You will not expect me, I am sure, to say much about the prospects, but you, with us, can feel, or should feel, very gratified at the present state of the company's affairs, built up, as it has been, on a very sound policy, and we can see no reason why it should not further progress. (Applause.)

The Chairman: Before I put the resolution, are there any questions?

GRATITUDE OF SHAREHOLDERS

Mr Chas. W. Goff said that on behalf of the shareholders he would like to compliment and thank the board for all they had done for the company, not only during the year under review but during previous years. He was not sure that shareholders always fully appreciated the amount of work entailed in producing a profit of a million a year, and he therefore felt that they should express their gratitude to the board for the hard work which they must have done in producing once more such a wonderful balance sheet. They had at the head of the company a board which was second to none in the kingdom. (Applause.)

The resolution was carried unanimously.

The chairman then proposed the re-election of Mr I. M. Gluckstein and Mr S. I. Salmon as directors. In doing so, he said that both these gentlemen had in the past rendered great services to the company, and he was sure that they would continue to do so in the future. (Hear, hear.)

Colonel G. R. Harding seconded the resolution and it was carried unanimously.

Mr I. M. Gluckstein, on behalf of Mr S. I. Salmon and himself, thanked the shareholders for their re-election and assured them that they would continue to do their best to serve the interests of the company with which they were so proud to be associated.

METHOD OF SELECTING DIRECTORS

Mr George W. Booth proposed the re-election of Mr Julian Salmon and Mr A. H. Salmon, who had been appointed to the board during the year. In doing so, he said he would like to say a few words on the board's method of recruiting its members. That method was instituted at the company's inception by the original directors, and consisted of putting everybody who aspired to a seat on the board through a most rigorous training so that anyone who reached that position was a thoroughly practical and qualified man. The results shown by the company were, he thought, sufficient proof of the wisdom of the system. The assets shown in the balance sheet of 1895 were just short of a quarter of a million; to-day they were £16,500,000, and that should be sufficient to show the value of having a thoroughly trained board.

It was generally accepted that the result was a board of highly skilled executives, but there were two other aspects not often referred to that he would like to mention. Ageing companies, like human beings, were apt to suffer from a tendency to hardening of the arteries by developing traditions, some of them good and some of them not so good, and one of them was a tradition of a method of control, which was apt to degenerate into a hide-bound routine. They thought the way to prevent that was periodically to inject into the board young blood, because young men in a position of authority, having vision and energy, did not readily submit to having their activities curtailed by red tape.

The second point was the value of all the directors having been workmen working with and alongside the body of workpeople so that they knew them as men and women and not merely as numbers in a wages book. That meant that they did not incur the reproach so often heard that the governing body of a large organisation was something remote and soulless, an inhuman machine with no thought beyond the earning of profits. It was on these two grounds that he had great pleasure in proposing the re-election of Mr Julian Salmon and Mr A. H. Salmon to the board. (Applause.)

Mr M. G. Liverman seconded the resolution, and it was carried unanimously.

MR JULIAN SALMON'S REMARKS

Mr Julian Salmon said that on behalf of Mr A. H. Salmon and himself he would like to say how proud and honoured they felt at having been appointed to the board and how grateful they were to the shareholders for the confidence they had shown in re-electing

them. They fully appreciated the responsibilities which rested on their shoulders, and if they succeeded in carrying them out, he felt that it would be very largely due to the wisdom and foresight of the senior members of the board, who had seen to it that they had had the training to which Mr Booth had referred. They owed more than he could say to the example and advice they had always had before them. They had had a great deal of encouragement and not a little criticism—(laughter)—and with those advantages they hoped that they might be worthy members of the board. The shareholders could be sure that they would continue to work, as they always had done, with the best interests of the company at heart. (Applause.)

On the motion of Mr Harry Salmon, seconded by Mr C. R. S. Taylor, Mr G. A. Pollard and Dr L. H. Lampitt were re-elected employee-directors of the company, and on behalf of Mr Pollard and himself, Dr Lampitt thanked the shareholders.

Mr C. W. Goff proposed the re-appointment of Messrs Turquand, Youngs, McAuliffe and Company as auditors, and this was seconded by Mr N. Hamblin and carried unanimously.

VOTE OF THANKS

Mr M. G. Liverman proposed a hearty vote of thanks to the chairman and directors for once more presenting such an excellent report and balance sheet. In his judgment, the shares of their company were a gilt-edged security in the industrial market, and that was the highest compliment that could be paid to the shares of any large company outside the gilt-edged market. He felt that they owed a debt of gratitude to those responsible for a sound and conservative policy, which gave the shareholders a feeling of confidence in the business.

Mr A. J. Wood, in seconding the proposal, said that in the forty-four years since its inception the company's progress had been continuous, and he thought that to-day it was in a better position than ever before in its history. (Applause.)

The vote was unanimously accorded.

The chairman said that he would like first of all to thank Mr Goff for his kind remarks and also the proposer and seconder of the vote of thanks and the meeting generally for the confidence they had shown in the board. He could assure them that so far as the directors were concerned they were always ready to do their best to further the interests of the company. (Applause.)

The proceedings then terminated.

PEASE AND PARTNERS

A GOOD YEAR

The ordinary general meeting of Pease and Partners, Limited, was held, on the 30th ultimo, at the company's offices, 20-26 Northgate, Darlington.

Mr J. Frater Taylor (the chairman) said that the profit on trading for the year just ended was £480,054, against £278,192 for the previous year. A considerable part of the profit had come from the sale of pig iron. Because of the abnormal position now prevailing, largely through excessive imports, the contribution of pig iron to the 1938-39 profits might not be quite so substantial. Each succeeding year for the last six years had shown a substantial increase in profits.

With regard to the performance of their main subsidiary companies, in both T. and R. W. Bower, Limited, and the Skinningrove Company, their trading profits were ahead of those for the previous year, and greater reserves had been made this year, especially for taxation in the case of the Skinningrove Company. Henry Stobart and Company, which for a long time had been backward, showed an increased trading profit of roundly £48,000 and had been able to provide for greater depreciation and increased reserves for renewals and contingencies. The balance sheet of that company was healthier than it had been for a long time. Excluding Skinningrove, the outputs of the year under discussion were coals 3,250,000 tons, coke 425,000 tons, ironstone 450,000 tons, pig iron 157,000 tons, limestone 138,000 tons, castings 37,000 tons, and substantial quantities of by-products, sulphate of ammonia, tar, crude and refined benzole, etc.

The present outlook for iron and steel was not quite so good. Once more he must voice his belief in real rationalisation. Natural mergers still appeared to him to be necessary. It was essential that costs should be lowered and that the export business should not be allowed to go.

With regard to coal, the nation industrially was dependent upon cheap coal, and he believed that the compression of the industry into a fewer number of companies was essential. In his opinion there were only two courses—effective private ownership and control from a private head source or national control. He preferred the former.

The report was unanimously adopted.

MARKS AND SPENCER, LIMITED

MR SIMON MARKS ON THE COMPANY'S FURTHER DEVELOPMENT

INCREASING SEARCH FOR HIGHER QUALITY GOODS

STAFF WELFARE

The Twelfth Annual General Meeting of Marks and Spencer, Limited, was held, on May 31st last, at Winchester House, Old Broad Street, London, E.C., Mr Simon Marks (chairman and managing director) presiding.

After referring to the sorrow and distress felt at the tragic death of Lord Milford Haven, a member of the board, the chairman in the course of his speech said:—

It is with pleasure that I am again able to report a satisfactory increase in the net earnings of the company. The net profit for the past year, after providing for directors' fees, management remuneration, depreciation, and other charges, amounts to £1,602,450, an increase of £169,200 over the preceding year.

ALLOCATION OF PROFITS

The directors recommend the following allocations:—	
To Staff Benevolent and Pensions Fund ...	£25,000
Debenture Redemption Fund	£11,760
Properties Contingency Reserve	£64,598
General Reserve Account	£324,730
Payment of a final dividend on the Ordinary and "A" Ordinary shares at the rate of 27½ per cent., thus making 42½ per cent. for the year ended March 31, 1938	£480,509
Carry forward to next year's accounts	£85,641

ISSUE ON BONUS TERMS

The directors recommend that £174,730 from the General Reserve Account be capitalised, and that a distribution by way of bonus be made to the holders of the existing ordinary and "A" ordinary shares of the company in the proportion of one "A" ordinary share for every ten ordinary and/or "A" ordinary shares held.

RESERVES

After making the proposed allocations and provision for the bonus shares, our general reserve will stand at £2,000,000, the whole of which is invested in the business and the proposed appropriation to Properties Contingency Reserve will bring the amount of that fund up to £265,000.

Freehold, leasehold and leased properties stand at £7,994,598, showing a net increase of £715,003. The furniture and fixtures stand at £729,387, a net increase of £92,342, and the stock-in-trade at £1,505,802 is an increase of £326,661 over last year.

The cash with the bankers and in hand stands at £872,139, a decrease of £620,087 compared with last year. Last year our cash-in-hand was swollen by the proceeds of the debenture issue which had then been only partially utilised for the development of the business.

CO-OPERATION WITH SUPPLIERS

Retail distribution is becoming more complicated and more exacting. The distributor must take into account new developments in technical processes and in materials at the production end, and must also follow the changing tastes, fashions and needs of the consumer. The public are much more discerning as to quality, durability and design of goods in relation to price, and indeed for this very reason they are more responsive to any improvement in values.

The greatest service that industry and the business sections of the community can render is to increase the public's purchasing power for the goods and the services which it needs.

Our policy has been based on the view that there is still in this country a vast untapped market which we can reach only by the creation of better merchandise values.

Our search for higher quality goods within our present price range is unceasing. This demands a close co-operation with the producer and an understanding of the joint problems involved.

I have frequently stressed the importance which we attach to close collaboration with our suppliers, and have told you how through this association both parties derive substantial advantages.

In recent years we have found it necessary to advance one step further and to establish direct contact with the producers of the material on which our manufacturers depend for their supplies. Jointly with them, our research department examines the quality and durability of the cloths or materials used by our manufacturers. We endeavour to follow the progress of research, and when new materials are discovered, to suggest their proper adaptation in the production of our goods.

The importance of our direct contact with the producer of materials in this country can be gauged by the fact that the yardage used by our makers-up equals in quantity the amount of cotton piece-goods exported to some of Lancashire's largest markets.

By linking up the three parties in this way—the producer of basic materials, the maker-up, and the distributor—goods of a higher grade and quality have been manufactured and entirely new markets have been opened up. Our experience shows that modern methods of production, allied to the continuous and expanding rate of sales provided by our company, result directly in a fourfold benefit: firstly, in better value to the customers; secondly, in an increased use of raw materials; thirdly, in greater employment; and lastly, in substantial improvements in the wages earned by the workers engaged.

The continued expansion of the volume of business which your company enjoyed in the past year indicates that the policy which I have tried to outline to you is appreciated by the public.

DEVELOPMENT

We have considerably extended the range of our goods and added new departments. This has forced us to create additional space in our stores to display our wares adequately, and compelled us to increase the size of the unit. In the past year we built 11 new stores (including one replacement) and enlarged 31 other stores. We are now operating 228 stores; and our programme for the current year embraces 11 new stores (including three replacements) and 40 extensions.

FINANCE

It has been the considered policy of your board to finance a substantial part of the development programme out of earnings. The beneficial effect of this is twofold. In the first place, it reduces the amount of capital which has to be obtained from time to time from outside sources, and in consequence relieves the company of a substantial annual charge for interest; and in the second place, the fact that the company's issued share capital and free reserves are constantly increasing strengthens the financial foundations of the business. This enables such additional capital as the company requires from outside sources to be obtained at lower rates of interest than would otherwise be the case.

The profits which we have earned during the past ten years, after making ample provision for depreciation and repairs and renewals, and after meeting interest on debentures and loans, have been dealt with as follows: Approximately 70 per cent. is accounted for by dividends paid in cash upon our share capital and by provision for income tax, and the balance of approximately 30 per cent. is represented by sums carried to free reserves, part of which have, as you know, been applied in the issue of bonus shares from time to time.

Notwithstanding that we have every year increased the ordinary share capital by the issue of bonus shares, the percentage rate of dividend has risen during the ten years from 15 per cent. to 42½ per cent.

The funds now in hand will be sufficient to take care of part of our proposed immediate programme, but in order to secure the continuity of development we have in mind we have made the necessary arrangements for additional finance, which will enable us to expand our business over the next two or three years.

WELFARE

For some years we have been much occupied with the improvement of the conditions under which our staff—which now number

well over 16,000—are employed. The various services and benefits which have been provided for them cost the company in the past year nearly £250,000, including direct welfare expenditure of approximately £100,000.

During the year we have put into operation an increased scale of wages for all grades, and have evolved a flexible wage system which takes account of age, length of service, and efficiency. We introduced the 48-hour week some years ago, and to-day our normal average working week is 46 hours. The holiday with pay, now much discussed, has long been an established institution with us, and at Christmas every member of the staff receives a bonus.

The company attaches great importance to the general health of the staff. Hospital, dental, optical and medical services are provided at nominal charges. Convalescent home service is provided for those who require rest after serious illness.

Subject to a minimum of six months' service, every employee who is away from work owing to sickness is entitled to wages in supplement of the National Insurance benefit for a minimum period of two weeks in each calendar year, and in a very large number of cases the Welfare Committee extend these payments over much longer periods.

As you are aware, there is in addition the Group Life Assurance and Pensions Fund, and also the Staff Benevolent Fund.

The Welfare Department organises and subsidises social and sports clubs, summer camps, and canteens, where wholesome food is provided at a cheap cost.

The system of training which we have developed is steadily improving the service which we are able to put at the disposal of our customers.

The board value very highly the co-operation and the loyalty of their staff of every grade, and I take this opportunity on your behalf, as well as on behalf of the board, to place on record our thanks to them.

Mr Marks then moved the adoption of the report and accounts.

MR I. M. SIEFF'S SPEECH

Mr Israel M. Sieff, B. Com. vice-chairman, in seconding the resolution, said:—

The merchandising principles which underlie our development policy have again justified themselves by the increased net earnings we are able to show for the last financial year.

As our chairman has emphasised, we take great trouble to discover what our customers prefer.

In this connection I would like to pay a tribute to the adaptability and to the progressive attitude of mind of the majority of British manufacturers who supply us. Indeed, it is no exaggeration to say that the initiative of our merchandising development has found a fertile field in the adaptability and efficiency of British producers, who have responded admirably to the demands of our public once these have been made clear to them.

The fact is that there are still many needs of our public which have to be satisfied. Through our merchandising development department we believe we are finding the mechanism which will enable manufacturers to keep in closer contact with these untapped demands.

STAFF WELFARE

I would like to add one or two words to the observations made by the chairman regarding our staff. The different steps we have taken, both in regard to the improvement of the conditions under which they are employed and in regard to their welfare, are creating not only a more contented, but a more understanding, staff. Our sales staff is increasingly composed of a more easily trained type of saleswoman, who is taking a deeper interest in her job. She is learning more about the way our goods are made and finished, and is able to impart useful information to the potential customer.

The fact that we are taking such a close interest in the health, welfare, and working conditions of our staff brings out in our employees a ready response and a desire to develop a team spirit in the interests of our company.

I desire also to express my thanks to our staff for their loyal and devoted co-operation.

The resolution for the adoption of the report and accounts was carried unanimously.

Resolutions were also passed re-electing the auditors and the director who retired by rotation, and approving the proposed capitalisation of reserves and the bonus issue of one in ten to holders of ordinary and "A" ordinary shares.

It was announced that dividend warrants and letters of allotment in respect of the bonus issue would be posted on June 3rd to those shareholders whose names were on the register of members on May 2, 1938.

EVER READY

MANUFACTURERS OF BATTERIES

DRY CELLS - ACCUMULATORS - RADIO EQUIPMENT
MOTOR CAR ACCESSORIES - PORTABLE ELECTRIC
LAMPS

POINTS from the Speech of Mr MAGNUS GOOD-FELLOW (Chairman) at the Annual General Meeting of THE EVER READY COMPANY (GREAT BRITAIN) LIMITED on June 1st, 1938

SATISFACTORY BUSINESS

While the report and accounts for the past year are satisfactory, nevertheless we must all feel regret that the expansion in our business that has continued year after year since the existing company was formed in 1920 was in the past year arrested—let us hope but temporarily.

Until the end of the year 1937 we recorded a normal expansion in our sales, but during the last four months ending March 31, 1938, we experienced a considerable recession, due to the fall in public consumption. It is well known that many important manufacturing businesses throughout the country experienced a similar falling off in business, and I have read the expression of many thoughtful views on the reasons for this state of affairs. It appears to me that during the past year we have all been brought to realise more clearly the very disturbed conditions existing throughout the world—and reflected in our country by the continued increase in the heavy burden of taxation, the fall in investment values, and the consequent curtailment of public spending.

COMPETITION

We have had to meet competition by price cutting during the period under review—not, for us (who have spent 35 years in developing and fostering this trade) a novel experience, and we are aware that some of these competitors are sustaining actual trading losses in selling their goods at the prices they do. It is fortunate for this company that the complete reorganisation of our manufacturing facilities, begun now some six years ago, enables us to view this competition with composure and to maintain in the face of it our business and our profits.

REPORT AND ACCOUNTS

The surplus of profit, over the sum required for the dividend we recommend to you, amounts to £151,000.

The various items of capital investment (buildings, plant and machinery, subsidiary companies and trade investments) have not yet had time to be reflected to any considerable extent in our profits. It is, however, our hope and expectation that we shall obtain advantages in the future. We do not anticipate any considerable expenditure under these heads during the coming year.

DIVIDENDS

The dividend of 35 per cent. on the ordinary stock we recommended for the year calls for the amount of £56,500 more than the similar dividend of a year ago. Whilst the surplus profits would have admitted of the payment of a bonus, we came to the conclusion that, having regard to the disturbed conditions of the world and our widely spread interests, we should best be discharging our duty by following the more prudent course of retaining this surplus in the business.

PRESENT YEAR'S TRADING

Whilst sales in the new year have not opened well (at this time last year we were benefiting from the Coronation festivities), the strength of our trading position, assisted as it will be by considerable saving in costs of production, gives me the hope that I shall come before you a year hence with a satisfactory report.

GOLD FIELDS AUSTRALIAN DEVELOPMENT COMPANY, LIMITED

DIVIDEND PROSPECTS

The fifth annual general meeting of this company was held, on the 30th ultimo, at 20 Aldermanbury, London.

Mr John A. Agnew (the chairman) said: At the Moonlight property the main features of interest have been the deepening of the Adelaide Shaft to the 874-ft. horizon, completion of development at the 630-ft. level, and the opening up of the ore body at the 830-ft. horizon. Further work, too, of a noteworthy character has been the exploration of the West Heading Lode between the 340-ft. and 450-ft. horizons.

Reference was made last year to the coming together of the Adelaide and No. 1 East Lodes in depth, and development to date on the 830-ft. level appears to confirm this theory, as at this horizon they have apparently merged into one and the same body of ore. Present indications tend to show that in the case of the No. 1 West Heading Lode this ore channel also is merging into the No. 1 East Lode Shear at about the 450-ft. horizon.

The total footage driven for the year amounted to 5,644 ft., or some 2,800 ft. less than in the preceding period, when a rather abnormal amount of work was done in connection with stope preparation down to the 450-ft. level.

INCREASE IN ORE RESERVES

The ore reserve position again shows a very gratifying increase over last year's figures. At the close of 1936 the reserve stood at 338,000 tons, averaging 6.1 dwts. per ton, so that this year's total of 409,000 tons, averaging 6 dwts. per ton, shows an increase of 71,000 tons. This increase is all the more satisfactory when it is remembered that just over 100,000 tons have been milled during the year. Last year it was pointed out that indications were that a considerably greater tonnage of ore would be developed between the 450-ft. and 630-ft. horizons than in the similar vertical interval above. Further development proved that both widths and lengths could be added to, so that actually at the end of this year, after drawing quite a considerable tonnage from below the 450-ft. level, the remaining reserve in this section is still estimated at some 35,000 tons more than the upper section is expected to produce.

It is equally satisfactory to be able to tell you that the next block down to the 830-ft. level is already estimated to yield practically the same as the block above, so that the joining of the two lodes has had, as anticipated, no detrimental effect on the tonnage. The reserve position is thus very sound, being, on a conservative estimate, over four years ahead of mill requirements.

ENCOURAGING RESULTS

The year's results have again on the whole been distinctly encouraging. Our principal asset, the Moonlight Mine, has responded exceedingly well to development at deeper levels.

We have again examined a number of properties in various parts of the State, but none of these has offered sufficient promise of success to warrant our exercising the options held. At present a geological, geophysical and aerial survey of the economic possibilities of the mineral bearing regions of Australia is being carried out by the Commonwealth Government. Such a survey should be of great assistance.

I am sure that you would like me to say a few words regarding the dividend outlook. You will, of course, appreciate that we are a developing company and that in our search for suitable properties a considerable sum of money has been already spent. We have already disposed of a large portion of this expenditure, so far as the balance sheet is concerned, by applying in reduction thereof a certain amount of the premium received on shares issued and the whole of the dividends accruing to us in respect of our Yellowdine holding. At the moment very little expenditure is being made in respect of search for further properties, but that does not mean that if something promising turns up we shall not look carefully into the prospects thereof. The Moonlight Company had in hand at the end of the year cash and bullion valued at £33,386 Australian currency, and that company is, of course, making steady monthly profits which we hope will increase as time goes on.

The indebtedness of the Moonlight Company to this company is still considerable, and it will be a matter for consideration of the local board as to whether the funds in hand will be applied by way of repayment of this loan or distributed in the form of a dividend. In the former event the money in our hands cannot be regarded as revenue, but if it is distributed by way of dividend it will in turn permit us to pay a dividend to our own shareholders. So far as it is possible to speak at the moment, I think there is little doubt about our being able to look forward to the payment of a dividend some time later in the present year.

The report was unanimously adopted.

EAST GEDULD MINES, LIMITED

YEAR OF CONTINUED PROGRESS INCREASED PROFIT AND DIVIDEND

The eleventh ordinary general meeting of East Geduld Mines, Limited, was held at Johannesburg, on May 4, 1938.

Mr P. M. Anderson, chairman of the company, presided, and, in the course of his remarks, said: The year under review has again been one of continued progress. The extensions to the reduction plant—to which I referred when addressing you last year—were completed in October last, and as a result the ore milled rose to 1,496,000 tons exceeding the previous year's figure by 127,500 tons. I might mention here that a further substantial increase in the tonnage milled is anticipated for the current year, which will reflect the full benefit of the enlarged plant, now capable of treating about 1,700,000 tons per annum.

Compared with the previous year the average yield at 5.83 dwt. per ton milled was slightly lower, but the price realised for gold was 3d. per ounce higher, and there was a reduction of 8d. in the working costs per ton milled, which averaged 17s. 1d. The net result was an increase in the working profit of £173,500, but, owing to the incidence of taxation and other minor causes, the dividend for the year was only increased by 1½ per cent.

PROFIT AND APPROPRIATIONS

The gold recovered amounted to 436,337 ounces, or 32,868 ounces more than in the previous year, and the revenue from this gold, together with a small quantity of silver amounted to £3,063,598, equivalent to 40s. 11d. per ton milled. The working profit was £1,782,959, and, with the inclusion of sundry revenue less sundry expenditure, the gross working profit totalled £1,787,297. An amount of £807,469, or about 45 per cent. of the working profit, had to be provided for taxation, but, owing to the changed method of assessment under the Income Tax Act introduced by the Inland Revenue Department, to which I referred last year, no payment is due in respect of Government share of profits as such share was insufficient to offset the increase that has taken place in taxation since the lease agreement was entered into. After allowing for taxation and donations, the net profit amounted to £972,804, or £53,931 more than in the previous year, and, with the balance brought forward at the beginning of last year, there was an amount of £1,063,801 to be dealt with. Of this £67,440 was appropriated for capital expenditure; £877,500 was absorbed by the two dividend distribution, aggregating 48½ per cent., and, after providing certain incidental items, there remained a balance of £108,061 to be carried forward to the current year's accounts.

In past years there have been substantial appropriations of profits to meet capital expenditure, but the coming into commission of the extensions to the reduction plant completed the main capital expenditure programme so that future appropriations, if any, of profits for this purpose will be of a minor nature, and a much higher proportion of the enlarged net profits will become available for distribution as dividends.

DEVELOPMENT WORK

The mine as a whole continues to open up in a remarkably satisfactory manner; the development footage driven during the year totalled 37,786 feet, and the footage on reef and sampled amounted to 30,625 feet, of which 72 per cent., or 22,150 feet, was payable, the average value being 12.7 dwt. over a width of 40 inches. It is pleasing to record that working conditions in the No. 2 Shaft area have been considerably improved by better ventilation, resulting from additional connections between the two shafts.

The ore reserves as at the end of last year, which were recalculated on a slightly lower pay limit, amounted to 10,100,000 tons of an average value of 6.2 dwt. over an estimated stoping width of 60 inches. In comparison with the previous year the tonnage shows the substantial increase of 1,100,000 tons, the value being one-tenth of a pennyweight lower and the width unchanged. The opening up of the No. 2 Shaft area has yielded gratifying results, the value and width being fully up to the average of the ore reserve as a whole, and the satisfactory position attained in building up the tonnage renders it unnecessary to carry out development on the same scale as in previous years.

THE CURRENT YEAR

In the first quarter of the current year the tonnage milled amounted to 426,000 tons, being 79,000 tons more than in the corresponding

period of last year. The yield per ton milled was approximately the same as the average for the year 1937, and the gold production of 122,922 ounces represented an increase of over 20,000 ounces compared with the first quarter of last year. Working costs at 16s. 5d. per ton milled reflect a further decline of 8d. in comparison with the average for 1937, 6d. of this decrease being due to a reduction in the development redemption charge; while the working profit for the quarter was £507,790, or an increase of £81,256 over the same period of last year. Development work continued to yield gratifying results, and, out of a total of 6,832 feet driven, 6,220 feet were on reef and sampled, the payable footage being 5,350 feet, or 86 per cent., with an average value of 11.1 dwt. over 38 inches, equivalent to 420 inch-dwt.

Our interest in Grootvlei Proprietary Mines has been increased to 134,400 shares by our subscribing for 14,400 shares at the price of 75s. under the offer made by the company early this year.

The report and accounts were adopted.

THE GROOTVLEI PROPRIETARY MINES, LIMITED

MR P. M. ANDERSON'S REVIEW OF OPERATIONS

The thirty-first ordinary general meeting of The Grootvlei Proprietary Mines, Ltd., was held at Johannesburg, on May 4, 1938.

Mr P. M. Anderson, chairman of the company, presided, and in the course of his remarks said: Since the end of the year the authorised capital has been increased to £2,800,000. 290,824 shares were offered to shareholders for subscription at 75s. per share on February 18th last and 10,636 were subscribed at this price by the guarantors. In this way the issued capital of the company has been increased to 2,725,000 £1 shares and 75,000 shares remain in reserve. The net amount of approximately £1,100,000 which has accrued to the company from this issue has been raised for the purpose of completing the present programme to commence milling with a reduction plant of a nominal capacity of 60,000 tons per month; for increasing the capacity to 80,000 tons per month as soon as the additional plant can be obtained, and for a further increase to about 120,000 tons per month when No. 3 Shaft has been connected with the workings of No. 4 Shaft and the necessary development work completed. Present expectations are that the initial reduction plant will start up about the end of next quarter, that the capacity of 80,000 tons per month will be reached about the middle of next year, and that 120,000 tons per month or thereabouts should be reached towards the end of 1940. The necessary additional plant for the extension to 80,000 tons per month has already been ordered and, provided there is no material increase in prices when the time arrives to order the plant for the further increase, the funds now in hand should be ample for all requirements to the stage of about 120,000 tons per month at present visualised. In addition, the company has 75,000 shares in reserve for future contingencies, such as an additional shaft and further increase in plant capacity.

EXPANSION IN DEVELOPMENT WORK

Development work has been expanded considerably. In all, 35,356 feet were accomplished during the year, as against 10,720 in the previous year. The footage on reef was 23,650 and the sampling and assaying of this showed 62 per cent. to be payable with an average value of 10 dwt. over a width of 35 inches, equivalent to 350 inch-dwt. During the first quarter of the current year a further 8,055 feet was developed, of which 5,115 was on reef and sampled and 58 per cent. found to be payable, the average value being 12 dwt. over 35 inches, equivalent to 420 inch-dwt. This brought the total development since the commencement of operations to 64,505 feet, of which 38,580 feet was on reef and sampled and 25,450 feet or 66 per cent. found to be payable with an average value of 10.4 dwt. over 36 inches, equivalent to 373 inch-dwt.

The ore reserves as re-calculated at the end of last year were estimated to amount to 2½ million tons of an average value of 5.8 dwt. over an assumed stoping width of 57½ inches. This represented an increase of 900,000 tons for the year, the average value and width being respectively 3/10ths of a pennyweight and 1 inch less than at the end of the previous year.

Four headings from the No. 2 Shaft of East Geduld Mines have now been extended into our property with the object of connecting with workings from our No. 4 Shaft and two of these have already been connected. The No. 1 South Incline from our No. 4 Shaft has also been connected recently with our workings from the No. 1

Shaft of East Geduld Mines. This will greatly facilitate the opening up of the South-Western section of our property.

The sinking of the No. 3 Shaft has proceeded satisfactorily and it is expected that the reef will be reached at an early date, which will be much sooner than was anticipated at last year's Annual Meeting. Connection between the workings from this shaft and those from the No. 4 Shaft is expected to be effected about the middle of next year.

PALMIETKUIL GOLD MINING COMPANY

As you know, we hold a share interest in our Eastern neighbour, the Palmietkuil Gold Mining Company, Limited. That Company's North and South Shafts were completed during the year and development work is proceeding from both. At the end of March last 33,539 feet had been developed, of which 17,320 was on reef and sampled and 4,855, or 28 per cent., disclosed payable values averaging 176 inch-dwt. These results, which have been obtained nearly three miles from our nearest workings, are a strong indication that payable values may be expected to extend right across our large property.

The report and accounts were adopted.

MARIEVALE CONSOLIDATED MINES, LIMITED

ENCOURAGING PROSPECTING WORK

The third ordinary general meeting of Marievale Consolidated Mines, Limited, was held, at Johannesburg, on May 5, 1938.

Mr P. M. Anderson, chairman of the company, presided, and in the course of his remarks, said:—As you are aware, the prospecting of the main portion of the property, which lies on the Vlakfontein farm, was initiated from the No. 1 vertical shaft to the west, which cuts the reef horizon at 755 feet, and from the No. 2 Incline haulage to the east, which starts from the surface at a point slightly outside our mining area.

RESULTS IN NO. 1 AND NO. 2 SHAFTS

Work in the No. 1 Shaft section has proceeded quite normally and the total footage accomplished on reef in this section from the start of work to March 31st is 13,240 feet, of which 5,100 feet was payable, averaging 15.3 dwt. over 20 inches, equivalent to 306 inch-dwt. A point of some interest is that a borehole which was put down recently to determine the depth of the reef horizon at a point some 1,400 feet north of our workings in this area showed 7.5 dwt. over 40 inches, equivalent to 300 inch-dwt.

Work in the No. 2 Shaft section was somewhat affected by an inrush of water. The water-bearing fissures in question have, however, now been successfully cemented and the total footage on reef accomplished to March 31st has not been unduly affected. The results are 8,905 feet sampled, showing 2,265 feet payable with an average of 29.5 dwt. over 6 inches, equivalent to 177 inch-dwt. During February of this year these two sections were connected by the holing of the 5th level drive, and further connection on the 7th level will be effected shortly. These connections will improve ventilation and will assist materially in laying out further work.

The scale of operations in the south-western portion of the property on the farm Draaikraal, has been relatively small. After doing a fair amount of work in the section opened up by the No. 3 Incline Shaft, without disclosing values of interest, the conclusion was reached that, as further development in this section would be costly, the money available for prospecting would yield more tangible results if spent in other areas and work from this shaft was therefore temporarily suspended. A small amount of work has also been done in the far south of the property, where some workings from an old incline, now called No. 4 Shaft, have been re-sampled. There remained intact in these old workings 350 feet of payable development, giving 16½ dwt. over 10 inches, and 455 feet of new work has been done, of which 200 feet showed payable values averaging 176 inch-dwt.

From the quarterly reports you will have noted the progressive improvement in reef disclosures by development work, and, taken as a whole, the results of our prospecting work must be considered as very encouraging. It is satisfactory to note that the development results from the No. 1 and No. 2 Shafts show definite signs of improving in depth. For example, the 6,345 feet which have been sampled on the 7th Level show 49 per cent. pay, running 19.2 dwt. over 18 inches, or 346 inch-dwt. If the work proceeds normally and disclosures continue to be equally encouraging, it is hoped that towards the end of the year our Consulting Engineer will be able to make a recommendation in connection with the erection of a Reduction Plant.

ADEQUATE FUNDS IN HAND

After making allowance for the call on the partly paid shares, we had available just under £457,000 at the close of last year. The call in question has now been made and, on the basis of the present programme, the funds in hand should suffice for all requirements during the current year. There will then remain in reserve 678,334 shares available for subscription at par by shareholders and by the Union Corporation Limited, in equal parts; 500,000 shares which are available for offer to the same parties at a premium provided the price does not exceed 15s. per share; and a balance of 17,500 shares, being the remainder of the shares originally reserved for acquiring neighbouring properties. According to present estimates, the funds provided by the issue of these shares as outlined above should suffice to bring the Company to the producing stage.

The report and accounts were adopted.

GEDULD PROPRIETARY MINES,
LIMITED

TONNAGE MILLED AGAIN A RECORD

The thirty-seventh ordinary general meeting of Geduld Proprietary Mines, Limited, was held at Johannesburg, on May 4, 1938.

Mr P. M. Anderson, chairman of the company, presided, and in the course of his remarks said:—For the ninth successive year a record tonnage was milled, the secondary crushing plant installed about 18 months ago having had the effect of increasing the total to 1,301,000 tons, which exceeded the previous year's figure by 25,000 tons. The yield per ton milled showed a slight decrease of 0·18 dwt. to 5·02 dwt., while the average price realised for the gold produced was 140s. 3d. per ounce, or 3d. more than in the previous year, and working costs increased 2d. to 14s. 5d. per ton milled. The net result of these changes was that the working profit of £1,354,379 was £58,891 lower. Sundry revenue less sundry expenditure amounted to £350,654, which is some £8,000 more than in the preceding year, due mainly to the higher dividend received by your company on its East Geduld mines shareholding. Out of the gross profit of £1,705,033 provision was made for taxation amounting to £615,317, and donations and sundry contributions absorbed £5,366, resulting in a net profit of £1,084,350, or £36,037 less than in 1936. With the balance of £312,235 brought into the appropriation account from the previous year, there was an amount of £1,396,585 available for disposal. The two dividend distributions totalling 75 per cent., which maintained the rate of the previous year, accounted for £1,095,643; after providing for expenditure on capital account of £39,650 in respect of calls on your company's shareholding in Grootvlei Proprietary Mines and certain incidental items there remained to be carried forward to the current year's accounts an amount of £252,492.

DEVELOPMENT WORK

As regards development work, the policy pursued during the last few years of splitting large blocks of ground and opening up low grade areas continued to give satisfactory results, though I would again point out that, owing to the nature of the work, the results disclosed are liable to show wide fluctuations from time to time. The footage driven amounted to 14,763 feet, and, of the footage sampled, 4,475 feet, or 41 per cent., was payable, the average value being 9·3 dwt. over 40 inches. The ore reserves were maintained at 9,100,000 tons, while the value and width, at 5·0 dwt. and 57 inches, respectively, also remained unchanged. The ore reserves position can be considered as most satisfactory and it is gratifying to record that a substantial portion of the tonnage milled has been drawn from sources outside the ore reserves, that is, from ground where actual stoping has disclosed more payable tonnage than indicated by development work.

THE CURRENT YEAR

In the first quarter of the current year, the tonnage milled, the yield and working costs per ton milled show little variation from the average for the whole of last year, but the profit of £332,320 showed a decline of about £12,900 in comparison with the first quarter of the previous year, due in the main to the lower price obtained for gold during the period. The development footage driven closely approximated to that of the first quarter of last year, while of the footage sampled 925 feet, or 30 per cent., was classed as payable with a average value of 5·9 dwt. over 32 inches. In the near future an additional tube mill and Dorr agitator will come into commission

and it is anticipated that the rate of milling will thereby be slightly increased.

Your company's substantial shareholding in East Geduld Mines remains intact, and that in Grootvlei Proprietary Mines has been increased to 89,600 shares by the subscription of 9,600 new shares at the price of 75s. per share under the offer made by the Grootvlei Company in February this year. Operations at East Geduld Mines continue to give every cause for satisfaction and the outlook for Grootvlei Proprietary Mines, which will enter the production stage in about five months' time, is most encouraging.

The report and accounts were adopted.

VAN DYK CONSOLIDATED MINES,
LIMITED

MILLING OPERATIONS COMMENCED

The fourth ordinary general meeting of Van Dyk Consolidated Mines, Limited, was held at Johannesburg, on May 5, 1938.

Mr P. M. Anderson, chairman of the company, presided, and in the course of his remarks, said:—At the extraordinary general meeting held on February 9th last, your directors were empowered to increase the authorised capital by £300,000 to £2,800,000 for the purpose of providing the additional funds needed for completing the initial programme of bringing the mine to the producing stage with a reduction plant of a nominal capacity of 60,000 tons per month, and for increasing the milling capacity at the earliest possible date to 80,000 tons per month. Under these powers, 500,000 new shares have been created and were issued to shareholders at 21s. 0d. per share on February 28th last, and the company now has ample funds available for the whole of the financial requirements to the 80,000 tons stage, which we may expect to reach towards the end of next year.

DEVELOPMENT WORK

The development work accomplished last year totalled 55,029 feet which was considerably more than double the previous year's footage. In addition, considerable work was done in widening and straightening old drives, raises, cross-cuts, etc.

An important feature of last year's work was the completion of the horizontal haulage way connecting Nos. 2 and 3 shafts, a distance of nearly 12,000 feet. An incline haulage, which will have a total length of about 8,800 feet, has now been started from the surface and will intersect the horizontal haulage about midway between these two shafts. This incline is expected to be completed early next year and will greatly facilitate the opening up of the shallower portion of the mine.

The development on reef amounted to 29,215 feet and the sampling and assaying of this showed 12,975 feet, or 44 per cent., to be payable with an average value of 10 dwt. over a width of 25 inches—equivalent to 250 inch-dwt. During the first quarter of the current year a further 11,591 feet have been developed, of which 6,335 feet was on reef and sampled and 3,125 feet, or 49 per cent., gave payable assay values averaging 11·8 dwt. over 27 inches, equivalent to 318 inch-dwt. The combined total of the old work done by previous companies and the new development work by this company as at the end of last quarter was 135,203 feet, of which 74,390 feet was on reef and sampled and 31,500 feet, or 42 per cent., payable, with an average assay value of 10·5 dwt. over 25 inches, equivalent to 262 inch-dwt. In the course of this work adequate stope faces have been provided to ensure continuous operation of the initial reduction plant at full capacity.

The payable ore reserves as at the end of last year were estimated at 1,800,000 tons of an average value of 5·8 dwt., over an assumed stoping width of 40 inches, the increase during the year being 800,000 tons with no change in either width or value.

COMMENCEMENT OF MILLING OPERATIONS

The most important event since we last met has been the commencement of milling operations. The various sections of the plant were tried out in turn during last month and from the beginning of this month the whole plant has been almost in full operation. It has of course still to be tuned up, and there will be the usual absorption of gold, so that representative outputs must not be expected for the first few months. The whole plant is, however, operating entirely satisfactorily, and I do not doubt that the hopes of a maiden dividend declaration at the end of this year, as expressed at the extraordinary meeting, will be realised.

The report and accounts were adopted.

WIGGINS, TEAPE AND CO. (1919)
LIMITED

FOREIGN COMPETITION

LORD PORTAL'S REVIEW

The nineteenth annual general meeting of Wiggins, Teape and Company (1919), Limited, was held, on the 27th ultimo, at Winchester House, Old Broad Street, London, E.C.

Lord Portal, D.S.O., M.V.O. (chairman of the company), said: Ladies and Gentlemen,—The report and accounts have been in your hands for the requisite period, and I propose, with your permission, to take them as read.

For the fifth year in succession your directors, in their report, have been able to report a larger volume of trade done by your company and its subsidiary companies during the year under review. During the greater part of the year 1937 trading conditions in almost all industries were more prosperous than during the year 1936. The latter end of the year, however, saw some slight recession, and though orders in the paper trade were naturally affected the mills were so booked up with orders that there was no question of running short time except in isolated cases.

THE CARTELS CRITICISED

Owing to the Trade Agreements with Scandinavia it has been necessary for various sections of the paper trade in this country to form Cartels with the Scandinavian countries. I must emphasise in my speech to-day that instead of the British firms being allowed to be the advisers in the policy of these Cartels, which anyone would consider to be the natural course to be pursued in our own markets, these Cartels are governed from Scandinavia, and we have to follow humbly in their footsteps. This is a Gilbertian situation which cannot be allowed to continue unless one wishes to see the whole of the paper trade in this country sink into a worse depression than that of 1930.

SCANDINAVIAN PULP AND PAPER PRICES

The Governments of the Northern countries apparently do not appreciate that their wood pulp and paper industries should be regarded for purposes of trade with this country as divisions of one unit. It is useless for them to assume that their pulp mills can go on indefinitely selling their pulps to this country at high prices whilst their paper mills seek to sell paper in this market at prices which not only leave the United Kingdom manufacturer, whose paper prices have to be strictly competitive, with no margin for conversion or profit, but actually involve him in many cases in financial loss. It is submitted that this situation is one which as a matter of principle merits the most serious attention of H.M. Government.

SATISFACTORY PROSPECTS

With regard to our own prospects, you have already received the progress report which gives the results for the first three months of the year 1938. The report shows that the profits for that period have been practically maintained as compared with those for the similar period of last year. Unless trading conditions deteriorate

OFFER TO NEW READERS

Any reader who makes his first acquaintance with this journal with this week's issue is invited to fill up the attached:

To The Publisher, Economist Newspaper Ltd.,

8 Bouverie Street, E.C.4.

In order to test the value of your publication I should like you to forward it to me by post for the next four weeks. If I then decide to become a subscriber, it is understood that there will be no charge for the copies thus received, but otherwise I shall be willing to pay 4s. to cover their cost.

Name

Address

I think we can look forward to being able to place before you next year a satisfactory balance sheet.

You will see that we recommend a payment of a final dividend on the ordinary stock of 5 per cent., less income tax, which brings the dividend for the year 1937 up to 8 per cent. In addition, we are recommending the payment of a bonus on the ordinary stock of 2 per cent., less income tax. Then we propose that £10,000 be transferred to income-tax equalisation reserve and £15,000 to special obsolescence reserve. We also propose the transfer of £96,322 to general reserve, bringing that account up to £660,000. The total allocation to these reserves of £121,322 compares with £110,000 for 1936, an increase of £11,322.

The chairman then moved the adoption of the report and accounts.

Mr L. W. Farrow (deputy chairman) seconded the motion, which was unanimously passed.

The dividend and bonus, as proposed, were approved; the retiring directors were re-elected; and the auditors were reappointed.

UNITED SUA BETONG RUBBER
ESTATES, LIMITED

POSITION OF OIL PALM INDUSTRY

MR J. G. HAY'S ADDRESS

The twenty-ninth annual general meeting of the United Sua Betong Rubber Estates, Limited, was held, on the 1st instant, at 19 Fenchurch Street, London, Mr J. G. Hay (the chairman of the company) presiding.

Dealing with the accounts, Mr Hay said:—In 1937 we succeeded in earning a profit of £220,000. Although that profit represents a not inconsiderable percentage on our issued capital, on the real capital engaged in the business it is just short of 11 per cent. After making what we deem to be necessary appropriations, we are able to recommend and pay dividends for the year which, on the same basis, are equivalent in total to approximately 7 per cent. Carrying that basic calculation a little further, it may interest you to know that our earnings for the years 1928-37 inclusive are equal to 4·87 per cent., and that the average rate of dividend for the same period is 3·74 per cent.—that is without making any deductions for amortisation. For any company engaged in tropical agriculture such earnings are modest indeed, and, since they relate to a company which is supposed to have enjoyed a singular success, my citation would seem to demonstrate that during the last decade the rubber plantation industry has been poorly required for its endeavours.

Referring to the company's holding in Oil Palms of Malaya, Limited, Mr Hay reviewed the general situation in the following terms: As in rubber, palm oil is consumed to a large extent in the United States, and the depression there has, unfortunately hit the palm oil industry just as heavily as any other. A further contributory cause is the very heavy processing tax of approximately £13 per ton which is levied on all palm oil used in the United States. Even at its present depressed world price of £14 per ton, this tax makes it quite expensive to the American consumer at £27 per ton. This acts as a very severe handicap to trade with America, and it seemed to your directors that the trade negotiations now proceeding between Great Britain and America offered a favourable opportunity of endeavouring to secure a remission or reduction of the tax. On making representations to the British Government to that effect it was a great disappointment to be informed that it had been decided to omit palm oil from the list of articles on which concessions would be sought by the British negotiators. The British Empire is still the largest producer of palm oil, and the omission of this commodity from the list is inexplicable.

ATTITUDE OF IMPERIAL GOVERNMENT

Our recent experience in this and other Colonial matters engenders the depressing thought that the Imperial Government take little interest in Colonial affairs until they have assumed the serious and disagreeable form of unrest in Jamaica and insurrection in Palestine.

Given a fair field, I am confident that we can make an adequate profit, but if we are to continue to be impeded by the self-sufficient policies of the chief consumer and refused help by our Government, I cannot deny that our chances of full success are seriously diminished.

Reverting to the position of rubber, Mr Hay examined the causes of the decline in price, and suggested that in the present state of political and economic unsettlement no prediction of future consumption could be made, and that it might be of greater advantage to turn attention to the question of production costs, and pointed

out that Malaya, which formerly enjoyed the advantages of economic agricultural production, had in recent years lost ground.

Mr Hay concluded: Malayan production is approximately 80 per cent. of the British share of the plantation industry. In 1937 the value of Malayan exports of rubber produced within that territory was over £40,000,000. Any decline in competitive power must eventually result in the loss of valuable export trade which can be ill afforded. For Malaya in particular any deterioration in her rubber industry is a serious matter, indeed, for on that industry depends, more than any other, the economic welfare of the whole country.

I suggest that the question of cost of production is a fitting one for close inquiry, and that if our performances are fairly measured by those of other competing countries, our complacency will be seriously disturbed. I hope sincerely that the Governments concerned, and the industry through its associations both in London and in the East, will enter into close and friendly collaboration for a proper ascertainment and study of the facts and with a determination to take all such steps as are within their competence to restore to Malaya's chief industry its former power to compete.

The report and accounts were unanimously adopted.

DALKEITH (CEYLON) RUBBER ESTATES, LIMITED

SUBSTANTIALLY INCREASED PROFIT

The twenty-eighth ordinary general meeting of the shareholders of The Dalkeith (Ceylon) Rubber Estates, Limited, was held, on the 30th ultimo, at the offices of The Rubber Growers' Association, 19 Fenchurch Street, London.

Sir Delves Broughton, Bt. (the chairman of the company), who presided, said:—Gentlemen,—From the annual accounts shareholders will appreciate that the profit for 1937, £18,567, shows a very substantial increase when compared with £7,616 in 1936. To this amount must be added £9,902 brought forward, making a total credit balance available for dividend as at December 31, 1937, of £28,470. Your directors recommend that replanting expenditure incurred during the year, £2,805, be written off, and a dividend of 10 per cent. (less income tax) be declared for the year 1937, which, with bonuses payable to the estate staff and additional remuneration to the directors, will absorb £15,320, leaving £10,345 to be carried forward to 1938, as against a balance of £9,902 brought forward from 1936, apart from the company's reserve of £10,000 invested in Government securities.

In view of the limited dividends paid to shareholders in recent years your directors feel that this distribution will be welcomed, having regard to the company's strong financial position, the result of a continued conservative policy extending over many years, current assets having increased as at December 31, 1937, by £10,484 to £39,931, of which sum no less than £33,423 is represented by cash £18,291 and gilt-edged investments £15,132.

The standard assessment for the estate has been slightly increased

Grains

Rising estimates of the United States winter wheat crop, and better weather reports in Europe and Australia brought a fall in wheat prices, though there was a better tone in the market at the end of the week. No. 2 Northern Manitoba is quoted at 42s. 3d. compared with 45s. per 496 lb. last week. The maize market has been quiet and prices have tended downwards; there has been little business in barley.

Other Foods

Provisions.—Bacon prices are unchanged and the market has been steady. Butter prices, affected by a slow demand, have fallen by 3s. per cwt., New Zealand now being quoted at 125s. per cwt. Meat and egg prices show little alteration.

*

Colonial Produce.—The fall in sugar prices during the previous week has been reversed and prices were restored to their former level on Tuesday.

Demand was slow at the tea auctions and prices were somewhat lower. The coffee and cocoa markets have been quiet.

*

Vegetables.—Prices of both old and new potatoes are lower, but demand is steady. There is still a shortage of cauliflowers, but spring greens and cabbage did not sell well over the week-end. There is a good demand for asparagus, at 1s. to 1s. 6d. per bundle, and also for tomatoes, whose prices are a little lower.

Miscellaneous Commodities

Oilseeds and Oils.—Very depressing conditions and falling prices have been experienced in these markets, largely caused by the unsatisfactory situation in the United States. The price of linseed fell by £1 per ton and Egyptian cotton seed is now quoted at less than £5 per ton for the old crop.

for 1938, being fixed at 1,212,151 lb., but the international and local percentage deductions, estimated at 50 per cent., together with the average price of rubber ruling to date, preclude any advantage to the company during the current year.

Colonel L. Bayly, in seconding the resolution, said:—I inspected the company's properties in April last and am very glad to give you a most satisfactory report of their condition, not only of the original plantations, but also of the replanted area of 743 acres, which, in my opinion, surpasses any estate that I visited in Ceylon.

The report and accounts were unanimously adopted.

RIO DE JANEIRO CITY IMPROVEMENTS COMPANY, LIMITED

EXCHANGE DIFFICULTIES

The seventy-sixth ordinary general meeting of this Company was held, on the 1st instant, in London.

Mr Francis M. G. Glyn, the chairman, in the course of his speech, said that the net balance of profit carried to the balance sheet amounted to £105,000, against £49,000 for 1936. That improved result was due to the fact that the payments received from the Government had been at the rate of 340 milreis per house.

The company had been able to remit the balance of the revenue for the first half in 1937, but no remittances had been received for the amount available out of the second half year. The board had thought it wise to limit the final dividend to 2 per cent., free of tax, making 4 per cent., free of tax, for the year, and increase the amount carried forward by £29,517. Shareholders, he thought, would not consider such a result unsatisfactory.

Towards the close of last year there had been a severe political and financial crisis in Brazil, resulting in events of outstanding importance, such as the publication by the President of the Republic of the New Constitution, the temporary suspension of the service of the foreign debt and a drastic change in the coffee policy of the country.

In the meantime, undoubtedly the exchange position was difficult. Unless exchange was obtainable to remit the milreis balances at present accruing in Brazil, the future distribution of profits in sterling must, of necessity, be problematical. The board were making constant applications to the Exchange Authorities, who had assured them that exchange would be allotted to the company in due course.

In the new contract signed with the Government last year there was a clause in which the company undertook to drain certain new areas, such expenditure being only undertaken upon receipt of a payment covering the difference between the net rate of 340 milreis per house and that of 218 since November, 1933. That payment had not yet been received, and the new drainage works, therefore, had not been commenced. Negotiations were now taking place with the Government regarding the payment of that sum.

The report and accounts were unanimously adopted.

The demand for oilcakes has fallen to insignificant levels.

*

Rubber.—Little business was done, pending the decision of the International Regulation Committee, but the rise in prices which the cut in quotas was expected to produce was short-lived and prices on the week are unchanged. The depressing outlook in America prevents any real recovery in this market.

*

Furs.—At the London spring silver fox sale, which opened on May 23rd and lasted until the middle of this week, a total of about 100,000 skins was on offer, of which 65 to 70 per cent. were sold. London and Paris buyers were responsible for the largest purchases. The general trend of the sale was better than expected and prices, except for some medium grades, showed no change on the January levels. The comparatively steady undertone of the sales does not indicate a changed trend on the fur market; silver fox skins are particularly favoured by fashion, and in recent years the silver fox market has frequently shown much more strength than the general fur market.

All tables appear regularly except those whose titles are printed in italics, which are special to this issue.

Then and Now

When signs of another recession in industrial activity are accumulating, it is interesting to examine the movement of the principal economic indicators in the months preceding the last great depression. The following charts have been designed to facilitate this comparison. In each chart the figures for the years 1928 to 1930 are compared month for month with those for the years 1936 to 1938. We have used our own indices for business activity and wholesale prices and that of the London and Cambridge Economic Service for industrial share prices. The unemployment percentages refer to insured persons aged 16-64 in the United Kingdom and the 1936-38 line is broken at September, 1937, when the new method of counting was introduced. Strictly comparable figures for the subsequent period would be somewhat higher than those shown.

Finance

GOVERNMENT RETURNS

For the week ended May 28, 1938, total ordinary revenue was £6,709,000, against ordinary expenditure of £10,413,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £43,107,000, against a deficit of £21,414,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On May 27th, applications at £99 17s. 3d. per cent. for bills to be paid for on any day except Saturday of the following week were accepted as to about 35 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications for bills to be paid for on Saturday at £99 17s. 4d. per cent. and above were allotted in full. £50.0 millions of Treasury bills are being offered on June 3rd.

Half a century
of Tyre Leadership

The Dunlop Rubber Co.
Ltd. extends its Jubilee
Greeting to Tyre
Users throughout the
World.

In 1888 John Boyd Dunlop's
invention of the pneumatic tyre
laid the foundation of the world-
wide tyre industry.

Dunlop now make the only tyre
with

Teeth
to bite the
road!

The Dunlop lead estab-
lished in 1888 has never
been lost. Dunlop Fort
represents the highest
achievement in tyre design
and manufacturing
technique.

DUNLOP Fort

-the tyre with 2,000 TEETH

* Free of Income Tax. (a) Paid on a larger capital. (b) Free of South African normal income tax and payable in South African currency. (c) Equal to 6½ per cent. on the capital of £742,029, now reduced to £463,770.

ANGLO-IRANIAN OIL.—Final ordinary distribution is again 20 per cent., making 25 per cent., less tax. The £6,712,500 bonus capital ranks for the full 1937 payment.

BRITISH EMPIRE FIXED TRUST (Comprehensive Series).—Distribution 3d. per sub-unit on all purchases up to May 6, 1938.

CONSETT IRON.—Ordinary dividend raised from 7½ to 10 per cent.

CROMPTON PARKINSON.—Interim dividend of 6 per cent. maintained on larger capital.

CROSSLEY MOTORS.—Ordinary dividend raised from 7½ to 10 per cent.

FIRST PROVINCIAL FIXED TRUST.—Seventh distribution on Series "B". Certificates payable on June 16th at rate of 5-2137d. net per sub-unit. It compares with 4-3325d. for previous six months and 4-6064d. for corresponding period last year.

GERMAN DYE TRUST.—Dividend increased by 1 per cent. to 8 per cent.

MANCHESTER COLLIERIES.—Ordinary dividend raised from 4½ to 5 per cent.

METALS AND MINERALS TRUST.—Distribution 3-6d. per unit, free of tax, on account of half-year to April 29, 1938.

MILLARS' TIMBER AND TRADING.—Ordinary dividend raised from 7½ to 10 per cent.

STANTON IRONWORKS.—This company is making a free share issue of one in five, in addition to the usual final dividend of 6 per cent., making 10 per cent. for the year.

SUEZ CANAL COMPANY.—The board recommend increased total gross dividends for 1937 on the capital shares, bonus shares, and founders' shares:—
1936 1937
Capital shares 600-00 820-00
Bonus shares 555-39 756-36
Founders' shares 625-79 852-23

Barbarism Unleashed

FAMILIARITY, say the wiseacres, breeds contempt; and it is indeed the case that the tale of other peoples' sufferings, when oft repeated, ceases in the end to shock or to stir the imagination. But the world has this week been shaken out of its indifference by the news from the countries where war is raging. These latest massacres of civilians in Spain and China are so ruthless, so devoid of direct military purpose, and so frankly a return to the methods of barbarians that we find ourselves in the presence of something which threatens the very basis of Western civilisation.

The aerial frightfulness in Spain has been the prelude to another offensive by General Franco and his foreign levies in a desperate attempt to "solve the Spanish problem." But belief in the speedy victory of the Spanish insurgents has waned, and the Italian authorities are preparing public opinion for the possibility that the war may not end this year. It is, moreover, reported that the German authorities, distrusting General Franco's ability to settle the matter with his present resources, have decided to plunge deeper into the Spanish cauldron. If this expectation be realised, it will play havoc with British policy; for Mr Neville Chamberlain's much-heralded Anglo-Italian Agreement will be suspended between heaven and hell while the

lation of the first principles of non-intervention." After s no one will dare to accuse Signor Gayda of possessing sense of humour! The steps taken by France to protect the Pyrenees frontier and reported to be in preparation by Britain to give greater protection to British ships are signs that there are limits to the patience of the most peace-loving governments.

Even, however, if these moves are effective and the rams of Spain and China unroll without an overt clash with other countries, and if we reach a precarious and unstable peace, this week's events—as we have said—raise an even more far-reaching question. What kind of peace can we establish if the groundwork of civilisation is blown to smithereens? For the sake of peace, for the sake of civilisation, for the sake of an understanding with Italy and with Germany—and, *pro tanto*, with Japan—we have been adjured to face facts, to be realistic. Let us do so without delusion. We have been officially informed, by the spokesmen of the Japanese Navy and of the Italian Foreign Office, that aerial frightfulness aimed at civil populations and property is justified because it can shorten war. War is to be abbreviated by a kind of perverted humanitarianism! We have heard this doctrine before, but it has never been so openly applied since the barbarian invasions of Europe. And if it is ever applied on the grand scale and is not checked by the civilised conceptions of humanity and justice, then indeed we shall be destroyed by forces we have created but cannot control.

To their credit, the British Government have not acquiesced. They have suggested to European Governments and to that of the United States that a corps of observers be established to determine whether aerial bombardment in future is militarily justified. Further, our Minister in Spain last week was instructed to report, on that very basis, whether the bombing of Granollers last week was warranted; and the Minister has roundly replied that

it was not. The Swedish and Norwegian Governments promptly offered to send observers. The American Government, to the manifest satisfaction of the German and Italian official Press, has been hampered, as usual, by the fear of European entanglements.

But if the British, French and other freedom-loving peoples cannot persuade the wave of barbarism to retreat, they will have to dam it. Reliance upon the policy of the "good neighbour" and upon argument and example has made non-intervention a laughing-stock and jeopardised the vital interests of this country—to say nothing of those of other countries, belligerents and neutrals alike. It takes two to make good neighbours, to reach agreement, or to preserve peace. What has occurred in and about Spain during the last few days reveals the second inadmissible attempt—the first was stopped by the establishment of the Nyon patrol last September—to institute an effective blockade of Republican Spain. The terror that lurked beneath the waves last summer and autumn now flies by night and day, and for the same illicit purpose: to enable intervening Powers to impose their will on another country.

To this policy of aggression, which is producing so rapid a deterioration in European affairs, the British Government must forthwith reply by equally firm demands. If these prove unavailing, Britain must unhesitatingly reply by acts. We trust His Majesty's Government will stand solidly with the Government of France in doing whatever may be necessary to prevent a conquest of Spain by foreign Powers. Protests to General Franco have proved fruitless. This week's news has made it crystal clear that unless Germany and Italy withdraw, General Franco is not, and will not be, in control of Spain, however his military campaign progresses. There are only two courses open that are consistent with British interests and the safety of France. One is that non-intervention should be made a reality. The second is to take other steps to see that intervention is not allowed to determine the fate of Spain.

The Arab World

WHILE the authorities in Downing Street have been taking their slow steps to follow up the recommendations of the Peel Commission, the political temperature in Palestine has been steadily rising again. The technical commission that is to look more closely into the partition scheme which the Peel Commission roughed out is now, at last, at work on the ground. But by this time the volume of outrages, with their heavy toll of deaths by violence, is also rapidly mounting; and the British police and troops in Palestine are finding it as hard as ever to keep order.

The latest suggestion for solving this police problem is that Palestine should be insulated by a wire fence; and this suggestion shows, in a flash, where the crux of the problem lies. If Palestine really could be insulated, it ought not to be difficult for the armed forces of the British Crown to re-establish order in a country no larger than Wales, with a population of no more than 1,400,000. The crux, however, is just this, that Palestine is impossible to insulate, even if we were to hedge it about with a Hindenburg Line of live wire. This is impossible because Palestine is a mere enclave in the Arab World; and no physical barrier can prevent the one million Arabs on the Palestinian side of the post-war frontier from feeling and thinking and acting in concert with the forty or fifty million Arabs who inhabit the vast spaces in the hinterland.

North and south and east and west of Palestine the Arab world extends; northward to Alexandretta and Turkey; eastward to Persia and the Persian Gulf; southward to Aden and Khartoum; south-westward to Lake Chad; and westward to the Atlantic seaboard of Morocco.

Throughout this vast expanse the Arabic language is not only the universal *lingua franca*; it is actually the mother-tongue of all the present inhabitants of South-Western Asia and Northern Africa, apart from a few islands of alien speech. Some of these islands are pre-Arabic survivals; others are encroachments on what has once been an Arabic domain. The principal survivors are the still Berber-speaking highlanders of the Algerian Kabylia and of the Moroccan Rif and Atlas. The principal intruders are three groups of European colonists who are all of recent date. In the French territories and protectorates in North-West Africa there is now a resident population of about one million French citizens (of whom a considerable proportion are of Spanish, Italian and Maltese origin). This French citizen body in Africa has come into existence since the French made their first landing in Algeria in 1830. Then in Tunisia, side by side with the local community of French citizens in that French protectorate, there is a separate and rival community—about 100,000 strong—of European settlers who are Italian citizens, and whose settlement in Tunisia began about the middle of the nineteenth century. Finally, in Palestine to-day, there is a community of about 400,000 European Jews, the great majority of whom have come in since the end of the War.

In this situation, what are the prospects? Are the recent European settlers in the Arabs' ancient domain going to increase and multiply and populate a hitherto Arab earth until the Arabs themselves have been pushed out of the town into the desert? There are perhaps some Zionists who dream of making Hebrew the language of the Levant from Tel-Aviv and Haifa to the western edge of the

Syrian desert; and there are certainly some Frenchmen who dream the similar dream of carrying their own language from Oran and Algiers to the northern edge of the Sahara and making new Frenchmen out of any Berbers who have not yet been turned into Arabs. Are these European dreams of expansion at Arab expense sheer fantasies? Or are they practical politics? The answer to this question depends on the Arab reaction to this European impact.

What are the omens? Mere community of language does not, of course, imply a common social consciousness, still less a common will or aim; and up till now the Arabs have been at sixes and sevens. Their lack of solidarity is signified by the very patchwork of colours on the political map. At the present moment there are four Arab countries—Saudi Arabia, the Yemen, Iraq and Egypt—that are fully sovereign independent States; three Arab countries—Syria, the Lebanon and Transjordan—that have come within sight of independence; and two—Tunisia and Morocco—which have kept the forms of statehood but have been reduced to the status of French protectorates. Three Arab countries—Palestine, the Sudan and Libya—are all being governed *de facto* as Crown colonies, though *de jure* Palestine is a mandated territory and the Sudan an Anglo-Egyptian condominium. Finally, in Algeria there are three French departments, administered by *préfets* under the Ministry of the Interior at Paris, which rank as integral parts of the metropolitan territory of France.

The present state of the Arab world is not unlike its condition in the time of the Crusades. The war-map itself is strikingly similar; for then, as to-day, Palestine and Tunisia were the two points at which the European invaders made their most effective lodgment on Arab ground; and then, as now, the deadliness of the danger evoked a movement of co-operation which would have seemed inconceivable only a short time back. The Normans were cleared out of Tunisia by deliverers from Morocco, and Saladin stemmed the Third Crusade by mobilising against it the united forces of Syria and Iraq and Egypt. Is history likely to repeat itself? There are signs which point that way.

At the present time the desperate resistance of the small and weak Arab population of Palestine to the combined forces of Jewry and the British Empire is arousing en-

thusiasm and emulation among Arabs far and wide. Sparks sent flying from Palestine have already started fires in North-West Africa, where anti-Jewish feeling has for long been hot. In Algeria, the French citizenship which the native Algerian Muslims have not yet acquired was conferred upon the native Algerian Jews *en masse* as long ago as 1870; and in Tunisia and Morocco likewise the Jews have aroused the jealousy and hostility of their Muslim fellow-countrymen by the greater ability which they have shown in profiting by the economic opportunities which French rule has opened up. In Tunisia and Algeria, the Arab now looks at his quarrel with the Jews in terms of his fellow Arabs' struggle with the Zionists in Palestine. In Morocco, where Germany looms larger on the Arab horizon, the Arab attacks the Jew to the war-cry of "Heil Hitler."

Until the other day, the Moroccan lowlands were, of all Arab countries, the most isolated and old-fashioned. The Atlas and the Rif, with their Berber tribesmen, cut off Arab Fez from Arab Tunis. In 1930, however, a violent Arab national movement was suddenly conjured up in Morocco by a French ordinance, issued in the Sultan's name, which threatened to remove the Moroccan Berbers from the influence of the Arabic and Islamic culture and to expose them to French influence instead. Ever since then the Moroccan Arabs have been on the warpath; and their restiveness under French rule has been increased by the spectacle of their fellow Moroccans from the Spanish zone campaigning in Spain in the footsteps of the ancient Muslim conquerors of the Peninsula. In Algeria and Tunisia, the native as well as the European element in the population has been stirred by the upheaval which has been taking place in France since the victory of the popular front. And here there is a strange confluence of influences which have nothing in common except the quality of being disturbing; for the Algerian Muslims are simultaneously being stirred by the Wahabi puritanical reforming movement from Central Arabia, and the Tunisian Muslims by the success of the nationalist movement in Egypt. From end to end, the Arab world is thus in ferment, and we may anxiously speculate on what is likely to happen if the pot boils over.

The Course of Prices

THE sudden collapse of the boom in primary products at the end of March, 1937, provided one of the first warnings of the coming recession in world economic activity. At first the headlong fall in prices was regarded as a necessary corrective to the inordinate bidding-up of quotations which preceded it. But the downward movement persisted. In examining the outlook in *The Economist* of December 4, 1937, we suggested that it would be rash to assume that the decline had reached its limit. This view has been confirmed by a further sharp drop in prices this year. The time, therefore, is opportune for a re-examination of the causes and implications of the abrupt reversal of the trend in the spring of last year and for an appraisal of the factors likely to influence the future course of prices.

Recent movements in prices of individual primary products have been far from uniform, though the trend

for the majority of commodities conforms to a general pattern. Before tracing the divergences between individual commodities, we may conveniently examine briefly the general tendencies at work. These are illustrated graphically in the accompanying chart, which shows the trend of the world production of industrial raw materials and crude foodstuffs, as well as of world stocks and sterling prices of primary products since 1929.*

WORLD PRODUCTION, STOCKS, AND STERLING PRICES OF PRIMARY PRODUCTS, 1929-38
(Average of 1929 = 100)

* The annual indices of production and the figures for stocks at the end of each year are those calculated by the League of Nations. The index of stocks is based on twelve industrial raw materials and twelve crude foodstuffs. The data for stocks relate to "visible" supplies as distinct from "invisible" supplies held by consumers. The trend of prices is shown on the basis of *The Economist's* index of seventeen primary products. For the purpose of comparing the movements of prices in 1929-30 with those in 1937-38 we have calculated this index back to January, 1929. All indices are based on 1929.

RAW MATERIAL PRICES

COPPER (Standard)

LEAD (Soft Foreign)

SPELTER (G.O.B.)

TIN (Standard)

RUBBER (Smoked Sheet)

TIMBER (Swedish)

PIG IRON (Cleveland No. 3)

The diagram illustrates the instability of the prices of many primary products, due mainly to the difficulty of adjusting supply to demand at short notice. As a result of this short-term inelasticity of supplies, stocks invariably tend to increase, and prices to fall, during a period of declining demand. Conversely, a recovery in demand is accompanied by falling stocks and rising prices. Hence the close inverse correlation between the movements of stocks and prices shown by the diagram.

These tendencies are well known, but they do not, in themselves, explain the violence of the downswing of prices during the early phase of economic recession in 1929-30 and in 1937-38. Nor do they throw much light on the violence of the upswing in prices in the winter of 1936-37, which had no counterpart in the last phase of the previous world recovery movement. The explanation is to be found in the lack of synchronisation between consumers' purchases and actual consumption. Towards the end of a boom, as in 1929, consumers invariably over-estimate their future requirements and tend to lay in supplies in excess of their actual needs. And if, as in the winter of 1936-37, this re-stocking movement by consumers is accentuated by the fear of an actual shortage of supplies (which was absent in 1928-29), it may develop into a veritable scramble. Producers, in turn, confronted with an acceleration of purchases, tend to increase production beyond current consumption. When consumption falls off, however, consumers are as anxious to reduce their stocks as they were previously to increase them. Consequently, their purchases of new supplies tend to fall appreciably below current consumption. Producers, therefore, are faced with the problem of reducing output much more than proportionately to the decline in actual consumption. Hitherto, however, production has not shown sufficient elasticity to prevent the rapid accumulation of stocks during a period of falling consumption. Moreover, if, as in the case of wheat, farmers attempt to maintain their income by increasing output during periods of falling prices, the maladjustment between output and demand is seriously aggravated. This tendency powerfully reinforces the desire of consumers to reduce their new purchases to a minimum in the expectation of lower prices later on. Hence a violent slump in prices occurs in the early stages of economic recession.

As the diagram shows, the fall in *The Economist's* index of the prices of primary products between the end of March, 1937, and the end of last month, amounting to 27½ per cent., has been even more violent than during the corresponding period in 1929-30, when the index fell by 18½ per cent. As the fall since the end of March, 1937, was preceded by a consumers' re-stocking movement of greater magnitude than eight years ago, its violence is scarcely surprising. But it has certainly shattered the widespread belief that the existence of output or export control for many primary products, and the fact that prices did not recover to the level of eight years ago, would prevent prices from declining as sharply as they did during the last depression.

The movements of the prices of fourteen individual commodities, monthly from January, 1927, are revealed in the remaining diagrams which accompany this article. In order to bring out proportionate price changes, these diagrams have been drawn on a logarithmic-ratio scale.

A comparison of the price movements of the four non-ferrous metals is significant; for two of them (copper and tin) are subject to control, while the others (lead and spelter) are not. Early in 1937, quotations for lead and spelter rose above the highest level reached in 1929, while the prices of copper and tin failed to reach that level. All four metals rose sharply during the scramble in the winter of 1936-37, but the control of copper and tin did not prevent their prices from falling sharply in 1937-38 with those of lead and spelter.

Similarly, the control of rubber exports did not prevent prices from being driven up inordinately during the hectic boom of the winter of 1936-37 and from falling abruptly during the past fifteen months. The restriction of timber shipments by the leading exporting countries has driven prices during the intense demand of 1936-37 well above the 1929 level. Nor has the fall since then been as violent as in the case of certain other commodities. Similarly, the price of pig iron was raised well above the level of eight years ago; moreover, as a result of the substitution of central control for free competition among producers, it has so far been possible to maintain prices despite a fall in demand accompanied by an increase in stocks. It is intended to maintain the prices of forge, foundry, basic and hematite pig iron at their current levels until the end of 1938.

Of the remaining seven commodities, only wheat recovered to the pre-depression level during the boom in the winter of 1936-37, when prices rose sharply as a result of a short crop. But the anticipation of a harvest in excess of requirements during the current year has sharply reversed the price trend. The rise in raw cotton prices in the winter of 1936-37 was less steep than that of metals, for example, but the subsequent fall has been equally steep, the downward movement having been accentuated by a record crop harvested in the United States last year. Moreover, the current price of American raw cotton is almost as low as in 1931. In the case of raw wool, too, the rise of prices was fairly gradual in the winter of 1936-37, but prices have since fallen sharply, as the reduction in consumption took place at a time when supplies showed an increase.

Although the area sown to jute in India (the main source of supply) has been deliberately restricted in recent years, the recovery in prices was not very marked. But the absence of a more marked recovery did not prevent an appreciable fall in prices since last spring. The tea restriction scheme has been among the most successful. An inordinate rise in prices during recovery, as well as an abrupt decline since last spring, has been successfully prevented. Raw sugar hardly rose in price before the 1936-37 boom, when recovery was reinforced by a restriction scheme. But despite the scheme, prices have since suffered a severe setback. Coffee stands in a separate category, and is among the few commodities whose prices have fallen appreciably below the lowest level of the depression. Persistent efforts on the part of the Brazilian Government have failed to eliminate the tendency to over-production.

Despite the severe fall in prices since last spring, which has already carried the quotations for many commodities with a free market well below the level of the winter of 1936-37, there is still no conclusive evidence of an early reversal of the trend. As the United States consumes a large proportion of the world's output of primary products, the trend of prices in coming months will depend, to a large extent, on the course of events across the Atlantic. Most observers appear to agree that recovery in the United States is unlikely to make headway before the autumn—if then. Meanwhile, even substantial cuts in new supplies may do no more than temporarily avert the downward movement of prices. Consumers cannot easily be tempted under present circumstances to increase their purchases; and that condition is essential to a reversal of the downward trend of prices. There is some evidence, however, that stocks of industrial raw materials in the hands of consumers have been substantially reduced in recent months as a result of the widespread curtailment of purchases. Moreover, stocks in producers' and merchants' hands are not yet as unwieldy as they were some years ago. Market demand and prices, therefore, would now respond more rapidly to an improvement in consumption than five years ago.

Britain's Future Budgets

THE task of the British Chancellor of the Exchequer in the years that lie ahead will clearly be a thankless one, and it is highly desirable that the problems involved should be considered in good time. In the Budget Supplement contained in our issue of April 9th, we endeavoured to sketch in outline the scale and trend of British revenue and expenditure in the next decade or so, and the difficulties which this picture brings are more fully examined in the memorandum by a group of economists which we print on pages 591 to 597.

Briefly, the authors conclude that we must expect expenditure to persist at a figure in the neighbourhood of £1,000 millions. It is not likely that the debt charge can be further reduced by a significant amount, and though we may hope in time for a reduction on defence expenditure, it would be taking a very rosy view to anticipate that it will fall below £200 millions for a long time to come. Even this figure represents a big reduction from the present high level, but against this saving we must anticipate that the rising tendency of civil expenditure, which has been rapidly growing since the beginning of the century, will continue.

To balance so large a Budget means that there is little hope of tax reductions, for, with a stationary or falling population, national productivity—and therefore taxable capacity—can hardly be expected to grow in the same spectacular way as it did during the nineteenth century.

Moreover, there are numerous features of the present situation which were not present a hundred years ago, such as the effect of a stationary population on the cyclical movements of trade; or, to take a problem with a more immediate bearing, the situation that will be created when re-armament and the resulting diversion of the resources of our metallurgical industries come to an end.

The net effect of this survey is a rather pessimistic one; for there can be no quarrelling with the general conclusion that the Chancellor's problem will not solve itself by the mere passage of time. It is therefore essential that the issue should be studied by the powers that be. For their consideration the authors of the memorandum have several suggestions to make. They are, for example, impressed by the difficulty of always balancing the Budget year by year, and in order to avoid the effects of restriction in bad times, they would like to see the principle established of balancing over a considerable number of years—which would mean, in effect, budgeting for surpluses in good years and deficits in bad. There is, however, an obvious political difficulty in resisting the pressure of the taxpayer for relief and persuading him that the surpluses of good years should be hoarded to make up the losses of the bad. The authors of

the memorandum therefore suggest that the desired result can be achieved in part by means of extra-budgetary funds, such as the Unemployment Fund which collects revenue in good years and dispenses it in bad. Again, the authors attach great importance to securing, and encouraging the public to expect, a lower level of the long-term rate of interest. This would help to maintain the volume of capital investment, which they fear may otherwise diminish in the decades that lie ahead.

These and other suggestions palliate, but do not solve, the main problem, which is that of meeting a steadily rising expenditure out of a static revenue. There are three possible ways out of the difficulty, namely, reduction of expenditure, an increase in the proportion of the National Income taken by taxation, or the discovery of some means of greatly increasing productivity. These possibilities—which are not in any way exclusive of one another—raise searching economic questions; and there may be, in fact, more hopeful possibilities than the authors of the memorandum suggest. For example, it is important to bear in mind that a very substantial proportion of the increased civil expenditure of recent years has been incurred in subsidies to industries of various kinds. This means a transfer from the taxpayer's pocket to concerns engaged in forms of production which in some cases are notoriously uneconomic. The time may come when we may decide that we cannot afford this luxury. Again, it has been the policy of the Government in recent years to encourage methods of control of industry and agriculture, which tend to restrict and limit output. This, on a short view, may safeguard profits, but in the long run is in grave danger of limiting the National Income, on which the nation's ability to pay its way depends. Again, it would not be unreasonable to expect that the growth in the wealth of this and other nations would be much greater than we have experienced in recent times, if there were less restriction upon international trade. The authors of the memorandum seem to think it unlikely that productivity will increase faster than in the nineteenth century; but, with the advantages brought within our reach by science and invention, there is no reason why the pace should not be greatly accelerated if we can free ourselves from the economic nationalism engendered by suspicion and fear.

The Budgets of the future will be determined by economic progress, and it is towards the problems of economic policy as a whole that this portrayal of our Budgetary dilemma will direct attention. The authors of the memorandum are well aware of that. And it is to be hoped that their work will help to stimulate public interest in so vital an issue.

Topics of the Week

Parliamentary Conspectus.—On Monday, Parliament reassembles after the Whitsun adjournment. Mr Chamberlain, who succeeded Earl Baldwin as head of the National Government just over twelve months ago, has difficult days ahead. Since the New Year, the events, which led to the resignation first of Mr Eden and then, more recently, of Lord Swinton have shown the limits within which, to retain his Government's prestige and support in the country, the Prime Minister must set his course. Since 1935, when Mr Baldwin (as he then was) brought back the National Coalition to Westminster with a very substantial majority, the world scene has changed. An international armaments race is now in full swing, and all parties have recognised the grim need for building

up national power. Yet, the Eden crisis revealed that over a wide front, ranging from within the Government's ranks to the extreme Left of British politics, the memory of the policy of collective security put before the electors by Mr Baldwin in 1935 had not faded. The Government's supporters still hope that Mr Chamberlain's Anglo-Italian Agreement may avert an international clash, while Lord Halifax has gained the credit of helping to stay Her Hitler's hand in Czechoslovakia. But the present impossibility of bringing the deal with Signor Mussolini to fruition leaves the Government's policy in a state of suspense where one false step, one move clearly detrimental to the international interests of peace and democracy, would gravely endanger Mr Chamberlain's prestige.

If the Government is not appreciably weaker than in January, the Opposition has scored some successes. On foreign affairs they ask for a foreign policy which does not compromise with principle. At home, they support the defence programme, but ask that it should be efficiently executed. Steady pressure, both within and without Government circles, has secured promises and some earnest of more adequate deliveries of aircraft and more effective development of air-raid defences. Mr Eden's departure was a warning to the Government in its foreign policy. Lord Swinton's resignation followed a widespread warning that all was not judged to be well in the field of home defence. And there have been secondary disturbances since the year began. The impossible task of unscrambling the Palestinian omelette has been pursued in surroundings of murder and repression. Riots in the West Indies have drawn attention to fundamental economic problems in the dependent Empire. Among domestic legislative projects the Coal Bill has been almost mortally wounded by the skilfully deployed opposition of vested interests. On the other hand, some useful measures have been passed. A harsh Budget has met the present emergency without seriously alienating the electorate. A notable agreement with Eire has been ratified. Bills to regulate hire-purchase and road transport wages have won popular favour; and legislation to facilitate the concession of holidays with pay is promised. Measures to rehabilitate the good name of Britain in a world of base propaganda, through the radio and other agencies, have been well-devised. In eight bye-elections, the Government groups have held three seats, and lost three to Labour, while Labour has retained the other two. But in spite of these reverses, the Government has lost little ground this year, though its position has grown much more precarious. The Anglo-American Agreement after a propitious beginning to the negotiations has hung fire. The promised Bills to reorganise electricity distribution and to reform prison conditions have yet to appear. The Government may catch up all these loose ends before the Session ends in the autumn. But its future almost wholly depends upon the part which Britain plays in the course of world events during the next few months.

Trade Recession.—Fears that the downward trend of business activity is not likely to be halted in the near future have been confirmed by the unemployment returns of the Ministry of Labour for May (which we discuss in detail on page 623). The total number of unemployed on the register on May 16th was 1,778,805, of which 1,314,118 were wholly unemployed. This was 31,041 more than on April 4th and 382,000 more (on a comparable basis) than the figure for May, 1937. Usually, unemployment falls in May. Although the number of workless in that month is commonly swollen by a seasonal decline in coal-mining activity and the appearance on the labour market of boys and girls leaving school without jobs, in most years these unfavourable influences are more than counterbalanced by

increased employment in the summer trades. Last month, however, diminished unemployment in building, public works contracting, the distributive, hotel and boarding-house trades, hosiery, bread and biscuit manufacture, and shipping was not sufficient to outweigh the increased number of unemployed persons recorded in the export and metal trades. It is true that the number of unemployed school-leavers, which increased by 10,236 between April 4th and May 16th, was larger than usual; that frost and drought had interfered with farming; and that temporary stoppages in coal and cotton swelled the number of workless. Nevertheless, the latest returns, even if these accidental factors are discounted, bear witness to a distinct and growing recession in trade. In a year, unemployment in the textile trades has risen by 105,000; in the metal trades by 27,810; in engineering by 18,070; in iron and steel by 17,710; and in motor, cycle and aircraft manufacture by 11,860.

The majority of consumers' goods trades are still active. Activity in building and public works contracting has been surprisingly well maintained, and is little less marked than a year ago. Yet the consumers' goods trades cannot long escape the unfavourable repercussions of the slump in the export and capital goods industries; and building plans approved have declined this year. When the current seasonal stimulus in general business has abated, therefore, a sharp decline from present levels of activity may be indicated; and the vitally important constructional trades may suffer an appreciable recession. Clearly, the demands of the re-armament programme upon industry are proving inadequate to sustain the whole structure of business activity at a time when wars, diplomatic tension, and falling commodity prices are taking their toll of British trade.

Birthday Honours.—The latest Honours List, published to mark the King's birthday, which was formally celebrated on Thursday, is relatively small. The organisation of a political party during years of great Parliamentary strength is no nominal task. Lord Stonehaven, promoted to a viscountcy, played a notable part between 1931 and 1936 as Chairman of the Conservative Party Organisation in removing friction among Conservatives held in National bonds. Mr Hacking, the present Chairman of the Conservative Party, is made a baronet. Civil servants, very properly, are widely honoured. But the most striking (and well-deserved) award is the conferment of a barony upon Sir Josiah Stamp. Sir Josiah, President of the London, Midland and Scottish Railway, member of the Economic Advisory Council, director of the Bank of England, and a former president of the Institute of Transport, the British Association and the Royal Statistical Society, bestrides the entire compass of our national economic life. Fittingly president of the new Institute for Economic Research, Sir Josiah bridges the gap between academic economics and

business. Other personages in the world of practical economics have been honoured. Mr R. C. Davison, authority on unemployment administration, has been knighted—for political services. Mr Arthur Reader, Deputy Director of Statistics in the Ministry of Labour, receives the O.B.E. Lord Weir, who recently withdrew from the Air Council, becomes a viscount; and among the minor beneficiaries several have played an important part in A.R.P. organisation. Sir Arthur Eddington receives the Order of Merit. Sir Arthur, by scattering star-dust in popular writings, which have startled his pragmatic colleagues and encroached upon the philosopher's field, has added a more general fame to his world reputation as a scientist. Arts and letters are under-represented in the List. Altogether, the Honours List continues to be no more and no less than a mirror of prevailing values in British public life.

★ ★ ★
France and Italy.—Having got Mr Eden out of office and an Italo-British agreement concluded on paper, Signor Mussolini has lost no time in justifying our former Foreign Secretary by differentiating between Italian nominal friendliness towards us and undisguised hostility towards our ally France. In the Chamber at Paris on the 2nd of this month, M. Bonnet told the Foreign Affairs Committee that, while there has been no contact between the French *chargé d'affaires* in Rome and Count Ciano since May 17th, he hoped for an early resumption of the negotiations for a Franco-Italian agreement on the Anglo-Italian pattern. At the same time, he made it clear, once again, that the reintroduction of international control along the Pyrenees frontier of France was to be conditional upon the simultaneous reintroduction of effective control along the Portuguese frontier and over seaborne traffic. On the same day at Milan, Count Ciano made a speech in which he said not a word about the resumption of the Franco-Italian negotiations, but boasted of Italy's "glorious participation" in a fight that was being "victoriously waged" in Spain. His only reference to Franco-Italian relations was, though indirect, both unmistakable and offensive. "Nothing is more dangerous," he declared, "than to conclude agreements which conceal, under ephemeral compromises, ambiguities and mental reservations." On Monday, at the Socialist Congress, M. Blum told his audience that if non-intervention were made, by agreements, to mean intervention by certain Powers only, France would take full liberty of action. We hope that Mr Chamberlain has been applying Count Ciano's words to the Anglo-Italian agreement, and has been taking the moral to heart. On Sunday, bombers from Spanish insurgents' territory went 48 miles into France and dropped 18 bombs of 220 lb. weight—happily without damage to life or limb, though with some destruction of property. On Monday they were driven off after having penetrated only 2½ miles, and before they had done any bombing. Both raids were the work of nine planes flying in formation, and it is difficult to explain them except as provocation. The French Air Force has now been given orders to attack at sight any foreign aircraft that shows itself in French air. "By gad, sir, Eden was right," is the comment suggested by these latest happenings on the Spanish front.

★ ★ ★
Germans and Slavs.—The attempt to solve the Czech-German problem by negotiations between Herr Henlein's deputies and M. Hodza is still dragging its slow length along. During the last week, however, the Sudeten German Party have simultaneously slowed down their demands, and increased their propaganda, both from within and without Czechoslovakia. On Wednesday it was unofficially reported in Prague that the extension of military service from two to three years (foreshadowed in our *Survey Europe Beyond Germany*, May 14th, page 351) was being introduced this week. Whether this becomes official or not, it is known that the Czechs fear a long-drawn-out campaign of nerve-racking pressure from Germany, by propaganda, economic

means and political incidents. Accordingly, Czech military preparations, especially at the frontier and now as close as fifty kilometres round Prague, together with the organisation of the new reservists, are not being curtailed. The military authorities are said to attach little importance to the withdrawal of German troops about thirty kilometres from the frontier, for they point out that the German road system would enable concentrations to take place on the frontier itself within less than an hour. The general worsening of the European situation this week has naturally been felt in Czechoslovakia.

★ ★ ★
Czechoslovakia's relations with Poland and with her Southern Slav ally in the Little Entente have this week taken a turn for the worse. The Slovak autonomists, led by M. Hlinka, have always been supported by certain Polish and Hungarian interests. On Whit-Sunday, these autonomists held a big meeting in Bratislava, and it was hailed by the German and Polish official press as a sign that Czechoslovakia was already splitting up. The autonomists, however, have only 30 per cent. of the votes in Slovakia. Before Poland and Hungary together could hope to nip off Slovakia, something like a major European conflict would have already broken out. This does not, however, prevent Colonel Beck from continuing to run with France and hunt with Germany. The position of M. Stoyadinovitch, on the other hand, is rapidly becoming as dangerous, *vis-à-vis* Germany, as that of Signor Mussolini. After the annexation of Austria, the endangering of Trieste—recognised this week by the announcement that new Italian subsidies are to be paid to compensate the port for its loss of Austrian trade—has been paralleled by German penetration of Slovenia. For some time Germans have been purchasing property in Slovene districts bordering upon Austria, and recently the purchases have greatly increased. The two largest towns, Maribor (Marburg) and Ljubljana (Laibach) have become centres of Nazi influence; and the Slovene Minister of the Interior at Belgrade, Father Koroshetz, has been driven to make several arrests. His action, however, has been hampered by the Government over the head of which the German Consul-General, who is also the Nazi Gauleiter for Yugoslavia, is said to have strong influence. While the Catholic Slovenes feel very bitterly against Germany, they are not strong enough to oppose German pressure through their narrow corridor to the Adriatic if M. Stoyadinovitch and his Government do not oppose it. It begins to look as if both Italy and Yugoslavia have already given up the attempt to keep Germany from the Adriatic, as they both gave up the attempt to keep her out of Austria.

★ ★ ★
Further Disturbances in Jamaica.—The mixture of responsible labour agitation with mere lawless violence, which has characterised the trouble in Jamaica, has continued during the past week. There have been several deaths as a result of firing by the police, but there are occasions when drastic action, in which the innocent may suffer, is necessary if a much greater number of lives is to be preserved. The acting Administrator has reported that conditions are normal in Kingston, and less difficult in the smaller towns than had been expected. An earnest of intention to alleviate the lot of the poor people of the colony has been given in the announcement, which has been well received throughout the island, that £500,000 would be spent on land settlement. In a debate initiated in the House of Lords by Lord Olivier, last week, Lord Dufferin declared that, while the economic problem in Jamaica was bound up with that of over-population, due to the high birth-rate and the closing of outlets for emigration, it fundamentally turned upon the price obtained for the colony's staple crops. The root cause of discontent, he admitted, was the low rate of wages paid, and wages could be raised only if the price of sugar were raised. Both Lord Dufferin and Lord Harlech defended the international sugar agreement, which they claimed had failed to ensure a satisfactory price, not by reason of its own

defects, but because the general fall of prices had brought down sugar prices with it, and because the Sino-Japanese war had curtailed Far-Eastern markets. The Government were hopeful that further surrenders of quotas would be made and would result in a higher price. Until it was clear that such efforts had failed, we should honour our signature to the agreement.

★ ★ ★
National Anthem in South Africa.—On the morrow of an election that had manifested the burying of South African racial hatchets, a tactless official decision provoked an unpleasant exhumation and embittered inquest. It appears that at certain military celebrations on Union Day, orders were given for the playing of a few bars of "Die Stem van Zuid Afrika" for the General Salute. This in itself was not objectionable, but the total omission of "God Save the King" from the musical programme naturally enraged many English-speaking South Africans. The apparent adoption of "Die Stem" as the Union's sole and privileged national anthem seemed to them a deliberate betrayal of pledges given only a few weeks before by the Prime Minister, and a breach of the understanding on which the General Election had been fought and won. A sharp swing against the Government in a provincial by-election in Johannesburg showed which way the wind was blowing. Mr Stuttford, Minister of the Interior, tendered his resignation from the Cabinet, but withdrew it when an agreed statement was issued, undertaking that on all formal occasions, under Government auspices, when either "God Save the King" or "Die Stem" was played, the other would be played also. It is to be hoped that this compromise will assuage an inflammation that ought never to have been so clumsily excited. The lesson of experience in mixed racial communities in the British Commonwealth is that democratic public life is constantly harrowed unless each party recognises and respects the symbolism of the other.

★ ★ ★
Congress and the Railroads.—Summer is wearing on in Washington, but Congress will scarcely be able to adjourn this week-end as had been hoped. Difficulties have arisen in an unexpected quarter. Instead of a deadlock in the conference between the Senate and House of Representatives on the level of the national minimum wage to be written into the Wages and Hours Bill, agreement on the 25c. per hour national minimum was reached on Wednesday. This measure will therefore probably pass into law this Session. But a new difficulty has been caused by the rapidly worsening situation of the railroads. Their plight has rendered measures for their capital reorganisation, and for financial accommodation in the meantime, both urgent and imperative. Measures of both kinds involve examination by the Inter-State Commerce Commission, which must certify a railroad's solvency before that railroad can obtain a loan from the Reconstruction Finance Corporation, and must also pass upon any scheme for capital reconstruction. It has long been said that if these measures were not quickly pushed through, all but two American railroads would have very shortly to suspend all interest payments. The railroads in 1937 paid out \$1,985,323,363 in all forms of wages and salaries; their employees have fallen within twelve months from 1,115,100 to about 960,000; and the total of unmatured funded debt in the hands of the public in 1936 was \$11,240,690,928. The problem is therefore as much one of national and political as of purely economic scope; and both senators and representatives of both parties have lately become seriously perturbed by the dimensions of the problem. Meanwhile the results of another primary election, this time in Iowa, have not succeeded in clarifying the issues in American politics; both parties' polls showed evidence of internal and as yet unresolved dissension. Politics is coming to hang more than ever on economic conditions in America.

★ ★ ★
Voices from America.—On June 3rd two authoritative and significant public statements were made on the present state of the world and on America's position and

attitude. While Mr Hull was speaking at Nashville, in his own state of Tennessee, his Under-Secretary of State, Mr Sumner Welles, made a statement at Washington after consultation with the President. Mr Hull's theme was, unhappily, as familiar as it was crucial. He spoke of the present wave of contempt for international law, justice and good faith; and also of the "scarcely imaginable brutality" with which this new lawlessness is now going to work in its use of armed force. He then took up the issues thereby presented to the United States, and deprecated, once more, the idea that America could effectively meet international anarchy by national isolation. This latter policy he stigmatised as a counsel of despair, an admission of defeat, and a fruitful source of insecurity. In conclusion, he prophesied that the chances of a re-establishment of international law and order would largely depend upon the sincerity and firmness with which some nations, at least, upheld, in the international field, the principles of law, justice, morality and co-operation. He expressed a hope that one of these nations would be the United States. Mr Hull also declared that the United States was prepared to join other countries in working once more for the humanising, by common agreement, of the rules and practices of war; and this was Mr Welles's subject on the same day at Washington. The Under-Secretary denounced the indiscriminate mass-bombing of civilians which has been intensified, during the past week, in both China and Spain. It will be noticed that the American statesmen were speaking on the same day and the same subject as Mr Chamberlain in the House of Commons; and this Anglo-American consensus is made all the more impressive by the fact—which was elicited from Mr Welles by a questioner—that there had been no pre-arrangement of their respective utterances. It is devoutly to be hoped, however, that there will now be some concerted action.

★ ★ ★
The Irish Election.—An unexpected issue has arisen in the general election campaign following the announcement by Mr de Valera that in certain circumstances he will seek to abandon proportional representation in favour of the former single-seat constituencies. When this change was made in Northern Ireland it was deeply resented by all shades of nationalist opinion as an attempt to secure unfair advantages for the Government party. Nobody, indeed, expressed more indignation at the change than some of the Irish Ministers, who are now prepared to follow Lord Craigavon's example. The arguments used in favour of the abolition of "P.R." are that it gives rise to unstable government by preventing any party from receiving an independent majority and that it puts the Government at the mercy of sectional interests. The alliance between

TRADING ABROAD

The existence of restrictions in a given country may temporarily prohibit dealings in forward exchange, but up-to-date information on this and on all points bearing on Forward Exchange generally may be obtained through any branch of the Westminster Bank. For any who may be unfamiliar with the facility, a very brief outline entitled *Forward Exchange* is always available at its counters

WESTMINSTER BANK LIMITED
 Head Office: 41 Lothbury, London, E.C.2

Mr de Valera's party and the Labour Party has been dissolved. Relations of bitter hostility have taken its place, and it is clear that Mr de Valera has no intention of being dictated to by Labour in the new Dail. Indeed, intelligent students of politics are forecasting that the policy of the Government, if returned at the election, will be far more Conservative and economically orthodox than in the past, and that the desire for an independent majority is based on the fear of being driven too far to the Left in social legislation if it is dependent on Labour support. Some commentators even prophesy that the Government will be not only Conservative but reactionary, and that the present liberty of the trade unions will be severely curtailed. This apparent "swing to the Right" by Mr de Valera will secure him a good many votes at the expense of the Cosgrave party, and may even give him the clear majority on which he has set his heart. In that event, presumably, "P.R." would be retained.

* * *

Engineers in Conference.—Unemployment in engineering and in motor, cycle and aircraft manufacture is still rising. The latest figures go some way to confirm the contention of the Amalgamated Engineering Union, who have been meeting in conference at Morecambe, that there can be no shortage of skilled engineers to justify the employers' request for the dilution of labour on urgent armaments work. On the other hand, the growing recession in engineering, despite the stimulus of Government orders, offers little hope that the A.E.U.'s claim for increased wages and a 40-hour week, strongly supported by the Conference, can be met in present circumstances. The A.E.U. are naturally jealous of their craft privileges. At Morecambe, protests against dilution by the transfer of unemployed trainees into engineering shops and the introduction of women were registered; and a time limit was set upon the Executive's negotiations for higher wages. In politics, the A.E.U. stand to the left of official Labour. At Morecambe, a resolution to approve the affiliation of the Communist Party to the Labour Party was defeated only by a casting vote. The A.E.U. are not certain whether their own trade union point of view was stated with proper independence at Sir Walter Citrine's recent interview with Mr Chamberlain. Altogether, the Conference suggested that the engineers are not convinced of the need to make widespread concessions of their privileges at the present moment.

The I.L.O.'s New Director.—The International Labour Organisation is, by its own international definition, a propagandist body. It is an association of States which recognise that "Conditions of labour exist, involving hardship, injustice and privation to large numbers of people, and seek to improve these conditions by common or international action." The character of the Organisation's work, moulded by M. Albert Thomas, its first Director and a Socialist, has never been partisan, but it has always been strongly reformist. Mr John Gilbert Winant, promoted from the Assistant Directorship to succeed Mr Harold Butler as Director, will carry on this tradition. A Republican supporter of President Roosevelt's New Deal in industrial relations, Mr Winant is aptly suited to the rôle of medical officer of industrial health, in an unfortunately insanitary world, which is the I.L.O.'s chief function. Facts speak for themselves from Geneva, and the I.L.O.'s collation of information and statistics about world labour conditions have more influence in the shaping of nations' industrial policy than much propaganda of a more argumentative kind. Mr Winant, who was once a school master and held the office of Governor of New Hampshire for a record term, will strengthen by his tenure of office the United States' membership of the I.L.O. Mr Winant has been three years at Geneva, and the experience of his whole public life qualifies him for promotion.

Two Wars.—The still undeclared wars in China and Spain have flared up to startling heights this week. General Franco's troops have still not attacked in force on the Ebro front, but are nibbling down the coast towards Valencia—an indication that the war will go on much longer than was thought possible a few weeks ago. The activity of the insurgents' foreign bombers has been paramount. On Wednesday they added to their bombings of French territory and of British trading vessels a deliberate attack on the British-owned harbour and warehouses at Gandia, though they were clearly marked by British colours; and bombed two British vessels on Thursday, killing two more British sailors. The quick dispatch by the British Government on Wednesday of a destroyer to inquire into the circumstances of the attacks may herald even farther-reaching measures in the near future; though small warships are of more use against submarines than against aircraft. Their presence will, however, force the aerial pirates to fly higher than 300 feet, the altitude from which British property at Gandia was bombed.

* * *

Despite the heavy toll in Spain, the continuous Japanese aerial bombardment of Canton this week has been much more dastardly and destructive. The city has been subjected to over a score of raids in less than 72 hours, resulting in the paralysis of municipal services and the destruction of foreign hospitals and property. Over 10,000 casualties are said to have been inflicted in this centre of Chinese civil life during the last two weeks, and the number of killed is reported to run into many thousands. As we pointed out last week, the Japanese are concentrating on breaking the Hankow-Kowloon railway and destroying the morale of the Chinese people. But in so doing they have elicited a sharp protest from the American Secretary of State on the bombing of the American University at Lingan, and evoked a spate of cabled protests from British, French, American and other doctors and missionaries to their Governments. The complete lack of defences at Canton emphasises the civilian character of the Japanese objective; and Marshal Chiang Kai-shek cannot spare aircraft to defend it now that the Japanese thrust along the Lunghai railway towards Hankow is being intensified. In both theatres of war "frightfulness" has now become the prerogative of the aggressors.

* * *

Expropriation in Mexico.—It was announced in Mexico City on Wednesday that the application of the 16 foreign-owned oil corporations in Mexico to the Federal District Court for an injunction against the expropriation of their properties, decreed by Government on March 20th, had been refused. The companies are now appealing to the Supreme Court. The District Court very naturally, and in accordance with tradition, could scarcely be expected to pass judgment finally upon so important a case as long as there was always a Supreme Court in the background. Consequently the District Court has preferred to hand the unwanted baby over to the higher court. In its judgment it says that the Government's action in expropriating the companies was constitutional and legal because it concerned a public utility—which principle, it says, is recognised by the most progressive countries as contributing to public welfare. (Is this a sly dig at President Roosevelt's attack on the American utilities; like the dig which the Mexican Government allowed itself in reminding the British Government, in the last exchange of Notes before the suspension of diplomatic relations between their countries, of the non-payment of the British war debt to the United States?) The District Court allowed the companies an injunction to protect their cash in hand and at the banks, their books and their documents, as being private property. All their other property and chattels were held to be validly expropriated as long as just compensation were paid. There is still the rub. How much compensation is to be paid? How, where and when?

THE LONG-TERM BUDGET PROBLEM

THE ECONOMIST is indebted for the opportunity of publishing this study of the long-term Budget problem to Messrs O. T. Falk and Company, on whose initiative it has been prepared. The study is the work of a group consisting of Mr O. T. Falk (Chairman), Mr Thomas Balogh, Mr Geoffrey Crowther, Mr N. F. Hall and Mr H. D. Henderson. The opinions expressed are those of the authors.

Introduction

THE recovery and the exceptional buoyancy of revenue which we have enjoyed since 1932, coming after the relief afforded by the fall in the debt service, have tended altogether to obscure the basic problems of the Budget. In the last few months, on the other hand, the necessity of further increasing re-armament, coupled with the threat of economic recession, has suddenly concentrated attention on the immediate outlook.

What is the burden that re-armament will eventually cast on our national finances before it is completed? How much further taxation must we prepare ourselves to shoulder as a consequence? This memorandum is concerned only incidentally with those questions. It attempts, as its title indicates, to look further ahead. It may be thought that this is a task which might advantageously be deferred until the immediate problems have become less acute, and until the situation that will confront us later has become

more clearly defined. Such a view would be natural; yet we think it would be mistaken. The questions of financial policy that will arise when the present phase of intensive re-armament is over are likely to be in many respects more difficult even than those of the period immediately ahead; and it is important that they should not take us by surprise. Moreover, the way in which our immediate problems are dealt with must necessarily depend largely on the assumptions that are made about the long-distance outlook.

The object of this memorandum is to show that the long-term problem of the Budget is not only a product of the present abnormal re-armament expenditure, but also that of achieving, in the conditions of the years to come, a balance between social progress and reform on the one hand and economic productivity on the other in an individualist capitalist country, democratically controlled.

I. The General Problem

1. The fiscal burden left behind by the Great War was of such magnitude as to appear disastrous, had it not been for the precedent of the period after the Napoleonic Wars. The National Debt in 1815 amounted to about £800 millions, or only about one-tenth of the post-1918 or present gross National Debt. But the National Income in 1815 was considerably less than one-tenth of what it is to-day. McCulloch's estimate for 1837 was only £297 millions, including the whole of Southern Ireland, and though Mr Colin Clark gives reasons for believing that figure to be too low for 1837, it may well be too high for 1815. The present National Income of the United Kingdom (including only Northern Ireland) is somewhere in the neighbourhood of £5,000 millions. Thus, as compared with the present, the burden of the National Debt after Waterloo represented at least the same, and probably a higher, proportion of the National Income, while the fiscal machinery available for transferring resources from the public to the State was then much less efficient than it has since become. Public opinion in the early post-war years was heartened by this parallel. We knew that in the nineteenth century the mere passage of time had served steadily to lighten a debt burden which at first had appeared to be almost crushing. It seemed not unreasonable to hope that this experience would be repeated.

2. There are, however, fundamental differences between the position last century and to-day. The decline in the oppressive nature of the debt burden in the nineteenth century was due only in small degree to the repayment of debt and the consequential reduction in the annual debt charge. The interest charge, which was £31½ millions in 1817, was still £28 millions thirty years later and £27½ millions sixty years later.

The reduction in the burden of taxation was due almost entirely to the fact that, while the National Income was rising very rapidly, the total of the Budget showed very little increase. Thus in 1817, when the National Income was probably no more than £300 millions, the Budget was £55 millions (debt £31½ millions; other expenditure £23½ millions). Fifty years later (1867-68), when the National Income was nearly £900 millions, the expenditure was £71 millions (debt £26½ millions, war services £26½ millions, all other £18 millions). By 1886, when the National Income was something like £1,400 millions, the Budget amounted to £91 millions, of which the debt took £28 millions and all other expenditure £63 millions. Thus, while the National income increased about five-fold, the debt charge remained stable, other expenditure increased in about the ratio 100:240 and total expenditure rose in the ratio 100:160.

A Changed Background

3. The disappearance of the fiscal problem of 1815 can therefore be ascribed to the following factors:—

(a) The eightfold or tenfold increase in the National Income due to—

(i) the increase in population from 10 millions (England and Wales) in 1811 to 36 millions in 1911;

(ii) an increase in average productivity per head to something like two and a half times what it was at the beginning of the period (a compound rate of just under 1.0 per cent. per annum).

(b) The relatively stable total of the expenditure of the State itself due to—

(i) the absence of major wars, which enabled expenditure to be covered by revenue without increasing the total of the debt;

(ii) the fact that expenditure on non-debt service did not increase in proportion to the national income. (In fact, it seems to have shown no increase at all during the first third of the century, to have increased at about the same speed as the population for the middle period, and to have more than doubled in the last thirty years before 1914.)

In the years to come not all these factors will be present.

The population has now almost ceased its growth, and within another two decades will begin to decline. In 1970, which is only a generation ahead, the population of England and Wales, at present about 40½ millions, will have been reduced to between 33,700,000 and 37,300,000, according to Dr Enid Charles' alternative estimates. We can expect a continuance of the growth of productivity per head. We cannot, however, say how rapid it will be, since it will depend on two unknown quantities: the supply of inventions and technical ingenuity and the policy adopted by the community to make them effective; and the degree to which potential productive capacity is not wasted, as, for example, by unemployment. This latter factor is likely to be of the greatest importance; for no advance in technical possibilities is of much avail if its fruits are thrown away.

Unfortunately, there are reasons for apprehending that in this respect there have been great changes in our present circumstances from those prevailing in the nineteenth century. Then there was an expanding demand for the use of capital in providing the rapidly growing population with new capital goods and in the exploitation both at home and abroad of the great scientific and commercial inventions of the age. To-day the British possibilities for overseas investment are much reduced, and the changing trend of the population will diminish the demand for capital required to supply the needs in houses and industrial equipment arising from constantly growing numbers. Thus, while the supply of savings is certainly no smaller and probably much greater than ever before, the demand for capital at any given rate of interest is tending to fall. The natural result will be a tendency for savings to run periodically to waste in depressions. Moreover, when other things are equal, the recovery from depression is likely to be slower under conditions of declining numbers. A condition of redundant productive capacity, having once been reached in any industry, is likely to prove more obstinate, when the automatic growth in demand arising from the growth in numbers is no longer there to help us out of our difficulties. Apart from these possibilities of greater unemployment, heavy expenditure on re-armament is likely to be a factor checking the growth of the national real income. All these considerations being taken into account, it seems unlikely, if conditions and policies do not change profoundly, that we shall experience a rate of increase of average productivity higher than 1 per cent. per annum, which is the maximum estimate for the smooth expansion of the nineteenth century. The actual rate experienced in the next generation may be no more than ½ per cent. per annum.

These figures enable us to fix limits within which the National Income of 1970, at to-day's prices, must lie. Assuming the larger estimate for population and a rate of increase of productivity of 1 per cent. per annum, a level of 126 per cent. of the present will be attained. Taking the lower estimate for population and a rate of ½ per cent. per annum, the National Income for 1970 will be only 97½ per cent. of what it is to-day. After 1970, it will require either a less steep decline of population or a rapid increase of productivity, or both, to stop the National Income falling.

Taxable capacity may be assumed to rise more than in proportion to income. But even so, it requires very optimistic assumptions to envisage a national revenue, on the present scale of taxation, of as much as a quarter larger

than the present at any time within the next thirty years. The pessimistic assumption is that taxable capacity will show no increase on balance, though it may rise in the earlier years and then decline.

Future Expenditure

4. Is it possible to make any similar prediction, or to place limits for prediction, concerning the expenditure side of the Budget? Total expenditure in 1938-39, omitting Post Office, will be as follows:—

	£ millions
Debt charge	230
Defence forces	340
Civil services	465
	1,035

There is no prospect of any substantial further reduction in the debt charge. There is not likely to be any margin of revenue for a large sinking fund, and further major conversions, though possible, are perhaps not likely. At present, we are borrowing heavily for re-armament expenditure; and for this reason alone, the total of the debt is likely to increase. There is, however, one proviso to any forecasts of the debt service, namely, that the real burden it represents would be reduced *pro tanto* by any fall in the value of money. In this way, a continuous increase of the debt of £80 millions per annum could, in theory, other things being equal, be offset by a steady rise in prices of 1 per cent. per annum. But unless we assume that the value of money is going to fall more rapidly than the debt is increased, it would be rash to forecast any reduction in the present real burden of the debt.

The future of the defence charge cannot be predicted. On the one hand, it is the official doctrine that a large part of the present expenditure is non-recurring, and it seems only reasonable to hope that we shall not for ever re-arm at the present rate. On the other hand, technical progress tends to increase the scale and therefore the cost of armament. Unless international relations become more settled than at present we are likely to be spending at least £200 millions a year on defence for a long time to come.

The present expenditure on civil services, in round figures, is as follows:—

	£ millions
General administration, tax collection, etc.....	67
Education and health	88
Pensions—Old age, etc.	65
War	43
Labour and unemployment	81
Industry, agriculture, roads, etc.	41
Contributions to local authorities.....	54
Margin for supplementary estimates	10
	449

The only one of these items that can be counted on to decline is present War Pensions. Since the proportion of old people, a generation hence, will roughly have doubled, any saving on War Pensions may be absorbed by an increase in the total of Old Age Pensions, irrespective of any increase in the low standard of such pensions. There will be fewer children; but in practice there is unlikely to be much opportunity for reducing the number either of schools or of classes, which are the main determinants of expense. Moreover, there will be pressure for improvement of standards. The "Education and Health" item will probably be no smaller than it is now and may well be larger. The same applies to "Labour and Unemployment." Moreover, a declining population will increase the difficulties of local authorities in raising revenue by rates, so that there will be either a larger contribution from the Exchequer or else the direct assumption by the State of burdens now borne locally.* Taking the total item by

* Of course in the very long run a declining population tends to reduce the absolute total of social expenditures, but this is no help because it is the expenditure per head which matters. This tends to increase.

item in this way, we are forced to the conclusion that there will be a substantial increase in civil expenditure, probably sufficient to offset any reduction in defence expenditure. And it would be unsafe to rely with any confidence on a reduction of the real burden of this category of expenditure through rising prices, as most items of expenditure may be expected to rise, though perhaps after a brief interval, in proportion to the rise in prices.

Thus the most optimistic reasonable assumption about total expenditure a generation hence is that it will be no more than £1,000 millions (in terms of to-day's value of money). The yield of taxation in 1938-39, which is still largely based on the incomes accruing at the highest point of the trade cycle, is estimated at £916.6 millions, the total revenue at £944 millions. Our most optimistic assumption regarding taxable capacity in 1970 was that it would be one-quarter larger than to-day. On the basis of present taxation the revenue would be about £1,180 millions.

Basic Assumptions

5. These calculations are intended to be only the roughest indications of the orders of magnitude involved. They are sufficient to show that we cannot hope, at best, to do more than maintain a balanced Budget with approximately our present burden of taxes, and that there is no margin for substantial remission.* Moreover, even this result depends upon the following assumptions, all of which are favourable:—

- That productivity continues to increase at the Victorian rate.
- That the total of expenditure on the Supply Services can be held to the present figure in spite of the prospect of international anarchy and the many civil burdens that can be clearly foreseen.
- That there is no increase in the debt burden—more accurately, that there is no greater increase in the debt burden than is offset by a falling value of money. (A rise in the value of money would, of course, increase the burden.)

This is a formidable list of conditions. There is, however, one over-riding condition: that there must be a favourable balance of prosperous as against depression years in the intervening period. If there are long and severe depressions, we cannot hope to attain the postulated overall rate of increase in productivity. Moreover, heavy depression will greatly increase the need for expenditure on unemployment, and probably on other social services as well. And finally, a run of depressions will swell the National Debt, both because revenue in the depression years will tend to fall short of expenditure, and also because there will be steady pressure on the Government to borrow for public works of various kinds.

The future of the Budget thus depends very directly upon the future of the trade cycle. If we have frequent severe depressions, the revenue will not increase at the estimated speed, the expenditure will go up, and the burden of the National Debt will increase; and we shall face a position a generation hence in which expenditure will be considerably higher than at present, while the taxable capacity of the nation is no greater.

Short Run Policy

6. Thus there is a Budget problem in the long run (thirty years or so) of the greatest seriousness. But the only hope of finding a solution for this long run problem lies in

* This memorandum is confined to the finances of the Central Government, but the outlook for the Budgets of Local Authorities is equally difficult. Though Local Authorities are not directly concerned with armaments expenditure the pressure towards increased social services falls largely upon them, while the expansion of their revenue is prejudiced by the decline in the growth of population.

adopting an appropriate policy for the short run emergency of each depression as it recurs.

Now in the short run of a depression, the fiscal authorities will have a very difficult problem on their hands in the narrow budgetary sense, even if they repudiate, and are allowed by public opinion to abandon, any intention of attempting to influence the course of the trade cycle. With revenue falling and expenditure rising, they will have great difficulty in preserving the long-run equilibrium of the Budget, even without deliberate borrowings to finance relief works. If, in such conditions, the Budget is to remain balanced, or within sight of balance, there will need to be both economies in expenditure and increases in taxation on the model of 1931.

But it has been argued above that the long run problem will be solved only if depressions are not severe and frequent. Consequently, even from the narrowly fiscal point of view, it would seem essential to take whatever steps are necessary to alleviate the severity of depressions when they occur. Some may argue that balancing the Budget in 1931 was, on the whole, a deflationary measure; but it was deflationary only because it led to the War Loan conversion and was accompanied by circumstances which caused or greatly assisted recovery. These circumstances were unusual and are unlikely to recur. In general, a policy of cutting expenditure and raising taxes will not alleviate but deepen a depression, as it did in the gold *bloc* countries between 1931 and 1936.

Extra-Budgetary Funds—a Suggestion

7. Thus there seems to be a conflict of policies. One of the conditions for successful solution of the long run problem was that there should be no increase in the National Debt. Another was that there should be no severe depressions. But when these conditions are translated into practical terms for short run application they appear to point towards conflicting policies. The necessity for preventing any rise in the debt burden would seem to point to balanced Budgets. The necessity for assisting economic recovery in every possible way would seem to call for unbalanced Budgets.

The two requirements, however, are not exact opposites. The former calls for balanced Budgets *on the average of good years and bad*; the latter for unbalanced Budgets in bad years. If there were some means of making quite certain of a repayment of debt in good years equal to the deficits of the bad years, the conflict would be at least partly resolved. The five-year or eight-year Budget has frequently been suggested; but it seems to be ruled out by the political impossibility, taxes being as high as they are, of piling up the necessary big surpluses in good years.

Nevertheless, something of this nature could be, and is, achieved through the intermediary of the various funds that are under the control of the State but outside the Budget. The clearest case in point is, of course, the Unemployment Fund which, in 1937, for example, increased its surplus by £21 millions, even after repaying £5 millions of debt. In a depression year the Unemployment Fund will draw on its balance to meet an excess of expenditure over receipts. Thus if the Budget, narrowly so-called, is exactly balanced every year, the operations of the Unemployment Fund will result in the income of the State exceeding its expenditure in good years and *vice versa* in bad years. Many of the other Government funds operate in much the same way, though not all of them have such a clear correlation with the trade cycle, or involve as large variations as the Unemployment Fund. Moreover, the Treasury usually accumulates in good years various nest-eggs which can be used to abate the difficulties of an awkward budgetary position in subsequent years.

This principle might well be extended further in principle and in practice. The Road Fund, had it not been taken into the Budget, might have combined a relatively steady income with an expenditure that was high in bad years and low in good years. There might be a works fund organised on similar principles to cover the ordinary works expenditures of the Government. The principle

might even be extended to that part of the burden of unemployment that is not carried by the Unemployment Fund, since if the one is actuarially calculable, so is the other.

Indispensable Conditions

It would be very necessary, however, if any such extended use of extra-budgetary funds were to be made, with the deliberate object of having reserves which could be accumulated in good years and drawn upon in bad years, to devise a technique by which it could be done without disturbance to the capital markets. If these funds invested their resources in gilt-edged securities, any draft upon their reserves would tend to depress the market for both long-term and short-term securities and thus tend to raise the rate of interest at a time when it should be lowered. This technical problem differs only in scale, and not in kind, from the familiar problem of reducing the effect upon the markets of the seasonal variation in the revenue and expenditure of the ordinary annual Budget. It could be solved by appropriate policies on the part of the Bank of England and the clearing banks. It is essential, however, that public opinion should be familiarised in advance with the decision to adopt measures of this sort, so that they should not cause a crisis of confidence.

Even an extended use of extra-budgetary funds and similar devices is not adequate to solve the problem of balancing the Budget during a trade cycle. If there is to be an equality on balance between the receipts and the outgoings of the State, and if in addition the excess of outgoings in bad years is to be large enough to exercise a dominating influence on the course of the trade cycle, it follows mathematically that these various extra-

budgetary funds would have to accumulate important surpluses in good years. It is arguable that such deflation in the first good years would nip recovery in the bud and defeat the object of the scheme. But, even if the plan worked, the existence of large and increasing surpluses in the extra-budgetary funds would constitute a standing temptation to any Chancellor of the Exchequer. Even in good years the budgetary position is not going to be as simple as to leave him immune from temptation.

Effect of Rising Prices

The extra-budgetary funds are thus, at best, only a partial solution of the problem. It is worth mentioning once more another way which exists, at least in theory, of alleviating it. This is by allowing the burden of the debt, expressed in money, to increase, but offsetting it by a steady fall in the value of money. A rise in prices is a *permanent* solution only for the debt burden. But it also tends to secure some relief from the other burdens on the Exchequer—only to the extent, however, that Civil Servants, pensioners, social service beneficiaries, etc., can be made to submit to a diminution of their real incomes. This might be an easy method of imposing cuts. In practical terms, however, as distinct from theory, it is very difficult to formulate a policy of conscious price-raising. The consequences of rising prices are complex and not all of them are favourable to economic activity. On the whole, it can be said that a gradual rise in the price-level, of moderate dimensions, would be welcome. And the practical conclusion can be drawn that at least nothing should be done to hinder it—still less to depress prices, since a rise in the value of money would immensely complicate the problem.

II. The Budget and Re-armament

8. So far we have been considering the future problem of the Budget in general terms. When, however, the presumably non-recurrent part of the re-armament programme has been completed, we shall be confronted with a financial situation of peculiar difficulty. It is conceivable, of course, if international relations continue to deteriorate, that new armament requirements will constantly present themselves, so that the phase of declining armament expenditure will not be reached within any future that is profitable to contemplate. Obviously, however, such a possibility contains no budgetary consolation, and would render a solution of the eventual problem extremely difficult, perhaps impossible, within the limits of the existing economic system. If, however, events before too long move in accordance with the hopes entertained in 1937, and our total expenditure on armaments begins to decline from a peak to be reached a year or two hence, very difficult issues of financial policy will arise. We shall then approach the time when, according to all orthodox canons and to official expectations, borrowing should cease and expenditure be met out of income. This would leave no scope for remissions of taxation or indulgence in further expenditure. On the contrary, it is highly improbable that the Budget could be made to balance without further taxation. For we must reckon with the adverse effects on trade, employment, and the level of taxable incomes of the reduction in expenditure on armament previously financed by loans.*

Nor is that all. If a serious setback to trade ensues, there is certain to be a widespread demand that the State should endeavour to check the depression and to mitigate the resulting unemployment by measures, under such heads as public works, as are likely to entail an increase in the charges falling on the Exchequer. Public works expenditure has, of course, been commonly advocated in past

* The present occurrence of a fairly severe recession of trade at a time when armament expenditure is still expanding serves to emphasise the reality of this danger.

periods of depression, while the policy of British Governments on this matter has fluctuated from time to time. It seems probable, however, that in the next depression the demand for large-scale expenditure, either on public works or on other objects which it is hoped may stimulate trade, will be stronger and more compelling than in the past.

Demand for Increased Expenditure

There are three reasons for expecting this: first, the fact that Government expenditure upon armaments is now playing, and for the next year or two is likely to play, so leading a part in maintaining economic activity that it will offer to a large section of opinion convincing testimony of the importance of the influence of Government expenditure on the ups and downs of trade. It will be widely felt as an intolerable paradox if it should turn out that the times when we are devoting an enormous proportion of our productive resources to the economically wasteful purpose of armaments are happier and more prosperous than those when armament expenditure is reduced to a more normal level. And the argument that it would indicate a bankruptcy of economic statesmanship if we cannot utilise the released productive resources for constructive purposes will be difficult to resist.

Secondly, the experience of other countries will serve in practice, whether rightly or wrongly, to reinforce the arguments in this direction. Orthodox financial maxims have undergone serious discredit throughout a large part of the world in the last few years, and the mere fact that other governments, such as those of the United States, Germany, and Italy, have pursued heterodox financial policies, all embodying the feature of large public works expenditure, will strengthen the hands of those who demand similar policies in this country.

The third reason may, perhaps, prove the most cogent. The industrial situation which is bound to arise when re-

armament expenditure is substantially reduced will be in some ways exceptionally difficult. At present the industrial structure is being distorted by the exigencies of re-armament; the productive capacity of many industries, such as iron and steel, shipbuilding, and certain branches of engineering, is being expanded to a level which, apart from re-armament, would be greatly in excess of our requirements. When re-armament is at an end, we shall be confronted accordingly with a problem of industrial demobilisation similar to those which arose after the war; and this problem will be the more difficult in that the industries in which redundant productive capacity is to be expected are largely the constructional industries which tend in any case to be the worst sufferers in an industrial depression.

Contrast with 1931

In this connection, it is well to appreciate that our recovery from the last depression was greatly assisted by a combination of circumstances, none of which is likely to be repeated. There was first the latent unsatisfied demand for houses, which made possible an immense expansion in the capital expenditure of the general public, as soon as favourable conditions as regards the rate of interest, an atmosphere of confidence, etc., had been established. The trend of our vital statistics forbids the expectation of another boom of comparable dimensions in the building of dwellings, and it is not easy to imagine another form of capital expenditure by private individuals which would exert a comparable influence. Secondly, till 1931 Great Britain had been an essentially free trade country, importing considerable and growing quantities of manufactured goods. The change from a free trade to a protectionist system supplied a stimulus which could not be repeated to certain industries. Third, there was the stimulus resulting from the fall in the exchange value of the pound sterling, which was of material advantage in the early years of recovery; this again could hardly be repeated. As against these considerations there is, it is true, the possibility that other circumstances may be more favourable to recovery than they were after 1931; in particular, that opportunities for the expansion of international trade and international investment may present themselves. These favourable possibilities are, however, speculative and uncertain.

It is, therefore, necessary to reckon with the possibility that the economic situation which ensues on a contraction of armament expenditure may not lend itself to solution by means of the expedients adopted in 1931. On the other hand, the situation will not be one in which the adoption of extravagantly heterodox policies, such as are often

advocated in connection with public works, would be appropriate. It is true that there could be no time in which local authorities, public utility bodies, etc., could more advantageously undertake commercially remunerative or otherwise desirable capital schemes which are capable of being postponed or speeded up. It is indeed important at all times that the possibilities of concentrating work of this character in a period of bad trade should be carefully surveyed, that plans should be prepared in advance, and that the State should be ready to help in every reasonable way. But it would be a very different matter in a post re-armament slump to pursue a policy designed to press forward with public works projects which would throw a heavy charge on the national Exchequer, and which could only be justified by their supposed reaction on the employment and industrial situation.

Public Works—Some Objections

Such a policy would be exposed to the most serious objections on financial grounds. It can hardly be suggested that the State should spend indefinitely every year £80 millions or more in excess of its revenue. It can hardly be supposed that, if it did so, financial confidence would be maintained. On the contrary, from the financial standpoint, the justification of the present policy of borrowing for re-armament is that borrowing will be limited to a very few years. To finance public works on a considerable scale by revenue raised from additional taxation would do little good and might do serious harm to economic activity. Except, therefore, in so far as expenditure on public works is or can be made financially more or less self-supporting (a proviso the importance of which ought carefully to be investigated) the policy of compensating for a decline of armament expenditure by an expansion and indefinite continuance of public works expenditure on anything like an equivalent scale would certainly not be compatible with even the principle of a balanced Budget.

The same objection applies to alternative financial policies which have been widely advocated in recent years and which are likely to be increasingly urged in future, e.g. expansion of the social services to improve nutrition or the provision of family allowances at the expense of the Exchequer. It can be claimed for such proposals that they might materially assist the economic situation at some of its vulnerable points, notably that they might help to prevent the recurrence of an undue fall of agricultural prices; but they are all exposed to the objection that they would aggravate a budgetary problem which in any case is likely to be difficult.

III. Issues of Policy

9. So stated the outlook is, indeed, formidable. Are there no means of relief, other than the device of fluctuating extra-budgetary funds and quasi-public investment, and the questionable expedient of raising the general price-level? It may be suggested that one line of policy, though by no means sufficient to provide a complete solution, nevertheless promises three-fold assistance. This is the encouragement of materially lower rates of interest for long-term capital.

There can be no doubt that lower interest rates have materially improved the Budget position since 1932, and, if interest rates on long- and medium-term capital could be permanently established on a lower basis than now prevails, the Budget would obtain some further direct relief. The possibility that a lower level could be established might be kept in mind in considering how far it is wise to borrow meanwhile at long-term and short-term respectively. A lower level of interest rates might open out a more hopeful prospect of reconciling an increase of public capital expenditure with the requirements of a balanced Budget. If the long-term rate of interest could be estab-

lished in future on a lower basis, there would be many as yet largely unbroached forms of useful expenditure which could be undertaken on an economic basis by local authorities and public utility concerns. It would seem desirable that this possibility should now be carefully considered.

Secondly, in so far as there is any tendency towards deeper depressions now and in the future owing to a shortage of opportunities for profitable investment in comparison with the volume of savings coming forward, a *permanent* reduction in the rate of interest would go some way towards restoring the balance. Whether such a reduction would lead to a fall in the volume of savings is open to dispute, though we doubt whether it would actually lead to an increase. But it is certain that the number of openings for investment would be increased. It should be noted in this connection that the narrowing of the margin between gilt-edged and other long-term interest rates is no less important than the lowering of the gilt-edged rate itself.

Finally, lower rates of interest would almost certainly promote, or at the very least not impede, that general

tendency towards rising prices which we have already noted as constituting an assistance to the Budget.

Lower Long-Term Interest Rates

But is it possible to secure permanently lower long-term interest rates? The general economic considerations set out above supply grounds for thinking that at any rate after a decline in armament expenditure, this should be fully possible. The establishment in practice of lower interest rates does not, of course, depend solely on these economic considerations. The state of confidence, the expectations in the minds of investors and stockbrokers, the need of banks to earn money, are influences that carry great weight. These difficulties, however, should be regarded not as reasons for abandoning hope that interest could be materially reduced; but rather as additional reasons for considering the problem in good time. It may well be that one of the most helpful steps that could now be taken with a view to the easing both of the Budgetary and the industrial problem of the future, would be the steady promotion in the City and elsewhere of the idea that interest rates are destined to become lower in the future, even than they have been in the past. It is important, however, to realise that the foregoing argument is concerned with *long-term* interest rates, and with the rate applicable to private as well as Government borrowings. The artificial depression of discount rates on short-term paper to unremunerative levels is no substitute for lower long-term rates.

