It is difficult to choose a standard by which to measure the performance of the companies. It would be unfair to use either a stock price index or a bond price index separately, or without proper weight for the make-up of the company portfolios. An analysis made by the Standard Statistics Company for fifteen investment companies showed that in 1930 assets were invested as to 15.6 per cent. in cash, 13.2 per cent. in bonds or preferred shares, and 71.2 per cent. in equities. In 1935, the proportions were 5.2 per cent. in cash, 21.3 per cent. in bonds and preferred shares, and 73.5 per cent. in equities. A composite index of bond and share prices based on the above proportions would show a 17 per cent. decrease over the seven-year period to the end of 1936, and a 20 per cent. increase during 1936.

If the individual performances in the table below are compared with these rough standards, it will be apparent that the year 1936 went some way to restore the reputation of the investment companies. In 1936, only one of the twenty-two companies did worse than the standard, and that was a company specialising in insurance company shares. Over the seven-year period, only two did worse than the standard. As might be expected, the worst performances were put up by companies specialising in single industries, such as insurance or public utilities. A wider survey, which includes approximately eighty investment companies of all kinds, shows an increase in combined net assets of about 27.5 per cent. in 1936.

Evidence of the improvement is also found when attention is transferred from assets to income. The effect of the trade recovery during 1936 and of the exceptional dividends stimulated by the new Revenue Act is illustrated for some of the leading companies in Table II. Many companies have been able to pay dividends on their own common stocks for the first time for years, if not for the first time in their history. But there still remains a large number of cases in which interest and preferred dividends are not being earned with a wide margin. High management expenses still absorb a large proportion of income in many cases.

The most interesting feature of the present market for investment company shares is disclosed by a comparison of asset values and market prices for the common shares of geared companies. These shares are esteemed in the market not for their promise, if any, of future income, but as counters in a gamble for capital gains. In this valuation the all-important factor is the gearing ratio, which is the proportion borne by the total net assets of the company to the net assets available for the common stock. The higher the gearing ratio the more rapidly the common stock stands to benefit from a given rate of increase in total assets. The higher the ratio the higher the premium the market is likely to put upon these shares in a time of rising security prices. Table III shows, for a number of companies: (1) the net asset value and (2) price of the common stock on December 31, 1936; (3) the gearing ratio at that date; (4) the asset value per dollar of market price; and (5) latest prices.

A glance at the table shows that of the twelve common stocks only two showed a market premium over asset value; all the other stocks stood at discounts averaging about 30 per cent. Nothing has happened during 1937 to alter this position. A number of explanations have been offered for the present disappearance of the premium characteristic of these shares during the earlier years of the recovery. In the market considerable prominence is given to the investigation of investment company practices by the Securities and Exchange Commission, which was first reported at the end of 1935, and still holds the market under its threat. It is feared that the known abuses of the movement in the past will be dwelt on in the Commission's report, and that, in view of the Administration's dislike of High Finance in general, stringent regulations may be introduced, which may permanently lower the status of investment company shares as speculative securities.

Perhaps an equally important reason for the disappearance of the market premium on investment company shares is that their prices have already risen substantially since the depression levels, and in the whole market to-day a pessimistic view of future prospects seems to be solidly entrenched. However high the gearing ratio on a given share, operators who do not anticipate an increase in net asset values are unlikely to pay a premium for it.

On the whole, the present position seems to be that American investment company shares are no longer valued as gambling counters. Conversely, even after one of the best years of recovery, they have not completely established themselves as a means of providing the benefits of skilled management and the spreading of risk. It may be that the movement started under somewhat inauspicious circumstances, and that the skill of managers may improve with experience. But the action of the S.E.C. remaining unknown, the movement may well lead from investment to speculation, from speculation to official control—and so back to investment again.

Investment and Company Notes

Course of Share Values.—August has been truer to its reputation as a holiday month than was expected when investors departed on the eve of Bank Holiday. In the early part of the month, indeed, there was reason for expecting the first real check to the persistent downward movement which has been characteristic of 1937. Before the middle of August, British ordinary share prices (as will be seen from the annexed chart) had recovered practically all the ground lost since the end of April. In America equities, which had been rising fairly steeply since the end of June, continued to move upward. Unfortunately, progress was rudely interrupted in both centres by the opening of hostilities at Shanghai. Probably not a hundredth part of the securities whose prices have been unfavourably affected have a direct and considerable interest in a Far Eastern conflict which, according to the firm conviction of the Stock Exchange, will remain localised. Even the threat of permanent damage to British trading interests in China would be insufficient, by itself, to explain the down-turn in the share indices in the second part of last month.

BRITISH AND AMERICAN INDUSTRIAL SHARE VALUES DURING THE PAST TWO YEARS

(1928=100)

British: "Financial News" Index of 30 Ordinary Shares.
American: "Standard Statistics" Index of 50 Common Stocks.

Nor can domestic business prospects be adduced as an adequate explanation of the behaviour of markets either here or in America. Trade activity is still running free in Great Britain, and such clouds as there are on the horizon are as yet no bigger than a man's hand. In America, general prospects are equally satisfactory, but conservatism, shading into pessimism, is becoming a determined attitude of mind in Wall Street. To say that the same mental approach was characteristic of London would be an exaggeration, for the undertone of the market is still relatively firm. For one thing, Britain has a larger stake than America in the recovery in international trade, which is still proceeding. And in London home politics can be taken for granted in a manner quite impossible in New York. There is still time for an impressive upward reaction in share values during the autumn; but its absence would be construed as definite evidence that the down-turn which began some months ago marked a definite change of trend. The markets would prefer increased business to a firm " undertone."

Railway Traffic Trends.—Railway stock-holders have received so much new information of major significance during the last two months that the trend of weekly traffics has dwindled to secondary importance. Now that wages and freight rates have been settled, however, the course of traffics resumes its customary rôle as the leading indicator of future railway dividends. Since the turn of the half-year, the general trend of the weekly figures has been reasonably satisfactory, but definitely uninspiring. The average weekly increase, for the four group lines, has been £119,000—a somewhat lower rate of advance than the average gain of £136,000 recorded during the first half-year, which included the abnormal Coronation receipts. From week to week, there is no perceptible tendency for the rate of improvement to increase—this week, indeed, the total gain has fallen to £73,000. By comparison with the figures for the "normal" period 1927–30, too, the traffics appear to have reached a roughly stable level. Passenger traffics have been satisfactory, but their relatively good showing has been almost entirely offset by a decline in the rate of improvement of merchandise and coal traffics. Thus, the showing of L.M.S.R. and L.N.E.R. has been somewhat uneven, especially during August. The Southern too, after an excellent return during Bank Holiday fortnight, has suffered some setback—this week its traffic was actually below the 1936 level. The Great Western has produced the most satisfactory results—an indication of the recovery in South Wales—but, unfortunately, this railway is the least interesting of all the four to the investor, for its proper market valuation depends upon the directors' intentions in reserve policy rather than upon the extent of traffic increases. As a whole, therefore, the trend of traffics from the long-term point of view is not unsatisfactory to the investor, but it provides little ground for the speculative purchase of "marginal" railway stocks.

★ ★ ★

French Railway Bonds.—A few investment trusts and private persons have interests in French railway stocks, but the majority of British investors are concerned only with the possible effect of the French Government's plan for railway reorganisation (discussed in a Note of the Week on page 465) on three sterling bond issues: Midi, 4 per cent.; Orleans, 4 per cent.; and Nord, 6 per cent. All three are, to all intents and purposes, French Government-guaranteed securities. Though they are direct obligations to the companies concerned, their principal and interest have a fourfold security: (1) the operating receipts of each railway, (2) a joint fund of the French railways into which the excess receipts of any one system are payable, (3) an undertaking by the French Treasury to make up any deficiency in the fund, and (4) the State's undertaking to pay any interest and capital due on the expiration of the companies' concessions. Their status, therefore, could not have been bettered even if the Government had decided to nationalise the railways outright, instead of halting at a half-way house between majority ownership and commercial control. Broadly, the future trend of quotations for the bonds will be governed mainly by movements in Rentes, and to this extent holders have a lively interest in the success of the Chautemps-Bonnet plans for reviving France's industry and reorganising her finances.

The Midi and Orleans bonds are finally redeemable by 1975, by cumulative sinking funds beginning in 1941; but the companies have powers to pay them off at 103 between 1940 and 1960 and at par thereafter. The Nord bonds are redeemable at par by 1950, by means of a cumulative sinking fund which started in 1928; but they can be called at 103 at any time in the interim. The market price of the two 4 per cent. issues is now a little better than 85—they stand, in other words, on a 4¾ per cent. yield basis. The 6 per cent. Nord bonds, at 103½ ex dividend, are practically at their redemption level, which clearly suggests the market's expectation of an early conversion. In view, however, of the prospects, if the French Government's hopes are realised, of a rise in general security prices which would make conversion feasible, say, on a 4 per cent. basis—it may be presumed that the Government will hold its hands for the time being. The fusing of the separate French lines into a single system will involve formal changes in the designation and security of the bonds, but any further alteration, except on a voluntary basis, is precluded by the terms of the contract. A purchase of the 4 per cent. issues, under these conditions, may therefore be construed as a gesture of faith in France's recuperative powers under her present Government.

★ ★ ★

Setback in Foreign Bonds.—Although in July there were important movements in individual quotations, good influences offset the bad sufficiently to keep bond prices as a whole practically unchanged. In August, by contrast, the bond market suffered from the steady deterioration of the situation in China, without the consolation of improvement in other quarters. Consequently, the index of 110 foreign bonds, compiled by Municipal and General Securities Company, fell no fewer than 9 points to 107·7 (January–June, 1934 = 100), and the whole gain achieved since the end of 1936 was wiped out in a single month. The movements of the index during the past year are shown below:—

Average January–June, 1934 = 100

Note: Figures in brackets show number of bonds.

The separate index for Near and Far East bonds has fallen to the lowest level of the period covered by the index (that is, since 1934). It is now 19 per cent. below the July level, and is nearly 24 per cent. lower than in June. Chinese bonds fell more seriously than Japanese. Their decline began immediately after the beginning of hostilities, and continued throughout August, though its pace was slower in the latter part of the month. The fall in Japanese issues was comparatively slow in the second half of August. The indices for both defaulted and undefaulted bonds have, consequently, been affected, that for undefaulted bonds falling to the lowest level since 1934. This category failed to experience the rapid improvement that was so conspicuous a feature of defaulted issues in 1937. In other sections of the foreign bond market, movements have been small, though the weakness of Brazilian loans has depressed the South American States index. European issues lost part of July's recovery; Greek coupons remain payable at 40 per cent., after the breakdown of negotiations for a debt settlement, while the reduction of interest on Danzig bonds does not take effect until after payment of coupons next due.

Rayon Shares.—From the investment point of view it is almost an exaggeration to say that the number of British rayon companies with a satisfactory earnings record can be counted on one hand. Apart from Courtaulds, whose dominant position and low price policy set the pace for the others, there are seven companies known to the investor, and only two of them (both small) have paid dividends on their equity shares in their latest financial year. The recent experience of the chief companies is set out in the accompanying table. Even Courtaulds have not consistently made progressive profits, though this company's experience is not wholly a reflection of the industrial position at home, owing to interests in overseas subsidiaries. The company has expended large sums in developing the new product "Fibro," which seems likely to become of the first importance.

Company	Year to	Gross Profit	Earned for fixed charges	Equity: Earned	Equity: Paid	Price and denomination
		£	£	%	%	
Courtaulds...	1935	4,168,747	2,133,063	7·2†	7½†	53/1½ (£1)

† Tax free, or equivalent. ‡ Ordinary shares (8 per cent. fixed dividend, and 25 per cent. of balance of profits).

British Celanese, having cleared off all first preference arrears, are still faced with arrears on 7½ per cent. second preference shares since 1930; the current price of 7s. 4½d. for the 10s. ordinary share takes no account of the company's history or of its current earnings position. The formation on private initiative in July of a Celanese Shareholders' Union is a commendable step. The Union has not existed long enough to accomplish the difficult task of uniting thousands of shareholders or to put forward definite proposals, but its founders are doubtless sensible of the virtues of perseverance. The position of Cellulose Acetate is improving, though its distributions still fall far short of the 8 per cent. preferential dividend to which the ordinary shares are entitled. North British Rayon and Kirklees, Ltd., have a fair record, but British Enka, which is handicapped by an accumulated debit balance of over £500,000, suffered a serious setback in 1936. Two other companies not shown in our table, Harben's (Viscose Silk) and British Bemberg, have been scarcely more fortunate.

★ ★ ★

British rayon production continues to make new records. The official total has risen from 54,570,000 lbs. of yarn and waste in 1931 to 145,310,000 lbs. in 1936 and 75,890,000 lbs. in the first half of 1937. As exports do not form a significant part of the whole output, home consumption has increased commensurately with production. During 1936 alone it rose by 21 per cent. to an aggregate of 125,693,000 lbs. The level of yarn prices has not changed significantly since 1934. Prospects for the future are rather more doubtful, and it is not to be expected that the rise in consumption can maintain its recent pace indefinitely. The exploitation of staple fibre may compete chiefly with the cotton industry, but it can hardly help producers of continuous filament yarn, upon which an Excise duty is still payable. There is still much scope for the development of other cellulose products, but the main hope for further progress may lie increasingly in economies within the industry. And it is clear that, from the investor's point of view, Courtauld's shares still stand in a class by themselves.

★ ★ ★

J. and F. Stone.—The investing public is less concerned with the retailing than the manufacturing aspects of the radio industry, but the possibilities of multiple trade in this branch are indicated by the rapid progress of J. and F. Stone, a comparative newcomer to the above market. A trebling of profits within two years has been accompanied by large increases in the number of shops opened, and this policy is apparently to be continued. The report makes no comment on the trend of profit margins; the company at least has the advantage of dealing in a variety of products. The field in which it operates is highly competitive, but the general standard of organisation of the trade is relatively poor, and offers scope for chain store methods and economies. The following table shows results since the company's inception, except for the initial six months' period:—

	Years ended June 30, 1935	1936	1937
	£	£	£

BREWERY UNIT TRUST

Trustees:
MIDLAND BANK EXECUTOR & TRUSTEE CO., LTD.

● Brewery Units make it possible for the first time for both small and large investors to acquire a well-spread interest in brewery undertakings.

● Brewery dividends are more consistent over periods of years than those of almost any other industry and rank among the safest shares in the industrial market.

● The fact that Brewery and Distillery Shares are tightly held and in many cases difficult to obtain, makes the facilities offered by the Brewery Unit Trust of real value to the private investor.

● The Brewery Unit Trust has been formed in consonance with the Board of Trade Report on Unit Trusts.

● Price of Brewery Units 17/9d., as at 2/9/37. Estimated yield at this price based on cash dividends alone is 4½%.

● Comprehensive booklet about the Brewery Unit Trust which forms the basis of all transactions, is obtainable from any Bank or Stockbroker, or direct from the Managers.

LONDON MANAGEMENT SECURITIES LTD.
7 ANGEL COURT, THROGMORTON STREET, LONDON, E.C.2
Telephone: Metropolitan 5614-7 *Telegrams: Lomansec Phone London*

been written off by a transfer of £53,059 from share premium and capital reserves, of which there remain £46,475. The excess of earnings over dividend payments has been allocated to a general reserve and to increase the carry-forward. The profits of the main subsidiary, Chain Store Finance Trust (carrying on hire-purchase finance business), have not been distributed, and since advances to that company amount to £272,620 out of a balance-sheet total of £686,563, it is satisfactory that the directors now publish a consolidated balance sheet covering the parent company and the Trust. The importance of the financial management of the undertaking (apart from the trading position) is well brought out by the item in the combined balance sheet of £355,236 for amounts receivable under hire-purchase agreements, which represent 46 per cent. of all assets. On the liabilities side, £82,110 comprises general reserves as well as provisions for future interest on hire-purchase agreements. At the current price of 9s. 6d. for the old 5s. ordinary shares, a yield of £9 4s. per cent. indicates a cautious market view of the future.

* * *

Initial Services Expansion.—Though this company, which supplies soap, towels and tea to business offices, is a specialist rather than a member of one of Britain's great industries, it has contrived to maintain its earnings throughout the depression, to increase its profits steadily in the earlier stages of recovery, and, in the latest period, to expedite its rate of progress appreciably. The record of the last three years is shown in the accompanying table :—

	Years ended June 30		
	1935	1936	1937
	£	£	£
Total profits	245,881	254,428	287,349
Tax	45,298	50,589	63,195
Other charges	7,493	8,952	10,656
Preference dividend	32,000	32,000	32,000
Ordinary shares :—			
Earned	*161,090*	*162,887*	*181,498*
Paid	87,188	114,844	130,094
Earned (%)	*92·4*	*35·5*	*34·9*
Paid (%)	50*	25†	25
General reserve	75,000	50,000	50,000
Carry forward	19,056	13,330§	14,734
Ordinary capital	225,000	675,000	690,000

* Also 100 per cent. capital bonus and £225,000 in ordinary shares issued on bonus terms. † 8½ per cent. interim on £450,000 and 16⅔ per cent. final on £675,000. § After writing off £3,769 expenses.

Roughly speaking, about half the latest increase in profits has been absorbed by higher charges, the other half being used to maintain the 25 per cent. dividend on a larger capital. The policy of expansion is to continue, for an issue of one new share in five is to be made to existing holders on bonus terms. The course of profits in recent years must be considered in relation to the extended sphere of operations and the absorption of new capital during the period. The original ordinary capital of 900,000 shares was doubled in 1935 by a bonus issue, and a similar number of shares was issued on bonus terms. Last year, 60,000 shares were issued at par to trustees for board and staff, and the new offer will involve a further 552,000 shares, again at par. At the current price of 33s. 9d. cum. dividend and rights for the 5s. shares, the yield of £4 7s. 3d. per cent. (allowing 4s. 8d. for the rights) implies solid expectations of further progress.

* * *

General Refractories.—General Refractories, Ltd., whose accounting methods are as progressive as its trading and profit-earning experience, has now circulated the statement of the combined assets and liabilities of its subsidiaries which was recently promised. The results have special significance for financial commentators who have urged, in season and out of season, that the issue of consolidated balance sheets should be common form with holding companies. The figures are somewhat difficult to interpret, for two reasons. First, the date of the subsidiaries' joint statement is March 31, 1937, while that of the parent company is December 31, 1936. Secondly, the figures were extracted in a transitional period, when the parent company was in process of taking over a larger proportion of the capital of some of the companies and was bringing others into the group. A comparison of the two documents as they stand, however, brings out several important features. The combined surplus of assets over liabilities in the subsidiary companies' books, attributable to shares held by the parent company, is £521,349, in respect of holdings which the parent company values in its own books at £379,591. There is thus a surplus of £141,758 in the holding company's favour. Secondly, the fixed assets of the subsidiaries, less their reserves against depreciation, total £859,000. As the parent company has apparently something like an 86 per cent. shareholding interest in the subsidiaries as a whole (if this interest may be measured by its share in the subsidiaries' surplus, already mentioned), it is clear that the fixed assets of the group as a whole greatly exceed those of the parent company, which were valued on December 31st last at £252,884. The stock-in-trade of the subsidiaries (shown at £162,154 on March 31st) is also much greater than that of the holding company (valued at £54,662 at December 31st). On the other hand, the parent company holds practically all the cash for the entire group; for the holdings of all the subsidiaries on March 31st were no more than £13,820. The group's general reserves are also held centrally with the parent. Finally, the group's vigorous expansion, re-equipment and extension are being financed partly by the parent company (which had advanced £179,085 to the subsidiaries on March 31st), and partly by secured and unsecured advances from outside (which represented an aggregate of £326,258 on the same date). The picture presented is one of vigorous progress and expanding scope, accompanied by conservative treatment of profits. The directors may be congratulated on a decision which marks a precedent in balance-sheet presentation, and should do much *pour encourager les autres*.

* * *

Wolfram Share Prospects.—One repercussion of the Sino-Japanese war has been a further rise in the price of wolfram and renewed interest in wolfram shares. The demand is speculative, and is based upon the rapid increase in the price of the metal from 59s. at the end of March to 105s. a unit to-day. Wolfram is used in the production of ferro-tungsten and steel alloys of various kinds, and demand will scarcely decline so long as military preparations and current technical trends are maintained. But the potential supply conditions are not easily assessable. Two-thirds of the supply comes from the Chinese Government monopoly's mines in the southern provinces. This is the fact mainly responsible for the latest advance in the price, for the market feared (or, rather, hoped) that General Chiang-Kai-Shek might be forced to control exports or that the Japanese blockade would prevent supplies from being shipped. Opinions differ about the longer-term prospects of wolfram. The Siamese supplies are within sight of exhaustion, but the resources of China are unknown. Indeed, there are other deposits throughout the world which are workable at current prices, and for this reason the maintenance of the present level of wolfram prices cannot be assured.

* * *

So much of the supply is controlled by the Chinese Government that the interest of the private investor is confined to only two shares—Mawchi Mines and Beralt Tin and Wolfram. There are other producers of wolfram —South Crofty, Kramat Pulai and Consolidated Tin of Burma are the chief—but their present supplies are relatively small and their resources are being exhausted. Interest, therefore, centres in Mawchi and Beralt. Neither share has held the ground it gained during the period of war scare. The 4s. shares of Mawchi stand at 66s. and offer an earnings yield of about 4½ per cent. on the 1936 results. So great is the response of profits to increases in the price of tin and wolfram, however, that if prices were maintained at their present levels for a whole year, and output at the rate of the last quarter, the "notional" prospective earnings yield would be of the order of 12 per cent. This level cannot be achieved in 1937, but its possibility in a "notional" year may attract the speculative investor. The other big concern, Beralt Tin and Wolfram, is in a less certain position. Its mines are in Portugal, and in the working-out of the big development programme, there have been serious teething pains. The latest news from the mines, however, is satisfactory. The 5s. shares stand at 16s. Both shares are, of course, inherently speculative.

Tea Share Outlook.—No surprise has been caused by the news that the tea restriction scheme agreed to by the Governments of India, Ceylon and the Netherlands East Indies, which is due to expire on March 31, 1938, has been renewed for a further five-year period. The tea share market, indeed, is in a happier position at the moment than for some time past. Little encouragement was drawn from the varied (and on the whole poor) tea company results published in recent months. But the greater majority of these companies did not include any part of 1937 in their financial period; and the accelerated improvement in tea prices and the substantial fall in tea stocks both date from the current year. Last week the average price for North Indian teas at the London Auctions was 16.61d. per lb. against 13.41d. a year earlier, and United Kingdom stocks have fallen by a third in the last twelve months. The possibility of a further increase, for 1938-39, in the present quota of 87½ per cent. is being freely canvassed. Recent changes in the prices of some of the leading shares are shown below :—

	Prices, 1937 (£1 shares)				
Company	Highest	Feb. 25	June 28	July 28	Sept. 1
Dooars	56/6	51/3	46/3	46/3	48/9
Doom Dooma	53/–	50/–	46/3	48/9	51/3
Jhanzie	34/7½	31/3	27/6	26/3	31/3
Jokai (Assam)	44/6	42/6	36/3	40/–	41/3
Jorehaut	46/6	43/9	36/3	38/9	42/6
Lunuva	42/6	38/9	35/–	36/3	38/9

In view of the improved outlook for and the greater activity in tea shares the recent rise in share prices has been relatively small, and the present level is still below the best of the year. On the other hand, tea shares are nearer their "high" for the year than most industrial shares.

* * *

The general investor and the specialist alike will find an excellent source of exact information in the latest edition of the manual of "Tea and Coffee Producing Companies." Particulars given include, besides comparative statements of profits allocations, net earnings and dividends, a five-year price record, capitalisation per acre, and where possible, crops, costs and the estimated crop for 1937. A set of tables summarises earnings and dividends for various groups. Not the least valuable features of this reference book are the symposium of views of the tea outlook put forward by representatives of the leading companies and the survey of events added by the compilers. The necessity for renewing the tea restriction scheme is strongly urged, since it has been estimated that potential production is no less than 350 million lb. in excess of current annual consumption.

* * *

Broken Hill South.—The cabled summary of the report for the year to June 30th (writes our mining correspondent) is satisfactory, though distinctly brief. It records a net profit which, at £768,300, is £282,100 higher than that of the preceding year. Practically the whole of the difference arises from the company's mining operations, as the income from investments is only about £5,000 up at £103,500. The expansion in earnings mainly reflects the marked recovery in lead and zinc prices, the setback in the price of silver being of much less importance. The quotations of the two former metals moved upwards almost steadily during the latter part of 1936, and reached their peak last Spring. Despite the recent setback, current quotations are well above the average of 1936, lead being approximately £21 15s. per ton against an average of £17 12s. 6d., and zinc £23 as compared with £15. Although the distributions for 1935-36 by the Broken Hill South included a jubilee bonus of 12½ per cent., increasing the total to 62½ per cent., the total for the past financial period further expanded to 70 per cent. The first quarterly distribution on account of the current year is at the rate of 1s. 3d. per 5s. share, equivalent to 100 per cent. per annum. This, of course, is in Australian currency; making the necessary allowance, the indicated yield is 9½ per cent.

Capital Issues in August.—Conditions in the new issue market were unusually quiet last month, even for August. On our old basis the total issued was £4.3 million, only two-thirds of the total for last year. That the new basis figure is high results almost entirely from the inclusion of an estimate for the amount of Tithe Redemption Stock issued by the end of the month. Figures are given in the table below:—

(000's omitted) Excluding Conversions

Monthly Average (Old Basis)		United Kingdom	British Possessions	Foreign Countries	Total
		£	£	£	£
1933		17,520	2,429	449	20,398
1934		11,474	2,494	125	14,093
1935		18,388	1,270	21	19,679
1936		19,195	2,035	58	21,288
(New Basis)					
1935		27,233	2,443	97	27,773
1936		37,370	2,823	964	41,157
Monthly Total (Old Basis)		Govt.	Other		
June, 1936	*Dr. 150*	8,556	1,676	30	10,112
June, 1937	*Dr. 650*	24,507	2,067	Nil	25,924
July, 1936	*Dr. 300*	16,621	2,669	138	19,128
July, 1937	*Dr. 750*	12,367	2,297	940	14,854
Aug., 1936	*Dr. 150*	2,949	3,712	Nil	6,511
Aug., 1937	*Dr. 450*	4,264	487	Nil	4,301
(New Basis)					
June, 1936	*Dr. 150*	20,752	2,019	168	22,789
June, 1937	*Dr. 650*	29,690	3,788	40	32,868
July, 1936	*Dr. 300*	35,691	6,763	138	42,292
July, 1937	*Dr. 750*	52,838	6,218	1,513	59 819
Aug., 1936	*Dr. 150*	12,887	4,779	Nil	17,516
Aug., 1937		† 41,254	8,246	1,163	Nil †50,663

† Includes £40,804 for Tithe Redemption 3 per cent. Stock.

If Redemption Stock be excluded from the new basis, new issues were only one-sixth of issues in the previous month, and about one-half of the total for August, 1936.

★ ★ ★

Other Company Results.—Apart from those already considered, the week's reports have produced little of general interest, our usual analysis of profit and loss accounts on page 500 comprising only seven further results. Although *Industrial Finance and Investment* earnings of £95,307 are over £20,000 higher, the dividend is unchanged at 2 per cent., since £48,972 is set aside for investment depreciation against nil in the two previous years. Dividends from Armstrong's Patents Company constitute almost the entire income of *Armstrong Shock Absorbers*, whose profits have declined from £27,245 to £12,007. The subsidiary earned £33,618 (before £4,491 depreciation and £9,500 tax), against £49,482 for 17 months, but information for the initial period does not show to what charges these earnings were subject. The week's news has included many good improvements in dividends. Investment trust dividend increases have so far rarely exceeded 1 per cent., but the *Second Alliance Trust* final payment of 11 per cent. makes 20 per cent. for the year against 18 per cent. *Leyland and Birmingham Rubber* have increased their final (and full year's) dividend by 5 per cent., thus paying 12½ per cent. for the year.

★ ★ ★

Company Meetings of the Week.—Prospects for the cinema industry in England were surveyed by Mr Oscar Deutsch in his address to shareholders at the statutory meeting of *Odeon Theatres*. The number of potential cinema patrons remained large, he declared, since in this country only 41 per cent. of the entire population went to the cinema every week, whereas in the United States the proportion was 69 per cent. There was a tendency, moreover, to favour the new and up-to-date cinema theatres. The first annual meeting of *Trojan (Holdings)* has also been held this week, Mr F. L. Blow commenting on the satisfactory speed with which the operating company had erected new buildings and installed its plant.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: SEPTEMBER 7 ACCOUNT: SEPTEMBER 9

The markets are not in a happy condition, the international situation rather than the economic outlook making a continuous readjustment of prices necessary. Few have any idea of what the future holds in store, and stray news has accordingly an almost disproportionate effect. The change of sentiment in the middle of last week did not last long. Dealers have returned to their old mixture of caution and pessimism—a mixture which the attack on H.M.S. "Havock" has done nothing to dilute.

Very little has been happening in the gilt-edged market. The downward movements affecting some issues at the end of last week became general on Monday, the trend being reversed on the following days. The usual beginning of September dividend disbursements contributed to the better development. Home Corporations and Local Loans shared these movements. Australians, after some initial selling last week, did very well on the optimistic budget speech of Mr Casey and the reiterated determination of the Commonwealth Government to keep down the rate of interest. Chinese bonds of all kinds depreciated steadily, less on any firm conviction of the outcome of the war than on an accurate knowledge of what Japan can do to Chinese revenues. Japanese bonds rose steadily, mainly through bear covering. On Wednesday, however, they fell for the first time in some days, on realisation of the implication for foreign investors of a war economy in Japan. Among European bonds, Austrians moved upwards erratically, German issues lost ground gained earlier late in the week, and Greeks and Roumanians did well. The recent weakness in Brazilians persisted.

Movements were also small in the home rail market. The final acceptance of the wage award was greeted with pleasure, and a few sporadic rises took place. But poor traffics brought fresh losses, London Transport also receiving little support. Argentine rails moved a good deal, ending weakly after some depressing traffic returns. Canadians and Americans followed the vagaries of Wall Street and therefore ended down.

Industrial markets opened on Monday with a featureless session, were slightly firmer on the second day and then drifted downward through the week. This reflected both local interpretation of outside events and the sharp drop in Wall Street prices. The only good feature in the iron and steel section was the demand for Vickers on the decision to redeem the whole of the 5½ per cent. first mortgage debenture stock. Prices in the coal group were lower, and among motors Standard were prominent with a rise on dividend hopes. Aircraft issues, after a dull opening, were slightly better in mid-week, and movements in the electrical equipment group, although small, were generally adverse to holders. Electric Supply shares were quietly firmer on investment demand. In mid-week Tennant Bros. shares gained sharply on the higher final dividend, but otherwise—as in most other directions—the brewery group was dull. Shipping shares were slightly better. The miscellaneous industrials section saw general but small losses, with some firm spots maintained among engineering issues.

The oil shares market was inactive, so that early in the week prices were unduly sensitive to quite small transactions. Though business remained quiet, there was a somewhat better tone later, interest again being shown chiefly in Anglo-Iranian and Burmah Oil. In mid-week prices sagged generally under the pressure of gloomy foreign news.

Business in rubber shares was quiet, with an extremely small volume of orders. The public neglected this market, for want of definite indications of the trend of the commodity price. The tea market was irregular and dull, the chief movements occurring mainly in Indian issues.

In the mining market there was no exception to the general tendency of a dull start to the week, a brighter session on Tuesday and a relapse in mid-week. On Monday Kaffirs showed very little movement, though at the end of the day's business there was a tendency towards greater activity. The improvement persisted throughout the next day, but conditions on Wednesday became quiet again. A general dullness of tone was more apparent than any selling pressure or marked decline in prices. West Africans stirred in their sleep, but succumbed later to Wednesday's inaction. Rhodesian coppers, though sharing in Tuesday's rally, were inclined to slip back. There was little business in base metals, Broken Hill South, however, rising 1s. 6d. on the good earnings statement.

OVERSEAS STOCK EXCHANGES

NEW YORK

The bears continue to rule over Wall Street. Prices were falling at the end of last week, and except for a partial recovery on Monday, have since continued their downward way, while turnover has been small. Reasons to which this condition has been attributed include the Far Eastern trouble, the growing evidence of the breakdown of international law in the Mediterranean, the political situation at home, and the usual Wall Street pessimism about the domestic business position. The public takes little interest in the markets, and Monday's temporary recovery was caused by the belief among many operators that the technical position justified a strong improvement. This market factor was augmented by a prediction of the U.S. Chamber of Commerce that a major boom in business lies ahead if labour troubles do not interfere. Steel issues led the fall later in the week on the estimate of *Iron Age* that steel mill activity for the current week is 83 per cent of capacity, as last week, and that the autumn demand in the industry is not yet clear. The possibility of applying the Neutrality Act to the Far Eastern trouble may have some adverse effect upon the business position, although there are considerable orders in hand for steel for Japanese buyers, who would be unable to carry away their goods if the Act is applied.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926=100):—

PARIS

BY some irony the increasing gravity of the Far Eastern situation came at a time when the Bourse was perhaps in a better mood than for some months past to make the best of a more cheerful outlook at home. In the first half of the month a healthy tone prevailed in spite of the normal summer slackening in activity, and under the lead of rentes, small advances were general. But with the resumption of business after the mid-August holiday, the China war caused heavy selling for the Settlement (mostly by professionals) and considerable losses all round; rentes, however, being saved by timely official support. For the rest of the month the Bourse was distracted between bad foreign news and satisfactory political prospects at home, so that the tendency of prices became very irregular from day to day. In the last week, Treasury issues were a good feature on hopes that the 10 per cent. tax on rentes coupons would be removed, sentiment being helped also by the new official plan to assist industry and by the recent fresh batch of decrees. It was not, however, till quite at the end of the month that doubts were disposed of by the announcement that the removal of the rentes coupon tax would apply only to individuals, but that the remission would extend to certain other issues. The decree giving details of the railway reorganisation was well received, and railway shares advanced.

BERLIN

THE share market in August was dull, even active securities being at times unquoted, and the average price declined. The Chinese troubles, and later the impending Reich Loan, imposed reserve, and trading was mainly speculative, the public remaining aloof. The month opened with relatively heavy buying of commercial bank shares, due to newly announced progress in the resumption of private control, but steel, electrical and other standard shares weakened. In the following week steel issues were rather firmer, Hoesch in particular being bought, and interest was taken in certain mixed engineering and armaments securities, with a pronounced boom in Deutsche Waffen. This movement, with some reactions, lasted throughout the month. Shipping shares were bought for a time on an advance in the freight index, but later sold on bad news from the Far East; and the same factor led to a sharp decline of Deutsch-Asiatische Bank. Public utilities and private railways were steady to firm, but textiles were neglected with the exception of Stöhr Wool. Speculation in Bemberg rayon continued. Potash shares resumed their decline, and Reichsbank closed the month three points down. Home bonds were principally sold, and the average price reacted slightly. Dollar bonds were little changed. The official shares index (1924–26 = 100) for July was 114·56, against 112·81 for June; official bonds average 99·03, against 98·85.

AMSTERDAM

ALTHOUGH the Bourse watches events in other centres very closely, in recent months it has given indications of a better *morale* in difficult times than some of its fellow exchanges. Its cheerfulness had in the end to yield to the *force majeure* of the war in China, but it resisted almost until the last week of August, and even then ended the month with small but noticeable gains on balance. The crisis acted as an untimely check to a vigorous upward trend in prices which in the first fortnight distinguished Amsterdam from other centres. Plantation shares were the most favoured at first, but as the Far Eastern situation began to force its attentions on markets, interest turned more to shipping shares, which continued active throughout a number of sessions, otherwise dull and irregular. Among industrials, Philips Lamps were the most popular. Early in the month Unilever N.V. had failed to respond to the simplification plan.

CANADA

THE Canadian stock markets, after a dull period of about two months, suddenly livened up in the middle of July—a rare development with brokers and investors on holiday—and although there has been nothing like a boom, the tone was satisfactory and encouraging and the general tendency of prices upward. Issues like Brazilian Traction, Consolidated Smelters and International Nickel registered good gains, while newsprint and power stocks were popular. There was, however, considerable weakness in the stocks of western grain and of farm implement companies as the result of the shortness of the prairie grain crop. Interest in the mining market also revived, with a considerable advance in the prices of both gold and base metal stocks. In the latter part of August, however, quotations in all sections tended to drift downwards under holiday influences, and movements at the end of the month were irregular. The Bureau's "Investors" Index which stood at 131·9 on July 16th climbed to 134·5 on July 22nd, then to 135·6 on July 31st, and had risen to 136·8 on August 12th. The bond market has been firm and there has been steady buying of good bonds by insurance companies and similar organisations. The Bureau's index for long-term Dominion bond prices which stood at 115 on July 16th had risen by August 12th to 115·5. Prices of western provincial bonds have strengthened as the result of the Federal Government's disallowance of Alberta's banking legislation and of the appointment of the Royal Commission to investigate public finances and correlated problems.

GETTING DOWN TO BUSINESS —— *quickly*

THE SCOTTISH INDUSTRIAL ESTATE

GIVES YOU MANY ADVANTAGES

- With the rapid rise in trade and with markets waiting—what is it worth to you to get down to business quickly—and to operate early? Had you to build a factory and waste time in negotiations and in making arrangements in connection with it, much valuable time would be lost and consequently, much money.

LEASE A FACTORY WITH ALL SERVICES AT NORTH HILLINGTON

By the services and amenities placed at your disposal you have the opportunity of an economic start to your business and encouragement to its growth. Factories for either light or heavy industries can be leased. The rents are low as the company does not operate for profit. Process steam is available. The Estate is a free delivery and collection area for railways. Insurance and upkeep of factories and upkeep of roads are paid by the Estate.

Transport facilities by air, river, rail and road are convenient. There is ample skilled labour in the vicinity.

For full information and particulars apply to—

SCOTTISH INDUSTRIAL ESTATES LTD.

41 ST. VINCENT PLACE, GLASGOW, C.1

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

COMPANY MEETINGS

TROJAN (HOLDINGS), LIMITED

A SATISFACTORY YEAR

The first ordinary general meeting of Trojan (Holdings), Limited, was held, on the 27th ultimo, at Winchester House, London.

Mr F. L. Blow, J.P. (the chairman) said that the accounts covered the working of Trojan, Limited, the operating company, to June 30th, resulting in a gross dividend receivable from them of £26,375. An interim dividend of £1,600 received from Beans Industries, Limited, had been reserved pending payment of that company's final dividend.

The directors considered the results to be very satisfactory. An interim dividend of 3 per cent. actual, less tax, had been paid, and the directors recommended a final dividend of 7 per cent. actual, less tax. Great credit was due to Mr Basil Monk, managing director of Trojan, Limited, for the capable way in which he had handled the affairs of the operating company since capital was placed at their disposal by the Holdings Company. Time and money had been saved by the prompt action taken to secure in advance steel and other material to be used in the erection of the new works, also in entering into contracts for construction without the slightest delay.

Within a comparatively short time the new buildings had been erected and equipped with lighting and heating. Roads, sewers and floorings had been made. Plant and machinery had been transferred from the old works to the new buildings with the least possible disturbance of the output, and a large amount of new plant had been installed. That had been carried out in face of abnormal difficulties due to shortage of labour and material and a rising market in prices.

On the commercial side of the business important contracts had been obtained—exceeding £450,000 with others in view—which would keep the works steadily engaged for some time. During the past year the manufacture of commercial vehicles and accessories had amounted to approximately 50 per cent. of the turnover.

The directors were optimistic about the future; the connection with Beans Industries was a valuable asset, and Mr Monk had joined the board of that company. The final dividend now recommended would be paid on the increased capital, from which the full benefit would be derived in the next accounts.

The report was unanimously adopted.

ITALY

ECONOMIC AND FINANCIAL DEVELOPMENT

The September issue of THE BANKER is mainly devoted to a special review dealing with economic and financial conditions in Italy. It contains articles by leading Italian authorities on such questions as State Finances, Monetary and Banking Policy, Price Movements and the general course of trade and social conditions.

Amongst the contributors are Alberto Pirelli, H.E. Count Thaon di Revel, H.E. V. Azzolini, H.E. Giuseppe Bianchini, H.E. Professor F. Guarneri, H.E. G. Tassinari, Professor Riccardo Bachi, T. Cianetti, Bruno Biagi, H.E. M. Benni, H.E. Alessandro Lessona and On. O. Bonomi.

There have been many fundamental changes in Italian economic conditions during recent years, and most of these are still imperfectly appreciated in England simply because in some respects Italy has been evolving a new system. This makes this issue of THE BANKER of considerable importance to a wide public, for one of the first needs for the maintenance of friendly international relations is a complete knowledge of the facts.

THE BANKER can be obtained through any good newsagent, price 2s. 6d. Orders for copies by post should be accompanied by a remittance for 2s. 9d. and addressed to The Publisher :—

THE BANKER

20 BISHOPSGATE :: LONDON, E.C.2

ODEON THEATRES.

A SUCCESSFUL START

MR OSCAR DEUTSCH ON THE OUTLOOK

The statutory meeting of Odeon Theatres, Limited, was held, on the 31st ultimo, at 40 Park Lane, London, W.

Mr Oscar Deutsch (chairman and managing director) said: It will be recalled that we acquired 86 theatres in various parts of the country, and, although no audit has taken place, I believe a satisfactory increase in takings and resultant profit over the corresponding period of last year has been achieved. The company has management agreements with 71 further theatres and a considerable interest in the profits of these, which profits have been very satisfactory indeed, and it is pleasing to record that, apart from the 37 which were actually completed and in operation at the time, since our issue a further 15 of these managed theatres have been opened.

Apart from these newly opened Odeon Theatres, we have acquired a further 18 existing modern theatres, which we are bringing up to Odeon standard. In nearly every case the whole of the staff has been taken over. It is most gratifying to notice how enthusiastic these employees have been at the prospect of joining the Odeon Circuit, and I should like to call attention to the extraordinary team spirit on the part of our employees generally. The results of these newly opened and further acquired cinemas have, so far, fully justified the favourable opinion we had of their earning capacity.

PROSPECTS OF THE INDUSTRY

I am of the opinion that the prospects of the cinema theatre industry are extremely good. The general increase in employment and prosperity throughout the country, with the corresponding increase in the spending power of the people, coupled with the natural reaction to be amused during their leisure hours, cannot fail to have a marked effect on cinema attendances. The growing tendency to favour the newer and more up-to-date cinemas is of particular value to the Odeon Circuit, comprising as it does such a large proportion of cinemas erected within the past few years.

It is interesting to note the vast number of potential cinema patrons still untapped in this country. Ignoring the number of people who attend cinemas several times a week, in the United States of America approximately 69 per cent. of the population, men, women and children, attend the cinema once a week, while in Great Britain only approximately 41 per cent. of the population do so. If cinema-going in this country were increased to the extent prevalent in the United States, it would mean an increase of between 12,000,000 and 13,000,000 attendances each week in addition to the present weekly attendance of roughly 19,000,000.

EFFECT OF EARLIER PROVINCIAL FILM RELEASE

I believe there is one way in which this increased attendance in this country can be achieved, and we propose to put that method to the test. I believe that if, after the West End run, a picture goes immediately into the London suburban and provincial theatres, it would be fresher, more attractive and would draw much larger audiences. That system is already in force in the United States, and may, to some extent, account for the larger proportion of attendances there. It is our intention, following upon the opening of the new Odeon Theatre in Leicester Square, to put that policy into operation in this country. In this connection we have the enthusiastic co-operation of United Artists, the distributors of the outstanding films of such important producers as Alexander Korda, Samuel Goldwyn, David Selznick, Walter Wanger and others.

We have still a further 19 managed theatres to take over as soon as the buildings are completed, and it is gratifying to report that they are well up to scheduled time, not forgetting the Odeon Theatre that is being built on the site of the old Alhambra Theatre, in Leicester Square, which will undoubtedly be a most valuable asset to the profits of this business, and I look forward with a considerable amount of interest to our first annual general meeting next year.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the week ended August 28, 1937, amounted to £8,810,000, against ordinary expenditure of £10,479,000. After increasing Exchequer Balances by £243,655, the operations for the week, as shown below, increased the gross National Debt by £1,913,000, to about £7,992 millions.†

CENTRAL AND SOUTH AMERICAN EXCHANGE RATES

The Bank of London and South America, Ltd., issues the following details relative to quotations for certain of the South and Central American exchanges. All these exchanges, with the exception of that of Bolivia, are related to the United States dollar, and the approximate sterling rates may be obtained by applying the dollar-sterling exchange rate :—

*Bolivia.** Commercial Banks' "free" selling rate was 120 bolivianos per £ on June 18th.

*Colombia.** Sight selling rate 175·80 pesos per 100 United States dollars on July 1st. This rate applies to holders of permits buying in the "open" market.

*Ecuador.** Official sight selling rate on New York was maintained up to July 2nd at 10·50 sucres per United States dollar.

Guatemala. Sight rate on New York is maintained at 1 quetzal per United States dollar, but a commission of 1 per cent. is charged by the Banco Central for the sale of drafts.

*Nicaragua.** Sight selling rate on New York was officially fixed at 2 cordobas per United States dollar on March 19th, 1937.

Salvador. Sight selling rate on July 3rd was 2·51 colones per United States dollar.

Venezuela. Sight selling rate on New York was officially fixed at 3·19 bolivares per United States dollar on April 27th, 1937.

* Exchange controls are operative in these countries.

GOLD MARKET

Messrs Samuel Montagu and Company write on September 1, 1937 :—

The Bank of England gold reserve against notes amounted to £326,406,625 on August 25th, showing no change as compared with August 18th. In the open market a general demand absorbed about £1,100,000 of bar gold offered at the daily fixing during the week. In sympathy with the firmer tendency of the dollar, prices recovered from the low level recorded last week, but continued to rule at about dollar parity. The s.s. "Cathay," which sailed from Bombay on August 28th, carries gold to the value of about £270,000. The Southern Rhodesian gold output for July, 1937, amounted to 67,093 fine ounces as compared with 66,330 fine ounces for June, 1937, and 66,652 fine ounces for July, 1936.

SILVER MARKET

There was more activity during the past week and prices moved sharply downwards under pressure of selling by the Indian bazaars where, following reports of large shipments of silver from Shanghai to Hongkong, there appeared to be some apprehension that this silver might be placed upon the market. Quotations had fallen to 19 ⅜d. for both deliveries by August 28th, but subsequently the nervousness subsided and bear covering purchases brought about a recovery, prices to-day being 19½d. for cash and 19 11/16d. for two months' delivery. The low rates attracted support from America and shipments were made to New York; the demand thus occasioned for spot delivery resulted in the cash quotation being quoted at a premium for the first time since March last—the premium was ⅛d. on August 31st, but decreased to 1/16d. on September 1st. At the moment the tone of the market is steadier, but the immediate outlook is rather uncertain, depending largely upon the attitude of the Indian bazaars.

Quotations for gold and silver are shown below :—

1937	Price of Gold per Fine Ounce	Equivalent Value of £ sterling	Price of Bar Silver in London per ounce standard Cash	Price of Bar Silver in London per ounce standard Two Months	Price of Silver New York per ounce ·999 fine

BANK OF AUSTRALASIA.—Interim dividend maintained at 3½ per cent.

BRITISH EMPIRE FIXED TRUST (Comprehensive Series).—Coupon No. 7 will be paid at rate of 3·2d. per sub-unit.

FIRST PROVINCIAL FIXED TRUST, LTD. ("Reserves" Series).—Third distribution on Series "Reserves" Certificates, payable on September 15th, will be at the rate of 5·537625d. net per sub-unit, including 1·041375d. net per sub-unit, amount realised on sale of bonuses, etc.

GENATOSAN.—Final ordinary dividend 20 per cent., making 35 per cent. for year as before.

SIR J. L. HULETT AND SONS.—Net profit year to April 30, 1937, £97,500, after £107,500 to depreciation and reserves. Net profit a year ago was £66,858 after providing £45,446. Ordinary dividend raised from 5 to 7 per cent.

LEYLAND AND BIRMINGHAM RUBBER.—Final dividend 7½ per cent., also bonus of 2½ per cent., making for year 12½ against 7½ per cent.

QUALCAST, LTD.—Final dividend of 12½ per cent. actual, less tax, with cash bonus of 10 per cent., making 30 per cent. actual, less tax, for the year. This compares with a total of 20 per cent. last year; also the capital has been increased by £25,000.

RANSOME AND MARLES BEARING.—Record dividend of 20 per cent. for year to June 30, 1937, compared with 15 per cent. Net profits have risen by £49,542 to £166,351.

SECOND ALLIANCE TRUST.—Final ordinary dividend 11, compared with 9 per cent., making for year to July 31, 1937, 20 against 18 per cent.

TIN COMPANIES INTERIM DIVIDENDS.—Three tin mining companies have announced increased interim dividends. Southern Malayan Tin is paying 15 compared with 5 per cent. The payment by Malayan Tin is 20 per cent., compared with 10 per cent. and Lahat Mines are distributing 10 against 7½ per cent.

UNITED GLASS BOTTLE.—Interim dividend increased from 2½ to 3½ per cent. paid on a capital increased from £500,000 to £1,117,022.

WALSALL CONDUITS.—Interim dividend of 20 per cent. is to be paid on ordinary shares.

WALLSEND SLIPWAY AND ENGINEERING.—Interim ordinary dividend increased from 3 to 4 per cent.

KETTON PORTLAND CEMENT COMPANY.—The final dividend on the ordinary shares is 7½ per cent., making a total of 12½ per cent. for the year. The total for the preceding year was 10 per cent.

UNITED TURKEY RED.—Although trading results for the half year to June 30th show a loss, the directors have decided to pay a dividend on the 4 per cent. first preference shares, and to pass the dividend on the 5½ per cent. second cumulative preference shares.

MODERN MACHINE TOOLS.—An interim dividend of 7½ per cent. (the same as a year ago) is payable on September 18th.

JONES AND HIGGINS.—An interim of 3½ per cent. (the same as last year) will be paid on the ordinary shares in respect of the year ending February 20, 1938.

SURVEY OF COMMODITY MARKETS

THE erratic movement of the prices of primary products this week reflects the prevailing uncertainty brought about largely by unfavourable political developments abroad which have arrested the upward movement of quotations a few weeks ago.

Copper, lead, spelter and tin all registered a slight decline on the week. In contrast, quotations for wolfram and antimony, which are normally obtained in substantial quantities from China, jumped ahead on fears that the Sino-Japanese conflict might lead to a reduction in the supplies of these two materials. The markets in vegetable oils and oilseeds were dull, while rubber remained depressed at the lower level of prices.

The movement of quotations for wool and cotton showed striking contrasts. The new wool selling season in Australia opened with a brisk demand at firm prices, while quotations for raw cotton dipped to still lower levels on the announcement of the United States Government's loan policy, discussed overleaf by our Manchester correspondent. Current quotations for raw cotton are substantially lower than a year ago.

The wheat markets have been spared from any further shocks. Liverpool prices showed little change on the week, but raw sugar quotations continued to drift downwards. Demand for tea at the auctions in London was again active at firm prices, the international export restriction scheme having been prolonged for a further period of five years.

In the United States, prices of staple commodities took a further downward plunge. Thus, Moody's index (December 31, 1931 = 100) declined from 197·0 to 192·9 during the week ended last Wednesday, compared with 205·5 a month ago and 183·4 on the corresponding day last year.

SHORTER COMPANY COMMENTS

APPOINTMENTS AND PERSONAL

Manufacturers Trust Company, New York, announces the appointment of H. W. Auburn as European Representative. Offices were opened on September 1, 1937, at 1 Cornhill, London.

Mr Stuart C. Sheppard has been elected chairman of Agar, Cross and Company, in succession to Mr William A. Agar, who will remain on the board; Mr Charles Hendry and Mr Walter Woodbine Parish have joined the board to fill vacancies; and Mr James Asher has been elected a director.

Dr J. Donald Pollock has been elected president of British Oxygen Company and Mr S. J. L. Hardie has been elected chairman. Sir Alexander Stewart, K.B.E., has been appointed a director.

The head office of Equity and Law Life Assurance Society from September 6, 1937, will be at No. 20 Lincoln's Inn Fields, W.C.2. Telephone Holborn 7612.

Mr Ralph Gore has been appointed a director of White Drummond and Company and of Municipal and General Securities.

Mr N. H. Dixon has been appointed secretary and chief accountant of the Standard Motor Co., Ltd.

First, Second and Third Conversion Investment Trusts announce that Mr Richard Coit has been elected a member of the boards of these companies.

Mr R. Hugh Roberts has resigned from the boards of Leadenhall Securities Corporation, Ltd., and Gambrell's Radio Communications, Ltd.

MISCELLANEOUS

PRICE BROTHERS AND COMPANY.—Operating earnings for year to March 31, 1937, were $1,789,316 against $675,324; net loss $293,913 compared with $1,595,625 loss.

DEBENHAMS, LTD.—Profit for year to July 31, 1937, amounted to £727,896, an increase of £21,450. Net profit after interest £22,491 higher at £580,754. To reserve £50,000 as before. Carry forward raised by £47,587 to £229,758. Ordinary dividend raised from 16⅔ to 20⅚ per cent.

HARVEY NICHOLS AND COMPANY.—Net profit for year to July 31, 1937, £129,565, an increase of £18,735. To reserve £10,000 as before. Issue expenses written off £26,874. Ordinary dividend maintained at 10 per cent. Carry forward increased from £27,086 to £29,777.

WIGGINS TEAPE AND COMPANY (1919).—Net profits for two quarters ended June 30, 1937, are estimated at £212,123, an increase of £20,520 over corresponding period of 1936. Balance after preference dividend, £130,249 against £109,367.

BRITISH OXYGEN COMPANY.—The company has acquired a controlling interest in the Odda Smeltewerke A/S of Norway, manufacturers of carbide.

DANZIG 7 PER CENT. TRAMWAYS LOAN 1928.—The Council of Foreign Bondholders announce that, in order to conform to the treatment accorded to other loans, the reduced rate of interest on the Tramways Loan shall not operate until after the payment of the next coupon due October 1st at the full rate.

PLATT BROS. AND COMPANY (HOLDINGS).—The Shareholders' Protection Association, in a circular letter dated August 30th to second preference holders, say they consider that the proposals for the scheme of arrangement (discussed on page 439 of *The Economist* of August 28th) are inequitable, and holders are advised to vote against the scheme, which is to be considered at meetings on September 15th.

ANGLO-ALPHA CEMENT.—Net profit £91,177 for year to June 30th, the first since amalgamation with Atlas Cement of South Africa. A first ordinary dividend of 5 per cent. absorbs £41,929. To reserve £40,000. Carry forward £30,784. Balance sheet shows stocks at £51,265. Debtors £86,918. Cash £80,509. Creditors £78,348.

NEWS OF THE WORLD.—Total profits for year to June 30th, 1937, £430,851, compared with £409,995. To income tax £68,420 against £60,190; depreciation £40,000, as before; employees' fund, £7,179 against £7,072. Net balance £315,252, an increase of £12,519. Ordinary dividend 20 per cent. for year as before. To reserve £100,000 as before. Carry forward £30,765, an increase of £9,252.

OIL OUTPUTS

TRINIDAD PETROLEUM DEVELOPMENT COMPANY, LTD.—Production for May, 171,727 barrels; deliveries for May (including purchased oil), 136,883 barrels; Production for June, 106,901 barrels; deliveries for June, including purchased oil, 144,118 barrels. Production for week ended July 3rd, 8,419 barrels. General strike in Trinidad continued throughout the week; work gradually being resumed. Production for the week ended July 10th, 28,614 barrels. Production for the week ended July 17th, 32,550 barrels. Production for the week ended July 24th, 30,848 barrels. Production for the week ended July 31st, 30,213 barrels. Production for July, 129,469 barrels; deliveries for July, including purchased oil, 148,286 barrels. Production for week ended August 7th, 30,738 barrels. Production for the week ended August 14th, 32,876 barrels. Production for the week ended August 21st, 31,423 barrels.

COAL

SHEFFIELD.—Holidays and a continuance of trouble at some pits tends to hamper supplies to some extent. On the inland market, industrial demand is very strong with supplies fairly steady. There is a shortage of good quality smalls for coking. Some revival of demand for house coal is noticeable, the better demand being attributed to the imminence of the operation of winter prices. On the export market washed singles and doubles are in better request and there is every likelihood that higher prices will rule in the near future.

Cokes are very firm and stocks are on the light side. Furnace qualities are prominent and the inquiry for graded coke for central heating shows improvement. There is a general expectation that shortly higher prices will rule and in consequence there is not much forward selling.

NEWCASTLE-ON-TYNE.—Whilst there is a little weakness in the Northumberland prompt position for large steam coals due to the difficulty in securing tonnage, all other sections of the North-East coal market are firm. The Durham section is particularly strong. Gas collieries are now working regularly and there is the continued firm demand from the home and export markets for all classes of coking coals. Bunker classes for ships' own use continue in good demand. Patent oven coke is becoming more scarce under the strong demand of the home trade.

GLASGOW.—Prices are well maintained, but in one or two directions a slowing-down in the movement of fuel is noticeable. Contract business provides the shipping collieries with a good outlet, but the quiet conditions of foreign buying of late now appear to be having some effect, the result being that supplies for new prompt orders are more plentiful than for some time. A shortage of tonnage is also an influence. The reaction of these conditions on the home market is seen in the stocks at colliery sidings, which result in a stringency in the waggon position. Industrial requirements remain heavy, but still leave fuel available for further business, while the expansion in demand for domestic coal has not yet made much headway. The concessions of 1s. 6d. to 2s. per ton granted by Lanarkshire producers for summer trade in house coal have now been withdrawn.

CARDIFF.—There has been little change in the state of business or in the level of prices on the Cardiff coal market during the past week. The improvement in the volume of trade is being maintained. Although spot transactions are comparatively few, collieries are being regularly employed on the strength of their contracts. The provisional returns of shipments abroad during August give a total of 1,089,222 tons for 24¼ working days, compared with 1,472,033 tons in 27 working days in July, and 964,231 tons in 24¼ working days in August, 1936. Quotations for future supplies are very firm, and a number of colliery companies producing certain sizes of anthracite and dry coals suitable for central heating furnaces have entered into an agreement fixing delivered prices in the London and other zones. Under these voluntary arrangements, which are for an experimental period of nine months, the allowance to factors is fixed at 15s. per ton. The joint audit for the three months ended July shows, compared with the previous three months, an increase of 9·17d. per ton in the average pithead proceeds, but owing to an increase of 10d. per ton in the wages cost and of 0·69d. in costs other than wages, the certified profit was only £78,298, or 2d. per ton, which compares with a profit of £135,886, or 3·52d. per ton, in the previous three months, and a loss of £182,056, or 5·56d. per ton, in the corresponding quarterly period last year. The heavy increase in wages cost, absorbing the whole of the increase in proceeds, is due to the recent advance in wages. Compared with a year ago the average earnings per man shift worked show an increase of about 10d. per shift, and now average nearly 10s. 6d.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates that there are signs of increased activity in the iron and steel trades as the close of the holiday season approaches and that greater pressure is being exercised by the consuming industries to obtain supplies. The situation remains difficult as the producing firms have sold their output for the remainder of this year.

In the pig iron department the position has slightly improved and, with the renewed shipments of ore, more furnaces are being put on the production of hematite. Supplies of basic iron, also, appear sufficient to meet the present needs of the steelmakers. There has been an easing in the demand for foundry iron from some branches of the consuming trades; but this has been more than offset by the expansion in the requirements of other departments.

The scarcity of semi-finished steel is still acute, and although increased quantities of Continental semis are reaching some districts, they are not sufficient entirely to relieve the shortage. More regular deliveries of British steel are arriving at the consuming works and the position seems to be improving.

Demand for finished steel is still in excess of supply, in spite of the record production, and consumers are endeavouring to place orders for delivery next year. The tendency, however, is for the manufacturers to adopt a conservative policy with regard to such far forward business, owing to the congested state of their books.

MIDDLESBROUGH.—Shipments of pig iron from the Tees during August amounted to 10,120 tons, or double the quantity shipped during July. It is noteworthy that parcels have been sent to overseas destinations, such as Finland, Netherlands, Belgium, France, etc. These shipments were made chiefly during the local holiday period, when the demand from the home foundries was very much reduced. Shipments of manufactured iron and steel from the Tees during August amounted to 41,345 tons, compared with 50,195 tons during July.

Autumn demand for all classes of material is strong, and although output is being maintained at a high level, deliveries are in certain cases still in arrear.

Pig iron prices are unchanged. Deliveries under current contracts are now being resumed to home users, and it is hoped to release further quantities for export. Foundry and hematite pig iron producers are almost fully booked to the end of the year. Producers of semi-manufactured steel are faced with increasing demands from re-rollers. Finished steel output is practically all sold, and prompt business is therefore impossible. Deliveries can only be undertaken for forward dates, and at prices then ruling.

Foreign ore imports are well maintained, the quantity imported into the Tees during August being 185,600 tons, against 199,600 tons during July. Chartering has now been resumed from Bilbao, and a cargo of ore has arrived at an East Coast port during the last few days. Coke is very firm at 40s. per ton, delivered at furnaces. Scrap is in good demand at fixed prices.

SHEFFIELD.—The holiday period, while giving iron producers an opportunity of making up delivery arrears to some extent, did little or nothing to help in the accumulation of users' stocks. Makers of forge and foundry pig iron are still unable to accept new business on any scale, most of them being fully booked to the end of the year; in fact, contract renewals are about the only form of business at present. The demand for basic pig iron is unabated, but it is almost impossible to place fresh orders. The position with regard to hematite shows little change, though supplies of East Coast mixed numbers appear to be rather less restricted. Not much West Coast hematite is on offer. Makers of finished iron are being hindered by the lack of material and cannot accept all the business on offer.

In the steel market it is becoming increasingly difficult to place fresh orders and no fixed date of delivery is promised. Supplies of billets from the Continent have done little to alleviate the demand, which is insistent. The distribution difficulties in the case of structural steel will possibly be straightened out now that the scheme for regulation is in operation.

The iron and steel scrap market is very active, but supplies are on the short side, particularly of cast iron. All prices are firm and unchanged.

All sections of the engineering trade here are fully occupied, and there is a steady flow of important orders from both home and overseas sources.

CARDIFF.—Conditions are once again normal in the South Wales iron and steel industry and the latest returns give a tinplate output of 77·5 per cent. of capacity. Prices remain unaltered for pig iron, steel bars and sheets as well as tinplates. Exports of tinplates at Swansea last week totalled 5,719 tons compared with 4,964 tons the previous week, and only 2,324 tons in the corresponding week last year. Stocks have increased and now amount to 5,577 tons.

OTHER METALS

COPPER.—This has been a comparatively quiet week for copper, although turnover has tended to increase in the last few days. As a result of the uncertain political outlook and the disappointing advices from the United States the direction of prices was downward. Standard cash declined by 12s. 6d. per ton to £55 6s. 3d. The contango has remained unchanged at 5s. The immediate outlook will be more dependent on "outside" than on "inside" factors, so that forecasts are impossible at the moment. The Chilean and Rhodesian copper production figures for July, which have become available this week, reveal an interesting change. In both countries there has been a substantial decline in output during that month (in Rhodesia from 17,863 long tons to 15,700 long tons and in Chile from about 37,000 tons to about 25,200 tons), although there were no technical difficulties which could explain the drop. It appears still too early to draw definite conclusions from the declines, but it is not impossible that certain producers are restricting their output again intentionally.

Sales on the London Metal Exchange: 1,500 tons on Monday, against 900 tons last week; 1,350 tons on Tuesday, against 1,950 tons last week; 1,700 tons on Wednesday, against 1,050 tons last week. Domestic spot was quoted at 13·57½ cents per lb. in New York on Wednesday, against 13·77½ cents a week ago and 14·20 cents a month ago. Wednesday's official closing price for standard cash in London was £55 6s. 3d. to £55 7s. 6d. per ton, compared with £55 18s. 9d. to £56 a week ago. Stocks of refined copper in British official warehouses at the end of last week at 11,608 tons, showed an increase of 353 tons, while stocks of rough copper, at 11,941 tons, were 548 tons larger.

LEAD AND SPELTER.—Both markets were comparatively lifeless although prices fluctuated in sympathy with the other metals. Lead closed 5s. down on the week at £21 15s. per ton, while spelter lost 18s. 9d., closing at £22 16s. 3d. per ton. The particular weakness of spelter was due to the liquidation of the small speculative position, accumulated during the short-lived August boom. As the statistical position of the lead market on this side of the Atlantic is stronger than that of the spelter market, a further contraction of the difference between lead and spelter quotations is likely, unless speculative spelter purchases in anticipation of large United States imports revive. As in copper and tin the immediate future of the lead and spelter markets will be more dependent on outside than on inside influences.

Sales of lead on the London Metal Exchange: 900 tons on Monday, against 950 tons last week; 900 tons on Tuesday, against 1,350 tons last week; 2,500 tons on Wednesday, against 600 tons last week. The New York quotation on Wednesday was 6·50 cents per lb., against 6·50 cents a week ago and 6·25 cents a month ago. Wednesday's official closing quotation in London for soft foreign for shipment during the current month was £21 15s. to £21 16s. 3d. per ton, compared with £22 to £22 1s. 3d. last week.

Sales of spelter on the London Metal Exchange: 700 tons on Monday, against 775 tons last week; 1,250 tons on Tuesday, against 1,500 tons last week; 1,300 tons on Wednesday, against 725 tons last week. Wednesday's quotation in East St. Louis was 7·25 cents per lb., against 7·25 cents the week before and 7·00 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £22 16s. 3d. to £22 17s. 6d. per ton, against £23 15s. to £23 16s. 3d. last week.

TIN.—Tin was very weak at the beginning of the period under review and on Friday last the price fell for the first time since the beginning of July below £260 per ton. Subsequently, however, a recovery took place and the closing price at £261 15s. was only 15s. lower on the week. The August tin statistics published on Wednesday proved to be bearish. After the extraordinary rise in stocks during July there was—according to Messrs A. Strauss and Company, Ltd.—only a moderate decline of 156 tons to 23,551 tons in August. The market had expected a decline of about 1,000 tons. As anticipated, world deliveries increased sharply by 3,171 tons to 12,348 tons last month as a result of the deliveries to consumers of the huge New York port stocks at the end of July. On the other hand new supplies showed a surprising increase of 500 tons to 12,470 tons, although Straits shipments declined by 754 tons to 8,525 tons after having reached an extraordinarily high level in July. The August statistics as a whole give reason for hopes that the position of tin supplies will improve slowly but steadily in the near future. Such an improvement is more than necessary to maintain the stability of the market, for the new Statistical Bulletin of the International Tin Research and Development Council, published this week, shows that production in the first half of this year, at 92,303 tons, was 2,560 tons below current consumption.

Sales of tin on the London Metal Exchange: 175 tons on Monday, against 240 tons last week; 150 tons on Tuesday, against 425 tons last week; 165 tons on Wednesday, against 150 tons last week. The New York quotation on Wednesday was 58·50 cents per lb., against 59·12½ cents a week ago and 59·12½ cents a month ago. Wednesday's official closing quotation in London for standard cash was £261 15s. to £262 per ton, compared with £262 10s. to £262 15s. a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 2,572 tons, an increase of 185 tons on the week.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted on Wednesday at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was quoted at £13 12s. to £13 12s. 6d. per flask of 76 lbs., the same as last week. Chinese antimony was quoted at £80 to £82 per ton, ex warehouse, as against £77 last week. Chinese wolfram for "September–October" shipment was quoted at 105s. to 110s. per unit, c.i.f., compared with 97s. 6d. for "August–September" last week. Refined platinum was quoted on Wednesday at £10 5s. per ounce, compared with £10 5s. a week earlier.

TEXTILES

COTTON.—Manchester.—The further downward movement in raw material prices has made buyers of yarn and piece-goods cautious, and although fair transactions have been arranged in one or two directions, there have been no signs of any real revival in demand. Merchants have been nervous as a result of developments in the Far East. The event of importance in the raw cotton markets has been the announcement of the loan plan to farmers in the United States. The terms, however, seem to have given very little satisfaction to growers, and the scheme has been considered bearish. The loan will be graded according to staple, and an important factor is that the subsidy of 3 cents per lb. to farmers agreeing to co-operate in next year's programme of crop control will apply to only 65 per cent. of the basic production. In the meantime the weather in the Belt continues generally favourable.

In the yarn market a feature of interest has been the decision of spinners of American cotton to increase their margins for certain counts and qualities, and at the end of last week more business was done than for some time back. The Oldham holidays have accentuated the pressure for deliveries. Spinners of Egyptian yarn have decided to continue the price maintenance scheme for another twelve months, the requisite 80 per cent. in the recent ballot having been obtained. Some sellers of piece-goods have reported an increased inquiry and the opinion is gaining ground that a substantial business is waiting to be done when buyers have made up their minds that prices are safe. News from India has not been encouraging, and most of the bids have been quite impracticable. Fair miscellaneous sales have been put through in fancies for Singapore and Java, dyed cloths for South America and prints for West Africa. Home trade buyers have acted with caution. There is still a tendency for manufacturers' order lists to run down.

COTTON PRICES

Loans for Cotton Producers.—After some delay the United States Government has announced the scheme for assisting cotton farmers in view of the prospective abundant supplies this season. Loans are to be granted on the basis of 9 cents per lb. for ⅞ths Middling or better, 8 cents per lb. on ⅞ths Middling or better, and 7⅛ cents on other cotton. The Reconstruction Finance Corporation will lend the Commodity Credit Corporation the sum of 150 million dollars. A subsidy of 3 cents per lb. is to be paid to producers agreeing to co-operate in next year's programme of crop control, but the payment will apply to only 65 per cent. of the basic production. On the details being announced, bearish sentiment in the Liverpool and New York markets was more pronounced and prices touched a new low level and are now lower than at any time since January, 1934. The proposals have not given satisfaction to the growers. It is evident that the Government is determined to discourage the use of loan facilities by producers of low-grade material.

It is probable that this assistance from the Government will put a bottom to the market at around 9 cents in New York. No details have yet been announced with regard to crop control for next season, but this will probably be by restricting the acreage. Previous attempts by the United States Government to prevent low prices for raw cotton have not met with much success. It is significant that exports from the United States have fallen during the last few years from 8 million bales to 6 million bales, and during the same period the production of outside growths has increased from 11 million bales to 19¼ million bales. There seems to be every probability of plentiful supplies of raw material during the next twelve months. With an output from the United States of 15¼ million bales and outside growths totalling 19¼ million bales, the available supplies with a carry-over from last season of 12,800,000 bales, are nearly 48 million bales. This compares with a consumption last season of about 31 million bales. As an item of interest it may be mentioned that this week 6,000 bales of Russian-grown cotton have been imported and sold in the United States.

WOOL.—Bradford.—The event of the week was the opening of a new selling season in Sydney last Monday, followed by Adelaide on Thursday, the result affecting every wool-consuming centre throughout the world. The auctions have hardly come up to expectations. Sydney has shown clearly that manufacturers' stocks everywhere are very low and in need of replenishment. Prices have barely moved in sympathy with those current for tops and yarns in manufacturing centres throughout this country, and the home trade has been by no means slow to seize the opportunity of purchasing. The offerings in Sydney have not been of the best, but good, useful, topmaking clips have been catalogued. The offerings at Adelaide on Thursday were of a most useful quality. Good wool has sold on a basis of 39d. for 64's warp tops, some cables giving the price a fraction higher. Even 39d. is more than can be freely obtained in Bradford to-day. The trade is faced with a big clip, but a new selling season opens with stocks lower than for a good number of years, and while there is not much likelihood of higher prices unless war needs in the Far East become very pronounced, current quotations satisfy growers, who are prepared to meet the market readily. What will suit the entire industry best will be steady, firm prices, with a ready absorption of all the wools catalogued.

GRAIN MARKETS

WHEAT.—Spot prices for the most part are somewhat higher, but futures have again fallen. The Australian crop is in an excellent condition and rain has at last fallen in the Argentine. This and the good Russian yield is having a depressing effect upon the price outlook.

On Wednesday last, "September" futures were quoted in Chicago at 104 cents per bushel, against 105½ cents the week before and 113⅛ cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba (Atlantic), ex ship, 51s. to 51s. 9d. per 496 lbs., against 50s. 3d. last week; No. 2 Northern Manitoba (Atlantic), ex ship, 49s. to 49s. 9d., against 48s. 3d. last week. According to the *Corn Trade News*, total shipments of wheat and flour last week amounted to 979,000 quarters, against 959,000 quarters in the previous week and 1,222,000 quarters in the corresponding week a year ago.

FLOUR.—Conditions in this market remain extremely quiet. Wednesday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 39s. per 280 lbs., as against 39s. a week ago; delivered inner London, 38s. 6d., as against 38s. 6d. a week ago. Manitoba patents, ex store, 37s. 6d. to 39s., as against 37s. 6d. to 39s. 3d. a week ago. Australian, ex store, 32s. to 32s. 6d., as against 32s. to 32s. 6d. a week ago.

BARLEY.—The shortage is diminishing. "October" futures were quoted at 56⅜ cents per bushel in Winnipeg on Wednesday, as against 56⅜ cents last week. Quotations per 448 lbs. in London on Wednesday were: "English feed," at farm, not quoted; "English malting" (new), at farm, 60s. to 70s., as against 60s. to 65s. a week ago; Californian, ex ship, 44s. to 58s., as against 47s. 6d. to 60s. a week ago. Chilean, brewing, ex ship, 44s. to 48s., as against 46s. 6d. to 50s. a week ago.

OATS.—On Wednesday, "September" futures were quoted at 28⅞ cents a bushel in Chicago, against 28½ cents a week ago and 28¼ cents last month. Quotations in London, Wednesday: "English Black," (new), at farm, 25s. to 26s. per 336 lbs., not quoted last week; "English White" (new), at farm, 25s. 6d., as against 26s. to 27s. a week ago; mixed Canadian feed (Vancouver), landed, 25s. per 320 lbs., as against 25s. 3d. a week ago.

MAIZE.—A good Continental demand has raised prices again. "September" futures were quoted on Wednesday at 95⅛ cents per bushel in Chicago, against 98½ cents a week ago, and 97 cents last month. Quotations in London, Wednesday; "Plate," landed, 28s. 3d. per 480 lbs., as against 28s. a week ago; "Plate," ex ship, 27s. 3d., as against 27s. a week ago; "Plate," "August," 27s., as against 26s. 9d. a week ago; yellow maize meal, ex wharf, was quoted at £7 5s. per ton, as against £7 2s. 6d. to £7 5s. last week.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1935–1937:—

Nearest Future	Jan. 2, 1935	Dec. 31, 1935	Sept. 2, 1936	Dec. 30, 1936	Aug. 25, 1937	Sept. 1, 1937
Winnipeg (No. 1, Manitoba) —Cents per 60 lbs.	82⅞	84⅛	94⅛	129	122⅛	122⅛
Chicago (No. 2, Winter)— Cents per 60 lbs.....	98⅛	101⅛	108⅛	135⅛	105⅛	104

HOTEL WESTMINSTER
Le Touquet

The visible supply of wheat in Canada amounts to 38,379,000 bushels, against 30,769,000 bushels last week and 63,861,000 bushels in the corresponding week last year.

SALES AND PRICES OF BRITISH CEREALS.—The following table gives the estimated sale of home-grown wheat during the harvest years 1933–34 to 1936–37.

	1933–1934	1934–1935	1935–1936	1936–1937
Estimated sales of home-grown wheat—	Cwts.	Cwts.	Cwts.	Cwts.
1 week to August 28	176,562	429,655	100,404	156,368
52 weeks to August 28	10,648,825	14,211,769	13,293,795	11,317,210
Average price of English wheat per cwt.	s. d. 5 3	s. d. 4 6	s. d. 7 9	s. d. 8 10

The following is a statement showing the quantities sold and the average price of British cereals in the past two weeks, and for the corresponding weeks in each of the years from 1933 to 1936:—

Week ended	Quantities Sold			Average Price per cwt.		
	Wheat	Barley	Oats	Wheat	Barley	Oats
	Cwts.	Cwts.	Cwts.	s. d.	s. d.	s. d.
August 26, 1933	340,650	63,649	46,420	5 0	11 0	5 5
August 25, 1934	176,562	29,743	30,706	5 3	10 5	6 4
August 31, 1935	429,655	87,699	55,085	4 6	9 6	6 1
August 29, 1936	100,404	17,406	21,070	7 9	10 1	7 1
August 21, 1937	102,339	6,008	23,052	9 2	12 2	8 8
August 28, 1937	156,368	13,378	31,186	8 10	12 7	8 8

OTHER FOODS

BACON.—Arrivals have been slightly larger this week, but demand and prices remain steady. The official quotations (per cwt. for No. 1 Sizable) which formed the basis for dealings on the London Provision Exchange this week, were: English, 101s.; Canadian, 94s.; Danish, 100s.; unchanged from the previous week. Arrivals in London last week included: Danish, 15,516 bales; Canadian, 5,611; Dutch, 1,904; Lithuanian, 1,305; and Polish, 3,352; as against 15,840, 5,073, 1,736, 1,341, and 3,151 bales, respectively, in the previous week.

BUTTER.—The improvement in the market remains and prices are firm. Quotations (per cwt.) on the London Provision Exchange on Wednesday were: New Zealand, finest salted, 116s.; Australian, choicest salted, 116s.; Danish, 132s.; compared with 116s., 116s., and 130s., respectively, a week ago.

CHEESE.—The market has been very active and several prices have risen. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: English Cheddars, finest farmers, 88s. to 90s.; Canadian, finest coloured, 71s.; and New Zealand, finest coloured, 70s. 6d. to 71s.; against 88s. to 90s., not quoted, and 66s. 6d. to 67s., respectively, a week ago.

COCOA.—Much enlarged arrivals have caused last week's price falls to continue, despite a good demand. The spot quotation in New York on Wednesday was 8⅜ cents per lb., as against 8⅝ cents per lb. last week. In London on Wednesday last, good fermented new crop, Accra, "November–January," was quoted at 37s. 3d. sellers per 50 kilos., c.i.f. Continent, against 37s. 9d. a week ago. Last week's movements of cocoa in London were as follows: Landed, 940 bags; delivered, for home consumption, 3,638 bags; exported, 867 bags; stocks, 242,515 bags, against 172,776 bags a year ago.

COFFEE.—The spot markets are quiet and quotations remain unchanged. On Wednesday, Rio No. 7 (cash) was quoted at 9 cents per lb. in New York, as compared with 9 cents per lb. last week and 9½ cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, 141 cwt.; delivered, for home consumption, 34 cwt.; exports, nil; stocks, 2,112 cwt., against 10,154 a year ago. Central and other South American: Landed, nil; delivered, for home consumption, 1,412 cwt.; exported, 312 cwt.; stocks, 96,294 cwt., against 90,649 cwt. last year. Other kinds: Landed, 376 cwt.; delivered, for home consumption, 2,683 cwt.; exported, 424 cwt.; stocks, 94,670 cwt., against 131,646 last year.

EGGS.—Prices have risen yet again for all grades of eggs. At Smithfield, on Wednesday, English (ordinary packing, Grade I, about 15–15½ lb.) realised 18s. to 18s. 6d. per 120, against 16s. 6d. to 17s. last week; while Danish (15½ lb.) made 12s. 6d. to 13s., as against 12s. to 12s. 3d. last week.

FRUIT.—Supplies are growing for the moment and with the end of the holidays approaching prices in some cases are easier. The demand for apples is satisfactory, and a large supply of good quality is selling well. National Mark Worcesters fetch 10s. to 11s. for extra fancy; 6s. to 8s. is the quotation for Bramleys, and Californian Gravenstein at 9s. 6d. to 10s. are steady. Plums are still arriving in great quantities, but there are signs that the crop is approaching its finish. Victorias and Pond's Seedlings have advanced to from 3s. to 6s. and 3s. to 5s. per half-sieve, respectively. Pears and grapes are doing quite well; oranges and grapefruit poorly. Blackberries are very cheap.

MEAT.—At Smithfield Market on Wednesday last, Argentine chilled hindquarters were quoted at 4s. 2d. to 4s. 6d. per 8 lbs., as compared with 4s. 4d. to 4s. 8d. a week ago. New Zealand frozen mutton was 3s. 6d. to 4s. per 8 lbs., against 3s. 6d. to 4s. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 8,371 tons, an increase of 207 tons on the corresponding week last year. Beef and veal accounted for 4,614 tons, mutton and lamb 2,550, and pork and bacon 687, as compared with 4,356, 2,672, and 678 tons, respectively, in the same week of 1936.

PEPPER.—On Wednesday, white Muntok, August–October, was quoted at 4½d. per lb., sellers, c.i.f. Rotterdam–Hamburg, against 4½d. per lb. a week earlier. Black Lampong, spot, in bond, was quoted at 3½d. per lb., sellers, compared with 3½d. per lb. last week. Movements of pepper in London last week were as follows: Black, landed, nil; delivered, 3 tons; stocks, 1,984, against 1,757 last year. White, landed, 27 tons; delivered, 32 tons; stocks, 11,399 tons, compared with 12,129 a year ago.

RICE.—The rise in price continues. The spot price of Burma No. 2 cleaned, was 10s. 9d. per cwt., ex warehouse, on Wednesday, as compared with 10s. 6d. per cwt. a week ago. "September–October," in singles to Continent and U.K., was quoted at 9s. 9d. to 9s. 10½d. per cwt., against 9s. 9d. to 9s. 10½d. for "August–September" last week. Movements in London last week were as follows: Landed, 108 tons; delivered, 121 tons; stocks, 2,088 tons, against 9,424 a year ago.

SUGAR.—The gradual recession of prices in New York and in London continues. The New York spot quotation was 3·50 cents on Wednesday, as compared with 3·60 cents per lb. last week and 3·53 cents per lb. a month ago. Wednesday's sales of raw sugar in London included "December" delivery at 6s. 1¾d. to 6s. 3d., against 6s. 2¾d. to 6s. 3¼d. a week ago. Movements of raw sugar in public warehouses in London and Liverpool last week were as follows: Imports, 7,428 tons, against 9,818 in the previous week and 11,330 in the same week of 1936; deliveries, 23,796 tons, against 20,949 and 19,473 tons, respectively; stocks, 129,559 tons, against 19,372 and 114,968 tons, respectively.

TEA.—The following table shows the average price (compiled by the Tea Brokers' Association) of tea sold in Mincing Lane on Garden Account in recent weeks:—

Week ended	Northern India	Southern India	Ceylon	Java	Sumatra	Africa	Total
	d.	d.	d.	d.	d.	d.	d.
July 22, 1937	15·15	14·55	15·33	13·44	12·38	13·52	14·92

At this week's public auctions in Mincing Lane, 52,970 packages of Indian and 24,052 packages of Ceylon tea came up for disposal. Demand has again been active at firm prices.

VEGETABLES.—There are some evidences of the seasonal decline in this market. Marrows, cabbages, and cucumbers are coming in for sale in large quantities, and prices are a little easier. Peas and beans of good quality are harder to come by and consequently dearer. The demand for tomatoes is unusually good, Jersey outdoor fetching 2s. 9d. to 3s. per doz. lbs. on Tuesday. The supply of good potatoes is increasing and at the Borough on Tuesday, King Edward ranged from 6s. to 7s., against 7s. to 8s. last week, while British Queen, Sharp's Express, Eclipse and Majestic made from 4s. 6d. to 5s. per cwt., against 4s. 6d. to 5s. last week.

MISCELLANEOUS COMMODITIES

VEGETABLE OILS AND OILSEEDS.—Markets for oilseeds and their products are on the whole slightly easier and in want of support. Demand for linseed continues on a hand-to-mouth basis, although prices have moved to some extent in buyers' favour. The outlook, however, is uncertain, especially for the new Argentine crop, which has already suffered from persistent drought and the future of which depends in a very considerable measure upon adequate rains during September. Scattered rains are reported, but they are not sufficient to meet the serious situation. However, there is hope that the crop will be saved, although there is some doubt whether it will be possible to seed the full area intended. Meanwhile, shipments of the old Plate crop continue at about recent levels, reducing the balance of the exportable surplus to below 300,000 tons. With only 150,000 tons expected in the ensuing four months from India, supplies are on the short side unless hidden reserves are revealed. Argentina has already exported 1,367,000 tons this season, against 972,000 tons at the same date last year. Fair quantities continue to be sent to the United States to meet the almost record consumption of linseed oil in that country. Indian shipments are again small. The quantity now afloat for Europe is 103,500 tons, including 19,800 tons from India. Prices of linseed oil have eased about 10s. per ton on the week, in sympathy with seed, and are 15s. lower than a month ago. Trade in Egyptian cottonseed is desultory and prices about steady. Cotton oil is weak. Crude Egyptian, ex Hull, October-December and January-March delivery changed hands at £21 and £20, respectively. Since then there has been some recovery. For prompt delivery £24 is quoted. Oilcakes are in improving demand, and there is some disposition on the part of buyers to arrange future supplies.

RUBBER.—Conditions are still quiet and price changes are small. The spot price in New York on Wednesday was 18⅝ cents per lb., compared with 18¼ cents per lb. a week ago and 18¾ cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 8⅞d. per lb., as against 8½d. on the corresponding day last week. In forward positions business has been done at 8 11/16d. for "October" shipment, as against 9d. a week ago. Stocks in London and Liverpool at the end of last week totalled 45,250 tons, against 44,023 tons a week earlier. A year ago stocks amounted to 108,066 tons.

The Rôle of Labour

IT is singularly appropriate that at this week's meetings of the Trades Union Congress at Norwich the Presidential chair should be filled by MR ERNEST BEVIN. At a time when the Labour movement as a whole is more than usually dominated by the Trade Unions, the Trade Unions themselves can produce no personality with influence or forcefulness to equal those of MR BEVIN. This situation is in part the result of MR BEVIN'S own qualities; but in the main it is due to the removal, by death, retirement or political dissension, of most of the older generation of well-known leaders. In the old days, before the split of 1931, the inner councils of the Parliamentary Labour Party always included the leaders of many of the large Unions. The position is changed to-day; but the result has been to make Parliamentary Labour not less, but more, subject to Trade Union influence. MR BEVIN himself has never played a large part in the Parliamentary Party; he typifies the extra-Parliamentary elements in the Labour movement.

It would, however, be a mistake to assume that MR BEVIN'S chief concerns are not merely extra-Parliamentary but also non-political. His Presidential address was taken up, to a remarkable degree, with political aspirations and problems, ranging over a very wide field. The views he expressed on a number of matters of public concern—such as the need for a policy to mitigate the next slump in trade, or the dangers of a policy of drift in foreign affairs—were eminently moderate and sensible, and will evoke a response far beyond the limits of the Labour movement itself. But the address will inevitably raise the question whether this concentration of Trade Union attention on political matters is in the best interests of British politics or, indeed, of the Trade Unions themselves.

The active participation of the Unions in party politics is a generation old. Its achievements are clear for all to see. From nothing, the Labour Party has been built up to the position of the undisputed Opposition. But its deeper effects are less obvious. The Trade Union tie undoubtedly limits the freedom of judgment of the political Labour party. This is apparent enough even in Opposition; it would become a major issue if the Party were to be placed in power with an independent majority in Parliament. The Trade Unions as a whole are a minority of the nation; they are even a minority of the workers; and on a specific issue, the Union most directly concerned may be a tiny minority. A Labour Party completely dominated by the Unions would tend to be a party of vested interests fully as much as any Conservative Party dominated by Big Business.

A particular example of this danger can be seen at the moment in the attitude which the Labour Party is taking to the question of uniting the various smaller Opposition groups. In the political field, any such union has significance only if it takes the form of an understanding between the Labour Party and the millions of largely unattached voters to its right. The various groups to the left of Labour are of little political importance and could safely be ignored. But in the Trade Union world the position is reversed; for unity means an alliance with the Communists, whereas there are no dissidents to the right. Consequently, the Trade Unions, with their eyes turned apprehensively leftward to the Communists, forbid the Labour Party to glance invitingly to the right and to make, or even to accept, any overtures from the Liberals.

The resulting position may, or may not, be bad for the country. But it is unquestionably damaging to

political Labour's chances of winning a majority at a General Election. The democratic system, as it is worked in this country, depends on the existence of two parties whose chances of attaining office are not wholly unequal. Periods have been known in the past when one of the two parties gained a decisive temporary advantage. But if the second largest party were to condemn itself to permanent inferiority, because of its exclusive tie to a body which by its nature must remain a minority, the normal processes of democratic government could hardly fail to be adversely affected. The remedy does not, of course, lie in any dissolution of the connection with the Trade Unions—any such suggestion would be utterly unrealistic—but in the reacquisition by the Parliamentary Party of the distinct personality and independent judgment it used to possess.

This is one side of the case that could be made out against the domination of political Labour by the Trade Unions. But the other arm of the argument is equally strong. Has the Unions' concern with politics caused them to neglect their real industrial job? We are accustomed in this country to talk as if the Trade Union battle for recognition as one of the partners of industry had been largely won. But the figures of membership hardly bear this out. The total membership of the Unions is slightly in excess of 4,000,000, which is little more than one-fifth of the number of persons included in the National Health Insurance scheme, and less than a third even of the smaller total of persons insured against unemployment. Membership is not in every respect a sure guide to influence, but there are many occupations and industries which are still largely unorganised, and in some of these the conditions of labour are not up to the standards which have been set elsewhere. Moreover, even in the organised trades there has been little advance in the last three or four years in the real standard of living of the workers. The salient figures were printed in *The Economist* last week. They show that average real earnings in 1935 were only slightly higher than in 1931, and that hours of work were longer. These facts can, of course, be explained and even excused; but it is surprising, to say the least, that the Trade Union movement appears to be so acquiescent towards them. Perhaps the attraction of increased money earnings by overtime work in a period of rising costs of living may explain, without justifying, it.

The history of the Trade Union movement in this country has hitherto shown a steady oscillation between predominantly political and predominantly industrial phases. For more than a decade the pressure of events has forced the political aspect to the fore. This period started with the rebuff administered to the theory of direct action in 1926, and it was prolonged by the coincidence of heavy unemployment with rising real wages for those who remained in work. But by all the omens it ought now to be nearing its end. Even now, however, there is no very convincing sign that the Trade Union movement is turning back to industrial affairs.

The proceedings at Norwich are testimony alike that not all of our democratic forces are getting their best expression, and that the Trade Unions have not been making real headway in the evolution of industrial relations and of the status of the workers as a whole. If the Unions now concentrate on repairing the latter deficiency it may mean more industrial strife, but it will also enable the purely political parties to put more life into domestic politics. Some may regret this. But anything which could bring the real issues in British social and political life to the fore would now be an advantage.

Britain and the Powers

WE go to press this week in a veritable hailstorm of urgent, critical and menacing international events. In the neighbourhood of Geneva a conference—to which the French and British Governments invited all the Powers with seaboards on the Mediterranean and Black Seas, except Spain, but including Germany—has assembled to take immediate steps for the repression of piracy on the high seas. Germany and Italy have declined to attend. One of the Governments invited has last week accused another of being the very pirate who sank two of the complainant's merchant ships; and Italy has angrily denied this Russian charge. In language that is only technically more conciliatory, the Japanese Government has intimated that it intends to employ the same tactics of sheer denial in meeting a British charge which—unlike the Russian charge against Italy—has already been substantiated. This charge convicts Japan of a breach of the laws of peace and war which is as gross, in its own way, as the crime of piracy.

There are several other aspects in which the two alarming trains of lawless violence at opposite ends of the Old World are now running ominously parallel. The warfare which started, hardly more than a year ago, as a civil war in Spain, has rambled into an international conflict which is now not only being waged on the territory of the devastated Peninsula but is being carried by submarine and aeroplane into the remotest corners of the Mediterranean. Neutral and legitimate trading ships are being sunk on sight. As for the extensive war in the Far East, it is still only a few weeks old; but the dimensions of the fighting on land have been vastly greater, from the outset, than those of the Spanish conflict. The Japanese have lost no time in extending their operations from the land to the air and the sea, and in committing those outrages against the life, property and interests of third parties which these extensions of the fighting almost automatically entail. And now the mischief is spreading, in this region too, from the territory and territorial waters of China into the high seas. The Japanese have declared a blockade of the entire coastline of China; and their protestation that they do not intend to interfere with the maritime trade of third parties has been qualified by reservations which have already been given practical effect in the stopping and searching of more than one non-Chinese merchant vessel and the diversion of British ships. The Japanese have also been bombarding, from sea and air, Chinese territories that are on the verge of the British colony and leased territory at Hongkong and of the French dominions in Indo-China. They have even forcibly occupied and fortified islands on the route from Hongkong southwards to Singapore.

Thus, to-day, two patches of local lawlessness have spread until one of them now stretches from Tientsin to well below Canton, and the other from Gibraltar to Batum. To call these disorders local or even regional disputes is to stretch the use of these terms to breaking point. They are extensive wars. And to-day we cannot even hug the illusion that the two zones of mischief are at any rate insulated from one another.

Anyone with the most rudimentary knowledge of political electro-physics will have been aware all along that the two death poles are connected by a pair of first-class conductors. One is the Soviet Union. The other is the British Empire. The Soviet Union is a land bridge between Japan's *de facto* Empire in Manchuria at one end and HERR ROSENBERG'S coveted empire in Eastern Europe at the other. As for the British Empire, it depends on its main sea route through the Mediterranean to Singapore and Hongkong. Now, while the Empire could suffer amputation at its extremities and still limp along, it cannot endure a concerted severance of its extremities and its vital artery. It might lose Hongkong at Formosa and exist, under an added strain on its circulation. But it could not exist if it lost the Mediterranean as well at the Balearic Isles or Ceuta. The supposition is unpleasant for our British peace of mind, but we certainly cannot afford to leave it out of account on the eve of SIGNOR MUSSOLINI'S visit to HERR HITLER.

The international hailstorm seems to be bringing down a whole world of trouble upon the British Empire. Britain's diplomacy and counsels have not sunk as low as they now stand—openly flouted and contemned by Great Powers and small—since the days of CHARLES II, when the Dutch burned our warships in the Medway. How has this happened? What is at stake? And what are we to do about it?

What has happened is that a combination of new factors has for the last six years been undermining the bases of a foreign policy which this country has pursued, with almost unswerving consistency and almost unbroken success, ever since the Revolution of 1688. What is at stake is not only the British Empire but something still greater. It is that system of international law and order which is both a result of, and a necessity for, the British Empire's existence. What has to be done, if we are to save ourselves and the world at this eleventh hour, is that we should once more take our place—as we are perhaps beginning to take it in the conference at Nyon this week—as the natural and traditional leaders of all those liberal forces in the world that stand for the maintenance of order, and the process of evolution not by war but by peaceful means.

What have been the bases of this country's foreign policy during the eighteenth and nineteenth centuries? In our golden age, we took advantage of our insularity to keep out of other people's minor local adventures in Europe while we indulged in minor local adventures overseas. But this first rule of British policy was subordinate to two others. Our second rule was to take a Great Power's part in all major international transactions (including wars) which involved any danger of an overthrow of the Balance of Power. It was by practising Rule Two as well as Rule One that we built up our Empire. But there is also a third rule which is the secret of our success in retaining, up to date, the possessions and prosperity we have accumulated. That third rule has been to use our power for one purpose which has always been appreciated by a majority of mankind.

This public purpose has been the maintenance of an international law and order. It may have been imperfect; but it has nevertheless been indispensable to the modern world. Since Britannia has ruled the waves, British sea power has been used for stamping out, or keeping down, piracy. Since London succeeded to the heritage of Amsterdam, the London money market has been at the disposal of the world for its development as one single economic society. And, till the other day, every territory governed from Downing Street under the British flag was open to the trade of all nations. This world-order was brought into being by us out of motives of prudence and self-interest. On the one hand, this order was as vital to our own life as the water in which a fish swims or the air a man breathes. On the other hand, it deflected the shafts of envy from an Empire that had come to embrace a quarter of the earth's surface, because it gave the rest of the world an appreciable share in our British imperial dividend. Such was the skilful architecture of the *Pax Britannica*.

Why is this great British edifice in jeopardy to-day? One reason is that, under the new technical conditions established by recent inventions, local disorders, as this week's news demonstrates, can no longer be localised. Another reason is that the Great Powers other than the British Empire are no longer conveniently parked on the Continent of Europe for British sea-power to corral them there. Japan in the Pacific, and Italy in the Mediterranean, are to-day in a position to cut our maritime lifeline, while German air-power can leap the North Sea to strike at our heart.

But are we going just to sit and cry, with our hands over our eyes, while the British Empire crumbles away, and the nineteenth-century world order with it? The feebleness and irresponsibility of British foreign policy since 1931 are alarming symptoms. Their outcome, our present jeopardy, should be clear to all. But any adventurer who may be counting on its continuance had better be careful. LOUIS XIV counted on CHARLES II; in the end he got WILLIAM and MARLBOROUGH. NAPOLEON counted on GEORGE III, the Opposition Whigs, and FOX; he got PITT, CASTLEREAGH, WELLINGTON. The KAISER and his War Lords counted on CARSON, Labour's pacifism, Britain's degeneracy; they got a world in arms against them. So to-day, the present rulers of Italy, Germany, Japan may be counting on Baldwinism, the Simonite heritage, blind Conservative sympathies with Right-wing exponents of aggression. For our own part we believe that England will again do what she has done before when the world has been menaced by aggressors. She will, at the bitter end, put herself at the head of a defensive but resolute coalition of all the friends of peace.

The Changing Capital Market

IT is no longer quite true to say, as it was before the War, that all financial roads lead to London. Financial emissaries still resort there from east and west and south and north, but they come to discuss plans for the partial payment of old loans rather than the contraction of new ones. During the last two decades, indeed, London's capital market has undergone a process of re-orientation, whose pace has been expedited by our departure from the gold standard in 1931, and by the maintenance of a large measure of official control in the market since the conversion of Five Per Cent. War Loan in 1932. The change, however, is much more than a mere reaction to external measures; in some respects it is fundamental. Its progress has been more or less continuous, but its extent and implications have hitherto received less than their due meed of comment in the market itself. How far the process has gone may, perhaps, be best appreciated by a comparison of the new issues made in the years 1934 to 1936 with those of 1911 to 1913. Both these periods were epochs of relative economic prosperity, spiced with a fair measure of re-armament. The figures are given overleaf.

These figures bring out in a striking way the post-war revolution in the geography of new investment. In several important respects, however, they understate the changes that have been going on. In the first place, they are *The Economist's* Old Basis figures; that is to say, they are rather rigidly confined to public issues proper, and exclude issues made by the method of private placing followed by introduction, which has become important

in the recent years. If comprehensive figures were available both for the pre-War and the post-War period, they would emphasise still further both the predominance of non-Government domestic issues in the latter period, and the increased part now being played by flotations of equity shares. Out of the totals given above, issues of ordinary shares accounted for £130.8 millions (22 per cent.) in the pre-War period, while in the recent period they accounted for £152.8 millions (33 per cent.). If new money raised by the method of placing and introduction were taken into account, the present-day proportion of equities would be much larger. In the year 1936, indeed, it was as much as 61.8 per cent. of our New Basis figures, excluding British Government borrowing.

NEW ISSUES IN LONDON: 1911–13 AND 1934–36
(Three year totals; *Economist* figures; Home Government borrowings excluded; Amounts in million £'s.)

Class of Borrower	1911–13		1934–36	
	Amount	*Percentage of Grand Total*	Amount	*Percentage of Grand Total*
UNITED KINGDOM:—				
Municipalities	3·7		166·7	
Other	103·7		229·7	
Total, United Kingdom	*107·4*	*18*	*396·4*	*84·5*
BRITISH EMPIRE:—

Total, Foreign	*277·9*	*47*	*2·4*	*0·5*
Grand Total	**599·0**	*100*	**468·7**	*100*

Other important changes in the rôle of the capital market are outside the scope of our figures. The enormous increase in the assets of the building societies, and the recent popularity of the unit trust movement reflect the growing importance of the small investor and the special machinery developed to meet his requirements. At the same time, the larger investor has been increasingly attracted by the improved facilities for speculation in New York. The growth of this class of foreign "investment" may to some extent offset the present preoccupation of the British market with domestic issues, which, according to our table, represented 84½ per cent. of the whole in 1934-36, compared with only 18 per cent. in 1911-13. Nevertheless, the change in this respect is vital. New loans to foreign governments and municipalities have completely disappeared, and loans to Empire governments and municipalities, to-day, are only a fraction of what they were. We have virtually ceased to finance railway development outside the British Isles, though this was our largest single type of new investment in 1911-13. To compensate for this, we have rapidly developed two other investment outlets: the finance of official and semi-official home borrowing, on the one hand, and the provision of capital for domestic industrial companies on the other.

Both these developments are symptomatic of far-reaching tendencies in our economic life. The enlarged scope of social policy since the War has increased the need for capital expenditure by home municipalities and public bodies. The greater part of this demand has been called for by housing programmes; the remainder is attributable to other types of public works, to utilities and to improvements. This species of borrowing has provided a type of investment which to some extent replaces the demand of foreign and Empire governments and municipalities before the War, and caters for investors who in pre-War years would have bought fixed interest securities issued for overseas account.

The second line of development has been the increased use by home industry of the machinery of the new issue market and the Stock Exchange. Before the war, the small industrial undertaking obtained a very large proportion of its finance without making a general appeal to the public. From choice or necessity, industrialists now deem it worth their while, in the periods when the market is active, to turn family businesses into public companies with widely diffused shareholdings. The public, for its own part, is prepared to buy and hold equities in undertakings about which shareholders know comparatively little and in whose management they cannot hope to have any decisive influence. The result has been to increase the range of enterprise for which the new issue market caters; it remains to be seen what will be the ultimate effect of the widening divorce between ownership and management in the case of medium-sized businesses.

What is the bearing of these changes on the market as a whole? It has been repeatedly stated that the market is coming more and more under the influence of the authorities, and losing—perhaps permanently—the freedom it formerly valued so highly. In a formal sense this is true, but it is worth while asking where "control" is really exercised. The demand of public bodies and municipalities on the capital market is not controlled at its source by the Bank of England, or even the Treasury; it originates in the social policies which make capital expenditure necessary. If we are committed to heavy expenditure on housing, or re-armament, or new schools, no amount of "regulation" or "timing" of the queue of public borrowers by the Bank of England can substantially influence the total demand on the market over any considerable period. In home industry, the question of control is hardly relevant. The dimensions of the volume of new issues depend almost entirely on the state of the contemporary market for industrial securities. When the market is rising such issues appear in profusion; when markets are sagging they disappear almost completely. The unstable character of this type of demand for new capital is admittedly dangerous; it would be even more so but for the fact that many small or medium-size businesses which really need money are generally able to postpone new issues, if necessary, because they can readily obtain temporary finance from banks, and in other ways.

The capital market, altogether, has for many years past been evolving rapidly in organic fashion. It has become more sensitive and even more temperamental. Authoritarian methods have not been wholly successful in discovering how to regulate it. These methods have effectively controlled the shadow. It is easy enough to close the new issue market to foreign borrowers, so long as prospective investors can buy to their heart's content abroad. It is easy to regulate official and semi-official borrowing, so long as regulation is not allowed to hamper official policy; or to control the market in gilt-edged stocks, so long as the Government is not itself a borrower. To control the *substance* of new borrowing, however, would be a herculean task. The enormously increased volume of new equity issues is volatile and hard to discipline; and there is every reason to believe that its importance will increase still further. The real problem for the market may be less to shake off the Old Man of Whitehall and his marital partner in Threadneedle Street than to find means of obviating dangers that must ensue if the supply of finance available for home enterprise is suddenly shut off every time share prices fall, and turned on in profusion in every minor Stock Exchange boom. Here is a task worthy of the market's—and the State's—keenest ratiocination.

Japan's Capacity for War

THE opinion is frequently expressed that Japan is inviting catastrophe by her war against China, and that even if she achieves military success she will have overburdened herself economically to the point of social collapse. Economically, financially and socially, it is suggested, Japan is unfitted for the strain of a prolonged war under modern conditions. She has, nevertheless, elected to go to war, and it may be well to inquire how far these assumptions are supported by the evidence of current facts and figures.

Japan's foreign trade is of vital importance to her. She is frequently compared with England, but there is one fundamental difference between the two countries. Japan is almost completely self-supporting in foodstuffs. The value of total Japanese imports in 1936 was 2,764 million yen, of which only 231 millions represented foodstuffs, while 2,214 millions was attributable to raw materials and articles for further manufacture, and 294 millions to wholly manufactured products. In the same year, total exports were 2,693 million yen, of which 204 millions represented foodstuffs, 843 millions raw materials and semi-manufactured articles, and 1,563 millions wholly manufactured goods. Of the total export, as much as 1,284 millions was accounted for by textile products of all kinds.

Japan's principal import is raw cotton, which she imported to a total value of 850 million yen in 1936. Approximately 45 per cent. of her cotton comes from the United States, and 42 per cent. from British India. Wool came second in importance, with a total import valued at 200 million yen, derived almost entirely from Australia. Among other imports, supplies of scrap iron, steel products, crude oil, wood pulp, machinery and cars came chiefly from America.

Japan's principal export in 1936 was cotton tissues, to the value of 484 million yen, of which roughly 33 per cent. went to British India, 30 per cent. to China, and 10 per cent. to the Dutch East Indies. Second in importance was raw silk, exported to the value of 393 million yen, of which the United States took over 80 per cent. Approximately 30 per cent. of Japanese export and import trade was with the British Empire, while the United States supplied one-third of her imports and took one-quarter of her exports. The combined empires of Britain, the United States, France and Holland account for two-thirds of all Japanese imports and exports.

In recent times Japan has developed sufficient steel-making capacity to supply her normal needs, and in 1936 she achieved a production of 5¼ million metric tons. Nearly two-thirds of her iron ore, however, is imported, mainly from the Straits Settlements, China and Australia. Approximately one-third of her pig iron comes from Manchuria and British India. For her increased consumption of war material she will require larger imports of pig iron, iron ore and steel.

Japan normally has an import balance of merchandise trade. On the other hand, she has an export balance of "invisible" trade, and makes large transfers on capital account. Her international payments were balanced by the export of gold and silver to a total of 388 million yen in 1931, when she had a heavy outflow on capital account, and of about 225 millions (mainly of silver) in 1935. A preliminary estimate for 1936 shows an adverse trade balance of 130 millions, a favourable balance of "invisible" items of all kinds of 120 millions and a small outflow of gold. During 1936 foreign exchange control was in force, and has become much more rigorous this year. In the first half of 1937 the adverse balance of merchandise trade jumped to as much as 641 million yen (compared with 314 millions for the same period last year), and exports of gold rose to 213 millions.

Japan is already faced with a rapid change in the terms of her trade, for between 1931 and 1936 the volume of Japanese exports required to pay for a given volume of foreign imports rose by nearly 50 per cent. The Government of necessity is increasing its control over all aspects of foreign trade, and its success in maintaining imports of war materials without depreciating the yen will depend upon its skill in cutting down other imports and in rationing the supply of foreign exchange. The national gold reserves have recently been revalued from the old parity of 750 milligrams of gold per yen to a basis of 290 milligrams. The central bank's gold reserve has accordingly been increased to 1,262 millions. This figure measures the extent of Japan's war chest.

