to the progress made by those companies during the three years in question.

I should like to bring that record up to date and to quote you figures for the four-year period, which will in some measure indicate the progress and development made by the associated companies—to a large extent attributable to the change in policy.

During the four years 1933, 1934, 1935 and 1936 the gross capital expended by the associated companies amounted to £6,921,000, an average of just over £1,730,000 per annum; and 1,010 villages and townships, with a population of 367,860, were connected to the company's mains. The overhead and underground mains erected or laid measured 4,150 miles, an increase of 78 per cent. over those in use four years ago. The number of consumers served increased from 179,140 to 338,100, or 89 per cent. The number of units sold increased from 322,916,000 to 634,550,000, or 96 per cent., as compared with a national average increase of 66 per cent. Our figures are exclusive of the 56 million units which were sold to the Central Electricity Board. The load connected to the mains increased from 501,200 kw. to 901,800 kw., or 80 per cent.

We have put into effect a continuous policy of reducing the price charged to the consumer when economic conditions make this practicable, and to show what the concessions made during the four years since 1933 mean I would mention that if the average price per unit for distribution sales for 1932 had been continued throughout the four years under review, the associated companies' revenue would have been £1,623,000 higher than was actually received. In other words, the consumer has profited to this extent by our voluntary reductions of tariffs.

THE MCGOWAN REPORT

During the year the committee appointed by the Government under the chairmanship of Lord McGowan to advise upon the problem of electricity distribution issued its report. Approximately two-thirds of the electricity distribution of this country is in the hands of local authorities, the major portion being held by undertakings of a size that represent in themselves economic distribution units. The problem of the grouping of the smaller towns and of the rural areas obviously calls for treatment on a regional basis and the necessary machinery for doing this already

exists in the form of the power companies, which seem eminently adapted for this purpose and which were given by Parliament rights in perpetuity. The McGowan report recommends that the power companies shall be made the controlling authority for the areas in which they operate, and that undertakings with an output of less than 10 million units per annum shall be absorbed by the power company, but that the life of the power companies should be limited to fifty years.

This is a statesmanlike recommendation, for under existing legislation the tendency has been for the townships to exercise their rights of purchase, and so abstract the nuclei of the areas, leaving the companies only the purely rural territory. The power companies have admirably lived up to the rôle assigned them, but the disintegration of their undertakings has rendered their task of the complete electrification of the countryside an extremely thankless and unremunerative one.

For example, the B. C. & H. undertaking is not yet earning its depreciation quota, while the South Wales Power Company, the Wessex Company and the East Anglia Company have, after years of unremunerative development work, only comparatively recently entered the dividend-paying list. It would be a manifest injustice and an economic blunder of the first magnitude, if, because of any desire on the part of local authorities to extend their activities over territory which the power companies have nursed and brought into bearing, the latter were now deprived of the fruit of their labour. We look to the sense of fair play of the Government to ensure that this does not occur.

ELECTRIFICATION OF RURAL AREAS

Our associated companies undertook in many instances the electrification of sparsely populated areas which the local authorities refused to touch. I feel certain that we shall have the unswerving support of all the stock and shareholders throughout the group in resisting any attempt that might now be made to dispossess us of this territory in favour of municipal undertakings. This would indeed be a poor reward for the enterprise which the power companies have shown.

It is our aim—in fact we recognise it as our obligation—to give an efficient electric service on reasonable terms throughout the whole of the territory of our associated companies, and we realise that we cannot expect any exaggerated reward in return. The total fixed assets of our various associated undertakings amount to nearly £21 millions, upon which the return obtained is scarcely 4½ per cent. It cannot, therefore, be contended that the interests of the consumers have in any way been sacrificed to those of the shareholders. As our undertaking progresses, we look forward to some more adequate return for the enterprise and patience which the shareholders of this corporation have shown in the past.

If you look abroad, you will find that it is exactly undertakings of the Edmundsons type which have been encouraged to develop. It has no sectional or parochial bias. It is there merely to do a job and, if it does it well, to obtain its due reward. In consequence, everything which contributes to the rational organisation of the industry commends itself to the Group, and it will not therefore surprise you to learn that before ever the McGowan Report saw the light of day we were moving along the lines of some of its most important recommendations. Last year you were told that we had before Parliament a Bill to consolidate the numerous small companies we control in Cornwall. That Bill has now become law, and, in advance of any Government intervention, a regional grouping has been effected. The year has proved to be one of continued progress, in which I am pleased to report each of our associated companies has had a share.

SOUND FINANCIAL POSITION

The balance sheet shows the sound financial condition of the company. The consolidated statement of assets and liabilities at December 31, 1936, shows that the fixed assets of the various associated undertakings amount to £20,941,718, an increase of £1,668,186. The statement, compared with that of last year, shows a further strengthening of the financial soundness of your company's undertaking.

The board proposes to utilise the profit available in writing off the balance of discount in respect of the 3½ per cent. debenture stock issue, absorbing £41,250; in placing to reserve account £30,000, and in paying or providing for the balance of the preference dividends for the year, absorbing £31,211. We recommend that the balance of £237,477 should be utilised in paying a final dividend upon the ordinary shares of 5 per cent., making 9 per cent. for the year, which leaves to be carried forward to the next account £50,477.

The report and accounts were unanimously adopted and a resolution was passed authorising the conversion of the shares into stock.

CABLE AND WIRELESS (HOLDING) LIMITED

CAPITAL RECONSTRUCTION APPROVED

The eighth ordinary general meeting of Cable and Wireless (Holding), Limited, was held, on the 24th instant, in London.

Mr J. C. Denison-Pender (the Governor), after dealing with the accounts, said: I now come to the scheme which the directors have put forward for a capital reconstruction. At the outset, let me remind you of the conditions which have made such a scheme necessary. It is essential to appreciate that since the time of the merger the whole position as regards international communications has radically changed.

There are several factors which have produced changed conditions: Firstly, the opening of additional direct wireless services operated or subsidised in various cases by the Governments concerned solely with a view to national prestige and irrespective of profitable operation; secondly, the increase in competition resulting from the fast developing airmail services, and, thirdly, the unprecedented world depression which reduced international trade to a shadow of its former proportions.

The authorised capital of the holding company was originally £53,700,000. This was reduced in 1935 to £47,246,593 by the repayment of £6,453,407 of the 5½ per cent. preference stock. The dividends paid on the preference stock have been as follows: In 1930 and 1931, 5½ per cent.; in 1932, 1933 and 1934, 2½ per cent.; in 1935, 4½ per cent.; and in 1936, 5½ per cent. If you approve to-day the dividend of 5½ per cent. on this stock recommended by your directors, the dividend will still be twenty-one months in arrear, amounting to a gross sum of £1,613,784. The financial position of the company, unfortunately, has not permitted of the payment of any dividend whatsoever on the "A" and "B" ordinary stocks.

EFFECT OF THE PROPOSALS

It is clear that the original capitalisation, although reasonable in the light of conditions then prevailing, no longer represents the position to-day; the company's assets in respect of its earning power are over-valued and a reduction scheme appears inevitable, accompanied by the funding of the preference dividend arrears. The main effect of the directors' proposals can be summarised as follows: (a) The cancellation of the arrears of preference stock dividend to December 31st, 1936, and the issue in full compensation of 4 per cent. cumulative funded income stock; and (b) the reduction of the issued amount of "A" and "B" ordinary stocks by £22,588,077 10s. to £6,883,102 10s. and the amalgamation of those stocks into one class of ordinary stock. Of this new ordinary stock, each "A" stockholder will receive £30 in respect of each £100 of "A" stock now held. Similarly, each "B" stockholder will receive £7 10s. of the new stock in respect of each £100 of "B" stock now held.

In the event of the directors' scheme being approved, the preference stockholders will receive immediately in the new 4 per cent. funded stock the equivalent of the net amount of their arrears, while the "A" and "B" stockholders will receive a dividend on their reduced holdings in the company in respect of the year 1937. At the same time the company will be placed in a sound financial position. We consider that the proposals are in the best interests of the company and that they are fair and equitable as between the three classes of stockholders. Otherwise we should not have put them forward.

I think I can claim that there has been general approval of our action in submitting these proposals. They have been received with a marked absence of adverse criticism in the financial Press, which, on the contrary, has generally accepted the scheme—though drastic—as desirable in the stockholders' interests, and we have received a very substantial number of proxies. This clearly indicates that the directors have the stockholders behind them in this plan to liquidate the past and provide for the future. Moreover, although we have over 36,000 members on our register we have received very few letters objecting to the proposals.

The directors have taken expert opinion, and our advisers state that they agree with the view that the company's liability for National Defence Contribution will be unaffected by the proposals for the reduction of its capital. If we find it makes any material difference we shall not proceed with this scheme.

Once the scheme is approved, and the company is in a position to pay a dividend on all classes of its stock, it is the intention of the directors that interim half-yearly distributions on the preference stock will be resumed.

The report was adopted, the preference dividend was confirmed, and at a subsequent extraordinary general meeting and class meetings the reconstruction scheme was approved by overwhelming majorities.

INCORPORATED ACCOUNTANTS

N.D.C. AND AUDITORS

MR R. WILSON BARTLETT'S SPEECH

The fifty-second annual meeting of the Society of Incorporated Accountants and Auditors was held, on the 25th instant, at the Incorporated Accountants' Hall, London.

Mr R. Wilson Bartlett, J.P., the president, said that the analogy between the National Defence Contribution and the Excess Profits Duty was readily apparent, but the circumstances of the pre-war and the war periods were so different from those of the recent past, and the immediate future, that the complexities which would be encountered in the administration of the N.D.C. must be infinitely greater than those which occurred in connection with Excess Profits Duty. One notable difference was that the immediate pre-war years were, in general, years of relatively stable prosperity, while during the past 10 years the experience of various industries had been so diverse that the utmost difficulty would arise in ensuring to each industry a fair normal standard of profit-earning.

The accountant's task and responsibility were increased by the fact that under the National Defence Contribution computation of capital was necessary in every case, whereas under the Excess Profits Duty precise computation was only necessary as an exception.

INCORPORATED ACCOUNTANTS' PART IN FORMULATING SAFEGUARDS

Certain members of the council of the society had given the closest attention to this important matter from the time that the proposals were originally enunciated, and he recorded with pleasure that Mr Henry Morgan, a past president of the society, in his capacity as vice-president of the Association of British Chambers of Commerce and the chairman of the finance and taxation committee of that body, initiated the formation of a committee, comprising representatives of important organisations, which could speak on behalf of trade and industry throughout the country.

As a result of the collaboration of these varied interests a memorandum was prepared, and submitted to the Chancellor of the Exchequer, which was designed to reflect the considered views of members of that committee as to the safeguards which were necessary to ensure that the Contribution should operate as equitably as possible. Subsequently the Chancellor received a delegation which was headed by Mr Morgan. Among the delegates was Mr A. Stuart Allen, another member of the council who had taken an active part in the preparation of the committee's report. The report, which was recently published, made it clear that the difficulties inherent in the suggested contribution had been fully appreciated by the committee.

THE FINANCE BILL

The issue of the Finance Bill yesterday afternoon had left him time for but a cursory scrutiny of the complex provisions relating to the National Defence Contribution. A number of the suggestions put forward by the committee of which Mr Morgan was chairman had been adopted.

He deplored that the Bill did not contain a provision setting an overriding limit to liability in individual cases. This was one of the most important recommendations of the committee, and more than any other modification would have served to remove uncertainty.

As an accountant he found himself left in considerable doubt as to the precise significance of the references in the Bill to the standard years as the years 1933, 1934, 1935 and 1936. It was to be hoped that the standard years would be calendar years in all cases, so that, by splitting accounts where necessary, all businesses might have an equal right to include the whole of 1936 in the standard period.

He felt he must refer to one important aspect of the representations which had been made to the Chancellor. In certain quarters it was alleged that trade and industry had attempted to dictate to the Chancellor terms on which the National Defence Contribution would be accepted. With an intimate knowledge of the attitude of mind which inspired Mr Henry Morgan and his committee, he (the president) could assert that the sole desire of that committee was to represent to the Chancellor certain major difficulties and inequities inherent in his proposals, and to put forward helpful and constructive suggestions thereon.

The fact remained that the additional revenue which trade and industry must provide could only be secured with the unstinted collaboration of the accountancy profession, which must equip itself by every means in its power to discharge its responsibilities with that independence and efficiency which are its proudest traditions.

The report was unanimously adopted.

INDUSTRIAL AND GENERAL TRUST,
LIMITED

MR POOLE ON THE N.D.C.

The forty-ninth ordinary general meeting of the Industrial and General Trust, Limited, was held, on the 27th instant, in London.

Mr W. Sandford Poole (the chairman) said that since their meeting a year ago there had been little improvement in the international political outlook, but in spite of political anxieties, and it might be partly in consequence of those anxieties, industrial recovery at home had been progressive. It was gratifying to be able to report a further expansion of their revenue. The income amounted to £395,131, as compared with £329,152, and they were recommending a dividend on the ordinary shares of 11 per cent. for the year, as against 10 per cent.

Looking to the prospects for the coming year, one would ordinarily expect some considerable benefit to accrue following the rise in commodity prices and the recovery in trade during the past year but, apart from other factors, trading results would be affected by the burden of increased income tax and the National Defence Contribution in whatever form it was eventually passed into law. It was difficult to understand why the Chancellor had permitted himself to table such an ill-conceived measure, which, by the way, was rendered hardly more palatable by the suggested modifications.

In his opinion the N.D.C. was a thoroughly bad tax; it penalised the enterprising and let off those who lived by the enterprise of others. Surely it should be the policy of a government to encourage enterprise, not to damp it down. By the imposition of that tax he was likely to lose a great deal in Stamp Duties and Death Duties owing to the proposed tax having taken the heart out of the stock markets and seriously depressed values. The wise course for the Government to pursue would be to withdraw the proposal for the present year and set up a committee composed partly of business men to consider whether it should be re-introduced in next year's Finance Bill in some modified form, but so that in any case it would not call for a basis of assessment distinct from that of income tax. (Applause.) In its present form the N.D.C. would tend to stifle enterprise, and he would plead with the Chancellor to reconsider the proposal in the light of the many untoward results which it would surely bring about. (Applause.)

The report was adopted.

W. J. BUSH & COMPANY, LIMITED

BENEFITS OF CONSERVATIVE POLICY.

The fortieth annual general meeting of W. J. Bush and Company, Limited, was held, on the 27th instant, in London.

Mr J. M. Bush (chairman and managing director) said: Gentlemen, The net profit is the largest in the history of the company. This should not be surprising if we consider the large amount of profit which has been reinvested in the business for a period of years. For instance, a sum of over £400,000 of undivided profit has been retained in the business during the last 15 years, and it is only reasonable to expect that such an investment has caused the business to grow and account for the higher level in our profits. Incidentally, during this period, the number of our employees has increased from about 600 to over 1,000.

In view of the National Defence Contribution Tax, which was mentioned in the Budget, the details of which have not yet been finally decided, and the prospect of increased competition in some of our most important chemicals, we feel that the policy of increasing our reserves is desirable. The disturbed international political situation to which I referred last year continues to restrict business in a number of overseas markets, but, in spite of this and the practical cessation of business with Italy during the period of sanctions and with Spain since the commencement of the Civil War our export trade has shown a moderate increase.

After providing for the amount required for the dividends on the preference shares, income tax and exchange, there remains a balance of £198,326 rs. 11d. Your directors recommend that this balance be dealt with as follows:

By the payment of a final dividend of 8 per cent. on the ordinary shares, making with the interim dividend already paid 13 per cent. for the year ...	£32,500	0	0
By placing to general reserve ...	50,000	0	0
And carrying forward the balance ...	115,826	1	11
	£198,326	1	11

Our subsidiary companies have all made satisfactory profits, and possess substantial surpluses.

The report and accounts were adopted.

MID-EUROPEAN CORPORATION,
LIMITED

THE GOLD POSITION

The thirteenth annual general meeting of this company was held, on the 24th instant, in London.

Mr Norman Holden, chairman of the company, who presided, said:—Gentlemen,—The policy of the board has remained the same as outlined to you last year, that is, to reduce our interests of the Continent of Europe, and when that is not possible, to transfer from what appear to be the most vulnerable into what we consider the safest of such investments.

Their percentage in Germany is now 16.67 per cent., as against 18.94 per cent. last year and 33.84 per cent. in 1930; their percentage in the remainder of Europe is now 15.25 per cent., as against 19.18 per cent. last year and 29.36 per cent. in 1930.

The total depreciation in the combined companies, including losses written off in Lothbury Continental Company, is £290,024, as against £164,628 last year, and a comparable figure of about £1,050,000 in 1932. Our net revenue this year is £50,639, as against £48,704. We have earned 3.81 per cent. (gross) on the ordinary stock, as against 3.43 per cent. (gross) last year.

A further amount of £8,500 of the corporation's 5 per cent. debenture stock has been redeemed, and during the year £45,914 of 4 per cent. redeemable debenture stock has been issued.

You will, no doubt, wish me to say a few words about the future. This is only my own personal opinion, but I have no doubt at all that all prices are moving to a higher level owing to the increase in the amount of gold in the world and its higher currency value. So deeply, however, has the depression complex entered the soul of man that the perfectly natural rise in prices is regarded by many as unnatural and highly dangerous. When world trade keeps getting better and better they create a new spectre with which to frighten themselves, and "If Roosevelt refuses gold?" is now the bogey.

But if America refused to be paid in gold and maintained her objection to be paid in commodities or services, she could not be paid at all. Therefore she could export nothing. So that I do not think action by America is very probable. I feel that gold expansion will be allowed to cure the ills of the world.

The report and accounts were unanimously adopted.

KEPONG (MALAY) RUBBER ESTATES,
LIMITED

LARGE INCREASE IN PROFITS

The thirty-second annual general meeting of Kepong (Malay) Rubber Estates was held, on the 21st instant, at the Great Eastern Hotel, London.

Sir Francis Voules, C.B.E. (chairman and managing director), who presided, said that the crop produced last year was 6,397,552 lbs., as compared with 6,274,826 lbs. in 1935, and had realised a gross average price of 8.25d. per lb., London landed terms, against 6.21d. for 1935. The f.o.b. cost, exclusive of depreciation, of 3.93d. per lb., showed a reduction, when compared with that of 4.19d. for 1935, and fulfilled the prediction he made last year that costs would improve in 1937 owing to the better organisation of their new acquisitions in Johore. Their assessment for 1937 was 10,435,129 lbs., as compared with 9,655,000 lbs., and this gave them an exportable crop on the basis of current releases of some 8,379,000 lbs. Last November they sold forward for delivery out of 1937 crop just over 1,000 tons of rubber at an average price of 8.35d. per lb., c.i.f. This left them with 6,392,600 lbs. for free sale, so they should show, if all went well, a remarkable profit for the current year.

The year's profit, amounting to £81,011, was more than three times that earned in the previous year, and the directors now recommended a final dividend of 8 per cent., making 11½ per cent., less tax, for the year, which compared with 4 per cent. for 1935, and was payable on a capital increased from £622,052 to £684,257 during the year. He was sure all would agree that these results were satisfactory.

With regard to the new form of tax on profits, the Chancellor had promised amendments on his ill-considered Budget statement, and until these were known it was impossible to estimate the results to a company like theirs.

Since the issue of the report the directors had concluded the purchase of a further area of 697½ acres of planted rubber adjoining the Fraser Division, including 150 acres of young bud-grafted rubber. The new acquisition had an assessment of 240,000 lbs., which would give an addition of over 200,000 lbs. to the company's exportable crop.

The report and accounts were unanimously adopted.

BATANG CONSOLIDATED RUBBER
ESTATES, LIMITED

NET PROFIT TREBLED

The seventeenth ordinary general meeting of this company was held, on the 21st instant, at 19 Fenchurch Street, London.

Mr E. F. Slade, J.P. (the chairman) said:—From the balance sheet you will notice that for the year 1936 the net profit is more than three times as much as that for the year 1935. This has been brought about by an increase in the selling price of over 2d. per pound, and in spite of the fact that our output for the year was some 104,773 lb. less than the previous year. This reduced output was caused entirely by the incidence of restriction. The actual average selling price for the year 1936 was 8.014d. per pound, as against 5.888d. in 1935.

A systematic system of manuring was begun in 1935, when 200 acres were treated for the first time. Definite improvement in this area was soon apparent, and a regular system has been instituted over a larger area covering five years. There is no doubt that with rubber getting on in years a system of manuring is essential if the best results are to be obtained from estates.

When we met last year I intimated the wisdom of acquiring areas of young rubber as and when the opportunity occurred. In days gone by estates were free to plant up their own jungle land—that is no longer possible under restriction, and so the acquisition of new planted areas is the only way to safeguard the future. Nothing has been done with regard to such acquisitions during the past year, but your directors are fully alive to the necessity, and no good opportunity will be lost.

During the past year the care and wisdom with which the International Committee have from the commencement of restriction carried out their duties, has become more and more apparent, and there is no doubt that the welfare of the planting industry and the consumer is safe in their hands. You will have noticed that forward sales have been made from time to time. They cover rather less than one quarter of the probable output for the year 1937 and have made sure of a substantial profit on that portion of the output. For the year 1938, five tons per month have been sold at 11½d. per pound c.i.f. This forward sale could not be repeated under present conditions of the market.

The report was unanimously adopted.

KASINTOE RUBBER ESTATES,
LIMITED

IMPROVED RESULTS

The twenty-third ordinary general meeting of Kasintoe Rubber Estates, Limited, was held, on the 24th instant, at 1-4 Great Tower Street, London.

Mr Eric Macfadyen (the chairman) presided and, in moving the adoption of the report and accounts, said that since their last meeting market prospects had further improved, and in the absence of a setback to world recovery, and in particular to the prosperity of the United States, the outlook appeared promising. Kasintoes "standard" had been a rising one; for 1935 it was fixed at 971,721 lbs., for 1936 at 1,010,670 lbs., and for 1937 at 1,046,460 lbs. He was glad to know that the Rubber Growers' Association was engaged in representing the interests of their industry as a whole in the matter of N.D.C. Was it even now too late to express a hope that the necessary revenue might be raised by the tried and proved machinery of the income-tax system, which had been hammered out by long use and experience?

The profit earned by the Java Company was Fl. 58,255, against Fl. 24,667 for 1935. The board felt justified in recommending a 5 per cent. dividend, which would result in their having £211 more to carry forward than was brought in. At present they were spending substantial amounts on a programme of renovating such portions of their estates as might be classed as obsolescent. The 12 acres which figured in their area statement as immature rubber represented areas thus dealt with. A further 74 acres would be replanted this year. So long as they continued with this programme, without increasing their issued capital and without depleting on balance their liquid resources, they were disposed to regard that policy as an adequate alternative to providing for any form of fixed amortisation charge. Allowing for their interest in the Namoe Tongan Company, shareholders might regard their company's acreage as 2,835 acres, of which 467 acres were young modern rubber, and that proportion was being steadily increased. Kasintoe was, everything considered, a better investment in rubber planting than many more pretentious concerns.

The report was unanimously adopted.

SUNGEI BATU (MALAYA) RUBBER
ESTATES, LIMITED

PROFITS AND DIVIDENDS DOUBLED

The twenty-fourth annual general meeting of the Sungei Batu (Malaya) Rubber Estates, Limited, was held, on the 25th instant, at 149 Leadenhall Street, London.

Mr E. D. Hewan (the Chairman), in the course of his speech, said: You will be glad to see that we have rather more than doubled our profit, which in 1935 amounted to £4,077—against £8,542 in 1936. This satisfactory result enables your directors to recommend a final dividend of 7½ per cent., which, with the interim dividend of 2½ per cent. paid last December, makes 10 per cent. for the year, or just double what was paid in 1935. Your board also recommend £1,000 being transferred to general reserve and £11,103 being carried forward.

If the releases for the four quarters of the current year remain as announced, we shall be allowed to export 83½ per cent. of our assessment, or 755,726 lbs., and I have to report that your board, carrying out their usual practice of selling forward a portion of the crop when that policy appears to be advisable, have sold for shipment out of this crop 304,640 lbs. at an average price of the equivalent of 10½d. per pound London landed terms; out of the 1938 crop 123,200 lbs. have been sold at the equivalent of 1s. 0½d. per pound.

With regard to replanting, it is obvious that a rubber tree is a wasting asset. Your board are closely watching the position and propose to continue a policy of replanting areas as and when they show the necessity for renewal.

I shall not say much about the proposed National Defence Contribution. You will have seen from the Press that the Rubber Growers' Association have been watching your interests and have presented to the Chancellor of the Exchequer a very clear and comprehensive memorandum showing how unfair and inequitable the tax would be to the rubber industry if applied under the conditions mentioned by the Chancellor in his Budget speech. The amendments to the original proposals which the Government now put forward have been, as you know, published this morning, but your board have not yet had time to study their implications and it is therefore advisable to withhold further comment.

The report and accounts were unanimously adopted.

MALACCA RUBBER PLANTATIONS,
LIMITED

DIVIDEND OF 7½ PER CENT.

The thirty-first annual general meeting of this company was held, on the 24th instant, in London.

Mr Charles Emerson (chairman of the company), who presided, said: We record a profit on the year's working of £71,050 6s. 6d., which compares with the £44,842 8s. 2d. which we were able to report last year. To this must be added the net balance brought forward from 1935, which is £31,922 7s. 6d., and gives us an available amount of £102,972 14s. Our recommendation is that a dividend of 7½ per cent. on both preference and ordinary stocks be paid, which, if you approve it, will absorb £69,870 19s. 6d., and leave us with a carry-forward, subject to Eastern staff commissions, of £33,101 14s. 6d.

The company's exportable crop for the year under the Rubber Regulation Scheme was 4,912,277 lb., and the crop actually harvested amounted to 5,092,578 lb., the excess forming an addition to our stock, which is within the amount we are permitted to hold under the provisions of the scheme. Our assessment for the current year has been agreed at 7,976,434 lb., which is 71,473 lb. more than our assessment for 1936. The proportion of this assessment which we shall be permitted to export depends, of course, on the decisions of the International Committee, which are subject to revision, but at present for the first six months of the year we are allowed to export 77½ per cent. of our crop, while for the six months commencing July 1st the percentage will go up to 90.

As to costs of production, there is no striking change. For the year under review they are .13 of a penny in excess of those for 1935, but our estimates for the current year made some time ago anticipated a slight reduction.

In accordance with our usual policy, we have deemed it prudent on successive rises in the price of the commodity to make forward sales. The amount outstanding for 1937 is 2,614,080 lb., at an average of 9.22d. per lb., landed London equivalent, and for 1938, 1,079,600 lb., at an average of 10.79d. per lb., landed London equivalent.

The report was unanimously adopted.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the week ended May 22, 1937, amounted to £11,316,000, against ordinary expenditure of £6,347,000. After allowing for an increase in Exchequer Balances of £199,074, the operations for the week, as shown below, decreased the gross National Debt by £4,770,000, to approximately £7,929 millions.†

No gold movements were reported at the Bank of England between May 21st and 27th. Details of previous movements appeared in last week's issue.

GOLD MARKET

Messrs Samuel Montagu and Company write on May 26, 1937:—The Bank of England gold reserve against notes amounted to £321,261,366 on May 19th, as compared with £318,661,810 on May 12th. The open market continued to be active and the amount of bar gold disposed of at the daily fixing during the week was about £3,000,000, which included some gold from holdings; the main proportion of offerings was taken for shipment to New York, but purchases were also made for an undisclosed destination. Prices continued to rule below dollar parity, but the discount tended to decrease towards the end of the week. The s.s. "Narkunda," which sailed from Bombay on May 22nd, carries gold to the value of about £141,000.

SILVER MARKET

The market continued to be narrow, and only 1d. separated the highest and lowest prices of the week under review. Conditions were quiet, buying by the Indian Bazaars and selling on China account again having been the main features. The tone is steady, and there are as yet no indications of any factor likely to cause a wide movement from the present level.

Quotations for gold and silver are shown below:—

1937	Price of Gold per Fine Ounce	Equivalent Value of £ sterling	Price of Bar Silver in London per ounce standard		Price of Silver New York per ounce -999 fine
			Cash	Two Months	
May 20	s. d. 140 6½	s. d. 12 1-07	d. 20 ½	d. 20 ½	May 19 45½
" 21	140 6	12 1-12	20 ½	20 ½	" 19 45½
" 22	140 6	12 1-12	20 ½	20 ½	" 19 45½
" 23	140 6	12 1-12	20 ½	20 ½	" 19 45½
" 24	140 5½	12 1-16	20 ½	20 ½	" 19 45½
" 25	140 7	12 1-03	20 ½	20 ½	" 19 45½
Average	140 6-17	12 1-10	20 3/32	20 3/32	" 19 45½
May 27	140 7	12 1-03	20 ½	20 ½	" 19 45½

The highest rate of exchange on New York recorded during the period from May 20th to 26th was \$4.94½, and the lowest \$4.94.

RAILWAYS

THE CENTRAL URUGUAY RAILWAY COMPANY OF MONTE VIDEO, LTD.—The result of the polling on May 24th on the scheme of arrangement was an overwhelming majority in all cases in favour of the scheme, which was dealt with in our issue of May 15th, pages 413 and 433, and which has now to await the approval of the court.

ANTOFAGASTA (CHILI) AND BOLIVIA RAILWAY.—Net revenue for 1936 £138,391 compared with £159,000. It is proposed to pay 2½ per cent. on the preference stock, being balance for 1933. Carry forward £136,000.