A Budgetary "Breathing Space"

10. There is another possibility which deserves to be considered. We regard the maintenance of the principle of a balanced Budget as an essential element of financial policy. In general, we are sceptical, as we have already indicated, about the practicability of balancing the Budget "over a trade cycle" instead of in each particular year. But something of this sort will, we believe, be necessary in the peculiarly difficult period which will follow a large reduction in armament expenditure. We shall then have an extremely difficult transition to effect, in view of the development of redundant productive capacity in the arms-serving industries. It is important, therefore, that during the transitional period, financial policy should have regard to the industrial difficulties. Otherwise a long period of depressed trade and heavy unemployment might ensue; the resulting decline in the national income might make a balanced Budget an unattainable goal. The discontent and agitation that would arise would probably lead to political changes, entailing a reversal of policy in which every principle of financial orthodoxy would be overwhelmed. Therefore it is suggested that a reasonable breathing-space will be required before revenue and expenditure are made to balance. If such a breathing-space is provided, the eventual results on the Budget are likely to be more satisfactory than if a policy of austere traditional orthodoxy is pursued, entailing immediately a serious deflation of income, and ultimately a reversal of policy.

Indeed, political exigencies will probably make some breathing-space inevitable; and perhaps the most important practical problem is how to reconcile the delay, which will be expedient before the Budget is completely balanced, with the maintenance of financial confidence. This task may, however, be easier than appears at first sight. For, as has already been indicated, the hold of orthodox financial ideas on public opinion has been greatly weakened by the events of recent years; the finances of very few countries are to-day in a position which would be regarded as sound by nineteenth-century canons; and the investing public would be unlikely to be seriously shocked if, when the period arrives for a transition to a peace economy, the policy of balancing the Budget over a period of years were to be frankly avowed.

What appears likely to be needed in the phase of declining armament expenditure is therefore, in spite of all its

difficulties, something in the nature of a four- or five-year financial plan. This would aim at an eventual return to a completely balanced Budget, but for a considerable period would subordinate financial orthodoxy to the needs of industry. This plan might appropriately provide both for remission of taxation and for additional expenditure of a type likely to be helpful to economic activity in a difficult period.

It is obviously possible that unfavourable international developments will prevent this expenditure from falling, for a considerable period, to as low a level as is contemplated by our present arrangements. This, however, as has already been said, would only aggravate the difficulty of the Budget problem, while also aggravating the eventual problem of a transition to a peace economy.

The Longer-Term Outlook

11. Behind this contingency lies the longer-term problem whose outlines have been sketched in the earlier paragraphs. The long-term Budgetary problem derives its peculiar difficulty from two facts, the implications of which we are only just beginning fully to realise. These facts are:—

- (1) that the British national economy is likely very soon to cease to be an expanding organism; and
- (2) that the expenditure of the State is showing a large increase, whether regarded as expenditure per head of the population or as a percentage of the national income.

Some secular rise in the productivity of the average individual will continue; but the number of individuals comprising the community will soon be falling at the same or an even greater rate. This may mean that the revenues of the State, on the present basis of taxation, will soon cease to increase. Expenditure, on the other hand, shows no such tendency. Indeed, it is difficult to foresee any end to the increase in its burden. The reasons for the present high level of expenditure, and for its increasing tendency, are not always accurately understood. The burden of the existing National Debt, which has traditionally played the leading part in discussions of national expenditure, is now by no means the greatest of the difficulties. The total cost of the service of the debt is only about one-fifth of the total expenditure, and its real burden is always susceptible to adjustment by way of changes in the value of money.

In the last few years the necessity for re-armament has been by far the largest factor in the growth of expenditure. Expenditure on defence has more than trebled over the last five years; it is still increasing at an extremely rapid rate; and it is impossible to forecast its future trend with any confidence. This is, of course, by far the most unfavourable factor in the immediate financial outlook; and, as has already been suggested, it is conceivable, if a condition of international tension is prolonged, that the necessities of national defence may eventually entail the overthrow of our existing economic system.

Anatomy of Rising Expenditure

None the less, it would be a mistake to suppose that the long-term Budget problem is synonymous with the problem of securing a reduction of armament expenditure to a manageable level. For even if this object is secured, fundamental difficulties will still remain. Expenditure under headings other than debt and defence has been increasing steadily and, for a long period past, at a rate far larger than the rate of growth in the national income. Indeed, owing to the successful debt conversion, if we lump together expenditure on the debt service and on defence, the combined expenditure under these heads, which may be said to represent the present cost of past and future wars, has not increased since 1929 by as much as other expenditure. These two items took roughly 10½ per cent. of the national income in 1929, and even in 1938 only about 11½ per cent., if calculated on the basis of the Budget estimates, including the £90 millions to be borrowed. All other expenditure,

however, increased from 7 per cent. in 1929 to over 9 per cent. of the national income in 1938. The ratio was as high as 10 per cent. in 1932, but some variation between the top and the bottom of the trade cycle is only to be expected. What is ominous is that, from the top of one cycle to the top of the next, although in the intervening period the national income has increased with unusual rapidity, the proportion of the national income required for the expenditure of the State, on matters other than debt and defence, has increased by about one-third. Moreover, when one considers the constituent items of the category one by one, it is difficult to foresee any future for this expenditure except one of continuous expansion. Thus within a generation it appears likely that, in even the most favourable circumstances, we shall be faced with the very difficult problem of meeting a steadily rising expenditure out of not merely a static revenue but a static taxable capacity.

What are the possible ways of escape from this dilemma?

Ways of Escape

There appear to be three ways of escape.

(A) A reduction of the scale of expenditure by the State, not merely in the defence departments but over the whole field of civil expenditure.

(B) Appropriation by the State, through the medium of taxation or otherwise, of a significantly larger proportion of the national income than at present.

(C) Discovery of some means by which the rate of increase in the productivity of the average individual can be greatly accelerated.

These are not exclusive alternatives. But no one of them is an easy remedy. It is simple to demand a reduction of the scale of expenditure of the State, but very difficult to achieve it. Twice since the War, efforts of economy have been made. But, after each occasion, expenditure has started once more to increase. A permanent reduction would be politically a very difficult matter.

The second possible expedient is the raising in taxation

Primaries and Political Prospects

WASHINGTON, May 25—This is primary time in national politics. The omens are giving a confusing prediction of the result of the November Congressional election. The first primary, to choose the Democratic nominee for the Senate from Florida, was turned into a straight fight for the New Deal, and was won on this issue by Senator Pepper. This so startled Washington, where the belief prevailed that President Roosevelt was losing his hold in the country, that some discipline was reintroduced into the party, and the Southern insurgents dropped their opposition to the President like a hot brick.

They had bottled up the Labour Standards Bill in the House Rules Committee, which meant that it could not come to a vote during this session, unless it was pried out of Committee by a petition signed by 217 members. Before the Florida election no one would have accorded such a petition a chance. But, after that result, the petition was laid on the Speaker's desk, and the necessary names were signed in the record time of three hours. New Dealers became so sanguine as to believe they might revive the Government Reorganisation Bill before the adjournment.

This elation was considerably tempered, however, by the Pennsylvania primaries. Here the situation was muddled by the split between the Democratic organisation and the Committee for Industrial Organisation. The state machine backed a party regular for Governor, and the present Governor Earle for the Senate, while the C.I.O. supported Lieutenant

of a significantly larger share of the national income without changing the present economic and political structure and without prejudicing economic progress. The possibilities in this direction are limited.

A large increase in productivity would represent a more satisfactory remedy. In recent years this has fallen rather under a cloud as an object of economic policy. There has been much talk about the dawn of an "age of plenty," in which it will somehow be possible to increase production and leisure at the same time. It might be salutary if it were more generally recognised that the greatest possible production of goods and services is, in general, more necessary to-day than ever if social progress is to be maintained. Unfortunately, as some of the earlier arguments suggested, present economic tendencies are by no means favourable to the realisation of this objective. Thus the time may have come to re-examine our system of taxation and our commercial as well as economic policy, to determine whether by amendment we can lessen the restrictions on, and increase the incentives to, productive enterprise. Earlier in this memorandum we made certain suggestions which may also help to achieve this object.

Obviously it is possible that we may pass through a considerable interim period in which the problem, like the French budgetary problem, will not be solved; but in which we, like France, may revolve in the vicious spiral of deficits, credit creation, rising prices, social agitation, diminishing confidence, restricted capital expenditure, unemployment, and again deficits. Yet in the long run, of course, the problem must be solved. Therefore we are bound to admit the possibility that a time may come when some people will begin to consider that the only practicable method to increase the national income, and at the same time to divert a substantially larger proportion of it into the coffers of the State, is the method of the totalitarian States. The growth of such a belief represents a real danger latent in the present financial and economic outlook. Therefore it is incumbent both upon public authorities and private persons to concentrate on the possible means of escape from our future difficulties by other methods.

Governor Kennedy, an official of the United Mine Workers, for Governor and Mayor Wilson of Philadelphia for the Senate.

Postmaster General Farley, master-mind of the Democratic National Committee, was in a quandary. If the party fought Kennedy, it might lose C.I.O. support in other states. If it supported the C.I.O. ticket, it would be destroying its own state machine. Mr Farley fell back upon the compromise of endorsing Kennedy for Governor and Earle for the Senate, and urging good Democrats to split their tickets. The advice was followed by many thousands, but not enough to nominate Mr Kennedy, who lost by 70,000 in a total vote of nearly a million. Mr Earle won easily for the Senate.

The result was hailed with the utmost satisfaction by Conservative newspapers as a decisive setback for John L. Lewis, and his determination to make the C.I.O. into a political organisation. In a depression, the C.I.O. is naturally weak, and it has lost heavily in public favour during the past year. In Pennsylvania, the American Federation of Labour was out to beat Kennedy, which made his downfall all the more significant to Conservatives. Even the United Mine Workers themselves were not wholeheartedly behind their own candidate, complaining of the heavy levy for political purposes, despite their low incomes.

Republican Hopes and Fears

Republicans in Pennsylvania held their primaries on the same day, and polled a heavier vote than the Democrats, a fact which was construed to forecast a return of Pennsylvania to its old loyalty to the Republican party. The feature

of the Republican primary was the decisive defeat of Gifford Pinchot, campaigning for another term as Governor as a Liberal.

A closer study of these results has somewhat heartened the Democrats. Mr Pinchot polled 400,000 votes, some of which will go to the more liberal Democratic party in November. The Republican vote was not much greater than the Democratic vote as it was in the primaries of '36, when Roosevelt carried the state. And though the Democratic adherents are split, Mr Farley has kept the door open to reconciliation.

In fact, the Landon Wing of the Republican party is more distressed by the result than are the Democrats, for if Governor Pinchot could not capture more than a forty per cent. following in Pennsylvania, there is little chance of the Eastern branch of the party accepting Liberal leadership. And unless it does (Mr Landon's followers believe) there will be little hope of a heavy Republican gain in November.

The Republicans are complaining bitterly that they are at a grossly unfair disadvantage because of the Federal Government's control over the organisation of relief. Certainly, the relief vote goes to the Democrats who provided the relief. But the Republicans go further and say that the relief organisation is itself a political machine as effective as any in the old boss-ridden cities. They hold it responsible for the heavy New Deal vote in Florida, and predict that it will decide many otherwise close contests this autumn.

The third primary was in Oregon, where the Administration opposed Governor Martin, because of his hostility to the C.I.O. and his general conservatism. Mr Martin lost by only 6,000 votes, being beaten in the cities. But the outcome was another New Deal victory. Still to come is the important vote in Kentucky, where the New Dealer, Senator Barkley, is in real danger of defeat, and every lure and pressure known to the Democratic National Committee is being employed to save him.

Roosevelt's Chances in November

If the Pennsylvania result is left aside, the political situation is much more favourable to the Roosevelt leadership than would have been expected a few months or even weeks ago. The fact that the country is in a new major depression had been expected to turn public opinion away from the President. The open revolt against the Government Reorganisation Bill dramatised the turning of the tide, and observers in Washington were quite sure—and thought the country was equally sure—that the New Deal was slipping, and that the future belonged to Mr Roosevelt's opponents. But the country is not only not sure of this; it actually continues to show its preference for Mr Roosevelt.

This is not to say that the Republicans will not make headway in November. But, to be on the way to power, they must win a majority in the House of Representatives, and their prospect of doing this is not bright. Of all the political barometers in America, the mid-term Congressional election has been the most reliable. The party which wins this election will probably win the Presidential election two years later. It is probable that the Republicans will win fifty more seats in the House than they now hold. An optimistic forecast is a gain of a hundred seats, which would give a total of 188 seats in a House of 435 members. Only a strong revulsion in popular feeling could secure the election of the 217 Republican representatives needed for a majority, and the primaries, so far, however inconclusive they may be, show no such revulsion.

In the past, the party in power during a depression has had to pay for it by defeat at the polls. But Mr Roosevelt appears to be an exception to the rule, not because the depression is not attributed to him, but because voters are afraid to be governed by Republicans in hard times. Mr Hoover drilled it into them that relief was no function of the Federal Government, and the Republicans in Congress still talk of handing back relief to the states—which voters know means reducing relief in most cases.

The relief policy is one of Mr Roosevelt's greatest assets. Another is the Republicans' continued want of leadership and a constructive programme. Mr Landon continues to press for liberalisation. Mr Hoover, in every address, demonstrates that he has not advanced with the times; and neither leader converts the other. Most Republican spokesmen are sure that prosperity will be restored simply by getting Mr Roosevelt out of the White House. That is, they are content to go back to the Harding-Coolidge-Hoover dogmas. If this is the alternative they present to voters in November they will learn, as in 1932 and 1936, that the electorate is not yearning for escape into the past.

Business and Taxation

NEW YORK, May 31.—Ever since the convening of the special session of Congress, last November, the business and financial community has looked upon tax revision as a brazen serpent to be erected in the wilderness of depression. The undistributed profits tax caused real hardship to certain categories of corporations, especially to those for one reason or another rather weak. It constituted, at the time of its passage, no hardship to strong corporations or to industries with steady earnings or only slightly affected by cyclical fluctuations.

Events subsequent to its passage, however, increased the number of "weak" corporations, and the violence of the decline in 1937 affected many corporations more adversely than one would have expected at the time the Act was passed. Furthermore, since the passage of the Act (as before), the market for capital issues has been almost exclusively limited to refunding operations; and the theory of the undistributed profits tax presupposed a receptive capital market.

The other item of tax reform on which great hopes were placed was the capital gains tax. Formerly, capital gains (i.e. profits arising from the sale of property held for more than two years) were taxed at a flat rate of 12½ per cent. Profits arising from the sale of property held for less than two years were charged with the appropriate rate of income tax; and capital losses could be deducted from general income. After 1934, only capital losses up to \$2,000 could be deducted from income; and capital gains were taxed at income rates, but on a sliding scale.

Since the institution of this tax, there has been an absence of new capital flowing into industry; and an almost complete absence of equity capital. Rightly or wrongly, this serious state of affairs has been largely attributed to the effects of the capital gains tax. Together, the capital gains tax and the undistributed profits tax had come to share, in business and financial circles, a large measure of responsibility for the present depression. The prospect of tax reform has therefore become, during the last six months, one of the most important reasons given for the hope that our economy will recover from its present grave distress.

The Proposed Reforms

The Tax Act of 1938 is actually a compromise reached in joint conference between two very different Tax Bills presented by the House and the Senate. The compromise Bill passed both Chambers by very large majorities, and was sent to the President for signature, for veto with reasons, or for acquiescence. A Bill passed by Congress becomes law without Presidential signature within ten days of its formal passage if Congress is in session. If Congress is not in session on the tenth day, the withholding of the President's signature constitutes a so-called "pocket veto." The Tax Act of 1938 has become law without Presidential signature, and against specific Executive objections.

The result has been accepted without enthusiasm. The modification of the undistributed profits tax has mitigated its punitive features, and affords a measure of relief for small or weak corporations. It is extremely difficult to measure the effects of the alteration in the capital gains tax. Persons taxed at rates of between 15 and 20 per cent. have lost the right to deduct \$2,000 of capital losses from general income; but they have gained the right to carry over capital losses to be set off against capital gains, if any, in the ensuing year.

Persons above the 15-20 per cent. bracket can apply the rate of 20 per cent. on sales made after 18 months from acquisition and 15 per cent. on sales made two years after acquisition. This, however, is only the approximate rate applicable to transactions completed after five years under the old Act. In short, the new Act reduces the rate of tax applicable to persons in the relatively high income grades on profits derived from property held for more than two years and less than five years.

The object of the reform is to release a flow of capital, especially of equity capital, into enterprise. Whether the reason for the stoppage of this flow was the capital gains tax is disputable. Whether the changes adopted are in themselves likely to release such a flow is problematical. At any rate, the Tax Act has gone some way to meet the wishes of the business community. Meanwhile, it is possible that the Act may be materially altered in the near future, since the President has given notice that he intends to seek a revision of the Act in the next session of Congress.

No Recovery in April

The Federal Reserve Board's indices of business activity for April are now available. The chief movements are shown in the table on the next page.

BUSINESS INDICES 1923-5=100. Adjusted for Seasonal

	April, 1937	March, 1938	April, 1938*
Industrial production (total)	118	79	77
Manufactures	118	75	73
Minerals	115	103	100
Construction contracts (total)	53	46	47
Residential	44	33	36
All others	61	56	56
Factory employment (total)	101.6	81.6	79.2
Durable goods	97.4	72.3	69.2
Non-durable goods	106.2	91.6	89.9
Factory payrolls (total)	104.9	73.3	70.5
Durable goods	106.4	63.8	61.7
Non-durable goods	102.9	85.3	81.8
Freight car loadings	79	57	55
Department store sales	89	77	86
Department store stocks	79	71	71

* Preliminary.

Although the level of activity in April was lower than in March, and indeed lower than in any month during the first quarter of the year, the decline was not sufficiently pronounced to indicate any change of the general pattern of business in recent months. The fragmentary data already available for May suggest that activity has fallen since April.

To say that these phenomena are disappointing to a community that had hoped for a seasonal upturn would be putting it mildly; but it should not be forgotten that there are more or less compensating seasonal factors in out-door industries, which, except for building, do not figure noticeably in the statistics. Residential building rose in April compared with March by more than was seasonally expected; and while it is still below a year ago, building activity is the most vigorous element in our economy.

France

Socialists Approve Government's Policy

PARIS, June 9.—The Socialist Congress at Royan, after the revolt of its Left extremists (the Pivertistes), carried by 4,872 votes to 3,165 M. Blum's resolution declaring that the maintenance of the Daladier Cabinet was in the interests of the Popular Front. In outline, the resolution endorsed M. Daladier's foreign policy and approved the rejection of ideological warfare and the maintenance of world peace even by co-operation with totalitarian States. On the other hand, criticism was levelled at the Government's domestic policy in economic matters. This decision can be explained by two circumstances: the fear of a Government crisis at a time of great tension abroad; and the growing discord among the members of the Popular Front.

The Socialists' attitude towards foreign policy affords fresh backing to the Cabinet. Their reservations about economic policy do not present any imminent threat, since the Socialists themselves confess that their programme of action is no longer adequate. The elaboration of a new social programme after the quick execution of the first, and at a time two years distant from the next elections, will be much more difficult than it was in 1935. And the decisive factor is likely to be the actual course of economic events.

The Economic Outlook

The Minister of Economics recently announced that the import surplus had declined from £50 millions during the first four months of 1937 to £30 millions in 1938. Speculative buying of raw materials has ceased, the spread between French and world prices has been diminished to France's advantage, and the application of the forty-hour week has been relaxed. Public sentiment is certainly better than for many years, and capital is seeking new outlets for investment. But time is indispensable for any comprehensive return of confidence.

The third batch of decree-laws will be published in a few days, before the end of this very short session of Parliament. These measures will entail provision for the development of electricity plants, closer control of insurance companies and probably some revision of social insurance schemes. They may include the much-sought-after pensions for aged workers, on condition that labour's working hours are increased from 2,000 to 2,020 a year. Other items of social expenditure have been demanded by the Communists, which

would have involved a sum of some 7-8,000 million francs a year, but they have been rejected by the Cabinet. A moderate increase in the wages of public servants will, however, be conceded.

This calm session has thrown into relief the confusion of the Left and the determination of the Cabinet. The foreign situation has become easier; and the markets would have been favourably influenced had not world economic recession led to a further decline in French industrial production.

Coal output in April was 4,125,427 tons for 22.5 working days, against 4,378,992 tons in March for 24.1 working days and 3,991,159 tons in April, 1937, for 22.8 working days. Average daily production in April was thus 182,862 tons, against 181,544 tons in the preceding month. The number of men employed was 248,136 at the end of April, against 246,964 at the end of March and 237,187 at the end of April, 1937.

The receipts of the Société Nationale des Chemins de Fer for the first twenty weeks of the year were 29.12 per cent. higher than in the same period of 1937:—

1937 (first 20 weeks)	1938 (first 20 weeks)	Increase
Frs. 4,039,359,000	Frs. 5,219,818,000	Frs. 1,180,459,000

During the twenty-first week, loaded waggons numbered 280,341, against 33,413 in the corresponding week of 1937; and since the beginning of the year they have numbered 6,334,463, against 6,826,636 in the same period of last year. During the week ended May 28th, the total number of unemployed persons was 380,826, against 384,939 on May 21st and 345,503 a year ago.

Germany

The Absorption of Austria

BERLIN, June 7.—Austria's railways were put directly under the Reich Minister of Communications on June 1st, certain powers being left to the Vienna Government. The Austrian Labour Offices have been incorporated in the Reich Board for Labour Exchanges and Unemployment Insurance. Austrian employees, like those in the Reich, will henceforth carry a "work book"; and in general Reich laws and ordinances concerning employment agencies, the local distribution of labour, occupational advice and apprenticeship will apply to Austria. The Minister of Economics has decreed that permits for Jewish emigrants to take bank balances out of the country will no longer be granted.

The following data have been privately compiled of Austria's textile position and foreign trade. Cotton constitutes 80 per cent. of the raw materials consumed in Austria against 53 per cent. in the old Reich; wool, 11 per cent. against 16 per cent.; and cell-wool and rayon 5 per cent. against 22½ per cent. Textiles represent 21 per cent. of total Austrian imports, and 18 per cent. of total exports. Of cotton yarn exports in 1937, 61 per cent. went to Roumania and nearly 20 per cent. to Yugoslavia.

It has been officially intimated that Austria's textile exports must be increased to secure a greater supply of foreign exchange. Unofficially, it has been stated that certain Austrian textile requirements (in particular of cloth), which have previously been supplied from Italy, Czechoslovakia and England, can in future be met by the Reich. Steps have already been taken to increase cell-wool production in Austria.

The NATIONAL BANK of NEW ZEALAND, Limited

Established 1872

Head Office:—8 MOORGATE, E.C.2

Subscribed Capital - £6,000,000

Paid-up Capital - £2,000,000

Reserve Fund - £1,000,000

Currency Reserve - £500,000

The Bank has branches throughout New Zealand and conducts every description of Banking business with that Dominion.

Increased Industrial Employment

Bankruptcies in May numbered 154 against 178 in May, 1937. Goods traffic on the railways in April was 2.7 per cent. greater than in April, 1937. The number of hours worked in industry in April was 18.4 per cent. greater than in April, 1937. Compared with March, the increase in employment was almost entirely in the production goods and automobile industries. Activity in iron and other metals increased considerably, while in the textile industry there was no change. There has been some improvement in the domestic supply of steel, but the demand of those consumers who have not priority in rationing is not being fully met.

In April, German exports of heavy iron and steel fell very sharply. The recent stagnation in foreign markets for steel is attributed to uncertainty about the prolongation of the International Cartel, and American and Swedish price-cutting is mentioned. Not only the Opel, but also other motor-car manufacturing companies report a rapid increase in exports during 1937. The Daimler-Benz company's exports of private cars rose 50 per cent., and of commercial vehicles 100 per cent. The Cologne Ford Company's exports amounted to about 25 per cent. of its output. The organised motor-car industry, it is stated, considers that one-third of its output ought to be exported, and lays stress on the importance of this trade in the securing of foreign exchange.

The question debated in the English Press whether a "subsidy" is being paid on motor-car exports from Germany, or only a sum sufficient to compensate for the devaluation of foreign currencies, is a mere matter of definition. The whole system usually called export-subsidising, of which the most prominent feature was Dr Schacht's levy on turnover, was from the first officially justified on the ground that the devaluations made it impossible for Germany otherwise to compete.

Pessimistic Trade Prospects

The foreign trade outlook is discussed pessimistically. Most stress is laid upon the continued fall in prices of raw materials and foodstuffs, which (says the Institute for Trade Research) has now gone far beyond a reaction from the previous advance in prices. The fall in prices during the fifteen months since it began early in 1937 is almost as great as that of the first fifteen months after the collapse of 1929, and in certain details it resembles the experience of eight years ago. In view of the outlook for crops and the magnitude of stocks held in leading consumer countries, any recovery in cereal prices is not (it is added) to be expected, and pressure on raw material prices will probably increase. Despite the resemblance to 1929, it is not likely (says the Institute) that the next three years will resemble 1930-33. A relatively slight stimulus might restore prosperity.

A leading woollen manufacturing company predicts that exports of woollen goods in 1938 will be only half those recorded in 1937. It is reported that Brazil has suspended deliveries of cotton to the Reich, alleging that the goods have been resold at higher prices for foreign exchange or gold. This is surprising, because the trade returns show that Germany in 1937 was herself paying much higher prices for inferior Brazilian cotton than for superior North American cotton.

The foreign trade returns for the first quarter of this year show a sharp drop in the proportion of imports taken from Europe and a corresponding rise in imports from overseas, and in particular from America. The distribution of exports changed little. Sales to Asia declined and sales to America increased. Some 54.9 per cent. of imports were European, and 44.8 per cent. came from overseas. Of exports 68.6 per cent. were sold to Europe and 31.3 per cent. to countries overseas.

Belgium

The New Government

LOUVAIN, May 24.—Public opinion in other countries was surprised that the question of M. van Zeeland's return to public office did not arise after the fall of the Janson Government. M. van Zeeland, however, cannot take any active part in politics until the judicial inquiry into the direction and management of the National Bank has been completed. The results of this investigation will probably be issued in the course of the next few weeks; and it is said that they will be wholly in M. van Zeeland's favour.

The advent of M. Spaak as Prime Minister was an important event. Never before had the country been under the direction of a Socialist. M. Spaak, who is a descendant of a Liberal statesman, was at first very radical, but has now become a Socialist sort of Nationalist. In his statement of

policy to Parliament, he repudiated the class war. Since he took office, he has been realistic in his policy, and his supporters are drawn from several parties.

France and Belgium

The Belgian Cabinet crisis coincided with a further devaluation of the French franc. A monetary crisis followed in Belgium, caused by the withdrawal of foreign capital and the commercial operations of Belgian importers in foreign exchanges. This situation was aggravated by some exports of capital and by uncovered operations by sellers.

Actually, there is no real link between the Belgian and the French economies. France only buys 8 per cent. of the exports of Belgian manufactured goods, while the sterling countries, including the United States of America, take 41 per cent. So far, too, no commercial crisis due to French competition has occurred. Nevertheless, because of a law passed last year to tax the so-called profits arising from the devaluation of 1935, the public took precautionary measures. In consequence, gold flooded away from the Central Bank. The gold reserve, however, was excessively large. The National Bank granted only a moderate amount of rediscounts and advances; and the movement took place without any danger.

It has nevertheless been necessary to increase the discount rate. The Belgians are specialists in foreign exchange dealings, and it is necessary to prevent people from borrowing money in order to buy foreign exchange. Credit restrictions have been abandoned and trade can secure all the credit it demands; but the banks refuse to satisfy the demands of a speculative order.

Improved Financial Outlook

The new Minister of Finance, M. Gérard, a financial expert, contributed to the success of the first van Zeeland Government and, in 1936, left an easy legacy to M. de Man. since business was good at that moment. His task is not as easy now as it was in 1935. The Budget deficit was originally estimated at 2,000 million francs. This figure, however, included expenditure which had not actually been voted, but was only anticipated. In addition, the short-fall in taxation revenue compared with estimates is likely to be less important than was then expected.

The Government is certain to secure the immediate passing of bills to produce a revenue of 800 to 900 million francs per year. The deficit which will remain after these measures have been enacted and after expenditure has been curtailed, will amount to 350 million francs. On a Budget of 10,000 millions such a deficit is not at all dangerous.

The main topic of discussion, however, is the course which the Belgian economy is likely to take during the next months. If a further decline occurs, the financial deficit will naturally be augmented, while if conditions improve a sensible improvement in the financial situation may be foreseen. Business activity is running at a low level, but no deterioration has recently been registered. Since the beginning of 1938, activity has been practically stable, except in coal-mining, where the situation has become definitely worse. The prospects of the textile industry has slightly improved. In metallurgy, orders are a little more numerous than at the beginning of the year.

Finland

Increased Revenue and Expenditure

HELSINGFORS, May 23.—Both revenue and expenditure increased considerably during 1937. The increase was made more pronounced by the inclusion of 625 million marks partly as capital revenue and partly as a transfer to the Budget Equalisation Fund.

	1935	1936	1937
Revenue :	Mill. mk.	Mill. mk.	Mill. mk.
Current revenue	3,482.2	3,725.2	4,315.6
Loans issued	860.0	900.0	845.7
Other capital revenue	217.2	245.1	823.2
Total	4,559.4	4,870.3	5,984.5
Expenditure :			
Current expenditure	2,872.7	2,983.6	3,557.1
Redemption of loans	815.3	915.0	623.3
Transfer to the Budget			
Equalisation Fund	65.0	31.0	709.7
Other capital expenditure ...	780.5	932.0	1,008.0
Total	4,533.5	4,861.6	5,988.1
Surplus	25.9	8.7	86.4

The increase in current revenue amounted to 590.4 million marks, including 123.7 millions from income and property tax, 102.0 millions from Customs, 77.3 millions from excise, 77.1 millions (net revenue) from the State Railways and 75.6 millions (net) from the State forests.

Recovery in Production

Industrial production, which had shown a tendency to fall during the last quarter of 1937, further increased during the first quarter of this year. This is shown by the following index numbers (1926 = 100).

	Volume of Industrial Production	Value of Industrial Production
1st quarter of 1936	161	138
1st " 1937	181	181
4th " 1937	178	194
1st " 1938	187	196

There was an increase in output in all the principal branches of industry with the exception of the sawmill industry, in which activity fell off owing to the weak state of the timber market. Building activity continues unabated. The decline in the number of plans approved, however, suggests that some decline is likely.

During the first four months of this year, foreign trade has been even more active than last year. The April figures of volume, however, suggest that the peak has been passed. It is especially noticeable that exports of paper, cardboard, cellulose and mechanical pulp are considerably lower than last year in consequence of declining demand. In imports, too, the April figures reveal a falling tendency, e.g. in metals and raw materials.

Surplus of Imports

The balance of trade, usually negative during the winter and spring, has shown a surplus of imports amounting to 557.0 million marks during January-April, against 462.9 millions in the same months of last year and only 103.7 millions in 1936. During April, however, the surplus of imports, at 154.6 millions, was slightly less than it was in April last year, 225.6 millions.

The level of prices is gradually falling. The index of wholesale prices has declined from 102 in January to 99 in April. The fall in the indices of import and export prices is appreciably larger; the former has fallen 6 points to 97, the latter 10 points to 102. The index of export prices does not refer to the paper and pulp products which are being exported at present; these were sold last year at the higher prices then ruling.

There has been a marked demand for credit. Owing to the plentiful accumulation of funds the banks have been able to satisfy it with ease. On the other hand, the foreign exchange position of the joint stock banks has been weakened by the large surplus of imports. The net foreign balance, which amounted to 306.5 million marks at the end of February, was reduced in March by 31.3 and in April by 129.5 million marks. At the end of April it amounted to 145.7 million marks, compared with 241.3 millions a year ago.

The large demand for credit is also shown by the rise in the credits granted by the Bank of Finland. These increased by 124.4 millions in March, by 70.4 millions in April and in the first half of May by another 30.0 millions. The credits granted by the bank amounted to 1,556.6 million marks and were considerably larger than in previous years. At the same time, the bank's reserve of foreign currency was also appreciably higher than last year.

Italy

Financial Deficits

TURIN, May 22.—The Finance Minister's Budget Speech and the report of the Governor of the Bank of Italy enable us to form a fairly complete picture of the financial and monetary situation. The expenditure on Abyssinia and exceptional defence requirements amounted to 975 million lire in 1934-35, 11,136 million lire in 1935-36, 17,519 million lire in 1936-37, and 9,000 million lire (estimated) in 1937-38. The deficits on the State Budgets in this period did not tally exactly with these figures. Sometimes the ordinary Budgets showed surpluses, sometimes deficits: in 1936-37, for instance, the total deficit was 16,230 millions, and in 1937-38 the total deficit was estimated at 12,000 millions. The total sum for which extra-revenue means were required during the three fiscal years from July 1, 1934, to June 30, 1937,

and the first nine months of the current fiscal year, 1937-38, may be estimated at about 36,000 million lire.

The chief disclosed ways and means whereby these deficits were covered were as follows. Some 5,885.8 million lire of 3½ per cent. redeemable stock was converted into 5 per cent. consols. This did not increase the public debt, since the nominal capital was not increased. New 5 per cent. consols to the value of 950.1 million lire were issued. A compulsory 5 per cent. redeemable loan brought in, up to March 31, 1938, some 7,004 million lire. Whether this sum ought to be included in the public debt is an open question. For a portion, amounting to 1,301 million lire, no securities were issued, taxpayers preferring to pay cash and free themselves from the obligation of subscribing to the loan. For the rest, subscribers are nominally State creditors; but, since they also pay an annual tax equivalent to interest and redemption on the loan, the transaction does not involve any additional burden on the Exchequer.

Ordinary one-year 5 per cent. Treasury bills, amounting to 8,937 million lire, have also been issued; and, between July 1, 1934, and March 31, 1938, advances from the Cassa Depositi e Prestiti increased by 6,507 million lire. These five items amount to about 29,300 million lire. The balance of some 7,000 millions was obtained from the sale of foreign securities compulsorily handed over to the Treasury; and by the issue of special 4 per cent. Treasury bonds and 10-lire State notes.

In addition to these measures to cover the deficits the market was called upon to satisfy other public demands for capital. According to the Finance Minister's estimate, some 6,700 million lire were required for land reclamation, electrification of the State railway, land improvement in Libya, hydro-electric development and similar enterprises subsidised, encouraged or guaranteed by the State. The Istituto per la Ricostruzione Industriale, which is now a permanent financial agency of the State, and the owner of several of the most important industrial concerns of the country, made, in 1937 and 1938, two bond issues of 900 millions each for the equipment of the Iri-Mare and Iri-Ferro. And this large public demand for new capital is wholly additional to the usual demand from private businesses and agriculture. Banks catering for short-term deposits increased their discounts and advances between August 31, 1936, and June 30, 1937, by 2,100 million lire to a total of 29,800 million lire.

No Inflation

Savings were sufficient to meet all these requirements, which amounted, during the three years and nine months between June 1, 1934, and March 31, 1938, to about 50,000 million lire. No recourse to inflation was needed. The note circulation was 16,296.5 million lire on December 31, 1935, 16,525.1 millions on December 31, 1936, 17,468.1 millions on December 31, 1937, and 16,279.7 millions on April 30, 1938.

Two items in the balance sheet of the Bank of Italy bear however, witness, of the pressure of public and semi-public requirements:—

	(Millions of lire)		
	Dec. 31, 1936	Dec. 31, 1937	Increase
Discounts	1,266.7	2,544.2	1,277.5
Advances	1,599.3	4,508.0	2,908.7
	2,866.0	7,052.2	4,186.2

(General Manager for British Isles)

2, 3 & 4 Cockspur Street, London, S.W.1

Advances made to subscribers to the compulsory 5 per cent. loans were the most important cause of these changes. By the end of 1937, the Bank of Italy had advanced for that purpose 255 million lire to banks, 869 millions to insurance institutions and companies and 428 millions directly to taxpayers. Moreover, banks and clients had asked for special advances of 2,027 millions (included in the 4,508 millions above), with 5 per cent. consols as collateral, and these were also due to the need for subscribing to the compulsory loan.

Certain general conclusions can be stated. The revenue of the four years, 1934-35 to 1937-38, can be estimated at 90,000 million lire. If we add to this figure, to cover deficit expenditure and semi-public subsidies or guarantees, a further sum of 49,000 million lire, we get a total of all expenditure (direct and indirect, current and capital) of 139,000 million lire. This works out at an annual average for the four years of just on 35,000 million lire, increasing, say, from 21,000 millions in 1934-35 to 40,000 millions in 1937-38.

Of present lire 40,000 millions are equivalent to about 24,000 millions of 1927 lire and about 6,400 millions of pre-war lire. This is more than the Italian taxpayer can bear; but Italian finance is probably moving towards an average ordinary Budget of 30,000 million lire. To reach this lower level will not be easy. But, meanwhile, savings should be sufficient to meet the further deficits which will be temporarily incurred.

The country's financial structure is becoming increasingly stabilised. There is, however, one precarious point in the structure. Of the assets of the Bank of Italy, amounting to 13,500 million lire, made up of discounts and advances, State securities, ordinary advances to the Treasury and advances to the Istituto per la Ricostruzione Industriale (which is State owned), some 80 per cent. is tied up, directly or indirectly, with the State or State agencies. How liquid are these assets? Great care is surely needed, on the part of the Finance Minister and the Government of the Bank, to avert the danger that they may become frozen.

Hungary

Dr Imrédy's Task

BUDAPEST, June 1.—Dr Imrédy has succeeded in forming a Government. In it there are at least two personalities who might have become Premier themselves, had they not preferred to serve under the former President of the National Bank in the strongest and most representative Cabinet Hungary has had since the war. It is generally believed that Dr Imrédy came at the right moment, when bold and active leadership was imperative to preserve law and order. His statement of policy was greeted with a jubilation almost unprecedented in Hungarian parliamentary history, and the Opposition were almost as eager to endorse his programme as the members of his own party.

It may be said without exaggeration that the tasks confronting the new Premier are stupendous, and Dr Imrédy is fully aware that without the faith of a Széchenyi and the iron hand of a Tisza he cannot succeed. He has to carry out a Five-Year Plan of re-armament and public works, and finance it entirely out of domestic resources, partly by taxation, partly by internal loans. The land hunger of the excited landless peasants must be satisfied; and the restriction of the number of Jews to 20 per cent. of the personnel in trade and industry and in the professions will be put in effect within the next five years. And, all the time, Hungary is vitally interested in the fate of Europe's minorities, since almost a third of the 12 million Hungarians live under Roumanian, Czechoslovak and Yugoslav sovereignty.

There will be no change in foreign policy. Dr Imrédy retained M. de Kánya as Foreign Minister, thus demonstrating that he wishes to maintain close and friendly relations with Italy and Germany, while seeking better relations with the States of the Little Entente. Dr Imrédy has also stated that all Hungarians welcome Great Britain's increased interest in Danubian affairs.

No Change in Financial Policy

Dr Imrédy made it clear that he does not want to resort to financial short cuts. There will be no inflation, and the monetary policy, which enabled Hungary to balance the Budget and resume the partial service on foreign debts, will be strictly maintained. The appointment of Dr Baranyai as President of the National Bank is particularly important. To

safeguard the financial and economic interests of the country, the Government has authorised the Presidents of the National Bank and the Central Banking Companies to exercise a power of veto over the appointments of presidents, general managers and managers of banks and insurance companies having a capital in excess of 3,000,000 pengő.

The 1938-39 Budget, which is now under discussion in Parliament, is the first balanced estimate which has been introduced to the House of Deputies since 1931, and is largely based on the actual results of 1936-37. It provides for an expenditure of 848.3 million pengő for administration proper, or 26.5 million pengő more than the estimate for the present fiscal year. Receipts are estimated at 878.5 millions, leaving a surplus of 30.2 million pengő, which would just cover the deficit on the State undertakings, whose expenditure is estimated at 486.6 million pengő, against a revenue of 456.5 millions.

In the first nine months of the current financial year, receipts (including the proceeds of the State undertakings) have exceeded the estimates for the next financial year, but owing to the economic recession caused by political uncertainties, a declining revenue must be expected in the second quarter of 1938. Dr Imrédy has announced, however, that the recession will not interfere with either the Five-Year plan or the service on the foreign debts. He estimated that there were sufficient reserves at the disposal of the Government to meet any shortage in budgetary receipts or in foreign exchange.

Poland

Polish Policy and Czechoslovakia

WARSAW, June 9.—If the Government-controlled Press accurately reflects the official attitude, the aim of Polish policy is to work for the break-up of Czechoslovakia by means of plebiscites, and to help in bringing about a separation of the Slovaks from the Czechs. This aim has been indicated for a long time by the officially-decreed friendship with Germany, by the close contact between the leaders of Poland and Hungary, and by the more recent flirtation with discontented Slovaks belonging to Father Hlinka's party. Whether or not these activities merely indicate that the Polish Government, regarding German expansion as inevitable, would prefer to see it directed towards South-Eastern Europe; whether the Government desires at any price to avoid trouble with Germany; or whether Czech tyranny and oppression are being "played up" to distract attention from the unrest within its own borders, are questions that cannot yet be clearly answered. But whatever the motive, the controlled Press and news services seem desperately eager to persuade public opinion that Czechoslovakia is in a hopeless position; that all the minorities there are living under a reign of terror; and that the recent calling up of reservists was solely because the civil authorities had lost control of the situation. In brief, the controlled Press here for several weeks has been working, unwittingly or otherwise, in close harmony with the German and Hungarian.

Opinion at large, however, seems fully alive to the dangers which the break-up of Czechoslovakia would hold for all the States lying to the east and south-east of that country. Most Poles who think for themselves seem to be in no doubt about the aims of Germany; and, while they rightly deplore the failure of the Czechoslovak Government to make an earnest effort amicably to settle the just grievances of the small Polish minority in the Teschen coal-mining district, they express the firmest opposition to the dismemberment of Czechoslovakia in order that Germany might be the chief beneficiary. Nor do they hesitate to express the view that within a fortnight of Czechoslovakia being "settled" the German minority in Poland might be used for precisely the same purpose as the German minority in Czechoslovakia is now being used. It seems probable, however, that until Herr Hitler disposes of Czechoslovakia (or breaks his neck in the attempt), and then decides what he intends to do about Soviet Russia, the policy of "friendship" between Poland and Germany will not undergo violent change. But there are many who feel that Hitler's task in Czechoslovakia has been made vastly more difficult, not by the apparent firmness recently displayed by the British and French Governments, but because the Japanese have allowed themselves to become "immobilised" in China, so that Soviet Russia could probably render valuable assistance to Czechoslovakia in case of war.

Economic Improvement Halted

After three years of slow but continuous improvement, which brought the index of industrial production in March to within 5 per cent. of the 1928 level, the economic recovery seems to have stalled. The supposition that Polish economy had been largely freed from external influences is now increasingly felt to have been ill-founded, and a leading economist recently wrote: "It is now time to think of preventing a new economic crisis in 1939, or at the latest in 1940." The opinion was expressed that, if the "recession" in the United States has not yet been widely felt in Europe, "it is only because the gigantic armament programmes have artificially stimulated the economic life of many countries."

It is hardly to be doubted that the armament and public works programmes have been primarily responsible for the economic recovery in Poland since 1935, and that the financial resources on which these programmes have so far been based cannot support their indefinite continuance. Sales to Spain, for instance, which were extensive in 1936 and 1937, and paid for mostly in gold, have now practically ceased, while the income from the French credits arranged for in December, 1936, has been much diluted because of franc depreciation. Nor can further help be expected from exchange restrictions, external debt conversions, and the lowering of interest rates on foreign bonds; while the capacity of the internal market to finance public expenditure and industrial development has been fully measured.

Devaluation Discussed

The step mainly discussed so far for "preventing a new economic crisis" which might have serious political repercussions is currency devaluation. It has long been evident that the zloty is much overvalued, and there is now a growing feeling among industrial leaders—and especially those who are mainly concerned with exports—that the "plunge" should be taken while commodity prices are falling, so that the effect of devaluation on the internal price structure might pass without violent reaction—as was the experience of "the sterling bloc" in 1931. Conditions are held to be similar now to those prevailing in 1931, when the zloty ought to have been devalued but was not. It is not likely, however, that it will be "re-aligned" until it becomes certain that the recovery movement has gone into reverse.

The foreign trade returns are now making a poor showing, the figures as published being as follows:—

	Exports	Imports	Surplus of Exports (+) or Imports (—)
	(In millions of zlotys)		
First four months, 1937 ...	400	391	+ 9
First four months, 1938 ...	372	450	— 78

Part of this year's import surplus, however, is covered by the liquidation of German indebtedness for railway transit across Pomorze. Current indebtedness on this account is now being met mainly in merchandise owing to Germany's lack of foreign exchange.

Turkey

Changing Trade Trends

ISTANBUL, May 24.—Although the economic situation is, on the whole, satisfactory, the effects of the general slackening of trade abroad have already been felt on Turkish foreign trade since the beginning of the current year. In January and February an increase in imports was not balanced by a corresponding increase in Turkish exports which, in fact, fell slightly below the level of the same period last year. The surplus of exports in the first two months has fallen from £T15,507,000 in 1937 to £T1,961,000 this year.

Germany's purchases fell from £T16,809,000 to £T10,374,000; while Turkey increased her imports from that country in order to diminish further the amount due under the Turco-German clearing agreement. Sales to countries other than Germany increased from £T10,150,000 to £T12,654,000. Exports to Italy were valued at £T3,665,000. Imports from countries other than Germany increased more rapidly still, from £T6,276,000 to £T13,388,000, the main suppliers being the United States, Great Britain and Soviet Russia.

The balance of trade with the United States, which had always been active in previous years, became passive. Turkey, who had always considered American trade as a source of free foreign exchange, now found herself compelled to draw on her foreign exchange resources to pay for American goods.

During the whole export season from August, 1937, to February, 1938, exports rose from £T98,476,000 in the corresponding period the year before to £T99,171,000. But, while tobacco exports increased from £T20,077,000 to £T41,148,000, those of all the other main staples, except barley and chrome ore, fell substantially. Tobacco, in fact, represented well over 40 per cent. of total Turkish exports.

There seems to have been some progress in the export of ores, but the quantities involved are still too small to play any outstanding part in the Turkish balance of trade. Next to chrome ore, antimony, lead and zinc ores gained in importance. State receipts have run steadily above the estimated figures, which has encouraged the Government to reduce the rate of various taxes, including, particularly, the income tax, and to lower the price of certain monopolised products. The new Budget for 1938-39 has been fixed at £T249,954,020 against £T231,017,776 for the current year. The Budget is to be entirely covered by ordinary revenue estimated at £T250,049,000.

Japan

War Economy

TOKYO, May 10.—The Government is taking active measures to finance enormous war expenditure without inviting rapid inflation, and also to preserve all essential resources for the services. A new department has been added to the Treasury to conduct a nation-wide saving campaign to neutralise the inflationary influence of Government spending on such a vast scale. No more materials have been added to the list of fixed maximum prices, which now includes crude rubber, raw cotton, cotton yarn, and bleached cotton tissues: but national and provincial committees have been appointed to prevent unreasonable inflation, and to keep an eye on profiteering. A Commodity Regulation Board has also been formed to be a bureau of economic intelligence and research on the supply of essential commodities, and to prepare schemes for controlling and safeguarding supplies.

The consumption of several more commodities has been regulated since the beginning of May. Rationing, which began with crude rubber and cotton yarn, has been extended to crude oil and petrol. The use of copper has been more widely restricted, including copper alloys, and the manufacture of about 40 articles in cast iron, ranging from poles and fences to ash-trays, has been prohibited or restricted. The list of materials whose consumption is regulated now includes raw cotton, raw wool, steel ingots, cast iron, gold, platinum, copper, lead, spelter, tin, brass, nickel, and antimony, besides those under the rationing scheme.

Capital for Munitions

Capital is being increasingly diverted to war industries. According to the quarterly report of the Treasury, new capital authorised by the Capital Adjustment Committee during the first three months of this year amounted to 645.6 million yen. Of this total, 457 million yen, or 70.8 per cent., was allotted to ancillary processes and services involved in munition production for the re-equipment and extension of capacity. In the preceding quarter, the amount rationed to war industries was 773.7 million yen out of 1,301 million yen sanctioned, or only 59.5 per cent. of the total.

The official gold purchase price was raised on May 2nd from 3.77 yen to 3.85 yen per gramme. This increase has removed the margin which had existed between the official price and the international market quotation. The higher purchase price will undoubtedly stimulate the gold-mining industry. It is expected that the objective of a yearly output of 500 million yen will be achieved by 1942, when the Five Year Plan for gold will expire.

After a consistent rise for five consecutive months since November last, the index number of wholesale prices prepared by the Tokyo Chamber of Commerce registered a fall of 0.4 per cent. in April; but it was still 13.8 per cent. higher than in April, 1937. On the other hand, April witnessed a continuance of the upward trend in the cost of living.

Letters to the Editor

Germany's Oil Supplies

TO THE EDITOR OF THE ECONOMIST

SIR,—I have read with interest the article on the above subject in your issue of May 28th. I think the writer would have been nearer the mark had he dealt with the horse-power available to Germany and not merely with her oil supplies.

Your contributor calculates that, by 1939, Germany should have 3,500,000 tons of oil available from all indigenous materials. While he takes count of the hydrogenation systems of production, he does not specify any amount of oil obtained from low-temperature carbonisation. Still more significant is his omission of power derived from the use of solid fuels. It is well known that the German Government offers a £50 grant in respect of every commercial vehicle fitted to run on producer gas derived from anthracites, lignites or smokeless coals; and that thousands of vehicles and tractors are running on this power.

A low-temperature carbonisation plant using 500 tons of coal per day can produce sufficient smokeless fuel per annum to give equivalent h.p. to 14 million gallons (or 62,500 tons) of petrol; and this in addition to a considerable quantity of oil. A couple of dozen low-temperature plants can, therefore, make the very useful equivalent h.p. of 1,500,000 tons of petrol per annum—more than enough to move all Germany's agricultural tractors and food transport, without even calling upon her oil supplies at all. And a low-temperature plant costs £200,000 to erect against £6,000,000 for one hydrogenation plant.

producer gas derived from anthracites, lignites and smokeless coals has as yet scarcely come under this heading is suggested by the fact that, in spite of the £50 grant which is made, the use of producer gas vehicles has so far progressed very little. Vehicles using this fuel are an insignificant proportion of the total number of vehicles in use; there were only 1,000 lorries out of 322,000 last year. Similarly, the oil obtained by low-temperature carbonisation did not appear to be sufficient in quantity to be included in our article. It may be estimated, however, that production was in the neighbourhood of 25,000 tons in 1936 and 40,000 tons in 1937. Oil produced in this way, however, is only a by-product of the manufacture of smokeless fuel; and that fact would seem to render it unsuitable as a significant contribution to Germany's total oil supplies.—Ed., *Econ.*]

An Anglo-German Clearing?

TO THE EDITOR OF THE ECONOMIST

SIR,—In connection with the threatened default on Austrian loans the old suggestions about the establishment of a compulsory clearing with Germany have been once more revived. But the time when Germany was genuinely afraid of a clearing agreement is long past. Experience has taught her, as well as the countries with which Germany is in clearing relationship: (a) that the balance of trade of a country is not an immutable magnitude; (b) that it would be much easier for a country whose foreign trade is centrally controlled to steal a march in influencing foreign trade relationships on a country where foreign commerce is still conducted by and at the risk of individuals.

The assumption is more than justified that the institution of a compulsory clearing *alone* would immediately lead to the disappearance of the favourable balance of trade of this country with Germany, either by Germany increasing her imports from us (especially of semi-manufactured or raw materials) or by ceasing to keep up her exports. In view of the necessity to offset the present over-valuation of the mark at the former parity by special measures, German exports could be influenced promptly and effectively. If, therefore, this country wishes to collect the service of its loans to Germany, very much more thorough methods of control of foreign trade are necessary than is usually supposed. One of the possibilities is to try to levy a duty on German exports to this country and to institute export licences. As Germany's trade with the Empire outside of this country is unfavourable, and as commodity prices are falling and force the producers to look for potential outlets, the problem is undoubtedly very difficult.

Conversely, Germany needs the imports, which she still takes, very urgently, and may be brought to reason if the measures adopted are stringent. It would be a dangerous mistake to suppose, however, that compulsory clearing is by itself a satisfactory solution to the problem.

Yours, etc.,

T. BALOGH.

War Loan Dividend

TO THE EDITOR OF THE ECONOMIST

SIR,—With reference to your comments of June 4th on the War Loan dividend (on pages 545 and 546), may I suggest that one possible cause of the failure of bankers' deposits to reflect the full payment of the War Loan dividend may have been due to the incidence of Treasury bill maturities and payments. In this connection, it is possible that the publication of the return of the Bank of England on Mondays, instead of on Thursdays, would assist in affording understanding of a situation created by offering Treasury bills for payment as desired during the ensuing week.

The Bank Charter Act, 1844, provides that the Bank of England issue a return weekly "on some day in every week to be fixed by the Commissioners of Stamps and Taxes."

In 1844, there was probably a very good reason for appointing the Commissioner of Stamps and Taxes as arbitrator, but, whatever the reason, it is obvious that, under existing circumstances, the alteration of the date of publication would enable a less confusing return to be presented.

Yours faithfully,

Belmont.

S. S. JOHNSON.

Books and Publications

Economics Through the Ages

THIS book* is welcome at the present time. We need to take stock of the position of economic theory after some years of controversy, and to set it in the long perspective of its history. It is Professor Roll's object to provide this historical background. He traces the evolution of economic doctrine from its appearance in the Old Testament down to modern times; and, at the same time, he endeavours to show the relation of economics at successive stages of its development to the economic, political and social structure of the age.

Wisely refusing to attempt to deal with every recognised contributor to economic controversy, Professor Roll has boldly limited his study to a comparatively few writers. His choice has been determined "by two considerations. First, apart from the most outstanding economists of the past, only those have been included whose contributions to economic thought appear to have significance in relation to present-day theory and controversy. Secondly, stress has been laid both on writers and views which exemplify most clearly different trends of thought."

This basis of selection results in Petty's receiving more ample treatment than the Physiocrats, and nearly as much as Locke, North, Law, Hume, Cantillon and Steuart put together. Although it means that some familiar names are hardly mentioned, the method justifies itself by the extent to which it allows of an adequate discussion of some writers who have received less than their due from former historians; and by the consistency of approach to every phase of economic thought which is maintained throughout the book.

Purely technical developments receive comparatively little attention, for Professor Roll is concerned primarily with the normative quality of theory, and he has heterodox views. He regards any formulation of theory as possessing two aspects, apologetic and critical. It represents advocacy of one state of affairs and criticism of alternative or opposing systems. At the same time, there are to be found in each theory certain elements that constitute the basis of the controverting view, for "every ideology contains antithetical elements precisely because it has to include the aspirations of the exploited classes."

Thus Marx is in the classical tradition, though he erected upon Smith's and Ricardo's apologetic for *laissez-faire* capitalism the most powerful criticism of that system yet put forward.

The claim of the utility schools of economic thought that, by enunciating propositions professedly of universal validity, they have removed any apologetic character from economics, is, accordingly, rejected. Professor Roll argues, indeed, that the very attempt to maintain "neutrality" has already resulted in a degree of formalism which has seriously reduced the authority of the science and put it "in great danger of becoming a plaything of demagogues."

This insistence on the social reference of economic doctrine ensures a careful and sympathetic treatment of those schools of thought consciously based on a social or political philosophy. We find valuable discussions of the German Romantics, of the non-Utopian Socialists, of the early nineteenth century, and of the Historical school. There are certain omissions; although Bentham was not a professional economist, he had shrewd things to say on topics relating to "present-day theory and controversy," and is not quite fairly served by references to his influence on less seminal—if more celebrated—minds. And it would be interesting to trace parallels between Gentz or Müller and our later English romantic, Ruskin.

Enough has, perhaps, been said to make it plain that this book is as stimulating as anything that the author has yet given us. For the most part, it is concise and clear. The chapters on Commercial Capitalism and Marx could hardly be bettered in a work on this scale. The book as a whole will

* "A History of Economic Thought." By Erich Roll. Faber and Faber. 430 pages. 12s. 6d. net.

be read with profit (if not always with ease) by the intelligent layman. To the student it is likely to become a standard work of considerable value, in spite of Professor Roll's unorthodox prepossessions.

Shorter Notice

"The Men Who Defend Us." By Commander Russell Grenfell. Eyre and Spottiswoode. 291 pages. 9s.

"Good men with poor ships are better than poor men with good ships." Admiral Mahan's dictum takes on a disturbing significance in the light of Commander Grenfell's vigorous onslaught upon the inadequate payment and terms of service accorded to our three fighting services. This is no mere polemic. The facts of service pay are set out, over the last hundred years, against the movements of wages in civil occupations and of salaries and pensions in other Government employment. The case Commander Grenfell makes is strong and very disquieting. He exposes the fallacies of the Anderson Committee's arguments for pay cuts in 1931, and concludes that "if the country wants officers and men who are not only men of war but masters of war it must pay the price." Commander Grenfell is clearly partisan and not always judicial, but recent improvements in Service pay and conditions have not fundamentally weakened the force of his indictment.

THE BUSINESS WORLD

Germany and Austria's Debt

ON March 13th, after the entry of the German Reichswehr into Austria had cleared the way for the *Anschluss* and for Herr Hitler's triumphal journey to Vienna, the prices of Austrian Government loans in London reached default levels. On Wednesday last week an official British Treasury statement declared that discussion between German and British delegations in Berlin had disclosed no possibility of reconciling the views of the two parties on the question of Austrian loans. Last Monday the trustees of the Austrian International Guaranteed Loan, 1933-53, and the Guaranteed Conversion Loan, 1934-59, announced that no part of the monthly instalment of the service of either loan, due on June 1st, had been provided. Next day the Bank for International Settlements made a similar announcement regarding the International Loan of 1930. Although last week's statement by the Treasury spoke merely of "interrupted" negotiations, which were to be "continued after Whitsun," no announcement of their resumption has yet been given; but a meeting of representatives from countries which guaranteed Austrian loans was held in London on Thursday, to explore the possibility of reaching a united front before the resumption of discussions in Berlin.

London financial circles have evinced deep resentment at the implied decision of the German Government to make default a *jait accompli* as a prelude to further discussion. The Association of British Chambers of Commerce, in a strongly worded letter to the Chancellor of the Exchequer, has assured the British authorities of support if firm measures are deemed necessary to meet the situation. Meanwhile, as will be seen by a glance at the following table of prices, the 7 per cent. sterling bonds of the 1930 loan have fallen this year by 72½ points, and the 4½ per cent. sterling bonds, 1934-59 (of which the British Government is a guarantor as to 24½ per cent.) by 34½ points. Only the 3 per cent. sterling bonds, 1933-53 (which, being fully

guaranteed by the British Government, enjoy gilt-edged security) have maintained their value this year.

AUSTRIAN BOND PRICES

	Issue Price	1930-37		End 1937	Mar. 13, 1938	June 9, 1938
		High	Low			
7% International Loan	95	105½	25½	103	44	30½
3% Guaranteed Loan, 1933-53 ...	96	104½	97	102	101½	102
4½% Guaranteed Loan, 1934-59	98½	101¾	76½	86½	54	52

In view of the week's events, indeed, bondholders may have regretted the natural reluctance of the British Treasury to dilate upon the reasons for the suspension of discussions which, in theory at least, were merely adjourned. In the absence of any authoritative explanation of the views which were found irreconcilable, different versions of their character have been current in Berlin and London. In usually well-informed quarters in the former centre, it has been suggested that the chief difficulties were political rather than financial; that the German Government took its stand, not on difficulties of transfer, but on a refusal to recognise any liability whatever for the obligations of the defunct Austrian State. In London, however, it is understood that the discussion turned on the extent of future payments rather than on questions of political status. The British representatives, arguing from the fact that Austria, before the *Anschluss*, was able to meet the service of her external debts and to give almost complete freedom for dealings in foreign exchange, maintained that the German Government should use its power to permit the transfer of full interest service on the Austrian Loans, in the same way as she already uses it in the case of the Dawes and Young Loans. This demand, however (according to unofficial London reports of what transpired behind closed doors), was met by the reply that Austria had been

AUSTRIAN LOANS: A SUMMARY

relegated to the position of a German *land* or province, and that the Reich had consequently no more responsibility for its external obligations than for those, say, of Westphalia. The correct procedure, therefore, was for payment to be made to the *Konversionskasse* in blocked marks. The British representatives, however, stood firm, and a concession was thereupon forthcoming (it is said) from the German side, under which 50 per cent. of the service of the Austrian Loans was offered in foreign exchange and the remainder in blocked marks. The British delegation, however, refused to accept the transfer of less than 100 per cent, and there the negotiations terminated for the time being.

If this version of events is the more correct there will be general sympathy in this country with the attitude of the British delegation; and a widespread desire that, when negotiations are resumed, the Treasury will maintain, with the utmost firmness, its view that they involve a question of fundamental principle, not of barter. The German Government, in possession of the assets of the former Austrian State and its National Bank, has obviously the wherewithal, if it so chooses, to continue those payments which Austria had proved her ability to transfer without straining her economic structure. To put Austrian Loans on the same footing as German provincial debts ignores certain considerations which are basic to the whole issue. These loans were not contracted lightly in a period of prosperity, when optimism ruled both borrowers and lenders. Nor were they expended prodigally, in ways which increased the borrower's amenities without contributing to the future service of the loans. They were an indispensable part of a considered, comprehensive and successful inter-

national effort to rehabilitate post-war Austria. As will be seen from the summary table on the opposite page, they had specific Austrian revenues hypothecated to them, and these much more than covered their service requirements. They were all issued in financial centres in many countries, and two of those which are now outstanding carried the guarantee of a number of outside Governments. Their proceeds are represented by solid and enduring assets, which have increased, and will continue to increase, the national income of the former Austrian territory.

Thus political, financial and equitable considerations combine to support the refusal of the British authorities to be satisfied with anything short of complete recognition by Austria's successor-in-title of her obligations towards Austria's bondholders; and to urge that, if need be, the Government should enforce its just claim by a termination of the agreement of 1934, under which all Anglo-German payments are now regulated, and by resort to a system of exchange clearing. A creditor who refuses to compromise with any action savouring of fraudulent bankruptcy protects, not merely his own interests, but those of all other creditors. Questions of the loss which would fall on the British taxpayer in the event of continued default are irrelevant to the main issue. Britain, as the world's most important foreign lender, has a long tradition of sympathy with the difficulties of an impoverished but honest debtor, and, equally, of repugnance to the employment of default as a weapon of high policy. And never, in the chequered history of foreign borrowing, has a clearer case arisen for the maintenance of the principle, basic to all international financial relations, that payment should follow ability to pay.

The Rupee's Weakness

FROM time to time during the past two months we have commented upon the growing weakness of the rupee. The latter's quotation, which has stood consistently at 1s. 6½d. for several years, has fallen away since the end of March, and early this week was no better than 1s. 5¼d. The Indian Reserve Bank is bound by law to buy rupees without limit at a rate of 1s. 5¼d., and the present rate is close upon that limit. Furthermore, until recently the Reserve Bank was able to meet Government's sterling requirements by buying sterling tendered to it each week at a rate of 1s. 6½d. In the middle of April, offerings of sterling at that rate ceased to be made. On April 20th the Reserve Bank rejected an offer at a rate of 1s. 6d. Since then it has endeavoured to obtain sterling by offering to buy without limit at a tap rate, initially fixed at 1s. 6¾d. This attempt has proved abortive, and the market rate for sterling has consequently fallen to its present level, while the Reserve Bank is being compelled to draw upon its own resources to meet the sterling requirements of the Indian authorities.

This weakness of the rupee derives, at bottom, from the fact that India is a primary producing country, which is sharing in the common troubles brought upon all primary producers by the recession in world prices. Her experience resembles that of Australia and Argentina, for example, inasmuch as her exports have been dwindling during recent months, both in volume and value, while her imports continue to reflect orders placed during the period of relative prosperity which lasted until the middle of last year. The result is that, temporarily at least, she has acquired a passive in place of her normal active balance. This is shown in the table opposite, covering quarterly periods since the middle of 1936.

The figures given in this table are not strictly comparable; for before April, 1937, Burma's trade was included in the Indian returns. Its subsequent exclusion has made the deterioration in India's case appear worse on paper than in reality, since Burma enjoys an active trade balance. Nevertheless, the table not only shows how India's active

INDIA'S TRADE AND TREASURE (in million rupees)

* January and February only.

trade balance has disappeared—entirely because imports have continued to grow while exports have been shrinking; it also demonstrates that while India is able to buy less silver, she is also selling much less gold. The result is that her final balance, derived from movements of goods and treasure, has shrunk to negligible dimensions.

These facts are of primary importance, since India has large remittances to make abroad each year. Prominent among these are the remittances made to London by the Government of India to provide for administration expenses in London and also for the service of India's sterling debt. The total cost to India under these heads varies from year to year, but may be taken as being approximately £30 millions sterling—equal to 400 million rupees a year, or an average of 100 million rupees a quarter. Reference to the preceding table shows that India's net exports of goods and treasure were sufficient to cover this requirement up to and including the third quarter of 1937, but since then they have failed to do so. As a minor aggravation of India's difficulties, it so happens that, owing to the recent constitutional changes, the family pension funds of the Indian Civil Service are being transferred from India to London.

This entailed an additional remittance of about £3,000,000 for the financial year to March 31, 1938, and will need nearly twice as much in the current financial year.

There is one further though more imponderable factor in the Reserve Bank's recent difficulties in obtaining sterling. For the twenty years preceding the war the rupee was fixed at 1s. 4d., and in spite of all subsequent vicissitudes there still remains an almost fanatical devotion in some sections of the community to the pre-war figure. Working in the same direction are the familiar arguments of those who believe that India would benefit from a moderate depreciation of her currency. Thus a not inconsiderable number of people have no particular desire to see the present one-and-sixpenny value of the rupee maintained.

The indications suggest, altogether, that before long the Reserve Bank may be forced to carry out its statutory duty of holding the rupee at its bottom limit of 1s. 5½d.; and in any case the Bank is already having to provide Government with its sterling requirements. In colloquial metaphor, the Reserve Bank may have no choice but to live on its own fat—possibly for the duration of the present world recession, and certainly until India's imports fall below the level established during her recent period of prosperity. This possibility raises the two vital questions: What is the magnitude of the Reserve Bank's sterling resources? And how long are they likely to last?

The following table throws some light on these questions. It shows the Reserve Bank's gold and sterling resources, and also its outside liabilities a year ago and to-day:—

	(In million Rupees)		
	May 28, 1937	May 27, 1938	Intervening Change
Gold	445	444	— 1
Balances abroad	245	20	— 225
Sterling securities	803	788	— 15
Total	1,493	1,252	— 241
Note circulation	1,902	1,802	— 100
Deposits—Govt.	113	194	+ 81
Bankers ...	267	145	— 122
Total	2,282	2,141	— 141

The Bank has lost during the past year some 240 million rupees out of its sterling resources, but its gold is practically intact. Simultaneously, there has been a contraction of 141 million rupees in its outside liabilities, which has offset to a limited extent the effect of its sterling losses. In any case, however, the Reserve Bank could lose considerably

more sterling before the gold and sterling cover to its note issue began to approach the statutory minimum of 40 per cent. In case of need, it could even allow the minimum to fall below 40 per cent. on payment of a tax to Government. There would, however, be grave psychological arguments against such a course—particularly in a country which has still to learn the uses and advantages of a modern banking system.

To-day, even the normal 40 per cent. limit is still distant, and there is little doubt that the Reserve Bank could continue to meet all likely requirements out of its resources for at least the next two years. Moreover, if the recession continues for so long, certain correctives will automatically begin to function. General impoverishment will alone be sufficient to compel India to curtail still further her silver imports, and, probably, to realise yet more of her gold hoards, which are still enormous. Even the present limited depreciation of the rupee will, in conjunction with the simultaneous slight depreciation of the pound, raise the rupee price of gold and thereby provide a stimulus to fresh sales of the metal.

The most immediate danger of the rupee's present weakness is that it may be a temptation to the Indian authorities to endeavour to correct it by traditional methods, involving higher interest rates or a restriction of credit at home. So far there is no sign of any such inclination on their part. It is important to remember, however, in this connection, that exchange weakness is only one of numerous problems created for India by the world recession. Some responsibility for the widespread attention which has been drawn to the present weakness of the rupee must, indeed, be attributed to the Reserve Bank's policy of maintaining a fixed rate for the rupee, without permitting even a variation of ½d. If the rate had been allowed to vary within the statutory limits of 1s. 5½d. and 1s. 6¾d., the present weakness would have excited much less comment. It is the more necessary, therefore, that there should be widespread realisation of the fact that the future of the rupee need occasion no serious anxiety. India passed through many similar periods of temporary disequilibrium before the Reserve Bank was established. The Reserve Bank possesses ample resources and has publicly stated, this week, its determination to fulfil its statutory obligations. The Indian authorities will doubtless consider that the fundamental objective of their policy, after all is to maintain and develop Indian production, consumption and purchasing power. Their success, in the long run, will be the best guarantee of the maintenance of the rupee's exchange value.

Cotton Textile Wages

THE cotton industry has relapsed yet again into severe depression. Over 40 per cent. of Lancashire's cotton machinery is idle; and 25 per cent. of insured spinners and weavers in the industry are out of work. These facts attest the urgency of the efforts now being made to secure a much overdue reorganisation of the industry's scope and status. The Cotton Spinning Industry Act of 1936 has effected some reduction in surplus spindles, but elsewhere in the industry, the Government's proposed Enabling Bill to reduce surplus capacity, to prevent undue competition and to regulate production and sales remains a subject of fierce controversy. Meanwhile, declining world demand for cotton goods combines with the inroads of Japanese and Indian manufacturers to curtail Lancashire's exports.

Against this gloomy background, what are the operatives' prospects of securing the improvements they are seeking in wages and working conditions? On the rising market of recent years, both spinners and weavers made appreciable headway. In December, 1936, the spinners obtained an increase of 9.5 per cent. on the standard piece-lists, equivalent to an advance of 5.63 per cent. in current wages. In April, 1937, weavers secured an increase of 7.3 per cent. in wages. But the spinners' original demand was for the restoration of the cuts made in 1932, or an advance of 14 per cent.; and the weavers asked for an increase of 15 per cent. and a minimum wage. These claims are still

outstanding; and the provision of holidays with pay, approved in principle by the employers, has been postponed.

Moreover, the average level of wages in the cotton industry is still far below that of industry in general. An investigation, conducted by the Ministry of Labour, into average weekly earnings in various industries on October 12, 1935, showed the following differences between earnings in cotton and other industries:—

	Numbers employed by firms who made returns	AVERAGE WEEKLY EARNINGS					
		Average earnings in week ended October 12, 1935					
		All work-people	Men (21 and over)	Youths and boys (under 21)	Women (18 and over)	Girls (under 18)	
Cotton spinning, carding & doubling (including thread manufacture) ...	148,119	s. d. 32 6	s. d. 49 6	s. d. 18 7	s. d. 27 6	s. d. 16 7	
Cotton weaving ...	111,938	35 6	49 10	19 9	30 8	16 7	
Cotton spinning and weaving (not separately distinguished) ...	56,002	33 0	49 4	20 3	28 6	15 8	
Other cotton ...	6,820	32 11	59 1	23 6	28 6	17 3	
All Cotton ...	322,879	33 8	49 9	19 1	28 8	16 6	
All industries investigated ...	5,507,729	48 11	64 6	23 0	31 3	16 4	

The high proportion of women and juveniles employed in the industry affords a partial, but only a partial, explanation of its low wage standards. In spinning, women constitute some 60 per cent. of the operatives, and in weaving 68 per cent.; and over a quarter of the women employed are married. But international competitive factors also clearly come into the equation. Under the changed conditions of the present time, the industry's organisation still approximates closely to that of its vanished heyday.

Finally, the mechanical operations involved in spinning and weaving dictate the character and, to some extent, the amount of the operatives' remuneration. Spinners and weavers are paid at piece rates according to the output of the machines they operate. In mule spinning, for instance, weekly earnings are determined, in the first place, not for individual operatives, but for the full team of workers engaged on a pair of mules: usually three—a minder, a big piecer and a little piecer.* The total sum is divided between these workers in proportions determined by agreement. In 1932, full-time weekly earnings in various districts were divided as follows:—

1932	Earnings of pair of Mules	Divided as below		
		Minder	Big Piecer	Little Piecer
	s. d.	s. d.	s. d.	s. d.
Oldham	132 6	75 9	33 0	23 9
Rochdale	149 10	87 0	36 4	26 6
Bolton	129 4	85 3	27 9	16 4
Stockport	138 0	81 9	32 5	23 10

Thus, though earnings in spinning run on the average at about the same level as in the other sections of the cotton industry, there are wide differences within the section itself. Minders are highly paid, compared with other adult males in the industry or, indeed, in many other occupations. Piecers and ring spinners (mostly women) are poorly paid.

In weaving, too, there are marked divergences in wages.† According to a census taken by the Amalgamated Weavers' Association in June, 1937 (which covered 39 per cent. of Lancashire's weaving operatives), average weekly earnings for adult male workers using five or fewer looms were £1 19s. For those operating six looms, earnings were £2 6s. 8½d., or 17 per cent. more; and for those employed on more than six looms they were £3 3s. 11½d., or 60 per cent. more. Rather less than 15½ per cent. of weavers operated six or more looms. The discrepancy between the earnings of these groups of operatives cannot be simply put down to differences in work done or skill required. It is attributed, by fairly general consent, rather to deliberate intention in the drawing up of the new Uniform List of piece rates in 1935 under the Cotton Manufacturing (Temporary Provisions) Act of 1934. Wage rates for weavers on five or fewer looms were then lowered by 6 per cent. Wage rates for weavers on six looms (which were already higher) were increased by 4 per cent., and a minimum weekly wage of £2 11s. 6d. plus a piece rate was established, for a 48-hour week. The object was to check the "more-looms" movement, to which a majority of employers was opposed, while the operatives feared that its adoption would involve serious labour displacement.

Differences between the earnings of male and female weavers, in general, are particularly noticeable in Lancashire, where men and women often work together at similar tasks. The average weekly earnings of all fully employed adult males on ordinary (non-automatic) looms in June, 1937, were £2 1s. 10d., while for fully employed adult females they were only £1 16s. 7d. Women, admittedly, have the alternative or supplementary occupation of marriage, and are less well fitted than men for physical strain. But, what is more to the point in this context, they are also less completely organised and less well protected by negotiation machinery.

* "Wages and Labour in Cotton Spinning." By J. Jewkes and E. M. Gray (Manchester University Press).

† "The Weaver's Wage." By E. M. Gray (Manchester University Press).

Labour's current objective, however, is not to remove these differences, but, in the first instance, to secure a minimum wage of 35s. a week for men and women weavers. At present, 9 per cent. of the adult males in weaving in Lancashire and 22 per cent. of the adult females earn less than 30s. a week, even when working their full complement of looms; and underemployment caused by the shutting-down of looms seriously reduces the earnings of weavers. The concession of the higher minimum would affect 47 per cent. of Lancashire's weavers, and would entail an addition of some 7 per cent. to the wages bill. The cotton industry, oversized, underemployed, disorganised and depressed, cannot now afford this additional cost; yet the claim is, *a priori*, reasonable.

That depression has done much to increase the tension between employers and employed in the cotton industry seems indisputable. Negotiations are conducted by methods of long standing. In the past these worked well, but during the industry's decline they began to run less and less smoothly, until in 1934 only statutory intervention saved the principle of collective bargaining. Wage rates for both weavers and spinners are determined by lists of piece-work prices agreed by employers' associations and trade unions. In spinning, the Federation of Master Cotton Spinners' Associations negotiates with two unions: the Amalgamated Association of Operative Cotton Spinners and Twiners and the Amalgamated Association of Card and Blowing Room Operatives. In weaving, the Cotton Spinners' and Manufacturers' Association is confronted on the men's side by the Amalgamated Weavers' Association. None of these bodies is comprehensive, or able in times of stress to enforce its agreements generally.

The piece lists for weaving, which were superseded in 1935 by the new Uniform List, went back in origin to the fifties of last century. In spinning, the lists and conciliation arrangements date back to the famous Brooklands Agreement of 1893, which was not superseded until 1913, when the lists of standard piece prices still the basis were promulgated. Traditionally, changes in wage rates have been effected by negotiations to secure percentage additions

Some phrases seldom ring true

"It gives me great pleasure"

but

YOU CAN BE

or reductions on the list prices. In 1933-34, however, undercutting in wages threatened to be fatal to collective agreements, and the Cotton Manufacturing (Temporary Provisions) Act of 1934 was passed, to give the Minister of Labour power to give legal force by Order to collective agreements, and so to compel the adherence of reluctant minorities. On July 15, 1935, the new Uniform List for weaving was legalised, involving some reductions in earnings. In April, 1937, agreements for spinning and weaving came into force, securing the first all-round increase in spinning and weaving wages for 16 years.

In the past two years agreements under the Act have saved the industry from chaos in its industrial relations. But strikes were only narrowly averted in 1935 and 1936. Last year's wage advances were achieved on the rising tide of recovery. The old gaps and starting holes in the industry's methods of negotiation have not been wholly blocked. The need to make wage agreements previously negotiated legally binding on all parties is still urgent.

What, then, is the present position? In general, the future of wages in both sections cannot be separated from the industry's ability, on the one hand, to take advantage of up-to-date methods of manufacture, and, on the other,

to cut its own coat (in the shape of its resources of plant and men) according to the world's diminished demand for British cloth. In weaving, labour problems are intimately connected with the movement to introduce the system of working more than five looms by one weaver. In spinning, the substitution of high-draft spinning and ring-spinning for the traditional method of mule spinning is similarly important in any estimate of the operatives' future prospects. In the short view, these innovations, if accelerated, must lead to technological unemployment, which the new diversification of industry in Lancashire (where 80 per cent. of the cotton industry is situated) cannot meet by the provision of fresh openings. In the long run, however, the new, compact, efficient and scaled-down industry, which alone can make profits in cotton manufacture, cannot be created without the fullest use of modern technical methods. On this showing the immediate outlook for the British cotton industry is hardly promising. Internal organisation may do something to restore its profitability, by increasing efficiency in production and marketing. But the industry can survive to supply its workers, managers and investors with adequate remuneration only by accepting a future of limited markets.

Finance and Banking

The War Loan Dividend.—The floating debt and Bank returns published this week have completely substantiated *The Economist's* forecast, made three weeks ago, that the Exchange Account's surplus cash, obtained from the French repatriations, would be used to pay the War Loan dividend, the Account receiving tap Treasury bills in exchange. Last week the Bank return was obscured by the fact that on June 1st the encashment of the War Loan dividend warrants was incomplete, while public deposits were still inflated through the fact that there were no Treasury bill maturities on Monday or Tuesday. This week's return tells a different story. Public deposits are reduced from £24.9 millions to the normal level of £11.7 millions, while bankers' deposits have risen to £111.1 millions. Meanwhile, the floating debt return for June 4th shows during the preceding week increases of £27 millions in "tap" Treasury bills and approximately £3 millions in Ways and Means advances from public departments. These are sufficient to finance the bulk of the War Loan dividend payment. Taking all these movements together, our forecast of the part played by the Exchange Account is completely substantiated. Its surplus cash has now been returned to the banking system in the form of the War Loan dividend. It only remains to add that as the War Loan dividend payment is eventually made good out of revenue, the consequent reduction in the floating debt will fall on tender issues of Treasury bills and not on the tap bills which have just been taken up by the Exchange Account.

Netherlands Bank Report.—In the Netherlands Bank report for 1937, the President, Dr Trip, submits the so-called "new gold standard" to critical scrutiny, and compares it, much to its disadvantage, with the gold standard in its orthodox and rigid form. He admits that under existing abnormal conditions the monetary and exchange mechanism based on the Tripartite Agreement has, on the whole, achieved good results; but he points to the depreciation of the French franc by nearly 50 per cent. as clear demonstration of the elasticity and imperfection of the Agreement. Its basic defect, he points out, is the dualism of thought on which it rests. On the one hand, the signatories fully recognise the necessity of stable exchange rates; but, on the other, each reserves to himself the right to change the value of his currency, if and when he deems that internal economic, social or political conditions render it desirable to adapt the value of his currency to that of some other power. This new gold standard, says Dr Trip,

under which the currency price of gold is made adjustable, preferably by international agreement, has a habit of working in one direction only—namely, towards a continuous depreciation of currencies in terms of gold. In discussing the gold problem, Dr Trip makes some pregnant observations. In order to belittle the fears of a gold glut, he points out that if the gold output had increased since the year 1915 by steady annual increments of 3 per cent. of the existing stock (which is commonly reckoned as the normal rate of growth) the present gold production would be fully one-third higher than it actually is. He is not, therefore, inclined to attach undue importance to the fact that the recent rate of growth has been well above this proportion. His argument ignores the fact that the recent expansion in the rate of growth is a product of the higher currency price of gold and is, moreover, based on the weight and not the value of the gold produced. None the less, it helps to place in better perspective some of the wilder fears which have been expressed as to the disequilibrium between the relative rates of increase in world productivity and the production of gold.

* * *

Discussing the situation in the Netherlands, Dr Trip points out that the reactions of economic and political developments outside the country have proved detrimental to the national finances. The position of the guilder, however, is solidity itself; and the greater part of the Netherlands Bank's activities last year were aimed at preventing through the Equalisation Fund an unwanted appreciation of the exchange value of the currency. In order to ease this upward pressure on the guilder, a policy of encouraging foreign lending has been pursued. Unfortunately, actual lending has been kept within decidedly modest bounds, owing to the scarcity of sound propositions received by the Dutch capital market.

* * *

May Clearing Bank Averages.—The May returns of the ten English clearing banks afford some further evidence of the effect of the French repatriations. Deposits have fallen since April by £4.8 millions and cash by £14.9 millions. The reduction in cash is easily explained by the early May transfers of cash to the Exchange Equalisation Account, and the consequent increase in public deposits and drop in bankers' deposits. The War Loan dividend payment, however, is now, clearly, making this good, and even last May the banks were just able to

preserve their 10 per cent. cash ratio. The fall in deposits is less than might have been expected, but the return shows an increase of £31.1 millions in discounts. Apparently most of the extra Treasury bills issued by tender during May are passing into the hands of the banks, while the Government's disbursement of the proceeds of these bills helps to swell deposits and so to off-set the French withdrawals.

(In £ millions)						
	May, 1937	Jan., 1938	Feb., 1938	Mar., 1938	Apr., 1938	May, 1938
Capital and reserves	132.5	136.0	136.0	136.0	136.0	136.0
Acceptances, etc.	125.5	111.0	108.9	111.7	111.7	115.8
Deposits (including undivided profits, etc.)	2,217.7	2,292.4	2,243.4	2,216.7	2,229.8	2,225.0
Total liabilities ...	2,475.7	2,539.4	2,488.3	2,464.4	2,477.5	2,476.8
Cash	229.6	247.8	239.3	240.8	242.8	227.9
Cheques, balances and items in transit	68.7	64.5	65.4	63.4	63.3	66.0
Money at call	163.4	149.0	139.9	146.2	145.2	141.2
Discounts	242.8	329.8	286.4	237.0	247.0	278.1
Investments	641.4	621.2	618.4	619.7	623.4	616.3
Loans and advances	936.6	948.8	962.6	978.1	976.6	963.8
Investments in affiliated banks	23.5	23.9	23.9	23.9	23.9	23.9
Cover for acceptances, premises, etc.	169.7	158.4	152.4	155.3	155.3	159.6
Total assets	2,475.7	2,539.4	2,488.3	2,464.4	2,477.5	2,476.8

Both investments and advances are lower than a month ago. A similar decrease in advances did not occur a year ago. It would seem therefore that, owing to the recession and falling prices, the demand for credit is diminishing.

* * *

Exports to Turkey.—In a leading article on page 540 of last week's issue of *The Economist*, we welcomed the conclusion of new agreements between this country and Turkey on the ground that, without

overlooking the needs of existing British creditors, they provided fresh opportunities for trade between the two countries. That they provide facilities which formerly were unavailable is self-evident; that is their *raison d'être*. It would be incorrect to infer, however, that they are designed to produce a considerable increase in the volume of British exports, in general, to Turkey. Clause I of the main agreement, in fact, with its accompanying Schedule lays down specific c.i.f. totals, in Turkish pounds, for imports into Turkey of British goods (to be paid for by deposit in the special account set up under the 1936 Agreement, and by transfer through a sub-account of the clearing) every three months, under a long list of headings. A deficiency in actual imports under any category, in any one quarter, may be carried forward to the next.

* * *

Chinese Exchange Rationing.—Poor exchange allotments last week-end caused the Shanghai exchange for sterling to weaken to 10½d. The Chinese Government have decided to cease asking the banks to submit bulk applications for foreign exchange, which so far have been partially met upon a *pro rata* basis. Instead, the banks must now specify in detail the purposes for which they require exchange, and the Government will then discriminate. In practice, exchange is only likely to be granted to cover the import of necessities. The conference of Chinese bankers, held recently at Hankow, has decided to restrict remittances to areas under Japanese occupation. Dr H. K. Kung, who is both Prime Minister and Finance Minister, informed the conference that few banks had had to close since the outbreak of war, and that, even in those cases, the claims of the depositors had been met. It is clear, nevertheless, from the general tenor of the conference that the war and the world recession are inflicting severe strain upon Chinese economy.

MONEY MARKET NOTES

Foreign Exchanges

THE London market has been very quiet. There has been very little business in French francs, and the spot rate has remained at Frs. 178½. Forward francs improved slightly during the week, the three-months' discount narrowing from Frs. 1½ to Frs. 1¼. The spot rate for belgas has, as usual, followed the dollar, but there has been a significant strengthening of forward rates, three months' belgas having come in from 70 to 50 centimes. It is clear that the pressure on the belga has subsided and that the recent change in Bank Rate was justified. Sterling improved in New York early in the week from \$4.94½ to \$4.93½, on further Paris

rumours of an impending devaluation of the dollar, and has since moved to \$4.93. The weakness of the Shanghai dollar is discussed in a Financial Note. The latest rate in London is 9½d. Recently there has been a speculative demand for Saigon piastres, based on the belief that they would be written up in terms of francs so as to make them conform more closely to the current price of silver. This caused some disturbance to both the spot and forward market in Saigon piastres against French francs. This speculative movement has now broken, and those who engaged in it are having to cut their losses as best they can.

The Bank Return

WHITSUN currency withdrawals explain the week's increase in the note circulation. The total expansion during the past fortnight is just over ten millions. The chief movements in the banking

department are the decrease in public deposits and further increase in bankers' deposits. These are discussed in a Financial Note. Had it not been for the Whitsun currency withdrawals, the growth in bankers' deposits would have been more marked. Whitsun also explains the week's drop in the Reserve.

The Money Market

THE completion of the War Loan dividend payment has made money very plentiful. Bill rates, however, are firmer, for the banks have ceased to buy bills readily. There is no demand for July Treasuries, and the banks are not taking August Treasuries at less than $\frac{1}{2}$ per

	June 10, 1937	June 2, 1938	June 9, 1938
Bank Rate	2	2	2
London Deposit Rate.....	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$
Short Loan Rates:			
Clearing Banks	$\frac{1}{2}$ -1*	$\frac{1}{2}$ -1*	$\frac{1}{2}$ -1*
Others	$\frac{1}{2}$	$\frac{1}{2}$ - $\frac{1}{2}$	$\frac{1}{2}$ - $\frac{1}{2}$
Discount Rates:			
Treasury bills	$\frac{1}{16}$	$\frac{1}{2}$	$\frac{1}{2}$ - $\frac{1}{16}$
Three months' bank bills	$\frac{1}{16}$ - $\frac{1}{8}$	$\frac{1}{8}$	$\frac{1}{8}$ - $\frac{1}{16}$

* Viz. $\frac{1}{2}$ per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity. $\frac{1}{4}$ per cent. for loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

cent. They are prepared to take bills at $\frac{1}{2}$ per cent. only if they can obtain mixed parcels of June and August Treasuries.

This change in attitude on the part of the banks is a purely seasonal movement, for the banks are merely engaged in preparing for their June 30th balance sheets. For this reason rates are likely to remain firm during June, but are equally likely to return to their normal weakness in July.

The Bullion Market

THE London price of gold has stood this week at too high a premium to permit of arbitrage operations against the dollar. An additional deterrent was the narrowness of the foreign exchange market in dollars, and the tendency of the dollar itself to weaken against sterling. In these circumstances the demand for gold came only from the Continent, and even this was on a slightly smaller scale than usual.

The renewal of the American-Chinese silver agreement imparted a little greater strength to the London market. The agreement was due to expire on

June 30th, but it has now been renewed for an unexpired period. The amounts

* Above or below American shipping price. The New York price of silver remained at 43 cents per ounce .999 fine during the week.

which the United States is to purchase and the price to be paid have not been disclosed. This news caused sellers to hold back, while there was some bear covering and American trade buying in London. The price now is well up to the American parity, and in the opinion of some observers is high enough. On the other hand, London stocks are very low, while the United States is still ready to take any silver on offer. Generally speaking, the London market is now narrow and sensitive, and so any movement either way might serve to shift prices.

Investment

Building Society Policy.—In recent years the chairman of the Building Societies Association has enjoyed the pleasant task of describing the continued progress of the movement. At the Association's conference this week Mr Walter Harvey was faced with the less inviting responsibility of commenting upon the fall in new mortgage business last year. Mr Harvey pointed out that new advances showed a decline from £140.3 millions to £136.8 millions, while repayments on existing mortgages represented as much as 63.7 per cent. of the new advances. He confirmed the suggestion made in our recent survey of the movement that this proportion would tend to increase, and, in an important passage in his speech, examined the potential outlets for an increasing volume of "return money" at a time when the demand for middle-class housing finance is tending to fall. Mr Harvey made the dual suggestion that industrial properties, flats and small houses for rent might absorb an increased proportion of building society funds, while the local authorities might also employ the resources of the movement in "the great housing enterprises" which they are commissioned to undertake. Mr Harvey spoke no less frankly on certain matters of domestic concern. The problem of war risks insurance has recently been pressed by the Council upon the Government, though so far with negative results. A movement with mortgage assets of £636 millions is necessarily exposed to the risk of heavy losses from war damage, and its leaders do not regard the issue as closed. The chairman also referred pointedly to new practices in dealing with properties in possession, in which, he suggested, the Chief Registrar might see a concealment of the true position regarding certain accounts. Both in its examination of current problems, and in its forward-looking vision—for Mr Harvey described the revision and enlargement of building society legislation as "most necessary"—the chairman's speech deserves consideration by building society executives and investors.

German Potash Reconstruction.—British holders of German Potash 7 per cent. bonds will find the following

details of the reconstruction of the operating group (communicated by our Berlin correspondent) of especial interest. The complete amalgamation of the potash group, which has consisted of the Kaliwerke Salzdetfurth, Kali Aschersleben and Westeregeln companies, hitherto only associated concerns, was decided on December 22nd last year. The fusion of the assets of the two latter companies with those of the first is now announced. This involves an increase in its capital from Rm. 28 millions to Rm. 44 millions, and its title is to be changed to Salzdetfurth A.G. This will be a holding company, for the potash works of the three companies, together with works of certain minor undertakings, are to be administered by a newly-created associate company—Vereinigte Kaliwerke Salzdetfurth—while certain Westeregeln electro-chemical and other undertakings are to be consolidated in another new company—Alkaliwerke Westeregeln G.m.b.H. The foreign potash loan, on which interest and amortisation is provided out of foreign currency proceeds from the group's export trade, is stated to have amounted (on a gold basis) to Rm. 37,947,427 on January 1, 1937. This debt will be apportioned between the new Salzdetfurth A.G. and the new Vereinigte Kaliwerke Salzdetfurth in such a manner that the joint liability to foreign creditors remains intact. The new balance sheet of the first-named company shows Rm. 16,237,000 as its "share of the pound or dollar loan of the Potash Syndicate"; that of the Vereinigte Kaliwerke Salzdetfurth Rm. 19,326,641 under the same heading. The new holding company, Salzdetfurth A.G., is to pay a dividend of 5 per cent. for 1937; later, it is understood, a further 4 per cent. will be distributed in respect of the first half of 1938. In future the group's trading year will commence on July 1st.

Industrial Profits in May.—The trend of industrial profits published during May shows the same characteristics as in recent months. The rate of increase over the profits of the previous year is still satisfactory, but it is lower than the increase recorded by a similar (though not identical) set of companies a year ago.

Year and Month	No. of Cos.	Net Profits*	Inc. on prev. year	Year and Month	No. of Cos.	Net Profits*	Inc. on prev. year

* After debenture interest.

The results are well spread over the 24 groups included in our analysis, though rubber and tea companies somewhat affect the results. Together they account for some 5 per cent. of total profits, but for 21 per cent. of the increase. Oil companies (which form the largest single group) have also contributed substantially to the improvement shown last month. Textile concerns, on the other hand, help to offset the influence of the commodity companies, for they showed a small setback compared with the previous year. Industrial profits continue to rise, but at a significantly reduced rate.

British Investments in Oil.—How large a stake has the British investor in the oil industry overseas? The question is topical, and an article in a recent issue of the *Petroleum Press Service* seeks to provide an answer. On the basis of Sir Robert Kindersley's latest estimates (for 1936), it appears that the nominal amount of British capital invested abroad in oil companies amounted to £126.6 millions, or 6 $\frac{1}{2}$ per cent. of the country's aggregate commercial investments overseas. This sum was made up as follows:—

	Million £
Share capital in British companies operating abroad...	106.8
Loan capital in these companies	1.8
Share capital in companies registered abroad.....	18.0

That these figures considerably underestimate the market value of the securities will be appreciated when it is pointed out that the total paid-up ordinary capital of the better-known British oil companies amounted to about £91 millions at the end of 1936, whereas the average Stock Exchange valuation of their shares in that year exceeded £290 millions. Through these large holdings the British investor shares in the control of companies with an annual production of 45 million tons of crude oil, equivalent to 18 per cent. of the world total. From them he secured in 1936 an income of £15,319,000—an average return of 12 per cent., against a comparable average of only 5 per cent. for the £1,922.4 millions of Britain's commercial investments overseas. Moreover, when allowance is made for the value of British materials purchased by the oil companies, for the net earnings of the tanker fleet and for the value of the tankers built in British shipyards, it is calculated that Britain's oil investments yield an aggregate annual income, direct or indirect, of almost £43 millions. This huge sum would be more than sufficient to pay for the whole cost of Britain's annual peace-time imports of petroleum products.

Insurance Share Index.—The steady recession shown by our index of insurance share prices during 1937 continued during the first quarter of this year. The fall in the average figure between December 31, 1937, and March 31, 1938, was practically 10 per cent. The indices are based on the course of an investment of £1,000 in 1913 in the ordinary shares of each concern represented,

allowance being made for bonus issues by assuming that rights are sold and additional shares purchased. Details of the index are given below:—

Company	1936	1937	Mar. 31, 1937	June 30, 1937	Sept. 30, 1937	Dec. 31, 1937	Mar. 31, 1938

It will be seen that, during the March quarter, the index number for every component company included in the table registered a fall.

Company Notes

Edmundsons' Finance.—Interest in the report of Edmundsons' Electricity Corporation for the year to March last will inevitably be concentrated on the far-reaching programme of structural reorganisation which the board is now carrying through. The revenue account itself follows the expansionary line of previous years. Trading profits (a considerable part of which has again been earned from contracting services rendered to subsidiary companies in the group) have increased appreciably from £208,587 to £281,737, but dividends applicable to the year and other income were slightly reduced. The 9 per cent. ordinary dividend is covered by earnings of 11.8 per cent., and after reserving £30,000 from revenue,

the balance carried forward is nearly doubled at £98,184. The latest profits are analysed below:—

	Years to March 31st		
	1936	1937	1938
Trading profits	196,693	208,587	281,737
Dividends and other income...	527,778	589,563	585,872

Expenses, fees and interest ...	48,374	33,675	78,468
Taxation	37,245	43,130	51,000
Debt service	128,599	200,978	203,022
Preference divs.	111,760	111,760	113,211
Ordinary stock:—			
<i>Earned</i>	398,493	408,607	421,908
<i>Paid</i>	299,200	336,600	344,200
<i>Earned %</i>	11.5	11.6	11.8
<i>Paid %</i>	8	9	9½
Reserve fund*	50,000	30,000	30,000
Carried forward	49,720†	50,477†	98,184

* Not including direct transfers of capital profits.
† After writing off new issue expenses of £44,150 and £41,250 respectively. ‡ And capital bonus of 50 per cent.

Changes of capital and grouping, however, will interest the far-sighted investor even more than these results. In the first place, the board proposes to distribute a 50 per cent. capital bonus. During the past year the reserve fund has been raised from £713,484 to £2,597,530, and £2,250,000 of this sum will be required for the bonus. The Urban Electric carried out a capital reduction, and distributed a large part of its accumulated reserves, following the acquisition by the parent Corporation of the Urban Electric interests in Cornwall Electric and East Anglian Electric. Other changes designed to consolidate and unify the areas under the Corporation's control appear no less important. For example, it has acquired from "Three Counties" Electric (a direct subsidiary) the controlling interest in South Wales Power, while the Ramsgate and District Electric holding has been sold. The board hopes to carry the process of consolidation further, so that, within a year or two, the group will consist of Edmundsons and only ten or twelve direct subsidiaries, compared with 16 direct subsidiaries and 32 sub-subsidiaries a year ago.

The importance of these changes in relation to any steps which may ultimately be taken to reorganise the electricity supply industry needs no emphasis. The Corporation's grouping is simplified—it will be noted that it has set up an independent power company by acquiring direct control of South Wales Power—while its geographical sections have been rendered more compact. Earnings, of course, will be unaffected by the capital bonus, and the directors explicitly point out that the annual dividend in future will not be maintained at the 9 per cent. rate paid in each of the last two years. Assuming that no change is shown in the earnings position, the basic dividend in future may thus become 6 per cent. payable from earnings of approximately 8 per cent. Such rates are in closer accord with those commonly experienced in the utility industries. The £1 ordinary stock units rose to 38s. 3d. on the report, and yield £4 14s. per cent. on this basis.

Royal Dutch Report.—The market was somewhat disappointed with the Royal Dutch dividend declared last month, and the directors themselves confess that the financial results of the past year did not entirely fulfil the high expectations which it had evoked. The balance of net profit has increased by the relatively modest proportion of 3½ per cent. from Fl.84,866,253 to Fl.87,617,256. Dividends received from interests in the group showed

a more spectacular increase from Fl.74,700,355 to Fl.91,409,015, but exchange differences which in 1936 provided a profit exceeding Fl.10 millions, involved a loss during 1937 of nearly Fl.3 millions. The adventitious profit arising from the devaluation of the guilder in 1936 has been succeeded by a loss on dollar investments (reduced by a profit on sterling investments) during 1937. In the following table and chart we show the distribution of profits in recent years:—

	Calendar years (in Fl. 000's)		
	1935	1936	1937
Dividends and interest received	57,302	79,531	96,102

Rate %	10½	16½	17
Commissaries, bonus, etc.....	865	1,817	1,930
Carried forward	910	801	812

ROYAL DUTCH DISTRIBUTIONS 1928-37

Since the amount of undistributed profits in recent years has been small, our chart has been drawn to show the actual amounts distributed on debenture and preference capital combined, and on the ordinary shares.

The Royal Dutch report, however, is a review of an industry. World production and demand was unprecedented in 1937. In the following table, we reproduce the company's estimates of world production of crude oil, with particulars for the leading eight countries:—

	PRODUCTION OF CRUDE OIL IN METRIC TONS	
	1936	1937
U.S.A.	149,464,000	173,734,000
Russia (inc. Sakhalin)	27,416,000	28,397,000
Venezuela	22,939,000	27,723,000
Iran	8,329,000	10,330,000
Netherlands E. Indies	6,387,000	7,189,000
Roumania	8,704,000	7,147,000
Mexico	5,947,000	6,751,000
Iraq	4,070,000	4,314,000
World production	247,130,045	280,940,560

World production amounted to almost 281 million metric tons, a figure which exceeded all previous records, while the increase of 33 million tons recorded over 1936 has never been excelled. Production increased most in the United States, Venezuela, Iran, and Bahrain (which produced 1,061,000 tons against 639,000 tons in 1936). In America, consumption reached the high figure of 1,185 tons per 1,000 inhabitants, compared with 1,000 tons in 1936, and with 252 tons per 1,000 inhabitants in Great Britain in last year. The directors see no sign of the approach of saturation point in America, and they are confident that Europe is only at the beginning of a pro-

misg development in consumption. Nor do they anticipate any shortage of supplies over the long period. At the end of 1934, for instance, total reserves available for North America were estimated at 13.6 milliard barrels. After 3.4 milliard barrels had been withdrawn, the reserves at the end of last year were estimated at 15.5 milliard barrels. Technical progress and drilling economies render such estimates, in the directors' phrase, of no more than relative value. From the detailed review of the group's interests in various countries, investors will note that the directors regard the future of the Mexican Eagle concern "with grave anxiety."

Boots Pure Drug Valuation.—For several years certain holders of Boots 5s. ordinary shares have watched with some impatience the waxing financial strength of the parent company and the growing muster of reserves retained by the subsidiaries. Recurrent disappointment over the absence of a capital bonus has always been tempered by the reflection that the melon, when eventually divided, would be the larger and more succulent. But the absence of any bonus announcement in the jubilee year profits declaration last month brought even the perennial optimists to rein. Moreover, the full report confirms the fall in trading profits from £966,116 to £940,333, although this decline is explicable, it would appear, largely by the incidence of N.D.C. Earnings for the ordinary dividend, of which 24 per cent. is paid, less tax, and a 5 per cent. bonus, tax free, are reduced from £695,915 to £607,774. Reserve fund receives no further addition—it stands at £2,000,000, compared with an issued ordinary capital of £1,600,000—but a total of £122,133 is applied to freehold property and development reserves. It is somewhat difficult to assess the proper valuation of the shares. The group's earning capacity is ample—last year's distribution was covered by earnings of 43.3 per cent. gross—but the 5s. shares, at 39s. 3d., are clearly higher than well-covered but stable dividends alone would warrant. Free and contingency reserves, together with the balance at profit and loss, exceed the ordinary capital by nearly £1,000,000. Yet the mere existence of these reserves provides no direct indication of future dividend policy, and to justify the present yield of £3 18s. 6d. per cent. on the ordinary shares, more generous distribution of profits, either on the existing capital or by maintaining the present rate on an increased capital, would appear to be called for. The board's dividend record during the past decade suggests that such a change might not lightly be made.

Coast Lines Position.—The considerable changes in the assets and capital structure of this company in recent years prevent an accurate assessment, from current earnings alone, of its real progress. The latest financial results (showing an increase in earnings of over £10,000) must, however, be regarded as satisfactory. In 1935 preference arrears were paid off and ordinary dividends resumed, and although the ordinary distribution has since been maintained at 4½ per cent., last year was the first in which it was covered by current profits, as we show in the following table:—

	Years ended December 31,		
	1935	1936	1937
Net earnings, after depreciation.	364,109	289,103	299,590

The Government of Southern Rhodesia invites enquiries regarding the potentialities of mining in the colony

Southern Rhodesia to-day offers a profitable field of investment to Companies undertaking exploration and mineral investment.

The colony is rich in Asbestos, Chrome, Tungsten, Coal and numerous other minerals.

Gold mining is in a flourishing condition and its further development is awaiting capital.

£100,000,000 IN GOLD ALONE HAS BEEN PRODUCED IN THE LAST FORTY YEARS, AND NUMEROUS PROSPECTS AWAIT INVESTIGATION. THE COUNTRY'S VAST MINERAL WEALTH REQUIRES MORE DEVELOPMENT

MINERAL PRODUCTION FOR 1937 EXCEEDED £7,400,000

Enquiries may be addressed to The Secretary, Department of Mines, Salisbury, Southern Rhodesia or to

The High Commissioner for Southern Rhodesia, Rhodesia House, 429, Strand, London, W.C.2.

OVER ONE HUNDRED AND TEN YEARS OF SERVICE
SCOTTISH UNION & NATIONAL
INSURANCE COMPANY
ASSETS EXCEED £17,000,000
FIRE LIFE ACCIDENT MARINE
Edinburgh: 35 St. Andrew Square
London: 5 Walbrook, E.C.4, and 45 Pall Mall, S.W.1.

Beginning in 1933, when prices for new construction were distinctly favourable, orders for 24 motor ships were placed, and it seems that, with the delivery of six vessels in 1937, this particular programme is completed. The construction of new tonnage for subsidiaries, however, continues. The balance sheet (now presented in an improved form) shows £342,000 (against £76,000) advanced for this purpose to date, financed by a bank loan which is to reach £380,000 in all. Reference was made last year to rising operating costs, but the company is relieved from the full incidence of higher coal prices, since many vessels are equipped with oil burners. Simultaneously, the financial structure of the company has also been improved. Both in 1936 and 1937 the subsidiaries distributed all available profits (the last special dividend from undistributed profits being received in 1936). Profits from sales of investments and vessels, however, have been considerable, and in addition £500,000 (representing the bulk of a profit on the liquidation of the British and Irish Steam Packet group) has been applied to reducing the value of investments in subsidiaries. These various realisations and the new construction work involve extensive changes in the balance sheet. Investments in subsidiaries now stand at £4,625,491 net, against £6,082,329 including interests in the liquidated companies. The book cost of the fleet is higher, cash has fallen from £120,346 to £27,444, while liabilities in respect of new tonnage amount to £401,700, against £138,560. The issued capital has been increased by £550,000 6 per cent. convertible preference shares, mainly in connection with the British and Irish Steam Packet liquidation. The report conveys the impression that Coast Lines are satisfactorily consolidating their position, though a yield of £7 8s. per cent. on the £1 ordinary shares of 12s. 1½d. reflects the uncertain outlook for the shipping industry.

William Cory and Consett Iron.—The latest reports of William Cory and Consett Iron are both indicative of the improvement in the heavy industries and coal trade during the past year. William Cory and Son is a coal merchanting organisation, with branches throughout this country and the world. It acts as agent for the sale of fuel produced by the Powell Duffryn group, and as bunker oil fuel agent for Anglo-Iranian Oil. The latest figures show an increase in trading profits, after depreciation and tax provisions, from £728,536 to £777,338. The ordinary dividend, recently announced, is maintained at 20 per cent., and is covered with the satisfactory margin of 6½ per cent. No further addition is made to reserve, which already stands at £2 millions, and the customary financial strength of the balance sheet is reflected in holdings of trustee and other securities entered at £3,607,041 which had a market value at March 31st of no less than £4,107,379. In the following table, we set out the results of the company during the past two years, together with those of Consett Iron:—

	William Cory & Son		Consett Iron	
	1937	1938	1937	1938
Total profits, after tax	728,536*	777,338*	729,976	847,953
Depreciation	—	—	325,000†	355,000†
Expenses	9,000	9,000	7,903	8,000
Debt service	—	—	112,062	90,500
Prof. divs.	42,500	42,500	40,000	40,000
Ordinary shares:—				
Earned	677,036	725,838	245,011	354,453
Paid	590,019	590,019	210,000	280,000
Earned %	23.9	26.3	9.2	13.7
Paid %	20	20	7½	10
To reserves	200,000	—	—	—
Carried forward	839,939	975,758	141,499	215,952

* After depreciation. † Of which £200,000 each year to reserve for extension of plant.

William Cory's dividend record scarcely suggests that it operates in an industry which has only recently passed from extreme depression into recovery. Its history, in fact, is wholly dissimilar from that of Consett Iron. The latter's reconstruction scheme in 1936 proves to have been well timed. During the year to March, 1937, profits amounted to £729,976, after taxation, and this figure has been

substantially exceeded in the latest year. Profits on the same basis have advanced to £847,953, and the increase has been roughly divided between the ordinary shareholders—who receive a dividend of 10 per cent. against 7½ per cent.—and the company's own coffers. William Cory ordinary shares yield exactly 5 per cent. at the current price of 80s., while Consett Iron yield 8½ per cent. at 8s. The former have the advantage that dividends during the past decade have never fallen below 15 per cent. Consett Iron, on the other hand, must be regarded as exposed to trade conditions on the North-East coast, both for shipbuilding work and coke, of which the company is an important producer.

Guest, Keen and Nettlefolds.—The preliminary profits figures of Guest, Keen and Nettlefolds, like those of other steel companies published recently, show an advance in marked contrast to the recent market behaviour of the shares. From the announcement, it may be inferred that trading profits, before depreciation, amounted to £1,326,733, a total which represents an advance of some 15 per cent. over the previous year's level of £1,150,525. The final dividend of 4½ per cent. tax free makes 7½ per cent. tax free, compared with 6 per cent. for the year to March, 1937. After providing £101,267 for debenture service, and £150,000 for depreciation, net profits amount to £1,075,466 (against £898,728) and ordinary earnings to £748,734 (against £571,996). The dividend is covered, in fact, by tax-free earnings of 11.6 per cent. At the current price of 25s. 3d. the £1 ordinary stock units yield no less than £8 12s. 6d. per cent. gross. This yield is high, even in the steel share group, and it measures the fear that earnings a year hence may tell a different story.

Investment Trust Problems.—Investment trust stockholders will find little support in recent chairmen's speeches for the belief that the operation of the much-discussed time-lag will protect their revenue in the near future. Without being exactly pessimistic, the spokesmen have not held out high hopes of a continuance of the rising trend of earnings. In some cases, the uncertain outlook in international politics has been invoked as a reason for not making public any estimate at all of the way in which 1938 revenue may compare with that of 1937; more often some diminution in revenue is forecast, though most chairmen hope that it will not be serious. Lower dividends from the United States are inevitable. The Brazilian default has been another disturbing factor. Payments of arrears of interest and dividend by home companies are now diminishing in importance. Trust chairmen, discussing the valuation of investment portfolios, have revealed some of the difficulties of making changes in holdings and in offsetting "quality" against considerations of immediate revenue or of capital value. Mr D. M. Touche, for example, is a firm believer in the principle that quality pays. The Sphere Investment Trust, he explained, had always held large lines of leading industrials. Yet these, paradoxically, suffered most in a period of forced liquidation in the market as a whole, because they were most readily saleable. Mr J. H. Clifford Johnston also discussed the illogical nature of a result which gave, as compared with a year ago, a higher revenue and a lower valuation for a largely unchanged portfolio. Sir John Cargill dwelt upon the difficulties of obtaining high-class bonds and preference shares at suitable prices, but expressed the intention, on behalf of one of the trusts of which he is chairman, of reverting as soon as practicable to a mainly fixed-interest portfolio. Mr M. Hely Hutchinson, in reply to questions at the first meeting of the First Conversion Investment Trust, explained that if the investments taken over from the British Empire "A" unit trust holders had been left undisturbed, dividends would have been somewhat lower, but the depreciation in capital value would have been considerably less. If the investments had been sold and the proceeds re-invested in gilt-edged, asset values would have been maintained but revenue halved. Plainly, the investment trusts are finding that, under present conditions, the text-book advantages of "switching" their securities are elusive.

The Week's Capital Schemes.—Of this week's capital schemes, that of the Trust and Agency Company of Australasia is undoubtedly the most interesting to the investment analyst. The company's capital consists of £414,377 of 4 per cent. debenture stock, £1,000,000 of 5 per cent. preference stock and £100,000 paid-up ordinary capital, subscribed in respect of £10 shares which are £1 paid. But at various dates since 1863, payments have been made on some 45,021 ordinary shares, in advance of calls, of the uncalled balance of £9, and on these sums interest has been paid free of tax. On this part of their capital, the ordinary shareholders concerned have ranked on an equivalent footing to the debenture-holders. Meanwhile, the preference shareholders' dividends are in arrear since the end of 1932. The circumstances, it will be seen, are unusual, if not unique. The directors propose that preference arrears should be cancelled, to the end of 1937, and that the shares should in future carry 4 per cent. dividend. Secondly, the amounts received in advance of calls, totalling £405,189, are to be deemed to be called up and to cease to rank for interest. On the "non-option" shares (i.e. those at present only £1 paid) a call of £1 per share is to be made, and £1 will be written off all the ordinary shares. In short, the resulting ordinary capital will consist of 45,021 shares of £9, fully paid, and 54,979 shares of £9, £1 paid and £8 uncalled. The senior capital will remain intact. It is doubtful if the limitations of partly-paid capital as a device for protecting the creditor have ever produced greater complexity. The preference shareholder, who will in future have a vote if his dividend falls in arrear, may find in the prospect of a regular dividend sufficient compensation for loss of one-fifth of dividend rights and five years' arrears. The option shareholder in future will rank for ordinary dividend only and not for prior interest on calls paid in advance. And the debenture creditor is still protected by the unpaid liability on over half of the ordinary capital. Meanwhile the non-option shareholder, who in recent times has been compelled to pay a transferee to undertake the risk of a capital call, may obtain a holding with a positive price, since the directors are hopeful of paying a dividend not exceeding 4 per cent. under "normal conditions." Compared with these complexities, the Tilling-Stevens scheme is a relatively simple affair. The company's trading profits have increased during 1937 from £12,824 to £38,053, but the assets deficiency amounts to £213,277. In consequence, the issued capital is to be reduced to £222,565, in 1s. shares, of which the preference shareholders will hold £203,146, or 91 per cent. Existing ordinary shareholders, the value of whose holdings seems contingent to a degree, should feel satisfied with their residual equity in the new capital.

Anglo-Egyptian Oilfields.—The report of Anglo-Egyptian Oilfields for 1937 provides no surprises. A year ago Sir Robert Cohen foretold a small decline in production in the absence of some yield from new wells, but it was hoped that the financial results for 1937 would be satisfactory. In effect, the 12½ per cent. dividend is repeated on the "B" shares, out of net earnings which are fractionally higher. Proceeds from oil sales at £492,483 compare with £495,072, and have thus fallen in a smaller degree than crude oil production, which was 11,178 tons lower, at 163,518 tons. Other receipts, however, are over £16,000 higher at £134,023, the increase sufficing to offset a rise in expenses. The amount earned for dividend is just under £235,000—an increase of £1,000, and as 90 per cent. of this sum is attributable to the "B" shareholders, earnings on this class of capital amount to 12.6 per cent. The technical position of the company is, however, of particular interest. Since 1931 production has been falling, except for a slight increase in 1936. It will be recalled that, at last year's meeting, the chairman stressed the importance of securing further oil-bearing territory. Accordingly the company applied to the Egyptian Government for 40 permits, covering 100 square kilometres each—the maximum grant to any one company under the new regulations. Permits were granted in various regions, and one well has been

drilled and tested. These developments are reflected in various items in the balance sheet. Net additions to properties and plant in 1937 amounted to £202,649, against £41,666. The value of materials in use or in stock is much higher, while exploration expenditure amounted to £37,119, against £2,312 in 1936. Cash is in consequence reduced by £81,000 to £7,862, and a loan of £87,000 is now due to the Anglo-Saxon Petroleum Company. It is too early to gauge the financial value of recent exploration work, but there is little doubt of the importance for the company of production from new wells.

Antofagasta Railway Position.—The latest report of this South American railway reflects the comparative prosperity enjoyed in 1937 by producers of primary commodities. The railways are predominantly carriers of ores, metals, mining stores and nitrate, and the remarkable increase in the volume of traffic handled has more than offset currency difficulties in Bolivia and higher costs arising from social legislation. In 1936 the volume of traffic was greater than in 1935, but the depreciation in the Bolivian exchange from Bs. 20.26 to Bs. 50 to the £ reduced gross sterling receipts despite higher surcharges, and local working expenses rose. Though similar difficulties continued in 1937 (the boliviano being further depreciated to 80 to the £), the increase in traffic handled was so great that gross railway receipts rose from £762,941 to £849,313, while working expenditure at £547,323 represented 64.4 per cent. of gross receipts, against 62.6 per cent. a year earlier. But while total receipts in 1937 were higher even than in 1935, the rise in expenses reduced net income to £453,364, a figure below the 1935 level, but 5 per cent. above 1936. Exchange reserve required only £53,000, against £104,000, and £123,849 (against £48,575) was retained for dividend. The 15 months' preference dividend to March, 1935, was, in fact, almost covered by current earnings. Reports from the Chilean and Bolivian sections are perhaps a better guide to operations in 1937 than the financial accounts in sterling. In Chile, public goods traffic, at 800,351 tons, showed an increase of no less than 34.7 per cent. over 1936. The tonnage of both nitrate and copper bars, for instance, rose by over 50 per cent., and though working expenses naturally increased, their ratio to gross receipts was little different from 1936. Improvement in Bolivia, though satisfactory, was less marked (goods tonnage rising by 7.3 per cent. to 369,140 tons), for though slightly more tin and tin ore was handled, labour difficulties in particular prevented Bolivia from producing her quota. Although higher working expenses were in part due to increased currency costs, it seems that the main cause was the payment of Customs duties (from which the railway had previously been exempt) on certain imported materials. The present outlook, however, is much less cheerful. Gross traffic receipts to the end of May, 1938, were £364,030, against £367,830 a year ago, and the Bolivian exchange, already a fruitful cause of difficulty, has become still more obscure.

"Johnnies" Group Dividends.—Although the existing basis of Transvaal gold mining taxation is less rigorous than the previous system, the companies display an increasing tendency to utilise low-grade ore deposits, even when this policy is not necessitated by the approaching exhaustion of the properties. Moreover, the average price of gold during the first half of this year has fallen slightly, compared with the corresponding period of 1937. Costs have shown a tendency to decrease; and in several instances the effects of the adverse factors have been more than offset by an expanded scale of operations. Nevertheless, as a whole, the dividend declarations for the first half of 1938 are unlikely to compare favourably with those of the corresponding period of 1937. This conclusion is confirmed by the declarations of the "Johnnies" subsidiaries. Three of the six payments are identical with those of twelve months ago, and three are lower. The latest dividends are given in the following table:—

	Total, 1936	June, 1937	Dec., 1937	Total, 1937	June, 1938
"Johnnies" Group					
East Champ d'Or	...	...	...	...	1/6
Govt. G.M. Areas (5/-)	5/6	2/3	2/3	4/6	1/9
Langlaagte Estate (£1)	3/-	1/6	2/-*	3/6	1/-
New State Areas (£1)	6/-	3/-	3/-	6/-	3/-
Randfontein (£1)	5/-	2/3	2/3	4/6	2/3
Van Ryn Deep (£1)	5/-	2/6	2/6	5/-	2/6
Witwatersrand Gold (£1)	4/6	2/6	2/6	5/-	2/-

* Including 1/- bonus from sale of land, etc.

A notable example of reduction is provided by Government Areas. In our review of the 1937 report, we stressed the significance of the further decline in the value of the ore reserves. The company's profits for the current half-year (estimating the June result) display a shortfall of something like £430,000. Under the terms of the lease, slightly over one-half of this deficiency falls to be borne by the Union Government. Nevertheless, a cut of 6d. in the rate has been found necessary. For the future, much depends upon developments in the upper reefs. On the basis of the June declaration, Government Areas show the high gross yield of 13½ per cent. Earnings of Langlaagte have ruled fairly steady at the greatly reduced level of about £10,000 per month, but a cut of 6d. per share is made in the distribution compared with that for the first half of 1937; in the case of Witwatersrand Gold a similar reduction follows a distinct falling off in the month's profits. The earnings of Randfontein for the current half-year are fully £180,000 below those of the corresponding period of 1937, and some reduction in the dividend had been anticipated, although uncertainty existed as to the degree in which the decline in profits might be offset by lower taxation and capital expenditure. In the event, the company has been able to maintain its distribution at the rate paid for each of the two preceding half years. Having regard to the trend of profits, a small reduction in the New State Areas dividend would have occasioned no surprise, but the company repeats its dividend of the four preceding half years, though it may be unable to do so much longer. On the basis of 6s. per share per annum, the indicated yield is nearly 11 per cent. A new entrant to the list is the East Champ d'Or. This concern has been financially reorganised by the "Johnnies" company, and for some months past its profits have shown expansion, the May total of £15,000 comparing with £10,130 in December.

Selection Trust.—The latest accounts of Selection Trust cover the fifteen months ended March 31st, compared with the calendar year 1936 in the preceding report. Recent market conditions are reflected in the fact that income during the latest period was derived principally from dividends and interest, whereas in 1936 profits from realisation of investments provided the chief source. Expenditure during the period ended March 31st on investigation and ventures was lower than in the previous year, but taxation absorbed a somewhat increased amount. Net profits amount to £364,500, against £434,400, but the distribution is maintained at 1s. 6d. Quoted investments appear at £2,977,300, compared with £2,733,200, but the

market valuation is substantially in excess of the book figures. Dividend receipts were derived principally from the company's interests in American Metal Company, Consolidated African Selection Trust and Trepca Mines. Rhodesian Selection Trust, it will be recalled, holds approximately 64 per cent. of the issued capital of the Mufulira Company, which paid a maiden dividend of 3s. per share. Reference to the annual report of the American Metal Company (which is circulated with the Selection Trust report) shows that this concern holds rather over 50 per cent. of the capital of the Rhodesian Selection Trust, together with a large interest in the Roan Antelope copper mines. Both these undertakings last year extinguished their debentures by issues of ordinary shares. During the year the American Metal Company resumed dividends on its ordinary capital, disbursing a total of \$3 per share. The prospects for Selection Trust during this year are less favourable than for 1937-38, in view of current conditions in the metal markets at home and in the United States. The market has also noted the reduction in the Trepca Mines interim dividend from 15 to 5 per cent., though the recent excitement in Western Holdings stimulated fresh interest in Selection Trust.

The Week's Company Profits.—Our usual analysis of profit and loss accounts (appearing on page 640) contains the results of 63 companies, excluding new concerns and those for which comparable figures are not available. The latest net profits for these companies amount to £6,795,000, compared with £5,910,000 for the previous year—an advance of 15 per cent. Total profits recorded by 1,269 companies during the year to date amount to £182,141,000, compared with £161,520,000 for the preceding year, an increase of 12.8 per cent. The heavy industries are well represented in this week's results, although numerically the tea group is the largest. The results are discussed on page 622 under the heading "Shorter Comments."

Company Meetings of the Week.—In this issue reports of company meetings begin on page 629. Addressing the annual meeting of the *Milk Marketing Board*, Mr T. Baxter reported that the sales of liquid milk had increased over the previous year by 51 million gallons, and represented 71.3 per cent. of milk passing through the Scheme, as compared with 66.2 per cent. Although expressing satisfaction with the new high record set up by the petroleum industry in 1937, Sir John T. Cargill, at the *Burmah Oil* meeting, attributed this result less to planned co-ordination towards regulation of demand and supply than to a fortuitous combination of other circumstances. Without a decline in Roumanian production and disturbances in Venezuela and Mexico, the equilibrium actually achieved would not have been possible. Improved trading results, moreover, were less due to higher values than to reduced costs, and for *Burmah Oil* lower costs had contributed largely to the expansion in profits. At the *Henderson's Transvaal Estates* meeting, Mr W. L. Castleden reported that at March 31st the market value of the company's investments was above book cost, despite the heavy fall in quotations that had taken place at that date. Discussing the newsprint position at the *Associated Newspapers* meeting, the chairman remarked that while 1938 would see the full effects of the rise in newsprint prices by 30s. a ton, changed world conditions indicated that there would be no further increase in 1939. Mr A. W. Allard informed shareholders of *Marston Valley Brick* that although extensions were ready too late to affect the latest financial results, the sale of bricks had risen considerably. Mr Douglas Christopherson pointed out at the *Associated Tin Mines of Nigeria* meeting that the completion of the capital programme left the company well equipped to meet any increase in quota, and at much reduced costs. Mr C. V. Thomas, at the *Tronoh Mines* meeting, emphasised that while Malayan producers were best able to face uncontrolled production, they bore an unfair share of the burden of restriction.

THE STOCK EXCHANGES

London

SETTLING DAYS
TICKET ACCOUNT
JUNE 21 JUNE 23

THE firmness which was evident in the London market on the eve of the holiday provided a satisfactory key for the re-opening of business. But neither in the volume of business nor in the course of prices is there cause for any special satisfaction this week. Dealers found the unemployment figures less dismal than had been feared, and the pre-holiday railway traffics, so far as they lent themselves to comparison, were favourably received. But the general run of business has been slack, and prices have been maintained by inertia, rather than any nicely calculated balance of business between buyers and sellers.

In the gilt-edged market, trading remained small, and after an initial rise, particularly in the dated stocks, a renewal of Government borrowing rumours was followed by realisation on a minor scale. Little interest was displayed in corporation issues (although the L.C.C. scrip made progress) nor in Dominion issues.

Support for Japanese issues was the only feature in a dull foreign bond market, but the improvement was technically explained by sinking fund purchases. Chinese issues were depressed by the exchange weakness. Austrian issues reacted relatively moderately to the news of default on the service moneys (discussed in a leading article on page 606), but the blow had already been largely discounted.

Home rail stocks received attention at first, though business was limited. Until the publication of the traffics, the modest improvement continued, but prices reacted later, to show net declines on Wednesday. Argentine rail stocks, on the other hand, provided one of the few features of the week. To the accompaniment of unconfirmed reports that some form of "nationalisation" was under discussion, the ordinary stocks led an improvement of up to two points. Cordoba stocks, however, became less prominent.

Except for one or two shares which show their heads rather timidly above an uninteresting and lethargic crowd, the industrial market was devoid of interest. With a very restricted turnover, the undertone was satisfactory after the Whitsun holiday, but gave way somewhat in mid-week. Good company reports assisted coal shares, and small gains were general, though business hardly expanded. Iron and steel shares were a relatively firm group, the brighter spots being John Brown on the dividend increase, and Sheepbridge, while Staveley recovered. Motor and aircraft issues were firm but inactive. On news of the increased revenue and the scrip bonus, Edmundsons gained 9d., but other electricity supply shares changed little. Except for an improvement in Crompton Parkinson, electrical equipment issues were irregular and uninteresting. Support for Salts (Salthire) was the main feature of an otherwise neglected textile market. Among rayon shares, Canadian Celanese were depressed on the decision to defer action

on the common stock dividend. Among stores, Great Universal rose in anticipation of the meeting, but other shares tended to sag, with a few exceptions. The provisions and catering section was irregular, and so were breweries and tobacco shares. Shipping issues also were undecided. Miscellaneous issues were rather better on Tuesday, but turned dull later, and price changes were unimportant.

The oil market reopened dull, with little change in prices. There was hardly any accumulation of orders to work off, and little interest was evinced by the batch of satisfactory annual reports, or by brighter Wall Street news. For Royal Dutch, however, there was some Amsterdam support on the re-opening of the markets.

The rubber share market has derived but little benefit from the quota reduction, though hopes are still entertained of an eventual recovery in the commodity price. Turnover was at a minimum, and prices hardly moved. Tea shares, after starting under the influence of general market apathy, became firmer in mid-week on good company news, with demand concentrated on Indian issues.

After starting on Tuesday quietly but firmly, Kafirs once more came to the fore. Turnover did not expand much, but quotations made the best of a small market. Dividend-payers were the centre of interest in anticipation of the June dividend announcements, but the developing mines were well maintained, and Western Holdings were active in short bursts. Other sections of the mining market were uninteresting.

ACTUARIES' INVESTMENT INDEX

Though the decline is small compared with the previous week, the Actuaries' index of 151 industrial ordinary share prices on Tuesday last (June 7th) reached a new low level for 1938, standing at 63.2, against 64.0 a week ago and 68.3 a month ago. The corresponding average yields are 6.03, 5.94 and 5.44 per cent. A selection of the separate indices follows:—

Group (and No. of Securities)	Prices (Dec. 31, 1928 = 100)	Prices 1938 High

New York

At the end of last week, Wall Street once more gave proof that whatever may depress stock prices, talk of inflation, no matter how loose, provides an immediate tonic. The market seized on inflation rumours—ranging from a new devaluation of the dollar to actual resort to the printing press if the autumn recovery failed to put in an appearance—and took the Dow Jones industrial average smartly up from 109.71 to 111.82 in the brief trading session. This salt lost some of its savour on Monday, although the index rose further to 113.19. Fractional changes have subsequently provided the rule, and turnover continues at a depression level, well below half a million shares daily. On Wednesday, indeed, trading totalled no more than 280,000 shares, a level which has not been witnessed for nearly four years. Rail stocks continue depressed, in view of the urgent financial difficulties of the more vulnerable roads, and made but little response to the news that bills have been drafted to secure immediate financial relief through the R.F.C. and to facilitate reorganisation proceedings. Industrial news remains depressing. Steel activity, according to *Iron Age*, remains at 25 per cent. of capacity, although this calculation, on six working days against five last week, indicates an actual decline.