The Japanese budget is chronically unbalanced. Public bonds, issued to balance the budget deficit, amounted to well over 800 million yen in every year from 1932 to 1935, and reached 685 millions in 1936. The initial budget for 1937 showed expenditure of 2,815 millions—of which the army and navy required 1,409 millions—and a normal revenue of 1,900 millions. But additional estimates have been passed for war expenditure totalling 2,549 millions, so that the year's deficit, apart from any further supplementary estimates, will be increased to 3,500 millions. The total of Government bonds outstanding at the end of 1936 was 9,264 millions, and by the end of this year the debt may have increased to nearly 13,000 million yen. This is almost exactly equal to Japan's estimated national income in 1936.

In past years the Government has been very successful in floating bonds to cover its deficit. But there are now signs of indigestion and the Government will probably need stringently to regulate the capital markets to obtain the resources it needs. During the first half of 1937, however, the amount of Government bonds issued was only one-sixth of that during the first half of 1936. In that year, as a whole, the Bank of Japan reported total new bond and note issues, including refunding operations, for the central and local Governments, banks and corporations, totalling 6,772 millions, and redemptions, in the same categories, of 5,713 millions. The estimated total of proposed new capital issues for business (stocks and corporation bonds), excluding refunding, was 2,000 million yen during 1936. It is obvious that the needs of the Government, disclosed in the supplementary estimates, will put a heavy strain on the capital market, which it will almost certainly be unable to bear without regimentation. This will be easier to enforce because financial affairs are highly concentrated in a few large family concerns.

It is clear that Japan has a very difficult task on her hands, the more so because she will be unable to raise loans abroad as she did in the Russo-Japanese war. There is bound to be a drastic reduction in the standard of living of the people, but so strong is the disciplinary power of the Japanese Government that social collapse need not be anticipated in the near future. Nationalist fervour will doubtless maintain the zeal of the populace, particularly if substantial victories are rapidly obtained. If the war or its aftermath are prolonged, the strain will become severe, but it cannot be confidently argued that her economic system will collapse and prevent her achieving her war aims, provided that the outside world does not apply any embargo against Japanese trade. A boycott by China would not be decisive; but a joint embargo by the United States and the British Empire would be a very different matter. The Japanese would in theory be able to use their own silk for clothing and would be able to feed themselves. But many of the vital needs of warfare would be withheld, and the effect upon employment and the standard of living would be drastic. Many observers, indeed, believe that the mere demonstration of a joint front by America and Britain would be sufficient to hold Japan in check. In its absence, economic factors alone are unlikely to prevent Japan from pressing forward with her present policy.

British Shops

ARE there too many shops in Great Britain? Are retail costs too high? The British Association has been debating these questions at Nottingham this week.

Professor Sargant Florence started the ball rolling in his presidential address to the Economics Section, on Friday of last week. He pointed out that the average number of employees per shop was only 2.4; and that the number of persons per retail outlet was only about 41.4. He asked for two things: a census of distribution to ascertain the facts; and knowledge among economists and business men of what facts they wished to discover. Last Monday a special Sectional discussion went some way to meet the latter demand. Three excellent examples of the technique of inquiry into retail trade were described; and it was made quite clear what problems needed a solution.

The only regular investigation of retail trade in this country is conducted, jointly, by the Retail Distributors' Association, the Statistical Department of the Bank of England and Mr Arnold Plant, who acted as its *compère* before the British Association. Some 100 to 110 firms with aggregate annual sales of about £50 millions are included in this scheme. They are largely homogeneous in character, with an average annual turnover of about £50,000 (compared with an average turnover for all shops of only £2,000), and therefore have roughly comparable costs. Their cost items are returned according to a carefully defined schedule, based on the experience of similar researches in the United States and South Africa. From this sample, it is possible not merely to trace the course of retail trade and prices, but also to examine the movement of costs in times of rising or falling trade, the effects of large-scale organisation and different rates of turnover. It deserves the credit due to a pioneer investigation of our largest industry, whose annual turnover is well over £2,000 millions; whose wages bill is about £200 millions; and whose staff, employers and employed, totals over 2,000,000 persons.

A second attack on the problem has recently been made, by way of a trial census of distribution, which was described to the Association by Mr H. T. Weeks. This inquiry investigated the number and kind of shops and the classes of goods sold in six English towns of similar population. The sample results showed that a large-scale inquiry, under statutory authority, would encounter no insuperable technical obstacle.

Finally, the Association heard a description by Professor Shields of the official Census of Distribution conducted by the Irish Free State in 1933. The census was instituted to ascertain the age, ownership, number and kind of shops; the number of employees and the amount paid in wages; the amount of rent; and the respective values of wholesale and retail trade and services rendered; it owed a great deal to American and Canadian precedents.

These accounts of work done served a dual purpose. They proved the existence of all the apparatus for a full inquiry into the subject of shops and shopkeepers (whose necessity we urged in *The Economist* as recently as August 7th) and they went a long way towards stating the problems of retailing. Mr Plant, for example, was impressed by the economies of large store organisation; the spreading of the costs of buying and accountancy; and the economies of finance and merchandising, in spite of the offsetting costs of advertisement and delivery. Large stores, he declares, have the best rate of stock turnover, for their stock, large and varied though it is, bears a lower ratio to their sales than that of smaller establishments. The undertakers of the six towns' census, however, were more concerned with the density of shops, whose total number varied in their count from 919 in Chorley to 491 in Jarrow. They found that, on the average, there were only forty potential consumers to each shop, and that much overlapping existed. In the six towns, there were only sixty-five chemists' shops, but 694 shops sold drugs or patent medicines. While 279 establishments were confectioners' shops, as many as 1,206 sold confectionery goods of some kind. There were 241 grocers', but 1,248 shops selling groceries. There seemed to be too many shops.

The special virtue of the Free State census was its detailed official corroboration of many of these very tentative conclusions. In 1933, there were 46,000 shops in the Free State—i.e. one shop to every 65 persons, compared with over three-quarters of a million in the United Kingdom serving some 40 odd persons each. Two-thirds of them had an annual turnover of less than £1,000, and accounted for only 13 per cent. of total sales. The annual retail wages bill totalled £5,860,000, or £83 per employee, and was equivalent to 12.1 per cent. of the aggregate sales. Moreover, the percentage of sales represented by wages to employees rose from 5.7 in the case of businesses with total annual sales between £100 and £500, to 12.8 in businesses of £50,000 or more; and the average annual wage rose, between these two extremes, from £40 to £130.

These researches take us near the heart of the problem, and, in so doing, raise some disquieting questions. Are conditions of work and remuneration of retail workers satisfactory? Is the large shop the most efficient? And is it as efficient as it might be? Or, still more bluntly, are retail costs too high for two reasons: the inefficiency of the small shop; and the tyranny of the large store? Mr Gordon Selfridge, jun., admitted before the British Association that the cost of retailing, averaged over all trade, was nearly 30 per cent. of the selling price; and in this country it amounted to well over £500 millions annually. This charge covered assembly, display, publicity, delivery, credit and "reasonable" profit. It represented the price consumers were willing to pay for freedom and variety of choice and convenient amenities. Since the demand of customers could not be generalised, it was necessary to hold a stock large enough to cover the idiosyncrasies of every *individual* shopper. Mr Selfridge's firm carried 10,763 kinds of stockings; and sold 135 varieties of tooth-pastes, though 80 per cent. of customers bought only six kinds. Customers put so high a value on "freedom to shop as they pleased," that they were ready to pay £150 to £175 millions a year for extra services above those necessary for bare efficiency. Delivery costs alone were over £30 millions annually. In short, the retailer had an "incontrovertible alibi": the consumer paid the piper because he called the tune.

To this plausible but not quite convincing *apologia*, Sir Josiah Stamp retorted that the consumer called the only tune the retailer allowed him. Why did not the retailer charge separately for delivery and credit? Was it because the consumer would not then pay the cost; and the retailer's profit would correspondingly suffer?

There, perforce, the Association's discussion ended, with its main problem still unsolved. What the Association's deliberations really showed was that the way was clear for a thorough national investigation, which would establish the facts about retail trading beyond all question. A census of distribution would cost about £500,000 —say, 20 per cent. of the cost of the beet sugar subsidy in 1936. In retail trade itself there is still some opposition to a census. This opposition comes, at the one extreme, from those who know much and possibly fear, as Sir Josiah Stamp has suggested, that the reward of their superior anticipation and market knowledge may be reduced when the facts and figures are made generally available. It comes, at the other extreme, from those (and they are estimated to represent nearly one-third of the whole) who know so little that they cannot say exactly what their own turnover and costs are. But *salus populi suprema lex*, and both the State and business men would have much to learn from a periodic census of distribution.

Notes of the Week

Trades Union Congress.—The highlights of the Trades Union Congress at Norwich this week have been Mr Bevin's presidential address and Friday's debate on re-armament. For the rest, the Congress gave the impression—on which we comment in a leading article on page 505—that trade union matters had been relegated rather to the background this time. On Tuesday, although the Nurses' Charter was introduced and conditions of work for women and shop employees were discussed, most of the day's discussion was devoted to unemployed demonstrations, the need for a Labour Government, and Spain. On Wednesday, the Congress instructed the General Council to make every effort to secure the forty-hour week without loss of wages, but the subject of paid holidays was postponed till the next day. And on Thursday the major topic, after a generous but somewhat Utopian discussion of pension schemes, was the perennial question of a United Front. The only really new ground covered by this year's Congress was indicated by Mr Bevin's announcement of the decision to set up a Scientific Advisory Council. This is highly welcome from every point of view; for, at present, systematic research by official Labour organisations into the economic and industrial problems of their constituents is almost non-existent.

* * *

Things to Come.—Mr H. G. Wells's vigorous address to the British Association on Education did little more than echo, twenty-five years too late, the voice of Ann Veronica protesting against the old-fashioned prejudices of her father. Yet the shadow of the New Machiavelli has hung heavy over many of this week's proceedings at Nottingham. Despite the empirical and individualist traditions of British science, the scientists have been much taken up with the principles and problems of planning our lives. Geographers, chemists, physicians, and engineers have vied with economists, physiologists and psychologists to produce blue prints for a new revolution—to control our eating and shopping, our work, our amusements, and our dwelling—with an avoidance, however, of the problems of scientific warfare. Maps and statistics have been flourished by the very prototypes of Mr Wells's Samurai. All this is in the vogue. Out of war and depression were begotten rationalisation and planning. Agriculture, iron and steel, electricity, distribution, road transport, coal-mining and Special Areas have felt the spur of regimentation. Nor is this trend to be deprecated. Even Mr Gladstone once advocated railway nationalisation. But most contemporary fashions have their dangers. Planning is surely wise if it endeavours to avoid the waste and friction of individual trial and error, to hasten the salvage of derelict people and places, or to mitigate the worst consequences of the trade cycle. But planning for *autarky*, which consecrates our life and resources to a single arbitrary end, is a misuse of power. It is well that, at Nottingham, our scientists have entered a *caveat* against the distortion of natural forces and resources and the constraint of freedom.

* * *

Criticism from the Scientists.—Even in the high summer of our economic prosperity the sayings of our scientists are not always comfortable words. In the agriculture section of the British Association, for instance, it has been argued this week that, since wages in farming average only 8d. an hour, the industry is properly described as depressed. Even the political status of agriculture is doubtful. To some observers it seems to be a State pensionary, to the tune of over £20 millions per annum, without a corresponding obligation to bring its methods or the quantity and quality of its production into line with modern ideas of what is fitting. To others, it appears as a mere hanger-on of the State, dependent on the Government's bounty and subject to its commands. In the inter-sectional discussion on September 7th, a geologist and a horticulturist both went further. Dr Boswell said that the absence of order in agricultural development had led to great wastage of money and resources, and Sir Daniel Hall, pointing out that the recent Marketing Acts and subsidies had raised internal prices without being co-ordinated in a national plan, suggested that such a plan could only be attained by the national ownership of land.

* * *

A similar refusal to adopt a complacent attitude was evident in the economics section. Here, the present policy of labour transference was criticised for not being related to a broad plan of national development. Various speakers argued that the tendency of isolated and subsidised transference was to denude areas of skilled labour; to depress existing industries still further; artificially to distort the industrial structure by disguising real costs of production; to lay waste social capital in the places of migration; and to increase the social expenditure and disamenities of expanding areas. It was further claimed that the present boom had not solved the problems of the depressed areas; and that the cleavage between them and the prosperous areas was more marked than before the depression. It was left to Professor Jones, appropriately as member of the recently appointed Royal Commission on industrial distribution, to point the moral of these Jeremiads. Planning the land and life of Britain, he said, meant planning a balance and location of her industries. And so the discussion returned to the point where Professor Florence opened it a week earlier—namely, the indispensability of detailed statistical investigation, to determine the ideal location for industries under modern conditions, without the costly preliminaries of the method of trial and error.

* * *

Cabinet and Conference.—The German and Italian refusals to attend the Nyon conference were expected in London; for a full British Cabinet on Wednesday decided to go ahead, without Europe's two *enfants terribles*, in an endeavour to restore the rule of law and order to the waves of the Mediterranean, as well as to what lurks beneath them. Whether the conference need now be held at inconvenient Nyon is doubtful; Geneva would be more practical for all the Powers who have accepted the Franco-British invitation—Greece, Turkey, Egypt, Roumania, Russia, Bulgaria, Yugoslavia. The Germans explained their refusal by Russia's presence and General

Correspondence invited

Franco's absence. They urged the London Non-Intervention Committee—the scene on which the diplomatic farce with the longest run is still being played—as a suitable venue. But the French and British Governments never invited the Spanish Government (a Mediterranean Power), or Holland, or Norway; and yet they did invite Germany (a non-Mediterranean Power). Why, then, should they invite General Franco? Why not Russia? Why Germany, indeed? This concerted Italo-German counter to the Franco-British initiative against piracy is as flimsy and clumsy as the Russians' dramatically direct accusation of Italy as the piratical State was diabolically clever. For the hotly-concerted reaction of Italy and Germany, almost to the point of rupturing relations with Moscow, has led them into a perilous quandary—into one, indeed, from which Germany will assuredly back out if the Duce awakes to face an array of Mediterranean navies with a common organisation, from which his alone is absent. The French on Thursday greatly increased their Mediterranean fleet. Nor need it be navies alone which protect the merchantmen of all nations on their peaceable and lawful avocations in the Mediterranean. Air forces can also be used. Indeed, if the British and French really mean, and want, to press on against piracy they may be more effective in the Mediterranean, and on the destinies of the Spanish conflict, than perhaps they realise. By their achievements this week-end the world will judge what they mean to do, and whom they intend to protect.

★ ★ ★

Spain and the Pirates.—The European war inside Spain has calmed down this week, save only for sporadic advances into Asturias by the insurgents from Santander and for further Government successes on the long-neglected Saragossa-Huesca front. Meanwhile, however, an inconclusive naval engagement—one of the few between the two Spanish contestants alone—is reported to have taken place off Algiers on Tuesday, in which the insurgent's cruiser "Baleares" and the Government's light cruisers "Libertad" and "Mendez Nuñez," accompanied by destroyers, were involved. This week the pirate submarines have not been so busy all over the Mediterranean. (It is undecided whether they are technically privateers or agents of an organised piratical State. The latter would be a case unknown since the days when ancient Rome empowered Pompey to sweep the Barbary pirates off the seas.) A British oil-tanker has been halted, visited and then allowed to proceed on her voyage from the Black Sea to Egypt. The submarine flew the insurgents' flag. It is now definitely established that the Spanish Government's submarine C.4, which limped into Le Verdon on the French Atlantic coast last week, could not possibly have got round there from where H.M.S. "Havock" was attacked; so at least one obvious lie has been laid to rest this week. A few other steamers of various nationalities have escaped torpedoes, and one has been sunk. Meanwhile the insurgents have captured and added one more British merchantman to the three which they have not yet released, in spite of the British Government's reiterated demands by our Ambassador to Spain at Hendaye. That makes the tally four up to date.

★ ★ ★

War in the East. — The Chinese forces between Shanghai, Wusung and Lotien have greatly delayed the advance around the city of the reinforced Japanese contingents from Wusung. The Chinese have held on like grim death; and on Wednesday it was learned that one of the well-equipped Chinese "Red" armies, under a General formerly antagonistic to Marshal Chiang Kai-shek, had gone into action against the Japanese south of Peiping. This is a portent of a united Chinese will to spin out the war. Meanwhile, Japanese forces have been rushed far into the Inner Mongolian plateau, to prevent Russian help through Outer Mongolia to the Chinese Government. At the same time the Japanese Navy, in great force, have occupied several groups of islands as far south of Hongkong as 200 miles. These are presumably to be used as bases for aircraft and light warships. The Japanese plans are now quite clear: to drive down in the north in an enveloping movement stretching from Tientsin-Peiping across through Kalgan to Inner Mongolia; to paralyse Nanking's revenues, communications and supplies at Shanghai and by the complete naval blockade; and, simultaneously, to cut the only remaining Chinese channel of supply at Canton-Kowloon and on the Canton-Changsha-Hankow railway. By coincident successes in these three zones China would be cut off from all conceivable assistance and so "beaten to her knees." The Western Powers cannot equably contemplate that Oriental canvas which they allowed Japan to begin painting in 1931 and 1932.

★ ★ ★

Roosevelt and Lewis. — The realignment of American politics, which all the prophets are so confidently predicting, is not going according to plan. The first stage is obviously to dissolve the old alliance constituting the Democratic Party—an alliance which, though geographical in its origin (between the defeated Confederate States of the South and a few large city "machines" in the North-East), has gradually become a marriage of incompatibility between agrarian conservatism and urban radicalism. This divorce is in a fair way to accomplishment, though the rebel Democratic Senators who defeated the Supreme Court plan are a little scared at their own temerity and may try to patch up the quarrel. The second stage, however, should have been an open alliance between the Roosevelt Democrats on the one hand and the farmers and trade unions on the other. This is the way in which the future has been mapped out in scores of predictions. But it is too simple for anything quite as complex as the politics of a Federalised sub-continent. Two hitches have immediately arisen. One is that Labour itself has split, and Mr Roosevelt, after backing for a time the faction which appeared to be the more vigorous, is now shying away when it seems that this faction, under Mr Lewis' leadership, is altogether too vigorous for public opinion. And, as a result, Mr Lewis is now accusing him of infidelity.

★ ★ ★

This particular quarrel should not be taken too seriously. Either Mr Lewis' star is waning, or else, if he becomes the undisputed master of the Unions, the harsh words will be conveniently forgotten. But the second difficulty is more obstinate. In theory, the farmers and the unions are united in enmity to the banks and to Big Business. But in practice, the farmers show not the slightest willingness to embrace the Committee for Industrial Organisation. This, of course, is the familiar phenomenon of all peasant communities, and it remains to be seen whether the American farmer is sufficiently far removed from peasantry to follow his supposed economic interests rather than his actual political instincts. That some such realignment of the political parties as has been prophesied is on the way can hardly be gainsaid. But it will be a slow process and its course will have all the uncharted deviousness peculiar to the American politician.

★ ★ ★

Nuremberg.—On Tuesday at Nuremberg the now annual congress of the German National-Socialist Party opened. The note for the new year was given, as usual, in the Führer's opening proclamation. In this year's manifesto, three features stand out. In the first place, Herr Hitler emphasises the solidarity between Germany, Italy and Japan. In the second place, he reiterates Germany's demand for Colonies—this time principally as an indispensable source of food supplies, instead of raw materials. In the third place, he gives warning to German capitalists that he does not mean to be hampered by any doctrinaire respect for Individualism in the execution of the economic policy which he believes to be in Germany's national interest. (This latter warning came pat with a report that Dr Schacht had offered his resignation as Minister of Economics.) The Western reader of the proclamation will probably find its main arguments as familiar as he will feel them unconvincing. Once again, the German-Italian-Japanese

"community of wills" is lauded as a protection of Europe against "chaotic madness" and as a defence of the civilised world against attacks which are being made upon civilisation to-day in Spain—with others, perhaps, to follow to-morrow in the East. On this ground, all right-minded nations were told by Dr Goebbels on Thursday that the new Germany's mission was to awaken, and direct, all Europe.

★ ★ ★

To a Western mind, this form of propaganda will seem to be nothing but a loud assertion of the inverse of the truth. At a moment when Italian troops are on the war-path in Spain, and Japanese troops in China, it is simply adding insult to injury for Herr Hitler to declare that these brigands are his fellow-upholders of order and decency. And the German leader's implied attribution to Russia of the very misdemeanours that are being committed in fact by Germany's two associates is particularly incongruous in a speech in which the Führer plainly intimates his own intention of taking Germany a long stage further down a Russian road. Herr Hitler moves on towards Socialism as Stalin moves back towards Individualism. Unless the two totalitarian commonwealths smash each other up first by coming into collision it seems likely that both of them will eventually come to rest half way in some working compromise between two contrary ideological principles. As long as their parallel experiments continue to be conducted peacefully, the rest of the world will watch them with interest, and not without gratitude. For we stand to learn valuable lessons from this Russo-German process of social trial and error on the grand scale. But there is one thing that Herr Hitler and his Japanese and Italian friends must not expect of us. That is, that we should sit still and look pleasant while the three Fascist Powers creep up, knife in hand, within throat-cutting distance, behind a pasteboard stalking horse labelled "Bolshevism."

★ ★ ★

Raw Materials and the League.—From the rather meagre summaries so far available it seems that the full report of the League Committee on access to raw materials is an extremely valuable document. The Committee's task cannot have been easy. It was obvious from the beginning that the economic claims of the Powers without empires were largely, though not wholly, unsubstantial; but it was obviously impossible for the Committee to say so bluntly. Instead, they seem to have concentrated upon giving a full and practical account of the question. They point out many cases in which preferential tariffs, control of production and their half accidental results of administrative methods, hinder foreign purchasers of raw materials to *some* extent; but they also mention that only 3 per cent. of commercially imported raw materials are produced in colonial territories. They deplore occasional prohibitions of the export of some materials for defensive purposes; but they insist that some consuming countries' exchange difficulties are very largely of their own choosing. They suggest that colonial Powers should declare their willingness to assist foreign concessionaires to exploit the resources of their colonies, while at the same time they recognise that the general reduction of obstacles to international trade as a whole would be a far more important contribution. The chief conclusion of the whole discussion is that difficulties of payment are infinitely greater than difficulties of supply.

M. Van Zeeland Hits Out.—The extraordinary session of the Belgian Parliament on Tuesday and Wednesday, provoked by Rexist and Flemish Nationalist allegations that the Prime Minister had improperly accepted emoluments from the National Bank after his entry into the de Brocqueville Cabinet, and his acceptance of the Premiership, was remarkable for M. van Zeeland's spirited onslaught upon his critics. The Prime Minister had already disproved allegations that he had received his salary as Vice-Governor of the Bank after becoming head of the Government. He showed that the Bank had traditionally set aside a certain common fund from its resources for the directors, until his Government had decided to abolish the practice. But when he was Minister without Portfolio in the de Brocqueville Cabinet, the Bank had refused to accept his resignation of the Vice-Governorship; but, upon the dissolution of that Cabinet and his own consequent resignation from the Bank and formation of the succeeding Cabinet, the Bank had paid him his due share of the directorial fund, i.e. Belg. Frs. 180,000, or £1,140. (His annual salary as Vice-Governor had been £4,000.) M. van Zeeland scorned the unprincipled, damaging, malicious provocation to which he and his Cabinet had been subjected as a result of these personal allegations from the extreme Right. He charged this minority with intent to abuse their liberties in order to destroy liberty, and warned them that a democratic majority would defend both itself and the popular institutions. His *apologia* was loudly cheered by the Government majority, and M. de Man, the Finance Minister, expressed the general feeling when he deplored the unpatriotic tactics of the Right-wing minority which had only harmed Belgium. On Wednesday the Prime Minister received a vote of confidence in the Chamber, confirmed next day by that of the Senate.

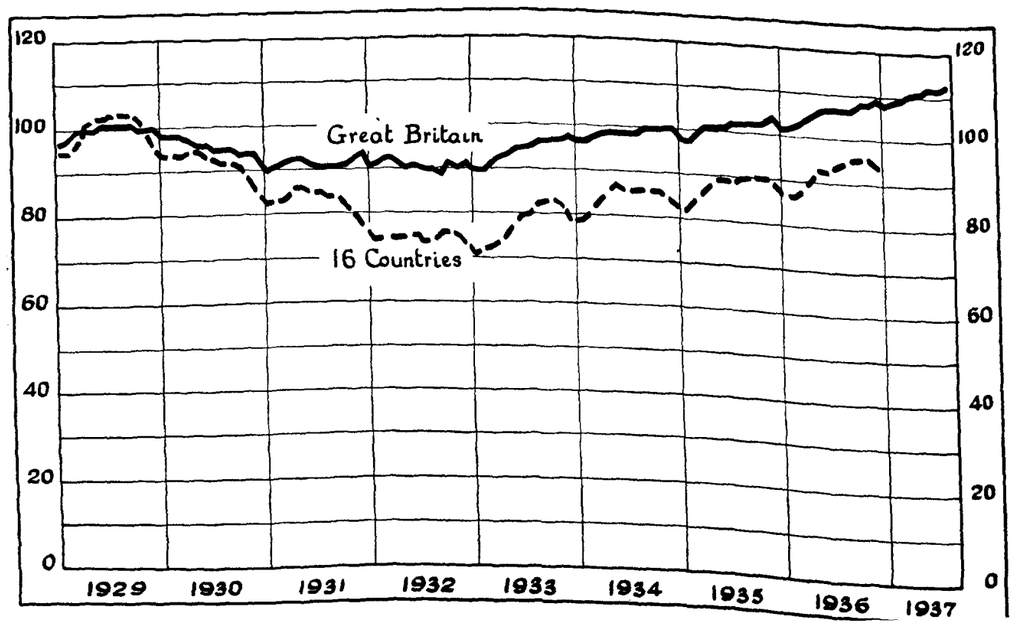
★ ★ ★

Marking Time in Palestine.—The Palestinian problem is now in an uncomfortable stage. We are only too familiar with it, because we have already had to pass through it in India. Self-government is now on its way, but it cannot arrive without a complicated constitutional procedure which inevitably consumes an inordinate amount of time. Meanwhile, every day's delay carries with it the danger of some recrudescence of violence which may wreck the prospective settlement. These difficulties are illustrated by the events of the past week, which has seen the publication at Geneva of the minutes and the report of the Mandates Commission's recent session on Palestine; while during these same days Palestine itself has once more been the scene of criminal outrages. This time, the majority of the victims have been Arabs; and though the murderers of Ibrahim Khalil Efendi at Haifa may have been Arab zealots who took his life because of his alleged sales of land to Jews, the rest of the Arab victims seem to have died by Jewish hands. Any attempt to assess the guilt as between the two nationalities would, of course, be futile; for the tragic history of Palestine since the War has left the country full of people, both Arabs and Jews, with a passionate sense of wrongs, both public and private, to be avenged.

THE LONDON & LANCASHIRE INSURANCE Co LTD
7, CHANCERY LANE, LONDON

The practical moral of these latest untoward events is that there is a call upon all parties concerned to expedite, with all possible speed, the consummation of the pending political settlement. In this context, Mr Ormsby Gore's sketch to the Mandates Commission of the procedure which still has to be gone through is rather appalling. First, the Council of the League will have to pass upon the British proposals at its session next week. Then, if the Council so wills, the British Government will have to enter into provisional negotiations with the Arabs and Jews, and at the same time to work out—again only provisionally—the boundaries of the three areas into which it is now proposed to divide Palestine politically. And finally, these provisional arrangements will have to be referred back to Geneva for approval, this time, not only by the Council but also by the Assembly. If this prospect is depressing, it is, however, reassuring to find that Mr Ormsby Gore went on to look ahead into the next chapter. He warned the League that in the near future there would be no less than six separate political units jostling one another in the narrow space between the southern frontier of Turkey and the eastern frontier of Egypt. There will be the three Arab States of Syria, Lebanon and Palestine; the Turco-Arab Sanjak of Alexandretta; the Jewish State of Erez Israel; and the residual British mandated territory round Jerusalem, Bethlehem and Nazareth. Unless these statelets enter into some rather close association with each other, they will none of them be viable.

* * *



Naval Promotion.—Among recent attempts to make the British services more attractive none is more praiseworthy in intention than the decision of the Admiralty to change the method of promoting young seamen to commissioned rank in the Navy. Hitherto direct promotion from the ranks in the Senior Service has suffered from three disadvantages. The ranker has differed widely in educational background, though not in ability, from the Dartmouth or public school cadet. He has also lacked the social graces conventionally expected from the naval officer. And the "axing" of 139 ex-mates, or promoted rankers, in 1922 has been a deterrent precedent. The new scheme goes some way to remove these obstacles. Encouragement to seek a commission will be given to all boys in training and in their early years at sea. At the age of twenty those picked out by their officers will be submitted to a selection board; and, if chosen, will undergo eight or nine months' special training akin to that given to the college-trained cadets. At the end of this course, the examination will be similar to that for midshipmen. Those successful may become acting sub-lieutenants. Before entering on their duties they will be instructed in etiquette and social customs, and advised of the niceties of uniform and dress. The desire to recruit officers from the widest possible field is commendable; but any superficial attempt to transform the new recruits into officers of the old type will seriously detract from the practical value of the new scheme. The chief barrier to this naval reform lies not so much in the service itself as in the structure of our society and the character of our educational system.

* * *

Employment at Home and Abroad.—The international employment index, published by the International Labour Office for the first time in a recent issue of its monthly review (Vol. XXXV, No. 5), is a useful addition to the statistical data indicating world economic trends. The index is based on the statistics of persons in employment in sixteen countries, with an aggregate population of nearly 500 millions and an industrial population of 65 millions. The latter includes persons gainfully occupied in mining, manufacture and handicrafts. The sixteen countries include Austria, Bulgaria, Canada, Czechoslovakia, Estonia, France, Germany, Hungary, Italy, Japan, Latvia, Luxemburg, Poland, United Kingdom, United States and Yugoslavia. While the employment returns of the various countries are not compiled on a common basis and, therefore, are not strictly comparable, the new index nevertheless provides an indication of the trend of industrial employment. The index is shown graphically in the chart below, an index of employment in Great Britain, based on insured persons aged 16 to 64, having been added for purposes of comparison. The chart shows that the decline in industrial employment during the depression in the sixteen countries as a whole was much more marked than in Great Britain. Moreover, while employment in Great Britain recovered to the pre-depression level as long ago as 1934 and has since considerably surpasssd that level, the index of international employment, though rising, remained well below the 1929 average in 1936.

INDICES OF EMPLOYMENT

(1930=100

End of the Tramp Subsidy.—Another of the Government's salvage schemes for industries especially affected by the depression is approaching its end. In 1934 Mr Runciman (as he then was) produced two plans for the relief of tramp shipping: the "scrap and build" scheme, with a maximum limit to advances of £10 millions, and the subsidy in relief of freights. The latter was to reach £2,000,000 when the Chamber of Shipping freight index was at 92 or below (1929 = 100), and to fall gradually to zero as the index rose to 100. The first scheme came to an end in February after only £3,548,124 had been advanced, chiefly because of the lack of scrap tonnage for the owners to buy up. The second was extended with minor changes to run through 1937. And now it too is to be wound up. The index for 1936 was 90.79, but for the first six months of this year it leapt to 135.7. As a result no payments are conceivably likely to occur and the continued existence of the Tramp Shipping Administrative Committee has become pointless. Its interim report published last week therefore has a somewhat deathbed character and concentrates mainly upon the continuance of its labours for the collaboration of tramp-owners in the fixing of minimum rates in the new world that is to dawn in 1938.

* * *

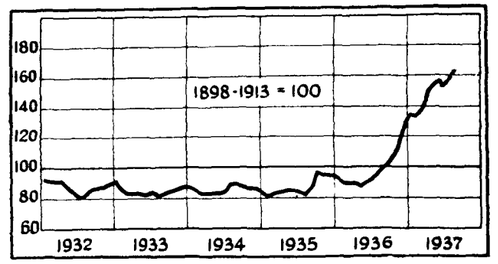
The results of the Committee's consultations with its heirs appeared in the draft voluntary scheme produced by the Chamber of Shipping on Monday. The details provide a good example of the way in which the temporary organisation of an industry for a specific purpose may lead to the formation of a permanent ring. If the promised support of the liner owners is maintained, and if 90 per cent. of the tramp owners approve at a meeting to be held in October, a new Administrative Committee is to be set up at the end of the year with wide powers of control over the industry for two years. Each owner is to bind himself to preserve the various minimum rates negotiated by the present Committee, and any modifications made by its successor. He is to submit to regulation of the amount of shipping going to particular ports, and he is to stipulate that these conditions are maintained in charters. Lastly, he is to pay the wages and ensure the conditions laid down by the National Maritime Board. A system of fines, which appear to be on an adequate scale, is to be established for any breach of these undertakings and arbitrators are to be appointed in cases of dispute. As far as it goes there is little ground for serious criticism of this scheme. There are, however, definite possibilities of abuse, as in any scheme of monopoly control. The statutory Committee insists in its reports that the rates it provides are minima, but if its voluntary successor were to exercise less restraint, and if an abatement of the steel shortage made commercial shipbuilding more profitable, the industry might become seriously disorganised. If an industry controls the price and volume of its output the public must be vigilant; but if the quantitative control is inefficient the industry too must watch carefully.

* * *

Industrial Activity Expanding. — Despite the deterioration of international politics, seasonal expansion in home industry is steadily gaining momentum. Employment showed an increase between the end of July and August, and may be expected to improve further this month. In heavy industry, output is expanding as additional capacity comes into operation. The demand for steel is still rising, and remains in excess of supplies. Many consumers are anxious to place orders well into next year, but steel producers are reluctant to add to their congested order lists. Coal production remains well above the level of last year. Output during the week ending August 28th amounted to 4,667,100 tons, against 4,432,800 during the corresponding week a year ago. The lull in the upward movement of the prices of the majority of imported industrial raw materials, such as non-ferrous metals, has temporarily covered the rise in costs in so far as it was due to the advance of these products. After a long period of small turnover, there are signs of an increase in inquiry, and new orders for Lancashire cotton goods. The industrial outlook over the next few weeks remains encouraging.

* * * *

Renewed Advance in Freight Rates. — After a reaction in July, *The Economist's* index of freight rates rose sharply in August to a post-depression record. According to this week's issue of *Fairplay*, the value of cargo boats changing hands during the week ended August 28th, at about £1,000,000, was probably higher than in any week since the post-war boom. Moreover, it is significant that the prices realised for these vessels were practically as high as those quoted by shipbuilders for new tonnage with deliveries as far off as the end of next year:—



(1898–1913 = 100

	Average, 1913	Aug., 1936	May, 1937	June, 1937	July, 1937	Aug., 1937
European waters ...	110·0	100·9	174·8	186·8	186·0	178·7
North America	113·1	95·3	123·1	120·7	119·2	125·9
South America	123·4	89·5	149·9	151·4	149·6	154·2
India	106·3	102·6	152·7	158·4	164·8	180·2
Far East and Pacific	117·4	99·5	159·1	159·3	158·5	170·6
Australia	127·9	97·0	169·7	165·5	149·2	161·1
Total	116·3	97·5	154·9	157·0	154·5	161·8
1913 = 100...	100·0	83·8	133·1	134·9	132·8	139·0

Last month's freight movements, however, were by no means uniform, as the next table shows:—

	Index No.	Inc. or dec. Points		Index No.	Inc. or dec. Points
Home trade	121·5	− 7·0	South America :—		
Bay—outwards	225·7	−40·5	Outwards	103·3	+ 0·2
Bay—homewards ...	251·6	− 9·9	Homewards	205·2	+ 9·1
Mediterranean :—			India—outwards ...	153·7	+ 2·9
Outwards	162·9	− 4·2	India—homewards ...	206·7	+27·9
Homewards	189·3	+25·2	Far East, etc.	170·6	+12·1
North America	125·9	+ 6·7	Australia	161·1	+11·9

We append a chart showing the course of the freight index number during recent years:—

As the volume of international trade normally shows a marked seasonal expansion in the autumn, the trend of freight rates is likely to be firm over the next few months.

* * *

A Census of the Land.—Dr Dudley Stamp, addressing the British Association this week, recorded the current results of the Land Utilisation Survey, which exists to enumerate with statistical accuracy the various uses to

BANK OF MONTREAL

(Incorporated in Canada in 1817 with Limited Liability)

CAPITAL PAID-UP $36,000,000
REST AND UNDIVIDED PROFITS $40,036,534
TOTAL ASSETS IN EXCESS OF $800,000,000

Head Office: MONTREAL

Sir Charles Gordon, G.B.E., President.
H. R. Drummond, Esq., Major-General The Hon. S. C. Mewburn, C.M.G., W. A. Bog, Vice-Presidents. Gen. Managers: Jackson Dodds, G. W. Spinney.

LONDON COMMITTEE:

His Grace the Duke of Devonshire, K.G. (Chairman). F. R. S. Balfour, Esq. Sir Hardman Lever, Bart., K.C.B. Sir Frederick Williams-Taylor.

London Offices: 47 Threadneedle Street, E.C.2 (Edward Pope, Manager)
9 Waterloo Place, Pall Mall, S.W.1 (J. H. Pangman, Manager)

Financial Agents of the Government of the Dominion of Canada in London.

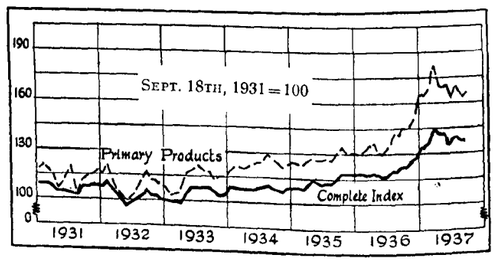
The Bank undertakes banking business in all parts of the world, and with its numerous branches offers special facilities in Canada, Newfoundland and the United States

which British land is put. Dr Stamp pointed out that, with the present use of land, Britain produced rather less than 40 per cent. of essential food requirements—only 15 per cent. of wheat and 44 per cent. of meat. It was possible, he argued, by examining the details of present land use, to suggest a reconditioning of the land within the limits imposed by natural factors alone, ignoring limitations imposed by economic or political considerations. He adduced the following figures:—

Present Land Use	Percentage of Total Land	Land Use After Reconditioning	Percentage of Total Land
Arable (intensive)	2·0	Arable (intensive)	5·0
Arable (farm crops)	20·0	Arable (farm crops)	26·0
Permanent grassland (good)	10·0	Permanent grassland :—	
Permanent grassland (other)	21·0	First-class	16·0
Rough grazing in fields	9·0	Other	22·0
Heath, moor and other rough grazing	26·0	Heath, moor, etc. (including recreational, sporting and national parks)	9·0
Forest and woodland :—		Forest and woodland :—	
For timber	2·5	For timber	11·5
Other economic	1·0	Other economic	2·5
Scrubland, etc.	3·0	Scrubland, etc.	0·5
Orchards	0·5	Orchards	1·5
Residual (housing, industrial, etc.)	5·0	Residual (allowing for improved housing, etc.)	6·0

Thus, by the reduction of heathland, moorland, rough grazing land and scrubland, the use of land for arable purposes, permanent grassland, timber, economic woodland and orchards would be so increased, according to Dr Stamp, as approximately to double the capacity of the land to produce foodstuffs. But these are only the *natural limits* to the current drive towards self-sufficiency. It by no means follows that these changes are either socially desirable or economically feasible.

* * *



Wholesale Prices Steadier.—The trend of wholesale prices during the past fortnight has been somewhat steadier. The complete indices for this country, the United States, Germany and, significantly, France have moved slightly downwards, but many materials have shown more resistance at the lower levels. Nevertheless, it is still doubtful whether the upward trend will be resumed in the near future:—

† Monthly averages.

The chart in the next column shows the course of *The Economist's* two index numbers of British wholesale prices from 1931 onwards. The index of primary products has slightly recovered in the past fortnight, but the complete index has fallen slightly. Changes in our group indices over the past fortnight are given in the table following the chart.

The Economist INDEX

	(1927 = 100) Sept. 18, 1931	Aug. 11, 1937	Aug. 25, 1937	Sept. 8, 1937
Cereals and meat	64·5	90·8	89·0	88·1
Other foods	62·2	67·0	66·7	66·8
Textiles	43·7	69·9	68·7	68·0
Minerals	67·4	109·8	108·1	108·9
Miscellaneous	65·8	85·4	85·6	85·3
Complete index	60·4	84·2	83·3	83·0
1913 = 100	83·1	115·8	114·7	114·2
1924 = 100	52·2	72·7	72·0	71·7

With the exception of the other goods and minerals groups, the indices showed a decline since August 25th. Declines in meat prices were mainly responsible for the fall in the index for cereals and meat, while the textiles index turned downwards on a reaction in wool prices. The rise in butter and coal prices accounted mainly for the advance in other foods and minerals groups respectively.

* * *

Unemployment Falls Again.—The figures for employment and unemployment in August are more satisfactory than developments in July suggested. During that month the Ministry of Labour's estimate of insured persons in employment showed no change, and unemployment rose, almost entirely through the inclusion of juveniles who had just left school. Last month the upward trend was resumed. The number at work on August 24th showed a rise of 45,000 to a total of 11,562,000 persons, a figure close upon half-a-million

UNEMPLOYMENT BY INDUSTRIES IN GREAT BRITAIN

Industrial Group	Number in thousands: Aug. 24, 1936	July 26, 1937	Aug. 23, 1937	Percentage: Aug. 23, 1937	Change since Aug. 24, 1936

All persons registered (including other trades)	1,613·9	1,379·5	1,358·6	...	...

* Figures for 1936 are not comparable.

more than in August, a year ago. The unemployment figures have fallen slightly by 20,838 to 1,358,621 between July 26th and August 24th, but such detailed figures as are available suggest that a great deal of this fall must be ascribed to the end of the holiday season. This influence was certainly responsible for the fall of 14,750 in the jute industry, and it may have contributed to the decline of 24,000 registered last month in coal mining. There is reason to believe that a number of industries are approaching the limit of their employable capacity. Among industries with over-average unemployment, mining and shipbuilding have a great number of registered workers who are, for one reason or another, unemployable, and public works contracting and tailoring inevitably have a high level of unemployment occurring "between jobs."

Opposition's Tactical Error

WASHINGTON, August 26.—Statements about the defeat of Roosevelt have been overdone, and a reaction is expected before Congress meets again. Its adjournment was frantic and unedifying. The strangling of the Wages and Hours Bill in the Rules Committee of the House was an episode that dramatised the opposition which the President has had to confront. It was unheard-of presumption by a handful of Southern members. The Rules Committee is the axle of the party machine in the House. It apportions the time for debate. That the Committee should refuse time for a major Administration measure is mutiny of the first rank. The mutiny is not disputed by those who conducted it, but their excuse is that they believed the Wages and Hours Bill needed longer consideration than it could get in a session which was about to adjourn. The excuse is convincing and would justify anything less than mutiny. But now the mutiny has occurred and the country does not heed the excuse. It only sees that to the obstructionism of the Supreme Court has been added the rebellion of the Southern members of the Rules Committee. The New Deal does not appear to be endangered by a hostile Congress majority, but by two small groups of stubborn men. It was in permitting this to be the picture that the Opposition went too far.

Powerful weapons have been put in the President's hands. He can speak of the defeat of democratic rule, as he did in his speech at Roanoke Island. He can speak of a do-nothing Congress, and he can rely on the discovery at home of most members by Congress that "saving" the Supreme Court has made them heroes only to articulate minorities in their constituencies. The Court issue is alive for middle and upper-middle class folk. The majority of the country is either not interested or else willing to see the Court weakened.

Where Stands Roosevelt Now?

Two theories are current in Washington. One is that reaction has already begun, and that the Republicans are sure to win in 1940. The other is that the President is not a beaten man, and will demonstrate it before the end of next year. At the time of his Supreme Court rout the first theory seemed plausible. It became still more convincing when the Housing Bill was emasculated in the Senate, and both Houses side-stepped action on other major New Deal measures. But the President and his leaders in Congress held on. They took the strategically sound line of forcing Congress to accept responsibility for its own inaction. The Wages and Hours Bill passed the Senate; the Housing Bill was repaired and passed by the House. Then the Rules Committee intervened with its mutiny on the Wages and Hours Bill, and Congress broke and ran for the railway station.

In 1938 come the mid-term elections. The entire House and a third of the Senate must ask for a vote of confidence at the polls. This means that members must have something to show their constituencies. To be sure, they can continue to obstruct New Deal measures, on the ground that Mr Roosevelt is destroying the American system, or, as Mr Hoover writes, is introducing the alien element of coercion into it. But it is doubtful whether a great many seats can be saved merely by crying that Mr Roosevelt is dictatorial, and laying the foundations for Fascism.

Thus it appears probable that most of the President's programme will pass next session. Already there is a pledge of crop control at the start of the session. The Wages and Hours Bill cannot be permanently held up by the Rules Committee, for the House can force it on to the floor by petition (a procedure that takes three weeks, and so could not be used in August). The Bill to reorganise the executive will also pass in some form, possibly amended to leave bodies like the Inter-State Commerce Commission and the Federal Trade Commission independent of the President's authority, and also to reduce the power he has asked for over the Civil Service. The "Seven Sisters" Bill, Senator Norris's proposal to create seven regional boards like the Tennessee Valley Administration, is also expected to pass.

The President, Democrats and Labour

The test of the Administration, obviously, is the result of the 1938 election. If its programme has passed Congress—even though somewhat mangled—and is ratified at the polls in November, Mr Roosevelt will remain in charge of the Democratic Party, and will be able to nominate his successor in 1940, or, if he chooses, be nominated for a third term himself.

There is a great deal of speculation about the formation of a new Party, including real New Dealers, Labour and North-Western Progressives. But, before it comes into being, Mr Roosevelt must have lost control of his present Party. Fundamentally, what has been waged in Washington this year has not been a fight about American institutions, but a struggle for the Democratic Party. The Supreme Court issue produced much fine oratory, but what was at stake was Mr Roosevelt's control of the machine. The determination to weaken the Housing Bill, to withhold action on the Wages and Hours Bill, and to scotch the remainder of the New Deal measures, was inspired first of all by the desire to wrest the leadership from the President. The Old Guard Democrats, like Mr Garner, want to run things themselves in the good old way. They want to choose a safe candidate in 1940.

The break in Party lines may yet come. Mr Roosevelt certainly lost his first tussle with Conservatives in his own ranks. He may lose the next one. But it now looks as though they had played their game badly. After beating him in the Supreme Court fight, which could be made to look like high patriotism, they blocked him in Congress, which looked like sheer conspiracy.

The President's greatest danger does not appear at this moment to be from Southern obstructionists, but from his inability to satisfy the Committee for Industrial Organisation and John Lewis. Mr Lewis is already hinting at a third party, and it is known that the personal breach between him and the President is almost beyond healing. That can only mean that Mr Lewis will insist on having a voice in naming the Democratic candidate in 1940 if the C.I.O. is to support the Democrat.

Business Contrasts

New York, August 30.—The contrast between the gloom of Wall Street and the sustained high level of production is striking. Summer production has been maintained at a level fully equal to the most optimistic hopes of the second quarter. At least, this statement holds for July, for which the Federal Reserve Board indices are available; for August, the incomplete data suggest some slight recession from July.

FEDERAL RESERVE BUSINESS INDICES
(1923–5=100. Adjusted for Seasonal)

	July, 1936	Dec., 1936	June, 1937	July, 1937
Industrial production—Total ...	108	121	114	114
Manufactures	109	121	114	115
Minerals.....	101	117	114	111
Construction contracts—Total...	69	66	61	68
Residential	44	45	42	45
All others	71	83	77	86
Factory employment	92·8	98·6	101·4	103·3
Factory payrolls	80·2	95·1	102·9	101·2
Freight car loadings	76	86	78	80
Department store sales	91	92	93	94

It appears that there has been no advance since December; and there is even some evidence of a slow recession; but this may be discounted by the fact that in December we were in a sellers' market, and enjoying a boomlet. Compared with July, 1936, residential building, after a spectacular revival in 1935 and the first half of 1936, has gained no ground in the past twelve months. In this instance, the reason commonly ascribed is the increase in building costs, especially in labour costs.

Corporate earnings have reflected the level of production. In the first half of 1937, the index of manufactures was about 20 per cent. above that of the first half of 1936; and estimates of corporate earnings for the first half of 1937 indicate that they were about 30 per cent. above the same period of 1936.

Declining Equities

Yet the indices of equity prices do not seem to harmonise with these data. Both rail and utility shares are lower than a year ago; and industrial shares barely higher. In a great many instances, industrial shares are substantially lower. In relation to the earnings of the first half year, and judged with reference to the criteria of the past, the level of money rates, etc., these prices are by no means exaggerated. It would appear that they reflect, and have reflected over the past half year, a profound distrust of the continuity of corporate earnings. This distrust may or may not prove to be justified; but it is not to be dismissed as without economic significance.

The past eight months have chronicled a continuous series of major disputes between industry and labour. The great motor and steel strikes had the attention of the Press, but they were probably of less consequence than the continuous and ubiquitous smaller strikes which were not "news." After the steel strike, there was some hope of a breathing spell; but the railroads, after reaching an agreement with their non-operating personnel, were served with a strike notice by the operating Brotherhoods. This dispute has been referred to a mediation board, and prospects of a strike have diminished, if not disappeared. Nevertheless, it is now generally conceded that increased labour and material costs will absorb any gain that the railways could have expected from their increased traffic, and their net income will be no higher this year than last. As their 1936 income was discouragingly low, such a conclusion not only affects the appraisal of railroad securities, but also the appraisal of the prospects of those industries whose activity hangs on the railroad demand.

After the rise in labour costs, the second major influence on profit margins is the continuous increase in taxation. While Federal taxation of corporations is levied against income, local taxation, which is a far larger sum, is levied on all sorts of other bases.

Wall Street Gloom

But the gloom of Wall Street is not entirely derived from its ponderings on these disturbing trends. The work of Wall Street is the launching of new issues, and the transaction of business on the Stock Exchange. The new issue business is all but non-existent this summer; and the brokerage business has become unprofitable. Formerly, in addition to commissions and underwritings, brokerage firms derived a considerable income from the margin of interest on their loans to customers. But with brokers' loans at only $1,400 millions, and call money at 1 per cent., the loan account hardly covers its own clerical cost.

While a Wall Street depression is only local, and affects only a few thousand persons, it can be, and is, serious. It is not impossible that the whole work of the capital markets now actually employs fewer persons, and at lower wages, than in the worst months of 1932. Under these conditions, the Wall Street *milieu* is not conducive to objective economic thinking.

The reduction to 1 per cent. of the discount rate of the Reserve Bank of New York was accompanied only by a rather vague official statement, but the explanation is clear enough. There are still large excess reserves in the system, but they are irregularly distributed. In the absence of a functioning short money market, distribution of reserves in proportion to demand seems sluggish and uncertain. The result has been that banks, pressed for reserves, or apprehensive of pressure, have fortified their position by a continuous liquidation of their large holdings of Government securities—a process which has been going on fitfully for some time; and has not only reduced the prices but impaired the market for Government securities.

It must always be borne in mind that the present problem of American banking is not the aggregate of reserves, but the distribution of those reserves; and that the reshuffling of reserves would at best be a question of time. The background explanation of the latest move is that for some months the Government security market has been under the pressure of bank liquidation, and that the lower discount rate is probably intended to strengthen this market. Still further in the background is the increased uneasiness about the absence of any definitive prospect of a balanced Budget. It is doubtful whether the discount reduction should be interpreted as evidence of a major change of credit policy.

France

Liberals and Socialists

Paris, September 9.—Two among the numerous speeches which have opened the campaign for the communal elections are noteworthy. M. Sarraut, one-time leader of the Radical-Socialist Party, warned the Socialists that, should they attack the Radical-Socialists, the latter would refuse to join a new Popular Front. And M. Blum, leader of the Socialist Party, attending a recent campaign of the party's press organ, declared that democracies and dictatorships should be able to collaborate.

Meanwhile, public opinion is very calm, although there is some anxiety about the rise in cost of living, which has been just raised by the higher prices of wheat, increased by 30 per cent. compared with 1936, of coal, some 12 francs more per ton, and of milk and butter, etc. These increases are the logical sequence of the previous increase in the cost of living and in the cost of production —a vicious spiral, indeed! Wholesale prices were, however, steady this week. The index of the price of domestic products was unchanged, and the index of imported goods was actually lower, so that the general index fell from 590 to 589.

The Government sees the necessity for increasing economic activity. Hence the Inquiry into the state of production, and the efforts to secure lower interest rates. The latter is the aim of the financial reconstruction, and of the further lowering last week of the rediscount rate of the Bank of France by ½ per cent., to 3½ per cent. The rationalisation of industrial plant is urgently needed, as well as an increase in working hours in certain industries.

But rationalisation requires money, and although there is an obvious revival of confidence in the country, the return of capital continues to be slow and money rates high. M. Bonnet, for instance, wishes to consolidate the rest of the 4½ per cent. 1932 bonds, which were deposited for reimbursement and were not subsequently consolidated in subscriptions to his recent loan. To do this he must issue new bonds of a 5 per cent. type (instead of 4 per cent.) but the yield of which is still 6½ per cent.

If, then, the high rate of interest is added to the persisting high import surplus and the rising cost of living, the balancing of the Budget "on paper" and the constitution of a National Railway Company are scanty consolations. In such circumstances, the stability of the franc and of public funds are a remarkable proof of the serenity of French public opinion and the skill of the experts—or as a promise of better days to come if the political truce continues, or if, as it is sometimes suggested, foreign markets should lose something of their attraction.

Some branches of the French economy continue to show great activity, such as the tourist industry and metallurgy. Furnaces in use now number 107, compared with 80 in September, 1936.

Important Changes in French Economy

In the annual *Revue d'Economie Politique*, M. Charles Rist notices that, after England, the Scandinavian states and Belgium, France made its socialist experiment in 1936. The technical errors of the Government, added to the frightened state of public opinion in face of socialist methods, have seriously disturbed the economic situation of the country. The greatest error was the refusal to decide upon devaluation sooner, a step which was delayed by the Communists, curiously allied in this respect with the Bank of France. When the devaluation finally became inevitable, the profits which it might have yielded to industry were already absorbed by the effects of the new social laws.

But M. Rist also observes that behind day to day economic events, a new factor has emerged, which will profoundly affect the future of the country. That is the more and more developed industrialisation of the French economy since the War.

M. Dugé de Bernonville classifies in the same issue of the *Revue* the various sorts of income before the War; at the peak of prosperity in 1929; and at the end of 1935:—

(PERCENTAGE OF TOTAL INCOMES)

	1913	1929	1935
Salaries and wages	43·3	47·1	50·4
Capital incomes	19·6	16·4	19·6
Mixed incomes	35·7	31·8	22·1
Pensions	1·4	4·7	7·9
	100·0	100·0	100·0

Figures show that the mixed incomes, those from investments and employment, and the incomes of individual industrialists represent, since 1913, a smaller and smaller portion of the total. Wages and pensions, on the other hand, increased correspondingly, so that the author concludes that the number of dependent workers is increasing. It is noticeable that the percentage of incomes from investments after declining from 19.6 in 1913 to 16.4 in 1929 has again returned to the pre-war figure. These changes undoubtedly explain a number of current misunderstandings and involve the greatest social and psychological consequences.

Germany

Official Price Cutting

Berlin, September 7.—The international unrest, uncertainty about the Nuremberg Congress and the cuts which have been decreed in the price of artificial textiles and electric lamps, caused a decline in share values last week. This has continued, although fixed-interest securities were rather firmer than in August. Reports from Hamburg about shipping and exports for China are most discouraging; and a statement by the Deutsche-Asiatische Bank indicates that no clear judgment about the Far Eastern future can be framed. Of all groups of shares shipping fell most.

It is a tradition, not always confirmed in practice, that the Nuremberg Congress must produce a sensation; and business in August was nervous about possible anti-capitalistic measures or the announcement of increased State intervention in industry. On these points Herr Hitler's proclamation contained practically nothing; and, in addition, his references to foreign politics were neither sensational nor new. In fact, the announcement of Signor Mussolini's timely visit to Germany has made a Nuremberg sensation superfluous.

The reduction in the price of "zellwolle" (cellulose textile material replacing both wool and cotton, etc.) is approximately 10 per cent., from Rm. 1.60 to Rm. 1.45 a kilogram. This is the fourth cut since 1933, when the price was Rm. 3.80. Since then it seems probable that the cost of production has fallen heavily, even if not to the same extent as the fall in price. The official tendency to decree, or virtually enforce, price cuts for special goods seems to be increasing, apparently in order to counteract the general slow decline in purchasing power. There have been such cuts this year in the price of "zellwolle," electric lamps, aluminium, nitrates, potash, cement, radio receivers, motor-car parts and batteries.

Inadequate Crop Prospects

The official provisional estimate of cereal crops is lower than last year's, but not so low as was feared; only rye shows a substantial decrease. With the exception of winter barley, there was no appreciable change in the yield per unit of the area sown; but the areas under wheat and rye decreased considerably. Only a comparison with 1933, the last good year for crops, and the best since the war, shows fully how unsatisfactory this year is for bread cereals and oats:—

	1933	1936	1937
	In metric tons (000's omitted)		
Rye	8,727	7,380	6,770
Wheat	5,604	4,420	4,300
Barley	3,468	3,400	3,420
Oats	6,952	5,620	5,680

Since the 1933 census the population has risen from

TRADING ABROAD

The existence of restrictions in a given country may temporarily prohibit dealings in forward exchange, but up-to-date information on this and on all points bearing on Forward Exchange generally may be obtained through any branch of the Westminster Bank. For any who may be unfamiliar with the facility, a very brief outline entitled *Forward Exchange* is always available at its counters

WESTMINSTER BANK LIMITED
Head Office: 41 Lothbury, London, E.C.2

66,029,000, including the Saar district, to an officially estimated 67,000,000 at the beginning of this year. The total cereals crop is estimated at 21,350,000 tons, which is 500,000 tons less than in 1936. This year the crop of flax has again risen considerably, and that of hemp slightly.

Internal traffic of all sorts and the consumption of public utilities continue to increase. The use of electricity in July was 17 per cent. greater than in July, 1936; and of gas nearly 12 per cent. greater. Railway goods traffic in July was 14.40 per cent. more than in July, 1936. The Railway Corporation's report for 1936 shows the following improvement:—

	Operating Receipts	Operating Expenditure	Operating Surplus
	Millions of marks		
1933	2,921	3,057	— 136 (deficit)
1936	3,586	3,434	+ 152
1937	3,985	3,513	+ 472

Including non-operating receipts, the latest surplus was Rm. 512 millions, of which Rm. 391 millions went to meet fixed charges and allocations to various reserves, and the Reich received Rm. 70 millions. There was a net profit of Rm. 121 millions. The company's balance-sheet total is Rm. 28,626 millions, the assets almost entirely consisting of operation rights, increased by Rm. 2,336 millions since 1924 by the expansion of roads and equipment. Among the liabilities are ordinary and preference shares amounting to Rm. 14,100 millions, a reserve for writing off the operation right of Rm. 11,390 millions, and other reserves and loans and debts totalling Rm. 1,800 millions.

Distribution of Foreign Trade

In the first half of this year, compared with the same half of 1936, the active balance of trade with Europe, and also, though to a smaller extent, the passive balance with overseas both increased. Balances with the various continents were:—

	January–June 1936	1937
	Millions of Marks	
Europe	+ 386	+ 470
Overseas	— 251	— 273
Africa	— 80	— 116
Asia	— 33	+ 5
America	— 130	— 147
Australia	— 8	— 15

Only Asia, among the overseas continents, shows a German export surplus. The balance deteriorated in trade with Great Britain, Turkey, France, Austria, Jugoslavia and Roumania; and improved in trade with Scandinavia, Holland, Belgium, Switzerland, Italy, Finland, Czechoslovakia and Russia. Imports and exports respectively were: in trade with Great Britain, Rm. 154 and Rm. 194 millions; with Holland, Rm. 93 and Rm. 222 millions; with France, Rm. 77 and Rm. 153 millions; with Switzerland, Rm. 42 and Rm. 112 millions; with Italy, Rm. 110 and Rm. 142 millions; with Russia, Rm. 27 and Rm. 78 millions; and with the United States, Rm. 116 and Rm. 90 millions.

The labour shortage seems to be increasing. The Labour Offices are inducing employers to take on older workers, especially technical and clerical. The Nazi Press discusses measures which would virtually abolish the freedom to choose a career. Indeed, this has already been restricted. The subject is debated under such headings as "Suitability Instead of Wish," "Wish" having, it is affirmed, disorganised the economy in the days of Liberalism.

The monthly official steel report mentions that it has been necessary to reduce deliveries to the non-rationed class of private consumers. Exports of heavy iron and steel are at present quiet, in part owing to the Far Eastern conflict; but in July they reached the very high figure of 392,100 tons and only 83,700 tons were imported. In July, for the first time, the value of these exports exceeded Rm. 100 millions.

The textile industry reports a new home demand for better quality goods. Retail sales of textiles in the first half of the year were 13.2 per cent. higher than in the same months of 1936. All the engineering trades are active. Motor-car production is about 7 per cent. higher than a year ago. Home sales have risen, but exports have declined, probably temporarily. Exports of pedal bicycles have increased very much, being 93,000 in January-July, against 37,000 and 5,600 in the same months of 1936 and 1934 respectively. The Solingen industries are in general fully occupied, and their export orders are satisfactory.

Holland

Declining Yield of Capital

AMSTERDAM, September 2. — The expected State conversion loan is being eagerly awaited in financial circles, and interest rates are still falling. For first-class bonds the yield is 3 to 3½ per cent. Even the numerous conversion loans issued by various municipalities and provincial authorities have failed to counteract a further drop in capital rates. The Netherlands Bank has lifted the embargo on foreign capital issues; and with the Bank's approval it is again possible for foreign issues to be brought on the market. So far, the opportunity has been little used.

Actually the interest of the Netherlands public has been lately concentrated upon local securities, American shares have been relegated more to the background; and there have so far been no introductions of new American securities on the Amsterdam market. On the other hand, it is difficult for issuing houses to bring good foreign bonds on to the Amsterdam market, because the yield in America and in England for good investment material is no higher than in this country, and is therefore not very attractive. Nevertheless, several timid efforts in this direction have been made recently. The latest foreign issue was of 7 million guilders 4 per cent. Norsk Hydro at 96; this issue proved a pronounced success. Issues of this kind have generally a good chance of finding favour, because the investing public is still averse to loans of the 3 per cent. kind.

In view of this aversion of the investing public to 3 per cent. loans, it is expected that the new State conversion loan will not be of the 3 per cent. kind; but that it will yield graduated interest—that is to say, after ten years the interest will be raised from 3 to 3½ per cent., and after that to 4 per cent.

The magnitude of the funds lying idle can be judged by the fact that the prolongation rate has dropped to ½ per cent., and the big banks have reduced their deposit rate to ¼ per cent. per annum for funds withdrawable at call.

Reducing Emergency Burdens

In the sphere of politics, tension is also growing. Expectations are optimistic. State revenue from taxation continues to increase month by month at a rate far in excess of the estimates. At the same time, the expenditure instituted at the height of the trade depression for various forms of relief is now falling. For instance, the assistance rendered to shipping has been abolished, the subsidies for the shipbuilding yards have been dropped, the improvement in the labour market involves far less expenditure for unemployment pay, and the better prices of agricultural produce, coupled with the enlarged selling outlets, have reduced the burden of relief to the agricultural community. There is therefore justification for hoping that these signs of improvement will induce our Government to remit some of the excessively burdensome indirect taxation. This looks all the more likely now that the new Minister of Economic Affairs recently decreed a reduction in the Government levies on meat, butter, margarine, oils and fats.

Rising Cost of Living

These reductions in levies on foodstuffs were all the more welcome because the cost of living in the Netherlands has been showing a disconcertingly persistent tendency to rise during the last few months. In view of the enhanced cost of living, the Netherlands Federation of Employers recently submitted a petition to the Minister of Economic Affairs, in which it was stated that:—

> The advance in the cost of living is a source of increasing concern among the members of the Federation. Since September, 1936, the month of the devaluation of the guilder, the following increases in the cost of living were recorded by the statistical bureau of the Municipality of Amsterdam.

	Total Increase since September, 1936 Per cent.	Increase in food only since September, 1936 Per cent.
September, 1936	...	...
October, 1936	1·1	2·1
November, 1936	1·4	2·2
December, 1936	1·0	1·0
January, 1937	1·6	2·1
February, 1937	1·5	1·1
March, 1937	1·7	1·7
April, 1937	3·0	3·7
May, 1937	3·2	4·1
June, 1937	4·5	6·9

> The Federation is of opinion that the Government ought not to permit the cost of living to continue rising. The Government have in their own hands the means of counteracting the advance in the price of food. We urge the Government to proceed to further reductions in the levies.

The Minister has shown some signs of yielding to pressure of this kind.

Satisfactory Balance of Trade

The development of foreign trade in the month of July provides every reason for satisfaction. In both weight and value, imports and exports were on a decidedly higher level than last year; and there is also a pronounced rise in comparison with the previous month. July, in fact, showed the highest value, both of exports and imports, for any month this year. One has to go back to 1931 to find higher values for imports and exports in the month of July.

	Imports				Exports			
	1934	1935	1936	1937	1934	1935	1936	1937
January	100	76	79	106	56	55	50	73
February	81	70	74	105	51	51	50	79
March	94	80	79	125	61	54	55	94
April	85	78	81	142	54	50	57	101
May	87	78	76	128	57	58	53	90
June	89	73	77	140	59	51	53	95
July	86	76	80	146	58	54	60	102
August	87	75	82		69	61	63	
September	78	76	82		69	59	72	
October	87	95	92		62	70	76	
November	88	86	101		60	60	77	
December	75	73	114		56	52	80	
January–July	*623*	*531*	*546*	*893*	*397*	*373*	*378*	*634*

Our imports having advanced to a greater extent than our exports, the import surplus was again decidedly higher than last year, amounting to 44,407,000 guilders, compared with 19,901,000 in July last year.

Switzerland

Advance in Foreign Trade

GENEVA, August 10.—Foreign trade returns for the first half of 1937 show that industry and commerce have steadily recovered from the crisis. During the first six months of the year, imports reached a value of 929,717,565 francs, an increase of about 71 per cent., compared with last year, while exports totalled 578,922,453 frs., a rise of nearly 47 per cent. The value of the exports of the four chief industries—watch-making, silk, cotton and machinery, were:—

	1936	1937
(Millions of francs)	(First six months)	
Watches	55·7	95·2
Silk goods	36·3	47·2
Cotton goods	45·1	62·9
Machines	49·4	82·6
	186·5	287·9

Trade with Great Britain improved, as is shown by the following figures:—

	Imports from Gt. Britain (First six months)		Exports to	
	1936	1937	1936	1937
	(Millions of francs)			
First quarter	17·4	28·6	19·7	40·5
Second quarter	16·1	30·5	22·1	34·5
First half-year	33·5	59·1	41·9	75·0

The principal exporters to Switzerland were:—

	1936 (First six months)	1937
(Millions of francs)		
Germany	144·8	194·7
France	82·4	122·3
U.S.A.	29·8	60·1
Great Britain	33·5	59·1
Italy	28·4	56·9

On the other hand, the five best customers of Switzerland were:—

	1936 (First six months)	1937
(Millions of francs)		
Germany	85·1	89·0
France	52·2	70·2
Great Britain	41·9	75·0
U.S.A.	23·8	50·8
Italy	29·0	40·4

The striking features of the first half of 1937 were: The recovery in American-Swiss trade, as the result of the new trade agreement concluded at the end of last year; and the resumption of Italo-Swiss trade which was still reduced last year by the application of economic sanctions.

Increased Transport Earnings

The general improvement in Swiss economic conditions is further reflected by the earnings of the transport undertakings which all recorded important increases compared with the previous year. The Swiss Federal Railways, for instance, transported during the first half year 55,192,000 persons, an increase of 1,170,000 compared with 1936, and 7,706,000 tons of goods, an increase of 2,068,000 tons compared with last year. Receipts in the same period totalled 159,294,000 frs., compared with 134,730,000 frs. last year, while expenses totalled 106,159,000 frs., compared with 106,222,000 frs. The surplus over expenses is thus 53,134,000 frs., while it was only 28,633,000 frs. in 1936.

The Swiss port of Basle registered a record traffic during the first six months of the year when 1,524,806 tons of goods were handled, compared with 1 million in 1936 and 1935. Up-river traffic totalled 1,431,000 tons, and down-river traffic 93,790 tons. A total of 990,498 tons was transported on the Rhine, and 534,308 tons on the side canal. Space has recently been lacking at Basle for the storage of goods, mainly of cereals and coal. Traffic in the port of Basle averaged 2,200,000 tons in former years for 1⅓ mile of wharf, that is about 1,701 tons of goods per yard; while the German port of Duisburg has 27½ miles of wharves for an annual traffic of 14,628,000 tons, or only 308 tons per yard. The Basle authorities have decided to spend 3½ million francs to enlarge the Klein Huningen port.

The Concordat Controversy

Belgrade, August 24.—Whatever the reason for Dr Stojadinovic's determination to push the Concordat through Parliament, he could hardly have anticipated such violent opposition as he encountered. Although it was certain that the Orthodox Church and the Moslems would be hostile to a measure giving large concessions to the Catholics, and that they would command a fairly strong following among the masses, it was the death of the Patriarch which came at a critical moment, and the attempt of political agitation to make as much capital as possible out of the situation, that fanned the opposition into flame. The character of this political agitation, however, needs to be clearly understood. Hitherto the chief attacks on the Government have come from the Liberals and the Left, who have demanded greater civic liberties, e.g. a new electoral law with secret ballot, freedom of the Press, of meetings, and of speech. But the attack on the Concordat came from the extreme Right (the so-called Jugoslav Nationalists) and the pro-Fascist groups, in spite of the fact that it was one of the Nationalist leaders, Mr Jevtic, who had originally sponsored the Concordat. It is significant in this respect that, in the wish to embarrass the Government, the pro-Nazi group, for instance, did not refrain from playing on the anti-Italian feeling of the masses. The situation seems, however, to have been correctly appreciated by Dr Macek, who avoided attacking the Government in order not to play into the hands of the extreme Right, and who declared that the Concordat was an irrelevant matter for the Croats; and that, anyhow, the politicians who are leading the anti-Concordat campaign are the foremost advocates of a "strong hand in Croatia."

Continued Trade Expansion

Trade continues to improve by leaps and bounds, the increase for the half-year in exports being no less than 90.19 per cent. in quantity and 72.90 per cent. in value, and in imports 3.39 per cent. in tonnage and 20.98 per cent. in value, the total increase in the volume of trade being 46 per cent. for the six months. Exports for the half-year amounted to 2,115,205 tons worth 2,820.8 million dinars, compared with 1,112,178 tons worth 1,631.4 million dinars in the first half of 1936. Imports were 498,282 tons worth 2,420.5 million dinars, compared with 479,442 tons worth 2,000.7 million dinars. The trade balance is thus active by 400 million dinars, this being the second-best active balance since 1931.

The approaching season is more difficult to appraise. Of wheat there will not be more than 25-30,000 tons for export, and the quality is poorer than last year. Fruit is disappointing, prunes having yielded not more than 1,000 trucks for export. Maize, however, appears to be better, although figures are not yet forthcoming. Some of the harvest deficiencies may be made up by increased mineral production, which has reached an index of 116.4, as against 89.3 in May, 1936. Trade with Germany is also not running so smoothly as formerly, although Germany still heads the export list. This is partly due to the fact that exporters are paid in marks at the official quotation of 14.50 dinars, while they cannot obtain at home more than 12.50 dinars per mark.

Economic activity as a whole is very satisfactory. The number of insured workers has reached 692,973, which is 67,100 more than May, 1936, and the highest number ever registered in Jugoslav industry. The chief increase in employment is in rail, road and bridge building, and then in the textile, wood, metal and tobacco industries. Wages have improved by 1.16 dinars to a daily average of 22.24 dinars. The total insured wages in May this year were 388.8 million dinars, or 55 millions more than a year ago. State receipts have been the best for years—10,326 millions—which is 3,000,000 more than the amount budgeted. Expenditure being 9,538 million dinars, inclusive of 92.7 millions of unpaid accounts, this leaves a surplus of 788 millions, which is being used for the settlement of former unpaid accounts, and to cover extra-budgetary expenditure.

Banking Developments

Interesting figures have been supplied by the Governor of the National Bank on the improvement in the banking situation. Although, of a total of 610 banks, 298 still enjoy the protection of deferred payment, deposits increased between the end of 1935 and September, 1936, from 10,225 millions to 10,602, while during the same period, their frozen credits diminished from 4,308 to 3,981 millions. Since then, by the end of June, 1937, deposits have risen by another 717 millions to 11,319, and frozen credits have correspondingly decreased, though the actual figures are not available.

In July, the Ministry of Trade gave permission for the opening of a branch at Belgrade of the Allied Banking Corporation of Great Britain, the first British banking capital to enter the country since the winding up of the British Trade Corporation. The company, whose initial capital is £50,000, of which £10,000 have been voted for the opening of the Belgrade branch, is reported to be backed by several important British banks and industrial concerns. It is to finance trade between the two countries and industrial concerns such as mining and forestry in which British capital in Jugoslavia is interested.

Labour's Monetary Policy

Christchurch, August 5.—A year has passed since the Labour Government began to put its monetary policy into operation. The results of that policy are so far reassuring. It is true that the Reserve Bank has been brought under State ownership and control, and there have been changes in the distribution of business between the Reserve Bank and the trading banks, but the money and banking operations of the past year disclose no sign of the departure from orthodox monetary methods that was widely expected. The Reserve Bank was made a State bank, ruled by directors holding office at the pleasure of the Government; and its general function was stated to be: "To give effect, as far as may be, to the monetary policy of the Government as communicated to it from time to time." The scope of Government borrowing from the bank was extended; and the bank was empowered to underwrite long-term Government loans, to make advances against Treasury bills up to a full year's revenue, and to finance the purchase and marketing of New Zealand produce.

These powers were very wide and it was expected that they would be used. Between May and December, 1936, exchange funds held overseas declined from £NZ45 millions to £NZ28 millions. It was plain that money was leaving the country, and it was said that capital was being driven out by the Government's policy. But part of this decline was a normal seasonal movement; part represented repayment of debt held overseas; part was due to repatriation of funds left in New Zealand in the hope of profit should parity of exchange be restored; and part was probably export of capital for investment in Australia.

Since December last the tide has turned, and overseas funds actually increased to £NZ37.4 millions on May 31st. This amount is greatly in excess of the sums normally held in the decade before the depression, which probably ranged between £NZ10 millions and £NZ20 millions. It is reflected internally in exceptionally high bank deposits and relatively low advances, so that, while bank funds are large, they are also exceptionally liquid.

Government's Financial Operations

The Government's operations are revealed in the Reserve Bank's returns. When the Government took over the marketing of exported dairy produce, the business of making advances against shipments was taken from the trading banks and transferred to the Reserve Bank. This business represents a transfer between the banks, who had originally assisted in building up this business, not an addition to existing credit facilities. The amount advanced on dairy produce account increased as the season progressed, reached a maximum of £NZ6.7 millions on March 1st last, and has since declined as the season nears its close. On June 28th the dairy produce advances had fallen to £NZ4.7 millions, and they have continued to decline.

The Government has also borrowed from the bank for various undefined purposes. These other advances began with £NZ700,000 in September, 1936, reached a maximum of £NZ1.8 million in December, and fell to £NZ200,000 in May, 1937. Total advances to the Government at the end of June were slightly under £NZ5 millions, all of which represented ordinary banking business done by the trading banks in the past.

Increased Note Circulation

The note circulation has, however, increased, and some critics have quoted this as evidence of inflation. In 1928 and 1929 notes in the hands of the public averaged about £NZ6½ millions. In the first half of 1937 they averaged nearly £NZ9 millions. The Reserve Bank note issue is about £NZ13 millions, and this figure is sometimes quoted as the circulation, but of this amount about £NZ4 millions is held by the trading banks. The increase in the notes held by the public corresponds roughly with the increase in total bank deposits, since the lower levels of the pre-depression years, and appears to be merely one aspect of the present abundance of money. This abundance reflects the large holdings of bank funds overseas. This is due in part at least to the dilution of money following the depreciation of exchange in the period 1930-33, and in part to the active balance of payments during recent years.

Last year's Budget outlined a public works programme to cost £NZ10 millions. Much talk about using public credit suggested that this might be financed by advances from the State-owned Reserve Bank. It now appears that part is paid for from revenue including sources, such as the unemployment tax and the highways fund, and part, probably most of the remainder, from internal borrowings from State departments. Over the past year deposits at the Post Office Savings Bank have increased by £NZ5 millions. These are normally invested in Government securities, and other departments probably have had funds for investment as well. The Reserve Bank and the trading banks show slightly increased holdings of Government securities, but these are likely to be ordinary investments made by the banks. The year's results, therefore, indicate that in practice the Government's monetary policy has been thoroughly orthodox, and unless a change in direction occurs those who expected interesting—or even dangerous—monetary experiments seem doomed to disappointment.

Letter to the Editor

India and her Gold

TO THE EDITOR OF THE ECONOMIST

Sir,—I have read with interest Professor P. J. Thomas's article on "India and her Gold," which appears in *The Economist* of June 19, 1937. Enlightened opinion in India was never opposed to conversion of barren hoards of gold into profitable investments, post office cash certificates, life insurance policies or into idle bank deposits, and it was never argued that virtue lay in permanently bottling the country's gold stocks.

What was objected to was the Government's currency policy—the policy of continuing the link of the rupee to sterling on the latter's departure from gold. It was pointed out that this involved under-valuation of the rupee, which, combined with the progressive depreciation of sterling, stimulated gold exports. Exports of gold were not attributable to the "high" ratio of sterling. The rupee was prevented from rising above the upper sterling point and the exports of gold could not, therefore, have the normal effect of raising the exchanges. It has never been said that "gold was exported with a view to maintaining the exchange," although gold exports did give a certain measure of support to sterling.

The Federation of the Indian Chambers of Commerce and Industry expressed the general view when on March 26, 1932, they urged the Government to place an embargo on gold exports and to purchase gold in the open market. By allowing free and unrestricted exports of gold, India lost the fruits of appreciation in the price of the metal.

It is difficult to appreciate the relevance of the differences indicated by Professor Thomas between gold exports from the monetary reserves of a country and of those from the Indian hoards. The first refers to exports of the metal under a gold standard, and the second to exports under a paper exchange standard.

Yours faithfully,

B. R. Shenoy.

Books and Publications

Prices and Houses

PROFESSORS WARREN and Pearson of Cornell University are widely known as the authors of the most rigid and simple version of the neo-Quantity Theory of Money. For a few months in 1933 Professor Warren was virtually in control of the monetary policy of the United States, and the failure of his theories to achieve lasting political esteem at that time has not in the least shaken his faith. The authors' latest book* is in reality two almost entirely separate books. The first is devoted to a re-statement of their price theory and to the presentation of a new series of uniform price indices for the same forty commodities in fourteen different countries. These are combined (with weights which seriously exaggerate the importance in the world's markets of the United States) into an index of the world price level. These statistics will be of considerable value, and particular interest will be found in the comparisons made in some detail between the combined index and, firstly, the different national indices, and, secondly, the indices for the different commodities.

As for the re-statement of the theory lying behind the statistics, it is only necessary to say that nothing has been added to it, or subtracted from it, in recent years. Professors Warren and Pearson are still sublimely confident that the relation between the supply of and the demand for gold, on the one hand, and the monetary price of gold, on the other, are the only factors which influence the price level. The present volume will not convince those who believe that the Warren-Pearson theory is not so much false as too simplified and mechanistic.

The second part of the book is the more interesting. In this, the authors devote all of their statistical indefatigability to the elucidation of fluctuations in the building industry, which they believe, with good reason, to be second in importance only to prices as underlying causes of the trade cycle. The economics of the building industry has been shamefully neglected in all countries, and records of building are in a shocking state. Nevertheless, Professors Warren and Pearson have collected a surprising amount of data on the subject, and have made out a very strong case for their belief that building, in all countries, runs in a cycle of about eighteen years.

Since this is almost a pioneer work on the subject, it will be worth while to set out, very briefly, some of the conclusions which are reached. Brevity compels a certain dogmatism, but it could hardly be greater than that of the original work.

The amplitude of the "swing" between top and bottom of the building cycle appears to be such that the volume of building at the top is three times that at the bottom. The cycle seems to be fairly independent of other cycles (i.e. those of prices and general business activity), though it naturally has some effect on the activity of industry. For example, peaks of the trade cycle seem to occur, with surprising regularity, two or three years after the building cycle has turned downwards.

As for the causation of the cycle, the following passage may be quoted:—

> The major force causing building seems to be an increase in demand for building relative to the supply rather than low or high costs of building and financing. Usually costs are low when there is little building, and high when there is much building. Properties are constructed primarily on the basis of expected income rather than because of low costs.

The authors believe that "high and low building cause high and low interest rates rather than low interest rates cause high building." They point out that periods of relatively high *per capita* purchasing power coincide significantly with periods of active building. This general view of the causation of the building cycle, emphasising the importance of fluctuations in the demand for houses rather than in the supply price, is in close agreement with that which has frequently been expressed in *The Economist*.

So little is known of the subject that it would be premature to hazard an opinion about the correctness of these views. The most that can be said is that Professors Warren and Pearson have cleared an approach to the theory of building cycles, and have supported their generalisations with statistical illustrations which, though scanty, are surprisingly uniform. The next step should be that improvement of building statistics which is so badly needed on both sides of the Atlantic.

MONEY AND BANKING

The Incidence of Treasury Bills

EVERY student of the Bank return must have noticed constant fluctuations in public deposits between one week and the next, which often total several million pounds. Frequently, these fluctuations are due to discrepancies between Treasury bill payments and maturities during the week in question, or in shorter and more technical language, to the "incidence" of Treasury bills. Incidence arises largely from the vagaries of the calendar. A Treasury bill runs for three calendar months from the day of payment, and it may be added that there are no days of grace. Bills are allotted at the tender held every Friday, and may be paid for on any day of the following week at the allottee's option. For practical purposes the Treasury bill week runs from Monday to Saturday, inclusive. On the other hand, the Bank return gives the position of the Bank of England at the close of business on Wednesday of each week.

Omitting leap-year, bills have the following lives:—

Bills maturing in	Life in days	Bills maturing in	Life in days
January	92	July	91
February	92	August	92
March*	90	September ...	92
April*	90	October	92
May*	89	November.....	92
June	92	December ...	91

* In leap-years, add one day.

Now, as 91 days are exactly 13 weeks, 91-day bills issued on a Monday are repaid on a Monday. For most months, however, Treasury bills run for 92 days, and could only be repaid on a Monday if they were issued on a Sunday. Therefore, in those months there are no Monday maturities. Complications are also caused by Bank Holidays, when there are neither payments nor maturities—and therefore no maturities exactly three calendar months ahead. We may proceed to state a few more general rules:—

(1) Bills due on Sunday are repaid on Saturday.

(2) Bills due on Bank Holidays are repaid the day after.

(3) Bills paid for on January 31st are repaid on April 30th. The same condition applies to bills paid for on March 31st and August 31st. There is thus a double repayment on the 30th of April, June, and November. Similarly, on February 28th, the bills paid for on November 28th, 29th and 30th, are all repaid.

(4) No maturities on July 31st, December 31st (except when the first day of the following month is Sunday), or May 29th (except in leap-years), 30th and 31st.

These rules show that incidence can cause appreciable variations in public deposits, and so in bankers' deposits, especially as £30 millions and upwards of Treasury bills are turned over every week. The next step is to illustrate this by several hypothetical examples. Let us assume that £36 millions of Treasury bills are paid for and redeemed each week, and that payments and maturities are spread evenly over the week, £6,000,000 each day.

Take first a month in which 92-day Treasury bills are maturing. Consider the amount passing into public deposits in respect of payments for new bills (whose length is immaterial) and the amount paid out on maturities of old bills. In a typical week, assuming that at the close of business the preceding Saturday, public deposits stood at £10 millions, the position would be as follows:—

	Paid in	Paid out (£ millions)	Balance
Monday	6·0	Nil	16·0
Tuesday	6·0	6·0	16·0
Wednesday	6·0	6·0	16·0
Thursday	6·0	6·0	16·0
Friday	6·0	6·0	16·0
Saturday	6·0	12·0	10·0

The table shows that during the first five days of the week, including Wednesday, the day of the Bank return, public deposits are £6.0 millions higher than their datum of £10 millions. When, however, 91-day bills come along, the balance between payments and maturities is restored, and so public deposits fall back to their datum. February, which gives rise to 89- and 90-day bills, works the other way. The 90-day bill creates no difficulty. Bills paid for on Mondays in January should mature on Sundays in April, and therefore are repaid on Saturdays. On the other hand, there are no normal Saturday maturities, for Saturday in April corresponds to Sunday in January. These two inequalities cancel out, and so a 90-day bill has the same regularity as a 91-day bill. Bills maturing in May are 89-day bills. In their case there is a double maturity on Saturday, but no maturities on Friday. Thus public deposits tend to be increased on Friday, but are restored to normal the next day. As the Bank return relates to Wednesday, it is unaffected by an 89-day bill.

Bank holidays introduce a further complication, which is best illustrated by reference to actual experience last month. The period covered by the following table is the first three weeks of August, the assumption again being that £36 millions of bills are issued and redeemed each week:—

	PUBLIC DEPOSITS		
	Paid in	Paid out (£ millions)	Balance
August 2*	0	0	10·0
„ 3	7·2†	6·0	11·2
„ 4	7·2†	6·0	*12·4*
„ 5	7·2†	6·0	13·6
„ 6	7·2†	6·0	14·8
„ 7	7·2†	12·0‡	10·0
„ 9	6·0	0§	16·0
„ 10	6·0	7·2†	14·8
„ 11	6·0	7·2†	*13·6*
„ 12	6·0	0¶	19·6
„ 13	6·0	7·2†	18·4
„ 14	6·0	14·4†‡	10·0
„ 16	6·0	0§	16·0
„ 17	6·0	0‖	22·0
„ 18	6·0	7·2†	*20·8*
„ 19	6·0	7·2†	19·6
„ 20	6·0	7·2†	18·4
„ 21	6·0	14·4†‡	10·0

* Bank holiday. † £36 millions divided between only five days. ‡ 92-day bill; cf. previous table. § Corresponds to Sunday in May. ¶ Corresponds to Coronation day in May. ‖ Corresponds to Whit-Monday in May.

The figures in italics in the third column relate to Wednesday, which is the day of the Bank return. This table shows how at times of bank holidays wide variations in public deposits can be caused by the incidence of Treasury bills. Actually between August 11th and 18th public deposits rose by £9.5 millions. The table shows a theoretical increase of £7.2 millions.

The final complication increases at the end of each quarter, and this is due to the banks' habit of accumulating cash for balance-sheet purposes on June 30th and December 31st. As the market knows that its loans from the joint-stock banks will be called on those dates, it has developed the habit of arranging for all its Treasury bill maturities in those weeks to occur on or before June 30th and December 31st, and its payments for new bills to fall due on or after July 1st and January 1st.

Therefore, for the portion of those weeks up to June 30th and December 31st, the whole £36 millions of the week's maturities will have been paid out, and none of the new payments will have been collected. On those particular dates, the Treasury will be £36 millions

out of pocket, and so may have had to borrow heavily on Ways and Means from the Bank. On June 30th last, when the week's maturities were £42 millions, Ways and Means borrowings from the Bank were £49.3 millions.

On September 30th and March 31st, the boot is on the other leg. The market not only has no maturities for those weeks on or before these key dates, but is also paying for all its bills on or before those key dates, so as to be well supplied with maturities on December 31st and June 30th. Therefore, public deposits tend to run £36 millions higher than usual, while in the absence of special assistance the banks and the market find themselves short of funds. To illustrate this during the week to March 31st, public deposits rose from £27.9 to £52.2 millions, while bankers' deposits dropped from £82.0 to £62.3 millions.

Sufficient has now been said to illustrate the effect on the Bank return of the incidence of Treasury bills. It is not the purpose of this analysis to suggest a remedy, but simply to show how these seasonal variations come about. Meanwhile all concerned could be pardoned for becoming ardent converts to the reform of the calendar.

Financial Notes

M. Pierre Quesnay.—The tragic death of M. Pierre Quesnay at the early age of forty-one removes one who had already done much valuable work in the sphere of international financial and economic affairs, and whom many hoped would have opportunities to do still more. Immediately after the war he joined the Reparations Commission, and later played a great part in the financial labours of the League. He was Secretary-General of the French delegation at the Young Conference, and then after a period at the Bank of France he became a director of the Bank of International Settlements, a post he held at the time of his death. The world is the poorer for the loss of one whose especial abilities were of great importance to all concerned with the sanity of economic politics.

* * *

August Clearing Bank Returns.—The August returns for ten clearing banks reveal a small decline in all the main items:—

(In £ millions)

	Aug., 1936	April, 1937	May, 1937	June, 1937	July, 1937	Aug., 1937
Capital and reserves	131·8	132·5	132·5	132·5	132·5	132·5
Acceptances, etc.	103·5	126·2	125·5	124·1	122·1	116·1
Deposits (including undivided profits, etc.)	2,208·8	2,213·6	2,217·7	2,255·1	2,255·6	2,245·9
Total liabilities	2,444·1	2,472·3	2,475·7	2,511·7	2,510·2	2,494·5
Cash	230·0	226·2	229·6	237·7	231·8	231·0
Cheques, balances and items in transit	56·4	64·6	68·7	73·0	63·7	64·6
Money at call	157·7	171·6	163·4	166·2	157·9	156·7
Discounts	343·7	239·5	242·8	257·5	280·7	275·8
Investments	625·7	646·0	641·4	638·2	631·7	630·4
Loans and advances	857·2	930·6	936·6	947·4	954·7	952·6
Investments in affiliated banks	25·2	23·5	23·5	23·5	23·5	23·5
Cover for acceptances, premises, etc.	148·2	170·3	169·7	168·2	166·2	159·9
Total assets	2,444·1	2,472·3	2,475·7	2,511·7	2,510·2	2,494·5

Deposits are down by £9.7 millions, and cash by £0.8, so that the cash ratio has risen a trifle from last month's figure of 10.3 per cent. Of the particular falls, money at call takes £1.2 million, discounts as much as £4.9 millions, investments £1.4 million, and advances £2.1 millions. The fall in advances is less than the fall between July and August last year, when total deposits rose, and probably foreshadows no change of trend.

* * *

Commonwealth Bank Report.—The half yearly report of the Commonwealth Bank of Australia is a full and informative document. The latest is of particular interest, coming as it does immediately after the Budget Speech (discussed in *The Economist* last week, page 466) and presenting a more cautious view of the future. The directors are obviously concerned with the eventual end of boom conditions abroad. Not being hopeful of a liberation of world trade, Australia's only second line of defence, they advocate a reduction of the Government's short term debt, an accumulation of sterling funds, and the preparation of schemes for public works for use when a recession occurs. For the present, they have increased profits and a 7½ per cent. increase in trading bank deposits to record; and useful statistical tables disclose the progress of the active balance, and the movements of interest rates. These last figures show a stability of rates within the control of the Commonwealth Bank and a gradual fall in the yields on Government securities. By contrast, the building boom, about which the Board appears somewhat anxious, has produced a definite tendency for mortgage rates to rise. The whole tone of the report suggests that its authors are taking their responsibilities as a central bank wisely and seriously.

* * *

The Money Market.—Little of note can be said to have occurred in the money market this week. Money has been exceptionally easy even by comparison with recent experience. The syndicate only succeeded in obtaining an allotment of 45 per cent. at the same low rate as last week.

	Aug. 19, 1937	Aug. 26, 1937	Sept. 2, 1937	Sept. 9, 1937
	%	%	%	%
Bank rate	2	2	2	2
Clearing banks' deposit rate	½	½	½	½
Short loan rate :—				
Clearing banks	½–½–1*	½–½–1*	½–½–1*	½–½–1*
Others	½–⅝	½–⅝	½–⅝	½–⅝
Discount rates :—				
Treasury bills	½	½	½	½
Three months' bank bills	11/16–⅝	11/16–⅝	11/16–⅝	11/16–⅝

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

The clearing banks have been very active buyers of bills.

* * *

The Foreign Exchanges.—The most important event of the week has been the decision of the French authorities on Thursday morning to cease supporting the franc. Such a move had been expected if the political situation in Paris remained uneasy, and no alarm was caused when the rate fell from Frs. 132.95, round about which it had been held, to Frs. 134½. To this fall, which is probably not yet entirely over, some capital movements to New York contributed. These accounted for the sudden rise in the dollar that afternoon to $4.94¾. The American control had previously had to sell a considerable volume of dollars on Monday to prevent a sharp appreciation, due partly to movement of funds provoked by the Italo-Russian *fracas* and partly to a good deal of commercial buying. The belga recovered after the vote of confidence in M. van Zeeland, though to a less extent than had been anticipated. There is next to no business in Far Eastern currencies.

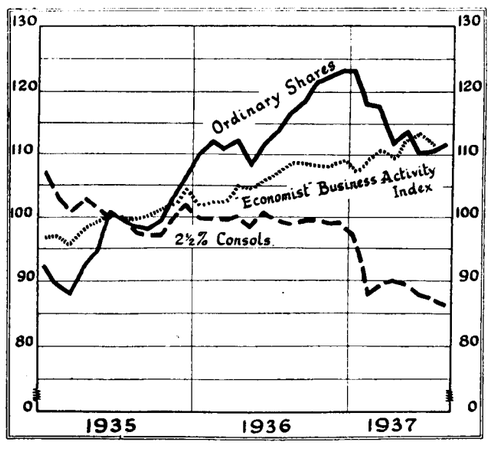
* * *

The Bank Return.—Only small changes are shown in this week's return. The note circulation has declined by the small total of £1.2 millions as the end of the holiday season approaches.

BANK OF ENGLAND

	Sept.9, 1936	Aug.18, 1937	Aug.25, 1937	Sept.1, 1937	Sept. 8, 1937
Issue Department :—	£ mill.	£ mill.	£ mill.	£ mill.	£ mill.
Gold	246·5	326·4	326·4	326·4	326·4
Note circulation	445·6	491·0	488·3	490·3	489·1
Banking Department :—					
Reserve	62·0	36·8	39·6	37·6	38·9
Public deposits	20·4	28·5	25·4	14·1	12·0
Bankers' deposits	99·8	88·5	92·8	104·2	105·7
Other deposits	37·8	36·5	36·0	36·5	36·3
Government securities	83·5	107·1	108·8	109·3	107·1
Discounts and advances	10·5	6·2	4·3	5·4	5·1
Other securities	20·1	21·6	19·6	20·8	21·0
Proportion	*39·2%*	*23·9%*	*25·6%*	*24·3%*	*25·2%*

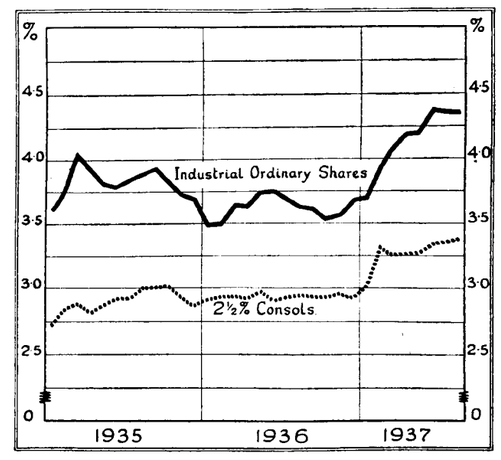
Public deposits remain very low after the dividend payments shown last week, and there has been a further small rise in bankers' deposits, which goes some way to explain the glut in the money market. The proportion is still extremely low.



THE STOCK EXCHANGE

Autumnal Investment Prospects

DIVERSE interests like scholarship, publishing and politics have one factor in common—their year begins, not in January, but in the autumn months, when gardeners are planting their bulbs and the lower animals are hibernating. Investment tends, similarly, to have its own annual rhythm, marked by a quickening of interest after the summer vacation, and a perceptible slackening, more often than not, about Budget time. This year, returning investors find little to cheer them in the immediate market prospect. Since the beginning of this year, industrial activity has climbed to new high levels, but industrial share values have declined, on the average, by about 10 per cent. At the beginning of August, the stage seemed to be set for at least a secondary revival in Stock Exchange interest. But the choice by Japan of Shanghai as a point of chastisement of China for her temerity in resisting hostile invasion has effectively checked any incipient recovery in prices. In times like these, when most market commentators must necessarily be Mark Tapleys, and "talk by their book," one hears much of the Stock Exchange's firm undertone, but little of any substantial increase of business, which is what the market most desires.



I.—Prices of 2½% Consols (Actuaries' Index) and of Ordinary Shares (*Financial News* Index) contrasted with *The Economist* Business Activity Index.

(Beginning of July, 1935 = 100)

II.—Yield on 2½% Consols and on Industrial Ordinary Shares.

(According to the Actuaries' Index.)

The moment, clearly, is opportune for an endeavour to see past, present and future in due perspective and to distinguish the main factors in the immediate investment outlook. The fact that the market is highly sensitive, to-day, to international political factors which do not differ in kind from those to which it was largely impervious between 1933 and 1935 (e.g. at the time of the German remilitarisation of the Rhineland) suggests one, or both, of two conclusions. Either political clashes are deemed more dangerous now than a few months ago, or the market's internal powers of resistance are not as strong as they were. Of the former possibility, every investor must judge for himself; but a careful study of recent market trends throws valuable light on the second alternative.

The first of the two accompanying charts compares the recent trends (1) of British business activity as a whole; (2) of the price of 2½ per cent. Consols; and (3) of quotations for industrial ordinary shares. The second chart closely compares the percentage yields obtainable on gilt-edged securities and industrial equities, respectively, during the last few months. The charts relate to a period of advancing prosperity in industry, when the background for the Stock Exchange—so far as earnings and dividends are concerned—was as favourable as it could well be.

A survey of the first chart brings out two significant facts. Since the end of 1936, undated gilt-edged securities have fallen by 12½ per cent., and representative ordinary shares by nearly as much. But the general level of business activity has recorded a further advance of 2 per cent. to a level never attained, hitherto, in Britain's economic annals. Our records of industrial profits have shown gains of 20 per cent. as compared with figures published a year earlier, in many recent months. Yet industrial shares are well below the level they reached last January. The second chart shows that the gap between gilt-edged yields and ordinary share yields has widened. Investors, in other words, are progressively less inclined to discount further increases in earnings and dividends on industrial shares. If there were widespread confidence that profits would continue to rise by anything like 20 per cent. per annum for the next two years we may presume that shareholders would be content with a lower immediate income return than 4.4 per cent.

The industrial prospect, however, no longer offers a virtual guarantee of constantly rising earnings. We may be able to maintain the present level of prosperity for some time, but only those who claim that the era of cyclical economic fluctuations has passed away can logically expect further capital appreciation from industrial shares as a whole. Less optimistic investors, on the other hand, may wonder whether we are not approaching the condition of "full employment" at which, economists tell us, the seeds of a setback may germinate.

For the trustee investor, official policy is still the guiding consideration. By stringent control of the market, the authorities have been able to persist with their policy of issuing new loans at something above prevailing prices, without any serious loss of prestige. The Treasury, with the backing of the Public Departments, can nurse its issues until the accumulation of investment money brings the public in as a buyer at a discount on the issue price.

The position of the Government's National Defence Bonds is a case in point. Some £100 millions of these 2½ per cent. bonds, redeemable 1944-48, were issued last April at 99½. The immediate public response was very small, and for many weeks the price had to be pegged, with scarcely any business passing. In due course, the fixed redemption date of the bonds began to appear a desirable feature to an increasing number of conservative investors, who put safety of capital above income considerations. Sizeable sales of the bonds have lately been effected—but only at a price three points below the original issue price.

The clearing banks' holdings of gilt-edged stocks have been falling—though in gradual and unspectacular fashion—during the last few months. The decline has certainly been much less than proportionate to the increase in the banks' advances, but it is not in conditions like these that investors look for a strongly rising gilt-edged market. What, then, are the omens for equity shares? Here the most striking contemporary feature is the wide spread of income yields. There is no longer an homogeneous " ordinary share market." In the early stages of recovery, sound industrial share yields were closely grouped between 3 and 4 per cent. To-day, many building material shares now yield from 8 to 10 per cent., and even a seasoned share like London Brick yields over 8 per cent. In the motor and steel groups, returns of well over 5 per cent. are common. The best brewery shares can now be bought on a 4½ per cent. basis, and electricity supply shares yield only a little less. Interspersed among these group averages are shares which are now specifically valued—rightly or wrongly—on their independent qualities and risks. Any random selection of shares—Richard Thomas (yielding 7.3 per cent.), Turner and Newall (3.9 per cent.), Associated Newspapers (7¼ per cent.), and British Oxygen (2.9 per cent.)—is sufficient to suggest that discrimination has become the order of the day among investors.

A second factor, which closely concerns holders of ordinary shares, is the effect of rising costs upon profits. Industries which operate within a context of fixed prices —such as public utilities and the railways—and industries whose products have a relatively elastic demand, may have difficulty in passing on their rising costs to the consumer. The rising tendency of wages and material prices is particularly important for the railway stockholder, for whom the last quarter of the year brings an increase in freights and fares which will be largely absorbed by the wage increases, granted last month, and the higher level of fuel and maintenance charges.

On the other hand, commodity shares should offer some scope for the investor. And industries with a stake in the further recovery of international trade may have better prospects than purely domestic industries which have already advanced far along the road to recovery. Yet even in these directions caution may be advisable. In the rubber industry Malaya seems likely to produce her full quota, and a rapid rise in rubber prices is unlikely. The position of copper stocks is becoming less stringent under the influence of unrestricted production. The consumption of oil has been at record levels, but supplies are fully adequate. These considerations do not preclude the earning of handsome profits, but they provide little combustible material for a share boom.

Finally, in the Kaffir market, " gold scares " have vanished—at least for the time being—but the market has not regained its former confident stride. In fact, for the last six months the market has been paying the price of its earlier speculative excesses. While the debris has been in process of collection and incineration, both in London and Johannesburg, the speculative operator has been deaf to the argument that established income-yielding South African mines have fallen to attractive yield levels. The statement would be broadly true, if conditions were more stable; and moderate instability in prices or costs could itself be comfortably offset by adjustments in mining policy. But so long as major uncertainties remain, the market is hardly likely to stage another big speculative advance.

There is, altogether, an autumnal tinge in the general investment prospect, in the fall of the year 1937. In these circumstances, sentiment is obviously likely to be more vulnerable to external political alarms and excursions. He would be a bold man who would undertake heavy speculative commitments on the assumption of political tranquillity, or would choose to follow a semi-professional bull market very far. It may be arguable that this is not the time for indiscriminate selling of a shrewdly selected and balanced portfolio. But it is difficult to make out a case for the retention of equities whose status is less than first class, and whose present price still leaves a profit to be consolidated. In such instances, reinvestment in short-dated fixed interest stocks, at prices near or under par, would be the best possible form of reinsurance.

Le Touquet

Investment Notes

Nerves in Wall Street. — More than a suspicion of panic seized Wall Street on Tuesday, when many shares lost up to 8 points in a turnover of $1,870,000. Although the fall was stayed next day, when the turnover was even larger, the uneasiness remains, and erratic movements are expected in the future. The cause of the trouble was Wall Street's expectation that the piracy in the Mediterranean, followed by Russia's note to Italy, and the reluctance of the Italians and Germans to attend a naval conference, could end only in war. Once again Wall Street has taken a much more pessimistic view of the outlook than the City of London, as we show in a Note below. It is widely held on this side that American recovery has several years of progress ahead of it; that political and technical market difficulties in America are overrated by Wall Street; and that even war would not bring down America in ruin, because she is conveniently separated from its consequences by a wide expanse of water and by her own determination to remain neutral. It is evident that many capitalists in Europe are prepared to back this opinion by transferring funds to America, as has been suggested by the strength of the dollar exchange in recent days. London is optimistic about America, and Wall Street is pessimistic about Europe. Both may be right. The upward trend of security prices in America may eventually be resumed, but even extra-American optimists see nothing in the immediate future but fluctuations, irregularities, and squally weather.

* * *

London's Unstable Equilibrium.—Although dealings have been transacted in a tenebrous and electric atmosphere, London has been steadier than New York this week. Foreign bonds have again, naturally, been heavily marked down. Chinese Customs issues have particularly suffered from Japan's blockading zeal against Chinese imports, which provide the sinews of war to bondholders as well as to their direct recipients. Industrial shares have been further marked down, more as a symptom of discouragement in speculative enterprise generally than on any reasoned calculation of the probable course of international events. *The Financial News* index, by falling to 109.3, has now relinquished all its gains since the beginning of July. A broad interpretation of market conditions—as true and as false as most generalisations—would be that while both New York and London have been pre-occupied with news headlines, Wall Street has registered something like fear while London has registered resentment.

An explanation of the relative steadiness of London may be that British investors, who are closer to the European storm area, have better learned to discount the peculiar technique of totalitarian States in their international communications, whose wording has abandoned the courtesy as well as the circumlocutions of the Old Diplomacy. An alternative explanation may be that America is over-hasty in considering, and London over-complacent in refusing to consider, the far-reaching investment consequences of any European imbroglio. So far, as we suggest in a leading article on page 527, the behaviour of the London Stock Exchange argues a state of mind which recognises that domestic trade activity and profits cannot increase indefinitely, but holds doggedly to the conviction that Europe will produce thunder but no lightning. Stockholders have a vested interest in peace. But the resumption of last year's confident rise in security prices, interrupted at the beginning of 1937, looks increasingly unlikely.

* * *

League Loans Report.—The reports of the League Loans Committee have always been interesting documents for anyone interested in the chequered history of post-war international lending. The Report published this week sets out the history of the loans in recovery. General details about the nine issues with which the Committee is concerned are given below:—

(Amount in £ millions)

Borrower	Nature of Loan	Original Issue Equiv. (at par)	Of which issued in London	Amount out-standing	Issue Price (London)	Price Sept. 8	Last coupon paid (per cent. of Full Service)
Austria ...	Guaranteed 1923.	32·8	14·0	Nil	...	...	Repaid or converted
Danzig Municipality.	7% Mortgage	1·5	1·5	0·7	90	67½	Full
Danzig Free City.	6½% Tobacco Monop. 1927	1·9	1·5	1·3	91	57½	Full
Estonia ...	7% Banking Currency, 1927.	1·5	0·5	1·3	94½	99	Full
Bulgaria ...	7% Settlement, 1926.	3·3	1·7	2·9	92	29½	32·5
	7½% Stabilisation 1928.	5·4	1·5	5·4	96	30½	32·5
Greece ...	7% Refugee, 1924.	12·2	7·5	11·6	88	41	Zero
	6% Stabilisation, 1928.	7·5	3·4	7·3	91	34½	Zero
Hungary ...	7½% Reconstruction, 1924.	14·2	7·9	10·4	88	47½	50

Apart from Austria, who converted her loan in 1935, only Danzig and Estonia have consistently maintained the full service of their loans, and they are rightly praised for their virtue and good fortune. The *Danzig* Government has now, however, produced a scheme for reducing the interest on both its loans by 2 per cent. and extending both the sinking funds for five years. Legally the loans could be converted, but since difficulties connected with the Free City's present position prevent that course the Committee recommend that the scheme, as a sincere effort to meet a difficult situation, be accepted.