MISCELLANEOUS

SOCIETY OF INCORPORATED ACCOUNTS AND AUDITORS.—The fifty-second annual meeting was held on May 25th. Mr. R. Wilson Bartlett, J.P., the President, in his address dealt extensively with the National Defence Contribution. The country as a whole had recognised that re-armament expenditure would involve substantial increases in taxation, but the President declared that the complexities of administration of the N.D.C. would be infinitely greater than the excess profits duty.

CROSSES AND WINKWORTH CONSOLIDATED MILLS.—Trading profit for 53 weeks to March 31, 1937, £44,478, compared with a loss of £6,734. After all charges except depreciation and debenture interest (no provision), profit £20,872 against a loss of £31,651, reducing debit balance to £245,431.

GOODYEAR TYRE AND RUBBER COMPANY (GREAT BRITAIN).—Profits for 1936, £215,121 against £175,858 for 1935. Tax free ordinary dividend, 17½ per cent., against 12 per cent. Carry-forward increased by £13,702 to £243,845.

PEASE AND PARTNERS, LTD.—Trading profit for year to March 1937, £278,192, against £236,590 for previous year and £193,427 for year to March 31, 1935. To depreciation, £65,000 against £89,320. Debenture and loan charges, £20,702 against £18,181. Preference dividend, £29,264 against nil. Ordinary dividend, 5 per cent., absorbing £60,459 against nil. Carry-forward raised from £85,446 to £185,479.

ABDULLA AND COMPANY, LTD.—Profit in 1936 of £71,550, compared with £70,961. Ordinary dividend raised from 10 per cent. to 12½ per cent., requiring £37,500. Carry-forward raised from £6,458 to £20,959. No addition to reserve.

SENA SUGAR ESTATES.—Profit for 1936, £133,009 (against £49,032), after expenses and debenture service. Ordinary dividends resumed after thirteen years, with 6 per cent. To debenture conversion expenses, etc., £19,968; depreciation, £20,000; general stock reserve, £36,000. Carry-forward reduced from £16,065 to £8,606.

MADELEY COLLIERIES.—Profit for year to March 31, 1937, was £12,169, compared with £15,333. To depreciation, etc., £5,000. Carry-forward, £684.

BOOTS PURE DRUG COMPANY, LTD.—Net profit for year to March 31, 1937, £799,889 against £770,889. Ordinary dividend, 24 per cent., less tax, plus 5 per cent. tax free bonus, as before, absorbing £464,000. To reserves: General, £100,000 as before; freehold property, £20,251 against £17,948; contingency, £50,000 against £54,193; overseas development fund, £50,000 against nil. Carry-forward increased from £298,089 to £316,987.

WHITEHALL ELECTRIC INVESTMENTS.—Net revenue increased in year to March 31, 1937, by £39,847 to £231,614. After preference dividend £187,500, £44,114 added to the sum brought in, making £316,873 to carry forward.

WARING AND GILLOW.—Profits for the year to January 31, 1937, £45,032 (or £4,485 more), after depreciation, etc. Debenture interest, £32,813, and redemption reserve £6,887. After fees £2,750, sundry remuneration £1,400, and crediting £7,764 brought in, £8,946 is carried forward.

ILLUSTRATED NEWSPAPERS.—At separate class meetings on May 26, and at the extra-ordinary meeting, the scheme of arrangement was passed at all meetings by an overwhelming majority.

METAL TRADERS.—Increase in cash bonus of 7½ per cent. to 17½ per cent. This, with usual 12½ per cent. dividend, will make a total distribution of 30 per cent., less tax (against 22½ per cent.) for year to March 31, 1937. Profit for year, £129,449 after tax, an increase of £46,831. To reserve, £50,000 (against £25,000). £9,290 added to the amount brought in, making £65,916 to go forward.

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

BUSINESS continues very quiet on the majority of markets and there are no important developments to record. The forced liquidations and speculative sales of the last few weeks are over, and consumers' purchases have not yet been sufficient to cause a resumption of the rising trend of prices.

Base metals have moved in somewhat diverse directions. Lead and spelter have risen slightly, though in the case of the former the expected renewal of Spanish exports will probably cause a setback. Copper and tin prices have fallen slightly, but supplies are low, and an increased flow of purchases might give rise to some sharp advances. Rubber is unchanged, but vegetable oils have moved a little upwards. There is no change in the position in the coal and iron and steel industries, and quotations for gas coal have advanced. With the exception of Egyptian, which has advanced a trifle, cotton prices are unaltered, but a fairly general decline has been noticeable in wool.

Wheat, beef, lamb, bacon and tea prices have all fallen, the latter in consequence of the increase in the tea export quota. Dairy produce and sugar have moved in the opposite direction. Other food prices are stationary.

In the United States, Moody's daily index of staple commodity prices (December 31, 1931 = 100) was 206.4 on Wednesday, against 211.1 a week ago, 210.6 last month, and 165.2 a year ago.

COAL

SHEFFIELD.—The general position in the coal market is strong, the holidays having curtailed available supplies. In the export market small coal is rather scarce, due largely to the fact that the coke works are taking enormous quantities. Prices of bunker coal are firm and supplies are short. Industrial needs are still heavy on the inland market and difficulty is being experienced in arranging adequate deliveries of furnace coke. House coal demand has quietened, now that the likelihood of a strike has receded. Prices all round remain firm. The Central Council of Colliery Owners announced that supplementary allocations for the current quarter have been granted in full to all districts making application. Allocations in the aggregate are nearly three and a half million tons.

WORKINGTON.—The coal trade is very brisk. The falling off in house coal requirements has been offset by the greater needs of industrial fuel. For one of the by-product coke oven plants, making 6,000 tons weekly, round coal is being crushed. Stocking for fear of a strike has slowed down. Nevertheless there is less than 2,000 tons of coal weekly to spare for Ulster and the Free State. Prices are steady. Best round coal costs 23s. 6d.; washed doubles, 22s.; washed singles, 21s., all f.o.b., per ton. Smalls are 15s. 6d.; best house coal, 35s. 8d.; house nuts, 34s., per ton at station. Gas coal costs 27s. and local coke from 15s. 6d. to 16s. 6d., per ton.

NEWCASTLE-ON-TYNE.—At this time of the year domestic consumption falls off rather sharply, but under the present conditions of the North-East coal market, foreign consumers are ready to take up any surplus. It is many years since collieries have held such full order books. Northumberland steam collieries are working regularly and have little or no coal for sale this year, whilst in Durham, home trade continues so heavy that many inquiries from abroad cannot be dealt with. Patent oven coke is a steady market at late figures.

GLASGOW.—Scottish collieries are well booked for some time ahead, and prices remain firm. Scarcity of tonnage on occasion brings an odd parcel on to the prompt shipping market, but in the main current output is moving under contract and coalmasters are not greatly disposed to accept further business meantime. Home industrial and public utility needs continue on a large scale, and even the seasonal slowing-down in house coal business is less pronounced than usual, the labour position and good buying from Ireland being helpful influences.

CARDIFF.—The Cardiff coal market remains firm. For the June quarter the original output allocation was 10 per cent. higher than in the corresponding period last year, but actual demand has shown a proportionately higher rate of increase, and at a meeting of the Executive Board on Monday it was decided to apply to the Central Council for more additional quotas. The normal contraction in inland requirements is more than balanced by the expanding demand for industrial coals, while exports continue to increase. Foreign and coastwise shipments at the South Wales docks last week totalled 239,600 tons for a three-day colliery working week compared with 191,000 tons in the corresponding holiday week last year. Prices are generally maintained at the recently improved levels. Coke quotations are also strong with those of patent fuel steady. Owing to a temporary scarcity of pitwood, prices for Portuguese supplies have jumped from about 27s. to 30s., ex ship.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates that markets have settled down following the Whitsun holidays and that demand in all departments is as strong as before the break. The recent advance in quotations has not affected the situation and consumers continue to experience considerable difficulty in finding producers able to continue to experience considerable difficulty in finding producers able to accept orders for reasonably near delivery. Most of the new business negotiated is for delivery over the second half of the year, and in some cases steelmakers are unable to promise delivery before October. In some departments, however, an impression seems to have been made upon accumulated arrears.

In the pig iron market expectations of an increase in the price of foundry iron have held up business as producers are reluctant to accept orders until the prices which will rule in the second half of the year are known. There is still a shortage of basic iron for the steelworks, but the scrap position has become slightly easier.

A little relief has been experienced from the stringency in supplies of semi-finished steel, but operations at the consuming works are restricted by

the scarcity of certain classes of material. Imports of Continental billets against the quota have increased lately, but there remain heavy arrears to be made up.

In the finished steel department there is unrelieved pressure on the part of consumers to obtain material and a heavy tonnage of business is offered. Export demand is sustained, but a considerable amount of this business has had to be declined owing to the extent of home requirements.

SHEFFIELD.—The inadequacy of supplies continues to cause considerable anxiety in the iron and steel market and there appears to be little hope of easier conditions for some time. Makers of forge and foundry pig iron are fully booked, and the only material users can secure are odd parcels here and there. Nothing was done about prices at the meeting of the Central Pig Iron Producers' Association last week and they are evidently awaiting the decision of the Federation. The shortage of supplies is causing consumers far more trouble than the question of prices. In East Coast hematite the position is a little easier and there is some forward buying. In finished iron, the demand for crown bars is growing and a large volume of business is being done in common and marked bars.

Requirements of special steels are fast increasing. Makers of basic billets have little or nothing for disposal and there is a constantly expanding call for acid qualities. The scrap market is firm and the price control scheme, which applies to most iron and steel sections, is working satisfactorily.

It is reported that a new steel works, using the electric melting method, is to be built at Rotherham.

WORKINGTON.—After the lighting next month of the relined furnace at Workington and the changing over of the two furnaces at Ulverston from basic to hematite iron, there can be

exceeded those of last year by more than 30 per cent., the greatest increase having taken place in those products in which there is no material scarcity. A similar situation that is rising exports in spite of high domestic requirements prevails in other countries. Apart from an increase in her exports of rolled steel products, the United States has recently shipped very large quantities of steel scrap, but it is doubted whether shipments can be maintained at the present level.

OTHER METALS

COPPER.—Although prices fluctuated considerably, the basic position of the market showed little alteration. While forced selling has now practically disappeared, buying remains on a rather restricted scale and prices consequently fail to advance. Actually, the cash price showed a net loss on the week at the close on Wednesday, while the forward quotation was slightly higher. The "backwardation" has therefore narrowed—which indicates an improvement in the technical position of the market; but in view of the smallness of home warehouse stocks, the position still appears far from sound. A sudden wave of buying would immediately find the market in short supply, and prices would probably fluctuate sharply. But in view of the near approach of the period of seasonal quietude and the chastening experience of the recent slump, consumers may continue their hand-to-mouth policy and thus prevent undue excitement in the market. Representatives of the leading copper producers of the world have been in London during the past few days; but there is no news of any meetings or of the taking of any important decisions.

Sales on the London Metal Exchange: 2,500 tons on Monday, against nil last week; 3,100 tons on Tuesday, against 2,300 tons last week; 2,200 tons on Wednesday, against 2,400 tons last week. Domestic spot was quoted at 14.45 cents per lb. in New York on Wednesday, against 14.35 cents a week ago and 13.92 cents a month ago. Wednesday's official closing price for standard cash in London was £61 10s. to £61 12s. 6d. per ton, compared with £63 15s. to £64 a week ago. Stocks of refined copper in British official warehouses at the end of last week, at 12,081 tons, showed a decrease of 1,530 tons, while stocks of rough copper, at 4,105 tons, were 977 tons larger.

LEAD AND SPELTER.—Both metals, although closing on Wednesday below the week's best, scored a net gain this week; an improved demand was the factor mainly responsible. It is reported that Spain is again producing lead at a fairly high rate. An early reappearance of Spanish lead on the market might cause some price reaction, for the general supply position of this metal is now better than for many months past.

Sales of lead on the London Metal Exchange: 2,250 tons on Monday, against nil last week; 1,650 tons on Tuesday, against 1,400 tons last week; 1,700 tons on Wednesday, against 1,600 tons last week. The New York quotation on Wednesday was 6.00 cents per lb., against 6.00 cents a week ago and 6.00 cents a month ago. Wednesday's official closing quotation in London for soft foreign for shipment during the current month was £24 7s. 6d. per ton, compared with £23 11s. 3d. last week.

Sales of spelter on the London Metal Exchange: 1,850 tons on Monday, against nil last week; 1,400 tons on Tuesday, against 1,050 tons last week; 1,200 tons on Wednesday, against 1,600 tons last week. Wednesday's quotation in East St. Louis was 6.75 cents per lb., against 6.75 cents the week before and 6.75 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £23 7s. 6d. per ton, against £22 18s. 9d. last week.

TIN.—As in the case of copper, the cash price declined, while the forward quotation advanced this week. But the basic position of the market shows little alteration. In the absence of a revival of buying interest, the market is likely to remain fairly quiet. For the first time for

six weeks, home warehouse stocks showed a substantial rise last week. The movement has caused market sentiment to deteriorate slightly, and if it should make headway an easier price tendency would be likely.

Sales of tin on the London Metal Exchange: 225 tons on Monday, against nil last week; 330 tons on Tuesday, against 175 tons last week; 300 tons on Wednesday, against 325 tons last week. The New York quotation on Wednesday was 56.00 cents per lb., against 56.25 cents a week ago and 56.25 cents a month ago. Wednesday's official closing quotation in London for standard cash was £252 to £252 5s. per ton, compared with £254 to £255 a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 1,937 tons, an increase of 441 tons on the week.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted on Wednesday at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was quoted at £15 12s. to £15 12s. 6d. per flask of 78 lb., the same as last week. Chinese antimony was quoted at £72 to £73 per ton, ex warehouse, as against £72 to £73 last week. Chinese wolfram for "May-June" shipment was quoted at 57s. to 58s. per unit, c.i.f., compared with 57s. to 59s. last week. Refined platinum was quoted on Wednesday at £11 5s. an ounce, the same as last week.

TEXTILES

COTTON.—Manchester.—Traders have been rather slow at getting to work again after the Whitsuntide holidays, and the business done during the week has not been important. Recently there has been a tendency for order lists of spinners and manufacturers to run down, but producers have still plenty of work to go on with. Fluctuations have occurred in raw cotton prices, but there has not been any marked alteration in the level of quotations. Increasing interest is being taken in the weather reports from the American belt and the prospects for the new crop may be described as encouraging. It is recognised, however, that many things may happen before the crop is harvested. Outside factors are believed to be slightly bullish.

The tone of the American yarn market has continued very firm. There has again been much pressure for the delivery of twists, especially ring beams. New business, however, has not been of any weight. Irregular operations have occurred in Egyptian qualities.

Manufacturers of cloth have reported a generally quiet demand. Some buyers have shown a tendency to distrust current prices, but there have been no indications of makers being more prepared to grant concessions when business has been offering. Not more than miscellaneous transactions have been put through for the several outlets of India. A certain amount of business has been done in fancies and specialities for the smaller markets of the Far East. Although less support has been met with from South America and West Africa, some moderate lines have been secured. A few contracts have been obtained in standard makes for the Dominions and the home trade. Makers with wide looms remain very busy.

COTTON PRICES

	1937				Corresponding Date

WOOL.—Bradford.—The past fortnight has produced nothing outstanding in the wool textile industry, and markets everywhere are quiet. There is a feeling in the market that an increase in Australia's clip this year may bring about a reduction in prices. Supplies, however, are so limited that requirements should be equal to absorbing every bale that is available, but somehow the Bradford market remains quiet, and spinners are only operating when compelled to do so.

West Riding spinners and manufacturers are feeling the need of larger exports, and many fear that the present move for shorter working hours, with no decrease in wages, cannot possibly help that section of the industry. The continuous export of textile machinery to countries which in the past have done very little manufacturing, is expected to involve a decreased call for British textiles. In former years, between seasons, many firms have been able to rely upon export requirements to keep machinery running full time till home trade clothiers began to place orders for the ensuing spring and summer season, whereas now it looks as if spinners and manufacturers are going to remain quiet until next August, when there could be a general buying of clothing materials for the spring of 1938. Prices for merino tops are slightly easier than a fortnight ago.

GRAIN MARKETS

WHEAT.—Business has been small throughout the week, and as usual at this time of year, the market is paying much attention to crop estimates. Prices fell sharply on Wednesday following reports of favourable weather conditions in Canada and the United States.

On Wednesday last, "May" futures were quoted in Chicago at 120 cents per bushel, against 133 cents the week before and 129 cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba, ex ship, 51s. 6d. per 496 lbs., as against 53s. 6d. a week ago; No. 2 Northern Manitoba, ex ship, 51s., as against 52s. 6d. a week ago. According to the *Corn Trade News*, total shipments of wheat and flour last week amounted to 1,617,000 quarters, against 1,580,000 quarters in the previous week and 1,378,000 quarters in the corresponding week a year ago.

FLOUR.—Business is confined to the immediate needs of bakers, and prices have shown a slight downward tendency. Wednesday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 52s. per 280 lbs., as against 42s. a week ago; delivered Inner London, 41s. 6d., as against 41s. 6d. a week ago. Manitoba patents, ex stores, 67s. 6d. to 39s., as against 38s. 6d. to 40s. a week ago. Australian, ex store, 39s. to 34s., as against 33s. 6d. to 34s. 6d. a week ago.

BARLEY.—Business on this market remains very quiet. "May" futures were quoted at 69 1/2 cents per bushel in Winnipeg on Wednesday,

as against 72 1/2 cents last week. Quotations per 448 lbs. in London on Wednesday were: "English feed" at farm, 35s. to 36s., as against 35s. to 36s. a week ago; "English malting" at farm, 38s. to 45s., against 38s. to 45s. last week. California (new), ex ship, 53s. 6d., as against 53s. 6d. a week ago. Chilean, brewing (new), ex ship, 44s. 9d. to 50s., as against 44s. 9d. to 50s. a week ago.

OATS.—On Wednesday, "May" futures were quoted at 56 1/2 cents a bushel in Chicago, against 52 1/2 cents a week ago and 50 cents last month. Quotations in London, Wednesday: "English black," at farm, 26s. to 27s. per 336 lbs. a week ago, as against 26s. to 27s. a week ago; "English White" at farm, 26s. to 27s., as against 26s. to 27s. a week ago; mixed Canadian feed (Vancouver), landed, 26s. per 320 lbs., as against 26s. 3d. a week ago.

MAIZE.—There is still little activity in maize, but the Continent and United States have resumed buying on a considerable scale. "May" futures were quoted on Wednesday at 139 1/2 cents per bushel in Chicago, against 133 1/2 cents a week ago and 129 1/2 cents last month. Quotations in London, Wednesday: "Plate," landed, 28s. 9d. per 480 lbs. as against 28s. a week ago; "Plate" ex ship, 27s. 9d., as against 27s. 3d. a week ago; "Plate" May, 27s. 9d., as against 27s. a week ago; yellow maize meal, ex wharf, was quoted at £7 2s. 6d. to £7 5s. per ton, as against £7 2s. 6d. last week.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1935-37:—

NEAREST FUTURE	Jan. 2, 1935	Dec. 31, 1935	May 27, 1936	Dec. 30, 1936	May 19, 1937	May 26, 1937
Winnipeg (No. 1, Manitoba) —Cents per 60 lb.	82 1/2	84 1/2	74 1/2	129	137 1/2	130 1/2
Chicago (No. 2, Winter) —Cents per 60 lb.	98 1/2	101 1/2	83 1/2	135 1/2	133 1/2	120

The visible supply of wheat in Canada amounts to 60,689,000 bushels, against 64,151,000 bushels last week, and 90,085,000 bushels in the corresponding week last year.

SALES AND PRICES OF BRITISH CEREALS.—The following table gives the estimated sale of home-grown wheat during the harvest years 1933-34 to 1936-37.

	1933-1934	1934-1935	1935-1936	1936-1937
Estimated sales of home-grown wheat—	Cwts.	Cwts.	Cwts.	Cwts.
1 week to May 22	87,106	188,578	193,215	143,967
38 weeks to May 22	9,883,408	12,454,531	12,472,292	9,825,808
Average price of English wheat per cwt.	s. d. 4 9	s. d. 5 6	s. d. 6 10	s. d. 9 9

The following is a statement showing the quantities sold and the average price of British cereals in the past two weeks, and for the corresponding weeks in each of the years from 1933 to 1936:—

Week ended	QUANTITIES SOLD			AVERAGE PRICE PER CWT.		
	Wheat	Barley	Oats	Wheat	Barley	Oats
May 20, 1933	Cwts. 132,073	Cwts. 48,505	Cwts. 18,811	s. d. 5 9	s. d. 6 7	s. d. 5 9
May 19, 1934	132,073	48,505	18,811	5 9	6 7	5 9
May 25, 1935	188,578	25,052	24,840	5 6	7 0	6 1
May 22, 1936	193,215	17,683	42,816	6 10	6 10	6 2
May 15, 1937	115,070	17,849	17,144	9 10	10 7	8 10
May 22, 1937	143,967	14,960	36,817	9 9	9 11	9 1

OTHER FOODS

BACON.—Business remains small, and prices have been somewhat weak in several sections of the market. The official quotations (per cwt. for No. 1 Sizable) which formed the basis for dealings on the London Provision Exchange this week were: English, 88s. to 92s.; Canadian, 82s.; Danish, 95s., against 90s. to 96s., 87s. and 95s. last week. Arrivals in London last week included: Danish, 13,802 bales; Canadian, 7,933; Dutch, 2,436; Lithuanian, 1,467; and Polish, 3,346; as against 14,062, 7,660, 2,490, 1,510 and 2,590 bales, respectively, in the previous week.

BUTTER.—Butter prices have remained firm throughout the week. Quotations (per cwt.) on the London Provision Exchange on Monday were: New Zealand, finest salted, 109s.; Australian, choicest salted, 108s.; Danish, 114s. to 115s.; compared with 108s. 6d. to 109s., 108s., and 108s. to 109s., respectively, a week ago.

CHEESE.—Nothing of any note has occurred in this market during the week, but prices are firm. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: Canadian, finest coloured, 76s. to 78s.; and New Zealand, finest coloured, 74s.; against 76s. to 78s. and 72s. 6d., respectively, a week ago.

COCOA.—The spot quotation in New York on Wednesday was 7 1/2 cents per lb., as against 7 1/2 cents per lb. last week. In London, on Wednesday last, good fermented new crop, Accra, "October-December," was quoted at 36s. per 50 kilos., c.i.f. Continent, against 36s. to 36s. 6d. a week ago. Last week's movements of cocoa in London were as follows: Landed, 2,983 bags; delivered, for home consumption, 7,353 bags; exported, 30 bags; stocks, 299,787 bags, against 159,378 bags a year ago.

COFFEE.—On Wednesday, Rio No. 7 (cash) was quoted at 9 1/2 cents per lb. in New York, unchanged from a week ago and 1 cent less than last month. Movements of coffee in London last week were as follows: Brazilian, landed, nil; delivered, for home consumption, 21 cwt.; exports, nil; stocks, 2,140 cwt., against 11,093 a year ago. Central and other South American: Landed, 588 cwt.; delivered, for home consumption, 1,849 cwt.; exported, 257 cwt.; stocks, 114,583 cwt., against 126,468 last year. Other kinds: Landed, 2,695 cwt.; delivered, for home consumption, 2,161 cwt.; exported, 290 cwt.; stocks, 121,292 cwt., against 180,088 last year.

EGGS.—Foreign eggs remain unchanged, but quotations are rising for English grades. A Smithfield, on Wednesday, English (ordinary packing, Grade 1, about 15-15 1/2 lb.) realised 10s. 3d. to 10s. 6d. per 120, against 9s. 9d. to 10s. last week; while Danish (15 1/2 lb.) made 8s. 6d. to 8s. 9d., as against 8s. 6d. to 8s. 9d. last week.

FRUIT.—Trade remains good at Covent Garden, sales are still large and prices for the most part well maintained. Apple prices have fallen generally after the large arrivals from Australia and Tasmania in the last week or so; but English lines are firm. English Bramleys are selling at 8s. to 10s. a box, and New Zealand Cox's at 14s. to 18s. The quality of most of the oranges coming on to the market is distinctly poor, but the exceptions are fetching excellent prices. Pears are doing quite well; but grapes of all kinds have moved slightly downwards. English forced strawberries sell well at prices varying between 2s. 6d. and 6s. per lb.; and peaches and nectarines can be sold at any price up to 30s. per dozen and 36s. per dozen, respectively.

MEAT.—At Smithfield Market on Wednesday last, Argentine chilled hindquarters were quoted at 4s. to 4s. 4d. per 8 lbs., as compared with 4s. 6d. to 4s. 10d. a week ago. New Zealand frozen mutton was 3s. 4d. to 4s. per 8 lbs., against 3s. 4d. to 4s. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 8,637 tons, an increase of 130 tons on the corresponding week last year. Beef and veal accounted for 4,669 tons, mutton and lamb 2,760, and pork and bacon 759, as compared with 4,665, 2,706 and 714 tons, respectively, in the same week of 1936.

PEPPER.—On Wednesday, Singapore white Muntok, spot, was quoted at 6d. per lb. in bond, against 6d. per lb. a week earlier. Black Lampong, spot, in bond, was quoted at 3d. per lb. sellers, compared with 3d. per lb. last week. Movements of pepper in London last week were as follows: Black, landed, 45 tons; delivered, 2 tons; stocks, 1,910, against 1,766 last year. White, landed, 18 tons; delivered, 24 tons; stocks, 11,963 tons, compared with 12,260 a year ago.

RICE.—The spot price of Burma No. 2, cleaned, was 10s. per cwt. ex warehouse, on Wednesday, as compared with 10s. per cwt. a week ago. "May-June," in singles to Continent and U.K., was quoted at 9s. per cwt., against 9s. last week. Movements in London last week were as follows: Landed, 19 tons; delivered, 62 tons; stocks, 998 tons, against 1,642 a year ago.

SUGAR.—Prices are steady, but futures have advanced slightly. The New York spot quotation was 3.35 cents on Wednesday, as compared with 3.35 cents per lb. last week and 3.45 cents per lb. a month ago. Wednesday's sales of raw sugar in London included "August" delivery at 6s. 5 1/2d. to 6s. 6d., against 6s. 2 1/2d. to 6s. 3 1/2d. a week ago. Movements of raw sugar in public warehouses in London and Liverpool last week were as follows: Imports, 42,362 tons, against 13,309 in the previous week and 1,127 in the same week of 1936; deliveries, 23,867 tons, against 13,090 and 17,758 tons, respectively; stocks, 200,338 tons, against 181,843 and 171,110 tons, respectively.

TEA.—At this week's public auctions in Mincing Lane, 37,926 packages of Indian and 25,168 packages of Ceylon tea came up for disposal. This was the first series held since the announcement of the increase in the export quotas for the current season, and prices were irregular and generally easier.

VEGETABLES.—According to *The Fruitgrower*, cabbages and spring greens are in good request and their prices are firm. Cucumber are selling at 8s. to 10s. per box of 18 to 24. Asparagus supplies are large, and the best can be bought from 2s. to 2s. 6d. per bundle. The supplies of tomatoes are rising, but demand is good and prices have shown no decline. New potatoes are doing excellently. Jerseys are selling at 32s. and 34s. per cwt., and Mataro about 8s. less. Good quality old potatoes have suffered no decline of price, but poor qualities are being cleared off. Best siltland King Edwards went at 10s. and 11s. per cwt. at the Borough on Tuesday, showing no change on the week.

MISCELLANEOUS COMMODITIES

VEGETABLE OILS AND OILSEEDS.—Markets continue very quiet, with very little disposition on the part of anybody to anticipate requirements. Demand for linseed is negligible, but prices remain quite steady. Crushers are using up the heavy supplies recently acquired and, meantime, are awaiting developments in the American crop situation. Sowing of linseed in the United States appears to be progressing satisfactorily, but a smaller area is expected. Meanwhile, demand for the Plate surplus is restricted, but as the unsold surplus is comparatively small, shippers are not pressing sales. So far this year, Argentina has exported in round figures a million tons of linseed and has about 650,000 tons yet to be marketed, against 900,000 tons actually shipped in the remainder of last year. The Indian new crop continues to move off very slowly, growers apparently awaiting the turn in the market which will determine how much of the 300,000 tons available for export will be offered. America's takings this year exceed 400,000 tons—all drawn from Argentina. Trade in linseed oil is slow and prices show very little change on the week and are steadily maintained around £29 10s. per ton for raw oil ex Hull for delivery to the end of the year. Cotton seed is weak. No demand is reported and prices of both seed and oil have declined further. Demand for oilcakes is only moderate, but normal for the time of year.

RUBBER.—The market has had a dull tone and prices are unchanged on the week. Selling pressure has now disappeared but, on the other hand, consumers show little disposition to enter the market. The International Committee met this week, but was occupied only with routine business. The spot price in New York on Wednesday was 20 1/2 cents per lb., compared with 20 1/2 cents per lb. a week ago and 20 1/2 cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 10 1/4d. per lb., as against 10 1/4d. on the corresponding day last week. In forward positions, business has been done at 10 1/4d. for "July" shipment, as against 10 1/4d. a week ago. Stocks in London and Liverpool at the end of last week totalled 46,835 tons, against 47,199 tons a week earlier. A year ago stocks amounted to 132,745 tons.