LONDON ACTIVE SECURITY PRICES AND YIELD

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption, where the stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum. div." shares.

TENDERS

Brighton, Hove and Worthing Gas Company.—Sale by tender of £50,000 Four per Cent. Preference Stock at minimum price of par. Applications must be for not less than £50 stock, and the latest date for receipt of tenders is June 23rd.

BONUS ISSUES

British Electric Traction.—A scrip bonus of 10 per cent. on the deferred stock is announced.

De La Rue (Thomas) and Company.—It is proposed to distribute bonus shares in the ratio of one bonus share for ten shares held.

Edmundsons Electricity Corporation.—A bonus is recommended of £1 of new ordinary stock for £2 of stock held, by the capitalisation of £2,250,000 of reserve.

“Sanitas” Trust, Ltd.—It is proposed to distribute a capital bonus of one new ordinary 1s. share for each ordinary 1s. share held.

CONVERSIONS AND REPAYMENTS

Victory Bonds Drawing.—The nineteenth drawing of Four per Cent. Victory Bonds will take place on June 20, 1938. A list of bonds drawn will be published not later than July 1, as a special supplement to the *London Gazette*.

SHORTER COMMENTS

Company Results of the Week.—The Burton brewers, MARSTON THOMPSON AND EVERSHED, report a moderate improvement for 1937-38, with net profits of £138,377, against £130,263. MANCHESTER COLLIERIES have earned £31,300 more, at £331,306, while trading profits are as much as 18 per cent. higher. Having experienced a good demand for coal at higher prices SOUTH HETTON COAL have doubled their dividend, at 5 per cent. Net profits of SHIPLEY COLLIERIES are slightly higher than the 1936-37 level at £189,171. J. STONE AND CO. (brass-founders and engineers, of Deptford) have earned £251,224, against £198,812, and the dividend is raised from 20 to 27½ per cent. Good progress has also been made by RUSTON AND HORNSBY, whose earnings are £81,000 higher at £222,426. Of this increase, however, £17,550 arises from profit on the sale of an investment. PHILLIPS AND POWIS AIRCRAFT again record a loss, though it is reduced to £19,297, compared with £31,586 for the previous year. The full benefit of increased orders placed in 1936 was not felt in 1937, but increased business was placed last year and the factory is now working to capacity. While LINGGI PLANTATIONS have earned no less than £65,897, against £25,202, the 5 per cent. dividend is unchanged, £30,000 being placed to general reserve. Tea companies generally show a substantial improvement in profits. ASSAM CONSOLIDATED, for example, has earned £40,051, against £17,400, and dividends are resumed with a 7 per cent. distribution. Profits of BRITISH ELECTRIC TRACTION again show a high rate of expansion, amounting to £446,472, against £390,895. The 5 per cent. dividend is maintained on an increased capital, and the 10 per cent. share bonus repeated. BROWNLEE AND CO., the timber merchants, record a fall of £8,000 in total profits to £63,878, the value of timber and investments having been reviewed before arriving at profits. MARSTON VALLEY BRICK are reducing their dividend from 20 to 17½ per cent. The works have been employed to full capacity, but extensions at Ridgmont

DIVIDEND

ANNOUNCEMENTS

Rates are actual, unless stated per annum or shown in cash per share. Rate for previous year refers to total dividend, unless marked by asterisk to indicate interim dividend.

in output will reduce the current rate of production from slightly over 50,000 tons to about 30,000 tons, which approximates to the level of the recent rate of absorption. A reduction in United States' stocks cannot therefore be expected, particularly as the supply of re-treated scrap copper is quite substantial. The restoration of equilibrium on the American market is now dependent on a recovery in that country's industrial activity, provided that the stringent restriction of production is maintained until consumption increases. Both factors are still somewhat uncertain, so that a definite view on the market's trend cannot be expressed at this stage. European copper interests, however, are watching very closely the new move of the United States copper industry, as the unsatisfactory state of that market and the danger of higher American copper exports provided the chief reasons for the recent slump in the London price of copper.

* * *

Co-operative Progress.—This year's Co-operative Congress at Scarborough, attended by 2,000 delegates, received an economic survey of the retail movement made by the recently established Research Department. The general conclusion is that during the post-War years the growth of co-operative retail trade has not been commensurate with the rapid growth in membership or with the increasing resources of the movement. Within the next few years, unless the merging of societies proceeds on a voluntary basis, certain societies will find themselves in financial difficulties. Therefore the Executive has recommended that the various areas shall be examined with a view to the amalgamation of societies. For the first time a census of co-operative shopkeeping has been taken. It shows the following distribution of trade:—

	No. of shops	Trade in millions £	Average weekly trade per member s. d.
Grocery, bread, etc.	10,660	135.0	6 8
Butchery	5,015	19.9	1 0
Greengrocery, etc.	1,249	3.9	0 2
Dairy	420	18.6	0 11
Drapery	2,101	18.4	0 11
Tailoring	728	6.3	0 4
Boots and shoes	1,236	5.9	0 3
Furniture, etc.	1,013	7.7	0 4
Chemist	421	1.6	0 1

Other businesses in which the retail co-operative societies are engaged include the provision of 50 shops for optical services, 20 for sports outfitting, 259 for tobacco, and 144 hairdressing saloons. Coal is supplied through 700 societies, 532 have laundry services, and 441 funeral furnishing departments. Co-operators have established 24,000 shops in all, which is twice as many as any figure with which the movement has been previously credited. If 750,000 is accepted as the total number of shops in the country, it would appear that there are now 685,000 private, 40,000 multiple and 24,000 co-operative shops, as well as 1,000 departmental stores.

* * *

Electricity in the Cotton Industry.—The appeal of the cotton industry against the increase in the delivery price of coal was disallowed by the Board of Trade's arbitrator last week. It is significant that this appeal should coincide with the putting into full operation of the great Barton Power Station. Coal prices have risen since the war, but during the last four years the movement has been accentuated; thus from an average of 18s. per ton in the years 1930-35, the price rose to 20s. 3d. in 1937, and it has been proposed by the coal owners that 24s. would be an equitable price for 1938. Despite the small part taken by power in the total cost of production of cotton goods, this increase lays a considerable burden upon the industry, which at present is in a state of real depression. Even before the recent rise in the price of coal, electricity was increasingly used in the textile trades as a source of power.

MILLION HORSE POWER

	1912	1924	1935
Electricity generated in own works...	46.5	92.4	141.2
Electricity purchased	29.9	168.7	453.2

Three main factors have been responsible for this change. In the first place, the increased efficiency of thermal power stations has reduced the coal equivalent of a unit of electricity from 1.97 lbs. in 1929 to 1.50 lbs. in 1936; with the further concentration of power production in a few large stations, it is possible that efficiency will be increased and that the cost of electricity will compare even more favourably than at present with that of power from primary engines. Secondly, many cotton mills have reached the stage when the obsolete nature of the boiler-room apparatus has made replacement essential, and at a time when it is difficult to raise new money in the cotton industry, the low capital cost of installing electrical machinery has been an important factor in increasing the use of electricity. Lastly, there are certain technical advantages that follow from the use of the electrical drive, such as elimination of variations in the speed of the different processes, the flexibility of individual units, the very considerable saving in floor space, and the freeing of the management from the responsibility for power production. For these reasons, the electrification of the cotton industry is an inevitable process, but it will be hastened by the replacement of obsolete plant and by any further rise in the price of coal.

* * *

Marketing Schemes and Fines.—The Agricultural Marketing Acts of 1931 and 1933 empowered the various Marketing Boards to impose monetary penalties for the contravention of their regulations. It was obvious that the Boards must have some method of compelling adherence to the provisions of the schemes, but, nevertheless, these powers have given rise to difficulties and to much criticism. The fines are imposed by a special committee of each Board, after hearing such evidence as they think fit, and the defendant has no appeal to any outside authority. The fines rank as commercial debts, and their payment has been enforced, where necessary, through the ordinary courts and ultimately by distraint. The Milk Marketing Board alone collected nearly £20,000 in the last two years by way of fines, which ranged in size from a few shillings up to several hundreds of pounds. The matter has been discussed recently in the House of Commons, and last week Mr Morrison announced that he would set up a departmental committee to enquire into the present arrangements for the imposition and recovery of penalties for contraventions of such schemes and to make recommendations for any changes they may think desirable.

* * *

Grass Drying.—Experiments in the artificial drying of grass have been carried on for some years. Investigation of the nutritive value of freshly-cut young grass showed that, when some of the water had been evaporated, it possessed a higher content of proteins, minerals and vitamins than the same weight of hay, and that it could be preserved in good condition for some months. The main problem has been to find a satisfactory and economical method of drying short grass quickly by means of hot air or by passing it over a hot surface. The subject has aroused much interest in the dairying and grazing districts, whose profits are greatly influenced by the eternal uncertainty of haymaking and by the cost of concentrated foods. Two reports on grass drying have been issued by the Agricultural Research Council and the Agricultural Economics Research Institute at Oxford has just published the results of its second inquiry into the cost of grass drying. From this report, which covered the operations of nine driers on nine farms during 1937, it can be deduced that neither the process nor the methods of operation are yet capable of standardisation. Each of the nine driers differed in some important respect from the other eight; the initial cost of the machinery ranged from £1,200 to £400, while the working costs (including

rent and depreciation) ranged from £8 7s. 2d. per ton to £3 17s. 6d. per ton of the dried product. At the latter level and with prices now ruling, dried grass is definitely competitive with corn as a source of protein, but as it contains less protein and more starch per unit of weight than the concentrated oil cakes, it is too bulky to be the sole foodstuff of cattle. The results of these recent investigations into costs and nutrition indicate that artificial grass drying cannot, as was originally hoped, produce sufficiently concentrated material to supplant altogether the use of other sources of protein. But when the more technical problems of method have been solved, it is probable that dried grass will provide a valuable supplement to winter rations on the larger farms which can afford the machinery and which maintain enough regular labour to keep the drier in operation for some months at a time. For most farmers, however, ensilage is likely to remain the cheapest and most convenient method of preserving grass for use in winter.

* * *

State and Industry in East Africa.—The dividing line between the functions of Government and those of industry have become increasingly blurred in the twentieth century. The report of the Joint East African Board for 1937 reveals the complicated rôle played by the State in the development of the colonies and protectorates of Kenya, Nyasaland, Tanganyika, Uganda and Zanzibar. Its activities have extended far beyond the provision of roads and railways, of harbours and airports, of educational, medical and social services. During the last year the Government of Nyasaland have instituted, by agreement with the industry, compulsory auctions for tobacco on the lines of those recently established in Southern Rhodesia. The excess ginning capacity in the Uganda cotton industry has been dealt with by a ginning and buying pool system, under Government encouragement, and a bill for the control of the cultivation, purchase, sale and ginning of cotton has been introduced into the Tanganyika Legislative Council. The coffee producers in Kenya, Tanganyika and Uganda have set up a Joint East African Coffee Producers' Board, under the chairmanship of the Secretary to the Governor's Conference; coffee exchanges have also been established in Nairobi and Mombasa. In all these territories, the State services of agricultural research and veterinary control are playing an active part in developing agricultural resources and educating the native farmers in the principles of good husbandry. Industry and State are, in fact, working hand in hand in building the economic structure of these new countries, and the Joint East African Board closes its report with a plea for a long-term policy of development, to be carried out by co-operation between the local Governments and private industry.

* * *

Diamonds.—At the annual meeting of De Beers on May 20th, Sir Ernest Oppenheimer pointed out that sales of diamonds this year would probably fall substantially below last year's level, and that in the absence of an improvement De Beers might be forced to curtail output. The decline in diamond sales this year is not surprising, for there is no commodity which depends more on prosperity in the United States than diamonds. In 1937 the value of the United States diamond imports, at \$44,132,424, showed an increase of one-third over the figure for the preceding year and was only about \$11 millions below the record level of 1929. Estimates for the current year put probable imports into the United States at less than \$30 millions. Such a decline must seriously affect world turnover. The recent estimate of the administrator of the South-West Africa Mandated Territory for world sales in 1938—£6,000,000, against £9,300,000 in 1937—appears too high rather than too low in the light of the recent trend of sales. In 1937 South African diamond sales, at 949,113 metric carats, were below the country's current production for the first time since the depression year of 1932, when sales amounted to 1,030,434 metric

carats. So far, however, the industry has had no difficulty in maintaining firm prices, a consequence of the strong organisation created in recent years. In 1937 the average value of South African sales was 78s. 10d. per metric carat, against 58s. 5d. and 24s. 6d., respectively, in the two preceding years and 80s. 9d. in the record year 1929. After the last slump the co-operating diamond producers had a hard task in restoring the confidence of the market. They may be expected to do their utmost to maintain prices and, therefore, confidence.

* * *

International Wholesale Prices.—The downward trend of British wholesale prices has for the moment been partially checked. During the past fortnight *The Economist's* complete British index number has fallen only from 119.6 to 119.1, which is a much smaller movement than occurred in the previous fortnight. The decline in primary products, both in England and the United States, is also less pronounced. Also the complete Irving Fisher American index has maintained a fair degree of stability ever since the end of March.

† Monthly average.

The following table shows the movement of the various groups comprised in *The Economist* index number:—

The Economist INDEX
(1927 = 100)

	Sept. 18, 1931	June 2, 1937	May 25, 1938	June 8, 1938
Cereals and meat...	64.5	93.6	88.3	88.3
Other foods	62.2	68.6	58.9	58.1
Textiles	43.7	73.2	52.1	51.9
Minerals	67.4	110.0	89.0	89.3
Miscellaneous	65.8	86.7	75.0	75.1
Complete index	60.4	86.2	72.2	71.9
1913 = 100	83.1	118.5	99.4	99.0
1924 = 100	52.2	74.5	62.4	62.1

Wheat prices are lower than a fortnight ago, though barley and oats show a rise. Potatoes and meat prices remain stable, and bacon is also unchanged. Butter shows a continued decline, this chiefly accounting for the fall in the "Other Foods" Index. Textile prices are again slightly lower. Tin and copper show some recovery, but there is very little change in the miscellaneous materials, though rubber and hides are dearer.

INDUSTRIAL REPORTS

THE latest employment returns do not indicate a quickening in the pulse of industry. New business in iron and steel continues at a low level, though consumption remains fairly heavy. The decision of the Basic Pig Iron Producers' Association to stabilise prices at the current level until the end of the year brings the price policy of this section into line with that of the producers of the other grades of pig iron. Reports from the coal trade indicate a decline in demand which cannot be fully explained by seasonal factors. In the cotton trade there has been some expansion of new business, but little change has taken place in the wool textile trade.

Coal

Sheffield.—The market was quiet this week. There are no signs of improvement in the demand for industrial steam coal, and very little movement is observable in gas and household fuels. Smalls are relatively quiet, and prompt business is slack. Electricity generating stations are taking good deliveries under contract. Coke stocks are increasing, largely attributable to the number of blast-furnaces which have lately been put out of operation. For Sheffield works the demand for patent oven coke is easier, and graded coke requirements are smaller. Values all round are steady. The export market shows no change and the reduction of prices has so far had little effect.

*

Newcastle-on-Tyne.—The coal market in this area shows little change, trade is dull with little new business passing. In recent tenders to Scandinavian consumers, concessions have had to be made on current prices to meet competition from foreign coalfields. Northumberland steam collieries are now feeling the seasonal decline in demand and have some difficulty in clearing production. The Durham market, whilst being fairly steady in the coking section, is generally quiet owing to a falling away in local industrial trade. Patent oven coke shows little improvement, there still being large stocks abroad.

*

Glasgow.—The past week has brought no improvement to the Scottish coal market. Conditions are in some respects even more depressed, and only a curtailment of production is preserving something approaching a balance between supply and demand. Large coal is freely available in Lanarkshire, especially with the reduction in household demand, and the hope of price concessions continues to retard sales. Industrial consumption is not unsatisfactory, but in some cases the utility undertakings have reduced their acceptance rate of deliveries. Lanarkshire and Fifeshire secured the bulk of the order for the supply of 25,000 tons of nuts to the Danish Sugar Works, and Fife and the Lothians hope to obtain part of the Swedish railways contract, tenders for which were lodged on Tuesday. These have been about the only features in an export market otherwise extremely dull.

Cardiff.—Work was resumed at the collieries on Tuesday, but hardly any new business has been reported on the Cardiff Exchange, which was closed until Wednesday. Prices are nominally unchanged. Shipments at the South Wales docks last week totalled only 349,800 tons, compared with 394,700 tons the previous week, and 394,344 tons in the corresponding week last year. The volume of traffic (foreign and coastwise) from January 1st to June 4th amounted to 8,371,939 tons, against 8,397,326 tons during the same period in 1937.

Iron and Steel

Sheffield.—Business in the iron and steel market has been at a very low ebb, consequent upon the holiday and the general weakening of the position. For forge and foundry pig-iron there is hardly any inquiry even for small parcels, and there is almost no forward buying. Hope of an early revival is meagre, heavy stocks at works and at furnaces having to be worked off. The quotation for basic pig-iron is to remain unchanged until the end of the year, so that the prices of forge, foundry, basic and hematite will stand throughout 1938. There is a limited inquiry for basic iron, but hematite is neglected.

There is no change in steel. Inquiries for billets are fewer, while actual business is in smaller tonnages. Delivery arrears appear to have been overtaken. Wire rods are in less active demand, but for stainless steel sheets and strip there is a good inquiry.

The fixed prices of steel scrap are to operate until the end of September. Business this week has been dull in all sections.

Production of steel remains at a high level, although some of the Siemens furnaces have gone out of commission. Furnaces producing special and acid steels are operating fully, and electric furnaces producing stainless steel are working to capacity. The heavy engineering works are as busy as ever, and the rather smaller flow of orders will not affect matters for some months to come. Although the immediate outlook is less satisfactory, the autumn is expected to witness a revival.

*

Middlesbrough.—During May the shipments of all classes of iron and steel from the Tees amounted to 40,762 tons, or approximately 3,000 tons more than the previous month. There is little change in the market for pig iron and steel.

Makers of black sheets, 24 gauge, have now reduced their price for export to £13 per ton. Semi-manufactured steel continues to arrive, a parcel of 6,000 billets having been imported into the Tees during the past week.

Consumers of pig iron in this area are still overstocked; consequently little business is being done. The intermittent production of foundry pig iron is going chiefly into stock in the makers' yards. East Coast hematite production continues in excess of requirements, whilst basic iron production is excessive, and since the last report arrangements have been made for two more furnaces on this class of iron to

be put out of operation. During the past week a parcel of 500 tons of pig iron was shipped to Finland.

*

Glasgow.—Export business is quiet in almost every branch of the iron and steel industry in the West of Scotland. Notwithstanding, the outlook is not unpromising; owing to the large amount of fabricated work which has been placed in the West of Scotland and other districts within recent months, heavy quantities of the raw materials of the various fabricators are being required from makers in this part of the country. Steelmakers have been finding orders more plentiful within the past few weeks, and the feeling seems to be general that business will gradually improve. There is still many weeks' work on hand at the steelmaking plants; in other branches it seems unlikely that any further curtailment of operations will take place within the next few weeks.

*

Cardiff.—Work has been virtually suspended this week at the tinplate works, and, owing to heavy stocks of ingot steel, several of the melting furnaces remained idle. Prices are nominally unchanged. Figures for production, stocks and shipments are given below:

		Tinplate Industry Statistics		
		Week ended		
		May 29, 1937	May 21, 1938	May 28, 1938
Production—per cent. of capacity		73.94	35.51	38.58
		Week ended		
		June 1, 1937	May 25, 1938	June 2, 1938
Shipments	Tons	9,169	4,638	1,356
Stocks (warehouse and in vans)	Tons	5,217	5,935	8,334
		Twenty-two Weeks ended		
		June 1, 1937	June 2, 1938	
Shipments	Tons	181,615	111,341	

Textiles

Cotton (Manchester).—Owing to the Whitsuntide holidays the market has been disorganised, but at the end of last week purchases of certain yarns increased, customers being attracted by the low prices caused by the fall in raw cotton rates. An unsettled feeling, however, has prevailed and the wider fluctuations in cotton futures in Liverpool and New York have had a disturbing influence. Raw cotton news has been rather mixed. Diverse reports have been received concerning the prospects for the new crop in the United States, but the statistical position remains bearish.

There has been freer buying in American yarns for home consumption, especially of coarse counts, some of this increased activity being due to short covering by manufacturers. In the Egyptian section some special contracts have been arranged in tyre yarns for Germany.

Operations in the cloth section have been restricted and for export and the home trade buyers have exercised caution in giving out orders. On the whole, however, customers have displayed more interest in prices. Owing to the depression a large number of spinning mills and weaving sheds have been closed for the whole of this week, the usual Whitsuntide holidays being extended.

COMPANY MEETINGS

ASSOCIATED NEWSPAPERS, LIMITED

THE HON. ESMOND HARMSWORTH ON THE YEAR'S RESULTS

The thirty-third annual ordinary general meeting of Associated Newspapers, Limited (proprietors of *The Daily Mail*, the *London Evening News*, and the *Sunday Dispatch*), was held in the Memorial Hall, Farringdon Street, London, on the 9th instant.

The Hon. Esmond C. Harmsworth, the chairman, presided. The secretary (Mr J. P. Hobbs, F.C.I.S.) read the notice convening the meeting and the report of the auditors.

The chairman, in moving the adoption of the annual report and balance sheet, said:

Ladies and gentlemen, the balance sheet and directors' report were sent with the notice convening this meeting; therefore, with your approval, I will take them as read.

The profit of the company for the year to March 31st last, after providing for interest on the company's 3½ per cent. registered notes, depreciation of plant and machinery, National Defence Contribution, income tax, etc., amounted to £785,035 15s. 1d.—a figure which we regard as very satisfactory, especially in view of the extremely difficult conditions existing during the period under review, to which I shall make further reference.

The dividends on the 5 per cent. preference shares and the 7 per cent. ordinary shares have been paid, and the directors have distributed interim dividends on the deferred shares amounting to 25 per cent. An amount of £50,000 has been transferred to publicity reserve and the balance, £525,131 6s. 6d., is carried forward.

The printed accounts are in the same form as previous years, and there is very little to comment upon on the liabilities side. Share and loan capital remain the same, but you will remember that, in accordance with the terms of the issue, registered notes to the nominal value of £25,000 are in October due to be drawn for repayment at 101 per cent. In this connection I am sure you will agree that the action the directors took last year in issuing these 15-year 3½ per cent. notes in substitution for the old 4½ per cent. Ten-year notes has been more than justified.

On the assets side of the balance sheet the item for properties and plant shows a normal reduction of £54,820 after depreciation, plus sundry additions to plant.

Stocks of paper, etc., are higher, newsprint stocks accounting for most of this item.

The alteration in investments on the balance sheet is largely a technical one. You will notice the item "Shares in Subsidiary Companies" has been substantially reduced, and the item for other investments increased. The chief reason for this is that, although the company's holding of shares in Anglo-Newfoundland Development Company, Limited, remains the same number as was included in last year's balance sheet, owing to shareholders exercising options obtained from it in 1933, the Anglo-Newfoundland Company has increased its issued share capital, so that our company's holding is now just below the number that determines a legal subsidiary company.

It is for this reason also that the item "Amount owing to a Subsidiary Company" on the liabilities side of the balance sheet is much less, because the balance owing to the Anglo-Newfoundland Company in respect of paper is, this year, included with the ordinary creditors.

With regard to our investments generally, I think shareholders would like to know that the total amount of gross dividends received from investments amounts to a sum in excess of 6 per cent. of the total value of investments shown in the balance sheet.

The debtor balances are a little less than last year, but these hardly call for comment, and cash at £370,350 is sufficient for our immediate requirements.

ANGLO-NEWFOUNDLAND DEVELOPMENT COMPANY, LIMITED

The Anglo-Newfoundland Development Company's report which has just recently been issued shows a substantially increased profit for the year 1937. The improved results were due to a much larger revenue received from that company's interest in the Buchans Mine through its subsidiary Terra Nova Properties, Limited. In paying a final dividend of 5 per cent., making a total distribution of 8 per cent. for the year, the directors of the Anglo-Newfoundland Com-

pany have pursued a conservative policy, as the dividend for the year represented approximately only half the available earnings before the provision for reserve for contingencies. Whilst future earnings from the Buchans Mine will naturally depend to a great extent on the price of the base metals which it produces—and the price of these metals has fallen very considerably in the last few months—we feel that, looking to the future, our holding of shares in the Anglo-Newfoundland Company is a very satisfactory one, affording us as it does security for our newsprint supplies with prospect of a good return from our investment by reason of the mining interests. I need not refer more fully to the position and prospects of the Anglo-Newfoundland Company because the annual meeting of that company is to be held in Canada next week, and the chairman's speech at the meeting will, as in previous years, be published in *The Daily Mail* and other newspapers.

IDEAL HOME EXHIBITION

The *Daily Mail* Ideal Home Exhibition, in the thirtieth year of its history, demonstrated once again its pre-eminence in public favour by attracting a paid attendance of 568,756.

The Exhibition enjoyed the honour of a visit by H.R.H. the Duke of Kent, and the great privilege of an opening by Mrs Neville Chamberlain, whose charming presence contributed to an impressive ceremony.

Exhibitors' reports of business transacted at the Exhibition again show its remarkable force as a trade stimulant for all enterprises touching the needs of home life, and statistics recorded during the event point emphatically to its unflinching appeal to women.

The 1939 Exhibition will be held at Earl's Court, the special amenities of which lend themselves to plans which it is anticipated will enable us to organise an event of an attractiveness beyond anything which has hitherto been offered to the public.

ADVERTISING REVENUE

Concerning advertisement revenue, it was not to be expected that previous records would be improved upon, or even maintained, over a period so difficult for business.

World unrest has had its disturbing influence on the home market. All too frequently international affairs have given rise to anxiety, and under this cloud of uncertainty the normal processes of trade were bound to be affected.

With laudable courage and commensurate reward, many of the big business concerns have increased rather than diminished their advertising spaces. In other instances, rightly or wrongly, selling enterprise has been noticeably curtailed.

In this connection it says much for the prestige of your newspapers—*The Daily Mail* in particular—that they represent the first to be affected by increases in advertising and the last to be affected by reductions.

The Daily Mail still enjoys its enviable supremacy as the most powerful advertising medium in the country. For the year under review, in spite of the keenest competition ever faced, the display advertising revenue of *The Daily Mail*—that is, trade and financial—exceeded that of its nearest rival by well over 10 per cent.

This in itself shows that no national advertising campaign is considered complete unless it is headed by *The Daily Mail*.

The great and incomparable strength of *The Daily Mail* as a publicity medium rests, of course, in the appeal of this newspaper to the better class public. As evidence of this, independent research has recently established that *The Daily Mail* is read by one in every three owners of private motor-cars throughout Great Britain.

To advertise in *The Daily Mail* is the accepted golden rule of successful selling. Similarly, it is the ambition of every progressive business house to see its products displayed in that "National Shop Window," the *Daily Mail* Front Page.

"THE EVENING NEWS"

Referring now to *The Evening News*, once again progress is a gratifying feature of the year. This virile newspaper, which reaches

more homes than any other evening publication in the world, has increased still further its lead, in net sales, over its competitors.

An increase is shown also in trade advertisement revenue, and the trend for the current year is revealed in the fact that store and display advertising has increased in *The Evening News* and decreased in the columns of its rivals.

Over recent months *The Evening News* has carried more than twice as much store advertising as that in the next London evening newspaper on the list. This fact is, of course, of exceptional significance. Such publicity, being keyed, is placed with those newspapers in proportion to the amount of business produced.

Concerning the *Sunday Dispatch*, I can again report a sound and steady situation, which reflects the high standing of this newspaper in the estimation of advertisers as well as that of the reading public.

The great value of the *Sunday Dispatch* in national publicity campaigns is shown in the fact that it is essentially the home and family newspaper of the middle classes.

The *Over-Seas Daily Mail*, unrivalled as a link with the Homeland for Britons abroad, has had yet another successful year. Gratifying features are a 5 per cent. increase in advertisement revenue and the frequency of the special colour issues.

The position of our provincial newspapers, both in regard to sales and advertising revenue, was well maintained during the year.

In this connection, however, you will realise that the rise in the cost of newsprint for the current year will affect the profits of these papers.

NEWSPRINT

I referred last year to the price of newsprint. At the time of our last meeting, owing to the rapidly increasing costs of raw materials, the price of newsprint was increased for 1938 by approximately 30s. per ton, and, whilst this rise only partially affected your company in respect of our past financial year, we shall feel the full effect of the increase during the present financial year. Your company's papers consume approximately 140,000 tons of paper per annum, and it is, therefore, not difficult to see the heavy extra charge to be borne by an increase of 30s. per ton on this large tonnage.

The conditions in the paper industry have changed considerably since we last met, and, owing to the recession in world trade, no doubt aggravated by the disturbed political situation, there has been a considerable fall in the price of raw materials and in consumption of newsprint. These changed conditions would indicate that for the year 1939 there should be no further increase in the cost of newsprint supplies.

At the commencement of my speech I referred to the difficult conditions prevailing during our last financial year. Most of you are, I am sure, aware of the factors, particularly during the last six months of the year, which disturbed trade generally, not only in this country, but throughout the world, causing a falling off in business all round and, unfortunately, for the same reasons, similar conditions persist to-day. To give you only one example of how your company is affected: the amount of financial and city advertising carried by your papers during the last financial year was lower by over £100,000 than that carried in the previous year.

In the newspaper industry competition was as fierce as ever, heavy expenditure being incurred all round in the struggle to maintain and increase sales. You have probably heard a great deal on the vexed question of canvassing. Your directors have so far found it necessary to continue using it as a defensive measure to compete with its rivals, some of whom apparently do not seem to care how much they spend.

I wish now to refer to the payments of dividends. It has been our practice for some years to pay quarterly dividends on the deferred shares. Owing to the present uncertain world conditions and the impossibility of forecasting results very far ahead, your directors propose to discontinue the payment of quarterly dividends and instead to pay two interim dividends during the present financial year—one in July and a further one in January next—to be followed by a final dividend at the next annual general meeting. This, as you know, is the dividend policy adopted by the majority of industrial concerns, and I would mention that the interim dividends will not necessarily bear any relation to the final dividend.

I cannot be expected to assume the role of prophet in regard to the future, but your directors are satisfied with the soundness and strength of the finance of your company, which are reflected in the balance sheet you have before you, and that your company will continue to enjoy its full measure of any general improvement there may be in world trade.

I am sure you will not wish me to close without an expression of thanks and appreciation to our many loyal friends in the industry—particularly the wholesale and retail newsagents, and the advertisers and advertising agents—And also an acknowledgment to our staff

throughout the business for their loyalty and good work during a difficult year.

The chairman concluded by moving the adoption of the report and accounts.

Mr Stanley Bell (managing director) seconded the resolution, which was carried unanimously.

The retiring directors were re-elected, and the auditors, Messrs Lever Honeyman and Company, were reappointed.

The proceedings terminated with a vote of thanks to the chairman and directors.

HENDERSON'S TRANSVAAL ESTATES, LIMITED

SATISFACTORY RESULTS OF A DIFFICULT YEAR

The twenty-sixth ordinary general meeting of Henderson's Transvaal Estates, Limited, was held, on the 8th instant, at River Plate House, Finsbury Circus, Mr W. L. Castleden, the deputy chairman and managing director, presiding.

The chairman, after paying a tribute to Sir Abe Bailey, in the course of his speech said:—

The profit for the year carried to the balance sheet is £75,810. This figure is less by £8,763 than the record profit of last year, but I think that in the difficult circumstances which have prevailed during the past twelve months, you will regard it with some satisfaction.

The balance of £48,360 brought into the accounts brings the credit to profit and loss up to £124,171. Out of this your directors recommend a first and final dividend of 12½ per cent. for the year, less income tax, the same as last year, leaving £53,741 to be carried forward, subject to the directors' additional remuneration, amounting to £1,676 13s. 6d.

It is with satisfaction that again I am able to state that as at March 31st the market value of our quoted investments was in excess of book cost. This is notwithstanding the heavy fall in market quotations, which were at their lowest about the date when our accounts for the year were closed, viz., March 31st. The unquoted stocks and shares, which are comprised almost entirely of holdings in our subsidiary and associated companies, are of necessity valued by us, and we are satisfied that this valuation has been taken on a most conservative basis.

During the year our investments in Government securities increased by £10,858 and other stocks and shares by £38,117. These increases account for the reduction in our cash balances of £27,468.

Our reserve accounts in addition remain intact.

The chairman, having dealt at some length with the results of the subsidiary and associated companies, continuing, said:—

There is little more to say with regard to the past year. It is perhaps not surprising that in such difficult times our profits did not quite reach last year's record, but we can, I think, view with satisfaction the fact that we are able to maintain our dividend.

CONDITIONS IN SOUTH AFRICA

Business generally in the Union of South Africa continues to be active and prosperous, and there is progress to be recorded in most directions. In the realms of finance, however, there has been a setback, and the lack of confidence which has brought about a restriction in markets is inevitable in these days of uncertainty.

As in the past, so in the future, our interests are linked up mainly with South Africa. In no country is there greater faith in the future as is evident in the developments taking place in industry and in mining. Even the Union of South Africa, however, must feel the evil effects of world unrest and the unsettled conditions in almost every part of the globe. Wars and rumours of wars are a daily occurrence, and cannot but adversely affect economic conditions everywhere.

Politics in South Africa are, however, now in a more settled state, and the recent elections prove that the country as a whole has no desire to return to party and racial strife and would take no risks that might jeopardise the future of their country.

The prosperity of the Union is bound up with its great gold-mining industry and the developments now in progress are on a truly phenomenal scale. An adequate supply of native labour is, however, an essential, and it is recognised that the securing of this is an outstanding problem and one that is causing considerable anxiety. The report and accounts were unanimously adopted.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Bouverie Street, Fleet Street, London, E.C.4.

MILK MARKETING BOARD

LIQUID SALES UP 60,000,000 GALLONS YEARLY

The annual general meeting of the Milk Marketing Board was held in London on the 8th instant.

Mr T. Baxter (the chairman) said:—I feel I must refer with sincere regret to the death of our late colleague, Mr John Garton, who was a member of the board for the South-Eastern Region. Mr Garton first became a member of the board in June, 1934, and was closely associated with agricultural interests for many years, and particularly with the National Farmers' Union, of which he was a past president. The board has lost a highly respected member.

One salient feature is the light thrown on the enormous part that milk production plays in the agriculture of the country and the number of individuals who are dependent on it. No fewer than 89,105 farmers have wholesale contracts, and 63,445 hold producer-retailer licences, a total of 152,550. There are approximately 22,000 producer-retailers, however, who have wholesale contracts also, so that some 130,000 farmers in England and Wales are concerned with the production and sale of milk.

VOLUME OF MILK SOLD

The total volume of milk sold was 1,011,249,539 gallons, which, when compared with the total production in the previous year, shows a decrease of 632,573 gallons. Actually on a true comparison the decrease would be greater because in this year's total there is included since October, 1937, the sale of milk which was previously exempt. There are two main factors which account for the lower production. One is the Government livestock policy, which has undoubtedly resulted in a little less attention being given to milk on some farms. I am inclined to believe, however, that the major cause is the higher costs of production, due to the rise in the price of feeding stuffs and costs of labour which producers had to meet during the year. It is unlikely that there will be any expansion in the quantity of milk produced unless and until milk production is more remunerative to the farmer.

The sales of liquid milk show an increase of 51,303,926 gallons over last year, and represent 71.3 per cent. of all milk passing through the Scheme, whereas in 1936 the proportion was 66.2 per cent. This development has been mainly at the expense of manufacturing milk, the volume of which this year was equal to 28.7 per cent., as compared with 33.8 per cent. for the previous twelve months.

BETTER POOL PRICES

Although production decreased slightly during the year, the sum realised from the sale of milk under wholesale contracts was £47,321,049, an increase of £3,138,000. The average pool price was 12.77d. per gallon, the highest yet paid under the Scheme, and an increase of 0.86d. per gallon. More than half of the increased price paid has been brought about by better marketing, by increasing the volume of sales through the liquid and higher-priced manufacturing markets. The remainder is due to the slightly better price per gallon in certain months which the Board was able to secure from the buyers. The average price per gallon for liquid milk this year was 15.58d.—last year it was 15.25d.; for manufacturing milk we realised 6.35d.—last year 5.39d.

Remembering that nearly 30 per cent. of the milk produced is used for manufacturing purposes and that, because of the low selling value of competing and subsidised imports, thoroughly uneconomic prices are obtained by producers, you will realise the drag which manufacturing milk has on your returns. During the period under review we have received no assistance under the Milk Act for manufacturing milk, and at present we are liable to be called upon to repay to the Government £26,320 for previous advances.

COST OF ADMINISTRATION

The cost of administration of the Scheme still remains at less than one-tenth of a penny per gallon, as in the previous year. In the year under review, increased liquid milk sales alone have returned to producers a sum which is three times greater than the total cost of administration.

While progress has been recorded in many directions, nowhere has it been more substantial than in the development of the liquid milk market. The people of this country are becoming more liquid conscious and realise that milk is a vital factor in national health. There is a net increase in sales of 40,000,000 gallons after allowing for the new entrants into the Scheme. So accepted has the milk habit become that the adult secret drinkers of a few years ago now come into the open to declare their faith in it.

The Board greatly appreciate the part which the Press of the whole country has played in this important development. In conjunction with the National Milk Publicity Council—whose splendid work on

behalf of the industry we gratefully acknowledge—a special approach has been made to employees in factories, offices and workshops throughout the country, with the result that 700,000 gallons of milk each month are being consumed in 6,624 factories. The service is proving beneficial to all who participate, and it has been followed by a decline in the sickness figures. There still remains considerable leeway to be made up by the use of more milk in the home before we can be satisfied that health, nutrition and fitness standards are being met and that we compare satisfactorily with some other countries in this respect.

You will be surprised that the total cost of transporting milk amounts to not less than £5,000,000 annually. After investigating the problem very closely we are convinced that there is a considerable wastage in the delivery of milk to depots and dairies and in the transporting of milk unduly long distances to consuming centres. The Board have been assisting producers in saving transport charges for a number of years. During this contract period we took action on behalf of 2,600 producers, so that their charges were reduced, and we estimate that a net saving of £20,000 per annum has been effected.

All wastage and inefficiency in the transport of milk is borne by the producers, although they have as yet but little control of it. We feel that as producers ultimately pay for transport, they should be able to direct and control it.

GOVERNMENT MILK BILL

We are aware of the main provisions to be embodied in the Milk Bill as published in the Government White Paper. I am extremely disappointed that the Government's policy does not contain provisions for a levy subsidy on imported milk products. That policy, at one time vigorously propounded, has apparently been discarded, and the main benefits of the Bill will be in the way of premiums on quality milks and in respect of attested herds which will be paid to the benefit of those producers participating in these progressive developments. I can only speak commendably on this aspect of the proposals; no progressive producer can criticise a policy of cash inducements for quality production. Another important feature will be a price insurance plan to guarantee to the Board a certain degree of assistance on manufacturing prices. With this the Board is not at all satisfied. The Government does not propose to guarantee a price for milk, but they will pay a subsidy when the prices of imported butter and cheese fall below a certain level, and this means prices even lower than those provided for in the present Milk Act. It also means that with such meagre help to the producer to combat the ravages of cheap imports there is little likelihood of the farmer being able to provide more milk—a tragic position for the country in these uncertain days.

I feel the recent drought was of such serious importance to farmers that some reference ought to be made to it here. The public themselves are well aware of the intensity of that drought and its effect upon the farmer's position. Throughout England and Wales there has been an abnormal shortage of grass for grazing cows, which has resulted in producers being unable to produce milk much under the cost of winter months by having to feed their cows with purchased and home-grown foodstuffs. In these circumstances I am of the opinion that a serious shortage may occur later on in the year unless the dairy farmer is compensated by an increase in the price of milk. We approached the buyers and asked them to agree to an increase in the wholesale price of liquid milk of 4d. per gallon in June and July, but I regret to say that they would not accede to our request. Hence we had no alternative but to take the matter before a consulted person whom we shall be meeting in a few days' time.

SOCIAL SCHEME'S PROGRESS

Let me review progress. The people of England and Wales are drinking 60,000,000 gallons of milk per year more than they were three years ago; nearly 40 per cent. of the country's total milk supply is now of accredited or tuberculin-tested standard; producers have received additional revenue; transport costs have been reduced; the remunerative markets have been given a first call on supplies; more mothers and infants in the Special Areas have availed themselves of the scheme to buy their milk at half price; more school-children have come on to their special milk roll; more and more milk bars are being opened; the Board has more creameries and is operating them successfully; altogether a record of progress which brings us a step nearer the day when producers of the most perfect food should have their costly, hazardous and arduous calling recognised by adequate remuneration.

ASSOCIATED TIN MINES OF NIGERIA, LIMITED

INCREASED EFFICIENCY FOR PRODUCTION

The eleventh ordinary general meeting of Associated Tin Mines of Nigeria, Limited, was held, on the 9th inst., at the Chartered Insurance Institute, 20, Aldermanbury, London, E.C.

Mr Douglas Christopherson (the chairman) presided, and in moving the adoption of the report and accounts, said that under the heading "Technical Management" shareholders would observe that, with a view to effecting economies, the management of their company in Nigeria has, from the first of January this year, been placed in the hands of a central organisation under the title of A. O. Nigerian Tin Mines, Limited. The same applied to their neighbour, London Nigerian Tin Mines, Limited. In future there would be one centralised clerical staff instead of two separate staffs, and it was the intention to standardise stores, as soon as possible, and to centralise them in one place instead of having them spread out as they had been.

Last year he had mentioned that a new dredge had been ordered and a Monaghan dragline; since then it was deemed advisable to order another Monaghan and to convert the 320 B. Shovel to an electrical dragline.

REDUCED OPERATING COSTS

With the completion of the present capital expenditure programme, so far as their technical management could see to-day, there would be no further call for heavy capital expenditure, whilst the property would be thoroughly equipped so as to meet at once any increase in the quota they might be called on to produce, and at greatly reduced operating costs. With the dredge and Monighans in operation their native labour requirements would be much less, and that also applied to the water consumption, the latter a most important consideration in a country where shortage of water supplies frequently occurred, which seriously interfered with maintaining a regular and steady output.

The fall in the price of tin during recent months and the reduced international quota had entirely upset their anticipations of being able to provide funds to meet those commitments from current profits.

It would be evident that the prospects for the current year were not good, but with an increase in the demand for tin metal, which they could safely anticipate, they could expect, equipped as they would be for much cheaper production, to find themselves once more in the position of earning substantial profits.

CREATION OF BUFFER STOCK

The directors were well pleased that the signatory countries to the Restriction Agreement had now agreed to the creation of a Buffer Stock, being convinced, as they were, that that was required to supplement the efforts of the International Tin Committee to prevent too violent fluctuations in the price of tin. From a study of the market during its periods of most violent fluctuations in 1937, namely, a rise of £82 between February 12th and March 15th and a fall of £83 between September 15th and November 8th, it was not too much to say that if even the old Buffer Stock had been in existence the fluctuations would have been confined to very much smaller limits. With the exceptional falling off in the consumption of tin, especially in America, during the present year he did not think either the Restriction Agreement or the existence of a Buffer Stock could have prevented some fall in the price, but it would have assisted in making the fall less severe.

Given normal fluctuations in consumption, the directors believed there was now machinery available which could be operated in such a way as to prevent abnormal fluctuations in the price. He used the word "abnormal" advisedly, because they felt, however it might be decided to operate the Buffer Stock, it was essential that it should not be operated in a way that would strangle the market for their metal. It was to the interest of them as producers that there should be a reasonably free market for their product, which could hardly be the case if the price was too narrowly controlled as to prevent reasonable fluctuations.

In the meantime, there had been a further reduction in the export quota. That was said to have been criticised in Malaya, because it did not fall in with the explanatory *communiqué* issued by the Committee at the beginning of May, but actually there had been a considerable fall in the price of primary commodities between May and June, and it seemed far better to make a sufficiently drastic cut at once, to bring production down below consumption; in other words, to start the process of eating into the existing large stocks rather than *shake half-measures*. The action of the International Tin Committee *pariis*, he thought, to be commended, and the report was adopted.

BURMAH OIL COMPANY, LIMITED

PETROLEUM INDUSTRY'S NEW HIGH RECORD

SIR JOHN T. CARGILL'S SPEECH

The thirty-sixth ordinary general meeting of the Burmah Oil Company, Limited, was held, on the 3rd instant, in Glasgow.

Sir John T. Cargill, Bart., chairman of the company, in the course of his speech, said:—In respect of the volume, both of production and demand, 1937 set up a new high record for the petroleum industry of the world. That on the whole orderly marketing prevailed and the industry in general benefited must, I am afraid, be attributed, however, not so much, if at all, to any universally planned co-ordination towards wise regulation of demand and supply of an asset vital to world progress and of a wasting nature, as to a fortuitous concatenation of other circumstances. Had there been in the period no decline in Roumanian production and export, no growth in the domestic demand for the production of that country and no disturbance of production from Venezuela and Mexico, such equilibrium between demand and supply as was achieved would not have been possible, despite the overhead expansion of the former. Even so, the improved trading results in 1937 of most of the petroleum companies operating throughout the world are due less to any higher values secured for the commodity itself than to reduction in their costs, consequent on larger outputs and to more remunerative employment of their tanker fleets due to higher ocean freights following on a temporary shortage of ocean tonnage.

OPERATIONS IN INDIA

In our own sphere in India our operations in the period were maintained approximately at the level at which we have stabilised them now for some years.

Selling prices on average were somewhat improved in our markets in India and Burma by the world conditions I have already referred to, but further reductions in costs themselves played a considerable part in producing the expansion in the net balance of trading profit to £2,502,284.

As regards your investments, and here I cannot too strongly emphasise the very considerable portion of your total profits for which they are responsible, and how much is due to them, the very satisfactory rate of your dividends and the capitalisation of surplus profits carried through in recent years and now further proposed, the considered view of your directors is that, considerable as is the overall excess of their present value, whether over the book cost as it is now, or as it will be after the writings up we are proposing, that excess in a normal course of events must steadily materially increase. In these circumstances we on this side of the table have had little hesitation in arriving at what we ourselves have already decided to do or at what we are to-day recommending you to do with the year's disposable balance.

Excluding export sales of paraffin wax—our only export—from the Eastern trading profits, an analysis of the total figure of profit shows that the following sources contributed in the percentages stated: India and Burma, trading 38.202 per cent., export trading 13.538 per cent., investment income and transfer fees 48.215 per cent.

BURDEN OF TAXATION

To emphasise what a serious factor taxation represents in the cost of petroleum products to the consumer I would instance the facts that expressing gross proceeds as one hundred we got out of them in 1937, in the case of kerosene 16.78 and in the case of benzene 9.58, whereas between Excise duties and taxation on profits the Governments concerned took in the case of the former product 29 and in the case of the latter 48.22.

You are aware that, unhappily, there developed in the beginning of the current year a situation in connection with the Burmese and Indian employees in our Burma fields which resulted in large though steadily reducing numbers withholding their labour for several weeks, and in the end compelled us, however reluctantly, to meet the balance of our requirements from the large body of those seeking employment there. We refrained from this immediate alternative as long as we could do so with safety to our operations and fairness to those seeking work. We have long enjoyed the reputation in India and Burma of being in the van of enlightened, generous, and considerate employers. It is a reputation of which we are proud, because we feel it to be justified and a reputation which it will be our constant endeavour to continue to deserve.

As regards the prospects for the current year, I prefer not to hazard conjectures, whether favourable or the reverse, beyond those implied or expressed in what I have already told you as to our own position in particular and as to that of the world industry in general.

The report was adopted.

MARSTON VALLEY BRICK COMPANY, LIMITED

DIVIDEND OF 17½ PER CENT.

The ninth annual meeting of the Marston Valley Brick Company, Limited, was held, on the 9th instant, at the Institute of Chartered Accountants, London.

Mr A. W. Allard, who presided, said that the trading profits and revenue from other sources amounted to £184,638; a slight improvement on the previous year, and, after various deductions had been made, the net profit was £116,912. Great difficulties had been experienced in getting deliveries of steel for the construction of the extensions to the Ridgmont Works, but those extensions were now proceeding satisfactorily and, having in view the continued large demand for the company's products, well known as Marston Besspres, and the difficulty of meeting their customers' requirements, he was still of opinion that the decision to provide for an increased output was fully justified.

Although the first section of the extension had come into partial production late in April and no benefit had been derived in the accounts under review, the sale of bricks for the past year showed a considerable increase. Both works had been in full production, working day and night shifts. During the winter the usual slackness of demand was experienced, but in February and March sales had established records. Out of the available profit of £92,068 it was proposed to pay a final dividend of 10 per cent., less tax, making 17½ per cent., less tax, for the year.

Their common and facing bricks were very popular, and there did not appear to be any falling off in the building trade generally; when one district got slack, another got busy. Demand for their facing bricks was growing so rapidly that the managing director intended largely to increase the output.

Mr Duncan Whitehouse (managing director) said that he was quite optimistic as to the future. Slum clearance was going on all the time private building continued, and in addition their bricks

(Continued from page 628)

Wool (Bradford).—Not much progress can be reported in the wool world during the past fortnight, all sections of the market marking time. It is the reports from Australia which have helped to maintain prices in consuming centres, although Bradford has inclined to a little weakness in tops. Raw material prices continue to be slightly ahead of prices for tops and yarns, and this is the strength of the present position. Manufacturing conditions are far from satisfactory, and many mills are standing idle the whole of this week. Good average 64's tops are available at 25d. per lb., and warp 64's at 26d.-26½d. per lb., while yarn prices are in line with these quotations. It seems as if the spring and summer trade of this year was a total failure, and this is causing no little concern regarding the future.

THE COMMODITY MARKETS

THE past week has witnessed a rally in the prices of primary products. There are no indications, however, that this really portends a change of trend, for there is little evidence of the imminence of a re-stocking movement by consumers.

Among commodities sensitive to changes in market psychology, copper, tin and spelter were marked up in price during the week ended last Wednesday. Rubber, raw cotton and wheat were also slightly firmer.

An improvement in prices was also noticeable in the United States. Thus, Moody's index of the prices of staple commodities (December 31, 1931 = 100) rose from 130.1 to 131.8 during the week ended last Wednesday. A month ago the index stood at 136.9 and a year ago at 201.0.

Metals

Copper.—On the news that the Kennecott Copper Corporation, the world's largest copper producer, will discontinue its output from America as from June 15th, a substantial improvement in London copper prices occurred this week. The standard cash price closed at £34 8s. 9d. per ton, a net gain of £1 10s. on the week. The prospects in this market are discussed in a special Industrial Note on page 623.

Tin.—Last Thursday's tin decisions, which are also discussed on page 623, have resulted in a substantial improvement in tin prices; and although the highest levels of the week were not maintained, there was a net gain of £8 5s., raising the closing price to £171 5s. per ton.

Lead and Spelter.—Lead closed this week at £13 6s. 3d. per ton and thus showed no change on last week's close. Simultaneously, spelter improved by 10s., to close at £12 7s. 5d. per ton. Demand for the two metals has not improved this week, but offerings have been on a much smaller scale than of late.

Grains

Private estimates of the United States winter wheat crop range from 768 million bushels to 845 million bushels, and are generally about 125 million bushels above the official estimate of last year's harvest. In spite of these forecasts, prices rose sharply before the holidays and though the market was easier early this week, old crop Manitoba registered a gain of 4s. to 5s. per quarter on the week, a recovery from the low prices of

were being used by the Air Ministry, H.M. Office of Works, the War Office and Admiralty, the L.C.C., and many other county councils.

The report and accounts were unanimously adopted.

TRONOH MINES, LIMITED

THE STANDARD TONNAGES POSITION

The thirty-sixth annual general meeting of Tronoh Mines, Limited, was held, on the 9th instant, in London.

Mr C. V. Thomas (the chairman) said that the profit for the year amounted to £276,594. The property account remained at the nominal figure of £1. That account represented the company's mining lands at Tronoh and Kampar, approximately 5,500 acres, the four dredges, the expenditure to December 31st last on the new dredge and all other plant, machinery and buildings at the mines. Dividends totalling 60 per cent. were paid during the year.

With respect to the question of the standard tonnages as being most unjust to Malaya, he had hoped that that would have received the attention of the authorities concerned.

Malaya stood out as the only country able steadily to produce her quota through 1937 when the quota was at its highest. It was thus proved that the Malayan standard tonnage was too low and that the standard tonnages of most other signatories were too high. Malayan producers, who were the best able of all to face uncontrolled production, were bearing a grossly unfair share of the burden of restriction. The standard tonnages had now been amended, but in discarding "operative" tonnages, Malaya's tonnage had been reduced by 4,500 tons (approximately), the N.E.I. tonnage had been reduced by 2,269 tons, and Bolivia enjoyed an increase of nearly 9,000 tons. Operating under the tonnages as amended and an International Quota of 45 per cent., the domestic quotas for Malaya, Bolivia, Belgian Congo and Siam would be 35 per cent. (approximately), 68 per cent., 64 per cent. and 60 per cent. respectively. If the other signatories were not prepared to agree to a fair revision of the tonnages, Malaya should at once give notice of withdrawal under Clause 22 of the Agreement.

The report was adopted.

the last ten days. Maize was also dearer before Whitsun, but there has been some reaction since. Demand for feeding barley is small, but prices are firm, in anticipation of a shortage of maize.

Other Foods

Provisions.—Meat has been a slow trade and prices are unchanged, as are those of bacon. The seasonal decline in butter prices continues and Danish is quoted at 122s. 6d. per cwt. Eggs were 6d. per 120 dearer at the end of the week, English selling at 11s. 9d. per 120.

★

Colonial Produce.—The markets for sugar, coffee and cocoa have been dull and prices are hardly changed. At the auctions held before Whitsun, teas were generally about ¼d. per lb. cheaper, and demand was quiet.

Miscellaneous Commodities

Oilseeds and Oils.—A certain amount of business has been transacted at the recent low prices, but the seasonal decline in activity has prevented any marked recovery. The new Indian crop of linseed is officially estimated at 457,000 tons, as compared with 420,000 tons in last year. There was a good demand for cotton seed ex Hull, which helped to improve prices.

★

Rubber.—There were only two full business days this week. The market was steady and prices were advanced by ¼d. per lb., on reports from New York that the cut in the production quota will soon cause a decline in stocks.

Scotland

We take the opportunity offered by the holding of the Empire Exhibition in Glasgow to present a series of charts on the economic position of Scotland. In the upper panel we show the distribution of occupations at the census of 1931 and the use of land in 1935. The series of pillars, which compare the importance of Scotland in different fields of activity, relate to 1937, except in the cases of the output of agriculture and industry—these are for the census years 1935 and 1930-31 respectively. Scotland's proportion of Great Britain's agricultural output in 1936-37 would be about 15.4 per cent. compared with 16 per cent. shown. The figures used for fish landed, output of coal and steel and merchant ships launched are of volume. To show the course of business activity we have used our own index for the U.K. and that of the Clydesdale Bank for Scotland. In the remaining space we have selected two industries—shipbuilding and fisheries—for further examination. As the curves of business activity and shipbuilding are based on annual figures they do not show the effects of the recent recession.

GOVERNMENT RETURNS

For the week ended June 4, 1938, total ordinary revenue was £7,966,000, against ordinary expenditure of £45,015,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £80,156,000, against a deficit of £56,586,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On June 3rd, applications at £99 16s. 11d. per cent. for bills to be paid for on any day except Monday (a Bank Holiday) and Saturday of the following week were accepted as to about 51 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications for bills to be paid for on Saturday at £99 17s. 0d. per cent. and above were allotted in full. £50.0 millions of Treasury bills are being offered on June 10th.

provides, or in the adequacy of its news service, the B.B.C. has fallen behindhand. It is, of course, impossible to please everybody, and there has always been running criticism of its programmes. But in general terms, the British public is satisfied with its broadcasting service, which it believes to be as good as any in the world.

Whatever judgment may be passed on the B.B.C.'s general services, there is little, if any, room for difference of opinion on one vital issue: that of political impartiality. Here, Sir John Reith's regime, taken as a whole, passes the test triumphantly. A decade and a half ago a few discriminating people realised that a monopoly of the use of the air for broadcasting might have very serious hidden dangers. To-day, it is crystal clear to the whole world that the right of expressing opinion through the microphone may be one of the most powerful, if not *the* most powerful instrument for good or evil; and that the power of controlling the knowledge of events which is vouchsafed to the people of a country may spell the difference between their being slave or free.

In the past ten years the B.B.C. has had to create new traditions in this respect. The confidence which the public feels in the information contained in the news bulletins is proof of the B.B.C.'s success. Indeed, it would not be unfair to say that the poise of the B.B.C. bulletins has greatly helped to give the British public a power of discrimination which has exercised a salutary influence on the Press and the screen. It is far more difficult to-day to bamboozle the common people of England—whether from the soap box, in the cinema or even by the printed word—than it would have been in past decades. If unbiased information tends to break down the barriers of party feeling and thereby to make the traditional organisation of democracy on a party basis more difficult and uncertain, it has unquestionably helped to consolidate the feeling for democracy itself. The dangers to which we refer still lurk in the background. Sir John has had his troubles with Government departments;

and one wonders what would happen to this independent monopoly in time of war. But up to the present the difficulties have been successfully overcome.

Sir John Reith would, of course, be the first to repudiate any suggestion that he alone is responsible for the happy evolution of this great experiment. He has been protected from interference and has been assisted and advised by an authoritative Board of Governors. He has had the advice of experienced Committees in many aspects of his work. But, above all, he has done his work under the searchlight of a critical public and in a country where Parliament and a free Press were on the watch. While it would be a little hard on some of our neighbours to suggest that a country gets the broadcasting service which it deserves, it is certainly very true that the B.B.C. is a typical reflection of twentieth-century Britain.

These reflections inevitably suggest the question whether, and by what road, the totalitarian countries will be able to escape from their present mental servitude, one of the most binding shackles of which is propaganda through the microphone. Our experience has shown that a monopoly of the air is not incompatible with democracy. But such compatibility can only permanently be secured on condition that the service itself is deliberately made independent of the political organs of the State and that there are other effective means, such as Parliament and the Press, through which differences of opinion on any topic can be freely ventilated. It is not to be expected that, short of a revolution, the dictators will hand over to anybody else the control of the air. The inevitable return of some measure of freedom must rather be looked for in the gradual unmuzzling of the Press. Meanwhile, there is hope in the comforting fact that scientists have not yet discovered a way of damming the ether waves themselves. And this means that some remain, even in the most closely guarded of dictatorships, who are able to listen and to learn from other countries other versions of many-sided truth.

Wages and Household Means

IF Great Britain has passed for good out of the Dark Ages of industrialism it is because we have ceased to think of "hands" in the same terms as we think of power or machinery. These same "hands" are no longer a mere factor in production or an element in costs; but the men and women for whose welfare the economic organism exists and functions. Moreover, anyone who has administrative responsibility knows from experience that every group of people, whether it be the employees of a firm, a unit in an army, or the members of a college or institution, presents some individual problem which requires that rules and regulations shall be applied with understanding and humanity.

These truths are illustrated on the grand scale in the Annual Report of the Unemployment Assistance Board, which records year by year the progress of the very ambitious attempt that this country is making to abolish destitution. Its two hundred pages are at first sight mainly concerned with the arid details of elaborate Acts of Parliament, administrative machinery and statistics; but behind this rather forbidding exterior is the record of a great organisation of officials and voluntary workers who are seeking to apply to hundreds of thousands of individual human problems the general rules framed by the central Government. The account reveals the extent to which the economic system still fails to employ the full capabilities of the population and the infinite variety of the need which arises for public assistance.

The Report is able to record that the great change of a few years back, which brought under a centralised organisation the whole system of assistance to those unemployed whose right to insurance benefits had lapsed, is working with greater ease and smoothness every year, and that the anomalies and inequalities are being done away with. No voice would now be raised to undo this important act of centralisation. But the greater possibility of seeing the picture as a whole is throwing into sharper focus the contrast between the income required to meet family needs and the income which many families in fact receive in the form of wages for work done. The U.A.B. is thus bringing to the fore a problem which has long been lurking in the background—but is now being underlined by the responsibility, which the State now accepts, of securing for every individual or family an income sufficient for its needs.

The use of the wage system as the main inducement to work requires that those who do not work shall not be as well off as those who do. The operations of the U.A.B. are therefore guided, like those of the Poor Law Commissioners a hundred years ago, by the principle of "less eligibility." Then, the rubric ran, "the condition of the pauper must be less eligible than that of the lowest-paid independent labourer in work." To-day, the U.A.B.'s regulation reads: "the assessment of an applicant's needs shall, in the absence of exceptional needs or special circumstances, be less than the amount which would ordinarily be available

for the support of the household out of the earnings of the applicant and other members of the household."

The purpose of this restriction is clearly to prevent the relief of distress due to unemployment from becoming a premium upon idleness. Actually, the principle is far from easy to apply in practice. For in the case of an appreciable number of applicants for assistance, allowances lower than normal earnings would be insufficient to cover the cost of the barest needs. The Report of the Unemployment Assistance Board for 1937 cites a number of such cases. "Wages," the Board points out, "are not determined primarily, if at all, by reference to the family responsibilities of the earner." The earnings of unskilled labourers with large families and of women with dependants not infrequently fall short of the Board's assessment of their needs. Indeed, earnings are often far below the minimum level laid down by Mr Rowntree and nutritional experts as necessary for the maintenance of health and physique.

The Pilgrim Trust's recent investigation of long unemployment revealed the same problem of basic poverty. Up to a point, the Board can cope with the difficulty by an intelligent local interpretation of the terms of the statute which permits it to depart from the general principle to meet "exceptional needs or special circumstances." But even so, the position remains wholly unsatisfactory. For idleness is encouraged, not by the generosity of the Board, but by the niggardliness of the applicants' normal earnings; and the dilemma is likely, in the Board's own words, to have "serious social consequences." The existence of a number of men and women living, even when in work, at a level below adequate physical subsistence ought not easily

to be tolerated. The adverse effects of earnings lower than the barest assessment of need upon the physique, morale, health, nutrition and industrial efficiency of their recipients and their families are far-reaching, and almost beyond remedy by the various agencies which exist to promote physical fitness. The houses of many more even than those unfortunate few are shown in the Board's Report to be obviously in disrepair and neglected.

The nation cannot afford the existence of these depressed conditions—depressed alike in boom and slump, for 1937 was a year of relative prosperity. To-day we are in a period of declining trade. Yet, clearly, the consumption industries will suffer and the depression be deepened if the expenditure of low-paid workers on the necessities of life is not maintained. Expediency and considerations of social justice alike require that the lowest-paid man and woman in work shall receive in wages, or in wages *plus* allowances sufficient to meet the needs of themselves and their dependants.

There are only two ways to achieve this end: by the introduction of child allowances into the industrial wages system; or by the institution of family allowances by State action. The principle of leaving parents with children a larger income than is left in the hands of the childless is part and parcel of income tax law, but persons earning less than £5 a week are not affected by these concessions. Those earning less than, say, 45s. a week suffer gravely for lack of some parallel concession if their families are large. Organised labour and political parties would do well to read and mark the Board's Report and, in conjunction with the employers of industry, to frame a policy to meet what is perhaps the outstanding anomaly of our present system.

War Risks at Sea

(By a Correspondent)

IN 1936, fire companies and underwriters who had been accepting in various degrees and amounts the liability for damage done to property in time of war, took stock of their position and asked themselves whether it was prudent to go on taking this risk. The answer they gave to themselves was "No"; and for the past eighteen months no European insurer has been covering the risk of war on land. The purpose of this article is to put to marine underwriters the same question. Are normal war risks written in time of peace worth while?

The reasons which led the fire managers to their decision were two-fold: first, that the damage likely to be done by war on land exceeded the resources of the insurance market; and, secondly, that the rate of premium obtainable in time of peace was nominal and inadequate to the risk which would have to be borne after the outbreak of war and until the insurances had run off.

It was thought, two years ago, that these two reasons did not apply to marine insurance. The marine underwriter's unit of liability is the value of a ship and her cargo, and the great concentrations of value in buildings and warehouses, which increase by so much war risk on land, are not to be found at sea. And the voyage book of a marine underwriter clears itself far more quickly than the risk book of a fire manager. The marine market, in fact, within a few weeks of the outbreak of war, could put its voyage rates on to a war footing. In the light of what we know now, but did not know then, and particularly in view of what has been happening round the coast of Spain, does that distinction between the fire manager and the marine underwriter still hold good?

Let us take the second of the two points—the speed at which the marine market would, after the outbreak of war, adjust its rates to the new conditions. If the marine

market is to be allowed to do what it did in the last war, quoting for any and every voyage, fixing its own rates, leaving the liability to the Government when danger increased, and cutting the Government's rates when the peril was reduced—if that happens in the next war, then the argument that marine underwriters would soon be filling their books at rates appropriate to war, would no doubt be sound. But is there any reason to believe that this will happen? Is it conceivable that the Government will do what it did in 1914, taking all the risks that are underpaid and none that are overpaid? Is it not almost certain that all war risks on cargoes, at least in British bottoms, will have to go to the Government, and that the marine market will have no cargoes to insure against war risks, except perhaps those that are carried under a neutral flag? If that surmise is correct, then the theory that the marine underwriter will be able to adjust his war rates quickly to war conditions collapses; for there will be no British cargo on which to raise rates.

If that forecast should turn out to be sound, the position of the marine underwriter on cargo at the outbreak of war will be unenviable. His war underwriting in British bottoms will have come to an end and he will have no more premium on British borne cargo; but he will have outstanding a considerable—a very considerable—amount of liability on cargoes which are waterborne at the outbreak of war or are loaded and become waterborne within forty-eight hours of the war cancellation notice being given. In ports, in the North Sea, in the Channel, in the Mediterranean and in the nearer waters of the Atlantic he will be covering at 3d., 6d. or 2s. 6d. per cent. a large number of cargoes in British bottoms all within striking distance of the enemy's forces. And it will be on those risks and those only that the result of his war underwriting,

so far as British shipping is concerned, will depend. He will have no more war premiums with which to pay his claims, but if there are heavy losses in the first week or fortnight they will fall on him. He will have to meet them out of his peace-time premiums.

What would happen at sea in the first week of war is clearly a matter of conjecture, but it needs no prophetic instinct to guess that attempts to deal a quick knock-out blow would not be confined to raids on shore property. An enemy would tell himself that the first few weeks, or even the first few hours, of warfare at sea were his golden opportunity. The period before the convoy system had come fully and effectively into operation would be the time for submarines to raid the Channel, the Mediterranean and the Atlantic passages. Before anti-aircraft guns had been fitted to the decks of merchant steamers would be the time for seaplanes to search the trade routes. Before the air-raid defences of docks and harbours had been tested would be the time for enemy planes to swoop over and try to bomb steamers as they loaded and discharged their cargoes, not only in home but in foreign ports.

It is not suggested that such tactics of an enemy would necessarily be successful or that the damage done in the first week or fortnight of war must be either great or disastrous. But it would be absurd to deny that these

earliest stages of warfare would be a most critical time for waterborne cargo—probably the most critical time of the whole war. The attack might prove to be less formidable than the defence and be successfully repelled from the first moment; but other possibilities exist. The result of that early clash between attack and defence cannot be foretold. And be the losses great or small, they must be borne by past arrivals. There will be no current premiums.

It might, therefore, be a good thing if underwriters, in writing war risks at present rates, had clearly in their minds that the first fortnight or month of war is what they are really writing. For a present stream of threepences, sixpences and half-crowns they are accepting liability for the uncertainties of that short but enormously critical period, and unless they reserve year by year the war premiums which they take on arrivals in time of peace they are not likely to have a fund of war premiums to pay for any losses which may fall on them in war. And the extent of their war liability, it must be remembered, is not fixed by the amount that they choose to write specifically on war risks. Since most war risk in time of peace is placed in conjunction with marine, their war liability is for the most part concurrent with their marine liability and what they have insured against perils of the sea they have also insured against perils of the air and the submarine.

Essays in Autarky

Can Italy Feed Herself?

Italy can and must achieve the maximum useful level of economic autonomy, for time of peace and above all for time of war. The whole Italian economy must be turned towards this supreme necessity: on it depends the future of the Italian people.—Signor Mussolini.

ITALY'S "battle for autarky" has brought into sharp focus conflicting trends of theory and practice which a close observer might have seen grappling each other, beneath the surface, for the last thirty years. In the supreme efforts now being made to render Italy fit to produce all her nutritive needs, the problems which have agitated agronomes since the days of Jacini and the Great Enquiry—*latifondi*, *bonifica*, reforestation, syndicalism, co-operatives—all receive their joint solution in terms of Signor Mussolini's pronouncement.

The corpses of dead problems infest the ministries of Rome. Will Nature give them life again? She has done her best this year by producing a drought which has affected a large part of the wheat crop. Now everybody knows that the *battaglia del grano* must be renewed again, and more vigorously. The first of the accompanying tables shows how the conflict has moved back and forth in recent years. Until the average annual production can be stabilised at

about 85 million quintals, Italy must remain to some extent dependent on imported wheat.

TABLE 1: WHEAT PRODUCTION AND CONSUMPTION
(In thousand quintals)

	1934	1935	1936	1937	1938
Production...	63,000	77,000	61,000	80,000*	60,000†
Imports	4,691	5,497	5,337	1,782	...

* Estimate in *Giornale d'Italia* for January 11th last.
† Forecast based on weather reports: probably lower.

TABLE 2:
CORRELATION OF WHEAT AREA WITH STOCK-RAISING

	1908	1918	1930	1936
Area under Wheat (hectares)	Abt. 4½ million	*4,542,440	4,822,716	5,132,677
Livestock (thous. of heads):—				
Horses.....	956	990	979	816
Oxen	6,199	6,240	7,094	7,235
Pigs	2,508	2,339	3,322	3,206
Sheep	11,163	11,754	10,269	8,862
Goats	2,175	3,083	1,893	1,795

* Average for 1915–19.

battaglia del grano is being utilised in finding solutions for both. Prices "are no longer guided by the criterion of comparative costs, or by the influence of exchanges, but by the needs of internal production." Just as the home price of

grain has since 1926 remained at a level far above the world price, so will each product in future be assigned an artificial price dictated by autarkic policy. It is proposed to maintain internal prices by a rigorous regimentation of supply, chiefly by storage in *amassi* and by the marketing arrangements of various official *enti*, of which several already exist. An initial rise in prices, though slight, seems generally to be anticipated: "A moderate rise in prices," a writer in an official publication stated last winter, "is not only inevitable, but convenient and even opportune: it helps to allow private enterprises to recover the greater costs deriving from new and increased productions." In January of this year the Minister of Corporations issued a warning statement declaring that "prices had reached the maximum level permitted by conditions of consumption," and that henceforward "any further rise in prices was in general to be considered unjustified." It is in face of such statements that one may realise the sacrifices to be imposed on the nation by a policy of agricultural self-sufficiency.

Maintenance of prices presents few difficulties compared with those encountered by the production side of the problem. Workers' and employers' syndicates will be called on to offer a perfectly co-ordinated mechanism, comprehensive of every living soul in rural Italy, upon which may be operated the Government's production plans. The transformation of the *latifondi* may no longer be delayed. Labour "constitutes the first of our raw materials," and "the farm is only the instrument with which labour operates."

The accompanying map shows how the wheat acreage in the principal regions of Italy is distributed between mountains, hillside and plain. But the kernel of the problem is indicated by our second table. How can Italy increase her livestock, so as to obtain bigger supplies of meat, dairy produce, and animal fats, and at the same time grow more wheat? In 1936 Italy produced 295 million quintals of forage stuffs on an area of 9,262,000 hectares; of those hectares 4,355,000 are classed as "permanent pastures"—land fit for no rotation crop without undergoing *bonifica integrale*. At this point Italy enters a vicious circle. Signor Mussolini may choose to await self-sufficiency through long years during which money for reclamation is first being saved and then being used. Since 1935, expenditure on *bonifica* has virtually ceased; and the rise in the cost of living, increased taxes, and mortgages on agricultural property have made it difficult to find private money available for the doubtful service of reclamation. Failing that, the Duce must aim at what seems to be the impossible. For to cover the barest national needs, Italian livestock will have to be increased by at least 10 per cent.; and if this is to suffice, the quality, which at the moment is very poor, will need to be greatly improved.

Unless an increase in the forage-growing area is contemplated, this objective cannot be attained without years of land improvement and a huge expenditure. But an increase in the forage-growing area would conflict with the increase in wheat-growing hectareage, which is none the less necessary, although it is not admitted. And it would conflict also with the essential increases in area contemplated for a dozen other products—for maize, poultry, olives, vegetables, citrus fruits, timber, industrial plants such as canapa, and so forth. Some of the methods suggested can hardly be taken seriously. To obtain self-sufficiency in olive oil, for example, Italy must have another 50 million olives and it is suggested that half a million be planted each year. On this time-table, self-sufficiency will not be achieved for

a century; and, even after allowing for replacements, most of the new olives must be put down on land now occupied by other, but indispensable, crops. The need for more sheep, again, is particularly urgent, and it has been suggested in an official publication that "in all the farms of Central Italy at least one sheep could find a place alongside a bullock," without weighing on the consumption of forage, since the animal would find sufficient nourishment on waste stuffs. The Tuscan *mezzadro*, a model of frugality and farming skill, who for centuries has been squeezing the last *soldo* out of his *podere*, would doubtless supply the best answer to this suggestion.

Several commissions have sat during the past few years, and made various recommendations designed to increase Italy's livestock. As Table 2 shows, however, their efforts have been fruitless. The *battaglia del grano* has weighed heaviest on sheep stocks; the marked decrease in the number of goats is due chiefly to reforestation and the police-work of the *Milizia Forestale*.

In the literature on agricultural self-sufficiency, each specialist tends to solve his own problem by assuming an increase in the area of production. The competition for land thereby caused creates what is perhaps the most serious problem of all. According to the inquiry of 1929, the completely unproductive area of Italy is only one-fourteenth of the total. We may leave aside the effects of autarky on the vital and admitted necessity of extending foreign markets for Italian produce. We may eschew the wholesale difficulties raised by its effects on the cost of living. If we consider its feasibility merely under the heading of production, we must conclude that the "battle for autarky" cannot be successful, for lack of land, or of time and money to transform Italy's *latifondi* and improve her hill-pastures. That judgment applies to the long period. If by autarky, however, is meant, merely temporary independence during time of war, it may be fair to add that by careful storage and a sharp tightening of their belts the Italian people might scrape through for a short time. But the war would have to be short.

AREA UNDER WHEAT, 1936

The areas of the circles represent the actual acreage devoted to wheat cultivation in 1936 in each of the principal regions of Italy. The circles are divided to show the distribution of wheat area between mountain, hillside and plain.

Topics of the Week

Anglo-German Economic Relations.—The Anglo-German negotiations in Berlin, necessitated by the incorporation of Austria in the Reich and the Reich's default of June 1st on the Austrian Loans services, bid fair to stir up a hornet's nest. Mr Oliver Stanley warned the Commons on Wednesday that payments from Germany after June 30th—the date on which the Anglo-German Payments Agreement may be ended—might be hard to collect. Last week we published an article on the background of the dispute; and the gloomy developments during the last week are described in a Note on page 667 of this issue. What concerns us here is the wider question raised by a dispute as gratuitous as it is unwarranted on the German side: Can Germany both have the cake of free-exchange relations with this country, and eat it by acting towards us—and others—in authoritarian fashion? The immediate cause of the dispute shows the matter clearly. The Reich conquers Austria and annexes all her assets, including the gold in the Austrian National Bank. The Reich then says it hasn't conquered and annexed them, but it has been invited to accept them by Austria's own representatives. This would render the Reich liable for the debts of the invaders. On Thursday, Herr Funk, Reich Minister of Economics, repudiated Austrian liabilities because Austria gave up her sovereignty: a contradiction in terms. The British Government and their representatives point to the Austrian assets taken by the Reich, and also to the £8,000,000 worth of free exchange at the Reich's disposal in London every year, after paying for Germany's direct imports from this country. It would be only equitable and just for them to insist that, if the Reich wants to take all Austria's assets (including those on which Austrian loans were secured) and default on Austria's debts, then she should not be permitted to enjoy every benefit which Austria's creditors have hitherto made to the Reich.

The conciliatory attitude of the British Government towards Germany, Italy and Japan during the last few years has unhappily led to the belief abroad that this country will take any rap which anyone cares to administer. British capital and property in China, or Mexico, or Austria, has been sent the way of British ships and British lives in Spain—so far with impunity. Protests, reservations and hortatory utterances by British spokesmen have availed nothing; and we have continued to confer upon our detractors, unilaterally, economic beliefs without counter-vailing advantage. Such a one-sided procedure is, to use Bentham's words, "nonsense upon stilts." It is beside the point to argue that to counter Germany's recent behaviour with an exchange-clearing might reduce our trade or that of the Dominions with her. It not only might; it almost certainly would reduce trade. Germany would probably curtail her imports from us and our Dominions—with the latter as a whole she has an import surplus—and curtail her exports to us. But, after all, Germany desperately needs the £6,000,000 or £8,000,000 of free sterling which she gets here in a year. It is her *masse de manœuvre*; her marginal fund for filling gaps and meeting emergencies in the rigid German system of trade and exchange control. And are we to let her go on enjoying this valuable latitude while at the same time she is repudiating her obligations? In our opinion the sanest and healthiest measure would be the threat of an exchange-clearing—with the knowledge that it might even force us in the end to exercise some measure of control over our trade with Germany. If this did not produce the £2,000,000 or so for the services of Austria's debts, it would at least clearly and decisively demarcate those countries who intend to trade and engage with each other, on honoured principles, from those who do not. When this is determined the rest of us will know how to reconstruct the trading world, and with whom.

British Trade Policy.—The debate in the Commons on Wednesday, initiated by the Opposition Liberals' motion to reduce the Board of Trade Vote, was remarkable only for two things. The first was the insistence of spokesmen from all Parties on the inestimable advantage to this country and other countries of speedily concluding the long-negotiated Anglo-American Trade Agreement. The second was the amount of consideration given to shipping. On the Anglo-American trade negotiations Mr Oliver Stanley once again expressed himself with extreme caniness; it was, he said, useless to conclude an agreement in which one side alone made sacrifices. This sounded ominous after the Government's surrender to the Lords on the Coal Bill, and after a united all-Party onslaught on the Federation of British Industries' protectionist objections to an Anglo-American trade agreement. Mr Lees-Smith for Labour, Sir Arthur Salter as an Independent, Mr Graham White for the Opposition Liberals, and Sir Alan Anderson for Conservatives, the City, and shipping, all pointed out how much greater were the general benefits to this country's economy (including our invisible foreign trade) than the particular losses which one or two branches of domestic industry here might—but only might—suffer. It was noted, as has often been remarked in these columns, that the United Kingdom and the Dominions and Colonies together practically balance their visible and invisible trade with the United States; and that, if we look at the Empire as a whole, a small loss in one part of one industry in one Dominion would be overwhelmed by the great and diffused advantages arising from freer trade between the U.S.A., the U.K., and the Dominions.

Some advocacy of the Van Zeeland Report in the debate was regretfully rejected by Mr Stanley, who said the time for its initiation was not now ripe; a rejoinder which, alas, seems true. But this does not mean we should do nothing to extend freer trading beyond the bounds of the Empire and the U.S.A. As Mr Boothby pointed out, there are many countries in Europe to-day—especially after the elimination of Austria—which are anxiously scanning the British scene for signs of an intention to organise, with France, the Low Countries and Scandinavia, an expansion of Europe's remaining freely-traded commerce. Mr R. H. Cross, Parliamentary Secretary to the Board of Trade, announced a refashioned Governmental war-risk insurance scheme for our shipping in time of war, and a plan to economise British shipping and utilise neutral shipping under one organisation if hostilities broke out. He foreshadowed a new levy for enabling owners of unwanted tonnage to be compensated for laying it up. It was a little dispiriting for listeners at the debate to notice that the Government seemed more energetically concerned to provide for economic administration in wartime than to build up and strengthen, now and henceforth, the economic sinews of war. Our trade is still our best insurance policy against poverty in peace, against a growing annual burden of armaments, and against defeat in war.

New West Indies Commission.—By grappling firmly with fundamentals, Mr MacDonald was able to withstand the Government's critics, vigorous as they were, in the debate on West Indian conditions, when the House debated the Colonial Office Vote last Tuesday. The Secretary of State admitted frankly that recent disorders had been the product of economic distress, and declared that from the beginnings made in the last few years there must be evolved a long-term policy of reconstruction. Social services must be expanded, assistance given to the staple agricultural industries on which the islands depend, and alternative additional occupations developed. A strong Royal Commission was to be appointed to make a comprehensive inquiry

into social and economic conditions in the West Indies, but the Government did not intend to use this investigation as a cover for delay. The Colonial Office and the local administrations, said Mr MacDonald, had been hampered at every turn by the economic vulnerability of colonies dependent on the export of one or two agricultural products. Greater self-sufficiency in the necessities of life was part of the long-term policy proposed, but it was also clearly implied that the needed improvement in social conditions was likely to entail a charge upon the home taxpayer, unless and until the prices of West Indian products improved. Among the critics were Mr Lloyd George, who spoke of the appalling conditions he himself had seen in Jamaica, and declared that we did not want a "Slum Empire." For the rest, the recent debates in both Houses on colonial affairs have given the Government an opportunity of plainly reaffirming their adherence to the policy of partition in Palestine, as the most hopeful and constructive solution in the circumstances.

War Planes.—The Air Ministry has at present two schemes of expansion in operation. The first (scheme F), formulated last year, is still wholly dependent upon domestic manufacturing capacity. The second (scheme L), announced in May, involves the speedy training of many additional pilots; and to augment British supplies of machines for training purposes under this scheme the Air Ministry has decided, as one result of the recent Air Mission to North America, to purchase 200 planes from North American Aviation Incorporated, of California. These machines for special training duties, as well as the further 200 planes for reconnaissance purposes ordered from Lockheed Aircraft Corporation (also of California), are expected to be delivered within twelve months; and the cost of the two orders is likely to exceed £7 millions. Actually, as was frequently stated at the time of the Mission's appointment, the American industry lacks the capacity easily to give early delivery of special types of machines in large quantities.

Orders for training machines have been placed in the last few weeks with British firms at Reading, Portsmouth, Hatfield and Luton, which, together with earlier orders from the same firms, amount to many times the American order. The possibility of expanding Canadian capacity to manufacture war planes on a long-range and large-scale plan has, indeed, been discussed as a result of the Mission; but the success of the air programme in speed and scale of deliveries almost wholly depends upon the British industry's ability to overcome the shortcomings in organisation and the shortages of special tools, equipment and, in part, of men which so far have seriously impeded efficiency. The co-option of Lord Nuffield's forthright abilities in the development of a large-scale undertaking on 130 acres at Birmingham augurs well for the future, though organised labour's hesitations suggest that there are obstacles still to overcome. At home and abroad, difficulties in the way of the defence programme are political as well as industrial. President Roosevelt has proclaimed his Government's intention to ban the export of military aircraft to countries responsible for bombing civilians. The target for this diplomatic attack is Japan. But surely Germany and Italy (who do not import much war material from America) cannot be excluded from the ban; and certain American pacifists have urged that police operations on the North-west frontier of India involve Britain as well. All countries are by their own profession defenders, not attackers; but the function of bombers, meanwhile, is to bomb. Until the Government of every country can give earnest of only the best motives in its foreign policy, thoroughgoing mutual assistance in re-armament will not be easy to secure.

Imperial Airways Chief.—The appointment of Sir John Reith, Director General of the British Broadcasting Corporation, to be whole-time chairman of Imperial Air-

ways is in line with the Cadman Committee's Report. This Report declared that the management of Imperial Airways had been defective, intolerant and unyielding; and that the managing director had taken "a commercial view of his responsibilities that was too narrow." Sir John Reith has at no time in his guidance of British broadcasting during sixteen years permitted commercial considerations to impede his conception of a public service. An engineer by training and experience, Sir John brings to civil aviation no direct technical qualifications. He has the record of a successful organiser and, at forty-nine years of age, he has still the vigour and determination of a young man. It will now be his task to ensure that, in the fresh pattern of civil aviation which it is the responsibility of the new Air Minister to draft, Imperial Airways will play its part in regaining Britain's place in world flying. The first problem which faces the new chairman is difficult. The storm broke over Imperial Airways initially in connection with the complaints of their pilot employees regarding working conditions and a series of subsequent dismissals. The Cadman Report claimed that, internally, the company's attitude in staff matters left much to be desired. On May 31st last, a number of Members renewed these charges in the House of Commons. The Government is satisfied that the pilots' dismissals were justified and that they were due in no way to victimisation. The House of Commons is less satisfied. Sir John will now be called upon, at the directors' behest, to examine a serious indictment, and if possible to exculpate them. Sir John's not altogether happy experience at Broadcasting House in such matters has at least given him a great insight into all the difficulties. For the rest, his strength of character and passion for efficient organisation should gain the day, if it is matched with similar qualities on the side of the Government. Once again, Scotland has been summoned to supply a strong man to industry in time of need.

After the Czechoslovak Elections.—Last week-end the third and last set of communal elections in Czechoslovakia passed off without incident. The net results of one month's nervous tension since May 20th (there were no elections Whitsun week-end) have been a great increase in political and military excitement, a strengthening of the Czechoslovak Centre and Popular Parties, an increase of the Henlein poll to 75 per cent. of all German votes (which is far from justifying the Sudetendeutsch claim to totalitarian representation of all Germans), and a crushing defeat of the Hlinka autonomists in Slovakia. The outcome has been a strengthening of M. Hodza's personal position as the Slovak Agrarian Prime Minister. He has now a stronger Slovak wing against the more Rightward Czech Agrarians; and the latter have discovered in Bohemia and Moravia that the

Czech electorate is firmly wedded to the principles and policies of Masaryk and Benes. The German Social Democrats, led by Herr Jaksch, suffered greatly in the German areas, owing to the Prague Government's desire not to "provoke" the Henleinians, who virtually enjoyed free rein against their electoral foes. But even in these circumstances, a poll of 25 per cent. of German Liberals, Jews, Communists, etc., against the Sudetendeutschen shows the importance of the State's guarantees of liberty to a minority within the minority. Negotiations are still proceeding between M. Hodza and Herr Henlein's deputies, on the basis of a memorandum which seems slightly more moderate than the intransigent minimum demands of Herr Henlein at Carlsbad on April 24th. But little has changed in the basic situation; and even though M. Hodza and the Agrarian Party are said to be willing to abandon the non-Henlein Germans in the Sudetenland to the tender care of Herr Henlein, the Government cannot blink the real danger. That danger is still what it was: the disruption of the Czechoslovak State from within, by agents from without.

Towns and Industry.—The Barlow Commission are nearing the end of their labours. What recommendations they will make for the mitigation of the ill-consequences of excessive town growth are unknown. It is significant that, on the eve of drafting their conclusions, the Commission this week recalled the representatives of the Garden City and Town Planning Association, whose admirable evidence presented some weeks ago included proposals for a National Planning Board to control industrial and commercial development in overgrown urban centres and, generally, in agricultural regions. The Town Planning Institute's representatives were also re-examined on Wednesday; and they too have advised the setting up of a National Planning Commission to co-ordinate the planning activities of Government departments and local authorities. Several considerations must by now have impressed the Commission deeply. The growth of our towns has been largely fortuitous and, in the last few generations, it has been part and parcel of a national dependence on manufactures and overseas trade and investment. These developments have served us exceedingly well. They have been instrumental in enabling us to build up a high standard of material living on the basis of a rising national income. But to-day there is a widespread revulsion against their social consequences. And experts combine to demonstrate, not only that urban over-development is detrimental to health, nutrition, happiness and aesthetic standards, but also that the excessive size of towns involves public charges for social services, utilities and transport out of all proportion to the communal advantages gained (as Political and Economic Planning point out in their latest broadsheet). Existing methods of town and country planning are ineffective, and almost certainly the Royal Commission are now seeking to devise influential ways and means of controlling urban and industrial development. The decimation of valuable agricultural land is an additional stimulus to these efforts; and agriculturists are at hand with the planners to advise Sir Montagu Barlow and his colleagues. None, however, has devised a satisfactory provision for the compensation of landowners who hold the key to national planning. Here is the Commission's most obdurate problem.

Forests and Smallholdings.—Reports published during the last few days by the Forestry Commissioners and the Land Settlement Association afford an encouraging record of the work which is being done to provide new occupations in country surroundings for a few at least of the victims of industrial decline in the Special Areas. The Forestry Commission's programme of forest workers' holdings was extended in 1936 to

include the establishment in ten years of 1,000 holdings in or near the Special Areas. The Land Settlement Association, formed on behalf of the Commissioner, in 1934 to settle miners and other men from the Special Areas on small holdings, have settled 3,500 persons on 11,500 acres, of whom 600 are now financially independent. The men are brought from their towns or pit villages, trained at central farms in horticulture, pig rearing or poultry keeping. If the training is successful, they are then provided with houses for their families and capital to start work on their own account. They are subsequently assisted by central buying of stock, central marketing and the provision of certain central equipment. Training costs are £300 per head. Working capital on the central farms, including tractors and machinery, works out at about £500 per smallholder, while the realisable assets provided to each settler amount to about £1,000. The regeneration of these forest workers and smallholders is an important social service, but certain outside criticisms cannot be ignored. The economic wisdom of land settlement depends ultimately upon reasonably profitable prospects for farming as a whole. And smallholdings of this kind, if they succeed, may be at the expense of farms and farm workers who do not enjoy the advantages of centrally provided capital, equipment and marketing facilities. But if these central agencies are so advantageous, their voluntary provision by and for farmers themselves would seem eminently desirable. Official forestry policy, similarly, does not go uncriticised. Afforestation to improve soil conditions and increase timber supplies is generally approved. But the wholesale planting of conifers is condemned, on the one hand by agriculturists who wish to see oak and coppice woodlands once more an integral element in British farming, and on the other hand by those who complain that the character of the countryside is being artificially altered. True, 93 per cent. of the Commission's planted acreage is under conifers; but the importance of home-grown timber in time of war can hardly be neglected in present conditions.

Decline in Automobile Production.—The recession in business, which has been reflected in the falling index of business activity, has also affected the motor industry. Production in the first six months of the current

Year ended September—	Private Cars and Taxis			Commercial Vehicles and Tractors (General haulage)		
	Output	Imports	Exports	Output	Imports	Exports

* Excluding chassis.

† Including second-hand commercial vehicles.

motor year (October, 1937, to March, 1938) has been at a considerably lower level than in the corresponding months of 1936-37. The output of private cars, including taxis, was nearly 10 per cent. smaller, and that of commercial vehicles 6 per cent. smaller than in the preceding winter. For every month since October the output of private cars fell below the level of the corresponding month of last year, but the output of commercial vehicles was stimulated in February and March by Government purchases and slightly exceeded the figures for February and March of last year. This explains the relatively smaller reduction in the half-year's production of commercial vehicles. Exports of private cars have been well maintained, while those of commercial vehicles have fallen to about two-thirds of those in the six winter months of last season. The new registrations for April totalled 25,649, against 31,121 for April, 1937. Although some of the fall must be ascribed

to the fewer working days in the month, caused by the late Easter, the figures show that the decline in demand for new cars has not yet been reversed.

Goods Road Vehicles.—The third annual reports of the Licensing Authorities appointed under the Road and Rail Traffic Act 1933, which have just been published, give more statistical information than has hitherto been available about the goods road transport industry. Compared with April, 1936, the date of the last published information, the number of licence holders at June 30, 1937, showed an increase of 24,506, or 11 per cent., while the number of vehicles in possession increased by 47,240, or 10.3 per cent.

Type of Licence	No. of Licence Holders		No. of Vehicles in Possession	
	April, 1936	June, 1937	April, 1936	June, 1937
"A"	25,648	23,750	85,337	83,626
"A" Contract ...	2,084	3,267	5,156	7,475
"B"	34,100	34,061	52,809	53,775
"C"	161,221	186,481	316,714	362,380
Total	223,053	247,559	460,016	507,256

Note.—"A" licences are for public carriers, "B" for limited carriers, and "C" for private carriers.

The increase in the number of goods vehicles on the road has come from the "C" licence holders. "A" contract licences, which also show some increase, may really be regarded as in the same category as "C" licences, as these vehicles are engaged exclusively in carrying goods of one particular firm and, in effect, constitute the transport department of that firm. The conclusion is inescapable that public haulage of goods by road is losing ground to private haulage. The introduction of statutory wages and conditions of service for employees in the goods road haulage industry (which in all probability the Road Haulage Wages Bill now before Parliament will shortly secure), coupled with the provision that the recent extension of the currency period of licences is to be accompanied by the upholding of the observance of the conditions of licences "by the strongest possible measure," may weaken the competitive position of some hauliers. The public haulier is not only in competition with other forms of transport, but must so organise his work as to make his charges lower than the "C" licence holder's cost of doing the work himself. On the other hand, the Minister of Transport is understood to have given a sympathetic reception to deputations from the British Road Federation, which urged amendments to the Road and Rail Traffic Act, 1933, designed to afford protection against objections by competitors to licence renewals, and to modify existing restrictions on the transfer of licences. Incidentally, among "A" licence holders, under the latest figures (apart from the railway companies), some 52 per cent. have only one vehicle and 86 per cent. have less than five.

A Blow to Mr. Aberhart.—The failure of the Social Credit Party in the Saskatchewan provincial elections is of much more than local moment. The electoral campaign had been Mr Aberhart's first major expedition beyond the borders of Alberta. Encouraged by some Social Credit successes in the neighbouring province in the Dominion elections, he and other Albertan Ministers invaded Saskatchewan in force, with every hope of triumph. In the result, although the Social Credit Party secured 15 per cent. of the votes, it won only two seats in a House of fifty, while the Liberals, with 36 seats, retained an ample majority, in spite of losses to the Co-operative Commonwealth Federation, Canada's Socialist Party. The latter, with 19 per cent. of the votes, won 10 seats—a disproportion which reflects its concentration of strength in urban areas. The C.C.F. suffered a disappointment at the last Dominion elections, but its path to power is made the smoother by episodes such as the debate the other day at Ottawa, in which accusations of mass corruption were

hurled between the Liberal and Conservative Parties. Meanwhile, through the success of the Saskatchewan Liberals, Mr Mackenzie King's Administration has staved off another threat to its once almost impregnable power; for Social Credit has been revealed as a merely local and perhaps a declining force in the West.

The War in Spain.—General Franco's pace is being set for him by the bread crisis in Italy. It is becoming almost desperately urgent for Signor Mussolini to win his war in Spain this summer, and last week's offensive on the Teruel front speaks as eloquently of the Italian dictator's straits as the persistent and deliberate bombing of British and French ships and the machine-gunning of their crews—which still go on despite Mr Chamberlain's hopes to the contrary. The insurgent forces have now taken Castellon and are pressing down towards Almeria. It is of little profit, however, for Signor Mussolini to win Spanish victories that do not bring his Italian war to a victorious end; and there is no reason to expect that the Fascist Powers' latest victory on the Teruel front is going to be any more decisive than their previous victory in Aragon. In the psychology of modern warfare, outbreaks of vindictive bombing are coming to be recognised as symptoms of military frustration. In the House of Commons on Tuesday the Prime Minister announced that since the middle of April twenty-two British ships had been involved in air attacks in Spanish ports; that eleven of them had been sunk or seriously damaged; that in several cases the attack appeared to have been deliberate; but that the Government had decided to take no action to protect British shipping in Spanish territorial waters, because they saw no way of doing this without taking an active part in the hostilities. The British Government were investigating—actively but not hopefully—the question of providing safety zones in certain harbours; and General Franco had suggested that one port (and apparently one only) in the territory under the Spanish Government's control should be constituted a harbour of refuge for British shipping, on condition that these ships refrained from supplying the Spanish Government, not only with munitions within the meaning of the Non-Intervention Agreement, but also with certain other commodities to be designated by General Franco. It is evident that nothing is going to be done by His Majesty's Government beyond representing to Burgos that "it is impossible that attacks, frequently involving loss of life and sometimes apparently deliberate, can be repeated without serious injury to friendly relations." The most illuminating commentary on Mr Chamberlain's decision is to be found in the Italian Press, which frankly expressed its anxiety that Italy might be facing another Nyon, and then as frankly displayed its relief that, after all, the British Foreign Secretary was now not an Eden but a Halifax.

INSURE WITH

7, CHANCERY LANE, LONDON, W.C.2

The War in China.—During the past week there has been some slackening in the air attacks upon the civilian population of Canton, while the Japanese have been resuming their advance on Hankow. Once again the Japanese Army and Navy seem to be in competition: the Navy pushing its way up the Yangtse, while the Japanese land forces are marching westwards to Hankow from Nanking. It had been intended that there should be a converging movement, down the Peking-Hankow railway, by the army that has been advancing up the Lunghai railway from Suchow. But the dykes of the Yellow River have been breached, and the flood waters have swept away the Japanese tanks and cannon like Pharaoh's chariots and horsemen. This catastrophe—whether deliberate or accidental—has also inflicted untold misery upon the peasantry over vast stretches of the Honan countryside. Yet China has survived still more devastating natural calamities and still more brutal invasions. Up the Yangtse the Japanese Navy now claims to have reached Anking and even to have landed troops at a point above it. They have still to encounter the Chinese booms and minefields; and the forcing of the Yangtse would appear to be an even more hazardous operation for warships than the forcing of the Dardanelles. With the flooding of the Honan plains, the Japanese advance on Hankow will now presumably be confined to the Yangtse Valley and will be based on Shanghai. We may almost take it for granted that the Japanese will reach this objective and that, when they have arrived there, they will find themselves no nearer than before to a decision of the war in their own favour. At quite an early stage in the war the Japanese marched into Taiyuan and proclaimed that Shansi was in their hands. To-day they have been forced to confess that this province has slipped back again into the hands of Chinese guerrillas. There are many other Shansis in the great continent of China; and, if Japanese experience to date proves an omen, the end of this war lies out of sight. Can Japan stay the course?

The Sanjak of Alexandretta.—Trouble has boiled up again in the small but important district of Antioch and Alexandretta in the north-western corner of Syria, adjoining the Turkish frontier. It arose originally out of the conclusion, in 1936, of a Franco-Syrian treaty on the lines of the British treaties with Iraq and Egypt. Turkey then demanded that, without the framework of the future sovereign independent Syrian state, a special status should be guaranteed to the district of Alexandretta on account of the considerable Turkish element in the local population. After a long-drawn-out, and at moments dangerous, controversy, through the good offices of the League of Nations, the district was demilitarised last year; it was given a far-reaching autonomy; and Turkish and Arabic were placed on an equal footing as the official languages. The approach of the first elections that are due to be held under the new regime has now produced a fresh wave of local unrest; and in reply to a demand from Turkey for the protection of the Turkish inhabitants of the district, France (whose mandate has not yet been terminated) has proclaimed martial law. The crux is that the Turkish element does not appear, any more than the Arab element, to amount to an absolute majority of the whole population; for the racial mixture in this corner of Asia is extraordinarily complex: there are not only Turks and Arabs there, but also Armenians, Kurds and Nusayris. Conversations over the recent hitch took place between the French Government and the Turkish Ambassador in Paris; and Turkey is to be empowered to guard certain areas. Meanwhile, Syrian public opinion is becoming restive over rumours that France has promised Turkey that there shall be a Turkish majority in the Alexandretan Parliament, whatever may be the results of the census that is now being taken under the League's auspices. We hope that Turkey will not press her claims too hard. President Atatürk is no doubt well aware that any present threats to Turkey's independence come, not from the south-east but from the north-west.

An International Highway.—The Suez Canal is now the artery of four Empires; and Italy's activity in the pioneer and primitive stages of Empire building figured appreciably in the Canal's busy traffic during 1937. The net tonnage of 36,491,332 which passed through the Canal last year was a new high record. Out of 697,800 passengers some 300,079 were Italian soldiers, compared with 332,010 civilian travellers of all nations and 48,270 British soldiers. An Italian company, Lloyd Triestino, was responsible for the greatest tonnage of Canal shipping during the year, with 3,913,000 tons, compared with 1,334,000 in the previous year. Nevertheless, the improvement of 12.7 per cent. in the volume of Canal traffic last year was due more to the high activity of world trade than to unusual military movements. The tonnage of the British Tanker Company which passed through the Canal rose from 2,932,000 to 3,019,000. The quantity of metals and machinery proceeding southwards rose 13.7 per cent. The movement of mineral and vegetable oils northwards was exceptionally active, and cereal cargoes in the same direction increased 50 per cent. British accounted for one-third of the Canal's traffic in both directions. Over 47 per cent. of the tonnage passing through sailed under the British flag. And, among the four Imperial users of the Canal, Britain's stake remains appreciably the largest.

Fewer Motoring Offences.—The first decrease since 1933 in the number of motoring offences dealt with in England and Wales is shown in the Home Office returns for 1937 published this week. While the numbers of prosecutions, convictions and fines, however, declined between 1936 and 1937, the totals of written warnings, suspensions, endorsements and disqualifications of licences and sentences of imprisonment were higher in every case. And the average length of prison sentences showed a slight increase.

MOTORING OFFENCES—ENGLAND AND WALES

	Total Offences	Written Warnings	Prosecutions	No. of Fines	Sentences of Imprisonment	Licences suspended or endorsed
1933	366,943	93,476	273,467	228,379	407	10,491
1934	433,060	113,817	319,243	266,775	576	18,496
1935	518,240	118,125	400,115	341,233	456	77,826
1936	593,778	134,427	459,351	397,001	594	100,119
1937	579,170	136,169	443,001	382,432	780	106,705

Among particular offences, the principal decreases between 1936 and 1937 were in connection with drivers' licences from 53,751 to 46,632 (13 per cent.), for lighting, from 59,263 to 55,744 (6 per cent.), and for speeding, from 136,762 to 123,707 (9½ per cent.). But while in each of these cases the number of fines declined, there was a sharp increase in prison sentences and licence punishments for offences connected with drivers' licences, and a slight increase in licence punishments for "speeding." Average fines were substantially unchanged, but the proportion of these offences dealt with by warnings increased. The principal increases were for reckless driving, from 9,039 in 1936 to 10,003 in 1937 (11 per cent.), careless driving, from 31,955 to 33,723 (5½ per cent.), for being under the influence of drink, from 2,849 to 3,040 (7 per cent.), neglect of traffic directions, from 67,199 to 71,755 (6½ per cent.), failure to stop or report an accident, from 7,014 to 7,770 (11 per cent.), and obstruction of the highway, from 71,645 to 74,964 (4 per cent.). In almost every case the proportion of offences dealt with by police warnings rose. Prison sentences for being under the influence of drink rose by more than 20 per cent., whilst the total amount paid in fines rose by only 5 per cent. Altogether, the latest returns bring only partial comfort to the average citizen; for they convey no suggestion that the average standard of driving, road sense, and consideration for others is rising in really convincing fashion. On the other hand, the increase between 1936 and 1937 in registrations of cars shows that there were more cars on the road, and probably more use was made of cars as a whole last year than ever before.

JAPAN'S BUSINESS FAMILIES

Organisation and Leadership

Industry, trade and politics are closely woven into the pattern of Japanese national policy. The inner significance of events in the Far East can be appreciated only by an understanding of the economic forces which have inexorably urged Japan towards her present military action in Asia. Western countries know little of Japan's industrial organisation and leadership, though they have witnessed certain of their effects, successively, in Japan's monopolisation of the world's trade in raw silk, the post-war conquest of the Asiatic cotton markets and the building up of the world's largest rayon industry. More recently, Japan has turned to the task of extending her steel, chemical and engineering industries, with the aim of securing an immense market in China. Who are the men behind these movements? How is Japanese industry organised? The difficulty of answering these questions is magnified, for most Europeans, by the complex forms of the Japanese written language. Particular interest attaches therefore to the following detailed survey of Japanese economic organisation and leadership, which has been drawn up by Mr Neil Skene Smith, formerly Professor of Economics in the University of Commerce, Tokyo, on the basis of authoritative material recently published, in the vernacular, in Japan.

In considering the leading figures in Japanese life, it should be remembered that often the men at the top, though important, are not the chief power in the group to which they belong, whether they are managing directors, generals or Cabinet Ministers. In the East, the real leaders stay behind the scenes, and can only be approached by indirect means. It frequently happens, also, that two men fulfil much the same functions at the head of affairs, each acting as adviser or censor of the other—much in the same way as did the Ministers of the Left and of the Right in ancient times. Although this method appears cumbersome, Japan in the last seventy years has shown that, with modifications, it can function fairly effectively under modern conditions.

PICTURE IN OUTLINE

It is estimated that, in Japan, with its national income of some 13,000 million yen (£1,300 millions at par or 40 per cent. less at present rates), there are only a few hundred persons who pay taxes on incomes exceeding 100,000 yen a year (£10,000 at par). In addition, there are said to be some 10,000 smaller active investors and speculators in the main financial centres, particularly Tokyo and Osaka. These few persons, together with certain officers in the fighting services and various Government officials, are the economic leaders of Japan. They compete or co-operate with one another in an electrical and volcanic atmosphere, supercharged with currents of intense group rivalry and semi-feudal loyalties.

For the last six years the fighting services have been calling the tune, and the capitalists have paid the piper to the extent of about a thousand million yen per annum. The services, like most Japanese institutions, are united against foreign interference and against any group at home which seems to hamper their progress. They are divided, however, into a number of complex and often traditional cliques, whose relative positions rise and fall with fluctuations in the national fortunes.

First, there are the South-Western military families. These families, after two-and-a-half centuries of unwilling and only partial submission to the Tokugawa dictators, joined with other discontented groups of soldiers in restoring the political status of the Imperial family in the Restoration of 1868. They have naturally endeavoured to retain their control over military and naval affairs.

Secondly, there are certain younger officers (particularly those from poverty-stricken Northern districts), who in the depression of 1930-31, were dissatisfied with their own chances of promotion and with the living conditions in their villages. General Araki, the new Education Minister, was for a time popular with this group.

Thirdly, across the sea, the Kwantung army has been busily building up the Manchukuo State, often with scant

attention to the immediate needs of the homeland. Their former Chief of Staff is now War Minister.

Fourthly, there was, until recently, the Tientsin Garrison, which desired the removal from power in North China of all anti-Japanese administrators.

A fifth influence is the garrison in Korea, whose former Governor-General, General Ugaki (who attempted unsuccessfully to form a Government in Tokyo last year) became Minister of Foreign Affairs at the end of May, 1938.

Last, but not least, is the Navy, which has its own internal factions, but invariably strives to protect its interests and prestige against the Army.

Since the war an attempt has been made to co-ordinate these rival forces by setting up Imperial Headquarters, a supreme body in charge of all military and naval matters, which exercises a tremendous potential influence over the Cabinet.

Within the Government itself there are numerous forces capable of exerting some degree of independent leadership in economic matters. These include: (1) The permanent advisers to the Imperial Household—namely, the Keeper of the Privy Seals and the Minister to the Imperial Household; (2) the only remaining (and very aged) Elder Statesman, Prince Saionji; (3) the Cabinet, with its several Advisory Councils; and (4) various Government Departments, particularly those of Defence, Finance, Home Affairs, Agriculture and Industry and Commerce. These Departments together exercise extensive powers over banking, industry and economic life generally. Among the Cabinet Advisory Councils special mention may be made of the Planning Council, which contains representatives of business and offers recommendations on the utilisation of the natural material resources and labour supplies. Another of these Councils is the Capital Adjustment Commission, which examines all private projects for the increase or decrease in the capitalisation of companies. Finally there are the Railway Ministry (which owns and works all the main lines of the country), the semi-Governmental Japan Iron and Steel Company and a group of "special" banks administered by the Government. Plans are also under way for the management of the chief branches of the electric power industry by a semi-Governmental company.

Private business and industry, apart from agriculture, small-scale trading and domestic workshops, is largely in the hands of four powerful family groups. The Mitsui and Sumitomo groups date back for several centuries. The Mitsubishi and Yasuda groups came to the forefront soon after the middle of the last century. All four groups are now being confronted by the "Shinko" (literally, New Rise) groups, which have developed during the past thirty years. Their combined financial power, however, is probably still less than that of the Mitsui family alone. The

largest of the Shinko, the Aikawa concern, sprang up largely as the result of fortunate speculative purchases, in the depression of 1930-31, of shares in Japanese heavy industry, whose prices subsequently soared to record heights, thanks to armaments expenditure following the Manchurian affair. The other Shinko groups are also connected mainly with the armament industries, particularly with those producing chemicals.

The smaller industrialists and traders of Japan have been organised (sometimes compulsorily) into local associations, or guilds, with national federations, in order to strengthen themselves against the big combines and to reduce cut-throat competition in the export trade. The farmers have been encouraged to buy supplies of fertiliser and seed, and to sell their produce, through co-operative societies, which now have five million members. These organisations have not been spontaneously evolved by the traders and farmers, but have been fostered mainly through the central and local Governments.

In Manchuria and China, Japanese economic enterprise is exercised chiefly through semi-Governmental companies. These include the South Manchurian Railway Company, with its subsidiary in North China, the Kōchu Kōshi (Internal Development Company). The newly formed Mangyo (Manchurian Industrial Development Company) is controlled jointly by the Aikawa interests and the Government. Two semi-Government companies were also formed a few months ago to promote economic expansion in North and Central China.

THE BIG FOUR

Such, in brief, is the framework of economic conditions in modern Japan. We may now proceed to examine the structure of Japanese industry in greater detail. Our survey must necessarily begin by describing the rôle of the Big Four families to which allusion has already been made. Of these, Mitsui is still the most powerful. The Mitsui family are descended from a soldier who, a thousand years ago, restored for a time the secular power of the Imperial family. They entered business in the early seventeenth century and carried on sauce brewing, pawn-broking and, later, cloth selling. After building up large connections as Government money exchange agents and financiers, they became the leading financiers of Old Japan. Seventy years ago, when the Tokugawa dictatorship was at the end of its tether, they financed the Imperial cause; and they played a large part in safeguarding Government funds during the first years of Modern Japan. The rapid expansion of Japan's trade and territory carried them from strength to strength, and only in the last decade has their domination been checked.

Sumitomo, next of the Big Four in seniority, were in charge of important metal mines in the Shogunate days, and had some control over the minting of coinage. They also were able quickly to adjust their mining and financial activities to the new state of affairs.

Mitsubishi, which is controlled by the Iwasaki family, were pioneers in ocean shipping during the first years after the Restoration. This business led them on to coal-mining, shipbuilding and heavy industry, and their influence grew rapidly during these years of industrial revolution.

Finally, Yasuda began his apprenticeship to a small money exchange dealer in Edo (now Tokyo) ten years before the Restoration. By dint of careful speculation in currency during the eventful first years of the new Government, he acquired sufficient capital to enable him to play a large financial part in the wars with China and Russia. He was assassinated in 1921, at the age of 84, but his family remains in charge of all the interests he acquired.

So much for the history of the Big Four. A brief review of their financial and industrial interests will serve to show the importance of their present rôle in Japan. Each of the Big Four is controlled through a family holding company as shown in the following table.

The capital of these holding companies, in fact, gives little idea of their actual strength. They have large interests in almost all branches of Japanese economic development and are the greatest "wealth-cliques" in the country.

Holding Company	Nature	Paid-up capital* (Million yen)
Mitsui Gomei Kaisha...	Unlimited partnership...	300
Mitsubishi Goshi	Limited partnership ...	120
Sumitomo Goshi	Limited partnership ...	150
Yasuda Hozen-sha† ...	Special Trust Co.	30

In banking, naturally, these concerns are powerful. Table II at the end of this article will show that, at the end of 1936, they held about 40 per cent. of the deposits of all the ordinary Japanese banks. Two other groups held a further 19 per cent. In life assurance, although they have not been engaged in the business for very many years, they held 20 per cent. of the reserve funds of all Japanese companies. In marine, fire and accident insurance their predominance is much greater, their holdings amounting to nearly three-quarters of the national total. Again, of the property held in trust by Japanese trust companies, firms managed by the Big Four were in charge of two-thirds of the total.

Their commercial and industrial interests are no less important (see Tables III and V-XIV). In Japan's cotton textile industry three firms handle, between them, from 70 to 80 per cent. of imported raw cotton and some 40 per cent. of total exports of manufactures. The chief of these concerns, Toyo Menka, is a subsidiary of Mitsui, who also control one of the largest mills (Kanegafuchi) and numerous other spinning mills and textile weaving factories. Mitsubishi have connections with various leading textile producing companies. Both Mitsui and Mitsubishi handle raw silk through their two companies, Mitsui Bussan and Mitsubishi Shoji, which are the largest foreign trading institutions in the country. The chief shipping line, Nippon Yusen Kaisha, and its subsidiaries, are closely connected with Mitsubishi, who were the founders of Japan's modern mercantile marine.

While Mitsui specialise in light industries, Mitsubishi and Sumitomo have concentrated rather on mining, engineering and the heavy industries. They have invested several hundred million yen in shipbuilding, aircraft manufacture, dock management, electrical equipment and armament manufacture, the chemical industry and mining production of all kinds. Mitsui, however, own a mining company with a capital of 100 millions, and engage in the production of electrical switchboards, in the electro-chemical industry, and in numerous branches of engineering.

The interests of the great families in the armaments industries, as might be expected, is considerable. According to a recent calculation of the *Oriental Economist* (Toyo Keizai), Japan's armament concerns have a paid-up capital of 748 million yen, 90 per cent. of which is under the control of a dozen large and medium-sized family groups. The biggest nine of these, which own nearly 80 per cent. of the total capital, are shown separately in Table III; and three of them, it will be observed, belong to members of the Big Four.

The list of industries controlled by these family concerns extends beyond textiles, engineering and armaments. The Oji Paper Trust—a huge concern which produces three-quarters of a million tons of paper annually and controls the greater part of the entire Japanese output—is a "side company" of Mitsui. Japan has the largest output of plate glass of any country in the world, and her chief manufacturing company is Asahi Glass, whose shares are owned, as to 59 per cent., by Mitsubishi. Japan's coal resources are somewhat limited, and much of the power used in her industry is derived from hydro-electric plants, in which the Big Four have large shareholding interests.

Altogether, recent estimates have suggested that sums equal to 60 per cent. of the 21,000 million yen (£2,100 millions, at par) invested in all Japanese joint-stock companies are controlled by these concerns; and that Mitsui alone accounts for 5,000 million yen (£500 millions), or nearly 25 per cent. of the total. These interests have,

* The par rate of exchange for the yen is 10 to the £ and the present rate approximately 17 to the £. The internal value of the yen has not depreciated nearly as much as the external value. In estimating internal conditions, therefore, the par rate may be a better guide than the current rate of exchange.

† Literally, Virtue Protection Company.

clearly, given a high rate of return recently, to judge by the following figures:—

PROFITS OF 350 REPRESENTATIVE JAPANESE COMPANIES
(Calculated by the Mitsubishi Economic Research Bureau)

	Rate of annual net profit to paid-up capital	Dividends
1936 { 1st half-year	12·6	8·3
2nd " "	12·8	8·2
1937 { 1st " "	14·0	8·5
2nd " "†	13·8	8·6

† Provisional estimate based on 190 companies.

Net profits in manufacturing and mining averaged as much as 16 per cent. and dividends 10 per cent. These high rates, however, were offset by lower figures for the electric power, transport and financial companies.

ORGANISATION IN THE FAMILY GROUPS

The capital of the Big Four's holding companies is owned by the chief members of the family, who are required to conform, in each case, to the Family Constitution. In the Mitsui group this constitution is about two centuries old. Actual day-to-day administration, however, is largely in the hands of one or more distinguished "Banto" (literally "head watchmen") such as Nanjo of Mitsui, Ishikawa of Mitsubishi, Kozo Mori of Yasuda and, until recently, Toyotaro Yuki of Sumitomo. At the time of his assassination, in 1932, Baron Dan was chief Banto of Mitsui. He was succeeded by Mr Seihin Ikeda, the new Minister of the Departments of Finance and Commerce, who retired in 1936.

These great businesses have a pyramidal structure, with a holding company at the top controlling the main operating companies and the "side-line" concerns. Each of these two classes of company has numerous subsidiaries, which frequently, in turn, have smaller companies largely dependent upon them. In addition, the families enjoy extensive control of outside businesses to whom their banking, insurance and trust organisations supply funds. Yasuda, in fact, has few direct manufacturing activities. Like the industrial banks of pre-War Germany, it exercises control chiefly through its lending power.

Before the last depression set in, all the family concerns were busy expanding, studying conditions abroad and modernising their constitutions so far as the traditional framework allowed. Although they had set their faces against trade unionism, their more enlightened leaders were conscious that they must pay increasing attention to the social consequences of their policy. The depression—and the increased attention given to social studies among junior army officers—coincided with the assassinations of economic leaders in 1932 and with military demands for an expansion in armaments, which had been cut down under the stress of deflation. Simultaneously, the younger members of the Big Four's staffs became very dissatisfied with their chances of promotion. Accordingly, Mitsui, under the direction of Mr Ikeda, took the lead in introducing a policy of "slewing-round"—in the Japanese journalistic term. This policy involved the large-scale donation of funds to national social organisations, accompanied by a slowing-up of the tendency of big business to monopolise all branches of trade, particularly in overseas markets. The big concerns sold a considerable portion of their shares to the general public, and made arrangements for the automatic retirement of senior staff members, including directors, between the ages of 50 and 60.

Although this reorientation of policy did not increase the popularity of the big concerns, it showed the military that their criticisms were not without effect. Meanwhile, after the absorption of Government armament bonds by the Japanese market had proceeded satisfactorily for some years, there were signs, in 1936, of hesitation both among the large capitalists and in the cabinet, in their willingness to support continued Budget deficits. The revolt of February, 1936, however, convinced them of the necessity of accepting their position with a good grace; and they were prepared to intensify their efforts when the war with China started. To-day they are becoming increasingly aware of two factors: first, the vast potentialities which are being opened up in China for the production of coal, iron, steel,

raw cotton and electric power; and, secondly, their own need for foreign capital.

SMALLER FAMILY GROUPS

Other old-established family groups beside the Big Four, have played an important part in the rise of modern Japan. The chief of these groups are:—

(1) The Shibusawa interests. These were built up by the late Viscount Shibusawa, who, among his many activities in all branches of Japanese economic life, established the Dai-ichi Bank and an important engineering works. He was one of the founders of the Tokyo University of Commerce, which has trained a large proportion of Japan's business leaders. The Viscount's son is now managing director of the semi-Governmental Japan Iron and Steel Company.

(2) The Okura group, which owns numerous small companies engaged in trading, mining and engineering, and is particularly interested in development on the East Asian mainland.

(3) The Fujita group, which is engaged in mining and trading.

(4) The Furukawa metal-mining and electric cable manufacturing concerns.

(5) The Shibuya Explosives Company.

(6) The Kawasaki Dock and Engineering Companies, banks and insurance firms.

(7) The Asano cement and building interests.

The relations of these smaller concerns to the Big Four have, on occasions, been close. Several of their managing families are connected by marriage with the main families of the Big Four, to whose subsidiary companies they frequently subscribe. On the other hand, the Big Four often take up their debentures. The Asano interests, for example, are largely dependent on loans from Yasuda.

NEWER GROUPS IN JAPAN

No picture of industrial Japan to-day would be complete without some mention of the newer "Shinko" groups, whose influence, while not as great as that of the old-established family concerns, has grown rapidly in the last five years. The most striking of these groups is led by Yoshisuke Aikawa, a trained engineer of fifty-seven years. After gaining experience in America, Aikawa in 1910 founded the Tobata Casting Works, with capital borrowed from his relations. In 1928 he bought up shares in the Kuhara Mining Company at ridiculously low prices, part of which he sold to the public after the armament boom of 1931, at eight or nine times their earlier quotations. The mining firm was then separated from the main company which became an open holding company, Nissan (or Japan Production). On the eve of the present Chinese war, Yoshisuke Aikawa controlled companies with a capital of 500 million yen and with 95,000 employees, in the mining, engineering, electric power, chemical, trawling and fishing, gramophone, wireless and match industries. He has also taken the lead in motor-car production in Japan. His policy of offering shares to the public, his successful handling of relations with foreign companies, and his willingness to take considerable business risks have combined to render him *persona grata* in military circles. He has, consequently, been entrusted with the development of mining, iron and steel production and engineering in Manchuria—activities formerly monopolised by the South Manchurian Railway—though half the shares in the Manchurian enterprise are held by the Manchukuo Government. Mr Aikawa, in short, has spread his net widely over both war-time and peace-time industries, and his family is connected, by marriage, with the Mitsubishi leaders and with several other big concerns.

Certain other Shinko industrial groups may be separately enumerated. They include:—

(1) Japan Nitrogen (Nichitsu), led by Jun Noguchi, and built up originally on imported fertiliser.

(2) Japan Soda (Nisso), whose wide range of products has been developed from the careful study, by Yurei Nakano, of salt and foreign processes for transforming it into chemicals.

(3) The chemical companies of Nobuteru Mori, first concerned with the manufacture of iodine and now engaged in electro-chemical processes and fertiliser manufacture. This group is largely dependent for funds upon Yasuda and Mitsubishi.

(4) The curious collection of companies controlled by an organisation known as Riken. These companies were developed from a Government-subsidised physical and chemical research institute and subscriptions were made to their capital by all the leading family businesses. The group has now started its own factories to produce light engineering products, particularly piston rings, precision machines and machine-tools.

Apart from Nissan, these new concerns do not approach the older families in capital power. They are of first-rate importance, however, in shaping the modern development of Japan, since they have applied Western science to Japanese industry. For example, they are already taking a leading part in the manufacture of ammonium sulphate, where, as Table XII shows, three Shinko concerns are among the "Big Six" which together own nine-tenths of Japan's productive capacity. The business of the newer concerns has been built up with noteworthy skill and dispatch; so much so, that Japan is now largely self-sufficient in chemicals and electrical apparatus, and will shortly turn her energies to the production of high-quality machines.

In general, the new concerns, like the old, are permeated with the influence of the family system. They are, however, far more than the older groups, the product of a small number of enterprising individuals; and, although their interests are widespread, they are, on the whole, rather more specialised. Perhaps their most significant feature is the part that armament expenditure has played in their recent development. Their prosperity, however, will depend ultimately upon their ability to turn their activities to peaceful ends. For this reason, they are particularly interested in the course of events in China, where, for centuries, public works,

transport and (until recently) Western science have all been neglected. Their co-operation in the war can be looked for as a matter of course; for their investments are confined to Asia, and military defeat would mean their destruction.

THE GOVERNMENT AND BUSINESS

Before bringing the survey to a close, a brief description may be given of the methods by which the Government is endeavouring to forward its ambitious policies on the economic side. The National Planning Council and the Capital Adjustment Commission, upon whose advice the Cabinet relies, have the co-operation of certain Government institutions. These include:—

(1) The Bank of Japan, the Central Bank, which now has outstanding 1,800 million yen of notes against its bullion holdings of 800 million yen. The bank buys up most of the Government war bonds and holds them until it can dispose of them to other banks.

(2) The Yokohama Specie Bank, which controls the foreign exchange market.

(3) The Hypothec Bank, which makes long term loans on the security of agricultural and city property.

(4) The Industrial Bank of Japan, which is able to compete with private banks in granting loans to industry.

(5) The special banks formed for assisting Hokkaido and the colonies.

All these institutions are under the control of the Department of Finance, and their outstanding loans aggregate more than 4,000 million yen (£400 millions at par). In addition to the departments controlling the railways, industrial welfare and agriculture, the Department of Commerce and Industry has powers to encourage the organisation of industrial guilds and selling associations.

Some eighty per cent. of the shares of the Japan Iron and Steel Company, which produces half of Japan's steel, were until recently owned by the Government. The company has now, however, raised its capital from 360 to 511 million yen, and private investors have increased their holdings. Under the latest scheme for national co-ordination of the electric power industry (in which the five largest companies have assets valued at a total of 1,500 million yen) there are to be a Board of Electricity to plan developments, a special National Power Company (formed from existing companies) to carry them out, and an Electric Power Council to supervise the results.

SOUTH MANCHURIA RAILWAY

The history of the South Manchuria Railway indicates the possible future trend of Japanese investment in China. This huge semi-Governmental organisation has a capital of 800 million yen, and assets which were worth, in 1936, some 2,000 million yen. It has been the pioneer of economic development in Manchuria, through its concentration on railways and the soya-bean trade. It now controls nearly all the railways in Manchuria, North China and part of Korea, and is comparable, in many ways, with the Canadian Pacific, the Trans-Siberian and other great lines. Some Japanese refer to it as their "East India Company," for, in addition to its purely transport activities, it has developed most of Manchuria's coal, iron and gold mining, gas, electricity and water supplies, docks, engineering works, modern hotels and newspapers.

The capital of the South Manchuria Railway was provided as to one-half by the Japanese Government and as to the remaining half by the big family concerns and others. No one set of private interests, however, has ever had dominating power in it. The Governors have usually been Government servants.

After 1931, however, side by side with the thirty years old South Manchuria Railway, with its headquarters at the trading port of Dairen, there rose up the Manchukuo Government, largely controlled by the Kwantung army, at the rapidly growing political capital of Hsinking. The authorities at the latter place became impatient with the monopoly of the South Manchuria Railway, and anxious for the rapid economic expansion of the new State. They desired to obtain increased supplies of coal, iron, oil and

LARGE CONCERNS IN JAPAN

The following tables give some idea of the importance of the leading group concerns in Japan's economic structure. Table I shows the total paid-up capital of the main and affiliated companies of most of the big groups (with the exception of the Shibusawa group, for which figures are not available). Table II indicates the part played by the "Big Four"—Mitsui, Mitsubishi, Sumitomo and Yasuda—as well as by Shibusawa and Kawasaki, in Japanese banking, insurance and trust companies. Table III discloses the relative shares of leading groups in the paid-up capital of Japan's armament manufacturing companies. Tables IV–XI give the positions of the various concerns in the production of iron and steel, coal, copper, gold, cotton textiles, sugar and flour and in the export of raw silk. Tables XII and XIII relate to the position of the newer group concerns in two leading chemical industries—the production of ammonium sulphate and the manufacture of soda by electrolysis. Finally, in Table XIV is given a list of Japan's leading shipping companies and the tonnage owned by them. (Most of the statistics in the article and tables are based on information contained in a series of twelve volumes, Nihon Konzern Zensho, the publication of which was begun last year by Shunjusha, Tokyo.)

TABLE I
JAPANESE GROUP CONCERNS. MAIN AND AFFILIATED COMPANIES

Total Paid-up Capital at end of June, 1937	
	Million Yen
The Big Four—	
Mitsui	1,177
Mitsubishi	848
Sumitomo	384
Yasuda	264
Total	2,673
Other Older Groups—	
Asano	236
Okura	133
Furukawa	102
Kawasaki	99
Total	570
New Groups (Shinko)—	
Nissan	474*
Japan Nitrogen (Nichitsu)	198
Mori	142
Japan Soda (Nisso)	85
Riken	31
Total	930
Total paid-up capital of all Japanese Companies at end of 1936†	4,173
Share of Big Four in Japanese total	17%
Share of New Groups in Japanese total	6%

* Before the formation of the Manchurian Industrial Development Co. (Mangyo) which has greatly increased Nissan's importance.

† Excluding semi-Governmental Banks and Companies.

The table, however, tempts us to under-estimate greatly the relative importance of the big concerns, whose shares are worth from 30 to 100 per cent. more than their nominal value, whereas those of smaller companies do not so often bear high premiums. Also there are numerous other companies largely under their control though not exactly affiliated to them. A truer picture can be obtained from the following table which indicates the vast amounts of loanable funds at the disposal of the big concerns.