* * *

The Committee also recommend the acceptance of a *Hungarian* plan to stabilise the service at 60 per cent. of the contractual interest, with a cumulative sinking fund to start in 1940. They point out that Hungary's foreign debt must inevitably be scaled down, and characterise the proposal as " a serious offer from an honest debtor." But they do not propose a permanent settlement with *Bulgaria*, being mildly critical of her budgetary policy, and about the *Greeks* they are very firm indeed. And certainly a Greek Government that proposes a permanent settlement at 50 per cent. of the interest, and then announces over the heads of a protesting Committee a payment of 40 per cent., deserves strong language from its creditors. The Committee have always endeavoured to be, and have been, fair to all parties. When they say that their goodwill has been seriously abused, their words are obviously being carefully weighed.

New Issue Mortality.—In a leading article on page 507 we refer to the dangers inherent in the tendency of company promoters and financiers to resort heavily to the new issue market when industrial shares are active on the Stock Exchange and to desert it when the going is less good. In a painstaking and scholarly article in the current issue of *The Economic Journal*, Mr P. W. S. Andrews aptly points the moral of this argument. Mr Andrews has analysed an extensive sample of the new public companies formed in the period between 1919 and 1932. His sample includes 481 companies, with a total original paid-up capital of £161,977,000. His figures show, first, that most of the companies were relatively small—nearly two-thirds of them had a capital of less than £250,000. Secondly, most of them were floated in the two post-war boom periods, 1919-20 and 1928-29. In the former period some 29.5 per cent. of the total capital was issued, and in the latter 31.5 per cent. Thus, the remaining ten years of the period saw the issue of only 39 per cent. of the total capital involved. Thirdly, there is a high mortality rate among new companies. The following table shows the proportion of companies in Mr Andrews's sample which passed out of effective existence within periods of one to eleven years:—

Period of years after formation	Average risk of death within period (%)	Period of years after formation	Average risk of death within period (%)
1	3	7	25
2	9	8	27
3	14	9	31
4	19	10	30
5	22	11	32
6	25	...	...

On the average, as much as one-quarter of the new public companies formed during the period passed out of existence within seven years of their registration. Possibly the survival rate has been improved by recent statutory measures, such as the Companies Act of 1929 and the stiffening of the conditions which must be satisfied before permission to deal in new issues is given by the Stock Exchange Committee. The figures, however, demonstrate clearly the need for the careful scrutiny of the auspices and management of companies new to the market and for the offer of their shares to the public on a substantially higher yield basis than is appropriate to established enterprises.

* * *

Mr Andrews proceeds to calculate mortality risks for new companies according to their industrial classification. The figures here are less valuable, for some of the groups are not large enough to be really representative. And it is difficult to say how far the experience of a particular group may be due to conditions in the industry itself, and how far to the fact that promotional exuberance has overcrowded the market with new

The Distinctive System
of
The Scottish Provident Institution

Under *The Distinctive System* the premiums are so moderate that, at early and middle ages, the annual sum charged elsewhere for a Whole Life Assurance of £1,000, with profits, will here secure from the first as much as £1,300 or thereby with right to share in the Surplus.

issues of that type. Taking the figures as they stand, however, it appears that 60 per cent. of the electric and radio companies in Mr Andrews's sample died within five years of their registration; the corresponding figures were 47 per cent. for motor companies, 38 per cent. for transport companies and 33 per cent. for building materials companies. At the other end of the scale, only 5 per cent. of the investment companies failed in their first five years, similar figures being 9 per cent. for tea companies, 14 per cent. for coal, iron and steel companies and 17 per cent. for engineering companies. These ratios support one conclusion at least—that new issues in highly competitive or currently "fashionable" industries should be capitalised more conservatively than even the average "mortality risk" would suggest. In view of the failure of certain of the 1935-36 popular light engineering issues to achieve their prospectus profit estimates, it might conceivably have been for the good of the investor and the market if Mr Andrews had published his analysis a couple of years ago.

* * *

Preference Shareholders' Rights.—During the last few weeks there has been the usual holiday spate of capital reconstruction schemes, and the now customary series of endeavours to cast preference shareholders for a sacrificial rôle. We have recently had occasion to criticise schemes put forward by the boards of Simms Motor Units, Limited, and Platt Brothers (Holding), Limited. In both schemes the rate of preference dividend was to be reduced, and the preference shareholders' dividend arrears were to be satisfied by the cession of part of the equity. In both cases strong opposition developed from preference shareholders, who were supported by the Shareholders' Protection Association. The board of Simms Motor Units has wisely bowed to the storm, withdrawn the obnoxious clause, and secured the shareholders' consent to its revised scheme. But the directors of Platt Brothers are adamant. At the end of last week a new statement was issued which was more moderate and informative than the original circular, but made no attempt to meet the fundamental arguments against the proposal. On the contrary, the board's endeavour to relate the company's future to two alternative sets of possibilities—according as Lancashire bought or did not buy textile machinery—was calculated to increase the strength of the opposition. For in the former event the arrears could be paid off without much difficulty, so long as the ordinary shareholders were willing to wait for a couple of years. There would then be no need for a capital scheme of any kind. In the latter event, the ordinary shareholders would gain from the reduction of the total preference requirements, but the second preference shareholders would lose income, and the first preference shareholders would relinquish their prior ranking. The scheme thus stands out as a measure for antedating ordinary dividends, and preference shareholders would be well advised to insist on at least as equitable treatment as their colleagues in Simms Motor Units.

Plain Words from the Chair. — Investors who have never held shares in the "Triplex" Safety Glass Company or (more unlikely) have never travelled behind the company's product in a British car, may nevertheless derive profit from a study of the speech of Mr G. Cunningham on Wednesday. There are as many kinds of chairmen's speeches as there are flies in amber; but the technique of the art shows the same confusion of objectives as exists in the world of the drama between "good theatre" and mere "box office." At one end of the scale are the bank chairmen who can appropriately treat a wider audience to a review of the financial world entire—since their own shareholders own almost a gilt-edged security. At the other extreme are chairmen like Mr Samuel Courtauld who, because their companies are leading units in their industry, can lay down law and policy for their trades with the determined clarity of a benefi-cent dictator. Between the two come many speeches which are neither informative nor well-defined, but leave behind them the self-satisfied glow which only really good platitudes can give. Mr Cunningham, however, has consistently followed a line of his own. On the assumption that his shareholders are rational, though interested, parties, he tells them plainly what are the favourable and the less favourable features in the outlook. This year, he declared that while the company's volume of work would probably be greater than ever, they would continue their policy of price reduction. And as costs were rising, this might conceivably affect total profits. This is plain speaking. In return, Mr Cunningham suggested that stockholders might show their appreciation not in the usual way, by cashing their dividend warrants and departing, but by taking an increased interest in their company's affairs. Early this year, when the chairman sent an analytical study of road accidents to every stockholder personally, only one used a three-halfpenny stamp to acknowledge its receipt. Perhaps *The Economist*, which has been neither oblivious of the need for wider publicity in company matters, nor unappreciative of the success of the Triplex board, may hope that the chairman will not be weary in well-doing and that stockholders will take him at his word and swell the postal revenue.

Company Notes

Second Alliance Trust.—The favourable impression created by the earlier announcement of a 2 per cent. increase in this Scottish trust's annual dividend are fully endorsed by the complete accounts. Income has risen by 11 per cent., and the dividend policy, despite the increased distribution, is conservative. The extra 2 per cent. absorbs only £4,500 of a total rise in income of £22,500. Taxes have required an additional £6,400 and £10,000 has been set aside to start a special taxation reserve, "in view of the possibility of increased liability to taxation in this country and in the United States." Comparative results for the last three years are set out in the following table:—

	Years ended July 31 1935	1936	1937
	£	£	£
Revenue	180,866	191,318	213,859
Taxes	30,050	31,303	47,768†
Interest	56,074	53,948	52,903
Fees and expenses	8,894	8,975	8,552
Preference dividend	24,675	24,478	24,084
Ordinary stock :—			
Earned	*61,173*	*72,614*	*80,552*
Paid	49,350	48,956	53,476
Earned (%)	*22·3*	*26·7*	*30·1*
Paid (%)	18	18	20
Contingent reserve	10,000	25,000	25,000
Expenses written off	741	163	772
Carry forward	12,531	11,026	12,330

† Including £10,000 to special taxation reserve.

Before the special tax reserve allocation of £10,000, earnings for the equity were 33.8 per cent.—which is little below the best rate of the past decade. The valuation of securities again shows a surplus, of undisclosed amount, over book values. Although so far this trust has not adopted the practice of including in its report a broad analysis of its portfolio, information has hitherto been given at the annual meeting. A year ago it was disclosed that three-fourths of the company's securities were in Great Britain or the United States, and that fixed-interest investments comprised rather less than two-thirds of the total portfolio. At 485 the ordinary stock yields £4 2s. 6d. on dividends and £6 4s. 6d. on earnings.

* * *

D. Gestetner's Progress.—In view of this company's progressive past record and of its increased interim dividend, the market was prepared for a satisfactory report. The results for the year just ended—presented as usual with exemplary promptitude—fully confirm and even surpass, the general expectation. How much of the 22 per cent. rise in profits has been contributed by the export trade is not disclosed, but in this branch the expansion of business has been both large and general. We show below the trend of earnings in recent years:—

	Years ended August 31 1935	1936	1937
	£	£	£
Profit	176,794	194,082	237,623
Depreciation	12,715	14,245	15,072
Taxation	15,000	16,500	30,000
Other expenses	9,024	8,655	8,942
Preference dividend	18,375	18,375	18,375
Ordinary shares :—			
Earned	*121,680*	*136,307*	*165,234*
Paid	89,250	100,406	129,094
Earned (%)	*51·4*	*51·4*	*54·9*
Paid (%)	35	35	40
Capital bonus (%)	12½	12½	25
General reserve	31,875	35,859	45,683
Carry forward	19,689	19,731	21,615†

† After £14,186 extraneous profit, and writing off securities by £2,759.

The 5 per cent. increase in dividend is not unexpected, but the doubling of the rate of capital bonus is an agreeable surprise. At the current price of the 5s. units the bonus is worth about 9s. 9d. per share. In the two preceding years, however, the surplus of earnings over cash dividend, was in fact, fully capitalised, since the reserve allocation corresponded exactly to the appropriation for capital bonus from general reserve, which remained at £100,000. This time the amount set aside from profits falls short of bonus requirements by £35,000, so that the general reserve will be reduced to £65,000. The company's earnings prospects are closely bound up with general business activity, and the yield of £5 3s. 3d. per cent. obtainable at the current price of 49s. 7½d. per 5s. unit implies a reasonable anticipation of benefits to come.

* * *

Eastwoods Position.—The further decline in the profits of this building materials undertaking finds no explanation in the report. The report presented a year ago itself showed a reduction, but at the subsequent general meeting it was stated that business in the first five months of the 1936-37 financial year was 10 per cent. greater than in the corresponding period of the preceding year. Last February an interim statement declared that "production and trading continued satisfactory." Unless some reversal of this condition occurred in the latter part of the year 1936-37, therefore, it would seem that the decline in profits for the whole year was due to an increase in costs or, possibly, in development expenditure. The course of profits in recent years is shown in the following table:—

	Years ended March 31 1935	1936	1937
	£	£	£
Profits	110,720	101,664	91,903
General expenses	16,183	13,100	13,577
Bad debts, fees and tax	11,499§	11,478§	11,422
Preference dividend	10,500	10,500	10,500
Ordinary shares :—			
Earned	*73,538*	*66,586*	*56,405*
Paid	45,000	45,000	45,000
Earned (%)	*27·3*	*24·4*	*20·1*
Paid (%)	15	15	15
General reserve	22,500	22,500	10,000
Carry forward	15,811	14,897	16,301
Profits from sales*	11,194	3,635	13,012†

* Profits on realisation of investments placed direct to investment reserve. † Of which £10,000 to general reserve. § Including £1,000 directors' bonus voted in September.

Shareholders have suffered no decrease in cash dividend, since earnings still cover the 15 per cent. distribution with an ample margin. But the general reserve allocation from profits has been more than halved, though an addition of £10,000 has been credited to it from profits on realised investments. If the continued decline in the value of building plans approved by local authorities means that the fall in building activity so long expected and equally long postponed is at last within sight, then its effects on undertakings like Eastwoods might be mitigated by an extension of public works programmes or by the development of new uses for the company's products. The problem of rising costs, however, remains, and the cautious attitude of the market towards the shares of even sound and efficient building companies is reflected in the price of Eastwoods £1 shares, which at 42s. 6d. offer a dividend yield of £7 1s. per cent.

* * *

Calico Printers Report.—The full accounts emphasise the measure of recovery achieved by the Calico Printers in their latest year. Two years ago the 5 per cent. preference dividend was paid in full by a large transfer from reserve. Earnings for 1935-36 covered only two-thirds of debenture interest. In the latest period gross profits have increased by as much as 33 per cent., and after a slightly reduced provision for depreciation and maintenance, fees and interest, there remains a surplus of £116,174, equal to 3.9 per cent. on the preference stock. The course of earnings in the past three years is shown in the following table:—

	Years ended June 30 1935	1936	1937
	£	£	£
Working profit*	556,894	470,887	627,402
Depreciation, etc.	375,125	379,335	372,428
Fees	10,800	10,800	10,800
Debenture interest	128,000	128,000	128,000
Preference dividend	150,805	Nil	75,403†
Reserve	*Dr. 100,000*	*Dr. 50,000*	...
Carry forward	39,827	42,579	83,351

* After adding back depreciation, maintenance, etc.
† For half-year to end of 1935.

In paying a half-year's preference arrears up to the end of 1935, therefore, the directors have wisely chosen not to trench further on reserves. The balance sheet, as always, discloses a satisfactory position. Capital and general reserves of £1,650,000 are nearly represented in full by securities standing at £1,619,440, while cash is £853,717. The outlook is more hopeful than for some time past. The quantity of piece-goods exported from the United Kingdom between January and July this year increased by 5 per cent., which, if not a large percentage, represents a satisfactory reversal of the previous trend. But the return to the dividend list of the £1 ordinary stock units, which now stand at 10s., is evidently not yet.

* * *

Oil Share Prospects.—The oil share market has been peculiarly sensitive to adverse international news. It is not surprising that Shell Transport, with its heavy interests in Japan and China, has fallen in the past two weeks from over 5½ to 5$\frac{3}{32}$. But shares which are politically less vulnerable, such as Burmah Oil and Trinidad Leaseholds, have also fallen this week—Burmah Oil from 6$\frac{7}{16}$ to 6$\frac{5}{32}$ and Trinidad Leaseholds

Assets exceed £18,000,000

from 6⅛ to 5 13/16. The apparently less reassuring news from the American oilfields is perhaps one reason why the decline has been allowed to go so far without meeting resistance. The production of crude oil in the United States has attained a new peak level of 3,731,450 barrels a day, which is actually 268,550 barrels a day above the "allowable" recommended by the U.S. Bureau of Mines for August. This may have disturbed some holders of oil shares, and the news that Pennsylvanian crude oil prices have been cut by 22 to 27 cents per barrel as from September 1st may have added to the confusion. The situation, however, is not as bad as it would appear. Texas and California have been largely responsible for the recent excess production, but from now on a decline may be expected in the output of Texas, since the State "restriction" authority has decided to reduce the "allowable" output for September by 110,000 barrels a day. It is, of course, essential that crude oil production should be reduced in September, otherwise there may be such an increase in stocks as would exert pressure on the oil price structure. If the expected reduction in supply is realised and if the consumption of gasoline maintains its anticipated increase of 10 per cent. in September, the oil industry will enter upon the period of seasonal accumulation of stocks without feelings of anxiety. As for the reduction in the price of Pennsylvanian crude oil, this is of slight importance in relation to the crude oil market as a whole and it was caused merely by the recent reduction in the prices of Pennsylvanian lubricating oils.

* * *

As for oil company earnings, it is expected that American companies in the current quarter will show the best results for many years. In the first half of this year, the earnings of 28 leading American oil companies were actually 52 per cent. greater than in the first half of 1936. These results are encouraging the oil share market to look for satisfactory dividend announcements in the near future from Burmah Oil and Trinidad Leaseholds. News was received this week that a settlement of the strike on the Mexican Eagle Oilfields was expected as a result of a meeting between leading industrial representatives and the Mexican President. This delegation declared that if the necessary supply of oil could not be obtained by this Saturday it would mean the stoppage of practically all the small industries in Mexico. The President thereupon urged the owners and the men to come together and 14 points, out of innumerable others, were agreed upon for immediate discussion with some hope of reaching an agreement. The settlement of the Mexican Eagle strike and one or two good dividend announcements would quickly lead to some recovery in the oil share market.

* * *

New Modderfontein.—The effect of the treatment last year of the record tonnage of 2,342,000 was so considerably more than offset by a decline in average value and an increase in costs that the working profit was much below the previous year's total. The revenue averaged 28s. 9d. as against 31s. 8d., and costs 14s. 10d. in place of 14s. Taxation absorbed £668,490 as compared with £649,970; provision for miners' phthisis was higher than before at £33,320. Comparative results during the last three years are given below:—

	Working Profit	Dividends		Carried forward	Ore Reserves Available	Value
	£	£	%	£	Tons	dwts.
1934–35 ...	2,280,210	1,505,000	107½	198,960	7,872,200	5·1
1935–36 ...	2,049,106	1,365,000	97½	206,940	7,736,500	4·5
1936–37 ...	1,626,220	910,000	65	206,190	7,436,800	4·1

Although the quantity of ore taken out of the mine during the year amounted to 2,606,160 tons, as against 1,104,800 tons developed, the available ore reserves show a reduction of only 299,700 tons, although the average is nearly ½ dwt. down. From the report of the consulting engineer, in conjunction with a study of the map, it is evident that little ore remains to be opened up on the main reef leader, hitherto the mainstay of the mine. Certain of the upper leaders continued to give satisfactory results, and it is considered that the prospects of developing further large tonnages of payable ore are favourable. Work in other directions was less encouraging. The total ore reserves—that is, including the quantity in shaft pillars, etc.—represent fully three years' supply. The tonnage will doubtless be eked out in the same manner as before. In view of the shrinkage in profits and dividends, and of the uncertainty regarding the remaining "life," the shares have lately fallen to about 25s. It would look as though a holder would probably do better to "see the thing through" than to accept this price.

* * *

Roan Antelope.—Although the profit for the June quarter showed an increase of no more than £78,500 upon that of the preceding three months, it brought the total for the financial year up to £1,790,000, compared with £514,500 in 1935–36. Hence the Stock Exchange was fully prepared for an increase in the final dividend. The payment of 50 per cent. brings the total for the year up to 80 per cent., compared with one distribution of 30 per cent. for the whole of 1935–36. But the announcement of a 200 per cent. share bonus came as a complete surprise; indeed, it is seldom that such a secret is so well kept. The scrip bonus will require £3,327,400. At the date of the last balance sheet the general reserve stood at £2,299,000; but premiums amounting to £1,449,000 have subsequently been received from the issue of shares made last February to redeem the balance of the debenture stock. This sum, possibly with an appropriation out of the profits for 1936–37, will still leave the general reserve at a substantial figure. Owing to various circumstances, the course of copper has lately been downwards. Nevertheless, consumption continues on a record scale, and a temporary recovery in the price is expected in some quarters of the market. Meanwhile, on last year's dividend, Roan Antelope 5s. shares at about 75s. show a yield of 5½ per cent.

* * *

Company Results and Meeting.—The accounts of some sixteen further companies (including *Barrow Barnsley Main Collieries* and *Whitworth and Mitchell*) are analysed on page 544. Although the report of *Tecka (Argentina) Land Company* points out that climatic conditions were often unfavourable, profits have risen satisfactorily by £7,500 to £39,488. Substantial recovery in the coal industry is once more revealed in the results of *Barrow Barnsley Main Collieries*, whose earnings of £101,188 are almost doubled. *Whitworth and Mitchell* have partly recovered the ground lost in 1935-36, their latest profits being £67,321 against £58,190; although conditions remain difficult in certain foreign markets, overseas trade has improved. Despite a small decline in profits from £58,045 to £53,008, *Ketton Portland Cement* have increased their dividend to 12½ per cent., appropriations from revenue no longer being necessary for writing off preliminary expenditure. The first accounts of *Anglo-Alpha Cement* issued since amalgamation with Atlas Cement of South Africa show a net profit of £91,177. An excellent first report is that of *Vaughan Brothers (Drop Forgings)*, whose total profits of £43,413 for a full year compare with a prospectus estimate of £35,780 based on results of the first quarter, and with £26,767 for the previous year. Results of another newcomer, *United Footwear Services*, are disappointing: a loss has been incurred. *United Caterers* return to ordinary dividends, but the auditors' report still points out that no depreciation of plant has been provided since 1933; the directors, however, consider the higher value of the freehold property more than counter-balances. *United Rubber and Coffee Plantations'* profits of £16,641 have increased fourfold. At the *Eaglehurst Rubber* meeting, Mr P. J. Burgess ascribed the company's progress to an increase in the price for rubber by some 2.68d.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: SEPTEMBER 21 ACCOUNT: SEPTEMBER 23

ONCE more, without surprising any observers whatever, the stock markets have had a thoroughly depressing week. The extremely critical state of international affairs would in itself have been a sufficient reason for gloom, but a sharp break on Wall Street, possibly due to the same cause, has added its own quota to the general depression. Dealers are finding what consolation they can from the belief that things might very easily have been worse. But unless the conference at Nyon is more successful than anybody expects, it seems likely that the bottom has not yet been reached.

The gilt edged market, though far from prosperous, has been relatively cheerful. Nearly every stock has been falling, but the day-by-day falls, in all but a very few cases, have been of trifling size. The main exceptions were, on the credit side, the Funding Loans which rose fractionally in the first days of the week, and on the other side, National Defence Bonds which were sold fairly heavily a little later. Colonials were inactive, though certain Australian issues were firm earlier on. Among the Europeans, holders of German and Greek loans responded quickly to the pronouncements of the two dictators—big and little—the Dawes and Young loans being especially depressed. French railway issues were also weak. Japanese and Chinese loans moved widely and erratically. Towards the end of the previous week both classes gained a great deal, especially the latter; but later the rot set in again, and Chinese were again the more sensitive. Brazilians also slumped continuously.

In the rail market, too, declines were the order of the day. Home ordinary stocks fell throughout, though by small amounts each day, with the sole and occasional exception of L.N.E.R. Prior charges also fell. Among the foreigners Argentines sagged after a period of strength, though in other South American issues changes were small. U.S. rails collapsed badly on Tuesday and Wednesday—without earlier firmness.

The new account in the industrial section opened firmly, but the slump in Wall Street on Tuesday had a depressing effect on this side of the water. Though London had resisted the dangers of war, it was bound to respond when New York became nervous. In the iron and steel section the decline was general, although Indian Iron stood out at first on dividend hopes. When Wall Street steadied up in mid-week, the iron and steel group here gained ground and coal shares followed the same trend. Thomas W. Ward improved on news of the disposal of the Langloan Iron property at Coatbridge. Richard Thomas responded well to the good tinplate export figures. Electrical equipment issues were lower, while the motor section was dull, and failed to move up in mid-week with the exception of Standard. Rayon issues went ahead on rumours of a rise in rayon prices, British Celanese sharing in the improvement. Among breweries Courage gained on hopes of an issue on bonus terms. There were practically no outstanding features in other groups which all followed the general trend of downward in the early part of the week and slightly firmer later.

The oil market started the week well, earning the distinction of being one of the few comparatively cheerful sections of the Stock Exchange. Although gains were for the most part of modest size (except for a rise of as much as 2s. 3d. in Attock), they were fairly widespread. This general improvement did not survive Monday's session, and prices sagged owing to lack of interest and to international preoccupations rather than to selling pressure. In mid-week the heaviness of the market was such that the report of a possible strike settlement did not prevent a setback in Mexican Eagles, although on second thoughts a firmer tone was imparted to the market on Thursday. Attock recovered part of their early gain, after a sharp reaction on Tuesday. The outlook for oil shares is surveyed in a Note on page 531.

Activity in rubber shares continued at a low ebb. Lack of support was at first attributed to the failure of the commodity price to improve. But a subsequent brightening of the commodity outlook left the share market quite unmoved, wider considerations of international politics prevailing. The Far Eastern situation provoked a little public selling, declines—though general—being however quite small. In the tea shares market too there was a tendency to selling by the public. Shares thus offered were quickly absorbed by professionals, though the trend of the market was downward, Ceylon as well as Indian issues suffering.

The Kaffir market enjoyed a relatively good day on Monday.

The available reserve shows a decrease of 299,700 tons, compared with the previous year, the value being 0.4 dwt. lower, and the width 1·5 inches greater.

The full Report and Accounts (with Plan of Workings) may be obtained from the London Secretaries, A. MOIR & CO., 4 London-wall Buildings, E.C.2.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

(a) Interim dividend. (b) Final dividend. (c) Last two yearly dividends. (g) Includes a Special Jubilee bonus of 2½ per cent. free of tax. (n) Based on current annual dividend rate $2·00 per share. (m) Including bonus of 5% free of tax. (r) Calculated on basis of 18½ annas per share of Rs. 9. Taken at 16 annas to one rupee. (p) Annas per share. † Free of Income Tax. (‡v) Yield worked on a 35% basis. (s) Yield worked on a 16⅔% basis. (t) Special Jubilee bonus. (z) Highest price, 132/- and 25 per cent. dividend on old shares, before 50 per cent capital bonus. Yield at 25 per cent. = £6 0s. 0d.; at 16 per cent. = £3 16s. 0d. (u) Paid on £300,000 more capital than in preceding year.

(*Continued from page* 533)

The Venterspost development news stimulated interest in West Rand issues appreciably, though in other sections business was quiet, owing largely to the closing of the Johannesburg Stock Exchange for the Jewish New Year. The formation of the new West Vlakfontein was widely discussed, but did not stimulate activity in East Rand Consolidated. Despite the satisfactory nature of recent news and rumours, Tuesday's business was disappointingly quiet, and West Rand issues slipped back on profit-taking. Far from reviving in mid-week, business continued to slacken. The uncertain temper of the market is illustrated by the behaviour of De Beers on the interim dividend announcement. The price was naturally marked up somewhat, failed to attract buyers, reacted sharply and ended up unchanged. Response to the Roan Antelope dividend and bonus (discussed in a Note on page 532) was hardly more reasonable. A sharp advance was followed by an equally marked reaction, but in later sessions, when the news was better digested, Rhodesian copper shares generally were helped. Australians were neglected, though the Mount Morgan results gave a good impression.

NEW YORK STOCK EXCHANGE

Last week ended with signs of an improving tone due to professional covering and to better expectations for fourth quarter business. Monday of this week was Labour Day, with markets closed. Post-holiday headaches became general on Tuesday when the level of stock prices fell severely to below the low level of last June. The market feared the outbreak of war in Europe following the exchange of accusations between Russia and Italy. It also found cause for domestic pessimism in the estimated reduction of 12·5 per cent. in steel mill activity for the current week—a greater drop than could be accounted for by the holiday. The decline affected the whole market; U.S. steel fell below the 100 mark, and the biggest drop was recorded by Chase with a fall of 14 points. In mid-week the market steadied itself, fears of war began to die down, and prices became firmer although a strong rally was not yet expected. There were slight gains or losses among the leading steels and industrials, but Harvesters lost 3 points and Allied Chemical 11 points. Oils and rails fell slightly. The bond market was weak for speculative issues, and government bonds were irregular.

TEMPLE BAR — 600 super feet **OFFICE SPACE** available on First Floor of thoroughly Modern Building. Perfectly quiet. Central Heating, Lifts, Uniformed Porters. RESTAURANT and Lounge.

SHORTER COMPANY COMMENTS

APPOINTMENTS AND PERSONAL

Mr P. Hawes has been appointed secretary of Abdulla and Company, Ltd.

Mr Eric Macfadyen has been elected a director of Dennistown Rubber Estates, Ltd.

MISCELLANEOUS

CERTIFIED ACCOUNTANTS.—The next examinations of the London Association of Certified Accountants will be held on December 7th, 8th and 9th in Belfast, Birmingham, Bristol, Cardiff, Cork, Dublin, Edinburgh, Glasgow, Hull, Leeds, Liverpool, London, Manchester, Newcastle-on-Tyne, Nottingham, Plymouth and Sheffield. Women are eligible upon the same terms as men. Particulars are obtainable at the offices : 50 Bedford Square, London, W.C.1.

FOREIGN GOVERNMENT BOND TRUST.—Progress report, March to September, 1937, shows that present half-yearly payment of 5.60d. tax free per bond-unit is at annual rate of £6 4s. gross per cent., and compares with an average of £5 19s. 6d. in the first three years. The past half-year has seen disturbances in the foreign bond market of a more serious nature than in any previous half-year of the Trust's existence.

TRUST OF BANK SHARES.—Progress report No. 3 shows a total net distribution since inception of the Trust of 11.6444d. for 20 months, equivalent to £4 1s. 9d. gross per annum. It is estimated that the gross yield for the current year will again exceed four per cent.

VENTERSPOST GOLD MINING COMPANY.—The crosscut East on 4th level No. 1 Shaft has exposed two payable reefs 6 feet apart, namely, the Ventersdorp contact reef, which sampled over 16 sections, averaged 71.7 dwts. over 6.4 inches reef width, equivalent to 15.3 dwts. over estimated 30 inches stoping width ; and an upper reef of the main reef group which, owing to faulting, is not fully exposed, and could only be sampled over 3 complete sections which averaged 5.2 dwts. over 48 inches. In a statement dated September 8th, the company announce the intersection in No. 2 Shaft of a reef with large pebbles at a depth of 2,770 feet. It is considered that the section so far exposed, consisting of 9 inches of compact reef, represents the top band of the Main Reef.

UNIT TRUST CHANGES.—Variations have been made to the trust deeds of the Trust of Bank Shares and the Trust of Bank and Insurance Shares. The half-yearly remuneration charge payable to managers has been reduced from 1-16th to 1-20th of 1 per cent. of market value of the trust fund and has been made chargeable against the trust fund capital instead of against income of the fund as hitherto. Rights may now be exercised by cash investment ; hitherto rights have been sold.

VAUGHAN BROTHERS (DROP FORGINGS), LTD.—First report for year to June 30, 1937, shows profit of £43,475 after depreciation. To reserve, £19,640. For taxation, £6,000. Ordinary dividend 10 per cent., absorbing £12,133. Carry forward £5,640. Stocks and work in progress stand at £34,324. Debtors, £34,097. Cash and War Loan £44,022.

ANGOLA DIAMOND COMPANY.—The accounts for 1936 show a net profit of £139,268—a fall of £483. After £13,077 to legal reserve, there remains £126,191, which, with £14,409 brought in, makes a total of £140,600. Ordinary dividend is maintained at 6¼ per cent., carry forward £1,191 higher at £15,600.

WHITWORTH AND MITCHELL.—Trading profits increased by £8,188 to £65,471 during the year ended June 30, 1937. Income from investments making the total £71,010, against £62,825. Ordinary dividend for year, 6, against 4¼ per cent. Carry forward, £3,821 higher at £9,183. Stocks are reduced by £8,449 to £192,761. Debtors are lower by £9,851 at £208,884. Cash is £55,462 higher at £142,101.

MOUNT MORGAN.—Report for year to June 30, 1937, shows a surplus of £143,043, an increase of £38,082. Dividend paid in July, 1936, of 4½d. per 2s. 6d. share, absorbed £40,333. To removal of overburden reserve £14,386, against nil. To employees' fund, £3,025. Carry forward £126,793, an increase of £85,299.

WILLIAM McEWAN AND COMPANY.—Profits (after contingencies) for year to June 30, 1937, amounted to £107,443, an increase of £18,340 over previous year. Ordinary dividend raised from 11¼ to 13½ per cent. To reduction of goodwill £15,000, against £7,357. Carry forward reduced by £2,057 to £70,688.

WEST VLAKFONTEIN GOLD MINING COMPANY, LTD.—This company has been registered in Johannesburg. Capital, £2,350,000 sterling, in 2s. 6d. shares. The directors include Mr H. G. Latilla and Sir Abe Bailey. Cash consideration payable to East Rand Consolidated is £335,000, and to Anglo-Transvaal Consolidated Investment Company, £15,000. Upon receipt of cash payment the companies will take at par in cash 2,680,000 and 120,000 shares respectively."

BRISTOL UNITED BREWERIES.—This company is acquiring the Charlton Brewery Company, of Shepton Mallett, on a share for share basis. This involves an issue of 75,080 United shares.

EDMUNDSONS ELECTRICITY CORPORATION.—The results of the group's operations during August, 1937, as compared with August, 1936, show an increase of 16 per cent. of units sold.

MATCHLESS MOTOR CYCLES (COLLIERS) LTD.—This company has acquired as from August 31, 1937, the "Sunbeam" Motor Cycle and Pedal Bicycle business carried on at Wolverhampton by John Marston, Ltd. It is proposed to change the name of the company to Associated Motor Cycles, Ltd.

COMPANY MEETING

EAGLEHURST RUBBER ESTATES, LIMITED

IMPROVEMENT IN RESULTS

The eleventh annual general meeting of the Eaglehurst Rubber Estates, Limited, was held, on the 8th instant, at Winchester House, London.

Mr P. J. Burgess, who presided, said that the results of the past financial year ending March 31, 1937, were reasonably satisfactory, the rate of profit carned on the mature area being well over £4 per acre. The improvement in results over the previous year was due to the better price realised for rubber, which was 2.68d. higher. The crops harvested and sold were nearly the same as in the previous year, and in spite of the consistent and general increase in costs of labour and material, the estate expenditure was within £100 of that of a year ago.

The profit carried to the balance sheet was £4,382, which, with the amount brought in of £1,452, gave a total of £5,834 to deal with. A dividend of 4 per cent., less tax, was recommended for distribution, the balance of £1,834 to be carried forward. The cash position was reasonably secure with rather more than £10 per planted acre. The board wished to see that further strengthened to meet the eventual obsolescence of their older areas by replanting. Some replanting was carried out in 1932 and 1934. The experience gained had shown that the soil of their older areas, with the use of indicated manures, was suitable for replanting rubber and a more comprehensive programme had now been agreed covering selected areas in all the three divisions comprising the property.

It was proposed to deal with 101 acres in 1937 and 88 acres in 1938, and operations for the current year's programme had now commenced. The effect of cutting out that considerable proportion of the older rubber would be felt during the next few years in the crop they were able to harvest, but the board were quite definitely of the opinion that it was in the real interests of the company not to put off any longer that rejuvenation of the property and the replacement of rather poor rubber by modern high-yielding and economically much more profitable material.

General conditions on the estate had been satisfactory and the properties were reported as being generally in good order.

The report was unanimously adopted.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the week ended September 4, 1937, amounted to £13,306,000, against ordinary expenditure of £22,009,500. After decreasing Exchequer Balances by £640,652 the operations for the week, as shown below, increased the gross National Debt by £10,043,000, to about £8,002 millions.†

THE BANK OF LONDON AND SOUTH AMERICA, LTD., has received telegraphic advice from the Valencia Branch that the gold surcharge for payment of Spanish customs duties has been fixed for the period September 1st to 10th at 180·69 per cent. The previous rate was fixed as from August 21st at 171·36 per cent.

Overseas bank rates and exchange rates for South Africa, Central and South America and Australasia appeared in last week's issue of *The Economist*.

GOLD AND SILVER

The following statistics of imports and exports of gold and silver for the week ended September 9, 1937, are issued by the Statistical Department of H.M. Customs and Excise.

No gold movements were reported at the Bank of England between September 3rd and 9th. Details of previous movements appeared in last week's issue of *The Economist*.

GOLD MARKET

Messrs Samuel Montagu and Company write on September 8, 1937:—The Bank of England gold reserve against notes amounted to £326,406,625 on September 1st showing no change as compared with August 25th.

In the open market about £1,500,000 of bar gold was available at the daily fixing during the week and was mostly taken for shipment to America. Owing to the firmer tendency of the dollar the price showed an advance, but continued to rule at about dollar parity.

The s.s. "Rajputana," which sailed from Bombay on September 4th, carried gold to the value of about £265,000.

SILVER MARKET

As the result of continued American support and of greater reluctance on the part of sellers, prices continued almost daily upon the upward trend, quotations on September 7th reaching 19 11/16d. for both deliveries, as compared with 19½d. for cash and 19 11/16d. for forward on September 1st. Indian operators have shown signs of regained confidence and, whilst they have worked both ways during the past week, sales have probably represented the liquidation of purchases made recently at lower prices.

At September 8th level of 19 11/16d. for cash and 19⅞d. for forward, quotations are very close to the American price parity and there would seem little to justify the expectation of any wide movement in either direction.

Quotations for gold and silver are shown below:—

1937	Price of Gold per Fine Ounce	Equivalent Value of £ sterling	Price of Bar Silver in London per ounce standard: Cash	Price of Bar Silver in London per ounce standard: Two Months	Price of Silver New York per ounce ·999 fine

Yorkshire Amalgamated Products					

(s) Paid on a larger capital. ‡ Free of income tax.
(v) Also 200 per cent. scrip bonus.
(t) Paid on £2,030,000 ordinary stock, against £1,690,616 ordinary stock a year ago.

BOLSOVER COLLIERY.—Interim dividend increased from 3 to 4 per cent.

CANADIAN CELANESE.—Dividend 40 cents per share on common stock, as before.

CELANESE CORPORATION OF AMERICA.—Common stock dividend, 75 cents per share for quarter to September 30, 1937, making $2·25 for 9 months to date, compared with $1·50 for whole of 1936.

DE BEERS CONSOLIDATED MINES.—Interim dividend 30 per cent. on deferred shares to holders on September 30th in respect of year 1937. First dividend since the 10 per cent. final dividend for year to June 30, 1929.

FOREIGN GOVERNMENT BOND TRUST.—Half-yearly payment of 5.60d. per bond-unit, free of tax.

GENERAL MINING AND FINANCE.—Interim dividend maintained at 10 per cent.

HOOVER, LTD.—A first interim dividend of 5 per cent. is payable.

IMPORTANT TIN DIVIDENDS.—Southern Tronoh Tin are increasing their interim dividend by 7½ per cent. to 10 per cent. and Kinta by 7½ per cent. to 12½ per cent. Tronoh's rate is 15 per cent., against 10 per cent. Sungei Besi Mines have increased their interim dividend from 12½ per cent. to 21½ per cent., and Kramat Pulai from 15 per cent. to 25 per cent. Ayer Hitam Tin interim increased from 5 to 30 per cent.

JAYS, LTD.—Interim dividends resumed on 5½ per cent. cumulative preference shares with a payment of 2¾ per cent. for half year to July 31, 1937. The last interim preference dividend was paid in September, 1930.

NORTH'S NAVIGATION COLLIERIES.—Interim ordinary dividend, 2½ per cent. This is the first dividend declared since 2½ per cent. was paid for 1924.

NUNNERY COLLIERY.—Interim ordinary dividend of 3 per cent. on an increased capital, against no interim dividend a year ago.

R. & W. HAWTHORN LESLIE AND COMPANY.—Ordinary dividend increased from 6 to 9 per cent. for year to June 30, 1937.

ROAN ANTELOPE COPPER MINES.—Final ordinary dividend 50 per cent., making 80 per cent. for year against 30 per cent. £3,327,390 from reserve is to be capitalised to pay a scrip bonus of 200 per cent.

SELANGOR RIVER RUBBER.—First interim dividend 3 per cent.

STOTHERT AND PITT.—For year to June 30, 1937, dividend of 10 per cent. and cash bonus of 2½ per cent., against 7½ per cent. for 1935-36. The latest dividend is paid on £250,000 capital against £191,585. Profits rose from £34,726 to £65,218.

TRUST OF BANK SHARES.—Third distribution will be at rate of 3.3326d. free of income tax.

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

WHILE price movements on the markets in primary products were again irregular, the tendency of quotations was generally firmer.

Among non-ferrous metals, for example, copper, lead and spelter showed a rise in price on the week, but tin was slightly cheaper. At its meeting on Thursday, the International Tin Committee decided to leave the quota of the restricting countries unchanged during the fourth quarter of this year. Chinese antimony and wolfram remained firm, the latter registering a further advance on a strong demand, due to fears of the possibility of a reduction in China's exports as a result of the Sino-Japanese conflict. Quotations for iron and steel materials remained unchanged, but house coal lists were revised upwards last week.

The increase in the United States Government's cotton crop forecast was anticipated, and quotations actually show a slight rise on the week. Wool prices at Australian selling centres showed a sagging tendency, as a result of which Bradford quotations were lowered. During the fifth series of London wool auctions, which begin next Tuesday, 80,200 bales will be offered, against 100,500 during the corresponding auctions last year. Raw jute was slightly dearer, though the official forecast of India's crop is considerably below private estimates. A revival of the demand for rubber has caused an increase in prices. Vegetable oils and oilseeds are scarcely changed in price this week.

Among foodstuffs, wheat staged a recovery, Liverpool "December" futures advancing from 8s. 4½d. per cental to 8s. 10⅝d. per cental. Raw sugar and tea were also firmer, but beef was marked down in price at Smithfield market.

In the United States, too, quotations for many primary products showed a rising tendency. Moody's index (December 31, 1931 =100) of staple commodity prices rose from 192·9 to 194·9 during the week ended last Wednesday, compared with 208·1 a month ago and 185·7 on the corresponding day last year.

COAL

CARDIFF.—The Cardiff coal market remains firm. Shipments last week in the foreign and coastwise trades totalled 458,800 tons, compared with 388,600 tons the previous week, and 334,555 tons in the corresponding period last year. This week the tonnage position has been exceptionally favourable. At some of the docks, particularly at Swansea, vessels are waiting their turn at the loading berths. Current sales are not very substantial, but the collieries are under heavy contract commitments, and it is anticipated that the Central Council will readily acquiesce in the application for an additional quota of 750,000 tons. There has been a slight increase in the stocks of large coal, but in smalls, particularly washed and sized classes, the supply is still very restricted. There is also a scarcity of coke. Prices for all classes of fuel are very firm, but nominally unchanged.

NEWCASTLE-ON-TYNE.—Shipments from the Tyne last week totalled 285,574 tons, an increase of 18,660 tons compared with the same week last year, bringing the total increase so far this year over the corresponding period of 1936 to 350,000 tons. This is not considered a particularly great improvement in view of the more active conditions in the coal trade on the North East in comparison with last year, and goes to prove that the strength of the market is dependent on inland trade. Northumberland steam collieries are working regularly, but tonnage is difficult, thus making prompt cargoes of screened coal available. The Durham section is firm, coking coals being as scarce as ever.

SHEFFIELD.—The decision of the Co-ordinating Committee, which has jurisdiction over the coalfields of South and West Yorkshire, Derbyshire, Notts, South Staffs and Leicestershire, to advance pithead prices for household coal by about 2s. a ton above summer prices from September 1st has caused a good deal of surprise, as it compares with an advance of 1s. 8d. per ton a year ago. Some collieries, however, have advised advances of 2s. 6d. per ton. It is reported that some Yorkshire dealers have made a protest, urging that it is impossible to pass on the whole of the advance. There is a big demand for best hard steam coal and for all grades of industrial fuel. Most qualities are fully taken up, stocks being rather light as a sequel to recent disputes at pits. Smalls are scarce and insufficient to meet the growing demand from coke and brick works and electricity generating stations.

On the export market there is some difficulty in meeting the full demand, and prices are very firm.

GLASGOW.—Stringency in regard to the shipping position has had a hampering effect on trade in some directions, chiefly from the East coast ports where the collieries have shaven their prices in one or two cases to keep stocks moving. The Lanarkshire and Ayrshire collieries are, however, experiencing no trouble in effecting a full clearance of output. Industrial demand generally remains brisk. In the export section there is a lull in new buying for the moment, as many consumers are already fully booked for a month or two ahead. Steam sorts and most sizes of nuts are now available for prompt or early delivery from the East coast districts. Apart from a slight shaving in these cases prices remain firm all round.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates that since the beginning of the month there has been a marked revival in the activity of the iron and steel trades. In practically all departments consumers are pressing for supplies and in many cases would be prepared to place orders for execution well into next year. It is by no means easy, however, to find manufacturers in a position to accept new business owing to the heavy tonnages already upon their books and to a natural disinclination to undertake far forward commitments.

In the pig iron market the demand for foundry iron is well maintained and although the usual autumn increase in demand has not made itself felt in some departments this has been more than counter-balanced by the increased requirements of other sections of the consuming industries. Supplies of basic and hematite iron for the time being seem sufficient to meet the needs of the steel makers.

In the semi-finished steel section of the market demand remains in excess of supply, but the conditions are better than those ruling a few months ago. More regular supplies are being received from British producers and some improvement is noticeable in imports of Continental steel.

Great activity prevails in the finished steel section of the market and steelmakers are concentrating upon supplying urgently required material. There is still great difficulty in placing new business for delivery this year. The export demand appears to be broadening but only a proportion can be accepted owing to the necessity of meeting the heavy home trade requirements.

MIDDLESBROUGH.—The demand for all grades of pig iron is well maintained, and makers are doing their utmost to keep pace with orders booked some time ago. Supplies of Cleveland foundry iron to home users are heavier than for some time, and a shipment of about 840 tons of this iron has also been made to Grangemouth this month. The output of East Coast hematite is larger, and after supplying their own requirements, makers are able to keep home users well supplied, in addition to releasing parcels for shipment abroad. During the last few days, shipments have been made to Finland, Germany and Lithuania. Total shipments of pig iron from the Tees from September 1st to 7th amounted to 4,514 tons, against 2,122 tons during the first week of August. The whole of the make of basic iron is required for steelworks' purposes, and there is none on offer. It is reported that a cargo of about 7,000 tons of pig iron is on the way to the Tees from a Canadian port. Prices remain at the official minimum figures, namely, 101s. per ton for No 3 Cleveland foundry pig iron delivered locally, whilst No. 1 East Coast hematite is 123s. per ton delivered locally, less the rebate of 5s.

Steel production continues at a very high level, with demand for all classes of material considerably exceeding the supply. Priority is given to orders for special requirements. Re-rollers are obtaining a regular supply of semi-manufactured steel from local producers but are demanding supplies of imported material. Sheet makers are particularly busy. In all departments there are buyers who are prepared to contract into next year, but under existing conditions makers are not prepared to book too far ahead.

Heavy melting steel scrap continues in short supply and makers readily take any quantities available from local merchants at the official prices. The price of good Durham blast furnace coke is well maintained at 40s. per ton, delivered at the furnaces. Foreign ore arrivals continue to be satisfactory and the first cargo from Bilbao since shipments were resumed is due in the Tees immediately.

SHEFFIELD.—Business in the iron and steel market is at a high level. Consumers are anxious to place orders, but producers are so fully booked that it is impossible to meet in full all the demands made upon them. Both forge and foundry iron are in heavy request, but beyond renewal contracts there is not much doing, makers having little or nothing for current disposal. Deliveries are on a somewhat better scale, but everything goes into immediate consumption, and any accumulation of stocks at works is out of the question. In hematite the position is rather easier so far as East Coast material is concerned, but West Coast business is difficult to negotiate. Finished iron makers are hampered by inadequate supplies of materials, and in consequence are not inclined to add heavily to their order books. Demand for basic steel billets is as insistent as ever, and producers, being booked well forward, are disinclined to add further to their orders for the present. Business in wire rods shows no sign of slackening, and there is a record demand for stainless steel sheets. High-speed steel quotations are moving up in consequence of the mounting price of tungsten. Wolfram now costs £6 per unit and antimony £70 per ton.

In the scrap market there is less anxiety concerning supplies of steel material. Most classes sell freely at controlled prices. Iron scrap not price-controlled is keenly sought. Heavy foundry cast iron costs 92s. 6d. per ton and heavy steelworks cast iron is 67s. 6d.

CARDIFF.—Production in the tinplate industry is being maintained at approximately 77 per cent. of capacity, and the orders at present in hand are estimated to cover about 6 million boxes. Prices are firm but unchanged. Shipments of tinplates at Swansea last week totalled 5,402 tons, compared with 5,719 tons the previous week, and 10,012 tons at the corresponding week last year; and as there was an increase of about 1,400 tons in the deliveries into warehouse, stocks have increased to 9,074 tons, against 5,577 tons the previous week. Galvanised sheets are steady, but comparatively quiet for export, but there is an expanding demand for black sheets. There may be increased shipments of these to Australia in view of the reduction in the Dominion import duties. The steel and blast furnaces continue to be fully employed.

GLASGOW.—All branches of the iron and steel industry in the West of Scotland are now exceedingly busy. Steel makers are still able to keep plant working to capacity although supplies of raw materials continue to give cause for anxiety. They have an enormous amount of work on hand and are unable to give promise of delivery this year for a number of sections. Supplies of material for re-rollers and sheet makers show some improvement and production has been increased in several directions, but not sufficiently to provide regular employment for all the available plant. All branches of the engineering trades and other steel consumers are making heavy demands on the various producers and there is no decline in the amount of new business on offer.

OTHER METALS

COPPER.—After turning easier in the first part of the week ended Wednesday, the copper market staged a sharp recovery and closed the week at £56 11s. 3d., a net gain of £1 5s. The contango, which amounted to 5s. a week ago, has disappeared, and on Wednesday both cash and forward copper were traded at the same price. The recovery was mainly due to some demand for armament purchases. The Japanese Government is believed to have purchased a substantial tonnage of the red metal. Nevertheless, the daily turnover at the London Metal Exchange was by no means large, and unless consumers come in for support the recent gains may not be held for a longer period. Home warehouse stocks declined last week by 1,353 tons to 22,196 tons as a result of the removal of a large quantity of refined metal into consumers' stores. Canada has published its official production figure for the first half of this year. It is 121,960 short tons, against 102,984 short tons a year ago, an increase which is particularly satisfactory, as Canada did not take part in the restriction scheme and thus produced at a record rate already last year. The United States' market continued uninteresting. Domestic business in America was not affected by the revival of the London market.

Sales on the London Metal Exchange: 850 tons on Monday, against 1,500 tons last week; 1,550 tons on Tuesday, against 1,350 tons last week; 1,700 tons on Wednesday, against 1,700 tons last week. Domestic spot was quoted at 13·62½ cents per lb. in New York on Wednesday, against 13·57½ cents a week ago and 14·40 cents a month ago. Wednesday's

official closing price for standard cash in London was £56 11s. 3d. to £56 12s. 6d. per ton, compared with £55 6s. 3d. to £55 7s. 6d. a week ago. Stocks of refined copper in British official warehouses at the end of last week at 9,855 tons, showed a decrease of 1,753 tons, while stocks of rough copper, at 12,341 tons, were 400 tons larger.

LEAD AND SPELTER.—Both metals moved more or less in sympathy with copper. Lead gained 11s. 3d. per ton, closing at £22 6s. 3d., while spelter improved by 7s. 6d. to £23 3s. 9d. There was some consumption demand, but it was not on a scale which would justify hopes of major improvements in prices during the next few days. Both markets are comparatively vulnerable in view of the rising output and the reserve by consumers. However, as the speculative accounts have been liquidated during the past few weeks, the technical position has improved considerably, and sudden deteriorations in quotations are no longer believed likely.

Sales of lead on the London Metal Exchange: 1,350 tons on Monday, against 900 tons last week; 1,250 tons on Tuesday, against 900 tons last week; 1,150 tons on Wednesday, against 2,500 tons last week. The New York quotation on Wednesday was 6·50 cents per lb., against 6·50 cents a week ago and 6·50 cents a month ago. Wednesday's official closing quotation in London for soft foreign for shipment during the current month was £22 6s. 3d. to £22 8s. 9d. per ton, compared with £21 15s. to £21 16s. 3d. last week.

Sales of spelter on the London Metal Exchange: 550 tons on Monday, against 700 tons last week; 750 tons on Tuesday, against 1,250 tons last week; 1,250 tons on Wednesday, against 1,300 tons last week. Wednesday's quotation in East St. Louis was 7·25 cents per lb., against 7·25 cents the week before and 7·25 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £23 3s 9d. to £23 5s. per ton, against £22 16s. 3d. to £22 17s. 6d. last week.

TIN.—The tin market was very quiet with daily turnovers on the London Metal Exchange below normal. The cash price closed at £260 10s. per ton., a loss of £1 5s. on the week. The outstanding event of the week was the meeting of the I.T.C., which was held on Thursday, and decided to leave the quota for the fourth quarter of 1937 unchanged at 110 per cent. of standard tonnages.

Sales of tin on the London Metal Exchange: 175 tons on Monday, against 175 tons last week; 150 tons on Tuesday, against 150 tons last week; 205 tons on Wednesday, against 165 tons last week. The New York quotation on Wednesday was 58·75 cents per lb., against 58·50 cents a week ago and 59·62½ cents a month ago. Wednesday's official closing quotation in London for standard cash was £260 10s. to £261 per ton, compared with £261 15s. to £262 a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 2,781 tons, an increase of 209 tons on the week.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted on Wednesday at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was quoted at £13 12s. to £13 12s. 6d. per flask of 76 lbs., the same as last week. Chinese antimony was quoted at £80 to £82 per ton, ex warehouse, the same as last week. Chinese wolfram for "September–October" shipment was quoted at 120s. to 130s. per unit, c.i.f., compared with 105s. to 110s. last week. Refined platinum was quoted on Wednesday at £10 5s. per ounce, compared with £10 5s. a week earlier.

TEXTILES

COTTON.—Manchester.—Unsettlement has continued to prevail in trading circles. Foreign political news has had a rather depressing influence and many merchants have not been in the mood to commit themselves to important contracts. In the raw cotton markets, chief attention has been centred on the American Government Statistics relating to the crop. A little more trade support has been experienced in Liverpool and New York, but any tendency for prices to advance has been checked by hedge selling. Many farmers in the Southern States are very dissatisfied with the promised assistance from the Government, but it is not likely that the officials at Washington will alter the terms of the loan and subsidy. The weather in the belt since the beginning of September has been rather less favourable, especially in the Eastern section.

The yarn market has been very firm. Fair weights have been booked in American counts. There has again been much pressure for the delivery of medium wefts. Users have been prepared to pay a premium for quick delivery. Certain Egyptian spinners have secured a few more orders.

The increased inquiry on the cloth market has been maintained and rather more business has been done. Manufacturers, however, have not met with much encouragement from India, and only scattered sales have been arranged, most of the buying being in printed and dyed sorts for Bombay and up-country. Some useful orders have been obtained in finishing styles for the Straits Settlements. The news with regard to the quota system in Ceylon has been much discussed, and the new conditions may affect Lancashire very adversely. Poplins have moved off fairly well for South America. There have been signs of a little more activity in muslins for Switzerland. Some speculative buying has been reported in standard makes for the home trade.

AMERICAN COTTON CROP.—On Wednesday last the Department of Agriculture of the United States Government published important statistics relating to the cotton crop for this season. The indicated total production was given as 16,098,000 bales, against 15,593,000 bales a month earlier. The increase of half a million bales was more than expected, with the result that prices declined to the extent of about 10 points in Liverpool and 20 points in New York. A feature of the report was the big production per acre of 228·5 lb., against 223·3 lb. at the beginning of August. On the other hand, the condition of the crop was given at 75·0 per cent., compared with 81·3 per cent. a month ago. It was announced that the area under cultivation abandoned was 1·3 per cent., bringing the total for harvest to 33,736,000 acres. The ginnings were given as 1,871,000 bales, against 515,000 bales a fortnight earlier, and 1,374,000 bales a year ago. There seems to be little probability of higher prices in the near future, especially in view of the fact that hedge selling is bound to be a factor during the next few weeks. The loan and subsidy to farmers will probably prevent any decided decline, but it is doubtful whether buyers of yarn and cloth in Lancashire will be in any hurry to place large lines with spinners and manufacturers. Fortunately, producers, especially in the American spinning section, have encouraging order lists and it is usual for a revival of demand to be experienced in the autumn of each year. Prices of American cotton are now lower than at any time since early in 1934.

JUTE.—Dundee.—According to the district returns, the final forecast of the jute crop is 8,617,700 bales, which compares with the final forecast of last year of 8,735,700 bales. The Director of Agriculture has revised these latter figures to 9,636,000 bales, but the crop actually yielded 10,700,000 bales, or two million bales more than the forecast. The trade is giving little or no consideration to the present figures, which are about three million bales less than the world will require this season, and it is expected that the Director has made an error this season, not of two million bales, as last season, but three million bales. Private estimates of the crop this season declare that the out-turn will be nearly twelve million bales. It is rather significant that raw jute prices declined by 5s. to 7s. 6d. per ton on Tuesday when the figures were issued. It is reported that the crop is growing well under favourable conditions. The estimated stocks of jute throughout the world are 6,250,000 bales, 4,400,000 of which are in India, the mills there alone having 3,600,000 bales.

The full group of Daisee 2/3 has reverted to £20 5s. after being up to £20 10s., with fours quoted at £19 and Tossa 2/3 at £21 3s. 9d. and fours at £20 5s., October/November. There are not many offers being made of white jute, and First Marks are nominal at £23, with Lightnings quoted at £21 15s., and Hearts at £20 15s., September/October. Spinners are still inclined to hold off in anticipation of lower rates.

Jute yarns are quiet, but firm, common 8 lb. cops being quoted at 2s. 1d. and 8 lb. spools at 2s. 2d. Buyers are not keen to pay these higher prices, after purchasing fairly freely at 2s. and 2s. 1d., respectively. Twist is firm at from 3¼d. to 4d. for 3 ply 8 lb., and sacking yarns are in some demand at from 2⅞d. for 24 lb. weft and 3¼d. for 8 lb. chains. Rove is quiet, but firm, at from £21 for 48 lb., and £17 5s. to £17 10s. for 200 lb., while the Rio 2s. 5½d. for third and 2s. 3½d. for fourth. Carpet yarns have been freely sold at from 3¾d. to 3⅞d. for 14 lb. warp.

Interest in jute cloth is still confined to moderate lots at from 2⅛d. for 10 oz. 40 in. and 2¼d. for 8 oz., though most manufacturers are now quoting ⅛d. more in each case. A fair inquiry prevails, but manufacturers find it difficult to establish any advance. Linoleum hessians are firm, but quiet, and heavy goods are in little demand.

Calcutta hessians have been fairly well maintained in price for some weeks past. They closed quiet at 17s. 9d. for 10 oz. 40 in. and 14s. 5d. for 8 oz., September, and 17s. 11d. and 14s. 7d. October/March. Liverpool twills are named at 48s. 7½d. and "B" twills at 42s. 10½d. September and 49s. 6d. and 43s. 7½d. October/December.

GRAIN MARKETS

WHEAT.—Chiefly because of the continuing deterioration of international relations wheat prices have been very firm this week. Increased Rumanian export bounties and the impending resumption of large Russian sales have had no depressing effects upon quotations.

On Wednesday last, "September" futures were quoted in Chicago at 108⅛ cents per bushel, against 104 cents the week before and 113⅛ cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba (Atlantic), ex ship, 52s. 6d. to 53s. 6d. per 496 lbs., against 51s. to 51s. 9d. last week; No. 2 Northern Manitoba (Atlantic), ex ship, 51s. to 51s. 6d., against 49s. to 49s. 9d. last week. According to the *Corn Trade News*, total shipments of wheat and flour last week amounted to 838,000 quarters, against 979,000 quarters in the previous week and 1,159,000 quarters in the corresponding week a year ago.

FLOUR.—Conditions in this market remain extremely quiet. Wednesday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 40s. per 280 lbs., as against 39s. a week ago; delivered inner London, 39s. 6d., as against 38s. 6d. a week ago. Manitoba patents, ex store, 38s. 9d. to 40s. 3d., as against 37s. 6d. to 39s. a week ago. Australian, ex store, 32s. to 32s. 6d., as against 32s. to 32s. 6d. a week ago.

BARLEY.—Trade has been good and Russian sales have increased considerably. "October" futures were quoted at 57½ cents per bushel in Winnipeg on Wednesday, as against 56¾ cents last week. Quotations per 448 lbs. in London on Wednesday were: "English feed," at farm, not quoted; "English malting" (new), at farm, 45s. to 65s., as against 60s. to 70s. a week ago; "Californian, ex ship, 50s. to 52s., as against 44s. to 58s. a week ago. Chilean, brewing, ex ship, 44s. to 48s., as against 44s. to 48s. a week ago.

OATS.—On Wednesday, "September" futures were quoted at 31⅛ cents a bushel in Chicago, against 28⅝ cents a week ago and 29¼ cents last month. Quotations in London, Wednesday: "English Black" (new), at farm, 25s. 6d. to 26s. 6d. per 336 lbs., as against 25s. to 26s. last week; "English White" (new), at farm, 25s. 6d. to 26s. 6d., as against 25s. 6d. a week ago; mixed Canadian feed (Vancouver), landed, 25s. 9d. per 320 lbs., as against 25s. a week ago.

MAIZE.—Good progress has been maintained in this market. "September" futures were quoted on Wednesday at 105¼ cents per bushel in Chicago, against 95⅜ cents a week ago, and 100¼ cents last month. Quotations in London, Wednesday: "Plate," landed, 29s. per 480 lbs., as against 28s. 3d. a week ago; "Plate," ex ship, 28s., as against 27s. 3d. a week ago; "Plate," "September," 28s., as against 27s. a week ago; yellow maize meal, ex wharf, was quoted at £7 7s. 6d. per ton, as against £7 5s. last week.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1935–1937:—

Nearest Future	Jan. 2, 1935	Dec. 31, 1935	Sept. 9, 1936	Dec. 30, 1936	Sept. 1, 1937	Sept. 8, 1937
Winnipeg (No. 1, Manitoba)—Cents per 60 lbs.	82⅞	84⅛	99	129	122⅛	129⅛
Chicago (No. 2, Winter)—Cents per 60 lbs.....	98⅜	101⅛	111⅛	135⅛	104	106⅛

The visible supply of wheat in Canada amounts to 49,764,000 bushels, against 38,379,000 bushels last week and 69,949,000 bushels in the corresponding week last year.

SALES AND PRICES OF BRITISH CEREALS.—The following table gives the estimated sale of home-grown wheat during the harvest years 1933–34 to 1936–37.

	1934–35	1935–36	1936–37	1937–38
Estimated sales of home-grown wheat—1 week to September 4	Cwts. 356,281	Cwts. 420,944	Cwts. 249,944	Cwts. 311,893
Average price of English wheat per cwt.	s. d. 5 2	s. d. 4 6	s. d. 7 3	s. d. 8 7

The following is a statement showing the quantities sold and the average price of British cereals in the past two weeks, and for the corresponding weeks in each of the years from 1933 to 1936:—

Week ended	Quantities Sold			Average Price per cwt.		
	Wheat	Barley	Oats	Wheat	Barley	Oats
	Cwts.	Cwts.	Cwts	s. d.	s. d.	s. d.
September 2, 1933 ...	346,869	295,398	42,986	4 10	11 0	5 3
September 1, 1934 ...	356,281	100,998	33,883	5 2	10 10	6 5
September 7, 1935 ...	420,944	212,810	53,889	4 6	10 0	6 0
September 5, 1936 ...	249,944	73,469	45,278	7 3	9 11	6 8
August 28, 1937	156,368	13,378	31,186	8 10	12 7	8 8
September 4, 1937 ...	311,893	33,498	43,620	8 7	12 10	8 6

OTHER FOODS

BACON.—Trade and prices have remained very steady throughout the week. The official quotations (per cwt. for No. 1 Sizable) which formed the basis for dealings on the London Provision Exchange this week, were: English, 101s.; Canadian, 94s.; Danish, 100s.; unchanged from the previous week. Arrivals in London last week included: Danish, 14,354 bales; Canadian, 8,480; Dutch, 2,534; Lithuanian, 1,467; and Polish, 3,336; as against 15,516, 5,611, 1,904, 1,305 and 3,352 bales, respectively, in the previous week.

BUTTER.—There have been no price changes in the week; trade is quiet. Quotations (per cwt.) on the London Provision Exchange on Wednesday were: New Zealand, finest salted, 116s.; Australian, choicest salted, 116s.; Danish, 132s.; compared with 116s., 116s., and 132s., respectively, a week ago.

CHEESE.—British cheeses have been in request, the rest of the market remaining quiet. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: English Cheddars, finest farmers, 88s. to 90s.; Canadian, finest coloured, 70s. to 71s.; and New Zealand, finest coloured, 70s.; against 88s. to 90s., 71s., and 70s. 6d. to 71s., respectively, a week ago.

COCOA.—New arrivals continue to be large, and the price of good fermented Accra has again declined. The spot quotation in New York on Wednesday was 8½ cents per lb., as against 8¾ cents per lb. last week. In London, on Wednesday last, good fermented new crop, Accra, "November–January," was quoted at 37s. sellers per 50 kilos., c.i.f. Continent, against 37s. 3d. a week ago. Last week's movements of cocoa in London were as follows: Landed, 1,104 bags; delivered, for home consumption, 4,596 bags; exported, 408 bags; stocks, 238,615 bags, against 167,570 bags a year ago.

COFFEE.—Little of note has occurred. Prices have risen fractionally. On Wednesday, Rio No. 7 (cash) was quoted at 9¼ cents per lb., in New York, as compared with 9 cents per lb. last week and 9¼ cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, 24 cwt.; delivered, for home consumption, 217 cwt.; exports, nil; stocks, 1,919 cwt., against 10,008 a year ago. Central and other South American: Landed, 361 cwt.; delivered, for home consumption, 1,875 cwt.; exported, 258 cwt.; stocks, 94,522 cwt., against 87,066 cwt. last year. Other kinds: Landed, 276 cwt.; delivered, for home consumption, 3,217 cwt.; exported, 536 cwt.; stocks, 91,193 cwt., against 127,701 last year.

EGGS.—Imported eggs are becoming more expensive. At Smithfield, on Wednesday, English (ordinary packing, Grade I, about 15–15½ lb.) realised 18s. to 18s. 6d. per 120, against 18s. to 18s. 6d. last week; while Danish (15½ lb.) made 13s. 3d. to 13s. 9d., as against 12s. 6d. to 13s. last week.

FRUIT.—The demand for apples is rising steadily. Bramley realise 6s. to 8s. a bushel, and cookers from 3s. 6d. to 5s. Among eating apples, Worcesters fetch 2s. 6d. to 4s., but the various grades of National Mark range from 10s. to 12s. per box. A short supply of Californian Gravenstein are selling well. Pears are also in request. Nuts and blackberries are going out in good quantities. South African oranges cost from 9s. to 15s. per box, a small supply raising prices. Among plums, best Victorias are being sold at 3s. to 3s. 6d. per 12 lbs. and Belle du Louvain 3s. 6d. to 4s. 6d. per half sieve. Greengages and damsons have risen in price.

MEAT.—At Smithfield market, on Wednesday last, Argentine chilled hindquarters were quoted at 4s. to 4s. 5d. per 8 lbs., as compared with 4s. 2d. to 4s. 6d. a week ago. New Zealand frozen mutton was 3s. 6d. to 4s. per 8 lbs., against 3s. 6d. to 4s. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 8,721 tons, an increase of 506 tons on the corresponding week last year. Beef and veal accounted for 4,784 tons, mutton and lamb 2,484, and pork and bacon 891, as compared with 4,302, 2,494 and 932 tons, respectively, in the same week of 1936.

PEPPER.—On Wednesday, white Muntok, "October–December," was quoted at 4¼d. per lb. sellers, c.i.f. Rotterdam–Hamburg, against 4¼d. per lb. for "August–October" a week earlier. Black Lampong, spot, in bond, was quoted at 3¼d. per lb., sellers, compared with 3¼d. per lb. last week. Movements of pepper in London last week were as follows: Black, landed, nil; delivered, 8 tons; stocks, 1,976, against 1,782 last year. White, landed, 14 tons; delivered, 21 tons; stocks, 11,392 tons, compared with 12,082 a year ago.

RICE.—The market is steady. The spot price of Burma No. 2 cleaned was 10s. 9d. per cwt., ex warehouse, on Wednesday, as compared with 10s. 9d. per cwt. a week ago. "September–October," in singles to Continent and U.K., was quoted at 9s. 9d. to 9s. 10½d. per cwt., against 9s. 9d. to 9s. 10½d. last week. Movements in London last week were as follows: Landed, 190 tons; delivered, 130 tons; stocks, 2,148 tons, against 1,532 a year ago.

SUGAR.—The downward trend of the last weeks has now been reversed. The New York spot quotation was 3·50 cents on Wednesday, as compared with 3·50 cents per lb. last week and 3·60 cents per lb. a month ago. Wednesday's sales of raw sugar in London included "December" delivery at 6s. 4d. to 6s. 5¾d., against 6s. 1¾d. to 6s. 3d. a week ago. Movements of raw sugar in public warehouses in London and Liverpool last week were as follows: Imports, 3,576 tons, against 7,428 in the previous week and 8,551 in the same week of 1936; deliveries, 16,847 tons, against 23,796 and 13,480 tons, respectively; stocks, 116,288 tons, against 129,559 and 110,039 tons, respectively.

TEA.—The following table shows the average price (compiled by the Tea Brokers' Association) of tea sold in Mincing Lane on Garden Account in recent weeks:—

Week ended	Northern India	Southern India	Ceylon	Java	Sumatra	Africa	Total
	d.	d.	d.	d.	d.	d.	d.
Sept. 3, 1936	15·13	12·19	13 39	10 88	10·19	11·76	13 86
Aug. 12, 1937	16·04	14·73	15·49	14·46	12·68	14·27	15·25
„ 19, „	17·55	14·88	15·55	14·53	12·79	14·36	16·22
„ 26, „	17·94	14·96	15·86	13·75	12·84	14·56	16·61
Sept. 2 „	16·97	14·88	16·03	15·12	13·09	14·32	16·27

At this week's public auctions in Mincing Lane, 46,255 packages of Indian and 22,324 packages of Ceylon tea came up for disposal. Demand has again been active at firm prices.

VEGETABLES.—A spate of tomatoes has caused a general fall in their prices, despite a good demand. Jersey fetch from 2s. to 2s. 6d. per doz. lb., and English and Guernsey from 2s. 6d. to 3s. Lettuce and green onions are in demand. Peas and runner beans have risen, by contrast with marrows and cabbages. Big arrivals and a weak demand have depressed potato prices and at the Borough on Saturday, King Edward ranged from 6s. to 7s. against 6s. to 7s. last week, while Eclipse and Majestic made from 4s. 6d. to 5s. as against 4s. 6d. to 5s. last week.

MISCELLANEOUS COMMODITIES

VEGETABLE OILS AND OILSEEDS.—Quiet and rather unsettled conditions prevail. On more favourable reports concerning the crop in Argentina prices of linseed having eased somewhat, but a steadying influence is the later firmness of wheat. There have been slight to moderate rains in some districts and hopes are entertained of more during the present month to enable sowing to be completed and seed already sown to shoot. Demand for linseed both here and on the Continent continues on very modest lines. Shipments from the River Plate last week were below average and smaller quantities are being sent to the United States, where the linseed harvest is in progress. Indian shipments show a tendency to expand, but the position is complicated by the scarcity of shipping room and high freight-rates which rendered forward business difficult to negotiate. The quantity of linseed afloat for Europe has increased to 117,000 tons, including 33,400 tons from India. The balance of the exportable surplus from Argentina continues to diminish and is now only around 250,000 tons Cotton seed has moved in sympathy with Alexandria, but little or no business appears to be passing at the lower figures now quoted; forward shipment is firmer. Vegetable oils are quiet and the downward trend for some varieties has not been entirely checked. Linseed oil has withstood the general weakness fairly well and has since recovered slightly and is out of line with soap making oils which are relatively cheaper. Cotton oil ex Hull was further marked down, Egyptian crude offering freely at £23 without attracting buyers. Refined oil is, as usual, quoted £3 per ton above crude. Trade in oilcakes is not so good, though prices are about maintained.

RUBBER.—Commercial buying has caused a jump in prices, but speculators are sitting very quiet. The spot price in New York on Wednesday was 19¼ cents per lb., compared with 18$\frac{15}{16}$ cents per lb. a week ago and 18⅜ cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 9$\frac{15}{16}$d. per lb., as against 8⅞d. on the corresponding day last week. In forward positions business has been done at 9$\frac{15}{16}$d. for "October" shipment, as against 8$\frac{15}{16}$d. a week ago. Stocks in London and Liverpool at the end of last week totalled 46,256 tons, against 45,250 tons a week earlier. A year ago stocks amounted to 108,093 tons.

Prologue to Policy

WHILE the Spanish tragedy and storm over Asia continue to command the attention of five continents, the domestic stage is being quietly set for the new political season. The full spate of advance publicity will not appear until the parties' conferences have been held and national campaigns have been inaugurated. Yet many of the chief actors have been busy. The Trades Union Congress has distributed their parts to the members of His Majesty's Opposition; and several of the Government cast have been touring the provinces.

With a new Parliamentary session barely five weeks away, the speeches of itinerant Ministers have already given some indication of the rôles they intend to play. This peep behind the scenes has only afforded a glimpse of events of secondary importance, but it gives perhaps some idea of the setting of the play.

The touring Ministers include THE SECRETARY OF STATE FOR HOME AFFAIRS, the MINISTER OF HEALTH and the MINISTER OF LABOUR; and their subject has been mainly the reform of details in administration. SIR SAMUEL HOARE has aptly expressed his zeal for prison reform by visiting Holloway, Pentonville, Wormwood Scrubs, and Dartmoor. MR ERNEST BROWN has toured South Wales, Lancashire, and the Midlands. SIR KINGSLEY WOOD has visited Cardiff and announced the details of an extended pensions' scheme for blind persons and contributory health insurance for workers under sixteen years of age.

The keynote of these pronouncements of policy was probably struck most aptly by the MINISTER OF LABOUR at Liverpool. Visiting the seamen's exchange, he wrote in the visitors' book: "Be of good cheer." Both in Lancashire and South Wales MR BROWN expressed the belief that we were now destined to enjoy "a year or two of betterment." In a time of recovery, he justly observes, it is possible to effect administrative reforms impossible in a period of depression. Moreover, these reforms are, in his view, now more concerned with the problems of employment and opportunities for work than with those of worklessness. Consequently, he has passed through the depressed areas of the West to examine, by consultation with administrators and employers, the *quality* of the remaining unemployed; to find help for the older people out of work and for the young people whom circumstances have given no chance to learn a trade; and to work out a satisfactory solution for the acute shortage of domestic servants. Similarly, SIR KINGSLEY WOOD'S forecast of an extended social policy was explicitly based upon the probable maintenance of current levels of economic activity for many months to come. In every case the reforms proposed have been administrative and qualitative. In almost every case a marked feature has been the recognition of the personal factor in social distress and maladjustment. And always the major premise has been prosperity.

No fair commentator could fail to welcome the instructive character of these pronouncements of policy. If SIR SAMUEL HOARE can purge the prisons of the last relics of an obsolete frightfulness; if SIR KINGSLEY WOOD can protect the health of young persons in the two dangerous years after leaving school; and if MR ERNEST BROWN can persuade employers to engage older workers on special conditions, young persons to undergo vocational

training willingly, and mistresses to raise the status of domestic service; if so, then definite progress will have been made in social and economic conditions.

Yet good though such measures are, they do not touch the main issue of our economic situation. It is not enough to set our house in order to-day. Thought must be taken for the days beyond the period covered by the comfortable words of MR BROWN. No one can assume the unlimited duration of prosperity. The cyclical nature of economic activity has long been established. The present world-wide regimentation of commerce, production and exchange has perhaps enhanced rather than diminished this tendency. Again, the boom is in too great measure based on the demand for armaments. Production has reached record levels. World trade has recovered astonishingly in a relatively short time. Although unemployment in this country still stands at 1,358,000, cyclical unemployment has practically disappeared. And, as yet, neither prices nor interest rates have given any signs that a slump is impending. But we need to know the answers to two questions before we can rest content with the latest pronouncements of official social policy. What steps does the Government propose to take when the slackening of the present boom begins? And what then will be the financial status of the social services, especially in view of the unfortunate but inevitable priority of armament expenditure?

The Government's replies to these questions may be satisfactory. They have been advised by MR KEYNES and the Oxford economists, by MR BEVIN and the Trades Union Congress, that the right course is to make preparation in advance for capital works to be set on foot on the approach of recession. The chorus has been so emphatic and unanimous that the Government may see the expediency of large-scale expenditure for social purposes when the tide does ultimately turn. But what will such a policy involve? It will mean embarking upon heavy expenditure of money, derived from higher taxation or increased borrowing, at a time when profits, production and employment are declining. This may demonstrably be the wisest and boldest course. But have we—have the National Government and their millions of supporters in the country—travelled so far from the fears and preoccupations of 1931? Such measures must be put into effect at a moment when the burden of taxation will be heavily felt and profits falling. Is it not to be feared that at such a time demands for retrenchment will be raised and the fear of adding to the burden of the debt in the ascendant?

Such fears are natural on a short view. But the certainty that they will arise is one of the strongest reasons for planning now a long-range programme and for inviting Parliament to think in more secular terms than has hitherto been our custom. It is inevitable that in the coming months the Government will be greatly preoccupied with foreign affairs. But the duty also lies upon it to deal with the state of affairs at home. If it will use this present breathing space to make a permanent contribution to the economic stability and well-being of the people, the session that is about to open may prove to be one of the most fruitful in the history of Parliament.

Nyon and After

THE action that was taken at Nyon last week-end and ratified on Wednesday by nine Mediterranean countries is welcome and commendable. The stand there taken against a tide of criminality that has been sweeping over the field of international affairs for half a dozen years past may turn out to be an historic event. The suppression of piracy was the first object of public welfare for which the sovereign States of the modern world consented to pool their resources and to act on the principle of international solidarity. It is one of the oldest rules of modern international law that it is the duty of any warship of any Power to protect any merchant ship of any Power against any piratical attack in any waters. (Our isolationists would do well to remember that.) If, at Nyon last week, this ancient international police regulation had been given up, on the plea that nowadays the piracy-business had been taken over by the Powers themselves, the last bulwark of international law and order would have been stove in by the welling wave of international anarchy.

A Tyrrhenian pirate had been captured by the naval patrols of ALEXANDER THE GREAT and was brought into the Macedonian war-lord's presence on the way to execution. He put the great man momentarily out of countenance by hissing out: "When I take a single cargo with my three galleys you call it piracy and put me to death if you catch me; but when you send 300 ships to steal an empire, they call you a hero and worship you as a god." To-day we are faced with piracy as an action of State.

If it is true that all piracy is a crime, it is no less true that all aggression is piracy. Now that we have acknowledged our duty to suppress piracy by force of arms, whoever the pirate may be, there is at least a glimmer of hope that we may learn in time to take the same line about every kind of aggression.

Here we have the criterion on which the Nyon Agreement is to be judged. How far has it translated into practice the principle that national armaments are to be used for the purpose of international police-work?

In the first place, all the non-territorial waters of the Mediterranean except for the Tyrrhenian Sea (which lies off the main international shipping-routes) are to be patrolled by the navies and air-forces of two Great Powers: France and the United Kingdom. In the second place, the Franco-British police patrol is not to limit its protective work to merchant-ships of French and British nationality. It is to protect merchant-ships of all non-Spanish flags against attacks by any submarines, "if such attack is contrary to the rules of international law as laid down by the London Naval Treaty of 1930." These rules prescribe that a submarine must not attack a merchant ship without warning, and that if, after due warning, it decides to send the merchant ship to the bottom, it must not do this without having made effective provision for the salvaging of the crew. Any submarine caught attacking merchantmen of any non-Spanish flag without complying with these rules is to be sunk by the Anglo-French naval patrol at sight; and the patrol ships are to deal in the same summary fashion with any submarine seen near an attacked ship in circumstances which "give valid ground for the belief that the submarine was guilty of the attack in question." Shipping is to keep to the main routes; aircraft are to assist the sixty French and British warships; and as the German and Italian warships have withdrawn from the former international naval supervision of Spanish coasts, all Spanish coasts will presumably be patrolled by the French and British warships.

So far so good. But exactly how far under the Nyon Agreement are the Anglo-French international police duties to extend? What, for example, is to happen if, under the guns of a French or British man-o'-war on patrol duty, a submarine hoists the flag of some Government (which may or may not be recognised by some or all of the now recognised Governments in the world), and if it then proceeds to send a non-French or non-British merchantman to the bottom in accordance with the accepted rules of submarine warfare? In these circumstances, is the international policeman to run up CAIN'S signal, "Am I my brother's keeper?" as the up-to-date substitute for NELSON'S "England expects every man to do his duty"? In trying to elucidate a point which the text of the Agreement leaves rather obscure, we must perhaps distinguish between Spanish naval flags and others. The nine parties to the Agreement expressly re-affirm that they do not intend any concession to either of the Spanish contestants of the right to exercise belligerent rights. Accordingly, if the attacking submarine hoists the flag of GENERAL FRANCO or (as is less probable) that of the legitimate Government of Spain, these colours are presumably to count as though they were just DAVY JONES'S private skull-and-cross-bones. In these circumstances, what action is the French or British warship to take? Is it still to sink the submarine as a private pirate? Or is it to stand by and let the submarine sink the, let us say, Greek merchant ship which it is attacking, on the ground that this is an act of war done in accordance with the rules of war, and that therefore it is the Greek Government's business to see to it? If the Agreement is obscure in this case, it is still more obscure on what the police ships should do if the submarine's flag were not Spanish but Italian.

It will be seen that, for non-French and non-British merchant ships in the Franco-British patrol zone, the certainty of protection is by no means complete; and the seven other signatories might even have cause to complain that they were hardly getting a *quid pro quo* for their own contribution to the security scheme. These seven States have undertaken to place their harbours and naval bases at the disposal of the Anglo-French patrol and to see to the policing of their own territorial waters—while the four Black Sea States have further undertaken the whole responsibility for dealing with any mischief in the Black Sea, if it should spread so far.

This element of uncertainty is a blemish. Yet, however faltering and reluctant the present steps of our British and French statesmen along the path of collective security, they are at any rate once more on the march, and their Russian colleagues have after all done nothing to hinder or embarrass them. While Russia has not demanded any share in the Mediterreanean patrol for herself, she has also not stood in the way of the British and French desire to invite Italy to participate. The invitation was duly sent, and the Tyrrhenian Sea reserved as a zone for Italy.

Italy's reply makes it clear that, as we pointed out last week, the precipitate Italo-German reaction to Russia's charges against Italy has left the two Fascist dictatorships isolated and in a quandary. The Italian reply, after Italy's hot refusal to touch the Nyon Conference, demands *ex post facto* complete equality of Powers with every signatory to the Nyon Agreement; it refuses to confine Italian activities to the Tyrrhenian Sea; and it grudgingly leaves open a loophole for collaboration at a later stage. The reply also harks back to discussion of the Nyon arrangement by the London Non-Intervention Committee, that theatre so well loved of Italy, Germany and Portugal. Italian and German newspapers have even been demanding that Portugal should now be included among the Mediterranean Powers. There is little doubt but that the solid Italo-German refusal to collaborate with Britain, France and the other Mediterranean and Black Sea Powers has, for the first time in years, resulted in the two Western democratic Great Powers calling the Italo-German bluff. They may have done it in absence of mind; or because Russia cunningly incited Italy and Germany to overreach themselves; or because the British and French were honestly persuaded that they must try to re-establish the rule of international law and order at the thirteenth hour. The result is that they have surprised none more than themselves in snatching back both the European initiative and the leadership of the smaller nations. We hope that they will now treat Germany and Italy with firmness and assurance and not deviate from the Nyon line. For the onus of responsibility for European affairs has now been placed on Italian and German shoulders.

Education and a Career—I

English Schools

THERE are as many definitions of the aims of education as there are explanations of the trade cycle; and where educationists are not in agreement it behoves economists to tread warily. But even the broadest descriptions of education's objectives have an indubitable economic element. "To live a complete life" presupposes, for most of us, the ability to earn a living. "Good citizenship" is a conception with which few existing Governments will quarrel; but it is the duty of a good citizen to pay his taxes.

Admittedly, to turn out able fitters, furriers, factory managers and foreign secretaries is far from being the whole aim of any liberal system of education; but in this context the greater purpose includes the less. Finally—as most parents know whose children are now on the threshold of another year in their school career—education costs money. Indeed it is one of the biggest, and certainly the most productive, of all our social services, on which parents, guardians, local authorities and the State expend many millions every year.

A few figures may serve to suggest the present scale of *official* payments for educational services. In 1934-35 some £87.5 millions were spent from rates and taxes on all kinds of education in England and Wales—an amount equivalent to over two guineas per head of the entire population, or approximately £6 10s. per member under 21 years of age. About 5½ million children received free education in elementary schools at a cost per child of £14. The cost of secondary education was £25 per child; and, out of 456,783 pupils, 215,759 were educated free. In 276 of 1,380 grant-aided secondary schools, approved free places were one hundred per cent. of the whole.

Expenditure on school education, however, by no means ends here. Parents and guardians are responsible for the clothing and maintenance of children at school. And even in the grant-aided secondary schools, there were 219,431 pupils in 1935 who paid full fees and over 21,000 who paid fees in part. These fees ranged between 4 guineas and 30 guineas and averaged a little over £12. It may be estimated, further, that apart from the grant-aided schools, there were in 1935 something like 140,000 pupils in private, grammar and public schools, of whom 91,000 were in institutions classed as "efficient" by the Board of Education. Many of these were boarding schools, and some came within the category which PROFESSOR J. HILTON recently described as the preserve of a privileged few, having the right to issue "special tickets" admitting their bearers to high positions in the service of the State, the professions and industry. The fees in these institutions vary widely. At the modest day-school they may run from £20 or £30 a year. At the other end of the scale, they may be as much

as £250 at a famous boarding school. This last figure includes a catering charge for bed and board during a given number of nights and days in the year. Nevertheless, the difference between the charges of the more and the less expensive schools is too great to be explained either in this way or by differences in the quality of the teaching provided. In fact, sentiment, tradition, custom and prestige confer on the pupils of certain schools a *cachet* of recognised value in the labour market. The fees charged therefore include an appreciable "goodwill" element which is tacitly accepted by parents as being in the nature of a capital investment, like the entrance fee to a particularly good club.

The social return obtained by the community as a whole for its annual expenditure on education is a matter beyond the limits of the present article. But it is pertinent to ask how far there are adequate links between the schools on the one hand and employers of labour on the other. What sort of jobs do the 6 million pupils of these widely discrepant types of schools go into, and what are the chances that the cost of their education will be returned in the material rewards of their employment?

Every year nearly three-quarters of a million boys and girls leave elementary and secondary schools in England and Wales. The 660,000 who leave elementary schools at an average age of barely 14 pass into a multitude of diverse occupations whose sum is the whole range of the lowest-paid manual and clerical employment. On the average they may look forward to a life's remuneration rising from a few shillings a week to little over £170 a year. At the best, apart from the exceptionally capable or fortunate few, they can expect a maximum of no more than £7 or £8 a week. A tiny fraction will earn very high incomes. Some 75,000, however, pass on to secondary schools every year; and session by session swell the total of something like 80,000 who leave the secondary schools annually at an average age of just under 17. Approximately 5 per cent. of the secondary school-leavers proceed to university institutions, where they constitute only 36 per cent. of the entrants, compared with 64 per cent. from non-grant-aided schools, other educational institutions, and overseas. Their prospects of employment will be reserved for discussion in the second article of this series.

The remaining 70,000 to 75,000 compete for the better-paid clerical, professional and technical posts. Some 12,000, however, leave before they are 15 years of age, and for the most part have little better prospects than the average elementary school leaver. But the bulk pass into offices, banks, insurance companies, engineering shops, public administration and the professions. It is true that, in most cases, they need further education, in evening classes, technical schools and courses for professional examinations to make the best use of their opportunities; but, in the end, they may expect to earn at least £250 a year. Many will earn up to £450, and a not inconsiderable minority will rise to an annual salary of £500 or £600. A select few will climb very much higher on the income ladder.

In general, therefore, it is true to say that, even in the narrowest sense, it pays to educate children. The longer they remain at school the greater, on the average, is their chance of remunerative and congenial employment. The process of recruitment, however, is itself very haphazard. Labour exchanges, Local Advisory Committees, and Headmasters' and Headmistresses' Committees provide a skeleton of organisation and co-ordination to bring the right job to the right boy or girl. But, fundamentally, industry and commerce have no articulated recruitment policy, and they have little direct contact with education, apart from a vague belief that Matriculation is an entirely suitable ticket of entry into many branches of employment. This is, to say the least, an over-generalisation.

There is, indeed, a good deal of hit-or-miss in the relationship between school education and a career. The result is the *misemployment* of thousands of boys and girls; and commerce, industry and education alike suffer as a consequence. The deficiencies of our technical education, for instance, cannot be excused some responsibility for the present grave shortage of skilled labour, and these deficiencies are a standing witness of a lack of liaison between employers and schools and colleges. Accordingly, the trend of recent years has been for employers to seek the "educated" recruit, to evolve schemes of training, and even, in some instances, to work out systems of recruitment akin to the grading of the Civil Service.

Thus, although money spent on education is well spent in the economic and in every other sense, it might be still better spent if the recruitment of school children for employment were better organised. In a future article we propose to discuss the extent, scope and economic aspect of university education, from the viewpoint of the 14,000 scholars who pass every year into the university institutions of Great Britain.

Outlook for Wheat Prices

WHILE day-to-day fluctuations of wheat prices are of little general interest, the implications of a marked change in the value of the world's wheat crop are far-reaching and of vital social significance. For example, last year's world wheat harvest, exclusive of the U.S.S.R. and a few countries for which reliable statistics are not available, yielded some 3,500 million bushels of 60 lbs., equivalent to 1,875 million cwts. Taken at 9.53s. per cwt.—the average British import price during the season ended last July—the value of last year's crop was nearly £900 millions, against £530 millions in 1933-34 and £1,100 millions in 1928-29. Actually, of course, the price received by the farmers is considerably below the average British import figure. Changes of this order of magnitude, nevertheless, vitally affect agricultural purchasing power and, incidentally, the course of international trade, as well as the livelihood of a large number of individual farmers for whom wheat is the principal cash crop. Their effect on consumers, though by no means negligible, is relatively less important, since the cereal itself represents only part of the cost of the average loaf, and expenditure on bread normally forms a smaller proportion of the consumer's total budget than the contribution of the wheat crop to many farmers' total income.

After declining catastrophically during the depression, wheat prices have now recovered to their pre-depression level. As we forecast in our last survey of the wheat outlook (see *The Economist* of October 10, 1936, page 53), prices rose rapidly during the winter and early spring, and reached their highest level for nine years. A year ago, however, we suggested the wheel of prices had almost gone full circle, and the present time is opportune for further examination of the probable long-term outlook—the more so in view of the unfavourable effect on the world's markets of the rich harvest garnered in the United States this summer.

In considering the factors influencing the supply of wheat, it may be useful to distinguish between short-term and long-term variations in prices and production. Supplies of wheat, as of all crops, are incapable of being augmented at short notice. A sudden spurt in demand, for storage purposes, for example, is likely to give rise to a sharp advance in market prices. In the long run, however, a rising trend of prices is usually accompanied by an extension of the area under the golden grain. But an increase in the area sown to wheat is not necessarily followed by a bigger harvest, for the influence of unfavourable weather conditions on the yield per acre may more than offset any increase in planting. Over a period of years, however, the growth in production is roughly proportionate to the extension in area. Conversely, a reduction in the area sown, whether caused by falling prices or restriction schemes, will ultimately—though not always immediately—lead to a decline in output. But while rising prices are almost invariably reflected in an extension of the area sown to wheat (unless the prices of other grains advance more rapidly), falling prices are not necessarily accompanied by an immediate curtailment of sowing; for individual farmers frequently attempt to offset a fall in income through lower unit prices by an increase in output. Since changes in prices are not at once reflected in variations of acreage, wheat prices tend, therefore, to be subject to wide fluctuations in cycles over a period of years which may be distorted, lengthened or shortened by variations in yield.

These tendencies are illustrated graphically from the experience of recent years in the first of the two charts accompanying this article. The chart, which is based on statistics issued by the Food Research Institute of Stanford University, California, shows variations in world acreage and production, exclusive of the U.S.S.R. and certain other countries for which reliable statistics are not available. The acreage figure for 1937-38 is based on provisional returns of the increase in the area sown to wheat in the leading countries during the preceding year. Acreage and production figures are expressed in the form of index numbers, whose base is the average of the three wheat seasons from 1925-26 to 1927-28.

Despite the gradual downward movement of prices between 1925 and 1929, the world's acreage under wheat was steadily extended, partly because falling costs due to technical improvements in production and harvesting methods tended to offset the reduction in prices. Not even the headlong fall in prices between 1929 and 1931 checked the steady extension of the area under wheat. This tendency has a twofold explanation. First, farmers in many countries attempted to maintain their income by increasing their production. Secondly, the threat to the livelihood of farmers in importing countries, caused by the collapse of market prices, induced Governments in these countries to endeavour to intensify protection by raising import duties or by imposing quantitative restrictions on imports. Thus, world exports of wheat fell from 925 million bushels in 1928-29 to 631 millions in 1932-33 and 505 millions in 1935-36. It was not until 1933-34 that the area under wheat was significantly curtailed, partly as a result of the prolonged period of low prices and partly through official restriction schemes.

The chart shows that world production of wheat has approximately followed variations in acreage, though not from year to year. Thus, a bumper yield of 15.9 bushels per acre in 1928-29 was succeeded by a subnormal yield of 14.4 bushels per acre in the following season. The upward trend of prices, which began towards the close of the 1933-34 season, heralded the end of the decline in acreage, which has since shown a steady increase. Production, however, did not respond to the increase in acreage owing to a succession of subnormal yields per acre, principally in the United States, Canada and Australia. In consequence, the world's wheat surplus, accumulated in preceding years, was exhausted at the close of the season last July, while prices continued their upward course and recovered to pre-depression levels. Our second chart shows the fairly close inverse correlation between the movement of stocks and prices since 1925-26. The data for stocks are taken from the August issue of the *Monthly Crop Report* of the International Institute of Agriculture, and include the United States, Canada, Argentina and Australia as well as wheat on the high seas. The trend of prices is illustrated on the basis of average British import values. As the scale of the chart is logarithmic, *proportionate* changes in stocks and prices are revealed. The chart shows that both stocks and prices have completed a full semi-circular movement during the period.

Reference to the first chart shows conclusively that the low level of production since 1934-35 was due entirely to the fortuitous succession of subnormal yields. The area under wheat has been steadily extended in recent years under the influence of rising prices without calling forth a corresponding increase in output. But the probabilities are against the indefinite continuance of subnormal yields. Sooner or later, the extension of the wheat area must have its natural consequence in terms of increased production and lower prices. Meanwhile, the area sown to wheat is still increasing. According to the International Institute of Agriculture, the figures for the principal countries in the 1937-38 season show an aggregate increase of as much as 10 per cent. over those for 1936-37—an increase shown on our chart by a dotted line. Prices have so far been maintained by the failure of the Canadian crop and the need to replenish stocks. But a normal yield next year might well reverse the wheat cycle, especially as demand for wheat is fairly inelastic. Even the outlook for prices over the winter is by no means certain and will depend to a large extent on the crops of the Southern Hemisphere, Russian export policy and reports of the area sown and progress of next year's crops in the Northern Hemisphere.

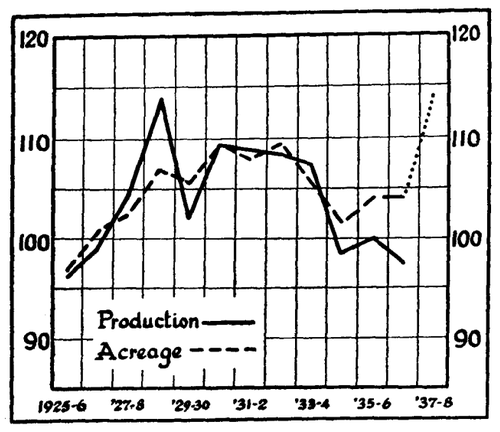
(Average 1925-6—1927-8=100)



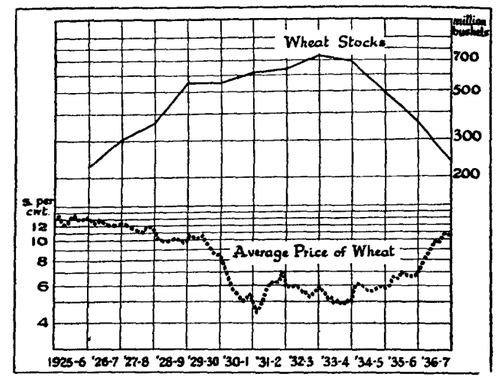


CHART II. WHEAT STOCKS AND PRICES

Life at Sea

THE social conscience of the community has been profoundly stirred by the question of slums in our midst, and the Ministry of Health and the local authorities are energetically working for their eradication. So far, however, little public attention has been given to the kindred subject of living conditions at sea. The quarters provided for the crews of many British merchant ships engaged in foreign trade are, by general admission, unsatisfactory; and the Board of Trade instructions are now out of date in many important respects when judged by modern standards. It is a disturbing fact that, while Britain, with her 17-18 millions of gross steamer and motor-ship tonnage, still leads the world in the size of her fleet, in the past she has fallen behind other nations in enacting and enforcing legislation for the welfare of her maritime population.

A change for the better is, however, indicated by the new Board of Trade Instructions which were published on September 6th. In brief, they are intended to bring the legal minima of crew accommodation into line with the standards provided by the most progressive shipowners and shipbuilders at home and abroad. Hospitals are to be provided in all merchant ships above 2,500 tons. Loftier quarters, single tier bunks, improved facilities for eating, sleeping, washing and bathing, and better ventilation are other requirements now laid down.

Many modern ships already conform with the majority of these requirements and a number even exceed them. It was from the Shipping Federation at the request of the Board of Trade that the original proposals for these changes came in 1930. Nevertheless, so long as the law on the subject was obsolete, serious deficiencies in accommodation were possible. A number of ships to-day are sadly below the new requirements—partly because of the low standards of war-time building, and partly because of the difficulties of making improvements during the recent depression—and so long as they put to sea there will be " sea-going slums " despite the new orders. Bad habit in ship design cannot be eradicated by official *fiat*, though some improvements can be made.

It is true that seamen's conditions have been steadily improved since Samuel Plimsoll began his memorable crusade against " coffin ships," in the latter half of the nineteenth century. In the newer and larger vessels, indeed, the raising of standards of accommodation has been appreciable. And the new regulations come at the end of more than a decade's activity by shipowners, seamen and sanitary authorities. Even so, there are still important problems to be solved.

Under Section 10 of the Public Health Act a ship has the status of a house, and, accordingly, must be maintained in a sanitary condition. The sailor, however, lacks the sanctuary of park and playing field in his hours of leisure. He is tied to his home at sea more closely than the dweller in the worst slum; and he lives at his job; for the mariner's house is his forecastle. For the landsman, the Ministry of Health prescribes minimum housing standards, and the Home Office has powers for the regulation of industrial conditions. Both authorities have medical departments to assist them in carrying out their duties, but for the sailor there is no analogous competent corps of medical men, apart from the port sanitary authorities, whose work is important in maintaining the best possible level of health, since they cannot make regular inspections under working conditions at sea.

For many years past, there has been a striking consensus of expert opinion on the shortcomings of living accommodation on many sea-going vessels—though it must be remembered that the port sanitary authorities, who make these comparisons, visit British ships in the worst conditions, when the crew has left at the voyage's end and quarters are dirty and deserted. As long ago as 1902, Dr Collingridge, Medical Officer of Health of the Port and later of the City of London, wrote that the sanitary state of British ships was fifty years behind that of the rest of the country. Eight years later, Dr H. Jones, late Medical Officer of Health of Newport, declared that Norway was far ahead of Britain in improving the hygiene and space for the crew. In the following year the Congress of the Royal Sanitary Institute passed the following resolution:—

> That having regard to the unsatisfactory accommodation provided for the crew of many new vessels built in this country, the Council of the Royal Sanitary Institute be asked to approach the President of the Board of Trade with the view of securing a thorough revision of the requirements of the Board of Trade under the Merchant Shipping Acts, in respect to the living quarters for officers and men of all new vessels built under their supervision.

Almost identical resolutions were passed by the Association of Port Sanitary Authorities in 1922 and 1935. And five years after the Shipping Federation recommendations of 1930, it was still asserted that the quarters in a British vessel then under construction closely resembled those provided for the crews of British ships 20 to 30 years earlier.

The uneven progress of improvement in these respects, hampered by the severe effects of depression on shipping and shipbuilding, is seen by comparing conditions in many present-day British ships with those of Norway and Sweden, whose seamen's quarters have usually been planned and furnished with a constructive imagination. In these vessels the dominant motives are comfort and cleanliness. They possess desirable facilities like washbasins, shower baths, mess-rooms, hospitals and a system of separate berths; and have clearly inspired the new Instructions of the Board. In Britain's case these amenities have often been confined to ships of large tonnage, or to smaller vessels belonging to progressive owners.

An intimate relationship between unhealthy environment at sea and the high rate of tuberculosis among seamen has been suggested by such pioneers in marine hygiene as Dr Dearden, Dr Howard Jones and Fleet-Surgeon Home. It is alleged that figures of the occupational incidence of tuberculosis in Cardiff for the eleven years 1924 to 1934 show that while the mean annual case rate per 1,000 of all males investigated during the period was 2.60, among sailors the rate was as high as 12.55. The death-rate per 1,000 from the same scourge in England and Wales, in 1934, was only 0.76; at Cardiff, however, between 1923 and 1934, it was 1.15, at Kingston-upon-Hull, 1.01; at Liverpool, 1.15; at Manchester, 1.13; at Middlesbrough, 1.24, and at South Shields, 1.75. These towns and cities are, of course, large centres of population, and not merely ports for foreign-going shipping; but the experience of Cardiff suggests that the unfavourable incidence of mortality among seamen has perhaps helped to swell the total figures. During the period mentioned, the rate for the whole of Cardiff was 1.15; but in the Municipal Ward of Adamstown, where the majority of the sea-faring population live, it was no less than 3.49.

These figures are not sufficiently detailed or comprehensive to support a general or convincing indictment of sea-going accommodation on health grounds. Their use in this way is controversial, but they do at least suggest that seafaring is a dangerous trade in more ways than are generally realised. It is hard to avoid the conclusion, in fact, that the conditions under which some crews live may be a predisposing influence to higher disease and mortality rates. The general improvement of these conditions has been delayed in spite of efforts on the part of both owners and men. But the new instructions will generalise the best current practice. As in certain of the more progressive foreign countries an endeavour will be made, under the new regulations, to check possible abuses at their source by laying down high standards to surveyors which must be satisfied before ships are passed for service. Moreover, not only will it be necessary, as in the past, to comply with the regulations before the deduction of crew space from tonnage for the purpose of dues can be certified, but also plans of new ships must be submitted direct to the Board of Trade. Although the latest reforms are still merely instructions for the guidance of surveyors there is now a double check on their enforcement. Yet improvement might possibly be expedited by the passage of a simple amending Act, empowering the Board, with the advice and approval of the Ministry of Health, to lay down binding regulations, from time to time, for the construction and maintenance of seamen's quarters.

Meanwhile, a first step has been taken towards this highly desirable objective. It is a greatly improved code which has now been ratified by the Board of Trade. Its application will require the provision of more ample living accommodation on all newly-built ships, and the progressive adaptation whenever circumstances permit, of facilities on existing ships to the new standard. The moment is particularly opportune for this overdue reform, since the industry has at long last shaken off its depression—which blocked the reforms advocated seven years ago—and is busily carrying out an extensive rebuilding programme. To seize the chance thus presented will be both good morals and good business. And at a time when many measures of far more questionable economic merit are being urged on the community in the name of preparedness for war, it is worth while reemphasising the traditional rôle of our mercantile marine as a carrier of supplies and a nursery of our naval forces. In the long run, the sea-going services, no less than the army, must offer attractive conditions of employment if they are to obtain ample numbers of the right type of recruit.

Notes of the Week

Masaryk.—Thomas Garrigue Masaryk, founder of modern Czechoslovakia and its President until 1935, died on Tuesday at the age of eighty-seven. One of the greatest personalities of the post-war world thus leaves the field of activity. This wise and venerable man retired from political life in December, 1935, leaving the leadership of the State he had founded to his collaborator, Dr Eduard Benes. Masaryk was born on March 7, 1850, in a little town of Moravia, a coachman's son. He was destined to learn the blacksmith's craft, but became one of the most unusual and happy of all statesmen; unusual because at the age of sixty-five he, a University professor, gathered the troops of his people outside the frontiers of Austria-Hungary during the Great War to lead them, as President of the State founded by him, into Prague after the Allies' victory; happy, because he attained all he desired—to liberate his people and give them their own State. He was even able to bring into double harness with himself his faithful pupil and co-worker to lead the State on a basis of conciliation between its peoples, democracy, and humanitarianism. He and Dr Benes worked in Hampstead during the war; and English was as natural to them as Czech.

* * *

To-day a nation is rarely led by professors; and the number of really great democrats standing at the head of Continental countries grows always smaller and smaller. Masaryk adhered to his ideals in spite of all changes in the face of Europe. He always emphasised that a State can be maintained only by those principles on which it was founded. When in December, 1935, with quiet dignity he laid down the Presidency, he did so in the way and the words of few statesmen to-day—as one to whom the individual means nothing, but the principle and the task everything. In his resignation speech of December 14, 1935, he said:—

> What we need is a good foreign policy, and at home justice for all citizens, whatever their nationality. I would like still to say that as my successor I recommend to you Dr Benes. I worked with him beyond the frontier and at home; and I know him. I am fully confident that all will go well, and if God wills it, I shall look on a little longer and see how you get on.

The key determining the music of Europe to-day differs from that of T. G. Masaryk. The people in Prague, standing by the bier of him who won for them their national freedom, may be proud to feel that the name of Masaryk belongs not only to them but to history.

* * *

Spain and the Mediterranean.—There has been a week's complete lull on Spanish territory, a few desultory actions taking place in Asturias and Aragon. General Franco has announced that he will only stop at a crushing and complete military victory over both Valencia and Barcelona, but the approach of winter in the high central plateau makes his victory seem a remote aim. Attention has been mainly riveted on the Mediterranean, where the effect of the Nyon Agreement has been suddenly to obliterate almost all evidences of the " unknown Power's submarines." General Franco's authorities have released two of the three British merchantmen held captive for two months; and another ship, captured last Saturday off Algiers, was allowed to proceed home. The Spanish Government, in a message from Valencia, have welcomed the Nyon Agreement, while General Franco's and Portugal's spokesmen have professed inability to understand why they were not invited to Nyon. General Franco was not invited because the Spanish Government were not invited; and, as the agreement records, no belligerents' rights are accorded to either side by the signatories, so General Franco has no standing for his protest. The Portuguese have some; for, after all, Germany, a non-Mediterranean State, was invited; on the other hand, Holland and Norway, whose big commercial fleets use the Mediterranean, were not invited, so Portugal's—and her friends, Germany's and Italy's—protestations savour of special pleading. Whether, as newspapers in their countries now threaten, the Italian, German and Portuguese representatives on the London Non-intervention Committee will try at its next meeting to hold it up, on the charge that the Nyon signatories have technically " intervened," remains to be seen. None knows what Russia will do to protect her cargo ships in the Mediterranean. And none knows whether the British and French Governments will agree, after Italy's refusal to attend Nyon, to allow her to mark out her own zones of activity as terms for her collaboration.