THE FINANCIAL NEWS

Special articles due to appear next week on the Leader Page of THE FINANCIAL NEWS are as follows:

MONDAY, MAY 31.—N.D.C.—ITS FUTILITY AND ITS PERILS. From the night of Mr Chamberlain's Budget Speech onwards *The Financial News* has spared no effort to expose the futility, injustices, anomalies and cumbersome inefficiency of the proposed N.D.C. Because we have received every indication that our efforts in this respect have been warmly appreciated by industry and finance, and because the Chancellor has made only insignificant and derisory concessions to the united demand of industry for revision, we feel that it is right and proper that at the beginning of the week which will see N.D.C. debated in Parliament, we should recapitulate the many unanswerable objections to the scheme.

TUESDAY, JUNE 1.—PROSPECTS IN THE BUILDING MATERIALS INDUSTRY. This article examines the changing nature of the Building boom and suggests what its effect may be on companies engaged in supplying the major classes of building materials.

WEDNESDAY, JUNE 2.—COMPANIES AND THEIR PROFIT-EARNING CAPACITY, No. 44.—DE BEERS. This article deserves a special note. Readers may appreciate that the series of articles under the above heading has been somewhat interrupted by Mr Neville Chamberlain. When even a Company's own accountants do not know what its earnings after N.D.C. are at present, it is likely to be in the future. It was, indeed, a somewhat bitter coincidence that the article for this series, which happened to be completed the day before the Budget, concerned of all companies—RHOKANA.

De Beers, however, being registered and controlled in South Africa, is one of the taxpayers' havens of rest.

THURSDAY AND FRIDAY, JUNE 3 AND 4.—MORE ABOUT FOREIGN BONDS. Last week the whole of the South American Bond Field was surveyed in THE FINANCIAL NEWS in a series of four articles. This week we come nearer home.

THURSDAY'S ARTICLE will examine investment opportunities amongst the bonds of the Balkan and other Central European countries.

FRIDAY'S ARTICLE will raise the question which of the German bonds (if any) are worth the bold investor's while at present prices.

For the benefit of those interested it may be mentioned that further articles in this series will follow, dealing, inter alia, with the Chinese and Japanese bonds and with the Foreign Government Bond Trust.

Decline and Fall of N.D.C.

THE resignation of one Prime Minister and the peaceful accession of another have involved quite a considerable re-shuffling of posts. Of the twenty-two offices whose holders sat in the last Cabinet, exactly half have changed hands in the past week. But of this Cabinet it can be said that the more it changes the more it is the same. The only real difference produced by last week's changes is the disappearance of the statesman whom, for a short time, we shall know as SIR STANLEY BALDWIN, K.G. How great a difference that is, it is far too early to say. But that some of the colour has gone out of British politics a glance at the list of the new Cabinet shows only too clearly. So obtrusive is this particular lacuna that even the retirement of two such experienced servants of the State as MR RAMSAY MACDONALD and MR WALTER RUNCIMAN has passed almost unnoticed. The recruits to the Cabinet are worthy of high office, but they are no replacements for losses such as these. The burden which MR NEVILLE CHAMBERLAIN has assumed is not lightened by the presence in his Cabinet of any colleagues of outstanding brilliance.

Among the specific changes of post, most attention has been directed to those at the Admiralty. SIR SAMUEL HOARE has gone to the Home Office and both his junior Ministers have been transferred. Thus an entirely new team, headed by MR DUFF COOPER, takes charge of the Navy in the middle of the re-armament programme—a circumstance which has naturally excited much comment and not a little criticism. The vacancy

at the War Office has been filled by MR HORE-BELISHA, who is to apply to recruiting the energy hitherto applied to the problem of the roads. Another appointment which has aroused hopes has been that of MR OLIVER STANLEY, son of the most prominent of the old Conservative Free Traders, as President of the Board of Trade. MR RUNCIMAN did valuable service in the earlier years of the National Government in moderating the Protectionist fervour of his colleagues. But more recently a positive inspiration has seemed to be lacking in British commercial policy, and a new President may prove readier to grasp the opportunity which circumstances now present for a decisive advance towards the reconstruction of world trade.

Next to the Premiership itself, the post of Chancellor of the Exchequer is the greatest prize which a political career can bestow. On this occasion, however, SIR JOHN SIMON has received condolences as well as congratulations, for he succeeded to the onerous task of being Parliamentary pilot for the Finance Bill, including the highly unpopular National Defence Contribution. The hostility to that tax showed itself on the first day that the new Cabinet met Parliament. In the debate on the second reading of the Finance Bill which took place on Monday and Tuesday, speakers of every party attacked the tax in the strongest terms. On Monday the new CHANCELLOR OF THE EXCHEQUER defended it with all his usual skill. But on Tuesday the storm continued and the clamour against N.D.C. received powerful support from a brilliant speech by MR WINSTON

CHURCHILL. The PRIME MINISTER was compelled to bow to the storm and his first speech in his new office was a retreat, no less precipitate for being skilfully executed. The National Defence Contribution was withdrawn in its entirety.

Beyond doubt, this was a wise decision. MR CHAMBERLAIN had previously claimed that the principle of his new tax was almost universally accepted. This was certainly true; but the accepted principle was that of a tax levied on profits—on the profits of re-armament, if possible, but in any case on profits. What little approval there was at first for the particular manner of taxing profits enshrined in the N.D.C. vanished as its details were examined. A tax on the increment of profits would, in present circumstances, inevitably suffer from the difficulty of finding a base period from which the growth of profits could be calculated. If the base period were put as far back as the years 1933-35, as was originally proposed, the incremental profits to be taxed would be those, not of re-armament, but of ordinary recovery. On the other hand, if 1936 by itself were taken as the base year, as many of the critics proposed, the corpus of profits to be taxed would be so small that the rates of tax would need to be very heavy to produce a worthwhile yield. This was the fundamental dilemma which brought N.D.C. down; for concessions sufficiently large to make it equitable would destroy its yield. As it was, the concessions made between the Budget and the Finance Bill reduced the gross yield expected for next year from the original total of £20,000,000 or £25,000,000 to £15,000,000, without fully meeting any of the main objections brought against the tax. MR CHAMBERLAIN was right in saying that the business world had shown "a certain amount of hysteria" over N.D.C. But the fact remains that the levy was most ineptly conceived for the purpose the Chancellor had in mind.

Some of the more extreme critics of N.D.C. have made no secret of their disapproval of any tax levied specifically on profits and of their preference for an increase in the standard rate of income tax. But the PRIME MINISTER undoubtedly has the country with him in refusing to be deflected from his main purpose of raising part of the emergency cost of re-armament from the profits of industry. In withdrawing N.D.C., he promised to find a "simpler tax upon the profits of industry . . . which is estimated to produce not less than £25 millions a year." In view of the short time available, it is unlikely that any of the more fancy suggestions that have been made will be adopted. The two leading can-

didates are a revival of the Corporation Profits Duty and an additional levy on Schedule "D" of the income tax. Both methods have their advantages and defects. Against the Corporation Profits Duty it can be urged that it would exempt the profits of unincorporated businesses and, since it would be levied on profits before distribution, would fall (like N.D.C.) entirely on the equity shareholder; but, on the other hand, it could be graduated, and it would be possible to vary the rate between industries, if such variation should be thought desirable. An addition to Schedule "D" would have the advantages of bringing in all profits, and of taxing the industrial debenture holder and preference shareholder as well as the equity owner; but it would also include the professions, which were to have been exempt from N.D.C.

These comparisons, however, are relevant to the discussions of the next few weeks before the new tax is produced; they will need to be very carefully elaborated before the choice is made. For the present, it is appropriate to draw the morals from the sudden demise of N.D.C. From all the morals which could be pointed two stand out. The first is the apparently growing power of Parliamentary and public criticism over even a strong Executive. This is the third time in little more than two years that a Government with a large majority has been compelled to retract a major element of its policy—and the retraction this time concerned the Budget, which has long been regarded as the peculiar prerogative of the Executive. In the constant flux of British constitutional practice, the House of Commons is clearly retaining its authority.

The second moral concerns the circumstances in which a tax, which proved so disastrously subject to criticism, could have found its way into the Budget. The "leakage" of last year unfortunately increased the tendency towards maintaining the utmost secrecy for the Budget, just in that year when discreet preliminary consultation was most needed. As the precedents cited by MR CHURCHILL show, Budget secrecy has not in the past prevented the most searching preparatory examination by Cabinet committees of novel proposals. Had N.D.C. been given such an examination, it is doubtful whether it would ever have seen the light of day. There has been a tendency in recent years for the Treasury to assume, within the circle of the Government service, an undue measure of power buttressed by secrecy. The fate of N.D.C. may prove to be a salutary check to a process which, if continued, might lead to a dangerous degree of bureaucratic irresponsibility.

Bombs on a Battleship

THE explosion of the four bombs which Spanish Government aeroplanes dropped on the German battleship "Deutschland" last Saturday afternoon has caused rapid and widespread reverberations. A European crisis has arisen which might only too easily, in the high tension of European politics, have started a war. Happily, such a disastrous outcome has been averted; but we have received one more warning of the perilously delicate adjustment by which the peace is being maintained.

This latest incident illustrates in a startling manner the consequences of the division of ideological sympathies among the Great Powers in Europe, and the unprecedented international conduct to which that division has given rise. The two Fascist dictatorships, Germany and Italy, have recognised GENERAL FRANCO's forces as the Government of Spain, but have recognised neither the constitutional Spanish Government nor the insurgents

as belligerents; for to do this would have conferred on the Spanish Government advantageous rights under international law, while detracting from the status of the insurgents. On the other hand, the democratic Great Powers, France and Britain, together with Russia and all other States (save only Portugal) on the London Non-intervention Committee, have continued to recognise the Spanish Government, while withholding all recognition of the insurgents as belligerents.

By itself, such a division of sympathies, aggravated by material aid to both sides in Spain, would have been grave enough. The situation, however, has been made more enigmatic and more serious by the unprecedented introduction of the concept of "non-intervention" into established international law and behaviour.

Ordinarily—that is, without that concept—there would merely have been a conflict of laws over the Spanish conflict. Germany and Italy, perhaps also Portugal,

would, under their own law, have been warranted in aiding GENERAL FRANCO, whom they designate the Government of Spain, to suppress other Spaniards whom they designate as rebels. The other Powers, the great majority, would not only have been warranted in aiding the Government they recognise to suppress GENERAL FRANCO's forces, but—in default of the new concept of non-intervention—might have been expected, by established international law and custom, to carry aid to a friendly Government if so requested.

Instead, the London Non-intervention Committee took to its bosom the representatives of both groups of States, and, after months of palaver in which neither group correctly observed international law and custom, the new doctrine of non-intervention was inaugurated and supervised by a *cordon sanitaire* round the land and sea frontiers of Spain. Accordingly, both groups of European States have retained their conflicting sympathies and rights, while at the same time they are officially preventing each other from lending any more material aid to the Spanish contestants. From such an unprecedented diplomatic situation, anomalies were bound to arise. If we may assume that non-intervention was desirable, even from the standpoints of both contestants, it would have been reasonable of the non-interventionist Powers to ask for the use of ports for their patrolling warships, as well as for safety zones. The British Government asked GENERAL FRANCO—though they refused to recognise him as any more than a rebel—to guarantee a safety zone at Barcelona. After passing an Act to prevent British ships from carrying prohibited goods for the Spanish antagonists, they were compelled, by British public opinion as well as by the exigencies of the rights they continued to claim, to convoy British ships proceeding to Bilbao with cargoes *not* prohibited by the Non-intervention agreement. The Italians lost a number of naval officers in the Balears, before supervision of non-intervention was set up, in an aerial bombardment of rebel strongholds by the Spanish Government's aircraft. The British lost eight members of the Navy in an explosion, officially said to have been caused by a floating mine, on H.M.S. "Hunter" a few weeks ago. A French commercial air line a fortnight ago had one of its machines, carrying passengers, shot down by German fighters in the service of GENERAL FRANCO. And both the Spanish Government and impartial foreign observers have long reported the suspicious movements of German and Italian warships along the Mediterranean coasts of Spain, especially while the insurgents were pushing along that coast to capture Malaga.

It was to be expected that German and Italian warships, though they might have refuelled or watered at Barcelona, Marseilles, Valencia, or Gibraltar, would prefer to do so at some port in the hands of GENERAL FRANCO's supporters. Italian and German warships had made the Balears their base almost from the outset of the rising in Spain. From this circumstance arose the risk that their warships might be hit in an aerial or naval attack on insurgent strongholds by the Spanish Government's forces. They had, as was pointed out above, a certain licence to be there. But, in the anomalous circumstances evoked by non-intervention, which partly overrode the sovereign rights of third parties *de facto* without overriding them *de jure* some things which were lawful were most inexpedient. And the presence of foreign warships in the Balears, known to be a base for operations against Barcelona and Valencia, was one of these things. For it was an embarrassment to the Government side in Spain, hampering their freedom of action.

The Spanish Government aeroplanes naturally did not desist from their operations in the Balears; and the self-styled "Chief of the German Forces in Spanish Waters" was technically in the wrong when he warned the Spanish Government last Saturday morning that

their aircraft would be fired upon if they flew over his ships. In whatever formation they elected to fly, they had the right to do so as long as they did not attack his craft. It would have been wiser if Germany had followed the British example and demanded a guaranteed zone of immunity *before* threatening warlike measures. What actually happened at Iviza last Saturday afternoon is still not established. The Germans say the "Deutschland" was wantonly bombed, hit by four bombs out of twelve, which killed twenty-six men and wounded seventy-three. The Spanish Government reiterate their earlier reply to the German Admiral's threat, saying that the German warship, though engaged on patrol work, was at an insurgents' base in waters which French warships had the duty to patrol. As we observed above, the "Deutschland" had a kind of tacit concession to put in for water or fuel at any port, either in insurgent or Government hands; but it would have been wiser for German, and Italian, warships to go to Gibraltar, Marseilles, or even Valencia or Barcelona, than to lie up in rebel strongholds. In any case, the damage done to the Germans called for compensation. It did not call for the sanguinary reprisal of last Monday, when six German warships shelled the town of Almeria, killing many Spanish civilians who were in no way concerned with the bombing last Saturday. Though Germany has declared herself satisfied with this dose of blood-letting, and though the shelling of Almeria is better than a European war, no civilised person can applaud a diplomacy which reverts to the *lex talionis* as a model of conduct.

Germany has done more than this; and Italy has seconded her. On Monday afternoon both Powers retired from the London Non-Intervention Committee and from the supervision system, while Portugal supported their demands for effective guarantees from the Committee that such events will not recur. While their retirement leaves Spanish Government coasts open for supplies, the possibility remains that their warships may be used for less pacific purposes than guaranteeing non-intervention. German warships have been instructed to fire on Spanish Government aircraft or warships immediately at their "onset" on German vessels. In such grave circumstances, the news that the British and French Governments are securing from Valencia guarantees against any repetition of the affray last Saturday, and that both Germany and Italy wish to return to the London Committee and the supervision scheme, is doubly welcome. At the same time, however, it should be made clear that vessels engaged on patrol duties must not afford, directly or indirectly, a cloak for warlike operations by either side in Spain, and *a fortiori* that they must not lend either side assistance.

The lesson to be learned from this crisis is that the doctrine and agreed practice of "non-intervention" by the European Powers—themselves divided into two powerful groups whose positions in international law are anomalously at variance—is only an experimental makeshift. It is even dangerous. It would appear more advantageous to extend the scope of non-intervention itself from the passive to the active mood. Both combatants, together with their backers, are tiring of an indecisive campaign which bids fair to become a guerilla of attrition ending in dust and ashes for victor and vanquished alike. Prestige, not profit or power, is now alone at stake. If the British initiative for an agreed truce, now being discussed in Paris, Rome, Moscow and Berlin, is urged energetically enough, it should not be impossible to save both sides in Spain from their friends, and the friends from the consequences of their own preoccupation with prestige. Intervention of that kind would be a fine thing, worth many non-intervention agreements. Their object is to keep the ring. The object of pacific intervention would be to stop the fight.

Who Owns Britain's Capital?

IN these progressive days it is frequently remarked that Great Britain is becoming a nation of small capitalists, in which inequality in the distribution of wealth is being rapidly reduced. High taxation is making the rich poorer, and the steady improvement of wages and salaries is making the poor richer. The scale of wealth is higher than before the War; and more people own property than ever.

Up to a point, available facts and figures support these optimistic generalisations. There has been, for example, a remarkable increase in the deposits of savings banks and building societies. It has been recently estimated* that 5 million people in England and Wales possess more than one hundred pounds each—or double the number over the hundred pound limit in 1913. The total includes small property holders who own the houses they live in or have savings in gilt-edged or other fixed-interest securities. It would be a mistake, however, to press the conclusion too far. Five million people, with or without dependants, are decidedly a minority of the total population, and £100 is not a very large sum. The number of people with over £1,000 is less than 1½ millions; and no more than 400,000 have over £5,000-worth of property.

Moreover, although there are now more people with capital than there used to be, the reduction of the inequality in its distribution has been going on very much more slowly than is commonly supposed. Inequality is less, but not notably less than before the War. PROFESSOR DANIELS and MR CAMPION have collected the latest available figures. They show that, to-day, of the persons over twenty-five years of age in England and Wales, 1 per cent. own 60 per cent. of the country's capital; whereas in 1913, 1 per cent. owned 70 per cent. of the capital. Five per cent. of all persons now over twenty-five own 80 per cent. of the total capital. In 1913, 5 per cent. of the population owned between 85 and 90 per cent. of the capital. There has been a change, but not a marked change, and the upshot is that the personal distribution of capital in this country is still very unequal.

No measurement of this kind can, of course, be wholly satisfactory. The authorities do not take a census of the number of persons possessing capital or of the amount of capital they possess. The authors whose conclusions we have cited derived their estimates from an examination of the value of estates assessed for estate duties. Nevertheless, the broad fact of persistent inequality in the distribution of capital is indisputable. Moreover, the common argument that high rates of direct taxation on large incomes and on estates passing at death exert a strong influence towards the diffusion of wealth must be accepted with caution. The scale of estate duties has been raised from a graduation between 1 per cent. and 15 per cent. to a graduation of 1 per cent. to 50 per cent. (on estates of more than £2,000,000). This change has certainly struck a powerful blow at large estates. During the last few years the Chancellor of the Exchequer has collected more than £80 millions each year from this source; and in 1936-37 estate duties realised £87,990,000. High taxation does tend in this way to redistribute existing capital; and the apparently slow reduction of inequality which we have noticed may be due in part to the fact that the fortunes made during the War are only gradually becoming liable to death duties. On the other hand, the present high rates of taxation have encouraged skilful evasions

of liability. Gifts *inter vivos*, changes of legal residence, and the formation of trust companies have lessened the effect of higher taxation in the diffusion of capital. Such devices increasingly tax the ingenuity of successive Chancellors of the Exchequer.

Popular belief and political platitude, in fact, have exaggerated the pace of the process whereby capital becomes more evenly distributed among the whole population. The broad features of the distribution of British capital remain very much as they were nearly a quarter of a century ago, in spite of high taxation, the multiplication of house ownership, and increased deposits in savings banks and building societies.

One change, however, has taken place which may alter somewhat the meaning of the figures compared with those of a generation ago. It used to be said that a family progressed "from clogs to clogs in three generations." Undoubtedly, there was in the past a considerable movement, not only from the lower to the higher capital groups, but also back again. The personnel of the various capital-owning groups was constantly changing. Nowadays it is appreciably less fluid. The growth of joint stock companies and of other facilities for investment during the last fifty years has enabled owners of capital to invest with a higher safety margin, without themselves engaging directly in business. The estate duty figures show that most people with more than £100,000 have their capital mainly invested in stocks and shares and real property. Those with less than £1,000 invest in house-property or in gilt-edged securities, while building societies and savings banks attract the bulk of small savings. More people own Government securities than own land; and those with less than £1,000 hold a relatively large share of their capital in the form of insurance policies. The recent building boom has considerably extended the already widespread ownership of houses.

The position has probably been altered also by lower rates of interest since 1932. But SIR JOSIAH STAMP's recent paper on "The Influence of the Price Level on the Higher Incomes" suggests that any change in distribution which may have taken place during the latest period can hardly have been considerable.

We cannot therefore speak with any certainty about the redistribution of wealth. The common belief that the tendency of modern civilisation and government is to produce an increasingly equalitarian society by a rising standard of life and high rates of taxation may be soundly based, but available data do not suggest that the movement has gone very far as yet. It may, however, be reasonably maintained that the figures, as they stand, give too narrow an impression of the progress actually achieved in ameliorating the position of the least wealthy citizens of this country. The post-war increase in public property and the wider provision of social services have enabled large numbers of people to enjoy many benefits which, in earlier times, were the prerogative of capital owners alone. Thus pensions for old age, for widows and for orphans—to cite but a few of the many apt examples—have provided a measure of social security and spread the benefits of property over a much wider field than its separate ownership. A life annuity equal to an old age pension of 10s. a week from the age of 65 would cost between £250 and £350 if it were purchased by an individual at that age from an insurance company. It is by such means that a more equal distribution of wealth has been achieved since the war, and the more honour is due to those who, in the face of determined and vocal opposition, laid the foundation of our social insurance system in pre-war days.

Dundee's Jute Trade

THE jute trade of Dundee is not least among the many Scottish industries which rose to fame during the nineteenth century by their initiative and enterprise. Jute had long been the basis of a small native industry in Eastern Bengal, where it was made into cordage and cloth for the manufacture of gunny bags. Elsewhere, sacks and packing canvas were made chiefly from hemp and flax until about a hundred years ago. Then, as the story goes, a consignment of jute from India found its way to Dundee and was acquired by an enterprising flax spinner, who discovered means of spinning the fibre into heavy yarn. Actually, the foundation of the industry dates from 1832, when practical experiments with jute were carried out at the Chapelshade Works in Dundee. Some years elapsed, however, before manufacturing was perfected and the possibilities of the new textile fibre gained general recognition.

The rapid growth of the Dundee jute trade began almost precisely a hundred years ago, when the Dutch Government was persuaded to substitute jute for flax yarns in the manufacture of coffee bags. It was stimulated, on the one hand, by the expansion of international trade and the consequent increase in requirements of sacks and packing materials, and on the other by a plentiful supply of raw material at prices below those of competing fibres. The establishment of the industry in Dundee, however, was largely accidental, and was due, first, to the existence of a highly developed textile trade there, and, secondly, to the fact that the only important source of raw jute happened to be India—an industrially backward British territory. The course of the Dundee jute trade during the past hundred years was shaped by these three factors, whose combined influence is revealed in the following table:—

WORLD CONSUMPTION OF JUTE *
(In thousands of tons)

Year	United Kingdom	India		Continental Europe	United States and other Countries	Total Jute Crop
		Mills	Native Industry			
1874	179	82	89	54	54	457
1884	214	161	89	116	89	670
1894	214	268	89	196	89	857
1904	214	518	89	321	89	1,232
1914	231	893	89	466	107	1,787
1924	158	894	100	393	128	1,673
1929-30 ...	168	1,076	100	500	134	1,978

* Estimated by A. Wigglesworth.

India's annual jute crop increased more than fourfold during the period shown in the table. Over one million ryots are engaged in its cultivation.

During the hundred years of its existence the jute trade of Dundee has passed through two complete and distinct phases, and has recently entered a third. Scotland, first in the field, maintained her lead for many years. Indeed, Dundee had for many years almost a monopoly of jute manufacture. After about 1850, however, jute mills began to be established in other industrial countries, as well as in India itself. The growth of manufacture outside this country was facilitated by the expanding demand for jute goods and by the comparatively simple technique of production. As practically all raw jute came from India, it was natural that attempts should be made to establish a manufacturing centre there. In 1855, one George Acland introduced jute spinning machinery to the Hooghly. But progress was slow at first, and only four mills run by power had been established in the Calcutta district by 1872. According to the statistics of consumption, Dundee was still by far the most important centre of jute manufacture in 1874, though its aggregate consumption was already equalled by the aggregate of other countries. Between 1874 and the Great War, however, the manufacture of jute goods

outside Scotland grew much more rapidly than in Dundee itself. The quantity of raw jute consumed by mills in India increased more than tenfold during this period, against an increase of only about 30 per cent. in Dundee. During this second phase, consequently, the relative importance of Dundee declined, and Britain's share of world jute consumption fell from 39 per cent. in 1874 to 13 per cent. in 1914. In 1894 consumption of raw jute by Indian mills was already bigger than in Dundee, and by the close of the century Calcutta had established a dominating position in the industry.

The third phase began after the Great War, when a further expansion of world demand for jute goods was accompanied by an absolute, and not merely a relative, decline in the output of the Scottish jute trade. British consumption of raw jute fell from 231,000 tons in 1914 to 168,000 tons in 1929-30, and Britain's share of world consumption from 13 per cent. to 8½ per cent.

The Dundee jute manufacturers made valiant efforts to stem the tide. Approximately one-third of the capacity of the industry was absorbed into a great public combine, Jute Industries, Ltd., which has striven hard to meet growing competition from India by exploiting new uses for jute and increasing its technical efficiency by the installation of the latest machinery. The company, however, has been unable to pay dividends on its ordinary shares or even to maintain the regular service of its preference capital. During the depression, when the world demand for jute goods declined sharply with the shrinkage of international trade, the difficulties of the Dundee jute trade were seriously aggravated. British imports of raw jute fell from 202,000 tons in 1929 to 129,000 tons in 1932. Since then, recovery of world trade and the development of new uses for jute have brought some improvement, but last year's imports of 166,000 tons of raw jute remained below those of the years before the depression. The shrinkage of the industry during the past ten years is reflected also in the decline of the number of insured workers, from 41,600 in July, 1926, to 30,500 in 1936, of whom 21.7 per cent. were unemployed in April, 1937.

Immediate prospects in Dundee are now fairly encouraging, for production and exports are again on the up-grade. But the scope of expansion is severely limited by competition from India, whose products are not only displacing British goods on the world markets but even in Dundee's own territory. British imports of jute piece-goods from India rose from 61 million square yards in 1934 to 141 millions in 1936, and imports of empty sacks and bags from 671,000 cwts. to 999,000 cwts. The tendency has continued this year; for imports of Indian piece-goods during the first four months of 1937 totalled 63 million square yards, against 47 millions a year ago, and purchases of empty sacks and bags rose from 308,000 cwts. to 387,000 cwts. Our current imports of Indian jute goods exceed even our own exports. British shipments of piece-goods between January and April, 1937, were 49 million square yards, against 39 millions in 1936; and exports of empty sacks and bags were 362,000 cwts., against 247,000 cwts. a year ago.

The Dundee jute trade, therefore, will celebrate its centenary with small cause for jubilation. In 1838 the industry was at the beginning of a period of rapid expansion, as a result of which it dominated the world's trade in jute goods for many years. To-day, circumstances beyond its control have affected the position of Dundee manufacturers in international markets, increased their difficulty in maintaining their share of home demand, and compelled them to apply for protection against Indian manufactures. This by itself will do nothing to improve the prospects of an expansion in the industry. The key to the position is in India rather than in Scotland; and the future depends on forces which no one country can control.

Blue Books for All

FREEDOM to buy Blue Books would probably altogether escape the count in any popular evaluation of British liberties. Though Government publications afford indispensable raw material for statesmen, administrators, industrialists, traders, sociologists and economists, they fall into the category of blessings which most men are content to take for granted. Yet the undisputed access of every free-born Briton to a copy of the report of the Select Committee on Fat Stock Prices has existed, as a right, for less than a century; and among the many centenaries now being celebrated, not the least significant, for all who value knowledge of public affairs, is that of the initiation of the case of *Stockdale v. Hansard*. In this action was involved, in the words of the then Attorney-General, the question "whether the representatives of the people may with impunity communicate to their constituents the information which they deem essential to the public welfare."

On May 18, 1837, John Joseph Stockdale issued a summons against the firm of Hansard, then printers to the House of Commons, for publishing a reference, in an official report of the Inspectors of Prisons, to "one of Stockdale's obscene books." Although in 1835 a Resolution of the House of Commons had ordered that Parliamentary papers and reports "should be rendered accessible to the public, at the lowest price at which they can be purchased," Stockdale won his case. It was necessary to pass an Act of Parliament in 1840 before the practice of selling Parliamentary papers was legally established, and an end was finally put to a system under which the ordinary citizen's only opportunity to obtain a copy of a Parliamentary paper was by the influence of an M.P. or through the chance that the porters or doorkeepers in the House of Commons might have some perquisite copies to sell. Readers had even longer to wait for official reports of Parliamentary debates, as distinct from Parliamentary papers. Although the Government began to subsidise Hansard in 1855, and to make more formal arrangements for a report in 1888, there was no verbatim official report until 1909.

For many years after *Stockdale v. Hansard*, readers of Blue Books secured advantages which in some ways exceed those of their present-day descendants. Government papers were not only made available, but were sold very cheaply because the original resolution of the House was interpreted to mean that no part of the cost of setting up the type should be included in the selling price. After the middle of the nineteenth century paper prices fell, and with the turn of the century mechanical composition added still further to the technical efficiency and cheapness of printing. Thus, the prices of Blue Books were successively reduced, and even the payment of these low prices was not always and rigorously insisted on. The free distribution of official literature in this country has never grown to the dimensions which it reached very early in the administrative history of the United States; but British Government publications were made available free of charge to many interested inquirers until the axe fell in 1921.