TABLE II
JAPANESE BANKS, TRUST COMPANIES AND INSURANCE COMPANIES MANAGED BY SIX LEADING GROUP CONCERNS (end of 1936)*

	LOANABLE FUNDS† (Million yen)			
	Banks	Trust Companies	Life Insurance Companies	Marine, Fire and Accident Insurance Companies
	Deposits	Property in Trust	Reserves	Reserves
Mitsui	977	533	47	26
Mitsubishi	1,090	393	288	230
Sumitomo	1,112	384	38	17
Yasuda	1,766	244	103	32
Total of Big Four	4,945	1,554	476	305
Shibusawa	1,386	None	39	None
Kawasaki	994	51	161	39
Total of Six Groups	7,325	1,605	676	344
Total for whole of Japan	12,403‡	2,360	2,431	417
Share of Six Groups in Japanese Total	59%	68%	28%	82%
Share of Big Four in Japanese Total	40%	66%	20%	73%

The six groups hold 57 per cent. of the national total of all funds included in the above. In 1929, the equivalent figure was 45 per cent.
* Insurance figures are for the end of 1935. † All figures include share capital.
‡ Not including Government and semi-Governmental banks.

TABLE III
JAPANESE ARMAMENT MANUFACTURING COMPANIES

water power, and to further agricultural development. Last but not least, they planned to settle a million Japanese families (i.e. five million people) in Manchuria during the next twenty years.

The clash between the Hsingking and Dairen ideologies reached a deadlock in 1935. The army remained dissatisfied with the S.M.R., but could not realise its objectives without money from capitalists in Japan, who were far from being convinced of the practicability of their plans. A series of decisive events, however, modified the whole position. In February, 1936, came the revolt of the younger officers; in 1937, attention was focused on economic developments in North China; and, finally, in July, 1937, came the war in China.

The army has now brought in the meteoric Aikawa to take over the Showa Steel Company, and many other industrial interests of the S.M.R. The latter, meanwhile, has its hands full with its newly acquired Chinese railways, which it plans to run on a continental basis, with the Manchurian and Korean lines.

Japanese plans for the economic exploitation of Chinese territories have found expression in the formation of three semi-Governmental companies. These are:—

(1) The new China Federal Reserve Bank. Half of the bank's capital of 50 million yuan (or yen) is being provided by the Yokohama Specie Bank, the Industrial Bank of Japan, and the Bank of Chosen (Korea) on behalf of the Provisional Peking Administration. The other half is being provided by various Chinese banks.

(2) The North China Development Company, with a capital of 350 million yen, half of which will be contributed by the Japanese Government (partly in kind).

(3) The Central China Development Company, with a capital of 100 million yen, some 50 millions of which will be provided by the Japanese Government.

TABLE XII

ESTIMATED CAPACITY FOR PRODUCING AMMONIUM SULPHATE IN JAPAN, KOREA AND MANCHURIA

Producing Groups—	Thousand metric tons
Japan nitrogen	645
Sumitomo	400
Mitsui	379
Mori	270
S.M.R. and/or Nissan*	300
	1,994

(89 per cent. of the total productive capacity.)

* No figures are available showing the extent to which the S.M.R. still retains control over production.

TABLE XIII

ESTIMATED CAPACITIES OF JAPANESE GROUPS PRODUCING SODA BY ELECTROLYTIC PROCESSES

Producing Groups—	Percentage of total capacity
Japan soda	12.7
Japan nitrogen	14.7
Mori	13.4
Fukuzawa	13.4
Mitsui	12.0
Nissan	6.0
	72.2

TABLE XIV

SHIPS OWNED BY JAPANESE SHIPPING COMPANIES

Owning Groups	Lines	Gross Tonnage over 1,000 tons	Group Total
Largely Mitsubishi	N.Y.K.	635,283	829,330
	Kinkai Yusen	153,706	
	Mitsubishi Shoji	40,341	
	O.S.K.	532,590	
Partly Sumitomo	Kokusai Kisen	151,066	807,145
	Kita Nippon Kisen	61,816

	Kyoritsu Kisen	35,926	
Asano	Toyo Kisen	63,556	85,235
	Hinode Kisen	14,440	
	Asano Bussan	7,239	
Yamashita	Yamashita Kisen	92,326	115,305
	Tamai Shosen	22,979	
		2,033,261	

(49 per cent. of Japanese total of 4,156,619 gross tons)

Among ships over 5,000 tons, the predominance of vessels belonging to N.Y.K., O.S.K., and Mitsui is much greater.

Both development companies may issue debentures to an amount equal to five times their paid-up capital. Their enterprises will engage in transport, communications, and the production of electric power, minerals, marine products, salt and other commodities.

THE FUTURE

Japanese economic leaders are now at the crossroads of nationalism and internationalism. They have steadily been building up the self-sufficiency of the Japanese Empire under tariff protection. They remain dependent, however, upon foreign countries for imports of raw materials and the latest machinery, and if they are to bring about a rapid reconstruction in China they will require foreign capital.

Meanwhile, Japan's economic development is still largely controlled by the Big Four, who play a leading part even in the semi-Governmental concerns. Their reputation among the people has become more favourable with the realisation that their efforts are indispensable if the war is to be brought to a successful conclusion. Probably their greatest living representative is now Minister of Finance and Commerce. The new concerns have supplemented rather than replaced the old family businesses. All groups, including the military, the Government, the capitalists, and the small traders and farmers, are at present working in unison, but on any sign of collapse old-standing jealousies would probably break out again. The greatest risk, from the point of view of Japan's economy, would be a war which dragged on indefinitely, and offered little opportunity for investment yielding a positive return. A peace which hampered Japan's newly expanded industries would be disastrous to them; a victory would show whether those industries could be as effective in building up Chinese life as in destroying it.

Striking Export Surplus

NEW YORK, June 7. — Last October the Federal Reserve index of industrial production (adjusted) fell to 102, nine points below the preceding month and 19 points below the record high level of December, 1936. A trade recession was clearly in progress. The same month saw a continued fall in imports of merchandise and a further rise in exports. For the first time for several years, the surplus of exports exceeded \$100 millions. During the first three quarters of 1937, imports had exceeded exports by a net amount of \$51 millions.

From that turning point, the United States has proceeded to pile up one of the largest "favourable" merchandise balances on record for a comparable period of time. Every month has shown a surplus of exports amounting to \$100 millions or more, except November, when the surplus was \$92 millions. The total export surplus during the seven months including April, 1938 (for which figures are now available), was \$747 millions.

The total surplus for these seven months is larger than for any complete calendar year since 1921, except 1924, 1928, 1929 and 1930, which showed export surpluses of \$981 millions, \$1,037 millions, \$842 millions and \$782 millions, respectively. The average monthly surplus during the last seven months for which figures are available exceeds the average monthly surplus in any of those years. Prior to the World War there was no year when the export surplus equalled this seven months' total.

This extraordinary surplus is not the result of any extreme rise in exports. During the last quarter of 1937 exports averaged just over \$300 millions a month, and during the first four months this year about \$275 millions. Imports fell steadily to the end of 1937, but the decline seems to have ceased during the first four months of this year.

Domestic Character of the Slump

These trade figures indicate the essentially domestic character of the business slump here. Imports fell persistently last year, while exports rose in October and remained steady during the rest of the year. During the first third of 1938 both exports and imports have remained steady with a large surplus of exports. This suggests that conditions in other countries are tending to sustain, rather than depress, business and prices here. Apparently, the dollar figures for trade represent fairly well the volume of goods, since the average price is reported to be substantially unchanged compared with a year ago. The Department of Commerce stated in its April report that: "The unit value (price) index of total exports and of total imports was at least 7 per cent. lower in this past April than in April, 1937."

The figures for April and the first four months of this year and last year are as follows:—

	Millions of dollars		Four months ended April	
	1937	1938	1937	1938
Merchandise:—				
Exports	269	274	981	1,102
Imports	287	160	1,112	667
Excess of Exports	...	115	...	435
Excess of Imports	18	...	131	...
Gold:—				
Exports	N	N	N	5
Imports	216	71	612	140
Excess of Imports	216	71	612	134
Silver:—				
Exports	2	0.2	7	1
Imports	3	16	25	74
Excess of Imports	1	16	18	73

N = Negligible.

Imports of gold and silver have covered a substantial portion of the favourable trade balance, but not all. Net imports of the two metals during the first four months of 1938 are reported at \$204 millions compared with the export surplus of \$435 millions. For the whole seven months gold

and silver imports (net) amounted to \$375 millions of the \$747 millions merchandise balance.

It would appear, therefore, that foreign balances in this country are being utilised to pay for goods. The figures compiled by the Treasury Department showed, during the fourth quarter of 1937, a reduction in foreign short-term funds held here, and the trade figures suggest that a continuation of this trend will be shown when the report covering the early months of this year is made. Movements of security prices do not suggest any important operations with foreign funds.

The Treasury and the Money Market

The Treasury has announced further steps in its programme to try to fill the triple rôle which it now plays as a result of the last depression. As a fiscal agency, the Treasury is preparing for the first substantial borrowing of new money for more than a year, in readiness for the spending programme. As an integral factor in the central banking mechanism, it is preparing to complete the programme to increase banks' excess reserves to new high levels, announced in the President's message on April 14th. As the chief agency through which monetary influence on business is now exerted, it is preparing to provide funds for expenditure and at the same time to attempt to maintain a stable bond market.

On June 15th, holders of \$618 millions of notes maturing then and holders of \$596 millions of notes maturing on September 15th will receive in exchange new 1½ per cent. five-year notes or 2½ per cent. 20-25 year bonds, at the holders' option. By anticipating the September quarter-date maturity, that date will be left free from maturities and open for an issue to raise new money for the spending programme. By the same operation, a large amount of floating debt is funded, while, at the same time, a long-term issue is put upon the gilt-edged market, which has recently been so buoyant because of rising excess reserves as to appear to need restraint.

From June 16th to June 18th the Treasury will repay \$250 millions of maturing bills in cash. And between June 22nd and July 20th another \$250 millions of maturing bills will be retired by refinancing only \$100 millions of the \$150 millions maturing weekly. By these operations, in addition to whatever excess of expenditure occurs during the period, the Treasury will be able substantially to reduce its present large cash balance. This balance was increased by the proceeds of desterilisation, which do not increase bank cash until disbursed by the Treasury. Repayment of these bills, therefore, will both increase bank cash and further reduce floating debt. From July 27th the Treasury will begin to borrow new money on bills again, and the reduction in the volume of available short-term investments, as well as the increase in bank cash, will tend to support the gilt-edged market.

The net result of these steps, together with those of recent months, is to exert unprecedented upward pressure on the long-term gilt-edged market and to "squeeze" the short-term market. From August, 1937, to May 31st the total outstanding Treasury bills were reduced by \$1,100 millions to \$1,553 millions, and by July 20th they will have been cut by another \$500 millions. Since the Federal Reserve Banks held \$715 millions of these bills on June 1st the market has only a small supply.

During recent months (up to May 31st) the volume of outstanding Treasury notes was reduced by nearly \$500 millions, and will fall still further as a result of the June 15th operations. Meanwhile, bank loans have been rapidly liquidated, and commercial paper and bankers' acceptances are declining. As a result, the market rate on Treasury bills, which averaged 0.45 per cent. in 1937, has recently gone to 0.025 per cent., and the rate on three-five year Treasury notes, which averaged 1.40 per cent. in 1937, is now 0.72 per cent. Last September the Treasury offered 2 per cent. five-year notes; it now offers $1\frac{1}{4}$ per cent. five-year notes, and the market has bid them to a substantial premium. The short-term money rate has essentially vanished so far as the Treasury is concerned, and money for several years' term has but little value. During coming weeks still more pressure will be felt.

France

More Decrees

PARIS, June 16.—The parliamentary session will probably end on the eve of the visit of the British Sovereigns, which figures more and more as the great event of the year in Paris. Meanwhile, fifty new decree-laws have been promulgated. The personnel of the fighting forces is to be augmented. Financial enactments provide for restrictions on the alienation of real estate; control of private insurance business; the prevention of fiscal fraud; fiscal relief; and the protection of savings. The country is to be newly sub-divided into economic regions. A tax will be imposed upon imports of cotton to encourage production in North Africa; and the subsidised steamship lines are to be reorganised.

Further decrees will be issued before, or soon after, the close of the parliamentary session, and these will be more important. They will be mainly concerned with the Wheat Office, and the development of electricity supply and distribution. The Minister for Air has announced that the introduction of the 45-hour week into aircraft factories has led to an appreciable improvement in the rate of building. Altogether, the Government's programme is making good progress.

Financial Difficulties

Claims for concessions to civil servants for agricultural insurance and pensions for aged workers, representing a total fresh expenditure of 8,000 million francs, were supported before the Chamber chiefly by the Communists, but also by the Socialists. M. Daladier rejected the claims, arguing that such measures would bring the exchange rate down to 220 or 230 francs to the £. He had promised that the rate of 179 would not be exceeded. Moreover, he said, to accept such proposals at this juncture would demonstrate an improvidence which would alienate every friend or ally.

M. Daladier's firm stand is a new thing in France, and the favourable impression it made was enhanced by its following hard upon a compulsory evacuation of the employees of the Mint, who had begun a stay-in strike because of a dispute over wages. The defence of the franc and the augmentation of the Army at a time of great international anxiety have strengthened the Prime Minister's position, as was proved in

Committee when the votes of the Socialists themselves were cast in support of his firm policy.

The moment is certainly not favourable for lavish expenditure. The Treasury still needs 30,000 million francs to cover the period up to the end of 1938, of which 15,000 millions have already been borrowed; 5,000 millions by the recent National Defence Loan and 10,000 millions by the issue of short-term bonds. The remaining 15,000 millions will be sought in the market in the course of the next six months and, in the main, during the autumn. Meanwhile, the statistics of production are far from encouraging. What will they be like in October? No confident answer can yet be given to this question.

Declining Imports

Foreign trade in May showed (compared with April) an increase in the value of exports but a decline in their volume. Imports also declined in volume, while their value remained practically unchanged.

	(francs '000 omitted)		
	May, 1937	April, 1938	May, 1938
Imports:—			
Foodstuffs	761,478	994,759	1,101,383
Raw materials	1,856,827	2,270,855	2,131,335
Manufactured goods	452,168	611,788	644,959
Totals	3,070,473	3,877,402	3,877,677
Exports:—			
Foodstuffs	255,096	365,343	330,438
Raw materials	621,301	710,107	714,717
Manufactured goods	884,488	1,288,310	1,279,280
Totals	1,760,885	2,363,760	2,324,435
Import surplus	1,309,588	1,513,642	1,553,242

Trade during the first five months of 1938 showed an average monthly import surplus of 1,558 million francs, or 1,228 millions if trade with the Colonies is excluded. In value, exports increased more rapidly than imports, a movement which is largely explained by the decline in imports caused, in the main, by the rise of foreign prices in francs and by the declining activity of French industries.

The Statistique Générale has just published its monthly figures showing industrial production:—

	1928=100			
	April, 1937	February, 1938	March, 1938	April, 1938
General index	97	85	84	...
Mines	91	92	96	95
Chemical industries	104	102	96	...
Paper	199	163	157	142

Gas and electricity	129	132	133	...
Miscellaneous	107	104	109	...
Old general index (1913=100)	105	96	95	93

Wholesale prices in May registered a rise equivalent to the latest depreciation of the franc. The rise in the prices of imported products was accompanied by an equivalent increase in the prices of certain domestic foodstuffs, due to social charges or unfavourable weather conditions. Meat prices, however, fell, probably because of hasty selling as a result of the prolonged drought and the pressure exerted by public authorities on certain prices, such as the price of milk. Because of these exceptional circumstances, retail prices are following the wholesale prices very slowly, but a new and serious rise may occur in the future.

	PRICES.				
	Apr., 1937	Feb., 1938	Mar., 1938	Apr., 1938	June 11 1938
Wholesale prices (1914=100):—

Foodstuffs	526	624	613	623	653
Industrial products	547	605	622	617	640

	Apr., 1937	Feb., 1938	Mar., 1938	Apr., 1938	June 11 1938
Retail prices (1914=100)	580	692	690	691	698
Lighting and heating (1930=100)	94.8	116.0	116.4	117.4	117.8

A seasonal fall in unemployment is perceptible. The number of unemployed was 375,719 on June 4th, against 380,826 in the preceding week. But the number of unemployed was 340,062 a year ago, when the monthly increase was 35,657.

Germany

Austrian Loans Discussions

BERLIN, June 15.—Exporters were perturbed last week by fear of complications arising out of the Austrian loans discussions. Except for a few privileged persons, they could obtain no information. It is a rule to prevent the circulation of international news which may be considered derogatory to the Reich Government, unless such news can be exploited as a demonstration of foreign ill-will. In accordance with this policy the difficulties which arose over the loans during the Leith-Ross negotiations were not reported; indeed, although the public had been fully informed about the successful course of the trade negotiations with Italy, the fact that there was any delegation about the loans at all was kept generally secret. The news of trouble over Austrian debts reached the public obliquely in the form of news about the British Chambers of Commerce letter to Sir John Simon, which was described as "malicious."

Commercial circles naturally fear the setting-up of a Clearing; and, if the Reich Government forces Great Britain to do that, it will belie its own recent policy, which has been to substitute direct payment for Clearing agreements. Any refusal to acknowledge the validity of the international loans, as distinct from a mere default on transfer, would place the Reich Government in a dilemma. A substantial part of these loans is held by Austrians. Under Reich currency law (extended to Austria), the Austrian holdings, being in foreign currency, are compulsorily deliverable against compensation in marks. On home political and other grounds, there could be no question of repudiating Austrian holdings of international loans. It is therefore hard to see how the loans could be repudiated as a whole.

Relevant to the transfer problem is the fact that, through the expropriation of Austrian foreign currency holdings and foreign securities, the Reich comes into possession of a very large sum in foreign exchange, in addition to the Austrian National Bank reserves, already taken by the Reichsbank. In banking circles different estimates of the expropriated windfall are current. Even the lowest estimate exceeds the outstanding capital of the three Austrian international loans.

Cereal crops are reported to have recovered substantially from the April setback. Although stocks were more than sufficient for the brief remaining part of the farming year, imports of wheat, barley and oats continued in May. Wheat imports in the first five months reached nearly half a million tons, valued at Rm. 66.5 millions. The condition of sugar beet is described as satisfactory; but the condition of nearly all vegetables is much worse than twelve months ago; and fruit prospects are very unsatisfactory.

Increased Employment

Five Reich laws and ordinances concerning mining have been extended to Austria, and their effect is to increase the State's authority in prospecting and exploitation. The number of employed persons in May (excluding Austria) reached 19,850,000, an increase in the month of 450,000, largely due to the number of children leaving school, but in part to the increasing entry into gainful occupations of married women, pensioners and workers formerly independent. The number of unemployed persons fell by 84,000 to 338,000, of whom only 37,000 were fully qualified for work. The number of unemployed in Austria, which is still separately returned, dropped by 65,000, but the total, 351,000, remains higher than in the Reich.

The building and allied industries are extraordinarily active. Housing has suffered a setback. The number of dwellings under construction at the beginning of the year was only 150,000, against 175,000 a year earlier. Various new factors are making for a housing shortage, which is often local. In Berlin flats and villas are being taken over, not only by Government and party administrations, but also by provincial business concerns whom the ever-expanding State central control compels to be represented in the capital. There has always been a shortage of small dwellings; to-day the larger houses also are fully occupied.

Movements of population due to the Four Year Plan have caused a housing shortage in many other districts, the unsatisfactory makeshift remedy for which is "barracking." According to the "Economic Building Group," some 72.6 per cent. of building orders in 1937 were for public constructions, 22.3 per cent. for industrial purposes, 4 per cent. for private dwellings (including orders from settlement asso-

ciations) and 1.1 per cent. for trade communications, banks, insurance institutions and agriculture. Since the capacity of the building industry is already fully utilised, it would seem that the decline in the absolute number of new dwellings can be arrested only by slackening the pace of public construction. Present indications, however, are that this pace will increase rapidly.

The recent decision to prolong the International Steel Cartel has been well received. Major-General von Hanneken, the head of the Iron Production Group under the Minister of Economics, stated that the undertakings of the Reich Ore and Iron Works (Hermann Goering) would be transferred to private industry as far and as soon as possible. The State had assumed the initiative with these undertakings only because they involved risks that industry could not take. Exports of machinery in April reached the high level (for post-depression times) of 38,600 tons. Exports of internal-combustion motors has increased to about 30 per cent. above the level of 1936.

Coal prospects are discussed pessimistically. In April it proved necessary to reduce output to 14,500 thousand tons, against 15,720 thousand tons in April, 1937, owing to the failure of increased home consumption to make good the loss of export trade. Home consumption of coal in the first four months of the year was 52,800 thousand tons, against 48,880 thousand tons in 1937; and exports were 11,020 thousand tons, against 12,520 thousand tons. Since 1932 home consumption and (with the exception of one year) exports had previously both risen continuously. The marked increase in German exports from 18 million tons in 1932 to nearly 39 million tons in 1937 was in part due to the activity of British industry, and the view is now expressed that any further decline in British trade would reduce German exports still more.

Distribution of Textile Exports

The *Frankfurter Zeitung* publishes some instructive figures about German exports of textile yarns, cloth, knitted goods and clothing. The value of these exports last year rose to Rm. 541 millions, against Rm. 510 millions in 1936 and Rm. 435 millions in 1935. But there have been great changes in the distribution of this trade. Since 1934 there have been heavy declines in exports to the Netherlands (then the chief customer), Switzerland and the United States, and smaller declines in exports to Belgium, France and Italy. Among North European countries, there have been substantial increases in exports to Great Britain, Denmark and Finland, and smaller increases in exports to other countries.

In 1937, for instance, Great Britain, with Rm. 69,700,000 against Rm. 51,200,000 in 1934, was Germany's chief customer for textiles. The percentage increases in textile exports to Central and South-East European countries (including Turkey), however, were much greater. Some of these countries, and in particular Yugoslavia, Roumania and Greece, show five to sevenfold increases. In 1934 only one out of eight countries in this group took textiles to the value of more than Rm. 5 millions; in 1937 five took over Rm. 10 millions; and of these three took over Rm. 20 millions.

In textile trade with Latin-America the tendency was similar, the percentage increases being in many cases even greater, though the absolute values were small. To Chile, for example, exports increased elevenfold. The growing trade association with South-East Europe and South America is illustrated by these figures. In Asia the most noteworthy change was the rise in exports of this class of goods to Persia from Rm. 300,000 to Rm. 7,500,000; in Africa there was an increase from Rm. 400,000 to Rm. 7,400,000 to British West Africa; and all other Asiatic and African countries show increases, great or small.

Jugoslavia

No Marked Recession

BELGRADE, June 11.—At the end of April business in Yugoslavia was still making headway, although at a slightly slower rate, under the continued stimulus of 1937 conditions. The index of mining output in April reached 132.3, against 111.7 in April, 1937, and that of foundries was 181.7, against 124.2 a year ago. During the first four months of 1938 mining activity was about 20 per cent. and foundry activity nearly 30 per cent. above the level in the corresponding months of 1937. Truck loadings during the same period were 527,000, compared with 465,000 a year ago. The employment index in January stood at 109.9, against 105.5; it was lower than in August, 1937, when it was 127.4, with 721,000 workers in employment; but employment in January is normally lower than in any other month. Building is showing signs of great activity, well above the level of recent years. The Budgetary year 1937-38 finished with a net surplus of 1,373.5 million dinars; receipts were 11,804.8 millions and expenditure 10,431.7 millions.

On the other hand, the impact of the trade recession abroad is beginning to be felt. True, the total value of trade declined during the first four months of 1938 by only 4.8 per cent. (from 3,472 million dinars to 3,313 millions), but this was due chiefly to heavy imports made to diminish the debts on clearing accounts. Thus, the import surplus through clearings in the first four months of 1938 amounts to 153 million dinars, against an export surplus through clearings of 109 millions in the same months of 1937. Trade during the period January to April was as follows:—

	January to April 1937		January to April 1938	
	Tons	Mill. dinars	Tons	Mill. dinars
Exports	1,341,000	1,903.3	1,227,000	1,569.5
Imports	307,000	1,568.7	410,000	1,743.8
Surplus of Imports (—) or Exports (+)	...	+334.6	...	—174.3

One interesting feature is the fact that Great Britain figures at the top of the list of Yugoslavia's customers. Exports to Great Britain in April were valued at 117 million dinars, those to Germany, which was second, at 78.6 millions. During the first quarter of the year exports to Great Britain were valued at 163.7 millions and imports from Great Britain at 146 million dinars.

It is too early to speculate whether this increase in trade between Great Britain and Yugoslavia will become a permanent feature. It is possible, however, that Yugoslavia may make efforts to achieve this. Hitherto, between 33 and 37 per cent. of total Yugoslav exports have gone to Germany and Austria. The inclusion of Austria in Germany may mean that Yugoslav exports will be tied too much to one country, and be consequently too vulnerable.

This possibility is serious, because no less than 76.67 per cent. of Yugoslavia's exports and 69.05 per cent. of her imports already pass through clearings, clearing arrangements being in existence with 11 countries, against 13 last year. It is with this new trade situation in view that commercial agreements are either signed, under discussion or about to be negotiated, with Turkey, Germany, France, Hungary, Switzerland, Czechoslovakia, Greece and Poland.

Difficult Days Ahead

There are other signs of diminishing activity. River traffic, which is dependent to a considerable extent on foreign trade, has declined. The fall in the exports of so important a commodity as timber is bound to have adverse repercussions. Harvest prospects for the autumn, both of grain and fruit, although not so bad as at first was feared after the rains and floods, are only moderate.

It is significant, too, that the minimum interest rate has already hardened from 7 to 7.5 per cent. (the maximum rate fixed by law is 10 per cent.), in spite of an increase in savings from 10,715 million dinars to 11,628 millions since April last year. The index of prices has hardly receded this spring from the high-water level of 80, where it has remained since October; it still stands at 79.3, against 72.3 a year ago, and the autumn seems likely to be difficult for the working class and people with fixed and limited incomes.

It is in the autumn that Yugoslavia will be faced with the problem of how far its internal economy, in the present semi-autarkic era, can resist an international recession. The Gov-

ernment obviously has this in view: the Minister of Finance has ordered that credits should be kept strictly within limits during the forthcoming budgetary year; and the authorities are laying great store by the issue of the first part of the large internal loan of 4,000 million dinars to be spent on public works and defence. At present, the internal debt stands at 6,193,296,000 dinars (April 1st), against 5,625,921,000 dinars on April 1, 1937, in spite of redemptions to the amount of 117.790 millions. This increase is due to the issue of 685 millions of new bonds to raise funds for agrarian reform, public works and the settlement of the agrarian debt.

Palestine

Economic Depression

JERUSALEM, May 23.—Various data published by the Government of Palestine throw some light on the economic depression from which the country is suffering. Postal revenue, despite the widespread reduction in commercial activity, continues to expand. The gross revenue of the Post Office rose from £409,172 in 1935 to £450,456 in 1936 and £507,586 in 1937. The increase was probably due mainly to the substitution of a charge per telephone call for a flat rate. Under the flat rate system, the use of the telephone was so extensive as to exceed (in the number of calls per installation) the use made of telephones in any other country. Telephone operators in Palestine, working at high pressure, could only attend to three-quarters of the number of subscribers allotted to each operator in England. Now that, in the greater part of the country, every call has to be paid for, the number of calls per installation has fallen, while at the same time the revenue has risen.

On the other hand, there has been an appreciable fall in the amount of new capital put into public companies. The net total of new capital in 1935 was £4,978,578, in 1936 (the year of the revolt) £1,869,839, and in 1937 £3,822,559. The sum invested in public companies last February was £112,600, compared with £723,843 in February, 1937, which was, however, an exceptional month.

This does not mean that there is no money available in Palestine. Actually there was over £16 millions lying on deposit in the banks in January. This sum had fallen by about £787,000 in the course of the year, but this sum, as well as further capital brought into the country in the course of the year, was not all invested. A considerable part of it must have been consumed.

The same tendency is seen in agriculture. Net additional holdings of about 1,100 acres were acquired by Jews in the first two months of the present year at a cost of £38,000, compared with the acquisition of 15,000 acres in the whole of 1937 at a cost of £393,000. New building, which averaged 65,221 square metres per month in 1933, 88,672 in 1934, and 101,192 in 1935, fell to 61,507 in 1936, 48,115 in 1937, and 34,200 square metres per month in the first two months of this year.

Trade and Transport Decline

Foreign trade is also falling. The value of imports into Palestine in the first two months of this year amounted to £2,337,081, compared with £2,796,354 in 1937 and £2,458,651 in 1936. The principal reduction was in food, but the value of raw material imports fell from £291,926 in the first two months of 1937 to £243,758. Exports of local produce in the two months were valued at £1,587,988, compared with £1,796,729 in 1937 and £1,409,683 in 1936. Only in imports of wholly or mainly manufactured articles, valued at £112,031, was there any increase in January and February; and this increase was more than covered by the rise in the value of Dead Sea chemicals exported. These chemical exports in January-February, 1938, exceeded in value the whole of the exports of manufactured articles in the first two months of 1937.

The railways showed a very great reduction in business in the first two months of this year compared with the same period of 1937. Gross revenue was £104,523, compared with £170,775; passenger revenue £30,220, compared with £49,266; goods revenue £69,161, compared with £112,064; the number of passengers 205,935, compared with 376,525; and the tonnage of goods carried 191,527, compared with 278,033. Even in 1937, if debt charges are taken into account, there was a loss on the railways. This year it would seem that the loss will be greater.

The road transport companies are not benefiting at the expense of the railways. In January, 1937, 5,592,000 passengers were carried on the roads, and the gross earnings derived from them was £47,000; in January, 1938, the number of passengers was 4,968,000 and earnings were £42,299. At the same time, the expenditure of these companies rose from £37,788 to £40,337. In the first two months of 1937, 45,981 tons of goods were transported by road, bringing in £12,618 at a cost of £10,405; and in the same period of 1938, 39,246 tons brought in £12,415 at a cost of £10,848.

Two other indicators to the economic situation can be given. The currency in circulation in January, 1936, was £6,298,135; it had fallen to £4,789,134 in January, 1938, and there was only a slight rise in February. Protested bills, which numbered 7,264 in 1935, rose to 10,111 in 1936, then fell to 7,987 in 1937 and rose again during the first two months of this year to the equivalent of an average of 8,634 per annum.

Canada

Trade Negotiations

OTTAWA, June 3.—Ministers are still optimistic about the triangular trade negotiations now in progress at Washington. Apparently no real hitch has developed; the tariff concessions which the United States Government is ready to make to Canadian products like fish, cattle, dairy products, base metals and other commodities are regarded as quite satisfactory, but difficulties have arisen, apparently, in arranging the compensatory concessions which the United States desires. "Bound" preferences in the Canadian tariff are involved and the acquiescence of the Governments of other Dominions will have to be secured to sanction any curtailment of their privileges.

Meanwhile, at the instigation of the Roosevelt Administration, the terms of a new draft treaty, about the projected St. Lawrence Waterway and allied problems, have been published. It mainly follows the lines of the original agreement, which (after it had been signed by both Governments) was rejected by the United States Senate. There are, in addition, quite important modifications of the earlier proposals, some designed to meet American objections and others to placate the Government of Ontario.

Ontario and the St. Lawrence

Ontario's main objection has been that it simply could not afford to spend the money required for its share of the power development planned for the international section of the waterway; and the new agreement proposes that the works on the Canadian side of this section can be postponed until 1949. The Ontario Government is also to be given permission to divert water from the Ogoki River and Long Lac in North-Western Ontario into the Great Lakes system, and to export surplus power to the United States after the agreement is ratified.

This move by the Roosevelt Administration is regarded here as a shrewdly timed intimation to the King Government that its vigorous sympathetic interest in the waterway project would facilitate the consummation of a new and enlarged trade agreement. Premier Hepburn of Ontario, however, declares that the concessions now offered cannot alter his fundamental opposition to the scheme and, on June 3rd, Mr Lapointe informed the House of Commons that there was no prospect of a treaty about the waterway being submitted to Parliament this session.

The King Government has surprised everybody by a sudden decision to buy out the private shareholders of the Bank of Canada, who now hold \$5 millions out of the bank's capital of \$10,100,000. The balance is already owned by the Government and the bank will become a completely State-owned institution. The price paid is to be the average price ruling for 1938, or between \$58 and \$59 for each \$50 share. This move is regarded as purely political, to enable the Liberals of Saskatchewan to answer the charge made by Premier Aberhart that the monetary policy of Canada is controlled by selfish and private financial interests.

Railway Merger Discussed

At the special Railway Committee of the Senate on May 24th Sir Edward Beatty, President of the Canadian Pacific Railway, submitted his proposals for the "unification" of Canada's two railway systems. The plan is very similar to the one put before the Duff Commission on

Transportation in 1931 and rejected as impracticable. The basis of the scheme is that the two systems should be brought under a common management, but that each should continue to keep its own securities, which would remain in their present ownership. No question would thus be involved of the value of the respective properties or a fresh structure of capitalisation.

Sir Edward disavowed any wish for a Government guarantee of the securities of the C.P.R., and proposed that each group should continue after unification to receive the net earnings which "past experience" indicated that their company would have received as an independent institution. Then the additional net earnings which unification would produce should be shared between them on an equitable basis. He admitted that his plan contemplated the abandonment of over 5,000 miles of railway line now unprofitable, with the Canadian National Railway making the larger sacrifice, and estimated the annual saving from unification (based on a normal traffic year) at \$75,300,000.

He was strongly of the opinion that the C.P.R. could easily survive as an independent organisation, and declared that he advocated unification in the national interest, in order to secure relief for the Federal Treasury from the ruinous drain of annual deficits.

Protests from communities, threatened with the loss of their railway services, are being freely heard, and on June 3rd Mr Howe, the Minister of Transport, agreed that it would be quite impossible to close down 5,000 miles of railway. Furthermore, Senator Dandurand, the Government's leader in the Senate, asserts that phrases like "past experience" are too obscure and vague. Sir Edward has been asked to set out explicitly what assets the C.P.R. proposes to contribute to the merger, exactly what proportion of the profits of the unified system he thinks that the C.P.R. is entitled to receive, and what securities it would be ready to bring into a common pool, when financial operations for refunding or making new issues became necessary.

Business Hopes

In most parts of the prairie country the young wheat crop is making good growth, with subsoil moisture conditions much better than they have been in any recent year at this time. But rain is reported to be needed badly in northern Alberta, and from other districts there are reports of serious attacks of wireworms and a recurrence of the grasshopper plague is threatened. In Eastern Canada crop conditions remain favourable.

Business conditions in recent weeks have shown remarkable stability despite some adverse factors. The general economic index of the Bureau continues to move slightly week by week:—

Week Ended	Carloadings	Wholesale Prices	Bank Clearings	General Index
May 29, 1937	81.78	85.1	97.1	109.0
May 14, 1938	75.23	80.8	85.6	107.6
May 21, 1938	75.15	80.3	79.7	108.0
May 28, 1938	73.18	80.3	78.2	106.3

In some directions business shows a tendency to expand; and, if uncertainties about the Budget, the new trade agreement with the United States and the fate of the Western grain crop were removed, activity might easily substantially increase during the second half of the year. The earnings of both railways continue to be very unsatisfactory. In the first four months of 1938 the net earnings of the C.P.R. totalled only \$1,747,501, compared with \$5,490,823 in the same months of 1937; and the C.N.R. showed a net deficit of \$4,430,786, compared with net earnings of \$4,566,511 in the same period last year.

Letters to the Editor

The Long Term Budget Problem

TO THE EDITOR OF THE ECONOMIST

SIR.—The analysis of the "Long Term Budget Problem" published in your current issue (June 11th, page 591) is most interesting and instructive, and provides a timely warning of the direction in which our financial policy is carrying us to-day. Nevertheless, I venture to think that if we turn our attention to the economic aspect, on which, of course, as always, the financial basis ultimately rests, we may perhaps draw a little more comfort.

To begin with the existing situation, a considerable part of our national expenditure is not really outlay but transference. The payment of pensions, for instance, out of the taxation of all classes does not reduce but redistribute the national income. Even the national debt, in so far as it is owned internally, does not diminish the economic income of the country as a whole, however much it may present a problem to the Chancellor of the Exchequer.

To-day we are building roads at the expense of the taxpayer where our grandfathers were building railways on money borrowed from investors. To that extent we are more financially provident. If one day water and electricity were to be laid on free to our houses and our taxes raised to foot the bill, the Budget would be considerably swollen, but it would not be a step towards national bankruptcy.

Turning to the future, it is, of course, necessary to make certain assumptions. In common with the authors of your Survey, I will assume that Europe refrains from the criminal folly of another great war and that armaments do not progressively increase. To assume otherwise would be to enshrine madness and to render any intelligent prophecy meaningless.

Granted peace at home and at any rate stability of defence expenditure, I find your contributors far too pessimistic. Their limited estimate of a 1 per cent. per annum increase in production would not be accepted by engineers and captains of industry. The productive capacity of 1970 is far more likely to be at least double that of to-day. That is, of course, provided it is not checked by out-of-date distributive and financial machinery.

What precise form the new machinery ought to take is the supreme question which the ablest brains will have to determine. But I think there will be wide agreement that it will involve some measure of socialised planning in place of the system in vogue to-day, with its intermittent working and wasteful scrapping of plant, man-power, and often even of the actual finished product.

Of course, this does not in any way imply acceptance of the principles of the totalitarian State, which are equally destructive of many of the most precious things of human individuality.

Yours, etc.,

F. W. PETHICK-LAWRENCE.

House of Commons.

Unemployment and Agriculture

TO THE EDITOR OF THE ECONOMIST

SIR.—The stoppage of emigration and the fall in exports of cotton and coal produced the vital necessity of providing employment for the resultant surplus labour. The British Government's policy of a constant low rate of interest somewhat mitigated the dangers of growing unemployment, but besides leading to some fundamental changes in the banking structure, this policy diverted the country's capital into houses and surface improvements, and swelled municipal indebtedness.

A country's employment problem cannot in the long run be founded on the maintenance of a low rate of interest, heroically defended in face of a growth in the monumental National Debt and punitive taxation. It is therefore imperative to provide an alternative outlet for the surplus labour. Short of a land policy, not to supply the country's total demand for agricultural produce but to maintain the

surplus labour, any solution of the unemployment problem is not possible.

Economic welfare postulates elasticity and the century-old movement from the land to the towns needs revision. A reversal of this drift, under Government supervision and support, would greatly mitigate the unemployment problem.

I am, Sir,

Your obedient servant,

Lodz, Poland.

S. HERSZBERG.

The American Deadlock

TO THE EDITOR OF THE ECONOMIST

SIR.—In your recent article on the "American Deadlock," you pointed out that many of the President's actions had had the effect of discouraging ordinary business enterprise, and that they had been a frankly deflationary force. Although there are periods when popular sentiment is aroused for the reform of abuses which inevitably develop from time to time in a democratic, capitalistic economy, nevertheless Americans are supposed to be very materialistic, and there seems to be little question that the majority of people are currently more interested in recovery rather than in reform.

Accordingly, is there any wonder that sentiment in Congress, which is supposed to represent the people, is becoming, especially under renewed conditions of depression, more and more hostile to a President whose actions and policies have been a deflationary force, and have discouraged business enterprise and resulted in a lack of confidence, which bids fair to neutralise the inflationary monetary policies now being pursued by the monetary authorities? America yearns for peace, but a decided change of attitude on the part of the President would seem to be a necessary condition precedent.

Yours very truly,

FRANCIS H. CUMMINGS.

Boston, U.S.A.

POINTS FROM LETTERS

Mars and the Stock Exchange.—It seems to me quite one-sided to draw conclusions concerning the evolution of securities prices in a future war only from British experience. Taking only a cursory glance at the development of securities prices in those countries where wholesale inflation was the consequence of the war, one does not gain a very reassuring prospect for the fate of capital in the next war. Investors in these countries lost nearly all their capital when it was placed in Government stocks, while investing in shares proved to be only less catastrophic. Monetary depreciation will probably be an inevitable issue of a future war, and the course of Stock Exchange prices will be influenced, not only by price inflation, but also by monetary depreciation. Great Britain's national debt at the outbreak of the war in 1914 was only one-tenth of what it is to-day. Investors would do well not to rely too trustfully on the fairly favourable aspect shown by the statistics in your article.—*Julius Bär, Zurich.*

American Deadlock.—You certainly took a running broad jump and landed far out to sea when you said on April 16th (page 131): "Above all, the business community can be criticised for deliberately working itself up into such a lather of hatred of the President, that its fury is choking the whole industrial and financial machine. . . . Both sides are now in the mood in which each protagonist delights to obstruct the efforts of the other." Does a man standing in front of the firing-squad develop a lather of hatred and choke with fury? Does the same man delight in catching the bullets with his hands, and thereby obstruct the efforts of the firing-squad? The remainder of the article makes just about as much sense as the New Deal allegations that there are nasty "kipitallists" sitting in their sky-scraper offices, selling all the securities they have, and throwing billions out of the window, merely because they are purple with rage at Mr Roosevelt.—*Cary W. Bok, Philadelphia, Pennsylvania.*

Books and Publications

Colonial Problems

It is satisfactory that the new Secretary of State for the Colonies has pledged himself to the issue of an annual statement on the affairs of the dependent Empire. The first such report,* signed by Lord Harlech, almost on the eve of his resignation, is certainly an experiment that deserves repeating. Within a compass that should not tax the digestive capacity of any legislator, it reviews the developments of the past year with a genuine effort to reach down to the roots of trouble.

Two-thirds of the survey discusses, for the whole dependent Empire, "matters of general interest," ranging from defence to the preservation of wild life, but concerning for the most part economic and social affairs. The remaining third of the statement treats each main colony or group of colonies in turn, singling out the chief events of the year, or the chief unsolved problems as they have arisen.

On the economic side, a brief report cannot deal very elaborately or very profoundly with the achievements or difficulties of so many and such different territories. The account is nevertheless most valuable, because it is both compact and up to date, qualities not shared by the vast and highly statistical "Economic Survey of the Colonial Empire" (the 1936 edition of which has not yet been published).

The statement at least renders the service of indicating what matters are uppermost in the Colonial Office's mind. In this respect it is on the whole reassuring. The vital problems of public health and nutrition, of industrial relations and wages, are given due prominence. "It is clear," the late Secretary of State writes,

"that labour organisation in some colonies is behind the standards reached in industrial countries, and that where large bodies of wage-labour are employed by mining companies or on plantations it is incumbent on government to ensure, in the interests of both capital and labour, that machinery is in existence for the constitutional settlement of disputes regarding rates of wages and conditions of labour. The increasing importance assumed by labour questions of all kinds will render it necessary for many colonial legislatures to review their existing enactments in order to bring their labour codes up to the levels now held to be consonant with modern conditions and outlook."

The urgency of this question is amply proved by the fact that important progress towards better labour relations in Jamaica came too late to prevent violent disorder.

On the subject of nutrition, the statement points out that the problem of malnutrition in the colonies, disclosed by an inquiry begun nearly two years ago, is not only one of improving money-incomes, but also one of making a greater variety of nutritious foodstuffs known and available. As the statement declares in an earlier passage,

"the resources of the colonial dependencies are predominantly agricultural and on the development of agricultural industry along efficient and soundly conceived lines their prosperity is dependent."

The major economic difficulty of many colonies to-day is their dependence on a volatile world market for a few primary commodities. The statement emphasises the grave troubles that have been brought about by the recent fall in prices, and particularly by the decline in American demand.

A good deal of space is devoted to the operation of the various international restriction schemes for tropical products. Two important aspects, however, are virtually ignored: the effect of restriction schemes on world trade as a whole; and the apportionment of the advantages and penalties of restrictions between the overseas shareholders and the people of the colonies themselves. Nor is there a just recognition of the need, when external prices are low, for keeping the prices of what the native buys as low as possible. There is no hint of any relaxation of the highly restrictive

* "The Colonial Empire in 1937-38." Statement to accompany the Estimates for Colonial and Middle Eastern Services, 1938. H.M. Stationery Office. 179 pages. 2s.

tariffs and quotas on textiles, which were in fact reinforced during the past year.

It is idle to overlook the international reactions of colonial economics; for, whether we like it or not, they will be pressed upon our attention more and more insistently by other countries. The world-wide controversy about the future of colonies is not, on the whole, rational, but that is no reason for failing to inform ourselves of the rational arguments one way or the other. Chatham House has brought out a small volume† on Germany's colonial claims which contains all the essential facts for an understanding of the controversy. The various arguments and counter-arguments are set forth in the shape of quotations from the protagonists, without any attempt to judge between them. Perhaps the most striking point that emerges is Herr Hitler's complete *volte-face* since he wrote "Mein Kampf." Whether his conversion is sincere or merely strategic remains a mystery.

Shorter Notices

"Milk Investigation Scheme." Costs of Milk Production in England and Wales. Interim Report No. 2, 1935-36. Agricultural Economics Research Institute, Oxford. 58 pages. 1s. 6d.

The most striking feature of this report, as of the earlier one issued last year, is the very wide variation in costs shown by the 600 farms included in the survey. The costs (excluding rent, management and interest) of 91 per cent. of the farms selling milk wholesale on contract ranged between 6d. and 1s. per gallon. When analysed by districts, under the Milk Marketing Board's classification, costs per gallon ranged from 7.8d. in the West Midlands to 9.3d. in the north-west and 10.3d. in the south-east, a spread of 2.5d. per gallon. Owing to the necessity of feeding large rations of concentrates in winter, summer feeding costs were between half and two-thirds of those in winter; and, on the average of the year, the cost of foods was roughly half of the total costs of milk production. The fall in the price of feeding stuffs in 1935-36 was responsible for a small decline in the total cost per gallon in the year, compared with the costs recorded in the previous report. The next and third report, covering the year 1936-37, will probably show a much larger rise in costs, due to the sharp increase in the price of all feeding stuffs during the last twelve months.

"Oil and Petroleum Year Book." Compiled by Walter E. Skinner, 15 Dowgate Hill, Cannon Street, London, E.C. 4. 536 pages. 10s. net.

Oil is world-important nowadays, and the thirtieth annual issue of this most reliable book of reference is more valuable than ever. It gives up-to-date details of 774 companies and their officials, and includes full technical, geographical and financial information about each one, in addition to summary statements of the statistical position and recent development of the oil industry as a whole.

THE BUSINESS WORLD

An Investment Horoscope—I

Equity Shares in Depression

THE British Government's decision, last month, to grant *de jure* recognition to the recession in British industry seemed belated to many investors; for on the Stock Exchange, depression, *forte et dure*, has been an established fact for well over a year. Ordinary share values have fallen since the end of 1936 by 30 per cent., according to the relatively solid Actuaries' Index, by 35 per cent. according to the somewhat more sensitive *Financial News* index, and by 26 per cent. according to the scholarly "London and Cambridge" Index. During the Stock Exchange year which ended on March 24th last, the market value of all the securities quoted in the Official List (excluding "British Funds, etc.") showed an average depreciation of nearly 20 per cent., while the number of bargains recorded fell by 22 per cent. and the number of items cleared by the Settlement Department declined by nearly 30 per cent.

The fall in values has varied in its intensity between different markets, but has extended from one end of the "House" to the other—from gilt-edged stocks to gold

mining shares. It has been accompanied, during the last few months, by so marked a falling off in business that the receipts of some Stock Exchange firms have barely covered their fixed charges. All classes of investors, from the smallest individual to the Prudential, have been affected. Many investment trusts whose portfolios showed an excess of market over book values at the end of 1936 now have a net depreciation.

What are the causes of the present Stock Exchange depression? Are prices near the bottom? What is likely to be the course of Stock Exchange values in the immediate and in the more distant future?

On a cursory glance at the first of the accompanying charts, the fall in the index of ordinary share prices appears to have been continuous since the bull market, which began in 1933, reached its peak at the end of 1936. Actually, in

the intervening period, there have been at least four distinct phases in the general market decline. The first ended with the spring of last year, after the Chancellor's decision to abandon N.D.C. in its original and objectionable form. During this, the real climacteric phase, security values

SHARE PRICES AND YIELD ON 2½% CONSOLS 1932-38

SHARE PRICES AND THEIR BACKGROUND, 1908-38

In the chart given below a number of different series have been linked together on a common base. In the case of ordinary shares, we have used the various indices published by the London and Cambridge Economic Service for the periods from 1908 to 1914, 1919 to 1924 and 1925 to date. For the years 1915 to 1918 we have used the market values of 38 commercial industrial shares published in the *Bankers' Magazine*. The indices of business activity and wholesale prices are those of *The Economist*. The employment percentages have been obtained by subtracting from 100 the percentages unemployed among members of trade unions for the period up to 1921 and thereafter among insured persons aged 16-64 in the U.K.

honoured precedent by turning downwards several months before the pace of industry showed any signs of slackening—*The Economist's* business activity index, for example, did not begin to recede until the autumn. In contradistinction to events in 1929, however, security prices fell against a background of rising commodity prices; for it was only in the spring of last year that the incipient boom in raw material quotations was checked and reversed. Both in 1920 and in 1929, the immediate signal for the collapse of share quotations was the advent of dearer money, typified by the raising of the Bank of England's discount rate. In 1937, the first depression investors had experienced under a "managed" currency, bank rate had lost its value as a portent. But it is significant that the turn in security prices as a whole coincided with a fall of 11½ per cent. in the price of 2½ per cent. Consols—i.e. with a rise in the "pure" long-term rate of interest—during the first two months of last year.

The evidence, in fact, lends support to the view that the present depression began by discounting a trade recession of the cyclical kind, in much the same way, allowing for a changed monetary background, as at the outset of many cyclical movements in the past. In the summer months of 1937 there was a typical "secondary" recovery. In the autumn, however, during the second phase of recession, the accentuation of the gradient of the decline in prices was unmistakably associated with the rapid deterioration of the European political situation. For a couple of months, at about the turn of the year, prices were stable, before the beginning of the third phase of decline, which lasted from the beginning of February to the end of March, 1938. By this time, increasing evidence of the arrival of domestic industrial recession was accumulating. Nevertheless, a temporary recovery in April (before and after a Budget which contrived to combine extensive borrowing with an impression of draconian orthodoxy) carried industrial share prices up by over 10 per cent. In the fourth and current phase, which is still in progress, this recovery has been negated, though prices, as a whole, have suffered little net depreciation since the end of March.

A fair summary, therefore, of the slump in share values, so far, may be to say that in its earlier stages trade factors and political factors pulled share prices down separately, and in its later stages they pulled together. How far are they likely to continue to exert their present force? So far, the steepness of the downward gradient suggests that the adjustment of Stock Exchange values in advance of industrial depression has gone faster and further than in earlier recessions—possibly because investors and operators have much better economic statistics to-day than ever before and can the more readily size up the general situation. But how much of this apparently increased readiness to discount unfavourable industrial developments (despite a considerable propaganda to the opposite effect from the Government, industrial leaders and sections of the Press) has really been due to the accentuation of the downswing of share values by the abnormal factor of political insecurity? The answer is crucial in any appraisal of Stock Exchange possibilities during the next few months. For the European position has already deteriorated so rapidly that security prices may be said to have discounted almost every contingency short of war itself. But industrial depression is only a few months old. If the immediate course of prices is likely to be governed more by cyclical than by political factors, everything depends on whether the setback in industry is to be sharp and short—the V-shaped depression beloved by American commentators—or severe and prolonged, like the depression of 1930-33.

One way of approaching this problem is to put the indices of share prices and the rate of interest, given in our first chart, against a background of the main factors which, directly or indirectly, determine market values; namely, national income and prosperity (shown indirectly by employment percentages and by *The Economist's* business activity index), and the level of wholesale prices. In the chart on the opposite page the comparison has been taken back for the last thirty years, except in the case of *The Economist's* business activity index which is available only

since 1924. Paucity of data has necessitated, in some instances, the linking together of diverse series of figures to give a continuous curve. The chart is valid, consequently, only for broad comparisons of the extent and timing of fluctuations in the different curves during relatively short periods, and not for drawing precise conclusions from the behaviour of the same curve in widely separated periods.

Within these limits, the chart yields valuable information for the investor. Broadly, it shows that relatively small variations of the order of 10 to 15 per cent. in employment tend to be accompanied by wider fluctuations of 20 to 30 per cent. in business activity and by sweeping changes, of the order of 50 or 60 per cent. in industrial share prices. Since the war, these cyclical upswings and downswings have been far wider than in the immediate pre-war years. Actually, 1908-09 saw the bottom of a "little depression" of the type which the market was discussing at the end of last year, and 1913 would probably, but for the war, have gone down to history as the peak year of a more or less normal trade cycle. During the greater part of the war itself, the curve of ordinary share prices showed somewhat remarkable stability, but from 1918 onwards its course has been strikingly unstable. The fall in industrial share values between 1928 and 1932 was as great as in the post-war slump of 1920-21, though it was somewhat more prolonged. The latest decline has so far resulted in roughly half the depreciation registered in the last two market cycles.

If one were arguing merely on the basis of "chart-reading" and post-war experience of the trade cycle, one would be tempted to infer that the downward movement in ordinary share prices might well endure for at least another twelve to eighteen months, and that it might produce a further depression in values of anything from 10 to 20 per cent. That conclusion might draw support from the fact that ordinary cyclical influences had been operating, in the last twelve months, against a background of rapidly falling wholesale prices and, possibly, slightly rising interest rates. An eventual upturn in the ordinary share curve on this argument might be expected to precede the eventual recovery in employment and business activity by at least six months, and to carry average industrial share values, perhaps, something like 40 or 50 per cent. above their present level. It would be unlikely to come about, however, until late 1940 or early 1941.

Post-war analogies based on the trade cycle, in short, hold out little prospect of a speedy recovery in share prices, though they suggest that in a few years' time prices may well be much higher than they are now. For holders to whom intermediate fluctuations are of secondary concern, there may be comfort in this generalisation; but to other investors it will hardly make pleasant reading. There are, however, other factors in the present situation which are non-cyclical, but which may affect both the short- and the long-term prospect. These considerations will be discussed more fully in a second article.

£1,300 instead of £1,000

UNDER *The Distinctive System* of The Scottish Provident Institution the premiums are so moderate that at the usual ages for assuring the yearly sum charged elsewhere for a Whole Life Insurance of £1,000 (with profits) will here be secure from the first as much as £1,300 or thereby with right to share in the surplus. The additional £300 is equivalent to an immediate and certain bonus of £30 per cent., as large as can be looked for in other Offices only after many years.

New Defence Loan

THE recent firmness of the gilt-edged markets had encouraged expectations of an early issue of the second tranche of the National Defence Loan. Last Tuesday the loan was announced, in the form of a 3 per cent. issue of £80 millions at 98, repayable at par on July 15, 1958, or, at the option of the Treasury, on or after July 15, 1954, by drawings or otherwise, at three months' notice. The sum payable on application is 10 per cent., with further calls of 48 per cent. on July 1st and 40 per cent. on August 12th. The July call is timed to coincide with heavy Government interest payments on the existing National Debt, and should not cause undue disturbance to the money market. The loan is being issued through the Bank of England, and, for the small investor's sake, through the Post Office. Lists opened on Wednesday and dealings began on Thursday, up to $\frac{1}{2}$ premium.

The new loan provides several important points of contrast with last year's issue. These we summarise in the following table:—

	1937 Loan	1938 Loan
Date of issue	April 28th	June 16th
Amount	£100 millions	£80 millions
Nominal rate of interest	2½%	3%
Issue price	99½	98
Dates of repayment	1944-48	1954-58

This year the Government are appealing for £20 millions less than a year ago, possibly because they already have in hand part of last year's loan, together with the 1937-38 Budget surplus. The issue price is much the same, but the nominal rate of interest is $\frac{1}{2}$ per cent. higher. On the other hand, while last year's loan ranked as "short to medium," this one can best be described as "medium to long." Last year's loan appealed mainly to bankers, though (as we pointed out at the time) it was a little long for the discount market. This year's loan is less appropriate for the banks, but its yield, by comparison with that on outstanding gilt-edged securities, should render it attractive to the general body of investors. The length to which the Treasury has gone in this direction may be inferred from a comparison of the redemption yield on other Government securities, based on the price of June 13th (before the terms of the new loan were known to the market):—

Loan	Price June 13, 1938	Redemption Yield (%)
2½% Funding, 1956-61	91	3 1 6
2½% Funding, 1952-57	97	2 19 6
3% Conversion, 1948-53	103	2 15 3(a)
3% Funding, 1959-69	99	3 1 6

3% Defence Loan, 1954-58 98* 3 2 8
* Issue price. (a) On basis of redemption in 1948.

On this basis the new offer has escaped the fate of its predecessor, which had to be taken up and held by the departments for a considerable period. On the other hand, the fact that the first Defence Loan now stands at above par suggests that it has reached the end of its initial troubles.

The background for the new issue differs significantly from that at the end of April, 1937. Markets were then reeling under the shock of the 1937-38 Budget, with its first version of National Defence Contribution. To-day, the gilt-edged market is standing firm, while other markets have been suffering from recession, from the troubles of the United States and from the political uncertainties of Europe and the Far East. Gilt-edged prices, indeed, are fractionally higher than they were a year ago, whereas equities generally have fallen heavily, as we show in a subsequent article. New savings coming forward for investment, which are largely deterred from entering the equity market, are tending to take refuge in gilt-edged securities. To this extent the new loan is well timed.

On the other hand, there seems little likelihood of any early rise in the long-term rate of interest. Why, then, has the loan appeared so soon, and on terms so much more attractive than those of last year's issue? The simplest

(and, perhaps, for that reason, the most correct) answer may be that the Treasury thought the present opportunity to be the most favourable it is likely to get, and wished to leave no "overhang" to affect the future gilt-edged market. It may be, again, that trade recession threatens some present or future depletion of certain departmental funds. The Unemployment Insurance Fund, for example, is beginning to feel the effect of heavier unemployment, and an intensification or prolongation of the recession may in time affect Savings Bank deposits. Such developments would make it harder for the Government to follow their normal technique of letting the departments take up part of a new loan with the intention of holding it until it can be resold to the public. There is no definite evidence that the departments would have any difficulty in doing so to-day, but they might have difficulty in six months' time. Hence the Government may have decided to time this new loan so as to ensure, beyond all doubt, that the department would have finally disposed of any portion of it by the autumn.

Whatever the motives of the Government, there is no doubt that their financial programme is well ahead of re-armament for a considerable time to come. On March 31st last they had in hand £35 millions, representing the unspent portion of last year's Defence Loan, and also the 1937-38 Budget surplus of £29 millions. The new loan will yield about £78 millions in cash. This makes a total sum of £142 millions. Sir John Simon, in his Budget speech last April, gave the amount of defence expenditure in 1938-39 to be financed out of borrowing as £90 millions, plus the amounts required to cover supplementary estimates presented during the present financial year. These totals are, of course, unknown, but the extension and acceleration of the re-armament programme means that they will be considerable. Thus something ought to be left on March 31, 1939, out of the available sum of £142 millions, but it may not be very considerable. The impression in the market is that the third Defence Loan will not appear for at least a year. This view, of course, is subject to the important reservation that the Government is its own judge of the advisability, at any given moment, of borrowing in anticipation of its future needs.

The reactions of the new loan on the money market deserve careful consideration. Initially there will be a reduction in the floating debt, amounting to £80 millions by the time all the calls have been paid up. This ignores, of course, the seasonal expansion in the floating debt, and other extraneous factors which affect its size. If part of the loan has been taken up "inside," then the reduction in the floating debt will be confined to "tap" Treasury bills held by the departments, which will merely receive Defence Loan instead. On the other hand, as the loan is taken up by the investor, either direct or by repurchase from the departments, the tender issue of Treasury bills will contract. If the banks take up part of the loan (or buy other securities), then deposits will not be reduced, for the banks will hold more securities and fewer bills. If, as is more likely, investors take up the loan, then the reduction in the volume of tender Treasury bills will be offset by a contraction in deposits at the joint-stock banks.

There is, consequently, a disposition to regard the immediate reaction of the loan as deflationary. This reasoning, however, ignores the fact that sooner or later the proceeds of the loan, as well as the £64 millions already in hand, will be spent. As this happens, both the floating debt and tender issues of Treasury bills will once more expand. By the time the whole £142 millions has been spent, the floating debt and volume of tender Treasuries will, in the absence of other influences, not only have returned to last week's level, but will have risen by £64 millions more, for the £64 millions described as being in hand has, pending its expenditure, been used to reduce the floating debt. In the long run, therefore, there will be no deflation at all.

So far as the gilt-edged market is concerned, a new loan always acts as a sedative. This, again, is a short-run view. If

there is no revival in trade and no recovery in equities, new savings will continue to gravitate to the gilt-edged market. The gilt-edged market has long ago recovered from the issue of last year's Defence Loan. On the other hand, if equities recover, or, alternatively, if the recession begins to deplete public and private savings, the recovery in gilt-edged securities may be arrested or delayed.

More generally, the new Loan represents a further draft on the nation's savings, to be spent in ways which can hardly be described as productive investment. At a time

when both trade and the civilian demand for savings may be receded, this special re-armament demand may perhaps be regarded as having an equalising influence, in so far as it mitigates the trade recession. On the other hand, war material yields no direct or tangible income, to set against the interest and amortisation cost of the defence borrowing. But the Treasury's present task is merely to meet the bill; and from that viewpoint the moment of issue seems well chosen. And if the terms are slightly generous, that, in present circumstances, may be a fault on the right side.

Finance and Banking

Austrian Debt Moves.—At the end of last week, meetings were held in London of the Committee of Guarantor States of Austrian Loans. These meetings were attended by representatives of England, France, Belgium, Czechoslovakia, Denmark, Holland, Sweden and Switzerland, but Italy and Spain were not represented. It was decided to address a united protest to Germany, and while the Governments reserved their right to take appropriate measures, they hoped that the German Government would reconsider their previous decision that they were not liable for Austria's external debts. On Tuesday, this week, Sir John Simon stated in the House of Commons that in view of the unsatisfactory position of these loans, it had been arranged that the British Government would terminate the present Anglo-German Payments Agreement on June 30th next without notice. This left the British Government free to take any necessary action as from that date. This Agreement, concluded in 1934, replaced the previous abortive arrangement for financing German imports of British goods by "sondermarks," and provided that 55 per cent. of the foreign exchange received in payment for German exports to the United Kingdom should be earmarked for the payment for British exports to Germany, the remaining 45 per cent. being used to meet such charges as the service of the Dawes and Young loans, and also being placed at the free disposal of the Reichsbank.

The following table gives an idea of the way the Agreement has worked in practice. The calculations are based on the British trade returns alone, and so are not quite in accordance with the terms of the Agreement:—

	Per cent. of Imports from Germany			
	1935	1936	1937	1938*
Exports to Germany	62.8	57.5	59.7	63.2
Re-exports to Germany ...	24.6	20.6	20.2	20.2
Total exports to Germany	87.4	78.1	79.9	83.4

* First quarter.

Imports of German goods in 1937 were £36.2 millions, and the surplus over total exports to Germany was £7.3 millions. The table shows that Germany has used part of her free exchange to import from England in excess of the 55 per cent. minimum stipulated in the Agreement. It is sincerely to be hoped that it will not be necessary to terminate an Agreement which on the whole has worked so well. The onus, however, rests entirely upon Germany, and the speech of Herr Walter Funk, Reich Minister of Economics, at Bremen on Thursday (to which we refer in a discussion of the wider aspects of the question on page 646) seems hardly a hopeful portent. Meanwhile, the Association of British Chambers of Commerce has addressed a further letter to the Chancellor of the Exchequer, declaring that if the Government deemed a system of licences for exports of British semi-manufactures and raw products to Germany to be essential in order to make an exchange clearing effective, the Association would support that policy. A measure of sacrifice by British traders might be indispensable if resistance to international breaches of good faith were to be made effective.

A New Dollar Scare.—Whatever President Roosevelt whispers in Washington reverberates around the world. In early April last year, at a time when he was still on the deflationary tack, he hinted that the dollar price of gold was too high. This almost casual utterance, which happened to coincide with abnormal offerings of Russian gold, precipitated the notorious gold scare of 1937, which helped to start world trade and prices on their recent downward path. Alarmed by the American recession, last autumn President Roosevelt went about on the reflationary tack, and in pursuance of his new course announced last Easter a fresh pump-priming programme, which included the desterilisation of the Treasury's gold and a reduction in member banks' minimum reserves. This at once aroused the thought that the next change in the dollar price of gold would be upwards. During May the political vicissitudes on the Continent increased the general desire to hoard gold, and so the psychological stage was set for a new flight into gold from currencies in general and more specifically from the dollar.

This week the rush into gold has begun. A new demand for gold has sprung up not only from the Continent, but also from India and the United States itself. To cope with this rush, the authorities in London have, as our Bullion Market Note shows, been selling gold in large quantities, but only at a price embodying a substantial premium, which on Wednesday and Thursday was 1s. 0½d. per ounce. Nevertheless, the premium is lower than during the previous dollar scare of last November, which suggests that the authorities are seeking to prevent the development of an atmosphere of panic. Also on Thursday morning there were signs that the rush was subsiding. There are two morals from this episode. The first is that, rightly or wrongly, some people have become obsessed with the idea that the American recession, with its attendant political considerations, will sooner or later force the President into a fresh devaluation, in which other currencies will have to participate through their need of maintaining equilibrium with the dollar. The second is that hot money, despite all its wanderings, will in the last resort always seek refuge in gold.

Belgium Borrows Abroad.—The exigencies of the Belgian Treasury position and the heavy calls in prospect for expenditure on the extraordinary budget have caused the Belgian Government to seek credits abroad. A credit of 35,000,000 guilders has been arranged with a group of Dutch banks, and negotiations are still proceeding for a credit of 25,000,000 Swiss francs in Switzerland. The Dutch credit is in the form of three months' bills, renewable at the option of the borrower for three successive periods of three months. The bills have been discounted at a price corresponding to an annual interest rate of just over 4 per cent. These seem unnecessarily harsh terms, seeing that the guilder bills have been

offered in London on a 2½ per cent. discount basis and all available supplies have been quickly exhausted at this rate. For the London discounter who covers the guilder exchange risk on the bills, the "swap" affords an additional return of ¾ per cent. The fact that it was deemed necessary to go abroad at all shows the legacy of stringency left by the recent attack on the belga. The severely orthodox means taken to repel it were successful, but for the time being they have paralysed the domestic money and capital markets.

Midland Bank Changes.—The directors of the Midland Bank have announced, with regret, the resignation, owing to ill-health, of Mr Frederick Hyde, their managing director, Mr Hyde, who remains a member of the board, has been an outstanding banker ever since Sir Edward Holden, in 1909, appointed him one of the general managers of the Midland Bank. Mr Hyde played an important part in the amalgamation of that era, which established the Midland Bank in its present position among the Big Five. On Sir Edward Holden's death in 1919 Mr Hyde became a joint managing director, and for the past nine years has been sole managing director. His evidence before the Macmillan Committee, in which he described the functions of the modern joint-stock bank, remains one of the outstanding contributions to the theory of banking. In consequence of Mr Hyde's retirement, Mr Astbury has been appointed chief general manager, with a seat on the board. Mr Astbury became an assistant general manager in 1920, and a joint general manager in 1924. Mr Lederer, who became a joint general manager in 1929, now becomes assistant chief general manager. Mr Sadd, who was assistant general manager from 1933 until 1936, and joint assistant chief general manager since that date, has been appointed deputy assistant chief general manager.

MONEY MARKET NOTES

Foreign Exchanges

The London market has been disturbed in several directions by the gold rush. It was begun partly by those who had made profits out of the Daladier devaluation, and who have since tried unsuccessfully to make further profits by attacking first the belga and then the Saigon piastre. They have now turned to gold and the dollar, but the whole movement has rapidly gathered a much

wider compass than mere speculation. As a result, the New York rate rose from \$4.94½ last week to \$4.98½ on Wednesday. It came back that evening to \$4.96½, on denials that the devaluation of the dollar was contemplated, but on Thursday eased again to \$4.97½. Some \$50 millions may have changed hands this week, and many people have been able to cover their autumn requirements. One month's and two months' dollars were bid owing to commercial needs, but longer positions were offered. Belgas have improved against

sterling from bel. 29.28 to bel. 29.20½, and so appreciated considerably against dollars. For the moment the belga has come to be regarded as a gold currency rather than a "dollar" currency. Swiss francs were also bought against sales of dollars, this week's sterling rate fluctuating between Frs. 21.64 and Frs. 21.66½. There was comparatively little movement in French francs. The spot rate was held at Frs. 178½, but the French Control had to take up a few francs. Forward francs were inclined to be offered.

ACTUARIES

Any public body, company, society or person requiring the permanent whole-time services of a qualified Actuary or of an actuarial student is invited to apply to the Chairman of either of the undermentioned Boards who will be pleased to supply the names of such members of the Institute of Actuaries or of the Faculty of Actuaries in Scotland as may be interested in the appointment and qualified to undertake the duties involved.

THE FACULTY OF ACTUARIES APPOINTMENTS BOARD
23 ST. ANDREW SQUARE, EDINBURGH, 2

The Money Market

MONEY remains abundant. The banks are now buying bills very sparingly. They have been taking mixed June and August Treasury bills at ½ per cent., and August or September Treasuries at ⅞ per cent., but are not buying July bills. There is an impression in the market that the banks have already obtained all their July maturities from sources outside the market. Bill brokers are now paying ¾ per cent. for both Treasury bills and three months' bank bills.

	June 17, 1937	June 9, 1938	June 16, 1938
Bank Rate	2	2	2
London Deposit Rate	1½	1½	1½
Short Loan Rates:			
Clearing Banks	1½-1*	1½-1*	1½-1*
Others	1½	1½-5/8	5/8
Discount Rates:			
Treasury bills	2½	1½-9/16	9/16-5/8
Three months' bank bills	11/16-5/8	19/32-5/8	5/8

* Viz. ½ per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity. ¾ per cent. from loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

An interesting position will develop at the end of the half-year. Maturities of Treasury bills on June 27th to 30th will supply the market with funds for June 30th, the day on which the banks call for balance-sheet purposes. On July 1st there will be the whole of that week's new Treasury bills to be paid for, amounting perhaps to £50 millions, and also the Defence Loan call of about £40 millions in cash. Against this there will be dividend disbursements of about £11 millions, while the market will also have the funds released by the banks, representing largely the proceeds of that week's Treasury bill maturities. No

shortage of funds is anticipated, but there will obviously be a heavy turnover.

The Bank Return

THE Whitsun notes have now been paid in again by the public, and so the note circulation is reduced by £5.0 millions. The Reserve is also strengthened by the same amount.

	June 16, 1937	June 1, 1938	June 8, 1938	June 15, 1938

Discounts & Advances	28.3	25.9	23.0	25.3
Other Secs.				
Proportion				

In the banking department there is little change in the Bank's earning assets. There is, however, an unusual increase of £7.8 millions in other deposits. A possible explanation of this lies in the fact that June 15th was the day on which the application money in respect of the new Defence Loan was paid in. Allotment letters, however, were only posted that evening, and pending their dispatch the application money had to be held in suspense as any applicant was free to withdraw. On these arguments, this money ranked among "other deposits" and not "public deposits." Bankers' deposits have fallen since last week by £2 millions, as the return of the Whitsun currency has been more than offset by the amount subscribed to the Defence Loan.

The Bullion Market

THIS week's sudden demand for gold is discussed in a Financial Note, but the table below gives some idea of the magnitude of the demand. By Thursday, however, there were signs that the rush was subsiding, for about one-quarter of the £1,194,000 dealt in at the fixing on that morning consisted of re-sales by private holders. It is true that the price rose to 140s. 10½d. after the fixing, but that only reflects the normal practice of the authorities who usually add on a halfpenny when selling after the fixing.

Date	Gold			Silver, price per oz. standard	
	Price per fine oz.	Prem. or Dis-count	Amt. dealt in	Cash	Two Mths.
1938	s. d.	d.	£'000	d.	d.

" 11	140 7	6½ pm	617	19	181½
" 13	140 6½	7 pm	741	18½	18½
" 14	140 8	8 pm	1,624	18½	18½
" 15	140 9	12 pm	1,783	18½	18½
" 16	140 10	12 pm	1,194	18½	18½

* Above or below American shipping price.
The New York price of silver remained at 43 cents per ounce -999 fine during the week.

Silver has eased with the weaker tendency of the dollar. Only a moderate amount was on offer, but demand was very limited. Wednesday's temporary rise in the cash price was due to bears buying in spot and re-selling forward, and it is noticeable that the spread between the two prices widened by ½d. The following day it narrowed again. It is reported that further Spanish silver has reached France.

Investment

Second Defence Loan.—At a moment when rumours of a second instalment of defence borrowing had temporarily subsided, the terms of the new loan became known to an unexpectant public on Monday evening. The loan (whose general relation to public credit and finance is discussed in an article on page 666) has enjoyed a conspicuous success. It was clear from the terms that the authorities had decided to re-orientate their tactics. Even for so large an issue as £80 millions, a 3 per cent. stock at 98, redeemable 1954-58, made obvious concessions to the investor, judged by the prevailing prices for such stocks as 2½ and 3 per cent. Funding, and 3 per cent. Conversion. The impact effect, therefore, was an appreciable adjustment of these issues to the new borrowing basis. The authorities, having now decided to woo the investor, have indeed been well repaid. The first instalment of defence borrowing, issued in April last year, took the form of £100 millions of 2½ per cent. stock, 1944-48, at 99½. These terms were significantly above the market, and a substantial proportion of the stock remained in the hands of the public departments for many months. The new tactics have presented the investor with an opportunity which could be judged on its merits, rather than Treasury dictate. It may be argued, indeed, that the authorities have carried kindness to extremes, for it is many years since the "stag" has been attracted to participate in a gilt-edged issue. During Wednesday—the lists remained open all day, in accordance with the prospectus—it became apparent that "stag" interest was significant. Allotments, handled with customary expedition by the Bank of England, disclosed that small applicants received the full amount, while larger applicants for over £5,000 were allotted 66 per cent. of their requirements. Dealings

began on Thursday at ¾-¾ premium, and the quotation improved by mid-morning to ¾ bid, closing at 1½-½ premium.

Gilt-Edged Reactions.—The market, plainly, has not yet had full opportunity to adjust prices to the new terms. In the following table we show the impact of the loan on the course of quotations of comparable securities:

	Fri., June 10	Mon., June 13	Tues., June 14	Wed., June 15	Thurs., June 16	Yield to redemption

How far the success of the new loan has been due to the activities of the "stags" or to the helping hand of the public departments is a matter for conjecture. An excess of indiscriminate "staggering," however, would have suggested the likelihood of a small opening discount rather than a premium. Meanwhile, if the market continues to appreciate the new-found generosity of the authorities by maintaining a significant premium on the scrip—the 48 per cent. call due on July 1st may provide a test for any wavering holders—a further measure of recovery may be enjoyed by the stocks which, as shown above, were most severely hit at first. Whether such improvement will cancel out this week's falls is more difficult to assess. For stocks, like Funding 3 per cent.—which after the impact of the new issue was offering an almost identical yield to redemption, despite its eleven years' longer life—should rightly rank below the new Defence Loan. Investors who search for deeper meaning in the timing of the latest offer will probably reach no more recondite conclusions than that the money will doubtless be needed some time this year, and that relative political quiet presents opportunities to the Treasury no less than to industry.

Tale of Two Debtors.—The psychologist might find profit in analysing the differences between Latin and Teutonic methods of default; the bondholder, unfortunately, is robbed even of this consolation. Seven months have elapsed since Brazil decreed the suspension of service on her foreign debt, pending the negotiation of a new agreement, based on Brazilian ideas of the republic's ability to pay. In a *communiqué* issued this week the Council of Foreign Bondholders states that the Brazilian Government has been continually urged to take definite steps to resume debt payments. It would appear that the Brazilian authorities are willing to contemplate making some payment sometime, but they are distinctly reluctant to put forward definite terms as a basis for negotiation. In a letter addressed to *The Financial News* last week, the Brazilian Ambassador emphasised that no amelioration in economic conditions had occurred since last November, and drew the inference that the opportunity of successful debt conversations had still to present itself. His Government, however, apparently hope that, within a short time, their programme of economic reconstruction will raise Brazilian foreign trade to a level sufficient to allow them to carry out regularly all their external financial obligations. Undoubtedly, the assurance of recognition of liability is better than nothing to the bondholder. But the latter may well ask whether the goodwill which Brazil is apparently anxious to preserve might not have been fostered more readily by avoiding unilateral default and by making some small token payment during the period of economic strain. The Aranha plan of 1934 was itself arbitrary in character, and total default is rendered no more digestible by amiable, but non-specific, statements of future intentions. Philosophical investors may note that the bondholders' associations with which the Council has made co-operative representations to Brazil include that of Germany. The latter appear to be playing a Protean rôle, holding that it is more blessed to receive from Brazil than to give from the Ostmark. This week's developments in the Austrian debt negotiations are related on page 667. City opinion does

not welcome clearing arrangements for their own sake; but an increasing body of opinion is prepared to contemplate the invocation of the existing powers to establish an Anglo-German clearing office should the need arise.

Cheerless Wall Street.—To the New York Stock Exchange, which is becoming habituated to a daily share turnover well below the half-million mark, the words of Sir Josiah Stamp, as he left New York this week, have contributed one of the few cheerful notes in the last few days. Sir Josiah advanced the opinion that the United States is now touching the bottom of the recession and that business would probably improve soon. Such forecasts, however, have brought but little balm to a market dulled by the passage of the Wages and Hours Bill, depressed by the plight of the railroads, and enjoying no stimulus from the rumours of a further devaluation of the dollar which have been rife in other world centres. The compromise Wages and Hours Bill has been approved by the House and the Senate, and now awaits the President's signature. Wall Street has no reason to love the Labour code in its new form. It may, ultimately, involve constitutional testing at the hands of the Supreme Court, or it may be administered with a sufficient degree of discretion to avoid bitter public controversy. But clearly, the market cannot read the measure as a bull point for common stocks. Nor does it see any immediate solution of the now desperate straits of the railroads. Recent expectations that special financial relief might be forthcoming from the Reconstruction Finance Corporation have evaporated. The facilities of the R.F.C. are strictly reserved for solvent companies, a requirement with which few of the railroads could comply to-day. The principal alternative, reduction of wage rates, scarcely holds out the prospect of an adequate or peaceful solution of the railways' problem. It is reported that American railway labour, which regards itself as threatened with the possibility of a 15 per cent. pay cut, holds the view that less rigorous loan conditions should be made conditional on the maintenance of present wage rates. Since the hope of such relief legislation has now been abandoned, however, controversy on wage questions may well spread during coming months. The unsupported weakness in railroad stocks has driven many quotations this week to new low levels. Nor does Wall Street see its salvation in "pump-priming." It is no longer convinced of the efficacy of these measures, nor does it find inflationary implications (which alone have been capable of stirring the market in recent weeks) in the renewed rumours of a further devaluation of the dollar, whose effects on the London bullion market are discussed on page 667. And, crowning all its uncertainties, the market is utterly unable to foresee the next move of a President whose policies in recent months have become more and more unpredictable. Industrially and politically, Wall Street lacks a rallying cry.

Company Notes

Stanton Ironworks Profits.—The Stanton Ironworks results for the year to March last accord in every way with the excellent investment history of the company. A total distribution of 10 per cent. on the ordinary shares has now become so axiomatic that more than ordinary importance attaches to the directors' decision to distribute a capital bonus of 20 per cent. Profits after taxation (which required a substantially increased sum) increased from £460,282 to £498,884—a figure which represents a comfortable record for the past decade. After again charging £100,000 for general depreciation (depreciation on the Bilsthorpe Colliery plant and wagons is already deducted before profits are struck), and providing for debenture interest and preference dividend, the amount earned for the ordinary shares is increased from £276,809 to £317,830, and covers the ordinary dividend with the generous margin of 14.3 per cent. The company's recent profits are given on the following page.

	Years to March 31st		
	1936	1937	1938
Profits, after taxation	427,266	460,282	498,884
General depreciation.....	100,000*	100,000	100,000
Directors' fees.....	4,600	4,600	4,600
Debt interest	40,379	37,602	34,683
Preference dividend	41,954	41,271	41,771
Ordinary shares :—			
Earned.....	240,333	276,809	317,830
Paid	155,279	155,279	156,029
Earned %	17.2	20.4	24.3
Paid %	10	10	10½
Reserves	...	...	160,000†
Carried forward	360,763	482,293	484,094

* Includes £50,000 for contingencies. † £40,000 Contingency reserve for staff provident fund, £120,000 general reserve. ‡ And capital bonus of 20 per cent.

It is clear that the directors will have no difficulty in maintaining the present rate of dividend on the increased capital, judging by its profits record. Much of the company's recent progress has been won through increased efficiency, which may have provided a permanent addition to profit-earning capacity. Capital and general reserves, together with the balance of profits carried forward, amount to £1,604,094, of which the scrip bonus requires no more than £316,559. The board has also taken recent steps to anticipate the redemption of the 4½ per cent. Treasury guaranteed debenture stock, which is finally repayable, through sinking fund operations, by 1945. A voluntary conversion offer is to be made under which holders may exchange into a longer dated unguaranteed stock at par, together with a cash bonus of £2½ per cent. Despite the lack of T.F.A. guarantee on the new stock, the cash bonus affords compensation for loss of interest, when allowance is made for the risk of redemption. While the company's recent prosperity has been based on large-scale building and road construction schemes, which may be affected by recession, it has proved its ability to maintain satisfactory earnings in good years and bad.

John Brown Profits.—Trading profits of John Brown for the year to March last are distinctly satisfactory. The total, including gross dividends and interest from subsidiary interests, has increased from £715,995 to £817,544, of which the tax-collector takes toll to the extent of £141,243, compared with £86,541 in 1936-37. The ordinary dividend, increased from 15 per cent. to 17½ per cent. tax free, as recently announced, is covered by net earnings of 22.2 per cent., and after allocating £100,000 (against £50,000) to reserve, the balance carried forward is slightly increased to £163,392. Our analysis of profits is given below :—

	Years ended March 31		
	1936	1937	1938
Profit.....	585,635	715,995	817,544
Depreciation	40,596	41,753	49,787
Taxation	49,736	86,541	141,243
Fees.....	4,881	6,832	5,867
Deb., etc., interest	89,858	91,876	93,674
Preference divs.	49,010	49,010	49,010
Ordinary shares (tax free) :—			
Earned.....	351,554	439,983	477,963
Paid	195,809	323,084	376,931
Earned %	29.9	20.4	22.2
Paid %	16½	15*	17½
To reserve	100,000	50,000	100,000
Carry forward	95,462	162,361	163,392

* And 6½ per cent. capital bonus.

These results appear the more satisfactory in the light of the dividend policy pursued by the directors of Thos. Firth and John Brown. The latter's distribution for 1937 may have provided as much as two-fifths of the increase in trading profits shown by John Brown. But the profits distributed by this subsidiary amounted to no more than 55 per cent. of the sum actually available. The directors' report also underlines the current importance of naval contracts. Mercantile tonnage now building includes the

"Queen Elizabeth" and a refrigerated cargo vessel, but the company is also at work on a battleship, a submarine depot ship, a light cruiser and two destroyers. It has, in short, a valuable armament equity, which affords no little protection against the fall in mercantile shipbuilding. In a survey of armament share prospects published in *The Economist* of March 26th last, we computed the value of naval business to be carried out by John Brown during the current financial year at £2,846,000, compared with £1,958,000 last year. This fact suggests that profits and dividends should be affected only in limited degree by trade recession during the current year. And since the 10s. ordinary shares at 27s. 9d. yield £9 5s. on a gross basis, it is probable that the market has already discounted any setback which may be experienced by the mercantile shipbuilding and colliery sections of the undertaking.

Whitehead Iron and Steel Profits.—Since the depression, this company has recorded unbroken and substantial progress. The latest year's total profits are nine times those of 1931, and increased by one-third, compared with the results for 1936-37, from £383,190 to £518,218. Comparison of the rate of improvement disclosed in the full report and in the interim statement last November suggests that the scale of operations during most of the year was satisfactory. Greater technical efficiency, a conservative financial policy, and rising industrial demand have all played their part in the company's progress. While earnings on the share capital (and the company's capitalisation is very low-g geared) have approached 75 per cent., the rate of dividend has remained unchanged in the past three years at 35 per cent., though for 1937-38 it is payable on a capital increased by a 25 per cent. bonus a year ago and an issue for cash on bonus terms. The allocation of profits in recent years is shown in the following table :—

	Years ended March 31		
	1936	1937	1938
Profit.....	305,760	383,190	518,218
Depreciation	20,000	25,000	25,000
Taxation	23,000	43,500	87,200
Interest and expenses	10,912	12,406	8,143
Ordinary stock :—			
Earned.....	251,848	302,284	397,875
Paid	175,473	175,579	219,474
Earned %	55.0	68.7	74.2
Paid %	35	35*	35
General reserve	70,161	126,000	178,413†
Carry forward	23,473‡	24,448	24,436

* And 25 per cent. capital bonus, absorbing £125,413. † Including £60,000 provision for special depreciation and contingencies. ‡ After writing off £1,284 issue expenses.

Although the amount needed for N.D.C. is not separately disclosed, it presumably accounts for much of the £43,700 increase in taxation. It will be observed that the directors have made a special allocation from last year's profits of £60,000 for depreciation and contingencies. While the 1937-38 results are in every way satisfactory, they appear when the outlook for the current year is debatable. In the past, the company has proved its ability to obtain a full share of available business, and some of the benefits of its improved technical efficiency are still to come. The report refers, for instance, to the success of the new cold rolling

plant, and the full scheme will probably be completed within a year. The present price situation, however, is double-edged. The concern which was expressed a year ago regarding the effect of rising tendency of prices on demand, has given way to the view that the official price maintenance policy may have to be revised sooner rather than later. Changes in stock values must always be interpreted with caution, but the sharp rise in the company's stocks, from £116,731 to £314,591 last year, may suggest either that demand had already slackened by the spring, or that abnormal purchases of materials in 1937, in anticipation of a shortage, proved excessive. For a re-rolling concern like Whitehead Iron, the question of supplies and profit margins is of the greatest importance. The current yield of £7 15s. per cent. on the £1 ordinary stock units at 95s. reflects the market's cautious attitude towards the company's immediate prospects.

Anglo-Iranian Oil Report.—The preliminary profits statement of this company was discussed at length in our issue of June 4th (page 549). The full accounts, issued this week, supplement the net profits already reported. Total income rose from £9,624,434 to £12,662,195, and the net profit figure of £7,455,094 was struck after charging royalty and taxation to the Iranian Government (£3,545,313, against £2,580,206), British taxation (£1,651,588, against £910,559) and directors' fees (£10,200). Total profits are disclosed after making a charge for depreciation, but this has been supplemented for many years by a provision for extra depreciation, which in 1937 reached the high level of £744,215. In the following chart, we show the course of distributable profits and their application during the past decade:—

ANGLO-IRANIAN PROFITS 1929-1937

Of the amounts distributed in ordinary dividends, nearly 56 per cent. is attributable to the British Government's holding and nearly 26 per cent. to Burmah Oil. The report discloses that last year's impressive increase in profits was due to a substantially increased through-put of crude oil at the Abadan refinery to meet growing demand, while prices were generally higher. The group's recent efforts to locate oil-bearing regions in this country have not so far proved successful, but additional territory has been proved in Iran.

NORANDA MINES, LIMITED DIVIDEND NOTICE

Notice is hereby given that an interim dividend of \$2.00 per share, payable in Canadian funds, has been declared by the Directors of NORANDA MINES, LIMITED, payable June 27th, 1938, to shareholders of record at the close of business June 10th, 1938.

By order of the Board.
Toronto, June 3rd, 1938.

J. R. BRADFIELD,
Secretary.

Anglo-Iranian ordinary stock yields £6 5s. 6d. at the present price of 83s. 9d. This yield is slightly lower than the gross return on "Shell" Transport ordinary.

"Shell" Transport Profits.—The oil share market has remained unresponsive to recent company reports, among which "Shell" Transport and Trading shows a substantial increase in net dividend and interest receipts from £6,034,499 to a record figure of £6,686,691 for the past decade. Neither the progressive nature of the report nor the increased cash distribution—the dividend rate is maintained at 20 per cent., tax free, but is payable for a full year on the increased capital—has moved the ordinary stock, which is practically unchanged at 83s. 9d. The 10½ per cent. increase shown by "Shell" profits is, however, less striking than the advance of some 22½ per cent. in dividends received by Royal Dutch (apart from exchange adjustments). In the following table and chart we analyse the course of disclosed profits in recent years. It is explicitly stated in the profit and loss accounts that dividend and interest receipts are shown net, and a conservative distribution policy by the constituent undertakings may be presumed:—

	Years ended December 31		
	1935	1936	1937
Dividends and interest received	5,067,195	6,034,499	6,686,691
Expenses	25,949	31,043	32,914
Directors' fees	20,000	20,000	20,000
Preference dividends	800,000	800,000	800,000
Ordinary stock (tax free)—			
Earned	4,221,246	5,183,456	5,833,777
Paid	4,221,238	5,427,306	5,789,126
Earned %	17.5	17.9†	20.2
Paid %	17½	20*	20
Carry forward	381,691	137,841	165,204‡

† On new ordinary capital of £28,945,633. * Of which 7½ per cent. interim on old capital of £24,121,361; in addition, 20 per cent. capital bonus. ‡ After writing off £17,288 new issue expenses.

"SHELL" TRANSPORT DISTRIBUTIONS 1928-1937

The chart shows amounts actually distributed for preference and ordinary dividends during the past decade, but these conform very closely to net disclosed profits.

The Royal Dutch "Shell" group's organisation is familiar to the investor, but there are two changes in the latest report. In the first place, the "Shell" company's interest in Anglo-Saxon Petroleum has been increased from £10 millions to £16 millions—a corresponding increase, in the familiar 60-40 ratio, was evident in the Royal Dutch holding, from £15 millions to £24 millions. Secondly, the balance sheet, whose largest asset item has hitherto

consisted of property and interests in sundry companies, now includes a subsidiary company—Shell Overseas Exploration—whose shares are entered at £600,000, apart from advances totalling £40,000. References to the group's fleet position show that, at the end of 1937, the group had 2,148,474 tons of loading capacity at its disposal, compared with 2,056,563 tons at the end of the previous year, while the fleet transported approximately 25,747,000 tons of cargo, an increase of 23½ per cent. over the 1936 total.

A large building programme is still in hand, and twenty-seven tankers, with a deadweight capacity of 282,000 tons, will be delivered during the current year. To the oil shareholder whose eyes are fastened on the American situation, the directors' reference to the past year's production and consumption figures may convey a hint of warning. Production in 1937 increased by 34 million tons, and consumption by only 19 million tons. Over the year as a whole there was a general improvement in prices, but in the current year the price trend may be less favourable. "Shell" Transport received increased distribution from most of its constituent companies last year, including the ill-fated Mexican Eagle—and the yield of £6 12s. per cent. gross on the ordinary stock suggests that the market is not disposed to assume a significant check to earnings during the current year.

Suez Canal Report.—Both the financial results and the traffic handled by the Suez Canal were exceptional last year. The net tonnage of ships passing through the canal, at 36,491,332 tons, surpassed even the 1929 peak, and was 12½ per cent. higher than in 1936. The tonnage of goods handled increased by no less than 27½ per cent., and the decline in the number of passengers was evidently of small financial importance. But for the devaluations of the franc, however, profits would have been lower in 1937 than in 1936. Dues were twice reduced (decisions which were estimated to diminish receipts by 5 per cent.), new charges based on the agreement with the Egyptian Government involved an 8 per cent. increase in expenses, and the net receipts would have shown a decline of 11 per cent. if expressed in Egyptian pounds. The fall in the franc transformed this situation. Adopting a conversion rate of Frs. 124.71 to the £ sterling, against Frs. 83.46, the company shows net profits of no less than Frs. 852.7 millions, compared with Frs. 627.9 millions for 1936. Gross traffic receipts were 43 per cent. higher at Frs. 1,355 millions, and a special profit of Frs. 45.3 millions net was realised on exchange transactions. The increase in net profit was achieved, however, despite increases of Frs. 50 millions in the cost of the debt service, and of nearly Frs. 100 millions (to Frs. 302.7 millions) in operating and management expenses. Operating expenses in terms of Egyptian currency were, incidentally, lower than in 1936. The balance of net profit was struck after allocating Frs. 45 millions, against Frs. 20 millions, to reserves, while the statutory reserve was increased by a direct transfer of Frs. 50 millions derived from the revaluation of balance sheet items, chiefly floating assets. Available balances are divisible in fixed proportions between shareholders, the Egyptian Government, founders' shares, directors and employees, the gross share accruing to capital shareholders being 71 per cent., or Frs. 605.1 millions in 1937. The gross dividends (including interest) declared for 1937 were Frs. 820 (against 600) per capital share, Frs. 756.36 (against 555.39) for each beneficiary certificate, and Frs. 852.23 (against 625.79) per founders' share. The relation of net dividends to total dividends varies according to the incidence of taxation, the net dividend on the bearer shares (which attract a higher rate of tax) being Frs. 521.62 per share. Compared with 1937, traffic in the opening months of 1938 has fallen, but the report mentions the possibility of a reduction in dues when conditions permit.

Baltimore and Ohio Railroad Position.—The outlook for American railroads is far from happy. Nor was 1937, in retrospect, one of the best years, for the growing disparity between costs and rates combined with falling

business activity to depress earnings. Even the Baltimore and Ohio Railroad was unable fully to cover interest and other fixed charges from last year's earnings; and a small deficit, of \$721,000 resulted, compared with a surplus of \$4,539,000 in 1936. This fall in net income was entirely due to higher operation expenses, which increased by \$5,259,000 to \$128,860,000. Gross railway revenue was, in fact, slightly higher in 1937 at \$169,436,000, against \$168,993,000, but although the railroad is predominantly a goods carrier, and obtained 87 per cent. of gross revenues from this traffic, passenger and miscellaneous traffic was actually responsible for the increase in gross takings, for freight receipts, at \$147,212,000, were slightly lower. Net railway operating income amounted to \$24,909,000 compared with \$30,185,000. Apart from increased wages, material and fuel cost more in 1937, and recoupment of these higher costs was hindered by the termination, from the end of 1936, of the emergency increases in charges previously authorised by the Inter-State Commerce Commission. It is estimated, in fact, that the continuance of these rates in 1937 would have increased revenue by \$7,000,000, and might thus have provided some surplus over fixed charges. The present level of business activity is seriously affecting railroads dependent on freight traffic, while the full burden of last summer's wage increase adds to the railroads' problem. By the end of April the gross operating income of Baltimore and Ohio amounted to \$40,555,000—some 30 per cent. below 1937—while accrued net operating income totalled no more than \$292,000, against \$9,489,000.

Earls Court Finance.—Between blue-print and finished structure, between prospectus estimate and eventual accounts, differences are often unavoidable. Debenture and shareholders in Earls Court, Limited, may consider that their company has been unfortunate, so far, in both respects. Structural difficulties have been experienced, and delays have arisen on which litigation is now in train. In November last year, the company found it necessary to increase its obligations by the issue of £300,000 5 per cent. debenture stock. This stock relegated the original second debenture to third place, in return for an increase in the latter's rate from 5½ per cent. to 6 per cent. At meetings held this week, the three classes of debenture holders consented to relegation in favour of a new first debenture, carrying interest at 4½ per cent., and redeemable in 1942. Some £125,000 of this stock is to be issued to the company's bankers, as collateral security for advances. The directors have explained that further capital expenditure of £65,000 is required, and that the balance of borrowing powers will be available to meet expenditure which arises before normal trading conditions begin. From the directors' estimates of profits, which are struck after full debenture service but before depreciation, it is evident that the equity shareholder's prospects lie some considerable way in the future, for the loan to the company's bankers is repayable by March 31, 1942, and it remains for future profits to provide the means. The prospectus of the company, issued in July, 1935, stated that the contract for the building provided for completion by the end of 1936. The subsequent delays have had an adverse effect upon lettings, and two re-arrangements of debenture finance have been involved. Investors will therefore hope that the difficulties inseparable from new enterprise, which in this case appear to have been unusually severe, will be rewarded, as the directors predict, by the development of a stable business affording ample security for the debenture stocks.

Further Rand Dividends.—This week's further batch of Kaffir distributions for the first half of the current year present singularly few features of interest. Perhaps the most noteworthy change consists of a further advance in the East Geduld dividend, which is raised to 5s. 6d., against 5s. for the second, and 4s. 9d. for the first, half of 1937. Following the expansion programme, the

quantity of ore treated has risen from 116,000 tons in January, 1937, to 146,000 tons in May, while monthly profits have risen from £142,760 to £175,735.

JUNE KAFFIR DIVIDENDS

	Total, 1936	June, 1937	Dec., 1937	Total, 1937	June, 1938

Rand Leases (10/-)	-/6	-/9	-/9	1/6	1/-
Wit. Deep	4/-	1/9	1/9	3/6	1/6

At the annual meeting, the chairman intimated that the increase in the capacity of the treatment plant might be regarded as completed, and that a larger proportion of the profits would in due course become available for distribution. On the basis of the latest rate the yield is 5 per cent. Thanks to the increase in the dividends upon its East Geduld Holding, Geduld Proprietary is able to maintain its rate at 7s. 6d. per share. The fourth liquidation dividend of the Modder Deep amounts to 6d. per share, compared with 9d. upon each of the three preceding occasions; but the recent report of the liquidators suggests that there may be many more payments to come.

* * *

No change is shown in the Rand Mines and Central Mining declarations, apart from Geldenhuis Deep. Even where a moderate cut might have followed a decline in profits—as in the case of the New Modder—the rate has been maintained. For the sixth half-year in succession Rand Mines is paying 4s. per share. Mild disappointment was aroused by two Gold Fields declarations. In view of the record profits, expectations had been entertained that Simmer and Jack's dividend might be increased to 6d. per share. The actual rate of 5d. shows an increase of only ½d. as compared with each of the preceding half-years. Similarly, the hope that Sub Nigel would find taxation less onerous has not been justified by events. The decline in the Rietfontein Consolidated dividend is due to the increase in capital to finance expanded operations, but London takes little interest in the shares. Robinson Deep has maintained the "B" share dividend, some decline in profits being offset largely by reduction in the fixed amount payable on the preferential issue, for which this year's requirements

amount to £37,500, compared with £50,000. The small cut in Van Ryn Gold dividend reflects the treatment of lower-grade ore. In order to extend its short remaining life, this mine is crushing ore carrying no more than 2½ dwts. per ton. In the Anglo-American group, the only change compared with the declarations of a year ago is a small reduction in the Springs dividend. Daggafontein pays slightly more than for the previous half-year. As usual, no interim declaration is made by Anglo-American Corporation and Anglo-American Investment. As generally hoped, Rand Leases, in the Anglo-Transvaal Consolidated group, makes a small increase in its distribution, and shareholders are looking forward to higher achievements in the future. Nigel Gold is also paying a slightly increased dividend.

* * *

Zinc Corporation Profits.—Last year, Zinc Corporation had the advantage of much higher prices both for current output and for stock on hand, while some intermediate products became realisable at a profit. The price factor explains a jump of over £500,000 in gross revenue. Costs, which had already shown a sharp advance in 1936, were further increased by bonus payments to employees, by increased cost of stores and by increased freights. Average costs were accordingly raised to 30s. 4d., against 28s. 3d. per ton in 1936. After provision for taxation and other changes, which also increased substantially, the residual profit advanced by no more than £158,500 to £527,910. Of this sum, £95,000 has been set aside for shaft-sinking and special development. The available surplus, however, was sufficient to cover record dividend rates of 82½ per cent. on the participating preference and ordinary shares. The financial results of the past three years are analysed below in sterling:—

	1935	1936	1937
Gross value of output	£1,042,940	£1,207,690	£1,741,820
Gross mining profit	292,910	354,910	587,240
Interest, dividends, etc.	90,580	78,520	89,030
Proportion of taxes, office expenses, etc.	59,490	64,000	114,360
Net profit	324,000	369,440	527,910
Fixed 20% Pref. dividends ...	49,140	49,140	49,140
Participating dividends	202,230	269,650	382,000
Mine development and plant...	50,000	50,000	95,000
Carried forward	54,710	55,360	57,120

Capital expenditure, for which provision was effected in 1936, amounted to the high figure of £321,900. Towards this cost, £100,000 was received from New Broken Hill Consolidated on joint development and equipment account. During the first five months of the current year the prices of lead and zinc were approximately 35 per cent. lower than in 1937. In these circumstances, the directors have properly adopted a conservative valuation of stocks on hand. No significance, of course, would attach to yield calculations based on last year's distributions, whose repetition cannot be expected. The investor may, however, note that current prices of 47s. 6d. for the ordinary and £5 10s. for the preference shares compare with peak levels of £7 5s. and £9 15s. respectively reached in the commodity boom just over a year ago.

* * *

The Week's Company Profits.—Our usual analysis of profit and loss accounts appearing on page 698 contains the results of 79 companies, excluding new concerns and those for which comparable figures are not available. The latest net profits of these companies amount to £20,342,000, and show an increase of 12 per cent. over the previous year, when they earned £18,220,000. The total profits of 1,348 companies analysed this year amount to £202,483,000, showing an increase of 13 per cent., compared with profits of £179,740,000 earned in the previous year. This week's results again include a number of tea companies, but with this exception, the reports cover a wide range of industry. We discuss the results on page 677 under the heading "Shorter Comments."

Company Meetings of the Week.—In this issue reports of company meetings begin on page 685. Discussing the year's operations of *Antofagasta (Chili) and Bolivia Railway*, Mr A. W. Bolden pointed out that the sterling receipts would have been much greater but for the further fall in the Bolivian exchange. Members of *Lisbon Electric Tramways* were informed by Mr Frederick W. Kerr that the improved services had entailed an increase of 7½ per cent. in car mileage during 1937. At the *Callender's Cable and Construction* meeting, Sir J. Fortescue Flannery disclosed that a record tonnage of copper had been handled at the Erith works during 1937, and that the sale of ship-wiring cables had been nearly 30 per cent. higher than in 1936. Sir T. O. Callender also reported that the company was still obtaining very satisfactory orders for home trade. At a meeting held to consider the scheme of arrangement of *Brush Electrical Engineering*, Sir Ronald W. Matthews emphasised the need for new capital, in view of the reports of independent consultants on the necessity for new equipment and plant organisation. At the *Welwyn Garden City* meeting, Sir Theodore G. Chambers cited figures of electricity consumption and of population to illustrate the town's growth as a business centre. Mr James White explained to *Millars' Timber and Trading* shareholders that trading profit last year was £30,651 more than in 1936, but that an increase

in depreciation and taxation reduced this improvement to £18,551. At the *Venezuelan Oil Concessions* meeting, Lord Bearsted explained the need for increasing the exploration and general reserve to £500,000. The company was participating to the extent of one-third in all the initial costs of new oil concessions taken up by the Venezuelan Oil Development Company, and had its own exploration programme to finance. Captain H. B. Jamieson, at the *East Rand Consolidated* meeting, summarised the technical position of companies still in the development stage in which the company has important holdings. The chairman of the *Suez Canal Company* disclosed that the board has under consideration a fresh reduction in transit dues. Lord Trent, at the *Boots Pure Drug* meeting, emphasised the solid foundation and careful financial policy of the business. Mr A. Chester Beatty satisfied expectations of *Selection Trust* shareholders by referring to the Orange Free State options, but emphasised that this development indicated no more than the possible existence of a speculative mining opportunity. The chairman of *Wm. Cory and Son* pointed out that the oil section of the business had a record year. Oil prices, however, had recently eased. Sir George W. Albu appealed, at the *General Mining* meeting for reconsideration of South African taxation on the mining industry. At the *General Ceylon Rubber and Tea Estates* meeting, the chairman discussed the effects of rubber and tea restriction.

THE STOCK EXCHANGES

London

SETTLING DAYS	ACCOUNT
TICKET	JUNE 23
JUNE 21	JUNE 23

THE centre of the Stock Exchange stage has been occupied by the National Defence Loan this week. Prevailing gilt-edged prices have been adjusted to its favourable terms, and already a considerable volume of switching has been reported. In other sections, the market story shows little heightening of interest, with the exception of renewed activity in the gold share markets, to the accompaniment of rumours of an imminent devaluation of the dollar, which are believed by few but publicised by many.

After a dull opening—so dull, in fact, that rumours of Government finance had completely subsided—the *gilt-edged market* busied itself with the necessary adjustment of quotations to fit the new loan terms. The extent of the falls in such comparable securities as 2½ and 3 per cent. Funding and 3 per cent. conversion is shown in the table on page 669. Buyers checked the fall on Tuesday, but switching among the redeemable stocks, and preparation for applications for the new loan led to further adjustments in mid-week. As reported on page 699, the National Defence Loan opened at ¼-½ premium, and improved during Thursday to ½-¾ premium. Corporation issues of similar date shared in the downward adjustment.

In the *foreign bond market* Austrian loans provided a sharp recovery on Wednesday, following Sir John Simon's statement, but lost half their gains on the following day, when the Reich Minister of Economics proclaimed the German case in extreme terms. Chinese issues remained persistently weak, and Brazilian stocks reacted on revised opinions regarding the possibility of a satisfactory debt offer.

Home rail stocks opened steadily, but fears regarding the traffic returns brought in moderate selling. The actual

figures, although not regarded unfavourably, had little decisive effect upon the ordinary stocks, and further losses were recorded among the preference issues. Argentine rail stocks staged a sharp reaction this week, when the nationalisation reports were seen in their proper setting, and left little justification for the speculative advances recorded last week.

Industrial shares were again uninspired and irregular, and a low rate of turnover persisted. Iron and steel shares remained quiet, and generally indifferent to company news. Neither John Brown nor Whitehead Iron and Steel responded to the latest results, and news of the extension of the steel cartel agreement until the end of 1940 also produced no effect. Richard Thomas issues were weak. Coal shares turned dull after a fairly satisfactory start. General Electric, on the increased dividend, were a firm feature, but other electrical equipment issues remained irregular, while motor shares continued uninteresting. The trend in aircraft shares was on the whole upward, Phillips and Powis at first responding well to news of a large Government order but later reacting on profit-taking. Imperial Airways were a shade better on Sir John Reith's appointment. Textile issues were neglected, while store shares were uncertain except for a good advance in Marks and Spencer. Breweries tended to decline, and business in tobacco shares was on a smaller scale than ever. Movements in miscellaneous shares were irregular, and mainly of small dimensions, one of the few firmer shares being Murex. Shipping issues became firmer after a hesitant start to the week.

response to the firmer prices of the commodity at the end of last week, and conditions continued idle. The undertone, however, was satisfactory, and there were a few symptoms of public buying. *Tea shares* began in active fashion, both prices and the volume of business improving, but by midweek they were once more neglected.

Dividend-paying *Kaffirs* were again the firm feature in an otherwise uninteresting mining market. Monday was a quieter day than for some time, but new batches of dividend announcements and renewed Paris support (mostly on dollar devaluation rumours) revived firmer interest. Though comparatively neglected, developing mines responded in midweek to the general improvement, but Thursday's gains were not entirely held. Rhodesian coppers were dull, with prices inclined to sag except on Wednesday. Base metals generally were neglected.

ACTUARIES' INVESTMENT INDEX

The Actuaries' index of 151 industrial ordinary share prices had recovered slightly by Tuesday last (June 14th) to 63.4, compared with 63.2 a week ago and 66.5 a month ago. The average yield has therefore fallen back below 6 per cent., standing at 5.99, against 6.03 and 5.62 per cent. respectively. A selection of the separate indices follows on page 676.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum. div." shares.

Industry and Trade

Increase in Milk Prices.—It was announced last Monday that the retail price of milk will be increased next month from 6d. to 7d. a quart, and that the whole of the increase will accrue to the farmers. The wholesale liquid price will thus be raised from 13d. to 17d. per gallon. The Milk Marketing Board claimed an increase in the wholesale price for both June and July, on the grounds that the late spring frosts and the long drought had seriously raised production costs. The arbitrator, Sir Stephen Demetriadi, stated in his award that, as the Milk Marketing Board and Central Milk Distributive Committee had not been able to agree upon a date in June from which any increase should operate, he had confined the increase to the month of July. That the farmer had a good case for temporarily higher prices is undeniable, but it is equally undeniable that the retail price of milk is already higher than it should be in the interests of the nation's health.

Prolongation of Steel Cartel.—At a meeting of the Joint Co-ordinating Committee of the European Steel Cartel at the end of last month a renewal of certain compoitors, and consequently of the Cartel, was held up by dissensions within the Belgian industry. At a further meeting of the Co-ordinating Committee in Paris last Tuesday it was reported that the difficulties of the Belgian producers had been overcome. It was possible, therefore, to renew all the compoitors until the end of 1940. The prolongation of the Entente Internationale D'Acier and of the latter's agreement with the British industry follows automatically. Moreover, the progress of the negotiations between the Cartel and the American steel exporting companies suggests that an effective agreement will be confirmed in the near future. Such an agreement would naturally strengthen the international control of exports and prices. In spite of the recent decline in demand, it was decided at Tuesday's meeting to stabilise prices at existing levels in the hope that the removal of uncertainty would bring about a revival of consumers' purchases.

The Herring Industry.—The third annual report of the Herring Industry Board, covering the financial year ended last March, emphasises once again the difficulties that beset a declining industry. The policy of self-sufficiency pursued in Germany and Russia has almost closed the two largest export markets for British herrings, and, in spite of large reductions in the fleet and personnel, there are still more vessels and more men in the industry than it is able to support. The Board estimates that there is scope for the profitable employment of about 300 steam drifters, less than half of the existing number; they suggest, however, that an increased number of motor drifters could find employment by alternating between herring and white fish. The difficulties of the industry have been increased by internal dissensions and by acute rivalry between the local centres, which has seriously impeded the Board's attempts to co-ordinate and reorganise the activities of the different sections of the industry. The proposals of the Government, embodied in the new Herring Industry Bill now before Parliament, include the reconstruction of the Board, which is to consist entirely of independent members; the six

nominees of the trade, who provided the major part of the Board under the present Act, are to form an advisory council. The Government are also preparing to augment the grants available under the 1935 Act, by providing finance to assist in the purchase of new motor drifters. In these circumstances, it is to be hoped that the admittedly difficult reorganisation of the industry will be able to proceed with a greater measure of co-operation than has been shown in the past.

Overseas Trade in May.—The returns for May show a further decline in overseas trade. The value of imports last month was 9.3 per cent. smaller than in May, 1937, although there were two more working days in May, 1938; British exports fell by 10.7 per cent., and the excess of imports over all exports declined by 8.9 per cent., owing to the greater absolute fall in imports. Compared with the previous month, which also had fewer working days, the value of imports and British exports showed

(£ thousands)					
	1936	1937	1938	Change between 1937 and 1938	Per cent.
May					
Total imports	69,136	83,131	75,394	- 7,737	- 9.3
British exports	36,396	42,732	38,165	- 4,567	- 10.7
Re-exports	5,635	7,393	7,177	- 216	- 2.9
Total exports	42,031	50,125	45,342	- 4,783	- 9.5
Excess of imports over exports	27,105	33,006	30,052	- 2,954	- 8.9
Transshipments under bond ...	1,908	2,864	2,563	- 301	- 11.7
Five Months ended May					
Total imports	335,451	395,245	393,427	- 1,818	- 0.4
British exports	175,852	206,858	196,307	- 10,551	- 5.1
Re-exports	27,392	33,411	27,933	- 5,478	- 16.3
Total exports	203,244	240,269	224,239	- 16,230	- 6.8
Excess of imports over exports	132,207	154,976	169,188	+ 14,212	+ 9.2
Transshipments under bond ...	10,621	15,380	13,457	- 1,923	- 12.5

small increases of 2.3 and 2.4 per cent., respectively. A comparison of the aggregate returns for the first five months of the current year with those for the corresponding months of 1937 shows that the value of British exports was 5.1 per cent. smaller, while that of imports was only slightly lower. *The Economist's* index of the volume of raw material imports in May was 16½ per cent. lower than a year ago, while the index of the volume of exports of manufactures showed a fall of no less than 22 per cent. Present indications do not portend an early reversal of the downward trend.

Overseas Trade by Commodities.—Quantitative changes in imports and exports of important commodities since May, 1936, are revealed in the accompanying tables:—

RETAINED IMPORTS—MONTH OF MAY				
Items and Measure	1936	1937	1938	
Wheat	'000 cwt.	8,912	7,501	8,387
Beef and mutton	'000 cwt.	1,158	886	1,116
Mutton and lamb	'000 cwt.	738	766	559
Sugar (unrefined)	'000 cwt.	3,396	4,320	3,308
Iron ore and scrap	'000 tons	632	642	25
Raw cotton	'000 cwt.	1,093	1,257	705
Sheep's and lambs' wool	'000 cwt.	831	601	636
Flax, hemp and jute	tons	25,549	28,251	19,427
Crude petroleum	'000 galls.	47,007	48,783	62,896
Hides, wet and dry	'000 cwt.	155	142	110
Wood pulp	'000 tons	188	161	114
Rubber	'000 tons	119	190	329
Unwrought copper	tons	20,416	34,100	36,193
Pig lead	tons	32,706	28,242	33,844
Tin: Ore and concentrates	tons	4,324	4,466	6,561
Blocks, ingots, slabs and bars	tons	798	1,858	243
Iron and steel manufactures	'000 tons	117	98	56
Machinery	tons	9,534	12,605	9,855

The continuing depression in the textile trades has brought a further fall in imports of their raw materials—cotton, flax, hemp and jute. Imports of raw metals,

on the other hand, remained at a higher level than in May last year, though there has been some decline from the imports in April, 1938. Imports of petroleum, wheat, beef and veal were also larger than either a year or a month ago, but imports of mutton and lamb show a fall.

BRITISH EXPORTS—MONTH OF MAY				
Item and Measure	1936	1937	1938	
Coal	'000 tons	3,162	3,216	3,323
Iron and steel scrap	tons	7,375	19,323	4,389
Pig-iron and ferro-alloys	tons	9,238	15,769	5,606
Railway materials	tons	20,242	18,293	13,618
Total, iron and steel manufactures...	tons	204,090	228,312	167,522
Textile machinery	tons	4,183	4,259	5,991
Total machinery	tons	32,685	34,594	37,238
Cotton yarns	'000 lb.	12,397	14,136	8,449
Cotton piece goods	sq. yds.	145,798	161,601	109,880
Wool tops	'000 lb.	4,431	3,999	2,304
Worsted yarns	'000 lb.	2,430	2,209	1,697
Woolen tissues	'000 sq. yds.	5,297	5,397	3,457
Worsted tissues	'000 sq. yds.	2,782	2,872	1,956
Linen piece-goods	'000 sq. yds.	6,892	6,506	3,825
Leather boots and shoes	doz. pairs	27,311	29,529	37,164
Leather	cwt.	23,113	27,993	15,812
Paper and cardboard	cwt.	326,073	349,014	288,441
Locomotives and parts	tons	2,737	930	1,992
Motor vehicles and chassis	No.	7,243	8,284	9,074

With a few exceptions, exports continued to fall, those of textiles being the most affected. Exports of machinery, of motor vehicles and locomotives, and of boots and shoes, however, were higher in May than in April or in May of last year.

South African Manganese.—The application for the introduction of the shares of the Associated Manganese Mines of South Africa on the London Stock Exchange has focussed attention on the South African manganese industry. Some of the world's largest deposits of manganese ore were discovered in the Cape Province of South Africa shortly after the war, and following the amalgamation of the chief mining interests at the end of 1935, the Dominion's output was rapidly increased. In 1936, South Africa's manganese ore output was 281,866 tons; in 1937 production reached 695,778 tons, and in the first four months of this year it totalled 286,554 tons, against 194,949 tons in corresponding period of last year. In 1937 the Dominion was already the third largest manganese producing country in the world; if the expansion of the industry continues, South Africa will oust India from second place within a year or two. As the South African deposits are extensive, the industry in that country has a promising future. Its rise to international prominence has caused a change on the world market. South African manganese already dominates the German market (in the first four months of this year the Dominion supplied 127,849 metric tons out of Germany's total imports of 171,411 metric tons) and is gaining ground rapidly in other leading consuming countries. Moreover, as a result of the rapid development of the industry in South Africa, the British Empire is now the world's principal source of manganese ore, a position formerly held by the U.S.S.R.

Supplies of Antimony.—Antimony prices have fallen sharply during the past few months. The London quotation for Chinese regulus, which was well above £80 per ton last autumn, is now quoted at £55 10s. per ton. Antimony, used mainly as an alloying element (particularly with lead) is an indispensable armament metal, and large quantities are required for the production of shrapnel and other bullets, storage batteries for tanks, aeroplanes, etc. Moreover, supplies of the metal are endangered by the Far Eastern war. China supplies normally 70 per cent. of the world output, and more than 95 per cent. of the Chinese output comes from the Province of Hunan, which is within the range of Japanese bombers. Indeed, Chinese exports have already fallen. In the first quarter of 1938, Chinese exports of crude, oxide and refuse antimony amounted to 5,725 quintals, compared with 9,745 quintals in the first quarter of last year; while exports of regulus amounted to only 13,845 quintals, compared with 49,308 quintals. This decline in Chinese exports is particularly serious, as the only other

important producing country, Mexico, is at present suffering from internal difficulties. A revival in demand may easily result in a sudden jump in prices.

Iron and Steel Production in May.—The output of pig iron declined from 661,000 tons in April to 633,900 tons in May, the lowest level since February, 1937. Production of steel ingots and castings in May, at 957,000 tons, was 18,400 tons higher than in April, but, with the exception of that month, was the lowest output recorded since August, 1936. Imports of iron and steel showed a further decline last month, but exports remained almost unchanged.

PRODUCTION AND TRADE IN IRON AND STEEL (In thousands of tons)				
Period	Production		Foreign Trade	
	Pig Iron	Steel Ingots and Castings	Total Imports	British Exports
1913—Monthly Average	855.0	638.6	185.9	414.1
1929	803.0	632.4	235.2	364.9
1932	297.8	438.5	132.7	157.4
1936	643.5	982.1	123.6	183.8
1937	708.0	1,080.3	170.0	214.7
April	680.7	1,080.4	88.5	239.5
May	696.3	1,047.3	98.1	228.3
June	699.3	1,106.4	174.8	235.4
July	729.3	1,059.2	202.3	232.2
August	714.0	987.7	213.4	201.4
September	726.7	1,163.0	226.2	193.6
October	769.6	1,133.6	220.5	206.9
November	762.3	1,178.3	272.5	198.0
December	783.8	1,103.8	288.3	196.8
1938—January	761.1	1,081.4	308.7	191.2
February	693.3	1,057.6	230.4	156.7
March	714.6	1,115.8	276.8	176.1
April	661.0	938.6	61.5	168.3
May	633.9	957.0	55.7	167.5

As a result of the contraction of domestic output and imports, *The Economist's* index of apparent iron and steel consumption (1935 = 100), adjusted for seasonal variations, fell from 123½ in April to 104½ in May; a year ago the index stood at 130. This index, however, does not take into account changes in stocks. Despite the recent reduction, the output of the industry remains substantial.

THE BALTIMORE AND OHIO RAILROAD CO.

SUMMARY OF ANNUAL REPORT FOR THE YEAR 1937

The report of the Company's operations for the year 1937 is being distributed to the stockholders. It shows that total Railway Operating Revenues for the year were \$169,436,436. This was an increase over the previous year of \$443,735, notwithstanding the termination on December 31, 1936, of the emergency increase in freight rates and charges authorised by the Interstate Commerce Commission on March 26, 1935. Had these emergency charges been continued during 1937, freight revenues of the Company would have been about \$7,000,000 more than they were for the year. Despite this loss in revenue, and the increase in costs of operation, due to higher prices of material and fuel, and increases in wages during the latter part of the year, the Net Income available for fixed charges was \$31,463,336, or but \$720,695 less than the total fixed interest and other charges of \$32,184,031 accruing during the year.

The total taxes accrued in 1937 aggregated \$11,216,077, an increase over 1936 of \$720,208.

Freight revenue for 1937 was \$147,212,330 or \$604,588 less than for 1936, this decrease being caused largely by the almost unprecedented decline in business activity during the last half of 1937. Passenger revenue for 1937 was \$11,918,602, an increase over 1936 of \$735,660, or 6.58%.

CONDENSED STATEMENT OF OPERATING RESULTS

	Comparison with 1936	
	1937	Increase Decrease
Railway Operating Revenues:		
From Freight	\$ 147,212,330	\$ 604,588
From Passenger	11,918,602	735,660
From All Other Sources	10,305,504	312,683
Total	169,436,436	443,735
Railway Operating Expenses	128,859,516	5,259,183
Net Railway Operating Revenue	40,576,920	4,815,428
Deduct: Other Operating Charges:		
Railway Tax Accruals	10,918,554	696,233
Equipment and Joint Facility Rents	4,749,741	234,981
Net Railway Operating Income	24,908,625	5,276,680
Add: Other Income from Investments and Other Sources	6,554,711	691,983
Income Available for Fixed Charges	31,463,336	5,968,663
Deduct: Fixed Interest and Other Charges	32,184,031	708,993
Income for Year (Deficit)	720,695	(Decrease) 5,259,670

BALANCE SHEET

The balance sheet at December 31, 1937, indicated total property (less accrued depreciation) and other investments of \$1,087,040,474, and current assets of \$29,987,154 (which include \$12,325 for materials and supplies, an increase of \$3,390,386 over 1936), as against current liabilities of \$29,034,104. The total of interest-bearing debt and leased lines obligations outstanding was \$680,862,793 (an increase of \$2,198,151 compared with preceding year). The outstanding capital stock was \$315,158,455, and corporate surplus \$75,839,767.

The Company renews and records its high appreciation of the loyal support and efficient co-operation of all the officers and employees, and solicits the interest of employees and security holders in securing business for the Company.

DANIEL WILLARD, President.

INDUSTRIAL REPORTS

THERE is little change in the reports from industrial centres, some of which are still affected by the Whitsuntide holidays. In both the coal and iron and steel industries inquiry has shown a slight improvement, but new business still remains very small. Activity in heavy steel and engineering continues at a high level in most districts but in the lighter sections of the industry demand is falling off. The renewal of the Continental Steel Cartel is expected to have some effect upon forward buying. The textile trades show no signs of an early improvement in activity, though the cotton yarn market has been slightly more active. The jute industry is still suffering from uncertainty due to the Indian situation.

Coal

Newcastle-on-Tyne.—The market is quiet, with little new business, and certain collieries have to curtail production. There is no sign of immediate improvement in the Northumberland steam coal section, home trade is disappointing and there is little overseas inquiry. Durham local industrial trade is fairly steady, but foreign buyers take no interest in the market. Patent oven coke is dull in the absence of inquiry from abroad and from the home trade.

Glasgow.—Dull and inactive conditions continue in the Scottish coal market. The collieries have some contract business to provide a basis of operations, but new inquiry is not brisk, and short-time working is necessary to keep stocks within manageable volume. Round coal is most affected by prevailing conditions, but in general sized fuel is moving relatively well. In Fifeshire doubles and singles are readily available. There is little indication of an early improvement in export business, and in the home market the household demand is notably curtailed.

Cardiff.—Business in Cardiff continues quiet. Shipments in the foreign and coastwise trades dropped last week by over 50,000 tons compared with the previous week, due, however, to the Whitsuntide holidays, for the total of 297,900 tons was 58,300 tons more than in the Whit week of 1937. This week stocks have been slightly reduced. Exports in the five months ended May total about 8,200,000 tons, compared with 8,300,000 tons a year ago. Prices are nominally unchanged, and for the best large steam grades they are steady to firm. Discussions are impending between British exporters and French importers, but the French railways are unlikely to order any further South Wales steam coals until the autumn, and the quantity then may not exceed one-tenth of normal requirements owing to their heavy stocks and the pressure in favour of the consumption of French coals.

Iron and Steel

Sheffield.—There is no improvement in the market, and the general view is that substantial revival may be

delayed until the autumn. A few small lots of forge and foundry iron are disposed of for early delivery, but there is an absence of term contracts. Hematites continue in poor request with the exception of special qualities, which are moderately well taken up. There is little interest in finished iron.

Active consumption of heavy basic steel billets and acid qualities keeps demand reasonably good. Business in stainless steel sheets, wire rods and in strips, continues on a satisfactory basis.

There is a minimum of business in the market for iron and steel scrap. Most prices are fixed until the end of September, but where the control does not operate there is a readiness to shade prices, without, however, much effect on buyers.

Middlesbrough.—As consumption of the iron which was imported some time ago by local foundries is proceeding more slowly than anticipated, there is no inducement for buyers to come into the market. Current production of foundry, hematite and basic pig iron is in excess of requirements, and stocks are accumulating in makers' yards.

It is now announced that official minimum prices for heavy steel scrap are established until the end of September.

Semi-finished steel producers and sheet makers are seeking orders, but the heavy steel producers are running well up to capacity.

Coke producers are having difficulty in finding an outlet owing to the reduced requirements. No business is reported in foreign ore, whilst arrivals under current contracts are being reduced, imports into the Tees up to the middle of June being 75,000 tons, against 101,000 tons for the first fortnight of May.

Shipments of finished steel from the Tees are keeping up remarkably well.

Glasgow.—There is little change in the West of Scotland. Neither steel-makers nor makers of semis have had heavy bookings, but there is still a fair amount of work on hand at the various plants, and it is expected that the renewal of the Continental Steel Cartel and the stabilisation of prices will be followed by heavier buying for forward delivery. Structural engineers in Glasgow and district have all been fully employed for many months and are still finding new business plentiful. During the present week they have booked quite an important tonnage, including some export business. There is continued activity at practically all the engineering shops and manufacturing plants and a steady flow of new business.

Cardiff.—Production in the tinplate industry continues at a little over one-third of capacity. Shipments up to June 9th show a decrease of 40 per cent. for the year. It is reported that in its revised form the International Agreement concedes to the new Belgian tinplate works the Belgian inland trade, but does not allocate to it any export quota. Stocks of steel ingots are exceptionally heavy, and more furnaces have been temporarily stopped. Prices are

nominally unchanged. Figures for production, stocks and shipments are given below.

Tinplate Industry Statistics

	Week ended June 5, 1937	May 28, 1938	June 4, 1938

Shipments			
Tons	10,518	1,356	4,403
in vans	2,666	8,334	6,259
Stocks (warehouse and in vans)	192,133	115,744	

Textiles

Cotton (Manchester).—The Whitsuntide holidays have had the usual disturbing influence upon business. Large-scale curtailment of production in spinning and weaving continues, and it is many years since there were so many extra stoppages at Whitsuntide. Prices for American cotton have recovered over 4d. per lb. from the low point touched at the end of May, partly as a result of the less favourable weather reports from the American belt, heavy rains having been experienced in certain parts. There are very few indications of any increase in world consumption.

The yarn market has been more active. In the American section coarse counts have been sold on a freer scale than for some time. Ordinary weaving qualities in the Egyptian branch have been comparatively quiet, but some special contracts have been put through for the Continent. Although inquiry in piece-goods has been of fair extent, only a limited business has been done. Some leading buyers are convinced that lower values are improbable and there has been an inclination to keep well covered.

Jute (Dundee).—The jute trade is still quiet. Buyers appear to be afraid to operate with any degree of freedom in view of the uncertainty of the future. It is rumoured that there are prospects of an early settlement of the working hours' problem in India, but nothing definite is known. The owners of a very small percentage of the looms refuse to co-operate with the majority. One of the principal outside mills consented to sign the agreement under which it is proposed that mills should work 45 hours per week, except the smaller ones with less than 250 looms, which would be allowed to work 54 hours.

The price of raw jute has fallen since the last report, particularly that of the new crop, which is being sold at about 20s. discount on old crop rates for Daisee. Spinners remain uninterested in the fibre. The quantity of jute in view for Dundee this season is approximately 360,000 bales less than at this time last season. The Government is helping the trade by placing large orders for sandbags, and a total of 275 million bags is required for delivery at the rate of two million bags per week. Ordinary trade is quiet, but spinners and manufacturers are adhering to their prices.

COMPANY MEETINGS

SUEZ CANAL COMPANY

IMPORTANCE IN WORLD ECONOMY

CLOSER LINK WITH EGYPT

MARQUIS DE VOGÜÉ'S ADDRESS

SERVICES RENDERED TO SHIPPING

The annual general meeting of the Suez Canal Company was held, on Monday, the 13th instant, in Paris.

M. le Marquis de Vogüé (chairman of the board of directors) presided.

The Chairman said:—Ladies and Gentlemen,—The report you have just heard reflects the extraordinary confusion of economic conditions. The incessant variations of currencies, and the uncertainty affecting their inter-relations, weigh heavily on the general position; the task of those who have to manage an international undertaking like yours, and translate into figures the record of its activities, becomes each day more difficult.