* * *

Light and Shade at Geneva.—At Geneva this week the annual session of the League Assembly, with the concurrent session of the Council, began. This time, the Assembly has started work in a gleam of light. The Nyon Agreement, which we discuss elsewhere in this issue, was concluded on the eve, and signed on the morrow, of the Assembly's opening meeting. The League, and all that the League stands for, will be strengthened by this success. The Assembly may also be congratulated on having avoided a pitfall which has once again confronted it. Nothing has been done to impugn Abyssinia's title to membership. The question did not come before the Credentials Committee because the Emperor wisely refrained from sending a delegation; but he did address a letter to the Secretary-General in which he once more stated Abyssinia's case and reminded her fellow States-members of their unfulfilled obligations. No member has had the face to move that, because these obligations have not been carried out, the Assembly should proceed to expel not the defaulters, but the victim of their default. So it has again been tacitly

as £250 at a famous boarding school. This last figure includes a catering charge for bed and board during a given number of nights and days in the year. Nevertheless, the difference between the charges of the more and the less expensive schools is too great to be explained either in this way or by differences in the quality of the teaching provided. In fact, sentiment, tradition, custom and prestige confer on the pupils of certain schools a *cachet* of recognised value in the labour market. The fees charged therefore include an appreciable "goodwill" element which is tacitly accepted by parents as being in the nature of a capital investment, like the entrance fee to a particularly good club.

The social return obtained by the community as a whole for its annual expenditure on education is a matter beyond the limits of the present article. But it is pertinent to ask how far there are adequate links between the schools on the one hand and employers of labour on the other. What sort of jobs do the 6 million pupils of these widely discrepant types of schools go into, and what are the chances that the cost of their education will be returned in the material rewards of their employment?

Every year nearly three-quarters of a million boys and girls leave elementary and secondary schools in England and Wales. The 660,000 who leave elementary schools at an average age of barely 14 pass into a multitude of diverse occupations whose sum is the whole range of the lowest-paid manual and clerical employment. On the average they may look forward to a life's remuneration rising from a few shillings a week to little over £170 a year. At the best, apart from the exceptionally capable or fortunate few, they can expect a maximum of no more than £7 or £8 a week. A tiny fraction will earn very high incomes. Some 75,000, however, pass on to secondary schools every year; and session by session swell the total of something like 80,000 who leave the secondary schools annually at an average age of just under 17. Approximately 5 per cent. of the secondary school-leavers proceed to university institutions, where they constitute only 36 per cent. of the entrants, compared with 64 per cent. from non-grant-aided schools, other educational institutions, and overseas. Their prospects of employment will be reserved for discussion in the second article of this series.

The remaining 70,000 to 75,000 compete for the better-paid clerical, professional and technical posts. Some 12,000, however, leave before they are 15 years of age, and for the most part have little better prospects than the average elementary school leaver. But the bulk pass into offices, banks, insurance companies, engineering shops, public administration and the professions. It is true that, in most cases, they need further education, in evening classes, technical schools and courses for professional examinations to make the best use of their opportunities; but, in the end, they may expect to earn at least £250 a year. Many will earn up to £450, and a not inconsiderable minority will rise to an annual salary of £500 or £600. A select few will climb very much higher on the income ladder.

In general, therefore, it is true to say that, even in the narrowest sense, it pays to educate children. The longer they remain at school the greater, on the average, is their chance of remunerative and congenial employment. The process of recruitment, however, is itself very haphazard. Labour exchanges, Local Advisory Committees, and Headmasters' and Headmistresses' Committees provide a skeleton of organisation and co-ordination to bring the right job to the right boy or girl. But, fundamentally, industry and commerce have no articulated recruitment policy, and they have little direct contact with education, apart from a vague belief that Matriculation is an entirely suitable ticket of entry into many branches of employment. This is, to say the least, an over-generalisation.

There is, indeed, a good deal of hit-or-miss in the relationship between school education and a career. The result is the *misemployment* of thousands of boys and girls; and commerce, industry and education alike suffer as a consequence. The deficiencies of our technical education, for instance, cannot be excused some responsibility for the present grave shortage of skilled labour, and these deficiencies are a standing witness of a lack of liaison between employers and schools and colleges. Accordingly, the trend of recent years has been for employers to seek the "educated" recruit, to evolve schemes of training, and even, in some instances, to work out systems of recruitment akin to the grading of the Civil Service.

Thus, although money spent on education is well spent in the economic and in every other sense, it might be still better spent if the recruitment of school children for employment were better organised. In a future article we propose to discuss the extent, scope and economic aspect of university education, from the viewpoint of the 14,000 scholars who pass every year into the university institutions of Great Britain.

Outlook for Wheat Prices

WHILE day-to-day fluctuations of wheat prices are of little general interest, the implications of a marked change in the value of the world's wheat crop are far-reaching and of vital social significance. For example, last year's world wheat harvest, exclusive of the U.S.S.R. and a few countries for which reliable statistics are not available, yielded some 3,500 million bushels of 60 lbs., equivalent to 1,875 million cwts. Taken at 9.53s. per cwt.—the average British import price during the season ended last July—the value of last year's crop was nearly £900 millions, against £530 millions in 1933-34 and £1,100 millions in 1928-29. Actually, of course, the price received by the farmers is considerably below the average British import figure. Changes of this order of magnitude, nevertheless, vitally affect agricultural purchasing power and, incidentally, the course of international trade, as well as the livelihood of a large number of individual farmers for whom wheat is the principal cash crop. Their effect on consumers, though by no means negligible, is relatively less important, since the cereal itself represents only part of the cost of the average loaf, and expenditure on bread normally forms a smaller proportion of the consumer's total budget than the contribution of the wheat crop to many farmers' total income.

After declining catastrophically during the depression, wheat prices have now recovered to their pre-depression level. As we forecast in our last survey of the wheat outlook (see *The Economist* of October 10, 1936, page 53), prices rose rapidly during the winter and early spring, and reached their highest level for nine years. A year ago, however, we suggested the wheel of prices had almost gone full circle, and the present time is opportune for further examination of the probable long-term outlook—the more so in view of the unfavourable effect on the world's markets of the rich harvest garnered in the United States this summer.

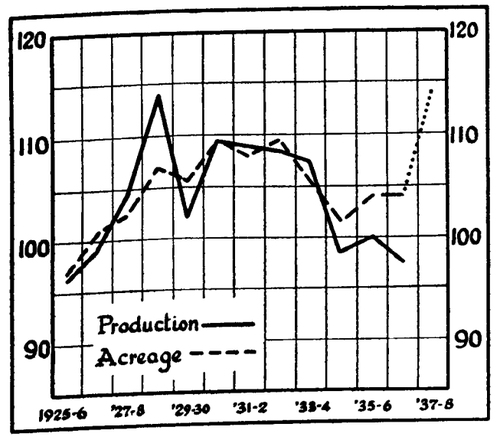
In considering the factors influencing the supply of wheat, it may be useful to distinguish between short-term and long-term variations in prices and production. Supplies of wheat, as of all crops, are incapable of being augmented at short notice. A sudden spurt in demand, for storage purposes, for example, is likely to give rise to a sharp advance in market prices. In the long run,

however, a rising trend of prices is usually accompanied by an extension of the area under the golden grain. But an increase in the area sown to wheat is not necessarily followed by a bigger harvest, for the influence of unfavourable weather conditions on the yield per acre may more than offset any increase in planting. Over a period of years, however, the growth in production is roughly proportionate to the extension in area. Conversely, a reduction in the area sown, whether caused by falling prices or restriction schemes, will ultimately—though not always immediately—lead to a decline in output. But while rising prices are almost invariably reflected in an extension of the area sown to wheat (unless the prices of other grains advance more rapidly), falling prices are not necessarily accompanied by an immediate curtailment of sowing; for individual farmers frequently attempt to offset a fall in income through lower unit prices by an increase in output. Since changes in prices are not at once reflected in variations of acreage, wheat prices tend, therefore, to be subject to wide fluctuations in cycles over a period of years which may be distorted, lengthened or shortened by variations in yield.

These tendencies are illustrated graphically from the experience of recent years in the first of the two charts accompanying this article. The chart, which is based on statistics issued by the Food Research Institute of Stanford University, California, shows variations in world

CHART I. WORLD ACREAGE AND PRODUCTION OF WHEAT

(Average 1925-6—1927-8=100)



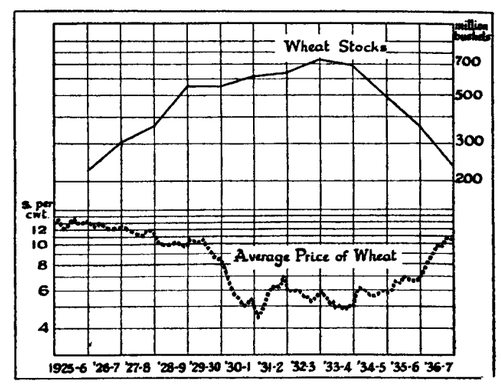


CHART II. WHEAT STOCKS AND PRICES

acreage and production, exclusive of the U.S.S.R. and certain other countries for which reliable statistics are not available. The acreage figure for 1937-38 is based on provisional returns of the increase in the area sown to wheat in the leading countries during the preceding year. Acreage and production figures are expressed in the form of index numbers, whose base is the average of the three wheat seasons from 1925-26 to 1927-28.

Despite the gradual downward movement of prices between 1925 and 1929, the world's acreage under wheat was steadily extended, partly because falling costs due to technical improvements in production and harvesting methods tended to offset the reduction in prices. Not even the headlong fall in prices between 1929 and 1931 checked the steady extension of the area under wheat. This tendency has a twofold explanation. First, farmers in many countries attempted to maintain their income by increasing their production. Secondly, the threat to the livelihood of farmers in importing countries, caused by the collapse of market prices, induced Governments in these countries to endeavour to intensify protection by raising import duties or by imposing quantitative restrictions on imports. Thus, world exports of wheat fell from 925 million bushels in 1928-29 to 631 millions in 1932-33 and 505 millions in 1935-36. It was not until 1933-34 that the area under wheat was significantly curtailed, partly as a result of the prolonged period of low prices and partly through official restriction schemes.

The chart shows that world production of wheat has approximately followed variations in acreage, though not from year to year. Thus, a bumper yield of 15.9 bushels per acre in 1928-29 was succeeded by a subnormal yield of 14.4 bushels per acre in the following season. The upward trend of prices, which began towards the close of the 1933-34 season, heralded the end of the decline in acreage, which has since shown a steady increase. Production, however, did not respond to the increase in acreage owing to a succession of subnormal yields per acre, principally in the United States, Canada and Australia. In consequence, the world's wheat surplus, accumulated in preceding years, was exhausted at the close of the season last July, while prices continued their upward course and recovered to pre-depression levels. Our second chart shows the fairly close inverse correlation between the movement of stocks and prices since 1925-26. The data for stocks are taken from the August issue of the *Monthly Crop Report* of the International Institute of Agriculture, and include the United States, Canada, Argentina and Australia as well as wheat on the high seas. The trend of prices is illustrated on the basis of average British import values. As the scale of the chart is logarithmic, *proportionate* changes in stocks and prices are revealed. The chart shows that both stocks and prices have completed a full semi-circular movement during the period.

Reference to the first chart shows conclusively that the low level of production since 1934-35 was due entirely to the fortuitous succession of subnormal yields. The area under wheat has been steadily extended in recent years under the influence of rising prices without calling forth a corresponding increase in output. But the probabilities are against the indefinite continuance of subnormal yields. Sooner or later, the extension of the wheat area must have its natural consequence in terms of increased production and lower prices. Meanwhile, the area sown to wheat is still increasing. According to the International Institute of Agriculture, the figures for the principal countries in the 1937-38 season show an aggregate increase of as much as 10 per cent. over those for 1936-37—an increase shown on our chart by a dotted line. Prices have so far been maintained by the failure of the Canadian crop and the need to replenish stocks. But a normal yield next year might well reverse the wheat cycle, especially as demand for wheat is fairly inelastic. Even the outlook for prices over the winter is by no means certain and will depend to a large extent on the crops of the Southern Hemisphere, Russian export policy and reports of the area sown and progress of next year's crops in the Northern Hemisphere.

Life at Sea

THE social conscience of the community has been profoundly stirred by the question of slums in our midst, and the Ministry of Health and the local authorities are energetically working for their eradication. So far, however, little public attention has been given to the kindred subject of living conditions at sea. The quarters provided for the crews of many British merchant ships engaged in foreign trade are, by general admission, unsatisfactory; and the Board of Trade instructions are now out of date in many important respects when judged by modern standards. It is a disturbing fact that, while Britain, with her 17-18 millions of gross steamer and motor-ship tonnage, still leads the world in the size of her fleet, in the past she has fallen behind other nations in enacting and enforcing legislation for the welfare of her maritime population.

A change for the better is, however, indicated by the new Board of Trade Instructions which were published on September 6th. In brief, they are intended to bring the legal minima of crew accommodation into line with the standards provided by the most progressive shipowners and shipbuilders at home and abroad. Hospitals are to be provided in all merchant ships above 2,500 tons. Loftier quarters, single tier bunks, improved facilities for eating, sleeping, washing and bathing, and better ventilation are other requirements now laid down.

Many modern ships already conform with the majority of these requirements and a number even exceed them. It was from the Shipping Federation at the request of the Board of Trade that the original proposals for these changes came in 1930. Nevertheless, so long as the law on the subject was obsolete, serious deficiencies in accommodation were possible. A number of ships to-day are sadly below the new requirements—partly because of the low standards of war-time building, and partly because of the difficulties of making improvements during the recent depression—and so long as they put to sea there will be " sea-going slums " despite the new orders. Bad habit in ship design cannot be eradicated by official *fiat*, though some improvements can be made.

It is true that seamen's conditions have been steadily improved since Samuel Plimsoll began his memorable crusade against " coffin ships," in the latter half of the nineteenth century. In the newer and larger vessels, indeed, the raising of standards of accommodation has been appreciable. And the new regulations come at the end of more than a decade's activity by shipowners, seamen and sanitary authorities. Even so, there are still important problems to be solved.

Under Section 10 of the Public Health Act a ship has the status of a house, and, accordingly, must be maintained in a sanitary condition. The sailor, however, lacks the sanctuary of park and playing field in his hours of leisure. He is tied to his home at sea more closely than the dweller in the worst slum; and he lives at his job; for the mariner's house is his forecastle. For the landsman, the Ministry of Health prescribes minimum housing standards, and the Home Office has powers for the regulation of industrial conditions. Both authorities have medical departments to assist them in carrying out their duties, but for the sailor there is no analogous competent corps of medical men, apart from the port sanitary authorities, whose work is important in maintaining the best possible level of health, since they cannot make regular inspections under working conditions at sea.

For many years past, there has been a striking consensus of expert opinion on the shortcomings of living accommodation on many sea-going vessels—though it must be remembered that the port sanitary authorities, who make these comparisons, visit British ships in the worst conditions, when the crew has left at the voyage's end and quarters are dirty and deserted. As long ago as 1902, Dr Collingridge, Medical Officer of Health of the Port and later of the City of London, wrote that the sanitary state of British ships was fifty years behind that of the rest of the country. Eight years later, Dr H. Jones, late Medical Officer of Health of Newport, declared that Norway was far ahead of Britain in improving the hygiene and space for the crew. In the following year the Congress of the Royal Sanitary Institute passed the following resolution:—

> That having regard to the unsatisfactory accommodation provided for the crew of many new vessels built in this country, the Council of the Royal Sanitary Institute be asked to approach the President of the Board of Trade with the view of securing a thorough revision of the requirements of the Board of Trade under the Merchant Shipping Acts, in respect to the living quarters for officers and men of all new vessels built under their supervision.

Almost identical resolutions were passed by the Association of Port Sanitary Authorities in 1922 and 1935. And five years after the Shipping Federation recommendations of 1930, it was still asserted that the quarters in a British vessel then under construction closely resembled those provided for the crews of British ships 20 to 30 years earlier.

The uneven progress of improvement in these respects, hampered by the severe effects of depression on shipping and shipbuilding, is seen by comparing conditions in many present-day British ships with those of Norway and Sweden, whose seamen's quarters have usually been planned and furnished with a constructive imagination. In these vessels the dominant motives are comfort and cleanliness. They possess desirable facilities like washbasins, shower baths, mess-rooms, hospitals and a system of separate berths; and have clearly inspired the new Instructions of the Board. In Britain's case these amenities have often been confined to ships of large tonnage, or to smaller vessels belonging to progressive owners.

An intimate relationship between unhealthy environment at sea and the high rate of tuberculosis among seamen has been suggested by such pioneers in marine hygiene as Dr Dearden, Dr Howard Jones and Fleet-Surgeon Home. It is alleged that figures of the occupational incidence of tuberculosis in Cardiff for the eleven years 1924 to 1934 show that while the mean annual case rate per 1,000 of all males investigated during the period was 2.60, among sailors the rate was as high as 12.55. The death-rate per 1,000 from the same scourge in England and Wales, in 1934, was only 0.76; at Cardiff, however, between 1923 and 1934, it was 1.15, at Kingston-upon-Hull, 1.01; at Liverpool, 1.15; at Manchester, 1.13; at Middlesbrough, 1.24, and at South Shields, 1.75. These towns and cities are, of course, large centres of population, and not merely ports for foreign-going shipping; but the experience of Cardiff suggests that the unfavourable incidence of mortality among seamen has perhaps helped to swell the total figures. During the period mentioned, the rate for the whole of Cardiff was 1.15; but in the Municipal Ward of Adamstown, where the majority of the sea-faring population live, it was no less than 3.49.

These figures are not sufficiently detailed or comprehensive to support a general or convincing indictment of sea-going accommodation on health grounds. Their use in this way is controversial, but they do at least suggest that seafaring is a dangerous trade in more ways than are generally realised. It is hard to avoid the conclusion, in fact, that the conditions under which some crews live may be a predisposing influence to higher disease and mortality rates. The general improvement of these conditions has been delayed in spite of efforts on the part of both owners and men. But the new instructions will generalise the best current practice. As in certain of the more progressive foreign countries an endeavour will be made, under the new regulations, to check possible abuses at their source by laying down high standards to surveyors which must be satisfied before ships are passed for service. Moreover, not only will it be necessary, as in the past, to comply with the regulations before the deduction of crew space from tonnage for the purpose of dues can be certified, but also plans of new ships must be submitted direct to the Board of Trade. Although the latest reforms are still merely instructions for the guidance of surveyors there is now a double check on their enforcement. Yet improvement might possibly be expedited by the passage of a simple amending Act, empowering the Board, with the advice and approval of the Ministry of Health, to lay down binding regulations, from time to time, for the construction and maintenance of seamen's quarters.

Meanwhile, a first step has been taken towards this highly desirable objective. It is a greatly improved code which has now been ratified by the Board of Trade. Its application will require the provision of more ample living accommodation on all newly-built ships, and the progressive adaptation whenever circumstances permit, of facilities on existing ships to the new standard. The moment is particularly opportune for this overdue reform, since the industry has at long last shaken off its depression—which blocked the reforms advocated seven years ago—and is busily carrying out an extensive rebuilding programme. To seize the chance thus presented will be both good morals and good business. And at a time when many measures of far more questionable economic merit are being urged on the community in the name of preparedness for war, it is worth while re-emphasising the traditional rôle of our mercantile marine as a carrier of supplies and a nursery of our naval forces. In the long run, the sea-going services, no less than the army, must offer attractive conditions of employment if they are to obtain ample numbers of the right type of recruit.

Notes of the Week

Masaryk.—Thomas Garrigue Masaryk, founder of modern Czechoslovakia and its President until 1935, died on Tuesday at the age of eighty-seven. One of the greatest personalities of the post-war world thus leaves the field of activity. This wise and venerable man retired from political life in December, 1935, leaving the leadership of the State he had founded to his collaborator, Dr Eduard Benes. Masaryk was born on March 7, 1850, in a little town of Moravia, a coachman's son. He was destined to learn the blacksmith's craft, but became one of the most unusual and happy of all statesmen; unusual because at the age of sixty-five he, a University professor, gathered the troops of his people outside the frontiers of Austria-Hungary during the Great War to lead them, as President of the State founded by him, into Prague after the Allies' victory; happy, because he attained all he desired—to liberate his people and give them their own State. He was even able to bring into double harness with himself his faithful pupil and co-worker to lead the State on a basis of conciliation between its peoples, democracy, and humanitarianism. He and Dr Benes worked in Hampstead during the war; and English was as natural to them as Czech.

* * *

To-day a nation is rarely led by professors; and the number of really great democrats standing at the head of Continental countries grows always smaller and smaller. Masaryk adhered to his ideals in spite of all changes in the face of Europe. He always emphasised that a State can be maintained only by those principles on which it was founded. When in December, 1935, with quiet dignity he laid down the Presidency, he did so in the way and the words of few statesmen to-day—as one to whom the individual means nothing, but the principle and the task everything. In his resignation speech of December 14, 1935, he said:—

> What we need is a good foreign policy, and at home justice for all citizens, whatever their nationality. I would like still to say that as my successor I recommend to you Dr Benes. I worked with him beyond the frontier and at home; and I know him. I am fully confident that all will go well, and if God wills it, I shall look on a little longer and see how you get on.

The key determining the music of Europe to-day differs from that of T. G. Masaryk. The people in Prague, standing by the bier of him who won for them their national freedom, may be proud to feel that the name of Masaryk belongs not only to them but to history.

* * *

Spain and the Mediterranean.—There has been a week's complete lull on Spanish territory, a few desultory actions taking place in Asturias and Aragon. General Franco has announced that he will only stop at a crushing and complete military victory over both Valencia and Barcelona, but the approach of winter in the high central plateau makes his victory seem a remote aim. Attention has been mainly riveted on the Mediterranean, where the effect of the Nyon Agreement has been suddenly to obliterate almost all evidences of the " unknown Power's submarines." General Franco's authorities have released two of the three British merchantmen held captive for two months; and another ship, captured last Saturday off Algiers, was allowed to proceed home. The Spanish Government, in a message from Valencia, have welcomed the Nyon Agreement, while General Franco's and Portugal's spokesmen have professed inability to understand why they were not invited to Nyon. General Franco was not invited because the Spanish Government were not invited; and, as the agreement records, no belligerents' rights are accorded to either side by the signatories, so General Franco has no standing for his protest. The Portuguese have some; for, after all, Germany, a non-Mediterranean State, was invited; on the other hand, Holland and Norway, whose big commercial fleets use the Mediterranean, were not invited, so Portugal's—and her friends, Germany's and Italy's—protestations savour of special pleading. Whether, as newspapers in their countries now threaten, the Italian, German and Portuguese representatives on the London Non-intervention Committee will try at its next meeting to hold it up, on the charge that the Nyon signatories have technically " intervened," remains to be seen. None knows what Russia will do to protect her cargo ships in the Mediterranean. And none knows whether the British and French Governments will agree, after Italy's refusal to attend Nyon, to allow her to mark out her own zones of activity as terms for her collaboration.

* * *

Light and Shade at Geneva.—At Geneva this week the annual session of the League Assembly, with the concurrent session of the Council, began. This time, the Assembly has started work in a gleam of light. The Nyon Agreement, which we discuss elsewhere in this issue, was concluded on the eve, and signed on the morrow, of the Assembly's opening meeting. The League, and all that the League stands for, will be strengthened by this success. The Assembly may also be congratulated on having avoided a pitfall which has once again confronted it. Nothing has been done to impugn Abyssinia's title to membership. The question did not come before the Credentials Committee because the Emperor wisely refrained from sending a delegation; but he did address a letter to the Secretary-General in which he once more stated Abyssinia's case and reminded her fellow States-members of their unfulfilled obligations. No member has had the face to move that, because these obligations have not been carried out, the Assembly should proceed to expel not the defaulters, but the victim of their default. So it has again been tacitly

reaffirmed that a breach of the Covenant does not legalise itself by being materially successful. This principle may still play an important part in a chapter of international history which opened in the Far East in 1931, but which is far from being closed to-day. On a long view, the prospects of the aggressors are not altogether rosy. But on a shorter view the gleam of light at Geneva is framed in gloom. One dark spot in the international landscape was touched upon in the opening speech of the outgoing President of the Assembly, Dr Negrin (Spain). The Assembly has paid no attention to General Franco's impudent demand that the credentials of the Spanish delegation should be declared invalid. On the other hand, it is unlikely to find itself able to take any practical action on the Spanish Government's arraignment of the Italian and German Governments for acts of aggression which they have been committing against it for more than a year past, and of which Signor Mussolini, for his part, has recently boasted with a studied ostentation. Nor is China's appeal under Art. XVII likely at present to have any more practical effect, despite Mr Koo's moving *exposé* on Wednesday of Japan's aims and methods in the Far East, and his reminder that if China is beaten, the other Powers—willy-nilly, within the League or without—will be left to face crude music if they want to save their interests. The tide of aggression is still flowing; and at the moment the League will probably be able to achieve little save in matters which do not directly touch the main issue. At its inception the sovereign States refused to make it supra-national. Now their own security is fast vanishing because their separatism and sovereignty have hamstrung the League.

* * *

Palestine Again.—Among the many side issues at Geneva is the problem of Palestine's future. The Council on Tuesday had before them the report of the Permanent Mandates Commission on the past administration of the Mandate, to which Mr Eden addressed himself. He remarked that none expected the twin goals of the mandatory's policy—Arab and Jewish nationhood and a Jewish National Home—to become two opposing poles, and pointed out how aggravated the situation had become because of the uprush of Anti-semitism in the West, and of Arab nationalism in the Middle East. Mr Eden, in asking for the Council's necessary approval to proceed with plans for partition, emphasised his Government's declared readiness to agree on any suitable scheme of partition. They were not bound to any details of the Royal Commission's recommendations. He proposed a further special body to visit Palestine and negotiate with Arabs and Jews for a scheme to be put before the Council. This body would have the task of delimiting agreed boundaries and making the financial arrangements for which the Royal Commission recommended the appointment of a financial commission. It seems that the Council will grant the British request; and then the real haggling will begin. That it will raise Arab and Jewish tempers again is to be feared, since murder and violence have recently once more reared their ugly heads in the Holy Land.

* * *

Rising Road Deaths.—In the wake of brilliant August weather and a record number of holidaymakers, come the official figures of road casualties. On the highways of Great Britain, according to the latest statement of the Ministry of Transport, some 612 persons were killed and 23,113 were injured in August. The number of deaths was 5 more than in July and 7 more than in August last year. It is true that the number of pedestrians fatally injured was 11 fewer than last year; that the number of injured declined in the same period from 24,116 to 23,113; and that the total number of killed and injured in the first eight months of this year was 153,700 against 154,092 in the same months of 1936. But the death roll for eight months was 4,237 against 4,043 last year. Clearly, the regulations and propaganda of the Ministry have barely sufficed to stabilise the total of accidents in face of an increased number of vehicles. The ultimate solution must be the adaptation of the roads to the needs of modern traffic and the requirements of public safety. Until this end is achieved, however, there is still considerable room for all road-users to exercise greater care, intelligence and restraint in the present inadequate and unsatisfactory conditions. The justified demand for better roads in no way excuses negligence or recklessness on existing highways, or disregard of inconvenient traffic rules which, in a better state of things, would not be necessary.

* * *

Physical Education.—The recent official recognition of the advisability of better facilities for physical training began with a Board of Education circular early in 1936, urging the need for more gymnasia, playgrounds, playing-fields, teachers and organisers, and for a new and extended curriculum in schools. The scope of this new policy of physical education was then increased to include those who had left school by the passing last March of the Physical Training and Recreation Act. The scheme has now been carried a stage farther by the issue of two handbooks by the Board of Education. These are intended to guide the physical training activities of all responsible for organising clubs, classes and centres; and for those who have left school they should serve the same purpose as the Board's Syllabus of Physical Training for schools. Indeed, these handbooks are remarkable in more ways than one. Blue-books are seldom "profusely illustrated." Still less often do they contain *dicta* about dress design. The drive towards a fitter nation has begun in earnest and, while the campaign must wait upon the appearance of an improved nutrition policy for general effectiveness, there is an encouraging breadth of vision in these books of guidance.

* * *

Political Processions.—The ban on political marches in the East End of London, due to expire on September 13th, has been extended for three months by the Commissioner of Police. The occasion of this decision was the Fascist proposal to march through the East End on October 3rd. The situation in the East End is still strained, largely on account of anti-Jewish provocation; and, although the route of the proposed march avoided specifically Jewish districts, the procession might well have been the cause of serious disorder. The task of the Commissioner is to preserve the peace. It is regrettable that freedom of political expression should be denied to any party, but the Fascists, by their deliberately provocative tactics, appear to have courted this latest rebuff.

* * *

American Monetary Policy.—One of the major aims of the New Deal, ever since its inception, has been to dethrone the New York Stock Exchange from its position of dominance in the American national economy. How imperfectly this aim has been realised has been demonstrated by the events of the last few weeks, when Wall Street has had a startling series of fainting fits. There has clearly been a divergence of opinion among the different agencies at Washington. The Securities and Exchange Commission, whose margin regulations are widely blamed in Wall Street itself for the trouble, has been unyielding. Mr Landis, chairman of the Commission, resigned some months ago, and his resignation happened to take effect this week. He made his own views clear, immediately after he ceased to carry official responsibility, by issuing a statement which put all the blame on the people who "fail to remember that Wall Street is bounded on the west by the United States of America." The Treasury, however, cannot afford to take this attitude of Olympian aloofness. It is still the largest actual or potential borrower in the country and has been suffering from the deterioration of the bond market.

Between the S.E.C. and the Treasury stands the Federal Reserve Board. Until recent months the Board's policy has been one of shortening monetary sail in order to remove all monetary incentives to inflation; the policy was exemplified by the successive recent increases in the percentages of reserves required to be carried by member banks of the Reserve system. This week, however, the Board has reserved its policy; reserve requirements are not to be lowered, but $300 millions of "sterilised" gold has been released, and the Reserve Banks are to engage in the open-market purchase of Government securities. These actions will, in the first stage, replenish the reservoir of credit precisely at the spot where it was tending to run dry, namely in New York City, where the banks have for some time past almost exhausted their excess reserves. But the effects will gradually be felt in a wider circle. The change of policy has had no perceptible immediate effect. It is an entirely different matter, however, to maintain, as is being done in some quarters, that it will have no effect at all, for it amounts to a formal notice that the authorities are not prepared to initiate or continue a restrictionist policy if the consequences are inconvenient to the Treasury. Next time the markets are in an expansive and optimistic mood, the logical conclusions will doubtless be drawn from this week's events. Sooner than was expected, it is being proved that consistent monetary policy is difficult, if not impossible, when the national Budget is unbalanced.

* * *

Japan's War.—Operations in China this week have been almost wholly confined to the north. The Japanese forces at Shanghai have formed a continuous line after the landing of all their reinforcements; and after assiduous bombardment of the advanced Chinese lines by Japanese warships on the Yangtse and by aircraft, the Chinese on Wednesday made an ordered retreat from the Woosung Creek-Hongkew line they have so stubbornly held. The new line now comes down from Lotien, 15 miles north-west of Shanghai, to Liuhang, 11 miles north-west; it then bulges out to Kiangwan, the racecourse, and thus to Chapei, across the river to the South Station, and then on well in front of the arsenal and powder factory. The Chinese have had three weeks to strengthen this reserve line; and they may hold it a long time. Meanwhile, the appointment of two of Japan's extreme militarists—Generals Terauchi and Matsui—to be Commanders-in-Chief on the northern and Shanghai fronts respectively, coincides with a big Japanese push in the north. The Chinese right flank was rolled back at Machang, 40 miles south-west of Tientsin on the Tientsin-Pukow railway; new attacks were then launched against the Chinese left flank at Kwan and the Liuli river, 30-60 miles south-by-west of Peking. The Japanese are also continuing their enveloping movement along the whole front from Kalgan through Liangsiang (Peking) to Tientsin, in an endeavour to destroy all solidarity in the Chinese forces. The naval blockade to below Hong Kong is being enforced by the Japanese with warships and war aircraft.

* * *

Nuremberg, 1937.—In one of his speeches at the Party's Rally of Work in Nuremberg last week, Herr Hitler—not for the first time, though perhaps in more emphatic terms than ever before—made the point that he has a programme of peaceful work for the German people within the four borders of the Reich, which will keep them busy for many years to come. If this was intended as a reassuring signal to the rest of the world, we welcome it. We also take it as a sign of grace that last year's drum-fire of vituperation at Russia was not repeated—though the usual things were not left unsaid. One small touch that was, perhaps, significant was Herr Baldur von Schirach's remark in his speech presenting the Hitler Youth to the Führer. He did not know, he declared, whether this or that boy was a little Catholic or a little Protestant, but he did know that every one of them was a believer in God. This ingeniously simple formula reconciles several desiderata of Hitlerian policy. It gives the impression that Deutschtum is something that unites people whom the churches divide. It stamps the Nazis as respectable deists in contrast to those godless Communists. And it also, perhaps, opens the door for a reconciliation between the Third Reich and the Vatican.

* * *

This reconciliation is reported to be one of the main objectives of Signor Mussolini in his forthcoming visit to Germany. "If I could do it, you can too," will be his argument with his fellow dictator. "You can see that it has cost me nothing, so why should you hesitate to follow my example? And if we can rope the Vatican into the Rome-Berlin axis, how much we both stand to gain!" Will the Vatican be disposed to lend itself to these tactics? Presumably it will first make some inquiries about the identity of the God whom the Hitler Youths are being taught to worship. We may reasonably assume that this is not the God of Abraham, Isaac and Jacob; and we have a shrewd idea of the Nazi divinity's name. The name is surely Deutschtum and the temple of this idol is the gigantic stadium of which the foundation-stone was laid at Nuremberg the other day by Herr Hitler himself. In this colosseum the German Leviathan is to sit and worship itself. The worship of the tribe is the religion which both Herr Hitler and Signor Mussolini are inculcating with all the resources of totalitarian tyranny. When Herr Hitler and his Party lieutenants swear that they will never allow what they call "Bolshevism" to settle in any other European State, we need not wonder at the tenuousness of the boundary between a stay-at-home, hard working Nazidom and an aggressive, expansionis

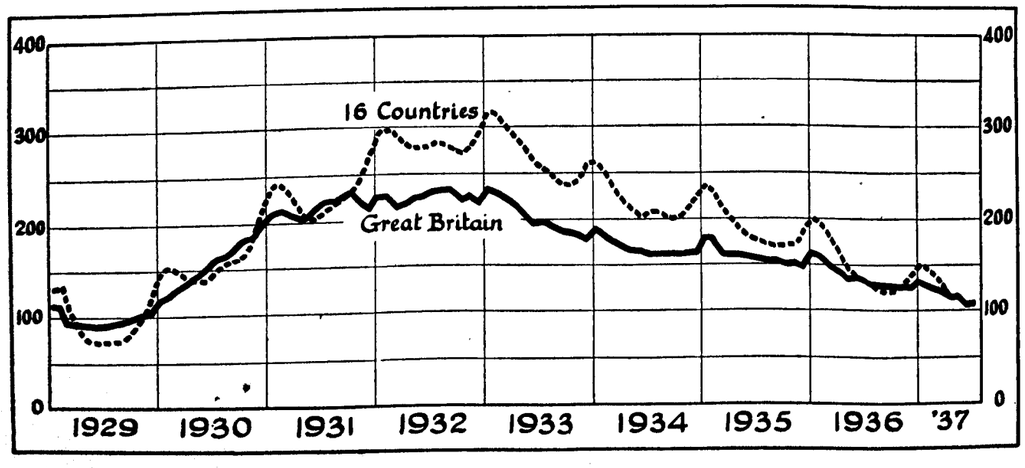
Deutschtum. What we still cannot quite understand is where Italy comes into all this Pangermanism. If Mussolini is to himself a Cæsar or a Sulla, how can he be an Alaric or Theoderic to Herr Hitler.

* * *

Native Policy in South Africa.—The process of reducing the already meagre status of the South African native is carried forward another stage by the newly passed Native Laws Amendment Act, 1937, which professes to implement the policy announced by General Hertzog last year. The new measure extends the Acts of 1923 and 1930, chiefly by handing over powers previously exercised by the Central Government to the local authorities. The former always had power, with the consent of the Governor-General, in "proclaimed areas" (i.e. areas in which the Governor-General had required natives by proclamation to live in defined locations or villages) to prohibit natives from entry into urban areas except under conditions it defined. Now any urban authority has this power and needs no consent from above. In addition, the Governor-General can now of his own motion prohibit entry. Foreign natives—by which is meant natives from outside the Union, the Protectorates and South-West Africa — are controlled even more rigidly; for they cannot enter these areas without the written consent of the Secretary for Native Affairs in consultation with the urban authority. This prohibition, however, does not apply to mining. Nor may any native reside upon land within five (or sometimes ten) miles of an urban area, though here again there are minor exceptions. Other provisions forbid the native (or institutions in which natives have an interest of more than 20 per cent.) to buy or lease land from non-native owners in urban areas.

* * *

The conditions which can be imposed upon native entry into the towns make interesting reading. For example, the prospective employer must give security that the native will be returned home when his contract is completed, and he may be compelled to pay the native's rent and other charges up to a quarter of the wage. The local authorities may also prohibit the entrance of female natives and forbid casual labour and independent contracting except service by the day under licence. They are given wide powers, further, to expel "redundant" labour in co-operation with the Governor-General. Unemployed natives, though not those permanently residing in the area, can be compelled to return home if they cannot obtain work within a fortnight. Lists of "redundant" natives may be drawn up and notices may be served on them, calling upon them to go to the area where accommodation has been provided. Non-compliance is to be followed by a warrant giving the police power to move them forcibly. They can also be ejected (and imprisoned) if, having been arrested, possibly without warrant, they cannot give magistrates "a good and satisfactory account" of themselves. Doubtless native legislation is technically the private affair of the Union: but few will envy the Colonial administrator his task of explaining to natives in other parts of Africa that this measure portends no ill to them. It is quite contrary to the whole spirit of trusteeship.



* * *

Unemployment at Home and Abroad. — As a companion to the chart showing the course of employment in sixteen countries and in Great Britain since 1929, which was given on page 514 of last week's issue of *The Economist*, we have prepared a chart to show changes in *unemployment* during this period. The index for 16 countries, like its counterpart in last week's chart, is calculated by the International Labour Office. Owing to changes in population, there is no close inverse correlation between the employment and unemployment indices. A comparison of the British and international unemployment indices shows a roughly proportionate movement until the autumn of 1931. After the gold standard was suspended in Great Britain, however, the international index rose well above the British index. The period between the autumn of 1931 and the turn of the following year saw a high but fairly stable level of unemployment in this country, and a further marked deterioration in conditions elsewhere. Since the beginning of 1933, both indices have followed a downward course, but the movement has been more rapid in foreign countries than in our own. Thus, by the middle of this year, when unemployment had been reduced almost to the pre-depression level, the two indices again closely coincided.

* * *

Railway Fare Policy.—An interesting article in the September issue of the *Economic Journal* by Mr E. J. Broster examines the effect of the last decade's general reduction in average passenger fares on the gross passenger receipts of the railways. The effect has been most marked since the introduction in 1933 of the Monthly Return Ticket at 1d. a mile, designed to prevent further losses of revenue to the road services and to regain earlier losses. Mr Broster argues that competitive road passenger development affecting railway traffics ended in 1931 or 1932; and that the factors influencing the trend of railway passenger revenues in the last five years have been changes in the purchasing power of money, movements in general prosperity and the declining level of fares. Accordingly, he first sets out the

INDICES OF UNEMPLOYMENT
(1929=100)

trend of *actual* annual passenger receipts since 1932 and variations in the average *actual* fare per mile in the same period. He then proceeds to adjust these figures to allow for changes in the cost of living and in the national income. He finally arrives at an estimate of the quantitative extent to which each factor—change in purchasing power, change in national income, and deliberate fare reduction—has contributed to the variations in passenger receipts since 1932.

* * *

His conclusion is that, from the point of view of the maximisation of gross passenger revenues, the reduction in the average level of fares was sound policy up to 1936. But he also argues that the railway companies' recent decision to raise rates and fares by 5 per cent. "or thereabouts" can reasonably be justified on financial grounds. The actual average fare in 1937 is probably lower than in 1936, and, since the value of the pound in terms of consumption goods has been steadily falling, the *real* fare is unquestionably lower than in 1936, when unit elasticity of demand for passenger travel had been all but reached. Accordingly, any appreciable further decline would, other things being equal, be accompanied by a fall in net revenue. Moreover, as Mr Broster points out, the chief concern of the railways is the maximisation not of gross but of *net* revenue. With a few exceptions, the fare which attracts the maximum net revenue is necessarily higher than that which attracts the maximum gross revenue. This is particularly the case when costs are rapidly rising.

* * *

A Scheme for Cocoa.—New arrangements for the purchase of cocoa on the Gold Coast market will come into force on October 1st, if negotiations now proceeding are successful. Competition among buyers on the Gold Coast has hitherto allowed the shrewd native sellers to play off one purchaser against another. "Gentlemen's agreements" among buying interests, it is alleged, have been nullified by the granting of secret commissions and excessive advances to the native growers. The new scheme drawn up by the West African shippers and the principal British and Continental cocoa manufacturers, is designed to eliminate these practices. Full details are not yet available, but there is apparently no intention of forming anything in the nature of a cocoa "pool." The signatories to the agreement will, it is stated, be allotted percentages of an agreed basic buying quota; though how this will work out in practice is difficult to foresee. In view of the recent upward movement of cocoa prices, the manufacturers can scarcely be blamed for attempting to obtain their raw material in the cheapest market. But whether the latest agreement will, in fact, succeed in stabilising the Gold Coast price remains to be seen.

* * *

What Sweden's Unemployed Have Done.—Unemployment in Sweden is down to a purely nominal figure. It appears to be as low as 10,000, of whom less than 1,000 are young men. It is interesting, however, to note what has been achieved by the Unemployment Committee in charge of the Government's public works schemes. Under the management of this committee the unemployed seem to have done a remarkable amount of work. They have built 6,250 kilometres of roads; 2,500 kilometres of ditches; and 24 flying-fields. Further, they have developed large areas for cultivation; improved the sewage system and the waterways, and built some new railway lines and canals. In addition to this, much work has also been carried out by the unemployed for the municipalities who managed their own schemes, but obtained support from the State through the Unemployment Committee. The opening up of waste land in the north of Sweden has provided many people with the means of maintaining themselves by cultivation and by seasonal work in the lumber industry. An interesting aspect is that of cost. During the 20-years period, 1914–1934, unemployment relief absorbed 679 million kronor. This does not include the costs of extensive special relief work organised during the years 1931–1934, nor the sums spent since. The total must amount to at least 1,000 million kronor; but the results are truly imposing. It is not without interest that 22 million kronor went in payment of unemployed labour engaged in "improving the churchyards."

* * *

Italy's Exchange Problem.—The latest statistical supplement to the Italian Official Gazette reports a surplus of imports over exports for the first seven months of 1937 of 3,678,806,000 lire (approximately £40 millions). This is more than double the deficit for the corresponding period of last year, and is surprising in view of previous forecasts by Italian economists of a trade deficit for the whole of 1937 of not more than 3,000 million lire; for even that is a figure much higher than has resulted from any recent year of normal trading. Estimates of the final deficit for 1937 have now had to be increased to 4,500 million lire. Nearly the whole of this difference can be attributed to larger imports of wheat, at 1,315,731,000 lire for the first seven months of 1937 compared with 127,672,000 lire for the same period in 1936. This is due to the very poor harvest in the cereal year 1935-36. On the credit side of the ledger, 1,000 million lire are expected from shipping, insurance and miscellaneous receipts and 2,000 millions from tourist traffic, which has been excellent this season. The latter figure can be deduced from an item in the Foreign Exchange Institute's budget which provides for a loss, to be met out of the taxpayer's pocket, of 200 million lire from the sale of "tourist" lire at about 10 per cent. below the official exchange rate. Even so, only two-thirds of the deficit in Italy's balance of international payments will be covered at most; and some 1,500 million lire will have to be offset, either by the export of gold or by letting the lira slide.

* * *

Good Business News. — This week's postbag from industrial centres contains few expressions of dissatisfaction with prevailing conditions. Lancashire cotton manufacturers have been less inundated with orders owing to the continuous downward trend of raw material prices. Any signs of a definite halt, however, are expected to bring out a substantial volume of new business. Yorkshire wool textile manufacturers, too, have received fewer orders as a result of the uncertain price of raw wool, but current activity remains high. The coal trade, on the other hand, remains brisk and profitable, the seasonal increase in household requirements having provided a further stimulus. Shipments of coal from Cardiff to September 12th this year were

14.7 million tons, against 11.8 millions during the corresponding period last year. Total output of coal is well ahead of last year, but production in the week ended September 4th, however, amounted to 4.8 million tons, compared with 4.45 millions a year ago. The number of persons employed rose from 748,600 to 780,300 during this period. In iron and steel the situation is unchanged. Supplies remain stringent and below consumers' requirements. Among the general indicators of business activity published this week, the overseas trade returns, analysed in the following Notes, show expansion in both directions. In fact, nothing has occurred which is likely to affect upward trend of business during the next few weeks.

* * *

Overseas Trade in August. — The only certain conclusion to be drawn from the latest returns of foreign trade is that the upward trend of exports and imports continues. In the chart below the trend of total imports and British exports is clearly shown :—

The detailed figures for August raise some important questions. Total imports continue to expand at a rapid rate, but the percentage increase over last year's figure has taken a sudden jump and now exceeds the percentage increase in exports. The increase in August was sufficiently great to make the aggregate increase in imports, for the year to date, proportionately larger than the increase in exports. Figures are shown below :—

MONTH OF AUGUST
(000's omitted)

	1935	1936	1937	Change between 1936 and 1937	
	£	£	£	£	%
Total imports	59,146	66,056	86,659	+ 20,603	+ 31·2
British exports	34,883	35,258	42,546	+ 7,288	+ 20·6
Re-exports	4,186	4,426	6,687	+ 2,261	+ 51·1
Total exports	39,069	39,684	49,233	+ 9,549	+ 24·3
Excess of imports over exports	20,077	26,372	37,426	+ 10,854	+ 42·7
Transhipments under bond...	2,024	2,524	2,969	+ 444	+ 16·9

FIRST EIGHT MONTHS
(000's omitted)

	1935	1936	1937	Change between 1936 and 1937	
	£	£	£	£	%
Total imports	479,045	536,565	654,375	+117,810	+ 22·0
British exports	277,737	283,170	341,439	+ 58,269	+ 20·6
Re-exports	36,744	41,810	54,201	+ 12,392	+ 29·6
Total Exports	314,481	324,980	395,640	+ 70,660	+ 21·7
Excess of imports over exports	164,564	211,585	258,735	+ 47,150	+ 22·3
Transhipments under bond...	15,818	17,784	24,504	+ 6,720	+ 37·8

Between July and August, imports rose by £1,154,044 and total exports fell by £5,450,785. These movements are in the usual direction, but the latter figure is uncommonly large. It is mainly to be accounted for by smaller deliveries of ships, locomotives, aircraft, iron and steel manufactures and machinery. Since many accidental factors influence the monthly totals for these categories, undue weight cannot be attached to these changes: it will not be possible to draw clearer conclusions until the figures for the next two or three months are available.

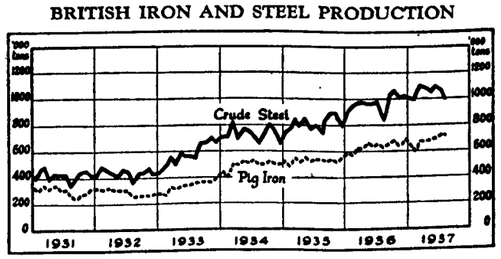
Trade by Commodities.—The two tables given below record the quantitative changes in the main items of import and export in August of the last three years:—

TABLE I.—RETAINED IMPORTS—MONTH OF AUGUST

Item and Measure	1935	1936	1937
Wheat ..... '000 cwts.	7,041	7,483	8,588
Beef and veal ..... '000 cwts.	1,411	1,178	1,181
Mutton and lamb ..... '000 cwts.	507	442	693
Sugar, unrefined ..... '000 cwts.	3,587	4,136	3,551
Iron ore and scrap ..... '000 tons	403	630	891
Raw cotton ..... '000 centals	618	1,145	645
Sheep's and lambs' wool ..... '000 centals	391	334	374
Flax, hemp and jute ..... tons	17,509	21,757	18,019
Crude petroleum ..... '000 galls.	45,617	50,565	42,966
Hides, wet and dry ..... '000 cwts.	128	168	217
Wood pulp ..... '000 tons	194	197	172
Rubber ..... '000 centals	363	89	414
Unwrought copper ..... tons	22,979	27,588	37,904
Pig lead ..... tons	28,998	29,424	27,379
Tin, ore and concentrates ..... tons	3,421	4,033	5,091
Tin, blocks, ingots, slabs and bars ..... tons	2,430	432	2,932
Iron and steel manufactures ... '000 tons	74	142	213
Machinery ..... tons	5,421	8,227	12,667

In themselves, the figures for imports in a single month do not tell very much, but the cumulative figures for the first eight months of the year actually tell much the same story. Most imports have increased gradually in quantity, and substantially in value. The value of food, drink and tobacco imported so far this year has increased 12 per cent. over 1936; of raw materials, etc., 29 per cent.; and manufactured articles 30 per cent.

TABLE II.—BRITISH EXPORTS—MONTH OF AUGUST



Item and Measure	1935	1936	1937
Coal ..... '000 tons	3,451	2,754	3,529
Iron and steel scrap ..... tons	9,491	8,350	12,818
Pig iron and ferro-alloys ..... tons	12,077	10,056	14,231
Railway materials ..... tons	20,135	21,137	23,838
Total iron and steel manufactures ..... tons	193,634	163,959	201,352
Textile machinery ..... tons	5,135	4,248	5,858
Total machinery ..... tons	28,653	28,243	34,723
Cotton yarns ..... '000 lbs.	11,943	11,685	13,577
Cotton piece-goods ..... '000 sq. yds.	160,557	158,995	161,992
Wool tops ..... '000 lbs.	3,634	3,928	3,303
Worsted yarns ..... '000 lbs.	2,503	2,166	2,025
Woollen tissues ..... '000 sq. yds.	8,025	7,907	8,377
Worsted tissues ..... '000 sq. yds.	3,946	3,889	4,145
Linen piece-goods ..... '000 sq. yds.	4,492	6,563	6,494
Leather boots and shoes ..... doz. pairs	30,494	27,110	35,494
Leather ..... cwts.	18,735	19,661	18,201
Paper and cardboard ..... cwts.	322,923	290,185	393,353
Locomotives, complete and parts ..... tons	1,191	1,064	1,653
Motor vehicles and chassis ..... tons	4,406	5,458	8,433

By contrast with the import figures, practically all the chief exports have risen in quantity, in nearly every case by a larger percentage than is the rule among imports. The aggregate value of manufactured exports this year, which account for over two-thirds of our exports, has increased by a trifle over 20 per cent. But it remains to be seen whether the increasing demand of the raw material producing countries will help to restore the terms of trade in our favour.

* * *

Steel Imports Exceed Exports.—Last month a seasonal decline occurred in the output of both pig iron and crude steel, though the reduction was less marked than a year ago. The course of output since January, 1931, is shown graphically in the following chart:—

BRITISH IRON AND STEEL PRODUCTION

Exports also showed a seasonal reduction but imports rose further, and, in volume, actually exceeded British exports, indicating the change in the situation that has taken place since 1932 when a tariff was imposed to keep out foreign materials.

(In thousands of tons)

Period	Production		Foreign Trade	
	Pig Iron	Steel Ingots and Castings	Total Imports	British Exports
1913—Monthly Average	855·0	638·6	185·9	414·1
1929 " "	632·4	803·0	235·2	364·9
1932 " "	297·8	438·5	132·7	157·4
1936 " "	640·5	974·8	123·6	183·8
1936—July	665·6	974·1	170·3	216·1
" August	635·8	872·7	141·8	164·0
" September	650·8	1,027·0	165·0	183·0
" October	670·3	1,060·5	101·0	194·4
" November	643·1	1,001·3	90·7	193·3
" December	671·4	1,019·2	94·8	204·8
" January	650·7	998·9	83·1	215·0
1937—February	603·7	995·9	82·9	200·5
" March	680·3	1,109·5	94·3	231·6
" April	680·7	1,080·4	88·5	239·5
" May	696·3	1,047·3	98·1	228·3
" June	699·3	1,106·4	174·8	235·4
" July	729·3	1,059·2	202·3	232·2
" August	712·6	987·7	213·4	201·4

The increase in imports has tended to alleviate the stringency of supplies, but only to a slight extent; for requirements continue to exceed supplies. Demand is as strong as ever, and there are no indications that the industry will be able to meet in full the requirements of consumers at current prices during the next few months.

* * *

Unemployment Among Older Workers.—In a Note of the Week on page 425 of *The Economist* of August 28th we published a table which showed how the decline in the total number of unemployed since May, 1936, had been accompanied by a significant change of age distribution in favour of the younger. The following table relates the numbers of unemployed men on the registers of Employment Exchanges in England and Wales to the total male population in different age groups in May, 1935, 1936 and 1937:—

NOS. REGISTERED AS UNEMPLOYED, AS PERCENTAGES OF TOTAL MALE POPULATION IN CERTAIN AGE GROUPS
(ENGLAND AND WALES)

Men	May			
	1935	1936	1937	
	Actual Percentages	Actual Percentages	Actual Percentages	*Datum Percentages* (*)
18–20	7·8	5·3	3·6	*5·2*
21–24	13·6	10·2	7·4	*9·0*
25–34	10·7	8·4	6·4	*7·1*
35–44	10·3	8·6	6·9	*6·8*
45–54	11·2	9·6	8·1	*7·4*
55–59	13·3	11·9	10·4	*8·8*
60–64	12·8	11·9	11·3	*8·5*
All 18–64	11·2	9·2	7·4	*7·4*

(*) Percentages presuming the changes in all age groups to have been strictly proportionate to the change in the *total* percentage between 1935 and 1937.

As a glance at the actual percentages for May, 1937, will show, the incidence of unemployment now increases steadily with advancing age, from 3.6 per cent. in the case of men aged 18-20 to 11.3 per cent. among men aged 60-64. In addition, while unemployment declined considerably in all age groups between May, 1935, and May, 1937, the decline was far greater among younger than among older men. The last column in the table shows what the percentages would have been in 1937 if the decline since 1935 had been the same at all ages. It will be seen that among men under 35 the proportion unemployed fell to a greater extent than could be accounted for by the general recovery, whilst the opposite was the case with those over 45 and, more particularly, over 55. As the number of older persons in the community is destined considerably to increase in the next few decades, the marked tendency of employers to prefer younger to older men gives rise to disturbing implications. The figures point the moral of the appeal made to employers by Mr Ernest Brown, Minister of Labour, in his tour through the Special Areas this month, to take on additional workers, as far as possible, from older men.

* * *

Indian Railway Inquiry.—A Committee set up last October under the chairmanship of Sir Ralph Wedgwood recently issued its report on the Indian State Railways. The Committee was appointed when it became apparent that Sir Otto Niemeyer's proposal that the State Railways should make a substantial contribution to the Federal Budget under the new constitution needed further examination. The terms of reference were wide and closely resembled those of the multitude of Commissions which have in the last few years examined nearly every railway in the world. The report points out that the Indian State Railways have withstood the depression better than most and have recently much increased their efficiency. It recommends the collaboration of road and rail transports, proposes two minor amalgamations and advocates the cultivation of "good public relations." But its financial proposals conflict somewhat with those of Sir Otto Niemeyer in that the State is advised not to look to the railways for funds in relief of taxation. This conclusion is reached, not so much on a broad point of general principle (though that alone would have been an excellent ground), as on a careful estimate of practical possibilities. The Committee urges the need for a carefully administered depreciation fund and for a general reserve fund to cover the fluctuations of revenue in the course of the trade cycle. Only after examining the desirable dimensions for these funds does the Committee decide that no surplus is likely to be available for general revenues and that the State should accordingly confine its interest in the railways to that of a debenture holder. The implication is, in short, that the State Railways should be raised to a status closely resembling that of the majority of English public utilities.

India's Food Problem.—In *The Economist* of December 26, 1936 (page 627), a correspondent discussed the nutritional adequacy of India's food supplies. The writer of that article is now able to add a number of new facts. After making certain consequential adjustments, the following figures are obtained of the amount of foodstuffs available per adult unit per day in British India:—

	Corrected Daily Average (Grms.)	British Medical Association Scale (Grms.)	Deficiency or Surplus (Grms.)
Proteins, 1st class	17	50	*— 33*
Proteins, 2nd class.....	55	50	5
Fats	37	100	*— 63*
Carbohydrates	548	500	48
Calories	*2,887*	*3,390*	*— 500*

If the B.M.A. scale is adopted, we find that there is not a surplus, but a deficiency of calories in the total food supply of British India. But the B.M.A. scale of 3,390 calories per adult unit is too high for India. Dr Akroyd, at the Indian Science Congress, declared that he estimated the minimum daily requirements per consumption unit of a South Indian peasant family at about 2,500. The conclusion of the December article, therefore, still stands; that the main problem is not so much a deficiency of calories as of fats, animal proteins and generally of the protective foods; and to give a balanced diet, the output of milk needs to be increased to at least twice its present figure.

Mixed Business Prospects

New York, September 7.—Labour Day, which this year fell on September 6th, is the traditional boundary between summer dullness and autumn revival. This year it seems unlikely that the conventional pattern will be noticeable. Except in the security markets, the summer has not been dull. On the contrary, June and July, which are seasonally months of receding production, were remarkably active this year; while August, which usually brings signs of upturn, showed some tendency to sag.

But the evidences of recession in August were indecisive and few. Steel operations, for example, have been steadily maintained at about 85 per cent. of rated capacity throughout the summer, and at the current level are still about 15 per cent. above that of a year ago.

Residential building, whose recovery was checked in July, 1936, by rising costs, ran for twelve months at about the level of that month; but it is now reported that residential building permits have slumped sharply this summer. Retail trade is remarkably slack, even for the summer, and gives no sign of the "increased consumer purchasing power" ostensibly created by the wage increases of recent months. Indeed, the sum of the evidence to date suggests that the increase in labour costs has been more effective in raising retail prices than in enlarging consumer demand. The high cost of living has once again become a stock subject of discussion.

It must not be supposed that the hope of an autumn revival has been abandoned. The gloom which still encircles Wall Street is not at all the mood of the industrial community. Industry is going ahead with sales campaigns, plant improvement and expansion, etc. These are sound reasons for questioning the objectivity of Wall Street's view about the current state of our economy; but there are equally sound reasons for not belittling the difficulties of our capital market. Industrialists may be quite right about the immediate course of business; but in the long run the problems which are agitating the security market are not without bearing on industry, however slow they may be in making themselves felt.

Stock Exchange Depression

It is well known that the volume of activity in our security markets is too small to support a financial centre geared to the extreme speculative activity of the past. It is estimated that Wall Street requires an average daily volume of approximately 1,500,000 shares to cover its costs with some comfort; and that volume has been rare in recent months. The result is that Stock Exchange seats sell practically at their 1932 low prices; several thousand employees have been discharged this year; and wages and salaries are extremely low. Persons are employed in fairly responsible positions in brokerage offices at wages which compare unfavourably with those of the lift operators in their office buildings. That is, Wall Street, as an industry and as a locality, is still in a process of deflation.

But another angle of the same picture is more significant. In the past six months the behaviour of quotations on the New York Stock Exchange could by no definition be described as orderly. From 195 in February the Dow Jones Averages fell abruptly to 165 in June, bounced back to 190 in early August and fell approximately to the low levels of June by the end of that month. During this period, business activity was on a singularly even keel, running from month to month with scarcely a tremor. There were, however, a number of factors influencing purely speculative sentiment—the gold scare, the steel strike and its ending, a sequence of international alarums. The significant fact is that market values could be so violently impelled, first in one direction and then in another, by considerations which moved few persons to action. The market is over-sensitive to ephemeral and even superficial influences.

No doubt a variety of factors have contributed to create this condition. Commonly, the Securities and Exchange Commission is blamed. By its relatively stringent margin requirements the S.E.C. has certainly reduced the activity of the casual speculator and so thinned the markets. But it would be difficult to prove that margin trading was essential or even conducive to orderly or stable markets.

Corporations Tax Effects

On the whole, it seems likely that the changes in our tax laws have a bearing on the question. It was until recently a common practice among American capitalists in the higher tax grades to incorporate their security holdings in the form of personal corporations or private investment trusts. In this form, distributed earnings, whether capital gains or income, were subject to the personal income tax; but so far as the corporation and its undistributed earnings were concerned they were subject only to the corporation tax. In 1934 such personal corporations were made the subject of special legislation, which imposed on their undistributed earnings a rate of about 30 per cent., or about double that on public corporations. In 1936 this tax was raised to a maximum of 48 per cent.; and this year the tax on such corporations was made higher than the highest rate of tax on personal incomes.

Thus on current income a corporate security must yield over 6 per cent. to compete with tax-exempt municipals available on a 3½ per cent. basis, for any individual subject to a 50 per cent. income tax. Whenever corporate securities yield less than 6 per cent. it may be advantageous for such persons to switch from taxable to tax-exempt securities.

Capital gains are counted as income, and subject to the full income tax, on all realisations within one year, with a descending scale on securities held for more than one year. While an investor might be willing to risk a certain amount of market trading against a 30 per cent. tax on his capital gains, no investor is so accurate in his market prognostications as to carry a handicap materially higher than that. As a consequence, large investors have tended more and more to withdraw from active participation in the markets of corporate securities. The absence of such participation has been a conspicuous fact during the past year, and even more so since the introduction of the latest tax bill in early August.

France

Foreign Policy and the Franc

Paris, September 15.—The firmness of the English and French Governments at the Nyon Conference had the entire support of public opinion in France, which considers that freedom of communications in the Mediterranean must be safeguarded, and that the prestige politics of the dictatorships do not matter so long as this policy does not overshadow the prestige and interests of the democracies. But the latest fall of the franc, the reappearance of strikes—notably a four-days' stay-in strike in a motor factory—and the destruction of the offices of the Employers' Federation by a bomb, are not factors likely to enhance prestige. The press is urging that a policy of authority in foreign affairs must be backed up by the spectacle of order and power at home.

As to the franc, which has plunged below 145, it is urged that a "floating" franc should not become a "drifting" franc. The reserves of the Equalisation Fund are perhaps adequate. The Rentes are showing a stout resistance in face of events abroad and of the dullness of foreign markets, and Wall Street in particular. But recent events have served yet again to underline the internal causes of the weakness of the currency—particularly the deficiency of production and the huge import surplus.

The bombing of the headquarters of the Employers' Federation was actually condemned by the Trade Unions. Thus, if this crime were aimed at provoking new conflicts in the community, it has failed. But although French solidarity in face of foreign disturbances and extremist plots has been reaffirmed, the Government is still experiencing considerable difficulty in securing the collaboration of both employers and employed. The latest example is that of the miners, who are now attaching to their offer to work four extra days in the next four months conditions to which the coal owners can scarcely agree. But to eliminate the import surplus due to the deficiency of production would necessitate much more than four extra days' work in four months.

This being the case, the issue of the pending Inquiry into the state of production, which apparently aims to force the Trade Unions to accept new working conditions, is doubtful. These circumstances explain why M. Chautemps has declared that, if a new Charter of Labour could not be obtained by the good will of the employers' and workers' organisations, the Government would take the responsibility of laying before Parliament a Bill to fix the juridical relations between Capital and Labour. The conclusions of the Inquiry must be made known at the end of the month. But the cantonal elections in a month's time will offer public opinion an occasion—the first since the Popular Front elections of 1936—to express its temper.

Political Auguries

No doubt the rise in prices, the foreign menace and—last but not least—the bomb outrages, will cause a large section of opinion to declare itself for a policy of authority. Another section, on the other hand, is now accustomed to the new social policy, but is at the same time more and more shocked by events in Soviet Russia. Nevertheless, one must reckon with the electoral alliances: even if the three parties of the Popular Front go separately to the poll, what combinations will be arrived at for the second ballot? The Socialists have recently declared in favour of resistance to the Senate, credit-control, and the nationalisation of key industries. Will they ally themselves electorally with the Radicals or the Communists? And will the Chautemps Cabinet or its successor be able to follow a policy modelled on the compromise over the railways? Though there are actually signs of a break in the Popular Front, the time does not yet seem ripe for the Ministry of the Centre, for which—inspired by the example of Belgium—so many people now wish.

Huge Import Surplus

Last week saw a new and sharp rise in prices. The general index moved from 589 to 605, the index of domestic products rising from 602 to 616 and of imported products from 566 to 585. The index of food prices rose markedly from 608 to 630, an advance which will rapidly make itself felt in the cost of living.

Foreign trade in August showed a general diminution in both quantity and value, and in both imports and exports. The import surplus was a little lower than in July :—

('000 francs)

	August, 1936	July, 1937	August, 1937
Imports			
Foodstuffs	513,467	776,334	780,327
Raw materials	957,887	1,878,567	1,861,102
Manufactured goods	293,495	544,814	516,820
Totals	1,764,849	3,199,715	3,158,249
Exports			
Foodstuffs	179,352	246,334	229,272
Raw materials	336,632	658,139	668,483
Manufactured goods	653,611	967,649	963,603
Totals	1,169,595	1,872,121	1,861,358
Import surplus	595,254	1,327,594	1,296,891

In August, the tonnage of exported manufactured goods declined, though the value remained comparable to that of July as a consequence of the rise in prices. Imports and exports of raw materials continue to be considerable, the imports of coal being 2·5 million tons valued at 450 million francs, compared with 1·9 million tons and 179 million francs in August, 1936.

In the first eight months of the year, imports were valued at 26,600 million francs and exports at 14,700 millions—an import surplus of 11,800 million francs. In this total imports from the Colonies were valued at 6,260 million francs, against 4,393 millions in 1936; and exports at 4,310 millions against 3,124 millions. The import surplus in colonial trade was thus 1,947 million francs, which added to a deficit of 9,924 million francs in trade with foreign countries gives the total of 11,800 millions.

Germany

Mussolini, Hitler and Britain

Berlin, September 14.—With the Nuremberg Congress over, interest is concentrated on the impending visit of Signor Mussolini. The visit will be a giant demonstration of solidarity, if not exactly, as is affirmed, "the most portentous meeting of rulers in history." It is conceivable, but not likely that some kind of formal diplomatic or military association will be announced. The event is hailed as a triumph for Germany in particular, as if the Third Reich needed overt recognition and patronage which the better-established Fascist system can do without.

The visit will increase German self-esteem. It is an important event in view of the not very satisfactory relations of both Germany and Italy with Great Britain. To Germany, as to Italy, England is undoubtedly the great antagonist. It has become the rule here to treat France as being out of the international race—sometimes as a British, sometimes as a Russian, satellite. The other animosity—against Russia—is unreal; indeed, it is a mere offshoot of that very real hatred

of the Jews, which is the one consistent passion of National-Socialists.

Yet to say that Anglo-German opposition is more real than Russo-German opposition is not to say that it is well founded. The opposition derives in great measure from its constant advertisement by persons, mostly English, who imagine that it would be easily ended if only statesmen were reasonable; and, with still greater optimism, that were it ended permanent European pacification would result. Between the two nations stand the realities of suspicion, resentment, and censoriousness, the very things which the best diplomatists could not overcome.

But the concrete problems which are sometimes supposed to separate England from Germany are either no problems at all, or remote contingencies. That applies first of all to armaments. Disarmament is not a mere Anglo-German issue; and since London acquiesced in the Reich's repudiation of the Versailles restrictions, it cannot make the dimensions of German armaments a cause of complaint. The question of a Western Pact is in the same category. If Locarno is dead through German act, a new Locarno may, indeed, be hoped for, but no grievance can be made out of Germany's unwillingness. It would probably improve Anglo-German relations were this issue entirely dropped, even if the alternative was the much-abused pre-war alliance system.

What other grievance England could have against the Reich it is hard to say. Germany's aggressive designs are by no means so obvious as alarmists think. There have been, indeed, authoritative German utterances in favour of war, but, almost simultaneously, utterances in favour of peace. As there is no continuity or consistency in German foreign policy it might be well to ignore both. And Germany's economic isolationism is her own affair. According to that very school of economists who condemn it most, it will do the most harm to Germany herself.

Baseless Antagonisms

Neither can it be said that Germany has any well-founded complaints against Great Britain. Indeed, the incessant German outcry about the lack of reasonable opportunities for development and expansion is usually directed against the world as a whole, being associated with the alleged Judeo-International conspiracy. Further, the outcry is accompanied by the announcements that Germany can triumphantly solve her economic problems; that she is making better materials than she could import; and that she has a better currency system than her richest competitors. Even if all these claims were baseless, it would hardly be London's business to help the Reich.

The recognition by prominent Englishmen, some in office, of a vague kind of international collectivism from which Germany might ultimately benefit has done only harm. The notion that, because Kent ought to help Sussex if Sussex has not enough to eat, one country is obliged to help another is inconsistent with the essentially national basis of international relations; and an England competing with Germany in armaments, yet helping Germany economically, despite the apprehension of war, would be acting unreasonably. The same applies to colonies. An England setting up anti-aircraft guns in one colony and presenting Germany with colonies which she would certainly, and quite properly, use as aviation bases would be absurd.

If the conflict of ideologies is a cause of Anglo-German antagonism, it is not England's fault but Germany's. It is quite true that private Englishmen, on platforms and in the Press, often express themselves unfavourably about the Nazi political philosophy and internal methods; and private Germans might be expected to retort. But private Englishmen may also publicly approve of National-Socialism, and Germans know that many do so; indeed their Press gives more than due advertisement to a few Englishmen who proclaim that Germany is always in the right and England always in the wrong. But anti-English agitation in Germany is not private but governmental. The attacks on England are sometimes very intemperate. The notion that Englishmen are particularly censorious and intolerant about foreign ways is the very contrary of the truth. In a world in which Russia will not tolerate Nazis, Fascists, or Democrats; in which Fascists and Nazis will not tolerate Communists nor Democrats; and in which all three are making war in order to enforce their respective political crazes, England deserves praise for her relative calm. Contemplating the Nabob's treasure of fanaticism and fury on the Continent, the most censorious Englishman might be surprised at his own moderation.

In fact, in so far as political systems are concerned, the German grievance is not that England is intolerant but that she is tolerant—in the wrong direction. The complaint at Nuremberg was that the Democratic countries would not join in the ideological war against Communism, which Herr Hitler and Signor Mussolini, the former with apostolic fervour, the latter probably with diplomatic guile, are now actively engaged. But Germany is resolved to extirpate Bolshevism. Yet she denies any intention of interfering in other countries or attacking Russia.

In all this confusion of thinking, one seeks in vain any indication of Germany's meaning when she summons the world to an anti-Communist campaign. Had Berlin any practical proposals for combating political tendencies which it does not like, and if it had any hope of their acceptance, it would long ago have made concrete proposals. There have been no proposals to convert the agitation into policy because there is no substance in the policy itself.

Hungary

Foreign Debt Settlements

Budapest, September 10.—That an all round resumption of direct transfer—though on a moderate scale—on all foreign debts, public and private, short and long term, is attempted without recourse to new foreign borrowing, clearly demonstrates that Hungary's financial administrators are attempting to adapt the economy of the country to its own resources.

In the first post-war reconstruction period, from 1924 to 1931, foreign borrowing enabled Hungary to spend considerably more than she produced. Later, a painful process of readjustment, beginning with a transfer moratorium on the foreign debt service and a budgetary deflation, was necessary to reach a new level of equilibrium. This seems to have been attained now, for the first time since the collapse of 1931. The Budget is balanced in spite of the heavy deficit of the State Undertakings, and foreign trade returns show a sufficient surplus for the new contractual obligations to be met.

The transfer moratorium is being gradually liquidated, but the exchange control cannot be discontinued for some time. The pengö has settled down to a new level, approximately 65 per cent. of its former gold value if the standard rate of surcharge is taken as a base. Though the authorities are buying gold at 5,800 pengö per oz., that is 53 per cent. over and above the old par rate, the revaluation of the pengö has not yet taken place. It is felt in competent financial circles that Hungary must await the stabilisation of the principal currencies, including the German mark and various other Central European exchanges, before another new par can be fixed in terms of gold or sterling.

The new debt settlement calls for an annual transfer of approximately £3 million, of which nearly £2 million is to be devoted to interest and the rest to amortization of the principal. As the export surplus for the first six months of the year is almost 75 million pengö, or just about £3 million, calculated at the standard surcharge rate, it would seem that the foreign exchange necessary

to satisfy all the foreign creditors is already at hand. This, however, is not so. Germany, Austria and Italy are the chief outlets for Hungarian exports, but they are not the chief creditors. Out of the 75 million pengö trade surplus achieved in January-June, 1937, more than two-thirds, 55 million pengö, have been obtained from the above named three countries. And, as is well known, neither German marks, nor Austrian schillings or Italian lire are freely convertible, so that from these balances no transfers into sterling, dollars, francs, guilders, etc., can be automatically effected.

In order to overcome the shortage in convertible foreign exchanges, the Hungarian authorities established in co-operation with the interested foreign creditors a system of additional exports to procure funds over and above those obtained from normal exports. The additional exchange gained from these exports went to the foreign creditors as a *quid pro quo* for the considerable sacrifices they accepted in liquidating their blocked pengö balances. These additional exports play a most important part in the temporary three years agreements with the various groups of foreign creditors. The settlements effected have been based on the experience of the past two years, when indirect transfers have been made from the proceeds of the additional exports to those who participated in the scheme at their own initiative.

Opinion on the Agreements

Not the least significant aspect of the new settlement is the satisfaction with which the move of the authorities was received by public opinion in Hungary. It is true that some politicians complained that the agreements involve additional burdens on Hungary, but Government and financial circles, including the debtors themselves, feel that the new obligations—unless some unforeseen major disasters occur—are about equal to the real transfer capacity of the readjusted economy of the country. The League Loans Committee has expressed the opinion that it was inevitable that the total foreign debts of Hungary should be scaled down; and that the offer to pay 50 per cent. in perpetuity is the "serious offer of an honest debtor."

In spite of the somewhat poorer crop prospects as compared with the bumper wheat harvest last year and because of the higher prices obtainable in the world markets for agricultural commodities, recovery proceeds hand in hand with sound public finances. Credit conditions are better than at any time since 1930. Banks are eager to resume lending. Liquidation of the partial agricultural moratorium, cautious financing of the new rural settlement policy, expanding public works and a series of social improvements afford legitimate grounds for the moderate optimism which prevails both in political and financial circles, that the second financial reconstruction, though less spectacular than the first, rests on solid foundations.

Japan

The Cost of War

Tokyo, August 11.—The special session of the Diet, which sat for a fortnight and adjourned on August 8th, approved supplementary estimates for the North China expenditure, the Gold Revaluation bill, tariff revision, and a few other urgent measures, mostly relating to national defence and international payments. Supplementary estimates for the North China operations, etc., amount to 537 million yen; and these bring national expenditure for the current fiscal year up to an unprecedented total of 3,409 million yen. The North China expenditure is to be supplemented by an additional levy upon personal and corporation income, excess profits, dividends and interest, and a new sales tax on jewellery, musical instruments, photographic apparatus, and the like.

The Gold Revaluation Act provides for the revaluation of the gold stock of the Bank of Japan together with that of the Bank of Chosen and the Bank of Taiwan, and the transfer of the writing-up profits to the Government's special gold account. The basis of the revaluation is fixed at 290 milligrammes to the yen against the old basis of 750 milligrammes or, roughly, 10 per cent. below the world gold price. The gold holdings at the new valuation will amount to 1,213 million yen, of which 800 million yen will be retained by the central bank, and the balance of 413 million yen will be transferred to the exchange readjustment fund.

In the tariff revision, the duties on petrol, motor vehicles and parts, card clothing, and cassava root are revised upwards; the additional special duty of 35 per cent. on refined sugar, caustic soda, textile yarns, printing paper, copper, and other non-ferrous metals is repealed; and iron and steel, wood pulp, newsprint, and synthetic oil are put on the free list.

Rising Import Surplus

The upward trend in imports was continued markedly in July, and the import surplus mounted, although July is the month when heavy exports should normally begin. The trade returns for July show that, compared with the corresponding month of 1936, imports rose by 155,943,000 yen (76.7 per cent.) and exports by 59,292,000 yen (26.6 per cent.). Thus the import surplus amounted to 77,072,000 yen, bringing the total in the first seven months of this year up to 695,372,000 yen. Iron and steel, non-ferrous metals and mineral oils accounted for nearly half the increase in imports; iron and steel imports alone rose in value by 59,163,000 yen. On the export side the expansion covered the whole list with the single exception of vegetable oils. Cotton exports increased by 8,448,000 yen, and raw silk exports by 4,127,000 yen.

The earnings statements so far published of important industrial companies for the first half of this year show that profits are still rising, and that the momentum of their advance has increased rather than decreased during the last six months. A large number of concerns in the iron, coal and steel, engineering, rubber, and shipping groups showed marked improvement, and the mid-summer dividends have generally been maintained, and even increased in some cases. The textile results, which recovered in the latter half of 1936, show a further definite improvement, and so have the earnings of trading companies.

Other economic indices for July do not disclose any striking change of trend compared with recent months. The Bank of Japan's index of wholesale prices for July showed a slight rise of 0.3 per cent. on the month. The output of cotton yarn in July totalled 134,948,000 lbs., a decrease of 1,236,000 lbs. compared with June; while rayon production amounted to 29,467,000 lbs., an

increase of 1,588,000 lbs. The aggregate value of all shares listed on the Tokyo Stock Exchange on August 1st, however, was down heavily by 519.9 million yen, or 6.2 per cent., compared with the previous month.

South Africa

Building Boom Checked

Johannesburg, August 23.—A big drop in building activity in Johannesburg occurred last month. The official figures show that 1,010 plans were passed by the municipality in the month, a fall in value of more than £250,000 below the record average of £1,000,000 a month in the previous six months. This indicates that while there is no abatement in the demand for residences, there is a lull in the big programmes for public and municipal buildings. No application for a building of more than £30,000 was received.

August started auspiciously with the passing of plans for a new hospital for the Transvaal Chamber of Mines at Cottesloe for £155,000. Informed opinion regards the drop as partly a lull after the temporary setback to the stock market nine weeks ago, but chiefly as the end of the period of abnormal activity to provide accommodation for the huge influx of people to the Rand since 1934. A new period of expansion will follow, it is thought, with building activity firm at slightly lower levels, but still well above normal.

Industries in Rural Areas

A Government Commission has been appointed to investigate the possibility of establishing industries in the rural areas of South Africa. The Commission has been instructed to make a survey of the industrial possibilities of the rural areas in the Union, and to secure information in regard to the facilities essential to the establishment of industries. The Commission has been asked to consider the feasibility of processing the maize produced in the Orange Free State and in certain districts of the Transvaal; and will examine the prospects of fruit canning in those portions of the country which have orchard resources. An inquiry will also be made into the fishing industry.

Principal interest in its work, however, centres in the possibilities of the base metals industry. The Government is keenly interested in this, and the work of the Minerals Research Laboratory, at the University of the Witwatersrand has proved extremely valuable. It is considered that there are many areas in the Union which could sustain industries much better than agriculture; and base metals appear to offer a suitable form of development. The appointment of the Commission is an event of considerable social importance, for it may possibly be able to suggest a policy to check the present disturbing drift to the towns, and more especially to the Witwatersrand. Private enterprise, however, has not been slow to point out that something more important than mere information is required. If fair treatment is offered, it is said, industries would appear at economic places; but reluctance is shown by industrialists to place themselves in the hands of possibly rapacious local authorities.

Assisting Small Mines

A new scheme to assist small gold-mining propositions outside the Witwatersrand has been approved in principle by the Minister of Mines. This will enable syndicates or private individuals to reach the production stage by facilitating the purchase of reduction plant and other machinery. No details of the scheme have yet been published, but it is likely that the Mines Department will take samples from ground that is being worked, and if it appears that development will prove profitable, the department will itself draw up plans and advise the owner how to carry on development with the best chance of success. Loans will continue to be granted at a low rate of interest, and the recipients will not be called upon to pay until the profit-earning stage is reached.

The amount of ore treated on small mines rose from 732,506 tons in 1935 to 942,080 tons last year; and the amount of gold won rose from 127,117 fine ounces to 143,031 ounces. Over £1,000,000 was recovered in small ventures outside the Witwatersrand by 144 producing concerns. The Europeans employed numbered 1,200, and non-Europeans over 12,000.

Letter to the Editor

What is Capital?

TO THE EDITOR OF THE ECONOMIST

Sir,—I think the basic definition of the article in your issue of August 28th should be amplified, since there are many capital goods in economic circulation whose owners—whether they are individuals or the general public—need their products and not their profit in money. As examples, one may cite sewing machines, typewriters, motor cars, ploughs, country residences, a power plant designed wholly to supply the own needs of a private workshop, a waterworks, sewerage, lighting, telephones, bridges and railroads. All these are capital investments whose value is given, not by their money earning capacity, but by the direct services they render, for the supply of which they were installed.

They are valued according as their use and maintenance cause less fatigue than their replacement by more up-to-date machinery. If a new machine would increase an output by 20 per cent., an industrialist would decide on its purchase if he could not at present finish his work within the due time and believed that this condition was likely to continue. If the machine cost £1,000 and £1 could be saved hourly by its instalment, it would pay for itself within 1,000 working hours. But he would retain the old machine if his orders were insufficient to justify a new one, or, if he were working for himself and had plenty of time to spare, or if he lacked the money or the credit to purchase a new one. Much work is done by hand, even in this century of mechanisation, although time-saving machines are readily available. *Mutatis mutandis*, the same applies to public ownership too.

Again, the question of earning-power plays no important part in the consumption of the well-to-do. The sales of a motor car do not necessarily depend on its speed and fuel consumption, and an overcoat may be discarded as a result of changes in fashions. Similarly, in the public utilities, gas lighting is discarded when electricity becomes the mode, and locomotives running at 50 miles per hour, though they may be quite serviceable, do not interest passengers who desire speeds of 100 miles or more.

The value of capital goods is determined by their earning power in terms of money only in cases where there are cash buyers for their products. Capital goods that have lost their profit-earning capacity do not lose their producing force, so long as the question of a money profit does not arise. Even where it does arise, many out-of-date machines are still in use. Primitively threshed wheat, sown by hand behind a wooden ploughshare, is entering steadily into competition with the wheat of the mechanical harvester sown in steam-ploughed soil. The motor car is still unable to force out the oriental rickshaw.

A capital investment may be valueless in terms of a money economy, but useful when existing needs remain unsatisfied. But if money profits alone are considered, the non-profitable machines, factories and stocks may stand in danger of destruction, although their ability to mitigate the dire need of the masses, to assuage hunger and cold, and to satisfy men's thirst for culture, may be unquestioned. Common sense suggests that the annihilation of all these capital goods is irrational. Could not the "Leviathan," now on the scrap heap, have usefully carried out pleasure cruising? Could not a 30-year old typewriter still ease human labour? Has not even a ten-year old radio still some entertainment value? Last but not least, would not foodstuffs, raw materials, cattle and pigs, though consigned to destruction, have been capable of assuaging the hunger of the masses?

Yours faithfully,

Budapest. Egon Virany.

[Our article, published in our Stock Exchange section, was concerned only with the valuation of "capital" items in the accounts of commercial companies.—Ed., *Econ.*]

Books and Publications

Employment Explained

In her new book* Mrs Robinson brings together a number of papers with the common inspiration of Mr Keynes's "General Theory of Employment, Interest and Money." The reader must therefore expect to find the still somewhat unfamiliar concepts and terminology of Mr Keynes's latest work employed without previous explanation; and will probably consider these essays more or less difficult according to the extent of his acquaintance with the "General Theory."

Once the new ideas have been grasped, however, there is a great deal to be gained from Mrs Robinson's discussion, which—as readers of her earlier work will expect—is always forceful, lucid and original. Most of the book is devoted to discussing various aspects of the employment problem, and it is in this connection that the author diverges most widely in her conclusions from the accepted opinions of the "neo-classical" economists or the instinctive mental attitude of bankers, politicians and civil servants.

The essay in which her arguments are perhaps most interestingly elaborated is that on "Disguised Unemployment." By disguised employment is meant the situation in which workers dismissed on account of a decline in effective demand find employment in worse paid occupations, such as match-selling. Broadly, it is Mrs Robinson's view that a more liberal provision of the "dole"—by an increase of the amount or by the relaxation of the conditions of benefit—would improve employment and output—or at any rate could not in any circumstances reduce them. And "a dole for which idleness is not a qualification is an unmixed benefit" (page 94), when it is worked on lines such as those of the well-known self-supporting comunity of unemployed at Upholland.

No doubt it can be objected that the validity of this theory as a guide to practical policy depends on the correctness of the formal scheme on which it is based. But the same can be said of any theory; and it is a merit of Mrs Robinson's writings that she never fails to make it clear what her premises are. The "Cambridge postulates," as they may be called, certainly constitute on their face a close approximation to the realities of the present situation of employment in England. There is no need to claim a universal and eternal validity for them.

It is impossible in the space of a short review to deal adequately with the whole of these studies. Although the main theme is the problem of the conditions affecting the volume of employment, including, of course, saving and investment, the last two parts of the book treat of other topics. In Part III an essay on the Foreign Exchanges removes this subject entirely from the restricted field of technical discussion, as the companion essay on "Beggar-my-neighbour Remedies for Unemployment" does the issues of tariff, subsidy or quota. Both of these are models of pure abstract analysis.

Least specialised of all are the three essays of Part IV, from which, although the "General Theory" remains the foundation, Keynesian terminology is absent. The general reader, indeed, might be well advised to start the book at "An Economist's Sermon." It will assure him that, however formidably abstract are Mrs Robinson's diagrammatic illustrations and—in places—her theoretical analysis, she is well aware that this is not the best of all possible worlds, and that economic science is for her a means of discovering and remedying the causes of imperfections, not of justifying them. Even the rarified atmosphere of the stratosphere is now being put to the humble uses of earthly dwellers.

Shorter Notices

"Colonial Population." By Robert R. Kuczynski. Humphrey Milford. O.U.P. 101 pages. 5s.

Colonies and population statistics have an equally topical importance. To have supplied us with a concise summary of the available facts about colonial populations, their numbers, race and mortality rates, is therefore a contribution worthy of Dr. Kuczynski's reputation. But he has done more. He has shown us in this book the many ways in which these figures cannot be trusted; and in so doing has frankly criticised the methods and parsimony of colonial administrators in this matter. The statistics in themselves are remarkable, covering as they do some 270 millions of people, or 13 per cent. of the estimated world population. It will also surprise many readers to find that these millions in colonial and mandated territories are equally shared among the empires of Britain, Holland, France and other Powers—with as many as 65 millions, almost the population of Germany, in the Netherlands Indies alone. Dr. Kuczynski has produced a study which will supplement admirably Professor Carr Saunders's larger work on World Population.

"Bank and Insurance Shares Year Book." Compiled and published by the Trust of Insurance Shares, Ltd. 723 + xxxix pages. 10s. 6d.

The 1937–38 issue of this reference book, which made its *début* last year, brings up to date the comparative tables concerning some 94 banking, discount and insurance companies. The work also contains the results of an actuary's examination of the net yield on 28 insurance shares over the period 1921–36. Mr. A. C. Thorne, after showing the yield that would have been obtained on an outlay of £2,800, and the degree of capital appreciation, discusses the outlook for insurance companies. Investors should welcome this excellently produced work of reference.

MONEY AND BANKING

The Falling Franc

It is no new thing for the French franc to be weak among the world's currencies. But not often even in its checkered post-War career can parallels be found to such recurrent sinking spells as have occurred in the last two weeks. A fortnight ago M. Bonnet's financial reforms seemed to be making creditable progress. The authorities, it was known, were supporting both the franc and the price of rentes, but in neither case did they appear to be meeting with great difficulty. Suddenly, last week, the pressure on the franc increased. After holding the rate for a day or two the French authorities allowed it to fall, since when it has lost a full dozen points. It is less than a year since M. Vincent-Auriol's devaluation, from which so much was hoped, but in that period the franc has lost almost half its value. Moreover, there can be no assurance that the bottom has yet been reached.

It is easier to diagnose the causes of the franc's weakness than to prescribe remedies. When such dramatic falls occur, there is always a cry of "speculators." On this occasion, though it is impossible in the nature of the case to be certain, there is some reason to believe that something in the nature of a "bear raid" was engineered. In any case, no other very obvious explanation can be offered of the sudden increase in pressure at that precise moment. It is true that it coincided with a period of rather more than usual diplomatic tension. But the financial pressure did not relax with the political nervousness, and those in the best position to watch the actual movement of funds are inclined to scout the notion that the sudden selling of francs had an international origin, though it may very well have been political in character.

"Bear raids," however, do not achieve such spectacular successes unless they have some substantial basis. The truth is that in spite of the amelioration under the stewardship of MM. Chautemps and Bonnet, the position of French finances is not satisfactory. The Budget is nearer a balance than for some time past, but it is still badly unbalanced. The adverse balance of trade was greatly increased in the first half of the year, though there was some improvement in July. The difficulties of the export trades are mainly due to the very large increases in costs imposed by M. Blum's social legislation. And finally, confidence has not yet been sufficiently restored to induce any considerable part of the French capital which has sought refuge abroad to return.

The difficulty is that these defects cannot easily be remedied. Taxation is already crushingly high, but expenditure on re-armament cannot be reduced. The burden of the National Debt is very heavy, and though it would be difficult to establish that it cannot be borne by the present size of the National Income, it is an undoubted obstacle in the way of sound fiscal policies. Any fall in the internal value of the franc would, of course, lighten this burden. At the same time, a fall in the external value would assist the French exporter to overcome the handicap of his high costs of production. Thus in the long run a fall in the franc would promote stability. But a long run which would not arrive until the franc had fallen very low and the cost of living had risen very high is too far off to be much comfort to present-day Frenchmen, and in the process, the world would run the risk of grave political and social disturbance at a time when the stability of France is a matter of first-class importance to Europe.

The picture must not, however, be painted too black. The immediate problem could be solved if a return flow of French capital could be stimulated, or even if the outflow could be stemmed. In the last analysis that is a political problem which French politicians alone can solve. Either the capitalist must be made to feel that he is welcome in France or the unpleasant consequences of his departure will have to be endured. That may seem to many to be a bitter alternative; but its bitterness does not diminish its ineluctability.

Confidence will not be re-established, apart from political considerations, until the franc is reasonably valued. It must not merely in fact be reasonably valued; it must be *believed* to be reasonably valued. Thus, if the political risks of a further fall could be disregarded (which, unfortunately, they cannot) there would be everything in favour of allowing the franc to fall further until it was palpably under-valued before holding it steady again. That it must be held steady before any decided improvement will be possible goes almost without saying. But it may be the policy of wisdom to allow the market to overdo its pessimism before it is invited to take an optimistic view. Looking backwards, it can be seen that the defect of the official tactics in the past twelve months has been that the franc has never been allowed to fall as far as it wanted to at the moment. The result has been that the strain has never been relaxed. It is possible that the opposite policy, that of Great Britain in 1931, is now to be tried. And if it is found advisable to place such temporary restrictions on the export of capital as were imposed in London in 1931, they would probably not be considered as coming under the general condemnation of exchange control.

It is impossible, however, to give such advice without reflecting on the probable effects on sterling. Since 1929, the dollar and the franc have both fallen further than the pound. Many of the so-called sterling currencies actually stand at a discount on London. There are very few free currencies in the world which now stand, in relation to sterling, above their 1929 parities. Sterling led the procession of depreciations, but it has been outrun by nearly all its pupils. In view of our bitter experiences between 1925 and 1931 it is only natural to inquire whether the pound is not once more in danger of over-valuation.

It is a difficult matter either to confirm or to dispel these suspicions. The state of the British gold reserve seems to point one way; the state of the balance of payments the other. Calculations of "equilibrium rates" of exchange based on index numbers of prices, such as have been presented in *The Economist* on several occasions, seem to point both ways at once. Thus if the movements of wholesale prices and of the cost of living in Great Britain and the United States be compared, it is not difficult to prove that the "equilibrium rate" between pound and dollar would be between $4.10 and $4.60. British prices, that is to say, are still higher, compared with their 1929 level, than American prices, and the fundamental value of the pound, as judged by this test, is therefore lower, in relation to the dollar, than in 1929. But if the comparison is directed towards changes in the two countries in hourly wage-rates (which are at least as fundamental elements in the conception of the value of money as wholesale prices) the "equilibrium rate" lies between $5.40 and $6.00, since there has been nothing in this country to match the steep rises in hourly wage rates in the United States. The reader may be left to decide which result appears the more unpractical. Similarly, in a comparison with France (where the statistical material for such calculations is even more imperfect) wholesale prices would put the equilibrium rate little above Frs. 100. But a comparison of wage data would set it as high as Frs. 170.

The only possible conclusion to be drawn is one of inconclusiveness. The best hope for restoring order to the franc seems to be to push it into under-valuation. But until this movement is completed, until it is known what is to happen to wages in France and America, until it is possible to see through the distortions produced by capital movements to the real underlying state of the different nations' balances of payments, it is impossible to tell where sterling stands. Stabilisation still seems a very long way off.

Financial Notes

War Risks Rates Again Raised.—The worsening of the Far Eastern situation has caused still further alterations in war risk rates. The committee of marine underwriters have now taken ships carrying armaments and oil and ships under the Soviet flag from the list to which minimum rates apply. Individual underwriters may now charge whatever rates they feel appropriate. The committee have also doubled the additional premiums on merchandise in ships calling at Chinese ports south of Shanghai. These measures appear necessary in face of the increasing Japanese blockade. Underwriters have, moreover, been unfavourably affected by casualties in the recent typhoon at Hongkong.

* * *

The Franc Again in Trouble.—Some of the main issues raised by the renewed collapse of the franc are discussed in the leading article on the previous page. But the bare history of the exchanges since control was more or less abandoned on Thursday morning last week is impressive enough. That day the spot franc fell against sterling from a little above Frs. 133, the figure at which it had been stabilised since July, to Frs. 136, and the three months' forward discount rose from Frs. 4 to Frs. 6. On Friday, spot slumped once more to Frs. 140⅝, but profit taking and a mild intervention by authority brought it back to Frs. 139½, and the forward rate also came back a little. On Saturday, spot was again stronger, with assistance, it is said, from the British control. It was even necessary for the French authorities on Monday to prevent a further rise in face of large profit-takings. The following afternoon the control had to spend considerable funds to offset a new attack. Before it intervened, the three-months forward discount at one point rose to Frs. 7, but it was brought back to Frs. 5¾. On Wednesday, the pressure became, however, too great, control was abandoned, spot collapsed to Frs. 146¾, and the forward discount to Frs. 7½, though there was less business than on Tuesday. On Thursday, the opening dealings were made at Frs. 147, a rate which weakened slightly a little later. The control then intervened once more and brought the rate up again to Frs. 145. This did not last long, and dealings continued at Frs. 146½ to Frs. 147 throughout the afternoon. It was rumoured that the Exchange Equalisation Fund was lending a helping hand. Forward rates followed the same course. At the worst period in the morning the one-month discount was Frs. 3½ and the three months Frs. 7½. The French control then operated in the way to which the market is now accustomed, and the two rates narrowed to Frs. 2½ and Frs. 6½ respectively. Obviously the present exchange is still very largely at a panic level. But the policy of the French control has only added to the mystification of the market. It cannot be said that its erratic intervention has done anything to moderate alarm. The willingness of the Rentes Stabilisation Fund to provide francs for anyone who wishes to sell—for that is what, in effect, the Fund does when it is maintained in conditions like the present—adds an especially puzzling factor to the situation.

* * *

The Foreign Exchanges.—Business in the foreign exchange market has naturally been dominated by the fresh series of falls in the franc. These are discussed in the leading article and recorded in the note above. Refugee Funds from Paris fled mainly to New York, and only to a much more moderate extent to London. Early in the week this counteracted sales of the dollar which followed the United States Treasury's decision to release $300 millions of gold from the inactive fund, and which caused spot dollars to depreciate on Monday from $4.94⅞ to $4.95⅝ down before the close. But later the American control was obliged to sell a considerable quantity of dollars to maintain stability, after French buying had started on a considerable scale, and the rate came back to the neighbourhood of $4.95. These movements further reduced the premium on forward dollars. On Thursday alarm spread from the francs to the belga. It was expected in some quarters, chiefly in New York, that the Belgian authorities would be obliged to devalue by the events in Paris. Though spot remained stable, forward belgas came on offer and the three-months' discount rose to Frs. 4, and there were some appreciable gold purchases. Other Continental currencies remained stable in terms of dollars.

* * *

The Money Market.—The renewed rise in banker's deposits has made money extremely easy once again. The banks have found little or no demand for night money. They have been eager buyers of bills at the minimum rates, and the market now has only a small number of September bills and no great number of Octobers and Novembers. There has been a certain amount of special buying. At last week's tender they only obtained 41 per cent. at an unaltered rate, the lowest figure for many weeks. The whole scheme of rates remains unaltered:—

	Aug. 26, 1937	Sept. 2, 1937	Sept. 9, 1937	Sept. 15, 1937
	%	%	%	%
Bank rate	2	2	2	2
Clearing banks' deposit rate	½	½	½	½
Short loan rate :—				
Clearing banks	½–½–1*	½–½–1*	½–½–1*	½–½–1*
Others	½–½	½–½	½–½	½–½
Discount rates :—				
Treasury bills	½	½	½	½
Three months' bank bills	31/32–15/16	31/32–15/16	31/32–15/16	31/32–15/16

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

The dividend payments on the Commonwealth 3½ per cents. on Wednesday caused a large turnover of funds, but an influx of French money came very opportunely from the market's point of view.

* * *

The Bank Return.—For the second week running the return is very uneventful. Notes are still coming in well after the holidays, and the circulation is back to its level in June. There are no overt signs of French hoarding, which does not appear on this occasion to have taken the form of notes of high denominations. Public deposits are up by £0.5 million, but remain at a low level.

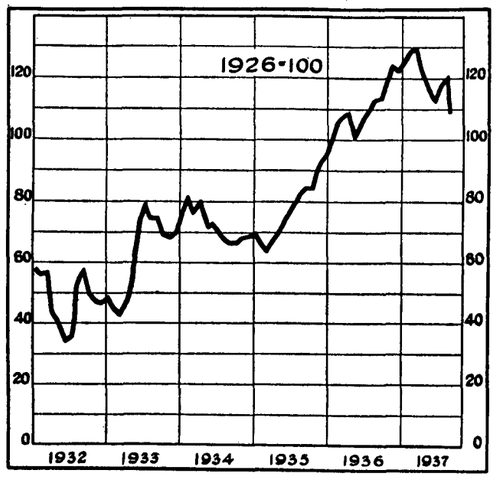
Government spending, mainly in the form of grants to local authorities, has caused a jump in bankers' deposits of £2.7 millions, bringing the total to £108.4 millions, an exceptionally high figure. Simultaneously Government securities have risen £2.0 millions.

THE STOCK EXCHANGE

Wall Street Pathology



THE events of the last fortnight, in Wall Street, suggest that the adage *mens sana in corpore sano* applies both to markets and men. British opinion had begun to accustom itself—more readily, perhaps, than American opinion—to the idea that the bull market which started in Wall Street at the beginning of 1935 was freer from speculative excesses and better justified by long-term earnings prospects than many of its predecessors. There had been little of the " New Era " psychology which heralded the crash of 1929. Industrial hopes were held in leash by political fears; and the fact that prices maintained their upward trend despite the Administration's controlling activities suggested that the advance had a fairly solid foundation.

Alas for such counsel! An ostensibly healthy organism has suddenly demanded the attentions of a physician. The causes of the malaise are obscure. President Roosevelt has been so little of a friend to the stock market that his present predicament—in which all his arts of political strategy will be called for if he is to recover the ground lost during the Supreme Court quarrel—can scarcely be the impelling cause of movements like the eight-point fall in prices last Tuesday week, or the similar fall of a week ago. The Russian Note to Italy did not seem, on this side, to be a market factor of first importance in itself, even though it threatened to loosen the linch-pin of the somewhat ramshackle chariot of European peace. When the President applied the expressive term " jitters " to the state of contemporary psychology he spoke for American rather than European investors.

Operators who have followed Wall Street's rise on the argument that it combined profit with political isolation will find that market's present disorder inconvenient and disagreeable but not wholly illogical. If war were as near as America seemed last week to fear, neither the breadth of the Atlantic nor the provisions of the Neutrality Act would preserve Wall Street from profound dislocation and, possibly, suspension of its normal activities. No amount of analysis of the factors making for resilience in America's domestic economy can obscure the fact that a single scare which causes the market to " break through the lows " will provoke immediate sales from Dow theorists, chart-readers and speculative holders whose margins have run out. In existing conditions a ten-word cable may produce a ten-point fall in prices in a single day.

What policy should be followed by British investors who, since January, 1935, have put about $440 millions into American securities? Last year (when they added approximately $220 millions to their interests) the continuation of American recovery could be taken for granted. Does the same condition hold to-day? And if so, will Wall Street quickly throw off its present mental depression? Before attempting to answer these questions, let us first ascertain the extent of the present damage. The accompanying chart and table present the movements of

MOVEMENT OF 419 COMMON STOCKS
(Standard Statistics Index).

leading stocks—industrials, rails and utilities—during recent years. Our chart is based on the weekly index figure of the Standard Statistics Company (published regularly in *The Economist*) for 419 stocks. This is not a highly sensitive index confined to a few dozen leaders, but a steadier representation of market movements. Since March the index has fallen by nearly 16 per cent., and during September it has declined almost perpendicularly. Something like one-third of the rise recorded since March, 1935, has been wiped out in six months. It would

* Six months. † Twelve months to May. ‡ Twelve months to June. § Twelve months to July. ‖ Indicated earnings 1937 based on reports to mid-August.

be optimistic to assume that this fall will be restored by next spring merely as a matter of course.

The winter prospect for Wall Street is admittedly uncertain. Thanks to the present margin rules, " New Era " buying since 1935 has been ruled out; but the 55 per cent. cover requirement, coupled with the close surveillance of short selling, has robbed the market of its former resilience. Lacking the cushioning effect of speculative sales—the classical antidote to overtrading or political crisis—the market experiences instead waves of wholesale liquidation. And the substitution of operation by index-number theories for operation by " hunch " or market rumour will tend to accentuate the first impact of all bad news. This, the real lesson of the past fortnight, may need to be continuously borne in mind during the next few months. At a time when many competent American observers are awaiting a winter recession in business, it would be unwise to anticipate, at the best, more than the maintenance of present prices. It is much more probable that prices will have touched lower levels before next spring.

Our table gives the simple price and earnings records of selected industrial, utility and rail stocks since 1935. Except for certain steel shares, current prices are well below the 1936 " highs." Indeed, several stocks, such as Chrysler, Du Pont, General Electric and Johns-Manville are only a few points above the 1935 " highs." Holders of representative utility stocks would find it hard to say whether the existing market situation or the President were their worse enemy. The railway market, again, has lately suffered two blows—a compulsory reduction in freight charges and the restiveness of the " brotherhoods." These forces have, together, produced capital losses this year ranging from 30 to 50 per cent.

" Back to 1935," indeed, would be an ominous motto to-day for more than one section of the market. In order to show prevailing prices in their due context, we have related the record of earnings per share since 1935, in the third section of our table, to prevailing quotations (the highest yearly prices recorded since 1935) by means of so-called " price-earnings relatives." For the industrial group of companies we have made the arbitrary assumption that the six months' earnings reported to June will be doubled. The utilities relatives are based on the latest twelve months' earnings, and the rail calculations on estimates made by the *Financial World*.

If it were certain that market and industrial stability could be preserved, the figures would suggest that many leading stocks are not overvalued on the basis of present earnings. Only Du Pont (an investment industrial) and General Electric (whose earnings advance is still prospective rather than achieved) now show relatives around 25—corresponding to earnings yields of about 4 per cent. For the most part, 10 per cent. prospective earnings yields are common for industrial stocks (and somewhat higher for motors and steels) with 7 per cent. for utilities and rails. Whether these returns will satisfy a prospective purchaser, however, will depend, first, on his view of the outlook during the winter and, secondly, on his estimate of further economic recovery, say, from next spring onwards. One can adduce many arguments in support of this "re-recovery" time table. Farm incomes are rapidly increasing, and they have always played a crucial part in the industrial prosperity of the Eastern States. There is still a substantial amount of re-equipment work which must be carried out by the utilities and railroads for reasons of pure physical exigency. There is some hope, at long last, that housing activity may gather momentum from Federal assistance and fatter private purses. And, finally, the Administration, having called spirits from the deep to repress the market's buoyancy, now shows signs —witness this week's decision to free $300 millions of sterilised gold—of a desire to prevent any far-reaching slump.

These favourable indicators, however, are counterbalanced by other factors. Costs are rising, and it is difficult to manufacture a boom on the basis of rising costs, except in circumstances of positive inflation. The cost factor is clearly destined to produce difficulties for the automobile industry—on which, in turn, a substantial section of the American steel industry depends. Despite the Administration's efforts to keep money cheap, there is growing evidence of " stickiness " in the new issue market, and a consequent lack of finance for new construction. And there is, finally, an impression that the potency of enterprise has become so dulled by administrative intervention that an appreciably greater economic incentive is now required to promote expansion.

Available evidence, in short, would appear to suggest that the next six months may well be a confused period, and that the early months of 1938 will be the decisive testing-time for the market. If recovery re-asserts itself, well and good; for then Wall Street's present phase will fall into perspective as a major but temporary reaction, imposed on a rising trend which may still have some way to go. If not, then it will be clear that the bull market of the nineteen-thirties has already become history. In the meantime, nervous investors who may wish to be near, but not in, Wall Street, may find that although U.S. Treasury Bonds do not yield a handsome income, they do at least provide a secure haven for capital until the snows melt and the trees begin to bud. But whether the oak will precede the ash it is, at present, impossible to say.

Investment Notes

London's Troubles.—In the penitential antiphony of the stock markets, Wall Street's *cantori* has this week evoked the appropriate strain, in a minor key, from London's *decani*. On the whole, American investors have been inclined to take heart of grace, but London has been unsettled and uneasy. *The Financial News* ordinary share index (July 1, 1935 = 100), which reached a high point of 124.9 last November and was nearly as high early this year, has this week been as low as 106.9. The increasing number of persons who like to operate between " parallels " and " brackets " have been appropriately impressed by the fact that this week's movement has carried the index under the lowest level previously recorded this year, and even under the " low " of 1936. Gilt-edged have stood firm as a rock and there has even been the slight flicker of a recovery in some foreign bonds. But ordinary shares, from the soundest industrial market leaders downwards, have been sold to the accompaniment of news of a small Stock Exchange failure in London on Monday and reports of difficulties in the provinces in mid-week.