From that year onwards part of the cost of setting up the type has been included in the price charged to the public for the finished article. The sale of most official reports is small in relation to the size of circulation necessary to ensure low unit selling prices, and the new arrangements consequently have made Government publications appreciably more expensive. Some of the asperity which the decision evoked has since been mitigated, partly by the passage of time, but mainly by the introduction of new pricing scales. These relate the cost of each publication directly to the amount of printed matter it contains, instead of the probable unit cost if an estimated number is sold. And even if prices are higher than in pre-war days, it is probably true that at no time has the price of official publications been as high

as the average price of any comparable works published commercially. For one thing, royalty payments and authors' fees do not enter into the economics of State publishing. Another factor which reduces costs is the use for State publications of the paper or manilla covers which are characteristic of Continental publishing but are rarely used by private publishers in this country.

In the decade ended March 31, 1935, the public expended some £1,369,000 on Government publications. The amounts for separate years are shown below:—

SALES OF GOVERNMENT PUBLICATIONS			
Years ended March 31st			
1926.....	£ 139,418	1931.....	£ 150,830
1927.....	132,470	1932.....	134,664
1928.....	133,200	1933.....	129,190
1929.....	133,700	1934.....	142,965
1930.....	137,343	1935.....	135,378

Some of this revenue is of a monopoly nature, e.g. the proceeds of the sale of Customs and Excise forms, factory and mines forms and the like, which are prescribed by statutory authority. Much of it represents sales of essential material to local authorities and other professional bodies. The figures suggest, nevertheless, that the State may claim a high place among publishers of best sellers.

What has been the influence of this new source of information and opinion on the public mind? That influence is not confined to those who buy and study Blue Books and White Papers; thousands more learn something of the contents of all the more important publications, indirectly through the Press, and through the leaders of thought and action over wide ranges of public life. A student of almost any branch of the social sciences ignores Government publications at his peril. So wide is the range of Government activity to-day that there are few contemporary problems of any magnitude or importance which have not received some consideration in the literature of State.

A vast quarry of facts and figures is available in the reports on the decennial census and in the annual reviews by the Registrars General of Births, Deaths and Marriages. For what figures we have of national production and employment we are mainly indebted to Government publications. In certain industries regulated by Statute (Mines, Gas, Electricity) the information is given in even greater detail. Industrial organisation and labour conditions are illuminated by many official returns. External trade and commerce has for many years been weighed, measured and valued. Hopes of parallel knowledge of internal trade, however, remain unsatisfied. Transport, which, in the American phrase, is "affected with the public interest," has been subject to special regulation, and the result is a steady flow of Government reports and statistical returns upon most of its phases.

The phenomenal development of the social services has provided a new source of official material. Problems of Poverty, Public Health, Incapacity, Education and Unemployment have all a large official literature of their own and many sub-sections and allied subjects which may be grouped with them. Betting and alcoholism are outstanding examples of old problems; the noise nuisance of the new. The traditional functions of State:—Law and Order, Police and Justice, Public Administration and Public Finance, Imperial and Foreign Affairs have an even lengthier official bibliography, and were among the earliest topics on which Government reports were issued.

Much water has, indeed, flowed under the bridges since *Stockdale v. Hansard*, but the general conclusion suggested by the Parliamentary outcome of that case remains valid. Along many lines of thought, Government publications have contributed to the enrichment of practical experience. The decision reached approximately a hundred years ago deserves to rank as an intellectual and social Magna Charta.

Notes of the Week

The Duke and Duchess of Windsor.—On Thursday the ex-King Edward VIII, now Duke of Windsor, was married at Monts in France to Mrs Wallis Warfield, formerly Mrs Simpson. This ceremony, the sequel to the ex-king's abdication last November, was performed according to the civil French law by the Mayor of Monts; but it also received a certain religious sanction in the form of the marriage service of the Church of England, voluntarily performed by the Rev. R. Anderson Jardine, Vicar of St. Paul's, Darlington. Both the Bishop of Durham, in whose diocese the Vicar alone has power to officiate (apart from special permission of the bishops of other localities), and the Bishop of Fulham, in whose diocese the Anglican Church of France falls, have announced that they have not given—indeed, would not give—permission to the Rev. Anderson Jardine so to officiate. He therefore conducted the service as an individual cleric, without the sanction of the Anglican Church.

The great majority of the British people will be glad that this unique episode in history is thus closed by the marriage of the Duke of Windsor. They will wish the Duke good luck in the life of a private citizen which he has chosen for himself, and will most sincerely hope that he and his wife will find happiness and peace. These good wishes are in no way a derogation from the sentiments which they feel towards the new King and Queen, nor is there any reason to suppose that the Duke and his bride will ever be a rival to them in public esteem. Some quarters may regret that the ecclesiastical authorities should have thought fit to attempt to deny to the Duke and Duchess the benefit of any religious ceremonial at their wedding. This is a matter which the Church leaders must be left to decide for themselves. We can only say that the action which may have the appearance of pursuing a vendetta to the bitter end can only have the effect of creating that cleavage in opinion which the path of wisdom seeks to avoid.

The Imperial Conference.—Hopes of vigorous and decisive results from the Imperial Conference have latterly receded. Apart from Mr Lyons' proposal for a Pacific pact of non-aggression, the Conference has not, apparently, applied itself to seek an agreement on anything precise in the field of foreign policy. The new crisis over Spain, of which the overseas delegates sought more than one full analysis from Mr Eden, has inevitably prolonged the merely expository phase of the debate. Despite rumours to the contrary, which attributed to Mr Eden and Mr Mackenzie King a subtle conspiracy to wean other Commonwealth Governments from support for a sanctions-armed League, the Conference seems not yet to have considered separately and explicitly the problem of general collective security and League reform. The regional approach to problems of foreign policy has been tacitly accepted by everyone. In both the economic and constitutional parts of its agenda, the work of the Conference appears to be hanging fire. The technicalities of the nationality problem, among others, are probably causing some difficulty. And the economic discussions, which have crystallised round the problem of an Anglo-American trade pact, have exposed certain conflicts of interest which can be overcome only by a vigorous determination to gain an objective of principle. Whether such a determination will inspire the remaining ten days' work of the Conference is an unanswered question on which a great deal turns for the future of world peace and prosperity.

Two notable reminders, recalling the Conference to a sense of the importance of the decisions involved, were issued in *The Times* on Thursday. The first was a special article by Sir George Schuster on the auspicious attitude of Americans to an Anglo-American Trade Agreement. He emphasised the unique and urgent nature of the opportunity thus afforded to this country, the British Commonwealth, and the world; warned his readers that time was of the essence of the contract, if ever a contract was to be made; and went on to note the consonance of many factors—e.g., the upward movement of prices, over-supply of gold, etc., on which we comment on page 572—making agreement between the United States and Britain imperative. The second reminder came in a leading article in *The Times* on the same day. There is no doubt that if the United Kingdom and other British Governments do not forthwith seize the opportunities held out to them by the democratic and sympathetic Governments of the United States, France, Belgium, Holland, and the Scandinavian Powers, they will be doing both themselves and the world a possibly irreparable economic injury, which will assuredly have dire political consequences.

Coal Agreement.—The coal strike threatened for May 29th was averted by the negotiation of an agreement between the employers and the leaders of the rival Nottinghamshire unions, which was ratified over a week ago by a delegate conference of the Mineworkers' Federation and is unlikely to be rejected by the rank and file of the Industrial Union. The new union under the agreement will amalgamate the Industrial Union and the Nottinghamshire Miners' Association, which is affiliated to the Federation. It will be called the Nottinghamshire and District Miners' Federated Union, and its permanent officers will be divided between the amalgamated bodies: Mr Spencer (president) and Mr Cooper (treasurer) from the Industrial Union will be balanced by Mr Coleman (secretary) from the Association; for five years Mr Spencer will represent the new union on the Federation executive, and from that time onwards the representative will be elected. There will be equal representation on district committees and in district appointments. The outstanding problem of re-engagement at Harworth Colliery has been met by the undertaking of Mr Spencer and the owners that the Association men who have been on strike shall be offered employment whenever possible. Honour has been satisfied. The "Spencer" unionists in Nottinghamshire have not been coerced. The majority in the country have successfully supported the principles of independent

SKANDINAVISKA
KREDITAKTIEBOLAGET

unionism and miners' solidarity. It will remain a mystery why this sensible solution was not agreed upon weeks ago. It differs very little from the agreement which the delegate conference of the Federation torpedoed two months ago. With the strike prevented and improved wage agreements peaceably negotiated in Wales and Durham, prospects seem, for the present, set fair. It is unfortunate, therefore, that the Government has seen fit to postpone its legislation for the projected unification of coal royalties. Parliamentary time is precious; and a preliminary Bill dealing with separate ownership, associated rights and working leases, is to be introduced this session. But postponement has too long been the only consistent mark of official policy.

* * *

Railway Wages.—The claims of the three railway unions for improved wages and conditions have been rejected by representatives of the main-line companies. Although no official statement has been made of the cost to the companies involved by the claims, it has been estimated at over £15 millions annually. The next step will be to bring the claims before the Railway Staff National Council which represents equally employers and men. Meanwhile, a mass meeting of railwaymen at Edinburgh has voted in favour of strike action should the claims be finally refused. Actually, the issue is complicated because the claims which have been rejected were composite, and varied from union to union. All three unions are asking for the restoration of the outstanding quarter of the cut made in wages in 1931. In January the Railway Staff National Tribunal suggested that this concession might be possible in August and laid down logically that "if the present improvement continues, railway employees should obtain a share in the improvement." Since then the railways have applied to the Rates Tribunal for authority to increase fares and charges by approximately 5 per cent., which we have estimated (see *The Economist*, May 22, page 446) would increase their receipts by about £8 millions per annum. The other claims for the restoration of the 1931 overtime, night, and Sunday rates, for holidays with pay, for a minimum wage, and for reduced hours, which are variously made by the three unions, are symptomatic of the determination of organised labour to take prosperity at the flood. A similar programme was adumbrated at the annual meeting of the National Committee of the Amalgamated Engineering Union when the demands of the re-armament programme upon engineering labour were discussed; and the refusal of the Engineering Employers' Federation to grant the aircraft workers' claim for an increase of 2d. an hour was reported. Strike action was, however, deprecated and here, as among the railway and transport workers, there is an official determination to press their claims in a peaceable way. The urgent task before employers and union leaders on the railways and in the engineering industry is to contrive an equitable relation between revenue and wages, in view of rising costs of production and the increased cost of living.

* * *

The Government's Agricultural Policy.—Mr W. S. Morrison took six months, after his appointment as Minister of Agriculture, to think out the main lines of post-Elliot agricultural policy. The result, as revealed in the long statement issued on Thursday of last week, and briefly mentioned in last week's *Economist*, has received no more than a tepid welcome from the agrarian interests. They were hoping for more, and since the statement expressly reserved the milk and pig industries for further consideration, they may obtain more. Last week's statement, in fact, dealt with little but grassland and cereals. There was a strong undertone throughout the statement of preparation for war. But the broad question of how such preparedness could best be achieved was not argued; and, in any case, the Government have, fortunately, resisted the temptation to put British agriculture entirely on a war basis in peace time. The most novel feature of the new policy is the provision to

be made for increasing the fertility of grassland. The prices of lime and basic slag are to be reduced, by subsidy, by 50 per cent. and 25 per cent. respectively; an Exchequer grant of £450,000 per annum is to be allocated for land drainage; and experiments are to be conducted in the potentialities of grass drying. These measures would have considerable value in wartime, but they are also worth while in peace. If a case can be made out for further subsidies to an industry already generously treated, this is undoubtedly the best method of dispensing the money, since it will go towards an increase of productivity, and not merely line the pockets of individuals. The same comment can be made of the supplementary measures for assisting the eradication of animal diseases.

* * *

The wisdom of the second part of the new policy—the encouragement of cereal growing—is more questionable. In peacetime, there are many forms of agriculture which would better repay nurture than the cultivation of cereals, for which other parts of the world have decided differential advantages. Even as a defence precaution, it is doubtful whether larger production at home is preferable to a scheme of storage of imported corn. The Government, however, have decided to encourage a substantial increase in domestic production. The quantity of wheat on which the guaranteed price will be paid is to be increased by one-third from 27,000,000 cwt. to 36,000,000 cwt., at a correspondingly increased (though concealed) cost to the consumer who pays the Wheat Levy. Oats and barley are to benefit from a similar scheme should the prices for these crops fall below the present levels. Standard prices will be guaranteed, being distributed on an acreage rather than a production basis. The new scheme has the advantage, compared with the wheat scheme, that the necessary funds are to be raised out of the Budget and not by a special levy. The cost is not to exceed £1 per acre or £1,750,000 per annum in all, and this sum ought, in justice, to be debited to re-armament rather than to agricultural policy, since its merits are strategic rather than economic. The Ministry of Agriculture are apparently profiting by the many criticisms of their earlier schemes. If the principle of encouraging cereal production be once admitted, the methods now adopted achieve the purpose with the minimum of disturbance or inequity. Unfortunately, the representatives of the farmer show no signs of having learned that, in a country where agriculture occupies less than a tenth of the population, the only lasting touchstone of agricultural policy can be the interest of the whole community. In milk, and some other sections of the industry, the farmers are still attempting to assert a right to constitute themselves unbridled monopolies, with complete power of control over prices and production.

* * *

Empire Press Conference.—The annual Conference of the Empire Press Union last week produced addresses and debates of wide public interest. The main theme of the Conference was technical advance—modern methods in editorship, news and picture transmission, typography, advertising—but the background against which these specialised topics were discussed was summed up in the question, posed by Mr J. A. Spender in the course of his address on the status of journalism and the journalist, whether the enormous increase in mechanical efficiency had been accompanied by a corresponding advance in moral and mental equipment. That many members of the public think not was suggested by a remark in another Conference paper. "I do not remember feeling so strongly as I do to-day," declared Mr Tom Clarke, "that I belong to an unpopular profession." The danger of this, as Mr Spender showed, is not merely that the journalist may find his prestige debased and his work handicapped, but that a handle is given to those who would like to curtail the freedom of the press. Conversely it is that freedom that gives the journalist his responsibility and the status that derives from it. Sir John Reith, in an address on the

relations between broadcasting and the press, suggested that in these essentials the interests of the B.B.C. were identical with those of the newspapers. Both were jealous of their freedom, but freedom must be conditioned by responsibility. In this, he believed, broadcasting was an ally of the press, because it was the enemy of irresponsibility, unscrupulousness, and the suppression of news. In the defence of freedom, internecine jealousy is as dangerous as the assaults of hostile forces; and one of the most satisfactory features of the Conference was the fresh evidence it afforded of the good relations that subsist between broadcasting authorities and the press of the Empire.

* * *

M. van Zeeland Wins Again.—To please the Flemish Nationalist Party, who with the Catholics and Socialists are the third pillar of M. van Zeeland's Government, the Belgian Prime Minister introduced a motion into the Chamber at the end of last year proposing an amnesty for the 300 Belgians, mainly Flemings, who, because they worked under the German occupation during the war for an independent Flemish Belgium, were afterwards convicted of high treason and deprived of civil rights. Against this liberal proposal by a Catholic, Liberal, and Flemish Prime Minister, the Liberals and Walloon Catholics reacted violently, threatening to drive out the Government they constituted. The motion was shelved until M. van Zeeland's striking successes over the Defence Bill, the defeat of the Rexists led by M. Degrelle, the notable improvement in Belgium's economy, and the Anglo-French guarantee of Belgium's new international status emboldened him to try again. His warranty was simple. Belgian unity had made great successes possible during the last three years. Why not begin to remove the remaining obstacles between the two nations within the nation: Walloons and Flemings? Yet, strangely enough, the Walloons of both Catholic and Liberal persuasion, together with Flemings who were Catholics and Liberals, showed more opposition to M. van Zeeland in Wednesday's debate than if he had been introducing a Communist Constitution. Finally, with sixteen abstentions, the Amnesty Bill was passed by ninety-five votes to seventy-five. With one more laurel on his brow, the Belgian Prime Minister can leave for Washington next week to pursue his discussions with President Roosevelt on the first steps to freer trade and economic appeasement.

* * *

The Oslo Powers Agree.—On Friday of last week the Oslo Powers—Norway, Denmark, Sweden, Finland, Belgium-Luxemburg and Holland—signed a Trade Convention after their latest meeting at The Hague. It was stated that the seven Governments are agreed on the necessity to secure freer trading by reducing tariffs and abolishing crisis measures. Holland and Belgium-Luxemburg have agreed to admit goods from all the other Oslo Powers without any hindrance save that of a tariff, i.e. no quotas will apply, and if import permits are required for certain goods, they will be accorded. These two important States have also agreed to impose no new barriers on the mutual trade of the Oslo States. Denmark, Norway, the Dutch East Indies, Sweden and Finland have agreed not to raise tariffs or introduce new restrictions against the trade of the group; and express provision has been made for joint consultation before any new measure restricting trade is imposed by any member-State. On Dr Colijn's suggestion, it has been agreed to examine proposals for the elimination of "abnormal competitive practices" in foreign trade; and this is expected to lead to the modification of the most-favoured-nation clause, so far as countries practising "dumping" attempt to claim all its benefits. The Convention comes into force on July 1st; and any State can withdraw on 14 days' notice; but an express provision for joint action to remove differences between any two States renders it unlikely that such differences will break the Convention. The amount of trade among themselves is not over-large, but the seven States have shown that it is possible to "call a halt to the upward trend of tariffs and to make a move in the opposite direction."

To the extent that they reduce tariffs for each other, they will *ipso facto* reduce them to all non-Oslo States which have treaties with the Oslo States embodying the most-favoured-nation clause. To this extent, Britain and other countries will benefit without lifting a finger or reducing one import duty. On the other hand, should the movement for freer trade, so energetically begun and conducted by the Oslo Powers, result in the smaller States making all the sacrifices, they may denounce the most-favoured-nation clause altogether, and even, perhaps, the onerous bilateral treaties such as those with this country, which evade the spirit of the M.F.N. clause by introducing quotas into the agreement.

* * *

The Spanish Deadlock.—No military decision of any kind has been reported from Spain this week; and Bilbao is still holding General Franco's forces at a distance from the city. Indeed, the Basques seem to have regained ground. The week has been quiet at Madrid, save for a successful sally on the Guadarrama front by the Government forces, which carried their line still farther over the sierra and away from the road between Barcelona and Madrid. The insurgents and their foreign helpers subjected Valencia to a severe aerial bombardment on Friday of last week in which over 100 lives were lost, and Bilbao has been constantly bombed. A modern Spanish cargo and passenger ship was sunk by unknown submarines in the early hours of Monday morning with the loss of about fifty lives.

* * *

Meanwhile in London the deputy-chairman of the Non-Intervention Committee (in Lord Plymouth's absence on a visit to the Baltic States) and Mr Eden have been busy trying to secure guarantees from both sides in Spain of certain defined zones of immunity for foreign shipping, both warships and merchantmen. Señor del Vayo, Foreign Minister of Spain, handed in at Geneva a strongly worded protest at the German bombardment of Almeria, which disclaimed responsibility for the bombing of the "Deutschland," charged the "Deutschland" with first firing on the Government aeroplanes, and virtually accused German and Italian warships of perpetrating acts of wanton aggression on the high seas as well as covering the activities of the insurgents along coasts where the Government exercised authority. The only bright spot in a critical week was the Spanish Government's indication that they would be willing to entertain any proposals for the complete evacuation of all foreign supporters from Spain. As we go to press we learn that the British Government have sent definite proposals to the Spanish, Italian and German Governments, and that much progress has been made towards the securing of guarantees for zones of immunity.

Another Cabinet in Japan.—On April 30th, General Hayashi, who had held the Cabinet together in Japan on a colourless policy for nearly three months, held a General Election in order to thin the ranks of the two big parties who threatened him with a vote of no-confidence. The result of the election was to return the Minseito and Seiyukai parties in virtually undiminished strength, and to double the poll of the Labour Party. General Hayashi's ruse had failed; and on Monday of this week he had to resign. The weakness of his Government from the outset was his attempt to placate the extremist military chiefs while conforming to all the parliamentary conventions. The crisis really came over the military estimates in the Budget, which the Army refused to curtail, though the Navy and other services were prepared to do so. The new Cabinet, headed by the moderate-minded Prince Konoe, who was a former adjutant to the Emperor, contains representatives of the Seiyukai and Minseito parties in minor posts, but the three Ministers for War, Marine and Justice remain as before. The new Minister for Home Affairs is a former Finance Minister, Mr Baba; but the new Finance Minister is not yet known. It is a key post, for it is the bone of contention between the Army and big business. Count Konoe has taken on a difficult and unenviable—perhaps, by all precedent for liberal-minded men, a perilous—task. But recent political and economic developments, both inside Japan and throughout the Far East, are now exerting moderating pressure upon the militarists, as they are on militarists in European countries. All whose chief concern is peace and prosperity will wish Prince Konoe, and Japan, well.

Gold and Silver Prices Since 1737.—In view of the controversy surrounding the price of gold we have prepared a chart showing changes in the average annual sterling value per fine ounce of the yellow metal during the past two hundred years. The figures for the period from 1790 to 1818 are based on the table given on page 215 of Mr A. E. Feavearyear's book "The Pound Sterling," published by the Oxford University Press in 1931. They represent the mean between the highest and lowest annual quotations and have been converted from standard to fine ounces. No quotations are available for the year 1800-03 and 1806-09. The remaining data, from 1737 to 1789 and from 1819 to 1936 represent annual averages and are taken from our own records. The second chart shows variations in the value of silver in terms of gold. The data showing the number of ounces of silver equivalent to one ounce of gold are taken from Dr A. Soetbeer for 1737-1832, from the

tables of Messrs Pixley and Abell for 1833-78, from daily cabled prices from London to the Bureau of the United States Mint for 1879-96, from daily London quotations for 1897-1914, and from daily New York quotations for 1915-34. A record of these ratios from 1737 to 1934 is given in the annual report of the Director of the United States Mint. The figures for 1935-36, based on New York quotations, are taken from our own sources. The number of ounces of silver equivalent to one ounce of gold showed surprisingly little variation until about 1870. Since then, however, the price of silver has steadily fallen in terms of gold, partly because an increasing number of countries substituted the yellow for the white metal as their standards of value. But for the brief interruption during the Napoleonic wars, the sterling price of gold has remained practically unchanged throughout the years shown in the chart until the Great War. Subsequently, the sterling price of gold has been subject to wide variations. Whether it will settle, and at what level, is still unsure.

A Successor to N.D.C.—The withdrawal of the National Defence Contribution from the Finance Bill on Tuesday evening (in circumstances described on page 553) was not wholly unexpected by the market. Many members of the Stock Exchange kept their annual appointment on Epsom Downs next day, but the tone of the House was firm, and the *Financial News* ordinary share index rose nearly two points. The chief beneficiaries were iron and steel, motor, aircraft, electrical equipment, shipping and, particularly, copper and other primary shares. The Prime Minister's statement discloses no more than the broadest outlines of N.D.C.'s successor, which will be "a simple tax upon the profits of industry, which is estimated to produce not less than £25,000,000." This description best fits the precedent of the Corporation Profits Tax, and it is generally assumed that as N.D.C. Mark I followed E.P.D. so closely, N.D.C. Mark II will borrow its main features from C.P.T. Whether, however, the words "profits of industry" are restricted to the profits of limited companies in industry is not yet clear; some suggestions contemplate the inclusion of firms and professional partnerships within the scope of the new tax.

At an earlier stage in his speech, the Prime Minister referred to "the profits of industry" being "something between £600 and £700 millions." The latest official figures of Schedule D assessments for profits from

GOLD AND SILVER PRICES FROM 1737 TO 1936.

(Gold prices are annual averages in shillings per fine ounce; ratio of silver to gold shows the number of ounces of silver equivalent to one ounce of gold based on average annual prices.)

businesses and professions, and "other interest" refer to 1934-35. The actual incomes chargeable amounted to £829 millions for that year, but the total included interest on securities (£175 millions), railway earnings (£26½ millions) and profits of finance and professions (£184 millions). If precedent were followed, the first two items would be excluded, and some part of the third item represents the income of firms and not companies. We may take £525-550 millions as the relevant total for the "profits of industry," applying the precedents of the Corporation Profits Tax. Since 1934-35, however, the general level of industrial profits, as shown by the chain index based on our most recent analysis, has risen by 27 per cent. On this showing, the current level of "profits of industry" may be put at something like £665-£700 millions. A tax of slightly over 3½ per cent. on these profits would produce £25 millions; but if payments under the new tax are to be allowed as a set-off for income tax purposes, a rate of 4½ per cent. would be necessary to produce a clear £25 millions for the Exchequer. These rates, incidentally, could be reduced, in proportion to any further increase in profits, during the current year, if the new tax, like its predecessor, is not expected to make any serious contribution to the revenue before 1938-39.

Corporation Profits Tax Recalled.—Our estimates bring us suggestively near the original rate of 5 per cent. laid down when Sir Austen Chamberlain introduced the Corporation Profits Tax in April 1920. The rate was reduced to 2½ per cent. from June 1923, and the tax was abolished by Mr Snowden in 1924. C.P.T., however, had an upper limit of 10 per cent. of the balance of profits, after deducting interest on debentures and preference capital. In other words, the highly-g geared equity share was protected from any unduly harsh incidence of the tax, arising solely through the capital structure of the company concerned. After allowing the abatement of the first £500 of profits, the taxable profits for C.P.T. amounted to £512 millions in 1921-22 and £459 millions in 1922-23, on which tax was levied at 1s. in the £. The limitation of the total duty to 2s. in the £ on residual equity earnings cost £256,587 and £350,368 in the two years respectively, leaving net assessments at £25,352,000 in 1921-22 and £22,582,000 in 1922-23. It will be seen that out of the total profits for the two years a relatively small proportion ranked for the 10 per cent. limitation. The amounts actually received by the Exchequer in the two years were £17,516,000 and £18,977,000 respectively, the shortfall being due to arrears and appeals, some of which were still outstanding as late as 1929. C.P.T. did not apply to individuals or unlimited firms, though foreign companies carrying on business in this country were liable. Public utility concerns operating under statutory restrictions upon charges or dividends were exempted from C.P.T. until the end of 1925; but this date was itself anticipated by the repeal of C.P.T. in the Finance Act of 1924. Profits were determined on the same principles as for Schedule D, and were assessed upon company accounting periods.

Industrial News.—The last few days have seen a still further increase in the congestion in the coal and iron and steel industries. Bank holidays have restricted the expansion in colliery output and prices of current supplies have risen substantially. In the iron and steel markets very little business is being done, since manufacturers can supply nothing before the fourth quarter of the year. Consumers are still rationed on the crude basis of their purchases in 1936, mainly because no better criterion has yet been devised. There are, however, a few signs that arrears are being gradually worked off. In the textile industries the lull that has been felt since the Coronation shows no signs of ending.

Divergent Price Movements.—During the past fortnight there was a further small recovery in British wholesale prices. The *Economist's* complete British index number rose by 0.9 per cent. In the United States, on the other hand, there was a fresh reaction.

* These figures refer to May 26th.
† Monthly averages.

We publish below a chart showing the course of *The Economist's* complete index of British wholesale prices, as well as of our index of the prices of primary products in this country from 1931 onwards:—

The chart illustrates the reaction in primary products since the earlier part of the year. The complete index number has not lost much ground. During the past fortnight there was a fall in cereals and meat and textiles and a rise in minerals:—

	The Economist INDEX (1927 = 100)			
	Sept. 18, 1931	Apr. 28, 1937	May 19, 1937	June 2, 1937
Cereals and meat	64.5	92.2	94.6	93.6
Other foods	62.2	69.7	68.4	68.6
Textiles	43.7	74.3	73.8	73.2
Minerals	67.4	105.5	107.1	110.0
Miscellaneous	65.8	87.1	86.7	86.7
Complete index	60.4	85.7	86.0	86.2
1913 = 100	83.1	118.0	118.4	118.5
1924 = 100	52.2	74.1	74.3	74.5

There was a reaction in wheat and barley, but maize and oats are firmer. Bacon is slightly cheaper. Among other foods, tea was cheaper and butter dearer.

American Co-operation in Europe

WASHINGTON, May 21.—The talk of a coming American initiative in Europe has not been unwarranted, based as it is on President Roosevelt's continued search for an open avenue of approach. But as the months pass, progress has been slow, and it becomes increasingly apparent that it will continue to be slow. The President has been served from three sources of information in Europe: Mr Norman Davis while he was in London; Mr Bullitt, the ambassador in Paris; and Mr Gibson while he was on a visit to Brussels. These three acted independently, in the loose way of American diplomatic enterprise; that is to say, they have not been part of a co-ordinated campaign preparatory to American action. Mr Bullitt stands close to the Blum regime and is credited with seeing the ultimate European solution through the eyes of the French Left. Mr Gibson, though no longer ambassador to Belgium, has been reviving old associations there, and is responsible for arranging the visit of Premier Van Zeeland to Washington. That visit, moreover, is attracting attention here as opening a by-pass to Europe never before used by the United States, through the Oslo States. Hitherto, Washington's most important European contact has always been London. But now it is seen that Washington has even more in common with the smaller democracies than with Great Britain, and might collaborate with them without incurring the heavier responsibilities of the British fellowship. The former neutrals are more directly in sympathy with disarmament and with the Hull approach of peace-via-trade, even though they are regionally minded when it comes to tariff arrangements.