These complications naturally strengthen the position of your board in the policy of considered wisdom which they have always followed, and which you have never failed to approve. You will again agree with them, I think, that the obligation to ensure in such conditions the satisfactory functioning of so important a service as the Suez Canal calls more than ever for prudence, as do the decisions of those who are responsible for it, decisions of which the effect, direct or indirect, may be felt far and wide and in the future. The comparatively important allocations which are submitted to you correspond to these preoccupations.

EFFICIENT WORKING OF THE CANAL

The report has given you all the necessary information on the present state of the Canal. Its width, its depth, the rectifying of curves, the precautions taken for the passing of ships, in a word, the technique of Canal navigation, meet the needs and the present tendencies of shipping, and guarantee the maximum security to transiting ships.

There remains, however, one difficult point: that is, the channel which gives access from the open sea to the port of Port Said. The 39 feet depths corresponding to the average depth of the Canal are found only at more than five miles from the shore, and tend to become still more distant. One can imagine the care exacted by a cutting 330 feet wide excavated for this distance in order to be constantly protected against sand brought by the storms which arise from time to time in this region, or from the silt continually deposited by the Nile. We have decided, in full agreement with the "Commission Consultative Internationale des Travaux," to try a more modern type of dredger which has proved its worth elsewhere and which would be intended to replace our present plant; the latter, in any case, will have to be renewed in the near future.

It does not take much reflection to understand the expenses to which our obligations put us, and to understand that the efficient functioning of the Canal comes before all other considerations.

EGYPTIAN DIRECTOR'S APPOINTMENT

To the respective rights of Egypt and of the company, and of the duties arising therefrom, the Agreement between the Egyptian Government and ourselves has given the character of a friendly collaboration. The appointment to the board of a first Egyptian director, and soon of a second, the admission of Egyptian employees on our administrative staff in Egypt, our important contribution to the expenses, both temporary and permanent, in which her new regime has involved Egypt, all these steps marked the beginning of a period of work in common which can but produce happy results. Thus your company sees itself becoming still more closely bound to the country of which the Suez Canal is one of the gems.

From this brief explanation you will see that the present position of your company can be considered satisfactory, and that the future is shaping favourably. You will also see a proof of the care your board devote, in the general interest, to the furtherance of the material and moral interests entrusted to them.

The meeting unanimously approved all the resolutions presented by the board.

ANNUAL REPORT

The following are extracts from the directors' report:—

In 1937, shipping through the Canal was more active than ever before, even during 1929, which had previously been the best year.

Consequently, the receipts for the year would have been much higher than those for 1936 if your company, continuing the policy it has always followed, had not, on two occasions, allowed the users of the Canal to benefit by these favourable circumstances; the reduction of 6d. in the transit dues on July 1, 1936, and that of 1s. on April 1, 1937, have had their effect on the receipts for 1937, one during the whole year and the other for nine months. As a result, these receipts, expressed in Egyptian pounds, are smaller by nearly 5 per cent. than those of 1936. As, on the other hand, the new charges undertaken by your company under the Agreement concluded with the Egyptian Government have increased expenses by about

8 per cent., the net profits for the year, expressed in Egyptian pounds, show a decrease of about 11 per cent. against 1936.

We propose that the gross revenue of the "Action de Capital" shall be fixed at 820 francs, an increase on last year of 36.6 per cent. The surplus available would permit the allocation of 15 million francs to the insurance and contingencies fund and the same amount to each of the two sinking funds, buildings and renewal of plant. We feel that the important rise in prices fully justifies these three allocations.

The results of the first months of the current year show a decrease of traffic of only about 5 per cent. in comparison with the corresponding period of 1937, which was exceptionally good.

In so far as it is possible to make a forecast based on this fact, on the present trend of trade and on the hope of a stability of the

exchange round about its present level, we contemplate taking a further step on the way constantly followed by your company, and giving the shipping community the benefit of a further reduction in dues before the end of the year.

The agreement arrived at with the Egyptian Government, of which we have kept you informed during the last two years, has been ratified by Parliament; for several months past it has been put into effect in a spirit of close and confident collaboration. The expenses for the year show, as we have already indicated, the charge of the annuity of £300,000 fixed in this agreement. Since January 1st last we have commenced engaging Egyptian staff on the agreed terms, and we have had the pleasure of seeing the first Egyptian director join your board.

INCREASE IN TRAFFIC

Traffic through the Canal in 1937 reached 6,635 transits, representing 36,491,000 tons net register. These figures exceed all previous ones. This result is due in part to the activity of the Italo-Abyssinian traffic, still very great, at least during the first half-year, but whatever the increase brought by this traffic, it was nevertheless smaller than that of the previous year, and, everything considered, it is to normal traffic that the 1937 increase of 12.7 per cent. over 1936 is in fact due.

The analysis of the net tonnage shows an important decrease of 924,000 tons in the transit of warships and troopships. On the other hand, all categories of merchant ships have increased.

The weight of goods through the Canal has reached 32,776,000 tons, thus showing the considerable increase of 7,220,000 tons, or 27.5 per cent. over that of 1936. European exports show proportionately less advance than European imports, as shown by the respective increases of transits in the two directions, i.e. 15 per cent. from North to South and 35 per cent. from South to North. If we examine the distribution of traffic by countries of origin or destination beyond Suez, we notice that they have all shared in the increase mentioned above. In particular, Australian traffic via Suez, which had greatly decreased in 1936, experienced an appreciable revival. The diversion of this traffic via the Cape of Good Hope was less important than in the previous year. If it is true that the reductions granted by the company are not unconnected with this return to the Suez route, it must also be attributed in part to the effect of favourable economic circumstances, and especially of a period of relatively high freights.

TREND OF WORLD TRADE

If the results of 1937 are particularly favourable, the year has been none the less marked by a reversal of economic tendencies, putting an end to a period of progress which has lasted for more than four years.

The economic slowing down first showed itself as customarily by a fall in raw material prices, which was felt already in March and April, 1937. Industrial production, affected in its turn between June and September, carried in its wake a reduction of world trade, which had reached its peak during the second quarter, and which declined progressively to a level which for the first quarter of 1938 was 10 per cent. lower than that of the second quarter of 1937. This falling off of world trade has had, as inevitable corollary, an appreciable reduction in freights and, since the first months of 1938, an increase of laid-up tonnage.

Trade via Suez has followed the evolution of world trade. For the first four months of 1938 the reduction of this traffic as compared with the corresponding months of 1937 has reached 10.8 per cent., and it is not possible at the moment to foresee, in the coming months, a reversal of this tendency to fall.

For the Suez Canal, 1938 has accordingly started under conditions less favourable than the preceding year, and it is therefore prudent policy to expect, for the figures of net tonnage through the Canal in 1938, a total result slightly below that of 1937.

The full report may be obtained upon application at the Company's Enquiry Office, 6 Bishopsgate, London, E.C.2.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to:—

Fleet Street,

London, E.C.4

Telephone: Central 8631

ANTOFAGASTA (CHILI) AND BOLIVIA RAILWAY COMPANY, LIMITED

INCREASED TRAFFICS

The fiftieth ordinary general meeting of the Antofagasta (Chili) and Bolivia Railway Company, Limited, was held, on the 14th instant, in London.

Mr A. W. Bolden (chairman and managing director) said that theirs had been a fairly satisfactory life. For more than forty years they had continued to pay dividends on their ordinary capital, and, although in the past few years they might be said to have had a somewhat lean time, they could look back with some satisfaction upon their record.

With regard to the operations of the year under review, they had carried considerably more traffic than in 1936 and had an increase in sterling receipts, which would have been much greater had they not experienced a further fall in the Bolivian exchange, which for the whole of the twelve months was calculated for their purposes at Bs.80 to the £, so that, in spite of some increase in the surcharge on the tariffs, not only did they not realise the benefit they should have done from the increased work—that is to say, the increased traffic—but they again had had to meet higher expenses through salaries and wages and the introduction of new social laws in Bolivia and in Chile. The net receipts showed an increase of £16,414 at £313,457. They had a disposable balance of £210,030, out of which they proposed to pay 3½ per cent., less tax, on account of the arrears on the 5 per cent. cumulative preference stock, leaving three and a quarter years' interest on that stock to be made up. In other words, the profits from their business and the income from their investments had been used to pay away interest and certain arrears on the cumulative preference stock to the extent of the total income.

He hoped that shareholders would think the result of the year's operations satisfactory under all the circumstances and taking into account the possibilities that were open to them.

He felt that there was a general development going on in Chile and Bolivia and that their railway had much to do in assisting this development.

The report and accounts were adopted, a resolution moved by a shareholder to use certain reserves for dividend purposes being lost by a large majority on a show of hands.

LISBON ELECTRIC TRAMWAYS, LIMITED

RECORD NUMBER OF PASSENGERS

The fortieth ordinary general meeting of the Lisbon Electric Tramways, Limited, was held, on the 15th instant, at 4 London Wall Buildings, London.

Mr Frederick W. Kerr, the chairman, in the course of his speech, said:—I am again pleased to be able to inform you that the traffic has been more than maintained; 125,863,595 passengers were carried during the past year, which is an increase of 3,807,113 over the preceding year, and constitutes a record.

The revenue from all sources shows an increase of £14,561, but the expenses have gone up by £20,320; hence the profit as shown in the accounts for the year is £165,761, and is a decrease of £5,669 on the previous year. The increase in the working expenses is largely due to the higher price of coal and the greater car mileage which has been necessary in order to give an improved service.

The board now has pleasure in recommending the declaration of a final dividend of 4½ per cent. net on the ordinary shares in respect of the year 1937. This, with the interim dividend that has been paid, makes 7½ per cent. net for the year, and is at the same rate as before.

The improved services given require a substantial increase in the car mileage, and in 1937 alone this increase was 7½ per cent. The first effect of so substantial an effort to improve the service must be an increase in the operating costs, but gradually, as the benefits of the improved service become appreciated by the public, we expect to see an increase in the number of passengers using the system. That increase for 1937 was over 3½ millions, and, while it was not sufficient to cover the increased costs incurred, we are encouraged to continue our efforts to improve the service and confirmed in our opinion that taking a long view the policy now outlined is in the best interests of the shareholders.

I am pleased to say our relations with both the Government and the Camara continue to be on a friendly footing. On the whole I think the record of the past year may be considered satisfactory, and from this year's returns I see no reason to anticipate any material change in the current year.

The report and accounts were unanimously adopted.

BOOTS PURE DRUG COMPANY, LIMITED

RECORD VOLUME OF TRADE AND NUMBER OF CUSTOMERS

RECORD SALES

The total volume of trade, number of prescriptions dispensed, and numbers of customers, all reached record figures. In fact, we had over 169,000,000 sales transactions, that is 3½ millions a week—and dispensed 150,000 prescriptions a week—and this in spite of the absence of any widespread epidemic.

Business has continued to expand, although not to a sufficient extent to offset increased taxation combined with increased expenses. Every effort is made to cope with the highly important problem of keeping expenditure within due limits, but wages, rents, rates, freights, fuel, lighting, raw materials of all kinds, in fact all our essential costs, have shown an upward trend. In a few instances, we have been compelled to put up our prices, but as a general rule, we have been at pains not to pass on to the public the extra cost of bottles, containers, etc.

REVIEW OF PROGRESS

The figures I have put before you concerning our progress, our profits and our resources, judged by any other standard than our own, and in view of all the circumstances, might be considered satisfactory. But I should not be frank with you if I did not say that your directors would have greatly preferred, in this our Jubilee year, to report in addition to record figures of sales transactions, staff employed and branches working, profits and prospects which would justify a larger distribution to the shareholders or special concessions to the staff, or both.

If the shareholders have not had an increase of dividend it is fair to recall that the present rate of dividend has been maintained for several years and was not reduced in the years of bad trade.

COLLABORATION WITH SCIENTISTS

We have continued to conduct our medical and scientific research work in close collaboration with distinguished research workers in the universities, hospitals and other institutions. Their advice has been invaluable, particularly in connection with our range of special medical products, which has been extended during the past year. At the same time, we make our own contribution to the medical research work of the nation by contributing or loaning chemicals or apparatus to other research laboratories, by providing our consultants with qualified research workers to extend the scope of knowledge in special fields, and by placing the results of our own investigations and experiments in the common pool. In these and other ways we keep abreast of current medical discoveries and play our part in the development of scientific knowledge.

A. R. P.

During the year, with the eager co-operation of Lord Mayors, Mayors and the local authorities, we have displayed our model gas-protected room, accompanied by explanatory talks, in some 80 cities and towns throughout the country. Some 300,000 persons have visited these displays and the publicity given to them in the Press has provided further valuable propaganda for A.R.P., of which the Home Office has expressed its deep appreciation.

MINISTER OF HEALTH'S TRIBUTE

On the occasion of the official celebration of the company's 50th anniversary earlier this month in London, we were honoured by the presence of the Minister of Health, who, in paying an enthusiastic tribute to the founder of the company, expressed the view that to provide good shops giving good service for money and good conditions for the people who worked in them, was as public-spirited an action as any man could do. Mr Walter Elliot, in those words, I think, summed up the general principles that have guided and should continue to guide the policy of the company.

FUTURE PROSPECTS

While I have every reason to express the board's complete confidence in the vitality and expansive powers of our company, the fortunes of a great retail business like ours must be intimately bound up with the purchasing power of the public, and that is a factor over which we have no control. It is impossible to shut one's eyes to the trend of prevailing economic conditions. The future is too uncertain to warrant any expression of easy optimism, but on the other hand, the broad foundations of our business and the careful financial policy we have pursued over many years combine to place us in a powerful position to face as successfully in the future as we have done in the past any rough weather we may encounter.

The report and accounts were unanimously adopted.

RESERVE FUND

Your directors do not consider it necessary to increase the general reserve fund at the present time, but in view of the trend of taxation, and the even heavier burdens foreshadowed in the Chancellor of the Exchequer's Budget speech, they recommend a transfer of £50,000 to taxation reserve. In addition, they recommend the transfer of £72,132 to freehold property reserve, £16,772 to works development reserve, £33,228 to overseas development fund, leaving to be carried forward to next year £346,730.

The company's holdings of Government Securities have now been finally disposed of, resulting in a capital profit of £56,140, and your directors recommend that from this sum a special cash capital distribution of 2d. per share (not subject to tax) be made to ordinary shareholders. This will absorb £53,333, and it is proposed that the balance of £2,807 be divided amongst the various Boots' benevolent funds at the directors' discretion.

Our subsidiary companies have continued to make progress, although they also have suffered from the necessity of paying N.D.C. During the year we have opened 31 new shops and closed three, so that on the 31st March we had 1,180 branches.

A POLICY OF CAUTION

At the general meeting in 1933, I said: "Our aim is to build a well-established sound business, and not to show figures merely to influence the market price of our shares." That remains our aim and our policy. It would have been easy and popular to distribute a larger proportion of our profits, but your directors feel strongly that the times in which we are living are too uncertain to justify a departure from the policy we have followed in recent years of accumulating and conserving our resources.

Reference should be made to the great new factory at Beeston for the manufacture of dry goods, which is almost completed and is already in partial operation. It was designed by Sir Owen Williams on similar principles to the neighbouring "wets" factory. The Beeston factories will constitute, from the point of view of aptness for function, probably the finest group of factory buildings in this country, if not, indeed, in this hemisphere.

WHOLESALE AND EXPORT

The wholesale connection at home has continued to expand and the export figures show a material increase. Our action in increasing the number of representatives in India has been justified by a steadily increasing sale of our products in India, Burma, Malaya and Siam.

Following a visit paid by the head of our wholesale and export department to Egypt, Palestine, Syria and the Sudan, agencies were arranged and extended in those markets, with results that up to date have been most encouraging.

During the year, also, our trade in Canada and South Africa has shown healthy development and our medical specialties are enjoying a growing demand in these Dominions.

NEW ZEALAND

With regard to New Zealand, your directors are quite satisfied with the steady progress which our two pioneer branches in Auckland and Wellington have made in all sections. We have not yet been able to open further branches in New Zealand owing to the Government's conservative policy in regard to the pharmaceutical industry, but with public opinion on our side we have every hope that restrictions on our progress in the Dominion will gradually be removed.

CALLENDER'S CABLE AND CONSTRUCTION COMPANY, LIMITED

RECORD RESULTS

FIFTEEN PER CENT. DIVIDEND, PLUS BONUS

The forty-second ordinary general meeting of Callender's Cable and Construction Company, Limited, was held on the 15th instant, at the Waldorf Hotel, London, Sir J. Fortescue Flannery, Bt., H.M.L., M.Inst.C.E. (the chairman of the company), presiding.

The Chairman, in the course of his speech, said:—It is once more my happy position to present accounts which show the largest front-page figure, as we call our gross profits, in the history of the company.

The excellent goodwill which the company enjoys, although it stands in the balance sheet as "nil," has again had the result that a large number of corporations have once more entrusted us with their annual contracts for mains cables, and during 1937 a record tonnage of copper was dealt with by the factory at Erith.

To meet the demand for greater output and prompt delivery, we have during the past year substantially modified and increased the cable factory at Erith. Part of the cost of doing so we have charged to "Repairs and Maintenance," but a very large sum has also been expended in erecting new shops, and our new armouring, testing, and packing shops are, we honestly believe, the best equipped and most spacious workshops of their kind in the world. The general effect is bound to have a beneficial result in economical manufacture.

THIRTY PER CENT. INCREASE IN CABLE SALES

It is at the Anchor Works, near Manchester, that the cables are manufactured which we employ in marine work. It is gratifying to note that the sale of ship-wiring cables for the year 1937 has been nearly 30 per cent. higher than in 1936; in fact, nearly all the leading shipbuilders order cables from Callenders.

Your company has been favoured with an order for a quantity of cable for the new Cunard liner Queen Elizabeth, our share including the Ring Main Rubber Insulated Cable, and to date we have received orders for some miles of this and other cable for that well-known ship. This order, following experience of Callender Cable in the Queen Mary, is a very valuable indication of the merits of this special manufacture.

After bringing in the balance from 1936 of £397,817, there is a net profit of £789,806.

We recommend a distribution of the usual 15 per cent. dividend for the nineteenth year, and in addition for this year a special cash bonus of 1s. (5 per cent.) per £1 of ordinary stock.

SIR TOM CALLENDER'S STATEMENT

Sir T. O. Callender, J.P., in seconding the resolution, said:—The company still maintains a first-class position. In spite of the universal falling-off of general business throughout the world, we are still obtaining very satisfactory orders for our home trade and for all parts of the world, and our Eastern business is closely up to our expectations.

The volume of our home business has been well maintained. After a careful examination of the conditions, I am well satisfied with the business which this company is effecting in all parts of the world. Further, our old customers, many of whom have dealt with us for an unbroken period of more than forty years, have contracts running with us; and new accounts are also being opened.

I want to call special attention to the cables which we have supplied and the main laying work which we are now carrying out in Trinidad, in view of the fact that in my early days I and my father were instrumental in developing the Pitch Lake of that island which has had such important results there. When I was last in Trinidad, and shortly afterward in America, I met all those interested, who gave me a hearty reception as one of the survivors of the old crowd who had done so much to push the resources of the island.

Mr. W. G. Hendrey, dealing with the export side of the business for the year, spoke of substantial improvement in Australia, New Zealand, South Africa and India. In South Africa an opportunity had recently occurred for closer co-operation between the South African factory of the company and the members of the Cable Makers' Association in this country, which latter had now acquired a large shareholding in the South African factory, and had entered into a contract to supervise the manufacture of the cables produced.

The company's Chinese business had been greater in 1937 than in 1936. During the last few years business with the Continent of Europe had been small, but there again there had been a considerable increase in turnover.

The report and accounts were unanimously adopted.

WELWYN GARDEN CITY, LIMITED

DIVIDEND AGAIN INCREASED

RISE IN PROSPERITY OF THE TOWN

The eighteenth annual general meeting of Welwyn Garden City, Limited, was held, on the 15th instant, in London.

Sir Theodore G. Chambers, K.B.E. (the chairman) said:—The accounts before you to-day indicate steady improvement in the financial position of the company, and the directors have much pleasure in recommending that the dividend for the year should be increased to 4 per cent. Our gross revenues have increased from £72,556 to £86,148, largely due to the larger income accruing from freehold house property completed and occupied during the year. The revenue for subsidiary undertakings has risen from £15,695 to £21,622. During the year one of our subsidiary undertakings, Welwyn Commercial Buildings, Limited, was converted into a public company and an issue of £120,000 5½ per cent. preference shares was made. The parent company holds the £120,000 issued ordinary share capital in the undertaking, on which an initial dividend at the rate of 10 per cent. per annum has been recently recommended. This subsidiary has become one of the most important elements in the development of the town, particularly in the provision of factories for letting. Although we have in practice left a considerable amount of building development to independent concerns, we have also retained for this undertaking certain special classes of work. The building of shops and flats in the principal centres of the town through this medium is not only profitable in itself but ensures the maintenance of a high standard of construction and design.

Welwyn Stores has had a successful year, and the results may be taken to indicate that the business is to-day on a stable basis. It has now been decided to provide more adequate accommodation for this business, and I am glad to be able to inform you that work was begun on the new building early this spring. The premises will occupy what is probably the most important site in the centre of the town, and will be of such a character as will not only enhance the value of our central area but will provide for the town and the surrounding districts a very attractive shopping centre.

Our increasing importance as an industrial and business centre is illustrated effectively by the following facts.

Between March, 1934, and December, 1937, the rateable value of the town that has risen from £78,500 to £110,000. In three years to December, 1937, the consumption of electricity had increased by over 50 per cent. From 1932 to 1937 the consumption of gas for industrial purposes rose from 2½ million to 26 million cubic feet. In three years the population has increased by over 33½ per cent., and at present stands at about 14,000. Nearly 6,000 persons are to-day employed in the town.

ADVANTAGES OF WELWYN AS LOCATION FOR INDUSTRY

Recently we had the privilege of giving evidence to the Royal Commission on the Location of Industry. I mention briefly the salient points of our evidence. Although Welwyn is not, and we hope that it will never be, part of the Greater London Area, its proximity to London and the very large market in the South-Eastern counties makes it an ideal location for a wide variety of industries.

Far-sighted industrialists never fail to be impressed with the scientific planning of the town as a single unit combining industry, general commerce and business, residential accommodation and social services and amenities and relating them one to another. Those industrialists who pay particular attention to the welfare and general living conditions of their workers appreciate the contribution which the general plan of Welwyn makes whereby workers are able to live in modern houses involving only fifteen minutes' walk from their work, thus saving the money, time and strain involved in travelling long distances to places of business under crowded transport conditions.

The evolution of a modern town such as Welwyn is not, of course, the work of any single organisation. The expansion of our industrial area involves the consideration of such important matters as new roads, drainage, trade effluents, sewerage disposal, water supply, electricity distribution, gas supply, together with the provision of houses, the expansion of educational and recreational facilities, and the development of health services, including hospital arrangements. The handling of all these matters at Welwyn involves the whole-hearted co-operation of many different bodies with widely different responsibilities, but with one object in view, namely, the development of a well-planned town.

Mr A. K. Graham seconded the resolution adopting the report and accounts and approving the dividend, which was carried unanimously.

BRUSH ELECTRICAL ENGINEERING COMPANY, LIMITED

CAPITAL REORGANISATION APPROVED

SIR RONALD W. MATTHEWS'S STATEMENT

A meeting of the holders of ordinary stock and shares of the Brush Electrical Engineering Company, Limited, was held, on the 14th instant, at the Holborn Restaurant, W.C., for the purpose of submitting a scheme of arrangement.

Sir Ronald W. Matthews (the chairman), in the course of his speech, said:—This fine old company, whose name is a household word in electrical engineering and whose history will always be associated with that great man Emile Garcke, has of recent years fallen upon evil times, under circumstances which have been fully elaborated to the shareholders in the speeches which your former chairman has made to you at the recent annual meetings.

It is obvious from the balance sheet that the company cannot continue in business without a drastic reorganisation of its capital. Not only is it necessary to deal with the existing bank and trade liabilities, but we must have further capital for modernising the plant and for supporting a larger volume of business.

Your late board obtained reports from independent consultants of engineering repute, who have emphasised the necessity for new tools, equipment and plant organisation. With new capital this can be achieved. Already the management has been thoroughly overhauled and new appointments made to important administrative positions in the company.

HEALTHIER TRADE POSITION

The present condition of the company's order book is satisfactory and there are signs of further expansion in the future. This healthier position will involve the provision of working capital.

In these circumstances I am very glad to report that your board has succeeded in negotiating with R.E.D. Trust, Limited, to subscribe new prior lien debenture stock and to underwrite an issue of further ordinary shares on the basis laid down in the scheme.

For ordinary stockholders the important point of this scheme is that their existing stock is reduced to one-quarter of its nominal value, and for the holders of the two existing 4½ per cent. debentures that they are asked to modify the nature of their security and their stock is made redeemable and sinking funds in respect of each stock are created.

The new members of the board have joined the board on the basis of this scheme of arrangement going through. We only agreed so to do upon satisfying ourselves so far as is humanly possible that the scheme was one which merited your support and which opened up the prospect of future prosperity for the company.

EXCELLENT REPUTATION OF THE COMPANY'S MANUFACTURES

The proved worth and reputation of the company's manufactures—of which I need only mention particularly Diesel engines, turbo alternators, transformers, switchgear and omnibus and trolley vehicle bodies—justified confidence in their further success; and we believe that the reorganisation of the finances and the administrative appointments to which I have referred will not only assist the company in production of these manufactures but will also increase the confidence of purchasers in placing with the company large orders involving, as such contracts commonly must, a considerable period of manufacture and the expenditure of large sums.

Under the scheme the existing stockholders are given the option to subscribe for the new ordinary share capital and such subscription carries with it certain option rights which, in the event of the company achieving success, should be of substantial further value.

Having very carefully considered the whole matter, your board have no hesitation in advising you to approve of the scheme. In fact the position is that the only alternative before you is to approve or reject it as no amendments can be allowed. If the scheme is approved by you, then under the Companies Act it has to be approved by the Court.

The board anticipate that the offer of the new shares will be made in September next.

Assuming that the proposals before this meeting are carried, there is every prospect of the business being re-established on a profit-earning basis.

The scheme submitted was approved, and the proposals were also sanctioned at subsequent meetings of the holders of 4½ per cent. perpetual debenture stock and 4½ per cent. perpetual second debenture stock, as well as at the annual and extraordinary general meetings of the company.

A hearty vote of thanks to the chairman concluded the proceedings.

VENEZUELAN OIL CONCESSIONS, LIMITED

INCREASED PRODUCTION AND BETTER PRICES

DEVELOPMENT PROGRAMME AND TREND OF COSTS

The twenty-second annual general meeting of the Venezuelan Oil Concessions, Limited, was held, on the 10th instant, in London.

The Right Hon. Viscount Bearsted, M.C. (the chairman), in the course of his speech, said:—Turning to the profit and loss account, you will see that oil proceeds and value of oil stock have been increased by over £1,960,000, the figure for 1937 being £5,300,000, compared with £3,338,000 for 1936. This increase is attributable to two factors, an increase in our production and an improvement in prices realised.

In my address to you last year I warned you that various factors were inevitably tending towards higher production costs. In addition to natural trends, four special causes of increased expenditure attended our operations over 1937. Firstly, the value of the bolivar, which is controlled by the Venezuelan Government, was adjusted in 1937 in a manner which resulted in an average exchange rate for 1937 of 16½ bolivares to the pound sterling, as compared with 20 bolivares to the pound in 1936. Compared with par conditions of exchange (25.25 bolivares to the pound sterling) our operations in 1937 cost us over £1,000,000 extra on this account. Secondly, the award terminating the strike in January, 1937, of one bolivar per day increase in wages affecting a large proportion of Venezuelan workers, and an additional one bolivar per day for those not provided with housing by the company, had a considerable direct effect upon our expenditure. Thirdly, the enormous and costly housing programme had an important reaction both on our current cash resources and on profits. Fourthly, the very costly coast defence works to which I have referred in previous years.

A NEW INTEREST

As regards 1938, while the same causes of high expenditure as obtained last year are likely to remain, an additional factor will be introduced. Looking to your company's future interests and expansion, an arrangement has been made with the Royal Dutch Shell group of companies under which we have acquired a one-third interest in certain new oil concessions recently taken up by a company called the Venezuelan Oil Development Company, Limited. These concessions, as recently granted, comprise a total of some 600,000 hectares, situated mainly in the region south of the Maracaibo basin and in Eastern Venezuela. The commitment, of course, involves participation as to one-third in the initial expenses and all exploration and development costs attaching before any tangible benefits are realised. It is to care for these requirements, in addition to the expensive exploration programme on our own concession, that the exploration and general reserve is increased by £500,000.

From the point of view of our ability to meet the very high rate of expenditure which the numerous factors I have enumerated foretell, it is fortunate that our present producing fields are standing up well and that our contract with the Asiatic Petroleum Company ensures the disposal of our oil.

CURRENT FIELD OPERATIONS

As far as our normal field operations are concerned, we are now operating a steady drilling programme of twelve strings of tools engaged on new exploitation, stepping out and exploration wells, and repairs to existing producers. Development has continued to be concentrated to a considerable extent in the Tia Juana expansion of the Lagunillas Field. V.O.C. 1937 production in this area of approximately 10,000,000 barrels will indicate the speed which can attach to the development of new fields under present-day conditions.

Regular production from Tia Juana was commenced in March, 1937, and to-day your company has approximately 170 productive wells. The total number of productive wells at Tia Juana, including those of the two American companies operating in the lake, is to-day about 400. The field has yielded to date approximately 42 million barrels of oil, of which V.O.C. has been responsible for about 17 million barrels.

The main Lagunillas field, as distinct from Tia Juana, has been steadily developed and remains by far our largest source of production, although in this case also the majority of wells are now being produced by pumping.

The production of the La Rosa Cabimas Ambrosio field has been maintained by a steady programme of repairs to wells and the installation of pumping facilities, while a few new wells have been completed in the northern sector. Although the production of this

area can be expected to show a slight increase this year, as compared with 1936 and 1937, it is apparent that, in the absence of any unforeseen developments, the field must be regarded as practically drilled up, and our efforts in future will have to be concentrated on maintaining the productive wells.

BACHAQUERO AND EXPLORATION WELLS

The next field to come into prominence is expected to be Bachaquero, some 20 kilometres south of Lagunillas, where drilling is in progress with two strings of tools some distance away from the lake shore. Shipments from Bachaquero will probably start towards the end of this year, and from information obtainable from the wells so far drilled the character of the oil is likely to be poor, as in the case of Lagunillas/Tia Juana.

As regards exploration to prove and block out reserves of oil territory on a scale commensurate with our large production, we are drilling exploration wells at Pueblo Viejo, to the south of Lagunillas, and at Siñucara, near the city of Maracaibo on the western side of the lake. We hope shortly to commence an exploration well at Pica-Pica, a structure in the interior of the Bolivar district some 35 kilometres east of La Rosa.

All our production continues to be sold to the Asiatic Petroleum Company, a member of the Shell group, under our contract with them covering a period of five years from July 1, 1936. This contract originally covered deliveries at the rate of 100,000 barrels of crude oil daily, but has since been increased to cover deliveries up to 170,000 barrels daily.

POSITION IN VENEZUELA

There have been references in the press, as a result of difficulties in Mexico, to the possibility of the extension of the same class of trouble to other Latin-American countries. I therefore feel it necessary to refer to this subject. The Government of Venezuela is in sound hands and is a wise Government, and the relations between this company and its employees are all we could desire. I feel with considerable confidence that we have little cause to fear that any agitation in Venezuela from Communistic interests will receive support either from the Government or the workers.

The report was unanimously adopted, and the final dividend of 2s. per share, making 3s. for the year, was approved.

MILLARS' TIMBER AND TRADING COMPANY, LIMITED

INCREASED PROFIT

The annual general meeting of Millars' Timber and Trading Company, Limited, was held, on the 10th instant, in London.

Mr James White, LL.D., the chairman, said the trading account gave a profit of £30,651 more than that for 1936. Their balance on profit and loss account was £18,551 more, but they had to take into account the fact that they had increased the allocation to depreciation account from £20,000 to £25,000 and also had provided an estimated sum of £7,100 for N.D.C. and income tax, thereby setting aside to depreciation and taxation £12,100 more than in 1936. There was a very striking point which could not be gathered from the accounts. The profit years ago had practically all been made by dealing in Western Australian timbers. To-day about half came from that source, and the remainder was made up of profits earned by their subsidiary companies and by trading in all their branches in soft woods and other merchandise.

He had before him a statement showing the financial position of the parent company and its subsidiaries at December 31, 1937. The figures showed that their fixed assets amounted to £523,461, while their net floating assets amounted to £712,384, which was a very good index of the liquid position of the company. Taking those assets together and comparing them with the share capital there was a surplus of over £159,179.

The bulk of their fixed assets were in Australia. The thing that was troubling them there was the tendency for the cost of production to increase. During the period of depression the Western Australian Government had reduced the royalties which the company had to pay on timber and railway and wharfage rates. The Government now proposed gradually to reinstate the old rate. If their costs exceeded an economic price at which Jarrah and Karri could be sold engineers and architects throughout the world would be forced against their will to buy other timbers, and if this results in decreasing the production of Jarrah and Karri, then the Government will lose revenue and may be faced with unemployment.

The report and accounts were unanimously adopted, and a dividend of 10 per cent. on the ordinary shares was approved.

SELECTION TRUST LIMITED

DIVIDEND AND BONUS MAINTAINED

OPTIONS IN ORANGE FREE STATE

The fifth ordinary general meeting of Selection Trust, Limited, was held, on the 16th instant, at 20 Aldermanbury, London.

Mr A. Chester Beatty (the chairman) said that the net profit for the fifteen months to March, 1938, was £364,000, compared with £434,000 in the year 1936. Income from dividends and interest was substantially higher, but profit on realisation of investments, after writing off certain sums, was much lower. A dividend of 1s. per share and a bonus of 6d. per share—the same as for 1936—were recommended. Investments stood in the books at £3,188,444. The greater part were quoted, and the current market valuation was in excess of the book figure.

The chairman dealt with the progress of the American Metal Company, Roan Antelope, Rhodesian Selection Trust, Mufulira Copper Mines and the diamond business of Consolidated African Selection Trust, in all of which they were interested. Trepcu Mines, in which they were also interested was considering proposals to merge with its associated companies in Yugoslavia—Kopaonik Mines, Novo Brdo Mines and Zletovo Mines by an exchange of shares and the raising of further capital for smelters.

EXPLORATION BUSINESS

On the exploration side of their business they had continued actively to search for new mines. The tendency at the present time was for further activities to be directed more particularly to territories in the British Empire. They had participated to a limited extent in the more recent gold mining prospecting and development in South Africa, and in association with the Union Corporation they had lately taken an interest in prospecting activity in the areas known as the Far South West Rand and in the Orange Free State. During the past few years a considerable amount of drilling had been done in these districts, and up to the present, while the results had been mainly discouraging, a few holes had encountered reefs which contained gold values.

Recently Western Holdings, Limited, reported that a drill hole put down by them on the St. Helena Farm in the Odendaalsrust district of the Orange Free State had encountered gold-bearing reefs, and the Selection Trust had consequently thought it worth while to acquire some options over mineral rights in the district. About the same time Union Corporation concluded an arrangement with Western Holdings relating to options over mineral rights which that company held in the district. Union Corporation and Selection Trust thereupon ceded to each other a 50 per cent. participation in their respective interests. He would like to make it clear that these steps had been taken in the normal course of the company's exploration activities. Their action should not be construed to imply anything more than that, in their view, a speculative mining possibility might exist. He wished to impress upon shareholders most strongly that when they heard of the company's participating in mining ventures they must not, solely on that account, take a too optimistic view.

BASE METALS

During 1937 prices of the base metals in which they were interested reached high levels, and a severe reaction was now being experienced. It was satisfactory that a spirit of friendly co-operation was being maintained between the principal producers of copper in efforts to keep a balance between supply and demand. The position in the lead and zinc business was not so satisfactory, and producers might well study once again the possibilities of active co-operation. The diamond business was also experiencing a setback, but here again the principal parties were working together to ensure market stability.

In regard to the general situation of the markets for the commodities in which they were interested, the trade position in the United States had probably been a major factor in the fall in world consumption of copper, lead, zinc and also diamonds. Outside that country the demand for base metals had been relatively well maintained, although no doubt the falling off in industrial requirements had been partially masked by armament needs. It could only be hoped that before long wise counsels would bring a friendly solution of the political issues in the United States and a return to confidence. Under such conditions he felt sure they could expect to see a strong industrial recovery.

The major businesses in which they were interested were in strong financial positions and ranked among low cost producers so that they could face with confidence any continuance of trade recession or take full advantage of any improvement. There was every reason for confidence in their enterprise.

The report was adopted.

GENERAL MINING AND FINANCE CORPORATION LIMITED

IMPORTANCE OF INVESTMENT REVENUE

STRONG RESERVE POSITION

SIR GEORGE W. ALBU'S SPEECH

The annual general meeting of the General Mining and Finance Corporation, Limited, was held in Johannesburg on June 7th.

Sir George W. Albu, Bart. (the chairman), before dealing with the affairs of the corporation for the past year, referred to the severe loss the corporation had sustained by the death of Mr Leopold Albu, for many years its able and distinguished managing director in London. He recalled the prominent part that the joint founders of the corporation, the brothers G. and L. Albu, had played in the initiation and development of the Rand, and, in considering the eminent position the corporation now occupied, paid tribute to them for the lifelong service they had rendered in the wise guidance of its fortunes.

In dealing with the report and accounts for 1937, Sir George said that the period under review had been one of difficulty and uncertainty with a decidedly downward trend in the market value of investments, but that the revenue-earning capacity of the corporation had not been appreciably affected thereby. The fact that the proportion of revenue from investments was steadily rising indicated that that was the main source from which their dividends were paid. The net profit at £527,599 was therefore within £14,000 of the record profit for the previous year. Two dividends totalling 25 per cent. for the year had been paid, while £200,000 had been placed to general reserve and £132,149 was carried forward. The general reserve now stood at £800,000 and, together with the amount carried forward, represented about 74 per cent. of the issued capital of the corporation.

STRONG INVESTMENT POSITION

The Chairman stated that investments in stocks and shares, British, South African and other Government and municipal securities, including participations, appeared in the balance sheet at £2,630,048, an increase of £735,322 during the twelve months. This increase was in the main invested in sound dividend-paying gold-mining shares, with a leavening of other interests at present in the course of development. He again directed shareholders' attention to the fact that the whole of the stocks and shares stood in the balance sheet at or under the market prices ruling at the end of the financial year. Consequently, he was pleased again to inform them that on the basis of present market quotations, the surplus over the figure at which they stood in the balance sheet was very substantial.

Sir George then proceeded to deal briefly with the corporation's principal interests, namely, Van Ryn Gold Mines Estate, Limited, West Rand Consolidated Mines, Limited, East Rand Proprietary Mines, Limited, Durban Roodepoort Deep, Limited, Phoenix Oil and Transport Company, Limited, and Metal Traders, Limited.

WEST RAND'S PROGRESS

The ore reserve of the West Rand Consolidated Mine, as re-calculated at December 31, 1937, showed a fully developed tonnage of 10,630,000 tons, with an average value of 4.4 dwts. over 44 ins., this being an increase over the preceding years of 224,000 tons, the value and stoping width remaining the same. Good progress had been made with the sinking of the South Sub-Incline shaft to develop the area below the plane of the 36th level. Since the year end a start had been made with the sinking of the Deep Vertical shaft, and good progress had also been made with the extension to the South Reduction Plant, which would bring the crushing capacity of the mine to an ultimate figure of 220,000 tons per month. Provided there were no undue delays in the delivery of machinery, this plant should be completed in accordance with their estimates early in 1939.

BURDEN OF TAXATION

The burden borne by the industry, both in direct and indirect taxation, continued to be far too heavy. Some relief in this respect should be brought about by the Government either by a reduction in the profits tax or in the excessive railway rates on materials. Sir George suggested that serious consideration should be given to this, especially in view of the fact that a very large amount of additional capital would be required for opening up the vast new areas now included in those fields. This capital would not be forthcoming unless there was sufficient attraction for it, and that could only be the case if the new ventures were not, as at present, overburdened by unnecessary taxation.

WM. CORY AND SON, LIMITED

INCREASED NET PROFIT

Sir Arthur C. Cory-Wright, Bart. (chairman of the company), presided, on June 16th, at the 42nd annual ordinary general meeting of Wm. Cory & Son, Limited.

The Chairman said that since the last general meeting Mr F. A. Leathers and Mr D. Cory-Wright had been appointed to the board.

Net profits for the year ended March 31st amounted to £777,338, an increase of £48,000 as compared with the previous year. After paying a dividend of 20 per cent. for the year on the ordinary stock, a balance of £975,758 remained to be carried forward to the credit of next year's account.

The present financial position of the company, as shown in the accounts, revealed a strength unprecedented in the company's history. The earnings of the subsidiary companies, many of which were mainly concerned with trading abroad, had on the whole proved satisfactory.

Successful trading during the year had, however, been difficult. The activity in coal and shipping which prevailed at the opening of the year covered by the accounts did not continue. Before the end of 1937, instead of demand being in excess of supply the reverse position developed.

The company enjoyed a good share of export trade during the year under review, but the country's export of coal fell seriously, and still continued to lose ground, the main reason being that we were unable to compete in price with other countries in which the cost of production was less or subsidy facility in one form or another was given. It was vital to this country to regain and expand its export of coal, and to meet subsidy with subsidy, whether provided from within the industry or otherwise.

The Government had granted added safeguards to coal consumers by widening the scope of Committees of Investigation, and had appointed a Departmental Committee to inquire into the costs of coal distribution. The distributors welcomed this inquiry and would render the Committee every help in its work.

The company's oil section had had a record year. Following the big rise in tanker freights in 1937 world prices for marine fuel oils advanced, but the recent falling back of tanker freights to something nearer the old levels had already produced an easing in oil prices on most routes.

GENERAL CEYLON RUBBER AND TEA ESTATES, LIMITED

DIVIDEND OF 4 PER CENT.

The forty-first ordinary general meeting of the General Ceylon Rubber and Tea Estates, Limited, was held, on the 16th instant, at 4 Lloyd's Avenue, London.

Mr D. E. Sinclair (the chairman), who presided, said that the balance at profit and loss account was £28,838, against £16,854 for the previous season. It was proposed to transfer £10,000 to reserve for income tax and N.D.C., £5,000 to reserve account, bringing that account up to £80,000, and to pay a final dividend of 2 per cent., less income tax, on the ordinary shares, making with the interim dividend 4 per cent. for the year.

The tea crop was some 325,000 lbs. lower than in 1936, due to the workings of the Tea Regulation Enactment, but they secured 2d. per lb. more in price. Against that, the f.o.b. cost rose about 3d. per lb., so that the profit on tea was a little over 1d. per lb. higher.

The directors had been pursuing a very careful supply policy on their tea areas, so that if at the end of the present regulation period, namely March 31, 1943, all restriction be removed the company would have a tea area capable of producing a full crop at a reasonable cost, thus anticipating the fall in price which, in his opinion, would inevitably follow the removal of restriction.

The company exported 1,323,792 lbs. of rubber, which was sold at an average price of 8.74d. per lb. gross. The total crop of some 1,326,821 lbs. cost 5.04d. per lb. f.o.b., and secured a net average of 7.87d. per lb., against 1,005,000 lbs., which cost 5.01d. per lb. and realised a net average of 7.51d. per lb. in the previous year.

Although cardamoms was a minor product, the return was satisfactory.

The International Committee had cut the exportable quota of rubber for the third quarter of this year to 45 per cent. The effect of that had been that the price had steadied and the danger of a further fall probably removed. He was not going to venture to forecast the trend of the market. Everything depended on American consumption, which, he was glad to say, had considerably improved in May compared with that for April.

The report and accounts were unanimously adopted.

EAST RAND CONSOLIDATED, LIMITED

IMPORTANT HOLDINGS

The ordinary general meeting of East Rand Consolidated, Limited, was held, on the 14th instant, at River Plate House, London, Captain H. B. Jameson (the chairman of the company) presiding.

The Chairman, in the course of his speech, said that the investments had increased by £247,264 to £790,281, accounted for mainly by the interest taken in the West Vlakfontein Gold Mining Company. The profit and loss account showed a loss of £6,370, which, deducted from the balance of £14,112 brought in, left £7,742 to the credit of profit and loss account.

The development work on Poortje for the year amounted to 20,194 ft. Of the 16,745 ft. sampled, 1,015 ft. were payable, averaging 21.9 dwt. over 8 in. The company's consulting engineer had a borehole put down on the northern part of the property, which

cut the reef at a depth of approximately 1,500 ft., giving satisfactory values, and he advised the sinking of a shaft close to the site of the borehole. Since the close of the year the outlook of the Spaarwater Gold Mining Company's property had definitely improved, the most important achievement having been the connection with the 21st drive from Sub Nigel, which was made during March.

On the West Spaarwater property, at the end of March, the shaft was down 3,600 ft. The Kimberley shales were entered at a depth of 3,361 ft. From indications it was considered that under normal conditions the reef would be reached at a little over 4,000 ft.

With regard to West Vlakfontein Gold Mining Company, the No. 1 shaft had reached a depth of 777 ft. Summarising the position, he said they had important holdings in companies which, although still in the development stage, were making good progress and giving promise of a successful future.

The report and accounts were unanimously adopted.

THE COMMODITY MARKETS

As a result of persistent but unconfirmed rumours of an impending devaluation of the dollar, the upward movement of the prices of primary products was accelerated during the past week, both in this country and in the United States. Nevertheless, there are still no indications of a re-stocking movement by consumers which alone would sustain the upward trend.

Wheat prices rose during the week ended Wednesday, partly on renewed Italian buying and an official forecast of the crop in the United States which was smaller than expected. Prices of tin and rubber advanced, following the recent cuts in quotas, and linseed, cotton and raw sugar were also dearer than a week ago. Copper and spelter prices, on the other hand, were marked down.

The rise of prices in the United States is reflected in Moody's index of staple commodities; the index advanced from 131.8 (December 31, 1937 = 100) to 135.3 during the week ended last Wednesday, compared with 137.7 a month ago and 199.3 a year ago.

Metals

Copper.—After opening fairly firm copper prices reacted on unsatisfactory industrial reports from the United States and the slowness of consumers' buying. The standard cash price closed at £33 18s. 9d. per ton, a net loss of 10s. on the week. The market has now entered its quietest season of the year and no major change in its trend is to be expected during the next few weeks. According to a report of the Bank of London and South America, the Chilean Government has introduced a subsidy for low-grade copper mines in order to secure the continuation of their operation for social reasons. As the three large Chilean producers (which control 90 per cent. of the country's output) are members of the restriction scheme, this subsidy will hardly interfere with the interests of the world market.

*

Tin.—The tin market was very quiet and sentiment unsatisfactory owing to the absence of United States buying orders. Consequently the gains made early this week were not maintained and the cash price closed unchanged at £171 5s. per ton. On Monday next the I.T.C. will meet to take

its decision on the buffer pool scheme and to fix the buffer pool quota for the next quarter. It is expected that the pool scheme will come into operation on July 1st.

*

Lead and Spelter.—Lead closed the week unchanged at £13 6s. 3d. per ton, while spelter declined on balance by 1s. 3d. to £12 6s. 3d. per ton, there being very little demand for the two metals. Consumption of the two metals is still running well below current production and as there is little evidence of declining production, the position of the two markets must become serious in the autumn unless the industrial outlook improves.

Grains

The United States official estimate of 761 million bushels for the coming crop of winter wheat was considerably less than the various private estimates, and this, combined with renewed buying on Italian account, helped to raise prices; No. 2 Northern Manitoba showed a rise on the week from 43s. 9d. to 45s. 3d. per 480 lb. The volume of trade in maize has been smaller, but higher prices for wheat have helped to keep the market steady. The market for barley has been quiet; buyers are holding off, pending the arrival of the new Northern Hemisphere crops.

Other Foods

Provisions.—A good demand for beef and veal during the week led to a small rise in prices, but otherwise the market both for meat and bacon has been dull. Dominion butter prices were reduced during the week, New Zealand being quoted at 118s. per cwt., while Danish at 122s. per cwt., was only slightly cheaper. Cheese prices also showed a fall, while a good demand for English eggs led to a rise of about 9d. per 120.

*

Fruit.—The Fruitgrower reports a temporary shortage of apples and pears, with consequent higher prices. The small supplies of English strawberries sell freely at 1s. to 1s. 6d. per lb. Spanish oranges are now over, but there are good supplies from California and Brazil.

*

Vegetables.—The first arrivals of English new potatoes sold at 18s. to 23s. per cwt., but supplies are short and prices of Jersey and of old crop King Edwards rose during the week. Salads and tomatoes were selling better, owing to the warmer weather.

Colonial Produce.—Sugar prices were advanced by 1½d. per cwt. at the end of last week, and cubes are now quoted at 23s. 3d. per cwt. Coffee prices fell and were lower on the week, particularly Costa Rica; at the tea auctions the last lots of the 1937 Northern India crop were sold at unchanged prices.

*

Milk.—The table given here is compiled from statistics issued by the

	May, 1937	Mar., 1938	Apr., 1938	May, 1938
Prices (per gall.)	d. 12	d. 17	d. 16	d. 13
Liquid	5.532	7.224	6.563	6.615
Av. manufacturing..	9.29	13.75	12.46	10.07
Contract sales (mill. galls.)				
Liquid	49.7	52.63	50.9	53.8
Manufacturing	39.4	21.59	30.9	36.3
Total contract	89.1	74.22	81.8	90.1
Used by farmhouse cheesemakers	2.9	0.88	1.6	3.4

Milk Marketing Board. Sales of milk for liquid consumption increased by 3 million gallons in May compared with April and by 4 million gallons compared with May in last year. Wholesale prices for both liquid and manufacturing milk were higher than in May, 1937, and the average pool price showed an increase of 0.78d. per gallon.

Miscellaneous Commodities

Oilseeds and Oils.—The latest forecast of the Argentine exports, at 645,000 tons, compare favourably with the 539,000 tons exported last year; the Indian crop, which is now arriving, is also expected to be somewhat larger than the previous one. Markets have been quiet, with little business transacted. There has been more inquiry for Egyptian cottonseed and prices are higher on the week, as are those of cotton oil.

*

Rubber.—Price movements, while somewhat irregular, have tended upward and the spot price of standard sheet, at 5½d. per lb., shows an advance of ½d. on the week. While demand is not extensive, sellers are inclined to hold off, pending the rise in prices which the cut in production quotas is expected to cause.

*

Furs.—Since the close of the London auctions, sales have been very small and prices easy. It is announced that Messrs Eastwood and Holt have taken over the London Fur Sales, Ltd., thus continuing the trend towards concentration in the fur trade.

Broadcasting

A leading article on page 641 discusses the social and political significance of British broadcasting. The following charts will serve as some indication of the magnitude and chief characteristics of the British Broadcasting Corporation's activities. They show the increase in the revenue derived from British licence holders in recent years; compare the number of licences per head in various countries in 1936, and the total number of licence holders in Germany and the United Kingdom annually since 1927; and indicate the interesting changes which have taken place in the British Broadcasting Corporation's distribution of programme time (exclusive of duplicated programmes by relay and the Empire and television programmes). (We are indebted to the B.B.C. for the figures used.)

Limited Investment Fund.—Distribution of 4.20d. per unit, tax free, for the half-year ended June 2, 1938. This is at rate of £4 16s. 6d. gross per cent. per annum on initial price of £1, compared with £4 17s. 9d. A progress report issued by the managers states that the slight decline is due to changes from higher to lower yielding securities.

Virol, Ltd.—Gross trading profit for year to March 31, 1938, £144,612. Available amount, £53,212 compared with £51,342. Preference dividends absorbed £8,750. Ordinary dividend 10 per cent. Carry forward £36,962 as compared with £35,092. Government securities, at cost, stand at £55,725, other investments, at cost, £90,790, and cash at £41,960.

Ribble Motor Services.—Profit of £142,115 for year to March 31, 1938, against £150,315. After £194,000 (against £191,000) to depreciation reserve. Ordinary dividend 10 per cent. as before. £40,000 to general reserve, as before. Carry forward raised from £31,477 to £40,592. It is proposed to distribute one new fully-paid ordinary share for every two held.

MONTHLY TRADE SUPPLEMENT

The Cabinet and Spain

TOWARDS the end of last week the Italian Government let it be known that they are now extremely anxious for an early ratification of the Anglo-Italian agreement. There is, of course, no unfulfilled condition on the British side. Ratification now waits upon a "substantial" withdrawal of foreign volunteers from Spain; for it has been repeatedly made clear that this is what was envisaged by Mr Chamberlain when he made ratification dependent on "settlement" of the Spanish problem.

This British condition was laid down at the beginning of the conversations, and is of the essence of the agreement in which these conversations resulted. Its fulfilment depends upon Italian, and not upon British action. Is Signor Mussolini now approaching a point at which he will be willing to withdraw from Spain *bona fide* without further procrastination? Or is he hoping, by a plea *ad misericordiam*, to induce Mr Chamberlain to forgo the most important Italian concession which the agreement provides; to persuade him to recognise Italian sovereignty over Abyssinia; and perhaps also to provide British Government guaranteed credits for urgent Italian wheat purchases—while Italians are still fighting in Spain for a Franco victory?

The Italian contention seems to be that Italy asked for, and obtained, the Anglo-Italian agreement in the belief

that the Italian breaches of the non-intervention agreement up to date had by then already ensured General Franco's victory within the next few weeks and that this expectation was shared by Great Britain. This reasonable expectation, say the Italians, has now been disappointed because the French have been cheating since then, to the extent required to neutralise the effect of Italian cheating during the previous chapter of the story. It was understood, they say in effect, between Signor Mussolini and Mr Chamberlain that a victory in Spain for Franco was part of the price to be paid for whatever advantages Mr Chamberlain believed himself to be purchasing.

The Italian move raises two questions: Did Mr Chamberlain give Italy any reason to think that a victory for Franco was, at least morally, part of the Anglo-Italian understanding? And is Signor Mussolini still determined to stake his own fortunes on making Franco win, even at the cost of jeopardising the ratification of the Anglo-Italian agreement and of aggravating the seriousness of an Italian economic and financial crisis which has been rendered unexpectedly acute by the calamitous failure of the Italian harvest?

The answer to the first of these two questions we take to be in the negative. Mr Chamberlain may have agreed with Signor Mussolini in expecting Franco to win soon;

he may have thought in his heart that it would be a convenience to himself and his Party if this probability were to become a fact. But he is not pledged, either explicitly or implicitly, to allow Signor Mussolini to win a victory for Franco before Italy implements her undertaking to withdraw from Spain bag and baggage. The essential feature of British policy in Spain to which Mr Chamberlain is committed by every consideration of British interest is that the territorial integrity and independence of Spain must be preserved. It is also of vital importance that the internal regime of an independent State must not be dictated by external force, or the strategic and political balance of power radically disturbed to the detriment of France. Neither Mr Chamberlain nor any other British Premier would willingly abandon any of these requirements; and he is, therefore, bound by every dictate of interest and humanity to make full use of any diplomatic opportunity for ending the war in Spain which may be offered by Signor Mussolini's present straits. But the Prime Minister's opportunity is the nation's anxiety. The nation does not feel sure whether his diplomacy will be as firm as the occasion demands. These doubts are increased by the Prime Minister's admission of his inability to find any way of protecting British ships engaged in Spanish waters in perfectly legitimate trade.

All, however, will heartily welcome the Prime Minister's declaration, in the same debate, that "the one satisfactory solution of the Spanish question would be a termination of the war," and that His Majesty's Government mean to do all that they can to this end. Though wishes may be deceptive, we may nevertheless feel that the prospects are for the first time not completely black. On the very Tuesday on which the Spanish situation was debated in the Commons the Non-intervention Committee at length adopted unanimously the British plan for an agreed and proportionate withdrawal of foreign troops from Spain which, in its original form, was submitted eleven months ago. The execution of this plan may be either misused as just another move in the Spanish war-game, or alternatively it may be turned to account for bringing the war to an end in which there will be no victors and no vanquished. This is a settlement which Signor Mussolini can accept without loss of face. He will not be asked to leave the whole of Spain in the hands of a "Red" Government under Russian influence. This bogey, which was never a reality, is, anyway, quite outside the picture now. All that will be required of him will be to forego his insistence on conferring a totalitarian victory in Spain on the extremists of the "anti-Red" ideology.

If once all the foreign Powers can agree upon allowing the war in Spain to end in a draw, then the British plan can be made to yield this result. The counting of the foreign combatants on either side can hardly be attempted

without an armistice; an armistice can be made the occasion for a demobilisation of Spanish, as well as for a withdrawal of foreign, troops; for when once the fighting has been suspended it will not be easy to start it again.

To throw his whole energy now into working for a prompt and militarily inconclusive peace in Spain is Mr Chamberlain's manifest duty—his duty to Spain herself, his duty to the world, and, last but not least, his duty to his own country. The Prime Minister has declared that stopping the war is the only certain way of stopping the illegal and atrocious bombing of Spanish civilians and of British merchant ships and seamen on their lawful occasions in Spanish territorial waters. Again, stopping the war at this stage and in this way seems to offer the only hope of domestic peace for Spain; for the sinister consequences of a knock-out blow, from which we are suffering in Europe to-day, would assuredly make themselves felt in Spain *à fortiori*, because of the passionateness and intransigence of the Spanish temperament. It is hard to imagine any Spanish victor voluntarily making life tolerable for his defeated Spanish opponents; and it is therefore hard to imagine any victory in the Spanish war proving durable. Salvation for Spain lies not in a knock-out blow but in the re-establishment of a pacific balance of power between the now warring forces of Spanish life; and this domestic balance of power in Spain is a necessary condition for an international balance of power in Europe. If Mr Chamberlain were to aid and abet Signor Mussolini in winning that totalitarian Spanish victory which the Italian dictator desires, we should then have been carried a long stage nearer to the general European war which is desired neither by Mr Chamberlain nor, we believe, by Signor Mussolini.

Finally, we may point out to the Prime Minister that, if he can achieve an agreed peace in Spain, it will offer him his best chance of healing the present serious moral rift in Great Britain for which Mr Chamberlain himself bears so heavy a responsibility. "If our voice is to carry conviction abroad," said Lord Halifax in a notable speech at the annual dinner of the Royal Institute of International Affairs on Tuesday night, "it must be the voice of a united nation." At the moment when the Foreign Secretary was speaking, "sharp words" were being used (to quote him further) "in the thrust and parry of debate" in another place; and the occasion of this parliamentary war of words was the war of bombs and shells in Spain. Mr Chamberlain's opportunity to-day is immense; but, by the same token, if this opportunity is frittered away he will have done himself, his Party, his country and the world an injury that may be irreparable. We earnestly hope that the Prime Minister will allow neither his own personal feelings nor his followers' ideological prejudices to warp his judgment and beguile him into the wrong choice.

Our Imperial Republicans

MR DE VALERA, seeking a fresh mandate from the electors of Eire on the morrow of the Anglo-Irish agreement, has triumphantly secured the independent majority that he demanded. This in itself is not surprising; for nothing succeeds like success, and Mr de Valera had achievement on his side—a smoothly accepted new constitution, a satisfactory budget, and, above all, a highly creditable end to a regrettable dispute with Great Britain. Nevertheless, the result of the elections arouses many speculations about the future of Irish politics, especially as they concern Anglo-Irish relations.

Ever since the Fianna Fail members took their seats in the Dail in 1927, the division between the two main parties in the State has been measured first and foremost

by the degree of their "anti-British" or "pro-Commonwealth" feelings, their republicanism or anti-republicanism. Now, after pressing through a constitution which deliberately evades the republican issue, Mr de Valera has sought the electors' endorsement of an agreement with Great Britain which implies, in every article dealing with defence and trade, that Ireland will remain a member of the Commonwealth. In the result, he has achieved what neither he nor any other statesman in the former Free State was previously able to achieve—a substantial and durable majority over all his opponents in the Dail.

Inevitably, the minds of many students of Imperial affairs will turn to the even more striking results of the recent South African elections, in which the Union Party,

formed by the fusion of General Hertzog's Nationalists and General Smuts's South African Party, retained an overwhelming majority on a straight platform of national unity based on Dominion status. Thus in the two countries of the Commonwealth with the strongest leanings towards republicanism the electors have apparently declared, with no uncertain voice, that they prefer the substance of national freedom to the shadow, and want a Government which will "get on with the job."

It would be impossible not to read this conclusion into the two results; but it is not by any means the whole story. In the first place, the analogy between Eire and the Union does not go very deep. Vital features of the South African electoral scene which are not present in Ireland include the existence of a coalition (with powerfully organised republican and loyalist parties to left and right of it), the racial and linguistic division, and the native question. If a parallel must be drawn, we ought surely to look rather to the early days of the Union of South Africa. In the election of 1910, General Botha could appeal to his own people, as Mr de Valera has appealed to his, on the strength of a pact with Great Britain (the Union Act) which compromised on some of the forms of nationalism in order to secure the reality. His main opposition came (as Mr de Valera's came last week) from the more "pro-British" groups, then organised in the Unionist Party. General Botha—with Generals Smuts and Hertzog in his Cabinet—gained a majority, though not without difficulty. Two years later, however, the kaleidoscope formed a new pattern. General Hertzog broke away and formed the Nationalist Party, and for twelve years the Botha-Smuts

Oth African Party held office. In 1924, General Hertzog became Prime Minister, first with the support of Labour and then with an independent Nationalist majority, which endured until the Coalition of 1933. During his periods of power, General Hertzog was content to accelerate the rapid process of constitutional change in the Commonwealth towards the position of the Dominions as free and equal States under the Crown. Now he himself stands on the programme of Dominion status in opposition to the "purified" Nationalists under Dr Malan.

From this history two main conclusions emerge: first, that there has been a rhythmic cycle in the position of republican nationalism as a political issue; secondly, that no nationalist leader, when actually in office, has seen fit to press his views to their extreme conclusion. The latter characteristic has so far been true of Ireland like-

wise, and the first may well prove to be. If it is, then the next episode to be expected would be, on the one hand, the hiving-off of a new republican party from Fianna Fail, perhaps in association with the Irish Republican Army; and possibly, on the other, a coalition between Mr de Valera and some of his former opponents in Fine Gael (Mr Cosgrave's party). It is reasonable to deduce from South African analogy that nationalism of the republican brand is far from extinguished in Eire.

For another reason it would be unwise to build too much on the apparent fact that the electors of Eire and the Union have put an end to quarrels over formal national status. If racial and nationalist issues were being permanently discarded by an electorate that had become impatient of them, one would expect new lines of political cleavage to be developing, probably on economic or social lines. Since the foundation both of the South African Union and the Irish Free State, the chief attempt to introduce such issues has been made by a Labour party. Labour would thus be the natural beneficiary of any strong reaction on the part of the electorate against the old, worn racial issues. Yet it is remarkable that in the last South African elections, while both the Nationalists and the Dominion party gained at the Government's expense, the Labour Party suffered a curtailment of its already tiny representation. And in Eire the Government's successes have been almost entirely at the expense of its former Labour allies.

Economic and social divisions, in fact, have narrowed rather than widened in the politics of both Dominions, where nationalism is still the dominant issue, but has changed its form. Practically everything in the way of legal independence has now been achieved that can possibly be secured without the final severance of the connection with the Crown and Commonwealth, and that severance is a step which the majority of electors in the two most republican of the Dominions are clearly anxious to avoid. If nationalism continues dominant, it must concentrate on the practical assertion of national independence in matters of foreign policy and defence. To-day, standing alone in external affairs may well seem unattractive to a thinking electorate. We may venture to hope, therefore, that Dominion nationalism will soon enter into a more constructive phase, and that the purely fissiparous variety may become eventually as unimportant as the provincialism of Connaught or the Cape is to-day in Irish or South African politics.

World Economic Trends

EXPANSION in world economic activity gained rapid momentum in the winter of 1936-37. Even in the spring of last year it was widely believed that the world was on the threshold of a period in which production and prosperity would everywhere be carried far beyond the pre-depression level of 1929. These forecasts, alas, have been belied; for the summer of 1937 proved to be a turning point in world production, trade and prices.

When we took stock of the general position in *The Economist* of July 31, 1937 (page 227), it was already clear that newly-found prosperity rested on precarious foundations. The growing pressure of the "expansionist" Powers—Germany, Italy and Japan—had undermined confidence in the world's political stability. Vested interests were stubbornly resisting any widespread removal of trade barriers. Recovery in the United States appeared to lack solidity; for it had largely failed to permeate to building and other capital industries. It is scarcely surprising, therefore, that world recovery came to an end before the world's resources of men and machinery had found full employ-

ment. But, as Mr Harold Butler has pointed out in his Report to the Fourteenth Session of the International Labour Conference: "The astonishing thing is not that the boom of the 'thirties should have been unspectacular and unacclaimed as compared with its predecessor of the 'twenties, but that it should have reached such considerable dimensions in spite of all the obstacles and suspicions it had to overcome."

The recent course of world production and trade is shown in the diagram at the foot of the next page, based on League of Nations indices. World industrial production (exclusive of the U.S.S.R.) rose almost as rapidly, it will be observed, between 1932 and 1937 as it had fallen between 1929 and 1932. Compared with the rapid expansion in industrial production, the recovery in world trade was relatively slow until 1936, when its pace showed a sudden increase. But while industrial production in 1937 rose above the pre-depression level of 1929, the volume of world trade barely regained it.

The sudden collapse of the boom in primary products

at the end of March, 1937, provided one of the first warnings of coming recession. Two months later the League's index of industrial production also took a downward turn. After a short interval (due to the time-lag between the placing of orders and their completion) the volume of international trade showed a sudden decline. Recession was established.

The collapse of the upward movement cannot be attributed to any single cause. The immediate cause of the sudden slump in the prices of primary products must be sought in the preceding boom, when fears of a shortage of supplies led to a scramble for materials at soaring prices, which in turn stimulated production. In the spring of last year it became evident that the fear of a shortage of supplies was unfounded. Hence, consumers suddenly ceased adding to their already heavy stocks. Collapse, therefore, followed boom, on textbook lines.

At the time it was widely held that the fall in the prices of primary products was likely to be temporary. But the accumulation of stocks was not confined to raw materials. The upward trend of the prices of primary products had provided a powerful stimulus to an increase in the output of manufactures. Stocks of semi-finished and finished goods were rapidly increased in industrial countries in anticipation of yet higher prices for raw materials. The re-stocking movement thus permeated to all stages of production and extended as far as the merchant. The downward trend of the prices of primary products set in motion the reverse sequence of events. Merchants became anxious to reduce their stocks of finished goods, and manufacturers found themselves loaded with large supplies of goods for which they could not find immediate buyers. Consequently, they were forced to curtail production.

The boom in primary products in the winter of 1936-37 undoubtedly precipitated the recession. But what appeared at first as a temporary corrective movement was aggravated by the precarious political situation in Europe, by the war between Japan and China, and by the radical change in the conditions under which private enterprise in the United States had to operate. The trend of production and foreign trade in important individual countries since the middle of 1936 is shown graphically in the accompanying diagrams. The indices of production are all based on 1929, in order to facilitate comparison. It should be remembered, however, that the method of construction and the sector of each country's activity covered by the indices are not identical.

As the production indices show, the extent of recovery before the onset of recession varied considerably from country to country. The indices for the United Kingdom, Germany, Japan and Sweden rose far above the pre-

WORLD PRODUCTION AND TRADE

depression level in the past year. Activity in the United States, on the other hand, took a downward turn before recovery from the depression had been complete. France and Belgium scarcely participated in the recovery of world economic activity between 1932 and 1937. The failure of recovery to make headway in France and in the United States is due largely to changes in the conditions under which private enterprise had to operate. Moreover, recovery in France and Belgium had been delayed by prolonged deflation.

The recession in production has so far been most marked in the United States, but Canada, whose economy is linked to that of her neighbour, also suffered a sharp setback after a short period of grace. Belgium and Holland were engulfed by recession before recovery had been able to make much headway. The official index for the United Kingdom also turned downwards early this year. The United Kingdom index, however, is a quarterly figure, unadjusted for seasonal variations. Our more comprehensive index of business activity turned downwards in October. Its subsequent decline has been even steeper than during the corresponding period in 1929-30. Industrial activity in Sweden, despite a downward trend, remains well above the level of 1929. In Germany and Italy, exceptionally, there is as yet no evidence of a decline in industrial production, the maintenance of a high level of activity being due to the intensification of re-armament.

In our diagrams on foreign trade tendencies we have chosen a number of representative industrial and raw material producing countries. Owing to marked seasonal variations, it is difficult, in all cases, to discern the precise turning point in recent months. Nevertheless, the diagrams clearly reveal that in the majority of countries the recent trend has been downwards. Equally interesting are the changes in the relation between the imports and exports of individual countries. As a result in the fall in the prices of primary products, the exports of raw material producing countries—Australia, India, Canada—have tended to fall faster than their imports. As foreign bondholders know to their cost, this phenomenon is usually associated with a downward turn in world economic activity. The recession in the United States has been accompanied by a substantial fall in imports, mainly of primary products, which accentuated the fall in their prices on the world markets. The fact that exports from that country have been surprisingly well maintained is due, in part, to her re-emergence as a large-scale exporter of cereals and to heavy purchases of American machinery by Great Britain and of armament materials by China and Japan.

The course of events during the past fortnight has encouraged a faint hope that the downward trend of world economic activity has been arrested, at least temporarily. The rumour of an impending devaluation of the dollar gave rise to a rally in the prices of primary products which has been sustained by the lull in political tension in Europe—especially by the belated adoption by the Non-Intervention Committee of the British plan for eliminating foreign intervention in Spain—and by the growing belief of an early revival of business in the United States. The rise in the prices of primary products, in turn, has already brought buyers of certain finished goods, whose prices vary closely with those of the raw materials they contain, on to the market. Thus, turnover in cotton yarn and piece-goods has shown an encouraging improvement this week. If the rally in prices is sustained—and this will depend largely on developments in the United States and on the political front in Europe—the buying movement may well spread, thus giving rise to an increase in activity. But the improvement still rests on precarious foundations, and there is not sufficient evidence to suggest that it portends a change in the long-term trend.

Town and Country Planning

THE limits of State interference with free private enterprise in general is still one of the most controversial of subjects in this country—in spite of the examples set by Messrs Hitler, Mussolini and Stalin. But in one sphere, at all events, there is little dispute that it is the business of the community to take a hand. We refer to Town Planning and the proper use of the land of Britain. Yet, in spite of the almost unanimous condemnation of the results of haphazard and chaotic development, extremely little has been done to ensure the wisest use of our limited territory, or to secure for the mass of the people the better environment and conditions of living that could be brought within their reach by the exercise of forethought and firm administration. Since the war a large part of the population has been rehoused in the millions of new houses that have been built, and these homes have been scattered far and wide over areas which have been opened up by the construction or remaking of thousands of miles of road. All this has followed no coherent plan, and there is a growing realisation of the opportunity that has been missed.

But it is not yet too late to make a fresh effort, for a steady shift of the population is still taking place. The fluid state of our economic structure, of our ways of living and of the occupations of the people, means that much building and rebuilding of townships and villages remains to be done. And, meanwhile, the Barlow Commission, set up to examine the distribution of Britain's industrial population and its causes, has been confronted with evidence which constitutes a powerful challenge to current trends.

The nature of the indictment is well known. Britain is an industrial country in which the process of urbanisation has run to excess. More than half the population of England and Wales lives in towns of more than 50,000 inhabitants. Over 15 million people live in the built-up or partially built-up areas in and around London, Glasgow, Birmingham, Liverpool, Manchester and Newcastle. Rural depopulation is proceeding steadily, and arable acreage has fallen continuously for more than 60 years. In the London Basin, roads, houses, factories, reservoirs, aerodromes and golf courses have almost entirely eaten up "a strip of alluvial market garden land as valuable as any garden land in the world." Our towns are the centres of an economy which has, admittedly, enabled us to increase the National Income nearly tenfold in little more than a hundred years. But many urban centres are so inconvenient to live in and so fabulously expensive to maintain that there is a strong case for checking their growth. The density of business, housing and traffic at cities' centres; their sprawling and remote suburbs; long, uncomfortable and costly journeys to and from work; the lack of fresh food, fresh vegetables, fresh air and sunlight; polluted air and water; high death rates and infantile mortality, bad teeth, poor physique, disordered digestions and shaken nerves: the price of urban civilisation, so stated, is indeed high. Materially, mounting expenditure on health and transport services, roads and houses makes the running of a great city the most expensive enterprise in the world.

The cost of excessive urban growth is thus equally great, whether expressed in terms of wealth, welfare or convenience. The London family spends over £16 per annum on involuntary travelling; the Birmingham family £8 17s. At peak hours on the Morden-Edgware tube there are 5,000 seats per half-hour for 13,000 travellers. The people housed at the city's centre live too many to a room, if they are in slum dwellings, and too many families to an acre, if they have been moved to slum clearance tenements. And the

new flats can only be let at reasonable rents because the State provides a high subsidy for rehousing on expensive sites.

Britain's large towns have suffered from overdevelopment; the countryside from neglect. Vulnerable in war because her great urban centres are obvious targets for bombs and sixty per cent. of her food supplies are drawn from overseas, Britain is also vulnerable in time of peace. In agricultural Britain the soil is deteriorating. The standard of grassland has fallen. Crop and animal diseases have increased. National nutrition is endangered.

On many counts, therefore, there are grave dangers involved in the continuance of present trends in land utilisation. More and more, already, the State has been compelled to step in, to abate nuisances and to adjust incompatible claims. Hitherto, town and country planning has for the most part been left to local authorities, while the national aspects of planning or control have been almost wholly ignored. The State has already assumed responsibility for the health and nutrition of the people, their safety on the roads, their physical fitness. It has been responsible for the disproportionate expansion of large towns, for without State subsidies urban growth would be financially impracticable. It is therefore clearly the State's responsibility to consider whether the trend of urbanisation cannot be now reversed. On the one hand, the growth of cities beyond a certain size entails social consequences and expenses which cannot be justified; and on the other the decimation of valuable agricultural land means the loss of essential perishable foods.

At bottom, the main obstacle is financial. If the building of houses and factories is effectively restricted in specified areas, if certain land is definitely reserved for agricultural uses, green belts, open spaces and recreational parks, and if the height and bulk of buildings are stringently controlled in congested areas, landowners will lose the values which might have accrued to them as the result of unregulated development. The cost of compensation is already the major deterrent to putting local planning schemes into effective operation; and the attempt under recent Planning Acts to establish a fund by imposing a betterment levy on land definitely improved in value by schemes has in practice been largely inoperative. Yet, in this direction, the solution to this urgent problem may surely be found.

The Town Planning Institute have proposed an advisory National Planning Commission to collect all the relevant facts about the use and development of land. The Garden Cities and Town Planning Association have recommended a National Planning Board to restrict new industries and businesses in overgrown towns and agricultural areas, and to schedule specified places, such as Special Areas, small towns, garden cities and trading estates, for planned industrial and residential development. Further, the Association suggest the provision centrally of funds to enable large local authorities and approved private bodies to acquire and develop these sites, and they recommend the adjustment of the present system of housing subsidies to favour the development of these chosen areas. The existing subsidy for rehousing on expensive sites in central urban areas, they suggest, should be diverted for this purpose. The transference of undertakings and their personnel from congested districts to new sites could, *inter alia*, be financed in this way. In other words, the power of the purse is to be used to see that subsequent developments shall follow predetermined lines. Considerations of welfare and economic advantage alike require that these proposals should receive the most careful and sympathetic examination.

Topics of the Week

"On Their Lawful Occasions."—The Prime Minister is staking a large sum, in the currency of Britain's prestige and his own political reputation, on a very speculative policy. This was made plain during Tuesday's debate in the Commons, when he had the unpleasant task of explaining why the Government would do nothing to protect British shipping in Spanish waters. Many of the growing list of outrages, if committed by belligerents at war, would be breaches of international law; if the perpetrators are not "at war," they are piracy or arson, which must brand the guilty parties as the King's enemies. It is, therefore, not surprising that Mr Chamberlain, who repeated once again that strong action would involve a risk of war, left his supporters in a very uneasy frame of mind. Mr Noel Baker, who opened the debate on behalf of the Labour Party, impressed the House with his well-documented case. As General Franco had no belligerent rights, and as our ships, engaged upon their lawful occasions, had been, by the Government's own admission, deliberately attacked, why did not the Government either put pressure upon Italy direct, or allow the Spanish Government to buy munitions from Britain and defend British ships and lives for us? There were open to us a number of possible courses of action—naval, political and economic.

With much of Mr Baker's statement of the issues involved the Premier agreed. But he proposed no action.

It is not a nice thing to hear of British ships being attacked in port. . . . We do not admit the right of General Franco or anybody else to attack these ships. What we say is that we do not believe any practical means of preventing it, without adopting a policy which would be completely at variance with that which we believe to be in the true interests of this country, has been found.

The only hope, in his opinion, was to seek to end the war.

All we can say is that we shall, from time to time, try to take soundings with a view to seeing whether there are any favourable prospects of success and that, when that time comes, we shall be only too glad to offer our services, either alone or in conjunction with others, to bring this lamentable conflict to an end.

With this aspiration, the prospects of which we discuss elsewhere, all will agree. But that meanwhile the Government should announce their impotence to safeguard British lives and shipping sent a chill through the House. Sir Archibald Sinclair, who followed, pointed out the danger of Italy's attempt to separate England and France. Why is it that when Germany and Italy intervene in Spain there is no risk of war; but when Britain takes steps to defend her nationals we run the risk of war? Mr Duncan Sandys alone among Conservatives joined the opposition speakers in expressing the sense of frustration which was felt throughout the House; while Mr Lloyd George declared that in all the years he had been in the House, the speech of the Prime Minister was without precedent. The only relevant comment on the debate has been made by the "actionists" in Spain, who, within twenty-four hours, proceeded to sink two more British ships and damage a third. There must surely be limits even to the patience of Mr Chamberlain.

Parliament and National Defence.—During the last few days time has been found in Parliament to discuss such civilian matters as roads and transport, and to examine, sometimes with no little heat, some of the Government's financial proposals for the current year. Even so, considerations of war-time policy have intruded widely upon all these discussions—except, happily, the Education debate. Last week's discussion of the Essential Commodities (Reserves) Bill revealed something of the

complexities of transport and storage involved in laying up supplies of food against the event of hostilities. Mr Burgin, in the debate on the Transport Vote, alluded to the probable need to divert shipping in time of war from East Coast ports to the West; and it is believed that plans have been fully prepared to meet this contingency. Despite the importance of Bristol, Cardiff and Liverpool, the present active equipment of western harbours could scarcely cope with the diversion of any large volume of imports; and the task of distributing increased supplies by land from the ports to the centres of population would entail considerable difficulties. Accordingly, a survey is being made of the berthing, docking and transport facilities of every western harbour likely to be of any use in time of need.

Finance on Wednesday last, no less than transport on the preceding Friday, was overshadowed by war-time preoccupations. Vigorous discussions of the Government's fiscal policy with regard to oil and petrol and power alcohol returned frequently to the need for secure supplies in time of war. The Labour Party were not happy about the Government's increase in the preferential duty upon home-produced oils. Following the lines of their official report on oil from coal, published on Monday, they wished to create a fully fledged oil-from-coal industry at an initial cost of £17½ millions. In general, however, the House accepted the Falmouth Committee's view that at present the production of oil from coal could not be justified on commercial grounds, and welcomed the increase in the preference as a guarantee against unforeseen improvements in the processes of oil distillation—though the oil duty which hits domestic transport is not perhaps the best way to subsidise the native oil industry. Britain must mainly depend in war as in peace upon seaborne supplies. The accumulation of reserves is urgent, but in the future, no less than in the past, Britain's security must rest upon her command of the seas.

Motor Cars and Import Duties.—On Wednesday Mr Oliver Stanley moved a resolution in the Commons to transfer the McKenna duties on motor cars, musical instruments, clocks, films and other articles

to the general tariff system instituted in 1932. The President of the Board of Trade fastidiously refrained from referring to this year's heavy importation of low-priced German cars which, by the indignation it aroused among British manufacturers, was the *fons et origo* of Mr Stanley's proposal. In the first four months of this year, imported German cars, to the number of 3,183, amounted to 55 per cent. of all imported cars. Three times as many were imported during these months as in the same period of 1937; and nearly 40 times as many as in the first third of 1936. The cars imported from Germany, mainly made by the Opel Company, are said to be in receipt of what is in effect an export subsidy amounting to some 43 per cent. of their value. Mr Stanley's resolution will authorise motor car manufacturers in this country to approach the Import Duties Advisory Committee with a request that the existing *ad valorem* duty of 33½ per cent. on imported foreign cars should be increased to cope with this subsidised competition. Dumping based on internal levies, in various forms, is an expedient frequently practised but seldom defended. Against it British manufacturers may feel that they have a claim to protection. But any tariff change based on present costs of production in Great Britain should take due heed of the fact that these are swollen by uneconomic factors like the excessive multiplication of models, particularly in the medium horse-power ranges. As the Liberal Opposition emphasised on Wednesday, the procedure of appeal to the Import Duties Advisory Committee gives considerable powers of initiative to industrial interests and little power of control and criticism to Parliament. The British car industry has been heavily protected for 22 years, but by world standards it has not become as efficient as consumers are entitled to expect.

* * *

The American Scene.—On Thursday of last week the 75th Congress of the United States was adjourned; and unless something untoward in the field of foreign affairs or railroad finance decrees the contrary, it should now have finished its labours. The 76th Congress will convene as a result of the Elections next November. The departure of all the 435 Representatives of the Lower House, and of one-third of the Senate (32 Senators), for the electoral arena comes at a time when, as we have already seen in Florida, the progress of the present economic depression is tending to enhance the President's control over both the Democrats and the electoral atmosphere. The knowledge that about another \$4,500 millions is now at the Government's disposal for expenditure in all the States will tend to act like the crack of a whip over the heads of recalcitrant Representatives in the Democrat herd; and the Republicans will have an even more difficult task. Those dissident Democrats who within the last twelve months have tended to break away from the Party line are now facing electoral contests when economic depression is hitting their constituencies and the President is sitting on the "pork barrel." The record of this expiring Congress is not mean; after a dispute with Southern rebel Democrats, the Wages and Hours Bill has gone through; the modification of the Undistributed Profits and Capital Gains Taxes have not been such as to constitute, in present circumstances, anything like a defeat, let alone a retreat, of the Administration; and the Republican and Business element is still bereft of programme and leadership. All this bids fair for the Democrats in November.

* * *

American public opinion has in the meantime been gravely stirred by the bombings in the Far East and in Spain; by the (to the Americans, as well as many British citizens) inexplicable acquiescence of the British Cabinet; and by the uncovering of an allegedly German spy-ring in the States, working with German agents on steamships and in Scotland. On this latter development, enough has already been published in America to indicate that, when the case gets into the Law Courts, sensational will prove a mild epithet. A Federal Grand Jury presented an

indictment of 18 Germans and German-Americans on Monday; and high officials in Germany are indicted for conspiracy *in absentia*. The Anglo-American conversations in Washington for the trade agreement are still dragging their slow length along; but there are signs that success is nearer than was thought possible a few weeks ago. Over America still hangs the cloud of economic depression; and this is not likely to lift appreciably before the autumn, if then.

* * *

Jew-baiting in Germany.—A fresh "drive" against the Jews was launched by the Nazis last week, and is still continuing. Gangs of Aryan apaches have been let loose against Jewish shops and private houses. Some thousands of Jews have been arrested by the police—for no other crime, it would seem, than that of having been the victims of these calculated Aryan disorders. And "This is a Jewish shop" has been painted on the plate-glass windows of shops in Jewish ownership. One semi-official German explanation of this fresh outbreak of anti-Semitism is that the Jews from Vienna have been seeking asylum in Berlin, and that the Aryan Berliners have spontaneously expressed their indignation at finding their city used as a Jewish city of refuge. It is true that, hitherto, life has been less intolerable for German Jews in Berlin than in the smaller cities of the Reich. But this explanation is somewhat discredited by the fact that the present outbreak has by no means been confined to the capital, though the outrages in Berlin may, this time, have been on a greater scale than those elsewhere. Another explanation is that the present outbreak in the Reich is designed to exert pressure on the international conference which, at President Roosevelt's suggestion, is meeting at Evian early next month in order to consider ways and means of helping Jewish refugees from Austria. At present, many States demur to receiving Jewish ex-citizens of Austria or Germany who have been stripped first by their own Government of all their property before their expulsion. It has been suggested that the latest turn of the screw of persecution in the Reich is intended to work up the charitable feelings of the delegates at Evian to a point at which they will accept the German proposition that Germany shall keep her Jewish ex-citizens' property while the rest of the world takes care of their persons. A third explanation is that the Jews in the Reich are now serving as "whipping-boys" in lieu of the Czechs. When the Czechs upset Herr Hitler's plans by impudently refusing to let him march into Czechoslovakia unresisted, the Führer had quickly to secure an alternative German victory. If so, it is not a famous victory.

* * *

Germany and the Danube.—Since the annexation of Austria by Germany, German measures to bring the Danube and its traffic under German control have been pushed fast and far. This is not due so much to the immediate preparations for the Rhine-Main-Danube canal, which is to link the North and Black Seas, as to the size of the Austrian commercial fleet on the Danube, which constituted 16 per cent. of the total mercantile and passenger tonnage on that river. Moreover, the Austrian military flotilla has been joined with the German, and both are being rapidly expanded. This flotilla may play a very important part on the Austrian Danube west of Bratislava. At the same time, German firms are preparing for the construction of the 45-kilometre canal to by-pass the Roumanian Danube between Cernavoda and Constanza. This scheme will diminish the significance of the hitherto most important Roumanian harbours on the Danube, Braila and Galatz. The Roumanian railway from Bucharest to Constanza carries about four-fifths of Roumania's total export of petroleum, wheat, timber, etc.; and this also will be affected. Roumanian capital is scarcely engaged in this undertaking; so that when these two canals are completed, the rivers Rhine, Main and Danube will form an almost purely German artery across Europe. The Danube

trade of Hungary, Yugoslavia and Roumania is virtually already under the control of Germany. The traffic upstream has always been more important, for it brought Austria-Hungary before the war, and will now bring Germany after the annexation of Austria, the raw materials from Central and South-Eastern Europe; oil, timber, metals and cereals. In return, Germany expects to be able in future greatly to increase her down-stream traffic carrying her industrial products in payment. The stretch of 172 kilometres between Hungary and Czechoslovakia is still very important; for from the Slovak harbours of Bratislava and Komarno run railway lines to the Czech and even to the Polish industrial regions and beyond, e.g. to Gdynia. The really threatening development on Europe's greatest and still internationalised river is the rapid expansion in Germany's armed forces on these waters.

* * *

Italy and Yugoslavia.—From the Thursday to the Saturday of last week, at Venice, M. Stoyadinovitch, the Prime Minister of Yugoslavia, was in conference with the Foreign Minister of Italy, Count Ciano. Italo-Yugoslav trade was the official subject of the conversations; but there was no statement that political questions were excluded; and the question of trade has, of course, an important political aspect. While the trade between Italy and Yugoslavia has been dwindling, that of each of these two countries with Germany has been markedly on the increase. This means that not only Yugoslavia, but even Italy, is in some danger of being drawn into a German economic system which, by curbing the non-German partners' economic liberty of action, might threaten to interfere with their political liberty as well. There are also certain directly political issues in which Italy and Yugoslavia have a common interest over against Germany. For example, the region at the head of the Adriatic where Italy and Yugoslavia march with one another is also the region where Greater Germany, within her post-Anschluss frontiers comes closest to Mediterranean waters; and the rulers of the Reich have certainly not forgotten that the Ostmark (as Austria is now called) included, down to 1918, not only the Czechoslovakian provinces of Bohemia and Moravia but also the Italian coast and Slovene hinterland of Istria. Both Italy and Yugoslavia, again, saddled themselves, in the peace settlement, with subject German minorities; and even the sensational renunciation, for all time, of the German South Tyrol, which was Herr Hitler's present to Signor Mussolini during his recent visit to Rome, can hardly have made Italy feel perfectly sure that her own frontier with Germany is better guaranteed than Yugoslavia's. In this matter of minorities, the relations between Italy, Yugoslavia and Germany are complicated; for there is also a large Yugoslav minority under Italian rule, and, at any rate until a very recent past, these unredeemed Slovenes have been no better treated by the Fascist regime than the unredeemed Germans of the South Tyrol. If Italy were one day to fall into serious difficulties, we can imagine Germany suggesting to Yugoslavia that they should effect a joint rescue of their respective nationals from Italy's clutches. Yugoslavia would then be confronted with an awkward dilemma.

* * *

Outer Europe.—The diplomatic game between Poland, Czechoslovakia, Hungary, Roumania and Yugoslavia is being played fast and furiously since the final results of the Czechoslovak communal elections appeared. All three week-end elections resulted in a strengthening of the Centre and Left parties; a big increase in the Sudeten German Party's vote; a relative weakening of the Agrarians in Bohemia and a strengthening of them in Slovakia, whence the Prime Minister, M. Hodza, derives his main support. The Sudeten vote was 91 per cent. of all German votes polled; but the distribution of Sudeten majorities was very uneven. In Reichenberg it was 90 per cent.; in Teplitz-Schönau 75 per cent.; in other mainly German towns of Bohemia and Moravia it ranged between 55 per cent. and 85 per cent. Thus, the German

Social-Democrats, Jews and left-wing groups contrived to secure many seats. The defeat of the Slovak autonomists under M. Hlinka has now led Polish public opinion and the Press to take a much more friendly tone to Czechoslovakia; though the appointment of Colonel Slawek as Marshal of the Sejm in place of M. Car, who died last week, lays the question of a united and clear official Polish attitude open once again. The struggle in domestic Polish politics has an important bearing on Polish foreign policy. There is everything to be said for a concerted effort between Poland, Roumania and France, on the one hand—they are all allies—and Hungary and Yugoslavia on the other, to bring the maximum of goodwill to bear on the vexed minority and economic problems besetting Central Europe. The Czechoslovak Government are understood to be preparing the new Minorities Statute in such a way that every concession to the Sudeten Germans can also be made, *mutatis mutandis*, to the Polish and Hungarian minorities; which is sound democratic procedure. The negotiations with Herr Henlein's representatives have further advanced, but clearly the Prague Government will have both to safeguard the republic's integrity and non-Henlein citizens' rights, as well as ensure that all minorities are equally and equitably treated. The repercussions of these day-to-day questions are now reaching down into the Balkans, and even into Turkey-in-Asia. For example, this week the Yugoslav-Italian discussions, noted above, are said to have taken account of Yugoslav, Italian and other political interests, shipping, trade and communications in the Adriatic, Aegean and Mediterranean, as well as on land in the Balkans.

* * *

The Irish Election.—The result of the General election in Eire is a complete victory for Mr de Valera, who has obtained a majority of 15 over all parties combined. It has thus been demonstrated that the system of proportional representation does not necessarily lead to a deadlock, and presumably no change will be made in the method of voting. Mr de Valera's increased strength, according to our Dublin correspondent, was obtained principally at the expense of the Labour Party, which has suffered the penalty of years of vacillation and inconsistency. Not a single Labour candidate was returned for any of the Dublin constituencies, all of which contain large working-class populations. Mr Cosgrave's party lost only three seats, and the result of the election is unquestionably satisfactory to all who favour a reasonably Conservative and stable government. The main plank in Mr de Valera's platform was the agreement with Great Britain. The enthusiasm with which the electorate accepted the agreement is of good augury for the future of Anglo-Irish relations, which are discussed in a leading article on page 702 of this issue. The two countries have been drawn together by the dangers of the international

situation, which has forced upon them a realisation of their identity of interest in matters of defence.

* * *

Attention now centres on the use Mr de Valera will make of his majority in matters of domestic economic policy. His election speeches suggest that he is becoming aware that the farming interests have had insufficient attention in recent years and that the industrial protective drive may be slowed down. It would not be surprising if some attempt were made to organise industry on co-operative lines and to curb the more obstructive activities of the trade unions. The new Government may be more conservative than the old, which was harassed on the one hand by the British penal duties and on the other by the Labour Party. The report of the Banking Commission, the publication of which is daily expected, may serve as a guide in the financial field. The principal ground for anxiety among taxpayers is the new programme of defence, which, to be effective, will necessarily be very expensive. Rumours are current of another large loan for capital expenditure on defence.

* * *

Road Safety and Road Users.—The Minister of Transport carried the Commons with him on June 17th when he elected to make the problem of road casualties the central theme in the statement of his department's progress and policy. Mr Burgin's opinion that carelessness was the chief cause of accidents was not received with similar favour. Many members held the view that radical improvements in British roads could alone abate the deplorable increase in the daily rate of casualties—which at present stands at eighteen killed and more than six hundred injured. Widespread anxiety about the failure of the Government to implement its promised plan to expend £130 millions in five years on major road improvements was not diminished by Mr Burgin's account of the elaborate surveys now being made of conditions on trunk roads which became the responsibility of the Ministry last year. Normal expenditure on the roads has not been markedly increased since the Government's pledges were made at the 1935 election. Mr Turton, it is true, expressed alarm in last week's debate at the prospect of any large increase in expenditure on the roads when every penny was needed for national defence. But most members felt, and few of the electorate would disagree, that money spent on making our roads safer for their users would indeed be well expended. In the last resort, however, under modern traffic conditions, safety must depend finally upon the road users' good sense and tolerance. So long as our roads are inadequate in space and design, this is especially the case.

* * *

Regulations for Cyclists.—The worst sufferers from road accidents are cyclists. The Transport Advisory Council propose, in a Report published on Monday, that for their own protection this largest class of users of the highway should be obliged to use cycle tracks where suitable ones are provided; that they should be prohibited from riding more than two abreast; and that cycles should carry red rear lights. About the first two proposals there can be no two opinions; they will conduce to additional safety. And red rear lights can only fail of their purpose if their introduction leads motorists to relax the caution which at present they are very properly compelled to exercise. Many of the safety devices put into effect since 1933 have been admirable. Some have been ill-advised. But at no point has the Ministry's urgent campaign to secure safety enjoyed the support due from the various organisations of road users. Only the good-humoured and sensible behaviour of the ordinary individual motorist, cyclist or pedestrian has enabled the Ministry to make any genuine progress towards the reduction of accidents. Roads must, indeed, be made safer in themselves; but organised road users must display that will to co-operate which the general public's shocked alarm about accidents very rightly requires as a duty.

Progress in Education.—In the current financial year expenditure on education from the Exchequer will amount to £51,072,000 and from rates to £47,810,000. Proposing the Education Estimates in the Commons on Monday, Mr Kenneth Lindsay declared that our educational system was undergoing fundamental changes for the better. The rapid provision of new buildings was facilitating that differentiation of post-primary training which was axiomatic in the Hadow Committee's generally accepted proposals for reform. Special stress was being laid upon reorganisation of rural schools. The National Fitness Campaign was giving a new and desirable purpose to British education outside the narrow confines of the classroom. In the view of the Opposition, however, the present measures to promote physical fitness were ill-directed; and, despite Mr Lindsay's claims for the achievements of reorganisation, the confines of the poor child's classroom were still too narrow. It was denied that the system of education was, in fact, being radically altered. Poverty remained the chief bar and disadvantage to the schoolchild's progress: anaemia and sub-normal nutrition rendered the necessitous child unable to profit from physical training. Classes in elementary and senior schools where the poorer children were mainly to be found were generally too large, and equipment was frequently wholly inadequate. Many speakers, again, were doubly anxious about the consequences of the new Education Act, due to come into force next year. The majority of children, it was argued, would not benefit from the raising of the school-leaving age, because they would be exempted in order to go to work. The remainder would benefit only slightly, because the post-primary schools to which they would go were, in the main, cheaply and inadequately equipped. The various criticisms made at least suggested the ways in which our democratic system of education tends to fall short of its pretensions. Mr Lindsay's tale of progress was largely authentic. His statement that we could not afford to spend less on education than we are doing was the barest truth. But it is still far from the case that the nation's fifty millions is being spent to the nation's best advantage.

* * *

Castlecary Accident Report.—Last December, 35 people were killed in a railway collision at Castlecary in Scotland. The official report on the disaster appeared this week. After pointing out that snow was falling at the time and visibility was bad, the report says that a goods train was held up at Dullatur East, the signal-box immediately ahead of Castlecary. The Dundee express, which was the next train, had therefore to be stopped at Castlecary. The signals there were kept at danger, but unfortunately the driver misread the distant signal and approached Castlecary at full speed. The signalman waved a red lamp, but thinking the train was not going to stop, he sent the "running away" bell signal to Dullatur East. The Dundee driver, however, did manage to stop his train at Castlecary starting signal, 450 yards down the line. Unfortunately the signalman failed to realise what had happened, and so accepted the next train, the Edinburgh express, from the box in rear. This driver, in turn, misread the Castlecary distant signal, raced through at full speed, and crashed into the back of the Dundee express. The report apportions grave blame to the Castlecary signalman for accepting the Edinburgh express "without clear knowledge of the position of the Dundee train and while actually expecting an accident to the latter." It was impossible to determine whether the Castlecary signal had jammed and so both drivers are given the benefit of the doubt. The fact that both drivers misread the same signal throws doubt on its reliability, but the report adds that in view of the bad weather the Edinburgh driver was going unduly fast. The report does not pronounce definitely in favour of all-steel coaches; but makes valuable recommendations for the adoption of safety devices already in use on certain lines. The real issue is whether the time is ripe for making the use of such modern safety devices compulsory.

United States

Business and the President

NEW YORK, June 14.—While current business indicators show little change on balance, discussions increasingly emphasise the political aspects of political economy, both in New York and in Washington. The antipathy of business interests to the Administration has been a feature here for years. The resentment in Washington to business interests is little less marked. In the absence of relevant statistical data, current discussions turn on such phrases as "confidence" and "psychology."

While these terms are unsatisfyingly vague and nebulous statistically, yet some more specific meaning can be indicated with certain figures. In 1936 there were 59,000 individual income tax returns showing net income in excess of \$25,000. In 1928 the number was 111,000. This group of large income recipients is presumed to have a major influence upon capital formation, an activity which accounts for a large part of the fluctuations in business activity. The total membership of this group is small, and if allowance is made for movie stars, minors and others whose influence on business motivation is slight, the total number of people who are in a position to exercise an important directional influence upon capital formation constitutes only a tiny fragment of the population.

The members of this group are doubtless preponderantly anti-Administration. If the assumption of an important directional influence on the economy by them be granted, the question is to what extent their political feelings affect their business operations. This is the question being widely asked to-day.

During the past few years, their political feelings do not appear to have varied greatly. At present, the business interests are disappointed at the outcome of the Congressional session. The unexpected support received by the Wages and Hours Bill, failure to clarify the utilities controversy and the President's strong stand against the tax measure have contributed to this. For the next four months political matters will be kept in prominence by the procession of primary elections leading to the elections for Congress in November.

Yet the thesis of the dominance of the political *motif* leaves many factors out of account. The more statistically-minded analysts lay stress upon large inventories, declining public buying (manifested by retail trade trends), declining loans and investments of banks, labour troubles and cost factors. Conversely, the more hopeful emphasise the improving new issue market, promising building developments, the forthcoming expansion in Treasury spending, diminishing inventories and cost adjustments. These tangible factors can hardly be left out of account in evaluating the current position, even if attention is given to the political factor.

Probably the current stress on political affairs is overdone. It may be one more instance of the tendency to seek unitary interpretations of current events. The ease with which developments can often be apparently explained by one group of economic phenomena, whether political influences, or capital goods or purchasing power, is tempting. The over-worked Martian visitor would be impressed by the extent to which explanations of this kind are current here at present.

Whatever the correct conclusions in this regard, there is a reasonable consensus of opinion about the outlook for business at the moment. With the Federal Reserve index for May unofficially estimated at about 75 compared with 77 in April, business is believed to be near its low point. There is great diversity of opinion, however, about the timing of recovery.

The low level of business is rapidly swelling the volume of unemployment. The report of the Department of Labour on employment in non-agricultural industries in April states that, since April, 1937,

there has been a reduction of more than 2,500,000 in the number of people on the payrolls of private industry and of public agencies engaged in regular Government activities, ex-

clusive of Works Progress Administration and other Federal and State emergency projects.

From these figures it appears that total present unemployment must be in the neighbourhood of 12 millions or 13 millions. This compares with the estimate made by the American Federation of Labour of 13,723,000 unemployed in 1933 (average for the year).

Relief Expenditure

Consequently, the need for relief is growing rapidly. Studies show that the number of persons who received relief, works programme employment and emergency employment, exclusive of public works, was 20,112,000 in March, compared with 18,846,000 in March, 1937. This number is covered by a wide variety of relief and aid projects; and it can hardly be doubted that the number is still growing. In this situation, the larger funds shortly to be available for various relief purposes will find ready channels for expenditure.

As a background for the new programme of relief and attempted stimulation now about to get under way, the magnitude of outlays for these purposes and the number of persons affected, excluding public works, is of interest. These figures have recently been officially assembled from the large number of programmes carried on during the past five years.

	EXPENDITURE ON RELIEF \$000,000		NUMBERS (000's omitted)	
	Total, All Public Sources of Funds	Federal Funds	Total, excl. Public Works and Surplus Commodity Programme excl. Public Works	Average Number of Persons that received Relief and Emergency Work
1933—1st half	610	390	507	19,625
2nd half	994	744	791	18,239
1934—1st half	1,931	1,556	1,468	24,187
2nd half	2,013	1,597	1,187	22,349
1935—1st half	1,976	1,530	1,417	23,205
2nd half	2,016	1,525	1,369	19,636
1936—1st half	2,628	1,932	1,827	20,241
2nd half	2,677	1,929	1,711	18,639
1937—1st half	2,463	1,747	1,774	18,201
2nd half	1,995	1,269	1,435	14,661

Overlapping totals have been eliminated as far as possible, in order to provide a complete and continuous series.

France

The Socialists' Policy

PARIS, June 21.—The parliamentary session has ended with two notable setbacks for the Communists. Their demands for a further large instalment of social reform have been rejected; and their desire to end the policy of non-intervention in Spain has been defeated. M. Daladier's opposition to these proposals was greatly assisted by the decisions of the recent Socialist Congress at Royan.

It is the view of M. Blum, the Socialist leader, that a fresh political crisis would be inopportune and even dangerous because of the international situation; and, indeed, it might even recoil upon the heads of those who still support the Popular Front. The gulf between Socialists and Communists is widening, although their leaders continue to discuss a unity which is now more remote than ever.

Chief Office: BROAD STREET CORNER, BIRMINGHAM

The Royan Congress underlined the great changes which have taken place in the Socialist party since the elections of June, 1936. Its members have had experience of being in power, and they now appreciate the small rewards of office. They have become a Government party, and their initiation has cost them a great deal in sacrifices of doctrine.

Anti-militarists, they have promoted a great re-armament programme. Supporters of exchange control and radical financial reforms, they have seen these policies blocked by the Senate, and have had to yield to the necessity of collaborating with liberal England. Their position in the country would have been seriously weakened if the Radical Socialists had not given a renewed lease of life to the Popular Front by skilfully refusing to turn directly against the views of the majority elected in 1936 and guaranteeing the definitive character of the new social laws of the last two years.

Autumn Prospects

Thus an alliance between Radicals and Socialists has succeeded the broader fighting Popular Front. How long will it last? The answer depends upon two things: the actual course of events at home and abroad, and the willingness of the Radicals to march with the Socialists in the carrying out of a policy of reform.

Actually, domestic developments have been deeply affected by world affairs. Recession abroad checked the flight of French capital, and weakened the depressing influence of France's budgetary difficulties upon the franc's rates of exchange. In May, revenue receipts were above estimates, although those in the first four months of the year fell below anticipations. The foreign trade figures could certainly be better, but they are not very unfavourable; and receipts from the tourist industry should be very much improved this year, because of the recent decrees and the lost cost of living for foreigners in France. The potato crop is good and there should be a surplus for export.

In general, the situation is propitious for a revival of private enterprise and the reinvestment of capital. Investors, after five years of crises, feel acutely the need for profitable employment for their money. The Bourse, realising this and the new chances of world peace offered by the collaboration between France and Britain, seems little by little to be showing more hope.

The Radicals' readiness to carry through social reforms has already been shown by the recent decrees, which included *réformes de structure*, at least in name. The fear of war and Communist extremism has created a favourable atmosphere for the formation of a political grouping, pivoted more to the Centre than the original Popular Front, firmly set between the extremes of Left and Right, but not involving any immediate break with the majority views endorsed by the electors two years ago.

The fourth instalment of decrees, already approved by the council of Ministers, was issued this week. The co-ordination of road and rail is one topic; the development of the tourist industry another. Attempts are to be made to stimulate the birth-rate. The construction of cheap dwelling-houses will be encouraged. Financial assistance will be given to local utilities, and the credits proposed for public works will be reorganised. Colonial gold mining and industry will be fostered; and measures will be taken to expand electrical undertakings at home.

Germany

Anti-Jewish Agitation

BERLIN, June 22.—The saying of that last of the real autocrats, Tsar Nicholas I, that "nothing is important in my Empire except what I talk of, and that is important only as long as I talk of it," might be applied, with adaptations, to present-day Germany. Considerations of propaganda are always much more important than actual events. Only matters officially deemed to merit emphasis are for the moment treated as significant. Hence particular topics are prominent for weeks on end in a flurry of agitation, and then, without any noticeable change in conditions, they fade from the public eye and are replaced by something new—often something old—which is in turn presented intemperately.

Between the morrow of the Anschluss and the frightening events of May 21st everything was Czechoslovakia—presented as a violent crisis, delay in the solution of which would be fatal. A few days after May 21st the Czechoslovakian question had become once more a tedious, permanent problem; and to-day it is hardly mentioned. Yet, objectively regarded,

the Sudeten-German dispute is just as it was in May. It has been officially displaced in the news by half a dozen matters, all of them minor but all staged with the customary vigour and vehemence.

To-day the burning question is once more the Jews. The Reich Government, except for measures such as expulsion of Jews from the Bourse, professes to hold aloof. The Nazi Party claims that it is obliged to agitate and incite merely to counteract the activities of foreign Judophiles. The Jewish question, however, has not revived automatically, but because its revival in the public mind was designed.

In itself the question is no more acute than it was a month ago. It has long been plain that the Jews in Germany are doomed to painful extinction, and that the only way to save them is to remove them altogether. The present anti-Jewish excitement will probably die down, but the Jews will gain nothing from a new Czechoslovakian crisis, a new building programme, or any other sensation that may be officially pushed into the limited field of vision of the public.

Foreign Debts

The official attitude towards Austria's international loans, now being negotiated with other payment matters in London, was clarified by Dr Funk's speech last week. Doubt about this attitude arose from apparently contrary reports that the loans had been repudiated on "political" grounds and that an offer of partial or conditional service and transfer was made during the first Anglo-German negotiations here. Dr Funk's speech made it plain that he realises that repudiation is impracticable against any guarantor Government that has means to compel payments, but he retains as a final fighting position the theory that Germany is not "legally, economically or morally" liable. He is, therefore, not committed should any conditional offers of part payment be rejected; and—which is probably more important—agreement to pay one country does not commit him to pay another.

Last week it was believed here that full payment would be promised to Great Britain, but only if counter concessions were made. It was also believed that the Dawes and Young Loans would be brought up for discussion. Should the guarantor countries consider themselves obliged to act together, the problem would take on a new aspect.

The latest foreign trade reports do not indicate propitious transfer conditions. The Reichsbank's reserve, however, remains unchanged, although net gold imports in May reached the very high sum of Rm. 44½ millions, and in the first five months of the year Rm. 72 millions—which slightly exceeds the Reichsbank's displayed gold reserve. Dr Funk declared that commercial debts would be respected, but added that a political debt did not become a commercial debt merely because the bondholders were private. In the light of earlier official statements that foreign loans to German private undertakings during the reparation years were political, Dr Funk's utterance is not reassuring.

Higher Industrial Output

According to an official report, industrial production in 1937 was 18 per cent. higher than in the good year 1928. The greatest and smallest changes since 1928 have been as follows. Output of "equipment goods" (machinery, plant, etc.) has risen 31 per cent. Output of consumption goods of elastic demand has risen only 2 per cent. In an address to bank officials Dr Schacht issued a warning against the dangerous situation "when a wage-earner does not produce consumption goods, but goods which economically are not directly productive (*sic*). The result, said Dr Schacht, must be shortage and higher prices. This is the position already, though it is not acute.

An instructive light on activity which is not "directly productive" is thrown by a return on theatres. The return, which comprises all theatres with fixed locations, shows 177 classed as State or municipal, and only 49 as private. Further, about one-half of the summer and open-air theatres are in public hands. Of all artists and employees in theatres with permanent staffs 90 per cent. belong to State or municipal theatres.

Pig-iron production in May rose further to 1,545,000 tons; and, in the first five months of this year, output has amounted to 7,295,400 tons against 6,406,100 tons in the same months of 1937. The prolongation of the International Steel Cartel has been well received, though Germany's chief interest just now lies in the Cartel's policy of maintaining prices. The British Government's decision in regard to import duties on motor cars is criticised. The annual report of the Auto-Union of whose cars two rank as high-priced, shows an increase in exports of 60 per cent., and in exports of motor cycles alone a rise of 93 per cent.

The annual reports of the Hamburg-America and North German Lloyd shipping companies are considered relatively

favourable, but have had no effect on the prices of the stocks. The short-term debts of both companies have been substantially reduced, and the long-term liabilities increased owing to credits for new construction. Including orders given in 1937, the Hamburg-America building programme comprises 21 vessels of 122,700 tons. The North German Lloyd is modernising about a dozen ships by altering the design and installing more powerful machinery.

Increased Import Surplus

The May foreign trade returns (Austria still omitted) show an import surplus of Rm. 28 millions, the largest since January; and the import surplus for the first five months amounted to Rm. 85 millions. In April the import surplus was Rm. 7 millions, and the increase in May was due to larger imports of industrial products, and in particular of raw materials. Four-fifths of the new imports came from overseas. Figures are:—

	April	May	Jan.-May
	Millions of marks		
Imports.	165.3	165.2	849.2
I. Foodstuffs	7.4	10.5	46.6
(a) Livestock	27.4	32.9	189.8
(b) Animal foodstuffs	100.9	89.8	463.4
(c) Vegetable foodstuffs	260.4	285.8	1,397.2
II. Industrial goods	149.6	166.2	815.2
(a) Raw materials	79.1	85.5	417.0
(b) Semi-manufactured	31.7	34.1	165.0
(c) Manufactured	429.5	455.2	2,265.9
Exports	4.7	4.0	25.4
I. Foodstuffs	0.1	0.1	0.7
(a) Livestock	0.5	0.4	2.2
(b) Animal foodstuffs	2.0	1.5	11.7
(c) Vegetable foodstuffs	417.7	422.9	2,154.2
II. Industrial goods	43.3	44.0	219.9
(a) Raw materials	28.5	31.1	167.3
(b) Semi-manufactured	345.9	347.8	1,767.0
(c) Manufactured	422.5	427.1	2,180.4

The May figures for "Great Germany" (covering German and Austrian foreign trade other than with one another) were: imports, Rm. 516 millions, and exports, Rm. 465½ millions.

Holland

Signs of Falling Activity

AMSTERDAM, June 15.—The repercussions of the economic decline in other countries are being increasingly felt in the Netherlands. There is no serious set-back so far, but signs of depression are becoming more and more evident. The short-lived period of reviving prosperity is once more a thing of the past. According to the returns of the Central Statistical Bureau, the number of registered unemployed did not fall below 310,000 in 1937. At the end of January, 1938, the number of registered unemployed had risen to 440,000, mainly owing to seasonal influences; and, at the end of March the number was 373,000.

In the third quarter of last year, exports reached their highest level since 1931; in the last quarter of 1937, however, exports to Great Britain, the United States and Argentina showed an appreciable decline, and in the first quarter of this year the decline became general. This decline in exports, coupled with the renewed keenness of foreign competition, is being severely felt in many branches of industry. The net effect is a marked hesitancy in industrial circles.

There has presumably been no diminution of the purchasing power of the community; wages are higher than a year ago; and the cost of living is back again at the level of a year ago, owing to the fall in prices towards the end of last year. The recent fall in unemployment is principally due to renewed activity in building and agriculture; but unemployment is particularly heavy in the textile, clothing, leather and food industries. Some branches of industry, supported by orders from the Government, are still fairly active, including iron construction works, shipbuilding yards, machinery and aircraft factories; and the first half of 1938 is believed to have been satisfactory for several ship-owning companies.

The Government's Policy

Nevertheless, the prevailing level of unemployment is regarded with great anxiety. Parliament has been actively engaged on this problem during the past few weeks, and demands for more active measures to cope with unemployment have become more and more insistent. In particular, demands for the execution of public works on a large scale are being increasingly voiced. The Government, however, according to recent statements by Dr Colijn, the Prime Minister, take the view that the execution of big public works does not constitute a satisfactory means of curing unemployment. During the period from 1931 to 1937, the country's burden of debt increased by 1,124 million guilders, and the curtailment of public expenditure is in consequence one of the primary preoccupations of the Government.

The Government's policy in face of rising unemployment is to stimulate exports, to encourage the reduction of costs of production, and to foster concerted action by producers. They eschew any avowed programme of self-sufficiency or protectionism, but are ready to accord Government support to certain articles.

In addition, the Government propose to arrange a better allotment of the available work among the available workers, and to provide for the execution of some public works in order to afford immediate relief to the unemployment situation. For road and canal work, defence, and unemployed camp work, expenditure will be provided in 1938, amounting to 125 million guilders more than the average of the last five years.

Funds are still in abundant supply on the Amsterdam money market. In spite of this, however, the flood of conversion loans has been brought to a standstill, partly because of the agitation conducted by the so-called Investors' Front, which is opposed to any rapid fall in interest rates.

Setback in Foreign Trade

The monthly value of foreign trade (excluding gold and silver) is summarised below, from the returns of the Central Statistical Bureau:—

	In million guilders					
	Imports			Exports		
	1936	1937	1938	1936	1937	1938
January.....	79	106	119	50	73	82
February...	74	105	118	50	79	82
March.....	79	125	120	55	95	90
April.....	81	142	115	57	101	81
May.....	76	128	110	53	90	83
June.....	77	140		53	95	
July.....	80	146		60	102	
August.....	82	123		63	99	
September..	82	130		72	113	
October...	92	149		75	106	
November...	101	130		77	98	
December..	114	128		80	98	
Totals ...	1,017	1,552		745	1,148	

The decline in foreign trade is shown by the figures for the first five months of the current year, when exports totalled 418 million guilders, compared with 438 millions in the same period of last year; and imports 582 million guilders against 606 millions.

Increased Expenditure

STOCKHOLM, June 8.—Clouds on the political and economic horizons have made the Government rush two new important laws through the Riksdag. One Bill provides for the additional expenditure of kr. 70 millions for national defence, and an Enabling Act for kr. 250 millions for public works to be carried out in the event of depression. The Government has introduced taxation on limited companies to yield kr. 21 millions; increased the existing special property tax by a further kr. 15 millions; and raised the existing income and property tax by 6 per cent., to yield an extra kr. 15 millions. Some kr. 19 millions will be obtained from the Budget surplus. The entire defence expenditure will thus be covered within one year. The emergency Budget to cope with any signs of depression, will probably be financed by loans.

In spite of the first signs of business recession, the Government has found the moment opportune to introduce two far-reaching social reforms. An eight-hour working day will be instituted in the merchant fleet, and all workers will receive 12 days paid holiday. The new taxation and these very expensive reforms will impose new charges on the already heavily burdened Swedish industry. A number of prominent business leaders have lately warned the Government, that the limit has now been reached.

Business activity is losing speed, and the general index of business activity declined in March from 118.4 to 116.7 (1935=100). Considerable orders have still to be carried out, however, and employment is on the whole satisfactory. The number of registered unemployed fell in April from 19,000 to 16,000, compared with 22,000 in April, 1937.

Poor Prospects for Exports

Reports from the chief staple industries continue to be discouraging. In spite of the restrictive policy of the European Timber Convention the timber market is dull with only restrained demand from Great Britain and heavily reduced German purchases owing to the Anschluss. Swedish timber sales at the end of April did not exceed 300,000 standards, compared with 640,000 standards at the corresponding date a year ago.

No important contracts have lately been signed for new pulp deliveries and further reductions in output have been made in the paper industry. The chief cause of this situation is the low level of business in the United States which is Sweden's chief customer for pulp and paper. Fortunately, the building industry is still active in Sweden, and the demand for iron and steel for home consumption is in general satisfactory.

Foreign trade has so far been fairly well maintained, although in April imports were for the first time for a long period lower in value than in the corresponding month a year ago. Foreign trade figures were as follows:—

(In million kronor)			
	1937	1938	
	January-April	January-April	
Imports	635.0	646.4	
Exports	500.3	569.6	
Import surplus	134.7	76.8	

Trade with Great Britain during the first three months of the current year was valued as follows:—

(In million kronor)			
	1937	1938	
	January-March	January-March	
Exports to United Kingdom	76.8	104.3	
Imports from United Kingdom	75.0	86.5	
Export surplus	1.8	17.8	

Prices Unchanged

Wholesale prices remained stationary in April and the general index of wholesale prices stands unchanged at 131, and the index of prices of consumption goods remains at 105.8. The supply of money is still abundant, though aggregate deposits of the joint-stock banks fell during the month by kr. 23 millions to kr. 4,050 millions. A Norwegian State-guaranteed 3½ per cent. loan of a nominal value of kr. 14 millions was issued in Stockholm at 99½ and was immediately fully subscribed. Following new gold purchases by the Bank of Sweden, the aggregate foreign currency reserves of the Bank of Sweden and the joint-stock banks

fell during the month from kr. 846 millions to kr. 827 millions.

Quotations on the Swedish Stock Exchange recovered somewhat in April and the general index of stock exchange prices stood at 158.6 at the end of April, against 157.1 at the end of March. The shares of the Swedish Match Company, withdrawn from the official list in 1932, were reintroduced in April.

Spain

Regulation of the Wool Trade

BARCELONA, June 10.—The Government have set up a committee to buy raw wool. The intention is to bring down wool prices by eliminating the competition of buyers. All wool produced in the country will be bought up by special inspectors, and put at the disposal of industry. The new committee will also take over authorised imports, and before being distributed to spinners, both home and foreign wool will be examined by the War Ministry for the selection of lots for the manufacture of yarns suitable for the weaving of military garments.

This measure is an important step in the Government's programme to prevent undue increases in the prices of manufactured goods. The owners of several large department stores in Barcelona, Madrid and Valencia as well as the owners of chains of shoe shops have had to pay fines up to half a million pesetas for infringing the price regulations.

In view of the constant enquiries which are now being made by employers who have insurance policies with companies domiciled in rebel Spain, the Government has issued a decree whereby such companies are obliged, if they wish to continue doing business in loyal Spain, to deposit a specified sum as a guarantee in a bank situated in Republican territory. If they fail to do so within thirty days, they will not be permitted to issue any new policies, and policy holders will be entitled to cancel their insurances. Many policy holders have been unable to pay their premiums owing to the impossibility of obtaining valid receipts.

Reform of the Tobacco Monopoly

One of the first articles which became scarce after the beginning of the Civil War was tobacco. One of the principal reasons for the shortage was the prohibition of tobacco growing in peninsular Spain, which forms part of the agreement between the Spanish Government and the Spanish Licensed Tobacco Company, originally concluded more than fifty years ago. When the rebellion broke out, most of the leading officials of the tobacco company sided with the rebels or left their posts, and the Government had to run the business as best they could.

This provisional state of affairs is now coming to an end. The Government have given notice that, according to a specific provision in the agreement with the company they declare the agreement void. A settlement with the company will be made by a committee, presided over by a chairman named by the Minister of Economics and Finance, and made up of three Government delegates and a further three proposed by a group of shareholders whose shares amount to more than 50 per cent. of the total capital. If the shareholders' representatives are not chosen within a given time, a minority of the shareholders may appoint two representatives. The latter course is most likely, since the great majority of the company's shares are in rebel hands, and the famous Juan March, General Franco's financier and erstwhile tobacco smuggler, is probably himself in possession of more than 50 per cent. of the shares. The maximum amount the State will pay to the company in final settlement will in no case exceed the latter's disbursed capital.

A new concern called "Monopolio de Tabacos y Fósforos" has been set up to regulate the production, importation, manufacture and distribution of tobacco, matches, and lighters. The State has advanced one hundred million pesetas for the running of this business, and the Government is authorised to advance further sums if necessary. Existing plants may not be shut down or new ones opened without the consent of the Government, and the Government will fix the prices to be paid for their crops to the growers of domestic tobacco, since the production of raw tobacco in Spain is to be encouraged. The total planted area must be increased each year by at least 1,000 hectares (2,470 acres).

Japan

War Economy

TOKYO, May 28.—Japan has become increasingly conscious that what it faces in China is not a brief "incident" but a protracted war. The country has been advancing step by step towards a fully fledged war economy. Practically all the familiar features of the economic life of a nation at war (or of a modern style dictatorship in time of peace) are to be found in Japan to-day.

State control over foreign trade and all transactions involving transfers of currency has been in force since the early phase of hostilities, and has been enforced with increasing rigour. The State also directs new investment of capital into what are regarded as desirable channels, since any fresh investment above a small amount must receive the Government's sanction.

Rationing is being applied to wider and wider categories of articles. As yet there is no visible shortage of food; there are no queues for rice, fish, soya beans and other standard items in the Japanese diet. But the pronounced deficiency in the supply of many essential metals and raw materials has led to familiar consequences: soaring prices, anti-profiteering ordinances, attempts to establish fixed maximum prices and to allot supplies in stipulated quantities. There is an intensive search for substitutes for imported raw materials.

The present war, limited as its scope has been, has brought out in clear relief the strength and weakness of Japan's economic position. Its strength lies in the fact that the Island Empire is virtually self-sufficient in food supply—so long as its connections with Formosa and with the mainland of Asia are maintained. On balance, Japan is a very small importer of foodstuffs; and most of its food imports are not used by the majority of the people.

It may be that the second year of the war will reveal some decline in agricultural productivity, as a result of the mobilisation of hundreds of thousands of peasants and the taking of considerable numbers of horses for military service. But, as yet, the only sign of difficulty in this field is a moderate rise in the prices of a few foodstuffs; and this is largely counterbalanced by the more abundant employment and higher wages in the munitions industries.

Shortage of Raw Materials

Japan's self-sufficiency in food does not, however, extend to raw materials. It is here that the pinch is being felt. Pure cotton and wool fabrics have become a thing of the past; mixture of staple fibre with cotton and woollen goods is compulsory, unless the goods are destined for export. So great is the shortage of lead, tin, rubber, mercury and lacquer that these articles are selling at three or four times the cost of importation.

The use of iron and steel is largely limited to military purposes; the construction of new buildings in which steel is needed has been suspended. The use of iron in some forty articles of daily use, such as fences, ashtrays and pillars, has been forbidden. Indeed, the shortage of metals and the high prices which they command have led to many thefts of metal fixtures in railway trains, of iron fences, manhole covers and other bits of unguarded metal. Copper has practically vanished from commercial use.

Petrol, of which Japan produces less than one-tenth of the amount required for peace-time consumption, is becoming an object of the most stringent economy. Gasoline is so rigidly rationed that owners of private automobiles are often able to make little use of them, and the fares of Tokyo's proverbially cheap taxicabs have been sharply raised. Compulsory dilution of gasoline with alcohol is planned together with the introduction of charcoal-burning vehicles.

At the same time, the Empire is being scoured for mineral resources. Under the stimulus of several increases in the price of gold, old forgotten veins of the yellow metal are being opened and reworked. Gold output, which has been variously estimated at 140 million and 192 million yen last year (figures of gold production, along with a number of other economic statistics, were withheld from publication soon after the outbreak of the war last summer) is expected to reach 240 million yen in the present year. Iron and steel production in Manchukuo and iron mining in Korea are being pushed forward.

There have been no economic sanctions against Japan, so that the shortage of raw materials is merely a reflection of certain weaknesses in the Japanese economic position: the

lack of many essential metals and materials and the limited gold reserve. These considerations make it necessary to restrict imports (apart from war supplies and raw materials destined to serve the export trades) to the barest minimum.

Limiting Imports

Japan's aim is to limit imports to a figure which can be balanced by exports plus newly-mined gold. And the figures for the first four months of 1938 show a much improved balance of trade. Exports declined from 1,011 million yen in the first four months of 1937 to 837 million yen. Imports were cut down from 1,407 million yen in the first four months of 1937, when imports were abnormally heavy owing to fears of restriction and of inflationary advances in prices, to 950 million yen. It is an open question, however, whether these figures are really as favourable, from the national economic standpoint, as they seem, because the reduction of imports was largely achieved at the expense of cotton and wool; and this may have an unfavourable influence on the future trend of exports.

While war industries are booming there has been a slowing up in many branches of peace-time production, accompanied by a deterioration in quality, because of the use of inferior substitutes. The financial authorities are aware of the danger that a runaway price rise may occur as a result of the combination of such factors as huge new bond flotations (the loans totalling 4,450 million yen, which must be floated to cover the special war Budget of 4,850 million yen, alone represent more than double the normal income from taxation); diminishing supplies of goods; and relatively high war-time wages. They are endeavouring to counteract this possibility by enforcing a huge programme of popular saving, which is supposed to realise 8,000 million yen.

As yet, there has been less disturbance of the normal economic pattern of life in Japan and of the living habits of the people than the Soviet Union and Germany have imposed during their drives for high-speed industrialisation and militarisation. It is not realistic to foresee any imminent financial or economic breakdown. At the same time, the acute raw material difficulties which have already appeared must raise doubts about Japan's economic capacity to sustain a prolonged war with a more formidable adversary than China.

Letters to the Editor

The Long-Term Budget Problem

TO THE EDITOR OF THE ECONOMIST

SIR,—More good than harm is done by meeting troubles half-way and the authors of "The Long-Term Budget Problem" (*The Economist*, June 11th) are to be congratulated on their treatise on a very difficult subject. But I think that certain points require further investigation and that a wider discussion is necessary.

1. *Dangers of a "Managed" Economy.*—The growing tendency to tamper with natural forces has its dangers, and this must not be overlooked when considering "ways of escape" from "The Long-Term Budget Problem."

The experimental stages of acquiring a new monetary technique are generally accompanied by unforeseen difficulties. Certain economic theories which have previously stood the test of time are now meeting heavy weather in a sea of cross-currents caused by manipulation and evolution. Thus it is more than ever necessary to move carefully when considering the adoption of new financial measures in order to make sure that secondary influences will not upset original theories.

2. *A Budget "Equalisation Fund."*—The authors' suggestion of accumulating reserves in good years is interesting, but I confirm their fears of political difficulties, and I agree that the capital markets would be disturbed both during the accumulation and the liquidation of those reserves. Nevertheless, provided that the authorities can continue to keep control of the monetary position, the financial difficulties might not be insurmountable.

3. *Re-armament and Its Effect on Trade.*—The authors are concerned about the trade slump which they assume must come when re-armament ceases. But is their assumption justified? First, if it were true that re-armament expenditure were such an important influence on trade, then surely the present recession in trade would have been more easily arrested. Secondly, the productive capacity of the constructional industries is limited, and, although re-armament increases demand, it causes, in some part, temporary diversion of normal trade. And if this diverted production were ultimately regained, it would offset at least part of the diminution in armament orders. Thirdly, it can be assumed that re-armament will cease only when there is political appeasement and the fear of war subsides. Then the restrictions on international trading could, and should, be relaxed, and a revival in export trade should help to absorb abnormal production created by re-armament. It is true that there may be a time lag between the cessation of re-armament expenditure and recovery in international prosperity, but the Government could help to reduce the time lag by allowing orders to diminish gradually, by giving as long a warning as possible, and by encouraging and helping those industries to regain the trade displaced by Government work and to discover new markets at home and especially abroad.

This presupposes political appeasement, but if there is none and our economic system is to perish at the hands of totalitarianism, then it is useless to attempt an economic survey of the future.