★ ★ ★

The prevailing weakness is not localised in any special group of ordinary stocks. The shares in the following table have been taken almost at random:—

Share (and Denom.)	Sept. 25, 1935 ('Sanctions Crisis')	Dec. 30, 1936 ('Near-High')	Apr. 29, 1937 ('N.D.C.')	June 30, 1937 ('Half-year')	Sept. 1, 1937 ('Semi-Recovery')	Sept. 16, 1937 ('Latest')	Fall this Year

yields have tended to decline by much the same amount as those with low yields, and companies which are confidently expected to pay higher dividends this year than last have been affected equally with the more stable-dividend counters. The movement, in other words, is psychological. By the same token, a moderate upward reaction may occur in due course. But augurs who read into this year's events the evidence of a major change of trend will argue that the latest movement has differed from its predecessors only in its immediate cause and its intensity. Changes in interest rates, N.D.C., gold scares, political alarms—all these in turn have put the market down, while in the intervening periods prices have recovered only a fraction of their decline. In 1935, after the "sanctions crisis," the markets had a resilience which seems absent to-day. Altogether, this week's events emphasise to the cautious view of the autumnal investment outlook which we expressed in a leading article last week.

* * *

The Fate of Rentes.—When the profits on the revaluation of French gold stocks were applied, last July, to the formation of a fund for defending *rentes* from the speculative seller, it was strongly urged in these columns that such measures could do no more than palliate a symptom, without removing a cause. This week's collapse in the franc (discussed on page 568) has produced no important reaction in *rentes*. Indeed, 3 per cent. perpetual *rentes*, which stood at 71·25 on July 21st, are now quoted at 71.125 xd., which argues a superficial success for control. Yet control was instituted to provide cheap money, and since the Government's latest borrowing consists of 5 per cent. stock, redeemable in five years at par, issued at 94, it can hardly be claimed that activities of the defence fund have scored any real gain. Rather, they have proved inconsistent with the maintenance of the franc, during the last two months, at about 130 to the £. The holder of *rentes* received a virtual assurance that his stock would fetch a given price. He also knew that the franc proceeds could be exchanged into other currencies at a roughly fixed rate —for a time. Every day that the Government spent in defensive policy, both in the *rentes* and exchange markets, thus allowed the nervous seller ample time to effect his dispositions. The speculative flight, in the result, was fed by francs conveniently created from the gold revaluation. It is now suggested that a freer exchange policy may be pursued in future, but that protection for *rentes* may be maintained. With a free and vulnerable franc, this is surely fated to be an expensive, and ultimately unsuccessful, policy.

* * *

Australian Stocks.—In a Note on page 466 of *The Economist* of September 4th last we discussed the latest Australian budget in relation to the position of the Commonwealth as a whole. The table below is an epitome of the recent history of quotations for various Australian stocks:—

	Lowest 1931–37	Highest 1936	Highest 1937	Lowest 1937	Aug., 25, 1937	Sept., 15, 1937
Commonwealth 5% '45–'75	58	113⅛	109⅞	105	08	108
Commonwealth 3½% '54–'59	97¼	106⅛	104	96	97	98
Commonwealth 3½% '56–'61	95	101⅛	100¼	89⅛	90	90
Commonwealth 3% '55–'58	87⅛	...	96⅛	87⅛	89	88x
New South Wales 5% '45–'65	47	113⅛	109⅛	105¼	108	108
New South Wales 5½% '47–'57	50	117¼	113⅞	108⅛	111	111
Queensland 4% '40–'50	40	104⅛	103⅛	100	102	101
Sydney 4% '56	99⅛	104⅛	104	100⅛	100	100

Since the Financial Agreement of 1927, finally enforced by the federal Financial Agreement Validation Act of 1929, the Commonwealth has been responsible for the debts of the States and the new Loan Council has imposed a strict control over borrowings. But the table brings out very clearly the surprisingly small extent to which these powers availed to prevent a collapse of security prices in the last depression. Granted the redemption dates, the yields implied by the lowest prices were fantastic; and granted the subsequent fall in general interest rates, the rise to a high level last year was reasonable. Since then the stocks have generally moved downward, as in Great Britain and most other countries, despite the efforts, or at least the wishes, of the Government to maintain low rates. But the fall seems to have been due more to the desire of some holders for liquidity than to fears for the future. The pending election in Australia will, as always, make for market uncertainty. Mr Lyons probably means more to investors than any Premier of different political complexion who could possibly succeed him.

* * *

Investment Debutante.—The past ten weeks have provided ample opportunity for comparing the promise and performance of those companies, nearly all of small or medium size, whose shares were offered or introduced to the public since the latter half of 1936. Over twenty companies, in fact, have published their first reports, some of them being sufficiently good to attract considerable interest. Vaughan Brothers (Drop Forgings), for instance, earned in a full year £43,738—some 22 per cent. more than the annual rate based on profits for the first quarter, which in turn was much above that for preceding years. Prospectus estimates were exceeded in addition by National Trading, Thorn Electrical, Steel Barrel Scammells, and a number of smaller companies. Other concerns, often of minor market interest, have fallen short of expectations by large relative amounts. Taking the reports as a whole, it appears that estimates (where based on profits for the latest preceding period) have only barely been achieved. We have compared the prospectuses, offers for sale, or statements for information of 21 companies with their recently published accounts. The annual rate of profit, based on the latest period covered by their statements, totals approximately £576,000. The total earnings lately published for their first trading years (adjusted to as comparable a basis as possible) amount to £562,000. But British company law neither defines profits nor requires a company to adopt the same definition on different occasions, and comparison must not be taken as perfect, save for a few cases. In six instances, however, it was clear that estimates had not been reached, and in seven that they had been exceeded. For the remaining companies the difference (in one direction or the other) between pre- and post-prospectus earnings was apparently small, and this group accounted for roughly £300,000 out of the total profits. Good or poor results were not associated with particular types of industry, nor were disappointing earnings confined to those companies which had shown an unusually sharp advance in earnings for the latest year given in the prospectus. It is, however, significant that all companies whose profits were substantially below estimate were small, earning only £104,000 in their best recent year and only £50,000 according to their latest reports. On the whole, these newer companies have kept faith with the public without fulfilling the frequently implied suggestion in their prospectuses that profits advance in regular geometric progression.

* * *

Industrial Profits in August.—In August, when the number of company reports issued is below the average, the trend of our industrial profits figures is liable to be unduly affected by the vicissitudes of a few large companies. An apparent fall in the rate of increase of profits from 19.62 per cent. in July to 9.41 per cent. last month was due almost entirely to the figures for *Arthur Guinness* and *Watney, Combe, Reid* results. These two companies alone account between them for over half the total profits earned, but their improvement over last year's results was under 2 per cent. If they are excluded, the rise in earnings of the remaining companies is 19.2 per cent., practically equal to the July figure. Among separate groups iron, coal and steel concerns and trust companies show encouraging progress—the latter group reflecting, in particular, the progress of *Cables Investment*. There is no indication, so far, of any change in the upward trend of profits generally. The record of recent months is shown below:—

Reports published in 1936—	*No. of Companies*	Rise in Profits* %	Reports published in 1937—	*No. of Companies*	Rise in Profits* %
May.....	*269*	9·41	January...	*110*	15·92
June	*214*	13·50	February	*208*	8·95
July.....	*228*	15·69	March ...	*307*	12·52
August ...	*47*	14·21	April	*245*	23·36
September	*107*	12·32	May	*255*	14·09
October ...	*146*	18·09	June	*265*	21·19
November	*177*	13·49	July	*193*	19·62
December	*175*	15·49	August ...	*62*	9·41

* After payment of debenture interest.

The total net profits during August amounted to £6,042,402 compared with £5,522,196 in the month of August, 1936.

Company Notes

Imperial Chemical Industries Interim.—When directors increase their interim dividend payments, they commonly accompany their decision with the qualification that a more even balance is sought between the two payments. The cautious board of I.C.I. has this week increased the interim payment from 2½ per cent. to 3 per cent., declaring that the decision is not to be read as indicating any increase in the total dividend for the current year. For the past three years 8 per cent. has been received by ordinary stockholders, and the disappointed optimists of yester-year are again canvassing the possibility of an increased total payment for 1937. Yet the board has acquired a reputation for straightforward speech, and such conjecture is clearly no dependable investment pointer. It is evident—indeed, it has been evident since 1935—that the company could pay more at the expense of free reserves, but this possibility was obviously not practical politics while the capital reorganisation remained in dispute. Last year, however, an additional sum of £500,000 was provided from revenue, together with £1,000,000 from the Central Obsolescence Fund and £5,434,141 from capital reserve to write down the value of subsidiary interests. Presumably the special reasons for applying £500,000 from revenue for this purpose no longer operate, and this sum itself is equivalent to 1 per cent. for the ordinary stock. But the optimists' case also contemplates an increase in profits for 1937, despite the stress which was placed on rising costs in the chairman's speech, and a further increase in trade, both at home and abroad, does appear certain this year. The directors, however, have always taken something more than a single year's view, and investors and optimistic speculators alike can be sure that the final dividend decision next year will take full account of the trading prospects of 1938 and 1939. Imperial Chemical ordinary, in short, is not to be bought merely on the speculative possibilities associated with a single year's dividend.

* * *

Paterson, Laing and Bruce Scheme.—In this year of grace, 1937, it is difficult to perceive any extenuating reason for the production of a reorganisation scheme which traverses canons of equity now, presumably, familiar to all company boards and their professional advisers. The directors of Platt Brothers (Holdings) have decided, very properly, to withdraw their scheme which was severely criticised in these columns and elsewhere. It is idle, therefore, to ask why it was brought forward at all, or, still more, why it was so long persevered with. But it is pertinent to demand why Paterson, Laing and Bruce, the Australian merchants, should put their first preference shareholders to the trouble of rejecting a scheme which, on the most casual inspection, is inimical to their interests. The company has two classes of preference capital, both carrying dividend arrears since July, 1930. A sum of £464,924 is required for the reconstruction, of which £356,250 is to be found from cancellation of capital and £108,674 from reserve. Dividend arrears on each class of preference share are to be cancelled, and the capital re-formed in the following manner:—

Existing Capital	£	*Proposed Capitalisation*	£
6 per cent. c. pref.... (Gross arrears, £147,000)	350,000	6 per cent. c. pref....	175,000
		6 per cent. n.c. pref. (part. up to 9 per cent.)	175,000
" B " c. pref. ..... (Tax free arrears, £105,000)	250,000	Ord.	100,000
		Def.	12,500
Ord.	250,000	Ord.	25,000
		Def.	6,250
		Written off	*356,250*
	850,000		850,000

COMMERCIAL SERVICE
The Bank has over 370 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

THE STANDARD BANK MONTHLY REVIEW is sent post free on application. It gives the latest information on all South, East and Central African matters of Trade and Commercial Interest.

The first preference capital obviously receives less than its merits under these proposals. Its arrears are cancelled out of hand, in return for a participating right which, in a good year (i.e. when net profits are *seven times the amount recorded in 1935–36*), will provide some £5,250 more in dividends, compared with existing cumulative rights. Loss of cumulative rights on half the preference capital and the sacrifice of nearly £150,000 of arrears (gross) deserve far greater compensation.

* * *

The "B" preference shares appear at first sight to receive the plums in the scheme; for under it they will hold 80 per cent. of the ordinary and two-thirds of the deferred capital—the balance going to the existing ordinary shareholders. But it is plain that the ordinary shareholders' interest has been as near extinguished as makes no matter. Their capital is represented by no present assets, their residual equity in any future recovery of earning power is infinitesimal, and any shareholding granted to them in the reconstruction is purely *ex gratia*. The "B" preference shareholders will receive 70 per cent. of the voting power in the company. In this sandwich, then, the meat is juicy, but the bread is dry. The bottom layer deserves to be so, but the top slice—representing the first preference interest—ought to be made more appetising. A substantial readjustment of the first preference shareholders' terms is plainly called for.

* * *

Selfridge Provincial Stores Position.—This important subsidiary of Selfridge and Company has recovered satisfactorily the setback of 1935-36 (when results were affected by rebuilding operations), but compared with earlier years, the progress made can only be called modest. The latest net profits of the controlled companies are £199,799, an increase of 23 per cent. over the preceding year's total of £162,611, but only 8 per cent. in excess of the earnings of the worst depression year. The following table shows the allocation of profits attributable to Selfridge Provincial:—

	Years ended August 31st 1935	1936	1937
	£	£	£
Balance available for Co.* ...	161,152	127,802	165,698
Dividends received	127,946	87,752	122,857
Total income	182,297	144,038	178,770
Loan interest	12,268	12,251	12,017
Management, etc.†	13,526	13,795	13,162
Income tax	22,639	15,441	28,729
Debenture service	45,770	45,705	45,681
Ordinary stock:—			
Earned	*88,094*	*56,846*	*79,181*
Paid	58,125	57,188	56,250
Earned (%)	*3·8*	*2·5*	*3·5*
Paid (%)	2½	2½	2½
Reserve	25,000	Nil‡	25,000
Carry forward	10,937	10,595	8,526

* Net profits earned by controlled companies, less payments to outside holders.
† Including £5,000 in each year for leasehold depreciation.
‡ £40,000 transferred from reserve direct to writing down interests in subsidiaries.

The allocation of the additional £22,300 earned for the ordinary stockholders (after the absorption of £13,300 more for income tax) is, however, conservative. For the seventh year, a dividend of 2½ per cent. is payable, the excess of earnings being placed to general reserve. This reserve is thus usefully reinforced, for in the previous balance sheet it had fallen to £25,000 (against total assets of £4,500,000) after appropriating £40,000 to write down interests in subsidiaries following the closing of certain stores. The balance sheet also bears witness to an expansion in trade. Stocks of Selfridge Provincial have risen from £8,513 to £30,585, and those of the subsidiary companies by some £50,000 to £482,249. In the latter case this increase of stocks, coupled with a rise of £40,000 in debtors, is supported by bank loans of £113,252. Current and loan accounts between parent and controlled companies show an appreciable gross increase, but the net change is slight. The substantial increase in stocks and in dividends receivable, however, greatly benefits the parent company's liquid position, which now shows net current assets of £41,000, compared with as little as £9,000 a year ago. Although greater trading activity in the current year should be possible, Selfridge Provincial profits have hitherto been somewhat insensitive to improving business conditions, while a further rise in costs must be regarded as certain. At the current price of 8s. 9d. (yielding £6 1s. 3d. per cent.) the £1 stock units appear fully valued for the time being.

* * *

Calico Printers Meeting. — Recovery for the Calico Printers Association has come *pede claude* and preference dividends are still in arrear from the end of 1935. This experience has been common to practically all large companies in the Lancashire cotton trade whose market is international. As the chairman, Mr Lennox Lee, pointed out at this week's general meeting, many of Great Britain's erstwhile largest overseas markets are continuing their policy of either manufacturing cotton textiles for themselves, or purchasing them in the East rather than in the West. Since 1913, India has increased her spindles from 6½ millions to nearly 10 millions, and her looms from 94,000 to almost 200,000. In the same period, Japanese spindles have grown from 3 millions to nearly 12 millions and her looms from 25,000 to 300,000. Even countries like Estonia, Norway, Denmark, Jugoslavia, Turkey and Persia all have nascent cotton industries. The converse of these facts has been a decrease of 17 millions in British spindles and of 380,000 in British looms. The industry, indeed, is up against a particularly stubborn set of facts, and the Calico Printers Association has had to adjust its policy accordingly. It has freed itself of foreign factories for which it could see no ultimate prospect of success. On the other hand, it has for some time been establishing pioneer establishments inside the tariff walls of more promising countries, leaving them to develop as opportunity offered. This policy has been followed in China, Egypt and, now, India, where two mills are being erected in association with Indian interests. The results of this policy may be undramatic and may need many years to come to full fruition. But the conditions which necessitate them seem likely, unhappily, to be permanent, and the Association is certainly well advised to act upon their implications.

* * *

Johannesburg Consolidated Investment.—A summary of the financial results for the year ended June 30th was issued with the dividend declaration early in July. Present interest centres, therefore, upon the details of the annual report. As usual, no particulars are given of receipts under different headings. It may be safely conjectured, however, that as conditions were not particularly favourable for market operations, and dividends from the company's gold share interests were reduced, the expansion in profits must be chiefly attributed to larger returns from the diamond and Rhodesian copper holdings. Rhokana, for example, announced a dividend of 5s. last March, after distributing 3s. 6d. in the second half of 1936. De Beers paid 60s. arrears of preference dividend early this year, but the subsequent payment of 15s. on the deferred shares and the balance of 40s. on the preference, do not come into the Johannesburg company's accounts this time. Incidentally, the latter's directors declare that a first dividend on the shares of the Diamond Corporation is in sight. The current balance sheet of Johannesburg Consolidated Investment shows an increase of no less than £564,100 in "loans at short call." Practically the whole of the surplus after payment of the dividend is placed to reserve, and raises the total to £2,950,000. The liberality of the appropriation is explained by the narrow margin of liquid assets over liabilities. A comparison of significant items in the accounts for the past three years is given below:—

	Year ended June 30 1935	1936	1937
	£	£	£
Stocks and shares*	6,626,260	6,075,080	6,204,110

* Including dividend. † At or above market value.

* * *

The directors take a confident view of the future of copper, and observe that on the whole the platinum market has shown substantial improvement. The new and enlarged plant at the Rustenburg mine should be finished before the end of the current year. As a whole, the company's coal interests are giving satisfactory results, while the South African Breweries is doing better than ever before. Among the company's newer gold interests, reference is made to the exceptional progress of Rand Leases. Six bore holes are being put down on the extensive area in which the company is interested south of Roodeport, and the Main Reef series is expected soon to be struck by the first drill. On the dividends of the past four years, "Johnnies" shares at 64s. give the relatively high yield of 6¼ per cent.

Consolidated Main Reef. — Shareholders have doubtless been disappointed by the reduction in the Consolidated Main Reef dividend, despite the very considerable expansion in the scale of operations. The explanation lies in the fact that the raising of the tonnage treated to a record total of 1,916,500 tons was accompanied by a decline of 1s. 9d. in the average yield. Although working costs were slightly reduced, profits fell by the significant amount of £69,750. Capital expenditure required the reduced amount of £66,020, compared with £92,670, but the taxation charge was almost identical with the 1935-36 figure at £206,360. The following statistics illustrate the trend of the past three years:—

	Working Profit	Dividends		Carried forward	Ore Reserves Tons	Value dwts.
	£	£	%	£		
1934–35	624,290	296,310	23¾	200,920	7,130,300	4·7
1935–36	686,540	374,280	30	215,880	9,688,700	4·4
1936–37	616,790	343,090	27½	214,390	11,154,300	4·2

The expansion of available ore reserves—an outstanding feature of the 1936 report—is continued, although its extent this year is less marked, and is also accompanied by a further decline in average value. Payable ore developed, at 3,355,000 tons, was 172,500 tons higher, and the value of 4.4 dwts. was also somewhat better. As capital expenditure during the current year is likely to be on an increased scale, an expansion in dividends can scarcely be expected. On last year's total distribution, the shares yield 8 per cent. gross.

* * *

Modderfontein East.—The year to June 30th last set up a high record for the quantity of ore treated, and a low record for average costs. The effects of these two favourable factors, however, was so largely offset by a decline of 1s. 1d. in average yield that the working profit showed an expansion of less than £18,000. Capital expenditure was reduced by £31,600 to £34,690; but

taxation absorbed £216,490, compared with £178,430, while the mineral lease charge amounted to £88,420, against £60,900. The small reduction in the dividend is thus explained, although shareholders will note that the amount carried forward is slightly higher. Operating results since 1935 are given below :—

Year to	Working Profit	Dividends Amount		Carried Forward	Ore Reserves Quantity	Ore Reserves Value
	£	£	%	£	Tons	dwts.
June, 1935...	615,220	255,970	27½	132,820	5,142,300	4·7
June, 1936...	626,910	290,880	31¼	157,610	5,514,300	4·6
June, 1937 ...	644,580	279,240	30	185,190	5,899,100	4·5

The development footage last year amounted to 66,500 ft., showing a small decrease, while the quantity of payable ore opened up was reduced by 76,720 tons to 1,371,680 tons. However, the available reserves show an expansion of 385,000 tons, accompanied by a small decline in average value. For the provision of additional treatment and other plant, the consulting engineer estimates capital expenditure of approximately £135,000 during the current year. It would appear, consequently, that shareholders might well contemplate the possibility of a further small reduction in dividends. The yield on last year's distribution is approximately 8 per cent.

* * *

Nourse Mines.—This "old stager" of the Rand treated the record quantity of 911,000 tons last year, but its achievement was more than offset by the fall from 29s. 10d. to 28s. 9d. in average yield, and by the increase of 4d. per ton in costs. The operating profit consequently fell by £57,620 to £293,810. Net capital expenditure, however, amounted to only £6,730, against £14,500 for the previous year, while taxation absorbed £75,630, compared with £116,240. In consequence the company has been able to maintain the 22½ per cent. dividend and to carry forward a larger credit balance. The results of the past three years' working are summarised below:—

Year to	Working Profit	Dividends Amount		Carried Forward	Ore Reserves Quantity	Ore Reserves Value
	£	£	%	£	Tons	dwts.
1934–35	350,580	146,940	18¾	98,330	4,007,100	4·7
1935–36	351,430	176,320	22½	134,420	4,132,800	4·4
1936–37	293,810	176,320	22½	156,720	4,001,500	4·4

The achievement of a smaller development footage is reflected in a shrinkage of 71,700 tons to 486,900 tons in the payable ore opened up. The total available reserves, however, indicate a decline of somewhat greater extent. Little information regarding the programme for the current year is contained in the report of the consulting engineer. On the distributions of the past two years, the shares offer a yield of over 11 per cent. In all the circumstances, this may not be regarded as excessive.

* * *

Mexican Eagle Strike Ended. — According to a Reuter message from Mexico City, the strike involving 2,000 men on the Poza Rica field of the Mexican Eagle Oil Company was settled on Wednesday. For a strike which has lasted fifty-eight days it is perhaps fitting that the negotiation of the settlement should have occupied forty-eight hours. It is, however, still too early to regard the agreement as a final settlement. Indeed, it appears to have arisen directly from the intervention of President Cardenas, who declared on Monday that the strike (unjustified according to his view) must be settled. A contributory factor, however, may be found in the threatened petrol famine in Mexico City, where stocks had been almost completely drained, with serious effects upon industrial activity. This experience has turned Mexican opinion against the Petroleum Workers' Syndicate. What is less certain, however, is that this happening betokens any fundamental change in Mexico's attitude towards foreign capital. Mexican Eagle has experienced two strikes this year—one in May, which was lifted on the understanding that new legislation would be introduced to cover the whole industry, and the latest strike, which arose out of extravagant demands by the Syndicate. Shareholders will trust that the settlement concedes none of the preposterous awards made by the Board of Arbitration in August—which included, among others, full pay while on strike—but they will note that "eighty points of minor consideration have been left for future discussion." Whether the Mexican authorities will reach—and adhere to—a general settlement remains doubtful. The shares rose a few pence to 14s. 7½d., and thus show little disposition to discount the possibility.

* * *

Other Company Results.—Our usual analysis of profit and loss accounts on page 591 contains, among the 21 further companies dealt with, a number of interesting results by medium-sized companies, particularly in the heavy industries. Manufacturing profits of *Vulcan Foundry*, for instance, rose by nearly 240 per cent., while net earnings (before depreciation) of £55,050 were more than doubled; the conservative dividend declaration is due to a much larger depreciation provision. Striking improvement is recorded also by *Stothert and Pitt*, whose net profits amount to £65,218 against £41,226 and by *Sheffield Forge and Rolling Mill*, whose net earnings of £25,017 and dividend of 20 per cent. are both doubled. Although the reason for the decline is so far unexplained, a reduction in final dividend had prepared the market for a drop of £5,800 in *Hilton Main and Holly Bank Collieries'* profits to £36,352. The full accounts of *Ransome and Marles Bearing* confirm the good impression made by a preliminary statement. Trading profits after depreciation have advanced 37 per cent. to £220,318, and in addition to the increased dividend of 20 per cent., against 15 per cent., a one-in-four capital bonus is to be distributed. *Leyland and Birmingham Rubber* have earned £119,775 against £70,694, and are writing off £10,000 from goodwill, now standing at £90,000. Both sales and net profits (£74,733) of *Lines Brothers*, the toy manufacturers and dealers, are above those of any previous year. The first accounts issued by *Kinemas, Ltd.*, show a net profit of £49,323. *Ardath Tobacco* (controlled by Universal Tobacco Co., in which British American Tobacco have a large interest) maintain their dividend at 12 per cent., tax free, despite a small decline in profits from £460,475 to £448,937. The benefits of Coronation trade are shown in the *Grosvenor House (Park Lane)* results, which have risen by £15,000 to £88,252. Rubber companies continue to show good progress; *Beaufort Borneo* profits have trebled, while the *Seaport (Selangor)* dividend is raised from 4 to 6 per cent.

* * *

Company Meetings of the Week.—In this issue reports of company meetings begin on page 582. Discussing the latest profits of *Eastwoods, Ltd.*, Mr Horace Boot pointed out that in the case of cement, a temporary lull in speculative house-building had been more than offset by the construction of public works and industrial buildings. Mr W. J. Chinneck explained to his hearers at the *Initial Services* meeting that the recent share issue was made to replace liquid assets that had been depleted through the continued expansion of the business. Addressing shareholders of *E. W. Tarry and Company*, Sir J. Fortescue Flannery reported that the percentage of gross profit had been satisfactory, despite the steadily rising costs. Important developments in the organisation of the *British Central Africa Company* were discussed by Sir C. A. Montague Barlow at the annual meeting. An increase of the area in tobacco was contemplated for 1938, while it had also been decided to expand production of soya beans considerably. Capital recently subscribed had permitted the erection of a tea factory and the purchase of the Mindali Tea Estate, while a stores subsidiary had been amalgamated with African Lakes Corporation, in which the company now held shares.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: SEPTEMBER 21 **ACCOUNT:** SEPTEMBER 23

THE London Stock Exchange has experienced its worst week for many months. International politics have not provided the most depressing factor — it is a long time since the Stock Exchange had an international agreement to discount. But the preliminaries of the Nyon Conference have left a transatlantic tale of destruction. Wall Street's worries were renewed at first, and as soon as Wall Street found its own level, London began to sell internationals and domestic securities on a fair scale. Rumours of troubles on the provincial exchanges added to the alarm of the general investing public. The *Financial News* index of ordinary share prices, which appears below, has, in fact, fallen through the lowest point of last year to its level at the end of December, 1935. The market outlook remains extremely uncertain, with only moderate support for the funds to relieve the general situation.

This, indeed, has provided the one bright spot. No eccentricities in New York and no panic in industrials have been able to affect the continued strength of gilt-edged. Funding loans rose each day throughout the week. Next in order of popularity came Consols, and then conversion stocks. Local Loans have also been in demand, but there has been little business and very few price changes in Indian and Dominion issues.

In the foreign market, movements have been wide and somewhat erratic, but the general tendency after the break last week has been firmer. Japanese stocks have also been bought and prices have moved up sharply. Chinese, though to a smaller extent, have also risen. Brazilians were very weak at first, but subsequently more cheerful views regarding the expected debt negotiations caused renewed buying. French rentes have, naturally, been weak. German stocks rose, partly because the Nüremberg congress has been safely negotiated, and partly because the departure of Dr Schacht is realised to remove one who is only a ghost of his former self.

Home rails were strong at the end of last week. Great Western ordinaries rose two points in two days and L.M.S. by 1½. Some prior charges were also in request. But this week they became dull, and rather unsatisfactory. Traffics gave rise to a good deal of selling on Wednesday—a bad day for the entire market. L.M.S. ordinary then fell by as much as ⅞. Among foreign rails the entire Argentine group has been consistently weak; and U.S. rails have faithfully reflected the vagaries of Wall Street.

After initial dullness and light trading, the industrial group faced a severe test on Wednesday, when rumours of provincial difficulties were widespread, but remained unconfirmed. A slight alleviation of the gloom was discernible on Thursday, but it found little reflection in prices. The inference from the forced selling of such shares as Distillers, United Molasses, and British Oxygen suggested that trouble existed, and jobbers immediately showed reluctance to take more stock. Indeed, it became difficult to obtain bids for such shares as British Oxygen on Wednesday afternoon.

Depressed at first by another break on Wall Street, and unable to translate an improvement in tone into steadier prices on Tuesday the story of the industrial market is, indeed, cheerless. London, after attempting to bolster up internationals, abandoned even New York parities. Small losses were common among iron and steel shares, Vulcan Foundry showing disappointment at the profits. Electrical equipment shares were also affected, G.E.C. closing at 81s. in mid-week. Motors were depressed, and aircraft shares neglected. Most store shares lost fractional amounts, while rayon, tobacco and brewery issues were all sold—Distillers in particular being pressed for sale. Shipping shares made no response to the further rise in freights, though they provided one of the steadier groups.

Leading industrials suffered severely in mid-week, for reasons which most observers were inclined to associate with forced selling. Turner and Newall, British Oxygen and United Molasses were especially depressed, but Imperial Chemical Industries responded to the increased interim (discussed on page 571). Building material shares followed the general trend and shilling losses were common.

The oil share market was quiet and depressed. Some Continental support for Shell and Royal Dutch gave a firmer appearance to leading issues on Tuesday, but the improvement was not maintained when Paris turned seller in mid-week. The report of the Mexican Eagle strike settlement (see page

TO MANUFACTURERS

THE SCOTTISH INDUSTRIAL ESTATE
FACTORIES AND FACTORY SITES

Establish your factory at The Scottish Industrial Estate (North Hillington—near Glasgow) where capital outlay for building is eliminated; where you can lease a factory; where rents are low and where the Estate looks after all services and arrangements.

The small manufacturer can have a modern factory of 1,200 sq. ft. floor space complete with all services for £50 PER YEAR, COST OF HEATING INCLUDED.

For the larger manufacturer units of 5,000 or 6,000 sq. ft. floor space are being constructed. A tenant may lease any floor space he requires based on these units. As his business grows, larger accommodation will be provided.

Process steam is supplied if required. Insurance and upkeep of factories and upkeep of roads are paid by the estate. Skilled labour is plentiful.

For full information and particulars apply to—

SCOTTISH INDUSTRIAL ESTATES LTD.
41 ST. VINCENT PLACE, GLASGOW, C.1

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

(a) Interim dividend. (b) Final dividend. (c) Last two yearly dividends. (g) Includes a Special Jubilee bonus of 2½ per cent. free of tax. (n) Based on current annual dividend rate $2·00 per share. (m) Including bonus of 5% free of tax. (r) Calculated on basis of 18½ annas per share of Rs. 9. Taken at 16 annas to one rupee. (p) Annas per share. † Free of Income Tax. (‡v) Yield worked on a 35% basis. (s) Yield worked on a 16⅔% basis. (t) Special Jubilee bonus. (z) Highest price 132/- and 25 per c nt. dividend on old shares, before 50 per cent capital bonus. Yield at 25 per cent. = £6 0s. 9d; at 16 per cent. = £3 17s. 0d. (w) Paid on £300,000 more capital than in preceding year.

(*Continued from page 577*)

576) was followed by a modest recovery in the shares. Rubber shares had an unsatisfactory week. Selling depressed prices out of proportion to its volume, but in mid-week a further fall in the commodity and more nervous selling found better resistance. Among tea shares, the tone was rather better, on signs of investment support.

The Kaffir market has been hesitant this week, with a tendency to decline, although activity was evident at one time in Venterspost on good development news. With Johannesburg closed on Wednesday, business was not active. Early in the week Paris gave support, but this did not last. Rhodesian coppers fell off in sympathy with the falling metal price, while tin shares, although firm early in the week, declined later.

We are officially informed that Mr William Edward Pooley was declared a defaulter upon the London Stock Exchange on September 13th.

NEW YORK STOCK EXCHANGE

FRIDAY, September 10th, was the second panic day of the week on Wall Street, and prices slumped so badly that many issues fell to their lowest levels in two years. An active short session occurred on Saturday, when foreign buying and bear covering produced a recovery in leading industrials of up to $3. On Saturday evening the Federal Reserve Board announced that $300,000,000 of gold would be liberated from the inactive fund, and that the Board would make open market purchases of government securities in order to relieve the pressure upon the banking system. As a result of this action by the Board, the market opened on Monday of this week with a brief rise, but the downward trend was soon resumed under the pressure of professional sales. In the last hour of business on Monday the market became firmer. This erratic movement through the day was followed by all the leading industrials. Tuesday saw a continuation of the recovery, which up to the last hour successfully withstood a heavy volume of profit-taking. Substantial gains of up to $4 were shown over the day by leading steels, mining, chemical, rail and utility shares, despite a slight recession in the last hour of business. Wednesday's opening was affected by the weakness of London, but conditions soon became brighter, assisted by an optimistic forecast of business conditions during the coming months by the Secretary for Commerce, and many substantial gains were recorded. But once again the last hour saw average prices brought down almost to the overnight close. Thursday's opening was quiet. The measure of the day-to-day changes is shown in the Standard Statistics indices below. Business reports reflect none of the pessimism evident on the stock markets. Steel mill activity for the current week is estimated by *Iron Age* at 80 per cent. of capacity against 70 per cent. last week, which included the Monday Labour Day holiday.

CAPITAL ISSUES

WITH markets in a state of mental depression, the volume of new issue activity must inevitably remain sub-normal, even as the holiday period recedes into the distance. Two public offers, however, have braved this week's terrors. In London, *Amalgamated Gowns* has issued 760,000 5s. shares at par. This concern amalgamates four companies and certain private businesses engaged in the manufacture of ladies' clothing. The amalgamated concern has net assets valued at £84,011, and the purchase consideration of £180,000 will, therefore, immediately introduce a non-specific asset valued at more than all the net tangible assets. The spectacular earnings yield of 19 per cent. on the shares is based on a profit for 1935–36, and the vendors' guarantee in respect of 1936–37 is limited to the achievement of a comparable net figure. Some £10,000 of the purchase consideration will be retained, under the terms of the guarantee, by the company. It is doubtful, indeed, whether this type of guarantee, for a single year almost expired, offers any advantage to a subscriber. The speculative nature of the business, and its relatively generous capitalisation reduce the attractions of the shares to the minimum. The 5s. ordinary shares of *Richard Lloyd and Company*, issued at 9s. 6d., will seek a market in Birmingham. The company occupies a good position in the machine tool business, and has a rapidly expanding profits record. Its modest capitalisation, which might prejudice the shares in London, should prove less inconvenient in a provincial centre, where local companies and the state of their business are widely known.

PUBLIC OFFERS

Amalgamated Gowns.—Issue of 760,000 5s. shares at par (of which 370,000 applied for by vendors). Acquires capital of four companies (including private businesses) making and wholesaling women's wear. Combined profits, before directors' remuneration, depreciation and amortisation, etc. (estimated at £11,735 in all) years to September 19 : 1934, £23,896; 1935, £36,648; 1936, £50,604. Combined net assets, £84,011 (stock, £64,556); purchase price, £180,000 cash. Further 40,000 shares to N. A. Cooper for services. Tokenhouse Securities pay expenses for payment of £13,775, met out of proceeds of issue of £40,000 5 per cent. debenture stock, taken by Equity and Law Life Assurance at par.

BY OFFER FOR SALE

Lloyd (Richard) and Company, Ltd.—Offer for sale of 192,916 5s. ordinary shares at 9s. 6d. Machine tool makers and engineers since 1803. Profits, after depreciation, before interest: 1935, £10,714; 1936, £23,802; six months to June 30, 1937, £15,437. Excess of assets over liabilities, £93,569 (stock, £40,855), or £117,971 after share issue and interim dividend. Fyshe and Horton take issue at 9s. and expenses. (Permission to deal sought from Birmingham Stock Exchange.)

BONUS SHARES

Riding's Stores.—It is proposed to capitalise £6,500, from undivided profits, among ordinary shareholders registered September 16th in proportion of one 2s. share for ten held; to rank from July 1, 1937.

ISSUES TO SHAREHOLDERS ONLY

United Caterers.—Issue of 100,000 1s. ordinary shares at par to holders on September 7th, in proportion of one new share for four held. To rank for dividend from July 1, 1937.

Margate Estates.—Issue of 17,071 £1 7 per cent. cumulative preference shares at 21s. to rank from October 1, 1937.

CONVERSIONS AND REPAYMENTS

Fourth Conversion Investment Trust, Ltd.—Holders of British Empire Fixed Trust units, comprehensive series sub-units may exchange into 1,912,000 17s. 6d. ordinary shares of the new company (one sub-unit for one share). Trustees and managers forgo £41,500 fees set aside, out of which promotion expenses (other than capital duty) payable. Managers (Fixed Trust Investments, Ltd.), receive back balance in half-yearly instalments over 18 years and provide management services; they receive also on purchases and sales usual return commission. Borrowing limited to £100,000 and directors' fees to ¼ per cent. of capital up to £1,000,000, and ⅛ per cent. over. List of investments circulated with accounts.

PRIVATE PLACING

Reserves Securities Trust.—The directors have placed privately 58,165 £1 shares, bringing the total of shares in issue to the 250,000 authorised.

OIL OUTPUTS

ANGLO-ECUADORIAN OILFIELDS, LTD.—Production for August, 23,061 tons.

ATTOCK OIL COMPANY, LTD.—Production for August: 22,734 barrels.

THE BRITISH BURMAH PETROLEUM COMPANY, LTD.—Production of crude oil, 48,015 barrels for August, 1937.

BRITISH CONTROLLED OILFIELDS, LTD.—Production for the week ended August 28th, 12,940 barrels. Production for August, 55,823 barrels; shipments for August, 59,479 barrels. Production for week ended September 4th, 12,480 barrels.

THE KERN RIVER OILFIELDS OF CALIFORNIA, LTD.—The total production during August amounted to 156,593 barrels, or approximately 22,371 tons.

LOBITOS OILFIELDS, LTD.—Production of Peruvian company for August, 32,230 tons.

PHŒNIX OIL AND TRANSPORT COMPANY, LTD.—The gross production of crude oil of the Phœnix Group for August was 59,423 tons.

TAMPICO OIL, LTD.—The total production from the company's properties in Mexico during August was 13,112 barrels, in respect of which the royalty due to Tampico Oil, Ltd., amounted to 983 barrels.

TRINIDAD CONSOLIDATED OILFIELDS, LTD.—The company announces that wells Nos. 136 and 137 were brought into production on August 20th and 6th respectively, and that the production for the month of August amounted to 47,723 barrels.

TRINIDAD LEASEHOLDS, LTD.—Oil produced during August, 62,956 tons; oil purchased during August from other companies, 75,965 tons.

TRINIDAD PETROLEUM DEVELOPMENT COMPANY, LTD.—Production for the week ended August 28th, 33,326 barrels. Production for August, 142,979 barrels; deliveries for August, including purchased oil, 105,298 barrels. Production for week ended September 4th, 32,800 barrels.

VENEZUELAN OIL CONCESSIONS, LTD.—Production for the week ended August 28, 1937, was: Bolivar district, 987,624 barrels; Maracaibo district, 23,047 barrels; total, 1,010,671 barrels. Production for the week ended September 4, 1937, was: Bolivar district, 960,099 barrels; Maracaibo district, 22,946 barrels; total, 983,045 barrels.

COMPANY MEETINGS

BRITISH CENTRAL AFRICA COMPANY, LIMITED

IMPORTANT CHANGES

The thirteenth ordinary general meeting of this company was held, on the 16th instant, at Southern House, London, E.C.

The Right Hon. Sir C. A. Montague Barlow, Bt., P.C., K.B.E. (the chairman), said that the debenture stock of Nyasaland Railways has been realised since the date of the balance sheet and the bank overdraft thereby reduced, so that the company's investments now consisted of the £109,620 of ordinary shares of the railways, which stood in the balance sheet at only £2,740. The value of that asset depended on the future of Nyasaland. Granted prosperity in the country, those shares ought to acquire in the future a substantial value.

As to plantations and their future development, in the year under review the area in tobacco was 200 acres. During 1937 the area had been increased to 380 acres and the programme for 1938 was to work an area of 685 acres. They had confidence that in 1938 they would be able satisfactorily to sell the produce of the larger acreage. For two or three years they had been experimenting with soya beans, and the directors had decided to go in for a considerable expansion in their production.

FURTHER TEA AREA ACQUIRED

The company had a large estate of land suitable for the cultivation of tea amounting to some 8,000 acres, of which at the moment only some 173 acres were in full bearing. Under the terms of the Restriction Regulations, they were allowed a quota up to 400 acres and planting had been proceeding accordingly in the last two or three years. An estate of 400 acres was, however, of insufficient area to maintain a factory. The capital made available by the recent issue of shares had made it possible for the directors to enter into an agreement with the owner of the Mindali Tea Estate, situated at a convenient distance from their own estate, to purchase that estate with a factory in course of erection. The cost was £18,000 and they had to complete the factory. The estate consisted of 1,000 acres, of which 250 were in bearing and the balance would be planted at an early date.

For many years the company had had as a subsidiary the Kubula Stores, and the company's experience had not been too happy in relation to that subsidiary. They had had no monopoly of the trade in Nyasaland; on the contrary, there was severe competition and the important step which they had now been able to take was, in effect, to amalgamate their stores business with that of their chief competitors, the African Lakes Corporation, Limited. The amalgamation took the form of the acquisition by the African Lakes Corporation of the buildings, stocks and goodwill of the Kubula Stores and also some agencies. The ultimate result would be that the British Central Africa Company would hold 40,000 shares of £1 each in the African Lakes Corporation, and would have in cash in its hands such excess as their might be after discharging its liabilities.

ORGANISATION SIMPLIFIED

The organisation of the company would be simplified by the sale of the Kubula Stores, which was a business of a different class from the other activities of the company, and the company was now in a position to devote itself to the development of the growth of tobacco, sisal, tea, soya beans and other commodities, and to the development or sale of its land as opportunity offered.

He thought he had exhausted all he need say on the changes that had taken place since September 30, 1936, and he thought that that date might well be looked upon as the close of an old epoch and the opening of a new one. The old epoch had started with bank overdrafts of £183,000; the new epoch started with no bank overdraft and, when the transactions he had mentioned were completed, they would find themselves with substantial moneys still in hand for development, with an important shareholding of £40,000 "A" shares in the African Lakes Corporation, and with a considerable holding of about 109,000 ordinary shares in the Nyasaland Railways Company, which should eventually prove of value as the country developed. They would also have valuable plantations of soya beans to which they attached importance, of sisal, of tea and of tobacco; all under careful and vigorous development and finally their large holding of some 300,000 acres of land.

The report was unanimously adopted.

E. W. TARRY AND COMPANY, LIMITED

PAYMENT OF PREFERENCE ARREARS

The annual general meeting of E. W. Tarry and Company, Limited, was held, on the 16th instant, at Southern House, London.

Sir J. Fortescue Flannery, Bt., D.L. (the chairman), said that the improvement in South African trade had continued during the year under review and their general managers and branch managers and staff generally had lost no opportunity of benefiting by the generally increased prosperity. Generally speaking, all their trading branches had done a larger amount of business and showed an increased profit over the previous year. So far they had had five months' trading in the current financial year and sales showed a satisfactory increase over the corresponding period of last year.

The gross profit for the year was £125,097, an improvement of £7,356 on last year. That increase reflected a larger turnover and the percentage of gross profit had been very satisfactory, having regard to the steady rising cost of goods purchased. The net profit for the year amounted to £38,387 and, although that was an improvement of only £760 on the results of the previous year, he thought they had cause to be gratified that they continued to progress despite the severe competition for business. It was proposed to transfer £10,000 to reserve and £5,000 to income tax reserve, and to pay a dividend of 7½ per cent. for the 1¼ years to March 31, 1937, on the preference shares.

It was also proposed to pay a dividend of 1½ per cent. for the three months to June 30, 1937, on the preference shares. The board were desirous of paying off the arrears of dividends on the preference shares as at the close of the financial year and also to pay the dividend for the three months to June 30th last, thereby bringing the dividend position up to date. The board had not forgotten that the ordinary shareholders had not been rewarded for a considerable time and were aware that with the improved fortunes of the company the way might become open for the resumption of dividend payments to them. Mindful, however, of the succession of recent bad years, the board had endeavoured to strengthen the company's position by building up the reserve account.

The report was unanimously adopted.

EASTWOODS, LIMITED

INCREASED DEMAND FOR PRODUCTS

The seventeenth ordinary general meeting of Eastwoods, Limited, was held, on the 14th instant, in London.

Mr Horace Boot, M.Inst.C.E., M.I.Mech.E., M.I.E.E. (chairman and managing director), said that the net profit was £71,904, which compared with £83,085 for last year. The directors recommended a final dividend on the ordinary shares of 10 per cent., making a total of 15 per cent. for the year. Industrial fuels, greases and oils, of which they used large quantities for power and brick-burning purposes, had all increased in price. The same conditions applied to iron and steel and other materials required for repairs and maintenance purposes. It might be possible to offset those disadvantages in the current year by increased production and by substantial economies in manufacture. There had also been two general reductions during the past eighteen months in the price of Fletton bricks, of which the customer had had the direct benefit. The lower selling prices should be substantially offset by increased sales of their multi-facing bricks. Stock brick loadings had exceeded those of the previous period by several millions. Numerous important contracts were supplied with Kent and Essex stocks and facing bricks from their own works.

The temporary lull in speculative house-building had been more than offset in the case of cement by large-scale construction of roads, aerodromes, public works, harbours and industrial and factory buildings. Their "Durocrete" (Rapid Hardening) and "Eastwoods" (Ordinary) brands had been supplied to some of the most important of those schemes.

While the price of building materials as a whole had advanced after having been below the basic mean throughout 1936, no part of such increase was attributable to advances in the price either of bricks or cement. The manufacturers had rigidly adhered to their policy not to exploit the position arising from public expenditure on housing. In view, however, of the increased cost to themselves, not only of wages, but of fuel and other raw materials, it remained to be considered whether some proportion of those higher costs ought not to be passed on to the consumer, as was being done in the iron and steel trades and in the coal industry.

The report was unanimously adopted.

INITIAL SERVICES, LIMITED

EXPANSION OF PROFIT

The ninth ordinary general meeting of Initial Services, Limited, was held, on the 15th instant, at Winchester House, London, E.C., Mr W. J. Chinneck presiding in the absence of the chairman and managing director (Mr A. P. Bigelow).

The Chairman, in the course of his speech, said that the net profit showed an increase of £32,000, being £277,693, as compared with £245,476 in 1936. The balance brought forward last year was £13,300, to which must be added the net profit for the year, amounting to £277,693, making a total of £291,023. From that total they deducted the cumulative preference dividend for the year to June 30, 1937, of £32,000, and a sum of £57,500 in respect of an interim dividend of 5d. per share on the whole of the issued ordinary share capital.

The directors proposed to transfer £50,000 to general reserve, increasing that account to £150,000, and also to transfer £1,000 to the Staff Benevolent Fund. They recommended a final dividend of 10d. per share, less tax, to be paid on the 2,760,000 ordinary shares of 5s. each.

The total aggregate profit of the company and its subsidiary companies for the accounting periods ended within the year to June 30, 1937, amounted to £294,212, compared with £267,006 in the previous year. That showed a total increase in profits of £27,000. The expansion of their business had resulted in a reduction of liquid assets. In view of that expansion, the directors had thought it advisable to issue to the shareholders at par one share in respect of every five shares now held. In order to carry that scheme into effect it would be necessary to increase the ordinary share capital of the company.

They trusted the continued expansion of the company's business was satisfactory to the shareholders, and the directors were hopeful that they would again be able to show improved results next year. The trading results of the first two months of the present financial year had been very satisfactory. Given normal trading conditions, the directors anticipated no difficulty in maintaining the present rate of dividend on the increased capital.

The report was unanimously adopted, and at a subsequent extraordinary general meeting the increase of capital to £1,400,000 by the creation of 700,000 new ordinary shares of 5s. each was approved.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the week ended September 11, 1937, amounted to £9,460,000, against ordinary expenditure of £9,804,000. After increasing Exchequer Balances by £260,171 the operations for the week, as shown below, increased the gross National Debt by £604,000, to about £8,003 millions.†

THE BANK OF LONDON AND SOUTH AMERICA, LTD., has received telegraphic advice from Valencia that the gold surcharge for payment of Spanish customs duties has been fixed for the period September 11th to 20th at 191·56 per cent. The previous rate was fixed as from September 1st at 180·69 per cent.

CENTRAL AND SOUTH AMERICAN EXCHANGE RATES

Quotations for the following centres were given on the dates indicated. Rates for other exchanges appeared in our issue of September 4th :—

Bolivia. Commercial Banks "free" selling rate was 100 bolivianos per £ on August 20, 1937.

Colombia. Sight selling rate on New York was 175·75 pesos per 100 United States dollars on August 26, 1937. This rate applies to holders of permits buying in the "open" market.

Ecuador. Sight selling rate on New York was 13·50 sucres nominal per United States dollar on August 27, 1937.

Nicaragua. Sight selling rate on New York, including tax and commission, was 2·16 cordobas per United States dollar on August 21, 1937.

Paraguay. Exchange is quoted on Buenos Aires; the sight rate was 70 Paraguayan pesos per Argentine "free" paper peso on August 14, 1937.

Overseas bank rates and exchange rates for South Africa and Australasia also appeared in the issue of September 4th.

GOLD AND SILVER

The following statistics of imports and exports of gold and silver for the week ended September 16, 1937, are issued by the Statistical Department of H.M. Customs and Excise.

No gold movements were reported at the Bank of England between September 10th and 16th. Details of previous movements appeared in *The Economist* of September 4th on page 498.

GOLD MARKET

Messrs Samuel Montagu and Company write on September 15, 1937 :—

The Bank of England gold reserve against notes amounted to £326,406,625 on September 8th, showing no change as compared with September 1st. In the open market about £1,900,000 of bar gold was disposed of at the daily fixing during the week. The amounts available were mostly taken for shipment to New York, prices continuing to rule at about dollar parity. The s.s. "Viceroy of India," which sailed from Bombay on September 11th, carries gold to the value of about £216,000. The Transvaal gold output for August, 1937, amounted to 987,433 fine ounces, as compared with 996,545 fine ounces for July, 1937, and 964,517 fine ounces for August, 1936.

SILVER MARKET

With American buyers continuing to give support, the market has been very steady, and prices have shown very little movement during the past week; the demand has been mainly for spot and, except for one day, the cash quotation ruled at a premium over that for two months delivery. Sales on China account have not been much in evidence, offerings being mainly composed of sales by the Indian Bazaars but, on the whole, sellers have been inclined to hesitate. No wide movement from the present level is anticipated in the near future.

Quotations for gold and silver are shown below :—

KINEMAS, LTD.—First report for year to June 30, 1937, shows net profits £49,323. Ordinary dividend 11¼ per cent. Carry forward £3,323. Revenue secured on holding of shares in African Consolidated Theatres and African Consolidated Films advanced from £44,440 to £54,120.

RAND SELECTION CORPORATION.—A dividend of 50 per cent. for the year to September 30th is announced, compared with 40 per cent. for 1935–36.

HOTEL WESTMINSTER
Le Touquet

SOUTH AFRICAN CLOTHING INDUSTRIES, LTD.—Net profit for 7½ months to June 30, 1937, £24,462. Preference dividend, £4,458. Dividend of 5½ per cent. (actual), equivalent to 9 per cent. per annum, on ordinary shares, £15,400. To capital reserve, £260. To general reserve, £3,000. Carry forward, £1,344.

SOUTH AFRICAN DIAMOND SALES.—Sales for first six months of 1937 are valued at £2 159,639, against £3,209,271 for whole of 1936.

MAYNARDS, LTD.—Net profit for year to June 30, 1937, £45,735 against £43,672. To reserve for improvements £6,000 against £2,000. To staff pensions, £2,000 against £5,000. Ordinary dividend 8 per cent. as before. Carry forward increased from £28,470 to £29,360.

INCORPORATED ACCOUNTANTS AND AUDITORS.—The next examination for admission to this Society will be held on November 1st, 2nd, 3rd and 4th next in London, Manchester, Cardiff, Leeds, Glasgow, Dublin, Belfast, Cape Town, Johannesburg, and Durban. Women are eligible on the same terms as men. Particulars obtainable from Incorporated Accountants' Hall, Victoria Embankment, London, W.C.2.

AIRE WOOL COMPANY.—Net profits for year ended August 31, 1937, £15,538 against £14,770. Amount available for distribution, £16,993. After the 6 per cent. preference and 10 per cent. ordinary dividends £4,218 is carried forward.

SUN LIFE OF CANADA.—At the end of July, 1937, the total assured by all policies in force was over £585,000,000, an increase since the end of 1936 of over £15,000,000. Total income has increased for the first seven months, while total expenditures are down about 4 per cent.; net result, excess of income over expenditures of nearly £8,000,000. Total assets now exceed £166,000,000. Bond account £70,000,000, an increase of £7,000,000.

VENTERSPOST GOLD MINING.—The reef recently intersected in No. 2 shaft at 2,770 feet has been fully exposed. Sampling gives average value of 4·4 dwt. over entire width of 116 inches, of which bottom portion consists of two highly payable reef bands averaging 9·5 dwt. over 43 inches.

ANGLO-SIAM CORPORATION.—Net profit of £35,900 for the year to March 31, 1937; balance available £80,195, after adding £44,295 brought forward. To staff provident fund £3,000; to dividend equalisation fund £7,500. Final ordinary dividend, 7½ per cent., making 10 per cent., less tax. Carry forward £45,145.

PRESTON BREWERIES SHAREHOLDERS PROTECTION ASSOCIATION, LTD.—This has been registered as a company limited by guarantee without share capital, each member being liable for 5s. Objects are to unite shareholders of Preston Breweries Company, Ltd., for mutual and co-operative assistance and action for the protection and promotion of their interests. Management is vested in an executive committee of three to ten members.

CROWDEN AND KEEVES CAPITAL SCHEME.—Meetings are called for September 28th to sanction proposals providing for cancellation of 15s. of each £1 preference share, cancellation of 29 ordinary £1 shares and consolidation of remaining ordinary shares into £5 shares. Sum of £4 18s. to be cancelled from the £5 shares. Resulting 5s. preference to be subdivided into 4 "B" preference 1s. shares and 1 "B" ordinary 1s. share. The "B" preference are then to be consolidated in 4s. shares and the "B" ordinary into 2s. "B" ordinary shares. Capital is then to be increased to £300,000 by the creation of 400,000 "A" preference 1s. shares, 200,000 "A" ordinary 1s. shares, 240,000 management shares of 6d. and 225,000 "C" £1 shares. The company has made provisional arrangements for an amalgamation with Wolchovers, Ltd. Total value of assets of Crowden and Keeves estimated at £39,000, and Wolchovers at £53,000.

BARROW BARNSLEY MAIN COLLIERIES.—Net profit for year to June 30, 1937, amounted to £101,189, an advance of £47,673. The ordinary dividend is raised from 6 to 10 per cent. To reserves: Depreciation, £25,000; general, £15,000. Carry forward raised from £16,471 to £19,104.

‡ Free of income tax. (a) Paid on a capital of £2,000,000, compared with a capital of £1,666,666 a year ago. (b) Paid on 10,000 shares. (c) Paid on 500,000 shares. (d) Six months. (e) Paid on £10,000 more capital. (f) Paid on £100,000 of capital against £50,000 a year ago. (h) Free of Indian Income Tax.

AIRE WOOL.—Ordinary dividend, 10 per cent. for year to August 31, 1937, compared with 10 per cent. for period to August 31, 1936.

ALLIED INDUSTRIAL SERVICES.—Final ordinary dividend 37½ per cent., making 60 per cent. on £100,000, compared with 7½ per cent., making 22½ per cent. on £50,000. Profits £128,467 against £93,088.

A. REYROLLE AND COMPANY, LTD.—Interim dividend maintained at 5 per cent.

ASPRO, LTD.—Final ordinary dividend 15 per cent., also cash bonus of 7½ per cent., making 32½ per cent. for year to June 30, 1937. For the initial 13½ months, 25 per cent was paid.

BANK OF SCOTLAND.—Interim dividend maintained at 9 per cent.

BRITISH INSULATED CABLES.—Interim ordinary dividend of 5 per cent. on £2,000,000, compared with 5 per cent. on £1,666,666.

BUSHTICK MINES.—First dividend on ordinary shares 5 per cent. for year to June 30, 1937.

CALTHROPS, LTD.—Initial dividend of 4½d. per share for period ending June 30, 1937, equal to 10·136 per cent. per annum.

CORDOBA CENTRAL RAILWAY.—With the concurrence of the trustees and the debenture stockholders' committee, payment of the half-yearly interest on 4½ per cent. first debenture stock due October 1, 1937, with arrears, has been postponed until April 1, 1938, or until such later date as may be determined. The Bill for authorising the Argentine Government to purchase the company's railway has not yet been considered by Congress.

CRAVEN BROTHERS (MANCHESTER), LTD.—Interim dividend 5 per cent. as before.

EAGLE STAR INSURANCE.—Third ordinary interim dividend, 6¼ per cent. compared with 6¼ per cent. a year ago, making the three payments to date 20¾ compared with 18¾ per cent.

HALESOWEN STEEL.—First interim dividend of 10 per cent. Company made public in December, 1936.

IMPERIAL CHEMICAL INDUSTRIES.—Interim ordinary dividend of 3 per cent. payable less tax at 4s. 8d. on November 1, in respect of the year 1937. This compares with an interim of 2½ per cent. actual in respect of 1936. This increase is not to be regarded as indicating any increase in the full dividend, but is to bring the interim and final dividends into better relationship.

INDIAN IRON AND STEEL.—Final dividend and bonus 10 per cent., making 20 per cent. for year. No dividend for six preceding years.

INTERNATIONAL DIATOMITE. — Final ordinary dividend 6 per cent., making a total of 8 per cent. for the first period.

INVESTORS FLEXIBLE TRUST.—Second distribution 4⅔d. net per sub-unit, in respect of income received March 2 to September 1, 1937.

INVESTORS GOLD SHARE TRUST.—Half-yearly distribution of 6·483d. net per sub-unit, payable October 1st.

KAMUNING RUBBER AND TIN.—Ordinary dividend raised from 10 to 12½ per cent. for year to June 30, 1937.

LANCASHIRE DYNAMO AND CRYPTO, LTD.—Interim ordinary dividend of 7½ per cent. payable on £387,000, against £260,000 a year ago.

LINES BROTHERS.—Ordinary dividend for year to June 30, 1937, 30 per cent. on 500,000 shares, compared with 1,200 per cent. on 10,000 shares. Net profit, £79,717 before tax, an advance of £11,311.

PERUVIAN CORPORATION.—The corporation will pay, on October 1, 1937, to holders of the first mortgage debentures on account of interest, £3 per cent. (Coupon No. 89) representing the instalment of interest due October 1, 1934.

RIDING'S STORES.—Final ordinary dividend 20 per cent., making 30 per cent. for year.

SECOND BRITISH FIXED TRUST.—Coupon No. 10, payable September 15th, at 7½d. per sub-unit, tax free.

TRUSSED CONCRETE STEEL.—First interim ordinary dividend 5 per cent. For year 1936, 12½ per cent. was paid.

JOHANNESBURG CONSOLIDATED INVESTMENT COMPANY, LIMITED (Incorporated in the Union of South Africa)

REPORT OF DIRECTORS.—To be submitted to the Shareholders at a Meeting to be held in the Board Room, Johannesburg Consolidated Investment Company, Limited, Consolidated Building, Fox Street, Johannesburg, on Tuesday, the 23rd November, 1937, at 11 o'clock in the forenoon.

ACCOUNTS.—1. The Company's Balance Sheet as at 30th June, 1937, and Profit and Loss Account for the year ended on that date, are submitted herewith.

PROFIT AND LOSS.—2. After making provision for taxation, for all ascertained and estimated charges and depreciation and for contingencies, the profit for the year amounts to £1,141,678 7 2
To which is added the balance brought forward from the preceding year 166,874 18 6
Giving an available balance of £1,308,753 5 8
The Directors have transferred to Reserve Fund the sum of £350,000 0 0
And on 7th July declared a Dividend of 3s. and a Bonus of 1s. per share, both less United Kingdom Income Tax, the gross amount absorbed being..... 790,000 0 0
1,140,000 0 0
Leaving a balance to be carried forward amounting to £168,753 5 8

RESERVE FUND.—3. With the addition of the amount of £350,000 transferred from Profit and Loss Account the Reserve Fund now stands at £2,950,000.

VALUE OF SHAREHOLDINGS, ETC.—4. The Company's shareholdings for which market quotations are available are included in the Balance Sheet at or below cost and in no case above the market value at 30th June, 1937. The Directors have considered it prudent to provide against contingencies by writing down certain shareholdings to below both cost and market value. Unquoted investments have been valued by the Directors on a conservative basis and in no case above cost. The Directors have also reviewed the other assets of the Company and made provision for contingencies where considered advisable. In the aggregate the market value of the shareholdings shows a large surplus over the book value. The strong financial position of the Company has been maintained.

GOLD MINING INTERESTS.—5. During the year ended 31st December, 1936, the Gold Mining Companies of the Group crushed some 12,000,000 tons of ore and produced 2,640,307 ounces of fine gold compared with approximately 11,500,000 tons, and 2,621,691 ounces, respectively, for the previous year. The total value of the production was £18,563,145 compared with £18,672,460 for the previous year. There were employed some 7,200 Europeans and 67,500 natives.

The table below summarises the details' from the reports and accounts of the Companies for the year ended 31st December last, and it also gives the figures of the previous year for comparison.

The relations of the European workmen with the Mining Companies continued to be friendly. There is some indication that the expansion of the gold mining industry and the return of the Union generally to more prosperous times will cause a shortage of native labour for the mines. In order to combat this the Union Government has passed a Bill allowing natives from north of latitude 22° S. to work on the Rand. It is hoped that this will go far to relieve the threatened shortage.

DIAMONDS.—6. The diamond trade continues to improve. For the year 1936 the total sales showed a substantial increase compared with the previous year, and for the first six months of the current year there was a considerable further improvement. De Beers Consolidated Mines, Limited, has paid all arrears of dividend on its preference shares, and an interim dividend of 30 per cent. has recently been declared on the deferred shares. The position of The Diamond Corporation, Limited, in which the Company has an interest, is also much better, and a first dividend is in sight. Whilst these evidences of prosperity are welcome, it is still more satisfactory to be able to report that the industry is in a better position to meet adverse circumstances than in recent years.

COPPER.—7. In the year 1936, the beginning of a return to prosperity in copper mining became apparent, and the early part of this year saw an accelerated improvement, which has been maintained, with the result that the companies in which we are interested are now making substantial profits. The position is promising, and although with such a widespread industry controlled by diverse interests it cannot be hoped to establish complete control, nevertheless producers have learned lessons in the hard school of adversity. It is unlikely, therefore, that we shall again experience such a small demar l and such low prices as prevailed in the recent depression, and there is strong ground for viewing the future with confidence.

PLATINUM.—8. The platinum market has experienced some rather wide fluctuations, but on the whole has shown substantial improvement. Consumption is higher and tends to improve, though a steady price would help consumers and be much more satisfactory to producers.

The new and enlarged plant at the Rustenburg mine, which was mentioned in the last Annual Report, is being installed and should be completed before the end of the current year. It is not anticipated that there will be any difficulty in disposing of the increased production, and the position looks brighter than it has done for some years.

COAL.—9. The cost of equipping the new section of the Consolidated Collieries, Limited, has been met by a loan from this Company and by the appropriation of the profit of the Colliery, and, in consequence, no dividend has been paid since October, 1936. The output of The Natal Cambrian Collieries, Limited, is increasing, and the new plant is working satisfactorily. A loan by Johannesburg Consolidated Investment Company, Limited, is being steadily liquidated. New Springs Colliery, Limited, has ceased production, the coal in its area being exhausted. Sufficient revenue to enable the Company to continue to pay a small dividend is being received from the proceeds of the sale of water to certain mines. Phœnix Colliery, Limited, commenced production in April, 1937, and is now making satisfactory profits.

ESTATES.—10. There was a steady sale of stands on the Company's estates. A new township was laid out near Boksburg on the farm Leeuwpoort during the year under review.

SOUTH AFRICAN BREWERIES, LTD.—11. For the third year in succession increased profits enabled South African Breweries, Limited, to make a larger distribution to the ordinary shareholders. Dividends amounting to 20 per cent., and a bonus of 2½ per cent., all free of tax, have been paid on the ordinary capital for the year ended 31st March, 1937, as against dividends amounting to 20 per cent., free of tax, for the year to 31st March, 1936.

COMPARATIVE STATEMENT OF RESULTS OF OPERATIONS, ETC., OF THE GOLD MINING COMPANIES OF THE GROUP
Referred to in paragraph 5 of the Directors' Report

		Government Gold Mining Areas (M) Consolidated, Ltd.	New State Areas, Ltd.	Langlaagte Estate and G.M. Co., Ltd.	Randfontein Estates G.M. Co., W., Ltd.	Van Ryn Deep, Ltd.	Witwatersrand G.M. Co., Ltd.	Totals and Averages

Stoping width (inches)		57	48	44	47	49	58	...

OTHER GOLD MINING INTERESTS.—The Company is interested in an extensive area of ground on the Witwatersrand to the south of Roodepoort, and at the present time six boreholes are being drilled on this ground. The holes will be deep, but it is anticipated that the Main Reef Series will be struck in the first at an early date. This area is looked upon as possessing great potentialities.

The modernisation and enlargement of the plant of The East Champ d'Or Gold Mining Company, Limited, is nearing completion. Its capacity will be, approximately, 25,000 tons per month. Development results have been very satisfactory.

The output of Rand Leases (Vogelstruisfontein) Gold Mining Company, Limited, has steadily increased since the commencement of production in April, 1936. An issue of Debentures was made in December, 1936, to enable the Company to repay certain loans and to provide capital to increase the output to 100,000 tons per month. It is noteworthy that the Company paid its first dividend in January, 1937, only 3½ years after incorporation.

Consolidated Murchison (Transvaal) Goldfields and Development Company, Limited, commenced milling operations in January, 1937. The mine is in a somewhat remote area, and the ore is refractory; thus the starting up of the plant was not a simple matter. The difficulties are being steadily overcome, however, and a satisfactory extraction is gradually being attained.

Vogelstruisbult Gold Mining Areas, Limited, commenced production in November, 1936. The usual initial difficulty was met in providing the necessary tonnage from prepared stopes, but this has now been largely overcome.

SOUTH AFRICAN CARBIDE AND BY-PRODUCTS COMPANY, LIMITED.—12. The demand for carbide was maintained, and increased dividends were paid on the ordinary and preference shares of South African Carbide and By-Products Company, Limited.

MISCELLANEOUS INTERESTS.—13. The interests of the Company in Carlton Hotels (S.A.), Limited, and Delagoa Bay Lands Syndicate, Limited, were disposed of during the year.

DIRECTORS.—14. The Directors record with great regret that Sir Willem van Hulsteyn has found it necessary owing to health reasons to retire from the Board, after some fifteen years of valuable service to the Company.

In terms of the Company's Articles of Association the following four Directors retire by rotation and, being eligible, offer themselves for re-election; viz., Mr Walter S. Webber, Dr J. G. Lawn, C.B.E., Mr G. J. Joel, M.C., and Sir Robert N. Kotzé, M.P.

ELECTION OF AUDITORS.—15. Messrs. S. Thomson and F. Dix, the Auditors of the Company in Johannesburg, and Messrs. Kemp, Chatteris, Nichols, Sendell & Co., the Auditors in London, retire from office and offer themselves for re-election.

By Order of the Board,
A. W. CHRISTIE, Secretary.

10 & 11 Austin Friars, London, E.C.2.
16th September, 1937.

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

THE firmer tendency of prices for primary products noticeable a week ago was not maintained. In general, markets remained dull and unexciting. Pessimistic views concerning the future of business activity in the United States—the principal consuming country of many raw materials—gave rise to the view that there is no need to lay in heavy stocks in anticipation of an advance in prices. With a few exceptions, prices of the principal materials drifted downwards.

With the exception of tin, where the attempt to expand production has not yet been strikingly successful, the leading non-ferrous metals all fell in price during the week. The market in rubber enjoyed a brisk turnover towards the end of last week, but has since fallen back into lethargy with prices below last week's level. Vegetable oils were a dull market. Cotton quotations continued their downward drift, and wool prices were sharply lower at the auctions in London. Jute prices again gave way.

Wheat prices maintained last week's recovery, partly because of the reduction in the American Government's crop estimate. The market in tea remained firm, and provisions generally steady.

In general, primary commodity markets in the United States held last week's improvements. Moody's index of staple commodity prices (December 31, 1931 = 100) rose further from 194·9 to 195·1 during the week ended last Wednesday, compared with 204·8 a month ago and 185·5 on the corresponding day last year.

JOHANNESBURG CONSOLIDATED INVESTMENT COMPANY, LIMITED

(Continued from previous page)

We report to the Shareholders that we have audited the accounts of the Johannesburg Office of the Johannesburg Consolidated Investment Company, Limited, dated 30th June, 1937, and have obtained all the information and explanations we have required. The Balance Sheet of the Johannesburg Office of the Company is, in our opinion, properly drawn so as to exhibit a true and correct view of the state of the Company's affairs in Johannesburg according to the best of our information and the explanations given to us, and as shown by the books of the Company in Johannesburg. We have also verified the securities in South Africa. The Company has kept proper books and records.

COAL

SHEFFIELD.—There is a strong demand for all grades of coal, and the fulfilment of contracts leaves little on offer. Demand for soft coal shows a steady improvement owing to the cooler weather. There is a bigger call for gas coal and household fuel is moving fairly freely. Prices for foundry and furnace coke tend to stiffen, while gas coke remains unchanged.

Business on the export market is increasing, some good contracts having been arranged for shipment from Humber ports. Competition from Polish coal is being felt in Baltic directions. Large orders have been placed for Yorkshire coal for Aarhuus and Riga.

NEWCASTLE-ON-TYNE.—Whilst foreign inquiry is limited owing to the heavy contracts already made, the coal markets of the North East remain very steady. Apart from odd cargoes of Northumberland screened steam coal offered for prompt delivery, there is little fuel available. Prices for steam coal show slight variations. Prime Blyth qualities are 23s. per ton, with singles and doubles sparingly offered at 24s. per ton f.o.b., and good quality smalls at 18s. 6d. per ton f.o.b. Durham manufacturing coal is as firm as ever, the prime brands of coking coal being nominally 24s. per ton f.o.b.

GLASGOW.—Full-time working remains the rule in most sections of the Scottish industry. Industrial demand remains strong and with the household trade now broadening, most of the collieries are well contracted for a good many weeks ahead. Export trade also remains satisfactory, and prices in this section of the market are again showing a marked upward trend in the case of both large coal and nuts. Little coal is obtainable for prompt delivery in the Lanarkshire and Ayrshire districts, but on the East Coast Fife thirds, Lothians steams and trebles in both Fife and the Lothians are still obtainable.

CARDIFF.—Shipments continue active at the South Wales ports. Last week's shipments in the foreign and coastwise trades totalled 450,600 tons, compared with 458,800 tons in the previous week, and 352,256 tons in the corresponding week last year, thus bringing total shipments for the current year to September 12th to 14,675,592 tons, against 11,805,679 tons in the same period in 1936. There has been very little expansion in the volume of new business, but the collieries are well employed under their contracts and last week the Central Council granted the application of the Executive Board under the Mines Control Scheme for an additional output quota of 750,000 tons for the September quarter. Supplies of large steam and bituminous sized coals are available, but for practically all other classes there is a scarcity for prompt shipment. Patent fuel and pitwood are steady markets and coke continues very firm. There have been no changes in prices. A strike at the Ocean Collieries over the non-unionist question has been averted by the submission of the recalcitrants, and it is hoped that the efforts to secure a hundred per cent. Federation membership at the Powell Duffryn pits will prevent a stoppage a week hence at these collieries.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates active conditions in the iron and steel markets. Demand is only held in check by the difficulty of finding suppliers able to accept orders for the required delivery. This situation has prevailed for some time, and although in one or two departments it is reported that the position is becoming slightly easier, the market is still governed by a severe stringency of supplies.

In the pig-iron market the outlook has improved, and enough iron is reaching consumers to enable them to maintain operations, although neither producers nor consumers have had any opportunity of accumulating stocks. For the time being the quantities of steelmaking iron available for the industry are sufficient to meet current requirements, but some nervousness is still felt regarding the situation which may rule later in the year.

The position in the semi-finished steel market is rather easier than for some time, although operations at some of the consuming works are still affected by the shortage of material. Increased quantities of Continental steel, however, are now being received.

The production of finished steel continues on a heavy scale, but it is insufficient to meet consumers' requirements. Many of the steelworks have practically sold their output until the end of the first quarter of next year; and others will enter 1938 with a heavy tonnage of orders on their books.

MIDDLESBROUGH.—Producers of all materials are doing their utmost to meet the heavy demands of home consumers. Deliveries against old sales are slightly better and shipments of pig iron are improving, the total quantity shipped from the Tees to September 14th being 8,879 tons, against 3,936 tons during the first fortnight of August. Slightly better deliveries of semi-manufactured steel are being made. Prices are all unaltered. Blast furnace coke is in good demand and heavy steel scrap can easily be sold at the controlled prices. The Iron and Steel Institute are holding their autumn meeting in Middlesbrough this week and this is well attended.

SHEFFIELD.—Pressure of business in the iron and steel market shows acceleration with the close of the holiday season, but the difficulty of obtaining supplies is causing users a good deal of anxiety. Output in most directions is at present capacity, and although expansion is in hand, requirements constantly increase. Consumers are unable to build up even meagre stocks and have perforce to carry on from hand to mouth. Makers of forge and foundry pig are contracted to the hilt and very few odd lots are on offer. Production costs are continually rising, and although selling prices of pig iron are stabilised to the end of the year, there seems every likelihood of a revision thereafter. Very few producers are accepting 1938 business except on the basis of prices which may then be ruling. East Coast hematite business is rather less difficult to transact, but producers of West Coast hematite are not anxious at present to add to their commitments. Bar iron makers' operations are hampered by short supplies of forge iron. The pressure for common and marked bars is fully maintained. Imported bars are at a price which does not attract buyers.

Output of basic and acid steel billets is at a record, yet falls short of requirements, and re-rollers are complaining of delay in delivery. Supplies of Continental billets are available and are helping to ease the position to some extent. Demand for rods, strip and structural steel is unabated. There are no official changes in prices.

GLASGOW.—In the West of Scotland there is no material change. Orders on hand are sufficient to ensure working to capacity at the steel plants for many months, and the output is being so rapidly absorbed that there is no possibility of stocks accumulating. While the slight improvement in deliveries of semis recently observed is maintained, users are still receiving supplies far below their present needs and continue to work from hand to mouth. Tube makers, sheet makers, bar re-rollers, etc., have all well-filled order books and could readily dispose of much more material than they are producing, but supplies of tube strip, sheet bars, slabs and billets are not on a scale to permit of all the plant in the district being put into operation. Demand for all classes of finished material is very heavy and buyers are willing to negotiate further contracts without guaranteed delivery dates.

CARDIFF.—Trade in the various sections of the South Wales iron and steel industry continues good. The blast furnaces and steelworks have been well employed, and the sheet and tinplate branches are also active. The latest output returns of the tinplate factories shows a production of 76·39 per cent. of allocated capacity. Prices are unaltered. At Swansea last week, shipments of tinplates to foreign destinations totalled 5,880 tons, against 5,402 tons the previous week, and 1,769 tons in the corresponding week last year, while stocks increased to 10,935 tons, against 5,768 tons at the same date in 1936.

OTHER METALS

COPPER.—The past week has been a disappointing one. Offerings were larger, while demand was somewhat thin. As a result the standard cash price eased to £54 11s. 3d., a decline of exactly £2 on the week. Although consumers' stocks are at a low ebb, both in this country and on the Continent, there is a growing disinterest in a restocking movement until both the economic and political outlook become clearer. On the other hand, production is rising steadily, although in one or other of the big extra-U.S.A. producing countries some form of voluntary restriction seems to be in operation again. Nor are reports from the United States encouraging. Under these conditions the expected autumn revival may well be delayed.

Sales on the London Metal Exchange: 1,550 tons on Monday, against 850 tons last week; 2,400 tons on Tuesday, against 1,550 tons last week; 1,350 tons on Wednesday, against 1,700 tons last week. Domestic spot was quoted at 13·42½ cents per lb. in New York on Wednesday, against 13·62½ cents a week ago and 13·92½ cents a month ago. Wednesday's official closing price for standard cash in London was £54 11s. 3d. to £54 12s. 6d. per ton, compared with £56 11s. 3d. to £56 12s. 6d. a week ago.

LEAD AND SPELTER.—The spot quotation for lead dropped by £1 3s. 9d. to £21 2s. 6d., while spelter declined by £1 6s. 3d. to £21 17s. 6d. The decline in lead is largely due to the seasonal slowing down in building and a more satisfactory progress in production. Spelter suffered particularly from the growing lack of speculative interest and a certain reserve in buying by galvanisers, who are still suffering from the scarcity of regular steel supplies and thus show great reserve in replenishing their stocks. In the United States the position of both lead and spelter supplies seems to be improving. It is true that United States stocks of spelter declined last month by another 2,334 short tons to 11,227 short tons, a quantity which covers current consumption for only about five days. Reports from the chief lead-zinc mining districts of the United States, however, speak of rising ore supplies and the refining capacity in operation is also being rapidly extended. Thus, according to the American Zinc Institute, the number of retorts in operation in United States zinc refining plants amounted to 50,163 at the end of August, against 46,199 one month before and only 40,285 at the end of January last. These figures seem to indicate that United States spelter supplies will expand substantially in the not too distant future—a fact which will naturally discourage United States consumers from purchasing foreign supplies.

Sales of lead on the London Metal Exchange: 750 tons on Monday, against 1,350 tons last week; 1,300 tons on Tuesday, against 1,250 tons last week; 1,500 tons on Wednesday, against 1,150 tons last week. The New York quotation on Wednesday was 6·50 cents per lb., against 6·50 cents a week ago and 6·50 cents a month ago. Wednesday's official closing quotation in London for soft foreign for shipment during the current month was £21 2s. 6d. to £21 3s. 9d. per ton, compared with £22 6s. 3d. to £22 8s. 9d. last week.

Sales of spelter on the London Metal Exchange: 1,175 tons on Monday, against 550 tons last week; 1,850 tons on Tuesday, against 750 tons last week; 1,500 tons on Wednesday, against 1,250 tons last week. Wednesday's quotation in East St. Louis was 7·25 cents per lb., against 7·25 cents the week before and 7·25 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £21 17s. 6d. to £21 18s. 9d. per ton, against £23 3s. 9d. to £23 5s. last week.

TIN.—Tin was the only metal which was firmer this week. The standard cash price closed at £264 7s. 6d., a gain of £3 7s. 6d. on the week. There was some buying on United States account, which led to a more cheerful tendency. In addition the Bolivian shipment figure for August, at 1,773 tons, against 2,707 tons in July and the monthly quota of 4,195 tons, again demonstrated that little progress, if any, has been made in Bolivia since the conclusion of the currency agreement between the Bolivian tin producers and the Government—which was designed to increase Bolivia's output. As Bolivian ore provides the chief basis of the Liverpool tin smelting industry, the London market is particularly impressed by the Bolivian inability to raise exports. In spite of the lower Bolivian supply, however, the recent gains in tin prices can only be maintained if consumers' demand continues on a fairly high level. In this respect the outlook is uncertain, although buying requirements of consumers are certainly fairly large.

Sales of tin on the London Metal Exchange: 400 tons on Monday, against 175 tons last week; 200 tons on Tuesday, against 150 tons last week; 355 tons on Wednesday, against 205 tons last week. The New York quotation on Wednesday was 59·87½ cents per lb., against 58·75 cents a week ago and 59·50 cents a month ago. Wednesday's official closing quotation in London for standard cash was £264 7s. 6d. to £264 12s. 6d. per ton, compared with £260 10s. to £261 a week ago.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted on Wednesday at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was steady at £13 12s. to £13 12s. 6d. per flask of 76 lbs., the same as last week. Chinese antimony was quoted at £80 to £82 per ton, ex warehouse, the same as last week. Chinese wolfram for "September–October" shipment was quoted at 122s. 6d. to 127s. 6d. per unit, c.f.f., compared with 120s. to 130s. last week. Refined platinum was quoted on Wednesday at £10 5s. per ounce, compared with £10 5s. a week earlier.

TEXTILES

COTTON.—Manchester.—Market conditions have not been favourable for any real expansion in business. The further downward movement in raw material rates and the foreign political news have resulted in buyers being cautious in giving out orders. With regard to the raw cotton situation, the bearish statistics published by the United States Government have brought out more hedge selling and nothing has happened to stimulate freer buying. The weather in the American belt since the beginning of September has not been very favourable, and it remains to be seen whether the latest forecast of production, at 16,098,000 bales, will be realised. In any case plentiful supplies of raw cotton during the next twelve months are assured.

Spinners of American yarns have held very firmly to quotations. A useful business has been done in coarse twists and medium wefts, and the pressure for deliveries is still pronounced. Buying in Egyptian yarns has been patchy. Buyers of piece-goods have continued to display more interest in prices. An improvement has shown itself in inquiry for India, and a few more sales have been put through in light bleaching descriptions for Calcutta and fancies for Bombay and up-country. Far Eastern trade remains very unsettled, but dyed cloths have moved off fairly well for the Straits Settlements. Makers who cater for the Dominions and the home trade have experienced rather freer buying. Cases have been reported, however, of some manufacturers being in need of fresh contracts.

COTTON SPINDLES REDUNDANCY SCHEME.—The Cotton Spindles Board, under the Cotton Spinning Industry Act, has now completed twelve months' work, and it is understood that within the next few weeks the Board will present a report to Parliament, the officials having no power to issue any statement other than this report. It is anticipated that in due course particulars will be made known of the number of spindles purchased and of the financial position of the scheme. From time to time it has been known that certain mills have been purchased, and it is believed that about 2,500,000 spindles have been scrapped during the twelve months, or arrangements are being made for the elimination of this amount of plant.

It is significant that immediately after the Spindles Board was appointed last September a trade revival was experienced and spinners have sold more yarn since that time than in any similar period for many years back. Most of the spindles obtained by the Board have been idle for some years, and only a few running mills have been bought for scrapping. Production of yarn, therefore, has not been very much affected, but to the extent indicated spinning employers have been relieved from the possibility of standing mills being restarted owing to the more profitable state of trade. There have been rumours that the work of the Board may come to a standstill owing to the higher prices which have now to be paid for spindles, but it is not likely that this work of dealing with redundant plant will be stopped by any means. At the outset of the scheme, the idea was to eliminate 10,000,000 spindles, as it was the opinion of the leaders of the industry that Lancashire trade had been lost, and could not be regained, equal to the output of this machinery. It is understood that the Government is keenly interested in this method of dealing with redundant plant and if the experiment is successful the same principle may be adopted by other industries.

WOOL.—Bradford: The fifth series of colonial sales opened in London on Tuesday, there being the usual large contingent of home and Continental buyers in Coleman Street, when a miscellaneous catalogue was put before the trade. The selection of merinos was not too good, particularly in greasy combing wools. Scoureds were fairly well represented, meeting good general competition. Compared with the close of the July series, prices for warp combing wools showed a decline of about 5 per cent., and medium and faulty descriptions about 10 per cent. Even these prices are well in front of the basis of values ruling overseas, but no doubt spot demand and the wools being available for immediate use account for the better market in London. Various estimates are made as to what 64's tops are going to cost. Some estimates average 64's costing 36d. and warp 64's 37–37½d.—prices which were definitely above Bradford parities last Monday.

Crossbreds are going to bulk largest in the catalogues this series, slipes dominating. The few greasy combing crossbreds catalogued found a ready sale, although the bulk of the wools were one to two years old. These showed an all-round decline of 5 to 7½ per cent., according to quality, though the very wasty parcels commanded bids often 10 per cent. below July rates. There were large offerings of slipes, and the decline here was considerable. Good halfbred lambs showed a general decline of 2d. to 2½d., fine crossbreds 1½d., and coarse wools, including short blanket slipes, about 1d. per lb. It will be a mistake on the part of owners if they do not meet the market and let the wools go into users' hands, and so prepare the trade for the marketing of a new clip at the end of November. Stocks are not heavy, particularly combing classes, but nothing will create confidence among users more than a free disposal of supplies.

There is very little business in consuming centres, everybody waiting for an established basis of values, which alone will bring confidence and lead to the placing of new orders. Botany noils have dropped in sympathy with wool and tops. The decline is rather unwelcome in many quarters because consumption is well maintained, but no doubt the political crises, together with the serious fall in stocks and shares, have had an adverse effect.

GRAIN MARKETS

WHEAT.—Although American grain markets have shared the nervousness of the stock markets, wheat prices have again been firm in London. The firmness of freight rates and the shortage of shipping tonnage have tended to support the wheat markets. Meanwhile, the Canadian crop has been officially estimated at 188 million bushels, while the total United States crop is put by Broomhall at 868 millions. The outlook for wheat is discussed in a leading article.

On Wednesday last, "September" futures were quoted in Chicago at 102 cents per bushel, against 108½ cents the week before and 110⅞ cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba (Atlantic), ex ship, 52s. 6d. to 54s. 3d. per 496 lbs., against 52s. 6d. to 53s. 6d. last week; No. 2 Northern Manitoba (Atlantic), ex ship, 51s. to 52s. 6d., against 51s. to 51s. 6d. last week. According to the *Corn Trade News*, total shipments of wheat and flour last week amounted to 934,000 quarters, against 838,000 quarters in the previous week and 1,504,000 quarters in the corresponding week a year ago.

FLOUR.—Prices are unchanged. Wednesday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 40s. per 280 lbs., as against 40s. a week ago; delivered inner London, 39s. 6d., as against 39s. 6d. a week ago. Manitoba patents, ex store, 38s. to 39s. 6d., as against 38s. 9d. to 40s. 3d. a week ago. Australian, ex store, 32s. to 32s. 6d., as against 32s. to 32s. 6d. a week ago.

BARLEY.—A steady demand for imported feeding barley has been experienced during the past week. "October" futures were quoted at 59½ cents per bushel in Winnipeg on Wednesday, as against 57½ cents last week. Quotations per 448 lbs. in London on Wednesday were: "English feed," at farm, not quoted; "English malting" (new), at farm, 45s. to 65s., as against 45s. to 65s. a week ago; Californian, ex ship, 45s. to 58s., as against 50s. to 52s. a week ago. Chilean, brewing, ex ship, 44s. to 48s., as against 44s. to 48s. a week ago.

OATS.—On Wednesday, "September" futures were quoted at 31 cents a bushel in Chicago, against 31½ cents a week ago and 29⅞ cents last month. Quotations in London, Wednesday: "English Black" (new), at farm,

Consolidated Main Reef Mines & Estate, Limited

(Incorporated in the Union of South Africa)

Extracted from the Annual Report for the Year ended 30th June, 1937

Capital, £1,247,602 in 1,247,602 Shares of £1 each (all issued)

DIRECTORATE

C. L. READ (Chairman). SIR ABE BAILEY, Bart., K.C.M.G.
R. S. G. STOKES. G. CARLETON JONES. MAJOR C. S. GOLDMAN.
W. A. MACKENZIE. A. A. AURET. W. H. A. LAWRENCE.

Tonnage Milled, 1,916,500.

		Per ton milled.
Total Working Revenue	£2,551,367 0 6	£1 6 7
Total Working Expenditure	1,934,581 2 11	1 0 2
Working Profit	£616,785 17 7	£0 6 5
Total Profit for the year		£623,087 14 7
Balance unappropriated at 30th June, 1936		215,883 4 6
Forfeited Dividends Account		138 0 4
		£839,108 19 5

This amount has been dealt with as follows:—

Net Expenditure on Capital Account for the Year	£66,018 6 5	
Miners' Phthisis—Provision on account of Outstanding Liability as at 31st July, 1936	9,251 0 0	
Provision for Taxation	206,355 5 6	
	281,624 11 11	
	£557,482 7 6	
Dividends declared during the year:— **No. 54** of 13⅛ per cent., and **No. 55** of 13⅛ per cent....	343,090 11 0	
Leaving a balance unappropriated of	£214,391 16 6	

Ore Reserve.—The available ore reserve has been re-estimated, and is as follows:—

	Tons.	Value, Dwt.	Stoping width, Inches.
Main Reef	606,400	4.14	58.7
Main Reef Leader	3,579,800	4.81	50.7
South Reef	3,332,200	4.39	48.5
Bird Reef	3,335,900	3.41	76.8
Total	11,154,300	4.23	56.1

In addition, there are 749,000 tons of payable ore, of a value of 5.17 dwt. standing in shaft and safety pillars, which are not at present available for stoping.

Compared with the previous year, the available reserve shows an increase of 1,465,600 tons the value and stoping width being lower by 0.16 dwt. and 0.4 inch respectively.

The Full Report and Accounts (with Plans of Workings) may be obtained from the London Secretaries, A. MOIR & Co., No. 4 London Wall Buildings, London, E.C.2.

25s. 6d. to 26s. 6d. per 336 lbs., as against 25s. 6d. to 26s. 6d. last week; "English White" (new), at farm, 25s. 6d. to 26s. 6d., as against 25s. 6d. to 26s. 6d. a week ago; mixed Canadian feed (Vancouver), landed, 25s. 9d. per 320 lbs., as against 25s. 9d. a week ago.

MAIZE.—Trading has been moderate, but U.K. prices are firmly held. "September" futures were quoted on Wednesday at 105⅛ cents per bushel in Chicago, against 105¼ cents a week ago, and 99⅛ cents last month. Quotations in London, Wednesday: "Plate," landed, 29s. 6d. per 480 lbs., as against 29s. a week ago; "Plate," ex ship, 28s. 9d., as against 28s. a week ago; "Plate," "September," 28s. 9d., as against 28s. a week ago; yellow maize meal, ex wharf, was quoted at £7 10s. to £7 12s. 6d. per ton, as against £7 7s. 6d. last week.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1935–1937:—

NEARBY FUTURE	Jan. 2, 1935	Dec. 31, 1935	Sept. 16, 1936	Dec. 30, 1936	Sept. 8, 1937	Sept. 15, 1937
Winnipeg (No. 1, Manitoba)—Cents per 60 lbs.	82¼	84⅛	106	129	129½	125⅛
Chicago (No. 2, Winter)—Cents per 60 lbs.	96⅛	101½	114⅛	135⅛	108½	102

The visible supply of wheat in Canada amounts to 57,144,000 bushels, against 49,764,000 bushels last week and 76,244,000 bushels in the corresponding week last year.

SALES AND PRICES OF BRITISH CEREALS.—The following table gives the estimated sale of home-grown wheat during the harvest years 1934–35 to 1937–38.

	1934–35	1935–36	1936–37	1937–38
Estimated sales of home-grown wheat—	Cwts.	Cwts.	Cwts.	Cwts.
1 week to September 11	476,680	435,043	280,121	403,466
2 weeks to September 11	832,961	855,987	510,065	715,359
Average price of English wheat per cwt.	s. d. 5 1	s. d. 4 8	s. d. 7 2	s. d. 8 6

The following is a statement showing the quantities sold and the average price of British cereals in the past two weeks, and for the corresponding weeks in each of the years from 1933 to 1936:—

Week ended	Quantities Sold			Average Price per cwt.		
	Wheat	Barley	Oats	Wheat	Barley	Oats
	Cwts.	Cwts.	Cwts.	s. d.	s. d.	s. d.

September 4, 1937	311,893	33,498	43,620	8 7	12 10	8 6
September 11, 1937	403,466	135,942	48,942	8 6	12 2	8 5

OTHER FOODS

BACON.—Demand has been good and the market has had a firm tone. The official quotations (per cwt. for No. 1 Sizable) which formed the basis for dealings on the London Provision Exchange this week, were: English, 101s.; Canadian, 96s.; Danish, 102s.; against 101s., 94s. and 100s. last week. Arrivals in London last week included: Danish, 14,352 bales; Canadian, 4,657; Dutch, 2,842; Lithuanian, 2,194; and Polish, 3,378; as against 14,354, 8,480, 2,534, 1,467 and 3,336 bales, respectively, in the previous week.

BUTTER.—After a rather easier opening, the market developed a firmer tone and prices show a net gain on the week. Quotations (per cwt.) on the London Provision Exchange on Wednesday were: New Zealand, finest salted, 117s.; Australian, choicest salted, 117s.; Danish, 135s.; compared with 116s., 116s., and 132s., respectively, a week ago.

CHEESE.—A steadier tendency has been general, though New Zealand is again rather cheaper. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: English Cheddars, finest farmers, 88s. to 90s.; Canadian, finest coloured, 70s.; and New Zealand, finest coloured, 68s. 6d.; against 88s. to 90s., 70s. to 71s., and 70s., respectively, a week ago.

COCOA.—New arrangements among purchasers of cocoa on Gold Coast markets are discussed in a Note of the Week. The spot quotation in New York on Wednesday was 8⅜ cents per lb., as against 8¼ cents per lb. last week. In London, on Wednesday last, good fermented new crop, Accra, "November–January," was quoted at 36s. 3d. sellers per 50 kilos., c.i.f. Continent, against 37s. a week ago. Last week's movements of cocoa in London were as follows: Landed, 3,340 bags; delivered, for home consumption, 3,352 bags; exported, 4,531 bags; stocks, 234,072 bags, against 157,972 bags a year ago.

FRUIT.—Business at Covent Garden remains good, says *The Fruitgrower*, and prices during the past week were generally above normal for the time of year. English apples met an active demand and the good showing of English pears sold well. Business in hothouse grapes showed an improvement, with prices steady. English peaches were short and dear, while nectarines were in limited supply. English and Guernsey green figs sold well, and some French black figs were on the market. With filberts finished, cobnuts were in better demand, while plentiful supplies of blackberries sold well. Plums continued an active item, Monarch being the principal line now available. Supplies of oranges were rather short and prices were accordingly higher. Lemons were dear, but grapefruit showed an easier tendency.

MEAT.—At Smithfield Market, on Wednesday last, Argentine chilled hindquarters were quoted at 4s. 2d. to 4s. 6d. per 8 lbs., as compared with 4s. to 4s. 5d. a week ago. New Zealand frozen mutton was 3s. 4d. to 4s. 2d. per 8 lbs., against 3s. 6d. to 4s. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 9,101 tons, a decrease of 620 tons on the corresponding week last year. Beef and veal accounted for 5,051 tons, mutton and lamb 2,512, and pork and bacon 931, as compared with 5,266, 2,696 and 1,088 tons, respectively, in the same week of 1936.

MILK.—Information relative to the operation of the Milk Marketing Scheme during August as issued by the Milk Marketing Board is given in the following table, together with comparable statistics for earlier months.

	August, 1936	May, 1937	June, 1937	July, 1937	Aug., 1937
Regional pool prices* (*per gallon*):	d.	d.	d.	d.	d.

	Million gallons				
Total sales under contract	80·00	89·08	86·85	81·53	75·34
For liquid consumption	45·82	49·73	48·93	50·50	48 69
For manufacturing	34·18	39·35	37·92	31·03	26·65

* On account to the nearest farthing.

Accredited producers receive 1d. per gallon in addition to the above prices. Premiums for level deliveries and for Grade "A" or special services are paid to the producers concerned in addition to the pool price. Transport charges are payable by individual producers and are deducted from accounts.

PEPPER.—On Wednesday, white Muntok, "October–December," was quoted at 4 7/16d. per lb. sellers, c.i.f. Rotterdam–Hamburg, against 4⅛d. per lb. a week earlier. Black Lampong, spot, in bond, was quoted at 3⅛d. per lb., sellers, compared with 3⅛d. per lb. last week. Movements of pepper in London last week were as follows: Black, landed, nil; delivered, 7 tons; stocks, 1,969, against 1,772 last year. White, landed, nil; delivered, 24 tons; stocks, 11,368 tons, compared with 12,067 a year ago.

COFFEE.—The London spot market was quietly steady, but a weaker tendency was evident in New York. On Wednesday, Rio No. 7 (cash) was quoted at 9 cents per lb., in New York, as compared with 9⅛ cents per lb. last week and 9 cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, 2 cwt.; delivered, for home consumption, 72 cwt.; exports, nil; stocks, 1,849 cwt., against 9,957 a year ago. Central and other South American: Landed, 13 cwt.; delivered, for home consumption, 1,709 cwt.; exported, 667 cwt.; stocks, 92,159 cwt., against 84,674 cwt. last year. Other kinds: Landed, 1,307 cwt.; delivered, for home consumption, 3,416 cwt.; exported, 319 cwt.; stocks, 88,765 cwt., against 124,616 last year.

EGGS.—With a good demand and a seasonal reduction in supplies, the market has had a firmer tendency. At Smithfield, on Wednesday, English (ordinary packing, Grade I, about 15–15½ lb.) realised 18s. to 18s. 6d. per 120, against 18s. to 18s. 6d. last week; while Danish (15½ lb.) made 13s. 6d. to 14s., as against 13s. 3d. to 13s. 9d. last week.

RICE.—The spot price of Burma No. 2 cleaned was 10s. 9d. per cwt. ex warehouse, on Wednesday, as compared with 10s. 9d. per cwt. a week ago. "September–October," in singles to Continent and U.K., was quoted at 9s. 10½d. to 10s. per cwt., against 9s. 9d. to 9s. 10½d. last week. Movements in London last week were as follows: Landed, 20 tons; delivered 45 tons; stocks, 2,123 tons, against 2,139 a year ago.

SUGAR.—The London market remains quietly steady, but New York prices have eased. The New York spot quotation was 3·45 cents on Wednesday, as compared with 3·50 cents per lb. last week and 3·60 cents per lb. a month ago. Wednesday's sales of raw sugar in London included "December" delivery at 6s. 6d., against 6s. 4d. to 6s. 5½d. a week ago. Movements of raw sugar in public warehouses in London and Liverpool last week were as follows: Imports, 3,748 tons, against 3,576 in the previous week and 13,183 in the same week of 1936; deliveries, 17,571 tons, against 16,847 and 16,305 tons, respectively; stocks, 102,456 tons, against 116,288 and 106,917 tons, respectively.

TEA.—The following table shows the average price (compiled by the Tea Brokers' Association) of tea sold in Mincing Lane on Garden Account in recent weeks:—

Week ended	Northern India	Southern India	Ceylon	Java	Sumatra	Africa	Total
	d.	d.	d.	d.	d.	d.	d.
Sept. 10, 1936	14·82	12·13	13–31	11·02	·06	11·28	13 88
Aug. 19, 1937	17·55	14·88	15·55	14·53	·79	14·36	16·22
" 26 "	17·94	14·96	15·86	13·75	11 14	14·56	16·61
Sept. 2 "	16·97	14·88	16·03	15·12	13·09	14·32	16·27
" 9 "	17·63	14·98	16·30	15·72	13·10	14·23	16·67

At this week's public auctions in Mincing Lane, 56,550 packages of Indian and 23,343 packages of Ceylon tea came up for disposal. Ceylon grades encountered keen competition at rising prices. The market in Indian teas was also firm in response to a strong and active demand.

VEGETABLES.—According to *The Fruitgrower's* Covent Gar report, tomatoes were cheaper during the past week on account of h supplies from Jersey. Good new crop cucumbers held their price, plenty of others were available at cheaper rates. Good quality ru beans and green peas were in short supply and cabbage and cauliflo consequently did better. A few Brussels sprouts of excellent qua have put in an appearance, and a few savoys have begun to arrive. Mu rooms were short and dear, but green onions were slightly cheaper. potato trade has been rather quiet and, although supplies were rather heavy, quotations again eased. At the London Borough market, best li soil King Edward made 5s. 6d. to 6s. 6d. per cwt., against 6s. to 7s. last week. Other varieties ranged from 4s. to 5s. per cwt.

MISCELLANEOUS COMMODITIES

VEGETABLE OILS AND OILSEEDS.—Oilseeds are only moderately active. Crushers are buying sparingly of linseed in view of the poor demand and unsatisfactory price of the oil product. On the other hand, oilcakes are in improving request, and stocks are within narrow compass. Linseed is firm and is advancing in sympathy with freight rates, while prospective supplies are only moderate. The better outlook for the new crop in Argentina has, however, a steadying influence, and the fact that the crop in the United States has been harvested indicates a slackening of demand from that quarter. Shipments from the River Plate last week were larger than for some weeks, reducing the balance of the exportable surplus to 267,000 tons, according to the Government report issued last Saturday. The Indian export is proceeding slowly, and is hampered by the scarcity of freight space. Nevertheless, there is now en route from India to Europe 37,600 tons, the greater part being for this country. This and 78,100 tons from Argentina give a total of 115,700 tons afloat for Europe, while that destined for the United States is 42,800 tons. Weather conditions in Argentina are favourable to the new crop, which, if all goes well, may turn out to be equal to expectations.

A fair trade in Egyptian cottonseed to Hull has been done at £6 5s. all positions to December, a slight reaction from last week's transactions. Demand for cotton oil on both home and export account continues poor despite further reductions of 20s. per ton. Refined oil, ex Hull, from the new seed is now offered at £25 per ton, with crude £3 less. Ground nut and palm kernel oils are easier, but castor oil is firm and dearer. Linseed oil is about 10s. per ton dearer on the week.

RUBBER.—Prices rose in the early part of the period under review, in response to active buying by American interests. The gain was not held, however, and prices declined sharply under profit-taking sales to close on Wednesday showing a net loss on the week. In the United States prices are also lower than those of a week ago. The spot price in New York on Wednesday was 18⅞ cents per lb., compared with 19⅛ cents per lb. a week ago and 18 7/16 cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 8 13/16d. per lb., as against 9 7/16d. on the corresponding day last week. In forward positions business has been done at 9d. to 9⅛d. for "October" shipment, as against 9 7/16d. a week ago. Stocks in London and Liverpool at the end of last week totalled 47,907 tons, against 46,256 tons a week earlier. A year ago stocks amounted to 106,279 tons.

Mr Eden's Offer

THE regular meetings of the Assembly of the League of Nations are determined by the calendar rather than by the progress of events. It has sometimes occurred that the Assembly has met when there is little happening. This year it has met when plenty is happening, but at a time when so many weighty movements are in mid-course that definite judgments are peculiarly difficult. The diplomatic scene is one vast mark of interrogation. Will Japan's descent upon China work to the advantage or to the ruin of the aggressor? Will the Western Powers be compelled, in spite of themselves, to take a part in the Far Eastern game? Will GENERAL FRANCO be able to make any substantial military progress before winter sets in? Will even the threadbare relics of non-intervention be able to survive? Will Italy join the Nyon patrol? And, whether she does or does not, will she send further troops to Spain? If so, what will France and Britain do? Above all, what will be accomplished at the dictators' meeting next week? Every one of these questions is of major importance. As each of them, in the coming weeks, slowly spells out its own answer, the chances of war and peace will shift. With them will fluctuate the hopes and fears of men throughout the world. In such a delicate and dynamic situation, no country can pretend to have a fixed policy.

There is thus some excuse for the lack of precision which has been criticised in the speech delivered by MR ANTHONY EDEN to the Assembly on Monday. Knowing as we do the past vacillations and present character of the British Cabinet we should be astonished to learn that the British Government had made up its mind what to do in all contingencies. And even if it had, it might be the reverse of diplomacy to announce it *coram publico*. On China, MR EDEN could, and did, say least of all. Indeed, the few sentences he devoted to the subject did nothing but express sympathy with the cruel plight in which China finds herself. On the Spanish struggle, he could be hardly more definite. So long as the legal fiction of "non-intervention" persists, London and Paris must shut their eyes to even such positive proofs of actual intervention as DR NEGRIN adduced.

Nevertheless, in spite of all these evasions, the FOREIGN SECRETARY'S speech was not an entirely negative performance. The immediate task of British statesmanship in the crucial and anxious period of the next few months is to hold the fort of peace—or what remains of it. Too great weakness would encourage the potential aggressors to attack. Too open and aggressive a challenge by the democracies might leave dictators, who have ridden to power on prestige and are now hag-ridden by the same imperious mistress, with no option but to put their fortunes to the last dreadful touch. The policy for France and Britain is thus to demonstrate in the most unmistakable terms that there are limits, perilously close, beyond which they will not retreat. But on the other hand they must remember that faces will have to be saved and they should provide a plentiful supply of diplomatic emollients. The process of *suaviter in modo, fortiter in re* was admirably begun at Nyon; it has been carried further in the sequel to Nyon; and MR EDEN'S speech was in the same key. There were no threats, open or veiled; there was plenty of willingness to explore every possibility of reconciliation; but there was also a tactful and most timely reminder of the

dimensions of British re-armament and of the near-unanimity of national determination behind it.

Those who are devoting all their energies to holding the fort cannot be expected to spend much of their time on long-range strategy. MR EDEN must therefore not be blamed for failing even to outline a prescription for universal appeasement. But his speech did contain one contribution which was both positive and new in the offer " to enter into discussion with any Powers which may approach the United Kingdom Government for an abatement of particular preferences in non-self-governing territories where these can be shown to place undue restriction on international trade."

This offer followed most appropriately on the publication of the report of the Committee set up by the last Assembly to study the problem of raw materials. The Committee (a majority of whose members came from countries which have no colonies) estimated that only about 3 per cent. of the world's production of all commercially important raw materials comes from colonial territories. Rubber comes exclusively, and tin mainly, from colonies. But these are the only important exceptions to the rule that the production of raw materials is not largely a colonial matter. It follows that any country's inability to obtain raw materials must be, in the main, an inability to obtain them from other sovereign countries. And this in turn may be due to the producers' inability to supply them or the complainant country's inability to purchase them.

Under the former head, the Committee could only find potential rather than actual grounds for complaint. Restriction schemes, for example, though they might be harmful, and had been harmful in the past, were now in the main run on sound lines. This judgment is open to dispute; but in any case such schemes do not discriminate between consumers of different nationalities. When it turns from difficulties of supply to difficulties of payment, the report becomes almost as blunt as an international document can well be. The foreign exchange difficulties of industrial countries, it says, are due to their own mistakes of currency policy and their own excessive expenditure on armaments. But as a minor exception the Committee declares that " there may be cases where the relaxation of preferences would be of assistance to countries importing raw materials."

MR EDEN did well to meet this challenge, even though it was of minor importance, and even though he has received only abuse from the German press for his pains. Only when every last scrap of economic grievance has been removed will the colonial question be clearly recognised for what it is—a matter of power-politics and nothing more.

But precisely because it is a political question, the removal of economic grievances will not finish the matter. A demand may have no logic but great psychological impetus. We in Great Britain must bring ourselves to realise that these patently fallacious economic arguments are merely the coating of pseudo-sense on a demand which may be as serious as any other obsession of a sovereign state. A settlement of the colonial question, on terms which recognise the nature of the demand, must be included in any programme of Anglo-German appeasement. To attempt any such settlement at this instant, to yield at the cannon's mouth what could only be granted to the Good Neighbour, would be both unwise and unsafe—just as would be any gesture towards unilateral disarmament. But, also like disarmament, the demand for colonial equality will be met with again in the future. We should prepare ourselves even now to meet it with a genuine will to find a solution.