The Oslo road began to look tempting when news was trickling in that the Davis mission in London was making slow headway. Before Mr Davis left for London, opinion in Washington was something like this: Roosevelt would like to bring American influence to bear in Europe in the interest of peace and recovery; to be successful any American action would have to be taken in co-operation with Great Britain, since their joint prestige would be needed to overcome the enormous difficulties; preliminary to joint action in Europe, Anglo-American problems needed settlement; the first of these was an Anglo-American trade treaty on the most-favoured-nation principle; and after that there would have to be a debt settlement sufficiently substantial to appease American public opinion. It was well understood that a trade agreement would not be easy to negotiate, and in any case would have to wait until after the Imperial Conference. But Washington was so imbued with the logic of this argument that it expected Mr Davis to receive as cordial and expressive a welcome in London as, say, Lord Tweedsmuir and Mr Mackenzie King received in Washington. It came as a distinct surprise that Mr Davis found a cooler temperature in London, and not

until his return to the United States did it become clear that the London weather was not as unfriendly as it seemed. At any rate, Mr Davis was able to leave behind a clear picture of the American attitude, and to bring home a sense that the trade agreement would be negotiated in due season. But his first impression seems to have been that the British were anxious to talk immediately about American loans to Europe and debt cancellation, without seeing that these subjects could only be taken up some time after a satisfactory trade agreement.

The Conditions of Peace

Washington opinion can be said to remain as it was about co-operation with Great Britain. About Europe as a whole, it amplifies into something like this: the maintenance of peace depends on three postulates; a political understanding, in which the United States can have no part; economic stability, the basis of which must be Anglo-American co-operation; and disarmament. The three, as Washington sees them, are interlocking. If Germany is to join a stabilised European monetary system, loans must be advanced to form a German equalisation fund. If these are to come from the United States it must be clear that they do not lighten the task of financing German re-armament. Hence disarmament is essential. Americans cannot be expected to resume lending in Europe unless something is done to correct the record on war debts. Hence a substantial settlement of debts is imperative. Germany cannot transform her present war-economy to a peace economy without revival of trade. Hence trade barriers must be torn down. The start must therefore be made by Britain and the United States, the two greatest trading nations. It is well understood here that Britain does not care to go in for reduction of armaments just yet, which sets the time factor for realising the full programme. But this also gives the necessary time to proceed with an Anglo-American settlement.

A few weeks ago it appeared as though this were going to be unreasonably difficult. One noted here and in New York, among many who by tradition were well-disposed to Britain, a growing resentment over the delay. They were beginning to say that the obstacle to American co-operation in Europe was Britain, and that along with the rest of Europe, the British wanted from America only the familiar concessions of debt cancellation and loans. It was new to hear Britain described as a barrier, after years of serving as a bridge. Talk of this sort still is to be heard in responsible quarters; but, fortunately, it is being corrected by news from London that Mr Chamberlain, far from being indifferent to American co-operation, is determined to establish it and understands its implications.

The Status of the Union

NEW YORK, May 25.—The historical cavalier who mounted his horse and galloped rapidly in all directions might serve as the exemplar of current constitutional developments in the United States. There are four distinct issues involved. First there is the traditional idea of a federal union of sovereign States. This was the concept of the founding fathers, and time has done hardly with it. The development of rapid transportation has removed the geographical reason for local self-government and local economic self-sufficiency. The combination of rapid transportation with the corporate form of enterprise has profoundly modified what in the Constitution is termed inter-State commerce.

Nevertheless, in some respects, the changes are more superficial than real. One hundred and fifty years ago,

even within the limits of the thirteen Colonies, and apart from difficulties of transportation, there were profound differences between, say, the New England States and the South Atlantic States; differences in some ways as wide and as difficult to reconcile as those between the Colonies and the Mother Country.

On paper, the relation of the central Government to the States, and to the people and of the State Governments to each other and to the citizens is just what it was when the Constitution was adopted. In fact, the scope of the central Government has continuously widened, and that of the State continuously narrowed; and in recent years this trend has become more rapid. The issue has been joined rather sharply in the proposals for the national control of agriculture and of the relations between employers and employees.

While the general trend towards nationalism is well defined, there are strong currents in the opposite direction. The States assert their sovereignty in surprising ways. No State has yet erected custom houses along its frontiers; but several States have imposed restrictions upon the movement of persons across their boundaries. Other States have imposed ingenious excises which are in the nature of export taxes on commodities of which they possess a monopoly. The idea that the United States is a free trade area, or an area in which goods and persons move freely across State boundaries, is by no means true without qualifications, and not so true as it was twenty years ago.

The latest and greatest manifestation of this particularist tendency is to be found in the taxes on chain stores. Many of these multiple distributing systems are nation-wide; but some thirty-two States have passed legislation which in effect makes it more difficult for them to conduct this business. Some of the anti-branch-banking legislation falls into the same category, as many States permit intra-State branch-banking, while excluding branches of banks chartered in other States. In short, just when there is a tendency to erase State lines, there are other evidences of a disposition to convert State lines into actual barriers. While there are tendencies towards the conversion of a federal union of sovereign States into a nation with a sovereign Government, there are other tendencies towards assertions of State sovereignty in manifest contradiction to the spirit not only of nationalism but of federalism also.

While the concept of the American system as a federal union of States is waning, there is a clear drift toward the creation of local and integrated groups of States. For example, there are the 12 Federal Reserve Districts and the nine Army Corps Areas. The Soil Conservation Act contemplates five agricultural regions, and the water-power and flood-control schemes suggest eight such regions. Any one of these groupings would create agglomerations of States climatically similar, socially homogeneous, and economically integrated, forming what might be described as natural components of a federal union, contrasted with the factitious or accidental delimitation of the States.

At the present time, legislative tendencies are quite irreconcilable. Congressional legislation is increasingly nationalistic in character and less federal in ideology; state legislation is increasingly particularist in character but similarly less federal in ideology. The courts are bound to interpret legislation in terms of a written constitution which, although devised with astonishing prescience, did not anticipate the projection of the industrial revolution or the development of transportation.

Apprehensive Prosperity

The second quarter of the year is two-thirds completed, and the evidence is that the average of production will exceed the first quarter. While sensitive commodities have reacted from the levels reached in March, the drift of prices in general still appears to be upward as increased costs, especially of labour, are gradually transmitted to the price structure. By this date, there are usually evidences of a seasonal recession in production; none has yet appeared. On the contrary, recent weeks have brought an increase in building after the somewhat disappointing showing of the past six or eight months.

Employment, production, prices, and earnings are all higher than a year ago and, generally speaking, substantially higher; yet equity prices are no higher. This paradox is obviously the measure of some distrust of the future, which may or may not be justified.

Concern is commonly expressed about four matters: taxation, labour relations, rising prices, and consumer credit. It has become customary in this country to introduce new forms of taxation every year. No new tax legislation has yet been introduced at this session of Congress, but it is awaited with apprehension. The rapid organisation of labour, the continuance of strikes after settlements have been reached, and the difficulties of calculating labour costs are not stimulating to the spirit of enterprise. Retail prices continue to rise, and so far there is no tangible evidence of consumer resistance. Nevertheless, it is still doubtful whether consumer income is rising as fast as retail prices. It is commonly agreed that consumer credit has expanded rapidly since the bottom of the depression, and that a part of the long sellers' market in consumer goods represents not merely earned income, but rising family and individual debt. The analogy is often made between the growth of consumer credit in recent months and the expansion of stock market credit before 1929. This comparison may or may not be warranted, as there are absolutely no comprehensive data on the subject.

France

The Government's Choice

PARIS, June 3.—Fiscal receipts in April were disappointing and realised only 2,639 million francs, which was 252 million francs below the estimated figure, and 183 millions below the receipts of April, 1936. This may be due to various causes such as the general adoption of the 40-hour week, and fiscal reform. The yield of the turnover tax fell from 539 million francs in April, 1936, to 397 millions in April, 1937, and the proceeds of indirect taxes fell from 205 million francs to 139 millions.

This decline when added to the difficulties of the Treasury will make necessary in the near future a series of increases in taxation and tariffs which indeed has already been announced by M. Blum. It may also provoke new protectionist measures in order to maintain economic activity, and the Government has laid before Parliament a bill for plenary powers to modify tariffs and quotas.

For the third time in twelve months, the Government is faced with the choice between liberty and autarky. The first occasion was after September, 1936, when the franc was devalued, and the second after March, 1937, when the breathing space was begun. The latest speeches of M. Blum and M. Jouhaux, the leader of the trade unions, emphasise that "syndicalism is not a doctrine of idleness . . . but a doctrine of activity, and that the triumph of syndicalism must depend equally upon an increase in the virtues of the individual and in production"; and show that the Popular Front Government remains attached to its former policy both at home and abroad. In order to prevent any misunderstanding,

however, the Committee for Customs proposed to include in the plenary powers Bill a guarantee that these powers would never be used to limit the liberty of the exchange market.

No doubt these measures, which will be as lenient as possible to secure Popular Front endorsement, will have some favourable effect on the markets. The activity engendered by the Exhibition will also be helpful and there has been a slight increase in exports shown in the latest statistics of foreign trade. The revision of tariffs may perhaps ease the situation. But the size of the budget deficit and the difficulties of production are so considerable that none of these steps can afford anything but a temporary relief.

The Coal Problem

Coal production was 3,991,159 tons in April, 1937, for 22.8 working days, against 4,179,765 tons in March for 23.8 working days and 4,134,124 tons in April, 1936, for 22.9 working days. Average daily production was 175,000 tons in April, 1937, against 175,600 tons in March and 180,500 tons in April, 1936. The number of men employed was 237,187 at the end of April, 1937, against 222,686 at the end of April, 1936. The production of coke in the coke plants of the collieries was 362,245 tons in April, against 367,847 tons in March and 336,489 tons in April, 1936. Coal consumption was 6,400,000 tons an increase of 400,000 tons compared with April, 1936. Imports were 2,555,000 tons, which was some 680,000 tons more than in April, 1936. The average price of imported coal was 132.60 francs per ton, and the value of coal imports was 327 million francs in April; if this continues in future months the yearly total will be 3,500 million francs, twice as much as the annual value in 1935.

In the last six months, production has declined by 1,170,000 tons, roughly 5 per cent., while consumption has risen by 3 million tons so that the taking of 865,000 tons from stocks (against 700,000 in the same period of 1935-36) was not sufficient to cover the deficit. The labour force in the mines has been increased by 15,000, and average daily production is about 175,000 tons, against 171,000 tons in November, 1936, the first month of the 38 to 40 hour week in the mines. Imports of foreign coal increased by 3,800,000 tons or 35 per cent. to 14,800,000 tons or 2,466,000 tons monthly. The value of these imports has nearly doubled, reaching 1,821 million francs.

The following table shows the movement of wholesale prices since May 31, 1936:—

	WHOLESALE PRICES			
	May 30, 1936	April 10, 1937	May 22, 1937	May 29, 1937
General index	377	542	532	529
National products	421	561	555	552
Imported products	299	507	490	486
Foodstuffs	405	533	516	515
Raw materials	354	550	546	541

Thus wholesale prices remain comparatively steady at a level slightly below that of April, but more than 40 per cent. above the level of a year ago, before the devaluation took place. Unemployment improved further last week, the number falling to 351,846 against 355,792 on May 15th.

Roumania

Internal Politics and Foreign Policy

BUCHAREST, May 29.—According to a statement made by the Minister for Foreign Affairs in a recent press conference, the internal situation in Roumania is quiet. From the time, in mid-February, when the Prime Minister, Mr Tatarescu, declared his intention to prosecute with extreme severity any illegal action by either of the extreme parties, the Iron Guard has retired into the background. The danger of a forthcoming extreme Right action has been much overestimated both in Roumania and in a certain part of the foreign press. The communal elections in all districts furnish a further proof of the strong position of the constitutional parties and the surprisingly small support won by those which support dictatorship. On the average about two-thirds of the votes have been cast for the two big constitutional parties, and the remainder was divided among several parties of the Right wing. The general elections are to be held not later than next autumn, and it is fairly certain that the people will vote for the continuation of a constitutional form of State. This trend in public opinion will probably be welcomed by King Carol, since any veering towards dictatorial systems would necessarily be followed by complications in foreign politics. Indeed, after the recent visit of Colonel Beck to Bucharest, France has abandoned her previously passive attitude towards the wayward foreign policies of some of her eastern allies. The attitude displayed by the Roumanian Ministry of Foreign Affairs after the French *démarche* has clearly shown that Roumania does not want to risk the loss of her powerful western friends.

The economic situation continues to improve. The Government has recently started a campaign against the increase in the cost of living, obviously with an eye on the approaching general elections. The price level in Roumania is still very low and, although wages are also low, even the less well paid classes can make both ends meet. In January the index of Roumanian wholesale prices, published by the League of Nations, stood at 72.6 (1929=100) compared with 66.4 a year ago. The upward trend of the price level is very moderate, the movement during the last sixteen months having been only 7 per cent. Economic activity is proceeding at full speed, and the peak figures of last year may even be exceeded. Accordingly, there is practically no unemployment among the working classes; but on the other hand in the middle classes it is becoming increasingly difficult for those belonging to any of the ethnical or religious minorities to find a job. This is the combined result of the nationalistic wave which is sweeping over Roumania and the marked tendency of the rural population to send their children to high schools and, in ever-increasing number, even to universities.

Freer Trade Forces

The exchange situation is still improving and the Minister of Industry and Commerce has declared in a recent interview that the restrictions on foreign trade will be further reduced. The export surplus for the first three months of the current year was valued at 1,995 million Lei, compared with 1,177 and 799 million Lei, respectively, for the corresponding period of the two previous years. Several commodities, but only raw materials, such as metals, and semi-finished goods, such as cotton and wool yarns, have been already freed from quota restrictions, but roughly three-quarters of the total of imports are still subject to these cumbersome restrictions. On the other hand, no thoroughgoing improvement in the exchange situation of the Roumanian National Bank is possible until the existing clearing arrangements are adjusted to the present economic situation. Nor can the exchange control be even gradually abolished until the foreign debt charge has been definitely reduced. Roumania is complaining about the unduly high quotas in most of the clearing agreements either for outstanding commercial debts, which have been paid in

the meantime, or for imports, which sometimes exceed the current Roumanian import requirements. The situation is even more entangled as regards the payments on the foreign debt, 72½ per cent. of which are due to a group of seven States: England, France, the Netherlands, Belgium, Switzerland, Czechoslovakia and the United States; whereas the bulk of Roumanian exports normally goes to other countries. In spite of all efforts to direct an increasing share of total exports to the creditor countries their aggregate share in 1936 was only 51.9 per cent. It has yet to be seen whether it will be possible to divert the stream of Roumanian farm produce from Germany to other countries.

The invitation addressed to foreign investors by the Governor of the Roumanian National Bank, during his recent visit to London, to extend their field of activities to Roumania is worthy of notice. These words were in strange contrast to some of the recent Government measures, such as the protection of native labour and the latest modifications of the mining law, which leave foreign-controlled companies only very narrow business opportunities. Since Roumania's own financial resources are far too small to rear a modern economic apparatus, a change in this attitude is inevitable.

Japan

Armament Stimulus to Industry

TOKYO, May 8.—The result of the general election held on April 30th shows no essential change in the composition of the House. Although the Labour Party has made considerable advance, the two major parties, the Minseitō and the Seiyūkai, still hold a substantial majority; and the new House is, as a whole, undeniably more hostile to the Government than before the election. The Government, however, has refused to admit its defeat, and has decided to remain in office until the Diet meets in a few months' time and a vote of non-confidence is carried. Thus, political uncertainty hangs over the business world like a cloud, although industrial activity continues on the up-grade.

Industrial activity is undoubtedly largely supported by the big armaments scheme. To finance the plant extensions necessitated by the Government's orders, steel, engineering, and metal-working companies have increased their capital; and many new companies have been formed in the hope of obtaining the Government's sub-contracts, or otherwise sharing at second- or third-hand in the fruits of armament activity. New capital raised in April for these purposes was 265 million yen, against 66.1 million yen in April, 1936, and the total industrial issue for the year to date is 677.2 million yen, compared with 254 million yen for last year. These demands for new capital, in conjunction with higher commodity prices and the activity in the stock markets, combine to harden money rates. The sale of Government bonds by the Bank of Japan is not very satisfactory, and the new 3½ per cent. loan is now being quoted at slightly below its issue price.

Production in many branches of both the light and heavy industries was at a higher level in the first three months of this year than in the corresponding quarter of 1936:—

	Jan.-Mar., 1936	Jan.-Mar., 1937	Increase in 1937	%
Cotton yarn	870,786 Bales	981,750 Bales	110,964 Bales	12.7
Cotton cloth	441,867 (In thousand yards)	471,297	29,430	6.7
Rayon yarn	57,327 (In thousand lbs.)	77,331	20,003	34.9
Pig iron*	508,043 Tons	528,583	20,540	4.0
Steel ingots*	673,341 Tons	725,808	52,467	7.8

* Output of the Japan Steel Corporation.

Rising Prices, Imports and Wages

Commodity prices continue to rise. The Bank of Japan's wholesale index number for April advanced further by 3.4 per cent. on the month to 248.0. This is 28.9 per cent. higher than in April, 1936, and 97 per cent. above July, 1914. In the middle of April, the general level of retail prices for commodities was 71.9 per cent. above the level of July, 1914, compared with 71 per cent. in March, 1937, and 60.4 per cent. in April, 1936. To check the upward trend in prices, a Prices Commission has just been constituted under the chairmanship of the Premier. The terms of reference cover a wide range, including national finance, money, foreign exchange, production, distribution and consumption.

The trend in our foreign trade remains unchanged. The value of imports in April amounted to 336,684,000 yen, an increase of 89,551,000 yen (36.2 per cent.) since April, 1936. Textile materials account for half the increase, but notable increases occurred in iron and steel, copper, and machinery. The value of exports, which totalled 263,028,000 yen for the month, was 57,767,000 yen (28.1 per cent.) more than in April of last year. Thus, imports still continue on a much larger scale than exports; the ever-widening gap between imports and exports is increasingly pronounced; and the import surplus for the year to date is 379,618,000 yen, about 65 per cent. larger than last year. Gold shipments are not sufficient to pay for the growing import surplus, and the Government is preparing to control import trade further by screwing up exchange restrictions.

Industrial disputes continue to occur. Their main cause is the demand for advances in wages; and wages have been widely raised as a result of disputes or to forestall disputes. The principal groups of workpeople affected by increases in wages were transport workers in the urban districts; men in the engineering industry; coal miners in Kyushu and Hokkaido; and men and women employed by the big cotton mills. Increases in wage rates amount to 5 to 10 per cent. in most cases.

Irish Free State

The Need for Exports

DUBLIN, May 27.—Trade statistics indicate the slight success of the attempt to find alternative markets for Irish products abroad. In spite of the interruption of trade caused by the economic war Great Britain still continues to absorb by far the greater part of the Free State's attenuated exports. It is a striking proof of the predominance of political over economic issues in the Free State that the Government has refused to take the opportunity of attending the Imperial Conference, where the future course of agriculture in the Commonwealth, and in particular the access of Dominion producers to the British market, will doubtless be discussed.

The following figures show the external trade of the Free State in the first four months of 1936 and 1937:—

	Imports		Exports	
	1936	1937	1936	1937
Great Britain	6,801,701	7,187,838	5,163,955	5,416,990
Northern Ireland	190,013	182,511	640,802	538,202
Other countries	5,570,377	6,062,867	542,229	746,374
Re-imports	46,464	43,496	...	...
Total	12,608,555	13,476,712	6,346,986	6,701,566

The figures also show that the import surplus has increased. If the same trends persist the total surplus for 1937 will exceed £20 millions in value. It is very doubtful whether the credit balance on invisible account, large as it is, will prove sufficient to bridge the gap. The next issue of the Currency Commission's consolidated balance sheet of the Free State banks will probably reveal a loss of sterling assets. If so, the position, though in no way dangerous, cannot be regarded as satisfactory, since further increases in the value of imports are likely as a result of the rising price of raw materials and capital goods.

It was possibly the realisation of this unpleasant development in the balance of payments which inspired the Minister for Industry and Commerce to emphasise the desirability of finding markets abroad for some of the products of the new industries. In a recent speech he reminded his audience that Ireland had succeeded in the

past in building up substantial export industries without possessing any special advantages in respect of raw materials. This is of course true, but what the Minister overlooked was that the advantages which Irish manufacturers enjoyed in the past have been to a great extent destroyed as a result of his own policy, which was until recently based on the ideal of self-sufficiency and the supplying of the home market. The measures which he has taken now act as impediments to manufacturing for export. The Minister cannot have it both ways.

Rising Production Costs

Industrial protection, combined with an advanced social policy, has raised production costs in many ways. Money wages are as high as in Great Britain, but real wages are less owing to the high cost of living. Hence industrial disputes are frequent. The Conditions of Employment Act, excellent as a humanitarian measure, increases the cost of labour to employers. Much of the capital invested in the new industries carries a high rate of fixed interest, and many of the new factories have been very costly to build because of the high price of structural materials. Taxation, both national and local, is high and shows signs of growing. The prospects of building up a substantial industrial export trade are not very bright.

Unfortunately the possibilities of expanding the home market are also moderate. Saturation point has been reached already in more than one industry, and many of the new concerns are experiencing difficulty through internal competition. The most disquieting feature in the Free State's industrial life is the gradual diminution in the population. If the export of goods is languishing, the export trade in human beings is flourishing. The drain caused by this emigration is very serious. When allowance is made for the cost of rearing, nourishing and educating a young person, each emigrant must represent a loss to the country of several hundred pounds for which no return, direct or indirect, is received. The bounty on livestock exports appears but a small and insignificant thing compared with this disguised bounty which is paid by the Free State on the product which it can least afford to lose—the brawn and the brain of its youth.

Letters to the Editor

The Gold Problem

TO THE EDITOR OF THE ECONOMIST

SIR,—The very fair discussion in your last two numbers of the possible harms and benefits to be expected from the present gold inflation, nevertheless leaves somewhat in the background the essential nature of this much discussed phenomenon, particularly from the international point of view. I wonder whether it is commonly realised that what is done by means of an ordinary inflation in a closed economy, an increase in the world output of gold will achieve in almost exactly the same fashion for the international community as a whole. The gold-producing countries practise "forced saving" at the expense of the importing ones through the general rise in prices.

There are, no doubt, many important differences. One is that the cost of operating a mine being much above that of a printing press, the profit accruing to the gold producer must be much smaller than the counterfeiter's. But in essence, there is no fundamental opposition between the functions of either. Another difference is that, in so far as gold still remains the nearest approach to absolute liquidity, its depreciation is likely to be influenced to a much smaller extent by such psychological factors as affect, for instance, the velocity of circulation in the later stages of an "ordinary" inflation (although the mass-disharding of the last few months seems to suggest that even this factor is operating); the more so because the supply of gold being limited, its increase cannot be cumulative in its effects. Indeed quite the contrary is the case and it is not surprising to see large gold inflations followed, as repeatedly in the past, by long and severe depressions.

In a world of frantic economic nationalism it can, at best, be considered as a *pis-aller*. But the notion, widespread nowadays, that a *permanent* world prosperity could be helped by a steady increase in the production of monetary gold, together with the preposterous idea that such a condition is one upon which economic progress depends, is likely to be soon frustrated. It is no wonder that, in such conditions, the public mind is turned away from the real economic difficulties of the modern world, and from their political foundations.

"Goldism" is but one of the many varieties of the common fallacy of inflationism. As, however, it carries about a certain flavour of "orthodoxy" that is likely to lead the more naïve supporters of "sound money" into confusion, I suggest that it is the worst of all.

Yours truly,
ÉTIENNE MANTOUX.

Paris.

TO THE EDITOR OF THE ECONOMIST

SIR,—We have lately seen how the mere hint that the U.S.A. might reduce its price for gold caused a violent depression on the Stock Exchange. The usual denials followed, but uncertainty persists; and a strong contributory reason is that the Bank of England continues to value its gold reserve at the obsolete rate of 85s. per ounce. This action is doing far more harm than good, as a consideration of the following facts will show.

For many centuries before A.D. 1300 the price of gold varied from 18s. to 20s. per ounce Troy. In 1300 the price was 24s., and the respective prices in 1400, 1500, 1600 and 1700 were 30s., 40s., 60s. and 80s. From 1717 for over

200 years the British Government by Act fixed the price at 85s. per ounce. All this is clearly shown by *The Economist* in a diagram published on November 16, 1935, based on Feavearyear's work "The Pound Sterling." The diagram has an ascending line which gives the *theoretical progressive value* of gold, and it shows that the price rose from 20s. to 130s. per ounce in 565 years ended 1935, or at the rate of about 20s. per ounce per 100 years.

The actual value of 140s. per ounce in 1937 is thus fairly close to the progressive value. The diagram shows that when wars occur the price of gold rises about 20s. above its progressive value. It is also quite clear from it that to have fixed the price of gold at 85s. for over 200 years was wrong, for in this period the average value should have been 107s. per ounce. It shows the five years ended 1931, when we went back to the 85s. price of gold, and the appalling losses the country suffered in those years are sufficient to prove that the 85s. price of gold has gone for ever, and with it the 22-carat gold sovereign.

The last six years have shown that prosperity increases as the price of gold rises. The U.S.A. has power to increase the price up to 170s. per ounce, and it is a lever that may have to be used; it would certainly come into action if a major war took place. But in the meantime there are the published facts that the world gold production in 1915 was 22½ million ounces, and in 1936 it was 35½ million ounces, and so the progressive price of gold may be checked in the near future by over-production.

The remedy is to use all surplus gold in coining sovereigns of 11-carat gold instead of 22-carat. These could not be melted with profit till the price of gold rose above 170s. per ounce. The promise of such an issue (in the case of need), with the revaluation of gold reserves in the banks at 130s. per ounce, would be all that is at present required to restore confidence.

The Equalisation Fund has been the salvation of the currency question. Its price of 140s. for gold seems to be

easy to maintain in collaboration with the U.S.A. The Fund is now correcting the mistake that occurred 220 years ago, when it was not foreseen that gold had, and always will have, a fluctuating value. When it is realised and admitted that the gold contents of the pound sterling should be adjusted at intervals of 50 years, the necessity for an Equalisation Fund may not exist.

I am, Sir,
Yours faithfully,
R. H. TICKELL.

Kensington, W.8.

Books and Publications

The Supply of Gold

GOLD has always been a Problem, and in the minds of many of us a Mystery. It is true that our current disputation about the proper price and distribution of gold is no unique feature of our time, but specially complex problems arose once the leading exchanges were freed from the ties of a gold standard. Gold producers on all sides express their anxiety that the sterling price of gold should not be lowered. Central bankers are canvassing the possibility of a gold restriction scheme. The economists point out the numerous incompatibilities in the uneasy equilibrium of the leading exchanges. And it is plain that the United States is becoming unwilling to unbalance her Budget indefinitely for the doubtful advantage of hoarding useless gold to suit the convenience of the Rand and Europe.

It is no purpose of this book* to answer these problems—indeed it was written some time before they assumed their present acute form. But the gold price is the measure of the present prosperity of the Rand. In the mining engineer's parlance, it now pays to work a 4 pennyweight proposition, as against 7 dwts. with gold at 85s. The industry is engaged in the biggest development campaign since the Rand was discovered. The reasons which threaten us with a "surplus" of gold can be ultimately traced to the decisions of mining entrepreneurs, under given conditions, to produce their output.

Dr Busschau's task, then, is to explain on what factors—economic, technological and fiscal—the supply of gold depends. He has written that rare phenomenon in economic literature—a work on an applied economic problem within a consistent theoretical framework. The book is necessarily difficult for those who are not well versed in economic method, for the author adopts Marshall's technique of measuring the effect of one factor, leaving

the rest unchanged. The reader, therefore, has perforce to examine such complex matters as the proper rate of return from mining investment, the determination of changes in grade, the optimum scale of mining operations, and the incidence of taxation by a "one thing at a time" method. The results, set out with skilful mathematical and graphical treatment, will be of great interest to the competent economist who has mastered the Pigovian treatment of average and marginal cost curves.

But for all this theoretical precision, Dr Busschau rightly recognises its abstractions at many points of his argument. It is good, no doubt, that economists should go to considerable pains to study mining, and even better that producers should grasp the basic principles of economics. But the entrepreneur is no master of mathematics, and Dr Busschau has performed the useful service of assembling the main considerations which determine his policy, even if the entrepreneur might not recognise the result as a cross-section of his mental process.

For the general reader, there are numerous passages of real value in the book: To many, the author's conclusions regarding the taxation policy of the South African Government will appeal with special force. They are couched in strongly critical terms and bring out the

existence of anomalies in the system. Similarly, the determination of the grade of ore worked and the super-imposed effects of taxation is one of the simpler sections from the mathematical point of view, and one which the mining investor should find particularly rewarding. And since the mathematical treatment in the remaining chapters is of the formal character which cannot be immediately applied to investment policy, there is no reason why the lay reader should not leave this to the wranglers and devote himself to the author's excellent literal argument and description.