4. *Is Cheap Money a Mixed Blessing?*—The authors suggest that lower rates of interest for long-term capital might be a remedy. In order to establish lower rates it is necessary, they say, to instil into the minds of investors and stockbrokers that interest rates are destined to become lower in the future. What arguments do the authors suggest that stockbrokers should use to persuade their clients that War Loan will rise, say, to 140? The investing public requires more than being told that War Loan will rise to 140 in order to yield 2½ per cent. These investors will ask: "Do you really mean that, because the Government are borrowing more and more money and using it for unproductive purposes, they can go on borrowing cheaper and cheaper?" Perhaps one could point out that interest rates have fallen in recent years, despite an increase in the National Debt.

But will history repeat itself, even under the conditions of "managed" money? First, it is easier to reduce long-term interest rates from 4½ per cent. to 3½ per cent. than from 3½ per cent. to 2½ per cent. Secondly, the very cause of re-armament expenditure—political unrest and the fear of war—has driven the investor to seek refuge in gilt-edged securities, and this has played no small part in the maintenance of low interest rates. When re-armament ceases, the tendency may be for "funk money" to emerge from its gilt-edged hiding-place and militate against the fall in long-term interest rates desired by the authors. Thirdly, is the reduction in interest rates by manipulation in the general interests of the State and the community? Naturally, the Government and others could borrow more cheaply, but can one place much faith in the authors' hopes that there would be no reduction in savings and the price level would rise if interest rates were forced to lower levels? If investors could be persuaded to accept lower rates of interest, they would receive less income in future, and the cumulative effect might, on the contrary, retard the natural growth of savings. Furthermore, if the rate of interest is forced below an economic level, the investor will seek more remunerative channels for investment, and may even export his capital abroad; at present

unsettled conditions abroad deter him and encourage the foreigner to invest his money in this country.

These factors have also assisted the Government in maintaining their policy of cheap money. But if we arrive at that stage of political appeasement that the authors envisage, which would allow for a cessation of armament expenditure, the present tide of investment into gilt-edged securities may well turn, and the less attractive interest rates are at that time the quicker it will turn. Moreover, the authors' assumption that lower rates of interest promote rising prices is not borne out by recent events. Although long-term interest rates have been inclined to fall during the last nine months, commodity prices have slumped, and from the end of 1936 until the middle of 1937, when rates were rising, commodity prices rose abruptly. And this is just as well, for how can the investor live, much less save, if the cost of living and taxation are rising whilst rates of interest are falling?

A cheap money policy has still to prove itself other than a mixed blessing, and to pursue it to a greater degree does not seem to be justified, and may even prove dangerous. There is already some evidence that investors are attempting to maintain their standard of living either by speculation or by exchanging gilt-edged securities for inferior securities giving a higher rate of interest. So far this tendency has reached only small proportions, but would be accentuated if long-term interest rates were reduced still further.

5. *"Ways of Escape."*—At this stage I will do no more than put forward a few questions for further discussion and investigation in order to carry on the enquiry which the authors have begun.

- How great an influence has re-armament expenditure on present trade?
- What remedies can be suggested for taking up the slack when re-armament expenditure ceases?
- Would lower long-term interest rates be beneficial or harmful?
- Could further currency devaluation be repeated, and, if so, would it be a way of escape? To what extent does currency devaluation (1) raise commodity prices, (2) lessen the burden of debts?
- Could the Government economise, not merely in the defence departments, but over the whole of civil expenditure?
- What other "ways of escape" are there which have not yet been suggested?

The authors do not consider that (d) can be repeated, but this is arguable. The partial failure of currency devaluation in France, America and Great Britain may have been due to special influences which have neutralised the normal results of currency devaluation. Therefore the argument against currency devaluation is still inconclusive. I am not suggesting that it should be attempted at this stage, but I do not think that currency devaluation should be left out of a general discussion dealing with possible "ways of escape."

Question (e) is based on the authors' suggestion (a) on page 597 of *The Economist*. Unfortunately, it is a hundred times more difficult to carry out economies in a Government Department than in a public or a private company. One has to contend with lack of competition, overlapping of departments, an enormous organisation, political influences, and the principle of the "old school tie." But if these could be overcome the saving might be enormous.

I am, Sir,

Yours faithfully,

NICHOLAS ARGENTI.

London, E.C.2.

POINTS FROM LETTERS

Free Travel for All.—Everyone should have free travelling facilities on one day of the week, and the cost provided out of taxation on the larger incomes. In this way, the unemployed, the poorly paid, and their dependants would be able to enjoy the benefits of our countryside and to take part in many activities now denied them.—*W. S. Bridgen.*

Holland's State Debt.—In your issue of May 28th the increase in Holland's State debt in 1937 from 3,545 million florins to 4,058 million florins is mentioned. In 1937 the entire outstanding debt of our railway companies (guaranteed by the State) was converted into 3 per cent. fifty-year State bonds, which increased the debt by 429,543,700 florins. This sum should be deducted from the above-mentioned 4,058 millions. Without this deduction a wrong impression of the increase in debt in 1937 is given.—*J. van Galen, Amsterdam.*

Books and Publications

Czechs and Germans

THE publication of Miss Wiskemann's careful study* of one of the chief vexatious problems in Europe to-day comes most aptly upon its hour. Few people to-day know the why and wherefore of the current clash between Czechs and Germans within Czechoslovakia; fewer know the vicissitudes through which the historic provinces of the Bohemian crown have lived their millennium of existence; fewer still know the reasons why the Teutons settled there, when, how, and in what numbers. That the struggle between Teuton and Slav has always been acute within the confines of the natural fastness of Bohemia many people have learned. But they do not, perhaps, realise the role of that racial, social and religious conflict in the drama of European history entire. Nor are they adequately equipped to distinguish between the different kinds of Germans (Austrians, Germans proper, Baltic and Teutonic knights) and of Slavs (Poles, Czechs, Ruthenians, Slovaks), as well as Magyars and other non-Slav, non-German peoples who played notable parts in the establishment, breakdown, and reconstruction of the crownlands of Bohemia.

Miss Wiskemann's outstanding merits are impartiality and discrimination. In the first eighteen pages she gives a summary of Czech and Slovak history from the earliest times which is a model of clear succinctness. The influences on the Czechoslovak peoples of the great religious schisms, of economic evolution and Teutonic commercial penetration in what is now Czechoslovakia, and of that nascent feeling of nationalism which sprang fully armed from the clear head of eighteenth-century Europe "about the year 1800" (as she does well to remind us), are carefully described and assessed. The first eight chapters take the reader in seventy-eight pages to the Peace Conference of 1919. Of these, the best are those which cover the fascinating and decisive history of Czechs and Slovaks under the Habsburgs. It is here that we first discern that great gulf fixed—despite recent historic events—between the Germans of the German States, later Germany proper, and those of Habsburg Austria. The Viennese authorities seem liberal indeed in their treatment of Czechs (though that could not be said of the treatment of the Slovaks by Vienna and Budapest) compared with the aims and pretensions sponsored by the Pan-German movement from which National Socialism drew its inspiration. In our day, now that Austria has been swallowed by Pan-Germany, this difference wears a menacing aspect for Czech and Slovak alike; yet it is to Miss Wiskemann's credit that she duly appraises, on many occasions, the Austrian element in the Germans of Czechoslovakia. She might, perhaps, have given her readers more of her own opinions on the possibilities of closer political and economic collaboration after 1919 between those two erstwhile industrial regions of pre-war Austria-Hungary: post-war Austria and Czechoslovakia. For her chapter on "The Economic Aspect" sticks perhaps unduly close to the Czechoslovak aspect of her book and its title. It is, none the less, the best essay on the economic background of the main problem which we have yet seen. Moreover, Miss Wiskemann has notably succeeded in elucidating the highly complex agrarian problem.

The author fairly examines the errors and shortsightedness of Czech administration, in the first flush of unleashed nationalistic fervour after 1920. Another good section is that in which the transfiguration of the non-co-operative Germans in Czechoslovakia into irredentist National Socialists is described. It is not generally realised how rapid and extensive has been this change; and Miss Wiskemann cautiously but clearly, indicates her belief in the efficacy of ultramontane propaganda and organisation in achieving it.

Those who expect her book to be more than a study, to proceed from diagnosis to prognosis, will be disappointed.

* "Czechs and Germans." By Elizabeth Wiskemann. Oxford University Press. 283 pages. 12s. 6d. net.

Her conclusion—"whatever the Government (of Czechoslovakia), friction there will be, so long as a racialistic nationalism is regarded as an absolute standard of good"—does not, however, prevent her from examining alternative proposals to solve the Czech-German problem: e.g. "cantonalisation," "federalism," "autonomy," "parallel administration," and the like. In all of these she lays bare one underlying puzzle: Where, and how, do you draw the administrative bounds? Her figures of racial distribution in certain towns and districts are most valuable; and she includes excellent maps and sources of information.

Shorter Notice

"How the City Works." By Oscar R. Hobson. "News Chronicle" Publications. 149 Pages. 2s. 6d.

To provide an accurate but popular account of the manifold markets which together make up "the City" is no simple task, but Mr Hobson has succeeded where others have failed. The ordinary layman demands a simple account of an organisation which is loosely knit, founded largely on custom, and so beset with technical detail that it is a lifetime's work to obtain a full understanding of any part of it. The City is often regarded with suspicion on this very account, for it has lacked the opportunity, enjoyed by some institutions, to "project" itself before the general public. Mr Hobson shows how all the markets are closely connected, physically and economically, with the banking system, and provides a clear exposition of our monetary mechanism. From finance to the exchanges, and thence to the Stock Exchange and the commodity markets, Mr Hobson guides the novice with the practised eye of the expert. The book deserves a considerable success.

THE BUSINESS WORLD

An Investment Horoscope—II

Who'll Buy Equities?

THIS week has seen an interruption rather than a break in a movement which has reduced British equity share values by 25 to 35 per cent. in the last eighteen months. A week ago, we suggested (page 664) that, putting war risks aside, the immediate outlook for equity shares depended on whether the present trade setback were a major or a minor one. On this point, the current issue of our *Monthly Trade Supplement* (published with this number of *The Economist*) suggests a number of indirect but not unhelpful inferences. Clearly, Great Britain is taking delivery of the industrial recession whose arrival Stock Exchange prices have been discounting so assiduously. Our business activity index has fallen 9 per cent. since last September, though it is still above the highest point of 1929. Deterioration has been most noteworthy in the textile trades. Though re-armament orders, so far, have not entirely staved off recession, the steel and engineering trades are still relatively busy. Internationally, the setback has been most marked in the United States and in countries with important textile industries and/or a considerable export trade. Finally, it would seem that the full

repercussions of the steep decline in world commodity prices during the last twelve months have not yet been seen.

Translated into investment terms, these conclusions do not rule out the possibility that the present business recession, though it has still some way to go, may be less severe than its predecessor. Contemporary share values obviously discount a more considerable setback than has, as yet, been experienced. Unfortunately, however, it must be admitted that the same facts are capable of a less consolatory interpretation. This absence of finality, indeed, explains the market's undecided and trendless state in many recent weeks. But coming months will at least decide the question, one way or the other, and in that connection (again excluding the possibility of war) two most useful pointers for the investor will be, first, events in the United States of America, and, secondly, the course of world prices.

Since self-respecting prophecy, at the moment, can hardly go further, it may be more profitable to ask what is likely to happen to equities, not in the next year or even the next five years, but in the next few decades. Even a

INDUSTRIAL ORDINARY SHARE PRICES
1908-1938

WHOLESALE PRICES AND INDUSTRIAL ORDINARY SHARE PRICES 1800-1938

The figures of wholesale prices used in this chart have been taken from "The Study of Prices" by Layton and Crowther. They are based on the index numbers of Jevons and Sauerbeck, continued by *The Statist*, and on the index of *The Economist*. The figures of share prices used in both charts have been obtained from Special Memorandum No. 37 of the London and Cambridge Economic Service.

generation is not too large a time-unit for a really well-considered investment policy; for the essentially continuous and dynamic nature of equity share investment governs both its technique and its objectives. The violent ups and downs which have been characteristic of ordinary share values, particularly since the war, suggest an exceedingly promising field for research into the possibilities of market operation "within the cycle," based on purchases on a rising curve of prices and sales, followed by complete abstention from the equity market, in the declining phase. As yet, however, that is a policy chiefly for investors who are exceptionally well informed, agile and lucky. For most people, cyclical fluctuations are still trials and tribulations which must be endured because they cannot be cured—a species of light affliction which should eventually bring the prize of long-term capital appreciation. Regarded from this angle, the small chart given on the opposite page may bring more comfort than reams of prophecy. On it we have plotted: (1) annual average figures, for the last thirty years, of ordinary share prices, according to the London and Cambridge index; (2) a ten-year moving average of these annual observations; and (3) a dotted trend line, which, for the thirty years, is in fact a straight line.

Within this chart, in brief compass, is an epitome of all the arguments for long-term ownership of equity shares. During the last thirty years, despite the Great War and its legacy of economic difficulties and crises, ordinary share values have appreciated on the average by no less than 3½ per cent. per annum. At the moment, prices are below, rather than above, the trend line. Is the trend itself likely to continue? Can one take a ruler and project the straight line, on our chart, to 1948, or 1958, or later?

Before an answer is attempted, something may be learned by a glance still further back into the past. Thanks to the scientific labours of the compilers of the London and Cambridge index, we have been able to chart, in a diagram at the foot of the opposite page, the course of representative British equity share prices since 1867. To this we have added an index of commodity prices for the whole of the nineteenth century. Examination of the figures confirms the view, expressed in an earlier article, that fluctuations in share values have been far more violent after than before the war. From 1867 to 1914, market cycles tended to run in series of three, a relatively large upward and downward movement being succeeded, more or less regularly, by two smaller ones. During that period, the trend of equities was steadily rising, but with a much slighter gradient than in post-war years, the average annual rate of increase over the whole period of nearly half a century being approximately 1 per cent.

Now, the growth of the national income is the really fundamental factor in long-term equity prices, and in the half-century before the war, the rise in general prosperity was exceptionally rapid. But the trend of commodity prices was, on the whole, adverse. Average prices had been halved in the first fifty years of the nineteenth century. Although new gold discoveries caused some appreciation in prices during the 'fifties and 'sixties, the downward trend was resumed in the early 'seventies and was only partially offset by a new rise after the establishment of the Transvaal gold-mining industry. In the pre-war period shown on our chart, increasing population and prosperity were pushing equity share values one way, while commodity prices were pulling, albeit with unequal force, in the opposite direction. There was, in fact (as the chart shows) a significant degree of correspondence in the timing of changes in commodity prices and shares prices during the whole of the period before the war.

What, then, of the future? Investors may assume, as an initial premise, that the population of Great Britain and other western countries will shortly cease to expand and, almost certainly, will begin to decline. Obviously the shares of companies engaged in industries whose past advance has owed more to the increasing numbers than to the rising standard of living of the population, will hold out diminished attraction in future. But the progress of new invention and other factors may well be powerful enough to prevent a corresponding decline in national pros-

perity as a whole, and even to produce a further long-term rise in national income.

If that be so, then, from the investor's viewpoint, much may depend on whether the "pull" of commodity prices is with or against the trend of share values. Perhaps the most remarkable feature of the last three decades has been the lack of success of all measures which might have been expected to produce a permanent rise in prices. The war and its aftermath carried prices, in 1920, to approximately three times their pre-war level. Yet by 1931-32 the index was actually lower than in 1914. Since 1931 the majority of the world's currencies have been devalued, and the monetary value of the world's gold reserves has been doubled. Yet prices after a moderate recovery are falling again.

It may be, however, that an attitude of fatalism, however natural, is dangerously inappropriate in this context. There have been many upward adjustments in the currency price of gold in the last six hundred years, and each has been the precursor of a period of rising prices. If the world were to apply the credit-creating technique learned in the last century to the gold reserves available to-day, not even the restraints of autarky on international trade (whose growth made so large a contribution to increased wealth in the last century) might be powerful enough to offset the impetus toward higher prices, particularly if it were reinforced by a regime of Budgetary disequilibrium and inflated State expenditure. In that event, commodity prices would be a stimulus to, rather than a brake on, rising equity share values.

The conclusion of the whole matter may be that, even if the long-term trend of share prices fails to maintain indefinitely the exceptionally rapid upward course of the last thirty years, its general direction is still likely to be favourable. The ordinary share has a substantial claim on the attention of serious investors.

The World's Platinum

DURING the last fifteen years, the supply of platinum has undergone a fundamental change, with consequent reactions on the price and demand for the metal. This transformation is one of the most interesting examples of the breakdown of a commercial market and of its subsequent reconstruction on a different basis.

Before the Great War, Russia supplied 90 per cent. of the world's output of platinum and the bulk of the remainder came from Colombia. Until the middle of the last decade, these two countries remained the most important producers, though the Russian output fell heavily after the Revolution. At the beginning of 1924, platinum was being sold at £29 per troy ounce, and was about six times as expensive as gold. At this price, the demand for the metal for industrial purposes was still barely greater than before the war, and the jewellery trade was responsible for more than half of the total demand, which was estimated at 200,000 to 225,000 ounces per annum.

The beginning of the transformation in the industry was caused by the rapid development after 1924 of the newly discovered deposits in the Transvaal, whose output in 1930

exceeded that of Colombia. In the following years, however, the South African supply again fell, owing to technical difficulties connected with the treatment of the ore, which kept production costs at a

high level. For the past ten years uninterrupted experiments have been carried out on these problems, and a year ago it was reported that much progress had been made. Should the experiments be successful, South Africa might increase the output from her rich deposits to something like 100,000 ounces a year. Even if this output were achieved, however, South Africa would still be overshadowed as a platinum producer by Canada, who has only lately developed her industry. The bulk of the Canadian output is a by-product from the nickel-copper ore of the Frood mine in Ontario, which was not extensively worked until the amalgamation of the old International Nickel Company with Mond Nickel at the end of 1928. From less than 17,000 ounces in 1925, Canadian production increased to 259,000 ounces in 1937, when she supplied considerably more than half of the output of the four countries included in the table. These countries produced more than 90 per cent. of the world's total supply; the United States, though not a producer, refines considerable quantities of Colombian platinum ore and recovers a large amount of secondary platinum.

From the beginning of the Canadian development, it was clear that the enormous increase in supplies could not be absorbed without a considerable fall in price. Such a fall might have been resisted by the older producers, but it was encouraged by the Canadian company, whose output is obtained as a by-product of other industries, and whose direct costs of producing platinum are therefore limited to the expenses of refining. At the present rate of output, these amount to 7s. or 8s. per troy ounce and are still well covered by the present price of £6 per ounce,

although this price is less than a quarter of that of 1924.

It is this tremendous fall in the cost of production and the consequent fall in price which have encouraged the use of platinum for entirely new purposes during the last ten years. The development has been hastened by the policy of the International Nickel Company, who have carried out research on the possibilities of platinum as an industrial metal. Its high melting point and specific gravity, its freedom from oxidation at high temperatures, and its comparative immunity from acid are all properties whose industrial value has not hitherto been adequately appreciated. In recent years, the electrical industry has greatly increased its purchases of platinum for such purposes as contact points, power switches, thermostats, resistors for high temperatures, electric control apparatus, clocks, etc., and the chemical industries have found it useful for laboratory equipment, for anodes, and as a catalyst in the production of sulphuric, acetic and nitric acids. Rayon firms now use platinum for spinnerets, glass manufacturers use it as a dye, architects employ it as a plating material. The armament industries have developed a considerable demand for

platinum and platinum metals for instruments, for reflectors and lamps for search-lights, and for contact points in aeroplane engines. As a result of these developments, the world's absorption of platinum increased

from the low level of 75,000 ounces in 1932 to 200,000 ounces in 1934, and to approximately 450,000 ounces in 1937.

The United States Bureau of Mines publishes annual estimates of the American consumption of platinum and of its distribution among the different industries, which may be taken as representative of the world's consumption. According to these figures, the jewellery trade remains the largest consumer of platinum, although its share of the total fell from 55 per cent. in 1928 to 37 per cent. in 1936. Owing to its much reduced price, platinum is becoming a popular jewellery metal which is replacing gold to an increasing extent. Dentistry is the second most important consumer and took 25 per cent. of the American deliveries in 1936, compared with 12 per cent. in 1928. The electrical and chemical industries accounted in 1936 for 14 per cent. and 13 per cent. respectively of the total consumption.

The fall in platinum prices from 1924 to 1936 has therefore been the sign of a healthy and expanding industry, though it has naturally brought considerable difficulties to the high cost producers. In the last few months, indeed, the fall has been accelerated by a decline in the demand for the metal for jewellery and ornamental purposes and by the cessation of the speculative buying which was very noticeable in the early part of last year. But the industrial demand has been stimulated by the expansion in armaments, and the fall in the price of platinum to a level in close proximity to that of gold opens the way to new industrial uses, which should ultimately restore a new equilibrium on the basis of the increased potential production.

Danish Agriculture

TO most urban-dwelling Britons, Denmark is probably known only by its popular Royal House and as a source of Danish bacon and butter. Such a simplification in the economic sphere has perhaps more justification than most. Although the agricultural exhibition now being held in Copenhagen to celebrate the 150th anniversary of the liberation of the peasants reveals the variety of Danish agricultural products, bacon and butter have played a dominating part in Danish economic life since the war. Between 1927 and 1929 these two commodities provided 60 per cent. of the total value of Denmark's merchandise exports; there were more pigs and only slightly fewer cattle in the country than there were Danes. Now that official measures have been taken to encourage British farmers to keep more pigs and produce more milk, it may be interesting to give a brief account of how these activities have been organised in the country from which we have drawn most of our imports of bacon and butter.

The emancipation in 1788 of the Danish peasantry from a form of serfdom led to a progressive rise in the social position and educational level of the agricultural population. Under the legislation of the late eighteenth and early nineteenth century, the enclosure of the village and waste lands created compact medium-sized farms, mostly owned by their occupiers. In 1934, only 2 per cent. of the total number of farms were more than 150 acres in size, and more than 90 per cent. were farmed by the owner. Nearly one-third of the population earned its living by agriculture, the great export trade of the country.

The geographical situation of Denmark, close to the two great industrial populations of Germany and Britain, has stimulated a highly commercialised agriculture, which is the exact antithesis to the subsistence farming with which English people have usually associated a country of small occupying owners. Danish farmers have concentrated on those dairy products which give a rapid turnover on the capital invested—bacon, butter and eggs—and have thus been able to achieve a high income from a small area. Although Denmark is primarily a dairying country, a Danish landscape is largely composed of unfenced arable fields, with a small stretch of pasture on which in summer the cattle are tethered in neat lines. Cereals, roots and rotation grasses occupy four-fifths of the cultivated area, of which only one-sixth is under permanent grass. Except for a few large farms specialising in cereals, the bulk of the crops are fed direct to the livestock, with a supplementary ration of imported maize and concentrates. High yields of cereals and roots are maintained by the use of fertilisers and of manure from the dense animal population. The milk produced by the dairy herds supplies not only the raw material for the butter trade but also a cheap source of protein for pigs and calves, in the form of skimmed milk.

The development of Danish agriculture in its present form is both the result and the cause of the co-operative movement, through which the produce of thousands of small farms has been collected, graded, processed and marketed. The co-operative bacon factory and the co-operative creamery, owned by their suppliers in the neighbourhood, are the focal points in the economic organisation; the local units are combined into a national federation, dealing with matters of common interest to agriculture. Through co-operative credit societies, the farmers have raised the capital to buy and equip their holdings; these societies have obtained their funds on terms almost as favourable as those secured by the Danish Government for its own loans, and have attracted the savings of the towns and a certain amount of foreign capital.

The co-operative structure, built up in the years before the war, was greatly expanded in the decade before 1930, when agricultural production and exports were steadily increasing. Its value was decisively proved during the last depression, when the difficulties caused by the falling prices, which beset farmers throughout the world, were

intensified for Danish farmers by the closure of their markets. The British bacon quota reduced Danish exports of bacon by nearly two-thirds between 1932 and 1936. British and German tariffs caused a steady fall in Danish exports of butter from 1931 to 1935, and the former level has not yet been regained. Exports of eggs were unfavourably affected in 1933 and 1934, and though they increased again in 1936 and 1937, the prices have remained relatively low. Actually, the average gross receipts of the Danish farmers in 1932-33 were barely two-thirds of those in 1928-29, and in 1936-37, the last year for which accounts are available, they were still only three-quarters of that level. The following table conveys a striking impression both of the expansion of Danish agriculture since the war and of the impact of the recent depression on agricultural exports:—

SOME DANISH AGRICULTURAL STATISTICS

* 1911. Includes fishing, forestry and horticulture. † 1921. ‡ 1930. § Midsummer of each year.

Before 1932, three-quarters of all pigs raised in Denmark were destined to be converted into bacon for British breakfast tables. The reduction in exports by more than one-half in four years involved, therefore, an abrupt and large reduction in the number of pigs to be reared. This reduction was enforced by allotting to each farmer a number of cards, each of which entitled him to send to his factory, within a given time, one pig to be sold as bacon to England. Pigs delivered in excess of the number allotted obtained a much lower price. The cards were allotted on a basis of land value, the pre-1933 output of pigs and that of skimmed milk. Through this mechanism, evolved by the central Agricultural Council and enforced by legislation, the number of pigs in Denmark fell from 4.9 millions in June, 1932, to 3.5 millions in July, 1936. As the number of pigs in the United Kingdom at the two dates was 3.2 millions and 3.8 millions, respectively, it will be seen that the increase in this country was smaller than the decrease in Denmark, though the latter is only one among a number of countries whose pig population has been affected by the British bacon quota. Further, at the moment when the British pigs marketing scheme broke down in January, 1937, because the price offered to the British farmers was insufficient to attract the requisite number of pigs, the Danish farmers were still making a very considerable profit on their sale of bacon to England.

The efficiency of the Danish dairy industry is based on a peculiar balance of specialisation and diversification. The total production of a Danish dairy farm, with its high output of field crops, is more varied than that of an English dairy farm of similar size. Imported feeding stuffs, though still essential to Danish agriculture, are not as important as in England, and a high standard of cultivation keeps the land in good trim. But if the criterion of specialisation be the absence of a wide variety of saleable commodities, then the Danish dairy farmer is definitely a specialist, for he sells, broadly, only bacon

pigs, milk, eggs, and a few livestock. These conditions compare too favourably with those in England, where farmers still produce many pigs that can be sold either for pork or bacon and are ideal for either purpose. The Danish farmer raises his pigs for a definite purpose—to produce good bacon. As a result the technique of feeding and of processing the bacon pig has reached high levels of efficiency. Except for a small proportion sold direct for liquid consumption, milk is paid for on the basis of its butter fat, and over 40 per cent. of the Danish dairy herds are officially recorded.

The reduction in pig herds caused by the British bacon quota has seriously modified the foundations of the intensive agriculture which the Danish farmers had established. Poultry are a partial substitute for pigs, and the greatly increased exports of eggs in recent years is a direct result of the enforced limitation of bacon production. There has also been a drive to increase the cereal and root crops so as to diminish the imports of feeding-stuffs. The fall in the value of Danish exports since the beginning of the depression necessitated a corresponding fall in the value of imports, and has thus emphasised the trend towards self-sufficiency. As exports of agricultural products still provide one-half of all Danish exports, changes in their value or volume react directly on the whole national economy.

Danish agriculture has been forced, therefore, to turn from the highly commercialised markets towards a more self-contained system. Every effort, naturally, is being made to expand and improve the sale of Danish products in foreign countries. But the sharp specialisation of the nineteen-twenties has been proved impracticable, and the Danish farmers have been compelled to adjust their efforts accordingly. They have met the critical years of the depression and the still difficult years of recovery by improving their technical efficiency and by maintaining the reputation of their products. The co-operative movement has provided a central organ, which together with other agricultural interests, has represented the farming community in discussions with the Danish or foreign Governments, and has provided a system of self-government to carry out the control of production necessitated by the British bacon quota. In short, the protectionist policies of Britain and Germany have checked the further development of Danish agriculture along the lines laid down in the nineteenth century. But while its superstructure may be altered, its foundations remain as they were established one hundred and fifty years ago. Danish agriculture is still a democratic community of farmers, who own the land they work and freely associate with each other to promote their common interests.

Finance and Banking

End of the Dollar Scare.—This week the new dollar scare has reached its end. As the table in our note on the Bullion Market shows, dealings at the fixing have shrunk to more normal proportions, while the premium, which last week was 12½d. per fine ounce, fell to 8d. on Tuesday and to 5d. on Thursday. On Tuesday, Mr Morgenthau roundly declared at Washington that there was no substance in the rumours that the dollar was about to be devalued. Everyone, of course, is free to place his own interpretation upon any denial, but there is little ground for believing that fresh devaluation was ever contemplated. In the world's present frame of mind, however, the scare was, in a sense, merely the logical consequence of President Roosevelt's reversion to reflation, backed by a vague fear that if American recovery fails to materialise by the autumn, the President may think it time to look round for fresh stimuli. But the Tripartite Agreement is still in being, and there would be an obvious objection to any policy likely to prejudice the already protracted Anglo-American trade negotiations. It is also significant that American wholesale prices have recently become somewhat firmer. A moderate recovery in prices would be the surest way of putting an end to any talk of fresh devaluation. Meanwhile, the authorities in London have successfully dealt with this latest scare, and, in the process, have made a considerable profit.

Negotiations with Germany.—The visit last month of British representatives to Berlin has been followed this week by the arrival of a German delegation in London, for the purpose of continuing the discussions over the Austrian debts. The default on June 1st, followed by Dr Funk's remarks just over a week ago, created a bad impression in the City, which was undoubtedly ready to support the British Government in determined action. At the moment Germany may be prepared to suggest some compromise solution, but the need for a firm stand by the British Government remains essential. Incidentally, Dr Funk raised the question of the rates of interest upon both the Austrian and also the Dawes and Young loans. The latter rates are admittedly high on any absolute comparison with those of loans issued by governments with a good credit rating in the present period of low interest rates. But an essential ingredient in every interest rate is the "risk element." No debtor can have it both ways, and if

doubts arise as to his ability or willingness to pay, then the rate of interest imposed upon him must remain high. This is an additional incentive to Germany to arrive at a settlement which precludes any risk of further default. But satisfaction of just claims must precede concessions.

German Clearing and Standstill Credits.—One aspect of the Anglo-German discussions on former Austrian debts which has hitherto received little public discussion, but has certainly not escaped the parties immediately interested, is the possible reaction of a unilaterally imposed clearing on the Standstill credits. Those credits and their service are at present in an altogether privileged category of German debts—certainly more privileged than the Dawes and Young loans. At no time has there been any suggestion of default on these credits from the German side. If a clearing were applied by this country it might be expected that their inviolability would disappear. The banking creditors would no doubt occupy a privileged position "in the queue," but at best this would compare unfavourably with their present status. Some such reasoning appears to have prompted certain banking creditors of Germany, during the past few days, to accelerate their sales of registered marks arising out of the repayment in marks of Standstill credits. These operations have been partly responsible for the weakness of the registered mark, which has fallen to 56 per cent. discount—a record for all time. Another contributory factor in the fall has been the slump in tourist travel to Germany and Austria since the *Anschluss*. Although travel marks are now available for tourist expenditure in former Austria as well as Germany, it is clear that their total sales are to-day but a fraction of those of this time last year.

The decline in registered and travel marks has been accompanied by signs of weakness in other members of the prolific family of blocked marks. This has been particularly true of *Auswander* or "Jew" marks, which have fallen to a low record of 90 per cent. discount as a direct result of the intensification of the anti-Jewish campaign in Germany. An edict accompanying this campaign rigorously limits the amount which can be liquidated by an individual through the market for *Auswander* marks. The exodus of

Jewish emigrants and their capital, consequently, has assumed a less official form, by way of a considerable smuggling of reichsmark notes out of Germany. A substantial black market has developed in Amsterdam and is overflowing to London. The rates quoted have touched 42 marks to the £. To re-enter into circulation these notes must be smuggled back into Germany, and the peril of their journey determines their comparatively low exchange value.

N.D.C. and Insurance Cos.—The Committee stage of the Finance Bill has provided an opportunity this week for considering an undoubted grievance of insurance companies over their liability to National Defence Contribution. Tenacity in defending illogical and anomalous views is, unfortunately, the converse of the zeal in maintaining questions of high moral principle which is the hall-mark of the British public servant. The present law, under which all the investment income of insurance companies, like that of banks and building societies, is subject to N.D.C., appears to be based partly on the lumping together, under the single heading "assurance," of a number of operations which in fact have little in common, and partly to a mistaken analogy with income-tax practice. The companies never had any quarrel with the Treasury's insistence that they should pay N.D.C. on their life investments. The principal of life investments is held against claims for contracted amounts, which, sooner or later, must necessarily mature. The interest represents income out of which bonuses to policy holders and dividends to shareholders can be paid. And in any case, sums allocated as policy holders' bonuses are outside the computation of profits for income tax under the Finance Act of 1923—and the mutual offices, whose profits belong wholly to policy holders, thus pay no N.D.C.

In motor car and marine and similar branches, however, the case is different. Premiums are fixed, after actuarial computation, in the expectation that only part of the risks underwritten will produce claims, and that the total premium income, broadly, will cover such claims as do mature with a margin of profit for the insurer. The fact that premium income is invested is merely incidental; if it were buried in the ground it would equally serve its purpose, in theory, so long as it were available when required. The interest received on it is, in fact, investment income in the same sense as the interest received by an industrial company on its holding of War Loan, which is exempt from N.D.C. But if an industrial concern invests its reserves in its own line of business, instead of in outside securities, the resulting income is, rightly, chargeable with that tax. And if the holding of adequate reserves is an essential part of prudent underwriting—as it certainly is—then income from reserves invested "in the business"—which, for insurers, necessarily means in securities generally—can equitably be charged with N.D.C. On what basis, then, ought these necessary reserves to be assessed? The practice of the insurance world is to reserve 40 per cent. of premium income to cover unexpired risk when accounts are made up and to make further reserves for claims outstanding but unpaid and, more broadly, for the general risk of catastrophe. We go to press before the Government's decision is known, but it would seem that an amendment under which essential reserves would amount, at most, to a year's premium income would command considerable support.

Gold Options.—The recent expansion in the activity of the gold market was accompanied by a considerable increase both in forward operations in the metal and in option dealings in gold. The latter form of activity is by no means a new development, but in the recent gold scare it increased appreciably. Option business in gold is conducted by comparatively few firms and clearly appeals only to a speculative clientele. It was essentially a one-way business during the recent phase, when the prevailing

view was that any change in the currency price of gold could only be upward. Consequently the demand from the public has recently been wholly for call options. Rates naturally tended to vary within fairly wide limits, but a quotation of 5d. per month over the spot price might be taken as representative of much of the business recently done. The firms handling it have, on the whole, adopted the practice of covering themselves to the full extent of the options they have sold. Thus, for a three-months call option for £100,000 of gold the price quoted might be 1s. 3d. The seller would buy the whole of the amount "spot" and finance it for the period of the deal. The practice of the bullion market differs from option dealing in the Stock Exchange, where it is customary to cover operations, by actual purchases or sales to the extent of only 50 per cent. The rates quoted for options in gold were appreciably dearer than those for forward deals. The normal rate recently quoted for forward sales of gold was 3½d. per month over spot. This, on the basis of a spot price of 140s. per ounce, represented an annual interest charge of 3 per cent. out of which the seller must finance the gold during the currency of the operation and pay the costs of handling and storage. It follows that any operator who desired to back his view of a rise in the currency price of gold, and had both the standing and the resources to do so through the forward market, would have confined his operations to this sphere and avoided the more expensive option market.

Bank of British West Africa.—The latest accounts of this bank reveal several marked changes from the previous year's figures. There is again a notable increase in deposits, but the bank has not been able to find employment for all its resources. The result is that cash is twice as large as a year ago, and is now equal to over half the bank's deposits. Conversely, there has been a heavy drop in advances, which is sufficient to explain the falling-off in net profits:—

	(Thousand £)		
	1936	1937	March 31 1938
Deposits	7,373	8,695	9,852
Cash	1,739	2,325	5,866
Investments	3,833	3,062	2,440
Treasury bills	100	80	170
Other bills	614	533	363
Advances	2,559	4,348	2,540
Net profit for year	55	91	60

The report of the directors provides a clue to the year's movements. It ascribes the reduction in profits mainly to recent difficulties in connection with the marketing of the cocoa crop in the Gold Coast Colony and Ashanti. This obviously has affected the demand for credit from customers in those areas. It would be mistaken, however, to conclude that the bank is wholly dependent upon those particular areas; for it does an

important business in Morocco, Gambia, Sierra Leone and Nigeria. Thus its activities are fairly well spread, though they are confined to primary producing countries.

P. and O. Banking Corporation.—The accounts of the P. and O. Banking Corporation for the year to March 31 last show a further downward trend in profits, which, after the usual appropriations to contingency account and investment reserve, total £85,228 against £102,481 for the previous year. The dividend is reduced from 5 to 4 per cent. The corporation has no doubt suffered from the disturbed conditions in China and from the effect of lower commodity prices on economic conditions in India and the Federated Malay States. At last year's meeting the chairman referred particularly to certain adverse influences, which must needs have continued during the latest financial year. The most important of these was the diminished profitability of exchange operations, owing to the increasing official control of the rupee exchange market. Narrower margins on exchange operations in India and China were cited by Mr Arthur Willis as a direct contributory cause of the falling off in profits. Eastern banks, he added, would have to rely in the future to an increasing extent on the financing of internal trade and local industries—a process which unquestionably has made further headway during the past twelve months. The balance sheet position again shows every sign of strength and liquidity. The main changes have been a switch from British and Foreign Government and municipal securities into Indian and Colonial Government stocks. Bullion in hand and in transit, which at the end of March, 1937, amounted to £495,341, had fallen a year later to £34,503. The figures

afford an interesting commentary on the reduced outflow of gold from India.

Banca d'Italia Meeting.—There are some significant contradictions in the report of the Governor of the Banca d'Italia, presented at the last general meeting of shareholders. The report opens with a review of the setback in world economic conditions which occurred during the latter part of 1937. It goes on to express unexceptionable sentiments about the indispensability of better political conditions and greater stabilisation of currencies as conditions of any lasting improvement in economic affairs. Then, without a break, the report launches into a panegyric of Italy's march towards economic autarky. From this point onwards the international aspects are forgotten, except in so far as they provide a justification for "realising in the shortest possible time the highest degree of independence for the economic life of the country." Import trade in partly or wholly manufactured materials is condemned, not only because it involves the outlay of foreign currencies but because "it implies a state of inferior or incomplete industrial organisation which can and must be rectified by the zealous work of the Italians." The description of the part played in this drive towards autarky by the official control of the foreign exchange market is interesting for its revelation of the extent to which foreign assets of Italian nationals, compulsorily disclosed to the authorities, have been liquidated. It is stated that by the end of last year, some 68 per cent. of the foreign currencies and 59 per cent. of the foreign securities declared by Italian nationals and firms had been taken over and liquidated. As an indication of the pace at which Italy is squandering her reserves this admission is most instructive.

MONEY MARKET NOTES

Foreign Exchanges

WITH the subsidence of the dollar scare, the New York rate has become firmer. After rising to \$4.98½ last week, sterling dropped to \$4.95½ on Wednesday, rising fractionally to \$4.95½ the following day. Swiss francs have followed the dollar, sterling falling from Frs. 21.67½ to Frs. 21.56½, and then rising to Frs. 21.59½. This first movement was helped by covering of open forward positions in Swiss francs. Belgas followed much the same course, the London rate falling from bel. 29.26½ to bel. 29.20½, rising later to bel. 29.22½. All these movements can be attributed to the recovery in the dollar, but the recent weakness of the belga in London is also attributed to the drop in the London gold premium; for the belga is based on gold. The spot Paris rate has been held between Frs. 177.90 to Frs. 177.95. Early in the week when the French Chamber went into recess, francs were bid, and the French Control sold at Frs. 177.92, but later in the week the French Control bought a few francs at Frs. 177.95. Forward francs also strengthened early in the week, but have since relapsed. Saigon piastres have now returned to their parity of Frs. 1,000 per 100 piastres, and speculators who bought at Frs. 1,030 and Frs. 1,065 will have to meet a fairly heavy difference. The Shanghai rate is weak at 8½d., and the Hong Kong dollar is steady at 1s. 2½d.

The Bank Return

This week has witnessed a further return of currency from the hands of the public, and so the note circulation has shrunk by £2.4 millions, while the Reserve has increased by the same amount. Bankers' deposits, however,

have not benefited from this fresh influx of currency, as it has been more than neutralised by a reduction of £4.2 millions in Government securities held in the banking department. It looks as if the authorities are pursuing their usual policy of keeping the total resources of the banking department at a constant level, for the result of these various movements is a net decrease of only £1.3 millions.

Last week other deposits had risen by £8.0 millions as the result of the lodgment of the Defence Loan application money in a suspense account pending allotment. Now that allotment is complete, this money has been duly transferred to public deposits, and this explains this week's decrease of £7.9 millions in other deposits and increase of £10.1 millions in public deposits. The point has been raised that the application money amounted to more than £8.0 millions, the reason being that the Defence Loan was over-subscribed. This is correct, but it is necessary to remember that not all the subscription cheques had been cleared by the close of business on the date of last week's Bank return.

The Money Market

Variable conditions have prevailed this week. The clearing banks had

plenty of money to lend, as for the moment they have reduced their bill purchases to a minimum, and so there was practically no calling on any day this week. On the other hand there was some shortage of bond money. The market last week had a 59 per cent. allotment of new Treasury bills, and so there were heavy payments to be made this week. This affected not only the discount houses, but also those banks and other houses who are normally lenders of bond money. Borrowers naturally did not like to go to the clearing banks who charge up to 1 per cent. for loans against bonds, and so ½ per cent. was paid for bond money. Business in bills has been limited as the clearing banks are reluctant buyers. The ruling rate is ½ per cent. for most classes of bills, but there is little demand for July bills, as money is always plentiful during that month.

No pressure for funds is anticipated on June 30th, but there has been some precautionary borrowing over the half year at rates of ½ per cent. early in

the week and ¾ per cent. later on. Still the main relief will come from the maturity of old Treasury bills and the absence of any payment for new bills. As suggested last week, it is thought

that July 1st will be the more difficult day from the market's standpoint, as the whole of that week's new Treasury bills will have to be paid for, as well as the Defence Loan call. The banks, however, will then be lending and buying bills once more, while the Defence Loan money has enabled next week's Treasury bills issues and payments to be cut down to £5 millions below the week's maturities.

The Bullion Market

As explained in a Financial Note, the dollar scare has now subsided, and about one-third of this week's offerings

at the fixing have consisted of re-sales. There is still, however, a hoarding demand for gold, which suggests that Mr Morgenthau's statement has not wholly reassured the Continent. The premium has now run down to 5d., but the London price is now approximately 1s. per ounce higher than it was in April.

The silver market has been very quiet but the London price has risen in sympathy with the stronger tone of the dollar exchange. There has been practically no offering of silver, even although the price is well up to the American parity, while bear covering has led to the continuance of a moderate demand. Another consignment of Spanish silver, amounting to about

5,000,000 ounces is reported to have passed through Perpignan.

Investment

How Far Recovery?—Investment markets in London and New York have this week provided a demonstration of unsuspected life. This change has been sudden, and its causation somewhat complex. Last Saturday, turnover in the New York market amounted to no more than 100,000 shares—the lowest level for some twenty years. On Monday, however, turnover exceeded one million shares, and the Dow Jones industrial index jumped nearly 5½ points. In London, similarly, the markets started with a show of brightness which may have flattered the volume of business, but was regarded in many quarters as significant. The desire of Italy to bring about the implementation of the Anglo-Italian pact was construed as an optimistic political pointer—an inference encouraged in no small degree by the character of certain Press comments. Perhaps the change may best be described as of spirit, rather than of tactics. Gilt-edged stocks, in which alone the bullish operator has been able to find profit in recent times, were neglected, and renewed attention was paid to good quality industrial equities. These trends were continued, both in London and New York, on Tuesday, and the continued irregularity of gilt-edged stocks suggested that London was following New York rather than discounting any far-reaching political appeasement. By the close of business on Thursday (when turnover reached the remarkable total of 2,400,000 shares) the Dow Jones index, at 127.41, had gained 14.18 points, while the rails index, at 24.60, had broken through the "critical" level of 23.50, and thus, according to the chart-readers, had confirmed a "change of trend." The mid-week check to commodities and home industrials in London was accompanied by renewed support for gilt-edged securities, but an all-round advance was resumed on Thursday, in which the new Defence Loan reached 1½ premium, and commodities took on fresh strength.

The manifest willingness of the market to seize upon the semblance of favourable factors in the present industrial and political situation does, of course, represent a modification of outlook. But it would be premature, at present, to regard it as a signpost to a sustained recovery. In New York, the market was ripe for a technical rebound, and it happens that official confidence in an autumn recovery has coincided with a slight improvement in steel output and prospects to support a speculative buying movement. A ten-point recovery in so short a period invites the possibility of profit-taking, and this might go far to offset more bullish views on the economics of "pump-priming." In London, many observers have felt that present share prices discount the assessable effects of moderate trade recession, and might be capable of recovery on any lightning of the political atmosphere. Like the possibility of autumn recovery in the United States, however, this may perhaps be described as legitimate hope rather than reliable expectation. There is, at least, no new economic evidence which suggests that a change of economic trend

is at hand, unless the modest signs of a revival in residential building activity in the United States—so long awaited—prove a reliable harbinger of things to come.

Trustee Act Reform.—Sir John Simon's statement in the House of Commons on Tuesday that he sees no sufficient reason for considering the amendment of the Trustee Act at the present time is not the first rebuff with which would-be reformers of trustee investment rules have been faced. The question, indeed, is perennial, and the answer itself might be described as a hardy annual. In answer to a supplementary question, the Chancellor of the Exchequer reminded Mr Assheton that the Cave Committee which examined this matter "some years ago"—its report, in fact, was presented in 1928—found in favour of the present rules. It is, of course, true that the Trustee Act merely prescribes certain tests for the award of trustee status, and does not proclaim a selected list of securities. In actual fact, during the phase of low interest rates the scope of its rules has been greatly reduced, for certain dated stocks are inadmissible if they stand at a premium of more than 15 per cent., or at any premium if redeemable within fifteen years. The loss of status by many railway stocks, eligible in earlier times, has further reduced the range of investments open to trustees. And critics have no difficulty either in disclosing the dubious investment principles by which certain stocks are included, or in proving the manifest quality of many stocks which, largely by accident of the calendar, remain outside the charmed circle. Parliament must remain the final arbiter of trustee status. But revision of the list under the present system must always be piecemeal and unduly prolonged. We venture, therefore, to revive a suggestion, ventilated in these columns some years ago, that a statutory commission should be set up—consisting, say, of a judge or eminent barrister as chairman, a representative of the Stock Exchange, a banker, an actuary, an accountant, a Treasury official and the Public Trustee—which would undertake the revision of the trustee list as investment conditions changed.

Canadian Investment Prospects.—The annual budget statement presented by Mr Dunnington to the Canadian Parliament last week has attracted no little investment interest. After eight years of very large deficits, the Dominion was only \$13,775,000 short of a balanced budget during the fiscal year to last March. Total revenue amounted to \$516,692,000, and total expenditure (which was necessarily expanded by drought relief) to \$530,467,000. Increases of over \$25 millions in the sales tax (to \$138,054,000) and of \$18 millions in income tax (to \$120,366,000) witness the industrial character of last year's budget progress. For the current year, estimated expenditure is \$524,600,000, and estimated revenue \$501,700,000. The Finance Minister, in fact, appears to be relying upon the present favourable crop prospects in

the Dominion—coupled, perhaps, with hopes of industrial recovery with the assistance of the United States—to cover the estimated deficit. The agricultural outlook in Canada has been described as the best since 1930, and world supplies of hard Northern wheat are low enough to suggest that demand for the Canadian crop should be good despite the prospect of surplus supplies from other countries. The potential effect of a good crop upon the Dominion's credit, its railway finances, and upon domestic industry needs no investment emphasis. Mr Davidson's speech at the British Empire Trust meeting this week, however, underlined the Dominion's economic relationship with the United States to a greater extent than recent trade forecasts from Canada. And he was forced to comment rather sharply on the harm which Alberta's financial policy has wrought upon the whole structure of Canadian credit. It is clear, indeed, that a substantial and sustained recovery will be necessary to provide satisfactory results for the investor during the current year. An index of the present position is provided by the Canadian Pacific Railway traffic, which show a fall of \$4,923,000 for the period to June 14th, compared with the corresponding period of 1937, while net receipts for the four months to April were \$3,743,000 lower at \$1,748,000.

Company Reorganisations.—It is sometimes impossible to conform with the now established principles which should govern capital reorganisations. The equitable balancing of sacrifice between preference and ordinary shareholders is an art rather than a science, and an ounce of expediency may be justifiable if it promises to remove a ton of opposition. These reflections are suggested by this week's batch of capital reorganisation proposals. The plan outlined by the directors of Brazilian Warrant Agency and Finance, however, can have few precedents. It does not represent a reorganisation scheme in the usual sense. Briefly, the board has decided that its present resources are in excess of its trading requirements, for the Brazilian business has been hard hit by depression in the coffee trade and by dire exchange restrictions. It is proposed, accordingly, to repay 7s. 6d. on each £1 7 per cent. cumulative preference share, and to pay the dividend on the £1 shares to the end of this month. Although the full dividend has been regularly paid, in only three years out of the last decade was it fully covered by earnings. The directors proceed, however, to make a proposal which is strictly irrelevant to the return of capital *per se*, under which the dividend on the residual preference capital would be reduced to 5 per cent., with the right of participation, *pari passu* with the ordinary shareholders, to a further 2 per cent. To adjust the capital to accord with current trading conditions is one thing; to propose a permanent change in the status of the preference shares, which would have the gratuitous effect of bringing the ordinary capital much nearer to dividends, is quite another. The proposal, in fact, seeks a unilateral sacrifice from the preference shareholder, without posing the question whether a comprehensive capital rearrangement is desirable, and it should provoke opposition from preference shareholders.

A.B.C. Coupler and Engineering is a small company with a chequered earnings record in recent years. In this instance, the directors propose to cancel seven years' arrears of dividends on the 7½ per cent. £1 preference shares, to reduce their dividend rate to 6½ per cent. non-cumulative, and to allot nearly 37 per cent. of the equity in compensation. These terms appear reasonable. Meanwhile, controversy continues on the subject of the Trust Agency Company of Australasia proposals. The capitalisation of the company, as we described it in our issue of June 11th, scarcely permits the formulation of a scheme which allows more than rough justice to the markedly conflicting interests of ordinary, option ordinary, and preference shareholders. It would surely be difficult to devise a more expedient solution of an almost intractable problem.

Company Notes

General Electric Record.—The announcement of a 20 per cent. distribution by General Electric gratified the market last week, and the full report has further encouraged investment interest. Trading profits and investment income, after allowance for contingencies, reached a new record level of £1,772,181, compared with £1,604,512 for the year to March 31, 1937. After making a substantially increased provision of £400,000 for income tax and N.D.C., and raising the depreciation charge from £343,248 to £368,642, the residual earnings for the ordinary stock amount to £759,404, compared with £745,290. The company's profits trend is set out in the accompanying table and chart:—

	Years to March 31		
	1936	1937	1938
	£	£	£
Trading profits and investment income, after contingencies	1,485,153	1,604,512	1,772,181
Depreciation	298,813	343,248	368,642
Taxation	194,245	275,000	400,000
Pension fund	43,772	45,569	54,008
Fees	4,585	4,836	4,287
Preference dividends	193,725	190,569	185,840
Ordinary stock:—			
Earned	750,013	745,290	759,404
Paid	436,536	551,036	608,764
Earned (%)	25.8	23.7	24.9
Paid (%)	15	17½	20
Reserve	100,000	125,455	100,000
Carried forward	680,495	749,294	799,934

GENERAL ELECTRIC PROFITS, 1929-1938.

Up to March, 1934, the company's accounts showed the dividend distributions before deducting tax. Subsequently, the company has charged the full tax liability, and has shown dividends net. The break in the chart at this date is intended to mark this accounting discontinuity.

The directors show that these profits were earned during a period of "exceptional prosperity," and acknowledge that there were signs of slackened demand during the latter part of the year. Overseas business has evidently contributed to no small extent to last year's heightened activity, while the inflow of orders has continued at a "satisfactory level." Last year's expansion in business called for the liquidation of over £1 million of gilt-edged securities, and corresponding increases in debtors and stocks. Whether this rate of activity will be maintained abroad or at home during the current year is perhaps more doubtful. The company's re-armament interests would scarcely offset the effects of a significant industrial recession, coupled with reduced demand in export markets. At 74s. 3d. the £1 ordinary stock units yield £5 7s. 9d. per cent.

Guest, Keen and Nettlefolds.—The preliminary figures of Guest, Keen and Nettlefolds (discussed in *The Economist* of June 11th, page 616) are confirmed by an impressive report. In the following table we analyse the full figures for the past three years:—

	Years ended March 31		
	1936	1937	1938
	£	£	£
Profit	1,047,720	1,150,525	1,326,735
Depreciation, etc.	125,000	150,000	150,000
Debt service	102,274	101,797	101,268
Preference dividends	326,732	326,732	326,732
Ordinary stock (tax free):—			
Earned	493,714	571,996	748,735
Paid	321,724	386,068	482,585
Earned %	7.7	8.9	11.6
Paid %	5	6	7½
Special allocations	100,000†	150,000†	350,000*
Carry-forward	531,558	567,486	483,636

* £100,000 to investments reserve and £250,000 to reserve fund.
† Written off under works reorganisation scheme.

The report records that although trading conditions were good during the year, raw materials were difficult to obtain, and the company's rolling mills had to accept restricted deliveries. Another manifestation of boom conditions in the heavy industries last year is shown in the delay in completion of the steel bar and hoop mill at Cardiff. The considerable progress actually achieved is marked by net additions to plant totalling £619,827 during the year, compared with £387,930 for the preceding period. The high gross yield of £7 16s. 3d. on the £1 ordinary stock units reflects the less certain outlook for the group during the current year, during which its manifold interests in sheets, constructional steel, wire, screws and bolts are unlikely to fare so well. As a yardstick, rather than a forecast, it might be pointed out that a fall of 50 per cent. in earnings would still cover a 5 per cent. tax-free dividend—which in turn would correspond to a potential gross yield basis of £5 4s. 3d. per cent.

Lancashire Cotton Profits.—The directors of Lancashire Cotton Corporation last week announced a net trading profit of £201,232 for the six months to April 31st. A similar announcement a year ago showed that £176,052 was earned for the half-year to April, 1937, and from the Corporation's full accounts for the year to October 31st, it may be inferred that profits for the second half of the year amounted to £432,778 net. Although the results for the latest half-year thus show a sharp fall in profits, they are more satisfactory than many observers had expected, for the setback in Lancashire gathered rapid force from the early winter. Assuming that a further sum of £155,000 is required this year for depreciation, full earnings' cover for the debenture and preference service would require a profit of slightly less than £100,000 during the current half-year. It is clear, in fact, that the prospects for the ordinary stock must be regarded with reserve, and the 5 per cent. non-cumulative preference stock, now quoted at 14s. 4½d., reflects a cautious valuation of prospects for the ensuing year, even assuming that full dividends are received this year. While the Corporation's stock position is protected by the standardisation of process stock, difficulty has recently been experienced in maintaining profit margins, and despite the recent improvement in cotton prices, a significant increase in demand is nowhere evident.

The Week's Colliery Results.—While many colliery reports show a significant improvement in profits for 1937-38, their record, as a group, is no longer one of consistent progress. Excellent results in 1936-37 were attributed jointly to improved prices resulting from the introduction of the selling schemes in August, 1936, and to rising industrial demand. These conditions continued to prevail during most of 1937, but the latest profits show, in some instances, the effects of rising costs and of the recent slackening in demand. Carlton Main Colliery profits for

the year to March 31st are, however, entirely satisfactory. Total profits of £169,842 compare with £150,082, the latter sum being slightly below the 1935-36 level. Although these profits are the highest in a decade, they probably understate the true progress in earnings, since they are shown after deduction of tax. Virtually the whole of the increase in profits is available for the ordinary shareholders, who receive a dividend of 6½ per cent., against 5 per cent., out of earnings which—as in recent years—cover the distribution with a small margin. The company was able to pay an ordinary dividend throughout the last depression, but a current yield of £8 19s. 6d. per cent. on the ordinary shares at 14s. 6d. shows that investors view with caution the industry's prospects during 1938.

Improvement in 1937-38 is also shown by the increase in the Powell Duffryn Steam Coal dividend from 7 to 7½ per cent., while Welsh Associated Collieries (whose ordinary capital is held to the extent of about one-half by Powell Duffryn Steam Coal) has increased its distribution from 1 per cent. to 1½ per cent. Powell Duffryn Associated Collieries—the merger company—has increased its total dividend from £450,000 to £475,000. Stephenson Clarke (which acts as selling organisation of the group) shows a slight reduction in net profits from £211,710 to £208,908, although trading profits were over £60,000 higher at £589,323. The dividend is maintained at 10 per cent. The experience of the Butterley Company in 1937-38 was less encouraging. Total income was £12,000 lower at £348,759, before charging £69,756 (against £63,535) for depreciation. While the dividend is maintained at 8 per cent., tax free, it is covered by reduced tax free earnings of 9.6 per cent., against 10.9 per cent., and the reserve allocation is cut from £50,000 to £30,000. A current yield of £7 13s. 6d. gross on the shares, however, represents a smaller return than is available from other coal shares.

Allied Ironfounders' Setback.—Although the latest year's results of Allied Ironfounders are presented without comment, various reasons may be suggested for the decline of 15 per cent. which is disclosed. The group chiefly manufactures cast iron goods for the building trades, and while greater diversification is being introduced in the business, the recent slackening in new construction can hardly have left it unscathed. The rising trend of costs may have been more pronounced than in 1936-37, when its first effects were masked by a substantial increase in turnover. Allied Ironfounders is mainly a holding company, but it discloses the trading profits of, and taxation paid by, subsidiaries, and the report now includes a consolidated balance sheet. Real variations in trading profits can therefore be traced in the following table:—

	Years ended March 31		
	1936	1937	1938
	£	£	£
Subsidiaries' trading profits	332,036	354,606	336,736
Subsidiaries' taxation	71,265	78,444	106,995
Parent company's total profits	265,502	282,261	240,372
Tax, interest, etc.	17,438	16,920	10,894
Central depreciation, etc.	15,000	30,901	30,000
Preference dividend	53,521	52,651	51,346
Ordinary shares—			
Earned	179,543	181,789	148,132
Paid	124,818	142,106	123,070
Earned %	14.4	14.4	12.0
Paid %	10	11½	10
Research and general reserves	35,000	36,671	20,000
Income tax refund	Cr. 1,919	Cr. 1,448	Cr. 1,289
Carry forward	146,411	150,871	157,222

The fall of £42,000 in the parent company's profits, it will be seen, is greatly in excess of the £18,000 decline in the group's trading profits, a disparity which is attributable to a substantially increased taxation charge. A reduction of £5,000 in Allied Ironfounders' own provision for income tax softens the blow a little for ordinary shareholders. The distribution is reduced to 10 per cent. by omitting the cash

bonus of 1½ per cent. paid a year ago, and the chief change in reserve allocations is the absence of any provision for research and development. The consolidated balance sheet shows that roughly half the total assets consist of current assets amounting to £1,349,958. An excess of £338,077 in the book value of the shares in subsidiaries over their net tangible assets compares with a total book cost of £2,974,564 in the parent company's balance sheet. Allied Ironfounders continues to extend its interests, for the trade investment item has risen from £23,000 to £35,000, and amounts due from subsidiaries are up from £373,329 to £460,610, with a corresponding reduction in cash. Although the company is seeking increased sales of domestic appliances in houses already built—in order to lessen its dependence on new building activity—the decline in the latter and the possibility of some reduction in general purchasing power limit the immediate prospects for the shares, which yield £9 8s. per cent. at 21s. 3d.

Rolls-Royce Report.—Although the Stock Exchange has raised the quotation for Rolls-Royce £1 ordinary stock units from 91s. 3d. at the date of the dividend announcement (which itself created little stir a month ago) to 96s. 3d. at present, there are few features in the full report which at first sight account for the recovery. Total profits, after making adjustment for contingencies, show a slight advance from £393,498 to £396,378, but the 1937 figures, unlike those of the previous year, include dividends received from subsidiaries. In January it was announced that Bentley Motors (1931) had declared a dividend of 100 per cent., and this would appear to represent an additional sum of £20,000 gross towards the latest year's profits. If this supposition is correct, therefore, the Rolls-Royce group itself was responsible for a smaller amount of distributable profits last year. Our analysis of the latest profits below shows that the 22½ per cent. dividend is covered by earnings of about 25 per cent.:—

	Years to December 31		
	1935	1936	1937
	£	£	£
Total profits, after contingencies	353,302*	393,498*	396,378†
Income tax and fees	73,500	93,261	103,119
Pension fund	30,000	30,000	30,000
Ordinary stock:			
Earned	249,802	270,237	263,259
Paid	191,146	223,296	242,959
Earned (%)	31.6	26.8	25.1
Paid (%)	22½	22½	22½
Reserve funds	50,000§	35,000§	22,266
Carried forward	81,972	93,913	91,947

* Includes no profits from subsidiaries. † Including subsidiaries' profits to extent of divs. received. § 25 per cent. capital bonus declared January, 1937, on which 15 per cent. final dividend paid. ¶ To dividend equalisation: £50,000 in 1935 and £5,000 in 1936.

The unknown extent of directorial discretion in striking disclosed profits naturally prevents any hard-and-fast interpretation of these results. But it may be surmised either that the car section of the business has experienced more difficult trading conditions, or that the aero engine side has not yet shown its full earnings possibilities. While the aero engine business has expanded, the board has always emphasised the continued importance of the car business. But fuller recognition of the long-term implications of the aircraft programme appears to be implicit in the extension of the Derby works and the erection of a new factory at Crewe. Moreover, the substantial increase in debtors, which amounted to £650,981 at the end of 1937, compared

with £158,894 two years earlier, may be associated with the large increase in aero engine turnover. Despite the uncertain outlook in the motor industry, prospects for the company seem reasonably assured, although a yield of £4 13s. 6d. per cent. on the ordinary stock perhaps assumes that a more generous distribution policy may be adopted at some future time.

Montague Burton Profits.—After a period of stable earnings, Montague Burton last year achieved an increase of 10 per cent. in total profits. It would appear that the company was able to reap the benefits of expanding turnover and efficient organisation without being greatly hampered by sharply rising costs and falling stock values. The fall in wool prices has seriously affected some companies, but it would seem that the forward purchasing policy pursued by the company has again served it well. There is, in fact, no hint in the value of stocks, as disclosed in the balance sheet in recent years, to indicate that fluctuations in material prices have played an important part in the determination of profits. These satisfactory results, however, have not filtered through to the ordinary shareholder, as we show in the following comparative table:—

	Years ended March 31		
	1936	1937	1938
	£	£	£
Total profit	861,241	861,928	947,449
Depreciation	129,820	155,094	178,199
Taxation	125,926	135,076	202,207
Other expenses	41,733	44,799	39,659
Debt interest	159,391	162,680	162,680
Preference dividends	155,000	152,500	150,000
Ordinary shares:—			
Earned	249,371	211,779	214,704
Paid	109,778	111,232	111,729
Earned %	15.9	13.3	13.5
Paid %	7	7	7
Capital bonus %	3	3	3
General reserve	130,000	100,000	100,000
Carry-forward	223,521	224,068	227,043

Taxation, including a provision of £35,000 for N.D.C., absorbs a large part of the increase in total profits, and the balance, in effect, is applied to depreciation. The net result is that the 7 per cent. dividend is covered by earnings which are only fractionally higher than for 1936-37, though the ordinary capital has been slightly increased in the meantime. Dividend policy has been consistently conservative. From 1929, in which year the company became public, until 1933 no dividends were paid, although substantial earnings were available, and subsequently about half of the available earnings, on the average, have been distributed. The part played by profits in financing the expansion of the business has been underlined by the declaration, in each of the past four years, of a small capital bonus. The justification for this policy is emphasised by the fact that stocks amount to £1,384,000, compared with surplus liquid assets of £1,225,000. At 14s. 1½d. the 10s. ordinary shares yield £5 5s. per cent.

British Sugar Corporation.—The trading profits of the British Sugar Corporation, in its second year of operation, are at first sight disturbing, for they show an apparent setback from £1,245,123 to £672,626 for the year to March last. That the comparison appears so adverse, however, is due more to the exceptional profits realised during the previous year, than to any defect in the past year's trading results. Having secured windfalls during its first year of operation, the company set aside no less than £434,318 out of earnings of £584,318 for various reserves and provisions for preliminary expenses. The comparable figure for ordinary earnings during the past year is £218,052, of which the dividend of 4½ per cent., against 4 per cent. in the initial year, absorbs £163,125. A sum of £210,000 (against £240,000) has been charged for depreciation, and net expenditure on factories amounts to £269,817. It will be recalled that

under the "Incentive Agreement" between the Corporation and the Treasury, the Corporation may retain the benefits of realised economies in proportions which vary according to the lapse of time and to the extent of the economies obtained. The basic ordinary dividend on the ordinary capital is 4 per cent., and it has been estimated that economies ultimately amounting to £300,000 may be envisaged in the first six or seven years of the Corporation's operations. Such savings would permit an average total dividend of 5½ per cent. per annum up to 1947, and in the absence of further economies would provide dividends of slightly below 5 per cent. in subsequent years. The £1 ordinary shares are quoted at 18s. 6d.

Oil Company Prospects.—The chairmen of the Anglo-Iranian and "Shell" Transport companies permitted themselves a moderate degree of optimism at this week's meetings. Both speeches were in part based on expectations of a continued secular increase in the consumption of petroleum products—an increase which continues despite the exigencies of Chancellors of Exchequer and Finance Ministers. Both speeches, necessarily, qualified these hopes by reference to the position in the United States where, until recently at any rate, the stock position was becoming increasingly serious. Evidence of greater control in the United States oil industry, therefore, should be welcomed by all oil shareholders. But oil politics are no less important than oil economics. Lord Cadman referred with satisfaction to the relations of the Anglo-Iranian company with the Iranian authorities—the latter, indeed, are sharing substantially in the company's prosperity under the royalty arrangement. This happy situation, as Mexican Eagle shareholders know to their cost, is exactly reversed in Mexico, and Lord Bearsted showed at the "Shell" Transport meeting that the Mexican Government's policy utterly lacked justification. Fortunately, the "Shell" direct financial interest in Mexican Eagle is small, although the management agreement is highly important. In Venezuela, where a large exploration programme is being undertaken, the company's relations with the Government were described by Lord Bearsted as "very happy." While it would be optimistic to expect the full maintenance of last year's oil profits, current share levels appear adequately to discount any setback which is at present apparent.

Lobitos Oilfields.—The full results of this Peruvian oil company for 1937 are even better than the increase in dividend from 12½ to 15 per cent. had led shareholders to expect. Total profits on revenue account are more than doubled at £347,419, although profits on sales of investments (which for 1937 are put to investments reserve) are about £13,000 lower at £31,180. Various factors have contributed to this satisfactory improvement. The Peruvian subsidiary produced 342,032 tons—an increase of 8 per cent.—and thanks to this larger output as well as better prices, it was able to pay 15 per cent., representing £138,000 for the parent company. The refinery at Ellesmere Port showed a profit for 1937, against a small loss in the previous year, and although the accounts no longer disclose the tanker profits separately, the report reveals that, thanks to improved freights, the fleet contributed substantially to the trading profit of £139,782, whereas in 1936 it yielded a mere £91. In addition, dividends and interest from other sources contributed 31 per cent. more at £69,430, and after providing £70,000 (against £30,000) for taxes, there remains £255,067 earned for dividend, compared with £120,105, representing 29.5 per cent. against 15.8 per cent. on the ordinary capital. Shareholders, however, will readily approve the increased conservatism implicit in the dividend announcement, which provides £100,000 against plant obsolescence and extensions. The company has already done much to extend its refinery plant; additions, which required £32,592 in 1936, amounted to no less than £83,131 in 1937. At the current price of 35s. 7½d., the £1 units yield £8 8s. 3d. per cent.

Recent Tea Company Results.—The impression of consistent recovery provided by tea company profits earlier this year is broadly confirmed by recent results. Results for 1936 were variable and largely unsatisfactory, but it has been exceptional to find instances of declining profits and dividends among the 1937 reports. In the following table we give a selection of crop statistics and profits of some of the more important companies' recent reports:—

Company	Crop 000's	Lon. price per lb.	Total income	Earned for Ord.		Div.	Current	
				Amt.	Rate		Price*	Yield
Neddeem:	Lbs.	d.	£'000	£'000	%	%		%
1935	5,603	12-30	255.8	11.9	5.5	5	22½	8.9

1936	1,614	16-28	99.3	16.7	13.3	15		
1937	1,877	15-27	118.4	23.4	19.4	17		

* All £1 shares. † Earnings equal to 0.9 per cent. on reduced capital, after preference rights.

Most of these companies earned less in 1936 than in 1935, though crops were not uniformly lower. Dividend increases, however, have lately been the rule, although distributions are on a slightly more conservative basis. Prices contributed more to the 1937 recovery than output, which under the Regulation scheme has not fluctuated so frequently nor so violently as that of commodities used industrially. For the years ended March, 1936 and 1937, the regulation percentages were identical at 82½ per cent., but they were increased by 5 per cent. for 1937-38 and again for 1938-39. An increase of this order now represents an addition to annual output of 40 million lbs. While the value of restriction is recognised, there is almost complete agreement that the tea-growers' real problem is to increase consumption.

Propaganda to this end is being financed by means of a cess, and a total expenditure of £570,000 in the current year has been reported for this purpose. Although there was a slight fall in British absorption of tea in 1937, a satisfactory increase has occurred in other European countries, and especially in the United States. The outlook, however, has become less favourable since the beginning of the year. Auction prices have recently ruled lower than a year ago, and the additional 2d. on the tea duty is obviously unhelpful. The consequences are the more serious for the producers of high-grade teas, especially as already these qualities had not risen in price to the same extent as lower grades. As Mr B. Langford James pointed out to shareholders of Consolidated Tea and Lands, the concentration of demand upon the cheaper teas diminishes the inclination for tea-drinking generally, and so affects consumption of all grades. But while the tea planter's difficulties have lately been increased, the prospects for 1938 are perhaps brighter than those of other commodity producers.

London Tin Corporation.—Comprehensiveness is the keynote of the London Tin report, in the new form which was introduced last year. In terms of profits, it tells a satisfactory story. The year's total income (to April 30th last) amounted to £344,083, compared with £336,356, and the dividend is maintained at 7 per cent., leaving £143,046 to be carried forward, compared with £83,370 brought in. This broad summary, however, obscures the great change in trend which occurred during the past year.

OVER ONE HUNDRED AND TEN YEARS OF SERVICE
SCOTTISH UNION & NATIONAL
 INSURANCE COMPANY
 ASSETS EXCEED £17,000,000
 FIRE LIFE ACCIDENT MARINE
 Edinburgh: 35 St. Andrew Square
 London: 5 Walbrook, E.C.4, and 45 Pall Mall, S.W.1.

Dividends from the Corporation's holdings increased substantially from £227,359 to £291,781, but net profits on investment transactions were reduced by a comparable amount, from £94,294 to £45,111. While the average price for tin amounted to £252 per ton during the first six months of the Corporation's financial year, the latter half saw a rapid fall to £183 per ton, with a reduction in the average rate of quota from 110 per cent. to 81 per cent. In short, dividend income relates to a period of prosperous mining conditions, while share dealings were affected by advance discounting of the fall in earnings which is now in progress. The Corporation, however, has added to its portfolio during the period, for investments, at or below cost (including unquoted securities valued at £632,047), show an increase from £3,357,783 to £3,558,640, and were slightly exceeded by market and directors' valuations on April 30th. Results of the principal interests of the Corporation are summarised in the report, which also includes a consolidated statement of the wholly owned management subsidiary companies. The report records an "intense effort" devoted to the new equipment and reconditioning of plants. Some 45 of the 62 dredges operated in Malaya, Siam and Burma were working during last year, and all 6 sluicing plants. Seven new dredges are in hand, of which five are now in course of erection in Malaya, while five other dredges are being entirely reconstructed. Technically, it is clear that the Corporation's mining interests are being kept up to date. But the level of tin-mining profits, with the quota at 45 per cent. (of which 10 per cent. represents the buffer pool allocation, as described on page 736) and the metal at £186, must be seriously affected at present. The possible success of the buffer pool in raising the price towards £200 is less important to the shareholder than the prospects of an improvement in industrial demand. London Tin 4s. shares, at 3s. 6d., recognise this truth by yielding 8 per cent.

* * *

Bangrin and Siamese Tin.—An expansion of striking extent occurred in the profits of these two companies last year, due primarily to the increase in the tin production quota, and secondarily to higher metal prices. Conversely, costs showed a substantial reduction, and consequently the mine profit of Bangrin amounted to as much as £77 5s. per ton, against £33 5s. for the previous year. Including the final distribution of 10 per cent. which has been announced, the total dividend amounts to 15 per cent., compared with 5 per cent. After allocating £10,000 to taxation reserve, the increased balance of £12,660 is carried forward. During the year the company acquired for £104,000 (found from its own resources) the Sydney Siam property of 1,000 acres, which is rather larger than its original area. This acquisition will, of course, bring a corresponding increase in the company's standard assessment. The parent company, Siamese Tin Syndicate, also secured a greatly increased revenue at a lower average cost. Gross profit amounted to £266,700 compared with £58,050; and after providing special amortisation to the extent of £45,840, a surplus of £148,640 was available for distribution—more than three times the 1936 amount. Payment of a final dividend of 15 per cent. brings the year's total distribution to 65 per cent., compared with 25 per cent. for the previous year. After transferring £41,000 to income tax reserve, a balance of £11,500 is carried forward, compared with £7,140 brought in. That these results have won little recognition in the share market is scarcely surprising, for they are far removed from the sharply reduced price and production conditions of to-day.

"Tanks" Report.—The report of Tanganyika Concessions for 1937 is largely of academic interest, for the reorganisation scheme, approved by shareholders in March, has markedly changed the structure of, and outlook for, the company. The effect of the scheme (which was outlined in *The Economist* of March 5th) is, however, revealed in the *pro forma* balance sheet which the directors submit in addition to the statutory accounts. Total income amounted to £186,055 last year, compared with £74,316, and a net profit of £161,093 was realised, against a loss of £78,156. The net credit on profit and loss deducted from advances totalling £542,000 made to the African Railway Finance Company (and treated as irrecoverable), leaves a net sum of £473,069. This sum has been eliminated under the reorganisation scheme, whose "slimming" effect is well illustrated by a reduction in the legal balance sheet total from £11,803,461 at the end of December to £6,876,409 in the *pro forma* account. In future years, the company's accounts will be made up to July 31st, and accounts will be published in due course covering the seven months' period to July 31st next. It will be recalled that the scheme provided for the elimination of irrecoverable advances, for stringent writing down of investments (and in particular of the holding in Benguela Railway) and for the substitution of a capital charge in respect of the guarantee of African Railway debentures, hitherto provided from revenue. Union Minière proposes to distribute a dividend of Frs. 134 per share net for 1937. Tanganyika Concessions will thus receive approximately £160,000 next month on its holding of 177,000 shares, together with a royalty payment of £28,500. Union Minière fortunately has low production costs, for the present situation in the copper market is much less satisfactory than a year ago. A substantial improvement in the net operating results of Benguela Railway from £77,723 to £220,600 is reported, and some £133,884 has been paid to Tanganyika Concessions on account of debenture redemption. Smaller mineral traffic during the current year, however, can only partially be compensated by an improvement in local traffics. While the position of the group has been greatly clarified, therefore, its immediate prospects are less progressive. The £1 preference stock, which now carries a cumulative dividend of 4 per cent. and a non-cumulative further dividend of 2 per cent. (with additional participation rights), is expected to receive a dividend for the seven months' period to July. The units are quoted at 10s.

* * *

De Beers Preference Position.—Although Sir Ernest Oppenheimer had stressed the "extreme quietness" of the diamond market in his speech to De Beers shareholders in Kimberley last month, there was no hint that the position was deteriorating so far that the preference dividend might be endangered. The chairman's announcement this week—at a public function in Kimberley to mark his retirement from public life—that the payment of the dividend on the 40 per cent. cumulative preference shares is to be deferred for the time being, accordingly came as a shock to the London market, which marked down the preference shares from 10½ to 9½, and the deferred from 8½ to 7½. The decision is explained by the depressed condition of the diamond market, and by the need for conserving the company's cash resources. Recovery in the diamond industry has, in fact, proved short-lived. Last year De Beers was able to bring preference dividends up to date by the payment of 2½ years' distributions to December last, while the deferred shares received an interim dividend of 30 per cent. in respect of the year to June, 1937. The company intends, as far as possible, to keep the mines on a two-shift basis, but Sir Ernest emphasised that the immediate outlook is serious. The company's dependence upon conditions in the United States found ironical reflection earlier this week, when diamond issues generally were much firmer on the Wall Street "boomlet."

* * *

The Week's Company Profits.—Our analysis of profit and loss accounts on page 760 contains the results of 71 companies, excluding new concerns and those for

which comparable figures are not available. The latest net profits of these companies amount to £7,358,000, and show an increase of 12 per cent. over the previous year, when they earned £6,592,000. The total profits of 1,419 companies whose results have been analysed this year amount to £209,841,000, representing an increase of 13 per cent. compared with earnings of £186,332,000 in the previous year. The heavy industries and engineering trades are well represented in the week's results, though the reports of tea and rubber companies continue to be numerous. On page 735 we discuss the results under the heading "Shorter Comments."

* * *

Company Meetings of the Week.—In this issue, reports of company meetings begin on page 741. At the *Ottoman Bank* meeting, General the Hon. Sir Herbert A. Lawrence remarked that there was no check to the recovery in the Near East, which was the chief field of the bank's activities and remained relatively insulated from the outside world. Sir James Lithgow, at the *William Beardmore* meetings, declared that the probable earning power, together with the present intrinsic value, of the assets, confirmed in large measure the valuation placed upon them by independent experts. At the *British Electric Traction* meeting, Mr J. S. Austen calculated that an original holding of £100 of deferred stock would be worth £4,500 to-day if every bonus had been kept. Colonel Charles E. Ponsonby explained that the excellent demand for the products of *Forster's Glass* had enabled the company to carry increased costs without serious effect on the business. Mr Harry Marland, at the *Griffiths Hughes Proprietaries* meeting, pointed out that the company had in four years distributed £1,007,500 in dividends to the public and had put £180,000 to general reserve. Addressing *Telephone Rentals* shareholders, Mr Fred T. Jackson attributed a large proportion of the increase of the company's business to sales promotion plans. At the *British Empire Trust* meeting Mr Davidson expressed satisfac-

tion that depreciation had been provided from special resources created in the past and that the trust's investments had been written down to the lowest quoted prices. At the annual meeting of *Willoughby's Consolidated Company* the chairman pointed out that the company still owned a million acres of land, and that the time must come, with a gradual increase in population, when it would be in good demand. At the *Zinc Corporation* meeting, Lord Horne discussed the benefits which could be expected from a working agreement with the new Broken Hill Consolidated Company, in which the Corporation held about 29½ per cent. of the issued capital. The two mines would be served by the new Freeman Shaft, and the ore from both would be treated in one mill. The speeches of Lord Bearsted and Lord Cadman at the "*Shell*" Transport and "*Anglo-Iranian*" meetings are discussed on page 729. Reviewing the company's record since its formation 44 years ago, Mr Claude A. de Bernales informed shareholders of *Great Boulder Proprietary Gold Mines* that the mine had distributed in the form of dividends no less than £6,495,340 since 1895. At the *Bangrin Tin Dredging* meeting, Mr Kenneth O. Hunter gave reasons for believing that the acquisition of the new Sydney Siam property would prove valuable, and would increase the dredging life of the company. At the *Siamese Tin Syndicate* meeting, Mr Hunter reported the satisfactory results of prospecting at the Kopah and the Ngow estates. At the *Edmundsons Electricity Corporation* meeting, Sir Thomas Royden cited figures to show that the corporation's objective in 1933, which was to double the business in five years, had actually been exceeded. The number of consumers, for instance, had risen by 115 per cent. to 378,000. Discussing the trend of costs, Sir Frank Newnes told *George Newnes* members that a substantial reduction in the price of paper was expected towards the end of this year. At the *Holyrood Rubber* meeting, Mr W. Arthur Addinsell reported that in the latest financial year the price of rubber had advanced by about 1d. a lb.

London

SETTLING DAYS

TICKET	ACCOUNT
JULY 5	JULY 7

THIS week's change of investment sentiment (which we discuss more fully on page 725) has brought a welcome improvement in equity prices, at first at the expense of gilt-edged securities, whose net progress has been much less rapid. Wall Street's boomlet and more hopeful political views have provided the spark to kindle a latent disposition, in some quarters, to read the existing levels of equity stocks as low enough. The improvement, however, was not marked by any substantial increase in turnover, and it was already noticeable in mid-week that London required confirmation of its more moderate advance from Wall Street.

If political factors were responsible for the change, it is perhaps surprising that *gilt-edged* at first failed to share in the recovery. For the first part of the week prices were irregular, and some tendency to divert funds into the industrial sections may have been operative. On later days, however, the funds were more active and the Defence Loan jumped to 1½ premium, encouraging similar dated stocks in turn. Recent unsettlement of Australian stocks subsided, and prices proved responsive to cessation of small but persistent selling.

Political factors were responsible for the early improvement in *European*

bonds. German and Austrian issues responded to more hopeful views regarding the debt service. Chinese issues rallied on the payment of the July coupon on the 1913 issue, while renewed speculative buying of Brazilian issues followed further statements regarding the resumption of debt payments.

*

Home rail issues became steadier, and both ordinary and marginal preference issues advanced, unchecked by the poor traffics. Interest in Argentine rails was limited, although Cordoba issues responded to expectations that the purchase of the line will be ratified in the near future.

Encouraged by a more hopeful international outlook the *industrial market* staged a considerable recovery. Turnover was not large at the opening, but prices gathered strength, assisted by the consistent advance in Wall Street. Steel shares were in steady demand at rising prices. Whitehead Iron were firm on the meeting, but Richard Thomas failed to share in the general improvement. Coal shares were a satisfactory market, Powell Duffryn responding to the increased dividend, while more interest was taken in engineering issues. Electrical equipment shares provided one of the best sections of the market; Callenders Cable were in the lead, and General Electric gained further on the report. Some broadening of interest in electric supply shares was evident.

Moderate gains were recorded in

motor shares, led by Leyland. Aircraft shares were active, Blackburn Aircraft rising in anticipation of the results. Rolls Royce were subject to profit-taking after responding to the accounts. Textile issues were firm rather than interesting. Patons and Baldwins rose on the relatively moderate reduction in dividend. Brewery issues became more active, partly on provincial support. Interest was taken in the stores group, though improvement was not consistent. Shipping shares strengthened on the Elder Dempster reports. Leading miscellaneous issues such as Turner and Newall and British Oxygen went ahead, and survived mid-week profit-taking.

*

Oil shares found a more cheerful mood than for some time past. Interest broadened into good investment demand for the leaders and moderate gains in prices were recorded. Rubber shares shared in the general improvement, following the rise in the commodity above 6d. Public interest increased, and a more hopeful view was taken of American business prospects and the ultimate effect of the quota cut.

While business was satisfactory in the *mining markets*, interest shifted from gold mines to the base metals. Prices in the Kaffir market were well maintained, but dealings were subdued in comparison with recent weeks. Copper responded well to the quota cut, and Rhodesian copper issues went ahead, though turnover did not

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are denominated at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

ACTUARIES' INVESTMENT INDEX

More pronounced recovery than in the previous week is shown by the Actuaries' index of 151 industrial ordinary share prices, which on Tuesday last (June 21st) stood at 64.3, against 63.4 a week ago, and 65.3 a month ago. The corresponding average yield, however, has also risen, to 6.02, against 5.99 and 5.79 per cent., respectively. A selection of the component indices follows:—

Group (and No. of Securities)	Prices (Dec. 31, 1928 = 100)			
	May 24, 1938	June 14, 1938	June 21, 1938	Prices 1938 High

New York

ON Saturday last week, Wall Street could muster a turnover of no more than 100,000 shares—the lowest level recorded for twenty years. On Monday, trading jumped spectacularly from the first hour, breaking through the million mark for the first time since early April. To the accompaniment of a rising turnover, stock prices have advanced on a wide front, the Dow Jones index leaping by 14.18 points in the brief space of four days. The recovery appears to have sprung from a renewed estimate of the effect of "pump-priming" on industrial recovery, coupled with greater confidence in the prospect of an autumn improvement. The advance in steel output from 26 per cent. to 28 per cent. of capacity (according to *Iron Age*) is also accompanied by a rise in scrap prices and by small but urgent buying to replenish consumers' reduced stocks. Steels, pivotal issues like Allied Chemical and Johns-Manville, and utilities shared fully in the week's advance. Rail stocks, depressed

to extremes a week ago, recovered appreciably, partly owing to chart operations, but also to the reported willingness of the Brotherhoods to negotiate on wage questions, although the apparent exclusion of wage cuts from the discussions temporarily checked the market in mid-week. Second-grade rail bonds improved sharply, but Treasury issues remained easy.

Capital Issues

DEBENTURE offers have monopolised the new issue market this week, and all are of high quality. An offer for sale of *B. C. and H. Power Station Company* 3½ per cent. first mortgage debenture stock at £99 per cent. was considered attractive. The stock is dated 1953-63, and thus had an appreciably shorter life than many comparable electricity stocks, including those of the Central Electricity Board, on whose behalf the station will be operated, and also the Kent Electric Power 3½ per cent. issue. The stock ranks virtually as a rent charge on the revenues of the Central Electricity Board, and is of first-class investment calibre. The re-financing operation of *Stanton Ironworks*, by which the existing 4½ per cent. guaranteed debenture stock will be replaced by 4 per cent. stock, is being accompanied by a cash offer of similar new 4 per cent. stock, issued at £102½ per cent., to provide for the erection of modern coke ovens. The company has an excellent dividend record, and its debenture issues are well covered by assets and profits. The company reserves a wide redemption option from 1948 to 1978, but repayment before 1968 can only be effected at a premium over the issue price. The stock is a high-class industrial debenture. Particulars have been published this week for information only of a placing of £300,000 4½ per cent. first debenture stocks of *Kemp Town Brewery, Brighton*.

PUBLIC OFFERS

Stanton Ironworks.—Issue at 102½ of £466,300 4 per cent. debenture stock, redeemable at 102½ in June, 1978, or from 1948, on notice at various rates or

by drawings at 102½ from 1940. (Part of £1,000,000 authorised, balance being in conversion of 4½ per cent. guaranteed debenture stock). Earned for debenture service, years to March 31: 1936, £471,972; 1937, £436,377; 1938, £632,391. Net assets (before deducting existing debentures), £5,396,409.

BY OFFER FOR SALE

B. C. & H. Power Station Co..—Offer for sale of £1,650,000 3½ per cent. first mortgage debenture stock at 99. Redeemable at par by June, 1963, by drawings from 1943, or from 1953 on notice. Service will be covered by payments from C.E.B. Until latter's liability begins, interest payable out of capital. Owned by a subsidiary of Edmundsons Electricity Corporation. To build generating station at Little Barford (60,000 kilowatts; later, 120,000 kw.). Lazard Bros. and Company take issue at 96½, or 98½ including expenses.

BY STOCK EXCHANGE INTRODUCTION

Kemp Town Brewery, Brighton, Ltd..—Particulars of issue £300,000 4½ per cent. first mortgage debenture stock. Redeemable at par, October, 2008, or, at 103 from April, 1948, on notice. Proceeds to discharge various deposits and to reduce bank loan. Directors take issue for £303,624, the company paying expenses: £124,800 sold at 102 less ½ to Messrs Rowe and Pitman.

SHORTER COMMENTS

Company Results of the Week.—Although *BARCLAY PERKINS AND COMPANY* have experienced a small drop in profits, from £314,194 to £307,479, the 8 per cent. dividend is maintained, and is covered by earnings (after depreciation) with a margin of 1½ per cent. *TRUST HOUSES* have made a slightly larger trading profit than in 1936-37, but increased taxation has resulted in a decline in net profits. The provision of substantial sums for various improvements to the properties continues. *BRITON FERRY STEEL COMPANY* report that conditions in the first half of the year ended April 2nd last were exceptionally good, and net profits are £49,000 higher at £212,194. A remarkable

recovery is shown by *FAIRBAIRN, LAWSON, COMBE & BARBOUR*. Total profits amount to £111,079 against £32,553, and after meeting debenture interest and preference dividend, the carry-forward increased by £49,000. *GREENWOOD AND BATLEY* have doubled their net profits, which amount for 1937-38 to £104,361. Although provision for depreciation has also been doubled, and the dividend raised from 7 to 15 per cent., the distribution is covered with a more generous margin than in recent years. Trading profits of *WHESOE FOUNDRY AND ENGINEERING COMPANY* total £136,320, compared with £77,955, and although taxation requires half as much again as in 1936-37, the dividend is raised from 20 to 30 per cent. While the very high rates of improvement shown by rubber companies are not generally maintained, *MALACCA RUBBER* have earned £88,069 against £71,050, but the 7½ per cent. dividend is unchanged. The more important of the week's trust company results include *GLOBE TELEGRAPH AND TRUST*, whose tax-free dividend is raised from 5½ to 7½ per cent., payable from earnings of £264,747 against £219,557. Thanks to the 50 per cent. increase in the dividend from *ELDER DEMPSTER LINES*, the Holding company is paying 9 per cent. against 5.9 per cent. The operating company's total profits of £1,035,502 are as much as 63 per cent. higher than in 1936, for an increased volume of cargo was carried at higher freight rates. Towards the end of 1937, however, the company's business was affected by the cocoa "hold-up" in West Africa, though increased timber shipments provided partial compensation. Having achieved a new output record, *METAL BOX COMPANY* show earnings of £331,956 against £285,641, and pay 17½ per cent. against 15 per cent. Earnings on the ordinary stock are equivalent to nearly 30 per cent. Substantial progress is recorded by *EDGAR ALLEN AND COMPANY*; net profits of £72,928 compare with £54,756. Extensions to property and plant have been made and are still proceeding.

MISCELLANEOUS

Rhokana Corporation.—It is announced that arrangements have been made between the co-operative producers that the Corporation will produce (in addition to its basic quota of 6,338 short tons per month) as from July 1, 1938, a further 952 short tons of copper per month at 100 per cent. production of basic quota. This additional tonnage is subject to same percentage changes as is basic quota.

Industry and Trade

The Cotton Trade Enabling Bill.—There have been misgivings in Lancashire during the last few months concerning the probable effects of the proposed Enabling Bill on the export trade. Some members of the Manchester Chamber of Commerce, which represents the merchant section of the industry, have suggested that the directors of the Chamber should convene a special meeting in order that the policy of the Chamber towards the Bill might be discussed. The directors have now sent a circular letter to the members stating that they have decided not to call such a meeting until the publication of the details of the projected legislation. When the draft Bill becomes available, the Chamber's special Committee will be able to consider how far the contemplated measures safeguard the export trade and are likely to prevent abuses of monopolistic powers; the directors of the Chamber will then convene a special meeting to discuss the draft Bill and the Committee's report. Meanwhile, the export trade continues to shrink; exports of yarn and piece goods in the first five months of the current year were 25 per cent. smaller than in the corresponding period in 1937, and exports of cloth have fallen to lower levels than have been recorded during the past 86 years.

Survey of East Anglian Farming.—The Farm Economics Branch of the Cambridge School of Agriculture have already issued a number of informative surveys of farming conditions in the Eastern counties of England. East Anglia cannot, of course, be taken as representative of the agriculture throughout Britain, but the changes in production and in methods recorded on the farms included in these surveys give an indication of the trends in this mainly arable district since the beginning of the depression. Two main changes have been noted in the previous reports in this series. There has been a very considerable increase in the volume of crops sold from the farms, an increase

EST. 1795

V.S.O.P.

LIQUEUR BRANDY

MATURED AND BOTTLED AT CHATEAU DE COGNAC

which is due both to an expansion in the acreage of such crops as wheat, potatoes and sugar beet, and to the fact that a larger proportion than before of the crops grown were sold. Thus the acreage of wheat grown on the farms recorded increased by 43 per cent. between 1931 and 1936, but the proportion of the total crop sold rose from about 70 per cent. in 1931 to about 95 per cent. after 1932, due to the stimulus given by the Wheat Act. The other main trend has been the steady increase in the output of livestock products by about 3 per cent. per annum after 1931; the increase was caused by a rapid expansion in dairying and in pig-keeping, though the latter activity was checked in 1936, when the difficulties arose which led to the breakdown in the pigs marketing scheme in December of that year. During the whole period covered by these reports there has been a steady fall in the number of labourers employed, but owing to the more efficient methods of working, and to the shift towards more intensive forms of husbandry, the volume of output per worker increased by about 20 per cent. between 1931 and 1936. But the survey just published,* which covers the financial years 1936 and 1937, reveals a check to these general trends. The rising cost of feeding stuffs was responsible, together with the uncertain market, for the decline in the number of pigs, and also resulted in a higher proportion of the crops grown being used on the farm. For the first time since 1931 the returns for 1937 show a fall in both the volume and the value of output per worker, the former falling by 5 per cent. between 1936 and 1937 and the latter by 1 per cent. Profits were also reduced in 1937 compared with previous years, due mainly to the poor crop yields and to the rising costs of feeding stuffs. These two factors of reduced output per worker and of falling profits show that the rise in agricultural incomes which has taken place since the depression has now been checked.

* * *

The Tin Buffer Pool.—Last Monday the International Tin Committee decided to fix the buffer pool quota for the third quarter of this year at 10 per cent. of the basic output. As the quota for that period was fixed at 45 per cent. on June 2nd, the quota for the free market will be only 35 per cent., which will reduce new supplies well below the level of current requirements. In addition to the fixing of the pool quota, the I.T.C. accepted and signed the new buffer pool agreement. Although the details of the scheme have not yet been made public, it is learned that there will be "no material variations as compared with the original draft." In this draft it was apparently agreed that attempts should be made to keep the price of tin between £200 and £230 per ton; these limits are believed to have been maintained in the final negotiations. During the past few days prices have risen sharply owing to substantial speculative purchases. While the pool decisions have been accepted with enthusiasm by many of the tin producers, there is a danger that a price as high as £200 or more will disturb the normal price relation between tin and its competitors amongst raw materials. In times of a trade recession, such as the present, a relatively high price for tin may have serious repercussions on consumption.

* * *

Copper in America.—Stocks of copper in the United States have increased from 108,585 tons at the end of May, 1937, to 369,809 tons at the end of last month. The rate of increase, however, has tended to slow down

since the beginning of the year; in February the increase was 9 per cent. over January, in May just under 4 per cent. over April. It is believed that one of the objects of the recently announced cuts in output is to induce an absolute reduction in stocks of between 5,000 and 10,000 tons per month. Owing to the conditions under which the Customs smelters work, it seems probable that exports of American copper will be maintained for the next few months at a relatively high figure. If it be the fact that consumption is somewhat in excess of deliveries, and if production is reduced to 30,000 tons per month, then, making an allowance for the output of scrap, it is conceivable that the much-desired reduction in stocks may in due course take place. There seems to be no doubt that the response to an improvement in American industrial conditions would be marked and immediate, but this desirable event is, perhaps, the most uncertain element in the situation. Outside the United States consumption has been running ahead of production, and any continuance of exports of American copper at recent levels would in such circumstances have been a lesser evil than allowing these supplies to depress the weak American market. In May, however, non-American consumption fell by 21,000 tons, reducing the margin over production to 1,400 tons. To this is doubtless due the decision under the restriction scheme to reduce output from July 1st from 105 to 95 per cent. of basic output, or by about 5,000 tons per month, as some measure of insurance against American exports. As to the American stocks themselves, it is believed that a large proportion is strongly held. Nevertheless, despite the drastic steps taken to reduce them and the 10 per cent. cut in the quota, a well-sustained revival of prices depends ultimately on an improvement in consumption in the United States and its maintenance in the rest of the world.

* * *

The International Coke Convention.—The International Coke Convention has just completed its first year of activity. Provisionally formed in the autumn of 1936, the final agreement was concluded in the middle of June, 1937, for a period of three years, between coke producers in Great Britain, Germany, Belgium, Holland and Poland. The object of the agreement was to ensure an equitable distribution of the export trade by means of quotas and a uniform price policy, but owing to the sharp increase of demand in the early months of 1937, competition had ceased before the understanding was reached, and the limitation of exports was not applied. The following table shows the course of coke exports and the share of each of the Cartel participants in the total shipments.

	COKE EXPORTS (Monthly average, long tons)					
	1936	Per cent.	1937	Per cent.	Jan.-April, 1938	Per cent.
Great Britain	192,835	17.5	204,202	16.1	144,134	15.8
Germany	599,208	53.4	721,200	57.1	440,826	48.3
Poland	29,262	2.7	30,195	2.4	19,893	2.2
Belgium	102,549	9.3	108,231	8.6	104,064	11.4
Holland	189,085	17.1	200,000	15.8	202,874	22.3
Total	1,102,939	100.0	1,263,828	100.0	911,791	100.0

Germany was the only country which increased her share of the aggregate exports of these countries between 1936 and 1937, but in the first four months of the current year the German proportion has been substantially lower, whereas that of Belgium and Holland has increased. The shares of Great Britain and Poland in total shipments show a persistent fall. This year's sharp fall in total exports reflects the deterioration on coke markets; prices have also been affected by the shrinkage of demand. Whereas the average value of British coke exports (gas coke and other sorts) rose from 19s. 4d. per ton in 1935 to 21s. 9d. in 1936 and to 28s. 6d. last year, the average value for May, 1938, has fallen back to 26s. 10d. per ton. The time has now come for the Convention to prove that it is able to stabilise the market under adverse trade conditions.

Dairy Research.—Farmers and their representatives are often heard to complain of the favours received by other industries from the Government, which so unaccountably neglects the sad state of British agriculture. But one favour the State does bestow on agriculture, in a greater degree than to any other trade in the country; it provides the finance not only for continuous research into the practice and the basic sciences of agriculture but also for the services of local advisers to assist farmers to make the best use of the new knowledge. The extent and scope of such activities is well illustrated in the report recently issued by the Agricultural Research Council on the dairy research now being carried out in this country. The report reviews the work of the two institutes for dairy research, at Reading and at Kirkhill, near Ayr, and describes also the work which is carried out at agricultural and veterinary colleges, at the London School of Hygiene and Tropical Medicine, and by the United Dairies, Limited, on matters affecting the dairy industry. The research now in hand on the physiology of lactation, the influence of various foods and methods of feeding on milk yield, the causes and prevention of various animal diseases, particularly mastitis, contagious abortion and bovine tuberculosis, is of immediate importance to dairy farmers; the Hannah Research Institute at Kirkhill has been the centre of efforts which have successfully eradicated tuberculosis from a number of dairy herds in the neighbourhood. One of the major problems, now being investigated, is to find efficient, speedy and simple tests for ascertaining the chemical and bacteriological composition of milk, so that grades and standards can be established which can command the confidence of the consuming public. Work is also in progress on the factors which determine the keeping qualities of milk and the flavour of milk products such as cream, butter and cheese. The report also reviews the work of the Dairy Bacteriological Service and its connections with the clean milk regulations of the local authorities.

* * *

Wholesale Prices Recover.—The past fortnight has witnessed an increase in British wholesale prices, which, though small, is the biggest fortnightly rise this year. *The Economist's* complete British index has advanced by only 0.2 per cent., but those for primary products have risen by 1.3 per cent. in England and 2.6 per cent. in the United States. The complete Irving Fisher American index number has also risen.

THE announcement that the European Steel Cartel is to be prolonged until the end of 1940 has given iron and steel markets a brighter tone in some districts, but there is still little increase in new orders. The heavy sections of the industry are still fairly busy and our Glasgow correspondent reports prospects of regular employment for a long period ahead. Activity in the lighter sections is slowing down, and is slackening in the coal industry, but this is mainly seasonal. There has been some improvement in the cotton textile trade. Less favourable weather reports from America have led to an increase in prices and in sales of yarn and piece goods. More detailed reports of recent developments in the main branches of industry are given in the *Trade Supplement* which accompanies this issue of *The Economist*.

Coal

Sheffield.—In most sections business is quiet, although collieries are working fairly regularly. Demand is steady for industrial steams, but quiet for house and gas coal. Production of

INDUSTRIAL REPORTS

soft coal is at about the summer level. Small coal is moving well to electricity works, and consumption is good at coke and brick works. There is little request for prompt or forward blast-furnace coke, and patent oven and graded coke are affected by the quietness of some sections of local industry. Very little interest is shown in the export market, and full supplies are available for export and bunkers.

Newcastle-on-Tyne.—The situation to-day is most disappointing and the immediate future does not appear to be bright. The Northumberland steam section is feeling the lack of home trade, and contracts made abroad last year are not being implemented. Stocks are increasing and idle time is frequent. Less Continental demand is having a serious effect upon Durham coking trade. Patent oven coke is receiving a little more attention from abroad, but the market generally is quiet.

Workington.—The situation gives rise to no immediate anxiety. Demand in the Irish and local land-sale markets

1913 = 100	83.1	115.8	99.0	99.1
1924 = 100	52.2	72.7	62.1	62.2

Wheat and flour are higher in price than a fortnight ago, but there has been a sharp drop in maize. In the other food group tea is cheaper, but butter is dearer. There has been some recovery in cotton, but wool, flax and jute are lower than a fortnight ago. Non-ferrous metals have all risen in price. In the miscellaneous group, hides and leather are cheaper, but there have been recoveries in rubber and linseed oil.

has diminished, but the coking plants are working to capacity for the iron smelters of the district, and needs of industrial fuel are accordingly as heavy as ever. Prices are steady.

Glasgow.—The market remains dull, with a diminishing demand in all the principal outlets. To some extent this is a seasonal movement, but the effect is more noticeable since the recession in trade has found consumers, particularly abroad, with heavy fuel stocks on hand. Polish and German competition for business is also keen, and the result of all these factors is a reduction of 946,000 tons in Scottish shipments this year compared with last. Scotland did, however, secure a small share in the Swedish Railways' contract. On the home market the needs of industry and the utility undertakings are less active, and the recent price reduction in house coal has not yet stimulated a stocking movement by the depôts.

Cardiff.—The position on the market is practically unchanged. Con- (Continued on page 740)

(Continued from page 737)

tract engagements are the mainstay of the collieries, and with favourable items the shipments have been well maintained. Last week the foreign and coastwise exports at the South Wales docks totalled 428,200 tons, compared with 431,849 tons in the corresponding week last year, and up to June 19th the year's total volume of traffic was 9,098,039 tons, as against 9,242,656 tons during the same period of 1937. Production, however, is in excess of the effective current demand, and pits are working irregularly in many parts of the coalfield. The Finnish Railways are inquiring for 28,000 tons and the Alexandria Electricity Works for between 2,000 and 8,000 tons of peas and beans. Prices are nominally unchanged.

Iron and Steel

Sheffield.—Business continues to be on a limited scale, with no indication of early improvement, particularly as business normally declines about this time of the year. Forge and foundry iron are neglected, and forward business is lacking, consumers being able to secure adequate supplies at any time they choose to come into the market. A little buying of hematite is reported, mostly of special qualities. Business in finished iron is quiet, common bars being the best feature.

A fairly good demand exists for basic billets, acid qualities and wire rods; business in stainless steel sheets is unabated.

Industrial conditions in this district have not deteriorated and in some branches activity is improving. The heavy engineering and electrical branches have plenty of work on hand, but the re-rolling and lighter sections are less busy. Output of basic steel is dropping, but stainless and the costlier alloy steels are reaching record figures.

★

Glasgow.—There is an increased demand for steel from Scottish works and plants will be taxed to capacity to meet the requirements of consumers who are pressing for deliveries before works close for the holidays in mid-July. There is also some business being placed for more distant delivery dates and every prospect of regular, if not intensive, employment at the steel plants for a long period ahead. Shipbuilding contracts have been placed by the Soviet Government with two Clyde yards during the past week and several of the yards are now exceedingly busy. There is no falling off in demand for finished material and many establishments have several months' work already on their books.

★

Cardiff.—Conditions in the South Wales tinplate industry continue depressed. The current rate of production represents roughly only about one-third of capacity. For the twenty-four weeks ended June 16th, the Great Western returns of exports show a decrease of about 80,000 tons, or 40 per cent. The persistent contraction in the steel bar requirements of the tinplate factories is affecting the heavier branches of the industry, and there are now in blast only four pig iron furnaces compared with seven at the beginning of the year. There has been a proportionate de-

crease in the number of melting furnaces and rolling mills in operation. There is little competition, however, and prices are nominally unchanged.

Textiles

Cotton (Manchester).—There has been some improvement in the amount of business passing, largely due to the hardening tendency in raw material prices. Sales in yarn and piece-goods have been rather more encouraging, with an increased demand for raw cotton. Rates in Liverpool and New York have been dearer. Values of the American staple are now over 3d. per lb. higher than the low figure touched on the last day of May. Less satisfactory weather reports have been received from the American belt and owing to excessive rains, chiefly in the Eastern section, there are distinct fears of the plants being damaged by insect pests, especially the boll weevil. Supplies of raw cotton, however, remain abundant and world consumption continues disappointing.

There has been a slight improvement in the turnover of small lots in the yarn market. Rather freer operations have taken place in coarse American counts. There has not been any general activity in Egyptian descriptions, but further buying has occurred for Germany in tyre yarns. Manufacturers of cloth have reported an increased inquiry and it is a long time since so many quotations were given out. Some very fair lines have been booked in light whites and prints for Calcutta, mulls and similar cloths for Karachi and dyed fabrics for the up-country markets. Occasional sales have been put through for Java, the Straits Settlements and Egypt. Rather more business has been done for South America in sateens and sheetings. There has been increased support from the Dominions, principally South Africa and Australia. Home trade buyers have been more active, and some fairly substantial contracts have been arranged in standard makes.

THE COMMODITY MARKETS

THE temporary scare of a further devaluation of the dollar has now subsided, but the American markets and Wall Street have shown a better tone during the week than for some time past. The improvement in prices, however, is still due mainly to speculative buying.

Metals rose in price during the week, tin and copper prices being assisted by the recent cuts in the production quotas. Cotton and rubber prices also showed a further advance, and wheat

prices were firmly held, with a more hopeful market.

Moody's index of staple commodities in the United States rose from 135.3 (December 31, 1931 = 100) to 137.2 during the week ended last Wednesday; this compares with 135.0 a month ago and 201.0 a year ago.

Metals

Copper.—Standard cash copper rose this week by £2 5s. to close at £36 3s. 9d. per ton, the best level since May 19th. There was a substantial amount of bear covering and a fairly large demand from speculators; consumers, however, have not returned to the market to any large extent. The rise in price was due partly to the better tendency in Wall Street and to the decision of the copper producers outside the United States to reduce their output from 105 per cent. to 95 per cent. of the standard tonnages as from July 1st. This action will reduce the monthly output of the restricting companies by about 6,330 tons per month.

★

Tin.—Tin prices rose sharply by £16 to £187 5s. per ton, the highest level since February 24th, on the news of the I.T.C.'s decision to fix the buffer pool quota for the third quarter of this year at 10 per cent. The decision and its effects are discussed in a special industrial note in this issue. Although the London tin turnover reached very high levels during the last few days, consumers have bought only small quantities and the great bulk of the demand came from speculators.

★

Lead and Spelter.—Both metals were naturally affected by the rises in the price of copper and tin; lead rose by £1 10s. to £14 16s. 3d. per ton, while spelter improved by £1 2s. 6d., to close at £13 8s. 9d. per ton. In the United States, the lead output declined from 39,300 short tons in April to 33,000 short tons in May, while deliveries remained stationary at 26,000 short tons. American lead stocks, therefore, increased further from 156,700 short tons on April 30th to 163,700 short tons on May 31st, the highest level since January 31, 1937.

Grains

THE wheat market was steady during the early part of the week, but prices advanced somewhat at the close, in sympathy with the firm market in North America. Reports of the deteriorating quality of the American winter wheat owing to bad weather conditions indicate that the last official forecast of 761 million bushels may be on the high side. Italy has now completed the purchases of wheat necessary to tide her over until the coming harvest. Demand for maize has been small and the margin between Plate and American has widened; Plate is 7½d. to 9d. per quarter dearer on the week, while American is slightly lower. Not much business has been done in barley, and with larger supplies due shortly from the Persian Gulf and from North America, buyers are cautious in their purchases.

COMPANY MEETINGS

OTTOMAN BANK

DIVIDEND OF 3s. PER SHARE MAINTAINED

DIFFICULT WORLD TRADING CONDITIONS

CONTINUED RECOVERY IN THE NEAR EAST

PROGRESS AND DEVELOPMENT IN TURKEY

SIR HERBERT LAWRENCE'S ADDRESS

The annual general meeting of shareholders of the Ottoman Bank was held, on the 21st instant, at Winchester House, Old Broad Street, London, E.C.

General the Hon. Sir Herbert A. Lawrence, G.C.B., presided.

Mr W. Stewart McKim (secretary to the committee) having read the notice convening the meeting,

The Chairman said:—Ladies and gentlemen, I have been informed that this meeting is properly constituted, and I presume it is your pleasure that the report and balance sheet circulated among you should be taken as read. (Agreed.)

First of all, it is my sad duty to pay a last tribute to the memory of Monsieur Raoul Mallet, who died suddenly very shortly after our last general meeting. Though in failing health during his last years, he continued up to the day of his death to take the greatest interest in our affairs. His devotion to the bank, which has been a tradition in his family since our foundation, dates from the beginning of the century. He sat on our committee for 35 years and presided over the Paris group since 1928. I am sure that in expressing our profound regret at the loss of our colleague I am speaking for all of you.

RETROGRADE MOVEMENT IN WORLD ECONOMIC SPHERE

The year 1937 opened under relatively good conditions, but the promise of the earlier months was not fulfilled. The international political situation was disturbed, and public opinion was faced with new causes for anxiety by the conflict in the Far East, added to the situation in Europe. In the middle of the summer a retrograde movement appeared in the economic sphere, starting in the United States and quickly extending to all the important commercial and financial markets.

It is open to question whether we are passing through a momentary reaction to a speculative boom in primary commodities or are standing on the threshold of a crisis. Views differ, and it is not for me to express an opinion here.

What is certain is that the atmosphere has not been such as to encourage in their efforts to recovery those nations which had not succeeded in regaining their balance after the last depression.

France, for example, was obliged to accept a new depreciation of her currency, with the result that the franc, which had already been lowered by the devaluation of 1936 from 75 to 105 to the pound sterling, was detached from gold and weakened by stages to 147 at the end of 1937. That makes a loss of nearly 50 per cent. in two years, and the further depreciation to 178 since the end of the year naturally increases the difficulties. Although precautions were taken long in advance to limit, so far as possible, our risks in this currency, there is, nevertheless, a part of our assets which must remain subject to this risk, if only for the reason that most of the banks and companies which we control have a capital expressed in francs.

NO CHECK IN RECOVERY IN NEAR EAST

In the countries of the Near East which provide the chief field of our activities, the Customs and currency barriers by which most of them are surrounded have at least the advantage of rendering their internal economy apparently less susceptible to the unfettered movements of the outside economic world. For this reason, no doubt, one notices there no check to the movement of recovery which was already in evidence.

You will be able to see in the survey which it is our custom to

make of these countries that our branches and associated institutions have all continued to benefit from this state of things, and the results obtained by them now may rank with those of the years before the crisis. They have also completed the liquidation of various doubtful debts which were the result of this long period of difficulty.

COMMITTEE'S SOUND FINANCIAL POLICY

You may be surprised that the profit balance of the accounts presented to you does not more fully reflect this encouraging state of affairs. The reason is to be found in the fact that your committee has considered it wise to make provision from the year's profits for the greater portion of the depreciation of currencies and investments which ensue from the new adjustment of the value of the franc and the fall in British Government stocks, especially as it was possible to do so while maintaining the dividend at the figure which has continued to be paid during, and notwithstanding, the economic crisis.

It is a good sign for the future that it has been possible in this way to avoid weakening to any appreciable extent the provisions which a prudent policy, consistently approved by you, has enabled us to constitute during prosperous years to meet eventualities of this nature.

PROGRESS IN TURKEY MAINTAINED

Among our various groups that of Turkey is, as you know, the most important from many points of view. Istanbul is the headquarters of a general management for Turkey. Its relations with the Government and the various State departments are the natural result of the Convention of 1933. But beyond all contractual engagements those relations are rendered more useful and cordial by reason of the mutual esteem and confidence displayed. I have no hesitation in confirming what I said last year about the very satisfactory spirit of collaboration which has been established since these agreements were signed. My distinguished colleague Lord Goschen recently encountered striking evidence of this in the course of a private visit to Ankara.

The Direction-General for Turkey is also in charge of the banking exploitation of the central office and the 29 branches which form the group. The progress, of which I have previously told you, was maintained, and with the rapid economic development of the country our profits also show a new advance.

INTERNAL ASPECTS OF ECONOMIC DEVELOPMENT

With regard to the internal aspects of this economic development, it will be enough if I mention that the crops have been as good in 1937 as in 1936, if not better; that, on the industrial plane, the first Five-Year Plan, chiefly concerned with textiles, is being carried out in accordance with programme; that another plan—the Three-Year Plan—has been worked out for the development of mining activity; that the public authorities are occupied also in acquiring a merchant fleet; that the operations of the Clearing House of Istanbul, which reflects commercial dealings, rose in one year from three hundred and six to four hundred and forty-two millions of Turkish pounds; and, finally, that the revenues for 1936-37 exceeded the Budget estimate of two hundred and thirteen million Turkish pounds by some twenty-eight millions.

The problem of trade relations with foreign countries is a very complex one, and one which is a matter of grave concern to the

Government. So far as imports are concerned, this policy consists not only in the abandonment of the quota system and the adoption in future of the principle: "I buy from my customer," but also in the encouragement of exports to buyers in countries with a free exchange.

LIFE OF TEMPORARY CREDIT EXTENDED

With a view to relieving the balance of external payments in the meanwhile, the Turkish Government requested us to extend by some years the life of the temporary credit of £1,250,000 which the bank granted to the Treasury on the renewal of its concession. We agreed to this and, as a corollary, the date for the redemption of our bank notes has been deferred for a corresponding period.

The Turkish Government has also approached the French and the British Governments. To the former it announced its intention to effect the entire service of the debt in Turkish pounds, to be used in the purchase of goods, whereas hitherto, in accordance with the Franco-Turkish Agreement of 1936, the operations entrusted to the Société Commerciale Franco-Turque, and carried out by the latter under satisfactory conditions, covered one-half only of these payments. Negotiations on this matter are now in course.

AGREEMENTS BETWEEN TURKEY AND UNITED KINGDOM

As regards the United Kingdom, agreements have just been concluded between Turkey and his Majesty's Government under which, besides a credit to facilitate the purchase by Turkey in Great Britain of material necessary for her national defence, a credit of £10,000,000 has been arranged by the Export Credits Guarantee Department to enable Turkey to develop its national equipment and resources and to promote commercial relations with the United Kingdom. Turkey thus obtains valuable assistance in the execution of the development programmes to which I have already referred, and is to be heartily congratulated on the successful conclusion of its negotiations.

So far as the bank is concerned, it has fortunately been able to co-operate with both the Turkish and the British Governments in the recent negotiations and is called upon to play an important rôle in the arrangements to carry out the terms of these agreements, and I need hardly say that we welcome this further opportunity given to us to take part in the development of Turkey's national resources and the promotion of her external trade relations.

IMPROVED POSITION OF EGYPT

In Egypt the past year was noteworthy for the accession of his Majesty King Farouk. The Budget figures for 1938-39 provide for total receipts of 39 million Egyptian pounds and an expenditure of 40 millions. There was a large increase in the foreign trade of Egypt during the year, imports amounting to 38,037,000 Egyptian pounds, as against 31,516,000 in 1936, while exports totalled 39,759,000 Egyptian pounds, as against 32,979,000 in the previous year. The balance of trade in favour of Egypt increased from 1,463,000 Egyptian pounds in 1936 to 1,722,000 in 1937.

Cotton exports represented 29,002,000 Egyptian pounds—an increase of nearly four millions for the year. The 1937-38 cotton crop is estimated at 10,500,000 cantars and constitutes a record. America also had a record crop in 1937, and as a consequence there has been a considerable fall in prices from March, 1937, onwards. Spinners were reluctant to purchase beyond their immediate requirements, and growers unwilling to sell at the reduced prices. A large amount of the new crop remained up-country in an unginned condition until late in the season, and the legal date for ginning cotton was extended from April 30th to May 10th. Up to May 26th, 7,134,000 cantars of cotton have been exported this season as against 7,793,000 to the same date last year, while on the same date the stock in Alexandria was 3,011,000 cantars as against 1,391,000 last year.

Our branches in Alexandria and Cairo have been able to increase their clientèle and to improve their earning capacity. Under reasonably favourable conditions, one may look forward with confidence to a continued improvement.

SITUATION IN PALESTINE

The economic situation in Palestine continued to be unsatisfactory throughout 1937 as the result of political tension, terrorism, and uncertainty. Imports of 16,000,000 Palestine pounds show an increase over 1936 of 2,000,000 Palestine pounds, while exports also increased from 3,600,000 to 5,800,000 Palestine pounds. Currency in circulation stood at 4,829,134 Palestine pounds at December 31, 1937, as compared with 5,741,134 Palestine pounds at December 31, 1936, a drop of roughly 900,000 Palestine pounds.

The orange season of 1936-37, which began satisfactorily, continued and ended disastrously, owing to bad climatic conditions which affected the quality of the fruit. It was the worst season ever experienced. The 1937-38 season opened with prices which barely covered cultivation and shipping expenses, but prices improved considerably during the last half of the export season. The grain crop was the most successful for seven years, and considerable quantities of barley and millet were exported.

Our Palestine branches have exercised a policy of caution and reserve, and in spite of adverse conditions results have been satisfactory.

ANOTHER PROSPEROUS YEAR FOR IRAQ

Iraq had another prosperous year in 1937, though in some directions early hopes were not fulfilled owing to the fall in world prices for certain products of the country. The increased prosperity affected all classes, whose purchasing power was greater. Currency in circulation rose from 4,641,312 Iraq dinars to 5,003,307 Iraq dinars; the dinar, as you know, is practically equivalent to one pound sterling.

Total exports, exclusive of oil, amounted to 5,570,000 Iraq dinars, as against 3,480,000 in 1936, while imports rose from 7,177,000 to 9,566,000. The export of crude oil by the Iraq Petroleum Company amounted to 4,113,000 tons as compared with 3,894,000 tons in 1936. The apparent adverse trade balance is balanced largely by royalties from these oil exports, by money spent in the country by the oil companies, by Royal Air Force expenditure, and Basrah port dues.

Date exports from Basrah showed an increase over the previous year with rather disappointing results for the growers and packers. It is clear that some form of control of growing, packing, and marketing is necessary, in order to put the date trade on a sound basis. Various proposals have been put forward for the establishment of a Date Monopoly Board, and are still under consideration.

During the year the Iraq Government raised in London its first loan of one million pounds sterling (out of three million pounds authorised by Parliament); and this was successfully issued on the market. The proceeds of the loan are earmarked in part for the linking up of the Iraq railways with the main line from Europe at the Turkish frontier.

Our branches continued to handle a large proportion of the commercial business of the country, and the increased prosperity is shown in the results they obtained.

CONDITIONS IN IRAN

In Iran there was some relaxation in the Government control of foreign trade. Carpets, dried fruits, lambskins, and furs were freed from the monopoly. Control of foreign exchange, however, remains extremely rigid. The Government is proceeding with its industrialisation plans. The northern section of the new State Railway is open to traffic from Tehran to the Caspian Sea.

Though the budget has risen by about 50 per cent. between 1936 and 1937, it is still balanced by ordinary revenue. The cost of living shows a continuous increase, and weighs heavily on certain sections of the population.

Our branches, though unable to undertake any operation involving foreign exchange, continue to have a satisfactory share of the home banking business.

GREATER PROSPERITY FOR CYPRUS

The year under review was one of greater prosperity for the Island of Cyprus. Climatic conditions were favourable, the prices for agricultural products satisfactory, and there was an increase in mining activity. During the year several new factories were opened.

Exports amounted to £2,180,048, imports to £2,219,429, increases of 36.7 per cent. and 49.38 per cent. over figures for the previous year. The apparent adverse balance of trade is covered by the expenditure of mining companies and by the tourist trade. It is estimated that the mining companies paid some £400,000 in wages and £21,000 in royalties.

The revenue of the Colony amounted to £967,935 and expenditure to £863,830, giving a surplus of £104,105, as against £63,889 in 1936. Prospects for 1938 appear to be good.

During the year negotiations with the Government for the reorganisation of the Agricultural Bank of Cyprus, Limited, which was formed by us in 1925, were completed. The result will be a closer collaboration between the Government and the Ottoman Bank in the activities of the Agricultural Bank, and it is hoped that this result will be of considerable benefit to the agriculturists of the Colony.

Our offices in London and Paris made their usual contribution

to the profit and loss account, within the limits imposed by the conditions ruling in their respective money markets.

FAVOURABLE YEAR FOR AFFILIATED BANKS

It remains for me now to say a few words with regard to our affiliated banks. Generally speaking, they found the year 1937 a favourable one.

The Banque de Syrie et du Grand Liban has not as yet held its general meeting. I am, nevertheless, authorised to inform you that the dividend proposed by the board will work out at 14.118 per cent., as compared with 11.4 per cent. for 1936. In the year the number of its notes in circulation increased from 423,300,000 francs to 474 millions. This was due to increased production and to a rise in prices caused in part by the higher level of foreign currencies. The tourist and summer traffic, to handle which our *filiale* long since organised itself, is now beginning to provide an invisible export to balance the chronic deficit in the trade balance.

The Banque Franco-Serbe has been in a position to raise its dividend from 5 to 6 per cent. The reserve fund has again been strengthened and, as a result of substantial amounts recovered on old debts for which provision had been made, this fund now figures in the balance sheet for a total in excess of seven million francs, compared with a capital of twenty millions.

In view of the share taken by us in the reorganisation of the bank, it is satisfactory to see that Yugoslavia shows itself more and more clearly to be a country full of possibilities for the future in agriculture, forestry, and also in mining. As regards the pre-War Serbian loans, of which the Banque Franco-Serbe and the Ottoman Bank are paying agents, I am able to report that, owing to the progress already realised, a recent agreement has been made possible by which the conditions of service to the bondholders are considerably improved.

BRITISH-FRENCH DISCOUNT BANK

The British-French Discount Bank, Limited, is still unable to enter the dividend-paying stage, for, although results in Athens and the Piræus have been satisfactory, severe exchange restrictions continue to make it impossible to transfer profits made on the capital invested in Greece. After large provisions have been made, these profits reach a sum in drachmae which represents 8 per cent. of the paid-up capital. Conditions in the country continue to be comparatively favourable. Agricultural and industrial production progresses consistently, and foreign trade is not unduly affected by the difficulties which hamper international trade.

In spite of a bad tobacco season, the Thessaloniki office of the Ottoman Bank continues to make progress.

The activities of our subsidiary in Roumania, the Bank of Roumania, Limited, are influenced to-day by the political events in Europe, particularly in the Danubian countries. The better conditions which were evident early last year have not continued. Reduced business has followed the disturbed political situation and no immediate improvement can be expected.

THE BANK'S BALANCE-SHEET

The balance sheet at December 31, 1937, which is submitted to your approval, shows a total, in round figures of £25,740,000, as compared with £22,818,000 on the previous December 31st, that is to say, nearly £3,000,000 more than last year, owing chiefly to the increase in sight and fixed deposits. On the assets side you will notice an increase of a little more than £2,000,000 in the facilities placed at the disposal of our clients in the form of current accounts and advances. Our acceptances, though still modest in amount, have risen to a certain extent from the very low level to which they had fallen owing to the decline in international trade.

This extension of our business has been accomplished without infringing in any way the principles of prudence proper to your establishment, and, as you may observe, without affecting its liquidity in any way. I may say, in fact, that two-thirds of the investments consist of British Government securities, which are easily realisable.

After deduction of all costs and charges the accounts show a net balance of £79,349, which, with the amount brought forward from last year, makes a total of £112,498 at our disposal. Your committee proposes to distribute the same dividend of 3s. as for the past few years. If you are so good as to follow our recommendation this dividend will be payable on June 27 in Istanbul, London, and Paris, free of all tax in Paris.

THE DIRECTORATE

To fill the two seats left vacant, one by the resignation of Monsieur Horace Finaly and the other by the death of Monsieur

Raoul Mallet, our general committee nominated Monsieur Charles Rist, honorary vice-governor of the Bank of France and an administrator of the Banque de Paris et des Pays-Bas, who, by reason of his wide reputation as an economist and an authority on financial affairs, needs no further introduction, and Monsieur Philippe Mallet, son of the late Monsieur Raoul Mallet, and, like him, a partner in the house of Mallet Frères et Compagnie. I have no doubt that your ratification of these appointments, which will be invited after the dividend resolution, is already assured, and also that you will renew the mandates of those members of the committee who have to retire this year in the ordinary way in accordance with the Statutes.

Monsieur Rist has, moreover, been elected president of the Paris group of the committee as successor to Monsieur Raoul Mallet. Our new colleague is with us to-day, and I beg to thank him in your name, as in ours, for his acceptance of a task in which his wide authority will be of the greatest value.

TRIBUTE TO COLLEAGUES

Before ending, I should like in your presence to express to all our colleagues of every rank our satisfaction and thanks. Just in connection with that I should like to say that for the first time for 40 years our colleague and friend, Mr Barry, is not able to be with us. The bank owes a great debt of gratitude to Mr Barry for assisting to steer it through most stormy and difficult times, and I believe that our French colleagues will endorse what I say about Mr Barry and his relations with them.

I now beg to move, ladies and gentlemen:—

"That the report and accounts now read be received and adopted; that the dividend for the year ended December 31, 1937, be fixed at the rate of 3s. per share, and that this dividend be payable in Istanbul, London and Paris on June 27, 1938."

Before I put this resolution I shall be happy to answer any questions.

M. Charles Rist: I second the resolution.

No questions being asked, the Chairman put the resolution to the meeting, and it was carried unanimously.

The Chairman: I have also to move:—"That Monsieur Charles Rist and Monsieur Philippe Mallet be and they are hereby elected members of the general committee."

Sir John P. Hewett, G.C.S.I., K.B.E., C.I.E.: I have the honour to second this resolution.

The motion was carried unanimously.

The Chairman: I have also to move:—"That Sir John P. Hewett and Monsieur Philippe Mallet be and they are hereby re-elected members of the general committee."

M. Anathase Roudy: I have pleasure in seconding that motion.

The resolution was carried unanimously.

VOTE OF THANKS TO CHAIRMAN, DIRECTORS, MANAGEMENT AND STAFF

Mr A. Bradbery: Ladies and gentlemen, we have had the pleasure of listening to a most interesting address by our chairman, in which I could detect a note of optimism as to the future. In spite of the troubles all over Europe and in other parts of the world, the policy of the board has resulted in the dividend for the year 1937 being maintained at the same rate as for several preceding years, and I think you will agree this is a matter for congratulation and appreciation by all concerned. But for the depreciation of currencies and securities there might have been a little bit more dividend.

You have heard that Monsieur Rist has accepted a seat on the board, and I am sure it is the wish of this meeting that we heartily concur in the chairman's remarks on his appointment, and I know you will be with me when I say that we hope that Mr Barry will be here in 12 months' time. On behalf of the shareholders I propose a very hearty vote of thanks to our chairman, to the members of the board of directors, and also to the management and staff.

Mr J. E. Rosselli: I have much pleasure in seconding that.

The vote was unanimously accorded.

The Chairman: Mr Bradbery, Mr Rosselli, and gentlemen, I am very much obliged to you for your kind vote of thanks, which very much appreciated by myself and my colleagues and by all members of the staff. Mr Bradbery is quite correct when he says that I have tried to impress upon this meeting a sense of optimism. The position of the bank is excellent; the bank is making good profits, but, as you know, these profits are very often made in currency which cannot be transmitted. We therefore have rather accumulate funds; it is impossible to follow any other policy. I thank you, gentlemen.