The American Constitution

ONE hundred and fifty years ago, on September 17, 1787, the Philadelphia Convention agreed on a draft Constitution for the newly united states of America. This draft became supreme law on April 30, 1789, when it was accepted by eleven of the thirteen original States. The American people are now celebrating the occasion with the familiar mixture of admiration for the constitutional work of the past, and concern for the future. That the constitution is at this time, as so frequently in the past, a centre of controversy is a sign that it is a living and growing structure. The notable fact is that the constitution has survived a century and a half of fundamental change in the conditions and behaviour of the American people, and that it has been sufficiently flexible to grow with the society to which it applies. It has fulfilled the hopes of its founders, and has become the tradition which binds together the American people.

The constitution has established its authority through a long history of crises, of which many were far more serious than the troubles of the present day. It has survived a bitterly-conducted and continuing struggle between the rights of the States and the powers of the Federal Government, with the victory running steadily toward increased national power. It has survived a civil war over the claim of one group of States to secede from the Union. It has been amended to include a legal statement of equality for the negro which JEFFERSON was unable to write into the Declaration of Independence. It has seen " that rabble," the common people, supplant the propertied aristocracy in exercise of the Federal Power. It has seen the growth of the United States from the rank of a European satellite to that of the most powerful unit in the world. Industrial property rights have superseded personal property rights in political importance; great combines and monopolies have refashioned the competitive society which was to have secured the economic rights of the people. And the constitution not merely survives; it flourishes.

It is perfectly clear that what is now recognised as the American constitution bears little relation to the agreed draft of 1787. For to the original words written on paper and the intentions of the drafters have been added the written amendments and, far more important, the changing interpretations of successive generations of Americans. The constitution is not to be contained in any glass case open daily for visitors' inspection; it is a body of legal rules, of moral principles, of hopes for the future, which together represent the past experience and the present political sense of the American people. The people, and not the Supreme Court, are the true custodians of the constitution. The Supreme Court under JOHN MARSHALL in the early nineteenth century took to itself the power to rule on the constitutionality of Acts of Congress; but it has been able to maintain and develop this power only because in the long run it has followed the wishes of the people.

The constitution has lived and grown only because the convention delegates in 1787 had the wisdom to provide for amendment, although by somewhat cumbersome processes (namely, ratification by each House of Congress and by three-quarters of the States), and because, perhaps unconsciously, they drafted their articles in general terms which could be reinterpreted

to suit the changing experience of successive generations. It is difficult enough to determine just what the delegates wished to express in their constitution; it is impossible to determine what rules they would have made if they could have foreseen the conditions of modern America. But what they thought then or would have thought in present circumstances is completely irrelevant. What matters is that their words have proved sufficiently flexible to be reinterpreted to meet changing circumstances, and by their own constancy have provided a thread of continuity necessary for the stability of American society. For every living and growing society needs not only progressive forces to adapt it to changing conditions, but also a receptive and passive conservatism in which the experience of the past can be preserved. In only one respect did the drafters of the constitution attempt to make a perpetual rule, when they provided that there could be no alteration in the equal representation of all States in the Senate. This rigidity may cause trouble in the future, as the boundaries of the States become less significant—though subdivision of the more populous States provides a loophole.

The fight between PRESIDENT ROOSEVELT, the Senate and the Supreme Court is only the latest example of the process of re-expression at work. The Supreme Court had given a long series of rulings, culminating in the decision that neither Federal nor State Governments had the power to fix minimum wages for women. These, if not challenged, would have effectively prevented the Government from dealing with those clamant social problems which are no respecters of written constitutions. The PRESIDENT went to the heart of the matter in his desire to secure from the Supreme Court interpretations of the constitution fitting to modern conditions. His specific proposal was that an assistant judge should be appointed for each judge over 70 who did not retire. This was rejected by the Senate. But the Court itself recognised the justice of the attack by revising its attitude towards the PRESIDENT'S social programme. To the vast majority of Americans it has seemed inconceivable that the constitution was endangered by the PRESIDENT'S proposals; but from the minority there has been criticism enough. The more vociferous opponents are those who, ostensibly in the name of the constitution, are really concerned to protect their own personal or impersonal property rights from the regulatory actions of the Government. These are the less important. More serious is the charge that the PRESIDENT wished, in fact, to subordinate the Supreme Court to the Executive branch of the Government, with the perhaps unconscious but possibly inevitable object of establishing an un-American dictatorship.

There is more substance in this latter criticism. But the gravamen of the charge is that the personal standard of the Supreme Court judges might have been weakened rather than that the Court would have been made the catspaw of politics. For the Supreme Court, in its constitutional functions at least, is already a political rather than a legal body. In the vast majority of cases which come before the Court for constitutional judgment, there is nothing in the law, and nothing even in the constitution, specifically relevant. There are merely observations about generalities such as " due process," " general welfare," " inter-State commerce," and the like. To decide whether or not these phrases are applicable in specific instances must inevitably and most properly turn upon political considerations—that is, in most cases, upon the individual preconceptions of the judges. To say this is not to criticise the Court, but to establish its place in the dynamic balance of the constitution. Under the mantle of the law, the judges exercise a political power. If the organic character of the constitution is to be preserved, this fact must be recognised and judges be appointed from the finest statesmen available. To seek protection by denying the political function and appealing to an imaginary strict and unalterable written law would halt the organic development of the constitution in which lies its strength. The appeal to legalism is no protection even for those who wish to strengthen the obstacles to dictatorship, for if the Supreme Court were ever forced to play the part of Reichstag to the President's HITLER, it would do so with the most meticulous attention to the written law and constitution.

The Englishman is generally amazed that the American constitution works at all. The secret of its vitality is the same as that of the British democracy: neither country considers itself bound by the actions of the dead, and both are willing to meet changing social problems by adopting remedies which would have been repugnant in the past. The British are duly grateful for the fact that they are not handicapped in this process by any written document supposed to be of permanent relevance. The Americans minimise their self-imposed handicap by progressive re-interpretation of a document which is catholic enough to mean all things to all men.

Education and a Career—II

The Universities

IN an earlier article we examined the chances of employment presented to the three-quarters of a million boys and girls who leave the elementary and secondary schools of England and Wales every year. Over 4,000 boys and girls from grant-aided secondary schools pass annually to university institutions in England and Wales. The total number of new entrants from all quarters into British universities and colleges is some 14,000 yearly, including about 3,000 for the universities of Scotland. The full-time student population of British universities in 1935 was 50,638, a figure equivalent to one in 885 of the population compared with one in 604 in Germany and one in 480 in France. A generation ago the British total was only 20,249. We propose, in the present article, to estimate the cost of university education to individuals and to the State; and to examine the material rewards, by way of remunerative and congenial employment open to students at the end of their university career.

More than £2¾ millions are applied every year from rates and taxes to university education in Great Britain, in addition to something like £350,000 devoted by local authorities to student scholarships. These sums represent an annual charge of about £55 per full-time student; but they provide only 44 per cent. of the universities' total income. The balance of the £6,000,000 spent annually by universities and colleges (excluding capital expenditure on buildings, land and permanent equipment) is obtained in various ways: some 14 per cent. from endowments, 33 per cent. from tuition, examination and registration fees, and 9 per cent. from miscellaneous sources.

The graduate of to-day at the end of his university career has cost his parents, guardians, local authorities, or the State between £500 and £1,000, according to the type of university of which he has been a member. These figures include tuition, lodging and maintenance, but exclude many overhead

costs of a university training. The annual cost thus varies between the different types of universities from £125 to £250, and these differences are reflected in the divergent types of entrant which they attract.

Of the 11,600 students who entered universities in England and Wales in 1934, only a little more than one-third came from grant-aided schools. The remainder, totalling about 7,500, were recruited from private schools, public schools, independent grammar schools, other institutions and from overseas. This latter class was largely concentrated at Oxford, Cambridge and London, where, out of 7,515 entrants in 1934, only 1,885 were drawn from grant-aided schools. At the University of Wales, however, pupils from State schools numbered 68 per cent. of the 1934 entrants. Entrants from State schools accounted for 60 per cent. of the whole at Sheffield, over 50 per cent, at Birmingham, Bristol, Leeds, Liverpool and the various university colleges in other areas; and just under 50 per cent. at Durham, Manchester and Reading. The problem of post-graduate employment is correspondingly complex, and its incidence varies between the different types of universities and of students.

Though there is a paucity of information available about graduate employment, it is possible to state certain general conclusions. In the first place, a serious lack of organisation and co-ordination in the finding of jobs for graduates has only recently been mitigated by the multiplication of appointments boards and the new interest taken by employers and public authorities in the recruitment, grading and training of educated recruits. Secondly, the problems of graduate employment have been especially acute in the post-war years. The numbers in universities rose sharply after the war; and subsequent economic depression revealed serious maladjustment between the number of graduates seeking work and the number and character of the openings offered. In Germany, similar troubles occasioned the drastic reduction of university entrants from 30,000 in 1932 to 16,000 in 1934, but in Great Britain unemployment among graduates never reached the same formidable dimensions. In 1934, MISS ELEANOR RATHBONE found an unemployment percentage of 6.5 among a sample of recent graduates of the combined universities. And in Wales 10 per cent. of those who graduated between 1933 and 1935 were still unemployed at the end of two years. But by January, 1935, the Board of Education reported that 80 per cent. of the students who had graduated in June, 1934, had found posts, and that the remainder would be absorbed by June, 1935.

The results of such precise work as has been done, in fact, suggest that, apart from cyclical unemployment among engineers and scientists, actual graduate unemployment is rare. The major problems arise from the danger of *misemployment*—which occurs when graduates pass into poorly paid posts with few prospects—and from the time-lag between graduation and appointment. The latter is much the simpler of the two problems. The great majority of graduates, in fact, succeed in finding employment within a few months after leaving college. Of 876 students who graduated from University College, Exeter, between 1931 and 1935, just over 2 per cent. had to wait twelve months before obtaining work. The Birmingham Appointments Board has recorded that, of 244 students who left the University in June, 1936, only 32 were unemployed six months later; and the Cambridge Appointments Board has estimated that, on the average, about 3.5 per cent. of graduates have to wait six months before obtaining employment.

The more serious problem of misemployment is less easy to assess in any precise way. Many graduates pass into posts for which their training and degree, except in the most general sense, will be useless. An instance of partial misemployment which arouses criticism among students is in the teaching profession. Many university students proceed to their degrees as intending teachers because it is the only way of securing a subsidised university training. They are trained to teach at secondary schools, but at the end of their course are compelled, for lack of suitable openings, to go into elementary schools. At Manchester University it has been estimated that, although some 80 per cent. of teachers in training have graduated, over 60 per cent. pass into elementary schools. Between 50 and 75 per cent. of trained graduates at provincial universities find their first teaching posts in elementary schools. The trouble is twofold: the university training of intending teachers is exclusively subsidised; and the reorganisation of education, including the effective raising of the school-leaving age, which was to provide openings for graduates in central and senior schools, has not been carried through. There is, of course, no inherent inferiority in elementary school teaching compared with work in secondary schools. But most graduates have not, in fact, been trained for elementary school work, which is, moreover, less well paid.

It is only at a few universities, however, where teachers in training predominate in total numbers, though, even at Oxford and Cambridge, educational posts bulk largely in the appointments secured through the Appointments Boards. At Oxford, for instance, out of 2,934 permanent posts secured between 1926 and 1936, while 545 were in Government employment, 785 in banking and insurance, 135 in journalism, secretarial and clerical work, as many as 1,459 were in schools and colleges. Similarly, the Cambridge Appointments Board reports that of 2,352 posts obtained between 1932 and 1936, as many as 926 were in educational employment, though in this instance over a thousand passed in the same period into commerce and industry. At Birmingham, of 300 graduates, recent and past, placed in the session 1935-36, 172 took posts in schools, 81 went into industry and engineering, and 47 into business and commerce. Thus, although teaching attracts a great many university graduates, a considerable number is recruited annually through university appointments boards by industry and commerce. Many more enter firms, offices or factories without the boards' assistance. Others become doctors or lawyers, having been directly trained at college.

The lack of contact between the universities and employers, between courses and the requirements of industry, commerce and the professions is still evident. Nevertheless, many employers, whether business men, industrialists or public authorities, have recently consented to cast their net tentatively among the British universities at large—though the products of the more expensive universities seem still to have a prescriptive right to prior consideration in certain fields. Several large firms have realised the possibilities of graduate recruitment and training. The possession of a degree by a recruit is not often regarded by modern employers as a liability—though some traces of an old suspicion still remain. More often, and wisely, graduates are specially prepared by employers for work for which their training has particularly suited them. Only infrequently are they wasted on routine work. Above all, the chaotic condition of this specialised corner of the labour market is now being set in order.

On the whole, apart from instances of misemployment, the prospects of a graduate justify, in the narrowest sense, the cost of his training, provided that he is willing to begin at a relatively low wage while he learns his job. He will start in life earning £200-£250 a year. He will rise to at least £500. On the average, he will earn considerably more; and an important minority of graduates will fill the highest paid posts in the land.

Commodity Market Prospects

THE downward tendency of prices in the leading commodity markets, in evidence during the last few weeks, has lately been much accentuated. In the early months of 1937, most commodities rose rapidly in price; to-day, wheat, cotton, lead and rubber have lost more than all their gains and cotton is actually cheaper than at any time since the end of 1933. The undertone of most markets is weak and the prospect of a further decline is being widely canvassed. This is an opportune time to ask how far the market's pessimism is justified, and why its views have changed so completely within the space of a few months.

The present acute weakness of commodity prices is generally ascribed by the leading market operators, first to the adverse effect of the international political situation, and secondly to the depressing influence of falling security prices in Wall Street and on other Stock Exchanges. Both factors have undoubtedly had an important influence on the commodity price structure recently, but they are far from affording a complete explanation of the *volte-face* in sentiment since last spring. If we examined the position a little more closely we shall find that the boom in prices in the latter months of 1936 and in the first quarter of 1937 was based on a definite conviction, common both to consumers and speculators, that producers would be unable to cope with the rapid increase in demand which was then in prospect, and that an acute shortage of supplies would consequently be experienced before the end of 1937. Consumers, therefore, abandoned their policy of hand-to-mouth buying, which they had consistently followed during the depression, and began to increase their stocks before the end of last year. In their wake came many speculative operators, whose intervention, from February, 1937, onwards, was on so extensive a scale that markets rapidly got out of hand and prices were forced up to uneconomic levels.

COMMODITY PRICES IN 1937

	Beginning of Year	Highest	Lowest	Sept. 22
Wheat *Liverpool, per cental* ...	9s. 1¾d.	10s. 5¾d.	8s. 0⅜d.	8s. 9⅛d.
Cotton *Liverpool, Am. middling, per lb.*	7·07d.	8·15d.	5·08d.	5·08d.
Copper *London, per long ton* ...	£ s. d. 49-10-0	£ s. d. 78-0-0	£ s. d. 48-7-6	£ s. d. 52-1-3
Tin *London, per long ton* ...	231-0-0	311-0-0	225-0-0	260-15-0
Lead *London, per long ton* ...	27-2-6	36-7-6	19-17-6	20-15-0
Spelter *London, per long ton* ...	19-18-9	37-0-0	18-8-9	20-13-9
Rubber *London, per lb.*	9 13/16 d.	1s. 1⅜d.	8¾d.	8 15/16 d.

The financial position of many operators was doubtful, to say the least, and it soon become clear that the bubble would be pricked as soon as the first technical reactions in prices forced them to increase the deposits on their commitments. In fact, prices fell almost as quickly as they had risen in earlier months. But between the middle of March and of June this reaction, where it was deemed necessary, caused no acute misgiving in the markets. Nowhere was there any disposition to look for a far-reaching change in the basic position.

By general admission, the present downward movement comes into a very different category. It started at a moment when many commodity markets normally show a strong seasonal improvement—a fact which itself suggests that the fear of an impending shortage of supplies, which was the mainspring of the rise of prices a year ago, is no longer acute. After the lessons of recent months, consumers and speculators are hesitant to begin a new and large-scale buying movement. The consumption of many commodities is admittedly maintained at record levels, allowing for seasonal fluctuations; but the possibility of maintaining, or further increasing consumption is being questioned. High prices have in recent months caused the cancellation of numerous orders and have hindered the conclusion of new contracts. Although armament demand has been substantial throughout the summer, its actual dimensions have been smaller than the market anticipated in its bullish mood of last spring. The building boom shows signs of slackening in some leading countries of the world, and doubts are even being expressed about the eagerly awaited autumn industrial revival in the United States. Trade buyers are the more inclined to be cautious, because they have already suffered losses through their heavy purchases of commodities at the higher prices ruling in the early months of this year.

The trend of supplies of many commodities gives point to the scepticism with which many buyers now discount reports of a future shortage. The world's output of copper has risen in the first eight months of 1937, according to the Copper Institute, to 1,559,162 short tons, against 1,053,025 short tons in the first eight months of 1936—a rise of 48.2 per cent. Consumption has simultaneously increased from 1,131,905 short tons to 1,531,702 short tons, or by only 35.4 per cent., and production is again in excess of current consumption. Since the end of April, the world's stocks of copper have been rising. On August 31st these stocks totalled 328,610 short tons—a figure some 45,247 tons above the lowest level touched this year. The world's tin production in the first half of this year is put by the International Tin Research and Development Council at 92,303 long tons, which is 2,560 tons below estimated consumption. But since the end of March production has actually exceeded consumption, and according to A. Strauss & Co., Ltd., stocks on August 31st totalled 23,551 long tons, and were 2,486 tons above the lowest figure for this year. Lead production outside Spain and the United States, an isolated market, advanced in the first seven months of 1937, according to Metallgesellschaft, from 608,735 to 695,175 metric tons, an increase of 14.2 per cent. But consumption outside the United States is estimated by the American Bureau of Metal Statistics to have risen by only 6 per cent. In the case of spelter the Metallgesellschaft reports for the first seven months of this year show a rise of 8.9 per cent. in output outside the United States, which has increased from 588,227 metric tons to 640,322 metric tons; the American Bureau of Metal Statistics put the rise in the extra-United States' consumption this year at 7.9 per cent.

Similar conditions have affected the markets for commodities other than metals. For example, total

supplies of American cotton in the 1937-38 season will be 22,216,000 bales (consisting of 16,098,000 bales from the new crop and 6,118,000 bales carried over from last season) against 19,369,000 bales in the 1936-37 season and an estimated consumption of 13,135,000 bales. Supplies of cotton outside the United States are placed at about 26,221,000 bales (i.e. 19,500,000 bales of the new crop and 6,721,000 bales carried over) against 24,521,000 bales last season and an estimated consumption of not more than 18,000,000 bales. Net exports of rubber from countries adhering to the international restriction scheme, *plus* exports from non-restricting countries, have been computed by the International Rubber Regulation Committee at 644,713 long tons in the first seven months of this year, against 473,951 long tons in the corresponding period of last year. World absorption in the same months has been as much as 677,759 long tons, compared with 588,031 long tons last year. In June and July, however, new supplies exceeded current absorption and the preliminary statistics for August suggest that this tendency has continued. All the large producing countries, indeed, seem to have convincingly proved in the last few months that they are able to fulfil their high quotas. Stocks of rubber outside the regulated areas had increased to 396,446 long tons on July 31, against 374,406 long tons two months earlier.

Last, but not least, the prospects of fairly satisfactory supplies of wheat have substantially improved recently. Despite the disappointing Canadian crop the prospective harvest of the Northern Hemisphere should total about 3,350,000,000 bushels, and will be the best since the bumper year of 1931—a result for which favourable crops in the United States and in Russia are largely responsible. If supplies from the Southern Hemisphere come up to present expectations, fears of an acute shortage of wheat supplies in the 1937-38 season will be happily belied, and there may even be a slight increase in stocks at the end of the season.

Altogether, the evidence suggests that producers may be able to cope with demand, even if it maintains its current high levels. It is by no means impossible, indeed, that before long restriction of production may need to be reimposed in certain instances to obviate a tendency towards glut. On the other hand, it is known that the recent increase in visible supplies of commodities has been accompanied by a sharp drop in consumers' stocks. So long, however, as consumers are disinclined to replenish their holdings (for the reasons mentioned earlier in the present article), this condition has no immediate significance for the market.

What, then, is the general outlook for commodity prices? One thing seems tolerably certain: that a return to the levels reached earlier this year is no longer in prospect, because the special conditions which produced the bull market have passed away. At the same time, unless consumption seriously declines owing to a reaction in international industrial activity, it is unlikely that commodity prices will fall far below their present levels—apart, that is, from the short-lived effects of a possible but temporary panic. In many cases, admittedly, present commodity prices are well above the output costs of economic producers. But while consumption maintains anything like its present figures, the output of the high-cost producers will be needed to satisfy it—and long market experience goes to show that commodity prices are closely affected by the highest production costs necessary to secure adequate supplies. If these conclusions are sound, the most important element in the outlook for commodity prices will be the future trend of the world's industrial activity. If demand is maintained, the fall in prices may be stopped before it has gone much farther, and there may even be a recovery to something like the prices prevalent before the most recent decline. Any deterioration in the international industrial situation, however, would be the signal for a much more severe setback in prices, for two reasons. In the first place, the recent rate of production of many commodities corresponds to a record demand. In the second place, general reduction in output would probably be effected much more slowly than the conditions of a declining market would require.

A Penny on the Bus

WHEN the London omnibusmen came out on strike earlier this year the London Passenger Transport Board declared that the effect of an increase in bus fares would be to lower rather than to raise traffic receipts. The dispute was terminated without the necessity for testing the accuracy or otherwise of that assertion, but the difficulties of omnibus operation in a period of rising costs have, if anything, been accentuated in the period that has subsequently elapsed. And while laymen may question whether the Board have succeeded in hitting on precisely the optimum fare for every stage on every bus route in the London area, so that the slightest change, upward or downward, would involve a loss of revenue, it may be admitted that the problem of passing on increased costs is peculiarly difficult in the road passenger transport industry.

Omnibus proprietors claim to be the victims of special economic circumstances. The average omnibus fare is under 2½d., and 1d. fares are by far the most important numerically. To increase them by 5 per cent. or 10 per cent., it is claimed, is not a practical proposition. The alternative of reducing the distance a passenger is carried for a given sum is difficult and even dangerous; for the omnibus industry is subject to fierce competition from private transport, i.e. from the pedestrians' own legs and from the humble but efficient bicycle. The prosperity of the industry in recent years has been based on its success in inducing people to ride for relatively short distances, and one lesson of this year's strike has been that the habit may be less deeply ingrained than many had supposed. There is a good deal of evidence to show, moreover, that the outward movement of population from congested urban areas to new housing estates, in the last few years, would have induced a much greater demand for bus transport, but for the concurrent, and very considerable, increase in the number of privately-owned bicycles, whose original costs are low and whose running expenses are almost negligible.

The omnibus industry was brought under the control of traffic commissioners by the Road Traffic Act of 1930. The first effect of this control was to stabilise the position then existing. For three years there was virtually no change in vehicle-mileage, passenger journeys, receipts and fares. Subsequently there has been no material alteration in fares, but a small expansion of 4.7 per cent. has taken place in vehicle-mileage, together with a somewhat greater expansion of 14.5 per cent. in the number of passenger journeys, and of 6.5 per cent. in total receipts. The number of short-distance passengers has been growing, and the number of long-distance passengers declining. The result of the 1930 Act, in short, was to confer immunity from new omnibus competition on existing proprietors, and to stabilise both their total receipts and the level of their fares in a period of falling costs. Consequently, their profits rose steadily. The improvement, however, was due almost entirely to reduced expenditure, and the omnibus proprietors are in a correspondingly vulnerable position to-day.

A few relevant statistics will make the position clear. Recent returns show that, for all operators with more than five vehicles, except London Transport, the average receipts per vehicle-mile are 10.42d., and the average expenditure is 9.09d. Thus, the ratio of expenditure to receipts is 87.2 per cent. For local authority operators alone, the figures are 12.78d. and 11.49d. respectively, and the ratio 89.9 per cent. For private operators, the averages are 9.72d. and 8.38d., and the ratio 86.2 per cent. In the case of London Transport, receipts per vehicle-mile are 13.69d., and expenditure 13.13d., the ratio thus being 95.9 per cent. The differences in the financial results depend largely on the size of the vehicles used, the average seating capacity being 43.79 for local authorities' omnibuses, 29.55 for those of private operators and 48.53 for London Transport. The components of these figures deserve close examination. It may be computed that approximately 30 per cent. of the costs of operating a representative omnibus fleet is accounted for by overhead costs and fixed charges—which continue even when the buses are not running—and 70 per cent. by running costs. Taking separate items, some 39 per cent. of operating costs consists of traffic expenses (of which three-fourths represents drivers' and conductors' wages). Some 18 per cent. is attributable to fuel costs, 14 per cent. to vehicle repairs, 14 per cent. to depreciation of vehicles, and 15 per cent. to licence duties and other expenses over which the operators have little or no control.

Throughout the period since 1930, wages costs have been tending to rise, for three reasons. The first has been the increases in wage-rates and reductions in working hours which followed the inclusion of a "fair wages clause" in the Act of 1930. The second has been the absorption of small concerns paying low wages by larger operators paying higher wages. The third reason has been the growing importance of local authority operation. Up to last year, increased wages costs were more than offset by economies under other headings, and particularly those of depreciation, repairs and fuel. To-day, however, the cost of new vehicles is rising. The largest omnibus-manufacturing company in the country, Leyland Motors, for example, recently increased its prices by £60 to £75 per vehicle. In the absence of any increase in average "life," therefore, depreciation allowances must be increased. Repair costs depend largely on mechanics' wages and prices of replacements and spare parts—all of which have risen this year.

One item—fuel—remains as a possible field for economy in operating costs. Of the 47,000 omnibuses now licensed, approximately 10,000 use heavy oil and 37,000 use petrol. The proportion of the total mileage run by the vehicles using heavy oil, however, is somewhat greater than these figures suggest. The heavy oil omnibuses can be run at a saving of about 40 per cent. in fuel cost, compared with the omnibuses which use petrol, and this on a typical omnibus is equivalent to about 0.7d. per vehicle-mile. This is an appreciable saving, but against it must be set the higher initial cost of the heavy oil vehicle. Some operators, again, are doubtful whether the heavy oil vehicle will have as long a life or as low repair costs as the petrol vehicle. Nevertheless, in present conditions it seems, on balance, to hold out the prospect of appreciable economies, and it is significant that 76 per cent. of all new omnibuses purchased this year have been heavy oil vehicles, against 58 per cent. last season and 48 per cent. in the preceding season.

Once the possible economies from the substitution have been gained, however, it is difficult to see other directions in which they may be sought on any decisive scale. If the industry is, in fact, faced by the problem of rising costs and stationary fares, its financial future may largely depend on how far it can obtain a better load factor by carrying more passengers per vehicle-mile, which in turn will depend on the ability and willingness of the public to exchange copper coins for omnibus transport. An improvement in the purchasing power and an increase in the leisure of the poorer sections of the community would greatly assist the bus proprietors. Their problem, reduced to its lowest terms, is to induce one extra passenger to travel on every vehicle for each mile of its journey. But this marginal passenger will not be easy to find.

Notes of the Week

The Coming Session.—In barely a month's time Parliament will have reassembled. Political activity shows its normal autumnal rise and the Prime Minister has returned to town. We are on the eve of the Party conferences, and already the policy of the Government and the programmes of the Opposition groups are being revealed to the electorate. One thing is certain: nothing in the recess has shaken general confidence in the Government, whose stock probably stands even firmer now than two months ago. The Nyon Agreement has encouraged the belief, perhaps prematurely, that the advent of the new Prime Minister portends a hardening in foreign policy. Yet the coming session is likely to be difficult for the Government, despite the fact that the success of the Labour National Campaign in restoring the battered prestige of the official Opposition has yet to be proved.

* * *

There are a number of thorny problems inherited from last session, when sectional interests were allowed to delay the reorganisation of the coal industry and electrical distribution. The physical fitness campaign has become widely popular during the summer, but not all the publicity to be given to the existing health services can conceal the absence of an effective policy for improved nutrition. The illogicalities of milk distribution and prices remain. Moreover, there are more general problems still to solve. Industrial prices are rising, and the re-armament programme has revealed many bottle-necks and shortages of plant and skilled labour. The regrettable gap between the condition of the distressed areas and that of other regions is still evident. And the Government's plans for the next slump are still uncertain. Mr Eden has sounded a trumpet call for an Anglo-American trade agreement, but there are few signs of the Government's readiness to place this country's authority behind a general move for freer trade. Nevertheless, the new Prime Minister is capable of following a progressive policy once the need has been proved. And, even during the recess, some members of his Cabinet have demonstrated praiseworthy zeal for departmental efficiency and reform.

* * *

Conservative Amity.—While the forthcoming Labour Party conference at Bournemouth seems likely to be marked by considerable controversy about foreign policy and Left-wing activity, the Conservative counterpart at Scarborough on October 7th and 8th promises little excitement and no acrimony. The agenda for the Scarborough meeting is singularly free from discordant notes. No bogys are likely to be raised to compare with the issue of Indian government some years ago or, more recently, the problem of National Defence. Most of the resolutions tabled are devised to commend the Government, and castigation is reserved for the alleged policy of Opposition groups regarding foreign policy and colonies. The nearest approach to criticism will come from Mr Victor Raikes, who will urge upon the Government the claims of the poultry industry, and from the Manchester University Constitutional Association, whose resolution will stress the need of a plentiful supply of cheap milk for hospitals. It is remarkable to find such unanimity among the multitude of the Government's Conservative supporters, and its existence is certainly a tribute to the Prime Minister.

* * *

Labour's Bid for Support.—The prestige of the Labour Party has been much blown upon since the *débâcle* of 1931, and the abortive come-back of 1935. There has been a notable lack of both agreement and direction in Labour pronouncements on foreign policy; and in domestic matters there has been similar dissension about tactics and strategy. Now the Party aims to rise like a Phœnix from the ashes of the burnt-out

enthusiasms of its early pioneers. With the launching last week-end of a National Campaign to win 100,000 new members, the Labour Party enters a new phase in its history. Until 1931 it was running with the wind. Since then it has been in the doldrums. Now it must vindicate its claim to be, as the official Opposition, the alternative to the National Government. Appeal has been made this week, in two million leaflets and at 5,000 meetings, to the middle and working classes alike. The Party can no longer claim the irresponsibility of youth. Mr Herbert Morrison, the organiser of victory in London, is leading the National Campaign. No better master of ceremonies could have been chosen to celebrate the Party's coming to years of discretion, but the success of Labour's new venture, in present political conditions, is highly uncertain.

* * *

Japanese Barbarism.—A reply has at length been received to the British Note of protest against the wounding of the Ambassador to China. The reply is considerably more conciliatory than seemed likely at one time. It states that—

> The Japanese Government consider that the incident may have been caused by Japanese planes which mistook the Ambassador's motor as a military bus or truck. As the wounding of the Ambassador may thus have been due to the action, however involuntary, of Japanese aircraft, the Japanese Government desire to convey to his Britannic Majesty's Government a formal expression of their deep regret.

In reply to the demand for the punishment of the aviators, the Note says that "it is needless to say that the Japanese Government would take suitable steps whenever it was established that Japanese aviators killed or wounded, intentionally or through negligence, nationals belonging to a third country." It is also stated that "instructions have been sent again to the Japanese forces in China to exercise the greatest care in safeguarding non-combatants." This reply has been accepted in London as satisfactory, and, so far as regards the particular incident of the Ambassador's wounding, there is no point in pursuing it further. But the general assurances contained in the Note on Japan's solicitude for the safety of foreigners and non-combatants must be read in the light of events which occurred on the very same day that the Note was published. On Sunday, Admiral Hasegawa, the Japanese Commander at Shanghai, warned the representatives of the Powers that air raids would be made on Nanking, the Chinese capital, and that the diplomatic representatives had better withdraw to safety. This intimation, which must surely be unparalleled in history, drew immediate protests in Tokyo from the British, French and American Governments, the latter protest being in particularly strong terms, saying that a raid on Nanking would be "unwarranted and contrary to the principles of law and humanity."

* * *

In spite of these protests, the threatened raids duly took place on Wednesday, anything up to 100 Japanese aircraft being engaged. Actually, comparatively little damage seems to have been done, and there was no loss of foreign life. But the enormity of this Japanese crime is not to be measured by piles of corpses. War is still undeclared between Japan and China. And Nanking's military importance is confined to the fact that it is a large and populous city which is the seat of the Government. To bomb this city, after cynically advising the Ambassadors of the Powers to clear out, suggests that the Japanese military authorities do not intend to observe any of the conventions of humanity. The world is being accustomed to horrors of this sort, but the raids on Nanking are more blatant and less excusable than almost anything that has gone before. There is every evidence that the opinion of the world concurs with the *New York Times* in conferring upon the Japanese action the epithet of "unprecedented barbarism." Nanking, unfortunately, is not the only city which has suffered. In Canton, a more thickly-settled and less protected city, the raids have been more frequent and the damage much more terrible. Are the Japanese really determined to put themselves beyond the pale of civilisation?

* * *

Campaign in North China. — Apart from aerial barbarism, there has not been much movement on the Shanghai front. The Chinese forces have evidently made good their retirement to a new line, and the Japanese are going to proceed slowly in attacking it. In the North, on the other hand, there has been swift movement. The main bulk of General Terauchi's Japanese army has been advancing in a general southerly direction from Peking, with its left flank on the Tientsin-Pukow railway and its right wing across the roughly parallel Peking-Hankow railway. Taking advantage of their superior equipment and mobility, the Japanese have forced the Chinese back almost to Paotingfu, the important centre some 100 miles south of Peking. Though they have thus gained much ground, the Japanese have failed in their attempt to cut off the retreating Chinese, who were able to withdraw with the assistance of the floods which cover a large part of the countryside. Though this tactical encirclement failed, the Japanese are attempting a larger strategic movement of the same kind. The forces which were sent west of Peking into the province of Shansi have made rapid progress and are now circling round to the South and East towards Paotingfu. This western diversion has another purpose, which is to strike north-west into Suiyuan and thence into Mongolia. Thus Japanese strategy is designed not merely to cut the communications of the Chinese in Hopei, but also to threaten the communications of the Soviet Far Eastern Army farther north. But at present the operations cover only a fraction of the vast area which may become involved in the war—a fraction, moreover, in which Japanese command of transport stands at its greatest advantage. It is impossible as yet to see more than the most sketchy outlines of what may well develop into a campaign on the largest possible scale.

* * *

Sequel to Nyon.—The succeeding stages of the diplomatic initiative begun at Nyon a fortnight ago appear to have been as speedy and effective as the first, which shocked Europe into the realisation that the democracies could, when they chose, act as quickly and incisively as the dictatorships. On September 17th, less than a week after the signature of the original agreement, the nine Nyon Powers signed a supplementary agreement designed to extend the protection against piracy to ships attacked by surface vessels and aircraft. The text is short, and merely authorises the war vessels of the signatory Powers to take measures against any aircraft or surface ships attacking merchant ships "when such attack is accompanied by a violation of the humanitarian principles embodied in the rules of international law with regard to warfare at sea, which are referred to in Part IV of the Treaty of London of April 22, 1930, and confirmed in the Protocol signed in London on November 6, 1936." In effect, this makes every air attack on shipping in the Mediterranean (always with the exception of attacks on Spanish ships) a piratical venture, since it is virtually impossible for an aeroplane to give the warning of its attack and make the arrangements for the safety of the crew which are required by the rules. Apart from its political importance, therefore, the second Nyon Agreement has the legal merit of extending for the first time a code of humanitarian conduct to air attacks. Unfortunately, the state of the world gives little encouragement for any belief that this code will be observed in future hostilities where there will not be an anti-piracy patrol to exact vengeance.

* * *

Italian Diplomacy.—From the start, however the true significance of the Nyon Conference has been political rather than naval. Signor Mussolini, having refused to attend the Conference, was annoyed to find it taking place without him and, still more, to learn that it had concluded so effective an arrangement in his absence. Italy was, indeed, in something of a dilemma. For the Mediterranean was clearly not "Mare Nostrum" if every corner of it was to be patrolled by the British and French fleets, but not the Italian. On the other hand, to beg for admission to the Concert of Nyon was to admit diplomatic defeat. Moreover, there was little time to lose, for the Duce is due to travel to Munich and Berlin this week-end, and must appear there as the strong-armed, undefeated Master of Italy's Destiny. Britain and France, however, stood firm. While welcoming Italy's adhesion to the Agreement on the terms provided in the document itself, they held that any proposals for amendment, designed to secure a larger part for Italy, must come from Rome. This diplomatic hurdle provided the occasion for much coming and going in Rome, but in the end Italy undertook to send naval experts to a meeting at Paris, which is to begin within a few days and work out the technical details of Italy's collaboration. It is believed that there is no question of Italy's being assigned a zone in which she would exercise the exclusive patrol, but that Italian destroyers will be attached to the British and French patrols. British and French diplomacy has shown at its best in these last few days. Wisely, the advantage has not been pressed too far, but the result can be expressed as at least a victory on points for London and Paris.

* * *

There are, indeed, signs that Signor Mussolini, being forced into some form of understanding with Britain and France, has decided to appear in Berlin not as Herr Hitler's weaker and out-manœuvred ally, but as a potential convert to the other side—not with entreaties, but with warnings. To the general surprise, the Italian permanent delegate to Geneva, Signor Bova Scoppa, was authorised to have two long conversations on Wednesday with M. Delbos, in which he gave the most emphatic reassurances on Italian policy in and towards Spain. He said that no more troops were being sent to Spain and that the "volunteers" already there would eventually be withdrawn. He also intimated that there was no intention of permanently maintaining the present occupation of the Balearics. These assurances were repeated to the British Chargé d'Affaires in Rome on Wednesday by Count Ciano himself. Signor Mussolini's diplomatic record does not encourage the world to take any of his pacific gestures at their immediate face value until proof is forthcoming, and the circumstance that the Duce is obviously in urgent need of some bargaining counters to take with him across the Alps is an added recommendation to caution. But it is just possible that he has decided, in view of the German hesitation and Franco-British firmness, that his Spanish game is up and that he had better get the best terms possible for withdrawing. If this should prove to be true, it would be the most hopeful thing that has happened in Europe for many months. Even the appreciation of its possibility has measurably relaxed the tension.

* * *

American Democracy.—Both President Roosevelt and his Secretary of State have within the past week defined the attitude of the United States towards the challenge which dictatorial aggression is offering all over the world to the principles and practice of democracy. The President was speaking on the 150th anniversary of the American Constitution, and his address was a skilful application of American respect for that venerable document to the external and internal problems of the day. As for the world at large he made no attempt to minimise either the success of the appeal of dictatorship, which led their leaders to "laugh at all constitutions, predict the copying of their own methods and prophesy the early end of democracy throughout the world." This external challenge the American people were determined to keep from their shores. "The known and measurable danger of becoming involved in war we face confidently." But the internal danger was more insidious, either from those who hankered after a plutocratic dictatorship or from those who were in too much of a hurry for democratic institutions. The answer to both was to raise the standard of American living and economic and social security "from what they are now to levels which the people know our resources justify." "That," continued Mr Roosevelt, turning his argument into familiar channels, "is why I have been saying for months that there is a crisis in American affairs which demands action now."

* * *

The President was thus most urgently concerned with re-establishing the necessity of his internal programme. Mr Cordell Hull, on the following day, was naturally more fully occupied with the international situation. No less than his chief he gave expression to the deep abhorrence with which American opinion regards the methods and ambitions of the dictators. There followed a passage which has attracted considerable attention:—

> It was a great temptation in some countries such as their own to believe that peace could be had merely by maintaining isolation apart from the rest of the world, both in peace and war. This was a basic and sound determination, and it should not be relaxed. But a policy of complete isolation from the outside world would in its ultimate effects be as ineffective as the opposite extreme of ill-advised and unnecessary intervention would be unwise.

These words give authoritative expression to the feeling which is undoubtedly growing in the United States that if America allows dictatorship to sweep the rest of the world, she will herself eventually have to meet the same challenge. But it would be a mistake to read in Mr Cordell Hull's words any intimation of a forthcoming change in the practical details of American foreign policy. Mr Hull himself said that the quest of isolation "should be relaxed." Foreign countries may consider that search unfortunate; they may be convinced that it is short-sighted even in America's own interests; but the wish of the American people is so clear and strong that it must be reckoned as a fact in world diplomacy.

* * *

M. Bonnet's Stewardship.—A broadcast address on Monday evening by M. Bonnet, the Minister of Finance and pivotal figure in M. Chautemps's Cabinet, succeeded in materially allaying the fears felt last week for the franc. M. Bonnet was able to report excellent progress in nearly every field of his economic programme. The 1938 Budget will not only be balanced, but will show a surplus of 1,600 million francs. This does not, of course, include the re-armament expenditure covered by the extraordinary Budget, but it is nevertheless a considerable achievement. Part of this surplus will be devoted to meeting the claims of the servants

COLLECTION of Bills

on all Scandinavian places through our offices at Gothenburg, Stockholm and Malmö.

SKANDINAVISKA KREDITAKTIEBOLAGET

of the State for increased salaries. But the major part will go towards the finance of re-armament. Moreover, the Caisse d'Amortissement will redeem 4,000 millions of the National Debt in the course of the year. The funding operations for the Treasury bonds which mature next month have been successful, so that the Treasury is out of all its difficulties for 1937 and the balancing of the Budget should make it fully possible to cover all requirements in 1938. M. Bonnet claimed that this improvement had been effected without crippling the country by increased taxation; the increase in railway charges had not led to any reduction of traffic, and the yield from taxation in August was better than for a long time past.

* * *

In his more specific references to the position of the franc, M. Bonnet confirmed by inference the new policy of refraining from any rigid pegging of the exchange rate (a declaration duly noted by the market), but he warned speculators that the Equalisation Fund was plentifully supplied with foreign exchange and would not hesitate to intervene when it saw fit. On the other hand, no form of exchange control was in contemplation and France would remain true to the principles of the Tripartite Agreement of a year ago. Finally, the Minister of Finance gave a clear, though tactfully worded, warning to his colleagues of the Left. For the further progress of the improvement already begun, a continuation of the " pause " is absolutely indispensable, whatever may be the gains of the Socialists in the forthcoming cantonal elections. Indeed, the Socialists, far from securing further social reforms, may be compelled to abandon some of their gains of last year. The report of the Government's Committee on Production, which is expected in a day or two, is believed to recommend the substitution of a 45-hour week for the prevailing 40-hour week. This will be a bitter pill for the Trade Unions, but it is not unreasonable to expect that they will take it with protest but without violence.

* * *

The Spanish War. — The past week has not seen much military activity in Spain. In the North, General Franco's forces have made slow advances towards the Asturias, the last part of the Atlantic coast still loyal to the Government. On the other hand, a Government offensive has been started in the Province of Cordoba, and it is claimed that an advance has been made into the Province of Badajoz. If this is pressed, it may menace the thin line of communication between the northern and southern sections of rebel Spain. The chief interest of the week has been concentrated on the revelations made in France of the part played by Franco agents in inspiring and carrying through terrorist acts. An attempt was made by Spanish Nationalists on Saturday last on the Spanish Government submarine C2, now lying at Brest, with the object of taking possession of the vessel and, presumably, of delivering it to General Franco's navy. This attempt was foiled by the loyal crew. In the course of their inquiries the French authorities have established that Colonel Troncoso, Military Governor of Irun, was personally implicated. The Colonel, having entered French territory, has been arrested and held for investigation. To complete this Ruritanian story, an attempt was made by armed men to invade France and rescue the Colonel; and the French police have officially declared that the same parties are also held responsible for other terroristic acts of the last few weeks in France. Thus piracy is spreading from sea to land.

* * *

Spain's Appeal to the League.—In the League Assembly at Geneva on the 18th of this month Spain appealed still more urgently, and denounced her assailants still more outspokenly, than on the occasion when, some months ago, she put her case before the Council. Her present spokesman, Señor Negrin, declared that, on the insurgent side, the war was now being waged almost entirely with Italian and German arms and men; and he effectively quoted both Herr Hitler and Signor Mussolini as witnesses to the truth of his charge. He further told the Assembly that the Spanish Government had reason to believe that Italy was on the point of sending to Spain another 150,000 troops in the hope of being able, with these huge reinforcements, to crush the Spanish Government's resistance before the winter. He went on to make five specific demands. The League should formally recognise that Spain was the victim of Italian and German aggression. The League should examine ways and means of bringing this aggression to an end. The Spanish Government should no longer be deprived of their legal right to acquire freely all the war material that they want. Non-Spanish combatants should be withdrawn from Spanish territory. And, finally, Spain (i.e. the legitimate Spanish Government) should be made both a participant in, and a beneficiary of, the measures just taken at Nyon for establishing collective security against piracy in the Mediterranean. As the pirates, Señor Negrin did not hesitate to name the Italians.

* * *

This Spanish address to the Assembly, which was an indictment as well as an appeal, was soon answered in a facing-both-ways speech by M. Delbos. " One elementary condition is that we must avoid the risk of war infection," said the French Foreign Minister. But he also talked gingerly of " the menace of a rupture of equilibrium to the detriment of the legitimate interests and vital needs of other countries " if illicit intervention continued and increased. Mr Eden, too, referred to the Spanish question—and this in much the same spirit—in his speech of Monday. He claimed that " the main object " of the policy of so-called non-intervention had been achieved because it had succeeded, for a whole year, in keeping the rest of Europe at peace. He added in the same breath that there had been wide breaches of the agreement; engagements had not been kept; there were foreign nationals in large numbers fighting on Spanish soil; and all this was pregnant with danger to the peace of Europe. Señor Negrin might have retorted that the danger to the peace of Spain had long since come to birth. The French and British Governments have made it clear that Spain's rights and interests are the *cadets de leurs soucis*. They are concerned in the first place to avoid war for themselves, and in the second place to secure this boon at the lowest possible cost to French and British national interests. This being so, there is as little likelihood of the Covenant being implemented in the case of Spain as in that of China.

* * *

Mr Eden's Speech.—The Far Eastern War was treated even more summarily than the Peninsular War by Mr Eden in his speech to the Assembly on Monday. The bulk of what the Foreign Secretary said on this occasion was as unexceptionable as it was ineffective. He said that war was futile and that greater freedom of international trade would tell in favour of peace. Mr Roosevelt and Mr Hull have been saying much the same things these last few days, but there is a great gulf fixed between truisms and action. On the actual contribution which the United Kingdom has made towards liberating the world's trade from its fetters, Mr Eden was perhaps rather unduly complacent. But on the whole there was little in his speech with which anybody—democrat or totalitarian—would seriously quarrel. He was adroit in slipping in his advertisement of the scale of British naval re-armament in the form of an illustration of the badness of the state of the world. But even this diplomacy was hardly needed. Nobody doubts that this country's intentions are unaggressive or that we sincerely wish for international peace and goodwill and co-operation. Our fault lies in our unwillingness to risk or sacrifice anything of our own for the sake of bringing these good things nearer. On this crucial point, Mr Eden's speech unhappily contained no hint of any positive or constructive policy.

The Council Elections.—The Spanish Government have had a second failure at Geneva. Spain has hitherto occupied one of the " semi-permanent " seats on the Council. Normally no State is eligible for re-election, but the Assembly is empowered to waive this restriction by a two-thirds majority. This year Spain applied as usual for her eligibility for re-election to be approved, but she obtained only 23 votes instead of the necessary 32. This result may have been in part a reflexion of the present situation in Spain. At any rate, dislike of the Spanish Government's actual or supposed " ideology " may have moved eight Latin-American States and Portugal to vote against her. On the other hand, Spain is believed to have obtained four Latin-American votes, as well as the votes of four States members of the British Commonwealth. What really spoilt Spain's chances was that the Islamic countries—and, with them, India—voted against her in the hope of securing the re-election of Turkey. These votes were cast in vain, since it was the general feeling of the Assembly that if Iran was to be elected to the Council (as she has been) to represent the Islamic group of States, it would be unreasonable that Turkey should retain her former seat as well. So Spain suffered without Turkey's benefiting. Another successful candidate besides Iran was Peru. But a place remains vacant, and at the time of writing Belgium is being urged to stand for it.

* * *

Other Business at Geneva.—While the Spanish appeal and the elections to places on the Council have been the principal events in the Assembly this week, they have not been the only business transacted at Geneva. China's appeal has been referred by the Assembly to a committee which has never officially been dissolved since it was constituted, to deal with the Sino-Japanese conflict, in the first act of the drama of Japanese aggression. The chief merit of this procedure is that on this committee, when it last met some four years ago, the United States was represented by an observer. This consideration has moved China to concur in the Assembly's action—but this with a reservation of China's right to bring the business back to the Assembly itself if the committee fails to make progress. The American Government is still willing to take a non-voting part in the committee and has nominated the American Minister in Berne as its " observer." This can hardly, however, be taken as a sign of a firmer American policy towards Japan. Of all the Great Powers, America has been one of the quickest to urge evacuation on its nationals who find themselves in the line of fire between the Japanese and Chinese forces, and though Mr Cordell Hull's protest against the announcement of the raid on Nanking was in strong terms, the Japanese will take more note of actions than of words. Moreover, there is little indication of a strong policy in the American Government's action in forbidding government-owned American merchant ships to carry arms and munitions to China, and in warning private American merchantmen that, if they do so, it will be at their own risk.

The Fall of Krylenko and Rakhimbaev. — The Russian proscription is not yet at an end. Last week Stalin struck down two men who each occupied a high position in one of the seven constituent States of the Soviet Union, Rakhimbaev, the Prime Minister of Tajikistan, fell at the beginning of the week, and on the 15th his fall was followed by that of Krylenko, the Commissar of Justice in the Russian Socialist Federal Soviet Republic. Of Stalin's two latest victims, Krylenko is, of course, by far the more important, and this in virtue both of his post and of his personality. While Tajikistan is one of the smallest and most backward of the seven States members of the Union, the R.S.F.S.R. overshadows all the other six put together. It not only includes in its boundaries almost the whole of the Greek-Russian-speaking element in the population of the Union; it also embraces, as its complicated title proclaims, a number of autonomous republics and districts; so that it contains representative samples of the peoples of the Union from top to bottom of their scale of civilisation. As for Krylenko himself, he has been a prominent member of the Bolshevik governing cabal ever since the revolution of 1917, and for the best part of these twenty years he has been in continuous occupation of the key position from which he has now just been ejected. Like Litvinov's predecessor Chicherin, Krylenko was a survivor from the *ancien régime*. The revolution found him an ensign in the Imperial Army and made him Commander-in-Chief with the mission of completing the disintegration of the Czarist force which thus came under his command. The satisfactory accomplishment of this task was rewarded with the appointment which he has held ever since.

* * *

A Check to the Declining Birth-Rate. — The Registrar-General's quarterly return has been widely greeted as evidence of a rising birth-rate. It is true that the total of births in the second quarter of 1937, at 163,867, was 6,215 higher than in the corresponding period of last year. But the increase is too small, and the period too short, to serve as bases for any wider conclusions. There is always a tendency for the number of births in any year to follow the number of marriages in the previous year, and marriages have been increasing ever since the bottom of the slump. This latter tendency may now have been arrested, since the number of marriages in the second quarter of 1937 was less than four-fifths of the total for the same period last year. There is nothing in the vital statistics of the last few years to invalidate the general outline of the future changes in population which is now becoming generally familiar. It so happens that many of the calculations of future population are based on the figures of 1933, when the number of births was exceptionally low. Use of the average figures of 1933-36 would lead to less catastrophically rapid estimated declines of population. But even with the slight increase in births in recent years, their number is still far below what is necessary to maintain the population.

The N.F.U. on Milk.—If a model were required of the arrogance which protectionism encourages vested minorities to assume, the search would have no need to go beyond the National Farmers' Union. That body, on Friday of last week, issued a statement calling for the immediate withdrawal of the Government's White Paper on Milk. The ignorant bystander might be forgiven for supposing that this piece of intransigence was inspired by an attempt on the Government's part to rob the dairy farmers of their living. But, on the contrary, the offending White Paper promised the continuance of the Government's insurance of reasonable prices in the manufac-

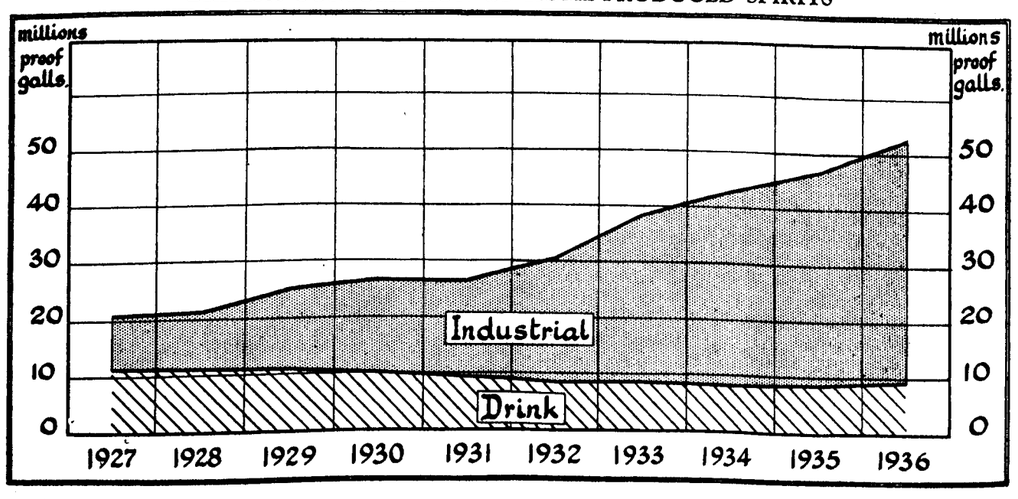
tured milk market, offered several new subsidies and maintained the farmer-elected Milk Marketing Board in all its one-sided monopoly. But all these count for nothing with the farmers beside the fact that the Government has failed to introduce the plan which they allege they were promised two years ago by which a tariff would be placed on the imports of milk products and the proceeds expended in a subsidy to the farmers. The N.F.U. chooses to ignore the fact that the Import Duties Advisory Committee (which can be trusted to find virtue in a protectionist device if there is any) has given its opinion that the proposed duties would not help the farmer and would be contrary to the public interest. It also ignores the harm that would be done to the nutrition of the people by increasing still further the price of the only form of milk which, thanks to the farmers' price policy, the very poorest can afford. These aggressive demands by the farmers are all based ultimately upon the claim that they were "induced" to enter the Milk Marketing Scheme by the promise of protection. This is a bluff which deserves to be exposed. There was no inducement. The farmers welcomed the scheme because it was the only means of saving their skins. If they do not like the scheme without protection, let them end it. The consumer would not object, since he would gain immediately in lower prices, while the farmers would be ruined. The truth is that the scheme has brought benefits to the milk producer and to nobody else, unless it be the distributor. It has certainly not benefited the consumer or advanced the public interest. *The Economist* cannot claim ever to have been enthusiastic about the methods of agricultural assistance adopted in recent years. But resolutions such as that adopted by the N.F.U. last Thursday and letters such as that written to *The Times* by the Union's General Secretary on Monday turn a lack of enthusiasm into positive distaste. Since the farmers so much dislike the White Paper, by all means let it be withdrawn. But let every penny which the State now pays into the milk producer's pocket be withdrawn with it. Gratitude and even good manners are doubtless out of place in such affairs, but the taxpayer who finds so many millions for agriculture may well wonder what he is supposed to be receiving in return.

* * *

Thrift in Recovery.—The twenty-first report of the National Savings Committee breathes a certain spirit of satisfaction, and it has every right to do so. There was a time, a year or so after the end of the War, when (as we described in an article in *The Economist* of May 22, 1937, page 439) it seemed as if the movement would die away after the emergency that produced it had passed. But it negotiated the crisis with great success and has expanded steadily ever since. At the end of last March there was invested in National Savings Certificates, the Post Office Savings Bank and the Trustee Savings Bank no less a sum than £1,378,400,000, the highest figure in the movement's history, and £69 millions above the total a year before. Nearly £25,700,000 of Savings Certificates were sold in the course of the year and over £192 millions was paid into the Savings Banks. Obviously, though the movement has come of age, it retains a youthful vigour. The number of groups of the varied kinds adapted to the needs of schools, factories and social organisations has increased steadily. Propaganda is going uninterruptedly forward, and the Committee has even added a film to the list of its weapons for the popularisation of elementary economic wisdom. There are no signs that it tires of well-doing.



* * *

Growth of the Distilling Industry.—The accompanying diagram illustrates the rapid growth of British consumption of home-produced spirits during the past ten years. It is based on the statistics of spirits retained for use in the United Kingdom, published in the official trade returns. Like the consumption of beer, the long-term trend of the use of spirits as a beverage has been downwards since 1927, though there has been a slight increase since the depression. Consumption of spirits for other purposes, however, has shown an astonishing increase. In 1927 industrial consumption was slightly smaller than human consumption, but in 1936 it was more than four times as large. The growth of spirits consumption in industry has been very marked in the rayon industry, in the paints, varnishes, polishes and allied trades and in the manufacture of oil and leather cloth as well as toilet requisites. Moreover, the use of spirits in industry is still on the upgrade.

* * *

Tyneside Local Government.—The Minister of Health, on tour in the North East, has at last indicated in a speech at Newcastle the views of the Government about the recommendations of the Royal Commission on Tyneside Local Government, published last March. Sir Kingsley Wood declared that, while the Government was convinced that some action was necessary to secure a measure of unification in local administration in this vast and complex urban area, the initiative for reform must rest in the first place with the authorities themselves. The majority report of the Commission suggested sweeping changes: the creation of a great regional authority having competence from the Cheviots to North Durham to administer Public Health, Education, Public Assistance, Police, Fire and Highways; and the establishment of a greater City of Newcastle to administer

BRITISH CONSUMPTION OF HOME-PRODUCED SPIRITS

more localised services in urban Tyneside. Official opinion on Tyneside, Sir Kingsley Wood pointed out, has proved strongly opposed to this drastic introduction of regional principles into Tyneside government, and is more disposed to consider the minority recommendations, themselves a protest against so extensive and unrestricted an amalgamation. In brief, the minority advocated the extension of the city and county borough of Newcastle to include Gateshead, Wallsend, Jarrow, Gosforth, Hebburn, Felling and Newburn. This scheme would involve no break with the normal structure and working of British local government, and would at the same time do much to end the anomalies, inefficiencies and extravagances which impressed the Commission in their survey.

* * *

Clearly, the Minister of Health's speech was intended to advise the local authorities concerned of the Government's readiness to meet any proposals of this kind embodied in a local Bill. While it is regrettable that the Commission's proposal for a great regional authority must be laid aside until the time is more ripe for it, we trust that certain incidental recommendations of the Report, such as the project of a unified transport authority, will not also be shelved. The majority proposals could not easily have been applied to Tyneside alone, but the time may well come when a general regional development in urban government will become inevitable. Then the principles of the majority Report will be of national importance. Meanwhile, an obligation rests upon the Tyneside authorities to respond speedily to Sir Kingsley's invitation.

* * *

The Tramp Steamer Scheme.—In a Note in *The Economist* of September 11th, page 515, a summary was given of the drastic voluntary scheme for the control of tramp shipping prepared by the Tramp Shipping Administrative Committee which it was hoped would succeed the Government's subsidy scheme at the end of the year. It was then arranged that the liner owners should meet on September 17th to give their assent to, or state their criticisms of, the plan. Their meeting has now been held, and they have registered their unanimous support. This is an important step forward, for without the liner owners' adhesion the scheme would have had to be redrafted and very much weakened. The unqualified acceptance by the liner companies of the principle of fines for breaches of the undertakings embodied in the draft augurs well for its eventual acceptance by the requisite 90 per cent. of the tramp owners themselves, who are to make their decision next month.

World Economic Trends.—The reputation of the Economic Intelligence Section of the League of Nations is deservedly increasing with the rising standard of the quality of its many statistical and interpretative services on world economic trends. Its annual reports are monuments of comprehensive research, and the two volumes* issued this week add further to the knowledge of the factors which have shaped world economic developments in the past twelve months. The "World Economic Survey," intended mainly for the lay reader, has again been prepared by Mr J. B. Condliffe. It provides the best concise summary of economic developments in individual countries and in the world as a whole during the twelve months ended last July. The second volume, "World Production and Prices," is more technical in treatment. It contains the usual, and now indispensable, indices of raw material and industrial production, both for individual countries and groups of countries as well as for the world as a whole. These indices show, for example, that world production of primary products in 1936 was slightly, and industrial activity considerably, higher than in 1929. The explanation of the fact that primary production last year did not keep pace with the growth of industrial activity is given by the League's index of changes in stocks of primary products—a new feature of the survey—which recorded a substantial decline. Accurate information is the prerequisite to the pursuit of rational policy. Unfortunately, the signposts put up by the League's Intelligence Section are still all too frequently ignored.

* * *

Revision of the Rome Protocols.—Political influences can clearly be seen at work behind the Italian decision to amend the commercial treaties with Austria and Hungary known as the Rome Protocols. They have been denounced, to terminate on September 30th, and new agreements will subsequently be negotiated. The reason for this change is to bring Jugoslavia, Italy's new friend, within the charmed circle. Hungary will have to abandon some of her agricultural preferences, while Austria will find her exports of timber to Italy affected. In both cases Jugoslavia is to gain by quota increases, tariff reductions and credit facilities. Apart from these concessions to Jugoslavia, Austria will have to make price concessions on her sales of steel, cellulose and paper, all of which are still badly needed by Italy. Italy is able to impose these changes on Austria and Hungary because of her import surplus in their mutual trade. But they clearly leave little remaining of the original purpose of the Protocols, which was to show Austria and Hungary that they could find in Italy the economic outlet which the rest of the world was alleged to deny to them. Italy's motive is to reinforce on the economic side the political agreement made by Count Ciano with Dr Stoyadinovitch at Easter last. This very eagerness shows how much Italian policy is facing round towards the Mediterranean and is prepared, for that end, to sacrifice Italian interests in the Danube valley. The advantage accrues, of course, to Germany. But none of the Danubian States can be expected to rejoice in this evidence of the division of South-Eastern Europe into German and Italian spheres of influence—least of all the two small States who are so clearly being made to feel their status as pawns. Hungary is already on the point of concluding a commercial treaty with Czechoslovakia, and Austria is also moving in the same direction.

Anglo-Scandinavian Coal Talks.—British coal exporters and the Scandinavian importers are discussing the Anglo-Scandinavian arrangements of 1933, under which Sweden agreed to take 47 per cent., Norway 70 per cent., Denmark 80 per cent., and Finland 75 per cent. of total imports from Great Britain. The Scandinavian importers claim that deliveries are not made to time and that prices are too high. It would be good policy from the British point of view to meet the importers' wishes where possible; for the agreements

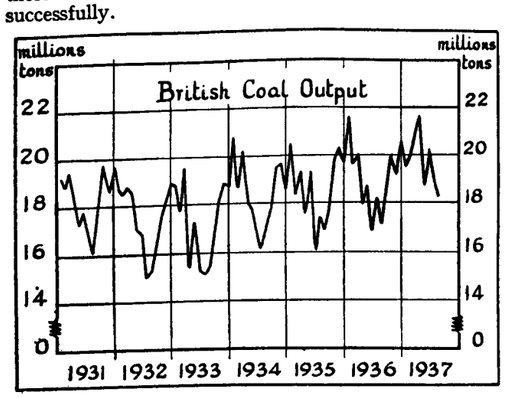
have certainly helped British exports, and improved her relative position. Their consequences are shown in the following table:—



COAL EXPORTS TO SCANDINAVIA
(Monthly average, in tons)

		Great Britain	Germany	Poland
Sweden	1933	165,346	29,025	195,990
	1937	261,720	52,496	192,963
Norway	1933	79,380	1,486	66,123
	1937	137,476	20,990	34,061
Denmark	1933	238,083	9,418	61,556
	1937	277,112	49,376	26,796
Finland	1933	39,391	3,370	33,460
	1937	96,965	13,228	23,525
Total	1933	522,200	43,299	357,129
	1937	773,273	136,090	277,345

No material alterations of the agreements are in prospect, but assurances over prices are keenly desired.

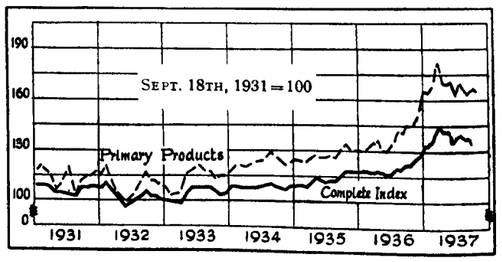
* * *

Seasonal Decline in Coal Output.—As the accompanying chart shows, the production of coal is subject to marked seasonal variations. In part these variations can be traced to the weather. Household requirements for heating, for example, vary directly with changes in temperature. Domestic consumption for heating purposes falls almost to zero during the summer and reaches a peak during the winter. By lowering prices during the summer collieries have attempted to even out these fluctuations in demand, though not very successfully.

This summer has been no exception to the rule, for production was sharply curtailed in July and August. But, as a result of the expansion of industrial requirements and export demand, output has been running above last year's level in recent months. Production in August was about 7 per cent. higher than a year ago, and the latest reports suggest that the improvement is likely to be maintained over the winter.

* * *

Business Activity Maintained.—This week has brought no developments likely to alter the course of business in the near future. One of the most significant features is the alleviation of the stringency in the iron and steel markets, brought about by increasing supplies rather than by falling demand. In some of the coal-mining districts, autumn inquiry has not yet come up to expectations, and in others quotations have been shaded. The cotton textile industry remains active, but, as our correspondent points out on page 637, new business has been smaller owing to the uncertain future of raw cotton prices. Jute manufacturers are being forced to curtail output owing to the growth of Indian competition at home and abroad. Dundee manufacturers, meanwhile, demand that imports from India be limited and regulated by a quota. More detailed information concerning the latest developments at home and abroad is given in the Trade Supplement published with this issue.



Fresh Reaction in Wholesale Prices.—Wholesale prices in England have again fallen, the complete *Economist* index number by 1.0 per cent. and primary products by 0.7 per cent. In the United States the complete Irving Fisher index number has risen by 1.4 per cent., but *The Economist* primary products index is a shade lower. The renewed depreciation of the franc is reflected in a fresh increase in French wholesale prices, which have risen by 1.5 per cent. during the past fortnight and by 4.1 per cent. during the past month. Italian prices have fallen by 0.8 per cent. during the past six weeks, but German prices have lately become a little firmer:—

* These figures relate to September 15th.
† Monthly averages.

The chart shows the course of British wholesale prices. The downward trend since the early part of this year is now quite noticeable:—

Details of group movements in the complete *Economist* index number are given below:—

The Economist INDEX
(1927 = 100)

	Sept. 18, 1931	Aug. 25, 1937	Sept. 8, 1937	Sept. 22, 1937
Cereals and meat	64·5	89·0	88·1	89·1
Other foods	62·2	66·7	66·8	67·2
Textiles	43·7	68·7	68·0	65·5
Minerals	67·4	108·1	108·9	106·4
Miscellaneous	65·8	85·6	85·3	84·5
Complete index	60·4	83·3	83·0	82·2
1913 = 100	83·1	114·7	114·2	113·1
1924 = 100	52·2	72·0	71·7	71·0

In the cereals and meat group, wheat, maize and bacon were all dearer, but meat prices moved irregularly. Advances in tea and butter explain the increase in the other foods index number. There was a general decline in textiles and also in non-ferrous metals, with the exception of tin. Among miscellaneous materials, hides, tallow and rubber were cheaper, but there was an advance in linseed oil.

Nerves in Wall Street

NEW YORK, September 14.—Last week Wall Street reached a condition aptly described by the onomatopoetic word of "jitters." The term is intended to mean more than nervousness, but less than hysteria. On Tuesday, September 8th, the day after Labour Day, on Friday, and again on Monday, the market was swept by waves of selling which recalled such days as, for example, those which followed England's departure from gold in September, 1931, or even September, 1929.

This followed a decline which in 24 days had brought average prices down approximately 20 per cent.; a considerable number of shares are now quoted at barely half the levels reached earlier in the year. The declines in the corporate bond market have been less abrupt; but, relatively, they are comparable.

Whatever the future may hold for American business, nothing in the current state of industry and trade can account for this phenomenon. Nor can it be rationally explained in terms of the news from the more troubled quarters of Europe or Asia. Unquestionably the causes lie in our own economy. A change of this magnitude in quoted share values is an economic fact of undoubted importance; but as yet no explanation is wholly satisfactory. Probably the simplest begins with the premise that the New York market has become very "thin"; and proceeds to the conclusion that minor disturbances in credit and even slight evidences of business recession produce in such a market violent repercussions out of all proportion to these influences.

Conflict in Policy

The gold sterilisation policy, combined with the increase in reserve requirements, did not introduce any shortage of bankers' cash into our banking system. The completion of the programme left the member banks with almost $900 of excess reserves, and they are still in the vicinity of this figure. These reserves were, however, irregularly distributed; and in recent months the banks of New York City, as a consequence of movements in our internal balance of payments, have never been entirely comfortable, and occasionally have been in a decidedly uncomfortable position. Subjected to an increasing demand from commercial borrowers, they have been steady sellers of investment securities, especially of Government stocks. At the same time, the Treasury continued to make large demands on the market. It became increasingly evident that the policy of credit control and the policy of deficit financing were in conflict, and the investment markets sagged under the pressure. Nevertheless, this pressure could not be described as very heavy. The long-term rate of interest in the past year has been under pressure in London, and, while in detail the circumstances have differed, it yet seems debatable if the credit pressure on investment markets in New York has exceeded that experienced by the London market.

Up to the end of August there were no data clearly forecasting a recession in business in the late months of the year. In Wall Street itself there were a number of doubts; but business opinion was confident in the highest degree, and inclined to belittle or ridicule the apprehensions of Wall Street. Before September, doubts about the future were due to the apparent fact that residential building had been checked by the rise in costs, and the suspicion that the consuming public would resist the mark-ups necessitated by increased labour costs in manufacturing generally. Furthermore, there had been continual small strikes, and threats of large strikes, notably on the railroads; and it was generally realised that a railway strike could be averted only by a wage increase which would seriously hit the companies. But these facts were, at the end of August, as well known to the business community as to the financial community. The difference was largely a difference of appraisal; the business community rated the outlook for the remainder of the year as excellent, and the financial community as fair—but neither classed it as really bad. In this account of the credit condition and of opinion about the autumn outlook, there is perhaps enough to explain receding markets such as occurred in August, but nothing that would anticipate the debacle which followed in September. To be sure, as the markets fell, Wall Street became more pessimistic, but it took heart from the continued confidence of business men.

Spreading Gloom

By the second week of September, however, as we have seen, sentiment had changed to almost unrelieved gloom. The data showed no change, but in financial circles opinion about the business outlook had changed from uncertainty to a nervous dread, which supposes that the sagging markets of the past week discount some approaching collapse in our industrial structure. The business community, attributing to the market an uncanny prescience, now became disconcerted and pessimistic. The events of the past week have given not only the financial but the business community a severe shock.

Something of this nervousness was communicated to Washington. The existence of some degree of credit pressure was belatedly recognised two weeks ago, when there was a general reduction of discount rates—a remedy not specifically relevant to the problem, and perhaps more disturbing than reassuring. On the morning of September 13th the papers carried the announcement that $300 millions would be released from the Inactive Gold Fund to the Federal Reserve Banks, and that open-market operations would be conducted as required during the approaching season.

This proposal was received by the financial community with mixed feelings. While Wall Street has been saying for some days that Washington would "have to" intervene to save the market from what Wall Street considers primarily the consequences of conditions created by Washington, the magnitude of the proposal and the fact that the decision was reached over a week-end (almost unprecedented in American officialdom) were initially interpreted as evidence that Washington was extremely alarmed. The immediate consequence was the wave of frightened liquidation. Only late in the day did some degree of confidence in the new proposal express itself in security prices.

France

Public Confidence

PARIS, September 23.— Public opinion greeted the latest fall of the franc with astonishing calm. The fall was due to the import surplus, political instability and the recent appeals of the Treasury to the Bank of France. Better prices for agricultural products, the diminution of unemployment in a year by a further 100,000, and the profits of devaluation and the tourist traffic have actually improved the position of many French people. M. Bonnet was able to oppose the fall of the franc by the surplus of deposits in public savings banks over withdrawals, was in August the highest for a long time. In the first fortnight of September this surplus was 54 million francs, compared with a deficit of 79 million in 1936. Deposits and withdrawals since the beginning of 1937 are again balanced, whereas, in the same period of 1936, a deficit of 2,300 millions was shown.

Yet, even if some individuals are better off, the same cannot be said of France as a whole. But the appeal for sacrifices and for the acceptance of "necessary disciplines" is more favourably received now than during the paralysis of the deflation. Consequently, the atmosphere is more congenial for Government action to safeguard the country against bankruptcy.

The most recent monetary depreciation has again improved the position of debtors and checked any inordinate rise in the price of exports. Thus most people think that the franc may now be stabilised at the parity of the Belgian franc.

M. Bonnet has announced that the 1938 ordinary Budget will show a surplus of 1,600 millions in francs; that 4,000 millions of the debt will be amortised; that railway traffics have been maintained since the recent increase in rates; that the consolidation of the 5,400 millions in francs of debt coming to maturity in October is now ensured; and that the Treasury will be easily able to meet its needs for the rest of 1937. There will be no control of the exchanges; and France will adhere faithfully to the Tripartite Agreement.

Measures to Increase Production

But M. Bonnet and M. Chautemps are still insistent about the necessity of quickening the *tempo* of production. M. Blum himself has recognised that some revision of the 40-hour week in certain branches of production may be proved necessary by the Inquiry into the state of Production. It is known that this Inquiry was ordered by the Government in order to provide a technical justification for its proposals to amend the 40-hour law. The Communists, however, remain staunch advocates of a strict application of this law. This is partly explained by the fact that the other Communist slogan, "Pensions for Old Workers," has been used by other parties, while their plans for nationalisation have been rejected by the Radicals and do not now interest the public as long as there is no return of the crisis.

For the time being, an appreciable improvement of the franc on the markets has been brought about by the relaxation in international affairs; by the firm declarations of M. Bonnet that "the price must be maintained and that the Cabinet will accept, either before or after the cantonal elections, any modification to a policy on which the Congress of the Radical-Socialist Party will be invited to vote"; and by rumours that negotiations between the Unions of employers and workers were in progress for a new charter of labour. But the immediate future of the exchange will ultimately depend upon the results of the cantonal elections; the decision about the 40-hour week after the inquiry into production; the magnitude of the import surplus; and the course of prices. Meanwhile, prices are still rising, the general index this week reaching 614 compared with 581, 586, 590, 589 and 605 in the preceding five weeks. The index of food prices was 608, compared with 546, 557, 572, 572 and 591 in previous weeks.

The monthly figures of industrial production, published by the Statistique Générale, are as follows (1913 = 100):—

	July, 1936	May, 1937	June, 1937	July, 1937
General index	98	104	102	101
Engineering	100	118	117	117
Iron and steel	81	105	106	104
Textiles	58	66	65	61
Mines (adjusted figures)	102	98	95	96
Building ,,	65	61	57	55
Leather ,,	108	101	98	94
Paper ,,	166	141	143	139
Rubber ,,	959	801	833	872
Motors ,,	418	423	433	448

Unemployment on September 11th was 308,178, compared with 308,419 on September 4th and 408,099 in the corresponding week of 1936.

Germany

The Real Basis of Foreign Policy

BERLIN, September 22.—The international situation is ill-regarded. It is noted that while the older complications, such as the Far-Eastern and Spanish, are apparently still far from solution, new questions such as the Piracies and the friction between Japan and Great Britain have arisen out of them. The visit of Mussolini though duly presented here as a demonstration for order and peace, will probably not operate in that way. It will increase the self-confidence of Berlin and Rome, a development which as long as these capitals stand in bad relations with London is not to be desired; and it will also probably increase the morbid irritability and passion for "manifestation" in both capitals.

Mr Eden's utterances at Geneva did not improve matters. Even if the view of persons who are unfriendly to Germany that the greatest conceivable concessions in the domain of colonies and raw materials would not keep the Reich quiet, is incorrect, it is certain that no propitiation could result from Mr Eden's contingent and conditional obscurities. If Mr Eden is criticised by Germans for not going far enough, he might be criticised by Britons for going too far. Germany wants colonies, for the reasons for which other countries have wanted them. She does not want raw materials; these are merely a *Zellwolle-Ersatz* shirt for her colony-bare body.

Unless one believes that the overseas expansion of England was unreasonable, one must admit that Germany's colonial ambition is entirely reasonable. Any fair person must admit that the Reich did not lose its colonies because it ill-treated the natives, or for any other reason than that it was defeated in war. It lost them as England, France, Spain, and Holland lost colonies. But that does not mean that Great Britain should repair the German loss.

Germany ought to be allowed to look after herself; to develop her own resources, as she is doing with praiseworthy and welcome success; and to nurse her own natural but entirely subjective resentments. Current arguments to the contrary are mostly fallacious. The present international discontent, though presented as abnormal and as due to an abnormal peace treaty, in no wise differs from the pre-war international discontent, and is entirely normal and human. The "have-not" *v.* the "have" outcry will not bear examination. When a "have-not" State demands colonies, it demands them, not in its capacity of a "have-not," but in its capacity of a "have"—of guns, tanks and aeroplanes.

The question of restoring colonies is a question of Power, not a question of Equity; and it would be dangerous and unreasonable for Great Britain to abate one inch of her Power, and judicious and safe for her to increase her Power. Of course, Anglo-German relations will continue to be bad unless Germany gets her way, but they will be worse if she does get it.

Supplies of Food and Labour

The food situation has changed little, and there is a continued shortage of eggs. Latest official reports on the condition of potato, sugar-beet, and root crops are satisfactory, but the indices of meadow and pasturage conditions are mediocre. The potato crop is expected to exceed that of 1936, which was 46,300,000 tons; and this will materially alleviate the fodder problem. Wheat imports in August were 167,250 tons. In the first eight months of 1937 they were 992,150 tons, valued at Rm. 123 millions.

The number of unemployed declined in August by 54,000 to 509,000, and was only half the figure of August, 1936. Of the present half million, some 150,000 are not fully employable. One-fourth of the total unemployed are women. The question of employing women in those industries that are short of labour is still being discussed. Between October, 1929, and September, 1934, the number of registered women workers, employed and unemployed of all kinds, fell from 6,590,000 to 5,380,000; but then increased to 5,740,000 at the beginning of this year. The present number of registered women workers is 680,000 lower than in 1929, but if certain adjustments (allowance for the Saarland, etc.) are made, the number appears to be only some 300,000 lower than in 1929. The official policy of favouring agricultural and domestic work for women continues unchanged, and in both trades labour is short. But women are also being increasingly employed in industry, on the condition, however, that they do not keep men out of work.

Rising Imports

The August export surplus in foreign trade was Rm. 59 millions, compared with Rm. 30 millions in July, and Rm. 63 millions in August, 1936. All of the four months May to August show less favourable balances than in 1936; but this is entirely due to increased imports. The trade returns indicate that, as might be expected, the Government prefers to use up the exchange yield from increasing exports to secure a corresponding increase of imports, rather than to accumulate foreign-exchange, which would only serve to attract the critical attention of foreign creditors. The active balance of the first eight months is Rm. 279 millions. In view of the great increase of exports, this surplus is small, the whole year 1936 having yielded Rm. 550 millions surplus. Figures are :—

	July	August	Jan.–Aug.
	Millions of marks		
Imports			
I. Foodstuffs	191·5	168·3	1,301·9
(*a*) Livestock	6·4	6·9	59·8
(*b*) Animal foodstuffs	36·1	37·3	291·1
(*c*) Vegetable foodstuffs	120·1	100·2	740·6
II. Industrial goods	304·1	308·9	2,174·0
(*a*) Raw materials	180·6	185·8	1,303·1
(*b*) Semi-manufactured	91·5	88·2	625·1
(*c*) Manufactured	32·0	34·9	245·8
Total	499·7	481·6	3,508·5
Exports			
I. Foodstuffs	7·4	7·8	60·1
(*a*) Livestock	0·1	0·1	1·9
(*b*) Animal foodstuffs	1·0	0·8	5·7
(*c*) Vegetable foodstuffs	3·9	5·1	32·8
II. Industrial goods	522·4	533·4	3,726·0
(*a*) Raw materials	50·3	54·0	367·0
(*b*) Semi-manufactured	45·7	51·5	353·7
(*c*) Manufactured	426·4	427·9	3,005·3
Total	529·9	541·3	3,781·1

August, like July, witnessed a considerable gold export, so that of Rm. 146 millions imported in eight months, only Rm. 6 millions remain.

U.S.S.R.

Enemies of the People

Moscow, August 23. — As if to prove the Marxist contention that politics and economics are inseparable, the Soviet Union's Central Statistical Bureau has released figures this week about industrial production during the first half of 1937, which clearly show the influence of the domestic political crisis through which the country has been passing. Although many of the issues involved in the recent political "purges" are still confused, there is now no doubt that they have produced at least a temporary slowing-up of the country's economic progress in the final year of the second Five-Year Plan.

The Soviet Press continues to place major blame for industrial troubles on "enemies of the people," and to allege sabotage in many factories where others would be content to call the trouble inefficiency. Few foreign observers doubt the existence of a measure of sabotage and "wrecking" in many branches of Soviet industry. They question rather the scale on which it is discovered by the ubiquitous N.K.V.D., or political police, and the effectiveness of widespread dismissals and arrests as a means of coping with the problem.

The following table, expressed in millions of roubles calculated at 1926-27 prices, indicates that, except for the lumber industry, most branches of Soviet economic activity have increased their production above the 1936 level, but have lagged behind the 1937 plan:—

	1937 Plan	Production First six months of 1937	Per cent. achieved of whole year's plan	Per cent. produced of Jan.–June, 193 figure
Total — All-Union and local industrial commissariats	77,848	34,316	44·1	112·9
Heavy industry	39,914	17,917	44·9	114·1
Lumber industry	3,938	1,457	37·0	90·8
Light industry	15,595	6,995	44·9	112·5
Food industry	12,550	5,267	42·0	112·6
Local industry	3,681	1,627	44·2	119·5

Later figures indicate that the lag behind the plan figures continued during July.

"Tight Places" in the Plan

The planned increase in national income for 1937 is 24 per cent., designed to raise the total to 105,500 million roubles. In the first six months of the year industrial production increased less than 15 per cent., throwing into jeopardy the accomplishment of the entire plan.

Iron and steel, fuel, lumber and building materials have been singled out as the "tight places" on which the Soviet Union must concentrate its energies during the remainder of the year. Some of the problems may be judged by the following figures. In seven months, the country's forges have produced only 52 per cent. of the annual plan in iron, 50.3 per cent. in steel and 47.9 per cent. in rolled iron. In July, the monthly production of each was below the June figures and below the figures for July, 1936. In coal, the situation is even worse. Production for seven months amounted to 71,200,000 tons, against a planned production for 1937 of 146,300,000 tons.

The problems of the lumber industry have been complicated this year by the Soviet Union's new policy of lumber conservation in the European sections of the Soviet Union, and by the decision to shift the centre of gravity of the industry to the east and north. The first six months resulted in the fulfilment of only 37 per cent. of the annual plan. Similar lagging in the production of cement, bricks and other building materials has slowed up the construction of new factories and housing. At the same time, building costs have shown an alarming tendency to rise.

In many finished goods industries the present situation is less worrying to Soviet leaders. Both the Stalin Automobile Factory in Moscow and the Molotov Factory in Gorki have apparently mastered many of the difficulties of conveyor-belt production. Their daily production of finished cars has been increasing steadily, and their directors have been criticised in recent weeks by the Press chiefly for failure to produce spare parts in requisite quantities and assortment.

THE
COMMERCIAL BANK OF SCOTLAND
LIMITED

Incorporated by Royal Charter and Act of Parliament

PAID-UP CAPITAL - - - £2,250,000
RESERVE FUND - - - £3,050,000

ESTABLISHED 1810

Bicycle production has increased during the first seven months of 1936 by 31 per cent., gramophones by 43.3 per cent. and watches and clocks by 51.2 per cent. The country's locomotive plants have turned out 761 locomotives in seven months, with an annual plan calling for 1,800.

A characteristic Communist Party campaign has now been launched to complete the 1937 plan.

Argentina

Preliminary Election Results

Buenos Aires, September 11.—The Presidential Elections were held on September 5th but the full results will not be known for some considerable time. The number of ballot boxes annulled owing to irregularities is higher than in previous elections, especially in the Provinces of Buenos Aires and Santa Fé, and supplementary elections will be held in many districts on September 19th.

It was expected that the Radical candidate, Doctor Alvear, would have a big majority in the Federal Capital; and, at the moment of writing, results available in Buenos Aires City show 66,597 votes for Doctor Alvear, 22,441 votes for the official candidate, Doctor Ortíz, 8,318 votes for Doctor Repetto, the Socialist, and only 742 votes for Doctor Molinari, a " freak " candidate, representing a secessionist Radical party.

The provincial returns already available show some surprises. In the Province of Entre Ríos, which voted Radical in the last election, Doctor Ortíz is leading. This is attributed to dissensions in the Radical Party, in consequence of which certain influential Radical groups decided to support Doctor Ortíz. In the Province of Mendoza, which was expected to support the official candidate, the Radicals at the moment have a substantial lead. In the Provinces of Santiago del Estero and Jujuy, the counting is finished, and the expected majorities were recorded in favour of Doctor Ortíz.

Continued Prosperity

Exports in August showed an appreciable fall, both in volume and in value, compared with the preceding month, but are nevertheless considerably higher than in August last year. The figures for each of the last three months are given together with the corresponding figures for 1936 in the following tables:—

	Exports			
	1936	1937	1936	1937
	Volume in Tons		Value in Pesos	
June.....	862,811	1,334,706	101,829,573	153,924,793
July	1,021,341	1,257,804	121,136,881	155,932,952
August...	1,146,939	1,203,698	128,367,676	147,114,738

The wave of Argentine prosperity has not yet receded. In the first eight months of the current year the value of exports amounted to 1,712,346,229 pesos, compared with 972,807,324 pesos in the same period of 1936, an increase of 76 per cent. In the same period the volume of exports improved by 67.5 per cent. Indeed the volume of exports for the first eight months of this year is the highest ever recorded, while the value has only been exceeded in 1920 and 1928. The cause of the present Argentine prosperity is to be found in bigger shipments of wheat, maize and linseed—and to a lesser extent of oats and barley. In value Italy has more than quintupled her purchases from Argentina compared with last year.

The progressive rise in imports continues. In the first seven months of this year the market value of imports was 29.5 per cent. higher than in the same period of 1936, while exports had risen 85.3 per cent. The value of foreign trade during the first seven months of this year and last year was as follows:—

	Imports	Exports (Pesos)	Export Surplus
1936	632,337,900	844,439,648	212,101,748
1937	818,682,112	1,565,006,789	746,324,677

According to tariff values Argentina bought 159,120,756 pesos worth of goods from the United Kingdom in the first seven months of 1937, compared with 142,168,897 pesos in the same period of last year. The percentage of total imports bought from the United Kingdom has, however, fallen from 21.9 to 19.8 per cent. In July there was a sudden increase in imports from the United Kingdom which amounted to 27,782,000 pesos compared with a monthly average of 21,956,000 pesos in the first six months of the year. The chief countries which have increased their exports to Argentina are Germany, Italy, Holland, Belgium and Peru.

Current prosperity is indicated by cheque clearings which amounted to 3,528 million pesos in August last compared with 2,897 million pesos in August, 1936. In the first eight months of 1937 cheque clearings were 28,009 million pesos compared with 22,423 million pesos in the same period of last year.

On August 24th it was announced that the Government would repatriate gold to the value of 200 million pesos from stocks lying for its account in the Bank of England. The Minister of Finance stated that the purpose was to reinforce the country's gold stocks. The Ministry of Finance also reports that, since 1929, Argentine currency has depreciated in terms of gold by 54.2 per cent., while the pound sterling and the U.S. dollar have fallen by 41.1 per cent., the Australian pound by 52.3 per cent., and the Japanese yen by 66 per cent.

The outlook for the next crops is better than a month ago. Rain has fallen over a big part of the cereal zone, but more would be welcome, and the position is by no means entirely satisfactory. Parts of the Province of Santa Fé and large zones in Córdoba are suffering from drought or semi-drought.

The British and Polish Trade Bank A.G., Danzig

Paid-up Capital: D. Gulden 5,000,000.--
Reserves: D. Gulden 3,527,571.57

Chairman: Sir William Grenfell Max-Muller, G.B.E., K.C.M.G.

Joint Managers: Stanisław Pawłowicz and Philip Frederick Rann.
Assistant Manager: Aleksander Kowalski.

The Bank was formed to facilitate Exports and Imports from and to Poland, including Danzig.

INQUIRIES SOLICITED

Irish Free State

The Free State and World Recovery

Dublin, September 19.—Every attempt to assess the economic position of any country at the present time must take note of the fact that the world is definitely passing through a period of recovery. This recovery is well-nigh universal; and, except in those countries which are weakened by war or by preparation for war, the same symptoms of progress may be observed. Some countries have proceeded farther along the path of recovery than others, but the general conjuncture is unquestionably rising. In what degree is the Free State participating in this upward movement?

Probably the most valuable index is the volume of employment, about which, in the absence of precise statistics, a certain amount of doubt must exist. Employment has increased in the protected industries, but on the other hand it has diminished to some extent in other industries. Prolonged strikes in the building trades have produced much unemployment in Dublin, and industrial disputes have recurred in other industries. The number of males employed in agriculture decreased from 579,409 in June, 1934, to 560,371 in June, 1936, and there is no reason to believe that this trend has not continued. In view of the facts that the population is declining as a result of emigration and that there is no significant decline in the numbers receiving public assistance, it is difficult to resist the conclusion that the total amount of employment is stationary if not declining.

At the same time costs of production are rising. This increase is caused partly by the rise in the price of imported raw materials, partly by the high protection of many articles, partly by the fixing of minimum wages in agriculture, and partly by the advanced labour legislation which is, in itself, wholly admirable. There is no reason to believe that any improvements in efficiency are taking place to counterbalance these cost-raising influences. The effect of rising costs and a stationary volume of employment must be a declining national income when net rather than gross production is measured. The possibility of such a reduction in the net income of the country must be taken into account before further experiments in social services are attempted or further indebtedness for non-productive expenditure is incurred.

Less Favourable Terms of Trade

The statistics of external trade reveal that imports have increased more rapidly than exports, with the result that the unfavourable balance on merchandise account in the past seven months of this year amounts to £12,417,700. The terms of trade have moved against the Free State, as the price of imports has risen faster than that of exports. Assuming that existing trends continue for the immediate future, the passive balance for the year will be well over £20,000,000, and, rich though the Free State may be as a creditor country, invisible exports will not suffice to bridge a gap of this magnitude. It is obvious that external assets will have to be realised, and evidence of such a liquidation is to be found in the banking statistics which reveal a decline in the net sterling resources of the Irish banks.

In relation to the very large sterling assets held in the Free State this decline in the banks' sterling resources is small in magnitude and need not give rise to any anxiety. The Free State is in a very strong position as a creditor country, and the repatriation of a certain amount of its external investments may be perfectly justified during a period of transition. The country has been penalised in its chief export market for five years as the result of the unfortunate Anglo-Irish dispute, and a drive towards self-sufficiency has necessitated adjustments in its economic structure. The Free State is still financially one of the soundest countries in the world. It possesses abundant external assets, the public debt is relatively small, and government credit is very high. The last few years have been difficult, but at no time has the stability of the currency or the solvency of the banking system been in the slightest danger. The worst that can be said of the situation is that the Free State has not yet participated in the benefits of general economic revival as fully as some of its neighbours. This tardiness to respond to recovery is readily explicable and should not be the occasion of any alarm.

Letters to the Editor

The People's Food

TO THE EDITOR OF THE ECONOMIST

Sir,—I was greatly interested in the excellent article in your issue of September 4th on " The People's Food " which comments upon the great improvement in the nutrition of most Western people in recent decades, but emphasises that the average standard of the industrial population of Europe is still very poor, especially in Great Britain, the United States and Scandinavian countries.

The article also emphasises that milk should " be the first objective of a British nutrition policy, since it is not only the most valuable food but also the one of which our consumption is most inexcusably low." The Food Consumption Statistics quoted on page 467 of your September 4th issue, show that the annual *per capita* consumption of meat and butter in Great Britain exceeds that of any other country in Europe, and that fact, coupled with the admitted shortage of milk prompts me to refer to an extended motor tour of the Midland Counties of England which I made in June of the present year, during which I was impressed by the great areas of meadow and pasture land, the scarcity of cattle and the lack of cereal and vegetable cultivation generally. The pasture lands indicated a deplorable lack of fertilisation, judging by the huge crops of weeds and buttercups. In fact, I could not resist a mental unfavourable contrast between the agricultural districts in England which I saw, and the more highly cultivated and fertilised farms of the Province of Ontario, where milch cows and beef cattle, and abundant crops abound.

If such agricultural conditions as I describe are general throughout England, what is the remedy, or is there a remedy?

Yours faithfully,

Toronto. Anglo-Canadian.

"The Under-Privileged"

TO THE EDITOR OF THE ECONOMIST

Sir,—" A fairer distribution of economic rewards will still be the demand of the under-privileged." This statement occurs in your issue of July 24th, in a summary of the economic outlook in view of a population that will soon be decreasing. The implication is that the present distribution leaves something to be desired. Most thinking people will admit that it does. In spite of a marked increase during the last few decades in our technical efficiency in the production of wealth, there are still millions of our people not far removed from the poverty line. Moreover, the improvement of the general standard of living except by very slow stages seems to be impossible. A vicious circle would appear to be inherent in our present economic system. If you increase wages or reduce hours you increase costs. Increased costs mean increased prices. Increased prices, apart from their ill effects on export trade, nullify the effect of increased wages. It would appear to follow that, until some system is invented under which the remuneration of the mass of the workers can be increased without increasing the costs of production, any considerable amelioration of the workers' position is impossible, and the demand of the under-privileged will remain unsatisfied.

This is not a prospect which any lover of his country can contemplate with equanimity.

Yours faithfully,

Wolverley, Little Bookham, Surrey. C. V. Brayne.

Defence of Empire

THE words of this title have been, indeed, are now being, invoked to cover a multitude of sins—both of omission and commission. The defence of the British Empire, as Sir Norman Angell commendably urges in his trenchant and logical analysis of that policy,* is valuable and necessary to Western civilisation as we have known it, and as we hope it will yet develop. But he scathingly denounces, for their lack of perception and logic, those blinkered British minds that only see in one direction: unilateral re-armament. Sir Norman is not content to refute this single-track policy by reference to some vague conceptions of pacifist objectives. Nor does he waste his time, as so many critics are wont to do, in attacks upon the cruder forms of Imperial sentiment, often irrelevantly confused with the very real problem of Imperial defence.

With judicious hammer-blows of logic he forges his own argument. It is a pleasure to read such a closely-knit, cool, and well-written book. It is an argument that, in his hands, appears crushingly obvious. He shows the paradox in British foreign policy during the last half-dozen years: the incomprehensible readiness, even apparent wilfulness, of Conservatives in tearing away from the Empire its best friends and most powerful potential allies, its most important strategic advantages and its access to material resources, in an unreasoning flight from responsibility in the face of the aggressive policies of Japan, Italy and Germany. He clarifies in this way the real causes and effects of the so-called "failure of the League"; and he shows how those who loudly advocated a British policy which necessarily conflicted with our League obligations and world responsibilities have already driven this country, and the Empire, into a far worse strategic situation than that which only *might* have faced us if we had had both the assurance and the will to lead the French and the other League nations, instead of allowing our policy to be a pale shadow of their fears. Sir Norman duly agrees that, if leaving the League and a return to isolation is to be our policy, it means heavy re-armament; we cannot afford enough to keep out of *any* combination against us; his logic then shows that the most economic re-armament is cast-iron military alliances; which is the opposite of isolation; so why ever bust the League and blow upon "collective security"? Sadly, in sorrow more than anger, Sir Norman concludes that "our real enemy has been confusion." Let us, then—and he has sharp things to say of Labour's confused ideas on foreign policy—proclaim a five-fold policy and stick to it, in its parts and its whole: readiness to enter on complete equality with the "dissatisfied Powers" into negotiations on their aims and claims; to ascertain whether they will publish the results among their own peoples; to stand for, and require all others to stand for, peaceful arbitrament in disputes; to offer to create the *means* of peaceful change in return for the collaboration of the "dissatisfied Powers"; and, finally, to express our set resolve to enter a defensive confederation involving obligations to use force, of all States who will accept this five-point policy.

Sir Norman's advocated policy is sane and practicable—granted the ability of the British people and their leaders rightly to assess the value and immensity of the issues, for them and the world, which now lie at stake, and their will to defend them. If the British people in Empire and Mother Country are confused, divided between acquiescents and activists, the Empire will lose both its force and its integrity. This is a matter above considerations of class or Party. And it is the merit of Sir Norman's book that he poses the real issues with superb clarity.

Shorter Notices

"The Economic and Social Foundations of European Civilisation." By A. Dopsch. Kegan Paul. 404 pages. 21s.

While by no means every historian can accept in full the proofs adduced by Dr Dopsch to show that there was, in fact, no break in the Dark Ages between Roman civilisation and our own, all students of social origins will welcome this translation into English of what has been, despite its German inaccessibility, a standard work for some time. As presented to English readers, the work is scholarly and full, embracing with astonishingly complete documentation every facet of barbarian society before the Carolingian age. Farming, politics, the Church, feudal origins, town life, trade, industry and money are surveyed with equal care. Every believer in a theory about these formative centuries, about feudalism or the mark, will find problems to solve in Dr Dopsch's massive study. The validity of the author's own conclusions will be the subject of much debate among historians. But this is scholarly erudition at its most weighty; and an excellent corrective to facile generalisation.

"Easy Money." By L. D. Edie. Yale University Press: Humphrey Milford. 183 pages. 8s. 6d.

It is often supposed that Government action can now maintain low interest rates and high bond prices even in times of boom. Mr Edie examines the practicability and implications of this policy; and in particular asks how a boom can be checked in conditions of "easy money." His arguments are directed to the investor and business man as well as to the student of economics. Topical and challenging if not always convincing.

"Sandwichman." By Walter Brierley. Methuen. 283 pages. 7s. 6d.

This book is a worthy successor to the same author's "Means Test Man." It shows a Midland miner struggling to escape from the drudgery and insecurity of the pit by the road of adult education. His goal is the university, and his place of study wherever he can find a solitude free from the pressure of his daily work and his exigent family. Circumstances are too much for him: he loses his job and fails to pass his examination. The book leaves him down and out, tramping south in search of a new life. Mr Brierley may not have delved very deep into the nature of adult education or the character of colliery life, but he has drawn a shrewd picture of a miner's struggle to rise above the economic determinism of a depressed stratum of our society. The book breathes life into the bare facts and figures of coal-mining and unemployment. The personages are real and the moral disheartening.

MONEY AND BANKING

America's Balance of Payments

THE annual estimate of the Balance of International Payments of the United States*, which has now been issued with an extensive discussion and interpretation, is, as usual, a most admirably detailed and informative document. The following table summarises the main items in the estimate for 1936, for the preceding year and for 1929, the last pre-depression year. The arrangement follows in the main that of the official estimate. The chief exception is that silver has been included with general merchandise, on the ground that, whatever the mixture of America's motives in buying silver, it is sold by other countries as merchandise.

* Including silver. † Including miscellaneous capital items. § Including net earmarkings.

For the second year in succession, the balance of merchandise trade was negative. This is due to the inclusion of silver, but even if it were left out, the positive (or "favourable") balance would have fallen to as little as $59 millions, less than a tenth of the 1929 figure, and little more than a fifth of the 1935 amount. This is a very remarkable result for a currency which has been devalued by more than 40 per cent. within the four years preceding 1936. The influence of returning prosperity in the United States in expanding imports has been stronger than any stimulus which devaluation, in this world of trade restrictions, was able to give to exports.

The other current items do not reveal any very startling changes. The larger debits on account of tourists, immigrants' remittances and charitable contributions reflect the higher level of purchasing power in the United States, but all these items have a long way to go before they will have recovered to their 1929 levels. The net receipt of interest and dividends, on the other hand, was lower than in 1935, payments having increased faster than receipts.

The net result of all these current items is to produce, for the second year in succession, a negative balance on current account. Moreover, the 1936 balance would be negative even if silver were included. Thus the old complaint against the United States that she did not know how to act as a creditor, but persisted in selling more than she bought, ought finally to be stilled. There never was a great deal in the complaint, since every creditor, in order to be able to continue lending, must have at least a small favourable balance on current account, and it is legitimate to point out that the American net balance in 1929 was smaller than the British.

There is, therefore, nothing in the current account of the American balance of payments which should occasion the least inconvenience to the outer world. The capital account is a very different story, for the inflow of capital in 1936 still reached the gigantic dimensions of $1,150 millions, second only to 1935, and directly caused an import of gold amounting to $1,030 millions. Movements of this sort are clearly not compatible with a balanced international economy. International capital is not so plentiful that it can be poured into a highly capitalised creditor nation without producing a shortage elsewhere. But it would be foolish to blame American policy for this paradox, for it is notorious that the American Government has been anxious to end it. The blame lies with the unsettled conditions of Europe.

Examination of the detailed figures thus reveals the United States in a much less aggressive light among the financial powers than is usually assumed on this side of the Atlantic. An even more obstinate delusion can also be disproved from the figures. Whatever may be the case with America's trade with the rest of the world as a whole, British-American trade in particular, it is generally believed, runs strongly in America's favour. In an attempt to throw light on this point, the following table has been compiled to show the visible and invisible current items of the British-American balance of payments. The figures are those of the official American report, together with some estimates made by *The Economist* on the basis of those figures. There are many gaps in the table, but it is believed that all the important items are included:—

ANGLO-AMERICAN BALANCE OF PAYMENTS, 1936

(In $ millions. A plus sign indicates a net balance to the credit, a minus sign a net balance to the debit, of the United States.)

	United Kingdom (1)	Crown Colonies (2)	Total Cols.(1) and (2) (3)	Canada and Newfoundland (4)	Other Dominions and India (5)	Total British Empire (6)

Total	− 82	−227	−309	− 55	− 50	−414

So far as the United Kingdom alone is concerned, there is a net balance in favour of the United States when gold is excluded. But even that balance is comparatively small, about £30 millions. Moreover, as is

* "The Balance of International Payments of the United States in 1936." Prepared in the Finance Division of the Bureau of Foreign and Domestic Commerce, Department of Commerce, under the direction of Amos E. Taylor. (Washington) Government Printing Office. 95 pages. 15 cents.

constantly emphasised in the United States, the United Kingdom cannot be taken alone. When the Crown Colonies are included, the balance, though still small, becomes adverse to the United States. Even without silver, trade between the United States on the one hand and the United Kingdom and the Colonial Empire on the other is thus as near as may be to a balance. The bearing of this fact on the negotiations for an Anglo-American Trade Agreement is obvious.

The introduction into the picture of the Dominions introduces some logical complications without substantially changing the outline. Canada and Newfoundland have been shown separately, since they are more in the dollar than in the sterling sphere of influence. The other Dominions and India show a balance on current account (excluding silver) of $54 millions in favour of the United States. But this is more than fully accounted for by the net excess of American exports to South Africa, which amounts to more than $60 millions. The counterpart to this is, of course, the substantial part of South Africa's gold production which finds its lasting home in America. When South Africa is included, therefore, some part (possibly quite large) of the American gold import should be counted as merchandise. The inclusion of either some of the gold or all of the silver sold to the United States by the British Empire would make the balance heavily adverse to the United States. Without either, the account is balanced. The British Empire has clearly nothing to complain of in its dealings with the United States.

Financial Notes

London and Washington.—The coincidence of the visit to Washington of a leading British Treasury official with the further depreciation of the franc has naturally suggested that the future of the Tripartite Monetary Agreement is under discussion. A moment's thought suffices to show that this visit was arranged long in advance of the franc's fresh troubles, and while no doubt the franc is being discussed at Washington, there is no reason for supposing that it is the only subject under review. The true explanation is that it has been long felt desirable both here and in Washington that close personal contact should be maintained between the two centres. The emergence this summer of such questions as the future of gold and Anglo-American trade relations obviously increases the need for contact. Presumably, therefore, no specific negotiations are now in progress at Washington on such matters as currency stabilisation or the revision of the Tripartite Agreement. The difficulties of France since the Agreement was signed a year ago are not, of course, in any way an argument for its abrogation. The term "Tripartite" has long been misleading, for the Agreement was quickly adhered to by many other countries besides the three original signatories. Nor has France broken the terms of the Agreement, for she has neither imposed exchange restrictions nor indulged in a wilful and competitive depreciation of her currency. To-day the chief need is to continue the Agreement, and to interpret it elastically.

★ ★ ★

The Franc and its Background.—This week there has been a rally in the franc to Frs. 145 to the pound. This is entirely due to fresh support by the French Control, which is estimated to have lost £5.0 millions sterling in the course of only a few days. M. Bonnet's speech, referred to in a Note on page 606, created a good impression as far as it went, but it contained two elements of doubt from the exchange point of view. First he made it clear that the Banque de France's gold would not be used to support the franc, and so the franc's future depends largely upon the resources of the Exchange Fund, which must be becoming attenuated. Next he gave no indication as to how he was going to fill the deficit of anything up to Frs. 20,000 million in the 1938 budget for re-armament, the railways and *collectivités publique*. One fundamental cause of the trouble is the institution of the Rentes Equalisation Fund. This has proved an open invitation to investors to exchange their rentes for francs, which in turn can be expatriated. In other words, at a time when orthodox exchange policy called for a restriction in the supply of francs, the Rentes Fund has served to increase the supply.

★ ★ ★

The Foreign Exchanges.—Apart from the franc, which is discussed in the Note above, there have been some interesting movements in the belga and the dollar. The depreciation of the French franc last week to Frs. 147 to the £, gave rise to some weakening of the belga, and as Belgium is still on the gold standard, the immediate result was an outflow of gold. This gold was exchanged for dollars, and the result was that sellers of belgas found themselves taking up dollars, and in order to obtain sterling had to re-sell their dollars in London. Hence the weakness of the belga caused a parallel weakening of the dollar, and by September 17th sterling had risen to $4.96¾. This week's rally in the franc, even though artificial, reacted right along the chain, for first the belga improved and then the dollar. For this and other reasons sterling has now dropped back to $4.95. Dutch interests have made heavy sales of American securities, and the consequent remittance of the proceeds to Holland has caused the Dutch authorities to cut their rate for dollars from Fl. 1.81⅞ to Fl. 1.81.

★ ★ ★

The Money Market.—This week money is much easier. Outside lenders are now only charging ½ per cent. for new bond-money, but outstanding loans are being continued at ⅝ per cent. The banks are keen buyers of bills, but brokers are not ready sellers, probably because they are well supplied with maturities. Still the banks have bought fair quantities of bills.