It is the peculiar feature of the Rand that the ore deposits are so regular that it can regulate its affairs almost with the precision of *homo economicus*. For that reason alone Dr Busschau's work is to be welcomed. It does not claim to solve the gold problem; but it does explain the considerations which determine the supply of gold from given mines in given circumstances, and the factors affecting the first bold decisions to develop a mine. The author, indeed, appears to be peculiarly fitted to develop the other side of the gold equation—the future of the demand for gold. His original thesis contained some discussion of the subject. If it could be amplified with the precision of the present work, it might well prove invaluable.

Shorter Notices

"Report on International Trade." Political and Economic Planning. 295 pages. 8s. 6d.

The decline of world trade in recent years, the menace of war, and the strain of warlike economies are facts which reinforce enlightened pleas for freer trade. The initiative of the Oslo countries and the overtures of the United States come opportunely. Similarly apposite is work like this compendious report of P.E.P., which adds facts, figures and sound arguments to the vaguer yearnings of politicians. The position is here made very clear: quotas, licences, clearing arrangements and exchange controls,

tariffs and State trading have imposed sharp limits upon international trade; Governments and cartels between them have almost eliminated the individual unit of world commerce. Meanwhile, trade languishes even below the wants and needs of nations determined to be more or less self-sufficient. The only way out is to organise international trade deliberately; to pursue freer trade through State and industrial planning rather than by freedom of intercourse between individual traders. Governments must take a long run view of trade and investment, and create appropriate agencies to expand commerce. Similarly, organised traders must look to conscious planning rather than blind competition for their ultimate salvation. Two-way trading must be fostered. International lending must be stimulated. In particular this country must participate in low tariff groups; be ready to modify the most-favoured-nation clause; and re-open the door of colonial trade. World trade must be restored. But the world has changed: special measures to expand the consumption of agricultural products are necessary to balance world trading; and the extraordinary steps which are being taken to reconstruct national economies for war or defence cannot be ignored. The report is realistic; it looks squarely at the facts and suggests a detailed programme. Its faith in planning and regulative machinery is certainly excessive. The rôle it would allot to cartels might be dangerous. But its work has been well and soundly done, and its recommendations, even if less valuable than its researches, should be more influential than merely pious hopes.

"The Directory of Directors for 1937." Thomas Skinner and Co. 1,900 pages. 25s. net.

The fifty-eighth yearly issue of this valuable compendium contains the usual up-to-date and exhaustive record of the directors of the joint stock companies "whose securities are known to the stock markets of the United Kingdom." It is, in fact, a register of the leaders of industry, business and commerce, and shows for 1937 a total personnel of about 33,000 names on company boards. The interlocking interests and activities of directors are clearly shown. The book is easy to handle and should be available for reference to every business man.

MONEY AND BANKING

Recovery in Central Europe

It is just six years since the whole financial structure of the European Continent collapsed with the Austrian Creditanstalt. To-day, however, the tide of recovery and rising prices for exports is sweeping over many hitherto depressed countries, among them the smaller Central European States. Of these, Austria, Hungary and Czechoslovakia are the most important; and as their mutual currency relationships are still arbitrarily controlled by exchange premia in Hungary and "clearings," it is opportune to examine their general economic experience in recent months, and its bearing on their national finances and currency relationships. For if they are to expand their mutual trade, which is the aim of the present negotiations, their mutual currency relationships, and those with other countries' currencies, will have to be regularised.

The Austrian ordinary Budget for 1936 closed with a small surplus (2.6 million schillings) for the first time since 1929. Though this was converted into a real deficit of 33 millions by extraordinary expenditure, called "investments," totalling 35.6 millions, this latter sum was 9.2 millions less than the estimate, and the smallest amount of expenditure outside the ordinary Budget since 1932. The ordinary 1937 Budget envisages a total deficit of 145.4 millions. Of this, 39.4 millions is to be covered by fresh economies and revenues, and 106 millions by two financial operations: first, as to 94 millions by proceeds of the new Investment Loan, and secondly, 12 millions by a credit from the Post Office. As the yield of all taxes, save only customs duties and the simple turnover tax, has considerably increased in 1935 and 1936—the emergency sur-tax on turnover most of all—revenue should well exceed the conservative 1937 estimates.

The continuous increase in Austria's index of production, in Austrian bond and share values, in her exports, and in the proportion of her national debt held at home, since the end of 1933 combined to offer the Government a chance to raise, on February 6th, a new internal loan, the Investment Loan. Of 180 million schillings at 4½ per cent. issued at 90, the Government gets 88 per cent., or 158.4 millions. This was the first domestic loan since 1930 to carry no gold-value, amnesty, or assigned revenue clauses; and its subscription enabled the Government to consolidate 54.0 millions of Treasury bills, to defray the 94.0 millions of new 1937 expenditure noted above, and to pay 10 millions to local authorities. After the recent repatriation of Austrian bonds held by Italians through the Italo-Austrian clearing, and other such operations, the Austrian State debt stands at about 3,900 million schillings, divided as follows:—

	AUSTRIAN STATE DEBT AS AT JANUARY 1		
	1925	1934	1938
	(Millions of schillings)		
Debt to National Bank.....	217.8	624.4	603.4
Internal bonded debt	178.4	505.7	1,122.0
Short-term debt	...	93.5	140.2
Debts guaranteed by the State ...	...	294.0	343.0
Total internal debt	396.2	1,517.6	2,208.6
Foreign debt, chiefly bonded	1,177.7	1,651.4	1,282.5
Relief credits.....	793.6	412.7	432.6
Total foreign debt	1,971.3	2,064.1	1,715.1
Total of State debt	2,367.5	3,581.7	3,923.7

The greater devaluations in creditor countries abroad than in Austria have helped to reduce slightly the foreign debt, to increase repatriation, and to increase the total held at home. Of this latter, 750 millions still represents the burden of financial disasters in the depression, shouldered by the State. Though amortisation

payments will rise from 45.8 millions in 1936 to 81 millions in 1938, the annual interest on Austria's total debt will in the latter year be only 118.9 millions (60.4 foreign and 58.5 internal) compared with 113.7 millions (89.2 foreign and 24.5 internal) in 1933. Interest and amortisation services together will actually require less than in 1933 despite an increase of nearly 30 per cent. in the total debt; namely, 226.7 millions as against 238.1 millions in 1933. This service can be met much more easily than two years ago.

The 1937-38 Budget in Hungary shows a drop in the total deficit from 75.6 millions last year to 67.9 this year. As in Austria, there is extra-budgetary expenditure, amounting in 1936-37 to 78 million pengő, of which 51 millions was for the Agrarian Relief Fund; and in 1937-38 this sum may be anything between 75 and 125 millions, since extra-budgetary "investments" alone rise from 27 millions last year to 46 millions. The State has borrowed 55.5 millions from the untransferred portion of the foreign long-term debt service, and 64.6 millions for Agrarian Relief from the National Bank. But revenue yields are rising, and the National Bank is receiving more foreign currency, both in exchange-controlled and free countries' currencies, owing to the recent sharp increase in foreign trade. The rise in railway goods traffic and revenues is lessening the drain on the "undertakings" Budget. Devaluations have reduced the State's foreign funded debt by 120 million pengő to 798.2 millions at March 31st; but the floating debt is still growing and on March 31st stood at 724.2 millions; 624.4 for the administration and 99.8 for loans to State undertakings. Of the total floating debt, 332.3 millions is foreign-held, and 391.9 held at home. As in Austria, Hungary's floating debt has grown during the depression, and her foreign debt has been greatly reduced; but in Hungary, half the floating debt is still foreign-held. Nevertheless, at about 1,750 million pengő, the total Hungarian State debt may prove manageable if world prices and world trade continue to rise.

Czechoslovakia has virtually no foreign debt problems. Her national debt, which has also grown in sum during the depression, though its annual burden has fallen with interest rates, is almost entirely held at home. As a considerable exporter of manufactures, Czechoslovakia's problem in the depression has been the blocking of her export proceeds in client-countries with exchange controls. This has involved a net loss of gold and foreign exchange holdings, offset by new short-term borrowings from Paris, Zürich, etc. The Czech crown has twice been devalued, latterly last September by a further 10 per cent.; and this, at a time of rising raw material prices, has caused a temporary difficulty in paying the growing bill for necessary imports. To alleviate it, and to prevent the gold reserve falling below its present level of Kc. 2,500 millions, a new two-year 4 per cent. loan of about Kc. 330 millions (Sw. frs. 50 millions) has just been contracted in Switzerland. Meanwhile, Czech exports, which have been rapidly rising in volume, are now rising in price; and this is expected to raise the 1936 total of Kc. 8,014 millions to about 9,500 millions this year, which should cover both the rise in import values and the repayment of tide-over credits. There is virtually no insuperable Budgetary problem; and tax yields are rising fast. The Bohemian and Moravian steelworks, machine-shops, coalmines, etc., are now turning out record productions; and the country has now become a considerable exporter of wheat and sugar. Moreover, during the depression the country has re-orientated its foreign trade so that it now does less trade with "clearing" or "exchange-control" countries and

WORLD FINANCE

1935-1937

By PAUL EINZIG

From the death struggles of the Gold Bloc Currencies to rearmament finance

Dr Einzig's main thesis is that Hitler's Germany owes her ascendance to the financial deterioration of France's power, due to the protracted defence of the franc against devaluation. The financial causes and consequences of the Abyssinian War and rearmament finance are also dealt with.

12s. 6d. net

KEGAN PAUL

more with the sterling area, U.S.A., France, Netherlands, Belgium, and Switzerland. This accounts for the large favourable balances now emerging from trade with China, U.S.A., Sweden, Switzerland, and Great Britain; while these are in turn employed to offset the unfavourable balances in trade with Australia, Egypt, India, France and Germany.

The following table is eloquent of the improved trading position of all three countries:—

Monthly averages, in millions of local currency.

Year or Quarter	Austria (million schillings)			Hungary (million pengő)			Czechoslovakia (million Kč.)		
	Im-ports	Ex-ports	Trade Balance	Im-ports	Ex-ports	Trade Balance	Im-ports	Ex-ports	Trade Balance
1929.....	272	182	-90	89	87	-2	1,663	1,708	+45
1932.....	115	64	-51	27	29	+2	624	612	-12
1935.....	101	75	-26	33	38	+5	561	618	+57
1936.....	104	79	-25	36	42	+6	659	667	+8
1936. 1-III	102	75	-27	35	38	+3	554	576	+22
1937. 1-III	116	89	-27	33	50	+17	777	835	+58

Austria's stable import surplus on merchandise account is offset by her peculiarly advantageous income from tourist traffic. The extent of improvement in trading is obvious; and it is significant that, of the increased exports, a much smaller proportion is going to Italy and Germany. The free markets and their currencies have begun to exert a pull on Central Europe at a time when Austria and Hungary can at last envisage an end to their long-standing debt problems, when they are beginning to sell in a seller's market once again, and when Czechoslovakia is best placed to supply both her two neighbours and the expanding free markets. If recent world tendencies continue, the opportunity may soon occur to unwind the paraphernalia of exchange controls in Hungary, and to bring the currencies of Austria, Hungary and Czechoslovakia into correspondence with each other. Hitherto, the Austrian schilling and Hungarian pengő have been tied to the destinies of the lira and the Reichsmark. If recent improvements continue—indeed, if they *are* to continue—these links will have to be gradually loosened. In any case, the prospects before all these three key countries of Central Europe are more encouraging than for six years past.

Financial Notes

The Gold Scare Renewed.—The past week has witnessed a fresh manifestation of nervousness over the future of gold. In the London bullion market the discount below the dollar parity price has widened suddenly from 1d. or 2d. to 5d. per ounce, and in the absence of purchases for shipment to the United States, the British control has given extensive support. One cause of this new uncertainty was the publication in London of a statement in *The Far Eastern Review* that Russia's 1936 gold production was likely to be 10.6 million ounces, instead of the previous estimate of 7.35 million ounces accepted by the Bank for International Settlements and other authorities. This places Russia as a gold producer almost upon an equality with South Africa, and also indicates a Russian gold output of £75 million sterling in place of just over £50 millions. The new scare has elicited a guarded statement from Mr Morgenthau that no change in the American price of gold is imminent, but in view of the time of a week or more taken by gold in transit from England to the United States this has failed to reassure arbitrageurs or the American banks. On Thursday afternoon he followed this up with a denial either that any fresh statement was to be made that day or that preparations for a new statement were going on at present. Meanwhile, the prevailing uncertainty has naturally set in motion the realisation of private gold hoards, and a large part of the gold recently offered in London has been of this character. Sir George Schuster, in *The Times* of

June 3rd, is the latest to call attention to the harm being done by this uncertainty over the future of gold. In his article, Sir George declared that, sooner than see public confidence in the value of gold destroyed, he would prefer Great Britain to return to gold at the former parity with the dollar without delay. The suggestion has also been canvassed that the only alternative to an agreed reduction of the price of gold would be an international scheme for the restriction of production, analogous to existing schemes for copper, tin and other commodities. These suggestions raise wide questions which cannot be adequately discussed in a brief review. We have already expressed the opinion that for the time being at least the world's expanding gold stocks should be allowed to exert their normal influence upon prices, but we were careful to add that in the long run the position of gold itself might need to be reconsidered. More precisely the problem of whether or not to segregate in Exchange Funds permanent additions to the world's monetary gold stocks requires careful examination.

Russian Gold Supplies.—The position of London itself is worth viewing in perspective. We have therefore prepared the following table of British imports and exports of gold bullion during recent months:—

	Monthly Average			April, 1937	May 1937*
	1935	1936	1st quarter, 1937		
	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Imports from:—					
S. Africa.....	5.9	7.0	3.5	7.7	6.8
India.....	2.9	2.0	1.2	0.7	1.4
France.....	6.5	13.0	21.4	2.4	nil
U.S.S.R.	nil	nil	1.9	20.0	1.7
Other countries	3.7	3.4	2.2	2.1	1.4
Total.....	19.0	25.4	30.2	32.9	11.3
Exports to:—					
United States.....	6.9	4.7	17.1	30.1	15.3
Other countries.....	6.4	2.0	1.4	0.8	1.1
Total.....	13.3	6.7	18.5	30.9	16.4

* Four weeks to May 27th.

The table shows clearly the emergence of the U.S.S.R. as a supplier of gold during April, but the effect upon our total gold imports has so far been greatly mitigated by the simultaneous cessation of the outflow of gold from France. The May returns illustrate the intermittent character of arrivals of gold from Russia. Exports during May, while little more than half those of April, were in excess of imports for that month. A survey of the table suggests that the United States had suddenly to assimilate the April Russian gold arrivals, and this is clearly linked up with the beginning of the gold scare. This, in turn, caused a sudden drop in exports to the United States during May, but these last remained fully comparable with those of early dates, and so it is wrong to say that the gold scare was a complete deterrent. The fact that, in spite of the export surplus, official support was needed in the London bullion markets is indicative of the extent of the offerings of gold from private hoards. So far as London is concerned, Russian gold is a potential rather than an actual threat to the stability of the gold market, but this does not diminish the psychological reactions of this new factor. It is, however, still permissible to plead for a better sense of perspective.

The Foreign Exchanges.—This week the British authorities have had to buy most of the gold in the London bullion market, and there has been practically none bought for shipment to the United States. Thus not only has the bullion market witnessed a widening of the gold discount to 5d. per ounce below the New York parity price, but there have been no offerings of dollars in the foreign exchange market against gold purchases for shipment to New York. In consequence the dollar rate has strengthened in response to a fair general

demand for dollars. After being quoted last week at \$4.94 and over, the sterling fell at one time this week to under \$4.92. At this juncture the British Control intervened and bought a few dollars. This raised the rate to \$4.92½. There has been no change in the Amsterdam-New York cross-rate, so that the guilder has followed the dollar. There was some demand for belgas and Swiss francs. The spot rate for Paris francs remained very steady during the whole of the week at Frs. 110½. There was some improvement in the three months' rate from Frs. 2 to Frs. 1½ discount.

The Money Market.—The War Loan dividend payment has for the moment made money very plentiful, and in some quarters it was described on Thursday as being unlendable. So far as an "outside" rate can be quoted at all, it was probably ½ per cent. The call on the National Defence Bonds took very little money off the market, which is strong proof that the bulk of the bonds are held "inside" by the public departments.

	May 13, 1937	May 20, 1937	May 27, 1937	June 3, 1937
Bank rate	2%	2%	2%	2%
Clearing banks' deposit rate	½	½	½	½
Short loan rate:—				
Clearing banks	½-1*	½-1*	½-1*	½-1*
Others	½-1	½-1	½-1	½
Discount rates:—				
Treasury bills	½	½	½	¾
Three months' bank bills	½-¾	½-¾	½-¾	¾

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

Although money is very easy, there has been a distinct stiffening of discount rates. On May 28th the syndicate managed to reduce its tender price for Treasury bills from £99 17s. 5d. to £99 17s. 2d. per cent., but nevertheless secured 49 per cent. of the allotment. It looks as if the demand from other quarters, which early in May reduced the syndicate's allotment to below 20 per cent., has now subsided. This week hot Treasury bills have been offered at ½ per cent., while the rate for three months' bank bills is practically up to ¾ per cent. This increase in rates is purely seasonal, the reason being that the banks are reducing their purchases of bills in preparation for their half-yearly balance sheets at the end of June. There was, however, some business this week in mixed parcels of June and August Treasury bills at ⅞ per cent.

The Bank Return.—The contraction in the note circulation after the Coronation and Whitsun has for the moment been checked by the normal currency requirements of the public at the end of the month. The circulation is fractionally higher than a week ago.

	BANK OF ENGLAND				
	June 3, 1936	May 12, 1937	May 19, 1937	May 26, 1937	June 2, 1937
	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Issue Department:—					
Gold	207.3	318.7	321.3	321.3	321.3
Note circulation	433.5	479.9	481.4	475.2	475.6
Banking Department:—					
Reserve	34.7	39.6	40.7	46.9	46.5
Public deposits.....	8.2	32.5	19.2	24.9	10.2
Bankers' deposits.....	89.7	87.7	97.4	91.4	109.5
Other deposits	37.1	37.2	37.6	37.5	37.3
Government securities	98.5	108.3	103.3	99.5	102.8
Discounts and advances	6.2	5.9	6.6	4.9	4.7
Other securities	13.3	21.3	21.4	20.3	20.7
Proportion	25.7%	25.1%	26.4%	30.5%	29.6%

In the banking department the payment of the War Loan dividend on June 1st has caused the normal transfer of funds from public to bankers' deposits. It may also explain the small increase in Government securities, consisting possibly of Ways and Means borrowing to finance the dividend. The interesting point about the return is that the Defence Bonds call of £25

millions, also due on June 1st, does not seem to have counteracted the War Loan dividend payment, for otherwise the above movements would have been much less marked. This is further evidence in support of the belief that the bulk of the bonds are held by public departments.

Land Settlement in Australia.—A circular recently published by the Bank of New South Wales calls attention to the shortage of agricultural land in Australia for pioneer settlement and suggests the lines on which future policy should be directed. It is strongly urged that Government assisted settlement in recent years has been wrongly contrived. Too frequently, it is contended, the object has been to cram the greatest possible number of settlers into a tract of land without due consideration of their technical ability, their business experience or even the economic prospects of their undertakings. Past experiments in closer settlement have therefore been costly and unsuccessful, and the settlers have been unable to repay their Government advances. The true objective of policy, the circular contends, should be to maximise agricultural production. In pursuing this aim the Government should take a realistic view of the limitations of agricultural settlement. There is a reduced demand for farm products due to the general adoption in the world of self-sufficiency policies; only certain types of cultivation are suited to closer settlement; and wool production is best based on units larger and not smaller than the existing ones. To achieve any practical result in increasing the amount of labour in agricultural areas and to avoid the repetition of previous mistakes, the Government should conduct a comprehensive survey of the possibilities; and in particular should investigate new kinds of primary production and new scientific methods. In all the circular suggests that an interesting stage has been reached in Australian agriculture; and that its adjustment to new world conditions will not be easy.

Sun Insurance Office.—This office was founded two hundred and twenty-seven years ago and is the oldest insurance office in the world. It is also in a very strong position financially. Fire premium income last year was £2,214,000, a reduction of £79,000 on the previous year. Underwriting profits, although favourable at 10.4 per cent. of the premium income, were not up to the standard of 1935. Accident premium income was also considerably smaller at £1,747,000 against £1,854,000, but in this department underwriting profits were very much more favourable than in the previous year. Marine premiums fell by £25,000 to £528,000, and £50,000 was again transferred to profit and loss. The results of the last two years are given below:—

	1935		1936	
	Amount of Profit	Percentage of Premiums	Amount of Profit	Percentage of Premiums
Fire	310,556	13.6	231,049	10.4
Personal accident, etc.	24,785	1.3	114,190	6.5
Marine	50,000		50,000	
	385,341		395,239	
Less items debited to profit and loss.....	196,806		269,939	
	188,535		125,300	

The departmental reserves are strong; in addition to the usual reserve for unexpired risks there are additional reserves in the fire and accident departments amounting to 72 per cent. and 36 per cent. respectively of the premium income in respect of risks still current at the end of the year. The consolidated balance sheets assets amount to £10,875,000. There is a general reserve of £1,000,000; investment and contingency reserve was £242,000, and the profit and loss balance after providing for the year's dividend of £1,217,000. The dividend declared for the seventh successive year is 53½ per cent., and costs £248,000, compared with interest earnings of £256,000.

THE STOCK EXCHANGE

Cable and Wireless Prospects

A FORTNIGHT ago the stockholders of Cable and Wireless (Holding), Ltd., agreed to a reconstruction scheme which wrote down their nominal holdings from £46½ millions to £23½ millions, provided for preference dividend arrears, and greatly simplified the capital structure. The reorganisation was desirable in principle and not unfair in its incidence. It squeezed out the water from an undertaking over-generously capitalised, even under the favourable conditions of 1929. In the light of subsequent world trade depression, a standard revenue of £1,865,000 has appeared unbelievably roseate. Even last year, when international trade was showing definite improvement, actual profits were no higher than £842,000. These are, however, largely matters of the past. The investor's present task is to assess the effects of the scheme upon earnings and dividend prospects in the light of the Governor's speech a fortnight ago. The proper study of investment is earning-power, and our analysis, accordingly, begins with the revenue position.

The directors of Cable and Wireless (Holding) provide a brief consolidated revenue account in the consolidated balance sheet published each year, though a separate and more detailed account would be welcome. In its existing form, two revenue figures are shown. The first covers the profit from traffic services, dividends from traffic and other companies, and manufacturing and other credits, after deducting administration and other expenses; the second shows the income from the invested funds of the old cable companies, after deducting their debenture interest payments. This latter item admits little change in accounting methods from year to year. The main item, however, is a final balance, struck after allocations by the operating and subsidiary companies, which may differ widely in different years. With this proviso the consolidated revenues, as defined by the company, are shown below:—

	1935	1936
Profit on traffic services, etc.....	805,269	833,478
Investment income	630,319	331,589
Total	1,435,588	1,165,067

In order to follow the revenues throughout the system of operating companies and subsidiaries, however, it is necessary to examine the constituent companies' accounts in greater detail. The table which follows shows the profits retained (or over-distributed) by the operating company (now known as Cable and Wireless, Ltd., but formerly as Imperial and International Communications), by the three cable companies and the Marconi company, and by the holding company itself. The account does not cover the special dividend transfers from the operating company to the old cable and Marconi concerns in 1935, since they were non-recurrent operations and therefore irrelevant to the annual trend of earnings.

It will be seen that, traced in this way, the surplus for 1936 is in fact greater than for 1935. Briefly, larger profits of the operating company and the Marconi company have combined to offset smaller interest revenues. It may be added that if the figures are carried back to 1933 and 1934 they show the same progressive trend. In 1935 the operating company was called on to over-distribute its revenues. This was effected by treating as a revenue credit the tax which would be recovered from the dividend paid by the operating company to the old constituent cable and Marconi concerns. But since this tax was inevitably payable at some point, whether by

the operating concern or by the ultimate stockholders out of their gross dividends, this special tax credit of 1935 was equivalent only to a withdrawal of £208,004 from hidden reserves. In contrast, 1936 saw the beginning of the policy (elaborated by the Governor in his speech of May 24th last) of appropriating larger sums from revenue for reserves. In this manner, the operating company has charged against profits an "additional amount written off cost of terminating joint purse agreement" of £50,000, and has increased the sundry provisions appropriation (which includes an unspecified amount towards writing off the joint purse asset) to a record figure of £102,500, against £75,500 in 1935. In the analysis above it has been assumed that at least £30,000 of last year's sundry provisions may be regarded as a true reserve. Thus, while the operating company was able to declare a dividend of only 2½ per cent. last year, against 3½ per cent. in 1935, the past year's accounting has been much more conservative. In addition to the joint purse appropriations which we have regarded as a reserve (as explained above), the operating company has increased the balance carried forward from £1,398 to £94,343. How do these considerations affect the new ordinary stock of Cable and Wireless (Holding)?

In future, until the company has extinguished the new Funding Certificates issued to satisfy the preference arrears, an additional burden of £61,500 a year must be met out of profits. Our calculation of Cable and Wireless (Holding) profits above shows a total earned for 1936 of £247,400, after paying the preference dividend. This sum would provide £185,900 net (after meeting the funding service), which would be equivalent to almost 2½ per cent. on the new ordinary capital of £6,883,103. Alternatively, on the more conservative consolidated account shown by the directors (which does not treat the allocations to writing off the joint purse agreement as reserves), earnings would work out at slightly below 1½ per cent. Traffic revenues in 1936, however, were only slightly helped by the sudden improvement at the very end of the year. The current year should permit a

much better contribution from the main communications business of the group. For the first four months of 1937 the traffics index has averaged 86.2, against 73.0 for the first four months of 1936. If the first four months of 1937 bear the same relation to the year's total as did those of January-April, 1936, the average index for this year would be 87.8 per cent., against 74.4 per cent. last year. Such a rise would imply a very substantial advance in revenues. Last year gross receipts from messages and wayleaves (represented by the 74.4 per cent. average index) were £4,826,145. On this basis an average index for 1937 of, say, 85 per cent (i.e. appreciably lower than the 87.8 per cent. suggested above) would be equivalent to gross message receipts of £5,500,000, an increase of approximately £675,000 over those of 1936. It may fairly be expected that fully 80 per cent. of a gross increase of this order could be retained as a net increase, which suggests a potential improvement in net profits of the order of £540,000. If we add to this figure the surplus profits shown in the directors' consolidated accounts for 1936, a balance of £640,000 would remain, in round figures, after allowing for the service of the new funding certificates. This level of earnings would be equivalent to 9½ per cent. on the new ordinary stock.

In making their initial ordinary dividend forecast for 1937 of 4 per cent., therefore, the directors appear to be adopting a distinctly conservative policy. We should be the last to cavil at conservative finance, but some stockholders may ask why, when a drastic—though demonstrably necessary—writing down of capital has just been announced, the directors should simultaneously warn shareholders that a conservative dividend policy is necessary for the further writing-down of assets. Such a course would be natural if the group were short of liquid reserves, but in fact its investments at December 31st last amounted to £12,116,009. Can it be, therefore, that the directors are deliberately limiting the dividend prospect on the new stock, either with the object of equalising dividends in a concern singularly exposed to cyclical fluctuations, or because they do not feel confident that the loss of traffics to foreign subsidised circuits and to air mail systems is yet at an end?

None but the board can answer this question. To offset such fears, however, it is permissible to point to the possibility—to put it no higher—that a further recovery in international trade will contribute to the restoration of traffics. Since a rise of 1 per cent. in the average index for the year would be equivalent to earnings of nearly ½ per cent. of the new ordinary stock, on our computation, the importance of further recovery in traffics is clearly substantial. A five-point rise in the index would imply an extra 3½ per cent. in earnings for the ordinary. Secondly, the Governor referred in his last speech to the possibility that the Government might grant some modification of the original charter. The board has always contended that certain services are unprofitable and are only maintained for their strategic value at the request of the Government. If the latter would agree to contribute towards their cost, a useful addition might be made to net profits.

While, for the moment, therefore, the directors are certainly not disposed to exaggerate the prospects for the new ordinary stock, investors may reasonably conclude that it provides a relatively high-gear equity in international trade recovery. Present indications, as we have shown, suggest that the stock is probably earning at least twice the anticipated 4 per cent. dividend. A conservative accounting policy may obscure these facts in the next accounts; but so long as there remain prospects for expansion in international trade, the new ordinary stock—still represented by the existing "A" and "B" ordinary of the holding company—should provide a speculative investment with interesting possibilities. The present price of the "A" and "B" ordinary stocks are equivalent to about 83½ per cent. of par for the new ordinary stock, on which a 4 per cent. dividend is virtually assured. There are few stocks, even after the recent market adjustment, which offer a prospective yield of 4.8 per cent., underwritten, so to speak, by the directors, and which also have a reasonable chance of being covered by earnings of twice that rate.

Investment Notes

Course of Share Values.—On the whole the policeman's lot has continued to be the shareholder during the past month, both in London and New York. As our customary chart shows, both markets have recovered substantially from the lowest point, and have shown only a small net decline during the month. But the recessionary movement (which started about a couple of months later in New York than in London) has lasted longer and gone further than any secondary depression in the last two years. The nigger in the British woodpile in late April and throughout May, was the National Defence Contribution of unhappy memory. In America industrial recovery is maintained, but Mr Lewis goes from victory to victory, and President Roosevelt, playing the lion's part, refuses to roar like a sucking dove.