The proceedings then terminated.

ZINC CORPORATION, LIMITED

SATISFACTORY RESULTS — INCREASED PROFITS

RECORD OUTPUT AND RECOVERIES

VISCOUNT HORNE ON THE PRESENT POSITION AND OUTLOOK

The twenty-seventh ordinary general meeting of the Zinc Corporation, Limited, was held, on the 22nd instant, in the Hall of the Chartered Insurance Institute, 20, Aldermanbury, London, E.C.

The Rt. Hon. Viscount Horne of Slamannan, P.C., G.B.E. (chairman of the corporation) presided.

The secretary (Mr F. A. Crew) having read the notice convening the meeting and the report of the auditors,

The Chairman said:—Ladies and gentlemen,—The directors' report and accounts have been circulated as usual and with your consent I will take them as read.

In many ways 1937 was for us a bumper year. Record mine output, record mill recoveries, high prices for products and substantially increased profits—these were its main features. The amount of ore milled showed an increase of over 25,500 tons at 390,360 tons. Moreover, lead recoveries were notably improved and we produced the highest grade of lead concentrates we have yet obtained. The outputs of recoverable lead and silver—and it is on these metals and not on zinc that we chiefly rely—were both substantially higher than in the previous years and constituted records in the history of our operations.

METAL PRICES

The average prices of lead and zinc on the London Metal Exchange during the year 1937 showed considerable increases, but silver was fractionally lower.

Starting in January, 1937, with an average of £27 4s. 2d. the price of lead rose to an average of £33 in March (touching momentarily £36 7s. 6d.), and from that point there was a gradual drop in the monthly average price to £15 18s. 11d. in December. As regards zinc, the average monthly price in January was £21 4s. 4d. rising to £33 5s. 11d. in March (touching one day £37) and falling from that figure to £15 7s. in December. The average price for lead in 1937 was £23 6s. 1d. and that for zinc £22 6s. 11d. The gain in the lead average compared with 1936 was £5 13s. 7d. per ton, and in zinc £7 6s. 3d. Unfortunately gravely disturbed shipping conditions—in part arising from the withdrawal of Japanese tonnage from normal trade, and in part from efforts of European countries to secure reserves of raw materials against possibilities of international trouble—both augmented costs and prevented the full benefit from price increases being obtained by producers.

REVENUE AND COSTS

What may be termed the value of our mine production—that is to say the actual receipts from products sold out of stock or output plus the valuation placed on the quantities in stock or transit at the close of the year—reached £1,741,815, or about £534,000 more than in 1936.

As stated in our report we have been more than usually conservative in valuing that portion of our production which is on hand or in course of realisation at the end of the year. Violent fluctuations in metal prices and irregularities in supply, together with high costs of freights make a special call for prudence.

Our receipts from interest and dividends on investments plus small items of sundry revenue were increased by £10,500 to over £89,000 for the year. The Corporation's total revenue from mining, smelting, and refining, plus investments, interest, etc., was £1,830,841, against £1,286,212 in the previous year.

The cost of mining and milling at Broken Hill as well as smelting and refining at Port Pirie, etc., was substantially increased by the sliding scale of bonuses based on lead prices payable to all employees under existing industrial agreements. In addition, much higher freights and substantial increases in the delivered costs of all supplies added greatly to the expense of working. Eliminating factors beyond the control of the management it is safe to say that the net costs incurred in 1937 compared favourably with those of previous years. Nevertheless, the total expenditure on mining and treatment of ore, transport, smelting, refining and realisation of products was over £223,000 higher at £1,001,886. Expenditure on mine development, both ordinary and special, and on shaft sinking

increased by £63,000 to £146,000. Royalties and taxation, including for the first time National Defence Contribution, absorbed £161,300, or over £89,000 more than in the previous year. Administration cost rather more as a result of the increase in output.

The new hospital at Broken Hill—an urgent necessity—is being financed by the Government of New South Wales, the City of Broken Hill, the Labour unions and the mining companies and we believed it to be desirable to provide for our proportion while our revenue was abnormally high. This, together with other necessary social services, takes £25,000. We have also taken advantage of the substantial profit of last year to transfer £16,000 sterling (i.e. £20,000 Australian) to an employees' provident fund. This we consider necessary in view of the increasing number of long service employees.

Directors' fees in both London and Australia, as a result of the expansion of profits and its effect on the percentage payable under the articles of association, have increased by £3,450.

DIVIDENDS

Subject to your confirmation to-day, a participating dividend of 4s. 6d. per share, absorbing £202,237, will be paid on July 1st next. This, together with £179,767 paid on January 1st last, and the preference dividend of £49,138, will make the total distributions from the profits of the year £431,142, and leave the sum of £57,124 to be carried forward. For the previous year the distributions in dividends totalled £318,787 and the carry-forward was £55,357.

It is worthy of remark that the total royalties and taxation paid or to be paid to Governments from last year's profits will be in the neighbourhood of £240,000, or approximately 35 per cent. of the whole.

BALANCE SHEET

The balance sheet reflects our heavy expenditure on property and plant, the total for the year being nearly £322,000. Here, again, costs were substantially increased by the conditions imposed by industrial awards, higher freights, etc. Against this expenditure we have received £100,000 from New Broken Hill Consolidated, Limited, as a provisional payment in connection with the joint working scheme to which I will refer later. Stores are over £31,000 higher than in 1936, but as the surface reorganisation and new equipment scheme approach completion this account should be reduced.

British and Dominion Government securities, cash at bankers and in hand and advances against security and loans at call total nearly £852,000, against approximately £630,000 in the previous year. During a period of falling security prices we have, as a result of our conservative financial policy, no loss to record on the value of our investments. This I feel sure you will regard as very satisfactory. Our investment reserve now stands at £109,835. (Applause.)

The fall in metal prices by the end of the year and a more conservative basis of valuation are responsible for the reduction in the value of products on hand or in course of realisation.

We have set out in our report details of the more important enterprises which are associated with us. These represent about £400,000 out of the total of approximately £485,000 which we have invested in associated or related enterprises. You will be interested to learn that last year the revenue from these holdings was equivalent to about 16½ per cent. on the conservative value at which they stood in our books on December 31st. Our interests benefited substantially from the widespread prosperity in Australia during 1937.

On the liability side of the balance sheet, reserve accounts, all of which are used in the business of the Corporation, stood at the end of 1937 at £750,995, against £640,392 in the previous year.

The balance sheet, as I hope you will agree, reflects a thoroughly sound and satisfactory position.

It is worthy of note that while expenditure on capital account during 1937 was large, revenue was high. During the current year we have still a great deal of capital expenditure to meet, while

revenue from production has been seriously reduced in the last six months. These movements will, of course, be reflected in the accounts for 1938.

OPERATIONS

The reports of our technical managers and consulting engineers—Messrs Bewick, Moring and Company—and of the mine manager—Mr A. J. Keast—which have been circulated to you, deal with the large amount of work carried out underground and on the surface at Broken Hill. The plans and photographic reproductions appended thereto serve to supplement the text of these reports.

The development of the lead lode has again been attended by satisfactory results. Owing to the sinking of the New Main or Freeman Shaft and other special work, the footage of normal developments was less than in 1936, whilst the tonnage mined was greater; nevertheless, the ore reserves at the end of 1937 stood at the same figure as at the end of the preceding year, and the indications from diamond drilling at the No. 14 level, which is at a vertical depth of 1,962 feet—the greatest now being driven—augur well for the future. Certain departures from former mining practice are mentioned in the report of our technical managers and consulting engineers, for example, the opening up of the ore body at and below the No. 14 level by footwall drives, and an increase in the distance between levels from 130 feet to 160 feet. Above the No. 14 level the main haulage ways were driven in the lode, thus opening up immediately large tonnages of ore, but we are now driving these in the footwall for greater security, and this practice will necessarily open up ore only at a later date when the crosscuts enter the lode. I would particularly call your attention to the temporary slowing down effect which this procedure may have on the estimate of the ore reserves at the end of the current year, and I would ask you to bear in mind that, though the estimate will show a reduction, it will in no way indicate any decrease in the size of the ore body at increasing depth. In confirmation of this fact, we already have highly satisfactory data from close boring by diamond drill now being carried out on the No. 14 level. Mention is also made in the managerial report of the investigation made into the various economic factors which affect stoping practice, especially the effect of dilution of value by the stoping of low-grade selvages of the ore body. The first result of control of dilution must be to reduce the tonnage of ore estimated to be in reserve, but it will improve the grade. It is important that you should understand that none of these factors lessen the potentialities of the ore body, the great vitality of which shows no signs of impairment. On the testimony of your managing director, who has recently arrived from Australia, your mine never looked better than it does to-day. (Applause.)

The high recoveries of metals in the mill recorded in 1937 have been more than maintained in 1938, and a further improvement has been made in the grade of the lead concentrate. The improvements in the last four years provide ample justification for the milling practice developed by your efficient mill staff.

Good progress is being made with the work necessary to reach and open up the ore resources of New Broken Hill Consolidated, in which we hold over 600,000 shares, or approximately 29½ per cent. of the issued capital.

JOINT WORKING ARRANGEMENT

We have agreed a basis and most of the details for a joint working arrangement with the New Broken Hill Consolidated Company. Under this agreement the two mines will be served by the new main, or Freeman Shaft, now being sunk on our lease, and the ore from both will be treated in one mill. This prevents duplication of engineering, repair and other shops, stores, etc., and obviates the necessity of completely separate staffs. The scheme is being considered in detail by both the English and Australian auditors and solicitors of the two companies, assisted by independent advisers. It is now in provisional operation, and, as our accounts show, we have received from New Broken Hill Consolidated a payment of £100,000 on account of expenditure incurred. We are justified in expecting very considerable economies, both in capital and working costs as a result of this agreement, which I have no hesitation in saying is in the best interests of the two companies. The capital cost involved will, over a period of years, be redeemed by debits against the production of the two mines.

PROGRAMME OF WORK

A large portion of the activities of the manager and staff during the year was devoted to the programme of underground and surface equipment designed to serve both the Zinc Corporation and New Broken Hill Consolidated Mines. Accompanying the directors' report

is a longitudinal section of the Zinc Corporation mine and the adjoining portion of the New Broken Hill Consolidated mine, showing the intimate connection of the two properties and the means to be taken for their joint operation. That you may have a clearer idea of the significance of this longitudinal section, it is well to remember that the areas coloured grey in the Zinc Corporation section have been responsible up to date for an output of nearly 6,000,000 tons. Taking this fact into account and remembering that diamond drilling has shown a continuation of values and dimensions well below the deepest workings, we may well feel assured regarding the potentialities of both companies. I would remind you that the dotted lines indicating the extension of the lead lodes beyond the actual workings must necessarily be founded on assumptions, to be verified or amended later in actual operations.

THE NEW MAIN SHAFT

Rapid progress has been made with the sinking of the new main (Freeman) shaft, which has been advanced to a vertical depth of 1,720 feet, the contemplated initial depth being 2,315 feet. Bearing in mind that, as regards size and capacity, this shaft is, so far as we know, the largest yet sunk in Australasia, I feel that all concerned with this work may well be congratulated on the excellent progress made in 1937. Recently, heavier ground has been encountered, which will entail some delay, but we believe that by January, 1938, the sinking will be completed to the No. 15 level. Before that, however, perhaps by the end of June of this year, the shaft should be in commission to the No. 11 level, as the erection of the headgear and the powerful electric winders is practically complete. The sooner it is in commission the better, for the strain on the old main shaft is severe, and the cost of maintaining it at full capacity makes it uneconomical.

Equally good progress has been made with the provision of an independent sand-filling winze and distributive drive in the footwall on the No. 8 level. Like the No. 14 and deeper main haulage drives, this has been located in the footwall away from the lode, with the object of minimising the risk of movement attendant on the extension of stoping in depth. This scheme has been designed to be of joint service at a lower depth for stope filling in both mines.

NEW BUILDINGS COMPLETED

The aerial photograph accompanying the directors' report will give you some idea of the progress made in the construction of buildings at the New Main (Freeman) Shaft. Already the new workshops, offices, change house, stores and messroom are complete and occupied. The equipment of the new shaft will soon be in commission, and the progress made with the construction of the new mill indicates that its completion may be expected in September.

The termination of this extensive programme of construction and centralisation will afford facilities for the economic development and operation of the properties of the two companies. The closest possible consideration has been given to the simplification of the handling of ore; to the equipment of the new workshops with precision tools and all arrangements for speedy and effective repair work; to the equipment and design of the mill; to office layout; to change-house conveniences for employees and to the general improvement of the mine surroundings. This work has made heavy demands on Mr A. J. Keast, the manager, and his staff, all of whom deserve our commendation. (Applause.)

You will have noticed from the periodical mine reports that our output is still increasing. Provided that there are no unforeseen stoppages, the production for 1938 should exceed 400,000 tons of ore. When the new main shaft is completed and in full operation the output will be further increased, if market conditions then justify this being done.

LEAD CONCENTRATES

All our lead concentrate production as you know goes to the smelters and refinery owned by Broken Hill Associated Smelters at Port Pirie, South Australia. Under the able control of Mr Donald Yates and his staff these works continue to operate at a very high level of efficiency, and contribute a very important element to the successful working of our property. (Applause.)

ZINC CONCENTRATES

Last year we produced about 63,900 tons of zinc concentrates, or slightly less than in the previous twelve months. These concentrates contain about 53½ per cent. zinc—very close to the theoretical maximum for our type of ore—and are in part sold for treatment

in Australia and, in part, for treatment in the United Kingdom. This division of our production dates back to the Great War and the policy then laid down by the British and Australian Governments. This policy aimed at supporting a domestic zinc smelting industry in the United Kingdom as well as in Australia and to the extent that zinc concentrates were smelted in England it naturally placed a restriction on the extension of treatment-works in Australia. The policy has been loyally supported by the big concentrate producers in Australia, though there have been periods when it would have been substantially more profitable to extend the treatment-works in Australia than to continue to ship to this country. Recently there has been a serious deterioration in the position of the zinc-smelting industry in the United Kingdom which, apart from the effects of the collapse in metal prices, has found itself in the impossible position of being left to carry on a heavy industry—a great labour, coal and transport user—in a protectionist country without reasonable protection for itself.

OUTSIDE PROPERTIES

Our staff keep in close touch with the development of the mining industry in Australia in case opportunities occur for the profitable extension of our activities. A number of propositions have been examined recently and two at least appear to justify some preliminary investigation by diamond drilling.

No considerable expense is involved in these operations. If, fortunately, our exploratory testing appears to justify more extensive operations calling for any important finance, the shareholders in the Corporation will be immediately advised and given the opportunity of providing the capital required, as in the case of New Broken Hill Consolidated. For convenience, we have registered in Australia a company with the title of Australian Mining and Smelting Company, Limited, which will handle all outside properties. This company has but a nominal capital at present, but if occasion arose it would be enlarged and would be utilised for financing any property outside Broken Hill which justified development and equipment.

METAL PRICES

While the prices of metals during 1937 were eminently satisfactory I regret to say that the markets up to date this year have been definitely adverse. Compared with the average for 1937, the first five months of the year showed a decline of £7 15s. 9d. in the price of lead and £8 4s. 6d. in the price of spelter. The declines have been greatest during the past few weeks, although there has been a modest upturn in the last 48 hours, and current prices until yesterday have been nearly £10 per ton less for lead and zinc than the averages for 1937. The price of silver also is about 1½d. per ounce lower. Declines of this magnitude have a grave effect on our revenues. Fortunately there are possibilities of some improvement. Reasonable co-operation amongst producers on the one hand and the overdue expansion in demands from consumers on the other would quickly be reflected in better prices. A year ago metal producers were being criticised for profiteering out of the re-armament scheme. Experience must since have proved conclusively to the critics that the interference with normal trade caused by purchases for armament purposes has a serious and adverse effect on general consumption. At a time when everyone is talking of arming against the possibility of war, nobody is inclined to embark on new enterprises or even to continue courageously the risks of those already launched.

THE OUTLOOK

World trade, which commenced its recovery in 1935, rapidly improved in 1936, and during the early part of 1937. Expanding consumption reduced stocks of most commodities, and especially of lead and zinc. Prices quickly increased, and the speculative boom on the Stock Exchange spread to commodities. In the wake of political portents both in Europe and in the United States—a partial reversion to a policy of deflation by some Governments and rumours of a reduction in the price of gold in America—the boom suddenly collapsed. Then followed increasing apprehensions of international trouble and world markets became "fear infected." Deflation having once been started quickly got out of control. Trade throughout almost the entire world and particularly in the United States contracted sharply. Prices for commodities slumped to levels which in many cases were quite out of accord with current costs. Altogether it has been a serious period for industry in every country, and if it were to continue much longer its national—and international—consequences would be grave. If we could but remove the effect of fear from the markets—in Europe the fears of war and of more deflation and in the United States the fear of political repression of industry—

I am confident that all markets would enjoy a healthy recovery. Much depends on the United States. There the political conflict with industry, measured by its damage to the well-being of the world at large, has indeed been disastrous. Its continuance would tend to eliminate all prospects of anything important in the way of an Anglo-American Trade Agreement and threaten even the much-advertised currency arrangements.

CONCLUSION

Since I last addressed you our secretary, Mr F. A. Crew, has spent a considerable time in Australia and particularly at Broken Hill in connection with the organisation and control of the Corporation offices. He has also given attention to the joint working arrangement with New Broken Hill Consolidated. From his visit we have derived great benefit, and I warmly commend his services. Two of your directors, Sir Clive Baillieu and Captain Oliver Lyttelton, also made special visits to Australia, and gave a close examination to our interests in all their aspects, for which we are greatly indebted to them. The managing director has, as usual, given his unstinted attention to our affairs on the spot over a period of many months and has earned our gratitude not merely by his services in the detail of administration but by the wisdom of his planning. (Applause.)

We continue the practice of sending members of our staff abroad, so as to keep in close contact with all the latest mining, metallurgical, and engineering developments in other countries. I am deeply impressed by the treatment our representatives have received everywhere they have gone—in Canada, the United States, Yugoslavia, the Rand and Rhodesia. I wish time permitted me to mention all those who have so freely placed their staff and works at the disposal of our representatives. As it is, I can only offer a general acknowledgment of their kindness and add that we shall be only too happy to reciprocate their hospitality if and when any of their staff visit us in Australia.

A GREAT MINE

You have a great mine, well equipped and efficiently managed, a substantial interest in the adjoining property of New Broken Hill Consolidated, which promises to develop into a profitable producer; large interests in lead smelting refining works and investments of importance in metal manufacturing and the like. These, with your loyal and efficient staff and employees, provide you with all but one of the essentials to success, viz., prices for your products showing a reasonable margin over costs. In the current year the margin has been steadily dwindling and cannot now be regarded as satisfactory. Unless metal prices recover, you must expect results for 1938 considerably below those of 1937, though I need hardly tell you that the strictest economy is being exercised both in Australia and here, and nothing is being left undone to counteract the effect of depressed markets. Given reasonable prices for metals, you need have no fears as to the prospects of your business.

TRIBUTE TO MANAGEMENT AND OFFICIALS

I cannot conclude without thanking our technical managers and consulting engineers—Messrs Bewick, Moreing and Company—and their chief representative in Australia, Mr Victor Edquist for their efforts on our behalf. Mr A. J. Keast, the manager of the mine, and his staff at Broken Hill have had an exceptionally busy and difficult year. Our warmest thanks are due to them for their efficient and enthusiastic efforts to further the interests of the Corporation. The work done underground, at the mill and in the surface workshops calls for the highest commendation. We must also express our appreciation of the results obtained by the Melbourne office under the management of Mr J. Fitzgerald. (Applause.)

The Chairman concluded by moving the adoption of the report and accounts.

The resolution was seconded by Mr. Robert W. Skipworth (the vice-chairman), and carried unanimously.

The retiring directors, Viscount Horne of Slamannan and Captain A. H. Moreing were re-elected, and the auditors, Messrs. Monkhouse, Stoneham and Co., were re-appointed.

The meeting ended with a hearty vote of thanks to the chairman, directors, and staff.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 Bowyer Street, Fleet Street, London, E.C.4.

EDMUNDSONS ELECTRICITY CORPORATION, LIMITED

BUSINESS MORE THAN DOUBLED IN FIVE YEARS

SUCCESS OF CO-ORDINATED CONTROL

SIR THOMAS ROYDEN'S REVIEW

REMARKABLE RECORD OF EXPANSION

During the year under review the figures are as follows:—
Number of consumers has increased from 176,000 to 378,000, or 115 per cent.
Number of units sold per year has increased from 321,027,000 to 735,933,000, or 129 per cent.
Load connected has increased from 496,000 kw. to 1,060,000 kw., or 114 per cent.

The overhead and underground mains have increased by 5,200 miles; 1,235 villages and townships, with a population of 425,500, have been connected, and £9,633,000 of additional capital has been expended. During the same period the company has received gross revenue from the sale of current of £16,305,922; paid in income tax and local rates £1,945,556; and paid in salaries and wages to its employees (who now number 8,488) the sum of £5,576,328. The distribution in dividends (less income tax) to Edmundsons ordinary shareholders has been £1,169,351.

In view of the above, surely it must be conceded that your company is meeting with a reasonable degree of success its obligations to the public it has the privilege to serve, and we see no reason why, during the next five years, the company's business, if left alone, should not again be doubled.

During the past year alone 45,000 new consumers have been added, an increase of 14 per cent; 165,800 kw. of new load connected, an increase of 19 per cent; an increase in output of 104,350,000 units, or 17 per cent; in addition to which 80,616,000 units were exported to the Central Electricity Board.

ADDITIONAL GENERATING CAPACITY

Under the direction of that Board we are now engaged in the installation of considerable extensions to the steaming and generating capacity of the three selected stations operated by the Edmundson group. In the Shropshire company the Stourport station is being increased by 90,000 kw., which will give this station, when completed, a total capacity of 170,000 kw. In the South Wales company the Upper Boat Station is being increased by 60,000 kw., which, likewise, when completed, will give this station a capacity of 123,000 kw., and in the Hayle station of the Cornwall Electric Power Company there is to be an increase of 15,000 kw., thereby making the total capacity of this station 32,500 kw.

Also under direction of the Central Electricity Board, an entirely new Selected station is in the preparatory stages of construction at Little Barford (Bedfordshire), which is in the area of the Bedfordshire, Cambridgeshire and Huntingdonshire Electricity Company, and which, when completed, will be operated by that company. The initial capacity of this station is to be 60,000 kw., which will eventually be expanded by another 60,000 kw., giving a total capacity of 120,000 kw.

The confidence of the Central Electricity Board in the Edmundson group's ability to construct and operate this large amount of additional generating capacity will be noted with satisfaction.

BILL PROMOTED BY OXFORD CITY

During the present session of Parliament the Corporation of the City of Oxford promoted a Special Bill to give to the city compulsory powers to purchase the order and undertaking formerly belonging to our Oxford company, but now acquired by, and consolidated with, our Wessex company.

When our Wessex Bill was promoted last year it was opposed by the City of Oxford, which attempted to prevent absorption of the company by the Wessex company. It was also attempted to introduce into the Bill a stipulation preventing the Oxford or Wessex companies from opposing, except in matters of detail, a Bill to be promoted at a later date by the Corporation of the City of Oxford giving it compulsory powers for the acquisition of the undertaking in question. This petition against the Wessex Bill was refused by a Committee of the House of Lords.

The questions at issue in the petition of Oxford against the Wessex Bill were, in the opinion of the company's counsel, precisely the same

The forty-first ordinary general meeting of Edmundsons Electricity Corporation, Limited, was held on 23rd instant at Thames House, Millbank, London.

Sir Thomas Royden, Bt., C.H. (the chairman) in the course of his speech, said: The year under review has produced results of exceptional importance to this Corporation. To enable you to view the situation in proper perspective over a period of time I will revert for a moment to the year 1933, when the executive management then in control of this highly complex business adopted a carefully considered plan for its future development and operation.

It has been mentioned to you on the occasion of two previous annual meetings that it was at that time there was initiated a policy of co-ordinated control of all the companies in the Edmundson group. This policy was predicated upon three basic principles, which may be defined as physical integration, corporate simplification, and a fixed objective of commercial achievement and physical growth.

The desirability of physical integration and corporate simplification may be accepted as a truism. Obviously integration is a sound course. So is simplification of corporate structures, which permits of intelligent investment, sound financing, and efficient management.

In the realm of achievement, definite objectives decided upon after careful consideration of all the possibilities give to the organisation and its personnel a standard of measurement by which it can be determined whether or not the expected and hoped-for progress and growth of the business is being achieved.

The accomplishment of the 1933 programme has presented many complex problems in that it requires that the interests of the consumers served, the moneys of the investor, and the company's interests generally, should all have fair and equitable treatment.

NUMEROUS CONSOLIDATIONS EFFECTED

The numerous consolidations that have been effected of various subsidiary and sub-subsidiary companies into larger and more scientifically controlled and operated units has advanced according to plan, and as rapidly and completely as statutory limitations made possible.

Six direct subsidiary and twenty-six sub-subsidiary companies have been put into liquidation, and when the liquidations now in progress or in immediate contemplation are completed, as they will be within the next year or two, the sub-subsidiaries will be entirely eliminated and the group will consist of Edmundsons as the parent company and ten or twelve directly-owned operating subsidiaries only.

It will be recalled that the Report of the Committee on Electricity Distribution issued in 1936, and commonly known as the "McGowan Report," strongly recommended this policy of amalgamation, and in this respect at least it is obvious the policy of your company has been, and will continue to be, in complete accord with one of the most important recommendations of that carefully considered document.

COMMERCIAL AND PHYSICAL DEVELOPMENT

From what has just been told to you you will, I hope, agree that reasonable and satisfactory progress has been made in accomplishing the first two basic principles of the company's development programme. As to the commercial and physical development, I think you will also agree, after hearing the following figures, that this too has been satisfactory. Our objective in 1933 was to double the business in five years, and though at that time this may have appeared to be more of an ambitious hope than a possibility, the results actually obtained are all the more remarkable, because they have not only attained, but satisfactorily exceeded, the objective which we then set before us.

as those presented in a somewhat different form in the Oxford City Bill just referred to. For all practical purposes the recent Bill promoted by the city may be regarded as an effort to have a Committee of the House of Lords reverse a former decision of another Committee of the same House.

IMPORTANT QUESTIONS OF PRINCIPLE INVOLVED

Wessex opposed the Oxford Bill, and was successful in this opposition. The questions of principle involved were of vital importance, not only to this company but to other companies within the United Kingdom which are charged with the responsibility of rural distribution and within whose areas of supply there happen to be important urban centres. Had Oxford City been successful in its efforts, and if the precedent thereby established had been followed by the many other urban centres which could quite properly have expected to be granted the same privileges of compulsory acquisition, this company certainly, and probably many other companies, would have lost such a large proportion of its consumers and load as to have made the continuation of rural development and supply economically impossible.

Oxford City's efforts would, if successful, have been highly anti-social. It is only by a combination of urban and rural supply that electricity can be brought to the homes of people living in sparsely populated districts at a price which they can afford to pay, and it follows as a logical conclusion that any successful effort on the part of urban authorities to acquire for themselves the advantages and economies of supplying electricity in highly concentrated centres of population, to the exclusion of the rural areas, is highly selfish—to say the least—and entirely disregards the rights to reasonable consideration of people living in sparsely populated rural districts.

UNCERTAINTIES CAUSED BY PENDING LEGISLATION

During the two years that have passed since the issuance of what is now commonly known as the "McGowan Report" the public in general, and the electrical industry in particular, have been awaiting the introduction by the Government of legislation. This legislation is confronted with what might be described as a psychological blockade, which is caused by an effort to solve an economic problem of vital importance by the application of political considerations. While it would be idle to speculate upon, or attempt to envisage, the form of the Bill which may be introduced next autumn, it is unfortunately true that the uncertainties surrounding the whole situation are daily becoming more acute.

The satisfactory development of the electric supply industry requires the adoption of plans and policies looking well into the future, and the expenditure of very large sums of money in carrying them out. It must be obvious that these sums of money cannot be economically or safely provided, and plans and policies cannot be soundly formulated, while the interests concerned—whether they be municipal or company—are hedged about by disturbing uncertainties. The industry as a whole must get on with its job, and if the Government see difficulties in the situation which are such that they desire additional time for consideration, it would be a help if legislation were introduced as soon as practicable under which the present *status quo* of both municipal and company interests—without prejudice to either—could be maintained for a period of, say, not less than five years. This would enable many of the interests concerned voluntarily to work out by mutually satisfactory agreements many of the problems which are at present in a state of complete uncertainty.

THE DIVIDEND

You will observe from the report that the balance available for distribution is £355,446. The board propose to utilise this in placing £30,000 to reserve account, in providing for the balance of the preference dividends for the year, absorbing £32,662, and it is recommended that a final dividend at the rate of 5 per cent. on the ordinary stock which participated in the interim dividend should be paid. This sum will involve a distribution of £187,000, and makes the total distribution for the year 9 per cent. In addition, the new ordinary shares issued at the beginning of January are entitled to a dividend at the rate of 2½d. per share for the period to March 31st, and this distribution requires £7,600. If these proposals meet with your approval there will remain to be carried forward to the next account £98,184.

CAPITALISATION OF RESERVES

In the report it has been stated that the directors recommend that there should be capitalised £2,250,000 out of the existing reserves,

by distributing new ordinary stock credited as fully paid, in the proportion of £1 of new stock for every £2 nominal of ordinary stock now held. Resolutions to approve of this recommendation will be submitted to you to-day. Before that is done, however, it will be necessary to increase the capital of the company to take care of this issue, and a proposal that 3,000,000 new ordinary shares of £1 each be created will first be submitted to you. The ordinary capital, as it will be after these changes are approved, will much more nearly represent the true equity capital, though it will in no way affect the earning power of the Corporation.

The report and accounts were unanimously adopted, and the proposed capitalisation of reserves was approved.

GEORGE NEWNES, LIMITED

The forty-first annual general meeting of George Newnes, Limited, was held, on the 23rd instant, at the company's head office, Tower House.

Sir Frank Newnes, Bart. (the chairman), said that the profits for the year amounted to £117,868 13s. 6d., as compared with £145,853 14s. 5d. for the previous year. The reduction was mainly due to increased costs of paper and printing and to lower earnings derived from the Newnes and Pearson Printing Company.

The directors proposed to allocate to the employees' sick and pension fund £4,000, and to development fund £20,000. They recommended a final dividend on the ordinary shares of 5 per cent., making 10 per cent. for the year, leaving to be carried forward to next year's accounts £51,021 12s. 7d., against £48,425 19s. 11d. last year.

There were few changes in the balance sheet, and the statement of combined assets and liabilities printed at the end of the directors' report showed a sound financial position. The combined cash balances of the company and its subsidiaries amounted to the substantial sum of £313,249, although during the year Pearson's and Country Life had invested £75,000 in gilt-edged securities. Investments outside the business had been increased by this amount and now stood at £193,907.

The earnings of Pearson's and Country Life had both been affected by heavier costs of production, and, in the case of Pearson's, also by a lower income received from the Newnes and Pearson Printing Company. But for these factors the Pearson business would have shown better profits than for several years, as their periodical business had done well.

Commencing January this year, paper costs rose heavily. Recently there had been a marked fall in the price of pulp and a substantial reduction in the price of paper was expected towards the end of the year.

THE PUBLICATIONS

Regarding the publications, with a list of over fifty it was not possible to refer to more than a few. Old friends like "Tit-Bits," "The Strand Magazine," "Wide World Magazine," "Home Notes," "Smallholder," and others continued in the front rank. "John O' London's Weekly" had just published its thousandth number. "Country Life" and "Homes and Gardens" maintained their great prestige in their particular field, and "Amateur Gardening" was still the leading horticultural paper. "Modern Woman," "Modern Home" and "Miss Modern" and "Woman's Sphere" were among the best known and most popular of the illustrated monthlies. More than a year ago "Woman's Own" had been transformed into a new all-gravure super-weekly. Printed in fine colours, it gave remarkable value for twopence. The large expenditure on its development had all been borne out of the resources of the company. Its high circulation justified the confidence placed in it by its large body of advertisers. A new twopenny weekly had recently been launched, produced in the same attractive new style and original make-up, this time appealing to the family circle. The title was "To-Day." As an example of new enterprise in the publishing field he felt sure that every shareholder would be interested in this publication, to which doubtless they would wish to draw the attention of their friends.

The position of the company had been strengthened in recent years by the development or acquisition of a greater variety of publications. A group of technical and semi-technical papers had been established, and through the company's investment in the National Trade Press, Limited, an important group of trade papers had been added. There was now no section of the community which advertisers could not reach through one or other of the company's publications. The advertisement revenue this year in the aggregate had been as high as it had ever been, and the reputation of the publications stood high among advertisers.

The report was unanimously adopted.

WILLIAM BEARDMORE AND COMPANY, LIMITED

CAPITAL SCHEME APPROVED

The annual general meeting of William Beardmore and Company, Limited, was held, on the 17th instant, in the Council Room of the Federation of British Industries, 21 Tothill Street, Westminster, London.

Sir James Lithgow, Bt., M.C., D.L. (chairman), in the course of his speech, said:—As to the financial results for the year, you will observe that the actual trading profit has again shown an increase, but it is clear that no payment of interest on the 5 per cent. interest certificates can be paid, and the credit must be carried forward and set against the existing debits. Immediate prospects are clearly satisfactory, but there are very definite indications of a substantial recession in the demand for commercial products.

The report was unanimously adopted.

REORGANISATION SCHEME

The chairman, before dealing with the scheme of reorganisation, referred with appreciation to the sacrifices by the late Lord Invernairn. He then continued: The need for a scheme giving effect to a revaluation of the assets has been recognised and referred to from this chair for many years. But until the revival in trade set in no useful basis for such a valuation existed.

You will observe from the documents that your board have committed themselves to very definite figures both as to the present value of the various shares and as to the future earning prospects of the company. These latter figures are put forward with a full appreciation of the difficulties of an accurate forecast. I can only say that they are the result of very careful thought and much study of the past as well as consideration of the future.

BASIS OF VALUATION

The accompanying circular is intended to make clear to you the method adopted in arriving at a true value of the assets side of your balance sheet. The board have also considered the company's probable earning power as compared with its present intrinsic value: our expectations in this regard justify and confirm in large measure the physical value placed upon your assets by the experts whom we have consulted. We have, therefore, some assurance that the basis upon which we are proceeding is a sound and justifiable one.

The vital feature in the scheme, from your point of view, is the apportionment of the issued capital to present interests. Existing debentures and other prior charges far exceeded the new debenture issue. It was, therefore, necessary to take existing prior charges one by one and obtain the agreement of their holders to modification either of their amount or their priority.

After the completion of the negotiations on the foregoing matters there remained to be adjudicated the proportion of the new shares which should be allocated between the holders of the first, second and third preference shares. As already indicated, the future earning power of the company is extremely difficult to forecast. We therefore adopted the principle of allocating to each of the preference shareholders some part of the equity in inverse proportion to their existing priority. The first preference shares are in a very few hands. It was therefore obviously expedient, as well as necessary, to determine their value by discussion and negotiation. I am advised that the result can be regarded as reasonable from the point of view of the remaining shareholders. The final allocation as between the second and third preference shares has been the result of careful weighing of the possibilities under the present scheme in consultation with admitted experts in such matters.

The results of those consultations have been submitted to an outside body for advice, and I can only say, on behalf of the board, that the proposals put before you are not only the result of much anxious thought on my own part and on that of my colleagues, but embody the outcome of the best advice and assistance which the wide ramifications and associations of the company have placed at our disposal. I have every confidence that when the time comes for our later meetings you, ladies and gentlemen, may be found to be in agreement that the scheme should be passed forthwith.

At class meetings of the holders of the first mortgage debenture stock; interest certificates; "A" income debenture stock; first, second and third preference shares; and of the ordinary shares the scheme was approved, after the chairman had replied to questions, by overwhelming majorities. At an extraordinary general meeting resolutions approving the scheme and the adoption of new articles of association were, after questions had been answered, carried by the requisite majorities on a show of hands.

The proceedings ended with a vote of thanks to the chairman.

ANGLO-IRANIAN OIL COMPANY, LIMITED

LARGELY INCREASED PROFIT

The twenty-ninth ordinary general meeting of the Anglo-Iranian Oil Company, Limited, was held, on the 20th instant, in London.

The Rt. Hon. Lord Cadman, G.C.M.G., D.Sc., LL.D. (the chairman), said: Ladies and Gentlemen,—Last year I drew your attention to the remarkable increase in the profit on trading account, but 1937 profits have exceeded those of 1936 by almost £3,000,000. This result is due to a large increase in the volume of sales and a further rise in values. Royalty and taxation payable to the Iranian Government are greater by nearly £1,000,000, and I feel sure that you will be as pleased as I am to see the Iranian Government thus sharing substantially in the company's welfare, which they are doing so much to promote. Income tax is naturally greater, on account of the larger profits. We have placed £546,872 to general reserve, thus bringing the total to £1,200,000.

EXCELLENT DRILLING RESULTS

The well-known fields at Masjid-i-Sulaiman and Haft Kel have produced with their customary regularity and their output has been supplemented by that from the smaller fields at Naft-i-Shah and Naft-Khaneh. In the aggregate, the net crude oil production from the company's fields in Iran and Iraq amounted during 1937 to 10,289,000 tons. In addition, we received 1,220,000 tons from the Iraq Petroleum Company.

I mentioned last year that oil had been proved at Gach Qaraghuli—a field which has now been renamed Gach Saran. Drilling on this field has been continued with excellent results. In addition to the original producing well, two others—on the north-east and south-west flanks—were drilled into the limestone and yielded production rated at 4,500 and 4,000 tons a day respectively. Further wells are being drilled at Gach Saran to define the extent of the field; and the apparent size of the structure, coupled with the thickness of the limestone, indicates that Gach Saran is a field which is even larger than Masjid-i-Sulaiman.

In addition to Gach Saran, I have to inform you of a further discovery, on the structure adjacent to Haft Kel, known as White Oil Springs or Naft-i-Safid. This area has been mentioned to you on former occasions. As long ago as 1913-19, wells were drilled there, but with negative results. In consequence, however, of developments at Haft Kel and of indications given by geological and geophysical work, a new test drilling programme was adopted at White Oil Springs. The first two wells of this programme proved the existence of high-pressure gas and the third struck oil. I cannot yet hazard any views as to the potentialities of this structure. It is, however, established that White Oil Springs is not an extension of Haft Kel, but is a separate structure whose extent can only be revealed by further drilling. White Oil Springs is in close proximity to the existing pipeline system connecting Haft Kel with Abadan.

With regard to marketing, the prices of products were, on the whole, maintained at higher levels than those of 1936. As a result of the non-fulfilment of optimistic forecasts of consumption in the United States, stocks of motor spirit and fuel oil accumulated considerably in excess of market requirements and prices suffered accordingly. At the moment, prophecy regarding future trends is difficult; but it is not too late for the balance between supply and demand to be restored. In Great Britain—our principal market—the upward trend of industrial activity has not been maintained; and, in addition, motor spirit and diesel oil for road vehicles have been subjected to increased taxation.

These conditions are among the unfavourable. Fortunately, however, they are counterpoised by others. There is, for example, steady progress in the numbers of oil-consuming machines in virtually all parts of the world, and notably in the great consuming centres. It appears, therefore, that the demand for petroleum products is still on the up-grade, which should benefit the industry as a whole.

POSITION AND OUTLOOK

So far as the company itself is concerned, we have good reason for satisfaction with the present position and with the outlook. Our relations with H.I.M. the Shah and the Iranian Government were never more cordial, and the considerable programme of work in Iran, which is necessitated by our expanding operations, is proceeding smoothly.

I have already told you of the satisfactory situation of the company in respect to its reserves of oil, its equipment and its staff. Our position is, in fact, very sound; and, provided there is no further serious drop in prices, I feel that you will have no reasonable cause to be disappointed in the results of the current year.

The report and accounts were unanimously adopted.

"SHELL" TRANSPORT AND TRADING COMPANY, LIMITED

SOUND POSITION—INCREASED PROFIT SITUATION IN MEXICO

The annual general meeting of the Shell Transport and Trading Company, Limited, was held, on the 21st instant, at Southern House, Cannon Street, London.

The Right Hon. Viscount Bearstead, M.C. (chairman and one of the managing directors), said that the balance of profit and loss account was £5,954,000, against £5,565,000 in the previous year, which enabled a final dividend of 2s. 6d., tax free, to be paid, making a total tax free dividend of 4s. per £1 unit on the increased capital. The soundness of the financial position was shown by the fact that with assets worth £53,000,000 creditors amounted to £204,000. During the year their tanker fleet worked to full capacity, and they had a large building programme in hand which was materially benefiting British yards.

OIL INDUSTRY AND TAXATION

After referring to the need for Government action in modernising the road system and to the growing importance of agriculture as a market for petroleum products, the chairman mentioned the success that had attended the introduction of their new motor lubricating oils. Shell motor spirit had continued to maintain its pre-eminent position. He had previously spoken of the steadily increasing antiquity which the oil industry had to pay to Governments in taxation. The import duty in this country had been raised to 9d., and in France increases had also been imposed. There were some countries enlightened enough to use surplus balances in encouraging road transport by remission of duty, among which South Africa stood out as a most pleasing example, while Southern Rhodesia has reduced the duty on petrol to 2d. per gallon, and Northern Rhodesia had abolished the duty altogether. In several countries attempts had been made to force the oil companies to carry for emergency purposes stocks largely in excess of commercial requirements. No industry could bear such a burden, and the cost of such special stocks must be a charge to the country as a whole. In U.S.A., in spite of the industry as a whole having shown improved over-all results, the general level of profit in 1937 must be regarded as a disappointment, and the outlook was uncertain, although there had recently been some improvement in bringing crude production in line with consumption. The Shell Union had increased its net operating income and paid dividends on its common stock totalling \$1.00 per share.

POSITION IN MEXICO

Continuing, the Chairman said: You will expect me to make some reference to the oil situation in Mexico. Your company's financial interest in the Aguila Company is comparatively small. We have, however, a very serious responsibility in that this group manages the affairs of the company. The interest of the company and with it the prosperity of Mexico and its people have been the sole guiding influence in the minds of those directly responsible for its management. The accusation that the Mexican Eagle Company has been operated to its disadvantage and to the advantage of its so-called twin company, the Canadian Eagle Company, is fantastic, as an unbiased examination of the affairs of the two companies clearly proves. There is also not the slightest truth in the rumour that the oil companies have interfered in domestic politics in Mexico, even to the extent of financially encouraging revolution. The Aguila Company has never in any way stepped outside the bounds of its legitimate commercial task.

ATTITUDE OF COMPANIES

I will not burden you with the origin of the troubles in Mexico; it has already been made public. I will say this, however, that in trying to reach agreement I am satisfied that the companies went to the utmost limits in endeavouring to avoid a breakdown, and that the final offer which they made would certainly have resulted in a serious annual loss to the companies had it not been coupled with the condition that hereafter the companies would need to be placed in a position properly to control their own administration and secure a fair return in work for a fair rate of pay in accordance with modern labour practice. Herein lies the chief difficulty of recent years. You are aware of the present position. By Government decree the properties have been expropriated; the companies have applied to the courts for an annulment of this decree; their application has been dismissed, but they have appealed, and the Appeal Court's decision has yet to be handed down. What this decision will be I cannot foretell, but the Aguila Company—as, indeed, I believe, all the other companies involved—are ready and

anxious to continue their operations in Mexico. A reversal of the decision would be the just and fair way of righting a very serious wrong, but I must point out that any kind of satisfactory co-operation between the Mexican Government and the oil companies, which has always been and continues to be the company's sincere desire, can only be attained if there is present on the Mexican side a genuine desire to co-operate on the protection of the oil industry, its workers, and the capital which has been legitimately invested in it to the great advantage of the country. I hope the problem will eventually be satisfactorily solved, but I cannot disguise from you the fact that the situation is very grave.

GOOD RELATIONS IN VENEZUELA

In contrast with the rather dismal picture of Mexico which I have had to give, I must refer to the very happy relations which exist between the Governments of other Latin-American countries and the companies with which we are associated. In this respect I would particularly mention Venezuela, since it is in this country that our group has developed such substantial production of oil.

SITUATION IN IRELAND

I must mention, with more than a passing regret, the state of affairs in Ireland. Our association with Ireland goes back many years, and we—and more especially our Irish staff—have done a great deal to encourage there the development of those mechanical methods and appliances which play such an important part in modern industry and transport. Our relations with the authorities were always cordial, but when they indicated a desire to erect a refinery for producing the greater part of their requirements from crude petroleum we thought it our duty to advise them against the scheme. We felt then, as we feel now, that the proposal was uneconomic and must inevitably result in excessive costs to the consumer and in failure to provide him with the highly specialised products which to-day are necessary. Shortly after we learned that others, who had never hitherto played any part in the development of the Irish market, had offered to erect a refinery in return for a monopoly of supply of the crude oil to be treated in it. It was suggested that we and other companies already working there should be the distributors of the products of this refinery. You will, I am sure, agree that we could never be parties to distributing products carrying our world-famous brand names under conditions which gave us no control over their quality. Equally, we have a natural hesitation to associate ourselves with a scheme which we believe would prove generally unsatisfactory to the Irish consumer and thereby react against those associated with it.

The report was unanimously adopted.

TELEPHONE RENTALS, LIMITED

RECORD NEW BUSINESS

The annual general meeting of Telephone Rentals, Limited, was held, on the 20th instant, at Southern House, London, E.C.

Mr Fred T. Jackson (chairman and managing director) said that all subsidiaries had traded at a profit for the year under review. The operating companies had made considerable progress, and the new rentals secured by these companies constituted a record. Trade generally during the year was most satisfactory, and it was logical that part of the increase in the rent roll should be attributed to the satisfactory industrial conditions prevailing throughout the country. However, they were also entitled to attribute a big proportion of the increase to the development of their sales promotion plans, and the directors were gratified with the present position, as it indicated that their policy had been proved to be sound and progressive.

Their Australian associated company had earned a substantial profit and continued to make satisfactory progress. During the first five months of the current year earnings were running at a higher level, and so far there was no indication of anything in the way of depression.

This time last year he was able to report that the year under review had been one of expanding trade in nearly every direction. The same remarks applied to the year 1937, but he did not anticipate that this time next year he would be able to report so favourably on general industrial activities. Reports from their operating companies all over the country indicated a falling off in general trade, but their experience during the first five months of 1938 was that, although it was a little more difficult to secure new contracts, the new business secured was little less than that secured in the first five months of 1937. Unless, therefore, the international political situation cleared up, it was hardly likely that they could anticipate another high record in new business for the current year. This did not indicate, however, that there would be any falling off in profits earned. In fact, the monthly revenue and expenditure accounts for the first five months of the year enabled him to fore-

ast a satisfactory 1938, as their profits showed an increasing tendency.

It was proposed to increase the authorised capital to £1,000,000 by the creation of 800,000 additional ordinary shares, although these further shares would not be issued at present.

Gross dividends showed a small increase on last year, amounting to £113,672, as compared with £112,897. There was a decrease in expenses, with the result that the net profit amounted to £110,492, as compared with £108,254. The increase in profits was greater than was apparent from the figures, as in the previous year they brought into profit and loss account the sum of £6,146, being reserve created out of past profits no longer required. A sum of £30,000 has been appropriated to general reserve account, raising it to £140,000, and the directors recommended a final dividend of 6 per cent., less income tax, making 10 per cent. for the year.

The report was unanimously adopted, and the proposed increase of capital was approved.

WILLOUGHBY'S CONSOLIDATED COMPANY, LIMITED

SATISFACTORY RESULTS OF A DIFFICULT YEAR

The ordinary general meeting of Willoughby's Consolidated Company, Limited, was held, on the 20th instant, at Winchester House, Old Broad Street, London.

Col. H. T. Fenwick, C.M.G., M.V.O., D.S.O. (Chairman), in the course of his speech, said:—

The issued capital now stands at £560,251 4s., divided into 1,400,628 shares of 8s. each, whereas before it consisted of the same number of shares—1,400,628 shares of 10s. each. This leaves 474,372 shares of 8s. each still unissued. This difference having been effected by the return of 2s. per share, I may perhaps be permitted to say that I have received many letters from shareholders expressing their appreciation of the transaction.

The profit for the year 1937 amounts to £31,465 7s.

From this the board have placed £2,000 to reserve account, bringing it up to £50,000, and recommend the payment of a dividend of 5d. per share, equal to 5.2 per cent., and to carry forward a sum of £6,485 13s. 9d., which is £280 more than was carried forward last year. Next, taking the credit side of the profit and loss account, you will observe that the profits secured in Rhodesia were £3,000 less than in the previous year. This is accounted for by a small loss on ranching—owing to an abnormal drought—compared with a profit for the previous year.

Profit on realisation of shares shows a considerable drop on the previous year, but, as you are all aware, the markets of the last eighteen months have precluded the possibilities of much good being effected in this direction. Dividends and interest at £25,916 0s. 1d. stood up well considering the times.

As to shares and debentures in companies, you will observe that these amounted to £307,101 6s. 1d. and showed on December 31st an appreciation of £41,254 13s. 4d. at market price over the amount at which they stood in the books of the company. Since the end of 1937 there has been further shrinkage in market values, but at the present date there is still a fairly satisfactory appreciation.

I would like to say a few words about the general situation in Southern Rhodesia. The country is gradually forging ahead. The returns of imports and exports—a good index—are gradually improving, helped, of course, by the better mining returns. The tobacco growers in the neighbourhood of Salisbury have had a good year, and, although the cattle industry suffered from an abnormal drought, owing to higher prices it is gradually recovering. At the present moment a Royal Commission is sitting and inquiring into the advisability of the amalgamation of Northern and Southern Rhodesia. I will not, of course, attempt to anticipate their finding or to give any opinion of my own, but will be content to say that I shall accept their judgment without question.

Before sitting down I would like to say a few words about the general position of Willoughby's. Our principal business for which we were formed is the development of Southern Rhodesia, and that part of our business is gradually improving. We still own a million acres of land, and the time must come when with a slow, but sure, and gradual increase of population there must be a good demand for this. We have never sold any land under 5s. an acre, and at that price it makes a big hole in our property and outlay valuation. Our stands and buildings are certainly worth more than they stand in our books. Another asset is our investment portfolio. This, as you may imagine, in these times is somewhat difficult. Taking, however, all our assets and liabilities, I have no hesitation in telling you that the capital is well assured.

The report and accounts were unanimously adopted.

THE GREAT BOULDER PROPRIETARY GOLD MINES, LIMITED

GOOD RESULTS AND PROSPECTS

The forty-fourth ordinary general meeting of the Great Boulder Proprietary Gold Mines, Limited, was held, on the 22nd instant, in London.

The chairman, Mr Claude A. de Bernales, in the course of his speech, said:—After charging all relative expenditure and writing off £30,719 18s. 11d. for depreciation, the profit for the year amounts to £73,553 6s. 8d., compared with £87,065 19s. 9d. for the previous year. The difference is due to the increased expenditure incurred in reconditioning existing shafts to levels which had previously fallen into disuse, and to the provision for depreciation of plant installed during the year but which did not come into operation until 1938.

Two dividends of 12½ per cent. each were distributed out of the profit for the year, and absorbed £62,500. To make full provision for Australian taxation it was necessary to draw on the previous year's carry-forward to the extent of £3,317 13s. 7d.

A substantial expansion in profits is already foreshadowed for the current year, and a first interim dividend of 12½ per cent. was declared on June 14th, and will be paid on July 21, 1938.

The development policy of the mine during the past year has been directed with two primary objects in view:—

1. To develop known ore bodies to such an extent that the tonnage of ore available in reserves at the end of the year would stand at a figure exceeding three years' requirements of the plant at the increased rate of milling.
2. To explore possible new ore bodies, whose existence had been indicated by diamond drilling and geological examination, and from which subsequent ore reserves might be obtained.

YEAR'S PROGRESS

In reviewing the company's operations for the past year, I think it will be generally recognised that but for the energetic handling the mine has received under the present management the position to-day would have been very different from that which I have been able to place before you. In the comparatively short space of two years the ore reserves have been increased from 781,081 short tons of an average grade of 6.1 dwt. per ton to 1,062,200 short tons of an average grade of 6.9 dwt. per ton; working costs have been reduced from 31s. 11.41d. to 29s. 6.63d. (Australian) per short ton; and within the next few months production will have increased from 148,000 short tons to 336,000 short tons per annum. Developments underground have been particularly encouraging, especially in the Conroy's and Robertson's lodes section of the mine, and the discovery of a caunter lode of considerable width at the 2,650 ft. level showing free gold and telluride adds strong support to the belief that important ore bodies of good grade still lie at depth awaiting development.

The current year's operations have so far been attended with most satisfactory results, and there is every indication that the grade of the ore reserves will be fully maintained. The mine has every indication of many years of profitable life ahead of it, and the achievements of the past year have brought the prospect of increased dividends appreciably nearer, so much nearer that I hope my colleagues on the board will be able to support the payment of a third dividend of 12½ per cent. during the current financial year. This is no promise, but there is a reasonable prospect in that direction.

REVIEW OF THE COMPANY'S RECORD

This company, as you know, was formed by Mr John Waddington in the year 1894, or 44 years ago, and the Great Boulder Proprietary is the premier Westralian mine floated in London. It will, no doubt, be of interest to the shareholders to have a short digest of its record. When originally floated the critics of the day, although they were more times than enough proved wrong, did, through unwarranted and vindictive criticism, an irreparable amount of damage. The board, however, under Mr Waddington, stuck to its belief and its work, with the result that the mine since 1895 has distributed in the form of dividends no less a sum than £6,495,340.

The position to date is that by October 31, 1938, we should have paid for everything in connection with the development of the mine and the new plant, will have increased the crushing capacity from 148,000 short tons per annum to 336,000 short tons per annum, have kept up our dividends at 25 per cent., with a reasonable prospect that for the year ending December, 1938, the annual dividend will have reached 37½ per cent., and the prospect for 1939 being further advance in the rate of dividend. I consider that these figures speak eloquently for the board.

The report and accounts were adopted.

BANGRIN TIN DREDGING

IMPROVED RESULTS

The eighteenth ordinary general meeting of Bangrin Tin Dredging Company, Limited, was held, on the 21st instant, at Winchester House, Old Broad Street, London.

Mr Kenneth O. Hunter (the chairman), in moving the adoption of the report and accounts, said he thought shareholders would agree that the accounts presented a satisfactory picture, their total mining revenue being £192,334, compared with £88,374 in 1936. The improved results had arisen from the higher price of tin ruling during the year, the increased and more valuable yardage treated, and the higher tonnage output. There was a balance to be dealt with of £52,656. The directors recommended the payment of a final dividend of 10 per cent., making 15 per cent. for the year, leaving £12,656 to be carried forward.

With regard to the cost of the acquisition and tests of boring of the new Sydney Siam property of £103,995, the directors had exercised the option, and the purchase money had been deposited with stakeholders against receipt from the Siamese authorities of the mining leases duly transferred and registered in the name of the company, of which shareholders had been advised in October last. Eight of the 10 leases had already been transferred to the company, but there had been unavoidable delay in the transfer of the remaining two, the transfer of which would no doubt be issued in due course. That new property, when dredged, was estimated to contain 50,000,000 cubic yards, with an average content of about .75 lb. of recoverable tin ore per cubic yard, from which shareholders would realise that the acquisition was a valuable one, and would considerably increase the dredging life of their company.

At the beginning of the present year the domestic quota for Siam was fixed as from January 1st to June 30th at 64 per cent. of assessment. The international release of tin ore was later considerably reduced, but that decrease had not affected the domestic quota for the first six months of this year. With regard to the current year, their output for the five months ended May 31st was 545 tons, with an estimated working profit of £37,456, the figures for the corresponding period in 1937 being 323 tons, with a working profit of £31,000.

The report and accounts were unanimously agreed to.

SIAMESE TIN SYNDICATE, LIMITED

DIVIDEND OF 65 PER CENT.

The thirty-first ordinary general meeting of the Siamese Tin Syndicate, Limited, was held, on the 21st instant, in London, Mr Kenneth O. Hunter (chairman of the company) presiding.

The Chairman, in moving the adoption of the report and accounts, said there had been a marked increase in tonnage output and of yardage worked in 1937 as compared with the previous year. The profit balance for the year was £148,639, to which had to be added the balance of £7,135 brought forward, and the directors now recommended a payment of a final dividend of 15 per cent., making 65 per cent. for the year, leaving £11,487 to be carried forward.

The dredge on the Huey Moot area during the month of December raised 98,982 cubic yards of ground and recovered 22 tons of tin ore. Since the close of 1937 the mine had commenced to show a profit notwithstanding the reduced price of tin.

During the year very little prospecting was done, but since the close of the year work of this nature had been carried out at Kopah and the Ngow estate. The result of the boring at Plaiwah had proved that considerable area of ground at the top end of the leases which was previously considered valueless would pay to work. The area was estimated to contain 3½ million cubic yards of approximately two-thirds lb. value, and should extend the lifetime of the dredge on its present ground to 2½ years at full working time.

The prospecting at Ngow estate had resulted in bringing in another 3,000,000 cubic yards of payable ground adjoining the company's present leases. A more important addition to this area was now being prospected, and had disclosed a payable run of tin values on the seaward side of their existing Wharf Area leases. That area had been covered by two exclusive prospecting licence applications, and the prospecting operations had proved the existence of approximately 20,000,000 cubic yards of ½ lb. per cubic yard ground. These two additions would greatly extend the life of the Ngow property, and were undoubtedly of great value to the company.

As to the working results for the present year, their total output in the East for the five months ended May 31st was 790 tons, with an estimated working profit of £39,371, the figures for the corresponding period in 1937 being 1,018 tons, with a working profit of £110,840.

The report and accounts were unanimously adopted.

BRITISH EMPIRE TRUST COMPANY, LIMITED

A SOUND POSITION

The thirty-seventh ordinary general meeting of the British Empire Trust Company, Limited, was held, on the 20th instant, in London.

Mr Davidson (chairman and managing director) said that when they met a year ago he stated that under conditions then prevailing they were liable to sudden and unexpected shocks. Having regard to all the circumstances, it was gratifying to be able to recommend the payment of 7 per cent. on the preferred ordinary and 9 per cent. on the deferred ordinary shares, which rates had been earned out of net income with an ample margin. He considered it satisfactory that they were able to pay these dividends, to provide all their depreciation out of special resources created in the past, to have all their investments written down to the lowest quoted prices, to have their capital and reserve fund of £300,000 intact, and to carry forward the substantial amount of £17,538.

After referring to the arrangements which had been come to between the cities of Victoria, Calgary, and Edmonton and the bondholders, which arrangements under the circumstances appeared to be fair and reasonable, the Chairman said he regretted that he could not report favourably upon the attitude and conduct of the province of Alberta. So far as the holders of the bonds of that province were concerned, the position had not improved. Efforts were being made by the bondholders' committees to have the validity of the Act reducing the interest by one half tested in the courts. Meantime the Government of Alberta showed no sign of abandoning its arbitrary and unjust policy. On the contrary, it recently passed further legislation, which had the effect of confiscating a portion of the money lent on mortgages in Alberta, and by heavy penalties, immediately applicable, virtually and intentionally depriving holders of mortgages of the opportunity of bringing the matter before the courts. Protests from all quarters had been made to the Government of Canada to disallow this vicious and unjust legislation. It was gratifying to know that the Dominion Government had disallowed this legislation, because while these happenings did not directly concern holders of Alberta Government bonds they had an adverse effect upon Canadian investments generally.

The report was unanimously adopted.

BRITISH ELECTRIC TRACTION COMPANY, LIMITED

ANOTHER GOOD YEAR

The forty-second ordinary general meeting of this company was held, on the 17th instant, at Winchester House, London.

Mr J. S. Austen (the chairman) said that they had had a very good year and their profits had increased by about £56,000 over those of the previous year, which itself had shown an increase of £59,000 over the year before, so that in those two years together they had had an increase of about £115,000.

They were adding the large sum of £185,000 to their undivided profits account, and in that connection he might say that every year they received one or two letters from stockholders asking them to "ladle out" something from that fund. Those letters came from stockholders who desired a larger income, but he had told the stockholders many times that their stock must not be looked to for income, but for increase of capital value. In fact, it was a sort of automatic savings bank, and, when he told them that an original holder of £100 of stock, if he had kept every bonus which had been declared, was worth to-day something like £4,500, even at the present depreciated price of the stock, he did not think that it could fairly be said that the directors had failed.

They were directly affected by two features of the last Budget, income tax and petrol tax. The effect of income tax on a company such as theirs, which retained a large portion of its profits, was that it had to earn more money in order to show the same result to the stockholders. He would probably have something more to say on that point next year. As to the petrol tax, the companies with which they were associated were probably the largest buyers of petrol in the country and a penny per gallon spread over a year meant a very large sum indeed. Their attitude to that tax was that they regarded petrol as a manufacturer regarded his raw material; in fact, it was their raw material. Every tax could be regarded as a necessary evil, but it seemed to him that this tax was rather more evil and rather less necessary than usual.

They must not expect the phenomenal increases which they had had, but at the moment he did not see any reason why they should not show at least a moderate increase in the current year.

The report was unanimously adopted.

FORSTER'S GLASS COMPANY, LIMITED

RECORD SALES

The nineteenth annual general meeting of Forster's Glass Company, Limited, was held, on the 21st instant, at Winchester House, Old Broad Street, London.

Colonel Charles E. Ponsonby, T.D., M.P. (chairman), who presided, said that the net profit amounted to £53,573, an increase of £7,501 over last year after charging £15,177 for depreciation as against £12,921. £15,000 had been transferred to reserve account and a distribution of a dividend of 6 per cent. and a cash bonus of 5 per cent. on the ordinary shares was recommended, leaving the carry-forward at £16,562, as against £7,270 brought in.

The satisfactory result of the year's working was attributed to the general state of prosperity which had prevailed throughout the period under review and to the beneficial effect of the Coronation celebrations on the demand for the company's products. The sales for the year were a record in the history of the company.

They had experienced a considerable increase in costs due to the increase in the cost of coal, and, in addition, during the year they had had wage increases and increases in transport charges. Owing to the excellent demand for the company's products and the increased production required to meet it, they had been able to carry the increased costs without any serious effect on their business, but in the event of a falling off in the demand and consequent reduction in production, the increased costs would obviously have a serious influence on their profits.

Every effort had been made to continue their policy of keeping the whole of their plant and machinery up to date. They realised that it was only by service and the quality of their products that they could maintain and increase the demand for their goods.

It was gratifying that the results obtained had permitted a slightly higher distribution on the increased ordinary share capital. The amounts which had to be allocated for income-tax and National Defence Contribution were a considerable burden, absorbing an amount equal to 11 per cent. on the issued ordinary capital, and the board considered that the present time called for a conservative policy. Speaking generally, the prospects of the present year were not unsatisfactory.

The report and accounts were unanimously adopted.

GRIFFITHS HUGHES PROPRIETARIES, LIMITED

PROFIT OF £154,199

The fourth annual general meeting of Griffiths Hughes Proprietaries, Limited, was held on the 21st instant, at Salford, Manchester.

Mr Harry Marland, J.P. (the chairman) said that he regretted the drop in profits for the last financial year, but the liquid financial position of the operating company continued to be very strong. The liabilities, including provision for the final dividend and also for taxation on the profits for the year, totalled £182,000, as against liquid assets of £679,000, of which £499,000 consisted of cash, investments, and sinking fund policies.

The business was world-wide and overseas markets had caused the board very considerable trouble and anxiety, almost wholly on account of currency depreciation, which had become worse during the year under review. There were now quite a number of important overseas countries in which the amount of business they could do

(Continued from page 740)

Miscellaneous Commodities

Oilseeds and Oils.—With more hopeful markets in the United States, prices of vegetable oils and oilseeds have been firmer than of late. A fair trade was transacted during the week in Indian linseed and prices were a little higher, influenced by a rising tendency for wheat prices. There was also a better demand for Egyptian cottonseed for June and July loading. The price of refined cotton oil has hardened to £21 per ton ex Hull.

Rubber.—The better sentiment in all markets and the recorded decrease

in stocks at the end of May improved the tone of the rubber market and the closing price for standard sheet, at 6½d. per lb., showed a net gain of ¾d. per lb. for the spot position.

Other Foods

Provisions.—Butter prices rose sharply during the week and at the close New Zealand and Danish were quoted at 124s. and 127s. per cwt., respectively. Dutch and Irish bacon were about 2s. dearer but other varieties were unchanged compared with last week. There was a poor trade at Smithfield and prices were generally lower, with the exception of lamb. A brisk demand for eggs brought an advance of 1s. 6d. per 120; English, 15-15½ lb., were quoted at the end of the week at 14s. to

was restricted simply by the amount of sterling available for the payment of their invoices.

In the home market the new lines had shown progress, and Digestif Rennie promised well. In large measure that was due to the enthusiastic reception of it by the medical profession, 1,198 doctors having written that that up-to-date remedy had proved of inestimable value to their patients, giving relief in a few minutes to the most stubborn cases of indigestion and acidity.

Regarding the dividend, if shareholders agreed to the board's proposal, it would mean that since they became a public company they had distributed £1,007,500 in dividends and placed £180,000 to general reserve. The total distribution to ordinary shareholders during the four years would be equivalent to 52½ per cent. of the ordinary share capital.

The report and accounts were unanimously adopted and the payment of the final dividend of 4 per cent., less tax, was approved. The retiring directors, Mr Harry Marland, J.P., Mr E. P. Carter, Mr C. B. Green and Mr W. S. Harris, were re-elected, and the auditors, Messrs Deloitte, Plender, Griffiths and Company, and Messrs J. B. Boyd Wrigley and Company, were re-appointed, and the proceedings terminated with a cordial vote of thanks to the chairman and directors.

HOLYROOD RUBBER LIMITED

DIVIDEND OF 12½ PER CENT.

The twenty-fifth annual general meeting of Holyrood Rubber, Limited, was held, on the 23rd instant, at 7 Martin's Lane, London.

Mr W. Arthur Addinsell (the Chairman) moved the adoption of the report and accounts and the declaration of a dividend of 12½ per cent. He said:—The report and accounts which have been in your hands for the statutory period record a satisfactory year's working and justify the expectations expressed in my address to you at our last meeting.

There was an appreciable increase in the quantity of rubber harvested, and the price advanced by approximately one penny per lb.

In addition to the quota allowance on the company's standard production, we were able to purchase the export rights on an extra 38,000 lb. I mention this as an illustration of the productive capacity of our trees, because you will recollect that for six months of the financial year the quota rate was 90. The inference, therefore, is that we are capable of harvesting the full quota, and the standard assessment which has been allotted to us is fully justified.

The appropriation of the balance on profit and loss account is on sound lines. I think it will be agreed that a dividend of 12½ per cent. is a reasonable return under prevailing conditions. The net carry-forward will amount to approximately £3,480 as compared with £1,683 brought in.

It is unfortunate that the progressive results which have accrued for the past five years appear likely to suffer a setback for the current financial period. The quantity of rubber which we shall be allowed to export must inevitably be substantially reduced.

With regard to the general outlook, I think it is possible to detect a slight improvement in many of the spheres that affect the welfare of our industry. Particularly does this apply to the United States of America, where there must exist a considerable accumulation of consumptive demand which has been held up by the force of economic circumstances. With confidence returning to the masses of that vast Continent, we can anticipate a demand for rubber which should improve the price to a fair and reasonable level, and give the International Regulation Committee the more pleasant task of raising the quota allowance.

The resolution was unanimously adopted.

14s. 6d. per 120 and Danish at about 11s. 6d. per 120.

Colonial Produce.—Markets generally have been quiet but steady. Cocoa prices were slightly lower on the week, and prices at the tea auctions tended to fall by about ¼d. per lb. for the poorer qualities; sugar and coffee prices are unchanged.

Vegetables.—All forms of salad sold briskly during the week; tomatoes were priced at 5s. 6d. to 6s. 6d. per 12 lb. There was a good demand for new potatoes and both English and Jersey sold well at 18s. to 22s. per cwt.; old potatoes have been scarce and prices were well held.

Recession in the United States

The following charts have been designed to throw light on the current economic position in the United States. For this purpose we have selected six of the recognised business indicators. In each chart we compare the movement of one of these over the period 1935 to March 1938 (shown as an unbroken line) with its movement over the period 1927 to 1931 (the dotted line). In this way the figures for the year 1927 appear directly above those for the year 1935, the figures for 1928 above those for 1936 and so on. All the indices are expressed as percentages of their average level in 1926. The indices of production and of the value of construction contracts awarded in 37 States are computed by the Federal Reserve Board, those of factory payrolls and wholesale prices by the Department of Labour, that of the prices of 347 industrial ordinary shares by the Standard Statistics Company and that of cash income from farm marketings by the Department of Agriculture. The latter series excludes payments under the Agricultural Adjustment Act. It is important to note that the indices of farm cash income and of the value of construction contracts are adjusted for seasonal variations, whilst those of production and factory payrolls are not.

GOVERNMENT RETURNS

For the week ended June 18, 1938, total ordinary revenue was £12,739,000, against ordinary expenditure of £19,611,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £90,476,000, against a deficit of £60,776,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On June 17th, applications at £99 17s. 1d. per cent. for bills to be paid for on any day except Saturday of the following week were accepted as to about 69 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications for bills to be paid for on Saturday at £99 17s. 2d. per cent. and above were allotted in full. £45.0 millions of Treasury bills are being offered on June 24th.

Transvaal Output, Employment and Working Profit.—Gold output, May, 1938: Witwatersrand, 992,501 fine ounces; outside districts, 26,750 fine ounces; total, 1,019,251 fine ounces. Value for purposes of declaration, £6 19s. 6d. Total output, April, 1938: 982,964 fine ounces. The number of natives employed at end of May was: Gold mines, 317,863; coal mines, 17,051; total, 334,914. Total estimated working profit for May, 1938: Witwatersrand, £2,566,965; outside districts, £9,476; total, £2,576,441. Comparable figures for April, 1938: Witwatersrand, £2,475,432; outside districts, £8,983; total, £2,484,415.

DIVIDEND ANNOUNCEMENTS

Rates are actual, unless stated per annum or shown in cash per share. Rate for previous year refers to total dividend, unless marked by asterisk to indicate interim dividend.

British Banking Trends

IN the Banking Supplements of past years we have been examining the trend of British banking under conditions of recovery. To-day it is our duty to review the trend during a period when the trade cycle reached its peak and began to decline. Thus the picture must be viewed from a slightly different standpoint, and inevitably certain allied questions spring to mind. Does the recent banking trend reflect the beginning of a general recession? Does it suggest that banking policy was in any way responsible for the recession? Alternatively, is there any evidence that banking policy is being framed so as to combat and reverse the recession?

On the whole, the curves shown in the charts accompanying this review provide very little evidence of a positive character. Certainly there are none of the usual banking or monetary signs of an incipient depression. There is no sharp rise in interest rates, no severe restriction of credit. On the contrary, the interest rate curves remain at their previous low level, while the banking picture as a whole gives evidence of continued, and to some extent deliberate, expansion. The only one of the three questions to receive a definite answer is the last. There are distinct signs that the policy of cheap and plentiful credit is being continued and intensified so as to combat the recession, and also so as to facilitate the financing of re-armament. Such a deduction is not at variance with the occasional reaffirmations of monetary policy which from time to time have emerged from official quarters.

The first chart shows the principal changes in the condition of the Bank of England during the past eight years. As forces governing the supply of credit, there are included first the Bank's gold, and second the chief assets of the Bank, consisting of the fiduciary note issue backing plus Government securities held in the banking department. It will be noticed that by adding these last two items together any distortion due to seasonal and other variations in the fiduciary note issue is eliminated. The two chief uses made of the supply of credit, namely the note circulation and bankers' deposits, are also included. The size of the first depends upon the public's demand for currency. The size of the second determines the size of the credit base.

The past few years provide a notable contrast. During 1936 the main method of increasing the supply of credit was that of adding to the Bank's gold. The "omnibus" securities item actually decreased during that year. Also the net increase in the supply of credit was only equal to the growth in the note circulation. There was no real increase in bankers' deposits, no permanent enlargement of the credit base.

Since the beginning of 1937, on the other hand, the Bank's gold has remained practically unchanged, but there

has been a noticeable tendency to add to the Bank's securities. On the whole, this latter increase has done little more than balance the simultaneous growth in the note circulation, for although bankers' deposits have been running high since the New Year, their recent size is not unprecedented. Still, in spite of the growth in the note circulation, in itself evidence of higher prices as well as more active trade and consumption, it is clear that the authorities are determined to maintain, if not increase, the size of the credit base. The general trend is still slightly reflationary.

The next chart gives the position of ten of the eleven London clearing banks, omitting the District bank, which was not a member of the London Clearing House during the earlier years included in the chart:—

So far as cash and deposits are concerned, there is again evidence of stability combined with slight reflation, but the rapid growth in deposits noticeable in earlier years came to an end in early 1937. On the other hand, while the total of deposits and therefore of earning assets has now remained stationary for over a year, there have recently been definite changes in the composition of earning assets. In particular, advances have continued to grow, while discounts and investments have begun to shrink. It is clear that the downward turn of trade has not yet affected advances, though this may be partly due to borrowing by the re-armament industries, but whatever its cause the banks would not be averse to it, for even at the height of the recent recovery they had lent less in proportion to their deposits than they had in 1929. Yet two facts remain clear. First, the trade recession is in no way due to a restriction of credit. Next, the authorities had to continue the easy money regime, or else the banks would have been unable to carry their quota of Treasury bills and Government securities. It is no exaggeration to say that the whole financing of re-armament depends upon plentiful money even more than upon cheap money.

The third chart shows the changes in the volume of outstanding Treasury bills:—

Here the main change of recent months arises out of last summer's addition of £200 millions to the Exchange

Equalisation Account. To see how this has worked out in practice, during the year ended April 9th last, tap issues of Treasury bills increased by only £128 millions, and the floating assets of the departments by £132 millions. It follows that, either a substantial part of the Exchange Account's new resources has been used to buy gold; or else that the departments are still holding an appreciable quantity of the National Defence Bonds issued a year ago; or else that the resources of the departments other than the Exchange Account have become reduced. During the six months to September 30, 1937, the Exchange Account bought £93 millions of gold, part of which may have been paid for out of its new resources. It is also a question if the departments have yet disposed of all the National Defence Bonds, which in effect they underwrote at the time of issue. It is still impossible to tell how the recent large withdrawals of French funds will alter the position, but the change is likely to be very considerable.

The final chart shows the course of interest rates:—

During the past financial year the net increase in the floating debt was mitigated by the Budget surplus and by the fact that not all the proceeds of the National Defence Bond issue have yet been spent. Had it not been for the enlargement of the Exchange Account, there would have been a net reduction of £56 millions. Even so, tender issues of Treasury bills rose from £500 to £512 millions, and so

the Government had to call upon the banking system for increased short-term finance to this limited extent. This is traceable both to the year's gold purchases by the Exchange Account and also to the departments' holdings of National Defence Bonds.

The clearing banks themselves did not take up these extra bills. On the contrary, their discounts fell during the year to March last by £10 millions, and their call and short loans (largely against Treasury bills) by £19 millions. Thus institutions outside the clearing system must have come to the rescue, and as their powers of assistance are limited, it is obviously necessary for the authorities to maintain the resources of the clearing banks. This necessity will be diminished by the French withdrawals and consequent sales of gold by the Exchange Equalisation Account, leading in turn to the redemption of Treasury bills held by the banking system.

Only one comment is needed on the recent course of interest rates. In spite of all the disturbances of recent months, short-term rates have remained unchanged, while even the long-term rate (on 2½ per cent. Consols) shows only minor variations. The latter is not quite so low as it was two years ago, but the total increase since 1936 is very small. In fact, for good or for evil, the authorities have successfully maintained the cheap money regime, and there is every indication that they intend to continue doing so.

This review covers a period antecedent to the recent repatriation of French money from London, and so takes scant account of the possible reactions of this movement. Broadly speaking, the London market will be relieved of the presence of French funds seeking employment, but against this the Exchange Equalisation Account will be holding less gold, and so fewer Treasury bills will be issued by tender in order to finance the holding of this gold. This means that the London market will be working on a narrower basis, but once the disturbances of the French repatriation are over the banks will be left with the same amount of cash, and so will have more cash in proportion to their total resources. The French repatriation, of course, is by no means complete, but if it continues the banking system should ultimately become more liquid and will also be able to see its position in better perspective, as it will be relieved of the presence of French funds and French gold. The circumstances of the May repatriation movement show that our monetary machine has worked fairly well, but that it is still not quite elastic enough to cope with so large and sudden a movement. Further possibilities of improvement are suggested in a leading article in the accompanying issue of *The Economist*.

Sterling Policy

IN a regime of managed currencies and fluctuating exchanges, without a fixed international standard, the "trend" of any one currency is but the inverse of the relative trend of other currencies and of gold. Thus the trend of sterling is but the inverse of the trend of the dollar, the franc, and of gold against the pound. It has, in fact, happened in the past year that the initiating forces of monetary movements were generated outside rather than inside sterling's own region. The three major forces affecting the position of the pound in 1937 were the outflow of capital from France; the gold scare—essentially an external factor, since it took the form of a rumour that the American buying price, the one effective link between the major currencies and gold, was about to be lowered; and the American stock market boom in the early part of the year, followed by a heavy recession later. It was not only the last of the three that involved a pendulum movement. Though on balance there was a large drain of capital from France in 1937, the autumn witnessed a considerable return flow, and the creation of the "Daladier franc" seems to have opened a completely new phase; and though the gold scare was much more decisive than its opposite, there was in fact a complete reversal of the earlier rumours in October and November, when an actual increase of the

American buying price for gold was expected by many prophets.

The important point to consider, therefore, is the reaction of sterling and of British monetary policy to those three groups of forces affecting in turn the three principal standards of measurement for a liberated pound—the franc, the dollar and gold. To say that the policy was to neutralise those forces is only to give the background of the truth; for with so many independent variables neutralisation might take a variety of different forms. For instance, while a great part of the pressure against the franc in 1937 and the early months of 1938 was "neutralised" by the purchase of gold, there was also, of course, a substantial fall of the franc against sterling, that is to say, an undetected rise of the pound against that particular standard of measurement. Nor was either of the other alternatives regarded as an absolutely fixed standard. Although on the long-term scale neither the price of the dollar nor the price of gold in terms of sterling varied by more than a relatively small percentage in 1937, on the short-term scale the movement of both these values was occasionally considerable. In some periods of abnormal activity in the money markets the authorities appeared to be trying to stabilise against the dollar, while gold took care of itself, in other periods

the position was reversed. This contrast, of course, would have been impossible if the United States had been on the full gold standard. The actual margin of variation between the gold price and the dollar price of sterling was indeed comparatively small. The substantial discounts or premiums on gold, compared with dollar parity, which appeared from time to time, must be regarded as passing accidents of a regime of instability and lost confidence. In general, the pound may be said to have been kept stable with the dollar and therefore with gold, differences on the trans-Atlantic balance of payments being liquidated by gold movements. The latter shrank almost into insignificance beside the much bigger movements associated with the flow of continental hot money. Whether this Anglo-American stability could have continued if the boom conditions of March, 1937, had been prolonged, or whether it can be continued in the future, is a question which a historical survey is not called upon to answer.

Historically, the vital question is how sterling policy reacted to the outflow of money from the continent of Europe, especially from France. In regard to exchange rates, it may be said that British policy has consistently been to take its cue from and to co-operate with the French authorities. While they were supporting the franc, the Exchange Equalisation Account assisted them in doing so. When they decided to let the franc find its own level, the Account did not intervene. When the Daladier franc was created at an arbitrary level of depreciation, Sir John Simon gave it his blessing and the Account sold gold to the Bank of France. The net result of the policy, as far as 1937 was concerned, was a large influx of gold, combined with a fall of the franc from about 105 to over 147 francs to the pound in the course of the year. The major problem for British monetary policy in 1937, given the exchange policy outlined above, was that of the internal effects of this gold influx.

In brief, the solution adopted was sterilisation of gold in the Exchange Equalisation Account, the gold being retained in the Account against the sale of Treasury bills. Only a very small sum was sold to the Bank of England, most of it in May and June, when the hoarding of notes (partly a by-product of the gold scare) reduced the Bank's Reserve to an awkwardly low level. When the Reserve needed amplification at Christmas this was not achieved through further acquisitions of gold by the Bank, but through a temporary increase of the fiduciary issue, from £200 millions to £220 millions. There was no repetition of the move of December, 1936, when gold was sterilised in the Bank of England instead of the Exchange Equalisation Account, through the sale of gold by the latter to the former, against an almost equal cut in the fiduciary issue.

Instead, when the Account became over-full of gold in June last, its authorised amount was raised by £200 millions to £575 millions. (To some extent these figures exaggerate the facts, for the Account makes a book loss on every sale of gold to the Bank, and though it offsets this by an equally hypothetical book profit, its actual resources in ready money are depleted by the double transaction.)

The presumable purpose of thus sterilising gold imports in the Exchange Account was clearly the old formula of neutralisation. The authorities have been anxious to prevent the influx of "hot money" from having a permanent economic effect internally by expanding the credit base. This aim is obviously justifiable, since the opposite policy would open up the danger that an outflow of the hot money, such as followed the latest French monetary moves, might require either severe internal contraction or a slump in sterling. But a number of critics, of whom Mr Keynes is the most scathing, have complained that the policy adopted was not merely neutralising but positively deflationary. They argue that the sale of Treasury bills by the Account, in order to finance its gold purchases, withdraws loanable money from the market, both directly and indirectly through the Government departments; the latter might otherwise be able to finance public expenditure which has, in fact, required long-term or medium-term borrowing. The banking system, against this, has at its disposal the foreign money, translated into sterling; but the critics point out that this money is idle in the sense that its owners prefer deposits or Treasury bills, or even notes for hoarding, to investment in trade and industry. There is undoubtedly a great deal of force in that argument, though its cogency, or at least its effect on the public mind, would have been greater had it been supported by more emphatic evidence that the credit system was in fact subject to deflationary pressure. The willingness of the authorities to expand the fiduciary issue, if need be, in order to support a record note circulation, suggests that they are anxious in other ways to remedy any deflationary effect of their gold sterilisation policy.

There is little doubt that the policy of neutralising gold and currency movements will continue, though if the strength of the franc continues the policy will be in reverse gear, and may prove as expansionist in the future as it has been contractionist in the past. The authorities are obviously satisfied that the present relation between the pound and the dollar, which is the effective standard of measurement for sterling, is economically justified. The force most likely to disturb that economic relation in future is re-armament, which, by bringing about an internal inflation or by immediately enlarging the debit balance of trade, would make sterling over-valued.

The London Gold Market

(By a Correspondent)

THE main features of the London Gold Market since October last have been the strength of the demand for hoarding and the growth of the influence of official operations. The consistency and size of the hoarding demand testifies to the almost complete return of confidence in gold as a sanctuary for the vast amount of capital which no longer exercises its proper function in the world economic system, but continues, as it has done for so many years, to wander uneasily between the various currencies and gold. During the early part of last year, as a result of the gold scare, confidence in gold had received a severe shock, and there was a wholesale migration from that metal, mainly into American dollars. Since that time, however, the trend has become reversed, and the main bulk of refugee funds have found their way back again into gold. Contrary to general expectations, the latest stabilisation of the French franc did not check this movement, and re-sales of hoarded gold contributed comparatively little to the recent heavy flow of funds to France. Gold sales on French account have been more than offset by fresh buying caused by fears that other currencies would sooner or later be further devalued. At one time the presence of huge deposits of hoarded gold

in London was viewed with some alarm in certain quarters, but it seems to be generally conceded now that it is a necessary evil of the times, and far less disquieting than large deposits of foreign funds in sterling. The grip which the "Control" now has on the gold market renders it easier to mitigate the effects of an exodus of funds from hoarded gold than from the more mobile deposits in sterling. A more tolerant attitude to private buying is evidenced by the fact that members of the London market are no longer expected only to execute forward buying if it is of a non-speculative character.

In spite of this almost complete return of faith in gold, quite a number of people, influenced by statistics of increasing gold production, fear the possibility of the development of another "gold scare." In view, however, of the alarming results of the last scare, one would imagine that the various financial powers would not again allow such a movement to get out of hand. Less emphasis by the American Treasury on the twenty-four-hour nature of its financial policy and a plain statement of its determination to maintain its fixed gold price would have soon checked the panic of last year. It must be remembered that this

country and the United States have a much larger stake in gold than, say, a decade ago, when world supplies were more evenly distributed. Also a big fall in the world gold price would be a serious matter for the United States, and to a lesser extent for Great Britain, which has not yet re-valued its stocks at the present sterling price of gold.

No review of the past half-year would be complete without some reference to the buying of gold coin which formed part of the hoarding demand. Gold coin has obvious advantages over bar gold as a hoarding medium for the "man in the street," and buyers of sovereigns and American gold dollars have paid considerable premiums over their intrinsic gold content values. This premium attracted supplies of these coins from various Continental State banks, who have been willing to give out gold coin in exchange for gold bars. In October last, and again in December, there was a very large turnover in gold coins at premiums ranging up to about 4 per cent. over their gold value. When supplies from the sources above mentioned began to peter out, prices showed an increased premium, and offerings were made from further afield. Large shipments were made to London from Canada, Mexico, South America and India. The demand, however, being for immediate delivery, stocks became very low and spot prices rose rapidly until the sovereign price included a premium of about 7 per cent. and that for gold dollars about 5 per cent. The arrival of forward shipments caused some drop in prices, but these still include a large premium.

As was mentioned in the October, 1937, Banking Supplement, the power of official intervention in the London Gold Market has been enormously strengthened by the improved technique of Central Bank collaboration, and the fact that the two chief outputs of the world—the Transvaal and the U.S.S.R.—can now only reach the open market as and when the British Control decides. The daily fixed price may often be the basis of far larger gold transactions than those recorded in the open market. The sale of the Transvaal and Russian outputs, together with direct arbitrage between central banking institutions or exchange funds—

operations from which the private arbitrageur is almost totally excluded—are all conducted in secret. Only such a proportion of this business emerges into the open market as is necessary to ensure that the price is fixed in accordance with the requirements of the "Control."

During the six months ended March this year, the total of dealings recorded at the daily "fixing" was about £67 millions. The amounts dealt in in the open market daily after fixing have varied considerably. On a few days they have amounted to as much as those at the fixing, but they have generally been on a small scale, and during the whole period mentioned have probably amounted to not more than 10 per cent. of the "fixing" total. The bulk of the buying has been for hoarding, as it was not until the end of last March that the price approached near enough to the "dollar parity" to permit of any arbitrage buying for shipment to New York.

As explained above, most of the supplies in the market are offered from official sources. These have been augmented by the sales of West African and Rhodesian production, which usually are realised in the market at the beginning of the week. Occasionally there have been some re-sales from hoards and maturing forward purchases, while Australian mined gold continues to be sold forward in London. Supplies of gold from India have been much less, and towards the end of March there was even a "squeeze" for spot delivery in the Bombay market.

The daily fixed prices have often shown quite considerable premium over the "dollar parity" based on the American exchange at "fixing" time, especially during November and February. The highest premium recorded at "fixing" was 1s. 8½d. per fine oz. on February 18th, but this was exceeded during "after-fixing" deals on November 8th, when the premium was estimated to have touched about 2s. per fine oz. At this level it would have paid to have taken gold from the American Treasury for London. This type of arbitrage is barred to the private operator, but the British "Control" is believed to have moved gold from New York to London about this time.

The Banks and Savings

(By a Correspondent)

THE March returns of the ten clearing banks (omitting the District Bank) show that during the preceding year cash expanded by £18 millions. In spite of this increase there was only an expansion of £8 millions in deposits. Among the banks' earning assets there was an increase of £58 millions in advances and a decrease of £33 millions in investments. Discounts fell by £10 millions and call and short loans by £19 millions.

In interpreting these changes, it is important to remember that the banks maintain a second liquidity ratio as well as the traditional 10 per cent. ratio of cash to deposits. Thus, regarding investments and advances as constituting the less liquid of the banks' assets, the banks' practice is not to let the combined total of investments and advances exceed a ratio of between 70 and 75 per cent. of deposits. That this practice has been maintained in spite of the marked change-over from advances to investments since 1929 is shown by the following table:—

RATIO OF INVESTMENTS AND ADVANCES TO DEPOSITS				
March	1929	1933	1937	1938
	%	%	%	%
Investments.....	14.6	26.5	29.4	27.8
Advances	54.2	39.8	41.8	44.4
Total	68.8	66.3	71.2	72.2

In particular, the growth in advances during the past year has entailed an increase from 41.8 to 44.4 per cent. in the advance ratio. To counterbalance this and keep the "total ratio" reasonably constant, the investment ratio has fallen from 29.4 to 27.8 per cent. At the same time, if 75 per cent. can be regarded as the upper limit of the total ratio, there is still a little room, but not very much, for expansion in either investments or advances, for unlike 1933 and even 1929 the combined ratio has in 1937 and 1938 exceeded 70 per cent. If the total of investments and advances is to grow much further, deposits themselves will have to continue their recent growth. This will quickly entail a further enlargement of the credit base if the traditional minimum 10 per cent. cash ratio is to be maintained.

These possibilities obviously link up with future Government finance, and in particular with the extent to which the Government will have to draw upon national savings in order to finance re-armament. As a preliminary to the main discussion, it is useful to set out the 1937-38 revenue returns in such a way as to bring to light the year's draft by the Government upon the national savings. This is done in the following table:—

	£ million	£ million
Revenue.....	949	...
Expenditure	...	979
Investment	...	15+x
Net draft on national savings	45+x	...
	994+x	994+x
Net borrowing	45+x	...

Revenue includes ordinary and self-balancing revenue. Expenditure excludes the sinking fund allocation, but includes ordinary and self-balancing expenditure, and also defence expenditure financed by loan and certain minor issues under the Shipping and Tithe Acts. Investment includes Post Office capital expenditure and also a deduction for certain minor repayments. The amount x represents the extent to which the recent increase of £200 millions in the Exchange Equalisation Account has actually been used in purchases of gold. This amount also represents an addition to the year's net borrowing, consisting in practice of tender issues of Treasury bills. The total figure of £45+x millions of net borrowing, which necessarily equals the item "net draft on national savings," is the resultant of the other items.

This amount has to be added to the general demand for

capital for new investment in calculating the total call on the savings of the year. These savings may have been reduced by heavy taxation, but, on the other hand, part of the ordinary expenditure represents investment, inasmuch as this money is spent on new capital goods. The £ x millions spent on gold purchases, moreover, may conceivably be regarded as hoarding, and not as investment. But with these and other reservations we may proceed to examine the part played by the banks in mobilising savings.

The guiding principle is that of regarding the banks as a main channel of communication between lender and borrower. The first point is that the supply of bank cash, which is beyond the banks' control, determines the width and depth of the channel, namely, the quantity of deposits the banks can carry and the amount they can lend or invest (using the word "invest" in its accountancy sense). Now, when a member of the public saves money and puts it in the bank, it is not, of course, normally "hoarded." It all depends upon what first the bank and then the borrower from the bank does with it.

Take first the case of bank advances. Suppose the money accumulated at the bank is lent to a borrower who spends the proceeds of his loan so that his consumption exceeds his income. Then there is no net saving, for the depositor and borrower cancel each other out. If, on the other hand, the borrower spends his loan on new equipment, then there is both new saving and new investment, with the bank acting as the channel. The depositor has refrained from spending part of his income and instead has lodged it in the bank. The borrower has "invested" the money, in the economist's sense of the term, by using it to buy new capital equipment. If at a later date the borrower repays his loan either out of future income by a new capital issue or by borrowing outside the banking system, then there is no new investment but only a change in the way the new lender's savings are employed. On the other hand, that part of the banking channel previously used in carrying this particular operation is set free.

Take next the case of bank investments. In practice these may be regarded as British Government securities, for the bulk of the banks' investments take this form. We may also include under this heading the banks' holdings of Treasury bills and also their call loans against Treasury bills and bonds, for the only distinction is one of timing. Treasury bills run for a matter of weeks, while other Government securities run for years, but both categories represent money borrowed by the Government.

Now, if the securities acquired by a bank represent new borrowing by the Government, it all depends upon whether the Government "spends," "invests" or "hoards" the proceeds. In the first case there is an equivalent dissipation of national savings, in the second case, a true investment, and in the third case hoarding. In every case the banking system acts as a channel between its depositors who have accumulated the savings and the Government which decides upon how they shall be used. If, on the other hand, banks acquire securities without new Government borrowing, then everything depends upon how the vendor uses the proceeds. He may spend, invest or hoard them, the word "invest" implying *new* investment in the sense of the purchase of new capital goods. In this case the decision passes to him. But whoever finally settles the matter, there is no distinction in principle between the cases of bank acquisition of securities and new bank advances. The same is true of bank discounting of commercial bills, if the financing of stocks of goods, in transition from producer to consumer, can be said to constitute "investment." The answer surely is in the affirmative, for adequate stocks are just as essential as adequate plant and machinery.

There is, however, one fundamental attribute of the banking system. Provided that this channel between lender and borrower is not being used to capacity, it can be used to make investment, or indeed, dis-saving, *anticipate*

savings. It is a truism that new advances create new deposits, regarding the banking system as a whole. The implication is clear. The money lent by the banks in due course is spent by the borrower and so finds its way into someone's bank deposit, and so may come to represent an addition to someone's savings. But it may take time for the money to reach someone who is not spending his whole income, and so a net increase in the banks' advances and/or investments may mean that investment is running ahead of saving. The result on the price-level can but be inflationary.

Again, the Government can always enlarge the channel by ordaining an expansion of the credit base; and it may be under the temptation to widen the channel too much. This brings us back to the revenue returns of last year and also to the declared Government policy of cheap money. A net draft on national savings of something over £45 millions is not in itself serious, but the draft will probably be greater next year. There is also the question of how

much the heavy volume of ordinary revenue and expenditure represents a net dissipation of savings or preserves a proper balance between saving and investment.

The fact is that the banking system offers a very convenient and flexible channel to a Government faced with heavy expenditure. Another fact, of a more banking character, is that the dividing line between the items "advances" and "securities" is much less definite than is popularly believed. The acquisition of securities by a bank may have just the same effect upon the national economy as the granting of a loan, for in both cases the money provided by the bank may be used by the recipient in just the same way. In both cases there may be either new investment or simply a general process of transfer whose ultimate ramifications it is possible to trace. Still the main fact remains. The banks provide one of the main channels of communication for the transmission of savings. The width of the channel is determined by the Government.

The Public and its Bankers

(By a Correspondent)

IN this country a great deal of service by the banks is taken for granted, owing to their having in the past undertaken, in addition to reasonable help to their customers, some things which they ought not to have been expected to do. But to be ready to oblige customers in any direction is to lay a bank open to risk of loss, against which it may be impossible to guard without their co-operation.

The desirability to the community of the banks' limiting the risks they run to those which are inseparable from the very nature of their business, and excluding those which even good judgment cannot avoid, is obvious enough. Yet bankers are rarely allowed to plead contributory negligence or misrepresentation by their customers in mitigation of loss. A customer rightly requires the highest care and probity from his banker, and yet is free in law to behave carelessly and thoughtlessly himself, even though his negligence amount almost to bad faith. Time and time again loss could be avoided if customers were less casual. Instances are the custody of the cheque book and, in the case of firms and companies, the checking of the accounts operated upon by subordinates and agents. Carelessness in these respects facilitates fraud, from which the bank suffers, but the care which could be effective in preventing loss must be exercised by the customer, who, speaking broadly, is under no legal obligation to exercise it.

Few people know in what legal relationship they stand to their bankers. The basic function of a banker is to take

charge of his customer's money and to pay it out again when called upon to do so. But besides his purely banking capacity, a banker may act in a mixed banking and agency capacity, as when he collects or pays cheques; or purely as an agent, for example, where he undertakes stock exchange or income-tax work; or in an entirely fiduciary capacity, when he is administering a deceased customer's estate. Again, when he accepts securities or plate for safe custody, he acts in the new rôle of bailee. Now these rôles give rise to different responsibilities, most of which are unsuspected by customers, and it may be useful to indicate what are the rights and duties of both parties in these various cases.

The only liability of a customer in regard to the use of his cheque book is that he shall so draw his cheques as not to mislead his banker or give opportunity for fraud. Even this applies only to the writing of the amount, though serious loss has been caused to a bank by a fraudulent addition to the name of a payee. If the words of the amount of a cheque are written with gaps and in such a way as to be capable of being "raised," providing the alterations are not obvious, the customer may be held responsible. Again, it is a moral, but not a legal, duty to keep one's cheque book where it is not accessible to anyone who has no right to it. A customer ought to advise his banker as soon as he loses his cheque book, so that payment of the remaining cheques may be stopped and steps taken to apprehend any-

AGENTS AND CORRESPONDENTS THROUGHOUT THE WORLD

one who attempts to use them to defraud the bank or someone else. He ought to—but he is not forced to do so.

Regarding the passbook, the customer has no responsibility whatever. He may insist on having an incorrect entry corrected, but the banker has no such right. It is the customer's moral duty to regard the passbook as an account stated, to be checked on receipt and contested within a reasonable time if it does not appear to be in order, but again he is not forced to do so.

The extent of the risk run by a banker in paying and collecting cheques is not generally appreciated. So far as the first is concerned, he is safe if he pays on a valid signature, in good faith and in the ordinary course of business, if over the counter; in good faith and without negligence, if the cheque is crossed. If his customer's (the drawer's) signature is forged, then the banker is unprotected, even if the forgery is so perfect as to defy detection. He has not only to know what your signature looks like, he has to be certain that it is actually yours. He has to be certain, also, that there is nothing irregular in the form of the cheque, for otherwise he will not be paying in the ordinary course of business, which is a condition precedent to his freedom from liability. He has to see that the endorsements are regular, and that the circumstances in which the cheques are presented are not such as to prevent his contending that he paid them in the ordinary course of business.

In collecting cheques for customers, the banker constantly runs the risk of an action for conversion. This emerges from the fact that a cheque may be passed from hand to hand, so as to pass complete ownership to the transferee, provided it is drawn to bearer, to someone or bearer, or is endorsed in blank. There is nothing to prevent a banker's accepting for collection for the account of A, a cheque payable to B. But if the former happens to have an imperfect title, or none—if, for example, he stole it or it was transferred to him on a forged endorsement, then the banker is guilty of conversion. This may be defined, rather briefly, as meddling with someone else's property without his consent, and unless the banker can show that he complied with certain rigid statutory conditions, he is responsible to the true owner of the cheque. One condition is that the cheque is crossed, which is why a customer should cross his cheques before paying them in: the banker cannot do so and thereby obtain protection. Again, if a customer gives an agent authority to draw or endorse cheques, the customer should keep a check on his operations, no matter how happy he may feel concerning his honesty, for it is by no means easy for a banker to be certain of collecting "without negligence"—this technical phrase meaning that he must show a high minimum of care whenever it is not clear that he is collecting a cheque which is his customer's personal property.

When you leave your valuables with your banker for safe custody, you place on him the responsibility of delivering them only to you, on your demand, or to your personal representatives if you die. If he refuses, or if he delivers to some unauthorised person, then he is guilty of conversion.

Therefore, he must be quite certain of any instructions he may receive as to their disposition—this apart from his ordinary responsibility as a bailee to use the precautions which any prudent man would employ to keep them safe.

When acting as an agent, a banker is fundamentally in the same position as any other agent. He must carry out his duties with proper expedition and without negligence. He may not make a profit out of his agency, except such as is agreed by him with his principal. He may charge a reasonable commission, and is entitled to be indemnified by his principal if he suffers loss while properly carrying out his agency duties. This, then, is the basis of a banker's acting for a customer on the stock exchange, or in the foreign exchange market, or in regard to income tax work. There is no legal responsibility on the customer here, but there is a moral duty to see that instructions given are free from ambiguity. It is true that where directions are capable of two meanings, and the banker places a reasonable interpretation on them, he may hold his customer responsible even if the latter meant something different; but this is unsatisfactory to both parties and often ends in the banker's giving way simply in order not to antagonise his customer.

Where a banker acts as a trustee, he is brought under the law relating to trusts just as is an individual trustee, and such is the rigour of that part of our English law, in its laudable desire to protect beneficiaries, that no private person in his senses would wish to be a trustee if he could properly avoid it. The consequences of mistake, to say nothing of negligence, may be serious to the individual trustee, and the rapid movement towards making banks and other corporations trustees owes much to the need of shifting this burden to shoulders broad enough to bear it. It is clear that very special relationships of confidence are thus set up, similar to those which in more primitive societies are found only within the family.

Enough has been said to show the degree of skill and care which is demanded of a banker, often in circumstances when there cannot be time for adequate consideration. It ought never to be forgotten that often a banker must act immediately for his customer's convenience. For instance, he has to decide at once whether to pay or refuse to pay a cheque presented over the counter. He may receive instructions to buy or sell securities from a customer who is abroad and not easily reached. A number of points may require settlement in order that the order may be properly carried out, and markets may change seriously in the meantime. Yet the banker is expected to divine what is intended.

The law does not help the banker to any appreciable degree. What statutory protection there was has now been so whittled down as to be worth far less than before. There is very little legal, and therefore enforceable, responsibility on the customer. It is surely not too much to expect that the latter should relieve the banker of excessive risk of loss by using reasonable care in the drawing of his cheques, in the drafting of his instructions, by keeping his cheque-book safe, by regarding and using his pass-book as a binding statement of account, and by observing a proper sense of proportion in all his dealings with his banker.

The French Monetary Position

(By a Correspondent)

THE table printed as an appendix to this article summarises the main features of French financial history during the two years prior to the recent voluntary depreciation of the franc. The salient fact is that the Government borrowed nearly Frs. 40,000 millions from the Bank of France, or even more if account were taken of the advances cancelled at the time of the 1936 devaluation. Meanwhile the currency had depreciated against sterling and the dollar by over 50 per cent. Internal prices have risen considerably, but not proportionately. Thus the old disparity between French and world prices has undoubtedly disappeared, and the competitive position of the country should have been greatly improved. Conversely, however, industrial activity is back to stagnation after a short-lived improvement in 1937. This mild recovery has

been reduced to nought by social strife, internal and external political trouble, a certain lack of spirit of enterprise, and last, but not least, by the uncertainty due to the persistent financial difficulties of the Government.

The inflationary process has in this respect not helped the country in the least. The prospects of continued and indefinite borrowing by the State from the Bank of France leading to further depreciation of the currency, stimulated fresh exports of capital under all possible forms (including excess forward purchases of import goods); and has drawn out of the country the newly created money. The gold reserve of the Bank was thus considerably reduced until, in July, 1937, the Equalisation Fund abandoned all hope of pegging the exchange, and allowed the value of the franc to drift downwards.

While the Bank of France's advances to the State rose by Frs. 40,000 millions, sight liabilities increased by less than Frs. 30,000 millions. About one-third of their last increase represents the deposits of the Exchange Fund, i.e. an amount which under normal conditions would have been cancelled and which is now practically blocked. The real increase in sight liabilities therefore does not amount to more than Frs. 20,000 millions, equal, roughly, to the increase in banknote circulation. In the meantime, deposits at the commercial banks showed a mildly rising tendency, but it is probable that their real trend had, until the recent inflow of capital, been downwards.

Thus, in spite of a depreciating currency and a rise in internal prices, the money supply of the country had remained unchanged except for a 20 per cent. increase in the note circulation. The result was an acute Treasury crisis not only for the Government but for the French economy at large. Profits of industry, trade and banking were, indeed, higher in 1936 and 1937 than during earlier years, and higher dividends are being—or could be—distributed in many instances. This, however, was due rather to higher franc values or money rates than to a larger volume of business, except in specific industries like steel. Again, replacement prices have risen quicker than profits, and so working capital has been depleted. Banking credits increased as far as was compatible with the maintenance of a fair liquidity by the credit institutions. This was reflected in the larger rediscounts (and direct dis-

counts) of the Central Bank, in the larger discount portfolio and smaller proportion of Treasury bills carried by the commercial banks, in the slow but constant development of acceptance credits, and in high money rates, both for short-term and for day-to-day operations.

In these circumstances it is remarkable that not more complaints were heard among business people about the resistance of the banks to larger credit demands. This can probably be ascribed to two factors. The first is the development of cash purchases under the pressure of sellers who do not desire to grant the customary 90 days' delay, and here the main result is that many traders are obliged to carry on a policy of hand-to-mouth purchases which reacts unfavourably on the industrial activity of the country. The second reason is the growing importance of State organisations as buyers in the market. No commercial paper can at present be drawn on such organisations, and long delays often arise before the accounts due can be collected. Medium term rather than banking credit would be necessary in such cases, but the means of the special institutions which were created for that purpose (Caisse des marchés de l'Etat, Caisse de crédit aux communes) were, until the May 2nd decree, ridiculously low as compared with existing needs. The new subsidy granted by this decree to the Caisse des marchés should be most welcome to many enterprises who have sound balance sheets but who lack working capital.

Such was the situation when M. Daladier took the

decision to anticipate a further depreciation and to fix the rate at Frs. 179 to the pound. For the first time, after so many ill-fated experiments, the new devaluation was made under favourable conditions. First, the new rate was economically sound and so easily defended, i.e. it took account of existing price parities plus a rather generous premium, representing an under-valuation of the franc. Second, the Government inspired "confidence," and public opinion believed that it could and would take steps to allay the fundamental evils which undermined the French economy, namely slow production and persistent budgetary deficits. The success surpassed all expectation, and the inflow of funds which followed was not only the result of quick speculative profit-taking—as in previous instances—but included a considerable amount of repatriated capital. The Treasury problem outlined above should therefore be practically solved for some time, for the Government is well as for private enterprises, while monetary stability seems easy to ensure in the near future. If banking deposits

and monetary circulation can increase without provoking a new exodus, one-half of the French problem is solved.

The second half of the problem remains. An exchange rate, however, cleverly established, can provide the basis for a recovery under favourable conditions, but it can do no more. It would not hold in the long run if public "confidence" did not appear justified, and for this reason Government action is both necessary and urgent. It is clear that the Government cannot overnight restore production to its 1929 level or balance the Budget entirely. It is not even necessary to go as far as that. But some improvement is indispensable in these two fields—especially in public finances, which depend directly upon Government action—if the capital which returned in anticipation of sound reforms is to remain in France, and if further repatriation is to be encouraged. "Monetary technique" has now done its part. The next task is to make its good effects permanent. It remains to be seen if M. Daladier is able to carry out this task.

American Banking

(By a Correspondent)

RECENT developments fall into two periods. The first, from the end of 1935 until August, 1937, witnessed the transfer of Treasury balances into the Reserve Banks; the August, 1936, increase of 50 per cent. in reserve requirements (promptly intensified by gold imports); the creation of the Inactive Gold Fund in December, 1936; and the second increase in reserve requirements in March and May, 1937, partially offset by open-market operations in April, 1937. The second period, which witnessed a reversion to expansion, began in August, 1937. It included a general reduction in discount rates, the release of gold from the Inactive Fund last September, a small open-market operation in the autumn, and the more definitive gold programme announced in February. A new phase was probably inaugurated in the middle of April, 1938, but as this involves looking ahead, it is best to consider first the banking position during the past two years.

Changes in the condition of the Reserve Banks are shown below:—

RESERVE BANK ITEMS (\$ millions)	Aug. 12, 1936			Aug. 11, 1937			Mar. 30, 1938		
	1936	1937	1938	1936	1937	1938	1936	1937	1938
Bills discounted	8	17	12						
Bills bought	3	3	1						
U.S. securities	2,430	2,536	2,564						
Gold stock	10,661	12,497	12,794						
Gold certificates in reserve banks	8,225	8,832	9,213						
Inactive gold fund		1,265	1,183						
Member bank balances	6,116	6,681	7,312						
Of which excess reserves	3,167	740	1,560						
Money in circulation	6,178	6,482	6,329						
Treasury and non-member deposits with reserve banks, etc.	930	839	870						

At the end of 1935, member bank reserves had reached a figure about double the requirements, and gold continued to pour in at a rapid rate. Commercial bank deposits were expanding under the double influence of gold imports and of deficit financing, and were approaching the previous record level of 1929. "Excess reserves" had thus become a major problem; and in the first half of 1936 the further expansion of reserves was limited by the temporary device of shifting Treasury balances into the Reserve Banks. In midsummer, when the total of deposits and currency had actually reached the 1929 level (a level high relative to our general economy) the Reserve Board introduced its programme of increasing reserve requirements, evidently with the intent of controlling further credit expansion. The first step was taken on August 15, 1936, and the last on May 1, 1937. Within that period, however, gold imports had continued on the usual scale, and in December, 1936, the Inactive Gold Fund was created; there was a continued increase in currency in circulation; and in April the Reserve Banks had bought \$96 millions of Governments. The dates August, 1936, to August, 1937, bracket a period

when monetary management centred on the problem of "excess reserves," and the table above shows how this problem was met. Between those dates the net increase in the gold stock was above \$1,800 millions, of which about two-thirds (arrived after December, 1936) had gone into the Inactive Fund. Total member bank reserves had increased by approximately the amount of the remaining gold imports, but excess member bank reserves had been reduced from almost \$3,200 millions to about \$700 millions, principally by the increase in legal requirements. Prior to 1934 \$700 millions of excess reserve was unprecedented, but by the summer of 1936 the internal balance of payments had concentrated these excess reserves in the interior, and New York was feeling pinched.

The following table shows changes in the position of the reporting member banks over the same periods.

REPORTING MEMBER BANKS (\$ millions)	Aug. 12, 1936			Aug. 11, 1937			Mar. 30, 1938		
	1936	1937	1938	1936	1937	1938	1936	1937	1938
Total loans and investments	22,324	22,331	20,810						
Total loans	8,352	9,917	8,771						
Of which, brokers' loans	1,119	1,356	680						
U.S. and guaranteed securities	10,657	9,385	8,934						
Other securities	3,315	3,029	3,105						
Reserve with Fed. Res. Banks	4,855	5,122	5,755						
Demand deposits	14,752	14,914	14,268						
Time deposits	5,021	5,229	5,218						
U.S. Government deposits	821	589	696						
Borrowings	3	42	11						

During the twelve months following the initial increase in reserve requirements, total loans and investments of the reporting member banks experienced no net change. Loans, however, increased, while securities fell. Demand deposits were affected by the transfer from Government to individual holders, and there was a moderate net increase in time deposits. The Government bond market had a flurry in March, 1937, which raised rates on the long maturities from about 2½ per cent. to about 2¾ per cent., but in general short quoted rates had remained at extremely low levels. Evidence of local tension may be detected in the small increase in borrowings.

In the middle of August the stock market turned down, and by early September was almost in a state of panic. Signs of business recession, although indistinct, were multiplying; and on September 15th the Treasury faced a refinancing operation of substantial magnitude. Given the relatively unsatisfactory distribution of excess reserves and the prospect of the approaching seasonal demand for currency, the Reserve Board took action which, at least by its sequences, represented a radical change of policy. In late August and early September, the regional banks reduced their discount rates from 2 per cent. to 1½ per cent. (in New York from 1½ per cent. to 1 per cent.). On September 13th the Treasury announced the release of \$300

millions of gold from the Inactive Fund. This quickly passed into the cash reserves of the New York City banks, putting them in a more than comfortable position. Later in the autumn the Federal Reserve Board undertook a small open-market operation, which increased the Reserve Banks' holdings of American securities by about \$32 millions. Thus \$320 millions was added to member bank reserves.

In February, 1938, the Treasury announced an important change in gold policy, namely, that gold increments (due to import or production) would be placed in the Inactive Fund only when such increments exceeded \$100 millions in a quarter. As a result of this decision, although the gold stock increased by only \$34 millions between December 29, 1937, and March 30, 1938, the Inactive Fund was reduced from \$1,228 millions to \$1,183 millions; and the gold certificates issued to the Reserve Banks rose from \$9,120 millions to \$9,213 millions. On March 30th the Inactive Gold Fund was smaller than in mid-August. As a result of this combination of factors, the total reserves of the member banks were at the end of March, 1938, about \$1,200 millions above the figure just preceding the first increase in member bank reserve requirements in August, 1936; the excess reserves were more than double the figure of August, 1937, and were very close to the figure at which they had stood on August 15, 1936, just after the initial increase in required reserves had gone into effect. That is, the second phase of the control programme had been neutralised, and the Treasury gold policy had been modified in the direction of providing a semi-automatic continuous increase in bank cash.

Meanwhile, a sudden and deep depression in business had developed. Between August, 1937, and March, 1938, the total decline in loans in the Reporting Member Banks was \$1,150 millions, about equally divided between brokers' loans and other loans—although this did not quite cancel the great increase in loans between August, 1936, and August, 1937. But whereas between August, 1936, and August, 1937, the decline in investments merely equalled the increase in loans, leaving total loans and investments unchanged; between August, 1937, and March, 1938, the decline in loans has been accompanied by a decline in investments (outside New York) as well, bringing total loans and investments down by about \$1,400 millions in seven months. The decline in demand deposits was about \$650 millions; and over the same period reserve cash in the reporting member banks rose by almost an equal amount. That is, the expansionist policy pursued during the past six months had not yet definitely arrested the liquidation of bank credit, since that derived from other causes than the condition of bank reserves.

It is worth noting, however, that while between August 11, 1937, and March 30, 1938, total loans and investments in New York City declined from \$8,323 to \$7,576 millions, demand deposits rose from \$5,968 to \$6,100 millions. The differential is mostly attributable to the increase in reserves from \$2,342 to \$2,958 millions. This is almost unique in American banking history, as ordinarily a contraction in loans and investments causes a reduction in deposits.

The expansion programme entered a third phase in the middle of April, 1938. It was then announced that the entire Inactive Gold Fund would be released, and that required cash reserves in the Member Banks would be reduced by about 13½ per cent., equal to \$690 millions. The latter provision took effect immediately, with the result that excess reserves rose from \$1,730 millions on April 13th to \$2,490 millions on April 20th. The Inactive Gold Fund stood at \$1,183 millions on April 13th, but the amount released was almost \$1,400 millions, that is, about \$200 millions more than had been reported. The effect on the Reserve Bank statement is shown below:—

RESERVE BANK ITEMS (\$ millions)	Apr. 13, 1938			Apr. 20, 1938		
	1938	1938		1938	1938	
Gold certificates and due from U.S. Treasury	9,245	10,642	+ 1,397			
Member bank reserve account	7,472	7,547	+ 75			
U.S. Treasurer, general account	140	1,428	+ 1,288			

It has been announced that these Treasury balances will be fed into the Member Banks by the retirement of \$50

millions of Treasury bills a week. The immediate sequel to this programme was a strong demand for Government securities. The rate on Treasury bills fell to about 0.7 per cent.; and the long Governments were in such demand that the Federal Reserve Bank, which had been a buyer in March, sold almost \$100 millions within the week.

German Banking

(By a Correspondent)

SINCE the advent to power of the Third Reich, the German banking system has naturally and inevitably formed part of the general economic machine which has gradually been evolved under the present Nazi regime. Thus to understand the trend of German banking, it is necessary to realise some of the fundamental concepts of Nazi economics. Briefly, these may be summarised as follows:—

(1) The ultimate basis of the internal credit structure is not gold, but *work*.

(2) The supply of credit, and indeed, of money (in the loose sense of the word), must be made available to the legitimate demand.

(3) Credit, like any of the other important factors of production, must primarily be made to serve national ends. *Inter alia*, this implies control over the capital market.

(4) To prevent any expansion in the supply of credit from dissipating its momentum through a rise in prices, internal prices, wages and costs must be controlled.

(5) To prevent any efflux of capital, and also because the reichsmark itself is based on "work" and not on gold, an elaborate system of exchange restriction is necessary.

(6) It is equally necessary to make the size of the country's import trade dependent upon its ability to export; and the consequent limitation of imports at once raises the question of self-sufficiency, which since 1936 has found expression in the second Four Year Plan.

From the banking point of view, this new system implies first and foremost that the banks must act as the main channels for the distribution of credit in the desired directions. The actual machinery is comparatively simple, for it depends merely on the fact that in Germany the private and commercial banks are free to rediscount at the Reichsbank. Thus, once it is thought desirable to finance any particular project, all that is necessary is for the contractor to draw his bill and have it duly accepted and endorsed by two out of various official bodies. The bill then carries three names and is eligible for rediscount at the Reichsbank. The contractor can therefore discount it at his own bank, which in turn rediscounts it at the Reichsbank. The result is an expansion in the Reichsbank's bill portfolio offset by an increase in the note circulation, and the bill remains with the Reichsbank, being renewed from time to time, until it proves possible to redeem it out of the proceeds of a more definite loan.

The effect upon the banking system has been very marked. The change in the position of the Reichsbank alone is shown in the following table:—

POSITION OF THE REICHSBANK AT CLOSE OF YEAR
(Rm. millions)

	Gold	Bills and Cheques	Advances	Securities		Note circulation	Other daily maturing liabilities
				Covered	Sundry		
1933	386.2	3,177.0	183.3	259.4	321.7	3,645.0	639.8
1934	79.1	4,020.6	145.7	444.8	318.6	3,900.6	983.6
1935	82.5	4,498.3	84.2	348.6	315.1	4,285.2	1,031.8
1936	66.5	5,447.6	74.4	221.3	302.5	4,980.1	1,012.4
1937	70.6	6,012.9	60.3	105.8	286.4	5,492.9	1,058.5

Since 1933, Reichsbank's gold holdings have shrunk to a negligible size. There has been a continual increase in the note circulation and also in other daily maturing obli-

gations, which include the private and commercial banks' balances at the Reichsbank. The counterpart to the whole of this expansion is to be found in the rapid growth in the Reichsbank's holdings of bills and cheques. Thus the national currency has come to be based more and more upon bills rediscounted by the Reichsbank, these bills representing work on various projects, many of which have long ago reached completion. For good or for evil, the currency now rests upon "work" instead of upon gold.

The next table gives certain items in the aggregate balance sheets of all the banks in the country. These include the "big five" Berlin banks, and also provincial banks, credit institutes, land banks and savings banks, together with the giro-zentralen, which now form the organisation through which the savings banks' resources are invested.

COMBINED GERMAN BANKING RESOURCES
(Rm. millions)

	Assets			Liabilities		
	Cash	Bills	Debtors	Deposits (general)	Deposits (savings)	Total Deposits
1933	438	2,760	8,670	14,787	...	14,787
1934	463	3,541	8,193	16,009	...	16,009
1935	514	3,808	7,015	14,920	1,314	16,234
1936	467	3,972	6,725	15,881	1,346	17,227
1937	384	4,557	5,971	16,592	1,308	17,900

This table also shows the growth in the importance of bills as one of the chief assets of the banks. There has been no inordinate expansion in deposits, just as there has been no markedly disproportional growth in the note circulation—for the German currency expansion of about 50 per cent. since 1933 compares with a parallel increase of 30 per cent. in the British note circulation. On the other hand, bank deposits, like the note circulation, have come to be backed to an increasing extent by bills of exchange. Conversely, bank advances have decreased in their aggregate amount. The explanation is first that the general recovery of the country has facilitated the repayment of loans previously frozen; and second that it is unnecessary for a contractor to borrow from his bank, when at any moment he can discount his bills drawn against the work in hand.

Thus the banking system has been easily adapted so as to play its part in the new German economic machine. There is, however, the question whether this is sound from the banking point of view. Too much stress must not be laid upon such doubts, for financial "orthodoxy" has quite a different meaning in Germany to-day from what it had before the days of the Third Reich or what it has in England and other countries to-day. Still, there is one apparent source of weakness. So long as the commercial banks can rediscount freely at the Reichsbank, they are under no incentive themselves to maintain adequate cash reserves. This throws the whole onus of defence against inflation back upon the Reichsbank. There is not the second line of defence, which in other countries is provided by the obligation, legal or traditional, of the commercial banks to maintain an adequate ratio of cash to deposits. The second table shows the minute amount of cash carried by the German banks in proportion to their deposits.

This fact has become of some theoretical importance during recent months. German production, the German national income, the savings of the people, and the revenues of the Reich have expanded to the point where it may soon become possible to dispense with undisclosed and unlimited borrowing from the banking system through the drawing and rediscounting of bills. Instead, the Government may be able to finance its needs out of tax revenue or out of disclosed borrowing by the issue of loans taken up out of the national savings. If so, the period of credit inflation will be brought to an end, and an opportunity will arise for tightening up the banking system and perhaps for establishing their cash as a second line of defence.

This is looking ahead in many important respects. There is no certainty that undisclosed borrowing will be eschewed in the future. The absorption of Austria, rearmament extension and renewals, new changes in policy, the progress of the Four Year Plan, all raise doubts in this direction. In any case, the final decision rests with the Government of the Reich. If the present regime adheres without modification to its basic concepts that work not gold lies at the basis of credit, and that the supply of credit must be equated to the legitimate demand, then unless it so happens that full employment can be financed out of current income and savings without a further credit expansion, any suggestion for tightening-up the banking system must be abortive. Indeed, the need for any such change in banking practice will be denied. Still, in certain ways there is now a better opportunity for this change in

practice than has existed since the advent to power of the third Reich.

As regards the German foreign exchange outlook, one fact can be taken for granted. There is not the smallest inclination inside Germany either to devalue the mark or to relax the present system of exchange control. This may appear a disappointing view, especially as the opinion has already been expressed in international banking circles that devaluation is becoming practicable. Moreover, the monetary sections of the Van Zeeland Report contained a broad hint at the need for German devaluation and relaxation as one of the basic conditions for the attainment of the objects of the Report. Such hopes are probably doomed to disappointment. Exchange control is an integral part of the German economic machine, and the Government neither wants devaluation nor free exchange dealings, or sees the need for them. On the contrary, while the existing restrictions may be irksome to numbers of German bankers, traders and manufacturers, the Government and the Party believe in the new economy, and think that the needs of the country are met, so far as they can be met, by export subsidies and clearing and compensation agreements. The latter also are a useful political instrument, whose value in Central and South-East Europe will be enhanced by the absorption of Austria.

To sum up, German banking and exchange may have reached a turning-point, if the authorities desired to reorientate their policy. There is, however, not the slightest sign of any desire to do so. On the contrary, they are likely to continue along the present lines.

Scandinavian Banking

(By a Correspondent)

DESPITE the many disturbing political and economic features of 1937, the past year must be considered a remarkably good one in the history of Scandinavian banking. In the case of Sweden and Finland—there is always a certain parallelism in the development of these two—it was actually a peak year, when the climax of several years of unbroken economic expansion was reached, the gloomy prognostications of those who after the record successes of 1936 foretold an imminent recession, thus proving hopelessly wrong. As to Norway and Denmark, it was a period of recovery and consolidation, the Norwegian position being as ever somewhere midway between that of Sweden and Denmark. In contributing to this recovery, Central Bank policy at times appeared more helpful than Government policy.

Thus in Norway the methods of taxing interest on bank deposits have given rise to much controversy, while in Sweden some already existing regulations that hampered the normal functioning of the banks have of late been further extended. There have always been obstacles to foreign investment in Swedish securities, which finally resulted in the creation of the "B" share by many companies. These "B" shares, as well as certain other "free" securities, can be bought for foreign account, but apart from that the Swedish banks—who also act as brokers—dare not accept a Stock Exchange order from abroad. Therefore, the recent influx of foreign money into Sweden has merely gone to swell the already enormous banking deposits. Then again the law demands that the banks should liquidate their industrial holdings, and in a country where in the past there has been a marked reluctance on the part of the public to finance industry direct through subscription to shares, so that this task was almost entirely left to the banks, it is no easy matter to bring about a complete reversal of procedure. Finally, stricter control of bank credits has recently been imposed, and this must seriously curtail the banks' future possibilities of giving their support to the establishment of new or expansion of old industrial and commercial undertakings.

It cannot be denied that the old Swedish system of financing industry through the banks has sometimes involved the banks themselves in considerable losses. More-

over, it must be admitted that in many cases the banks did go too far in their credit accommodation to industry and commerce. It may also be true that the present need for industrial expansion is extremely limited, but there can be little doubt that the day will come when the experience and the resources of the banks will once more be required for maintaining or further building up the country's industry and commerce. To restrict, as has been done so rigorously, the normal and healthy activities of the Swedish banks, which have played their part in helping to increase the standard of living, may in the long run prove to have been a very unwise step.

Under the circumstances it is nothing short of remarkable how well the Swedish banks managed their affairs in the past year. There are twenty-eight of them in number, the three leading banks transacting by far the greater part of all the business.

The net profits of the twenty-eight banks aggregated in 1937 the sum of Kr. 60.35 millions (£3,320,000 at par)—on a total share capital of Kr. 481 millions—against Kr. 64 millions for the preceding year. If the profits compared with the corresponding figures for 1936 appear smaller, this is entirely due to a different method of presenting the account. For the past year the banks have in most cases made provision for taxation prior to the calculation of net profits; moreover, a number of the banks have likewise made certain other provisions, such as for pension funds, before striking their net profits. Consequently, and owing to a number of direct transfers having been made from hidden reserve accounts to visible funds, i.e. to special reserves and the like, comparisons with the preceding year are rendered difficult.

The most important features in the development of the Swedish banks in recent years, and not least during 1937, may be summarised under the following main headings:

(1) The greatly enhanced liquidity of the banking system, notably in the three biggest banks.

(2) The increased importance acquired by short-term deposits in relation to long-term deposits, this feature being also most marked in the case of the three principal banks.

(3) The change in the relative position of the commercial banks' foreign assets and liabilities. This has taken place gradually, and became especially pronounced in 1937 on account of the public discussion that was then going on concerning the possibility of abandoning the Swedish krona's connection with the pound.

(4) The steady consolidation of the commercial banks' position which has been effected *inter alia* by the gradual liquidation of the banks' interest as direct or indirect owners of industrial and commercial undertakings.

Statistically, this trend is made apparent by the following figures taken from the balance sheets. From the end of the boom year 1929 to the close of 1937 the cash ratios have approximately been quintupled—from 3.7 per cent. of the total deposits at the end of 1929 to 15.3 per cent. at the end of 1937. During the same period the short-term deposits have increased by about 50 per cent., and now amount to nearly 25 per cent. of the total deposits, compared with about 19 per cent. at the end of 1929. At the end of 1929 the difference between the Swedish claims on abroad and foreign claims on the Swedish banks amounted to a surplus of approximately Kr. 183 millions, whereas the corresponding figure at the end of 1937 represented a deficit of about Kr. 4 millions. The causes of the commercial banks' enhanced liquidity and increased importance of sight deposits are to be found, apart from the changes already mentioned, in the fact that favourable economic conditions have allowed industry (and not the least Sweden's export industries) to increase its deposits and reduce its demands for credit from the banks. Finally, a striking feature is that despite the sharp rise on the Bourse there was a decline in loans against shares. This suggests that share buying is becoming more of a form of capital investment and less pure speculation than was the case in the past.

On the other hand, there has been a certain amount of domestic and foreign speculation in the Swedish krona, though it has been very limited in extent. Indeed, all the four Scandinavian countries have throughout the year managed to maintain the established sterling parity.

Out of Finland's nine joint-stock banks, three—and especially two—are responsible for something like 80 per cent. of all banking business. All the banks experienced in 1937 an excellent year. Deposits grew by nearly 1.5 million marks to the huge figure of ten milliards at the close of the year, and since then have even further improved on that record total by adding yet another 600 millions to it during the first three months of 1938. Credits, which had been steadily shrinking since 1929, expanded in 1937 by 1.2 milliard marks, reaching the imposing sum of 8.6 milliards last February. Unable fully to utilise their cash, the banks saw it rise to 1.3 milliard marks as compared with 851 millions at the close of 1936 and 633 millions in 1935.

The Finnish banking law stipulates that cash and cash reserves should represent a minimum of 20 per cent. of sight liabilities; but so great was the liquidity of the banks in 1937 that this ratio actually amounted to nearly 70 per cent., viz. to 67.2 per cent. at the close of December. To bring their own resources into more adequate relation with their liabilities, the two principal banks increased their share capital by 40 and 50 million marks respectively, and now each dispose of about 520 millions of their own funds.