	Sept. 2, 1937	Sept. 9, 1937	Sept. 16, 1937	Sept. 23 1937
	%	%	%	%

Clearing banks' deposit rate	½	½	½	½
Short loan rate :—				
Clearing banks	½–½–1*	½–½–1*	½–½–1*	½–½–1*
Others	½–½	½–½	½–½	½–½
Discount rates :—				
Treasury bills	½	½	½	½
Three months' bank bills	½–⅝	½–⅝	½–⅝	½–⅝

* Loans against Treasury bills and other approved bills and British Government securities within six months of maturity; 1 per cent. Treasury Bonds and other gilt-edged stocks within six months of maturity; and other collateral respectively.

The keen demand for end-of-December maturities has reduced the average tender rate for Treasury bills to just below ½ per cent. Next week, payments up to and including Thursday will be for December bills, and so the low rate will persist until then.

★ ★ ★

The Bank Return.—There has been a further seasonal contraction in the note circulation, which has now fallen to £17.8 millions below its early August peak. The Reserve is also higher than a week ago.

BANK OF ENGLAND

There are only minor movements in the banking department. Their net result is a contraction of £2.8 millions in bankers' deposits.

THE STOCK EXCHANGE

What are Profits?

PROFITS—past, present and to come—have a decisive influence on Stock Exchange business. They are the incentive of investment, the mainspring of industrial enterprise, and the fountain of dividends. They afford the only sound basis for the valuation of a company's shares and even of its capital assets; for capital without profits is like faith without works.

British company law lays down that dividends can be paid only out of profits. Every company publishes a statement of earnings every year, upon which financial writers comment in more or less detail. But if the average shareholder were asked to say what profits are, he would probably be surprised by his own inability to give more than a vague answer. In theory, a profit is easy to comprehend; for it is simply the excess of incomings over outgoings in a given period, after allowing, on the one hand, for all additions to capital, and, on the other, for the wastage (or "using-up") of capital assets in the process of earning those profits. Every word, however, in this definition involves a host of difficulties of connotation when applied in practice. The published figures in a company report usually depend on a lengthy series of estimations into which the element of human judgment enters so largely that the product is a matter of approximation rather than accuracy in the mathematician's sense.

It is important that investors should grasp the implications of this fact. Every increase in the scope and complexity of modern business operations makes the ascertainment of ultimate profits more formidable. For example, the following table shows the trend of published earnings, during the last eight years, of a large and successful British concern, J. Lyons and Company, Ltd., whose name and products are household words:—

J. LYONS AND COMPANY. PROFITS, 1930–37.

Years to Mar. 31	Profits Balance*	*Same, 1930=100*	Years to Mar. 31	Profits Balance*	*Same, 1930=100*
	£	%		£	%
1930 ...	947,821	*100·0*	1934...	1,020,254	*107·6*
1931 ...	954,270	*100·7*	1935...	1,021,222	*107·7*
1932 ...	953,950	*100·7*	1936...	1,022,679	*107·8*
1933 ...	984,339	*103·8*	1937...	1,024,329	*108·0*

* Before charging directors' fees.

The profits record should rightly make a powerful appeal to the conservative type of investor. It is a blend of gilt-edged stability and consistent progress. Since 1933, profits have made a new "record" every year. But what are profits? The profit and loss account to March 31, 1937, mentions directors' fees of £13,452, and proceeds to define the year's results thus:—

> By balance from trading account, dividends from subsidiary and associated companies and transfer fees after deducting interest on debenture stock and mortgages, directors' fees, salaries, wages, rents, rates, repairs, maintenance, and other expenses and after providing depreciation and reserves against contingencies, £1,010,877 0s. 9d.

The company, it will be seen, has two distinct sources of profits—namely, its own trading operations and the dividends it receives from subsidiary and associated companies in which it has a shareholding interest. The *gross* amounts of profits from these sources are unknown, but they are obviously much greater than the *net* figure of just over £1 million disclosed to shareholders. Actually, four different groups of charges have been allowed for before the final figure was struck: (1) direct business expenses, like wages, repairs, maintenance, and, doubtless, "other expenses"; (2) overhead expenses like interest on debenture stock and mortgages, directors' fees, salaries, rents and rates; (3) depreciation; and (4) "reserves against contingencies." The amounts actually charged under all these headings are set out in the company's books of account, but they are not revealed to shareholders. Many of the items under (1) and (2) are matters of accurate record, but (3) must necessarily have been based on estimate; for depreciation allowances depend on the probable life of plant and other fixed assets, not in terms of physical serviceability but of economic use. Finally, (4) is quite indeterminate.

Investors must make due allowance for all these factors *plus* the fact that the parent company's receipts from its subsidiaries and associated companies are based not on the latters' profits (some of which are subject to a process of estimation on much the same lines as those of the parent concern), but on the dividends which those companies declare and pay. On the whole, shareholders will be compelled to admit that they do not know the actual earning power of the J. Lyons group of companies, or how far it varies from year to year. They have

† Administration and selling expenses at home and abroad, including salaries, commissions, travelling expenses, warehouse wages, rent, rates, insurance, maintenance, lighting and heating of warehouses and offices, advertising and samples, bank charges, postages, printing and stationery, etc. * Including in 1930 £8,900 reserve against fall in prices of stocks and forward contracts. ‡ Including discount on calls received in advance (1932, £1,892). § Including development expenses written off (1933, £7,360; 1934, £258). †† Including obsolescence provision (1936, £2,962). ‡‡ Including special credits.

only a " smoothed curve " of profits, after adjustment by the board in their good judgment of what is best for the company. Shareholders are, in fact, the contented subjects of a benevolent directorship, " too wise to err, too good to be unkind."

Investors, however, obviously cannot afford to apply this reasoning to every company report. The records of Carey Street prove, unhappily, that not all directors are as wise, nor all companies as strong, as J. Lyons and its board. The question therefore arises whether it would not, after all, be advantageous if the largest companies, without prejudice to their high reputation, were to take their shareholders more completely into their confidence, *pour encourager les autres?*

Disclaiming all invidious intentions, we may venture to cite, as an example of the helpful possibilities of generous disclosure, the figures published by another progressive and successful company, Wiggins, Teape, and Company (1919), Ltd. This concern, like J. Lyons, is an operating-*cum*-holding company, and its profits figures, similarly, include dividends received from its subsidiaries. But a separate section of each report shows, firstly, the *combined gross earnings* of the parent concern and its subsidiaries, and, secondly, the *actual deductions* made under a variety of headings. In the table on the preceding page we have set out these figures for every year since 1930, and have added three columns of percentages. From these calculations it is apparent that only 1 to 2 per cent. of the total gross revenue comes from sources extraneous to the group's main trading activities. Approximately 60 per cent. of the total gross revenue is absorbed by expenses and charges of various sorts, of which general and overhead expenses are much the most important. It is noteworthy, however, that between 1930 and 1936, an increase of 39 per cent. in total revenue has been accompanied by an increase of only 15 per cent. in overhead and general expenses. As a consequence, the proportion of total revenue absorbed by these expenses has fallen from 47 per cent. in 1930 to 39 per cent. in 1936. After general expenses, the most important charge occurs under the heading of depreciation. The fact that a 39 per cent. increase in total revenue has been coincident with an 84 per cent. increase in the total depreciation charge (which has consequently risen from 7 per cent. to 9 per cent. of the total revenue), affords *prima facie* evidence of a conservative policy on the directors' part.

On the basis of these and other figures given in the company's report each year, we have made the following comparison between (a) the gross revenue of the whole group of Wiggins, Teape companies, and (b) the net profit balance of the parent company alone, shown on the nearest possible basis to that adopted by J. Lyons and Company:—

WIGGINS, TEAPE PROFITS, 1930–36

Calendar years	Gross Revenue, Whole Group	*Same, 1930=100*	Net Profits, Parent Co. only*	*Same, 1930=100*
1930	767,017	*100·0*	217,119	*100·0*
1931	774,872	*101·0*	198,782	*91·6*
1932	838,975	*109·4*	237,608	*109·5*
1933	850,087	*110·9*	259,917	*119·7*
1934	896,486	*117·0*	273,305	*125·9*
1935	1,003,553	*130·8*	289,156	*133·2*
1936	1,067,171	*139·1*	323,341	*148·8*

* After debenture interest and all charges.

By every test, the record is strikingly progressive. The table suggests, however, that the trend of gross and net revenue is not necessarily identical for any company. Net profits, in fact, are always a " geared " figure, and the investor ought to know the extent of the " gearing."

It is more than probable that the dividend and reserve policy of the directors of Wiggins, Teape has been quite uninfluenced by the decision to publish detailed profits information. But the fact is equally incontrovertible that shareholders in Wiggins, Teape know much more about their company than shareholders in J. Lyons. Their advantage may be moral rather than financial, since both companies are of the highest standing. But if stockholders in the R.M.S.P. Company, or in a host of smaller ventures had been as well informed, history might well have been different.

Investment Notes

The Slump Arrested.—The new Stock Exchange account opened inauspiciously in London on Monday, when the market took its cue from the weakness of New York in the short Saturday session. By the middle of this week, however, the two rôles had been reversed, and Wall Street was inclined to follow London's lead in a modest technical recovery. The investment relevance of the maxim: " Nothing is but thinking makes it so," was aptly illustrated by the fact that the rise in the *Financial News* ordinary share index from 105.6 on Monday to 108.0 on Thursday had a background of political and economic news which, taken by and large, was little worse and very little better than that which helped to put prices down last week. Japan held the predatory tenor of her way in China; the blast of publicity for the forthcoming cementation of the Berlin-Rome axis was not exactly a market bull point; and the evidence of Italy's second thoughts about the watch on the Mediterranean was too intangible to relieve existing tension. On the other hand, industrial news was as excellent as ever, and the week's vintage of company reports and dividends was of high quality. The market recovery, altogether, was welcome but inconclusive; and protests against the very idea of any possible difficulty in meeting heavy differences at Thursday's financial Settlement might have been less numerous—and more accurate. Revival is overdue, and may go further; but optimism has had too severe a hammering to make any hearty recrudescence of speculative activity at all likely in the near future.

* * *

Wall Street Steadier.—After the series of alternating days in which mild recovery and deeper slump carried stock prices into new low ground, Wall Street this week experienced some relief. Prices have improved day by day, and the bears appear to be treading cautiously, although there is no general expectation yet of any long or rapid rise. This relief, as in London, cannot be attributed to any change in the conditions outside the market—whether in America, in Europe or in the Far East. The prospects of war are neither greater nor less than a week ago. The attitude of the Washington administration to business and the stock market has long been known, and no change has been disclosed. The appointment of Mr Douglas as chairman of the S.E.C., following Mr Landis, marks no change in policy. Mr Hull fears that if international trade is not freed from restraints there will be a military catastrophe or an economic depression in two years owing to falling armament employment; but this choice has been clearly evident for many months. Last week the markets paid more attention to their fears of a business recession in America, but even granted the possibility of a winter check, there is no new evidence to suggest that this would herald a general setback. Indeed, a great deal of old evidence suggests that this inference would be far from reasonable. There still seems, in fact, an excuse for some dogged optimism about the course of American recovery, despite the rapidly rising trend of costs. But it is not so certain that this week's improvement marks the turn of the tide. For some time to come, in all probability, it would be wiser to expect irregular movements from Wall Street. The reaction of longer term prospects upon the market demands a somewhat lengthy time in which to demonstrate itself. Wall Street will probably continue to be a law unto itself for the present.

* * *

European Money in Wall Street.—The United States Treasury Department has recorded, since the beginning of 1935, the weekly movements of foreign resources into America, and (*inter alia*) the net purchases of American domestic securities by nationals of foreign countries. The figures provide a new source of investment statistics; and although they have resulted from the campaign against " hot money," they would make a valuable permanent addition to the world's investment information. They do, in fact, provide a method for assessing the pull of market forces in Wall Street at the present time. The investigation falls into two stages. From other American sources, the British and European holdings of American stocks and bonds can be obtained, as at December 31, 1935. The figures are given below:—

(In $ millions)

	British Holdings	European Holdings
Common stocks (at market value)	372	1,274
Preferred stocks (at par)	146	240
Bonds (at par)	91	516
Total	609	2,030

The preponderant interest in Wall Street, from this side, has always been in American common stocks, despite the sizable holdings of preferred stocks on British account and of bonds on Dutch account. This fact enables us to compute, within rough limits, the experience of the influx of investment money into Wall Street up to March this year—the second stage of the inquiry.

* * *

By analysing the Treasury Department's weekly figures for purchases of U.S. domestic securities, convenient quarterly totals can be obtained for this purpose. These are not divided into categories, nor do they indicate the total turnover in all security transactions in the United States on foreign account. (For example, the total of British purchases of all securities in America during the fifteen months to March last was $1,683 millions, while sales reached $1,322. The net purchase of domestic securities on British account during the period, however, amounted to $288 millions.) Calculations based on the quarterly figures below, therefore, refer to net movements and must inevitably ignore the wider effects of profit-taking sales and " switching." We are also compelled to ignore the holdings of preferred stocks and bonds at the end of 1935, and to assume that all purchases since have consisted of common stocks. On these assumptions, the following table has been prepared, to show the net movements of British and European investment funds into United States domestic securities up to last March, together with an estimate of their present value:—

In $ millions

	United Kingdom Base Value	United Kingdom Current Value	All Europe Base Value	All Europe Current Value	*Rate of Appreciation (+) or Depreciation (−) shown at present* (%)
Value of common stocks held Dec. 31, 1935	372	407	1,274	1,394	+ 9½
Net Purchases:					
1936—					
1st quarter ...	25	25	98	98	...
2nd ,, ...	15	15	77	76	− 1¼
3rd ,, ...	45	42	102	95	− 6¼
4th ,, ...	132	113	254	218	− 14¼
1937—					
1st quarter ...	71	58	138	112	− 18½
Totals to March	660	660	1,943	1,993	

The " current value " totals are calculated, for each quarter, by applying the movement of the Standard Statistics index of 419 stocks, between the respective quarters and the present month, to the " base value " figures—the latter, of course, representing the values of common stocks held at the end of 1935 or since purchased.

* * *

It will be seen that no profits are now running, on the average, upon securities purchased after 1935 and held to-day. For the British holder of common stocks, by a coincidence, the depreciation of stocks purchased from last autumn onwards has exactly offset the 9½ per cent. appreciation in his end-1935 holdings. The rate of increase in European interests in Wall Street, however, is much less rapid, and modest capital gains still appear to be available in total. Part of the British purchases may represent French operations, but both columns suggest that security movements in London, Amsterdam and Paris will be determined for some time by the fate of these extensive holdings. The settlement of heavy differences on international stocks appears to rule out any hope of market improvement for some time to come. Investors who ponder these figures should not find it difficult to understand why Wall Street has lately called the dirge on the world's bourses.

* * *

Brazilian Debt Position.—Under the Aranha debt plan of 1934, the condition was laid down that, six months before the scheme expired, a new agreement should be ready to take its place. The scheme expires on March 31st next year; the new arrangement, therefore, should be completed by next Thursday. It seems unlikely that this time-table will be kept. Negotiations between a Brazilian delegation and the creditors' representatives in New York were broken off last month, and there is no indication, official or otherwise, of their resumption. Investors do not even know what measure of disagreement remains to be bridged. Little credence is attached to reports that Brazil will attempt to reduce the service on the funding loans, in order to pay more on the lower groups. Although this course has been suggested in Brazil, it may be presumed that no responsible government would be anxious to tamper with stocks which, above all others, are the touchstone of its credit. Brazil is burdened with her coffee problem, and her recovery has been slower than that of other primary producers. But her position certainly does not justify the violent movements which have occurred in the funding issues in the past two months. Possibly a policy of temporary postponement might, for once, have much to commend it. The extension of the present scheme for another year would give Brazil a chance to settle down after the excitements of the Presidential election this winter, and would bring her one year

FINANCIAL INDEPENDENCE can be every widow's INHERITANCE

Make certain that *your* widow would be free from financial anxiety. A "Widow's Income" Policy will not only ensure your own peace of mind, but will provide the comfort and security of a guaranteed income for the lifetime of your wife if she is left to face the world alone.

An enquiry for full details and for an illustration suited to your own circumstances will cost you nothing; rest assured you will incur no obligation by doing so.

nearer to extinguishing the Vargas bonds. Without a dramatic change in the coffee situation, again, there is little promise of improved payments on the debt, save that funds gradually released by the repayment of the Vargas bonds might well be used for stepping up the annual payments under a new scheme. But it is more than desirable that an official statement on the future of the debt service should be forthcoming at the earliest possible moment.

* * *

Chinese Customs Revenue. — The full terror of Japanese attack by land, sea and air this week has been followed with increasing anxiety by holders of Chinese bonds. The position of the Customs loans, which together with indemnities and internal loans were covered last year with a 50 per cent. margin by the revenues, is particularly affected, for the Japanese attacks are concentrated upon important centres of collection. In the following table we set out the contribution to total revenues of various important cities, in order that investors may assess the possible order of magnitude of the sharp fall in revenue which is bound to occur this year. The figures are given in Chinese dollars:—

	1934	1935	1936	*Percentage of 1936 Total*
Shanghai ...	175,363,474	149,127,439	148,869,136	*46*
Tientsin	41,138,710	41,089,011	35,518,115	*11*
Hankow.....	19,365,550	22,396,228	23,874,359	*7*
Canton	8,013,102	9,616,502	10,925,799	*3*
Kowloon ...	7,462,841	7,346,729	9,120,867	*3*
Swatow	5,793,706	4,760,905	6,828,894	*2*
Others	77,508,025	81,182,898	91,446,121	*28*
Total	334,645,408	315,519,712	324,583,291	*100*

Taken at an approximate average rate of 1s. 2½d. to the dollar, last year's revenue was equivalent to almost £20 millions. The large share contributed by Shanghai—apart from other cities now being attacked—is evident from the table. The collection of the Salt Revenues (which have steadily advanced from $145 millions in 1932 to $206 millions last year) will also be seriously impeded—a matter of importance to such loans as the Anglo-French issue of 1908, the Crisp loan of 1912, the Hukuang coupons and the Vickers-Marconi notes.

Company Notes

Staveley and Sheepbridge Reports.—Results of the excellence of Staveley and Sheepbridge Coal and Iron companies to last June would have been greeted with enthusiasm twelve months ago, but in the present market context they did well merely to assist the market to its feet. The record of both companies is analysed in the following table:—

Years to June 30

	Staveley Coal and Iron			Sheepbridge Coal and Iron		
	1935	1936	1937	1935	1936	1937
Profit	518,983	594,634	835,646	151,777	219,117	280,521
Depr'n and renewals ...	196,242	207,791	242,042	43,041	42,763	103,884
Directors' fees	6,452	6,557	6,667	4,000	4,000	4,065
Deb. interest	...	...	...	19,652	17,498	15,676
Pref. divs. paid.....	...	...	...	10,460	16,737	16,736
Part. pref. div. %.....	...	...	...	6·25	10	10†
Ordinary shares—						
Earned (a)	*316,289*	*380,286*	*586,937*	(a)	(a)	(a)
Paid	270,828	304,682	423,169	73,197	117,116	117,116
Earned %‡.....	*9·3*†	*11·2*†	*17·3*†	*5·7*	*11·0*	*11·1*†
Paid %	8†	9†	12½†	6¼	10	10†
Reserve.....	50,000	50,000	100,000	...	20,000	20,000
Carry forward.....	98,743	124,346	188,114	84,698	88,702	88,746

† Tax free.
‡ Allowing for further preference participation.
(a) Surplus, subject to further preference participation: 1935, £74,624; 1936, £138,119; 1937, £140,160.

The Staveley figures must be regarded as remarkable, even for a company with an already impressive record. Total profits have jumped at a bound from £594,634 to £835,646. Earnings for the ordinary stock which, between 1928 and 1935, ranged from 6.2 per cent. to 9.3 per cent., tax free, have reached 17.3 per cent., tax free, and the total distribution has been increased from 9 per cent. to 12½ per cent., tax free. The Sheepbridge figures are similarly impressive, with profits up ostensibly from £219,117 to £280,521. It appears, however, that this understates the real advance since the 10 per cent. ordinary and preference dividends are this year paid tax free—an accounting change which would add £45,000 to the latest profits on the 1935-36 gross basis. Distribution policy, however, is still conservative, for £70,000 has been set aside for renewals, compared with £20,000 for the previous year. The reports of the two companies (which have points of contact, including their interests in Doncaster Amalgamated Collieries) record an active year. Both concerns were bound to prosper in a period of constructional activity fostered by re-armament. The Sheepbridge report, in particular, refers to the favourable effect of the Coal Selling Schemes which commenced last August, but underlines the effect of sharply increased working costs. No shareholder would deny the wisdom of the further modernisation proposals which the board has in view. Staveley shareholders are informed of the successful operation of the new pipe plant since last February, while the balance sheet reflects the sale of the Yorkshire Main Subsidiary and other coal interests to Doncaster Amalgamated Collieries. It would be unwise to regard Staveley or Sheepbridge shares as immune from broad market movements, despite the excellence of these reports, but investors may reasonably expect that the companies would weather any future depression as confidently as the last. At 60s. 3d xd., Staveley ordinary yields £4 3s. per cent., tax free, while Sheepbridge at 46s. 9d. offers the slightly higher return of £4 5s. 6d. per cent., tax free.

* * *

Thos. W. Ward Progress.—Another report which aptly coincides with this week's improvement in the market comes from Thos. W. Ward. The shares of this concern have attracted attention on the strength of the scrap steel market, which has clearly played a big part in the advance of profits during the year to June last from £173,427 to £292,600. The board's treatment of this massive increase, however, is commendably conservative. The sum of £52,005 is set aside for depreciation, which has received relatively small provision in recent years. The reserve allocation, at £80,000, is doubled, and £24,573 is added to the balance carried forward. The 10 per cent. dividend (against 7½ per cent. for 1935-36) is in fact covered by available earnings of 22½ per cent., as the following table shows:—

	Years to June 30 1935	1936	1937
Trading profit	97,137	173,427	292,600
Depreciation, etc.	5,786	7,100	52,246
Preference dividends—			
1st pref.	14,025	19,297	18,984
2nd pref.	62,500(b)	25,000	25,000
Employees' shares & staff fund	6,651(b)	3,009	8,952
Ordinary shares—			
Earned	*8,175*(c)	*119,021*(c)	*187,418*
Paid	Nil	63,250	82,844
Earned (%)	*1·0*	*13·9*	*22·5*
Paid (%)	Nil	7½	10
Reserve	...	40,000	80,000
Carried forward	40,530(d)	50,301(e)	74,874

(a) Including unstated investment profits and income tax recovered. (b) 2½ years' payment. (c) Subject to extra employees' dividend. (d) After £2,366 issue expenses. (e) After £6,000 issue expenses.

Next to the scrap business, the company's diverse interests in machinery renovating and trading, general engineering and road materials, have probably made a better return than in any year for a decade—apart altogether from its recent dealings in large industrial properties. The accounts, however, do not deal specifically with these varied activities of the company, and the balance sheet throws no direct light on the position. The scrap market is now subject to the elaborate organisation of quotas and price control, and investors may expect further benefits from this source, provided—and the proviso is important—that adequate supplies of obsolete ships are available for scrapping. The £1 shares at 36s. 3d. yield £5 15s. 3d. per cent.

* * *

Dividends of the Week. — This week's partial recovery in the market has been assisted by a number of favourable dividend announcements. United Steel Companies have increased the total distribution for the year to June 30th from 7½ per cent. to 8½ per cent. This rate is payable on a substantially increased capital, for in May, 1936, £2,205,455 of ordinary stock was issued, raising the total ordinary capital from £6,616,365 to £8,821,820. Investors will expect a good report on October 3rd. The company is engaged on an extension of the Appleby-Frodingham plant, estimated last January to cost £3,700,000. Such technical improvements, which the company has always pursued, lend long-term interest to the £1 ordinary stock units, which rose to 31s. 9d. on the dividend announcement and yield £5 10s. per cent. The Austin Motor dividend declaration is not exciting, for the dividend and bonus have been maintained at 50 per cent. for the third year. This distribution was covered last year by earnings of 77 per cent., and it is difficult, therefore, to draw any dependable inference from the announcement, save that profits have probably not advanced spectacularly. The 5s. stock units fell 1s. 9d. to 42s. on the announcement, and yield £6 5s. per cent. The company—like its competitors—is experiencing the full burden of rising costs, but the recent increase in motor prices appeared not only tardy but also relatively moderate. Investors may have to consider the possibility that the profits outlook in the motor industry is undergoing important changes. Comparison of the Murex dividend is complicated by the capital changes of the past year. A final distribution of 12½ per cent. brings the total payment to 20 per cent. on the £1,000,000 ordinary capital. For the previous year to June, 1936, the total rate was 25 per cent., but payable on £553,500 ordinary capital. Shareholders may feel some disappointment at the result, but the net total dividend payable amounts to £150,000, compared with £105,511 for the previous year. At 4⅜ the ordinary shares yield £4 9s. per cent. Only Electric and Musical Industries has disappointed the market by maintaining the 10 per cent. dividend. There is an element of mystery about the decision, however, for profits have jumped in spectacular fashion from £266,789 to £363,964.

* * *

The Unilever Proposals.—A further stage in the reorganisation of the Unilever group is marked this week by the issue of notices of meetings and the formal scheme of arrangement. These documents confirm the outline of the scheme which was published early in August, and was exhaustively analysed on page 302 of *The Economist* of August 7th. On that occasion we explained how the amalgamation of Unilever Limited and Lever Brothers Limited had been devised to produce benefits for every participant, and the latest information adds nothing to the general nature of the scheme. Unilever 7 per cent. and 5 per cent. preference stocks will be exchanged, £ for £, for similar stocks in the amalgamated company ("Lever Brothers and Unilever Limited"), which will rank *pari passu* with the existing 7 per cent. preference stock of Lever Brothers. It is again emphasised that the revenue cover of these prior charges will be enhanced. The new agreement between the new amalgamated company and the corresponding Dutch company does not threaten the position of the existing preference and preferred ordinary capital of Lever Brothers. It is, indeed, essential to preserve the policy of identical distribution of profits and assets and similarly constituted boards. The right to nominate persons for election to the board will vest, as hitherto, in the holders of a majority of the deferred stock; the fact that all classes of stock will have one vote for £1 stock cannot, therefore, affect ultimate control. The terms of the scheme do not disclose the specific non-British assets to be transferred to the Dutch group, nor is any reference made to the transfer of the earning power so represented upon future dividend possibilities. Unilever shareholders will meet on October 11th in London and Lever Brothers' members on the following day at Port Sunlight. The scheme is inherently complex, but it should command general approval.

* * *

An Unwelcome Precedent.—Neither equity nor logic was evident in the proposals submitted by the directors of Pease and Partners to the holders of 4 per cent. redeemable stock at last Thursday's meeting. Yet some 828 holders of £254,575 of the stock were in favour, and only 8 holders of £46,625 stock in opposition. The scheme, and its circumstances, however, deserve to go on record. At the end of last year the stock was established on its present basis. The rate of interest was reduced from 5 per cent. to 4 per cent., final redemption was extended from 1954 to 1977, and holders wrote off their interest rights since March, 1931. This year a regular sinking fund of £4,975 per annum begins to operate, and the latest accounts, to March last, provided for three months' interest on the stock. On the basis of 1936-37 profits it would seem that the full debenture requirements, including sinking fund, were covered more than eight times, while a 5 per cent. ordinary dividend was paid out of normal earnings of 12 per cent. The directors' proposals appeared the more remarkable in the light of this recovery. The directors declared that, at the time of last year's settlement, "it was not considered necessary to provide for any other form of redemption apart from the operation of the sinking fund." The market value of the stock is now higher than at the beginning of the year as a consequence of improving cover—and it is now quoted at 96-100. But it did not follow that "both the holders of the stock and the company" would benefit "if provision were made for the redemption at the company's option of the whole or any part of the stock"—at £103 per cent. up to October 1, 1938, or £102 per cent. thereafter. This, however, is the option which the debenture holders, by their vote on Thursday, presented to the company. It may be argued (as the board did argue) that the market value of the stock would be improved, but even if this proved true it would operate only up to the redemption limit and would be largely irrelevant to those holders who wished to keep their stock on the ground that after several years of patience they now saw promise of a reasonable return. In short, the debenture holders appear to have made a decision which might be definitely prejudicial to their interests, on proposals which were not circulated to the Press. The implications will be unwelcome to other long-term debenture holders.

Harrisons and Crosfield Position. — It was a foregone conclusion that the 1936-37 accounts of this merchanting, agency and investment company would reflect the general revival of produce markets, but the profits announced this week probably exceed expectations. They show an increase of 30 per cent. in revenue, which restores profits to pre-depression levels. The growth of deferred ordinary capital under the company's unusual distribution rights has, of course, prevented a corresponding return to the former rate of dividend. After making a special provision of £25,000 for staff pensions, and assigning £24,200 more to management shares to cover their participation rights, the deferred ordinary stock receives a further £26,200. The effect of these provisions is shown in the following comparative table:—

	Years to June 30		
	1935	1936	1937
	£	£	£
Profit†	268,284	271,642	354,014
Staff pensions	...	...	25,000
Pref. and pref. ordinary divs.	137,800	137,800	137,800
Management shares dividend	43,011	44,945	69,159
Deferred ordinary stock:—			
Paid	81,022	84,889	111,099
Earned (%)	*21·0*	*20·6*	*26·6*
Paid (%)	20	20	25
Carry forward	141,007	145,015	155,971
Defd. ordy. capital	405,108	424,447	444,395

† After provision for N.D.C., and after adding back staff pensions contribution.

Despite the substantial improvement in profits the main interest of this report is to be found in the company's internal finances. Under Article 14 (a), deferred ordinary holders may apply at par for further shares in respect of one-half of the dividend payable over the fixed 10 per cent., the proportion being one-tenth for management shares. Since 1934 the rate of dividend has, of course, resulted in the regular exercise of this right, under which 31,080 shares fall to be allotted (tax being deducted at 4s. 5½d.) in the latest year. This will leave only 24,525 shares unissued, which would not meet the share option for another year at the current rate of dividend. The directors, however, state specifically that they do not recommend any increase in the £500,000 deferred capital at present authorised. It is not clear at this stage how this apparent conflict between the shareholders' option (which in the immediate future should still be operative) and the directors' function of controlling, in practice, increases in authorised capital will be settled. The annual meeting on October 12th will perhaps throw light on the question, but meanwhile the £1 deferred ordinary stock units have fallen from 6 21/32 to 5⅛. The privilege is obviously of financial moment to holders of the deferred shares.

* * *

Debenhams' Accounts.—Although the preliminary figures had already shown that Debenhams' latest profits increased at a somewhat lower rate than in recent years, the full accounts again convey a satisfactory impression, within the limits of the information supplied. Earnings allocations of recent years are given in the accompanying table, but the apparent improvement of £21,450 (or 3 per cent.) under-estimates the actual progress made, since the balance has been struck after providing an unstated amount for N.D.C. The entire increase in profits becomes available for the ordinary shares. The dividend is again raised by 4⅛ per cent., but the directors maintain their strictly conservative distribution policy. Following the practice of recent years, the provision for general reserve remains at £50,000, and a large increase in the credit balance carried forward is also shown. During the past three years this item has been nearly doubled, and it now represents no less than 46 per cent. of the ordinary capital, which is in 1s. shares. The latest profits are analysed below:—

	Years ended July 31		
	1935	1936	1937
	£	£	£
Profit†	654,928	706,446	727,896
Fees	1,800	4,050	4,050
Debenture interest	145,127	144,133	143,092
Preference dividends	379,000	379,000	379,000
Ordinary shares:—			
Earned	*129,001*	*179,263*	*201,754*
Paid	62,500	83,333	104,167
Earned (%)	*29·7*	*41·8*	*46·9*
Paid (%)	12½	16⅔	20⅚
Reserve	50,000	50,000	50,000
Carry-forward	136,241	182,171	229,758

† After income tax (and N.D.C. in 1936-37).

Changes in the balance sheet of the parent company alone are of restricted significance when net interests in subsidiaries amount to £4,668,000 out of total assets of about £12 millions, but Debenhams' balance sheet, so far as it goes, contains various indications of an improved position. An expansion in both debtors and creditors implies growing turnover, while net liquid assets (excluding accounts with subsidiaries) of £603,000 are as much as £251,000 higher. A large increase in the amounts due to subsidiaries, however, has resulted in a decrease of £171,000 in the balance in favour of the parent company, which now stands at £998,000. Some compensation for the lack of consolidated accounts is offered by the Harvey Nichols and Company report. The balance of profit (including dividends) of this subsidiary is £143,471, against £111,630. The excess of earnings over the usual dividends and £10,000 to reserve is, however, absorbed by interest and expenses in connection with the recent issue of 3½ per cent. debenture stock, to finance rebuilding and repay loans. London premises have been written up to the amount resulting from a revaluation last November, the excess of £67,083 having been added to capital reserve. Debenhams' 1s. ordinary shares stand at 4s. 6d., but in view of the large balance of undistributed profits, a yield of £4 12s. 6d. per cent. is probably reasonable, subject to the effect of rising costs on the trend of profits.

* * *

Other Company Results.—A large number of interesting results has appeared this week, and our usual analysis of profit and loss accounts appearing on page 635 covers over thirty further companies. The heavy industries are well represented by such companies as *Manvers Main Collieries* and *Horseley Bridge and Thomas Piggott*. Among miscellaneous industrials satisfactory improvement is shown by *Allied Industrial Services*, and by *Qualcast*. The reports are discussed on page 636 under the heading "Shorter Company Comments."

* * *

Company Meetings of the Week.—Reports of company meetings commence in this issue from page 630. The shareholders of *Second Alliance Trust* were informed by Mr James Prain that the balance of revenue (after paying interest) for the latest period was the highest in the company's history. He hoped that the factors which operated during the past year in favour of investment trusts had not spent their force, although there had since arisen new factors, such as the decline on Wall Street, the causes of which were reviewed. At the *D. Gestetner, Ltd.*, meeting, Mr Sigmund Gestetner referred with especial satisfaction to the increase in the company's export trade. Addressing *Grosvenor House (Park Lane)* shareholders, Mr A. O. Edwards expressed the opinion that the facilities offered by Grosvenor House enabled it to face all competition, which had become keener as a result of air development.

THE WEEK IN THE MARKETS

THE STOCK EXCHANGE

SETTLING DAYS

TICKET: OCTOBER 5 ACCOUNT: OCTOBER 7

THE markets have come through with one minor casualty and more safely than was expected at one time, one of the worst weeks in recent years. Recurrent slumps on a disorganised Wall Street have had a bad effect, and rumours, last week and over the week end, that provincial and even London firms were in difficulties, gave rise to a bout of selling on Monday. The more speculative issues were badly affected, and only gilt-edged and well-established industrials survived unhurt. On Tuesday and after fears for the settlement abated considerably. Business remained small, but prices recovered part of their losses, and a much more cheerful view was taken of the outlook, assisted by the recovery in New York.

Gilt edged, which stood above the storm throughout the last account, made further progress this week. There were a few small falls, as well as other rises on Monday, but on Tuesday quotations were marked up sharply, some stocks advancing as much as 1/16, and on the following days the market continued very firm. Among Dominion issues, the chief movements have occurred among Australian issues. After opening quietly, the stocks brightened up a good deal later, and early losses were more than offset.

Chinese and Japanese issues have again been subject to sharp movements in the foreign section. Chinese issues rose at the end of last week, but this week's air raids upset the market. Japanese issues tended, though with some exceptions, to rise as the news of military "successes" came in. Brazilians have been depressed, but as sentiment fluctuated about the results of the elections and about the nature of the impending debt settlement, occasional speculative rises occurred. Greek and Hungarian issues recovered from their earlier depression, but German issues remain unpopular.

Home rails, after taking part in the general slump, recovered rapidly with daily rises in the ordinaries of anything up to a point, while prior charges were also firm. London Transport "C" stock, however, was weak throughout. In the foreign sections, the Argentine group fluctuated sharply, falling badly on Monday, but recovering subsequently. U.S. rails have followed Wall Street, rising up to 5 points on Friday, falling up to 7 on Monday, and regaining most of the losses on following days.

This week's partial recovery in the industrial share market owes as much to an improvement in sentiment (assisted by some good company news) as to the slight expansion in trading. The market opened with a spasm of weakness, when the slump of transatlantic securities brought almost every section of the domestic market down in its train. Electrical equipment, steel, motor and aircraft, and the leading miscellaneous industrial shares were all marked down sharply. After a hesitating opening on Tuesday, however, conditions showed a distinct improvement, and some large over-night losses were regained. Crompton Parkinson, to quote only one example, regained the 4s. drop which was recorded on Monday, and General Electric recovered its fall.

In the steel group, Dorman Long led the improvement, which spread on the publication of good results to such shares as Thos. W. Ward and United Steel. Vickers were also a good feature. Austin Motor reacted on the dividend announcement (discussed on page 623), but there were moderate recoveries in other shares. Reports of weakness in Amsterdam caused a sharp fall in Unilever on Monday, but the shares recovered later with the rest of the market. Brewery and tobacco issues received better support, and shipping shares, which again withstood the worst impact of Monday's fall, made further progress in mid-week. Among the leaders, Turner and Newall, British Oxygen, and Imperial Chemical presented a relatively firm front in mid-week, but building issues required a longer breathing space to absorb the shock of the latest building plan returns.

Oil shares, after opening flat, responded to the cessation of Continental selling with a sharp rally and continued to make progress in mid-week. Burmah Oil provided a strong feature and Trinidad Leaseholds, after their recent irregularity, were in better demand on dividend anticipations. Rubber shares became steadier, but were still listless, and only the leading tea shares attracted attention.

The mining markets shared the general trend, with assistance from the recovery in the base metal quotations. Although much of the interest was professional in character, the improvement tended to attract modest public support for dividend-paying Kaffirs, while Cape support for the developing mines was evident. Diamond issues improved, and Rhodesian copper issues recovered appreciably from their depressed levels.

ACTUARIES' INVESTMENT INDEX

This index of 177 industrial ordinary share prices had fallen on Tuesday last to 80·0, against 81·4 a week ago and 83·5 a month ago. The corresponding yields are 4·55, 4·47, and 4·37 per cent., respectively. A selection of the component series follows:—

Group (and No. of Securities)	Prices (Dec. 31, 1928 = 100)			Yield (%)		
	Month ago (Aug. 24, 1937)	Week ago (Sept. 14, 1937)	This week (Sept. 21, 1937)	Month ago (Aug. 24, 1937)	Week ago (Sept. 14, 1937)	This week, (Sept. 21 1937)
Building materials (5)	88·9	87·6	85·6	6·10	6·20	6·34
Coal (7)	125·9	124·5	121·1	3·68	3·96	4·13
Cotton (6)	46·0	45·3	43·7	2·33	2·34	2·38
Iron and steel (12)	77·2	75·4	73·8	4·99	5·12	5·25
Oil (5)	95·4	91·3	88·3	6·89	7·06	7·32
Electric supplies (10)	149·0	143·5	139·8	4·30	4·40	4·49
Stores and catering (17)	75·7	74·0	72·8	3·85	3·94	3·98

We are officially informed that Messrs George Thomas Lockett and Maurice Clifford Scawin, trading as Thomas Roberts and Company, were declared defaulters upon the Stock Exchange on September 23rd.

NEW YORK STOCK EXCHANGE

THE year's low for industrial securities was reached on Monday morning of this week, since when the level of prices has zig-zagged upward. Foreign selling was blamed for the setback at the opening of the week, and steels were depressed by lower estimates of mill activity. Railroad shares resisted the opening trend, on the intention of the railroads to ask for a general increase in freight rates. Tuesday's business opened strongly, under the influence of support in American securities in foreign centres. Steels were slightly lower but railroad issues continued strong. Last hour trading saw a recession, but prices were higher on the day. In mid-week the recovery was continued, with the usual partial setback toward the close of business. Oil and steel issues were slightly better, but rails suffered from the news that a joint wage conference had been cancelled. On the bond market government issues were firm, but in mid-week the more speculative issues lost ground slightly. *Iron Age* estimates steel mill activity for the week at 76 per cent. of capacity, and anticipates a further reduction unless new orders pick up. This possibility depends mainly upon the automobile industry which is changing models, and upon the railroads whose equipment work is held up at present by wage and freight rate disputes. The building industry shows little sign of substantial progress, but the farmers are in a very good position and may be able to influence the demand for consumption goods.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values calculated on closing prices (1926=100):—

	1936		1937		Beginning of Year 1937	Sept. 8, 1937	Sept. 15, 1937	Sept. 22, 1937

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks quoted below allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any enhancement or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

CAPITAL ISSUES

ONLY one prospectus has extended its attractions before the investor this week. Since it was announced on Thursday that the lists had been closed "in accordance with the terms of the prospectus," the inference was prompted that the lists were open longer than the now customary five minutes. This impression was confirmed by the later announcement that owing to the small public response the directors had decided not to proceed to allotment. The company is *Southampton Sportsdrome*, which issued 260,000 5s. shares at par. It proposes to extend an existing ice rink to form a "modern sportsdrome." Part of the properties acquired are apparently subject to conditions affecting the user of the properties for the purpose intended, but counsel advise that these restrictions are not enforceable. The latest record of the existing business is embodied in an estimate of future profits by the managing director which holds out the prospect of 15 per cent. earnings. The valuation statement adopts the questionable procedure of valuing the existing assets and the new buildings when completed, as a going concern, at an omnibus figure of £82,600. It is evident, indeed, that the enterprise is in the highest degree speculative. The directors of *Tredegar Iron and Coal* have given notice of their intention to redeem the outstanding 6 per cent. debentures on March 31st next, and offer existing holders the right to convert into an equal amount of 4½ per cent. stock. The service of the new stock would be covered almost four times on the basis of the latest profits.

PUBLIC OFFERS

Southampton Sportsdrome.—Issue of 260,000 5s. ordinary shares at par. General amusement caterers. To build sportsdrome and acquire "The Ice Rink" from vendors, who acquired it in 1934 from receiver for debenture holders. Ice rink net profits, after repairs, before interest, depreciation and fees, years to August 31: 1935, £1,783; 1936, £3,051; period to June 30, 1937, £5,058. Estimated profits from other activities, £7,500 annually; or £10,058 in all after interest, etc. Properties and buildings when complete, valued at £82,600. Purchase price for rink and sites, £40,800 cash. Vendors advance £20,000 on a 5 per cent. debenture (first charge). Extensions to cost £30,500; preliminary expenses, £9,000. Lists closed September 22nd at end of banking hours.

PRIVATE PLACING

Swansea Gas Light.—The company has placed privately £20,000 3½ per cent. redeemable debenture stock, bringing the issued amount of stock to within £1,816 of the authorised total of £200,000.

BY TENDER

Liverpool Bills.—The Corporation is inviting tenders, to be received at the Bank of England, London, on September 27th, for bills to the amount of £1,000,000 (in amounts of £1,000, £5,000 or £10,000), dated September 30, 1937, and payable September 30, 1938.

Banbury Water Company.—Offer for sale by tender of £40,000 5 per cent. maximum dividend ordinary stock, at a minimum of 102½.

BONUS SHARES

Olive and Partington.—This company is to distribute a scrip bonus to ordinary shareholders of 25 per cent. by capitalising £60,000 of undivided profits.

Serck Radiators.—It is proposed to capitalise £50,000 of reserve, and to distribute a bonus of £1 stock for every £3 held.

ISSUES TO SHAREHOLDERS ONLY

Gold and Base Metal Mines of Nigeria.—Issue at par of 765,441 2s. 6d. shares in proportion of one share for five held.

Clondalkin Paper Mills.—Issue of 87,843 5s. shares in proportion of one for six held on September 6th.

CONVERSIONS AND REPAYMENTS

Uruguayan Amortisable Bonds.—A Decree has been issued providing for redemption at par on October 1st next of 3½ per cent. Amortisable Sterling Bonds.

Tredegar Iron and Coal.—The company is repaying the £555,600 6 per cent. debentures at 103 on March 31, 1938, and is issuing £600,000 4½ per cent. first mortgage debenture stock at 103. Existing holders may convert into the new stock. For each £100 of debentures converted, holders will receive £100 of stock, plus a cash bonus of 11s. 3d. Debenture and share holders may apply at 103 for any stock not required for conversion. Conversion and cash lists will close on October 7th.

RESULT OF ISSUE

Amalgamated Gowns.—Underwriters to recent issue of 760,000 5s. shares receive 60 per cent. The Stock Exchange committee has deferred consideration of application for permission to deal until after first annual report—subject to usual right of appeal.

COMPANY MEETINGS

SECOND ALLIANCE TRUST COMPANY, LIMITED

INCREASED DIVIDEND—RECORD REVENUE FIGURES

MR JAMES PRAIN'S REVIEW

The annual ordinary general meeting of The Second Alliance Trust Company, Limited, was held, on the 17th instant, in the Company's Office, Meadow House, 64 Reform Street, Dundee.

Mr James Prain presided, and after formal evidence of the proper calling of the meeting had been submitted, the interim secretary read the auditors' report to the shareholders.

THE LATE MR BRUCE

The Chairman, in moving the adoption of the annual report, said:—I cannot proceed to the consideration of the report for the year without referring to the loss which we have sustained through the sudden death of our secretary, Mr Bruce. The loss is a personal one. By the sincerity and kindliness of his disposition and his genuine desire to serve, he earned the warm regard and confidence of everyone connected with the company, and we mourn his passing as that of a personal friend.

But it is more appropriate here that I should speak of his services to our companies. He entered the office of The Alliance Trust Company in 1896, and for over forty years he devoted himself with unfailing earnestness to his work, first with that company and later with it and this company. His heart was in his work, and the reward which he valued most he found in the success of his companies. His real natural ability and his sterling qualities of character made him an official of singular value. I am sure you will wish to join us in an expression of our sense of the high value of his services and of deep sympathy with his widow and children.

We have been able to fill the vacancy created by Mr Bruce's death by the appointment of Mr Alan L. Brown, C.A., Edinburgh, whose abilities and experience in connection with the management of investment trusts will, we are sure, make him a valuable acquisition to the companies' staff.

RECORD REVENUE

I have now to submit for your approval the directors' report and accounts for the past year. They have been in your hands for the statutory period, and I think that you will agree that the results set forth make a satisfactory showing. If we exclude the amount brought forward and deduct interest on borrowed money we have a balance of revenue remaining for the credit of our shareholders of £113,864. This figure not only shows an increase on last year of £16,935, it also exceeds the highest corresponding figure for any year in the company's history by £2,251. It is reassuring, therefore, to feel that the company has made so complete a recovery from the depression.

We must not lose sight of the fact that the year was one exceptionally favourable to the revenue showing of investment trusts. As mentioned in the report, the year's revenue has benefited from the payment of arrears to the extent of over £9,000 and the restoration of defaults, increases in dividends, and the continued reduction of the rate of interest on our short-term borrowing all contributed to swell our net income. Still we felt that with such figures before us we were entirely justified in recommending the increase in this year's dividend.

STRENGTHENING OF RESERVES

We are particularly glad to be able to make this increase without departing in any way from our policy of continually strengthening our reserves in one form or another. It is just that policy which, when depression came, enabled us to restrict the necessary decrease in our dividend to a comparatively small percentage and in due course has made our recovery from the results of the depression so speedy and so complete. I would add also that this policy particularly appeals to our debenture-holders, whose essential interest is the absolute security of their loans, and no one familiar with our operations can doubt the importance to the company of the well-founded confidence of those who lend us money.

Our position on valuation continues to be satisfactory. At last year's meeting I was able to report that the usual valuation showed a substantial appreciation over the book cost of our bonds and stocks, and this year a further advance is shown. Market values constantly fluctuate, of course, but it is always reassuring to find a good revenue buttressed by a satisfactory valuation.

FAVOURABLE CONDITIONS

I dealt at considerable length last year with the reasons which led one to regard the conditions then prevailing as favourable to the immediate future of investment trusts. The views then expressed have been justified by results, and we trust that the factors then operating have by no means spent their force. At the same time, new factors have arisen to alter the picture. We are certainly presented with figures which point to progress. Industrial production in the June quarter of the year was unprecedentedly high, being fully 9 per cent. greater than in the same quarter of 1936, and the steady expansion in international trade points to the present phase of the recovery being a healthy one and—so far—independent of the stimulus of rearmament, etc. In the first eight months of this year total exports from the United Kingdom were higher in value by over £70,000,000. But, as *The Economist* points out, in little more than a year from the middle of 1936 there has been a rise of 20 per cent. in the index of wholesale prices, a fact which makes the increased figures of overseas trade look much less impressive.

The principal trouble in my view, however, which will check the prosperity of the concerns in which our money is invested is the rising costs of manufacturing in their varied forms. A moderate rise is healthy, but such a rise for instance as that affecting the steel consuming industries springing from a congestion of orders and a scarcity of raw materials is pathological and in the end vicious and paralysing in its effects. Then we have, of course, the international situation. The clouds that darken the Far East have almost overshadowed the troubles connected with the Spanish Civil War, but both are full of potentialities of disaster.

THE UNITED STATES

As regards the United States, where nearly 20 per cent. of our invested funds are located, your attention has no doubt been attracted to the spectacular declines which have occurred recently in the New York Stock Market. In the first place, however, we must remember that that market is the victim of gambling operations to an extent for which we find no parallel on our side, and wild and disorderly movements are the natural result.

The economic position gives no apparent justification for what has happened. There is a large demand for goods and services accumulated during the depression still not satisfied, money is easy and likely to remain so, and there is a strong revival in agriculture—the country's greatest industry and the basis of its prosperity and of its export trade. On the other hand, we cannot treat such movements as have taken place as if they had no significance at all. They show real lack of confidence somewhere, and without reasonable confidence healthy and sustained recovery cannot take place.

The trouble lies in the political sphere. The wild methods of government finance, President Roosevelt's attitude to big business—particularly to the utility companies—the success which has attended the shock tactics of organised labour and so on, have tended to sap confidence. We can hope, however, that the great resources of the United States and the energy and ability of its business community will enable it to overcome all the difficulties which politicians put in its way.

CAUTIOUS POLICY

The whole situation the world over, however, suggests a cautious policy on our part—a policy which enables us to be ready for every eventuality and has put our company in the strong position it holds to-day.

I shall not detain you further, but with once again a hearty acknowledgment of the valuable services of our staff, I shall conclude by moving that the directors' report and accounts for the year ended July 31, 1937, be adopted and approved, and that the final dividends be declared at the rates therein recommended on £700,000 preference stock at the preferential rate of 4½ per cent. per annum, and on £350,000 ordinary stock at the rate of 11 per cent. actual, making 20 per cent. for the year, both subject to income tax.

The report and accounts were adopted, and the resolutions declaring dividends, re-electing the retiring director, and appointing auditors were unanimously passed.

D. GESTETNER, LIMITED

RECORD TURNOVER AND PROFITS

The ordinary general meeting of D. Gestetner, Limited, was held, on the 23rd instant, at the registered office of the Company, Neo-Cyclostyle Works, Fawley Road, Tottenham, London.

Mr Sigmund Gestetner, who presided, said: It is most gratifying to your directors to be able to meet you once again with figures marking new high records, both as regards turnover obtained and profits earned. The home market has shown steady progress, but the pleasurable feature is the increase in our export trade.

We again propose an issue of bonus shares. This distribution will reduce our general reserve to £65,000, but when you take into consideration the total amount of general reserve and carry-forward which will remain after our proposals have been given effect to, we think you will agree that the issue is not imprudent.

The balance sheet calls for little comment. Cash and cash items, trustee securities, sinking fund policies and the like, show an increase of approximately £70,000 as compared with last year. Sundry debtors and loans are approximately the same figure. Bearing in mind our considerably increased turnover, this position may be regarded as a very satisfactory feature of our trading operations.

I draw your attention to the taxation reserve, to which, as you will note, we propose to add £30,000 to include provision for National Defence Contributions. I am sure you will agree that building up this reserve in prosperous times is the correct procedure in view of the method of assessment to income tax in this country.

You will expect me to say something regarding the outlook for the coming year. We again start the new financial period with a fixed determination to do even better than in the year which has passed. Given reasonable trading conditions, I can see no reason why our ambitions for 1937-38 should not be realised.

The report was unanimously adopted and a resolution was also passed approving the capitalisation of £80,683 10s. of the reserve fund and its distribution as ordinary shares of 5s. each (subsequently converted into ordinary stock) *pro rata* among the ordinary stockholders.

GROSVENOR HOUSE (PARK LANE), LIMITED

FURTHER INCREASE IN PROFITS

The ninth ordinary general meeting of Grosvenor House (Park Lane), Limited, was held, on the 17th instant, at Grosvenor House, Park Lane, London. Mr A. O. Edwards (the chairman) presiding.

The Chairman, in moving the adoption of the report and accounts, said that the balance of trading profit for the year was £134,446, compared with £120,163 last year, and the net profit for the year was £90,450, against £76,208 last year. The directors recommended a dividend of 5 per cent. on the ordinary shares.

The Great Room had been air-conditioned and the cost, together with the cost of additional furnishings, amounting altogether to £23,402, was written off out of profits available, and £10,000 was transferred to income tax reserve. There was now no banqueting room in London that could be compared with Grosvenor House Great Room for spaciousness combined with luxury and comfort.

Air development was making the world smaller and competition between hotels of like standard in every part of the world was keener, but Grosvenor House could face up to all competition. They could claim to offer more facilities and amenities in one building than any other hotel in Europe, and they need not fear comparison with any hotel in the world. The disabilities affecting this country's hotels, however, were important, and in that connection he would mention D.O.R.A., and two new taxes, N.D.C. and tax on Monopoly Value. The cost of commodities represented 40 per cent. increase on the average prices for the five years from 1931.

The year's increase in profits was due largely to the Coronation. The unfurnished flats at Grosvenor House were proving attractive, as they were unique, being a combination of a first-class flat with a first-class hotel. It was the only building in London providing such services for unfurnished flats. Until international relations improved it was best to look to the future in a spirit of optimism tempered by caution.

The report was adopted; the retiring directors were re-elected and a tribute paid to Mr A. H. Jones, the general manager.

GOVERNMENT RETURNS, &c.

NATIONAL ACCOUNTS

The total ordinary revenue for the week ended September 18, 1937, amounted to £15,394,000, against ordinary expenditure of £17,563,000. After increasing Exchequer Balances by £147,077 the operations for the week, as shown below, increased the gross National Debt by £2,546,000, to about £8,005 millions.†

No gold movements were reported at the Bank of England between September 17th and 23rd Details of previous movements appeared in *The Economist* of September 4th on page 498.

GOLD MARKET

Messrs Samuel Montagu and Company write on September 22, 1937:—The Bank of England gold reserve against notes amounted to £326,406,625 on September 15th, showing no change as compared with September 8th.

In the open market about £1,770,000 of bar gold was disposed of at the daily fixing during the past week. There was a good general demand, which occasionally raised prices to a slight premium over dollar parity; most of the offerings, however, were taken for shipment to New York.

The s.s. "Rangura," which sailed from Bombay on September 18th, carries gold to the value of about £246,000.

SILVER MARKET

Reports received from New York during the week indicated that the agreement under which the United States Treasury pays a premium for home-produced silver and which expires at the end of the year may be extended with little, if any, alteration. Further it was thought likely that the Treasury would work for a renewal of the London Silver Agreement of 1933, which also expires at the end of this year. The news appears to have occasioned some bear covering operations and prices hardened slightly to 20d. for cash and 19⅞d. for two months' delivery; the demand did not continue, however, and prices eased, the Indian Bazaars being disposed to sell, and a little miscellaneous selling adding to supplies. At 19 15/16d. for cash, America gave support, this price approximating American parity, and in present circumstances no wide movement from this level is expected in the near future.

Quotations for gold and silver are shown below:—

1937	Price of Gold per Fine Ounce	Equivalent Value of £ sterling	Price of Bar Silver in London per ounce standard: Cash	Price of Bar Silver in London per ounce standard: Two Months	Price of Silver New York per ounce ·999 fine

‡ Free of Income Tax. (c) Payable on £1,000,000 of capital. For previous year 25 per cent. was paid on £553,500 of capital. (s) Paid on £435,600 of ordinary stock, against £396,000 of ordinary stock a year ago. (t) Paid on increased capital. (v) Paid on 1,186,875 deferred 5s. shares, against 1,050,000 deferred 5s. shares a year ago.

ASHANTI GOLDFIELDS CORPORATION.—Second ordinary interim dividend of 22½ per cent. (as before) for year to September 30, 1937.

AUSTIN MOTOR COMPANY.—Annual ordinary distribution maintained at 50 per cent., less tax, and again includes cash bonus of 25 per cent.

BEECHAMS PILLS, LTD.—Interim dividend on the deferred shares raised by 5 per cent. to 17½ per cent., paid on a capital of £296,719, as increased by the £34,219 share bonus.

BORNEO COMPANY.—Two years' arrears on 7½ per cent. cumulative preference shares are to be paid October 20th, bringing payments up to August 4, 1934.

BRITAIN STEAMSHIP.—Interim ordinary dividends resumed with payment of 4 per cent. Previous interim, 1½ per cent. in respect of 1929.

BRITISH ALUMINIUM.—Interim ordinary dividends resumed with a payment of 4 per cent.

BRITISH GENERAL FIXED TRUST.—Half-yearly distribution, payable October 15, 1937, of 5·4d. net per sub-unit on series "C."

BRITISH PISTON RING.—Final dividend of 17½ per cent. on 800,000 5s. ordinary shares, making 25 per cent. for year. For previous year an interim of 7½ per cent. was paid on 400,000 and a final dividend of 15 per cent. on 600,000 5s. shares.

GENERAL ACCIDENT FIRE AND LIFE ASSURANCE.—Interim payment is increased to 7½ per cent., less tax, from 7 per cent.

MALAYALAM PLANTATIONS.—Final dividend of 6 per cent., against 5½ per cent. Total for year is 10 per cent. (against 8 per cent.).

MANCHESTER LINERS.—Ordinary dividend 7½ per cent., against 5 per cent. paid for last four years.

MEUX'S BREWERY COMPANY.—Interim ordinary dividend is maintained at 3½ per cent.

PHILIP HILL AND PARTNERS.—Interim ordinary dividend, 12½ per cent.

RAND SELECTION CORPORATION.—Ordinary dividend 50 per cent. on £1,000,000 for year to September 30, 1937, the highest distribution in the history of the Company. For each of the two preceding years a dividend of 40 per cent. was paid.

ROYAL MAIL STEAM PACKET.—A first dividend of 6d. per £ payable October 30th is announced by the liquidator.

SHORTER COMPANY COMMENTS

COMPANY RESULTS OF THE WEEK.—Substantial progress by MANVERS MAIN COLLIERIES is ascribed to greater activity in the steel and allied trades and to the success of the Central Selling Scheme. Owing to heavy commitments for improvement, the dividend is increased by 1 per cent. only, to 5½ per cent. Difficulty in recent months in obtaining steel supplies has not prevented HORSELEY BRIDGE AND THOMAS PIGGOTT from showing excellent results: net profits have reached £45,069 against £24,798, and ordinary dividends have been resumed. R. & W. HAWTHORN LESLIE AND COMPANY, the engineers and shipbuilders, whose profits of £36,439 compare with £25,648, are absorbing the locomotive works of Robert Stephenson and Company. Although they have earned £19,654 against £1,636, W. H. DORMAN AND COMPANY still show a debit balance of £37,577. After debiting funding certificate interest, PETTERS, LTD., report a loss of £914 against a profit of £13,640. A circular from the new Board says these results testify to the acute competition in the oil engine business. A reduction of preference dividend is proposed in exchange for a free issue of ordinary shares. Profits of £74,900 constitute a record for QUALCAST, LTD. The ordinary dividend is raised by 10 per cent. to 30 per cent., but is also payable on a larger capital. A higher level of manufacturing activity combined with technical improvements has enabled RENOLD AND COVENTRY CHAIN to earn £305,164 against £246,310, and to increase the dividend by 5 per cent. to 15 per cent. Good progress has also been made by SERCK RADIATORS, who pay 22½ per cent., against 20 per cent., and also declare a capital bonus of one in three. Rapid expansion is recorded by ALLIED INDUSTRIAL SERVICES, who supply an industrial clothing cleaning material service. Net profits amount to £128,467, against £93,088. S.G.B. (DUDLEY) shows an increase in profits of over £3,000 to £24,997. RIDINGS STORES have made a trading profit of £49,287, against £31,169 for the two preceding half-years, and their 30 per cent. dividend is supplemented by a 10 per cent. capital bonus. The first year's trading of VITA-CREAM, LTD., as a public company has resulted in a net profit of £21,553, manufacturing profits of £46,549 comparing with £39,734. Another company issuing its first report, CALTHROPS, LTD. (makers of cattle and poultry foods) has earned £14,000 net for its initial 4½ month period, or £51,768 trading profit for the full year. Proprietary article manufacture is well represented in the week's results. ASPRO, LTD., have earned, £292,320 against £278,855 for the initial 13 month period. The company pays 32½ against 25 per cent. and allocates £20,000 to dividend equalisation reserve. BEECHAMS PILLS interim dividend of 17½ per cent. is not only 5 per cent. higher, but is payable on a capital increased by £34,219. PHOSFERINE PRODUCTS maintain their 20 per cent. distribution, having earned £4,104 against £5,426. A higher average price for sugar has resulted in a rise in net profits of SIR J. HULETT & SONS from £122,304 to £214,249 (total revenue of £1,225,000, being 27 per cent. higher); special provisions and reserves are generously increased. The latest rubber company results reveal excellent progress during the past year. JOHORE RUBBER LANDS report trebled profits, and TANGOEL have earned £5,795 against £1,312.

MISCELLANEOUS

PATERSON LAING AND BRUCE SCHEME.—The Shareholders Protection Association consider that proposals under this scheme would seem to be inequitable to the preference shareholders, and suggest that these holders should refrain from sending in proxies pending a communication from the Association.

CABLE AND WIRELESS, LTD. (Index Numbers).—Monthly figures reduced to working day average. Working day average of comparable receipts, year 1929 = 100. Index number, August, 1937, 73·0 (lowest figure this year), compared with 73·4 for July, 1937, and 69·1 for August, 1936. For table showing monthly index since beginning of 1930, see *The Economist*, August 28, 1937, page 451.

COURAGE AND COMPANY.—This company is acquiring the ordinary shares of C. N. Kidd and Son, of Dartford.

HOSEGOOD INDUSTRIES, LTD.—First report shows profit for year to June 30, 1937, of £104,871. Tax provision £20,000. Preference dividends £15,467. Ordinary dividend 7½ per cent., absorbing £45,474. Carry forward £23,931.

ASPRO, LTD.—Profits for year to June 30, 1937, rose by £11,593 to £292,913. To depreciation £2,362 against £2,598. Ordinary dividend raised from 25 per cent. to 32½ per cent. To reserves: Tax, £75,000 against £65,374; general, £50,000, as before; dividend equalisation, £20,000. Carry forward £10,959.

INDIAN IRON AND STEEL.—For year to March 31, 1937, a net profit of Rs. 40,80,704 was secured. Ordinary dividend 20 per cent., absorbing Rs. 40,42,636. Carry forward Rs. 38,068. The accounts include, for the first time, the figures of the Bengal Iron Company, Ltd.

MANVERS MAIN COLLIERIES.—Trading profit for year to June 30, 1937, £157,797 compared with £103,495. To depreciation £34,078 against £29,236. Ordinary dividend raised from 4½ to 5½ per cent. Special charges £46,453. To obsolescence, etc., reserve, £15,000. Carry forward £25,047.

CARRIER ENGINEERING.—A rise in profits from £60,198 to £91,386 is shown in the accounts to June 30, 1937. Ordinary dividend is again 50 per cent., but is payable on a doubled capital. A sum of £10,594 is allowed for income tax and N.D.C., compared with £10,272 and issue expenses of £808 have been written off. Carry forward £26,855.

CANNOCK ASSOCIATED COLLIERIES.—The report for period from June 4, 1936, to June 30, 1937, shows a profit of £176,609. The dividend on the first preference shares of the parent company takes £10,209 and the second preference dividend £25,219. The total ordinary dividend for the period is 10 per cent. Carry forward £16,405.

RENOLD AND COVENTRY CHAIN.—The income from investments and profit on trading for year to July 4, 1937, including trading results of subsidiaries, totalled £309,899, before fees, against £251,946 for 1935–36. Ordinary dividend from 10 to 15 per cent. General reserve allocation, £25,000, against £15,000, and £14,320, against £15,487, is carried forward.

QUALCAST, LTD.—Net profits for the year to June 30, 1937, are £21,036 higher at £53,349. Final dividend 12½ per cent. and bonus of 10 per cent., payable on increased capital, making a total of 30 per cent., against 20 per cent. for the two preceding years. It is proposed that £100,000 should be transferred to reserve (£74,050 from share premium account and £25,950 from profit and loss balance). Carry forward £47,882.

COMMERCE AND TRADE

SURVEY OF COMMODITY MARKETS

THE markets in industrial raw materials remained under a cloud during the past week, and the majority of quotations were again marked down. The uncertain political outlook and the pessimistic view taken by some observers concerning the future of recovery in the United States are causing consumers to refrain from buying far ahead, just as the anticipation of shortages early this year had prompted them to increase their reserves of raw materials.

Copper, lead, spelter and tin fell sharply in price, with tin holding up rather better than the others. The market in rubber remained dull, and vegetable oils and seeds attracted little interest from buyers. Raw wool prices failed to recover, and raw cotton quotations again drifted downwards in spite of the proposed reduction of next year's crop in the United States. On the other hand, the iron and steel markets remained firm, and prices are expected to be increased further at the turn of the year. In general, quotations for coal and coke are firmly held, but there are a few isolated reports of price-shading in certain districts.

Foodstuffs, on the whole, showed a steadier tendency. Wheat rose a little in price on a persistent demand and advancing freight rates. The yield in Argentine and Australia, however, is still uncertain. The markets in sugar and tea were quite firm. Meat prices at Smithfield are scarcely changed on the week, but bacon, butter and eggs were dearer.

The general trend of prices in the United States was downwards, reflected in the decline of Moody's index of staple commodity prices during the week ended Wednesday from 195·1 (December 31, 1931 = 100) to 192·0. A month ago the index stood at 200·4 and a year ago at 184·1.

COAL

SHEFFIELD.—The outlook on the export market is better, and there are enquiries for forward deliveries to the end of the year. The competitive prices of other coal producing countries are, however, proving a somewhat serious problem. Lightning strikes continue to disturb output to some extent, making supplies difficult to arrange. Prices are very firm on inland account. The scarcity of washed singles and washed smalls is still a source of inconvenience. Cooler weather has increased the demand for household coal, and this will tend to restrict the supply of some qualities of hard coal favoured on the household market. Coke is in full demand and prices are strong.

WORKINGTON.—Coal output does not suffice for the various markets. House coal needs alone can be met. But there is a famine in smalls for coking coal, and round coal therefore has to be crushed and Welsh coal imported. Futhermore, iron smelters which absorb the whole of the make of coke are compelled to buy East Coast fuel. Shipments to Ulster and the Free State seldom exceed 3,500 tons per week. The Irish demand is brisker. Prices are firm. Best round is 23s. 6d.; washed doubles, 22s.; washed singles, 21s.; all per ton, f.o.b. Smalls are 15s. 6d. Best house coal is 35s. 8d.; house nuts, 34s. at station. Gas coal is 27s.; local coke, 15s. 6d. to 16s. 6d.

GLASGOW.—The coal trade is experiencing a lull at the moment in regard to new buying. This applies both to the home and the shipping markets. There is, however, a fairly good tentative enquiry circulating, so that the slackening of business may be a temporary phase. Meantime, the collieries in all districts are fully engaged on contract work, and are having no difficulty in keeping outputs moving, although here and there prices are now being shaded a little for prompt orders. This easiness is most apparent in the East Coast shipping districts. Both the Lanarkshire and the Ayrshire collieries are in a strong position, and adhere to full prices for practically all grades of round coal as well as nuts. London business is quieter at the moment.

CARDIFF.—Shipments of coal at the South Wales docks continue active. Last week they totalled 436,800 tons, compared with 347,815 tons in the corresponding week last year. The market is disappointed at the delay in the normal autumn expansion in current inquiries. Contract commitments, however, are absorbing practically the whole of the increased output and supply quotas, but for spot positions buyers have been able to obtain parcels of large descriptions at prices a shade lower than those which have been ruling recently. The new zone scheme for the marketing of grades suitable for central heating is stated to be operating satisfactorily. Negotiations with the gas companies for the renewal of contracts are hanging fire, although it is reported that one of the South Western coalfields has been able to obtain an advance of 5s. per ton compared with 1936. Coke is very firm, and patent fuel and pitwood prices are unaltered.

IRON AND STEEL

LONDON.—The weekly report of the London Iron and Steel Exchange indicates that great activity rules in the industry. The works in nearly all departments continue to operate at capacity. Some improvement is noticeable in the imports of steel, though Continental makers are still badly in arrears with their quota deliveries.

In the pig-iron market conditions have become somewhat easier; and not only are consumers receiving regular tonnages, but arrears against contracts appear to have been reduced. New business is scarce as producers are unable to accept orders for execution this year. The steel-works are also getting larger supplies of iron and appear to be in a better position in this respect than for some time past.

There is still great stringency in the semi-finished steel market, although conditions have improved compared with those which existed a few months ago. More regular supplies of British material and larger imports from abroad have to a certain extent relieved the situation; but operations at most of the consuming works are restricted by the limited quantities available.

The pressure to obtain deliveries of finished steel material is unrelaxed in spite of the record production. Consumers are still rationed on the basis of their purchases in 1936, and the makers are concentrating upon producing the material most urgently needed. New business is hampered by the inability of the manufacturers to take orders excepting for far forward delivery. Business on overseas account has become rather quieter, but there is a good volume of inquiry.

MIDDLESBROUGH.—The pressure for supplies continues. The output of Cleveland foundry pig iron is below requirements, but is being distributed to home users in order to keep their plant going. It is understood that supplies of foundry iron are still coming into this district from the Midlands. The price is unaltered at 101s. per ton, delivered locally, for No. 3 Cleveland foundry pig iron. Production of East Coast hematite is being maintained, with the bulk of it being sent to home consumers after producers have covered their own requirements. Business is restricted to small parcels as most works have good order books and are not inclined to sell further ahead. The official price is based on No. 1 hematite at 123s. per ton, delivered locally, less the rebate.

The supply of semi-manufactured steel, both from producers in this country and from abroad, is better but additional quantities would be welcome. Sheet makers have much work in hand.

Finished steel producers, whilst running their plant at capacity, find it difficult to ease the position owing to the flow of orders for all classes of steel, structural and shipbuilding requirements being very pressing.

Heavy melting steel scrap remains in good demand and the official prices of 69s. for No. 1 quality and 67s. per ton for No. 2 quality are strictly adhered to. Blast furnace coke is very firm at 40s. per ton, delivered at the furnaces. Chartering in ore has been resumed from Bilbao, and cargoes are arriving at East Coast ports. Freight rates for ore from Mediterranean ports are inclined to increase. Transactions are limited to odd lots.

SHEFFIELD.—The position in the iron and steel market varies little week by week, though there does appear to be rather less hesitancy in accepting new business. Supplies of forge and foundry pig iron are still short. There is a fair amount of foreign iron on offer, but consumers do not readily pay the high prices demanded for this material. East Coast hematite makers are accepting contracts rather more freely, but business in West Coast is still very difficult to negotiate. Common and marked bars are in heavy demand, and producers are unable to satisfy all requirements. Pig-iron prices are regarded as stabilised to the end of the year, but there is talk of early revision in view of the sharply rising cost of production.

The rapidly advancing price of high-speed steel is causing new business to be accepted only subject to price at time of delivery. Business in wire rods, steel strip, etc., is at record levels, and prices are everywhere firmly held. The scrap market is becoming steadier with supply and demand more balanced. High-speed steel scrap fetches £100 per ton, delivered. Iron scrap not subject to control is still in strong request, but prices have not advanced further. Government work in this area is now on such a scale that some firms are finding it increasingly difficult to keep pace with ordinary business.

WORKINGTON.—The North-West Coast hematite pig-iron market is quieter than for many months past. If makers are over-sold users are over-bought, and until prices are revised in November there is no intention of reopening books for dealing with orders for iron for delivery in the first quarter of next year. Smelters are concentrating upon maintaining production at a maximum in order to give rather larger supplies to the Midlands, South Wales and Scotland. Despite the periodic uncertainty concerning the adequacy of ore and coke supplies, makers are succeeding in driving their furnaces hard, and are consequently reducing, if only slightly, the arrears into which deliveries have fallen. Prices are firm and unchanged. Bessemer mixed numbers are £6 3s. per ton at Glasgow; £6 8s. 6d. at Manchester; £6 11s. at Sheffield; and £6 13s. 6d. at Birmingham, with 5s. 6d. to 16s. 6d. extra for special qualities. Malleable iron is in lively request at £8 delivered at Birmingham; and the whole of the make of ferro-manganese is readily absorbed, at £18 15s. home.

The steel industry is in full swing. Output is heavy, Workington's production occasionally rising almost to 6,000 tons weekly. Chiefly it is the smaller products that are being rolled, but in most weeks both Workington and Barrow are engaged on rails for China, South Africa, and the home railways. Orders on the books ensure a run of at least another nine months. Progress is being made with the expansion of the output of native ore, which is quoted at 24s. 6d. per ton, f.o.t. Heavy imports of North and West African ore are, however, still necessary.

GLASGOW.—Great activity continues in all branches of the iron and steel industry in the West of Scotland, and where supplies of material are available all works are running to capacity. On the whole supplies are somewhat easier than for some months past. Supplies of semis are still insufficient for the requirements of users, but there is some increase both in home and continental deliveries, and there are prospects that these will further increase within the next few months. Pressure from all sides for finished steel is very great and producers are still unable to meet all the demands made upon them. Within the past week or two several large contracts have been placed with sheet metal workers and also with tank makers in the Glasgow district. During the present week it was announced that an order for four locomotives for the San Paulo Railway, Brazil, has been placed in Glasgow.

CARDIFF.—During the week ended September 11th, production in the tinplate industry was 77½ per cent. of allotted capacity. Prices are unaltered, but the mills are working regularly, and shipments last week at Swansea reached the exceptionally high total of 13,986 tons. This quantity has only been exceeded during one other week in the current year, and compares with 6,118 tons in the corresponding period in 1936. A great part of these consignments were drawn from stocks which were consequently reduced from 10,935 tons to 6,598 tons. The demand for pig iron and steel ingots is as active as ever, and according to the returns compiled by the British Iron and Steel Federation, the output of steel in South Wales and Monmouthshire, at 207,800 tons, was greater than that in any other district in the United Kingdom. Sheets are in good demand, particularly for the home market. Prices are unaltered.

OTHER METALS

COPPER.—This has been the worst week for copper since the speculative breakdown of March last. Despite a sharp recovery on Tuesday and Wednesday, the standard cash price closed on the latter day at £52 1s. 3d., a loss of £2 10s. on the week. The reason for the setback was a substantial increase in offerings by holders who had become nervous under the con-

tinuous abstention of consumers' buying, the weakness in Wall Street and the international political crisis. The recovery on Tuesday and Wednesday was primarily technical, although a certain amount of consumers' buying was noticeable at the lower levels. The immediate future of the market will be mainly dependent on the progress of the autumn revival in the world's industrial activity and the development of the United State's market. But reports from America are not very encouraging. Purchases by United States consumers in the first three weeks of this month aggregated only 15,106 short tons, the lowest level for many months. The United States price for scrap copper was lowered substantially last week, and the New York export price is now so much below the U.S. domestic quotation that there is again talk of a reduction of the latter.

Sales on the London Metal Exchange: 3,900 tons on Monday, against 1,550 tons last week; 2,000 tons on Tuesday, against 2,400 tons last week; 2,850 tons on Wednesday, against 1,350 tons last week. Domestic spot was quoted at 12·77½ cents per lb. in New York on Wednesday, against 13·42½ cents a week ago and 13·77½ cents a month ago. Wednesday's official closing price for standard cash in London was £52 1s. 3d. to £52 3s. 9d. per ton, compared with £54 11s. 3d. to £54 12s. 6d. a week ago. Stocks of refined copper in British official warehouses at the end of last week, at 8,706 tons, showed a decrease of 555 tons, while stocks of rough copper, at 13,794, were 908 tons larger.

LEAD AND SPELTER.—Both markets continued their downward movement, and although they closed the week well above their lowest levels, lead lost 7s. 6d., while spelter declined by £1 3s. 9d. The causes of the fresh decline in lead and spelter are the same as those mentioned for copper. In addition, the new decline in the Ministry of Labour statistics of building plans approved during August, and the publication of the July production figures depressed the two markets.

According to the Metallgesellschaft the world's lead smelter output, excluding the United States and Spain, increased in the first seven months of this year by 14·2 per cent. to 695,175 metric tons. Zinc smelter production outside the U.S.A., increased in the same period by 8·9 per cent. to 640,322 metric tons. In both cases production rose faster than consumption this year, so that supplies are now quite substantial. The outlook is mainly dependent on a revival of consumers' buying, but in this respect no favourable signs are noticeable at the moment.

Sales of lead on the London Metal Exchange: 3,650 tons on Monday, against 750 tons last week; 800 tons on Tuesday, against 1,300 tons last week; 2,600 tons on Wednesday, against 1,500 tons last week. The New York quotation on Wednesday was 6·50 cents per lb., against 6·50 cents a week ago and 6.50 cents a month ago. Wednesday's official closing quotation in London for soft foreign for shipment during the current month was £20 15s. to £20 16s. 3d. per ton, compared with £21 2s. 6d. to £21 3s. 9d. last week.

Sales of spelter on the London Metal Exchange: 2,450 tons on Monday, against 1,175 tons last week; 2,400 tons on Tuesday, against 1,850 tons last week; 1,600 tons on Wednesday, against 1,500 tons last week. Wednesday's quotation in East St. Louis was 7·25 cents per lb., against 7·25 cents the week before and 7.25 cents a month earlier. Wednesday's official closing quotation in London for "good ordinary brands" for shipment during the current month was £20 13s. 9d. to £20 16s. 3d. per ton, against £21 17s. 6d. to £21 18s. 9d. last week.

TIN.—In spite of a price decline of £3 13s. 6d. per ton, the undertone of the tin market was comparatively steady throughout the past week. The panic conditions which at times prevailed on the other metal markets were not noticeable here. The reason for this exception is, of course, the fact that speculative holdings of tin are negligible and that buying requirements of consumers even for their immediate consumption are substantial. In addition, the market expects a new decline in tin stocks at the end of this month. The September Bulletin of the International Tin Research and Development Council reports a decline in the world's tin output during July from 17,100 to 15,900 tons. Consumption declined simultaneously, according to the same source, only from 14,990 to 14,700 tons. In spite of the particularly favourable statistical position, however, the tin market can maintain its present strength only if the general industrial and political outlook improves and thus keeps consumption at its recent record level.

Sales of tin on the London Metal Exchange: 405 tons on Monday, against 400 tons last week; 410 tons on Tuesday, against 200 tons last week; 205 tons on Wednesday, against 355 tons last week. The New York quotation on Wednesday was 59·62½ cents per lb., against 59·87½ cents a week ago and 59·12½ cents a month ago. Wednesday's official closing quotation in London for standard cash was £260 15s. to £261 per ton, compared with £264 7s. 6d. to £264 12s. 6d. a week ago. Stocks of tin in London and Liverpool at the end of last week totalled 2,966 tons, an increase of 85 tons on the week.

OTHER NON-FERROUS METALS.—Among other non-ferrous metals, aluminium ingots and bars for home delivery were again quoted on Wednesday at £100 per ton, and rolling billets at £102 per ton. Nickel, for home and export, was maintained at £180 to £185 per ton. Quicksilver, on the spot, was steady at £13 12s. to £13 12s. 6d. per flask of 76 lbs., the same as last week. Chinese antimony was quoted at £82 to £83 per ton, ex warehouse, as against £80 to £82 last week. Chinese wolfram for "September–October" shipment was quoted at 120s. to 125s. per unit, c.i.f., compared with 122s. 6d. to 127s. 6d. last week. Refined platinum was quoted on Wednesday at £10 5s. per ounce, compared with £10 5s. a week earlier.

TEXTILES

COTTON.—Manchester.—Spinners and manufacturers in the Lancashire cotton industry remain very busy completing existing contracts. Here and there, of course, order books are lighter, but practically the bulk of producers have sufficient work on hand to last them many weeks. Demand for yarn and cloth has been fairly extensive, but business has not been on so large a scale as recently, owing to the lack of confidence in raw cotton prices. A disconcerting feature has also been the political situation abroad. In the circumstances, buyers have been disposed to act with caution, and it is considered probable that this policy will be followed out until there are definite indications of raw material rates moving on to a higher basis.

The raw cotton markets have been lifeless. Any slight advance in American futures prices in Liverpool has brought out more hedge selling, and these small see-saw movements are likely to prevail for some time. With regard to crop control for next season, it is expected that the yield will be kept down to around 12½ million bales, against 16 millions this season. This news, when released, had practically no effect upon prices.

There has been more inquiry for cloth and a slight improvement in turnover. India has bought fair lines, while useful sales have taken place for the Straits Settlements, South America, the Crown Colonies and Dominions. Home trade purchases have comprised a wide range of cloths.

Spinners have been very firm in quotation. Quite a number of orders have been placed in American yarns for delivery to follow on current contracts. A moderate business has been done in Egyptian numbers.

INDUSTRIAL RELATIONS.—Labour questions are likely to play an important part in developments in the Lancashire cotton industry during the next few months. The steady improvement in trade, with definite evidence that the spinning mills and weaving firms are making much larger profits than at any time during the past ten years, has encouraged the leaders of the trade unions to agitate for reforms. They are pressing for holidays with pay for the 400,000 workers throughout the whole textile industry and in addition, they will now table a demand for a minimum weekly wage of 35s., which will affect anything between 25,000 and 50,000 weaving operatives. This last move was adopted in place of applying for an all-round advance to cover the increased cost of living since twelve months ago. The employers will oppose both applications. The industry is also concerned with dealing with redundancy in the manufacturing and printing and dyeing sections. Further plans will probably be formulated at an early date. On the broad issue of trade affairs, representations are to be made to the Government on the recent surrender of the Ceylon textile quota system to the benefit of Japan. But more important than this will be the terms of the new Anglo-Indian trade pact, which is now being negotiated.

JUTE.—Dundee.—The jute industry is passing through an anxious time. What with heavy imports of jute cloth and bags into this country from India and prices for raw jute maintaining a level at which it is impossible to make ends meet when it comes to selling yarns and cloth, spinners and manufacturers are having to curtail their production. The volume of business passing is very small, even at low and uneconomical prices. Imports of jute cloth from India for the eight months ending August this year were 121,061,000 square yards, compared with 94,616,000 square yards during the same time last year and 41,616,000 square yards in 1935. These Calcutta goods are being sold at prices with which it is impossible for Dundee manufacturers to compete, and further representations are being made to the Board of Trade to press for a quota system based on the imports for the year 1928, when these were only 28,000,000 square yards. A meeting held in London between representatives of the Dundee jute industry with representatives from the Indian jute trade resulted in the latter refusing to consider giving any concessions to the home industry, but there is still an opportunity to save the jute trade of Dundee, which will be very materially affected if these cheap goods are allowed to continue to enter the U.K. free of import duty or without restriction of some kind, when the Government comes to discuss the terms of an Agreement with India to take the place of the Ottawa Agreement which expired about a year ago.

Though imports of jute into Calcutta have increased considerably, there is evidently a sufficient demand, principally from the Indian mills, to absorb them. Prices are being very well maintained, with slight fluctuations taking place from day to day. The full group of Daisee–2/3 is firm meantime at £19 17s. 6d., after being recently down to £19 12s. 6d. Daisee–4 is quoted at £18 10s., while Tossa–2 3 is named at £20 17s. 6d. and fours at £19 17s. 6d., October–November. Good First Marks have been sold at £22 12s. 6d. and £22 10s., while Lightnings are offered at from £21 10s. to £22, and Hearts at £20 15s., September–October.

A little more interest has been taken in jute yarns, and prices are the turn firmer because of restriction of supplies. One large mill is closed all this week. Common 8 lb. cops have been sold at 2s. 0 d. and 2s. 1d. and 8 lb. spools at 1d. more. Twist is steady at from 3½d. to 4d. for 3-ply 8 lb., and sacking yarns rule at 2½d. for 24 lb. weft and 3 ⅛ d. to 3 ⅜ d. for 8 lb. chains. Rove is very firm at £21 for 48 lb. and £17 10s. is now lowest for 200 lb. and the Rio yarns are steady at 2s. 8½d. for second quality 8 lb. warp, 2s. 5½d. for third and 2s. 3½d. for fourth. Carpet yarns are in some demand at from 3 ⅛ d. for 14 lb. warp.

The cloth market is very quiet, and prices are not being seriously tested. Manufacturers, however, are refusing to accept less than 2⅛d. for 10 oz. 40 in. and 2½d. for 8 oz. Linoleum hessians are slow and deliveries have been stopped by some firms in America. Heavy goods remain quiet, but steady. The War Office has circulated the jute manufacturers with a view to elucidating how many sand bags they could supply in a stipulated period.

GRAIN MARKETS

WHEAT.—Despite reports of substantial rainfall in Argentina and Australia, prices are higher on the week. Demand has broadened out, while freight rates continue very firm. Meanwhile, the area sown to wheat in Argentina is officially estimated at 17,500,000 acres, against 17,495,000 actually sown last year and 14,200,000 in 1935. The average area sown in the period 1930–34 was 19,059,000 acres.

On Wednesday last, "September" futures were quoted in Chicago at 105⅜ cents per bushel, against 102 cents the week before and 105¼ cents a month ago. Quotations in London, Wednesday: No. 1 Northern Manitoba (Atlantic), ex ship, 54s. 9d. per 496 lbs., against 52s. 6d. to 54s. 3d. last week; No. 2 Northern Manitoba (Atlantic), ex ship, 53s. 3d., against 51s. to 52s. 6d. last week. According to the *Corn Trade News*, total shipments of wheat and flour last week amounted to 899,000 quarters, against 934,000 quarters in the previous week and 1,553,000 quarters in the corresponding week a year ago.

FLOUR.—The quota payments were re-imposed as from Monday of this week, the rate being 6d. per sack. The market has had a rather firmer tone this week. Wednesday's London quotations (excluding quota payments) were: Straight run, delivered Home Counties, 40s. 6d. per 280 lbs., as against 40s. a week ago; delivered inner London, 40s., as against 39s. 6d. a week ago. Manitoba patents, ex store, 39s. to 40s. 6d., as against 38s. to 39s. 6d. a week ago. Australian, ex store, 32s. to 32s. 6d., as against 32s. to 32s. 6d. a week ago.

BARLEY.—Barley has been a steady market. "October" futures were quoted at 62⅜ cents per bushel in Winnipeg on Wednesday, as against

59½ cents last week. Quotations per 448 lbs. in London on Wednesday were: "English feed," at farm, not quoted; "English malting" (new), at farm, 45s. to 65s., as against 45s. to 65s. a week ago; Californian, ex ship, 45s. to 58s., as against 45s. to 58s. a week ago. Chilean, brewing, ex ship, 44s. to 48s., as against 44s. to 48s. a week ago.

OATS.—On Wednesday, "September" futures were quoted at 32½ cents a bushel in Chicago, against 31 cents a week ago and 28⅛ cents last month. Quotations in London, Wednesday: "English Black" (new), at farm, 26s. to 27s. per 336 lbs., as against 25s. 6d. to 26s. 6d. last week; "English White" (new), at farm, 26s. to 27s., as against 25s. 6d. to 26s. 6d. a week ago; mixed Canadian feed (Vancouver), landed, 26s. 3d. per 320 lbs., as against 25s. 9d. a week ago.

MAIZE.—Demand remains active and the market has had a firm tone. "September" futures were quoted on Wednesday at 112½ cents per bushel in Chicago, against 105⅜ cents a week ago, and 98½ cents last month. Quotations in London, Wednesday: "Plate," landed, 29s. 6d. per 480 lbs., as against 29s. 6d. a week ago; "Plate," ex ship, 28s. 6d., as against 28s. 9d. a week ago; "Plate," "September," 28s. 6d., as against 28s. 9d. a week ago; yellow maize meal, ex wharf, was quoted at £7 10s. per ton, as against £7 10s. to £7 12s. 6d. last week.

AMERICAN WHEAT MARKETS.—The following table shows wheat quotations for selected weeks in 1935–1937:—

Nearest Future	Jan. 2, 1935	Dec. 31, 1935	Sept. 23, 1936	Dec. 30, 1936	Sept. 15, 1937	Sept. 22, 1937
Winnipeg (No. 1, Manitoba) —Cents per 60 lbs.	82⅛	84⅛	109½	129	125½	127⅛
Chicago (No. 2, Winter)— Cents per 60 lbs	98⅛	101⅛	116⅜	135⅛	102	105⅜

The visible supply of wheat in Canada amounts to 67,452,000 bushels, against 57,144,000 bushels last week and 80,131,000 bushels in the corresponding week last year.

SALES AND PRICES OF BRITISH CEREALS.—The following table gives the estimated sale of home-grown wheat during the harvest years 1934–35 to 1937–38.

	1934–35	1935–36	1936–37	1937–38
Estimated sales of home-grown wheat—	Cwts.	Cwts.	Cwts.	Cwts.
1 week to September 18	532,140	589,614	238,903	315,965
3 weeks to September 18.....	1,365,101	1,445,601	748,968	1,031,324
Average price of English wheat per cwt.	s. d. 5 1	s. d. 5 0	s. d. 7 4	s. d. 8 7

The following is a statement showing the quantities sold and the average price of British cereals in the past two weeks, and for the corresponding weeks in each of the years from 1933 to 1936:—

Week ended	Quantities Sold			Average Price per cwt.		
	Wheat	Barley	Oats	Wheat	Barley	Oats
	Cwts.	Cwts.	Cwts	s. d.	s. d.	s. d.
August 21, 1937	102,339	6,008	23,052	9 2	12 2	8 8
August 28, 1937	156,388	13,378	31,186	8 10	12 7	8 8
September 4 1937 ...	311,893	33,498	43,620	8 7	12 10	8 6
September 11, 1937...	403,466	135,942	48,942	8 6	12 2	8 5
September 11, 1937 ...	403,466	135,942	48,942	8 6	12 2	8 5
September 18, 1937...	315,965	533,905	49,650	8 7	12 0	8 5

OTHER FOODS

BACON.—The market remained generally firm on a sustained demand. The official quotations (per cwt. for No. 1 Sizable) which formed the basis for dealings on the London Provision Exchange this week were: English, 105s.; Canadian, 100s.; Danish, 106s.; against 101s., 96s. and 102s. last week. Arrivals in London last week included: Danish, 13,234 bales; Canadian, 4,716; Dutch, 2,342; Lithuanian, 2,132; and Polish, 3,261; as against 14,352, 4,657, 2,842, 2,194, and 3,378 bales, respectively, in the previous week.

BUTTER.—The market had a very firm tone and prices were marked up. Quotations (per cwt.) on the London Provision Exchange on Wednesday were: New Zealand, finest salted, 119s. to 120s.; Australian, choicest salted, 119s.; Danish, 136s. to 138s.; compared with 117s., 117s., and 135s., respectively, a week ago.

CHEESE.—Cheese was in generally steady demand, with prices occasionally higher. Quotations (per cwt.) on the London Provision Exchange on Wednesday were as follows: English Cheddars, finest farmers, 90s. to 92s.; Canadian, finest coloured, 70s.; and New Zealand, finest coloured, 68s. 6d. to 69s.; against 88s. to 90s., 70s., and 68s. 6d., respectively, a week ago.

COCOA.—Prices suffered a sharp decline in mid-week. The spot quotation in New York on Wednesday was 7⅛ cents per lb., as against 8¼ cents per lb. last week. In London, on Wednesday last, good fermented new crop, Accra, "November–January," was quoted at 35s. 6d. sellers per 50 kilos., c.i.f. Continent, against 36s. 3d. a week ago. Last week's movements of cocoa in London were as follows: Landed, 2,086 bags; delivered for home consumption, 3,482 bags; exported, 641 bags; stocks, 232,035 bags, against 159,679 bags a year ago.

COFFEE.—The London spot market was quiet, while the New York quotations were unchanged. On Wednesday, Rio No. 7 (cash) was quoted at 9 cents per lb., in New York, as compared with 9 cents per lb. last week and 9 cents per lb. a month ago. Movements of coffee in London last week were as follows: Brazilian, landed, 1 cwt.; delivered, for home consumption, 41 cwt.; exports, 67 cwt.; stocks, 1,742 cwt., against 10,031 a year ago. Central and other South American: Landed, 229 cwt.; delivered, for home consumption, 1,995 cwt.; exported, 215 cwt.; stocks, 90,178 cwt., against 81,353 cwt. last year. Other kinds: Landed, 379 cwt.; delivered, for home consumption, 2,770 cwt.; exported, 201 cwt.; stocks, 86,173 cwt., against 120,151 last year.

EGGS.—The seasonal rise in the price of eggs continues, the markets having had a firm tone. At Smithfield, on Wednesday, English (ordinary packing, Grade I, about 15–15½ lb.) realised 18s. 6d. to 19s. per 120, against 18s. to 18s. 6d. last week; while Danish (15½ lb.) made 14s. 3d. to 14s. 9d., as against 13s. 6d. to 14s. last week.

FRUIT.—With supplies rather below normal for the time of year prices at Covent Garden have been firmer, states *The Fruitgrower*. Business has been steady. English apples enjoy an improving demand, and pears are in steady request. American barrel pears, on the other hand, are slightly easier. Hothouse grapes are inclined lower on heavy arrivals. English peaches are short and rather dear, but fair quantities of Italian peaches are still arriving. English melons are cheaper and green figs a point easier. Cobnuts are steady in price and walnuts and chestnuts are now selling well. Blackberries, however, are not so plentiful. Oranges are in heavier supply and have consequently declined in price, but lemons are firm. Grapefruit are plentiful and lower in price.

MEAT.—At Smithfield Market, on Wednesday last, Argentine chilled hindquarters were quoted at 4s. 4d. to 4s. 8d. per 8 lbs., as compared with 4s. 2d. to 4s. 6d. a week ago. New Zealand frozen mutton was 3s. 4d. to 4s. 2d. per 8 lbs., against 3s. 4d. to 4s. 2d. a week ago. According to the Smithfield Market official report, supplies during last week amounted to 9,208 tons, a decrease of 442 tons on the corresponding week last year. Beef and veal accounted for 4,850 tons, mutton and lamb 2,488, and pork and bacon 1,051, as compared with 4,930, 2,882, and 1,111 tons, respectively, in the same week of 1936.

PEPPER.—On Wednesday, white Muntok, "October–December," was quoted at 4½d. per lb. sellers, c.i.f. Rotterdam–Hamburg, against 4 ⅛ d. per lb. a week earlier. Black Lampong, spot, in bond, was quoted at 3½d. per lb., sellers, compared with 3½d. per lb. last week. Movements of pepper in London last week were as follows: Black, landed, nil; delivered, 10 tons; stocks, 1,959, against 1,782 last year. White, landed, 22 tons; delivered, 27 tons; stocks, 11,363 tons, compared with 12,041 a year ago.

RICE.—The spot price of Burma No. 2 cleaned was 10s. 9d. per cwt. ex warehouse, on Wednesday, as compared with 10s. 9d. per cwt. a week ago. "September-October," in singles to Continent and U.K., was quoted at 10s. per cwt., against 9s. 10½d. to 10s. last week. Movements in London last week were as follows: Landed, 2 tons; delivered, 116 tons; stocks, 2,009 tons, against 1,867 a year ago.

SUGAR.—Although the London spot market in raw sugar was steady to firm, New York showed a weaker tendency. The New York spot quotation was 3·42 cents on Wednesday, as compared with 3·45 cents per lb. last week and 3·60 cents per lb. a month ago. Wednesday's sales of raw sugar in London included "December" delivery at 6s. 6½d. to 6s. 7d., against 6s. 6d. a week ago. Movements of raw sugar in public warehouses in London and Liverpool last week were as follows: Imports, 37,003 tons, against 3,748 in the previous week and 17,712 in the same week of 1936; deliveries, 18,557 tons, against 17,571 and 19,446 tons, respectively; stocks, 120,911 tons, against 102,465 and 105,183 tons, respectively.

TEA.—The following table shows the average price (compiled by the Tea Brokers' Association) of tea sold in Mincing Lane on Garden Account in recent weeks:—

Week ended	Northern India	Southern India	Ceylon	Java	Sumatra	Africa	Total
	d.	d.	d.	d.	d.	d.	d.
Sept. 17, 1936.....	14·29	12·13	13·32	11·03	9·96	11·53	13·56
Aug. 26, 1937	17·94	14·96	15·86	13·75	12·84	14·56	16·61
Sept. 2, ,, ...	16·97	14·88	16·03	15·12	13·09	14·32	16·32
,, 9, ,, ...	17·63	14·98	16·30	15·72	13·10	14·23	16·67
,, 16, ,, ...	17·36	15·14	16·47	15·83	13·12	14·59	16·77

At this week's public auctions in Mincing Lane, 58,592 packages of Indian and 20,735 packages of Ceylon tea came up for disposal. The market in Indian grades was firm on an active demand. At Tuesday's Ceylon sale plain teas were fully firm and medium kinds were usually ¼d. per lb. dearer. Competition was strong generally.

VEGETABLES.—Heavy rains have restricted supplies, with the result that quotations are generally higher, states *The Fruitgrower*. Thus, tomatoes are dearer; but demand for cucumbers is not so good, with the cooler weather, and prices are consequently barely steady. Cabbage, cauliflower, sprouts and marrows are in demand and are making good prices. Best runner beans are fetching up to 8s. per bag. Celery is more prominent, and a fair showing of green peas is still arriving. Meanwhile, the potato trade at the various London markets shows little alteration, though a firmer price tendency is expected shortly. At the Borough market on Tuesday, best siltland King Edward realised from 5s. 6d. to 6s. 6d. per cwt., and other varieties from 4s. to 5s., the same as last week.

MISCELLANEOUS COMMODITIES

VEGETABLE OILS AND OILSEEDS.—Among oilseeds, linseed has a slightly easier tone, consequent on the improved outlook for the new crop in Argentina. Good rains are reported from many districts; these nourish the seed already in the ground, and assist sowing in the late districts. Should all go well in the next few weeks a substantial harvest, though perhaps not a "bumper" one, is expected. Meanwhile, shipments of old crop continue at a fair level, last week's total including 12,000 tons for the United States. The balance of the exportable surplus has now been reduced to around 200,000 tons. The latest official estimate of the new crop in the United States is for 190,000 tons or 10,000 tons less than forecast a month before. Canada is estimated to have only 19,000 tons. Together, these make 209,000 tons for North America, compared with 193,000 tons a year ago. America is considered likely to make further calls on outside sources to supplement the domestic yield and to make good the decline in wood and other oils from China. Demand in the past few days has been more active, both English and Continental crushers participating.

While the trade in oilcakes is improving, linseed oil is in only moderate demand, and with supplies on the short side, crushers have been more reserved. With regard to cottonseed, new crop Egyptian is steady without much activity, and business is reported at £6 10s. per ton, January–March loading, for Hull. Some old crop on spot is offered at a discount, while new for September shipment has been done down to £6 5s. There is no improvement in the demand for refined cotton oil which has declined still further to £23 10s. per ton, naked, ex Hull. Prospects of large supplies of cottonseed in the United States are a depressing factor.

RUBBER.—In sympathy with the stock markets, and in response to the unsettled international political outlook, the market in rubber again had an easy tone. The net loss on the week was, however, small. A meeting of the International Rubber Regulation Committee is to take place on Tuesday next, but no important decisions are expected. The spot price in New York on Wednesday was 18⅛ cents per lb., compared with 18⅛ cents per lb. a week ago and 18¼ cents a month ago. Wednesday's official buyers' price for standard ribbed smoked sheet on the spot in London was 8¼d. per lb., as against 8 ⅛ d on the corresponding day last week. In forward positions business has been done at 9d. for "November" shipment, as against 9 ⅛ d. to 9¼d. a week ago. Stocks in London and Liverpool at the end of last week totalled 48,761 tons, against 47,907 tons a week earlier. A year ago stocks amounted to 104,327 tons.

SATURDAY, JULY 17, 1937

Found Thieves in Her House at 2 a.m.

SCOTLAND YARD were investigating to-day a burglary at the home of [redacted] Hanover-gate, Regent's Park.

Mrs. [redacted] who is a relative of Viscount [redacted] returned home at about 2 a.m. on Saturday and found the burglars in a dressing-room next to her bedroom.

She screamed. The thieves escaped through a window.

To get in the house they had climbed a drainpipe and forced a window.

A quantity of jewellery was stolen.

The C.I.S. is A WONDERFUL OFFICE

IN reviewing the C.I.S. Report and Accounts for 1936, the Editor of the *Insurance Mail* (24-3-37) said :—

"The Co-operative has had another wonderful year . . . the Industrial Branch increase in premium income is £465,515—a record for the Society . . . In 1936 the total was £4,197,869 . . . in the last 12 years the Industrial branch premium income has been multiplied by more than four times. As far as we know there is no similar office in the world with a comparable record. It is a marvellous record . . . The other branches of the Society's business have been uniformly successful. But everything the Society touches is successful. The Co-operative is indeed a wonderful office."

I.—INSURANCE AND THE PUBLIC

Insurance and National Wealth

CURRENT impressions concerning the proportion of Britain's national wealth represented by insurance companies are simply that the proportion is large. Beyond that, little has been done to give statistical precision to a subject whose interest extends far beyond insurance itself. That the chances of obtaining significant results are small is in no way due to the insurance companies, whose statutory accounts, collected and summarised in the Board of Trade's annual returns, provide a convenient and precise set of figures. The difficulty is rather to discover a really satisfactory measure of the national wealth. Valuable work has been done by private individuals, on their own initiative and at their personal expense, to find some basis for such a figure; but the task is big enough, and important enough, to justify its remission of an official agency with the financial resources and personnel necessary for keeping the figures, once ascertained, up to date.

In the absence of such arrangements, calculations of national wealth, income, savings and investment are subject to a wide margin of error. Nevertheless, the existing material is sufficient to dispel some of the clouds which now surround the subject and to impose, at least, a limit on possible flights of the imagination.

In 1931 Sir Josiah Stamp assessed the national capital, after deducting debt charges, at £18,405 millions. This estimate was subject to a margin of error of ± £1,350 millions. Total assurance funds for all classes of business in the same year amounted to £1,397 millions. This is an aggregate of balance sheet totals. It represents 7.59 per cent. of Sir Josiah's middle figure for the national capital. The corresponding balance sheet total for 1935, the latest year for which Board of Trade returns are available, is £1,655 millions. Since the latest available report of the Industrial Assurance Commissioner relates to the year 1934, industrial assurance funds have been estimated on the assumption that the rate of growth between 1932 and 1934 has been maintained. Though these figures are in no way spectacular in themselves, their implications are undoubtedly impressive. Some 220 companies and societies contribute to the total, but many have only a small individual share in it. A mere handful of companies account for a large proportion, and the Prudential alone is responsible for roughly one-fifth of the whole.

Our estimate that about 7 per cent. of the national wealth is represented by insurance companies is largely corroborated by the results of an alternative approach to the problem. Messrs Daniels and Campion, working on the figures of deceased estates, put the total *personal* capital owned by persons over 25 years of age in England and Wales in 1924-30 at £13,680-£15,150 millions. Average *life* assurance funds in the same period amounted to £980 millions, or 6.80 per cent. of the mean figure. The correspondence between the two results, arrived at by widely divergent methods, is close.

When we turn from capital to income, we are fortunate enough to have estimates of the national income up to and including 1937. For 1935 Mr Colin Clark put the *net* total (i.e. excluding maintenance and depreciation) at £4,530 millions. The total insurance premiums and annuities received by the companies in that year are

shown by the various official returns to have been £290 millions, or 6.41 per cent. of the national income. A cross-section of these figures can be obtained from the Estate Duty returns in the latest report of the Commissioners of Inland Revenue. These give the total gross capital value of deceased estates as £611,116,756, of which insurance policies account for £22,377,871, or 3.66 per cent.

To calculate the total value of investments is no less difficult than to calculate national income or capital. We know, however, the par value of the 5,522 marketable securities which were quoted in the Official List of the London Stock Exchange on March 24, 1937—namely, £17,846,746,382. If we exclude certain groups, such as American Railways, which are not widely held in this country, this figure is reduced to about £16,234 millions. The total of Stock Exchange investments by insurance companies (excluding mortgages and loans) is £1,122 millions. This figure is taken from the latest Board of Trade returns, which relate to accounts deposited during the year 1936. The two figures are not precisely comparable for we have no returns of the *market value* of all the securities dealt in on the Stock Exchange, or even on the par value of securities in the Supplementary (as distinct from the Official) List. Taking the figures as they stand, however, the ratio is 6.87 per cent.; and in view of recent controversies, it is certainly significant to know that something like 7 per cent. of the total investment in this country may have been contributed by purchasers of insurance policies without any meticulous calculations of interest rates—representing some £1,000 millions of accumulated automatic saving.

The following table shows comparative changes in (a) national income and premiums, and (b) total investment and investment by insurance companies in the years 1930-36.

Year	Net National Income (Clark) (1) (£ Millions)	Total Insurance Premiums (Board of Trade) (2) (£ Millions)	% (3)	Total Securities in Stock Exchange Official List (4) (£ Millions)	Stock Exchange Investments by Insurance Companies (5) (£ Millions)	% (6)
1930.....	4,318	271·5	6·29	...	873	...
1931.....	3,889	267·8	6·89	18,458	911	...
1932.....	3,844	275·9	7·18	18,371	938	...
1933.....	3,962	276·1	6·97	18,476	1,009	...
1934.....	4,238	285·8	6·60	17,584	1,070	6·08
1935.....	4,530	290·2	6·41	17,603	1,122	6·37
1936.....	...	...	...	17,524	...	...
1937.....	...	...	...	17,846	...	...

N.B.—Owing to the fact that the total figures in column (4) include more items before 1934 than in the later years, no precise comparison is possible and pre-1934 percentages are therefore omitted from column (6).

The figures suggest that no important changes have recently occurred in the rôle played by insurance companies in national recovery; but the significance of that rôle is beyond question.

In 1935, the population of the United Kingdom was 46,885,000 and the number of life assurances and annuities in force was 95,769,892. Thus there were two policies to every person. One shilling in every sixteen of the national income was paid out in premiums. Between seven and eight per cent. of the national capital—say £1,500 millions—was administered by the insurance companies. Insurance policies account for over 3½ per cent. of the gross capital value of estates of all sizes. For estates of £15,000 and under they cover 5.71 per cent. For estates of £1,000 and under they amount to £5,113,785—or 10.94 per cent. of a total of £46,750,632. They thus form the fourth largest single item, the three first being House Property and Business Premises £13,817,130, Cash £10,186,784, and British Government Securities £5,307,657. In small estates not exceeding £300 gross value which are included in the Estate Duty Returns, insurance policies account for £1,474,846, or 20.21 per cent. of the total of £7,296,907. And it is probable that in estates of under £100, for which there are no returns, they would bulk very large indeed, for a considerable proportion of the savings of the working classes take this form. Some impressive figures of this proportion are given in Mr Colin Clark's "National Income and Outlay." Of a total of £172.4 millions saved by working- and middle-class persons in 1934 through repayments of principal to building societies, life insurance, savings banks, provident societies and Savings Certificates, net savings through life insurance accounted for £54.6 millions, or 31.67 per cent. Net savings through life insurance are defined as the amount by which the income of life assurance and industrial assurance companies exceeded their outgoings during the year, transfers to and from reserve not being included.