BRITISH AND AMERICAN INDUSTRIAL SHARE VALUES DURING THE PAST TWO YEARS (1928 = 100)

British: "Financial News" Index of 30 Ordinary Shares
American: "Standard Statistics" Index of 50 Common Stocks

After the first flush of gratitude to Mr Chamberlain: his abandonment of N.D.C., British investors will doubtless realise that its successor will be a heavy impost, though it will be more fairly spread, and that it is likely to fall entirely on the equity shareholder. the market's present mood, this may itself be enough prevent a widespread recovery, or even to cause a slight further reaction. The occupants of the woodpile, index have changed so frequently this year that there is strong suggestion that any face is black enough to frighten those whose nerves are already jangled. There is no doubt however, that the market is technically stronger than was a month ago, and attention has been shifted from immediate possibilities to the longer term outlook, which is discussed in the next Note.

The Market Horoscope.—When King Ahab sought the advice of his prophets, only one spoiled the music of the resulting invocation to go up to Ramo Gilead and prosper. A year ago, this thankless rôle was reserved for *The Economist*. To-day, the cautionary minority is larger. Three reviews of the outlook, issued this week—two by stockbroking houses and one by merchant banking firm—are symptomatic of the character. One circular discusses rising costs, Government expenditure and the background of the gilt-edged market. reaches the conclusion that investment policy should be based upon the anticipation that during the next years interest rates are likely to rise and gilt-edged prices to fall. The writers proceed to argue that ordinary share earnings are tending increasingly towards stability.

There is little fear that company profits will be reduced but it is unlikely that dividends will be greatly increased. This argument, it is expressly stated, does not apply to shares in shipping companies, overseas banks, and investment trusts, to producers of certain primary commodities and to some iron and steel or textile companies. In the groups, however, to which it does apply, a rise in interest rates would be a bear point for ordinary shares. The writers of this circular refuse, however, to believe that prosperity is yet passing its peak. A lucid and well-argued bulletin issued by another firm begins by postulating the importance of the Government's defence expenditure programme. It contains the following analysis, covering 90 per cent. of the total provided under the Defence Estimates:—

DEFENCE EXPENDITURE
(£ millions)

	1934-5	1935-6	1936-7	1937-8
Pensions	18.0	18.2	18.6	18.7
Wages and salaries (a)	41.5	48.2	53.2	59.1
Food, clothing, quartering, barrack stores, etc.	9.5	11.1	13.2	16.4
Oil and petrol	2.0	2.5	3.9	5.4
	74.0	80.0	88.9	99.6
Aircraft, guns, ammunition, vehicles, all engineering supplies and metal goods (b) ...	12.0	20.5	44.9	85.0
Constructional work (aerodromes, etc.) :—				
Staff salaries	1.0	1.0	1.1	1.7
New construction (inc. land purchases) (c)	4.0	7.9	13.3	32.5
Maintenance work	1.5	2.2	2.3	2.3
	6.5	11.1	16.7	36.5
Shipbuilding and naval engineering :—				
New construction (inc. machinery, armour and gun-mountings, but not guns)	10.5	12.1	16.6	28.0
Repair work	6.0	7.8	9.2	10.1
Dockyard stores, etc. (d)	4.0	5.9	8.2	11.9
	20.5	25.8	34.0	50.0
Total (including miscellaneous items) ...	114.0	145.6	195.2	284.6

(a) Includes all pay of all sections of the troops, and all salaries, including administrative salaries. Also includes social and health insurance.
(b) All goods of a metal nature—lorries, armaments, aircraft, ammunition, tanks, electrical apparatus, etc. The 1937-8 figure includes a large item for machine-tools, including an estimate of machine-tools needed for new Royal Ordnance Factories.
(c) Includes cost of land for new factories, both private and Government.
(d) This item represents the provision of naval stores—steel, timber, armour, etc.—in excess of actual construction needs.

In view of the huge increase in metal and engineering supplies and in constructional work, shown by these figures, the writer concludes that the Government's programme will require a slowing down of non-Government engineering, shipbuilding and house-building.

The report proceeds to argue that Great Britain has entered upon the inflationary stage of her internal boom, which will last as long as re-armament expenditures increase, but will eventually be checked by increasing costs and taxation. No severe reaction may occur in 1938, particularly if the export trades can be revived, but a severe slump is possible if Government re-armament expenditures are eventually curtailed and no scheme of public works is ready to replace them. These views certainly go beyond those of the majority of observers—or perhaps they are more clearly expressed. There is, however, a general disposition to believe: first, that some kind of internal inflation is inevitable; and, secondly, that this is likely to deter the authorities from appreciably expanding the basis of national credit. The merchant banking circular, to which we have referred, aptly sums up the position by saying that the difference between contemporary optimists and pessimists lies mainly in the emphasis they place on the effect of possible expansion in export, as distinct from domestic, trade activity.

First Conversion Investment Trust.—A company with a capital of £1,000,000 has been incorporated under this title. Its shares are now being offered, one for one, to holders of sub-units in British Empire Fixed Trust Series "A," who were recently invited (see *The Economist* of April 17th, page 157) to express their

willingness to receive a scheme of conversion. In principle, the scheme obtained sufficient support to enable the directors to publish the details this week. The board consists of five gentlemen, of whom the chairman and two others are directors of existing management trusts. Mr A. L. Aymer, at present managing director of Fixed Trust Investments, Ltd. (the managing company for the British Empire Fixed Trusts), is also a member of the board. The new company thus has the advantage of a capable and experienced board. When the British Empire sub-units were subscribed, Fixed Trust Investments received a management charge covering the twenty-year life of the fixed trust, of which less than four years have elapsed. This company, therefore, proposes to provide secretarial services to the new investment trust "on terms which ensure that the latter will be relieved, in respect of the capital subscribed through the conversion of sub-units, of all ordinary management expenses [up to November 1, 1953], except directors' fees and audit fees." In other words, Fixed Trust Investments will reimburse the proportion of its original loading charge in service and not in cash. Further, F.T.I. undertakes, "under the instructions of the board of directors," to carry through all transactions in securities. For this service they will receive the "usual return commission paid by stockbrokers to agents," or alternatively not more than a quarter of 1 per cent. on the value of the securities. Capital duty has been paid by the company, but other formation expenses are chargeable to F.T.I.

Points of Principle.—In the First Conversion offer no reference is made to the proposed investment policy of the board who, like the boards of other investment trusts, will have practically *carte blanche*. This is a sad recantation for one of the best sellers in a movement which based its original investment claim on immunity from the errors of management. An actual example of the time (not from the British Empire publicity) reads oddly nowadays:—

The fixed trust differs from all other forms of investment trusts in the fact that its constitution, framed in the trust deed, eliminates all practical possibility of an error of judgment from the administration of the trust's investments.

To reproach the white-robed penitent, carrying book and candle, is an ungrateful act, particularly when the doctrine re-embraced may be nearer the true faith than the heresy forsworn. In the present instance, however, certain practical consequences demand careful analysis. For example, problems of marketability may well arise, particularly if the new board intends to form a diversified portfolio with a lower yield basis than the existing units. The public for trust units and managed trust shares is not identical, and there are advantages of marketability for the former, provided that circumstances are not wholly abnormal, which have not always been achieved by the latter. A flexible unit trust might have provided most of the advantages claimed for the new company. A further point concerns the proposed management arrangements. Since F.T.I. are entitled to return commission, it follows that the new trust itself will have to meet full commission, since no further rebates—such as are commonly made to large clients on business exceeding £2,500—would be permissible. Presumably this limitation will increase the working expenses of the new trust compared with others whose management is not tied in this way. It may be asked, moreover, whether brokers will be encouraged to approach the trust with investment proposals under this arrangement. In fine, a decision to make over the unexpired loading charge on converted units in cash to the new company would have been simpler and perhaps, on the whole, more advantageous than the method which has been adopted. The offer is open until June 15th. So long as any holders elect to continue their existing sub-units, the British Empire Series "A" fixed trust will necessarily remain in existence.

Foreign Bond Movements.—Foreign bond prices closed with a net gain in May, despite the critical international situation during the closing days of the month. Only South American issues showed a fall, and European bonds, despite the tense atmosphere, achieved a small improvement. In consequence, the "Municipal and General" index of 110 foreign bonds shows an advance from 115.4 to 116.2 (average January-June, 1934=100). Component indices follow:—

Average January-June, 1934=100										
	Europe	Near & Far East	Egypt	South and Central America			Complete Index	Under-allocated Bonds	Defaulted Bonds

Note: Figures in brackets show number of bonds.

Among the component series, Far Eastern and Egyptian bonds are close rivals for best performance. On the other hand, defaulted Brazilian and Chilean issues have been largely responsible for the weakness of the South American section.

City of Moose Jaw Debt Proposal.—Unofficial news has been received in London that the City of Moose Jaw, a Saskatchewan municipality, has obtained an order under powers conferred by the Province of Saskatchewan as recently as last December, to reduce the interest on its bonds by 40 per cent., with a minimum level of 3 per cent. The City has two sterling issues totalling £583,000 and bearing interest at 4½ and 5 per cent. Bondholders in London, who were unaware of the existence of the Local Government Board which has granted the order, have received no notification of the proposals. Apart from their arbitrary nature, additional hardship is involved by a rule that objections must be filed in Regina by June 12th. It is understood that the decision may be cancelled if 20 per cent. of the bondholders affected lodge objections within 30 days of the issue of the order, which was, in fact, made on May 14th. Meanwhile, the bonds, which were quoted last Thursday week at 76-81 for the 4½ per cent. and 82-87 for the 5 per cent. issues, have been withdrawn from the Official List. Although there is some possibility that the last day for objections may be extended to June 19th, bondholders will obviously have little opportunity to obtain forms from their brokers and lodge them by this date. They have every right to object in the strongest terms to this secretive and arbitrary treatment.

Total of Listed Securities.—The Stock Exchange Committee's report on which we commented last week, has been augmented by the usual statistics showing the total of the securities in the Official List and the granting of permission to deal. The nominal amount of the issues outstanding at the end of the latest Stock Exchange year was £17,846,746,382, of which roughly £10,426,000,000 was in various Government and corporation stocks and bonds. Allocations to the List during the year 1936-37 resulted in a net increase of £322,261,009, out of which, as a result of the Funding Loans, British funds alone accounted for some £290 millions. Investors will note with interest that the number of bargains marked in the Supplementary List rose by 27 per cent., against 5 per cent. for those in the Official List.

Capital Issues in May.—N.D.C. effectively barred industrial issues during May, and the month has been redeemed by a small number of important fixed-interest issues, of which the largest was £4,040,000 of new money represented by the Leeds 3½ per cent. loan. The following table shows our computation on the new and old bases:—

(000's omitted) Excluding Conversions				
Monthly Average (Old Basis)	United Kingdom	British Possessions	Foreign Countries	Total
1933	17,520	2,429	449	20,398
1934	11,474	2,494	125	14,093
1935	18,388	1,270	21	19,679
1936	19,195	2,035	58	21,288
(New Basis)				
1935	27,233	2,443	97	27,773
1936	37,370	2,823	964	41,157
Monthly Total (Old Basis)	Govt.	Other

March, 1937	Dr. 200	7,339	2,261	9,400
April, 1936	Dr. 350	10,321	280	10,281
April, 1937	99,150	8,786	3,129	111,065
May, 1936	Dr. 300	15,078	2,014	17,000
May, 1937	Dr. 400	7,001	3,077	9,678
(New Basis)				
March, 1936	200	17,762	1,203	19,965
March, 1937	Dr. 200	25,672	5,507	30,979
April, 1936	Dr. 350	22,447	1,495	25,585
April, 1937	99,150	12,485	11,495	123,130
May, 1936	Dr. 300	28,442	2,387	30,821
May, 1937	Dr. 400	22,551	3,314	25,465

Comparison with April is affected by the National Defence Bond issue, but excluding this loan, issues to the public or to shareholders amounted to £11 millions. The figure for May fell to £9½ millions, of which 83 per cent. represented large fixed-interest offers. Our calculation on the "new basis," however, shows a slight increase in May, due entirely to a rise in non-Government domestic borrowing, which totalled £28½ millions against £22½ millions. The month as a whole, however, was sub-normal.

"I parted with £1,600, including all my securities."

Widows with a little capital and no experience in financial matters are sometimes easy prey. The tale is always the same. The tempting bait of high interest yields is swallowed... glowing promises are followed by bitter disillusionment and loss of capital. Tragedy indeed. For the protection of your wife, should you leave her a widow, choose the 'Safeguard' plan. None better. It provides a guaranteed income of £3, £6 or £9 per week according to her needs. It will free her from investment worries and shield her from traps laid for the unwary.

The 'SAFEGUARD' PLAN

provides a non-fluctuating income of £3, £6 or £9 per week for a period of years after your death and a cash sum, if desired, when the income commences. When the annual income ceases a cash payment of £1,000, £2,000 or £3,000 is made. If you survive the period of your family responsibilities it can be arranged that the cash sums are payable to you.

An enquiry for full details and for an illustration suited to your own circumstances will cost you nothing; rest assured you will incur no obligation by doing so.

LEGAL & GENERAL ASSURANCE SOCIETY LTD.

General Manager: W. A. WORKMAN, F.I.A.

Company Notes

Callender's Cable Record.—A striking advance to record profits is shown by the Callender's Cable and Construction report, which is even better than the recent increase in the dividend from 15 per cent. to 20 per cent. could have suggested. Total profits have increased from £647,515 to £833,640; and the amount available for ordinary dividends shows an advance from £252,449 to no less than £392,366. The ordinary distribution, in fact, is covered by earnings of 39.8 per cent., after allowing for income tax. Even in pre-depression years, the earnings percentage (on a capital of £800,000 compared with the present level of £1,123,916) was little more than 30 per cent. In short, the company's profit-earning capacity has been transformed during the past decade. Even granted the close system of co-operation in the cable industry, such results are remarkably good, and they betray no ill-consequences of rising costs. The results, indeed, seem to be attributable to an increase both in home and export business, and to recent technical improvements which the company has effected. Such expansion is reflected in the balance sheet, which matches the favourable nature of the profit and loss account with a display of great strength. In particular, the general reserve stands at a round million pounds after the present allocations, and suggests obvious bonus possibilities in due course. The last capital bonus was in 1928. The ordinary stock stands at 94s. for the £ unit, yielding £4 8s. per cent. on dividend, and £8 15s. per cent. on earnings. It may be regarded as a "gilt-edged" industrial investment, balancing its stable dividend prospect with handsome earnings cover at present and eventual bonus possibilities.

Marks and Spencer Meeting.—Mr Simon Marks' speech, at the Marks and Spencer meeting, fell into two parts. The first reviewed, with natural and proper satisfaction, the achievements of the company during the last decade. Profits have risen from £88,000 to £1,430,000; the company has expended over £8,000,000 on capital account, of which £7,250,000 has been invested in properties. The business, of course, has not grown by the mere addition of numbers. During the period, its entire trading scope has been perceptibly altered. The size and the character of its stores have been transformed, and the volume of business has increased fourteen-fold. Such growth demands the most careful attention to the recruitment of personnel, and to problems of staff welfare. On both these points, Mr Simon Marks' comments were of decided interest. Even more important, from the aspect of retail management, was the chairman's second main topic—the new link which the company has forged with its suppliers. The large market which the fixed-price store organisation now provides enables the manufacturer to achieve remarkable economies in the costs of merchandise. By a process of co-operation, the store management brings its experience and experiment in the mass retail market to the assistance of the manufacturer. This process has not been exhausted, even within the context of a 5s. price limit. Since the chairman emphasised that this joint policy would enable the company to solve the problem of a further rise in costs, the outlook for the undertaking remains favourable.

J. Lyons Profits.—It is at least singular that a company engaged in the competitive catering trade should show so little variation in profits as J. Lyons and Company. The company has recently declared a dividend of 22½ per cent. for the tenth year; during the decade, earnings for the equity have varied between £522,967 and £482,036. The investor appreciates the stable nature of J. Lyons dividend and earnings record, but he must not imagine that disclosed earnings reflect the actual fluctuations that have taken place in the business. We reproduce *in extenso* at the foot of the

accompanying table the definition of the profits figure as given in the latest accounts. Without knowledge of the appropriations made for contingencies, the real changes over the past few years are hidden in mystery:—

	Years ended March 31st		
	1935	1936	1937
Profit†	1,021,222	1,022,679	1,024,329
Directors' fees.....	11,950	11,925	13,452
Preference dividends*	490,353	490,353	490,353
Ordinary and "A" Ordinary:—			
Earned‡	518,919	520,401	520,524
Paid	374,911	374,911	374,911
Earned (%)	29.5	29.8	29.9
Paid (%)	22½	22½	22½
Proportional shares dividend	42,750	42,750	42,750
Reserve	100,000	100,000	100,000
Carry forward.....	36,602	39,341	42,203

† "Balance from trading account, dividends from subsidiary and associated companies and transfer fees after deducting interest on debenture stock and mortgages, directors' fees, salaries, wages, rents, rates, repairs, maintenance and other expenses and after providing depreciation and reserves against contingencies." * Including preferred ordinary. ‡ Includes earnings on proportional profit shares.

We know, however, that the strain of increasing costs is reducing the company's profit margins. The company raised its price for tea during the year, and that it did so in collaboration with its main competitors proves how general are the price problems confronting caterers. Increasing costs are still the problem, although the disclosed profits give no sign of it. The financial stability afforded by the company's record is fully reflected in the present price of 6½ for the ordinary shares. The yield of £3 11s. per cent. is on the low side for a stable industrial, even of this high quality.

Imperial Continental Gas Developments.—The latest reports of utility undertakings have for the most part shown only a moderate increase in profits. In a year of changing conditions on the Continent, therefore, it is satisfactory that the I.C.G. profits of £599,906 to March 31st last fall short of the previous level by only £7,000, so that the 10 per cent. dividend was again just covered by earnings. Fortunately, the Association is interested primarily in Belgium, a country which has shared in growing industrial prosperity, and overcame its devaluation terrors earlier than last autumn. Most of the dividends from Belgian subsidiaries have been maintained or increased, Les Cokeries du Brabant, for instance, being able to resume distributions. In France, however, current industrial problems are emphasised by Sir Thomas Royden's statement at the annual meeting that the working year had been reduced to 251 against 305 days—while wages are 30 per cent. higher than formerly. Stay-in strikes, moreover, have affected the industrial power load. But, owing to the Association's policy of covering exchange risks, the devaluation of the franc did not materially affect the report. It was stated at the meeting that French income was brought into account at Frs. 79.31 to the £. The important acquisition of Edmundsons' Electricity ordinary shares was made last July. A full year's revenue from this new interest should go far to offset the reduction in income from France in the current period. This outlet for the Association's extensive liquid resources consists of some 28 per cent. of Edmundsons' ordinary capital. The balance sheet shows that investments in allied and subsidiary companies have risen from £7,814,139 to £9,684,615, but the Association has been drained of surplus liquid assets in the process. Current assets amount to £121,894, but creditors and provisions stand at £477,065, and the final dividend requires £252,000. Yet there is a bank loan already standing at £155,000. Thanks to Edmundsons' purchase, however, and the favourable industrial outlook for Belgium, the Association's prospects for the current year on the whole continue to be promising. The ordinary stock, at 156½, yields £6 8s. per cent.

Anglo-Iranian Oil.—The dividend and profits statement from Anglo-Iranian this week have fulfilled the best expectations. The cash distribution has been raised from 15 per cent. to 25 per cent., and the directors propose a capital bonus of one new share for every two held. These results comfortably exceed the market's estimates of 22½ per cent. with a scrip bonus of one in three. The profits' statement, similarly, has satisfied even those who were prepared for a demonstration of two years' recovery. It has generally been held that the 1935 profits were conservatively computed, as a result of the Sanctions crisis. This year's increase of 75 per cent. in net profits, however, substantiates the company's capacity for recovery, as the following table shows:—

	1934	1935	1936
Total profit	6,109,277	6,129,645	...
Royalties, etc.	2,159,143	2,191,921	...
Taxation and directors' fees...	524,439	418,541	...
Debenture interest	242,500	...	...
Net profit	3,183,195	3,519,183	6,123,469
Additional depreciation	459,107	408,747	514,976
Preference dividend	1,071,234	1,071,234	1,071,234
Ordinary stock:—			
Earned	1,652,854	2,039,202	4,537,259

† And 50 per cent. scrip bonus.

If the Sanctions interpretation of this rapid advance is even partially correct, the forthcoming results of other large oil producers may not show comparable progress. But for reasons common to them and to Anglo-Iranian alike, their performance and prospects should be good. Anglo-Iranian itself is interested both in the British petrol market and in world markets. Unless investors are disposed to take a gloomy view of the American stock position, the oil outlook is demonstrably favourable. For Anglo-Iranian, moreover, the Iraq petroleum interest should continue to produce an increasing source of revenue. The present earnings basis of the ordinary stock, after its jump from 6½ to 6¾ this week, is exactly 6 per cent. If investors make the common assumption that the total cash distribution will be increased as the result of the capital bonus, the ordinary stock seems fairly valued. Its dependence upon an assured outlet from the Mediterranean, indeed, appears to be the one qualifying factor in its long-term outlook.

"Shell" and Royal Dutch Dividends.—Compared with the welcome accorded to the Anglo-Iranian results, the market gave the Shell and Royal Dutch dividends a less enthusiastic reception. The directors of "Shell" Transport have decided to pay a final dividend of 12½ per cent., tax free, on the ordinary capital, including the one-in-five free bonus issued last January. The total for the year, therefore, is 20 per cent. On this news, the shares dropped back to 5½, to yield the equivalent of £4 17s. 6d. per cent. gross, after allowing for the accrued dividend. The Royal Dutch final dividend is 11½ per cent., making 16½ per cent. for the year, compared with 10½ per cent. for 1935. This announcement, similarly, was greeted with a setback in the shares from 47½ to 45½. These payments were not up to the market's most hopeful expectations, though they might have fallen on more fertile ground, but for the renewal of the gold scare in an acute form, which affected the market on Thursday.

D. and W. Murray Reconstruction.—Since July, 1930, dividends on the 7 per cent. preference shares of D. and W. Murray have been unpaid. The 1935-36 accounts, however, suggested that the turning point has been reached after a series of heavy deficits, and the prospects for Goode, Durrant and Murray, in which the company has investments of £291,000 at cost, have also improved. The reconstruction scheme now presented involves the

cancellation of seven years' arrears on 1,000,000 £1 preference shares. These are to be converted into one 5 per cent. cumulative preference share of 10s. and two ordinary shares of 5s. The 450,000 £1 ordinary shares are to be reduced to 4s. 6d. nominal, and consolidated into 5s. shares. The ordinary capital, however, had but a nuisance value, and appears to receive its full deserts—if indeed not more—under the scheme. The new capital will require a fixed preference charge of £25,000 in future years, and since the company hopes to show higher profits than the £33,496 recorded last year (though before full provision for unrealised exchange losses), payment of this sum should involve no difficulty. The equity of nearly 17 per cent. in the remaining profits, which the existing ordinary shareholders receive, seems to err on the side of generosity, seeing that it is largely an *ex gratia* allowance made, out of their goodness of heart, by the existing preference shareholders.

United Sua Betong.—Although no details are given of the average realised price of rubber or of costs of production during 1936, a rise of 26 per cent. in the gross profits of this estate company is welcome, since the payment of a 13½ per cent. dividend, against 10 per cent., was somewhat lower than the best estimates. Purchases have been made of 930 acres of adjoining properties, the value of new acquisitions appearing in the balance sheet at £38,423, against £15,874. The crop expected during 1936 was 8,476,000 lbs., against 7,650,000 lbs., and the outlook for the current year is the more favourable since the standard assessment has been fixed at 15,512,000 lbs.—or 11 per cent. more than the 1936 figure. After deducting estate and London expenditure of £157,472 from the 1936 gross profits of £289,908, earnings for the equity amount to 17.4 per cent., against 11.8 per cent. The actual distribution, therefore, is the most conservative of recent years by a wide margin. For the first time since 1929 an appropriation is made to general reserve, raising it to £180,000. The need for large reserves, however, is

HAVE YOU TRIED

of the petrol. The result is even

smoother running, better pick-

up, and an absence of 'pinking'.

YOU CAN BE SURE

OF SHELL

reduced by the substantial balance on share premium account, which stands at £939,948 in spite of a transfer of £100,000 to a newly-created estates reserve. The various classes of reserves in fact amount to £1,336,947, against a balance-sheet total of £2,282,677. Holdings of gilt-edged stocks have risen, while a new item appears of £50,000 deposited with a finance house. Although the information given to stockholders by this company is not so detailed as in some cases, the prospects for the current year, measured by the general experience of the industry, appear favourable. At a current price of 33½, the ordinary stock yields £3 18s. per cent.

* * *

Other Company Results.—Our usual analysis of profit and loss accounts, appearing on page 599, again comprises over fifty further companies. The reports continue to cover a wide field, and include some interesting trust results and a number of miscellaneous industrials, such as Great Universal Stores and Associated Newspapers. A discussion appears on page 600 under the heading "Shorter Company Comments."

* * *

Company Meetings of the Week.—Reports of ten company meetings will be found on later pages of this issue. The speeches at the *Marks and Spencer* and *Imperial Continental Gas Association* meetings are discussed in notes on page 578. Mr P. M. Anderson's speech to the members of *Union Corporation* in Johannesburg was referred to on page 520 of the last issue of *The Economist*. Mr Anderson expressed his full concurrence with the views of Sir Henry Strakosch, the chairman and managing director of the Corporation, which emphasised the untoward deflationary effects which would result from lowering the price of gold. Addressing the shareholders of *Sena Sugar Estates*, Mr A. N. Lubbock discussed the brighter prospects for sugar resulting from the success of the International Sugar Conference. Mr Lubbock disclosed that the free market quota allotted to the Portuguese colonies would allow the company to expand its own production when prices became remunerative. At the *Val de Travers Asphalte* meeting, the chairman stated that the depreciation of the lira prevented the company from distributing a dividend since special stock depreciation was required. The chairman of *Stephany (Furniture Trades)* disclosed that much of the stock had been bought at prices considerably below current values. Shareholders of *Boulder Perseverance* were informed that the Enterprise Leases showed 180,000 tons of proved ore and over 450,000 tons of probable ore. Lord Trent, in his address to *Boots Pure Drug* shareholders, surveyed the field covered by the Research Department, outlining some of the more interesting developments. He referred, moreover, to the progress made in the new Beeston factory. At the *Ever Ready Company* meeting, Mr Magnus Goodfellow explained that owing to forward purchases and the saving in production costs resulting from mechanisation, he was of opinion that it would not be necessary to increase prices during the year. The chairman of *Dalkeith (Ceylon) Rubber Estates* reported that 60 per cent. of the estimated exportable crop for 1937 had already been sold forward at prices 31 per cent. over 1936.

OFFER TO NEW READERS

Any reader who makes his first acquaintance with this journal with this week's issue is invited to fill up the attached:

To The Publisher, Economist Newspaper Ltd.,

8 Bouverie Street, E.C.4.

In order to test the value of your publication I should like you to forward it to me by post for the next four weeks. If I then decide to become a subscriber, it is understood that there will be no charge for the copies thus received, but otherwise I shall be willing to pay 4s. to cover their cost.

THE WEEK IN THE MARKETS THE STOCK EXCHANGE

SETTLING DAYS

TICKET: JUNE 8 ACCOUNT: JUNE 10

THE market is rid of N.D.C. and would have made a smarter recovery as a result but for its two new burdens—political uncertainty arising from the "Deutschland" incident, and a renewal of the gold scare. Satisfied that it has made a good bargain by losing a burden of £12½ millions in exchange for one of £25 millions, industry welcomed the abandonment of N.D.C., and admittedly its removal does lift the restraints on enterprise and investment which were threatening the prospect of further industrial advance. It seems, however, that the market has an equal fear of a fall in the gold price, for business has not picked up to any appreciable extent, and price advances have been limited.

Political trouble was responsible for the virtual cessation of business on Monday, which affected almost every department of the "House." In the gilt-edged market, the prospect of further corporation borrowing on terms more favourable to lenders acted as an additional restraint. The tone was steady on Tuesday, but again closed dull. In mid-week, Old Consols and Local Loans were quoted *ex* interest unchanged, but other issues were slightly easier. In the Dominion list, "Sydney Drains" attracted no interest, being ½ discount in mid-week.

The uncertain political situation brought some selling of German issues, and the political crisis in Japan was also marked by lower quotations. Both groups were better in mid-week dealings. Brazilian issues opened weak, but improved later.

The initial depression affected home rails, although there was no general readiness to sell, and the quoted falls flattered the volume of offerings. Even in mid-week the market was unable to retain all its gains—only L.M.S. ordinary were higher and the rest unchanged. The rally was more effective in the Argentine rail market where, after two poor days, some useful gains were recorded.

The first two days in the industrial market were characterised by the growing feeling that N.D.C. would be withdrawn. Shares which had been singled out for selling on N.D.C. were as quickly marked up when anticipation was officially confirmed, the main improvements being recorded by iron and steel and motor shares. In the latter group, Standard were prominent.

Aircraft shares staged a prompt recovery, and the leading electrical equipment shares, including Crompton Parkinson, were marked up. Brewery shares improved with the rest of the market, although there was no great accession of business. The fixed-price store issues led the recovery in the store group, where small advances were common. Shipping shares opened dull, but staged a mid-week rally.

In the miscellaneous group, Turner and Newall, Murex and British Oxygen all advanced sharply, but failed to hold the whole of their gain. The building material and light engineering shares also showed the same partial recovery.

The oil share market has naturally been dominated by vicissitudes of the N.D.C. and by the situation in Spain. At the end of last week the outbreak of a strike in Mexico caused a sharp break in Mexican Eagles, and the market as a whole was dull despite excellent consumption figures. On Monday a further general fall occurred, though conditions improved later. The Anglo-Iranian results and the end of N.D.C. then gave rise to a sharp reversal of opinion, which continued merrily, led by Royal Dutch, on Wednesday. The "Shell" and Royal Dutch dividends were followed by lower quotations. In the rubber market events moved in much the same way, though with less violence. Not all the sharp advances in quotations were maintained, and business was consistently small.

Monday's recession in mining shares was large, but both then and later the volume of business was small. At the same time Roans and Rhokana fell sharply in sympathy, as did also West Africans, Barriers and Trepsa. Copper shares were the first to recover, but the rest remained weak, until the withdrawal of N.D.C. caused a general recovery. Nevertheless, the renewal of gold scares kept the advance in Kafirs very moderate, and Thursday saw yet another relapse.

OVERSEAS STOCK EXCHANGES

NEW YORK

THE past ten days have the unenviable distinction of producing further low two-year records in the number of bargains done. Before the Memorial Day holiday, business was lifeless, an exception being U.S. Steel, which gained partly on hopes of orders diverted from the independent producers owing to the strikes, and partly from the afterglow of the preferred distribution. On reopening on June 1st, prices were lower than at the previous close, and sagged slowly but uninterruptedly; the later recovery was accompanied by a very poor volume of business. The main point of discussion was the renewal of rumours of changes in the price of gold, and Mr Morgenthau's denial that any immediate steps were being taken. In the next session measurable but unconvincing technical recovery took place under favourable London influences and slightly less gloomy news from Spain. Rails were well supported, and steel and automobile shares advanced, although it had already been reported that as a result of the strikes, steel mill activity had fallen from 91 per cent. to 77.4 per cent. of capacity. By mid-week there was further bad news from the labour front. Following an incident at the spare parts plant, a stoppage spread to other sections of the Chevrolet organisation, symptoms of trouble occurring also in other automobile plants.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926=100):—

PARIS

ON the whole the month of May was the very opposite of merry, and passed in uneasy fashion—though in that respect it has been no different from other centres. The trend of prices was downward in spite of occasional rallies, weakness in Renten depressing other sections, though by way of compensation, helping them during one bright session towards the end of the month. The irregularity or lethargy affecting nearly all stock markets was, however, made more pronounced in Paris by a difficult technical position. A more cheerful tone was noticeable early in the month, as the end-April settlement, helped by lower interest rates, seemed at first to be taking place more smoothly than had been expected. But by the

(Continued on page 584)

IN QUEEN VICTORIA'S REIGN

—1854— the House of Rattray was established. Now, as then, they specialise in the blending, tending and maturing of choice tobaccos—their fame is world-wide—their reputation unique. Unheeding of the modern craze for speed and output, the Rattray's tobaccos are still matured and blended under the same careful and leisurely conditions.

7 RESERVE

is skilfully blended from seven selected varieties of choice tobacco—no single flavour predominates.

(Continued from page 581)

middle of the month prices were depressed by unfavourable foreign influences combined with much forced selling. Bank shares were affected by a slump in Union Parisienne shares. The last ten days were in the main dull, one of the quietest sessions in the year being experienced during that period. The German-Spanish incident brought the closure to an unsatisfactory month.

AMSTERDAM

SENTIMENT in May was little different from that of the preceding month. There was no marked change in the trend of prices, though the Bourse seemed to escape much of the stupor that settled from time to time on other centres. Prices were again sensitive to foreign influences, particularly to Wall Street, which acted in the main as a depressant. Overseas events were, in fact, entirely responsible for the cloud under which the month ended, for Amsterdam as well as for other stock exchanges. Serious news of the American labour situation was followed by still worse news from Spain, though the outlook improved somewhat in the opening days of June. The Bourse, however, was not indifferent to home news and tendencies, though the election results produced no excitement. Philips Lamps were firm on the surprise interim, and Unilever responded well first to the plans for the simplification of the group, and later, in common with Jurgens and Van den Bergh, to the latter company's issue. Royal Dutch moved upwards on hopes of the dividend declaration, but the trend of rubber shares was irregular or downward.

CANADA

THE last week of April witnessed the severest slump since the great crash of 1929, and the record of losses would have been worse if there had not been a rally on the last day of the month. Mr Chamberlain's Budget was undoubtedly a considerable factor, as it caused heavy selling of international issues and also served to bring to a head a situation of technical weakness that had developed. This has now largely been remedied as weak accounts have been eliminated and others fully protected, and in some quarters the view is held that an oversold condition now exists. In the first half of May there was considerable recovery, but the market remained nervous and hesitant and its action in the coming months will undoubtedly be influenced by speculation about Washington's remedies to check the inflow of unwanted gold, the effect on business of sharp recessions of certain commodity prices and the extent to which business will decline in the summer. A bear point with the newsprint stocks has been disappointment with the plans proposed for the reorganisation of the bankrupt Abitibi Company, though there was some improvement in the preferred in mid-month on the announcement that the reorganisation was not likely to become effective till late in 1938. Prices in the latter part of May were irregular, quiet conditions prevailing round about the Empire Day holiday. In the mining market, the worst slump was in gold stocks, which in April lost on an average all their gains of the preceding 11 months; the index on May 7-127 was 21 points or 14.2 per cent. lower than for April 7 and was 6 points below the figure for May 7, 1936. The bond market also weakened, but a better demand with rising prices has since developed. The Bureau's "Investors" index for common stocks, which stood at 137.1 on April 16 had declined by April 30 to 130.0; but on May 7 it had climbed back to 133.9.

CAPITAL ISSUES

THE shade of N.D.C. and the setback in the industrial markets hangs heavily over this week's new issue operations. Fixed interest issues are almost entirely the rule, but they contain several features of interest. The terms of the *West Riding* loan, for instance, mark a prompt retreat from those ordained for Leeds Corporation recently. The issue price, redemption date, and the first coupon (a full half-year's payment is made next January, although the loan is not fully paid until the end of July) are all more favourable to the lender. Since the Leeds issue was at ½ discount on the day of the present issue, these concessions were evidently wise and necessary. It is worthy of comment that *South Wales Electric Power* has also marketed £1,000,000 of 3½ per cent. debenture stock on terms which are only slightly dearer than the *West Riding*. This stock, however, is redeemable by cumulative sinking fund by 1967, or optionally callable from 1947. The loan replaces a 5 per cent. issue, and is an adequately secured utility debenture. The 5½ per cent. preference shares of *Red and White United Transport* are issued at 21s. per share. This undertaking is a merger of four road transport concerns, and claims to be the largest undertaking still independent of the railway companies. These shares are redeemable at 23s., and their dividend appears reasonably secure in relation to their yield basis. The *Imperial Cold Storage and Supply Company* has offered £450,000 5 per cent. debentures at £103. This concern shows a rapid recovery in profits during the last three years. The company's capital structure is somewhat highly geared, and past fluctuations of profits suggest that the high yield basis of the debentures is warranted. The only industrial offer of the week—on behalf of *Oldham Paper Staining Company*—is a dual offer of 6 per cent. 10s. preference shares at par, and 4s. ordinary shares at 43½ per cent. premium. This concern braved the perils of N.D.C. but made no reference to its prospective impost, despite an expansive profits record. The structure of the company and its record is of the type now familiar to investors, and the shares are not of special interest. Statements for information only have been published by *British and Foreign General Securities* and *Climax Rock Drill and Engineering*.

PUBLIC OFFERS

County Council of the West Riding of Yorkshire.—Issue of £1,000,000 3½ per cent. stock at 100½ (a trustee stock). Redeemable at par 1957. Rank *pari passu* with existing issues. Rateable value, £7,436,500; estimated population, 1,525,410. Net debt, £4,200,000. Proceeds to repay £584,700 loans and for education, highways, public health, etc. Lists closed 9.5 a.m., June 2nd, oversubscribed.

Red and White United Transport.—Issue of 220,000 5½ per cent. cum. redeemable £1 preference shares at 21s. Redeemable by purchase with 10 to 25 per cent. of profits after preference dividend. Acquires capital of four passenger road transport companies for £70,062 cash, 110,684 5½ per cent. preference and 446,916 ordinary shares. Passengers carried: 1936, 20,481,695. Combined profits, after depreciation, before interest and hire purchase charges, years ending in: 1934, £51,373; 1935, £73,419; 1936, £80,190. Net assets, £232,639 (vehicles, £207,700). Lists closed 9.5 a.m., June 2nd, oversubscribed.

BY STOCK EXCHANGE INTRODUCTION

The Climax Rock Drill and Engineering Works, Ltd.—Issued capital 720,000 5s. ordinary shares. Makers of pneumatic rock drills, etc., in Cornwall since 1880. Profits, after depreciation: 1934, £21,008; 1935, £16,993; 1936, £26,217. Net assets £152,323 (stock, £76,459). Northern Holdings, Ltd., take 172,500 shares at 8s. 9d. and certain expenses, and purchase 187,500 further shares at 8s. 9d.

British and Foreign General Securities and Investment Trust, Ltd.—Particulars of issue of £50,000 4 first debenture stock at par. Redeemable at par 1964, or from 1948 on notice. Ranks with 4 per cent. and 5 per cent. first debenture stocks.

BY OFFER FOR SALE

South Wales Electric Power Company.—Offer for sale of £1,000,000 3½ per cent. debenture stock at 98½. Redeemable at par by 1967, by drawings from 1938, or from 1947 on notice. Ranks by 1967, by drawings from 1938, or from 1947 on notice. Ranks with 5 per cent. debenture stock (maximum £295,000); right (upon conditions) to issue further stock *pari passu*. Part of Edmundsons' group. Area, 1,069 sq. miles; population, 1,650,000; consumers, 29,000. Capacity, 63,750 kilowatts, to be increased to 93,750. Units sold 1936, 185,101,000, plus 40,860,000 to C.E.B. Profits, before depreciation and interest: 1934, £150,442; 1935, £171,427; 1936, £216,681. Lazard Bros. and Company take issue at 95½, or 97½ including expenses. Lists closed at 10 a.m., June 1st.

Imperial Cold Storage and Supply Company.—Offer for sale of £450,000 5 per cent. first mortgage debentures at 103. Redeemable at par in 1962, or at 102½ on notice, or by drawings at par from 1942. Operates through subsidiaries cold storage plants in Union of South Africa. Profits, before interest: 1934, £66,637; 1935, £160,419; 1936, £187,052. Net assets, £2,278,259 (before deducting debentures, and bank loan now repaid). British and Allied Investments Corporation take £500,000 debentures, the present offer costing them £452,250, including a half-year's interest.

Oldham Paper Staining Company.—Offer for sale of 50,000 6 per cent. cumulative 10s. preference shares at par and 175,000 4s. ordinary shares at 5s. 9d. Wallpaper manufacturers since 1933. Profits, before depreciation, bank interest, fees and managing directors' remuneration, etc.: 1934, £11,373; 1935, £19,265; 1936, £21,720. Net assets, £88,315 (stock, £28,878), purchased for £93,000 (£6,685 goodwill), payable by £33,000 cash, 50,000 preference and 175,000 ordinary shares. Ridgeford Trust take issue at 10s. per preference and 5s. 2½d. per ordinary share, net. Lists closed 9.5 a.m., June 2nd, oversubscribed.

ISSUES TO SHAREHOLDERS ONLY

Hield Brothers, Ltd.—Issue of 880,000 new 1s. ordinary shares at 2s. 6d. to ordinary shareholders registered May 18th (one for every complete four held). To rank *pari passu* with existing ordinary shares after June 1st dividend and bonus.

Indian Iron and Steel.—Issue to ordinary shareholders registered on May 10th of 419,468 new ordinary shares of Rs. 10 at Rs. 25 (£1 17s. 6d.) (one new for every five). To rank *pari passu* with existing shares.

West Devon Electric Supply.—Issue to ordinary shareholders registered May 19th of 100,000 £1 ordinary shares at 24s. (two new shares for five held). To rank with existing shares from July 1st.

CONVERSIONS AND REPAYMENTS

New Monckton Collieries.—There will be redeemed with accrued interest on December 1, 1937, £50,000 6 per cent. first mortgage debenture stock at 104, and £50,000 7 per cent. second mortgage debenture stock at 102. To provide for this and for fresh working capital the directors have decided to issue £150,000 5 per cent. first mortgage debenture stock at par.

R.M. Realisation Company.—It is announced that one-half of present holdings of 5 per cent. income debenture stock will be redeemed at 10 per cent. premium on July 3, 1937.

BONUS ISSUES

Whitehead Iron and Steel.—Bonus distribution proposed of one share for four held, absorbing £125,414. A similar scrip issue absorbing £100,161 was made in 1934-35.

Forster's Glass Company.—Share bonus of one ordinary for every four held. The sum involved is £29,375.

Anglo-Iranian Oil.—A capital bonus issue is proposed of 6,712,500 £1 ordinary shares, at rate of one new share for £2 stock held on June 30th. The capitalisation is therefore recommended of £2,327,500 from debenture stock redemption reserve and £4,385,000 from general reserve.

Watch America the Banker's Way . . .

To keep themselves well informed on the rapid changes in American business, leading bankers in Great Britain and on the Continent—as in America—depend on *The Wall Street Journal*.

The *Wall Street Journal* is complete, accurate, authoritative. It covers developments and trends in all industries, in banking, insurance, securities, commodities, import and export markets.

A wide inquiry conducted by certified public accountants revealed that American Bank Presidents consider *The Wall Street Journal* more useful to them than any other publication.

Free specimen copy, with subscription or advertising rates, furnished on request at London Office.

COMPANY MEETINGS

MARKS AND SPENCER, LIMITED

MR SIMON MARKS ON THE COMPANY'S PROGRESS

CO-OPERATION WITH MANUFACTURERS

STAFF WELFARE

The eleventh annual general meeting of Marks and Spencer, Limited, was held, on the 29th ultimo, at Winchester House, Old Broad Street, London, E.C.

Mr Simon Marks (chairman and managing director) presided.

In the course of his speech the Chairman said:—It is with pleasure that I am again able to report a satisfactory increase in the net earnings of the company. The net profit for the past year, after providing for directors' fees, management remuneration, depreciation and other charges, amounts to £1,433,250, an increase of £168,844 over the preceding year.

ALLOCATION OF PROFITS

The directors recommend the following allocations:—
By transferring to staff benevolent and pensions fund ... £25,000
By writing off discount and new issue expenses in respect of the 3½ per cent. debenture stock ... £54,454
Debenture redemption fund... £11,160 (against £10,544 last year)
Properties contingency reserve £61,457 (against £50,000 last year)
General reserve account ... £308,846 (against £343,496 last year)
Payment of a final dividend on the ordinary and "A" ordinary shares at the rate of 25 per cent. per annum, thus making 40 per cent. for the year ended March 31, 1937 ... £397,115 (against £358,741 last year)
By carrying forward to next year's accounts ... £82,583 (against £87,684 brought in)

ISSUE ON BONUS TERMS

The directors recommend that £158,846, from the general reserve account be capitalised, and that a distribution by way of bonus be made to the holders of the existing ordinary and "A" ordinary shares of the company in the proportion of one "A" ordinary share for every ten ordinary and/or "A" ordinary shares held.

RESERVES

After making the proposed allocations and provisions for the bonus shares, our general reserve will stand at £1,850,000, the whole of which is invested in the business, and the proposed appropriation to properties contingency reserve will bring the amount of that fund up to £250,000.

Your directors decided, in view of the low rates of interest prevailing in the money market, to make an issue of £2,500,000 in debentures carrying interest at 3½ per cent. at a price of 98 per cent. Out of the proceeds of this issue they paid off outstanding loans of £1,500,000, and the balance of £1,000,000 was available for the acquisition of further properties and the general development of the company's business.

Turning to the assets side of the balance sheet, freehold, leasehold and leased properties stand at £7,279,595, being a net increase of £897,261. Furniture and fixtures stand at £637,045, being a net increase of £79,959, and the stock-in-trade stands at £1,179,141, an increase of £273,149 over last year.

The cash with the Bankers and in hand stands at £1,492,226, showing an increase over last year of £471,503.

DEVELOPMENT

To-day we are operating 218 stores throughout the country. During the last 12 months we opened 15 new stores, four of which replaced stores which had become inadequate for our developing requirements. We have, in addition, extended 25 other stores. Two small stores were closed in places where we had previously opened modern units. We now operate 37 miles of counter space, an increase of about 14 per cent. over the corresponding amount of selling space a year ago.

Our present programme already embraces 15 entirely new stores (two being replacements) and over 40 extensions.

Practically all our stores have been modernised and enlarged in order to take care of the increasing business. This intensive development is a particular feature of our present policy.

The volume of business, which since 1926 has increased nearly 14-fold, has demanded our constant attention. It has from the first been one of our guiding principles to encourage to the utmost the home production of the goods we sell, and to-day over 92 per cent. of the manufactured goods on our counters are British-made.

CO-OPERATION WITH MANUFACTURERS

With so large and so rapidly expanding a volume of turnover, continuity of supply became a factor of the greatest importance, and to secure it special arrangements have had to be made with our manufacturers.

Together we have aimed at keeping down costs of production whilst improving quality, so that larger sections of the community could have their wants, for an increasing variety of goods, satisfied at prices within their capacity to pay.

Planned production, ingenuity, and adaptiveness have made it possible to produce goods in a variety of qualities and styles and at prices which we could not have visualised years ago.

The policy of progressive cost reduction and improvement in quality and variety has won steady support over a decade, and produced the results which are before you to-day.

By restricting ourselves to price limits up to 5s. per article, we of this company have set ourselves the task of including within that price range the most extensive variety of goods for which a large-scale demand exists, or can be created. We have done pioneer work in this field, which has been appreciated by the public.

STAFF WELFARE

Our employees now number nearly 15,000, and our relations with them are based on a spirit of friendship and understanding. We are concerned not only to pay adequate wages, but with the conditions in which they work, their efficiency and with their general welfare. The service which is rendered the customer by a contented and efficient staff plays a very important part in building up a business.

Our welfare department maintains intimate and cordial contact with the staff. It strives to develop conditions which make for happiness in work, and to improve the general conditions of employment. The individual well-being of each employee, the lessening of strain, the provision of personal help in all problems, is the concern of the welfare supervisors.

The benefits and amenities which the department has organised cover a wide field—sports and social clubs, holiday camps, medical services of all kinds, canteens where wholesome meals at low costs are provided, and rest-rooms for relaxation during the working day.

The welfare department administers directly and through special staff officers in each store the welfare fund, the budget of which this year will be in the neighbourhood of £100,000.

The welfare fund is one of the three funds—the others are the pensions fund and the benevolent fund—operated by your board in the interests of the staff. Each fund has its own field.

The pensions fund, designed for the headquarters and management staff, is on a contributory basis. Pensions are provided for those who retire from business at the age of 60 and for their dependents in the event of their earlier death.

The benevolent fund, which was inaugurated last year, will meet such contingencies as cannot be calculated actuarially and provided for by insurance. It will deal with many personal problems which may arise through ill-health or age on the part of the general body of our employees.

The provision for the future made by these funds has given a sense of security, the absence of which is so commonly a source of grave anxiety. Our reward is an efficient staff giving loyal and enthusiastic collaboration. They respond to all the calls made by

IMPERIAL CONTINENTAL GAS ASSOCIATION

ANXIOUS YEAR—IMPROVED POSITION IN BELGIUM

At the general meeting of the Imperial Continental Gas Association, held, on the 28th ultimo, in London, the chairman, Sir Thomas Royden, Bart., C.H., in the course of his speech, said that the past year had been one of considerable anxiety.

The Compagnie Continentale would have to bear its share of the extra burdens which had been placed on French employers, but he hoped that the higher standard of living of the working classes would favourably affect the amount of gas and current consumed. Notwithstanding the "stay-in" strikes, the sales of gas in 1936 showed a decrease of only ¼ per cent. compared with 1935, whilst sales of electricity rose by 3 per cent. Trading profits were down by Frs. 4,700,000, because while the price per unit sold was lower, expenses were higher on account of wage increases. Owing to the lag in the adjustment of prices to costs, the increased costs in 1936 would not be reflected in prices until 1937.

The value of some of the investments of the French company having fallen below their book values, it was thought advisable to make provision for this shrinkage out of profits, but with the help of Frs. 2,034,000 from reserves the company was able to maintain the same rate of dividend, involving a disbursement of Frs. 24,400,000. As a result of devaluation the French franc fell from 75.11 to the £ on April 1, 1936, to 106.33 on March 31, 1937, but, thanks to the exchange cover obtained, the association was able to bring its French income into account at an average of Frs. 79.31 to the £. Owing to exceptional reasons the dividend from the Compagnie Continentale amounted to £212,430, as compared with £197,897 in 1935, but at the present rates of dividend and exchange the annual income would be approximately £150,000.

POSITION IN BELGIUM

As regards Belgium, the situation was most encouraging, trading profits throughout the country having increased and the number of unemployed fallen. The increase in the sales of the various companies in which the association was interested varied from 1.6 to 9.8 per cent. for gas and from 7.3 to 15.4 per cent. for electricity. He estimated that 80 per cent. of the houses in Belgium were equipped for the use of current. Every form of price tariff was offered to meet the varying need of consumers, for the companies realised that it was their duty to give efficient service to all who required it. Gas and electricity were ancillary to each other. Moreover, if electricity, in addition to supplying lighting and power, had to carry the whole of the heating and cooking loads, the capital expenditure on the necessary plant would attain astronomical proportions.

In order to increase the territorial spread of its business, the association had in July last acquired 1,000,000 shares in Edmundsons' Electricity Corporation, Limited, out of 2,747,025 shares which had been purchased by a British group. Assuming maintenance of the Edmundsons' dividend at 9 per cent., the association's revenue from home sources should rise to £102,000 next year as compared with £62,200, which should go far to compensate for any reduction in income due to the devaluation of the franc.

THE ACCOUNTS

Turning to the accounts, the chairman expressed regret that he was unable to submit to the proprietors a consolidated balance sheet and profit and loss account owing to the impossibility of introducing a uniform financial year for all the subsidiary companies, and for other reasons. He explained that the increase of £10,000 in fixed assets represented the purchase price of additional offices acquired in Brussels and London, and that the increase of £1,870,000 in respect of investments in, and advances to, subsidiary and allied companies was mainly owing to the investment in Edmundsons. The increase of £110,000 shown in advances was a balance figure; actually advances had decreased by £247,000. Since the date of the balance sheet one of the Belgian companies had refunded advances amounting to £200,000, and this had been utilised to repay loans from bankers amounting to £155,000, the cash position being at present in credit. Apart from Edmundsons, the market value of the general investments showed a surplus over book value of £54,000. Amounts owing to subsidiaries had decreased by £88,000, whilst general and specific reserves had risen by £90,000. Owing to lower exchange profits and the larger amounts placed to reserve by the Belgian companies, the total income of £599,900 showed a reduction of £7,000 and the net profit was £427,000, or £10,000 less than last year.

The report and accounts were adopted, and a final dividend of 6 per cent., less tax, making 10 per cent. for the year, was approved.

an expanding business and it is a great pleasure to me to place on record the thanks of the board to every one of them.

Mr Simon Marks then moved the adoption of the report and accounts. Mr Norman Laski, B.A., in seconding the resolution said:—

It is gratifying to note that the large increase in profits shown this year does not come from charging high prices or obtaining large profit margins, but from the greatly increased volume of business.

I should like to add a word about our personnel and welfare departments, with which I am more particularly associated. I think we can say that while we now employ a record number of persons, our contacts with our staff have never in the history of the company been as close or as cordial as they are to-day.

PROVISION FOR HEALTH OF EMPLOYEES

The chairman has referred to our health services, which are administered by the welfare department. A healthy staff is an asset to a business, and a great deal of thought and attention is given to the maintenance of fitness among our employees. Since the institution of our medical services we are happy to report that the general standard of health has considerably improved.

CONDITIONS OF EMPLOYMENT

The maximum working week for our staff is 48 hours, and the average 46½ hours. Every employee of over one year's service is entitled to a minimum of two weeks' holiday with pay. In addition, in the event of absence due to sickness, full wages are paid up to two weeks in each year, and in many cases for a longer period.

In conclusion, it is my pleasure to join the chairman in thanking our staff for their work and co-operation in the past twelve months.

The resolution for the adoption of the report and accounts was carried unanimously.

Resolutions were also passed re-electing the auditors and the directors who retired by rotation, and approving the proposed capitalisation of reserves and the bonus issue of one in ten to holders of ordinary and "A" ordinary shares.

It was announced that dividend warrants and letters of allotments in respect of the bonus issue would be posted on June 5th to those shareholders whose names were on the register of members on May 1, 1937.

VAL DE TRAVERS ASPHALTE PAVING COMPANY, LIMITED

SUCCESS OF REORGANISATION POLICY

The sixty-seventh ordinary general meeting of the Val de Travers Asphalt Paving Company, Limited, was held, on the 28th ultimo, at Cannon Street Hotel, London.

Mr J. O. Murgatroyd (chairman) presided, and in moving the adoption of the report, said although they submitted accounts showing more than four times the trading profit brought into the 1935 accounts, a circumstance entirely outside the control of the Board had deprived him of the pleasure of announcing the recommendation of a dividend. The devaluation of the lira had made it necessary for the company to provide no less than £12,633 for depreciation in the value of stocks of asphalt rock in Sicily, thus depriving them of a net profit of £7,740, which the directors would have felt justified in recommending for distribution.

Last year he had announced that they were undergoing a period of reorganisation. This phase they had successfully passed through, and they now entered upon a period of retrenchment. They had turned their attention to the condition and efficiency of their manufacturing plants, and in this process of reconstruction they had been fortunate in forestalling the big advance in the price of all engineering commodities which had taken place, particularly in steel and iron, by ordering at least 75 per cent. of their requirements nearly six months ago, thereby saving some 20 per cent. to 25 per cent. compared with present-day prices. The work they did was of first-class order, and they had a very high reputation both in the building and road trades, and they had only that morning received a letter congratulating them on splendid workmanship.

They had completed the first unit of the paving tile plant, which was already working to capacity and would soon have to undergo the enlargement for which provision had been made.

Delays resulting in waste of labour and material are inseparable from bad weather conditions, and the year under review was one of the worst on record in this respect.

Work in progress, debtors and stock were all up on last year, which was very encouraging.

The report was adopted.

BOOTS PURE DRUG COMPANY, LIMITED

RECORD TURNOVER AND PROFIT

The forty-ninth annual ordinary general meeting of Boots Pure Drug Company, Limited, was held, on the 3rd instant, at Station Street, Nottingham, the Right Hon. Lord Trent, chairman of directors, presiding.

The Chairman, in the course of his speech, said:—Our trading profit, after providing for contributions to staff pensions funds, management remuneration and income tax, amounts to £966,116.

The net balance amounts to £790,898, an increase of £20,009 over last year, and another company record. Our total turnover for the year was also easily a record one.

After payment of all preference and preferred ordinary dividends, and of four quarterly dividends of 6 per cent. less tax on ordinary shares, we have a balance of £310,148, which, together with the balance brought forward, amounts to £617,238, as compared with £550,230 last year.

Your directors recommend the payment of a bonus of 3d. per share, free of income tax, on the ordinary shares, absorbing £80,000.

LIQUID RESOURCES

Your directors consider it prudent to recommend a transfer of £100,000 to the general reserve fund, £20,251 to the freehold reserve fund, £50,000 to the contingencies reserve fund and £50,000 to the overseas development fund. This leaves £316,987 to be carried forward.

At the present juncture your directors regard a continuance of the policy of conserving our liquid resources as being in the best interests of the company.

During the year our subsidiary companies have continued to make progress. Besides the usual enlarging and modernising of shops, thirty-seven have been opened and five closed, and on March 31st we had 1,152.

Our total sales have once again exceeded all previous figures, and, as was perhaps to be expected in view of the influenza epidemic, our dispensing figures show a substantial increase over our previous record.

BEESTON FACTORY

We moved into a portion of our new section at Beeston in June, 1936. Owing to the difficulty in obtaining supplies of various kinds its completion has been considerably delayed, but the large number of visitors we have had from overseas, amongst whom we were especially pleased to welcome a number of troops from the Dominions who were in this country for the Coronation, have been greatly impressed. As you remember, the Beeston factories were planned and started during the severe time of the depression in pursuance of our policy of creating employment when employment is scarce and planning in bad times for the better times that lie ahead. A few figures will show convincingly how far the enterprise of your directors was justified. During the four years since the new factory went into production tonnage showed an increase of 26.9 per cent., articles produced show an increase of 30 per cent., and staff show an increase of 23.7 per cent.

From these figures you will readily understand that, apart from the commercial aspect of the matter, it would have been quite impossible to deal with the great demand for our products created by the influenza epidemic of this spring had we not had the new buildings.

RESEARCH DEPARTMENT

Our research department continues to play an important part in our work of making the latest discoveries of medical science accessible to the public and in helping to maintain the high standard of quality that we set ourselves.

Another field in which our research chemists are active is that of sex hormone therapy, an important branch of modern therapeutics, in which the medical world is showing great and increasing interest.