A notable pioneering contribution to the study of insurance company figures has been made in Messrs Schwartz and Paish's "Insurance Funds and their Investment." The figures given in the present article are designed to supplement this work and to present some idea of the relative importance of insurance in our modern economy. It is desirable that the layman should know more of the work of the insurance companies; and, perhaps, that the companies should have wider opportunities of seeing their contribution to national well-being in due perspective.

Retailing Life Assurance

THE last few years have seen a rapid increase in the number of ways of insuring his life offered to the citizen. There was a time when his only choice, roughly speaking, was between obtaining a lump sum at death or at some particular age. The decision once made as to which of these to adopt, he had then only to search out the assurance office that gave him the best terms. But now, with the introduction and growing popularity of various schemes, which embody in one form or another the principle of an annuity, the position has become far more complicated.

Few of us would trust our own unaided judgment as to the precise value of annuities of different terms, purchased with different premiums, and associated with different alternative lump sums.

The answer to the question: What sort of cover? has thus become a matter on which the layman most decidedly needs specialist advice. The problem of finding the best means of obtaining this advice faces an increasing number of people. In one form or another, it concerns every person who takes out a policy for himself in his declining years, for his dependants or for his successors. And the figures which we give elsewhere in this Supplement show that the aggregate net sums assured under policies with the British life offices who make returns to the Board of Trade has nearly doubled in the last ten years. In 1926, the total was £129 millions. In 1935, it was £224 millions, and the figures which we have assembled for a large number of offices for 1937 suggest that the increase during that year alone was of the order of 18 per cent. If true salesmanship is designed, not merely to induce the buyer to buy, but to teach him to buy what is best adapted for his special purpose, the need for its application to the retailing of insurance is increasing with every year that passes.

Thus simultaneously life assurance has become more complicated and more important. For many people it is now the largest and most complicated financial decision they ever take in their lives. Naturally, therefore, they need highly expert advice in taking that decision; and it is being increasingly realised that the existing machinery of the life assurance market does not necessarily and invariably provide them with advice that is either sufficiently impartial or sufficiently informed.

Once one has decided to insure one's life one has to set about discovering the appropriate scheme and office. Some people walk straight into some insurance office with which they are acquainted and take the best they can get there, which, unless they are lucky, is not necessarily the best. But the great majority go to an agent or to an insurance broker, and it is upon the efficiency of this middleman that their fate depends. One has therefore to examine his possible qualifications closely.

Now, in this country anyone under the sun may become an agent. It is a matter simply of asking a permission which is rarely refused. You need neither have any knowledge of the subject nor show any signs of aptitude. Since your payment is a percentage commission on any sum assured through your activity, merely becoming an agent puts no one to any expense. But if you bully your friends to insure themselves through you, or if they come to you because they like your style at tennis, and so on, they may be poorly served. You are quite likely to be unable to judge their exact wants, and, at the same time (since life offices are legion and you are probably not an agent for more than one), even if you could tell exactly what they needed, you might not be able to tell where they could best get it. Many offices, furthermore, permit a curious system of commission (which is well known, but might as well be recorded here for the sake of future generations), by which anyone who takes out a policy direct and asks at the same time to become an agent is allowed a commission on his own policy. And if the office is in need of new business, a little pressure may easily get him an unusually large commission. Four out of five who do this must imagine that they are doing well out of it, though of course they actually pay for the delusive concession in the terms of their policy. Nor perhaps in some cases would they be unwise to suspect a little the reasons for such anxiety to secure them as clients.

The simplest facts about the agency system thus speak for themselves. The reasons for doubting the efficiency of insurance brokers in all matters of life assurance are less obvious. It can at once be said of them (and of many hard-working whole-time agents) that they devote their whole working days and working intelligence to their job. There is certainly less likelihood that they will be ignorant, and also they have the advantage that, in effect, they are the agents of the general body of offices, and not of one or a very few like the ordinary agent. The trouble is that, with the best will in the world, they may be subject to forces which put a considerable strain on their impartiality. They are almost exclusively paid by commissions from the insurance offices, and only very exceptionally by fees from their clients. Unless, therefore, they are entirely immune from temptation, it is important that no differences in the commissions offered them should deflect their judgment. But such differences as between one plan of assurance and another exist and are in some cases large. Unfortunately the merely technical difficulty of devising a proper schedule of commissions for a wide variety of prices is not the whole explanation. Different offices may offer different commissions for the same policy, with the definite objective of securing as large a number of customers as possible. It is thus not impossible to conceive of a situation in which office A may be offering the broker more than office B to sell an inferior article. Since brokers must needs earn their living, and may therefore be occasionally influenced a little more than they would freely admit by economic motives, the intending policyholder, even when he has been wise enough to go to a broker, is not certain of getting the very best advice.

Naturally these arguments must not be carried too far. There are many agents of proved aptitude and experience. The majority of brokers carry out their duties with a highly commendable sense of responsibility for their clients' best interests. But the machinery for retailing assurance is certainly less than perfect, and it is just as well that the ordinary public should know it. Its defects are well understood by the best minds in the insurance world, and attempts, so far unsuccessful, have been made to devise safeguards. The obvious remedy would be to abolish the agency system altogether and for all life offices to agree upon one identical scale of commissions to the brokers. That, of course, would be very drastic: many offices would certainly object with considerable energy, and the revised system could scarcely work unless broking could be raised to fully professional standards. But if, with a judicious mixture of official pressure and internal propaganda, the thing could be done—either in the way suggested or by some less violent device, the possible nature of which is not so obvious to an outsider—the gain, both to insurers and insured, would be immense. In the world of industry experience has shown that the twin ideals of eliminating all possible sources of waste and of giving the customer the best possible article at the lowest possible price are, at bottom, one and the same. This argument applies even to the simplest articles which are in universal use and on whose quality and suitability the non-technical buyer may himself be in a position to reach a sound judgment. In the case, however, of highly complex products, whose purchasers must largely put themselves in the sellers' hands, its force may, in the long run, be decisive.

Sooner or later, therefore, it will probably be decided that some reform must be carried out. The need for expert advice is greater than ever, not only for the reasons which have been mentioned, all of which are chiefly personal to the policyholder, but for social reasons which should not be forgotten. Insurance is increasing every year. It is covering more people and more of each person's life. And as the rate of interest gradually declines, it may become less attractive. Unless everything is done that can possibly be done to make it attractive and suitable to the public, it is not impossible that part of the ground won may eventually be lost again.

Insurance and House Purchase

THE abnormal conditions which existed during the War, together with the increase of population attaining adult ages, produced an acute shortage of houses after the cessation of hostilities. Under pre-war conditions, much of this shortage would doubtless have been made good by the investment of large amounts of capital in the erection of new houses for renting. But rent restriction legislation made such investment relatively unattractive, and potential house occupiers were forced to become house owners on an unprecedented scale. In the great majority of cases a large portion of the necessary purchase money had to be borrowed.

More recently, the increase of working-class purchasing power, due to the stability of wage rates in a period of rapidly falling prices, has given a considerable stimulus to the demand for owner-occupied houses. The result has been a phenomenal increase in the operations of the British building societies. In 1890 the total assets of these societies amounted to £51,000,000, in 1914 to £66,000,000 and in 1919 to £77,000,000. The corresponding figure in 1926 was £194,000,000, and according to recent official returns a new high level was reached in 1936 at the formidable total of £656,000,000. In 1936 alone some £140,000,000 was lent by the Societies ; the average amount advanced was about £550, and 96 per cent. of the mortgages were for sums under £1,000.

These figures refer to societies whose *raison d'être* is the financing of house purchase, and which are required to make official returns of their operations. Insurance companies do not publish detailed particulars of their mortgages, but it is well known that in the aggregate their house purchase advances have also increased very considerably. Building society loans are normally repayable by fixed monthly instalments of principal and interest over an arranged term of years, and a higher percentage of the value of a property may be lent than is usual under an ordinary " straight " mortgage. The system of gradual repayment by regular instalments is, however, well adapted to the financial circumstances and habits of the average borrower. It is a system, moreover, with which the payment of premiums under a life insurance policy has familiarised many peoples, and this similarity has been the basis of a marriage between the two operations, which has been consummated in a large number of cases.

The method customarily adopted for combining insurance with house purchase may be briefly described: in conjunction with the loan from the society, etc., a policy may be effected on the life of the borrower, under which the sum assured decreases in the same way as the loan itself. Thus, at any time, the sum assured is equal to the amount of the loan outstanding. A single premium is payable, which is advanced by the society, added to the original loan and repaid on the same terms. If the death of the breadwinner occurs before the whole has been repaid (when normally the family might be forced to sell the property) the proceeds of the policy cancel the loan. Sometimes it happens that a borrower is unable to put down in cash the minimum percentage of the property value required by a society. The difficulty may then be overcome by the society advancing more than its maximum limit, on condition that the borrower effects a guarantee policy with an insurance office, indemnifying the society against any loss in excess of what would have been incurred had the loan been on the society's normal basis.

Instead of this combination of building society loan and life assurance policy, much the same end may be secured if an assurance office lends the money, which is secured on the property with an endowment assurance on the borrower's life as collateral. Many life assurance offices transact this type of business. The building society movement, naturally, does not view it with any enthusiasm, but it is, in fact, an eminently suitable method, both from an investment point of view and in relation to the ordinary course of life assurance business. From the borrower's viewpoint the income tax rebate on the endowment assurance premium is an attractive feature ; and so is the option of effecting the policy with the right to participate in profits. At death, or at the end of the term agreed upon, the loan is repaid out of the proceeds of the policy.

In recent years a number of life assurance companies have co-operated with building societies in operating another method, which has different features. It involves the financing of a house purchase loan by a building society on a straight mortgage of the property. Simultaneously, an endowment assurance policy, effected on the borrower's life, is mortgaged to the society.

An idea of the way the system works out, and its relative cost to house-buyers, may be obtained from the following example which has been taken from the leaflet of a life assurance office. It shows the effective cost of a loan of £750 at 4½ per cent. for a term of twenty-three years, secured on suitable house property, and repayable by means of an endowment assurance policy, without profits, on the life of a borrower aged thirty next birthday.

	£	s.	d.
Annual interest	33	15	0
Annual premium (in advance)	26	3	9
Annual payment	59	18	9
Less (*a*) tax at 5s. in £ on interest £8 8 9			
(*b*) tax rebate at 2s. 6d. in £ on premium 3 5 5			
	11	14	2
	£48	4	7

This dual system is an interesting development. It is understood to work harmoniously in practice, but whether it will ever attain major importance may be doubted.

How America Insures

AMERICAN insurance presents an example of dependence upon geographical, political and legal conditions. The American population of 128 millions is distributed over forty-eight different States, each of which has its own insurance legislation. Further, the principle of State supervision of insurance has been increasingly enforced during the last eighty years. There is scarcely a week in the year when one or more laws affecting insurance is not either changed or supplemented. All States have regulations for the different branches of insurance, and supervision applies not only to investments and periodical balances, but also, more or less, to methods of rate-making and policy conditions. In some cases (e.g. life insurance commissions) even expenses are regulated. Most of the larger and more important States require the taking out of a licence, renewable annually, for both agents and brokers. Agents are frequently required to undergo an examination of their knowledge, ability and fitness. Altogether, the United States probably leads the world in the number of restrictions placed on the insurance market.

Insurance, nevertheless, is one of the best developed of American businesses. There are as many life policies sold in America as there are people living in the country. Life insurance, indeed, with more than $100,000 millions worth of insured sums, is much the most important branch of American insurance. Yet only a small proportion of American families would be able to live for even a year on the proceeds of life policies, the majority of which are industrial and are designed mainly to defray funeral costs.

Thus the army of 320,000 licensed life insurance agents (usually known as underwriters) still have much to do before their field can be regarded as adequately covered. It is surprising how often the same people take out life policies again and again. Life insurance, in fact, is viewed more as an investment in the United States than in any other country. This is one of the most characteristic features of the market, and it accounts for the fact that, contrary to experience in most European countries, one type of policy stands out pre-eminent—the straight life insurance policy. Endowment policies take only a secondary place, and annuities are not popular.

The most typical American institution in the entire system of life insurance is the sales organisations. The National Association of Life Insurance Underwriters, which has branch offices distributed all over the United States, has an organisation comparable with that of a strong political party. Its activities include meetings and publications, educational work and advertisement. In addition, the College of Chartered Life Insurance Underwriters was founded about ten years ago. It acts as an academical examining body, and has granted the degree of C.L.U. to about 1,200 leading agents, as the symbol of their membership of the aristocracy of their profession.

Ever since a New York company, in 1862, introduced the granting of high first commissions to life insurance agents there has been continuous discussion on the question of correct percentage commissions. In life insurance—indeed, in American insurance generally—the percentage of administrative costs is much higher than in Europe. The United States has yet to follow the example of the British industrial insurance offices, which have reduced their costs in recent years to a remarkably low level. Another problem is the regrettable frequency with which policies are allowed by holders to lapse, especially industrial policies in their first few years. This feature has been attributed, in part, to

over-competition among agents, frequently of the same company.

The organisation of the life insurance market was profoundly affected by the introduction of group-life insurance, an American product of the year 1910. Its success has provided a medium between commercial and social insurance, but it has the serious defect that it fails to afford protection if the workman leaves or loses his job. Usually he is himself unable to keep up the policy, which has no surrender value; and he frequently ends by realising the advantages, from his own point of view, of other types of policy which are more favourable, though they may be more expensive.

The majority of American life companies are mutual, not joint-stock companies—this applies particularly to the giant companies. It is estimated, indeed, that joint-stock companies do only one-quarter of the total business.

In marine insurance the United States plays an insignificant rôle. English marine insurance companies and Lloyds are predominant, and seem likely to remain so in the absence of extensive State subventions. Inland marine insurance has a more important market among American companies, and a wide variety of policies are in force.

In the fire insurance market, by far the largest proportion of the total business is transacted by joint-stock companies. Mutual offices are responsible for only about 10 per cent. of the whole, which is carried by about 2,500 fairly small concerns, most of which cover special risks such as factories, farms, etc., usually without the help of agents. Among the joint-stock companies, however, there is enormous competition in selling fire insurance policies, and as many as 230,000 agents and brokers are employed. This competition, however, is closely restricted in the most important States by regulations laying down a standard form of policy, and frequently a common rate-making bureau, in which both joint-stock and mutual companies are represented. Rates also require the approval of the State Commissioner, who may modify them. In recent times there has been a significant reduction in the percentage of losses, and, concurrently, a decided increase in administrative costs. Fire insurance companies are beginning to handle marine insurance and so-called collateral or side-lines to an increasing extent. These subsidiary lines include windstorm and tornado, hail, riot and explosion, sprinkler leakage, use and occupancy, as well as other consequential losses. In some States, however, fire insurance companies are debarred from undertaking certain business. The casualty insurance companies (a specifically American term) have the right in some cases to cover risks which fire companies are not permitted to carry, including plate glass, burglary and robbery, steam boilers, engine and machinery, automobile, fidelity and surety, liability, health and accident risks. This differentiation, however, is steadily being broken down. It has been predicted that when the New York insurance law secures its much overdue revision it will permit the granting of multiple line charters. This lead will probably be followed by the rest of the United States, and it will do much to eliminate the difficulty which has been undoubtedly caused by overlapping between the two types of companies.

In America, the land of experiment, the potential intervention of the State and Federal authorities is a contingency which insurers must needs keep constantly in mind. There have been various attempts by State authorities to undertake insurance schemes. Workmen's compensation has been essayed in seventeen States, hail insurance in five, and automobile liability in one. The results, however, have usually been unfavourable. The Federal Government, for its part, has a monopoly of the insurance of bank deposits. It also insures the lives of men in the military services, with demonstrable success. It is now proposed that the Federal Government should undertake an all-risk insurance for the wheat crop, but what the result will be is at present uncertain.

General Results of British Offices

THE experience of the British insurance companies in 1936 was satisfactory. In the life branch the net rate of interest earned on the funds showed only a small reduction, while new business was marked by considerable further expansion. Annuity consideration moneys, which have increased remarkably in recent years, would have remained at practically the same level as in 1935 but for a large reduction in the case of one company. In the fire and miscellaneous branches premium income changed little, but underwriting profits were less favourable, due largely to the exceptional fire insurance results in the United States in 1935.

In the annexed table, which gives the results in respect of all branches of insurance of twenty-two of the most important companies, the figures have been calculated on a uniform basis for all the offices. The reserve for unexpired risk, except in the marine branch, has been taken at 40 per cent. of the premium income of the year, which is the basis used by the majority of offices. It is not possible to use a uniform method of calculating underwriting profits in the case of the marine accounts, and the method of the company concerned has been followed. Special attention is drawn to the headings of each column; the calculations may differ from the published results of individual companies, as is only to be expected when various data are reduced to a comparable basis,

FUNDS OVER *£40,000,000*
ANNUAL INCOME OVER *£5,000,000*

"The National Mutual of the Empire"

and this fact should constantly be borne in mind. In arriving at the trading surplus shown in column 2 all allocations to investment and other special reserves have been deducted; undoubtedly this will operate somewhat unfairly in certain cases, but it is impossible from the accounts to distinguish between what may be regarded as an addition to free reserves and what is required by ordinary business prudence. Column 4 indicates the amount of the contribution to the net trading surplus derived from the operations of the life department. Such profits emerge from actuarial valuations, and in the majority of cases these valuations take place only at quinquennial intervals. It may be mentioned that some companies set aside the shareholders' proportion of surplus revealed at a quinquennial valuation, and, in each year of the new quinquennium, credit one-fifth of that surplus to profit and loss. This practice, however, is not universal. Hence the absence of any figure in this column for some companies which transact life business merely means that no valuation was due to be made. The Prudential is in a special position, since the life profits belong entirely to the "A" shareholders. The table is concerned only with the "B" shareholders, whose interest is confined to the remaining departments and who have no rights to any share in the surplus of the life and annuity department.

DIVIDEND POSITION

As will be seen from the table, 79 per cent. of the total dividends were made out of interest earnings, which, it is very satisfactory to note, are well maintained; excluding the Pearl, whose activities are mainly confined to life assurance, the figure is 84 per cent. By a policy of meeting the cost of a very substantial part of the shareholders' dividend from interest earnings, a considerable portion of the underwriting profits is available to augment the special reserves. In consequence the offices are in a very strong financial position.

A summary of the results of the same group of twenty-two companies is given below for each of the last five years.

Year	Total Premium Income (Excl. Life Annuity and Sinking Fund)	Underwriting Profits: Net Trading Surplus (Excl. Life Annuity and Sinking Fund) Amount	Underwriting Profits: Net Trading Surplus (Excl. Life Annuity and Sinking Fund) *Percentage of Premium Income*	Dividend Position: Total Net Interest Earnings	Dividend Position: Cost of Ordinary Share Dividend	Dividend Position: *Proportion of Dividend Met out of Interest Earnings*

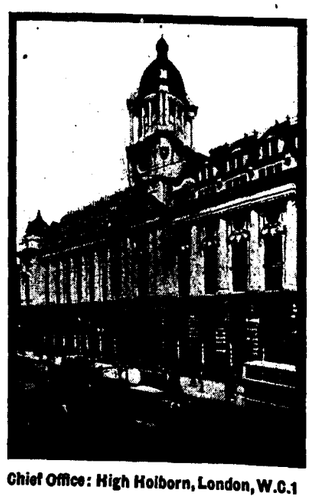
ENDOWMENT POLICIES
WITH HOUSE PURCHASE PRIVILEGES

SOME ADVANTAGES OF ENDOWMENT POLICIES



1 If you take up a policy at once, you can obtain it at a cheaper rate than you will have to pay in the future. "DO IT NOW."
2 You may be insurable now, but not insurable in the future, when an advance for House Purchase would prove of great service to you.
3 **The Life Assurance comes into force immediately the first premium is paid; the policy is a sound investment even if the privilege of obtaining an advance is never exercised.**
4 You can take out your policy now and defer the selection of the house until a suitable property is available.
5 The premiums paid under these policies enable you to obtain statutory rebate of income tax.
6 The policy entitles the assured to all the benefits of an ordinary Endowment Assurance Policy with the additional advantage of being available for House Purchase.

II.—LIFE ASSURANCE

Life Assurance Results

THE latest returns made by the British Life Offices to the Board of Trade in respect of their 1935 accounts show that exclusive of industrial insurance policies there were 5,646,000 policies in force at the end of that year, representing sums assured plus existing bonuses of £1,936 millions. The total interest income in 1935 was £36,482,000 and the premium income £80,687,000; while the accumulated funds totalled £902,723,000. The following table is compiled from the same official source.

Year	Aggregate Net sums Assured under New Policies Mill. £	Increase or decrease per cent. compared with preceding year
1921	109	−25·3
1922	106	− 2·8
1923	112	+ 5·7
1924	124	+10·7

1931	161	− 3·0
1932	164	+ 1·9
1933	183	+11·6
1934	208	+13·7
1935	224	+ 7·7

NEW BUSINESS

(a) *Life Assurance.*—The following table shows the new sums assured, excluding industrial assurances, effected in each of the past two years by a number of representative offices. The Dominion offices are omitted, as the figures of their new business in this country are not made public.

While all four groups show further expansion, there is a distinct slowing down in the rate of the industrial-cum-ordinary group, in which the increase in 1935 was approximately £5,700,000. On this occasion the largest proportionate increase took place among the proprietary life offices, followed by the composite offices.

(b) *Annuity Business.*—Last year we expressed the opinion that after several successive years of increasing annuity business it seemed likely that new business had reached a more or less stable condition at the higher levels attained. The following table shows a fall last year of nearly £1,000,000 in consideration moneys, almost the whole of which is explained, however, by a reduction in the Prudential figure. It is interesting to notice a further increase for the Equity and Law, and in view of the very large amount of business secured in recent years by that office it is of particular interest to learn from the chairman's speech this year that the annuitant mortality experience on the tables employed is proving profitable. It has, indeed, been the reiterated opinion of that office that the fall in interest rates since 1932 had broadened the basis of annuity business, and that on the average financial necessity was likely to counteract the well-known self-selection of annuitants.

Family provision scheme

A scheme to secure a Capital Sum payable at death and a regular income over a period of years for dependants in the event of early death, at a cost which is little more than that of ordinary life assurance.

Example of Benefits provided by the Scheme

£1,000 payable immediately upon proof of Death, *and, in addition,* if death occur before age 60, *an income of*

£150 per Annum until the time when the age of 60 would have been attained.

ANNUAL PREMIUMS (CEASING at AGE 60)
Age not exceeding 25...£27.4.8 *Age not exceeding* 35...£34.14.10
" " " 30...£30.3.6 " " " 40...£41. 9. 4

The Scheme is readily adaptable, and rates will be quoted on application for policies to suit the needs of each individual.

Interest earned by annuity funds is virtually on a gross basis, and where mortality does not operate unfavourably annuity business, under the terms at present offered, should prove definitely remunerative to the companies. In our opinion, whatever the future course of interest rates, any marked recession in business is unlikely.

MORTALITY

It is quite unusual for offices to give any information in regard to their mortality experience which would serve as more than a very rough guide as to the amount of mortality profit earned. A perusal, however, of the annual reports and chairmen's speeches gives the general impression that the experience in 1936 did not differ very materially from that in the previous year. The O^M table is rapidly being displaced by the A1924/29 table as and when actuarial valuations fall due.

INTEREST

In spite of the small increase in income tax in 1936, it will be seen that the fall in the average rate of interest earned by the following offices on their life and annuity funds was only 1s. 5d. per cent. This result is distinctly encouraging from the point of view of bonus maintenance, and more favourable than would have been forecast by most people a year or two ago. The actual average net rate earned, namely, £4 2s. 5d. per cent., gives a very considerable margin over the rates of interest commonly used in assessing the liabilities; the margin is really a good deal greater as actuarially the rate of interest should more properly be calculated not on the life assurance and annuity funds, but on actuarial reserves which are much smaller. The further increase in the rate of tax for the current fiscal year will, by itself, operate to reduce the earned rates of interest; but there now seems less reason to anticipate a general and marked fall in bonus rates, in the earning of which the interest element is the most important factor under modern conditions. In considering the following table, it should be borne in mind that the net rates shown for any two offices are not necessarily strictly comparable owing to differences in bookkeeping. Among other things, a good deal depends on the method of valuing the assets.

LIFE OFFICE INVESTMENTS

The annexed table shows the percentage distribution of the assets of the principal British companies, the average of the percentage held in each group of assets by all companies, and also the average percentage holdings in each of four groups, viz. mutual, proprietary industrial-cum-ordinary and composite offices.

We stated last year that owing to the general fall in interest rates in recent years, among other causes, it had become increasingly difficult to obtain attractive mortgages. In reviewing the accounts of 1936 it was noticed that the diminution in this type of investment appeared to have been arrested, and it is of interest to note that in the aggregate there was a definite upward swing on the year. In other directions the tendency of late years to change from gilt-edged has been continued. Thus there is a further reduction in British Colonial and Foreign Government securities which is approximately compensated by increasing debenture preference and ordinary stocks. The following table gives the average distribution of all the companies for each of the last five years:—

Class of Assets	Year 1932 %	1933 %	1934 %	1935 %	1936 %
Mortgages, including loans on policies	27·2	24·2	22·8	22·0	22·3

Life Office Valuations

The Assurance Companies Act, 1909, provides that every office "shall cause an investigation to be made into its financial position, including a valuation of its liabilities," at least once in every five years. These investigations mark the occasion for the distribution of bonuses to policyholders.

The table on page 16 analyses the results of the valuations made at the end of last year, together with the corresponding data for the preceding valuation. In all cases where no allocation to shareholders is shown, this simply means that the office is a mutual society and has no shareholders.

As will be seen from the notes which follow, bonus rates were remarkably well maintained in view of the general belief held in recent years that the reduction in interest rates would force a lower level of bonus distributions. Of the nine offices declaring bonuses annually seven repeat their 1935 rates, while the only biennial declaration (National Mutual) is unchanged. Only one of the triennial bonuses shows a definite reduction, while the quinquennial declaration of the Eagle Star was on a more generous scale than in 1931. In the industrial branches of these offices doing this class of business, the bonus distributions were at least as favourable as in 1935. While it might be unduly optimistic to regard present bonus levels as static, the outlook seems to suggest that the offices may find it possible to maintain bonuses at rates not greatly differing from their latest declarations. In the last few years premium rates have, of course, been modified in many cases to allow for an assumed lower future rate of interest on the one hand, and on the other hand for improving mortality, and these adjustments tend in practice towards the maintenance of approximately existing bonus rates.

ANNUAL VALUATIONS

Britannic.—Ordinary branch bonus 38s. per cent. on the sum assured (same). As usual, the cost of the bonus, including shareholders' proportion, is well within earnings.

Co-operative.—Ordinary branch bonus 36s. per cent. on sum assured (same).

London Life.—The rate of bonus declared by the London Life is again 35s. per cent. per annum calculated on the sum assured and existing bonuses. In the reduction of premium class the rate of reduction for the second successive year is 3 per cent.; the rate for some years prior to 1935 was 2 per cent., and it is once more stated that 3 per cent. must be regarded as exceptional.

London and Manchester.—The rate of bonus in the ordinary branch is 40s. per cent. calculated on the sum assured, and the cost is amply covered by the trading profits. For many years the rate of bonus has been 44s. per cent., and the present reduction reflects a cautious view of the future, as it will be seen from the accompanying table that the previous rate of bonus could have been maintained out of trading profits. In the industrial branch the basis of allocation is unaltered.

Pearl.—Ordinary branch bonus 40s. per cent. on sum assured (same). In the industrial branch the rate of bonus is increased in the whole-life class from 14s. to 16s. and in the endowment assurance class from 11s. to 12s. for each weekly premium of 1s.

Prudential.—Ordinary branch reversionary bonus declared is 46s. per cent. for whole-life and 40s. per cent. for endowment assurances, both rates being calculated on sum assured (same). In the industrial branch the remarkably high reversionary bonus of 32s. per cent. declared in 1935 is repeated. To policies assured in the industrial branch of the British Widows' Assurance Company, whose business was transferred last year to the Prudential, the method of allotting bonus adopted

Security and Service

61, THREADNEEDLE STREET, LONDON, E.C.2

by that company has been adhered to and enlarged in scope.

In the allocation to reserves in the accompanying table the industrial branch figures for 1935 and 1936 include £1,200,000 and £800,000 respectively to strengthen the actuarial reserves. The outdoor staff receives bonuses each year out of the industrial branch surplus, and amounts of £662,000 and £671,000 are included above among the reserve allocations in respect of the last two years.

Refuge.—The bonus in the ordinary branch is reduced from 38s. per cent. to 36s. per cent. calculated on the sum assured. In the industrial branch the amount payable under claims arising in the current twelve months will be the same as would have been paid under the latest scale of benefits (same).

Standard.—Rate of bonus 42s. per cent. calculated on sum assured and existing bonuses (same). This rate of bonus has now been paid each year for the past ten years.

Wesleyan and General.—The rate of bonus in the ordinary branch for both whole-life and endowment assurance policies is 38s. per cent. calculated on the sum assured, contrasted with 44s. per cent. for whole-life and 38s. per cent. for endowment assurances in 1935, and with 46s. per cent. and 40s. per cent. in 1934. In the industrial branch the form of distribution follows the same lines as in the previous year.

Biennial Valuations

National Mutual.—Rates of bonus 52s. 6d. per cent. per annum for whole-life and 45s. per cent. per annum for endowment assurances, calculated on the sum assured and existing bonuses (same). These rates are, of course, extremely high, and are indeed unequalled. It should be noted that 10s. of the 52s. 6d. and 7s. 6d. of the 45s. are expressed, as on the previous declaration, as being a special distribution.

Triennial Valuations

Caledonian.—Rates of bonus declared 42s. per cent. per annum for whole-life policies and 40s. per cent. per annum for endowment assurances, in both cases calculated on the sums assured (same).

Life Association of Scotland.—Under the association's immediate bonus plan the rate of bonus was reduced at the preceding investigation from 44s. per cent. per annum, calculated on the sum assured, to 40s. per cent. per annum, and the rate has now suffered further reduction to the modest figure of 35s. per cent. per annum. Under the office's other plan, in which bonuses do not vest until attainment of the expectation of life, the rate of bonus remains unaltered at 60s. per

cent. per annum where the expectation of life has not yet been attained, but has been reduced from 40s. per cent. per annum to 35s. per cent. per annum in the remaining cases; in 1933 an additional special reversionary bonus of 3 per cent. of the sum assured was declared, to which there is no counterpart this year.

National Provident Institution.—The basic rate of bonus allotted to whole-life policies remains at 3 per cent. per annum calculated on the sum assured. Varying substantial addition to this minimum rate is made where the life assured has survived his expectation of life; this addition is slightly smaller in all cases than in 1933. The basic endowment assurance bonus varies with maturity, age and duration; an additional bonus is given payable only on survival of the endowment term. Examples of the basic rates of bonus, which are identical with those allotted in 1933, are given below. The additional survival bonus, however, is reduced from 8s. per cent. per annum to 5s. per cent. per annum, calculated on the sum assured.

Endowment Assurance—Annual Reversionary Bonus calculated on the Sum Assured

Age at maturity	Duration: 18 years or less	21 years or over
	%	%
50	39/–	49/–
55	43/–	53/–
60	48/–	58/–
65	53/–	63/–

Quinquennial Valuations

Eagle Star and British Dominions.—For the quinquennium ended December 31, 1931, bonus rates were 28s. per cent. per annum of the sum assured in the ordinary section, 29s. per cent. per annum in the abstainers' section and 15s. per cent. per annum in the low premium section; on the present occasion the corresponding rates are 40s. per cent., 41s. per cent. (42s. per cent. for whole-life policies) and 27s. per cent. (28s. per cent. for whole-life policies).

Legal and General.—The rate of bonus is 38s. per cent. per annum compound, being the maximum rate to which existing with-profit policyholders are entitled. Since 1919 the issue of participating policies has been discontinued.

Sun Life.—The bonuses under the special contribution method adopted by the Sun vary according to the age at entry and the number of years a policy has been in force. The rates of bonus on this occasion are practically the same as in respect of the previous quinquennium, except that for very long durations some small reduction appears to have been made. The published scale varies from about 35s. per cent. per annum in the case of a policy effected at age 30 and five years in force to about 45s. per cent. per annum for age 50 at entry and 30 years in force, these rates being calculated on the sum assured only.

III.—OTHER INSURANCE

Fire Insurance

THE following tables relating to twenty-two large composite offices include many subsidiary companies, but there is no duplication in the figures shown. Some further small reduction took place in the premium income, but premiums in this country alone would appear to have been greater. Reference is made by the various chairmen to the fall in foreign premiums being mainly due to restrictive nationalist legislation in certain

countries and to the devaluation of currencies in gold *bloc* countries. Expenses—which include the increasing burden of foreign taxation—although smaller in the aggregate, ate up a slightly higher proportion of the reduced premium income, but the commission ratio remained unchanged. The loss experience in 1935 was quite exceptionally good, due to conditions in America, and it was only to be expected that 1936 would not register so favourable an experience. At 41.8 per cent. of the premium income the loss ratio is, however, still very satisfactory. Among the individual offices the highest profit ratio, namely 20.1 per cent., again belongs to the General Accident, while the Alliance, an office which enjoys consistently excellent fire results, although suffering considerable reduction in profits, comes next with 16.5 per cent. The Century has the highest commission ratio, as in the previous year, but on this occasion its profit ratio is better than that experienced by the Employers' Liability and the Norwich Union and much above the average of the twenty-two offices in 1932.

Marine Insurance

In spite of a further fall in Hull rates during 1936 (owing to lack of effective co-operation among the underwriters), the expansion of trade, increased values and also extra war risk premiums resulted in an aggregate increase in marine insurance premium income, thus reversing the experience of recent years. The underwriting profits were, however, less favourable than in 1935. During the depression, at the height of which there were over 2,000,000 tons of idle shipping laid up in the United Kingdom ports, only the best vessels and personnel were in commission, a condition which reacted favourably on claims experience and enabled the offices to obtain quite satisfactory profits in spite of successive rate reductions. There is now practically no idle tonnage, and it has always been recognised that when such a situation arose heavier claims were to be anticipated; and recent experience seems to have justified this view. Unless there is an upward movement in premiums to meet heavier rates of claim and increased costs of repairs, underwriting results are bound to suffer. As we go to press it is announced that marine underwriters at London and Liverpool have come to an agreement providing for a sliding scale of percentage increases in rates for renewals. It is the practice of those offices who confine their activities mainly to this class of business to leave the underwriting account open for two years. The account is then closed by taking the unexpended balance of the first year's premiums to profit and loss, after making suitable provision for further claims by a transfer to a suspense account. Hence the 1936 report shows the profit which, it is estimated, emerges from the 1935 premiums. The following table gives the results obtained during the past five years by representative marine companies:—

Office	Account	Premiums	Claims and Suspense	Expenses	Surplus or Deficit
		£	£	£	£
British and Foreign	1931	481,573	345,603	97,855	38,115

	1935	452,005	360,006	34,124	57,875

The general practice of composite offices is to present their marine accounts in the form used for their fire and accident business. The claims are thus to a large extent unrelated to the premiums appearing in the same account. The amount transferred to profit and loss does not represent the underwriting profit of any particular year or years; the results can be gauged approximately by comparison of the total premiums received over a period of years with the total claims and expenses in the same period.

The following table refers to five composite offices doing a large marine business:—

Office	Premiums	Claims	Expenses
	£	£	£
British Dominions:—			
1931	413,794	368,709	64,759

NOBODY MINDS PAYING A PREMIUM

—even year after year into their extreme old age—

IF it is counter-balanced by the allotment of handsome bonuses which year after year grow larger in amount.

- *Our Terms for Whole-Life Policies which share in profits are outstandingly good.*
- *You should apply for quotations and details of our attractive terms.*

UNITED KINGDOM PROVIDENT INSTITUTION
Head Office: 196 STRAND, LONDON, W.C.2
FOUNDED 1840 *FUNDS OVER £24,000,000*
Chairman and Managing Director: SIR ERNEST J. P. BENN, BT.

Accident and Miscellaneous Insurance

All branches of insurance, except life, fire and marine, are included under this category. Premium income, after falling continuously for a number of years, has shown a steady increase since 1933. The profit never forms other than a small proportion of the premium income, and at 4.4 per cent. the 1935 profit ratio was considered satisfactory. Last year there was substantial improvement to 5.1 per cent. and the effective result was probably rather better than this owing to the large increase in the amount required for unexpired risks. Improved economic conditions in the United States and this country have resulted in increased premium income in the two main divisions, namely workmen's compensation and motor insurance. The motor department presents problems of special difficulty, owing to the absence of any general basis for the settlement of claims, while the anomalies occurring in the damages awarded have added much to the actual cost of claims and to settlement expenses. The proportion of accidents to the number of vehicles on the roads has shown some reduction. Unless the experience of the offices improves an increase in motor insurance rates is regarded as likely. Among the individual offices, it will be seen that the results vary considerably, as might be expected, owing to the widely different distribution among the offices of the various classes of casualty insurance.

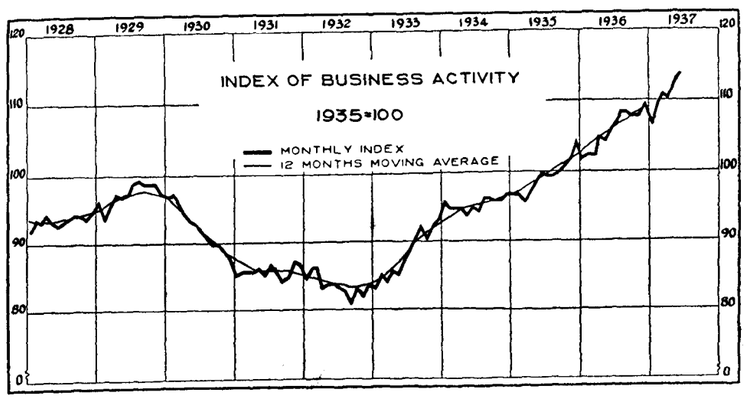
The Economist



TRADE SUPPLEMENT

New Series | SATURDAY, JULY 24, 1937 | No. 7

The Trend of Business

In contrast to the normal seasonal trend, business activity continued to expand during the past month. The improvement is reflected in a further rise in *The Economist* index of Business Activity from 113 (1935 = 100) in May to 114 in June. Of the fourteen component series of the index, shown on page 3, eight showed a rise between May and June, while five registered a decline and one (merchandise on railways) remained unchanged.

The latest reports from the principal industrial centres, moreover, indicate that the volume of new business is being well maintained, and in some cases is still increasing. Indeed, the available evidence points to a further expansion of activity during the next few months. There are no signs as yet that the rise in costs is tending to restrict demand, especially as it is accompanied by a steady expansion of credit. The latest company accounts indicate that profits are increasing as rapidly as ever. The temporary uncertainty brought about earlier this year by Mr Chamberlain's first version of N.D.C. and by repeated gold scares, appears to have passed, and the capital market has shown signs of revival in recent weeks. The possibility of a series of labour disputes has also receded into the background since trade union leaders have apparently no intention of being pushed into extreme measures by the Left Wing element.

The salient feature of recent months has been the rapid expansion of the volume of British exports of manufactures, which, in June, was some 28½ per cent. higher than a year ago. The improvement, moreover, is fairly general and comprises the majority of industries. Imports of raw materials also continue to increase in volume, and *The Economist's* index has reached a new record last month. Average import prices have risen much more rapidly than average export prices since the beginning of the year, and this points to appreciable improvement in the purchasing power of primary producing countries. It is significant, however, that although the terms of trade have moved against this and other industrialised countries by reason of the relatively greater advance in the prices of primary products, the prices obtained by British exporters are satisfactorily remunerative, since the net rise in the cost of converting raw materials into finished goods has been, in most cases, relatively small.

Apart from a number of consumption goods trades which have experienced a seasonal lull in new business, the majority of individual industries have made further headway in recent weeks. The iron and steel industry and those trades dependent on it are operating practically at capacity. But the demand for steel continues to exceed supplies, though the latter are now steadily increasing. The stringency of the position has been alleviated to some extent by heavy imports of pig iron, which will be followed by an increased intake of semi-finished materials purchased after the reduction of duties a fortnight ago. Production of coal is now substantially higher than a year ago, for the technical difficulties which prevented a rapid increase in output are gradually being overcome. Even the constructional trades continued to expand last month, despite the downward trend of the value of new plans passed. Since a year ago, however, unemployment in public works contracting has fallen more than in building, while, in the latter category, residential construction has probably passed its peak.

World recovery has now entered a phase during which international trade is rapidly expanding in spite of the obstacles to the exchange of commodities and services. This tendency is a direct consequence of the expanding demand for the majority of primary products and manufactured goods at rising prices and of the decreasing ability of individual countries to satisfy their domestic needs from internal sources. Consequently, the volume of world trade, which has already recovered to the pre-depression level, may be expected to surpass that level during the next twelve months. The long-term trend of the prices of primary products still appears to be upwards, and there are indications that the sharp reaction of quotations earlier this year, following an inordinate upward rush, has exhausted itself. Any further increase in raw material quotations is likely to provide a stimulus to international trade by inducing a further improvement in the purchasing power of primary producing countries, such as the British Empire, South America, China, Scandinavia and the Eastern European countries.

Predictions of a setback in the United States, due to strikes and over-expansion of production last winter, have not been fulfilled. Business activity has so far been well maintained in spite of a number of serious labour disputes, and the slight decline in June, caused partly by seasonal influences, does not necessarily herald the beginning of a major recession. The indications are that activity will resume its upward trend in the near future, for much leeway remains to be made up to raise America's capital equipment to pre-depression standards. Industrial activity in Germany, Austria, Holland, Poland and Czechoslovakia continues to expand, but in France recovery is still hanging fire, an improvement in confidence, following the second devaluation of the franc, having been prevented so far by the militant attitude of the left-wing supporters of the Government. But while prospects in the economic sphere are still satisfactory in most countries, there are unfortunately still no indications of an early improvement in the European political situation.

British Industrial Developments

The following reports on British industry cover, in most cases, the period to the middle of July. In the remainder they relate to the month of June.

COAL

The seasonal decline in output has been less marked than usual at this time of the year. The output of commercially disposable coal was 20,232,700 tons in June, against 18,715,300 tons in the previous month and 16,865,000 tons in June, 1936. The percentage of "wholly unemployed" miners was fractionally lower last month, compared with May, but the number "temporarily stopped" showed a substantial rise, partly in consequence of pit stoppages on account of the Yorkshire mine workers' annual demonstration. Export business continues to forge ahead, total shipments last month being 3,482,340 tons, compared with only 2,574,365 tons in June, 1936. Shipments to France, the industry's principal overseas customer, showed a remarkable advance, while Sweden and the Irish Free State were prominent buyers. Germany took more than in recent years and shipments to Italy, although only half as large as in 1935, were far in excess of last year's corresponding figure. The development of the latter market is, however, hampered by potential difficulties in securing payment. In recent weeks the export section has been quieter, forward inquiries having dwindled in number. Meanwhile, on the home market, demand for house coal is very slack and the reduction in output due to this cause makes it difficult to find the smalls needed by industrial users. Demand from the latter continues active and deliveries against contracts are well maintained.

IRON AND STEEL

The demand for iron and steel remains as strong as ever, and the industry is still unable to meet all requirements at current prices within reasonable periods. But the capacity of the industry is being steadily enlarged, and output is gradually expanding. Activity continued to increase last month, when pig iron output was higher than in any month since May, 1927, and crude steel production was almost equal to the all-time record of last March. The salient feature of the past month was the marked increase of imports of pig iron, totalling 75,809 tons, against 12,568 in June, 1936. These imports came mainly from the United States and British India. Moreover, since the reduction of duties a fortnight ago, arrangements have been made for a substantial increase in imports of steel from the Continent, which should alleviate somewhat the stringency of supplies. The trend of exports remains upwards, last month's shipments being appreciably heavier than a year ago.

GENERAL ENGINEERING

Activity in the engineering trade is still on the up-grade, and the volume of new business on offer continues to exceed the industry's capacity. The proportion of insured unemployed workers in general engineering showed a further decline in June to the low level of 5 per cent. The expansion of demand, moreover, is not confined to the home market. For example, the volume of exports rose from 27,550 tons in June, 1936, to 37,557 tons in the past month. Most sections of the industry benefited from the expansion of export demand, but machine-tool makers, who are hard pressed by home consumers, were unable to ship abroad as much machinery as a year ago. Imports, especially of machine tools, are also at a substantially higher rate than a year ago, totalling 12,529 tons, last month, against 7,573 tons in June, 1936. Until recently the industry's chief anxiety has been the difficulty of obtaining supplies of iron and steel, and it is significant, therefore, that current complaints are mainly directed against the marked increase of the prices of raw materials. Nevertheless, there are no indications that the rise in prices is likely to lead to an early decline of new business.

SHIPBUILDING

As a result of the rapid expansion of international trade, accompanied by a steep upward trend of freight rates, the demand for new mercantile shipping tonnage is steadily increasing. The tonnage of merchant vessels under construction at the end of last month, at 1,199,973 gross, was the highest since June, 1930, and showed an increase of 185,519 gross tons over the past three months and of 351,241 gross tons over the figure for June, 1936. Moreover, the indications point to a further improvement during the remainder of this year, though the small volume of overseas orders is a less satisfactory feature.

ELECTRICAL EQUIPMENT

Manufacturers of electrical machinery and equipment remain very active, and the volume of inquiry and new business is still at a high level. The B.E.M.A. index of new orders received for heavy electrical machinery, given on page 5 (items 8-10), showed a further increase last month, a slight decline in foreign orders being more than offset by an increase in domstic orders being more than offset by an increase in domestic showed a substantial increase over the corresponding month last year.

AUTOMOBILES

The event of the month was the increase by approximately 5 per cent. in the price of cars; the effect of this action on demand remains to be seen, but it is not believed in the trade that the check will be serious. In May, however, production of cars was below the previous year's corresponding figure—33,093, compared with 36,231. The total output during the first eight months of the present season amounted to 272,377, against 248,224 in the previous season; while production of commercial vehicles totalled 80,806, against 71,730. Imports of cars in June were substantially above the previous year's corresponding figure, while exports also continued to increase. Overseas sales of commercial vehicles were also larger than in June, 1936.

BUILDING

Building activity is maintained at a high level, and no marked decline appears likely in the immediate future. The number of houses built in the year ended March 31st last, at 346,047, was 21,187 more than in the previous twelve months and constituted a record. Little change in the general position of the industry was apparent last month, although the unemployment percentages were fractionally lower than in May. The slight improvement was common to each of the administrative divisions and to each occupation group, except painters. Meanwhile, the value of building plans approved by the local authorities continues to move irregularly, with the aggregate showing a downward tendency. Compared with a year ago, the June total shows a decline of 13 per cent. An increase in the value of plans approved for factories, workshops, churches, schools and public buildings was offset by a decline in plans for other purposes—including residential buildings. It is unfortunately true, however, that for a number of technical reasons the plan figures are becoming less reliable as a guide to the future course of building activity.

CHEMICALS

There has been little notable change in the home chemical market during the month of June, the industrial chemicals section continuing in fair demand. Tartaric, citric and acetic acids have been particularly good items, due probably to seasonal factors. The wood distillation products market has been moderate. Improvement was again shown in overseas trade during June, exports of chemicals, drugs, dyes and colours being £12,586,595 for the first six months of this year, an increase of £2,313,556 over the same period of 1936. Imports showed an increase over last year of £496,694, the total for the first six months of 1937 being £6,521,208.

POTTERY

The position on the home market showed practically no change during June. Employment in North Staffordshire remained fair generally and was much better than in the same month of last year. Employment continued good at Bristol and Derby and very good at Worcester. Nevertheless, a considerable proportion of operatives are working short-time and conditions are by no means uniform. Export business was considerably above the level of a year ago. Shipments of general earthenware showed a satisfactory expansion, Canada and other Empire countries being the principal customers. Sales overseas of electrical ware, sanitary ware and tiles were also larger than in June, 1936, but exports of china were rather smaller.

FOOTWEAR

The employment position showed a marked improvement between May and June, but comparison is rather unreal, since unemployment was increased in the former month by holiday stoppages. Activity, however, is well above last year's level at this time. Exports of leather boots and shoes amounted to 30,836 dozen pairs last month, compared with 21,301 dozen pairs in the same month of 1936. Imports showed a similar expansion.

COTTON

Activity in Lancashire is well maintained on the basis of past contracts, but sales of yarns and piece goods in recent weeks have been less than output; order lists are consequently lighter. Employment at June 21st showed an improvement compared with May 24th, when, however, holiday stoppages affected the position. The volume of unemployment was substantially smaller than at this time last year, and acute shortages of juvenile labour are reported from many centres. A shortage of weavers was occasionally experienced. Meanwhile, the attitude of buyers is being affected by bearish news of the American cotton crop. The acreage under cotton is 10.4 per cent. larger than in the past season and, although the growing cro phas still to pass through the most critical period, there is every probability of a large output. Demand for cloth from India is of small dimensions, and only occasional transactions have been put through for Egypt and season and, although the growing crop has still to pass through for China, Java and Singapore, while prints have been bought in fair volume for West Africa and dyed goods for South America. Business for the Continent remains irregular and home trade buyers are cautious. Spinners are firm in their quotations, most rates being protected by legalised price agreements. Spinning continues at about 92 per cent. of capacity, against 79 per cent. a year ago.

JUTE

Fluctuations in the price of the raw material have occasioned uncertainty, and anticipations of a decline in quotations tended to hamper business during most of the period under review. According to the first forecast of the Indian jute crops for 1937-38, the area sown (at 2,747,100 acres) is not so large as had been expected. The industry is, however, inclined to distrust the returns since the crop has been underestimated by an average of 1,750,000 bales during the past six seasons. Nevertheless, jute prices have shown a firmer tendency since their publication. Yarns, which had been a very quiet market, are now receiving more attention at rather firmer rates. New business in cloth is, however, concerned mainly with small lots for immediate delivery and quotations are nominal. Meanwhile, representatives of the industry are seeking protection against Calcutta manufactures, which at present enter the country duty free.

LINEN

Flax is in quiet demand, and holders refrain from pushing sales as they anticipate difficulty in securing replacement. Courtrai fibre is in brisk demand. Reports on the growing crops are generally favourable. New business in yarns shows a seasonal decline, but pressure for delivery against current contracts is intensified. New cloth business is practically confined to routine requirements, buyers conceding the higher prices now established.

RAYON

Business in yarns is generally healthy, some of the popular deniers of viscose being in particularly good demand. Considerable forward buying is taking place—a tendency which is being stimulated by the firmness of prices. Demand from Lancashire for acetate yarns is somewhat restricted, while business with the West Riding in yarns for satins and satin beautés is also decreasing considerably.

WOOL

Unemployment was swollen in May by holiday stoppages, and it is therefore not surprising to find that the position showed some improvement last month. The percentage of insured workpeople recorded as unemployed was 8.7 on June 21st last, against 11.1 a year earlier. Export business last month showed a satisfactory increase compared with June, 1936, total overse assales of woollen and worsted yarns and manufactures being valued at £17,647,931, against £15,310,740. Prominent customers of the industry were Canada, the Union of South Africa and Argentina; each of these took larger quantities than in the previous year. Germany, however, which is the second largest buyer, absorbed less than in June, 1936. Meanwhile, machinery activity is now showing a seasonal decline, but active preparations are being made for the spring and summer season of 1938. Raw material prices remain firm, the tendency at the recent series of London sales being stronger than was expected; but users are seeking to obtain concessions.

AGRICULTURE AND FISHERIES

Weather conditons during June were, on the whole, favourable for land work and crops made good growth. Corn crops made considerable progress. Early autumn sown wheat is generally healthy and vigorous, but later sowings and spring wheat are variable, especially on wet and heavy land; yields are expected to be below average generally. Despite recent improvement, barley is still backward and yields may be rather below average; oats are in a similar position. Beans are promising, and should produce at least an average yield, while peas have also been making good progress. Potatoes, although backward, look well and, where litting has begun, are yielding satisfactorily. Root crops and hops are making good growth, although some of the hop bines in Kent have been attacked by aphis and downy mildew. The growth of hay has been good, but harvesting operations have been prolonged by adverse weather; yields are estimated to be above the ten-year average. Grass has continued plentiful. Cattle and sheep have consequently done well, milk yields being well maintained. In the first six months of 1937 British takings of wet fish aggregated 9,447,778 cwts., against 9,450,497 cwts. in the corresponding period of last year. Prices realised, however, showed a marked decline and the total value of the catch consequently amounted to no more than £6,858,207, compared with £7,271,314 last year. Prices, however, showed a slight recovery in June.

SHIPPING

The rapid rise in freight rates, which has been a notable feature in the shipping world since the middle of last year, was checked in June. Nevertheless, the *Economist* index of whole cargo shipping freights rose from 154.9 in May to 157.0 in June (1898-1913 = 100), against only 90.6 in the same month of 1936. Quiet conditions continued to rule during the first half of July, but, under the lead of the River Plate market, the principal homeward markets are now showing a better tone. The gradual expansion of international trade and the recovery of the prices of primary products are a good augury for the immediate future of shipping.

Business Developments Overseas

BRITISH EMPIRE

AUSTRALIA.—A cabled report from the National Bank of Australasia states that seasonal conditions are exceptionally promising in Western and South Australia, but that Victoria, New South Wales and South-East Queensland need early rains. The wool clip is estimated at 3,146,000 bales, or 2 per cent. more than last year, while the area under wheat is estimated to be 11 per cent. more. Recent high levels in industry and trade have been maintained; the trade balance for the twelve months amounts to £35 million sterling, against £22,500,000 for the corresponding period last year.

SOUTH AFRICA.—Latest available data suggest that the tide of prosperity in the Union continues to flow. The expansion of the gold mining industry has not only enabled the public finances to be established on a much more favourable basis, but has contributed in many ways to the social amenities of the country. Thus, a great national road scheme has recently been inaugurated, the programme to be completed in five or six years. Meanwhile, overseas trade continues well above last year's level. Imports in June were valued at £9,004,000, against £7,269,000 in the same month of last year; while total exports were £11,322,000, against £8,469,000 in June, 1936.

CANADA.—Business activity, as is pointed out in the Monthly Letter of the Royal Bank of Canada, has recently been maintained well above the 1936 level. While the improvement has been general, the growth in the output of iron and steel, newsprint, nickel, copper and gold is particularly striking. Employment has consequently increased and retail sales are greater than at any time since 1931. Meanwhile, wholesale prices have been steadily rising. Data for May and June are still incomplete, but it is suggested that the seasonal slackening of activity will be rather more pronounced than usual. The outlook is clouded by the adverse weather conditions in the wheat belt.

NEW ZEALAND.—The improvement in the Dominion's economic position is reflected in the national accounts for the year ended March 31st, which disclose a surplus of £472,000. The tax yield is steadily rising, but the Government has embarked upon an expansionist programme of social services, and some concern is being felt lest taxation should be further increased. Meanwhile the export industries continue to benefit from rising prices and overseas trade continues to grow. Imports amounted to £4,412,000 in May and exports to £5,896,000, against £3,196,000 and £5,025,000 in May, 1936.

EUROPE

FRANCE.—France is one of the few countries which have not yet been caught by the rising tide of recovery. Industrial activity had shown a very gradual increase between August, 1936, and April, 1937, but even in the latter month the official index of production was still some 25 per cent. below the pre-depression level. In contrast to France, Switzerland and Holland have been making fairly rapid headway since devaluation last autumn. France lost the benefits of the initial exchange depreciation owing to the rapid rise of internal costs and prices due to the reduction of hours of work and wage increases. In May, industrial activity again took a downward turn, and in June France found herself in the throes of another Budget crisis which led to a change of Government and a further measure of exchange depreciation. But despite the severe measures taken to balance the Budget, there are still no indications of an early revival of confidence and of a repatriation of capital, partly owing to the militant attitude of the Government's Left Wing supporters. The outlook remains uncertain.

GERMANY.—Business activity continues to expand. The index of industrial production of the German Institute for Business Research rose from 113.7 (1928 = 100) in December, 1936, to 119.8 last May. This year's expansion, however, has been practically confined to capital equipment and other durable goods. The index relating to consumption goods has actually shown a downward trend since last December. During June the official returns of the number of unemployed persons showed a further decline, from 776,300 to 649,000. Wholesale prices and quotations for industrial securities have shown little change in recent months. As far as Germany's foreign trade is concerned, both imports and exports have risen in value since the beginning of the year, but as the increase was most marked in imports the excess of exports over imports has fallen from Rm. 79 millions in January to Rm. 9 millions in May.

NORWAY.—Business activity has been well maintained in recent months at a level showing an increase of 25 per cent. over 1929. Foreign trade has shown a remarkable increase during the past twelve months. Thus, the value of imports rose from Kr. 77.4 millions in May, 1936, to Kr. 120.0 millions in the corresponding month this year, while exports advanced from Kr. 47.7 millions to Kr. 60.6 millions during this period. Again, the number of registered unemployed has shown a steady decline, from 36,260 last December to 22,028 in June, against 26,139 a year ago.

GREECE.—Heavy rains and hail during June caused some damage to the crops. Harvesting has nearly finished. On the whole, crops are expected to be larger in quantity and better in quality than last year's. A seasonal lull in internal trade and in certain industries is noticeable. Foreign trade returns for May show an increase both in imports and exports compared with May, 1936. Sharp rises in quotations took place in Juné on the Athens Stock Exchange. The foreign exchange reserves of the Bank of Greece, as well as the index of wholesale prices, have registered a slight fall.

POLAND.—Industrial production is steadily expanding, though not rapidly enough to absorb the increase in the number of persons applying for work. Thus, registered applicants for work last April numbered 414,974, against 407,734 a year ago. On the other hand, the index of industrial production calculated by the Polish Institute for Economic Research rose from 71.2 (1929 = 100) to 85.7 during the twelve months ended last May. The current volume of activity, however, is still about 15 per cent. below the pre-depression level.

UNITED STATES OF AMERICA

Despite a number of serious labour disputes business activity has so far been well maintained. After a slight setback in January, industrial production continued at a high level until June, when a small decline took place as a result of the strikes in the steel, automobile and other industries, and owing to seasonal influences. There are no indications, however, of a more serious setback during the next few months. The rise in the prices of food crops and other primary products has brought about an improvement in America's economic balance. For example, the United States Department of Agriculture estimates the farm income for 1937 at $9,500 millions, an increase of $1,500 millions over last year and of $5,123 millions over 1932. However, much leeway remains to be made up to raise America's capital equipment to pre-depression standards. Residential building, in particular, has fallen heavily in arrears since 1929 and is now gradually expanding. The increasing demand for accommodation is reflected in the upward trend of rents, which recently has been even more marked than the rise in costs of construction. The improved outlook is reflected in a sharp recovery of quotations for industrial securities during the past few weeks.

LATIN AMERICA

ARGENTINE.—Although exports continue to decline from the record high level registered in the first quarter of the year, their aggregate value in May, 1937, was still some 72 per cent. higher than in May, 1936. Both the tonnage and value of imports in the first five months of 1937 were the highest recorded for that period in any year since 1931. United Kingdom goods remain at the head of the import list, at over 20 per cent. of the total. Argentina's favourable trade balance for the first five months of this year is over £44 millions sterling and higher than for any full year since 1919. Retail business in Buenos Aires is definitely better than a year ago.

BRAZIL.—The exchange value of the milreis continues steadily to improve, believed to be due to official intervention. Imports are rising faster than exports, and the favourable balance of trade fell from £2 millions (gold) during the first four months of 1936 to £1,578,000 (gold) during the corresponding period this year. Suggestions for restoring statistical equilibrium to coffee include the elimination of millions of trees, or, alternatively, production quotas to each district or planter. Whichever is adopted, planters will expect monetary compensation.

CHILE.—Foreign trade continues to expand, notably in copper exports; and, mainly by arbitrage of the United States dollar, there is at present a sufficient supply of sterling exchange cover available for legitimate trading.

OTHER COUNTRIES.—Under the new Trade Agreement between Colombia and Germany, the latter should take larger quantities of Colombian coffee. Arrivals of new crop coffee in Ecuador are satisfactory, but business generally is difficult owing to the control of exchange and imports. Guatemala's coffee crop has sold well, while the national accounts have again closed the year with a surplus. The new Nicaraguan coffee crop promises well, and in Venezuela there is also a brisk demand for coffee from abroad.

THE FAR EAST

The feature of the past month has been the growing political tension between China and Japan, a factor which has tended to obscure the economic outlook in both countries. In Japan, however, business activity, stimulated by the needs of the re-armament programme, continues on a high level. The money market in that country has hardly been affected by the outbreak of hostilities, but Stock Exchange prices have suffered a setback. Commodity prices have continued to show weakness generally, silk and cotton having suffered a sharp break; rice, however, has risen in price. The main feature of Japan's foreign trade has recently been the growth of the import surplus, the excess of imports over exports aggregating 641 million yen in the first half of 1937. Imports in June amounted to 397 million yen, against 242 million yen last year, while exports totalled 295 million yen, against 216 million yen in June, 1936. China's imports rose from 111 million standard dollars in May to 115 millions in June, against only 84 millions in June, 1936; while her exports increased from 78 millions to 85 millions, compared with 58 millions in June last year.

TRADE SUPPLEMENT

New Series SATURDAY, AUGUST 28, 1937 No. 8

The Trend of Business

THERE has been no major change of trend in British business activity since the publication of our last monthly Trade Supplement on July 24th. On the whole, the lull in business during the summer has this year been less marked than usual. The volume of employment in Great Britain at the end of July, for example, was as high as in June and showed an increase of 511,000 over the year. *The Economist* index of business activity declined from its peak of 113½ in June to 111½ in July. But a glance at the movement of the constituent series on page 11 shows that the decline was by no means general. Six series actually registered a rise, while seven declined and one remained unchanged. In any case, a number of indices for July are still provisional; the heavy fall in the provisional index of British coal consumption, in particular, almost certainly fails to represent the true position, but movements of stocks during that month are not yet available.

Although the evidence is not altogether conclusive, the latest reports from the principal industrial centres point to a resumption of the upward trend of business activity during the autumn. The more rapid rise of costs of production is as yet scarcely reflected in business profits, which, indeed, continue to show greater percentage increases than a year ago. Nor are there any indications that rising prices are meeting with much resistance on the part of consumers. Demand for iron and steel, for example, is still greater than supplies at current prices, though the latter are steadily expanding. Our index of British iron and steel consumption, indeed, reached a record level last month, the steadily expanding demand embracing nearly all branches of engineering and shipbuilding. The value of building plans passed by 146 Local Authorities has recently been much below last year's level in spite of the rise in construction costs, and it now looks as if residential construction, in particular, may take a definite downward turn next year. For some time, however, the impact of the decline in private building is likely to be softened by Government contracts which are not included in the figures of building plans passed by Local Authorities.

In contrast to the metal industries, the textile and clothing trades experienced a lull in activity accompanied by a fairly general increase in unemployment; but, in view of the increasing purchasing power, this lull is expected to be only temporary. The Ministry of Labour's index of weekly wage rates (1924 = 100) rose from 100 in the first quarter to 101½ in the second quarter of this year, an increase of 2½ per cent. over the corresponding period in 1929. On the other hand, the official index of the cost of living, though it has risen from 86.3 (1924 = 100) to 87.1 during this period, against the normal seasonal trend, still stands about 5 per cent. below the 1929 level.

As we pointed out a month ago, recovery in this country has been considerably strengthened in recent months by the rapid improvement of British exports, due to the rise in prices of primary products, on the one hand, and to the increased trade between manufacturing countries on the other. This trend has continued in July, when the value of British exports was 18.7 per cent. higher than a year ago.

Following a fair measure of recovery in July, prices of many primary products have again tended to decline. In the case of wheat and cotton, the renewed fall is due mainly to heavier crops, while in the case of metals the absence of further improvement may be ascribed to the continued absence of consumer buying accompanied by the rising trend of production. But the erratic movements on the commodity markets in recent weeks does not necessarily portend a change of trend. In any case, current quotations are in most cases still substantially higher than a year ago. Moreover, stocks of primary products in first hands are still considerably smaller than a year ago, and a resumption of purchases may lift prices again to higher levels.

There is thus little danger of an early setback in the prosperity of primary producing countries whose increased purchasing power has contributed much towards raising the volume of international trade. The latest reports from these countries, including the British Empire, South America, Scandinavia and Eastern Europe, point to progressive or sustained improvement. China's overseas trade has also been expanding fairly rapidly in recent months, and it is as yet too early to estimate the repercussions on China's economy of Japan's attempt to gain control over her Northern Provinces by force of arms.

As far as manufacturing countries are concerned, there are no indications of an early interruption of the progress of recovery. News from the United States is somewhat conflicting, and the immediate outlook has been rendered uncertain by internal political dissensions. Nevertheless, the autumn is expected to witness a further expansion of business activity. Industrial activity in Germany has continued to expand in recent months under the self-sufficiency programme, but in view of conditions prevailing in Germany, a rising volume of production accompanied by a decrease in unemployment is not necessarily synonymous with an increase in the standard of living. In Austria, Belgium, Holland and Poland activity is considerably greater than a year ago. In France, the volume of industrial production has actually tended to decline in recent months. While it is now gradually being realised that improvement in the standard of living is impossible without an increase of production, it still cannot be said that France has definitely turned the corner. But the outlook should become clearer before long.

British Industrial Developments

The following reports on British industry cover, in most cases, the period to the middle of August. In the remainder they relate to the month of July.

COAL

Latest available data suggest that activity in the coal-mining industry remains above the seasonal norm. Output declined from the high figure of 20,233,000 tons in June to 18,942,000 tons in July, the latter figure comparing with 18,186,000 in the same month of last year. Employment last month, though affected by the seasonal decline in demand, was fairly good for the time of year in most districts. The employment position is now considerably better than at this time last year. Meanwhile, exports registered a further sharp increase last month, amounting to 4,130,600 tons, compared with 3,360,000 tons in July, 1936. The best customers were France, Sweden, Italy, Finland, Canada and Argentina; whereas Italy took no British coal in July, 1936. Export demand has been rather quiet in recent weeks, but some benefit is expected from the cessation of shipments from South Africa. Meanwhile all grades of industrial fuel remain in active demand, but business in house coal continues seasonally slack.

IRON AND STEEL

No fundamental change has taken place in the position of the iron and steel industry during the past few weeks. Demand is as good as ever, but supplies are increasing only slowly, and there is still a severe stringency of materials, especially in the semi-finished steel section. The output of pig iron continued to expand last month, but, contrary to last year's experience, production of crude steel showed a decline between June and July. Higher imports of iron and steel have given some slight relief, the intake in July having been 202,300 tons, against 174,800 tons in June and 98,100 tons in May. Exports of iron and steel in July, at 232,200 tons, have been well maintained, but it is significant that the volume of exports, which, in the past, was normally considerably greater than imports, is now running only slightly above the level of imports, measured by tonnage. Our seasonally adjusted index of British steel consumption, shown on page 11, reached a new record in July. Moreover, there are as yet no indications of an early slackening of demand at current prices.

GENERAL ENGINEERING

The steady expansion of activity in the engineering industry has been temporarily arrested by seasonal influences, such as local holidays. But provided the industry can obtain sufficient materials and labour, the indications point to the continuance of the upward trend next month. The demand for machinery, both at home and abroad, is still tending to expand, despite the increase in prices. The improvement in foreign demand is reflected in a further expansion of exports during the past month. Imports, too, continue to increase rapidly owing to the inability of British firms to supply all the requirements of the home market. Measured in volume, imports of machinery rose from 6,588 tons in July, 1935, to 9,016 tons a year later and 14,311 tons last month. But the f.o.b. value of exports during the first seven months of this year was still almost double the c.i.f. value of imports during this period. The increase in imports has been very marked in the case of machine tools and rolling-mill machinery. The heavier purchases of rolling-mill machinery, incidentally, reflect the efforts which are being made to increase the capacity of the iron and steel industry. The prospects of the industry remain promising.

ELECTRICAL EQUIPMENT

Owing to the pressure of demand, manufacturers of electrical apparatus and machinery have had little respite this summer. Actually, there has been scarcely any decline in activity in recent weeks. Mainly as a result of the pressure of home demand, exports of electrical machinery in July were lower in quantity and in value than in the corresponding month last year. But this decline was more than offset by an increase in exports of apparatus and appliances. Despite a slight fall in the volume of new orders for heavy electrical machinery last month, the outlook for the electrical equipment industry is still good.

AUTOMOBILES

As was anticipated last month, the increase of about five per cent. in the price of certain makes of car does not appear to have affected demand. The decreased demand during May is attributed by the trade to the temporary effects of the Coronation, and it may be noted that the rise in June more than offset the fall in May. The output in June was also well above last year's corresponding figure—35,657 against 29,968. Total production during the first nine months of the present season was 308,034, against a corresponding figure of 278,192 last year; while the output of commercial vehicles was 91,125, against 80,992. Imports of cars this year have been higher than a year ago, due partly to larger purchases from Germany. Exports also continue to exceed last year's corresponding figures.

BUILDING

Activity in the building industry is maintained on a high level, with unemployment at its lowest since 1929, despite a 25 per cent. increase in the number of workpeople since that date. A slight seasonal increase in unemployment, common to all districts, occurred in July, but in most areas the percentage of unemployment was lower than in July, 1936. Shortages of bricklayers and other skilled operatives were reported in some districts. While there is no sign of an early recession, the maintenance of operations on the present scale is problematical in view of recent movements in the plan figures. The value of building plans approved by 146 local authorities during the past four months was 9.5 per cent. below the previous year's corresponding total, despite the rise in costs in the meantime. Although these figures do not take account of Government work, and may be open to qualification on other grounds, it appears unlikely that Government building will be sufficient to ensure the maintenance of the present level of activity after a comparatively short time has elapsed.

CHEMICALS

During the past month trade in the home chemical market has been on a very fair scale for the time of year, particularly in the industrial chemicals and wood distillation products sections. In the coal tar products market refined coal tar and creosote oil have been quite active, but there has not been much new business in other products. Demand for pharmaceutical chemicals has been steady, but rather limited. Overseas trade in chemicals, drugs, dyes and colours continues to increase, July exports being £267,955 greater and imports £151,025 greater than in the same month of last year.

POTTERY

In North Staffordshire activity was affected by seasonal slackness and temporary stoppages occurred towards the end of July. At Derby and Bristol, however, employment continued good, while at Worcester it was still very good. Meanwhile, exports of general earthenware last month were slightly smaller than in the same month of last year; but exports of tiles, sanitary ware and electrical ware showed an improvement.

FOOTWEAR

Following the improvement in June, employment showed a slight seasonal decline at most centres in July, though it remained fairly good for the time of year. The industry is considerably more active than at this time last year. Export demand shows a similar improvement. Exports totalled 37,108 dozen pairs in July, against 30,367 dozen pairs in the same month of 1936, the best customers being Empire countries.

COTTON

The sagging tendency of raw cotton rates has made buyers of manufactures cautious, and few producers have been able to sell their full output. The American cotton crop is officially estimated at 15,593,000 bales, while production of "outside" growths is expected to aggregate 19,500,000 bales. With a carry-over of 12,800,000 bales, total supplies amount to nearly 48 million bales, compared with a consumption last season of some 31 millions. The outlook for raw cotton therefore appears bearish. Order lists of manufacturers have tended to run down during the past month, though producers remain busy on current contracts. Operations for India have been limited and business with China has come to a standstill. Moderate sales have been made for other outlets, with home trade buyers cautious. Sales of yarn have been disappointing, though margins have been maintained. Spinning production continues at about 92 per cent. of capacity, the same as a month ago, against 79 per cent. at this time last year.

JUTE

The industry has recently been passing through a quiet spell. The raw material has been maintained on a high price level, though a rather weaker tendency has been evident in recent weeks. Spinners and manufacturers have encountered a quiet demand and unemployment in the industry remains on a high level. Stocks in consumers' hands, however, appear to be running down, and some revival of demand is consequently being looked for in the near future.

LINEN

As usual at this season, very little flax is on offer, excepting odd lots in merchants' hands; these have mostly been disposed of at full rates. No indications regarding the new crop have been given either by the Soviet or by the Baltic monopoly, but supplies of Irish fibre will be smaller than last year. Courtrai promises well, with prices tending upwards. Demand for both yarns and cloth is on a hand-to-mouth basis, seasonal buying not commencing until next month. Exports are well maintained.

RAYON

In the rayon spinning trade there is considerable activity for the time of year. While there is not an abundance of new business, deliveries are maintained on a high level and there is a shortage of certain types of yarn. Staple fibre is in steady request, and business is materially larger than at this time last year.

WOOL

The raw material has been firm in price during the period under review and some further rise is expected when the new season opens in Australasia at the end of this month. Employment in the industry showed a slight decline in July, but this was largely due to seasonal causes and occurred almost entirely in the worsted section. There was little change in the woollen section, but a slight decline in the carpet section. Machinery has been kept busy, except for holiday stoppages. Meanwhile, prices of tops and yarns show a firm tendency and new business is reported to be good. The export position remains satisfactory, the value of total shipments of yarns and manufactures last month being £3,548,258, against £3,180,474 in July, 1936. The industry's best customer was Canada, followed by Argentina and the United States. Sales to a long list of countries showed an improvement over the year.

RETAIL TRADE

The money value of retail sales in July, according to this week's *Board of Trade Journal*, was 8.1 per cent. above last year's corresponding figure. The increase was common to each of the seven districts, being greatest in the Midlands and South Wales (+ 11.9 per cent.) and least in Central and West-End London (+ 0.8 per cent.). Sales of food and perishables were up by 10.2 per cent. compared with July, 1936, while sales of other merchandise showed a gain of 6.1 per cent. Part of the increase is, of course, due to the rise in prices, but it is difficult to assess the quantitative importance of this factor. Total sales for the first half of the trading year (February to July) were 8.2 per cent. in excess of those for the same period of 1936, the rise being greatest in the Midlands and South Wales.

AGRICULTURE AND FISHERIES

Corn crops are variable but generally fair; at the end of July more sunshine was needed to ripen the grain. Harvesting has begun but is not yet general. The yields of wheat, barley and oats are at present forecast to be below the average of the past ten years. Both early and main crop potatoes promise an average yield. On present appearances the yields of root crops are expected to be about average, but the yield of hops is expected to be below average. Haymaking has proceeded slowly owing to the absence of sun. The yield per acre of both seeds and meadow hay is estimated to be above average. Cattle and sheep are thriving. Milk yields generally have been up to average for the season. Meanwhile, British takings of wet fish aggregated 2,140,472 cwts. in July, against a total of 1,940,699 cwts. in the same month of last year. Average values were, however, lower than in July last year, and the total catch was consequently valued at only £1,485,291, compared with a comparable total of £1,505,343 a year ago.

SHIPPING

The tendency of the freight markets was somewhat irregular during July; and *The Economist* index of whole cargo shipping freights (1898-1913 = 100) eased from 157.0 in June to 154.5 in July, compared with 92.3 in July, 1936. Subsequently, although the volume of business has been limited, the markets have had a firm tone, and there appears to be no early possibility of a substantial setback. The demand for tonnage has been intensified by the stoppage of South African coal exports; for importers' requirements must now be satisfied from farther afield.

Business Developments Overseas

BRITISH EMPIRE

AUSTRALIA.—Industry and trade show signs of winter recession, states a cable from the National Bank of Australasia, but activity generally remains above last year's level. Until recently the farming outlook was obscured by unseasonable weather, but good rainfall has occurred this week. With the improvement in the trade balance, bank deposits have reached record figures. The stock markets are firm, with prices showing a rising tendency.

SOUTH AFRICA.—General business in the larger centres is steady, states a cable from the Standard Bank. Wholesale orders in Johannesburg are, however, below expectations, owing to excessive purchases earlier in the year. The building and allied trades are well employed, while, despite drought in some districts, the agricultural position generally remains favourable. Commodity markets are, in the main, active; while railway earnings remain above Budget estimates.

CANADA.—The disastrous crop failure in Saskatchewan and Alberta has made it necessary for the Federal Government to undertake relief measures and has thus thrown a strain on the public purse. Meanwhile, however, the second half of July witnessed a revival of business confidence; business activity is now slowly expanding. Production in the mining industry is maintained on a high level and rising prices have benefited the industry. The newsprint industry is also making headway.

INDIA.—India's merchandise imports amounted to 14,12 lakhs of rupees in July, against 13,88 in the previous month. Exports, on the other hand, aggregated 17,36 lakhs, compared with 17,85 lakhs in June. Taking into account bullion movements, the favourable balance of trade in July amounted to 5,13 lakhs, against 3,74 lakhs in June. Meanwhile, rainfall has been general in most parts of India, and the crops are reported to be in good condition, except in Bihar Province, where flood damage has occurred.

EUROPE

FRANCE.—While the second quarter of the current year witnessed a steady decline in industrial production, the latest reports indicate a slight improvement. Thus, in contrast to the movement a year ago, unemployment declined during the past month, the number of persons in receipt of benefit falling from 319,161 to 313,553. Moreover, this trend has continued during the first fortnight of August. At the end of July, 1936, the number of unemployed persons in receipt of benefit was 420,776. Yet, in spite of the substantial reduction in unemployment since last year, industrial production is only slightly higher and remains some 25 per cent. below the 1929 level. Even now it would be rash to state that France has definitely "turned the corner." There are signs, however, of a growing realisation of the fact that legislation alone is not sufficient to lift the country out of the depression. Commodity prices are still on the upgrade, but quotations for industrial securities, after rising steeply in the first half of August, have fallen back almost to the level of a month ago.

GERMANY.—Industrial activity continued to expand, partly as a result of the drive for national self-sufficiency and re-armament work. However, the problem of unemployment has now given way to the problem of labour shortage. According to the official returns, the number of unemployed persons declined from 648,400 to 562,900 during July, against 1,169,900 a year ago. But while Germany's resources are now almost fully employed, it must be remembered that this state of affairs is not necessarily synonymous with a high standard of living. Wholesale prices are scarcely changed on the month, but quotations for industrial securities have shown a rising tendency. Coal production, as well as the output of pig iron and steel continue above the level of a year ago.

AUSTRIA.—Recovery has made rapid progress in recent months. The index of industrial production for May (the latest available) stood at 107 (1929 = 100), against 87 in January and 81 a year ago. The number of applicants for work has fallen from 322,501 at the end of June, 1936, to 281,401 at the corresponding date this year. The improvement is likely to be maintained.

POLAND.—Poland is slowly emerging from depression. The volume of industrial production has not changed very much in recent months, but is substantially higher than a year ago. The number of registered applicants for work, however, declined only slightly, from 314,014 at the end of June, 1936, to 293,025 at the turn of the half-year of 1937. Present indications point to a continuation of recovery, if at a slow rate.

SWEDEN.—Industrial production continued to expand in recent months, the index having risen from 135 (1929 = 100) in January to 142 in June, against 127 a year ago. The improvement is reflected in a remarkable increase in foreign trade. Exports rose from Kr. 126 millions in June, 1936, to Kr. 169 millions this year, and imports advanced from Kr. 121 millions to Kr. 179 millions during this period.

UNITED STATES OF AMERICA

While industrial activity showed a moderate decline in June, there has been no further deterioration since then. The current volume of production, though different in composition, is about equal to the 1929 level. Prospects for the autumn are fair, and an early resumption of the upward trend is expected. The income of the agricultural community is increasing as a result of heavier crops and higher prices. In industry, labour disputes have tended to decline. But a more rapid expansion of activity is prevented by rising costs and uncertainty concerning future legislation affecting business. The capital market, indeed, is still slow in reviving, while constructional activity is increasing only slowly. Foreign trade is at a considerably higher level than a year ago. The outlook remains promising.

LATIN AMERICA

ARGENTINA.—Following record exports, purchasing power is expanding and finds reflection in the steady improvement in the retail markets. Imports during the first six months of 1937 amounted to 669 million pesos, against 539 millions in the same period of 1936, the highest figure registered in the period since 1930. All the principal imports registered substantial increases. Although British goods continue to head the list, at nearly 132 million pesos, against 121 millions last year, the proportion declined from 21.9 per cent. to 19.8 per cent. of total Argentine imports. A feature is the growth of Argentine trade with the United States and Japan, with a large balance of trade in favour of the Argentine, and these two countries are pressing for the removal of the 20 per cent. surcharge on exchange, which would intensify their competition with British goods. Similarly, under the recent Italo-Argentine Trade Agreement, importers of Italian goods should now be able to obtain exchange at the official rate, and, helped by subsidies, are under-selling in the Argentine market, particularly woollen textiles. Japan has reduced the price of cotton goods by 20 per cent. and competition with Lancashire goods from this source is extremely keen. Although figures of Argentine exports for the complete six months ended June last registered a spectacular increase over 1936, there has been a contraction of exports during the last month or two from the record figures in the first quarter, which will probably assist the Government in avoiding any reduction in the official selling rate of exchange. Despite recent light rains, the prolonged drought has held up ploughing for the next fine cereal harvest, and this year's wheat harvest will undoubtedly be appreciably below that of 1936.

URUGUAY.—The economic position is improving steadily, and the general pastoral and agricultural outlook is satisfactory. The exchange value of the peso is being appreciated gradually, but yet under the control of the State Bank.

BRAZIL.—Trade shows an increase on both import and export account. Coffee exports are languishing, but the outlook for the coming cotton crop is now better. Conditions are normal with regard to general business and in the import markets.

CHILE.—Foreign trade statistics show steady expansion, whilst there is a notable growth in exports of mining products, particularly copper. Assisted thereby, there continues to be a sufficient supply of sterling and dollar cover for legitimate trading in the exchange market.

OTHER COUNTRIES.—Peru's export trade continues to flourish, with a large visible balance at end-May, whilst the outlook for the new coffee crop in the Central American Republics is so far favourable.

THE FAR EAST

The outbreak of hostilities between Japan and China has been the principal feature of the past month; it is reported that Japan is making preparations for a long conflict. Industrial production, which has been on a high level in Japan for some time, is being intensified, and the growing need for raw materials is reflected in the steady expansion of the import surplus. Imports in July amounted to 373 million yen, against 215 millions last year, while exports aggregated 294 millions compared with 230 millions in July, 1936. Meanwhile, production is being hampered by shortages of labour and of raw materials in the capital goods industries, and in some cases also by scarcity of necessary machinery. The Government, however, is taking steps to deal with these problems. Political developments caused uneasiness on the commodity and stock markets at the end of July, but some improvement in prices has since been evident. China's imports amounted to 124 million dollars in July, compared with 115 millions in June, while her exports aggregated 89 millions, compared with 85 millions a month earlier.

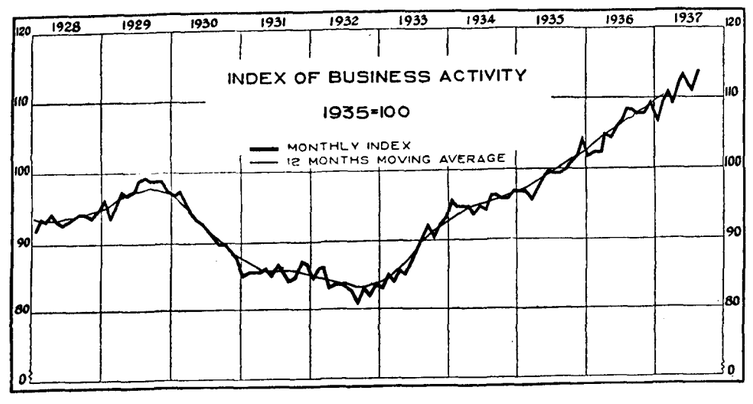
THE ECONOMIST



TRADE SUPPLEMENT

New Series SATURDAY, SEPTEMBER 25, 1937 No. 9

The Trend of Business

THE seasonal decline in business activity during August has been less marked than usual this year. *The Economist's* index of business activity (shown graphically on this page) which is corrected for seasonal variations, rose to a new record in August, after falling slightly in July. Moreover, the latest reports from industrial centres indicate a strong seasonal revival in most branches of activity in September. But the favourable trend of affairs at home is overshadowed by the conflicts in Spain and in the Far East, which show no signs of an early termination.

Of the fourteen component series of *The Economist* index of activity given on page 19, ten registered a rise last month and only four showed a decline. One of the few unfavourable tendencies is the consistent decline in the value of *building plans* passed by 146 local authorities, reflected in the fall in our index of building activity, from 109½ in August, 1936, to 95½ in the past month. But as these plans exclude London as well as Government contracts they tend to exaggerate the prospective decline in building activity. Actually, aggregate employment in building and public works construction is still higher than a year ago. To some extent plans may also have been held up by a shortage of materials, especially constructional steel. Nevertheless, the steady downward trend of the building plans passed by a substantial proportion of local authorities may foreshadow some slackening in residential construction next year. As a result of the persistent fall in raw cotton prices, new orders for manufactures have fallen off, and this movement is reflected in a decline in our index of *cotton consumption*. The position of the Yorkshire wool textile trade has also deteriorated slightly, following the recent decline in the price of the industry's raw material. The decline in the figure for *Town bank clearings* is partly a reflection of the reduction of Stock Exchange transactions, due to the fall in commodity prices, to general uncertainty and to the weakness of Wall Street. After rising to a post-depression record in June, our index of the volume of *exports of British manufactures* has been declining, though it is as yet too early to deduce a change of trend from the movement of the index during the past two months.

Against these unfavourable tendencies must be set the continued upward trend of the majority of general indices. The figures for *employment, power consumption, transport, postal and cable traffic, imports of raw materials* and *local bank clearings* all show an increase between July and August. Among individual branches of activity, the iron and steel and metal-using industries are still gaining ground. Our index of *home consumption of iron and steel*, for example, has risen to a new record last month. Although steel supplies are steadily increasing, the volume of new business offered at current prices remains generally in excess of the capacity of manufacturers. Nor are there any indications of an early lull in the metal trades so long as prices are not pushed up much further. The shipping and shipbuilding industries have experienced a marked revival under the stimulus of rising freight rates and world trade.

Our monthly analyses of industrial profits show that the trend of earnings has remained upwards. At the same time, there is hardly a chairman who, in his annual address to shareholders, does not express anxiety about the effect on profits of the continued rise in material and labour costs. Much will depend, therefore, on the movement of costs over the winter, for if they were to rise so far as to reduce profit margins, a decline in some lines of activity might follow. Meanwhile, the majority of reports from individual branches, summarised on pages 18 and 19, indicate sustained activity.

Until recently business activity in the majority of overseas countries has shown a tendency to expand, and the rise in the prices of primary products has provided a strong stimulus to world trade. The League of Nations' index of the volume of international trade (1929 = 100) took a sharp upward turn from 92.8 in January-March to 98.1 in the second quarter of this year. The trend of raw material prices will continue to play an important part in the future course of activity in most countries as well as in international trade. The sharp decline in the majority of quotations since last spring, therefore, is ominous for the producing nations, especially if it should persist over the winter. Current prices of primary products, however, are remunerative to most producers, and, in the absence of a further general fall, the British Dominions, Latin America, Scandinavia and Eastern Europe should continue to make headway. The rapid progress of recovery in China earlier this year was unfortunately arrested by the Sino-Japanese conflict, and the value of her foreign trade was halved between July and August.

In the United States, there has been a lull in the expansion of business, due partly to the dislocation of price and cost relationships caused by a too rapid increase in wages and material costs, and to the stringency in the capital market brought about by a change in the Government's monetary policy last spring. Many observers, therefore, envisage a period of adjustment which may hold up progress for some time. In Germany, business activity remains at a high level, while Austria, Belgium, Holland, Poland and Switzerland continue to gain ground. France is still lacking the confidence necessary to encourage capital investment, and, although the budget problem is less acute and industrial relations have improved, the outlook remains somewhat uncertain, though slightly more hopeful.

British Industrial Developments

The following reports on British industry cover, in most cases, the period to the middle of September. In the remainder they relate to the month of August.

COAL

Activity in the coalmining industry was well maintained last month, when the output of saleable coal amounted to 18,231,000 tons, against 18,942,000 tons in July—a month which had two more working days. In August last year the output was only 17,056,000 tons. Mainly owing to a reduction in the number of persons "temporarily stopped," the employment position was better in August than in July, and showed a striking improvement over August, 1936. The market in household coal benefited from a rush of orders at the end of August, before prices were advanced, but business has subsequently been below normal for the time of year. Stocks are consequently heavy. Meanwhile, industrial grades of coal and coke remain in active demand, no difficulty being experienced in disposing of the full output. Prices are firm. Shipments of coal last month, though rather smaller than in July, were again well in excess of last year's corresponding figure; the improvement in demand came mainly from non-British countries. Sales to **France** were again heavy, while the Scandinavian countries and **Argentina** were good customers. Italy took almost as much as in **August**, 1935 (sales to Italy dropped to zero last August), while exports to Germany showed a welcome improvement. New business on the export markets has been rather quiet in recent weeks, but order books are healthy and a shortage of some sorts is anticipated.

IRON AND STEEL

The past month witnessed a seasonal decline in the output of pig iron and crude steel, but the reduction was less marked than a year ago. Moreover, despite the relatively small decline in output, manufacturers were unable to add materially to their stocks. Exports also showed a seasonal reduction, but imports rose further, and, in volume, actually exceeded British exports—an indication of the change in the situation since 1932 when a tariff was imposed to restrict imports. As a result, our index of British iron and steel consumption (shown on page 19), adjusted for seasonal fluctuations but not for variations in stocks, rose to a new record in August. The increase in imports has tended to alleviate the stringency of supplies, but only to a slight extent; for requirements continue to exceed supplies. Since the end of August a further expansion of activity in the industry has been rendered possible by an increase in raw material supplies. But demand is as strong as ever, and there are no indications that the industry will be able to meet in full the requirements of consumers at current prices during the next few months.

GENERAL ENGINEERING

While seasonal influences, such as holidays, were responsible for a slight lull in the expansion of production in the engineering industry, pressure for supplies remains as strong as ever and Government contracts are increasing. Consequently, the industry is expected to make further progress during the next few months. The volume of imports of machinery rose from 8,227 tons in August, 1936, to 12,667 tons last month. Exports, however, show an even bigger increase, from 28,243 tons to 34,723 tons. Imports of machine tools, mainly under licence, continue to show a marked increase over last year, and the intake of rolling-mill machinery is more than double that of a year ago—an indication of the steps now being taken to re-equip and extend the capacity of the iron and steel industry. There is still some difficulty in obtaining supplies of iron and steel. Industrial relations are satisfactory for the time being, and the agreement concerning working conditions reached at the end of last July is expected to be ratified in due course. As far as individual sections of the industry are concerned, the oil engine, railway equipment and printing machinery branches are improving. Business is good in power equipment and fair in the case of textile machinery.

ELECTRICAL EQUIPMENT

The electrical equipment industry has continued very active throughout the summer. Apart from the steady increase in home sales, exports have shown considerable expansion. Shipments of electrical machinery in August were substantially higher in volume than a year ago, and the value of exports of electrical goods and apparatus rose from £753,000 in August, 1936, to £959,000 last month. While the industry has a large volume of orders on hand, new business in heavy electrical machinery has shown a decline in August, both as far as home and overseas business is concerned. The outlook for the industry as a whole, however, is still promising.

AUTOMOBILES

The automobile industry remains very active, and a further expansion of business is looked for in coming months in view of the motor exhibition. The registration figures reflect an encouraging rise in sales. New registrations of private cars and taxis in July totalled 28,783, an increase of 3,058 units over the corresponding month of last year. Commercial-vehicle registrations showed an increase of 115 units over the same period—8,970 against 8,855 last year. Sales overseas also continue to show a gratifying improvement compared with a year ago. Thus British exports of cars aggregated 6,200 last month, compared with only 3,607 in August, 1936. Overseas sales of commercial vehicles rose during the same period by 187 units, from 1,512 to 1,699. Rising prosperity at home is also reflected in the growth of imports, which have recently been running well above last year's level.

BUILDING

The building trades remain very active, with unemployment at a low level in the skilled occupations. Conditions in August showed little change compared with those ruling a month earlier and the percentage of unemployment was about the same as a year ago. In some districts shortages of skilled operatives, especially bricklayers and plasterers, were reported. But while current activity is well maintained on the basis of past plans, the outlook is less certain. The value of plans approved by 146 local authorities last month, as reported in *The Ministry of Labour Gazette*, was over 20 per cent. below the level of a year ago. Although these figures are not comprehensive, their steady decline in recent months suggests that the present level of activity is unlikely to be exceeded and will probably not be maintained much beyond the end of the present year. On the other hand, there are grounds for supposing that some revival of demand would be experienced if the difficulty of obtaining supplies of certain essential materials could be surmounted.

CHEMICALS

Most sections of the home chemical market have been rather quiet during the past month, but business has been quite up to the normal for the time of year. Chief interest has been shown in industrial chemicals and wood distillation products. Export trade in chemicals, drugs, dyes and colours has continued to increase, the value of exports for the first eight months of this year now being over £2,000,000 greater than during the same period of last year. The increase in August, as compared with August, 1936, was £331,739, salt being the only item for which an appreciable decrease was recorded. August imports of chemicals, drugs, dyes and colours were £117,476 higher in value than in August, 1936.

POTTERY

A further general improvement was recorded last month. Following the termination of local holidays, business became more active in North Staffordshire, while conditions in Derby and Bristol remained good. At Worcester employment was still very good. Export business, on the other hand, was rather less satisfactory than in August, 1936. Overseas sales of general earthenware, sanitary ware and tiles were rather smaller than last year; but business in china was a little better.

FOOTWEAR

Conditions in this industry remain rather patchy, both overtime and short time being common. Nevertheless, unemployment was slightly reduced last month at most of the principal centres and was fairly good on the whole. Export business remained above the level of a year ago, shipments of leather boots and shoes aggregating 35,494 dozen pairs last month, against 27,110 dozen pairs in August, 1936. Imports, however, showed an even larger increase.

COTTON

Although current activity is maintained on a high level, new business has been restricted by the continued fall in raw cotton rates. The price of American cotton is now lower than for about four years and bearish sentiment has been accentuated by the raising of the official crop estimate to 16,098,000 bales. The United States Government loan and subsidy plan has not availed to check the decline, and spinners are assured of plentiful supplies during the next twelve months. Overseas sales of cotton manufactures have been less than production, though exports remain above the level of a year ago. Sales to India have been disappointing and the position in the Far East has been very unsettled. Nevertheless, dyed goods have moved off fairly well for the Straits Settlements. Lancashire traders have been upset by the change in the quota system in Ceylon, and strong representations are being made to the Government. Irregular buying has taken place for the Crown Colonies, the Dominions and South America. Home trade buying has also been limited. On the other hand, sales of American yarns have shown an improvement and the margin for some counts and qualities has been increased under the price agreement schemes. Pressure for delivery continues to be the feature of this section. Spinning production continues at about 92 per cent. of capacity, against 79 per cent. at this time last year.

JUTE

The final official forecast estimates the yield of the Indian jute crop at 8,617,700 bales, against an actual out-turn of 10,700,000 bales last season. Trade circles, however, believe that this seriously under-estimates the true position, and in some quarters a yield of almost 12 million bales is anticipated. Prices are accordingly rather easier. Yarns have been in quiet demand, but are firm in price, while business in cloth has also been restricted. The industry is complaining of acute competition from India, and the Government is being pressed to place quota restrictions on British imports of jute manufactures from that country. Negotiations to this end are at present proceeding between representatives from India and officials at the Board of Trade, but no decision has yet been taken.

LINEN

Merchants' stocks of old crop flax have now been liquidated, and there are unconfirmed reports of sales of new crop fibre by Baltic states to Germany at full quoted rates. Soviet material has also been purchased by merchants on sellers' terms. Yarns remain rather quiet, but damask and fancy spinnings are in demand. The new season's cloth business is developing slowly. The Far Eastern crisis has complicated matters and shipments are being held up until the situation is clearer.

RAYON

Forward buying in rayon yarns is somewhat limited at present, but there has lately been an improvement in this respect in several sections of the trade. Meanwhile, deliveries against old contracts are maintained on a high level; machinery activity in both weaving and hosiery sections is reasonably good for the time of year. Despite rumours of a pending increase, prices remain unaltered.

WOOL

Prices of raw wool at the opening of the new selling season in Australasia failed to come up to expectations. The temporary absence of Japanese buyers from the market has been followed by a significant price decline, and London quotations have reacted in sympathy. The employment position in the woollen and worsted industry showed some improvement last month and was a little better than at the same time last year. More recently, however, the outlook for the industry has suffered a certain deterioration in view of the break in raw wool prices. New business in tops and yarns was virtually at a standstill in the early part of September, pending the clarification of the outlook. A gradual improvement in the volume of inquiries has since taken place, but little new business has been booked. The market nevertheless has a firm tone, and it is believed that a buying wave would develop if the raw material showed a firmer tendency. Meanwhile, the export position remains moderately satisfactory. Exports of wool tops and of woollen and worsted yarns were smaller last month than in August, 1936, but sales of woollen and worsted tissues were larger. In view of the advance in prices, the value of the August shipments was substantially higher than a year ago. Larger sales were made to a long list of overseas customers.

AGRICULTURE AND FISHERIES

The corn harvest became general by the middle of August, and proceeded under favourable conditions. The yields of wheat, barley and oats are at present estimated to be below average. The yield of potatoes is forecast to be equivalent to the final estimate for the ten years 1927-1936. It is expected that average crops of roots will be obtained in most districts. The yield of hops is expected to be rather below that of last year. The condition and quality of hay are good. The yields of both seeds and meadow hay are expected to be above the ten years' average. Cattle and sheep have done well generally. Milk yields are about average for the time of year. Meanwhile, British takings of wet fish aggregated 1,740,499 cwt. last month compared with 1,884,542 cwt. in August, 1936. Prices were rather better than in the previous month, and the total value was £1,340,520, against £1,397,161 in the same month of last year.

SHIPPING

After the irregular tendency noted in July, the freight markets showed an improved tone last month. Thus *The Economist* index of freight rates rose sharply from 154.5 in July (1898-1913 = 100) to a post-depression record of 161.8 in August. A year ago the index stood no higher than 97.5. The improvement has since been well maintained and no setback appears likely in the near future. Some reluctance on the part of owners to send tonnage through the Mediterranean has been dispelled in consequence of the Anglo-French anti-piracy measures.

Business Developments Overseas

BRITISH EMPIRE

AUSTRALIA.—Owing to the favourable weather recently experienced, crop prospects are excellent, states a cable from the National Bank of Australasia. Meanwhile, secondary industries and trade remain active, though some easing is expected during the election campaigns of the Federal and Victorian Parliaments. The new wool selling season opened strongly, but an easier tendency has since been evident; prices nevertheless remain well above those of a year ago. Industrial share prices have weakened in response to the deterioration of the international political situation, while mining shares have reacted in sympathy with the metal markets.

NEW ZEALAND.—The available data suggest that the Dominion continues to enjoy moderate prosperity; the country has benefited substantially from the rise in the price of such staple exports as wool, dairy produce and meat. Fears of financial instability as a result of the Labour Government's monetary policy have not been realised and overseas funds have been augmented since the beginning of the year. The Government's public works programme is being financed partly by borrowing and partly from current revenue.

SOUTH AFRICA.—Agricultural conditions in the Union are generally favourable, according to the Standard Bank, though drought has affected certain districts. The new wool selling season has opened satisfactorily. Wholesale and retail trade shows little change, except in Johannesburg, where business has failed to come up to expectations. In the latter centre, too, building plans show a decline, but activity is well maintained on the basis of past plans. Seasonal slackness is evident in some of the secondary industries.

CANADA.—Despite the disastrous failure of the wheat crop in Saskatchewan, general business conditions remain satisfactory and there is increasing confidence about the outlook for the autumn and winter. Commodity prices have shown greater stability recently. The labour situation, nevertheless, gives cause for some anxiety, for an epidemic of strikes has been spreading. However, the heavy industries remain busy and sales of motor cars are actually 25 per cent. above those of a year ago.

EUROPE

FRANCE.—The official index of production continued to decline during July, but remained slightly above the level of a year ago. The value of both imports and exports also declined in July as well as in August. Wholesale prices, on the other hand, continued their upward movement during the past month. But there are some indications of an improvement in the Budget position under the guidance of M. Bonnet, the Minister of Finance. According to a statement by M. Bonnet on September 20th, the 1938 Budget is actually expected to show a surplus of 1,600 million francs, part of which will be used for capital purposes in order to reduce the loan requirements of the Treasury. Furthermore, there are also signs of an improvement in industrial relations, and it is hoped that the trade unions will agree to an adjustment of working conditions which will restore profit margins and enable output to be increased. There has been a marked revival of the tourist industry this summer and autumn, partly because of the depreciation of the franc and partly because of the Paris Exhibition. Nevertheless, confidence has not yet been fully restored, and some time is expected to elapse before capital investment and industrial activity take an upward turn. But the outlook is now more promising than earlier this year.

GERMANY.—In contrast to the position in France, industrial activity in Germany has so far remained at a very high level. As in the United Kingdom, the current volume of industrial production in Germany is well above the pre-depression level. Activity is particularly marked in the iron and steel, engineering and constructional industries. Further expansion, however, is to some extent limited by a shortage of materials and skilled labour. The official returns disclose a further reduction in unemployment in August from 562,900 to 509,000. Both wholesale prices and quotations for stock exchange securities are scarcely changed on the month. The value of Germany's overseas trade has risen rapidly during the last twelve months. The value of imports showed a slight reduction in July, but exports, at Rm. 530 millions, compared with Rm. 481 millions in June and Rm. 395 millions in July, 1936.

POLAND.—Recovery has proceeded steadily since the beginning of the year. The index of industrial production calculated by the Polish Institute for Economic Research, for example, has risen from 77.7 (1929 = 100) in December, 1936, to 86.7 in last July. The output of coal rose from 2.3 million tons in July, 1936, to 3.2 millions in the corresponding month this year. Moreover, foreign trade has shown a strong upward trend. During the twelve months ended July last imports rose from 82.4 to 114.7 million zloty, while exports advanced from 84.0 to 98.3 million zloty. Owing to the increase in Poland's working population, however, the improvement is not fully reflected in the unemployment returns, which still show only a small reduction in the number of persons unemployed compared with a year ago.

HOLLAND.—Since the devaluation of her currency Holland has experienced an almost uninterrupted recovery. The extent of the expansion is reflected in the rise of the index of production, from 63.6 (1929 = 100) in July, 1936, to 97.5 in June and 102.5 in July this year. Business activity, therefore, has now recovered to the pre-depression level. Unemployment, however, is still at a relatively high level, the total number of registered unemployed having declined from 375,700 to 312,900 during the past twelve months. Foreign trade is buoyant, but both imports and exports showed a reduction between July and August.

SWEDEN.—As in other Scandinavian countries, business activity in Sweden has been maintained far above the pre-depression level. Thus the index of industrial production (1929 = 100) rose from 127 in July last year to 142 in the corresponding month this year. The proportion of workers unemployed has fallen well below 10 per cent. this summer and both imports and exports rose in value between June and July.

UNITED STATES OF AMERICA

The heavy decline in the value of Stock Exchange securities has revealed some doubt concerning the future of economic progress in the United States. Actually, industrial production has never recovered to the level reached in December last year. A recession in January was followed by gradual recovery until May, but since then the volume of production has fallen slightly. There are indications that cost and price relationships have been somewhat disturbed by sharp rises in labour and material costs, while the deterioration in industrial relations has also tended to undermine business confidence. In addition, the capital market became definitely sticky last spring, thus rendering it most difficult for industrialists to finance new capital investment. Building activity, though gradually increasing, has not reached earlier anticipations. In the case of residential construction, the slowness of recovery is attributed mainly to the sharp rise in costs of construction. Again, railway expenditure on new equipment, after rising steeply earlier this year has since shown a marked reduction with the decline in net operating income. Capital expenditure by the utilities has been retarded by the unfavourable conditions in the capital market and by the uncertainty concerning future Government policy. On the other hand, the income of the farming community is substantially higher this year as a result of bountiful crops. On the whole, it would appear that, after a period of adjustment, business may recover.

LATIN AMERICA

ARGENTINA.—Slight to moderate rains have fallen over the Argentine agricultural area, but generally much more precipitation is required for the satisfactory progress of the fine cereal crops. The livestock market is firm. This being now between crop seasons, Argentine exports are falling rapidly, while imports show an expanding tendency. Nevertheless, aggregate exports for the first seven months of 1937 were nearly double the value of those in the corresponding period of 1936, whilst the favourable balance, at 746 million pesos (nearly £50 millions sterling), was more than trebled. Although British goods continue to head the Argentine import list, there is considerable expansion in Argentine trade with the United States and Italy. Buenos Aires bank clearings show considerable expansion, total clearings in the first eight months of 1937 having been 28,009 million pesos, compared with 22,424 millions in the same period of 1936.

BRAZIL.—Negotiations are proceeding concerning the future service of Brazilian bonds, and are probably connected with the scheme mooted for a Central Bank. Certainly, stability of exchange would be welcomed in international trade. Coffee exports, however, continue to shrink and there is little possibility of reviving the export trade unless prices are lowered by the reduction or elimination of part of the existing taxes and dues.

OTHER COUNTRIES.—Chilean overseas trade continues to expand, particularly in copper and fertilisers. The rate for the peso has been appreciated from 26 to 25 pesos per United States dollar, equivalent to about 124.50 pesos per £, and there are rumours that further appreciation may be effected. Exchange continues to be forthcoming for approved imports. Lower world prices for cotton have depressed the Peruvian market. In general, the outlook for the new coffee crop in the Central American countries is favourable.

THE FAR EAST

Stimulated by rearmament and war needs, business remains very active in Japan, with industrial profits still on the up-grade. The price-level also continues to rise, though cotton and silk showed a weaker tendency during August. The growing need for raw materials is reflected in the remarkable expansion of the import surplus in recent months. Imports last month were valued at 314 million yen and exports at 260 million yen, thus showing an import balance of 54 millions. A year ago, on the other hand, Japanese exports exceeded imports by as much as 34 million yen. The prosecution of the war in China has thrown a serious strain on the Japanese Budget and heavy supplementary estimates have had to be passed. The additional expenditure is being met by the revaluation of gold stocks, by the upward revision of tariffs, and by higher income and sales taxes. The Stock Exchange, which had previously shown a reactionary tendency, has now registered an improvement. In China, too, the war has had serious economic consequences. The effect is particularly noticeable in foreign trade, whose value was halved between July and August. Imports aggregated 55 million dollars, against 124 millions in July and 70 millions in August, 1936; while exports were 46 millions, against 89 and 55 respectively.

(a) Old quarterly Board of Trade indices linked on to new indices; figures in italics based on old indices. (b) Annual figures relate to year ended September.
(c) Figure for 1936 is average of August-December. (d) Indices shown in last month of quarter to which they relate. (e) Daily average. (f) Monthly figures are averages of quarterly returns. (g) Average of weekly figures. (h) Annual figures are totals for financial year beginning in year shown. Monthly figures are cumulative.
(i) Period June 1–28.