In Norway the banks experienced all-round expansion and consolidation, though not quite so spectacular as in

Sweden or Finland. Shipping had a most excellent year, whaling was good, and so on the whole was industry, but conditions in agriculture and fishing can only be described as average. As the result of the general expansion the banks were able either wholly to wind up or considerably reduce some of their previous engagements which had appeared rather risky. These had been incurred either through excessive zeal in boom periods or had been forced on the banks during the years of crisis, but in their aggregate they represented a serious danger to Norwegian banking. During 1937 a great step forward was taken in this "melting process," but it is not completed yet. Two of the leading banks, whose liquidity had become greatly impaired in the past, will continue to enjoy for some time—though in a much curtailed form—the special support of the Bank of Norway.

All the figures for 1937 show progress, and a good indication of improved economic activity will be found in the fact that the turnover at the Oslo Bankers' Clearing House amounted to Kr. 3,735 millions in the past year as compared with Kr. 3,184 millions and Kr. 2,854 millions respectively in 1936 and 1935.

In Denmark, the two most striking features of the year have been the wide price fluctuations and the improved foreign exchange position. During the first half of 1937 the export price index declined by 5 per cent., while that for imports rose by 17 per cent.; but during the second half-year the very opposite process took place—the import index dropping nine and the export index rising twenty-four points. It is obvious that so violent a change in the trend of foreign trade must have affected the whole economic life of the country, and the adverse conditions prevailing up to June, 1937, resulted in a severe drain on Denmark's foreign currency resources. During the six months that followed, however, there was a spectacular recovery, enhanced by the record earnings of Danish shipping.

The result of this was an improvement of no less than Kr. 110 millions in the foreign exchange position, the National Bank's holdings increasing by Kr. 85 millions and those of the private banks by Kr. 25 millions. The total net credit foreign currency balance of the banks amounted at the close of 1937 to Kr. 67.5 millions. During the first two months of 1938 the foreign exchange situation, which up to a point is the determining factor of the country's prosperity, continued to improve, but since then there has been a certain recession. The liquidity position of the private banks showed some strain during the first months of 1937, but during the second half-year the influx of foreign currency which they sold to the National Bank greatly eased the situation. Thus the year ended on a fairly cheerful tone, with larger resources, higher earnings than in 1936 and increased dividends in many cases.

There were 162 banks in Denmark in 1937, but out of these the three large banks in Copenhagen alone regularly transact as much or more business than all the others put together. While the pace at which banking activity expanded during 1937 was not quite as spectacular as in 1936, both loans and deposits continued to increase and at the end of the year showed totals that were Kr. 44 and Kr. 38 millions larger, respectively, than corresponding figures in the previous year. During the first quarter of the present year this movement has been maintained. Nevertheless, Denmark's economic position remains largely dependent on British commercial and agricultural policy, and that adds further uncertainty to the general international complications affecting all the four Scandinavian countries.

South American Banking

(By a Correspondent)

EVENTS during the past 18 months have amply demonstrated the liability of the fortunes of the South American countries to sharp fluctuations in relation to the vicissitudes in world markets for primary products. Factors such as European political uncertainties and crop failures in North America led in the last few months of 1936 and early 1937 to a sharp upward movement in prices of metals and food-stuffs produced in South America, and the resulting expansion in export trade brought with it some improvement in exchange rates and in the currency transfer position generally. Conversely, the pronounced fall in world prices of primary products since May, 1937, has led to a contraction in exports from South America, which has already resulted in a return to stringency in the foreign exchange markets of the principal countries concerned. Therefore, there has on balance been little, if any, relaxation of exchange control restrictions, which weigh heavily upon all activities, and especially banking.

The overseas trade of the Latin American Republics continues to be based mainly upon principles of reciprocity, which find practical expression in bilateral commercial agreements, compensation arrangements, quotas, etc., and this tendency will become aggravated by the return of difficulties to the export trade. In the River Plate countries of Argentina and Uruguay, this policy of trade reciprocity has so far been successfully pursued without accompanying entanglements of a "compensation" nature, but, on the other hand, many of the other republics—especially those in a state of over-production—have been enabled to sustain their export trade only by entering into compensation arrangements, the outstanding example of which is the German Ask mark system. Such arrangements result in a large part of the proceeds of exports from countries such as Brazil, Chile, Peru and the Central American Republics, being restricted to the payment for imports from the country buying their exports, and so not yielding balances of freely negotiable currencies.

The suddenness with which, in the South American countries, a period of prosperity may be followed by one of depression has been well exemplified in the case of Argentina. Following drought in North America, the economic recovery of Argentina reached a remarkably high level early in 1937, when monthly exports, especially of grain, attained record dimensions. In the result, total exports for last year reached 2,308 million pesos, against 1,656 millions in 1936, and, despite an increase of 40 per cent. in imports, the favourable trade balance for the year was nearly 751 million pesos (say, £47,000,000 sterling), against 539 millions (£34,000,000) in 1936.

This balance for 1937, however, was mainly accumulated in the early months of the year, and, with the exhaustion of grain stocks and imports running at a high level, there actually emerged an adverse balance in the month of November. This recession in export trade became even more marked in the early months of 1938, crops of fine cereals having turned out short, with Argentine farmers unwilling to accept the ruling level of wheat prices. Moreover, the coming maize crop is estimated to be only about 50 per cent. of that of 1936-37, so that total maize exports during 1938 will probably not exceed about 3,400,000 tons, compared with 9,000,000 tons in 1937 and average exports for the last six years of over 7,000,000 tons. Although purchases from abroad are now being restricted, imports are still running at a high level—due to the usual time-lag after a year of prosperity. Therefore, the adverse trade balance as at end-March, 1938, was 22 million pesos, compared with an export surplus of over 530 million pesos twelve months previously, total exports for the first three months of this year having been 392 million pesos, against 838 millions in the like period of 1937, and total imports 414 million pesos, against 307 million pesos.

Despite the sudden turn for the worse in agricultural

affairs, the Argentine banking and credit situation may be considered very sound. This is unquestionably due to the fact that the Central Bank has fulfilled expectations and has persistently followed a cautious policy carefully based upon the idea of general average and not simply on the strength of one particular favourable agricultural year. It was through the exercise of this policy that the Bank scientifically prevented the undue credit expansion, which, under the previous regime of banking organisation, would almost inevitably have occurred under circumstances of such economic prosperity as were experienced during the early part of 1937. The favourable outlook which then existed brought in its train increasing investment of foreign capital, including "hot" balances, which, added to the abundant proceeds of exports, threatened to cause an undue expansion of credit. The Central Bank, however, followed the policy of the absorption of surplus banking funds, the tendency for the expansion of credit being arrested in two ways: first, by paying for the foreign exchange purchased from the banks with certificates of participation in Consolidated Treasury Bonds, special Treasury Bills, or gold and foreign exchange custody certificates; or, secondly, by using the resources of the exchange fund to pay for the purchases of foreign exchange made from the banks without the necessity of creating new banking funds. The total of banking funds absorbed by these means reached a maximum of 1,060.5 million pesos in May, 1937, but this amount included the sums remaining from the revaluation of gold.

THE CHASE NATIONAL BANK OF THE CITY OF NEW YORK

(Incorporated with Limited Liability under the Laws of the U.S.A.)

HEAD OFFICE:
PINE STREET CORNER OF NASSAU, NEW YORK

A commercial bank of international standing—
An important link in the trade and financial
relations of the United States with Great Britain
and the world—A bank for bankers, business
men and merchants, providing wide facilities for
Anglo-American and international trade.

The Chase Banking Organisation has Offices in:
PARIS, HAVANA, SAN JUAN-PORTO RICO, PANAMA,
CRISTOBAL, COLON, HONGKONG, SHANGHAI and TIENTSIN

and Special Representatives in:
BERLIN, ROME and MEXICO CITY

That figure, however, was reduced by the utilisation of part of the foreign currencies for the debt repatriation fund, and by the egress of foreign exchange in the second half of 1937 to compensate for the disequilibrium which had risen in the balance of payments. Thanks to this policy of retiring banking funds by the Central Bank, cash holdings of the banks averaged 832.0 million pesos in 1937, or only 34.2 millions more than the average of 1936.

The magnitude of the reserves of gold and foreign exchange, the Bank stated, assures the stability of the official exchange market, which, as the medium for conducting the fundamental business operations of the Republic, is unaffected by movements of international floating funds, such movements being now confined to the "free" market. Some 83 per cent. of imports is paid for at the official selling rate of 16 pesos per £, in which there has been no alteration during the past year, and it is sincerely to be hoped that no weakening of the rate will occur, particularly as official exchange is smoothly forthcoming for imports from Great Britain. With regard to the "free" exchange market, this weakened sharply in the spring of 1938, owing to the withdrawal of support by the Central Bank. The latter had intervened where necessary since 1934 in the "free" exchange market, but, owing to the recent sharp fall in exports, the cost of doing so had seriously depleted the reserves destined to supply the official market.

The actual position of the Central Bank is very strong, the proportion of gold and foreign exchange reserves as at March 15th representing 84.78 of notes in circulation and other sight liabilities. The Central Bank continues smoothly to regulate the bases of credit, and, with that Institution's rediscount rate unchanged throughout 1937 at 3½ per cent., interest rates have remained at a low level, while the keen competition in the money market was reflected in the low rates of discount at which Treasury Bills continued to be placed regularly by tender. The Bank Investments Mobilising Institute which was formed in March, 1935, as an integral part of Argentina's financial organisation, indicated in its report for 1937 that there had been active liquidation of the frozen banking assets originally acquired by it.

During the first quarter of 1937 the Brazilian "free" exchange rate was steady at around 80 milreis to the £, subsequently improving gradually to 75. In September, however, a certain degree of stringency developed, probably owing to the shortage of coffee export bills and, in October, certain additional restrictions were placed upon exchange operations. By the end of October, the "free" rate was approaching 90, and, early in November, the Government announced their intention of modifying the coffee policy in an endeavour to recapture part of their lost world markets. This modification, so far as it affected exchange, took the form of abolishing the system whereby a proportion—usually 35 per cent.—of exchange arising from exports had to be sold to the Bank of Brazil at the official rate of about 56 milreis to the £. The result was an automatic increase in the supply of exchange to the "free" market.

About the same time, a new Federal Constitution was promulgated and the suspension of the External Debt service was announced. Following these vital economic and political changes, there was a temporary improvement in the value of the milreis, but the rapidly dwindling trade balance remained an adverse factor. An intensification of exchange control was brought about by Decrees passed at

the end of December and early in January by which the Bank of Brazil was granted a monopoly to purchase all export bills and transfers from abroad, and accounts in milreis of parties domiciled abroad were blocked. From the exchange acquired in this manner the Bank of Brazil supplies the Government's requirements, and the balance is distributed in specified order, preference being given to payments for imports. In order to avoid the protest of foreign import bills for which exchange is unobtainable at maturity, deposits in milreis are made on due date by the drawees at a provisional rate. Since the beginning of January, 1938, the Bank of Brazil have made periodical announcements regarding the distribution of exchange cover in payment of foreign import bills for which deposits in milreis at the stipulated provisional rate had been duly effected. Such cover was at first provided by them weekly for delivery within 60 days, but some improvement in the exchange situation was indicated on February 21st, when it was announced that exchange cover would be distributed daily for delivery in 30 days. Purchasers of exchange pay a tax of 3 per cent.

All aspects of Brazil's economy are so bound up with the coffee industry that the outlook will continue obscure pending definite indications of the result of her new competitive policy in world coffee markets. Although coffee exports now show a tendency to expand, there is much leeway to make up for the heavy cut in prices, whilst the vital problem of over-production still awaits solution. Whatever the immediate sacrifices incurred, it is to be hoped that Brazil will now adhere to the sound policy of placing the industry upon a basis regulated by the laws of supply and demand.

Although projects have been drawn up for the establishment of a Central Bank in Brazil, as also for regulating general banking operations, nothing concrete has recently transpired. The same remark applies to the powers in respect of the nationality of shareholders of foreign banks provided for in the new Brazilian Constitution. Public confidence in foreign banks is demonstrated by the fact that total deposits therein at end-September last—latest date available—were 1,733,504 contos, compared with combined capital and reserves of 173,267 contos, whilst, in the case of Brazilian banks, deposits were 6,898,542 contos, against total capital and reserves of 1,602,301 contos. Moreover, the deposits with the foreign banks were higher than the figure twelve months earlier of 1,584,135 contos.

Prices of all grades of coffee have fallen following Brazil's recent change of policy, and this is adversely affecting Colombia and the Central American "coffee" States, where currencies show signs of weakening and where there is, generally speaking, intensified effort to restrict imports and to control the exchange markets. Peru has avoided exchange control, and foreign trade has shown considerable expansion, but much will depend upon cotton prices.

Owing to the heavy demand for copper early in 1937, Chile's total exports in that year were almost double in value those of 1936. Steady contraction in exports over recent months, however, is again leading to exchange stringency, and there has been no relaxation of the strict exchange control. Credit is ably controlled by the Central Bank, however, and the position of the money market has continued normal. With the expansion in trade, total bank advances increased during 1937 by a little over 7 per cent., which was a satisfactory movement in the circumstances, as was also the position of the cash holdings of the banks.

To all Travellers

Whether you make your journeys by road, rail,
sea or air, there is no need to carry more cash
than is immediately necessary if you hold

MIDLAND BANK
TRAVELLERS' CHEQUES
or alternatively a
MIDLAND BANK
LETTER OF CREDIT.

Money requirements for long or short journeys,
at home or abroad, may be covered with
safety and ease by using Midland Bank
Travellers' Cheques for £2, £5, £10 or £20.

These Cheques may be changed into cash at
banking offices in all countries and are accepted
in payment of accounts at the following points:

The world's leading hotels
European air line offices
Ships cruising to all parts
British railway stations
Principal London Stores.

Midland Bank Travellers' Cheques are obtain-
able free of commission at any of the 2600
branches of the Midland Bank and its affiliated
companies, the Belfast Banking Company, The
Clydesdale Bank and the North of Scotland Bank.

A copy of
"TRAVEL IN EUROPE"
may be obtained upon application to any branch, the
Overseas Branch, 122 Old Broad Street, London,
E.C.2. or the Head Office, Poultry, London, E.C.2.

The BRITISH OVERSEAS BANK

LIMITED

Incorporating FREDK. HUTH & Co.

THROUGH its world-wide connections and agencies the Bank is able to offer to its clients at home and abroad exceptional facilities in foreign exchange and in the financing of foreign trade, and also to provide up-to-date credit reports and information as to international business conditions. Correspondence invited.

33 GRACECHURCH STREET, Lombard Court, LONDON, E.C.3

TELEGRAPHIC ADDRESS

Inland: "SAESREVO, PHONE, LONDON" Foreign: "SAESREVO, LONDON"

TELEPHONE NO. MANSION HOUSE 7842

Trading Abroad

The existence of restrictions in a given country may temporarily prohibit dealings in Forward Exchange, but up-to-date information on this and on all points bearing on Forward Exchange generally may be obtained through any branch of the Westminster Bank. For any who may be unfamiliar with the facility, a very brief outline entitled *Forward Exchange* is always available at its counters

All descriptions of Banking and
Exchange Business TransactedCorrespondents in all
Parts of the WorldSTRUCTURAL CHANGES AND
BUSINESS CYCLES IN SOUTH
AFRICA, 1806-1936By C. G. W. SCHUMANN, B.Sc., D.Comm.,
Professor of Commerce, University of
Stellenbosch. 16s.

Bankers' Magazine: "This volume covers very thoroughly the economic history of South Africa over the last one hundred and thirty years. . . . The book is especially valuable as a study of the cyclical business movement in a country which in the latter part of the period covered has become the main source of the world's gold supplies."

EMPIRE TRADE: A Concise
Handbook to the Markets of
the British Empire.By W. H. WILLSON, B.Sc. (Econ.), with a
Foreword by the RIGHT HON. LORD
HIRST OF WITTON, President of the
Federation of British Industries. 10s. 6d.

A marketing and statistical survey of the trade of the British Empire. The book surveys the openings in each overseas Empire area for the manufactured products of Britain, and the market in the United Kingdom for primary products from overseas. Market data, marketing methods and documents required in export trade are presented in detail, and trade figures for each area are the latest available, obtained from official sources.

This book is a unique reference work for all engaged or interested in Empire markets and the commercial progress of each area.

BANKS IN EIRE

BANK OF IRELAND*

The governors and directors report that the net profits of the bank for the year ended December 31, 1937, after meeting all charges, and providing for bad and doubtful debts, interest due on deposits, rebate on bills not at maturity, pensions and other contingencies, amount to £390,749, to which must be added a sum of £100,970 brought forward from December, 1936, making a total of £491,719. Out of this total the proprietors declared an interim dividend of 6 per cent., less income tax, absorbing

£128,769. The governors and directors having transferred £75,000 to reserves for contingencies, now recommend that a final dividend of 7½ per cent., less income tax, be declared for the year ended December 31, 1937, which will absorb £160,961, making, together with the dividend paid on August 1, 1937, a distribution of 13½ per cent., less income tax, for the year, leaving a surplus of £126,988 to be carried forward.

THE HIBERNIAN BANK LIMITED

The directors' report shows that after providing for rebate on bills, interest on deposits, bad and doubtful debts and contingencies, the net profits for the half-year ended December 31, 1937, amount to £40,468, to which has to be added the balance of undivided profits from last account £29,882, making a total

of £70,350. The directors recommend that the balance be applied as follows: In payment of a dividend for the half-year at the rate of 12 per cent. per annum, subject to deduction of income tax, £30,000; in reduction of bank premises account, £2,500; to next account, £27,850.

MUNSTER AND LEINSTER BANK LIMITED

The directors' statement of the bank's affairs for the half-year ended December 31, 1937, shows that the profits, after deducting expenses, providing for interest on deposits, rebate on bills, and for all bad and doubtful debts, amount to £70,684, to which has to be added the balance from the last account

£43,655, making a total of £114,339. The directors recommend the payment of a dividend for the half-year at the rate of 12 per cent. per annum free of income tax £45,000, and after transferring to contingencies account £15,000, and applying in reduction of premises account £5,000, and placing to staff pension fund £5,000, there will remain to be carried to next account £44,339.

PROVINCIAL BANK OF IRELAND, LIMITED
The directors' statement for the half-year ending December 31, 1937, states that, including £36,472 brought forward from last account, there remains a profit of £74,559. Out of this the directors have declared a dividend for the half-year at the rate of 12½ per cent. per annum, less income tax, which will require £25,312. They have added to reserve fund £5,000, written off bank premises account £6,000, and carried forward £38,246.

THE ROYAL BANK OF IRELAND LIMITED

The directors have to report that the net profits of the bank for the year ended December 31, 1937, after making provision for bad and doubtful debts, amounted to £40,279, which, with the amount brought forward from last year of £11,600, make together £51,939. From this an interim dividend at the rate of 8 per cent. per annum (less tax) for the first six months of the year, has been distributed to the shareholders, £9,300, leaving

a balance of £42,639, out of which the board have appropriated to reserve fund, officers' superannuation, and other contingencies £20,000, leaving available a balance of £22,639, which they recommend should be appropriated as follows: A further dividend at the rate of 10 per cent. per annum (less tax) for the six months ended December 31 last, £11,625; the balance to be carried forward to the credit of next year's account, £11,014.

BANK OF BRITISH WEST AFRICA, LIMITED

The directors' statement of accounts for the year ended March 31, 1937, states that after providing for current charges (including contributions to the staff profit sharing fund and the provident fund), rebate on bills and appropriations to contingency accounts, out of which accounts provision has been made for all bad and doubtful debts, there remains a balance of profit for the year of £90,636. To this must be added £54,973 brought forward from last year, making a total amount available of £145,608.

Of this sum £24,000, being an interim dividend of 2 per cent., has already been distributed, less income tax, and the directors now recommend the payment of a final dividend of 3 per cent., absorbing a further sum of £36,000, less income tax, making a total distribution for the year of 5 per cent., less income tax. The directors also recommend a transfer of £30,000 to premises and furniture account, leaving a balance of £55,608 to be carried forward.

BANK OF AUSTRALASIA

The directors state that, after providing for rebate on bills current, for British, Australian and New Zealand rates and taxes, and making a transfer to the credit of Contingencies Account, out of which account provision for all bad and doubtful debts has been made, the net profit for the year ended October 11th last amounted to £309,501. To this has to be added £193,329 brought forward from the previous year's account, making a total of £502,830. From this, £129,938 was paid as an interim dividend

on October 1st last, and the directors have now appropriated a further sum of £167,062 to pay a final dividend of 4s. 6d. per share, less income tax at 3s. 6d. in the £, making, in all, £297,000, equal to 8s. per share, less tax, and representing for the year a distribution at the rate of 8 per cent., less tax. There will remain £205,830 to be carried forward to the next account.

BANK OF NEW SOUTH WALES

The directors submitted to the proprietors the following statement:—The net profits for the year, after deducting rebate on current bills, interest on deposits, and paying income, land and other taxes, reducing valuation of bank premises, providing for bad and doubtful debts, fluctuations in the value of investment securities, and other contingencies, and including recoveries from debts previously written off as bad, amount to £543,242, to which is added undivided balance from September 30, 1936, £129,500—£672,742; interim dividends

at the rate of 6s. per share (Australian currency) for quarters ended December 31, 1936, March 31, 1937, and June 30, 1937, paid out of the year's profits, in terms of Clause 105 of deed of settlement, £395,100, leaving a balance of £277,642, which the directors recommend to be dealt with as follows: To quarter's dividend to September 30, 1937, at the rate of 6s. per share Australian currency, £131,700; to balance carried forward, £145,942—£277,642.

BANK OF NEW ZEALAND

The directors state that the profits for the year ended March 31, 1937, after providing for expenses of management, and for all bad and doubtful debts, and other contingencies, and after making provision for the annual donation to the provident fund, are £600,008, to which has to be added balance brought forward from last year, £339,100, making a total of £939,108. From which has been paid: Dividend on preference A shares, £50,000; interim dividend on C long-term mortgage shares, £7,031; interim dividend on D long-term mortgage shares, £17,578; interim dividend on preference B shares, £31,250;

interim dividend on ordinary shares, £187,500, leaving available for distribution, £645,749. This the directors propose should be disposed of as follows: Dividend on C long-term mortgage shares at 6 per cent. per annum, £7,031; dividend on D long-term mortgage shares at 7½ per cent. per annum, £17,578; dividend on preference B shares (making £100,000 for the year), £68,750; dividend at rate of 5 per cent. on ordinary shares (making £375,000 for the year, equal to 10 per cent.), £187,500, leaving balance to be carried forward £364,890.

THE NATIONAL BANK OF NEW ZEALAND, LIMITED

The directors' statement of the bank's affairs as on March 31, 1937, states that the net profit for the year, after making full provision for bad and doubtful debts, exchange and other contingencies, amounts to £102,838, and to this amount has to be added £113,959 brought forward from the previous year, making an available total of £216,797. The interim dividend at the rate of 4 per cent. per annum, free of income tax, paid in January, 1936, absorbed £40,000, £14,000 has been placed to

pension and gratuity funds, and £10,000 has been transferred to premises account, leaving £152,797 available for distribution. The directors propose to allocate this amount as follows:—In payment of a dividend at the rate of 4 per cent. per annum for the half-year ended March 31, 1937, making 4 per cent. for the year, free of income tax, £40,000; balance to be carried forward, £112,797.

THE UNION BANK OF AUSTRALIA, LIMITED

The directors' report for the year ended August 31, 1937, shows that after making provision for bad and doubtful debts and other contingencies, there is a net profit for the year of £254,383, to which is added £146,864 brought forward, making £401,247. The interim dividend paid in July last of 3s. per cent. having absorbed £100,000, the amount now available is £301,247. From this the directors have made an appropriation of £20,000 to complete a Special Centenary Fund set aside to pro-

vide a bonus to shareholders and staff. From the balance the directors have declared a final dividend of 4 per cent., less income tax at 3s. 1d. in the £, making 7 per cent. for the year, less income tax. The final dividend will absorb £135,333, and leave £145,914 to be carried forward. The directors have also declared from the Special Centenary Fund a bonus to proprietors of 2 per cent., less income tax at 3s. 1d. in the £, and granted a bonus to the Staff of 7½ per cent. on their salaries.

THE EASTERN BANK, LIMITED

The directors state that the net profit to December 31, 1937, after providing for income tax and national defence contribution, and after appropriations to the credit of contingency account, out of which account full provision for bad and doubtful debts has been made, and including the balance brought forward from the last account, amounts to £201,191. An interim dividend at the rate of 3s. a share was paid

in September, absorbing £30,000, and the directors now recommend a final dividend of 4s. a share, less income tax at the rate of 3s. 6-64d. (after allowing for relief in respect of Dominion income tax). They propose to set aside £50,000 on account of contingencies, leaving a balance of £81,191 to be carried forward to the next account.

MERCANTILE BANK OF INDIA

The directors' report for the year ended December 31, 1937, shows that the balance of profit and loss account for the year amounts to £183,497, and the amount available, after adding £172,829 brought forward from last account, is £356,326. From this sum has to be deducted £63,000, being the interim dividend of 6 per cent., less income tax, on the "A," "B" and "C" shares paid in September last. The directors have added

£12,000 to the officers' pension fund, written £20,000 off freehold banking premises, and made an additional allocation of £25,000 to contingencies account. They now recommend a final dividend on the "A," "B" and "C" shares of 6 per cent., less income tax (making 12 per cent. for the year), leaving a balance of £173,326 to be carried forward.

P. & O. BANKING CORPORATION, LIMITED

The directors report that the net profits for the year ended March 31, 1937, after providing for taxation, bad and doubtful debts and valuing investments at or below market rates, amount to £102,481 which, with £56,014 brought forward from last year, gives an available balance for disposal of £158,495. The

directors have transferred £5,000 to the Officers' Pension Fund. Out of the balance of £153,495 they propose to pay a dividend of 5 per cent. less income tax, absorbing £100,524; carrying £52,971 to next account.

THE NATIONAL BANK OF INDIA, LIMITED

The directors' report for the year ended December 31, 1937, shows that the net profits, after providing for all bad and doubtful debts, amount to £465,862, and adding £243,955 brought forward from the previous year, the available total is £709,817. An *ad interim* dividend at the rate of 18 per cent. per

annum was paid on September 23rd last, absorbing £180,000, and the directors now recommend a further dividend at the same rate less income tax. They propose to add £50,000 to the staff pension funds and to write £50,000 off house property account, leaving a balance of £249,817 to be carried forward.

THE BANK OF ROUMANIA, LIMITED

The report for the year 1936 states that the balance of earnings in Roumania, namely, £11,739, cannot be remitted and has therefore been added to the provision for bad and doubtful accounts in Roumania. On the other hand, sterling expenses, covering London office, directors' fees and payments on account of the Bucharest branch exceed earnings by £3,459, which has been covered by a transfer from sterling reserve for doubtful debts, contingencies, etc.

BANQUE COMMERCIALE DU CONGO

The report of the board of directors for the year 1936-37 announces a net profit of Frs. 2,400,233, out of which a dividend of 8 per cent. free of tax, has been paid. Frs. 250,000 have been allotted to the reserve, and Frs. 13,345 are carried forward.

Owing to a change in the presentation of the balance sheet, the figures for 1935-36 and 1936-37, below, are only approximately comparable with those of previous years.

BANK OF NEW SOUTH WALES

ESTABLISHED 1817

The first bank in Australasia and the largest, the Bank of New South Wales offers a unique banking service to investors, traders and travellers. Over 860 branches are maintained throughout Australia, New Zealand and the Pacific Islands. At the main London Office, 29 Threadneedle Street, the Intelligence Department is fully equipped to provide information on economic and financial conditions in these countries. The branch at 47, Berkeley Square, W.1 advises travellers and makes arrangements for them.

AGGREGATE ASSETS, £123,145,000

(Incorporated in New South Wales with Limited Liability.)

BRITISH AND CONTINENTAL BANKING COMPANY LIMITED

The report of the directors for the year ended September 30, 1937, shows a net profit of £16,126, to which must be added the balance brought forward from last year £2,642, making an available total of £18,768. The directors propose to appropriate this balance as follows: Payment of a dividend of 5 per cent., free of tax, on December 31, 1937, £5,000; to be placed to an additional reserve account, £10,000; to be carried forward, £3,768—£18,768.

BRITISH OVERSEAS BANK, LIMITED

The directors' report states that the profit, after allowing rebate of interest and providing for all bad and doubtful debts (other than provided for out of contingencies account), for the year ended October 31, 1937, amounts to £52,454; balance available from last account, £69,147, making a total of £121,601, which has been appropriated as follows: To contingencies account, £50,000, leaving a balance to be carried forward to next year of £71,601. The directors do not recommend payment of a dividend on the "A" ordinary shares, as they consider it prudent to conserve the resources of the bank in view of the unsettled state of world affairs.

COMPTOIR NATIONAL D'ESCOMPTE DE PARIS

The report of the directors for the year ended December 31, 1936, shows that net profit, after the necessary reductions for expenses, taxes, and other charges, amounts to Frs. 34,818,957. A dividend was announced of Frs. 40 for each share, and Frs. 6.21 for each founders' share. This leaves Frs. 51,386, which increases the amount carried forward into the shareholders account to Frs. 6,566,757.

HAMBROS BANK, LIMITED

The directors' report for the year ending March 31, 1937, shows that after payment of all expenses, making provision for rebate on bills discounted, bad and doubtful debts, and income tax, the accounts show a profit of £325,726. Deducting the directors' remuneration of £15,078, and adding the balance brought forward from last year of £92,502, there remains an available total of £403,150. After transferring £150,000 to contingency reserve account and allowing the sum of £61,000 for interim dividend on the £10 shares and £9,150 for interim dividend on the £1 "A" shares paid on October 30, 1936, the directors now recommend the payment of a further dividend of 10 per cent., less income tax, on the £10 shares, making a total of 18 per cent. for the year, less income tax, and a further dividend of 3 per cent., less income tax, on the £1 "A" shares, making a total of 6 per cent. for the year, less income tax, and that the balance of £99,001 be carried forward.

THE HONGKONG AND SHANGHAI BANKING CORPORATION, LIMITED

The directors report that the net profits for the year ending December 31, 1937, together with \$3,340,790 balance brought forward from last account, after paying all charges, deducting interest paid and due, and making provision for bad and doubtful accounts and contingencies, amount to \$18,773,007. They recommend writing off bank premises account the sum of \$1,000,000. After deducting \$1,000,000 the interim dividend of £2 10s. per share, paid on August 9th last, viz.: £400,000 at 1s. 2½d.—\$6,564,103, and remuneration to directors, there remains for appropriation \$11,127,542, out of which the directors recommend the payment of a final dividend of £3 per share, viz.: £480,000 which, at 1s. 2½d., the rate of the day, will absorb \$7,744,538. The balance \$3,383,004 to be carried to new profit and loss account.

THE IMPERIAL BANK OF IRAN

The profits for the year ended March 20, 1937, after making provision for expenses of management, general charges in London and at chief office and branches, income tax, and bad and doubtful debts, amount to £77,430, to which has to be added £50,604 brought forward from last account, making a total of £128,034. The assets and liabilities of the branches in Iran have been converted at the rate of exchange of Rials 80½ per £ sterling, being the rate on March 20, 1937. The rate last year was Rials 80. The directors now recommend payment of a final dividend of 7s. per share, and a bonus of 2s. per share, making with the interim dividend of 4s. per share a total for the year of 13s., free of income tax. It is also proposed to add £10,000 to reserve, which is thereby increased to £750,000, and to carry forward £33,034.

THE NATIONAL BANK OF EGYPT

The report for the year ending December 31, 1937, shows the following statement: Gross profit for the year, after providing for depreciation on the bank's buildings and furniture, for rebate of discount, and for doubtful debts, amounts to £938,843. After deducting from this for directors' fees £17,797, and for current expenses £461,471, the remainder is divided between the statutory dividend of 4 per cent., amounting to £120,000, and an additional dividend of 11 per cent., amounting to £330,000. By adding the balance brought forward from last year, £229,870, there remains £239,445 to be carried forward.

SWISS BANK CORPORATION

After deduction of expenses and taxes, and making provision for bad and doubtful debts, etc., the net profit for the year ended December 31, 1937, amounts to S.Fcs. 8,275,272, which together with the amount carried forward from last year, viz., S.Fcs. 1,574,184, S.Fcs. 1,298,913, makes a total of S.Fcs. 9,574,185. The board propose to pay a dividend of 5 per cent. on the paid-up capital, which will absorb S.Fcs. 8,000,000, and to carry forward S.Fcs. 1,574,184.

THE NATIONAL ACCOUNTS 1937-38

THE result of the financial year ended March 31, 1938, is difficult to characterise by any single figure. The total of revenue (excluding self-balancing revenue) was £872,580,000. The total to be ascribed to expenditure depends, however, on whether the sinking fund, or expenditure on defence met out of loans, or both, is to be included. Omitting both items, the total expenditure was £833,250,000, giving a surplus of £39,330,000. Including only the sinking fund the total expenditure was £843,794,000, and the margin between this figure and the revenue—namely, £28,786,000—is, by the conventions of Treasury accounting, the official surplus. If all the defence expenditure is included, but sinking fund omitted, the total of expenditure is £898,117,000 and there is a deficit of £25,537,000. If defence expenditure and sinking fund are both included, the grand total of expenditure comes to £908,661,000 and the deficit to £36,081,000. It is possible to give still a fifth figure. When the Budget was introduced the Chancellor of the Exchequer expected to raise £863,100,000 in revenue, to spend (including borrowed defence expenditure) £942,848,000 and to provide nothing for debt redemption. Actually, he has received £9,480,000 more than he expected, spent £44,731,000 less and put £10,544,000 to debt redemption. He has therefore done £64,755,000 better than he expected. It is clear that the days when the year resulted in either a simple surplus or a simple deficit have gone. Indeed, of the five figures quoted above, the "official" figure is the one that seems to have least logic and consistency to support it.

The figures for the revenue are given below:—

	REVENUE, 1937-38 (£000's omitted)		
	Actual Receipts 1937-38	Larger (+) or Smaller (-) than Budget Estimate 1937-38	Actual Receipts 1936-37
Income tax	297,986	+ 9,836	+ 40,749
Sur-tax	57,060	- 940	+ 3,520
Estate, etc., duties	88,980	- 20	+ 990
Stamps	24,170	- 4,830	- 4,970
National Defence Contribution	1,420	- 580	+ 1,420
Other Inland Revenue	1,730	+ 230	...
Total Inland Revenue	471,346	+ 3,696	+ 41,709
Customs	221,561	+ 1,711	+ 10,279
Excise	113,700	+ 550	+ 4,200
Total Customs and Excise	335,261	+ 2,261	+ 14,479
Motor Vehicle Duties	34,608	+ 608	+ 1,881
Total Tax Revenue	841,215	+ 6,565	+ 58,069
Post Office (net receipt)	10,470	- 1,330	- 500
Post Office Fund	825	+ 825	+ 725
Crown Lands	1,330	- 20	- 20
Sundry Loans	5,230	+ 930	+ 680
Miscellaneous Receipts	13,510	+ 2,510	- 11,091
Total Ordinary Revenue	872,580	+ 9,480	+ 47,864

The healthy appearance of the total figure is very largely due to the excellent performance of the income tax, which

has exceeded the estimate by nearly £10 millions and last year's yield by over £40 millions. Customs and Excise also show small improvements on the estimates. The other main taxes, on the other hand, have been disappointing. Sur-tax has failed to yield the estimate; it is this persistent failure of sur-tax to emulate income tax which lends credibility to the stories of large-scale evasion. The yield from stamps is badly down, as was only to be expected.

The largest item in the shortfall of expenditure below the Budget estimate is in the Civil Services. A margin of £10 millions was left in the Budget for supplementaries, but in the event only £3,666,000 of this was required. There were also savings on many items, of which the largest was one of £8½ millions in the vote for the Unemployment Assistance Board. The National Debt, on the other hand, has required rather more than last year, and the margin left in the fixed debt charge was not quite large enough to meet the statutory sinking funds. The figures are given in the following table:—

	EXPENDITURE, 1937-38 (£000's omitted)		
	Actual Issues	Larger (+) or Smaller (-) than Budget Estimate 1937-38	Actual Issues 1936-37
Interest and Management of National Debt	216,233	- 7,767	+ 5,360
Payments to N. Ireland	8,887	+ 887	+ 891
Other Consolidated Fund Services	3,115	- 85	- 125
Post Office Fund	...	- 300	- 421
Total Consolidated Fund	228,235	- 7,265	+ 5,706
Army, Navy and Air Votes	197,250	- 1,018	+ 11,178
Civil and Revenue Votes (exc. Post Office)	407,765	- 21,315	+ 26,607
Total Supply Services (exc. Post Office)	605,015	- 22,333	+ 37,785
Total Ordinary Expenditure	833,250	- 29,598	+ 43,491
New Sinking Fund	10,544	+ 10,544	- 2,583
Total Expenditure	843,794	- 19,054	+ 40,908
Sums met out of Loans under Defence Loans Act	64,867	- 15,133	+ 64,867

SELF-BALANCING REVENUE AND EXPENDITURE (£000's omitted)

	Actual Revenue & Expenditure 1937-38	Larger (+) or Smaller (-) than Budget Estimate 1936-37
Post Office and Broadcasting	76,080	- 378

Expenditure on the defence forces fell £16,151,000 short of the estimated amount; but it was nevertheless £76,045,000 in excess of the amount spent in the previous year.

A difficult problem faces the Chancellor of the

cost of arms, and therefore called "National Defence Contribution." In its original form, the tax was of much complexity. It was payable on the growth of profits from an industry, trade or business (but not a profession or employment), calculated on the excess above one of two standards, at the taxpayer's option. The profits standard was the average of the three years 1933, 1934 and 1935; the capital standard was, for companies' profits 6 per cent. and for individuals 8 per cent., on capital—i.e. the assets employed in the business. Under each standard, N.D.C. was to be graduated in accordance with the rate of profits on capital. After much opposition, which extended likewise to modified proposals put forward in May, the final version was decided in June. The new N.D.C., to be levied for five years starting with accounting periods ending in the 1937-38 financial year, is a flat rate on profits: 5 per cent. for companies and 4 per cent. for unincorporated businesses. Professions and certain public utilities are exempt. Profits are calculated on income-tax principles, and N.D.C. (which will normally fall on the ordinary shareholders of a company) can be deducted before arriving at profits for income-tax purposes. Under both old and new versions, profits under £12,000 are allowed a graduated abatement, so that on £2,000 nothing is payable. In 1937-38, N.D.C. has yielded £1,420,000, against an estimate of £25 millions for a full year. The yield estimated in the 1937 Budget from the original N.D.C. was £2 millions in 1937-38 and £20 millions in a full year.

Death Duties.—These duties yielded their estimate of £89 millions in 1937-38, against Exchequer receipts in 1936-37 of £88 millions. In 1936-37, estate duty provided 88 per cent. of net receipts from all the death duties. The relationship between the number and size of estates, and the amount of tax they provide, is brought out in the accompanying table. It remains true that over 85 per cent. of all estates liable to duty have a net capital value of under £5,000, these same estates yielding, however, only around 4 per cent. of net receipts. But the number of all estates liable to estate duty in 1936-37 has risen by

† i.e. up to £500 gross value.

27 per cent. since 1928-29, and by 40 per cent. since 1924-25. Large estates of £1,000,000 and over contributed appreciably less of net receipt in 1936-37 than in 1935-36 (12.28 against 19.14 per cent.). Of the net capital value total in 1936-37, personalty (excluding leaseholds) accounted for 84 per cent. The gross capital value of all properties was £638.3 millions, of which 55.8 per cent. was in securities of various kinds, 12.7 per cent. in house property, etc., and 20.3 per cent. in cash, money lent, insurance policies, etc. Legacy duty of £9.5 millions was paid on a capital of £264.7 millions.

Stamp Duties.—In 1937-38 Exchequer receipts of £24.2 millions fell short of estimates by £4.8 millions owing to the large decline in Stock Exchange activity. The various sources of these duties are shown in the accompanying comparative table. In 1936-37, 35 per cent. of all

stamp duties came from stock and share transfers, while share, debenture and loan capital duty provided £1,854,000 between them, against £1,306,000 in 1935-36. As com-

STAMP DUTIES: NET RECEIPTS

	(£ thousands)

Total	9,648	24,244	25,805	28,976

pared with 1928-29, the proceeds of transfer duties in 1936-37 yielded 10 per cent. more, and capital duties 60 per cent. less—a drop not wholly accounted for by the halving of share capital duty in 1933-34.

Motor Vehicle Duties.—The Road Fund continues in being as the intermediary for subsidising road expenditure, but all receipts from motor vehicle duties are payable into the Exchequer (instead of a fixed share, up to and including 1936-37), and the Road Fund is financed from Votes under Class VI. The Exchequer no longer

 (£ millions)
(Years beginning April 1)

	1933	1934	1935	1936	Est. 1937
Motor vehicle duties, net receipts	30.7	31.5	30.8	32.7	34.6
Petrol and oil duties	40.4	42.3	45.1	47.8	50.3
Motor duties retained by Exchequer	5.2	5.1	9.5	10.5	12.1
Road Fund expenditure (Revenue Acc.)	21.0	20.0	20.9	22.9	27.0

receives a contribution from the Road Fund towards block grants under Class IX, and our estimate of expenditure in 1937-38 accordingly includes £6,500,000 from that Vote as well as issues direct to the Road Fund. In the accompanying table we show the course of total motor vehicle receipts in recent years, and bring in for comparison receipts from duties on fuel, and road fund expenditure on revenue account. The sums shown as retained by the Exchequer included not only the £5,000,000 or so "Exchequer share," but also the Road Fund's surpluses for 1934-35 and 1935-36 paid into Miscellaneous Receipts in 1935-36 and 1936-37.

Non-Tax Revenue.—This class of revenue consists of miscellaneous receipts (the largest item), Post Office net profits, receipts from sundry loans, and net revenue from Crown lands. In 1937-38 miscellaneous receipts of £13.5 millions exceeded the estimate of £11 millions, which had been put at no less than £13.6 millions below 1936-37 receipts, owing to the disappearance of certain non-recurring items, especially the £5 millions odd of Road Fund surplus. Details of such revenue in 1936-37 show that to the total of £24.6 millions, note issue profits contributed £985,000, Post Office Savings Bank surplus £3,937,000, while the Mint (in addition to its normal payment for 1935-36) handed over £1,500,000

* 1937-38 final, 1938-39 Budget estimate. † After addition of proportion of Defence Loans. ‡ Ordnance 1937-38 onwards.

Power was obtained to provide £400 millions from loans in the five years ended March, 1942, and estimates for 1937-38 and 1938-39 accordingly include £80 millions and £90 millions respectively from that source. The various services are paying interest (only) at 3 per cent. during the five years ended 1942, and thereafter enough to repay the principal in thirty years. Also any Budget surplus, instead of being used for debt redemption, is to be spent on defence and to count towards the £400 millions from loans. Thus estimates for 1938-39 for the respective services include interest.

NAVY.—Total expenditure in 1938-39 is estimated at £123.7 millions, or about double that in 1935-36, and 18 per cent. above 1937-38 estimates, and the net cost in 1938-39 will be £93.7 millions, or £15.6 millions more than in the previous year, after allowing for £3 millions more from loans. While allowance has as usual been made

† After adding proportion from Defence Loans.

ORDINARY expenditure in 1937-38 (including those sinking fund allocations falling within the fixed debt charge) was, at £841 millions, only £10.7 millions higher than in 1936-37, and was thus £11.8 millions below the Budget estimate. This unexpected result is due entirely to Civil votes. The Budget provided £10 millions for Civil supplementaries, but this was drawn upon to the extent of £3,666,000 only, and issues for the Civil and Revenue services of £407.8 millions were below original estimates, Budget provision, final estimates, and 1936-37 issues by £11,300,000, £21,300,000, £15,000,000 and £820,000 respectively. The most important saving was £8,500,000 on the Unemployment Assistance Board (as happened in 1936-37 also). Broad divisions of expenditure are compared in the accompanying table. While the increasing pressure of armaments expenditure is by now a commonplace, the trend of civil expenditure is also upwards. The year 1937-38 was exceptional in this respect, but extensive saving in 1938-39 is unlikely, the estimates for Class V apparently discounting variations in employment.

* Without provision for eventual Supplementary Estimates. † Excluding £90 millions from Consolidated Fund. ‡ Excluding sinking fund allocations falling outside the fixed debt charge (£224 millions in 1937-38). § Former Road Fund self-balancing expenditure transferred to Civil Services for comparison.

Consolidated Fund Services.—The Service of the National Debt (which is analysed in page 8 of this Supplement) accounts for over 95 per cent. of the £236 millions spent from the Consolidated Fund. In 1936-37 the total national debt service was again £224 millions, made up of £117.1 millions interest on funded debt and annuities, £92.7 millions interest on unfunded debt, £1.1 millions for management and expenses, and £10.2 millions for specific sinking funds, leaving £2.9 millions for general debt redemption. Civil List and other allowances and services absorbed £1,375,700, while issues for miscellaneous services were £1,864,000.

Defence Services.—Just over a year ago it was estimated that some £1,500 millions would be spent on the fighting services in five years, but it has now been stated that this figure is almost sure to be substantially exceeded. And although the cost of defence in 1938-39 is so far estimated at £343.2 millions (including £90 millions from loans), or over three times the expenditure in 1934-35, it is believed that the peak year will not be until 1939-40. But European events since the Estimates were published, and the resulting decision to intensify re-armament, make it practically certain that there will be heavy supplementary estimates in 1938-39. For 1937-38, however, the original provisions of £198.3 millions (excluding loans) were roughly adequate, and issues to the defence services from Votes were £197.3 millions, against £186 millions in 1936-37. While £100 millions of 2½ per cent. National Defence Bonds were issued in April, 1937, and the 1937-38 estimates required £80 millions from loans, only £64.9 millions of the proceeds were actually issued by the end of the year.

for underspending on contract work, the new estimates include nothing on account of the New Construction Programme for 1938, and a Supplementary estimate will have to be presented for the coming year's proportion. The accompanying table compares expenditure under various headings in recent years. For 1938-39 the shipbuilding programme estimates total expenditure on new construction at £34.8 millions, against an original estimate of £28.0 millions for 1937-38 (or a probable sum of £25.6 millions). The need for large repairs and modernisation of capital ships, and the increasing prices of materials are reflected in the rise from £16.1 millions for 1937-38 to £20.2 millions for 1938-39 in the estimated cost of the rest of the building programme.

ARMY.—Estimates for the army and the ordnance factories in 1938-39 require £86 millions from votes and £30 millions from loans, against 1937-38 estimates of £63.7 and £27 millions respectively. In 1938-39 the the army (only) requires in all £106.5 millions, including £21.1 millions from loans, an increase of £22.2 millions

from votes and £2.1 millions from loans as compared with 1937-38 estimates. Details are given in the accompanying table. Warlike stores alone (mostly guns, small arms and ammunition) call for £38.4 millions gross, against an estimate of £25 millions in 1937-38. Vote 10 (works, buildings and land) is assuming an increasing importance in view of the policy of improving living conditions in the army. The gross estimate for this vote is £13.9 against £10.1 millions.

					(82,500)†	(103,500)†

† After adding proportion from Defence Loans.

equally between the three services), it still costs the least in cash and the most in relation to the personnel. Estimates for 1938-39 require £73.5 millions from votes and £30 millions from loans, against £56.5 and £26 millions respectively in the 1937-38 estimates. If civil aviation be excluded, the amount from votes should be £70.6 against £54.6 millions. Details of expenditure appear in the accompanying table. The gross cost of aircraft and balloons is estimated at £42.7 millions, against £30.1 millions for aeroplanes and spares for 1937-38 under the old classification. This increase is largely attributable to payments maturing on long-term contracts already placed. Vote 4, for works and buildings, actually shows a decrease, owing to the completion of new factories.

Civil Estimates.—The 1938-39 Estimates for the Civil and Revenue Departments (excluding Post Office and broadcasting) and Roads require £439 millions, compared with Exchequer issues in 1937-38 of £407.8 millions, and a final estimate for that year of £422.7 millions. Of the increase over 1937-38 final estimates, however, air raid precautions account for £3,315,000, and, as explained later, apparently about £5,000,000 of the higher charge upon Votes for roads does not represent a real rise in expenditure. Supplementaries in 1937-38 were small, the

largest being £864,000 for land fertility improvement. In 1936-37 net expenditure (excluding roads) of £381.2 millions was £8.6 millions less than final estimates, owing largely to substantial saving on unemployment. The accompanying table analyses broadly the

actual or estimated cost of the Civil Departments in recent years, and the separate classes are discussed in more detail later under their respective heads.

CENTRAL GOVERNMENT (Classes I, II and III).—Expenditure in these classes of the estimates is compared in the accompanying table. In 1938-39 the Central Government Votes should cost less than in 1937-38, as, in spite of a rise from £350,000 to £450,000 for the Secret Service, the expenditure of £302,000 for the Coronation will not recur. Supplementaries in 1937-38 included a

† Including headquarters' expenses.

further £84,300 for M.P.s' salaries. Under Class II there is an increase in 1938-39 of £995,000, mainly due to £847,000 more for Colonial and Middle Eastern services, despite the reduced cost of defence in Palestine. Expenses incurred in Spain and to a lesser extent in China accounted for over £200,000 of Supplementaries for £285,000 in 1937-38. In the Home Department, A.R.P. services are now assuming an importance second only to that of the police. Of the 1938-39 gross total for A.R.P., £4,518,000 is for equipment and materials, £1,400,000 for grants to local authorities for A.R.P. (a new item) and £2,120,000 for emergency fire brigade services.

EDUCATION.—For 1938-39, total net estimates for Class IV are £65,487,000, but if broadcasting is excluded, requirements of £61,847,000 compare with a final estimate for 1937-38 of £60,096,000 (including a Supplementary of £177,000 for the new physical training services) and net expenditure in 1936-37 of £58,457,000. In recent years, however, average attendance in elementary schools has been slowly falling. For 1938 it has been estimated at 4,441,000; in 1934 it was 4,907,453. The number of pupils at secondary schools, on the other hand, has risen appreciably. Last year the attendance was 484,676, against 448,421 in 1934 and 377,540 in 1928. For 1938-39 the Class IV estimates include (for England and Wales only) £35.5 millions for elementary and £11.7 millions for higher education, £3.8 millions net for pensions and £2.3 millions for the universities, while £7.9 millions is needed

for public education in Scotland. Apart from sums included in the certain grants for schools and colleges, physical training and recreation will require £515,000 against £238,000. Some details of expenditure on education generally in England and Wales are given in the accom-

panying table. A large part of the increased total cost of elementary education in 1938-39, as against 1937-38, is due to special services and expenditure on reorganisation in preparation for raising the school-leaving age. Secondary education in 1936-37 cost £27 14s. per pupil, against £27 in the previous year and £12 10s. in 1912-13.

HEALTH, LABOUR AND INSURANCE (Class V).—In 1938-39 this important class will absorb 39 per cent. of Civil and Revenue Votes. Total net estimates will require £172.3 millions, against an original estimate of £170.2 millions for 1937-38. In that year, however, Supplementaries for £608,000 net were presented: £110,000 was wanted for special Coronation payments by the Unemployment Assistance Board, £301,000 for financial assistance to site companies and new factories in the Special Areas, and £197,000 owing to the larger number of old-age pensioners.

Expenditure under this class in recent years is shown below:—

(£ millions)	1933-34	1934-35	1935-36	1936-37	1937-38†	1938-39‡
Total, Class V ...	150.7	150.8	161.9	162.2	170.9	172.3
Pensions.....	52.4	54.8	57.2	59.2	61.6	64.7

† Final Estimate. ‡ Budget Estimate.

The small net increase in 1938-39 does not reflect some substantial changes within the Departments. Thus, old-age pensions will require £2,200,000 gross more, the automatic increase in contributory pensions involves £1,000,000, and £4,000,000 more is to be spent on the Special Areas. Payment to the Unemployment Assistance Fund, on the other hand, is estimated at £7,070,000 gross less than the 1937-38 estimate.

Health.—By far the greater part of Votes under this head is for housing, grants in the 1938-39 Estimates being for £17.7 against £17.3 millions gross. Grants in respect of the National Health Insurance Acts are to absorb a trifle more at £6,726,000. Apart from services actually rendered by the Ministry, and payments under the health insurance Acts, direct expenditure for health purposes continues to be quite small, though provision is made for physical training under the Education Votes.

Labour and Pensions.—While the cost to the Exchequer of unemployment insurance does not fluctuate greatly (it is estimated at £22.8 millions gross in 1938-39, against £21.9 millions in 1937-38), unemployment assistance varies widely with the state of trade. A small rise in unemployment seems to be foreshadowed in the 1938-39 contribution of £42.5 millions to the Unemployment Assistance Fund, as it exceeds by £7.1 millions the 1937-38 estimates, which are now known to have been

about £8½ millions too large. The gross cost of administration by the Ministry of Labour in 1938-39 is estimated at £6,297,000, of which £3,855,000 and £2,087,000 will be recoverable from the Unemployment Fund and the Unemployment Assistance Fund respectively, it being estimated that in 1938-39 some £39 millions will be paid out at the Labour Exchanges in benefit and some £39.2 millions in unemployment allowances.

Measures to stimulate employment (as distinct from the cost of unemployment as shown and defined in our table analysing the Civil Estimates) are, however, becoming increasingly important, the Special Areas Fund, for instance, receiving £7,500,000 in 1938-39 against £3,500,000 in the previous year, while employment schemes will receive a trifle less at £3,520,000. The net estimates for Class V in 1938-39 include some £80.6 millions for "labour," after adding in all such kinds of ancillary expenditure.

Though it is normal for the cost of old-age pensions to rise, the increase of £2,200,000 to £47,700,000 for 1938-39 is larger than in recent years, while the original estimate for 1937-38 did not prove quite sufficient. Contributory pensions are to receive £17 millions, the Exchequer share rising automatically by £1,000,000 each year.

TRADE, INDUSTRY AND TRANSPORT (Class VI).—Estimates for 1938-39 amount to £40,646,000, against final and original estimates for 1937-38 of £33,166,000 and £31,383,000 respectively. The Supplementaries were larger for this than for any other Civil class in 1937-38, the total of £1,783,000 including £864,000 for the new service for land fertility improvement, £208,000 to the Milk Marketing Boards' campaign to increase the demand for milk, and £334,000 in respect of foot-and-mouth disease. In 1938-39 roads will cost £22 millions, against £15.5 millions estimated for 1937-38, but the latter year's grant was based on the assumption that the year would start with a balance of £5 millions in the Road Fund, so that the increase in expenditure by the Fund seems to be only about £1,500,000. But total grants under Class IX are practically the same in 1938-39 as in 1937-38, so it appears that some £6,500,000 for roads will again be provided from that source, making Exchequer and Road Fund expenditure on roads £28.5 millions, say, in all in 1938-39. The Ministry of Agriculture will cost £3,444,000 net, while the Beet Sugar subsidy and the livestock industry are estimated to require £2,550,000 and £4,575,000 (against £2,250,000 and £4,732,000) respectively. A new item is £203,000 for the oats and barley subsidy in the United Kingdom.

WORKS, STATIONERY, ETC. (Class VII).—Estimates for this Class in 1938-39 amount to £11,692,000, against an original estimate of £9,899,000 in 1937-38 and actual expenditure of £9,360,000 in 1936-37. In 1937-38, however, Supplementaries estimates for a total of £558,000 were presented, chiefly for various minor purposes.

PENSIONS (Class VIII).—This class comprises besides war pensions (including merchant seamen's) some £3½ millions annually for Royal Irish Constabulary pensions and sundry superannuation allowances. The whole Class will cost £43.1 millions in 1938-39, against an estimate of £43.9 millions in 1937-38, and actual expenditure in 1936-37 of £45 millions. The gradual drop in war pensions roughly offsets the increase in widows, etc., contributory pensions under Class V.

CONTRIBUTIONS TO LOCAL REVENUES (Class IX).—Exchequer contributions under the Local Government Acts will absorb £54,248,000 in 1938-39, against an estimate of £54,392,000 in 1937-38 and actual expenditure in 1936-37 of £45,192,000. Since 1936-37, however, grants have been continued which formerly were reimbursed by the Road Fund.

Revenue Departments.—The cost of the Revenue departments (other than the Post Office) continues to rise slowly: details are given in the accompanying table.

REVENUE DEPARTMENTS (£ thousands)

	1913-14	1935-36	1936-37	1937-38 Est.	1938-39 Est.
Customs and Excise	2,431	5,628	5,792	5,973	6,065
Inland Revenue	2,052	7,500	7,611	7,923	8,220
Total	4,483	13,128	13,403	13,896	14,285

Expenditure in 1936-37, however, was slightly below estimate. Details for 1936-37 show that the cost of collection was 1.85 per cent. of gross sums collected, against 1.93 per cent. in 1935-36.

POST OFFICE AND BROADCASTING.—In and after 1937-38 broadcasting belongs nominally to Class IV (Education), but for comparative purposes is referred to here. The Finance Accounts show that hitherto the gross proceeds of wireless licence sales (£4,041,000 in 1936-37) were paid into the Exchequer as telegraph receipts, so that "Post Office net receipt" in the weekly revenue returns included the Government's share of these sales (£705,000 in 1936-37). Theoretically self-balancing, the Post Office nevertheless hands over about one-eighth of its takings, a fixed annual contribution of £10,750,000 being due to the Exchequer. The Post Office gives up all its net surplus (total receipts less expenditure and net wireless receipts, subject to adjustment for work done by and for other departments), the fixed contribution being made up by payments to or by the Post Office Fund, whose assets in March, 1937, were £3,842,000.

Post Office and broadcasting are estimated to cost £80,442,000 in 1938-39, against issues of £76,080,000 in 1937-38, and expenditure of £71,866,000 in 1936-37. Of

these sums, payments to the B.B.C. require £3,640,000 in 1938-39, against a final estimate of £3,230,000 for 1937-38 and issues of £2,939,000 in 1936-37. In 1937-38 a Supplementary Vote of £900,000 was required for Post Office purposes and £360,000 for broadcasting, largely for television and foreign broadcasts. The past year saw no important changes in rates, but there has been considerable development of air mail services. Improvement and expansion of the telephone service has also continued.

The Commercial Accounts for 1936-37 show operating income on general account (excluding broadcasting) of £84,140,000, to which postal business contributed £44,080,000, telegraphs £3,257,000, telephones £30,389,000 and remuneration for services for other departments £4,149,000. This was an increase of £4,087,000, thus revealing a similar rate of progress to that of 1935-36. Operating expenditure was £66,375,000, including £35,001,000 wages, etc., to the non-industrial staff and £7,984,000 for plant depreciation, but excluding £5,942,000 interest on capital. The year's surplus (after charging interest and bringing in non-operating receipts) was slightly lower at £12,307,000. Letter traffic expanded satisfactorily, while parcel revenue recovered from the decline following the rate reduction of 1935, but owing to increased expenses, the telephone surplus was £654,000 lower at £1,472,000, although operating income was £2,004,000 higher. The development of the telephone service is illustrated also by capital expenditure, which amounted to £13,598,000, against £10,477,000 in 1935-36 and £7,653,000 in 1934-35. Capital is provided from the Consolidated Fund (issues in 1937-38 were £16,950,000) and is repaid by annuities from the Post Office Vote, which includes £12,358,000 for this purpose in 1938-39.

THE NATIONAL DEBT

AFTER its great fall at the period of the conversion of War Loan, the annual cost of interest on and management of the National Debt has recently started to rise again. The requirement in the year just ended was £216.2 millions, which was £5.4 millions more than in 1936-37, when the figure was the lowest for recent years. This increase is only partly to be explained by the new policy of borrowing for re-armament, as the nominal amount of National Defence Bonds issued during the year was only £100 millions. Moreover, the amount actually spent out of this loan was only £64.9 millions, and even that total was only reached in the last days of the financial year, so that the money raised by the National Defence Bonds was available for the greater part of the year to reduce the floating debt. The total of the floating debt, however, was higher for the greater part of the year owing to the increase in the total of the Exchange Equalisation Account by a further sum of £200 millions. Defence borrowing will, of course, become more important in the coming year, and it is clear that the lowest point of debt expenditure has been passed.

Apart from the two transactions mentioned above—the issue of £100 millions of National Defence Bonds and the issue of a further £200 millions to the Exchange Equalisation Account—the year 1937-38 was comparatively uneventful so far as the National Debt was concerned. In the remainder of this section, the historical review has to end at March 31, 1937, in the absence of detailed figures for the latest year.

Nominal Value.—The accompanying table divides the Debt into internal and external debt, and subdivides the former into categories according to dates of maturity. Funded debt includes all loans with no redemption dates or callable at the Treasury's option only. Unfunded debt comprises all loans with definite dates of maturity, and the subdivision of Floating Debt includes liabilities falling due within a few months. The year 1922-23, when the post-war peak was reached, is retained for comparison.

It will be noticed that the changes in the year 1936-37

were comparatively small. Floating debt was reduced by £84.1 millions and the remainder of the unfunded debt increased by £89.7 millions. This was accomplished, in the main, by issues of 2½ per cent. and 2¾ per cent. Funding Loan and by the reduction, on maturity, of the total of Treasury Bonds.

NOMINAL VALUE OF NATIONAL DEBT AT MARCH 31ST (£ MILLIONS)

	1923	1934	1935	1936	1937
INTERNAL DEBT					
Funded Debt:—

* 2½% Consols, 2½ and 2½% Annuities, and Debts to Banks.

† Includes National Savings Bonds

The table, however, does not give a completely accurate picture of the position of the National Debt. On the one hand, it takes no account of the assets acquired against the debt; and on the other hand it omits the interest accrued on Savings Certificates. The table also omits certain other liabilities of the State, such as loans contracted under various Telegraph Acts, Public Offices Acts, etc.; but since there are physical assets against these liabilities, they may properly be omitted from a calculation of deadweight debt. The same remark applies to the contingent liabilities of the State. The external debt poses a difficult problem. This all arises from the Great War and interest is not actually being paid upon more than 0.01 per cent. of the nominal amount. If it is to stand in the accounts as a liability, the equally moribund claims of the British Government on other countries, amounting in the aggregate to a much larger sum, ought to be offset against the total. It would seem more realistic, at least for recent years, to ignore both liabilities and claims.

In the following table an attempt is made to arrive at a figure of the net indebtedness of the State. External liabilities and claims are ignored, as are the "other liabilities" mentioned in the preceding paragraph.

NET INDEBTEDNESS OF THE STATE

	(£ millions)	Mar. 31, 1934	Mar. 31, 1935	Mar. 31, 1936	Mar. 31, 1937
Net total deadweight (as above)	7,822.3	7,800.4	7,795.8	7,797.2	7,797.2
Deduct External debt	1,036.5	1,036.5	1,036.5	1,032.6	1,032.6
	6,785.8	6,763.9	6,759.3	6,764.6	6,764.6
Add accrued interest on saving certificates	98.5	107.3	116.3	124.0	124.0
	6,884.3	6,871.2	6,875.6	6,888.6	6,888.6
Deduct estimated assets	620.7	517.1	510.1	499.7	499.7
	6,263.6	6,354.1	6,365.5	6,388.9	6,388.9
Deduct Exchequer balances	2.6	2.5	2.7	2.7	2.7
Net total	6,261.0	6,351.6	6,362.8	6,386.2	6,386.2

Even this does not give a complete picture, for there are various assets held by Public Departments and funds under the control of the Treasury. The "estimated assets" shown in the table include only financial assets. The largest items on March 31, 1937, were the Exchange Equalisation Account, £375 millions, and the estimated market value of the Government's holding of Suez Canal shares, £78.6 millions.

Changes in the National Debt, 1937-38.—The chief changes in the National Debt in the past year were as follows:—

	(000's omitted)		(000's omitted)
Receipts	£	Issues	£
2½% National Defence Bonds, 1944-48	99,660	National Savings Certificates (net decrease)	4,300
Sums raised under the Post Office and Telegraph (Money) Acts	16,950	National Savings Bds. paid off	409
Treasury Bills (net increase)	154,048	Other debt redeemed	93
Temporary Advance repaid	300	Ways and Means Advances (net decrease)	10,440
Other repayments	1,696	Temporary advance	300
Exchequer balances decreased	336	Issues under the Post Office and Telegraph (Money) Acts	16,950
	272,990	Issues under the North Atlantic Shipping Act	500
Surplus	28,787	Issues under the Tithe Act	3,867
		Issues under the Exchange Equalisation Account Act	200,000
		Issues under the Defence Loans Act	64,867
		Issues to National Debt Commissioners	40
		Old Sinking Fund	11
	301,777		301,777

FLOATING DEBT
(000's omitted)

	Mar. 31, 1937	Mar. 31, 1938	Change
Ways and Means Advances outstanding:—			
By Bank of England	Nil	Nil	...
By Public Departments	23,535	13,095	— 10,440
Treasury Bills Outstanding	674,595*	828,660*	+ 154,065

Total Floating Debt Outstanding 698,130 841,755 + 143,625

* Includes £49,000 in 1937 and £66,000 in 1938, the proceeds of which were not carried to the Exchequer during the period of the account.

The list of issues under various Acts is lengthening year by year. All these are formally repayable. Even the issues under the Defence Loans Act will be repaid out of Supply Votes. But some of these sums in past years, especially the advances for various agricultural purposes, have proved to be merely disguised current expenditure.

The increase in the floating debt over the year is more than fully accounted for by the issue of £200 millions to the Exchange Equalisation Account. But for this there would have been a reduction over the year of £56,375,000. The balance of the cash raised by the issue of National Defence Bonds and not spent in the year is £34,793,000.

The Debt Charge.—In his Budget of 1928 Mr Churchill introduced the principle of a fixed debt charge which should include both interest and sinking funds. This charge he put at £355 millions. In the second Budget of 1931 this principle was abandoned and separate provision was made for interest and sinking funds. For the last five years no provision has been made in the Budget for sinking funds, but in fact the sum provided for interest and management has in every year been sufficiently in excess of the actual requirement to provide a margin for debt reduction. The reduction of the Budgetary provision for the Debt from £355 to £224 millions, however, is not entirely due to the omission of a sinking fund. Over £50 millions of the reduction is due to the fall in the interest charge, which is shown in the accompanying table.

NATIONAL DEBT INTEREST (£ millions)

	Treasury Bills	Savings Certificates	Total of (1) & (2)	Other Interest Charges	Management and Expenses	Total Interest, Management, etc. (3) to (6)
1931-32	(1) 20.7	(2) 15.3†	(3) 36.0†	(4) 251.6	(5) 1.9	(6) 289.5†
1932-33	5.9	15.0†	20.9†	259.2	2.1	282.2†
1933-34	4.1	11.1	15.2	230.0	1.1	216.3
1934-35	3.5	9.0	12.5	198.1	1.0	211.7
1935-36	3.5	8.9	12.4	198.1	1.0	211.5
1936-37	3.8	9.4	13.2	196.6	1.1	210.9

† In 1931-32 these figures were exclusive of £8,430,922 and in 1932-33 of £2,655,995, paid as interest on Savings Certificates in excess of provision in the Permanent Debt Charge.

The total charge in 1937-38 was £216.2 millions.

Debt Redemption.—The composition of the nominal sinking fund during the six years 1931-37 is shown in the following table:—

	(000's omitted)	1931-32	1932-33	1933-34	1934-35	1935-36	1936-37
Specific Sinking Funds							
Principal of Terminable Annuities	£ 932	£ 909	£ 920	£ 928	£ 922	£ 933	
Sinking Fund for—							
3½% Conversion Loan	15,302	7,503	...	...	...	...	
4½% Consolidated Loan	10,000	2,310	...	...	...	...	
4% Funding Loan	3,451	3,581	3,726	3,868	4,002	4,141	
3% Funding Loan	...	...	...	1,135	1,639	1,688	
4% Victory Bonds	2,823	2,936	3,053	3,175	3,302	3,434	
U.S.A. Government Loan	...	9,091*	...	...	...	...	
Total of above	32,508	26,330	7,699	9,106	9,865	10,196	
Balance	...	...	51	3,237	2,601	2,931†	
Nominal Sinking Fund	32,508	26,330	7,750	12,343	12,466	13,127	

* This represents proportion of total payment made on December 15, 1932, which would normally count as repayment of capital, although the right was reserved to treat the whole sum on this occasion as a capital payment.

† This balance was issued to the National Debt Commissioners and used to purchase and cancel £2,931,162 of 4½ per cent. Conversion Loan.

The total of the sinking fund, however, does not necessarily indicate the actual debt redemption in any year. Budget surpluses or deficits have to be added or subtracted, as the case may be, and in addition there are borrowings

many definitions, and even when precisely defined is subject to a margin of error in estimation. The estimates in the table, however, are all based on the same assumptions. Their proportionate variations should therefore be considerably more precisely reliable than their absolute amounts. It should be added that each of the earlier periods, except 1911-13, included the whole of a trade cycle.

Period*	National Income†	Total Expenditure†			National Debt‡		Defence		All Other

* Including Road Fund expenditure, but not Post Office. † Figures of National Income refer to calendar years, figures of expenditure to financial years ended March 31st of following calendar year. ‡ Annual average. † Estimate. ‡ Figures are taken from "National Income and Outlay," by Colin Clark (Macmillan, 1937), pages 88, 90 and 232; they represent net National Income, as defined by Mr. Clark. The figures for 1936, 1937 and 1938 are tentative estimates for which Mr. Clark is not responsible; the 1938 figure in particular is necessarily no more than a guess. ‡ Inc. Sinking Fund.

The last line of the table is necessarily even more approximate than the rest. Not only are the figures of expenditure those of the Estimates, which may prove to be very wide of the mark, but it is also more than usually difficult this year to forecast, even within a wide margin of error, the probable national income of the year, since it is not yet possible to say by how much the trend of recovery has been affected. The figures do, however, suggest that, even including the whole expenditure on re-armament, the total expenditure of the State is not as large as it has been in at least one previous year. On the other hand, it has now virtually returned to the crisis level of 1931-32. And if, as is not impossible, we are to have in the next few years both steadily rising expenditure and some fall in the national income, the position will rapidly become very difficult. We have no previous experience, save only in war-time, of raising more than one-fifth of the whole national income, either by taxation or by borrowing, for the purposes of the State. Borrowing is at best a temporary expedient, which cannot do more than postpone the real burden. Moreover, even borrowing, if it becomes so large as to disturb general confidence in the solvency of the Treasury, may have the effect of complicating rather than easing the problem of the Chancellor of the Exchequer. It is important, however, to notice that if the National Debt and Defence expenditure be taken together they still require in combination a smaller proportion of the national income than they did in 1924, and an only slightly larger proportion than in 1929 or 1932. Since much the largest part of the National Debt was incurred in past wars, it is still possible to say that the cost of human bellicosity, past and future, is not yet imposing a substantially larger burden on the community than in the immediate post-War years. It is disturbing, however, to notice that the proportion of the national income required for all expenditure other than the Debt and Defence Forces is substantially larger now than it was in the last roughly comparable period of prosperity. In 1924 these Services required 6.8 per cent. of the national income, and an almost exactly similar proportion in 1929. By 1938, however, the proportion has risen to over 9 per cent. If there is to be a trade recession it is certain that this proportion will rise, for unemployment expenditure will increase while the national income will fall. It is thus possible to argue that the uncomfortable position in which the Treasury is facing the possible onset of another trade cycle is due at least as much to the uncontrolled increase of peace-time services as to the combined cost of past and future wars.

Whatever the cause of the great growth in expenditure, however, it is quite apparent that it has now reached the most serious dimensions. This does not mean that it will now be arrested. Even apart from the unpredictable element

of defence expenditure, there are many other items which can be relied upon to go on increasing. Unemployment has already been mentioned. But in addition there are contractual liabilities for old age pensions, which are certain to rise, and there is steady pressure for similar increases in other social services. Our position to-day is fundamentally different from that of the last century, when a steady and rapid increase in tax revenue could be relied upon, as a result of the mere expansion of the community. To-day we are at the end of our increase in population, and any further rise in the national income will have to come from the necessarily slow increase in average productivity.

It would therefore be a mistake to lull ourselves into security with the belief that with the eventual reduction of defence expenditure, which we may still hope to be granted some time, our budgetary problems would come to an end. We may well wake up one day to discover that what we thought to be the temporary emergency of re-armament has been covering a much more deep-seated problem. That problem is either to cut down the scale of State expenditure to which the community has grown accustomed or alternatively to discover new sources of tax revenue.

The search for new sources of revenue is not made any easier by the contemplation of the present position, which is shown in broad outline in the following table:—

TAX REVENUE, 1929-30 to 1937-38
(£ millions)

	1929-30	1931-32	1934-35	1935-36	1936-37	1937-38
Inland Revenue:						
Income Tax	238	288	229	238	257	298
Sur-tax	57	77	51	51	54	57
Death Duties	79	65	81	88	88	89
Stamps	25	17	24	26	29	24
Other Inland Revenue	3	3	3	2	2	3
Total Inland Revenue	402	450	388	405	430	471
Customs and Excise:						
Customs	120	136	185	197	211	222
Excise	128	120	105	107	110	114
Total	248	256	290	303	321	335
Of these:						
Sugar	14	16	12	12	12	12*
Tobacco	63	63	71	75	77	80*
Alcohol	124	113	96	101	104	108*
Entertainment	7	8	10	8	8	10*

All other duties	25	27	61	62	71	63*
Motor Vehicle Duties	27	27	32	31	33	35
Total tax revenue	677	733	710	739	784	841

* Budget estimate.

It is probable that there will be a further "natural" increase in the yield of income tax in 1938-39, but this should mark the end of the rising cycle, and we may expect declines after that unless there is an increase in the standard rate. Sur-tax is still well below its crisis yield, which suggests either a substantial amount of evasion or a condition of diminishing return, or perhaps an element of both. The figures for income tax and sur-tax taken together do not encourage the hope that there is a substantial new source of revenue to be found in direct taxation. The rates of death duties have not been altered sufficiently in recent years for an opinion to be possible on the probable revenue from a further turn of the screw in this direction, but it is possible that there might be some revenue for the Chancellor there. Indirect taxation is already heavy, but the average level of popular consumption in recent years has been so high that further burdens can undoubtedly be carried; but there would be difficult questions both of equity and of incidence to be weighed before any far-reaching increase in indirect taxation could be secured.

In short, we are already a very heavily taxed nation, and if at the height of the trade cycle there is no margin of revenue over expenditure the fiscal problem becomes almost insoluble. Defence borrowing, and other expedients that are open to a resourceful Chancellor of the Exchequer (such as the revaluation of the national gold stock), may give us a brief breathing space. But it is vitally important that realistic and unremitting thought should be given to the problem of permanently reducing the State's expenditure, or, alternatively, of discovering methods by which more than one-fifth of the whole national income can be diverted into the Treasury's coffers.

THE ECONOMIST BUILDING SOCIETIES

SATURDAY, APRIL 23, 1938

ABBEX ROAD BUILDING SOCIETY

LONDON'S LARGEST BUILDING SOCIETY

During sixty-three years the confidence of a discerning and growing membership has built up a great Building Society with resources exceeding fifty million pounds sterling.

Thus, since the War alone, over 100,000 families have been enabled to enjoy the benefits of owning their own homes throughout the length and breadth of Great Britain.

248,000 members dwelling all over the World have entrusted the Society with their savings, for which they receive a fair and equitable rate of interest paid free of liability to Income Tax.

That the Society enjoys a unique measure of public confidence is evidenced in the fact that for some years it has not been necessary to advertise its investment facilities.

Despite rapid expansion during the post-war years, the policy of the Society has remained unchanged—sound finance, and liberality of mortgage terms consistent with safety.

Its traditions are courtesy, efficiency and speed of service. These are the surest guarantees of mutual goodwill.

ABBEX ROAD BUILDING SOCIETY

Sir Harold Bellman : Managing Director

ABBEX HOUSE, BAKER STREET, N.W.1.

The Progress of a Great Financial Institution

Year by year, million by million, the assets of the Woolwich Equitable Building Society increase. Year by year these assets are wisely employed, helping thousands of people to the privileges of home ownership and earning interest for the shareholders.

The balance sheets and accounts of the Society show a healthy relationship between new capital received and mortgage advances to borrowers, while the reserve funds of the Society steadily increase as the Society's prosperity and income continue to grow.

Extracts from the Society's Balance Sheets:—

Year Ended	Share Capital	Advances	Total Assets	Reserve Funds
30th September, 1933	£18,059,543	£3,912,805	£23,714,191	£935,000
30th September, 1934	£20,003,823	£6,403,957	£27,094,596	£1,040,000
30th September, 1935	£21,633,676	£7,158,855	£30,112,549	£1,200,000
30th September, 1936	£23,937,635	£7,462,762	£33,923,432	£1,400,000
30th September, 1937	£25,962,833	£7,193,634	£37,216,067	£1,600,000

WOOLWICH EQUITABLE BUILDING SOCIETY

Building Societies To-day

ON April 11, 1936, *The Economist* published a full-length survey covering many aspects of the building society movement. The two years which have since elapsed have been an eventful period in the movement's history. Indeed, their passage finds the societies, in no exaggerated sense, at a decisive stage in their growth. Those who would attempt to forecast the movement's future must first be prepared to search out the lessons of the past. Their next task will be to assess the scope for further growth in building society business after the greatest building boom of this century. In essence, the inquiry involves two main questions. What is the financial position of the movement to-day? Will it be able to maintain that position in the future?

In the following pages we have attempted to provide an answer to these main questions and the various ancillary problems which they involve. We have, in the first place, brought our statistical analysis of the leading societies up to date, thus providing the first comprehensive indication of the trend of business recorded by the movement last year. The financial growth of 110 of the largest societies since 1925 may be traced in tables on pages 10 and 11. For as many as 99 of these societies we have extracted comparable totals, under some 37 headings, for each of the years 1925, 1929 and from 1932 to 1937. These figures are presented in a synoptic table on page 5, and form the basis for the smaller analytical tables accompanying the discussions on particular aspects of building society finance. These articles occupy the first section of this survey, and form the sequel to the historical review of the movement which was given in the first six sections of our previous supplement.

It has seemed convenient, in the second place, to relate the conclusions which emerge from this examination of the position of the leading societies to-day to certain problems which, sooner or later, the movement may have to consider. We have accordingly invited three closely-informed correspondents to discuss certain more technical

matters, such as the operation of the builder's pool system, the extension of mortgage facilities to cover a wider range of property, and the responsibility of the movement for building standards. Their comments present a personal, but none the less authoritative, view. Further, we have suggested a rather wider horizon for the consideration of the movement in two articles on the future demand for housing and the related problems of housing and industrial location.

So much for the general outline of the present survey. If the past two years have been eventful, they have certainly not been without their difficulties. Official figures published by the Registrar of Friendly Societies up to 1936 suggested no check to the remarkable growth of the movement, which formed the text of our historical discussion in the previous survey. The main figures are summarised in the following table:—

	No. of Societies	Total Assets	Mortgage Assets	Shares	Deposits
1925	1,092	169.2	145.9	127.8	27.3
1929	1,026	312.7	268.1	250.2	38.9
1932	1,014	469.3	388.4	380.9	61.5
1933	1,013	501.1	423.5	395.5	95.5
1934	1,007	555.6	476.2	424.3	97.3
1935	999	602.0	529.7	447.2	114.8
1936	985	656.1	586.5	480.6	128.4

These figures are presented graphically on the chart above, which includes an estimate, based on our examination of the reports of 99 leading societies, covering the year 1937. The size of the building societies' resources, like the growth in electric power output, is one of the most striking illustrations of regular and, so far, unchecked growth.

Yet the latest reports show an aggregate decline in new mortgage advance business in 1937, for the first time since 1932. New advances made in 1936, officially computed at £140,293,312, may prove to be the peak of the society's

achievement, at least in this housing cycle, when the complete figures for 1937 are available. Our own computations suggest that new business declined by some 3½ per cent. last year. And the level of house building activity, which is closely associated with the demand for building society accommodation, has shown a significant further decline in recent months. This is a broad economic movement which the societies, by themselves, can do little to modify. But its potential repercussions on advance business in the future, as we show on later pages, are very considerable.

For the societies' part, the year of peak advances—if we may so label 1936—produced fruits which were bitter as well as sweet. During the two preceding years the leaders of the movement had worked towards the introduction of a code of business practice which, it was hoped, would secure general and voluntary acceptance by all societies. It was designed to cover all aspects of lending policy, whose terms, particularly since the introduction of the builders' pool, had tended to become more elastic and competitive. Voluntary agreement in such a contentious field was bound to be difficult, but at the beginning of 1936 it appeared that two years' work was nearing success. That promise, however, was not realised; for despite the general support for a policy of co-operation, in principle, a section of the movement found itself unable to agree to the new code when its introduction was proposed. In June, 1936, it became necessary to take the extreme step of dissolving the National Association of Building

Societies; out of its ashes arose the Building Societies Association, consisting of 210 societies which controlled assets of the order of £475 millions, and which were agreed on the necessity for the introduction of the new code of practice. A number of the dissenting societies at the same time formed the National Federation of Building Societies, whose members were responsible for the administration of total assets of the order of £50 millions.

Such a division of the movement's ranks, in the circumstances of to-day, is obviously unfortunate. Doubtless, any regulation of business practice was bound to be experimental in the first place; in fact the members of the Association itself have in recent weeks been considering certain revised terms of co-operation. But such revision would have been facilitated by a greater feeling of common purpose within the whole movement. Again, there are matters involving legislation or jurisdiction on which the movement ought to speak with one voice. The episode arising from the introduction of N.D.C. last year is a case in point. The whole movement, again, is vitally interested in the problem of war risks insurance. More recently, certain litigation, which is at present *sub judice*, has thrown up the problem of the societies' statutory lending powers, and has challenged, in particular, the practice of accepting certain forms of collateral security in mortgage business. And, finally, the adaptation of policy to current economic trends itself demands consideration in a cosmic, rather than parochial, spirit.

Building Society Finance Since 1925

In our earlier supplement, we examined the financial progress of 110 building societies since 1925. On pages 10 and 11, we have brought these results up to date for the same societies, by the inclusion of their figures for 1936 and 1937. It will be seen that our table records, for each society, the growth in total assets and mortgage assets, and the corresponding increase in shareholders' and depositors' balances, by which it has been largely financed. Three final tabulations, showing new shares and deposits subscribed in recent years, and new mortgage advances made by the societies, involve the problem of continued growth of the movement, which we discuss on a later page.

In addition to the detailed items listed in this table, however, we have also extracted from the reports of these societies information covering every aspect of building society activity. The record for 1925, 1929, and 1932 to 1937 relating to 99 societies is presented in the summary table opposite. In a similar table published in our earlier supplement, we included 98 societies, and the figures have been adjusted for the slightly different composition of the total. The societies which have been excluded consist almost entirely of those whose financial year ends at March 31st, and whose figures were consequently too late for inclusion in our table. The considerable task of analysing the results of nearly 100 leading societies during this period, under nearly 40 separate headings, has been greatly assisted by the ready co-operation of the societies themselves, and of the Registrar of Friendly Societies and his staff, whose help we gratefully acknowledge.

Current economic conditions suggest that an examination of recent trends in the building society movement is desirable, and it is hoped that our summary table, stretching well over a single trade cycle, and covering what may be a peak period of building society business, at least in this cycle, will be accepted as a prompt and adequate statistical contribution, which fairly sets out the scope of the movement's achievements and its potential problems. From the statistical aspect, the 99 societies included in our summaries should provide a fully representative picture of the whole movement. The total assets of all building societies in 1936, as officially recorded by the Registrar of Friendly Societies, amounted to £656 millions. As much as £554 millions of this total was contributed by the 99 societies concerned, and it is unlikely that this coverage of 84½ per

cent. has been markedly changed during 1937. Again, the official returns show that 80 societies in 1936 controlled total assets exceeding £1,000,000, and of these societies, as many as 71 are included in our table. Conclusions based on our sample, although it refers to only 10 per cent. of the total number of societies in existence, are likely, therefore, fairly to represent the position of the movement as a whole.

Before examining the results in detail, it is necessary briefly to note certain changes arising from the new form of annual accounts which came into operation last year. Societies are no longer required to present a receipts and payments account; this, in itself, appears a sensible reform. But they must now specify loans separately from deposits. In order to preserve comparability with our previous figures, however, we have included the relevant loans with deposits as far as possible. Changes have also been made in the presentation of management expenses, which may tend to affect the comparability of previous figures. Up to 1936, we have attempted as far as possible to exclude interest from the amounts under "shares withdrawn" and "deposits withdrawn," but the 1937 returns no longer allow of this adjustment, and the figures consequently include accrued interest for that year. The taxation charge includes N.D.C. paid in respect of 1937. Finally, in our analysis of outstanding mortgages, the figures now include mortgages to non-members, and substantially cover the entire amount outstanding on mortgage for all the societies concerned.

Indices of Growth

With these preliminary observations, we may proceed to discuss the general trends revealed by the returns, before examining certain more detailed problems which they suggest. During the past twelve years, the total assets of these 99 societies have increased more than four-fold from £136,876,400 to £598,555,500. In the same period, their mortgage assets have increased, at a slightly faster pace, from £117,318,100 to £531,604,500. The most convenient way of examining this growth is undoubtedly to recast the actual figures in the form of index numbers based on 1925. The indices are presented in the following table, together with an analysis of mortgage assets and share and deposit

liabilities as a percentage of balance sheet totals for each year:—

BALANCE SHEET TRENDS—1925-37							
	1925 = 100				Relation to Total Assets		
	Total Assets	Mortgages	Shares	Deposits	Mortgages	Shares	Deposits
1925 ...	100	100	100	100	85.7	73.8	15.3
1929 ...	189	187	211	142	84.7	82.3	11.5
1932 ...	293	278	328	240	81.3	82.5	12.6
1933 ...	311	303	346	300	83.6	82.1	14.8
1934 ...	345	340	360	397	84.6	77.0	17.7
1935 ...	371	378	375	472	87.3	74.5	19.5
1936 ...	405	420	403	532	88.8	73.5	20.1
1937 ...	437	453	434	578	88.8	73.2	20.3

The striking feature of the table is the consistent and regular growth in the total resources controlled by these societies. In recent years, they have annually increased their stature by about one-third of their total size in 1925; in fact, total assets, outstanding mortgage advances, and the amount due to shareholders have all increased by approximately four and a half times since 1925. There has been no repetition, as yet, of the slower rate of growth of outstanding mortgages recorded between 1932 and 1933. On the investment side, however, the effect of a regime of cheap money is particularly prominent. Although certain societies

have, during the past year, relaxed the restrictions which they imposed on new investment, particularly in shares, the growth in the total amount due to depositors continues to be much more rapid than the growth in shareholders' balances. The former represented no more than one-eighth of the societies' total funds in 1932, but during the past two years the proportion has slightly exceeded one-fifth. By contrast, shares which represented over 82 per cent. of the total funds in 1929, 1932 and 1933, have provided less than three-quarters of the total resources during each of the past three years. Two consequences of considerable importance follow from this trend. The societies, as a whole, have been able to finance their growing business at a somewhat reduced over-all interest charge (apart, of course, from the actual reduction in rates offered to both classes of investors), but they have tended appreciably to increase what may be called their "short notice" liabilities, as contrasted with their "deferred" liabilities.

Nor is the relation of outstanding mortgages to total assets less interesting. In the two latest years, these societies had as much as 88.8 per cent. of their total resources outstanding on mortgage advances. In 1932, the proportion temporarily touched 81.3 per cent., but it has since grown steadily, and has reached apparent stability during the past two years. The balance of the societies' residual assets consists largely of municipal and county

Building Societies Finance—1925-1937

[Note.—THE TABLE COVERS THE OPERATIONS OF 99 LEADING SOCIETIES SINCE 1925]

(Amounts in £'000)

* Excluding interest as far as possible up to and including 1936.

† Includes N.D.C. for 1937.

securities and loans, other investments, and cash, the totals for which are set out towards the foot of our summary table. The proportion of mortgage assets to total assets, of course, varies considerably as between different societies. If we take the first five societies recorded in our main tables, for instance, it will be found that the proportions are as follows:—

	Mortgages as per cent. of Total Assets
Halifax	80.2
Abbey Road	87.6
Woolwich Equitable	90.9
Leeds Permanent	93.8
National	91.2

Mortgage Business and Repayments

It is commonly acknowledged that, in the absence of the building societies' organisation, the house-building boom of recent years could not have achieved its fullest scope. The underlying conditions would, in any case, have been favourable, for interest rates were low and real wages were rising. But the translation of these conditions into actual mortgage business owes much to the work of the societies themselves. The extension of their advance business before the years of highest building activity proves, in fact, that the societies' publicity was already attracting increased custom some years before the dramatic increase in their mortgage business occurred.

In the following table the principal figures relating to increased mortgage business, and the method by which it has been financed, are set out. In column 5, we have expressed the new advances made in each year since 1933 as a percentage of the average amount outstanding on mortgage for the corresponding years. Similar percentages are given for the proportion of repayments to the average mortgage outstanding, while the final column relates the repayments and new advances in each year from 1925:—

TRENDS IN MORTGAGE FINANCE

	Total Mortgages outstanding	New Mortgage advances	Repayment of advances inc. interest	Proportion new advances to average outstanding	Proportion repayments to average outstanding	Proportion repayments to new advances
	(£'000)	(£'000)	(£'000)	(%)	(%)	(%)
1925	117,318.1	41,987.0	25,154.9	...	...	59.9
1929	219,824.2	64,133.3	40,405.4	...	...	63.0
1932	326,098.5	67,640.0	62,425.2	...	...	92.2
1933	355,655.1	85,517.7	74,932.2	25.1	22.0	87.6
1934	399,317.6	104,665.5	80,062.5	27.7	21.2	76.5
1935	443,891.1	108,087.8	85,229.1	25.6	20.2	78.9
1936	492,189.4	115,191.6	91,168.0	24.6	19.5	79.2
1937	531,604.5	111,437.0	95,602.0	21.8	18.7	85.9

The first positive fact which emerges from the table is that new mortgage advances last year showed a reduction—actually for the first time since 1932. This fact may come as something of a surprise, since general economic conditions, as measured by *The Economist's* Index of Business Activity, showed a growth of 5½ per cent. The decline of 3.2 per cent. in new advances, however, may be more accurately compared with a reduction of 8 per cent. in building activity last year. During the past two years the possibility of some decline in house construction has been stressed by economic forecasters. Its dimensions have so far been of a comparatively moderate order, and its effects on building society business are limited to a minor check to the advance figures, which still leaves them appreciably higher than the excellent returns of 1935. The potential effect of reduced housing construction on the immediate prospects for mortgage business of the societies is examined at a later stage in this section.

Our first inquiry, however, is to examine the relation between the flow of advances on new mortgages to the repayment money received from existing mortgages. The growth in mortgage assets in recent years has in fact been more rapid than that of new mortgage advances. Since 1934, when the proportion of new advances to the average mortgages outstanding reached 27.7 per cent., a fairly rapid decline has occurred, last year's figure being no

In general, however, as the movement has grown in size, it has extended its frontiers to new mortgage business. As we have seen, the year 1932 was somewhat exceptional, and the proportion of other assets held in that year was consequently in excess of the normal. The determination of the safe lending limit is in the last resort a matter for the societies themselves, but many outside observers may feel that the halt in the proportion of total mortgages to total assets recorded during the past two years is not without its advantages, at a time when the total resources of the movement are still expanding, but new mortgage business is tending to fall off. The recent trend of new mortgage business forms our next topic.

higher than 21.8 per cent. The proportionate decline in the relation of repayments to average mortgages, however, has been much less rapid, falling from 21.2 to 18.7 per cent. in the same period. It is for this reason that the repayments, expressed as a proportion of new advances, have increased from 76.5 per cent. to as much as 85.9 per cent. in the latest year. These figures illustrate the problem of "return money." To a large extent the societies have become self-financing; even if their outstanding share and deposits were to remain unchanged they would be faced with the problem of re-investing repayment moneys.

An appreciable part of the gross mortgage repayment figures, however, consists of interest, from which the societies must provide a return on their share and deposit capital and meet their management expenses. It is impossible precisely to separate the amounts repaid in respect of capital, and the amounts paid for interest on outstanding mortgage balances. Until last year, moreover, the "repayments" included certain amounts derived from the sale of properties in possession. We have, however, again adopted a basis of estimation in order to separate capital from current mortgage interest as far as possible. The effective rates of mortgage interest which are shown in a table on page 14 have been deducted from the percentage repayments figures shown in column 6 of the above table. In the following table the computed rate of capital repayment, excluding interest, is expressed as a percentage of the average mortgage balances for each year since 1933:—

GROSS AND NET REPAYMENT RATES

(As percentage of average mortgages outstanding)

	Gross Rate	Computed rate of interest	Approximate net rate of repayment	Net repayments as percentage of new advances
1933.....	22.0	5.6	16.4	65.3
1934.....	21.2	5.5	15.7	56.7
1935.....	20.2	5.2	15.0	58.6
1936.....	19.5	4.9	14.6	59.3
1937.....	18.7	4.9	13.8	63.3

Strict accuracy, of course, is impossible in this type of calculation, for during the period the total figures have been moving with great rapidity, and the age composition of mortgages has also been changing. The figures are sufficiently consistent over the period since 1933, however, as to suggest that no major changes of lending practice have occurred. There is, however, a decline in net repayment rates which may suggest that the average length of mortgage advances has been slightly extended. The latest figure of 13.8 per cent. for the net rate of mortgage repayment would correspond to an average length for mortgage advances of 7¼ years, and this in turn would suggest, on the assumption of regular capital repayments, that the average actual life of mortgage advances, as distinct from the pre-arranged term of years, has slightly increased to between 14 and 15 years. Such calculations, however, are considerably affected by the sale of houses before the full mortgage term has expired.

The final column in the table above may be compared

THE NATIONAL BUILDING SOCIETY

FOUNDED 1849.

Today, more and more people are availing themselves of the House Purchase and Investment facilities of The National Building Society. Since its foundation in 1849 it has been the constant aim of the Society to justify the confidence and trust which has been placed in its services. The continued growth of 'The National' bears testimony to the success of this policy.

Assets exceed £33,000,000. Reserves exceed £1,800,000

Head Office:

National House, 12-18, Moorgate, London, E.C.2.

Met. 8410.

Managing Director: R. Bruce Wycherley, M.C., F.C.I.S.

West End Office: 33 St. James's Street, S.W.1.

(THE SOCIETY IS A MEMBER OF THE BUILDING SOCIETIES ASSOCIATION)

with the final column of the preceding table at the beginning of this section. It expresses the proportion of net capital repayments to new mortgage advances, after adjusting for the amount of interest included in the earlier figures. It will be seen that, on a net basis, the societies to-day are probably able to finance nearly two-thirds of their new advances from repayments on existing mortgages. The possibility that new mortgage advances in the immediate future will be less expansive than in the past, coupled with the certainty that a substantially greater volume of repayments will be forthcoming in respect of the bumper advance business recorded in recent years, confirms the conclusion which was provisionally suggested in our previous supplement. Building societies now have less necessity to achieve a substantial expansion in the investment branches. They are tending towards a position in which, granted the maintenance of their share and deposit funds, they will be able to rely increasingly on repayment money to finance new mortgage business. It will rather be more essential to obtain an adequate volume of new mortgage business if the movement as a whole is to retain its present financial stature.

Mortgage Advances and Building Activity

We have suggested in the preceding discussion that the fall in mortgage business last year may be accounted moderate, in relation to the available evidence regarding building activity. A closer comparison of the two trends reveals a considerable degree of correlation between the value of plans approved for dwelling-houses and the total of new mortgage advances. There are, of course, considerable imperfections in the comparison. Not all plans approved are actually built, and the time lag between their approval and construction is difficult to measure with accuracy. Further, building societies derive a large volume of new mortgage business from transactions in existing properties. On the assumption, however, that the plan approved this year may become the new mortgage advance of the next, it is possible to devise a series of index numbers which give some advance indication of the potential movement in advance business during the succeeding year. In the following table we have set out the value of plans approved since 1928, and the totals for mortgage advances since 1929 (as officially recorded, together with our estimate for 1937). The former are expressed as a percentage of 1928, but are shown under the succeeding year to provide a comparison with the index number of mortgage advances,

which is based on 1929:—

	Amounts in £'000s		Index Numbers	
	Value of Plans Approved for Dwelling Houses	Mortgage Advances (all Societies)	Plans Approved 1928=100 (post-dated one year)	Mortgage Advances, 1929=100
1928	40,124	...	...	...
1929	44,260	74,719	100.0	100.0
1930	46,764	88,767	110.3	118.8
1931	40,492	90,253	116.6	120.8
1932	46,888	82,142	100.9	110.0
1933	62,308	103,196	116.8	138.0
1934	69,588	124,559	155.3	166.6
1935	78,145	130,947	173.4	175.3
1936	75,061	140,292	194.7	187.8
1937	67,636	135,500*	187.0	181.3
1938	...	...	168.6	...

* Estimated.

The close correlation between the index numbers given above is exhibited in the following chart:—

It is unjustifiable, of course, to claim accurate prophetic qualities for a method which, in the last resort, is merely a matter of statistical presentation. But throughout the period since 1929 the correlation between the two movements has been reasonably close, and particularly in recent years. If, therefore, last year's returns for plans of dwelling-houses approved are a reliable portent of the mortgage business to be expected during the current year, it would seem that a fall of the order of 7½ to 10 per cent. in new advances is not beyond conservative expectation.

Mortgage Values Analysed

We have already referred to the part played by the building society movement as a positive encouragement to the recent building boom. For two important reasons the composition of their mortgage assets deserves closer analysis. From the social aspect, it is desirable to measure the contribution which the societies have made towards the rehousing of the people during the past decade. And, secondly, our inquiry should indicate from what direction the societies can expect new advance business in the future. Sir Harold Bellman has estimated that of the 1,708,674 houses erected by private enterprise between 1919 and September, 1934, some 1,300,000 were financed by building society advances. Largely, though by no means exclusively, these advances have been made in respect of Class "A" and "B" houses. The datum value for the typical new house has been £500-£600 in the London area—with perhaps some tendency to fall in recent years—and, say, £400-£500 in the provinces.

These limits are broadly confirmed by the following calculations of the average value of new mortgage advances for 1929 and from 1932 for the 99 societies included in our table:—

AVERAGE VALUE OF NEW MORTGAGES			
1929	£544	1935	£564
1932	£522	1936	£562
1933	£538	1937	£580
1934	£578		

The striking regularity of the average value, since 1934, around £575 suggests that the societies have made little variation in their lending practice in recent years. Actually, however, it is probable that they have tended to increase the proportion of large mortgages, and that the average value of the smaller properties has tended to decline somewhat during the past two years. The exact situation cannot be accurately judged, more especially since the rise in building costs has prevented any appreciable fall in new property values, even under the stress of considerable competition.

In the absence of full details for the composition of new mortgage advances, the inquiry may be carried a stage further by an analysis of the distribution of outstanding mortgages. The figures, of course, merely summarise the position of the mortgage assets at the end of the societies' financial years, and are necessarily weighted by advance business carried out several years earlier. During a period like the past decade, in which mortgage business has been exceptionally active, the trend may therefore become slightly distorted. When the addition of new mortgages exceeds the rate of repayment, the average behaviour of the separate groups from year to year may be affected.

With this proviso, we set out in the first table below the percentage of distribution of outstanding mortgage

NA = Not available. (g) Combined totals of the two Societies. (f) Estimated

(a) Includes Halifax Equitable. (b) Includes Friendly Benefit and Birmingham and Midland Counties. (c) Operating as Borough Land and Building Society in 1925.

(c) This Society united with the "Cinque Ports," April, 1935; 1935 figures show, combined with

balances, by value, in their various categories, for 1925, 1929 and from 1932:—

PERCENTAGE DISTRIBUTION OF MORTGAGE ASSETS

	Under £500	£500- £1,000	£1,000- £3,000	£3,000- £5,000	Over £5,000
1925	46.3	30.6	13.7	3.1	5.4
1929	44.2	36.1	12.4	2.3	3.8
1932	40.6	42.8	11.1	2.0	3.1
1933	42.0	42.9	9.9	1.9	3.0
1934	43.5	42.3	8.6	1.9	3.3
1935	44.2	41.3	7.6	1.9	3.8
1936	45.7	40.0	7.2	2.0	4.4
1937	46.6	39.2	7.0	2.2	5.0

Until 1937 this analysis covered all mortgages with the exception of those to non-members, which have been included in the total for last year. "Scheduled mortgages," where the society has been in possession more than twelve months, or where repayments are more than twelve months in arrear, have also been excluded. Since 1932 the proportion of mortgage assets valued below £500 at the end of each year has risen steadily from 40.6 per cent. of the whole to 46.6 per cent. During the same period there has been a comparable decline in the relative importance of mortgage balances in the £500-£1,000 and £1,000-£3,000 groups from 42.8 per cent. to 39.2 per cent. and 11.1 per cent. to 7.0 per cent. of the whole. Balances exceeding £5,000 still account for no more than 5 per cent. of the whole, but five years ago they represented no more than 3 per cent. of a much smaller total.

To what extent the relative growth in the "under £500" and the relative fall in the "£500-£1,000" class is due to the process of repayment on mortgages which originally may have exceeded £500 and have since fallen below the limit, it is impossible to judge. But it would not be surprising if the major part of the outstanding balances in the lowest category consisted of mortgages originally made for sums below, or not appreciably exceeding, £500. The societies have not financed the purchase of the smallest type of working-class property to any large extent; but they have brought home ownership within the reach of the artisan with moderate wages and the clerk with limited salary, whose housing requirements may be said broadly to fall within such limits.

The other significant movement lies at the highest end of the scale. It has been apparent for some time that certain societies have been prepared to extend their lending operations to larger properties outside the usual definition of "owner-occupied." This fact was brought out by Sir Enoch Hill in his last speech as president of the Halifax Building Society at the end of March. Sir Enoch declared that the societies might be able to find compensation for any reduction in the number of small borrowers by care-

ful selection of larger investment mortgages, and he has long held the opinion that in the interest of building society investors the basis of mortgages could be considerably broadened. Our analysis suggests that the process is already in operation. Between 1932 and 1937 the total value of mortgage balances exceeding £5,000 for the 99 societies we have examined increased from £10,184,800 to £26,548,300. This development is discussed by a correspondent in a later article. Wisely controlled, it would appear to provide an outlet for a certain proportion of building society funds. But, at the same time, it involves the exercise of a type of judgment which many societies may have been unable to develop in the administration of smaller owner-occupier mortgages. Such business, indeed, appears more suited to the larger society, whose valuation staff can be relied upon to observe the necessity for a generous margin of security to cover commercial, as well as personal, hazards.

A cross-check on these conclusions may be obtained by calculating the average values of outstanding mortgage balances, which are given in the following table:—

AVERAGE VALUE OF MORTGAGES

	Under £500	£500- £1,000	£1,000- £3,000	£3,000- £5,000	Over £5,000
1925	£ 313	£ 615	£ 1,443	£ 3,755	£ 9,395
1929	266	668	1,360	3,810	10,540
1932	275	665	1,351	3,770	10,640
1933	281	655	1,412	3,705	11,200
1934	287	648	1,407	3,490	11,570
1935	293	643	1,420	3,865	13,045
1936	303	632	1,452	3,815	14,000
1937	301	637	1,454	3,845	13,950

Since 1929 there has been a steady growth in the average balance in the under £500 category and a fall in the average for the £500-£1,000 group. It is, however, somewhat remarkable that the average in the three groups between £500 and £5,000 is in each case closer to the lower than to the upper limits, although in both of the larger groups, £1,000-£3,000 and £3,000-£5,000, the average values in recent years have tended to increase. These movements, however, are dwarfed by the very substantial increase in the average value of mortgage balances exceeding £5,000. From a level slightly exceeding £10,500 this class shows an average growth to nearly £14,000 during the past eight years. It is already evident that some societies have broken away from the conventional limits which were formerly held to apply to building society mortgage advance business. And this development may have far-reaching effects on the future business and policy of the movement.

Investment Business and Interest Rates

It is commonly said that the building boom owed its strength to cheap money. This generalisation contains some, but certainly not the whole, truth. For the increase in real wages during the years of recovery, coupled with the liberalisation of mortgage conditions, was undoubtedly a very material factor in releasing purchasing power for new houses. Nevertheless, cheap money has certainly been of prime importance on the investment side of the societies' business, from which the funds for new mortgage advances have been provided. When War Loan was converted in 1932, substantial investors switched an appreciable volume of funds into savings media which had hitherto catered primarily for the small investor—like savings bank deposits and building society shares and deposits. At a time when the new building wave had yet to get under way, this wave of "bad money" formed a distinct embarrassment for the movement.

The societies replied by drastically limiting the amount of new money in the share department—in some cases applying a closure to new business—and also by restricting individual amounts of new deposits. In each case, the basic rates of interest were reduced, both for new and old balances, although they still remained attractive, after

allowance for income tax, compared with the gross rates obtainable on comparable securities. The effect upon the turnover of new and old funds, both for shares and deposits, is shown in the following table:—

TRENDS IN INVESTMENT BUSINESS

	Average Balance Outstanding	Subscribed during Year	Proportion of Average Outstanding	Repaid during Year	Proportion of Average Outstanding
	(£'000)	(£'000)	(%)	(£'000)	(%)
Shares—					
1925*	96,928.6	29,383.8	30.3	15,072.3	15.6
1929*	194,645.7	54,152.8	27.8	28,458.3	14.6

3 SAFETY INVESTMENTS

WITH 3 PRUDENT ESSENTIALS

—Absolute Security
Freedom from Fluctuation
Withdrawal at Short Notice

At a time when the financial world is beset with doubts and fluctuations, the Temperance Building Society offers a security to investors that is without doubt or challenge. The choice of three attractive methods is offered or two or more may be used simultaneously up to an investment limit of £4,975 in the aggregate.

1. Fully Paid Shares

are now being issued of £25 each bearing interest at the rate of 3%, Income Tax paid, equivalent to a yield of 4% to an investor liable to Income Tax at the standard rate. Dividends are paid half yearly by warrant.

3%

INCOME TAX PAID

2. Subscribing Shares

In response to a general demand Subscribing Shares of £25 each are now issued. The subscription is a minimum payment of 4/- per month per share. Interest at the rate of 3% is credited annually until share becomes fully paid.

3%

INCOME TAX PAID

3. Deposit Accounts

may be opened with any sum from £1 upwards and added to as desired. Interest is at the rate of 2½%, Income Tax paid, equivalent to £3. 6. 8. per cent. if liable to tax at the standard rate. Deposits are covered more than 2½ times by assets.

2½%

INCOME TAX PAID

In financial strength the Society believes itself to occupy the premier position among Building Societies throughout the country. Reserves now represent nearly 19% of the combined share and deposit capital and are greatly in excess of those of any large Building Society with Assets of £2,000,000 or over. Whichever investment you may elect to make is abundantly secure.

Reference to our summary table on page 5 shows that the volume of new shares subscribed in 1932 was no less than £63.3 millions. Not until the latest year has this figure been equalled. New deposits, which amounted to no more than £23.8 millions in 1932, quickly achieved—and have almost maintained—a substantially higher level of about £40 millions. The relative importance of deposits in the movement's investment business has thus been vastly increased in recent years. In consequence, the societies have achieved some reduction in their over-all interest charge through the changing composition of their total resources.

In order to throw light on an important financial factor for the societies—the rate of turnover of its investment funds—we have expressed new subscriptions and withdrawals, both for shares and deposits, as a proportion of the average balance outstanding, in each year since 1933 for 99 societies, and for preceding years for 98 societies. The difference between the two rates in each case, therefore, should show the rate of retention of new funds for each year. Even in 1933, it will be seen, the societies showed a small net receipt on shares account. Following the relaxation of restrictions, new share subscriptions have again increased—last year they represented 15 per cent. of the average balance outstanding—but, at the same time, increasing repayments have tended to reduce the rate of growth of net new money on shares, even compared with 1935. A similar trend is even more evident in the case of deposits, where the rate of turnover has always been higher than in the share department. In terms of net subscriptions, the societies' funds increased last year by approximately £24½ millions, after repaying funds to a total of £76½ millions.

These calculations, however, are subject to one important qualification. Until the latest year we have excluded accumulated interest, as far as possible, from the amount of capital withdrawn. It is impossible, however, completely to eliminate interest from the figures up to 1936, and for 1937, in particular, no dissection of interest from capital can be made, owing to the changed method of presentation of the figures. In order to indicate the importance of this factor, we give below the relevant figures for societies which disclosed interest and capital separately, both for shares and deposits, for the two years 1935 and 1936:—

(£000's)

	Shares Withdrawn		Deposits Withdrawn	
	Principal	Interest	Principal	Interest
1935	16,555.9	5,779.0	15,522.0	780.5
1936	19,466.0	5,504.0	15,218.4	768.2

Strictly comparable figures with 1937 may be obtained by adding back the amount of interest shown above to the respective amounts of withdrawals for shares and deposits in the two years. Alternatively, an estimate, based on the 1936 sample figures given above, may be employed to adjust for the amount of interest included in the 1937 figures. Such formal accuracy, however, is probably not required in considering a problem which, in the last resort, concerns the balance of receipts and payments of the societies, whether they may be strictly regarded as capital or revenue in character. Indeed, from the figures quoted above for interest it would appear that an appreciable proportion of share capital balances in fact consists of accumulated interest which has been credited to share accounts over a period of years. In this respect it may well be that the 1937 figures are the more reliable guide to financial turnover than those of earlier years.

If the total volume of the building societies' financial resources is to remain as high as it is to-day, the societies must positively maintain the total funds entrusted to them by the public. On the side of interest rates, it does not seem likely that they will be compelled to increase their rates through any deterioration in cheap money conditions which can be foreseen at the moment. Factors no less real than interest rates, however, demand attention. The first is the tendency, partially evident during the previous depression, to withdraw shares and deposits of a "savings-bank" nature. The second is the factor of confidence, which has

not been seriously challenged since pre-war times. Its importance, however, has been recognised in recent years by attempts to secure the observance of safe lending limits, and a higher proportion of cash assets. It is somewhat remarkable, therefore, that no significant quantitative increase in cash reserves and investments has been achieved. As the movement's total assets have increased, the proportion of mortgage assets has grown even more rapidly since 1932. A ratio of 88.8 per cent. for mortgage assets to total assets, recorded both in 1936 and 1937, appears significantly high in relation to the vastly increased responsibilities of the movement in recent years. The societies have steadily expanded their general and "No. 2" reserves since 1929, but these still represent less than 5 per cent. of their total assets. Cash assets and general investments represent some 10 per cent. of the total, but they are actually lower, absolutely as well as relatively, than in the three years from 1932 to 1934.

The societies, in fact, have been faced with a dilemma. In order to cover interest payments on their funds, together with management expenses, they have been forced to seek outlets, as far as possible, in new advance business rather than in cash and short-dated securities. Moreover, it is scarcely to be expected that, in a competitive world, the movement as a whole should suddenly impose a self-denying ordinance by which it could increase liquidity only at the expense of profits. The societies' share capital has, in fact, only a limited equity basis. The distinction between deposits and shares is largely a matter of priority for interest and principal, but the share capital, scarcely less than deposits, is of a fixed-interest *cum* short-term character. Both classes of capital, in practice, are readily withdrawable, although their ultimate security is the value of mortgage advances which, in the first place, may have fifteen or more years to run. To achieve the most adequate degree of liquidity, within the limitations which the building society movement is compelled by law and precedent to observe, is an objective deserving of the closest attention.

Changes in Interest Rates

In order to relate the trends in the investment business of the societies with changes in interest rates in recent years, we have brought up to date a series of calculations which appeared in our previous supplement. In the following table the amounts of interest paid on deposits and shares and received from mortgagors are related to the average balances under each heading for the years 1925, 1929, and from 1932 to 1937:—

COMPUTED INTEREST RATES

	Average Balances (£000's)			Interest Paid (£000's)			Computed rates of interest (%)		
	Shares	Deposits	Mortgages	Shares	Deposits	Mortgages	Shs.	De- posits	Mort- gages
1925*	86,929	18,794	100,179	4,242	725	5,857	4.4	3.9	5.9
1929*	194,644	28,344	126,145	11,111	1,492	11,492	4.5	3.9	5.8
1932*	309,054	44,607	308,060	18,884	1,659	18,144	4.5	3.7	5.9
1933..	340,117	56,692	340,877	13,035	1,956	19,077	3.8	3.5	5.6
1934..	356,270	73,145	377,486	13,148	2,046	20,689	3.7	2.8	5.5
1935..	370,958	91,243	421,604	13,183	2,708	21,941	3.6	3.0	5.2
1936..	393,019	105,434	468,040	13,360	2,908	23,037	3.4	2.8	4.9
1937..	422,841	116,534	511,897	14,031	3,126	24,916	3.3	2.7	4.8

* Based on sample of 98 societies. 99 societies subsequently.

It will be observed that, since 1935, the downward trend of rates has continued in each category. Substantial benefit has accrued to the societies, though they are still able to pay gross rates on their shares and deposits which compare favourably with the return on comparable investments. But the benefits granted to borrowers since 1932 are no less impressive. The rates for new mortgage business have been reduced to a basic level of 4½ per cent. and some societies are prepared to advance on even more advantageous terms.

Many societies have also distributed the fruits of cheap money to existing mortgage borrowers by allowing a rebate of interest. The fact that, in general, no obligation rested on the societies to make downward adjustments does not derogate from the equity and sound policy of the rebate system. Unless the societies pledge themselves to maintain fixed rates on mortgage advances—which, incidentally, certain important societies do—a measure of relief to existing as well as new borrowers, which has involved no strain on the movement's finances, should be welcome.

The Pool System: An Appraisal

THE building societies' "pool" system of house purchase finance now occupies a central position in their mortgage technique. It is impossible to assess the precise proportion of current mortgage business which is financed on this basis, but in some of the larger societies it probably accounts for as much as one-half of the annual advances.

The essential features of the system were outlined in our previous Survey. Briefly, it was devised to permit the sale of houses on terms which did not require the purchaser to provide a cash deposit of normal proportions. Looked at from another angle, the pool system allows advances in excess of normal to be made, while at the same time it safeguards the societies' position. When the pool system was introduced, building societies, as a rule, limited their advances to about 80 per cent. of their valuation of the property, and the purchaser thus provided cash equivalent to at least 20 per cent. And if the valuation was below the purchase price—as it frequently was—he was left to provide more than 20 per cent. The system tended to retard sales, since for every potential purchaser who had cash resources equal to 20 per cent. or upwards of the valuation, there were many more whose capacity was limited to, say, 5 or 7½ per cent.

In short, the pool system enables a borrower to purchase his house on the basis of a more modest personal stake. The societies' position is protected by an arrangement which is usually involved and varies somewhat for different societies. In general, the builder provides the society with an agreed proportion of cash representing the difference between the society's normal advance and the amount of the advance actually made. This cash constitutes "the pool," on which the society retains a lien to cover any losses which may arise through default while the mortgage debt exceeds an agreed datum. Further, the builder undertakes to repurchase the property if the society should become empowered to sell while the outstanding balance still exceeds the normal limit. Clearly, the pool system has been one of the basic factors in the recent expansion of building society business. Without the pool, or an equivalent arrangement for reducing the borrower's personal stake, housing construction would not have assumed boom dimensions and economic recovery might well have been much less vigorous.

An appraisal of the merits and demerits of the pool system, however, is difficult, for there is little available information concerning its operation. Its significance for any given society will depend, again, upon circumstances which cannot be assessed outside that society's offices—such, for example, as the care and skill with which the property is valued. At the best, therefore, an individual observer must rely on generalised impressions.

In so far as an extended range of house ownership is regarded as desirable in itself, the system may claim sub-

stantial merits. It has sensibly broadened the path to ownership, and many thousands of the 1,300,000 existing borrowers owe their homes to it. If it is argued—as it can be with broad justice—that the majority of these borrowers have been satisfied in their new ownership, the system has still further justified itself. They have, in the main, secured a better standard of housing accommodation than was otherwise open to them. If they are able to maintain their contract, their "compulsory thrift" will provide a considerable capital asset which, without the "pool" system, many might not have possessed at all.

In real life, however, a boon is rarely gained except at a price. Some house purchasers under the "pool" system have no doubt footed this traditional bill. Some prospective purchasers may have been encouraged to judge a house in relation to the initial cash deposit and the monthly outgoings rather than from the essential criterion of capital value, and to this extent the "pool" may have facilitated, especially some years ago, an inflation of selling prices. Moreover, it may be that some builders have treated the proportion of cash which they have been called upon to lodge with the society as a capital cost. In localities where the purchaser's range of choice has been wide these disadvantages may not have been severe. And on balance it might still be urged that, if the "pool" was the only available medium for raising large numbers from the status of tenant to owner, it has provided a net benefit.

The building societies themselves have to consider the system from a rather different angle, although they cannot be insensible of the value of the satisfied borrower. The decisive test of "pool" business, so far as the societies are concerned, is whether it provides an adequate measure of security. For reasons already suggested, the question can scarcely be answered by a categorical "yes" or "no." The system was already in operation, though much less extensively than to-day, during the severe depression of 1930-32 and it successfully survived the difficulties of those years. Moreover, if the schedules of properties in possession and with payments in arrear are a partial guide, the position to-day is actually healthier than in "pre-pool" years. There is no evidence, again, that the societies' management expenses have been adversely affected in an appreciable degree. There appears to be substance in the argument that the exceptional qualities of the average British borrower's personal covenant, though intangible, must be borne in mind in judging purely mechanical safeguards. On the other hand, some doubt has been felt whether low deposits have not tended to encourage—on a restricted scale—a type of borrower whose financial and social capacities did not fully qualify him for ownership. Certainly, discrimination must still be exercised. It would be regrettable if there was any relaxation of standards under the pressure of a shrinking mortgage market.

The principal danger, however, is that the "pool" system may be so far extended under the stress of competition that the necessary margins of security may be prejudiced. On a broad view, adherence to agreed minimum standards appears vital to the movement's continued stability, especially having regard to the new phase of the building cycle which is now in progress, for free competition can scarcely be carried much further with complete security. For this reason, it may be hoped that the scheme of co-operation now understood to be before the societies affiliated to the Building Societies' Association will meet with a consistent support denied to its predecessors.

Moreover, it appears somewhat anomalous that although

Parliament has sought to provide checks on the societies' operations by insisting on statutory accounts, these throw comparatively little light on this important feature of building society operations. If an effective method could be devised whereby the societies would disclose the amount of money held as collateral security, and the amount of excess advances in respect of which it was held, the facts would enable the observer to assess the problem of adequate security on an objective basis. On balance, the "pool" system is no doubt beneficial; the principle has been recognised in housing legislation, and on a long-term view, it has unquestionably come to stay. But the movement must employ it with care and discretion.

The Outlook for New Advance Business

OF the several aspects of management which have lately engaged the attention of building society directors and officials, none has received more serious consideration than the question of future lending policy. Its importance is obvious for two reasons. The first is that the abnormally high level of mortgage lending which in the past few years has thrust prosperity upon the building society movement, at last shows unmistakable signs of recession. There is no abrupt check to new business, but the steady slowing down in the demand for advances is a sure indication that the shortage of owner-occupied house property, the purchase of which is mainly financed by building society loans, has in great measure been met by supply.

This fact leads to the second point. A diminishing volume of applications for loans intensifies the problem of what is technically termed "return money." The enormous amount of mortgage business transacted during the past ten years is being naturally succeeded by a correspondingly increased volume of repayment of loan instalments; while the normal loan outlet for these funds is narrowed by the reduced demand for new advances. In these circumstances the problem of safe and profitable employment for building society funds has now assumed considerable importance. The re-investment of substantial mortgage repayments is essential if the building society movement is to maintain its present position. There is, however, some danger lest this very diminution of demand should lead to intensified competition to secure mortgage business on terms exceeding the limits of prudence.

Unless the societies' surplus funds can be employed in the normal business of mortgage advances, they must be invested, as prescribed by law, in trustee securities—a development which, if carried to excess, would find the building societies operating as investment trusts on a narrow basis. But as the yield from trustee securities would not repay the rate of interest paid by building societies to their shareholders, such investment is manifestly unprofitable. In a previous survey of the movement *The Economist* posed the question whether the societies should endeavour considerably to extend their lending facilities into such fields as financing large residential flats or commercial and industrial premises, and at the other end of the scale whether they had fully developed the finance of smaller houses to let, as one contribution towards the national task of slum clearance. These possibilities have been closely explored, and in some cases acted upon, but they have a greater appeal in present circumstances than even two years ago. It may well be that, in some degree these suggestions may provide opportunities for the employment of resources that might, owing to their magnitude, otherwise become an embarrassment.

Of these several suggestions, that of further co-operation in the provision of small dwellings to let at low rents is of the greatest importance, for it is the more necessary and affects the greatest number of people. It should have been a major consideration of all engaged in the provision of small houses. Until the urgent demand for this type of dwelling is met, the problem must remain, but so far little has been done, either by local authorities, private enterprise, or investors in house property, to utilise the building societies' resources for that purpose. The latter, however, have always been available and the societies can

do no more than offer their financial assistance in new schemes of this sort. Legislation, however, appears to have confirmed the position of the local authorities as "most-favoured" undertakings for the provision of houses of this class. They enjoy rights to acquire land; and can draw upon specially cheap money. They are not under any necessary obligation to make a profit; indeed, their building schemes may do no more than pay their way or operate at a loss. Such factors tend to deter private enterprise from engaging in this particular branch of building. Except in relatively few cases, local authorities have not responded to the building societies' offer of financial co-operation in their housing development. The tripartite guarantee provisions of the 1933 Act have commended themselves little to local authorities, who apparently prefer to undertake the entire risk of housing schemes rather than surrender even in part their independence of action.

What are the prospects of new business in other directions? The financing of improvements to existing properties represents a legitimate outlet for building society funds, but while the total sums involved are significant, they absorb only an infinitesimal portion of the large sums seeking employment. The extension of lending facilities to commercial properties is more debatable. In many quarters it is objected that the constitution of the societies as settled by the statutes under which they work is not best suited to that class of business. While their primary purpose is to assist in the acquisition of dwelling houses for occupation or investment, however, business premises and other freehold or leasehold property are not excluded as mortgage securities. Thus, societies may lend on factories, cinemas, warehouses and land. Indeed, such lending is already carried out to some extent, but only with the backing of substantial collateral security. Commerce, industry and entertainment are subject to periodical and sometimes violent profit fluctuation, and after some experience of the consequent ill-effects upon their security values, many societies have avoided this type of business.

It remains, finally, to consider the operation of the Small Dwellings Acquisition Acts, under which powers have been widely adopted by municipal and other public bodies to provide a supply of houses of a class which, as the building industry contends, rightly belongs to private enterprise. Whatever useful purpose the Acts may have served in the past, their importance to-day is certainly reduced. It is estimated that perhaps £60 millions is owing to local authorities in respect of loans under the several Housing Acts, and it has been suggested that this sum might be financed by surplus building society funds. The transfer to building societies of the mortgages held by local authorities would relieve them of the burden of administration and would set free a corresponding volume of public money for other purposes.

Whatever the eventual solution of the problem of new advance business may be, it would seem that, in default of the continued large-scale absorption of their expanded resources, the building societies will be faced with the alternative of relating the volume of their funds to mortgage loan requirements. In such circumstances, they might be compelled severely to restrict the inflow of new money or even to reduce any portion of withdrawable capital on which no satisfactory return could be obtained.

Building Standards and Building Societies

DURING recent years a large proportion of the population has been rehoused, mainly by the enterprise of speculative builders in association with building societies, and few would deny that the process has contributed substantially to the general welfare. Quite apart from the support given by building activity to business recovery, the new houses have brought greatly improved living conditions to millions of people. This is not to say that the best possible use has been made of the special opportunities of the post-war period; indeed, examples of housing development without due regard for appropriate standards of lay-out and construction have been all too numerous. But the housing shortage was so acute for several years that hasty construction was perhaps unavoidable, and certainly discrimination was dulled by the needs of the time. More recently, however, the relaxation in the pressure of demand has permitted increasing attention to the questions of house design and construction.

Unsatisfactory housing development is not new. The drab consequences of the rapid urban development which took place last century are to be found all over the country. Some would assert, indeed, that the finest achievements of British building passed with the advent of the industrial revolution, and that the work of the Adams brothers represented the last contribution of this country to architectural distinction. More relevant to our purpose, however, is the fact that the housing problem, in its modern form, did not emerge until the concentration of population into crowded industrial and metropolitan areas was well under way. The results of early efforts to meet housing difficulties were dismal, and for decades improvement was far from rapid.

About eighty years ago, for example, a large land and building society, of which Richard Cobden and John Bright were prominent founders, published a series of model plans for new houses on the outskirts of London "suited to the wants of a considerable number of members." Suburban development, then as now, was pressing outwards in all directions, and prospective householders were informed that the costs of construction would range from £160 to £320 for each house "in a row." By that time, the characteristically urban type of dwelling, with its narrow frontage and deep construction, was well-established, but the cheapest houses in the plans had no bathroom and only one window to each of the rooms downstairs, while a narrow, unlighted corridor ran practically the depth of the house and ended in a steep, dark staircase. The more expensive houses did provide a bathroom, but they also had basements with domestic offices. As to the exterior, central valley roofs with a parapet giving a false impression of height were popular. The old drawings show that elevations became more highly decorative as the price increased, displaying a remarkable mixture of styles to be executed in stone or "Roman cement compo." New estates, judging from this old publication, were then commonly designed with straight, monotonous roads, and the houses were crowded closely together in rows and terraces. Yet these standards, propounded by the distinguished reformers directing the society concerned, were probably among the highest of the period.

The progress of building standards is illustrated by the fact that development of this kind would be quite impossible to-day. It is most unlikely that such plans would now be approved by any local authority, or accepted, for that matter, by any financially interested party. Apart from the positive demand for higher standards of housing accommodation, building control has been greatly strengthened during recent years. For centuries, some measure of direct regulation has been exercised over building, at least in London, and during the past sixty years

local authorities in all parts of the country have enforced by-laws relating to new construction, designed to protect public health and safety. Building projects and property in course of construction are subject to regular examination, and in 1936 the legislation by which these powers are exercised was consolidated and amended. More recently, however, even wider applications of the principle of control have been made. Town-planning, following valiant pioneer efforts in the early years of this century, reached more complete expression in the Acts of 1925 and 1932. To-day, as a general rule, the maximum density of house development may not be greater than twelve dwellings to an acre, while in most areas other amenities are protected, and future building will be directed along pre-determined lines. A further example of the new outlook is provided by special legislative restrictions imposed upon ribbon development in 1935.

Even so, control by local authorities has not entirely prevented bad housing in the past, and it will be observed that the new powers are directed more particularly towards the preservation of local amenities in a wide sense. In general, moreover, regulation is of a negative kind; it usually defines what may not be done. At present, as hitherto, positive action towards the improvement of building standards depends largely upon the house builder and the house purchaser. The builder's principal concern is to produce a house for which there is a ready market and, within the restrictions imposed by local by-laws, he is usually willing to provide such houses as the public demands and can afford. Wide variations, however, exist in structural materials and methods, and sometimes the claims of salesmanship have been placed before those of workmanship in new buildings. Well-directed efforts to ensure the observance of suitable standards of construction are, however, already being made. A central council has been established, with the approval and support of the Minister of Health, which consists of distinguished architects and surveyors, together with representatives of house builders and building societies. Any competent builder willing to observe the agreed standards may register with the council, which will then undertake regular and independent inspection of his work while it is in progress, and will issue a certificate to the purchaser that the house conforms to sound and reasonable standards of construction.

This service, it should be noted, is permissive; its widespread adoption depends upon the building industry and also upon the purchaser. Here a new aspect of the problem is revealed. Until recent years, house-owners were relatively few in number; in the past most people rented the houses in which they lived, and their interest in structure and design was correspondingly remote and temporary. To-day, house-ownership is becoming the general rule and the concern of buyers regarding building standards is, correspondingly, immediate and lasting. It is surprising that, although the purchase of a house may frequently represent the most important monetary transaction in the buyer's life, expert advice is rarely sought. Again, the aesthetic standards of the public at large may not be reliable, and they are certainly not uniform. In short, the exercise of increased discrimination, which might have been expected to accompany the spread of home-ownership, has not been immediately effective, though in time it will doubtless play a more important part.

It is sometimes urged that the responsibility for unsatisfactory new development may be held to rest with the building societies, in view of their intimate concern both with the building industry and the buyers of houses. But such suggestions are not in accord with the facts. Building

societies, as lenders, are mainly concerned with the security value of a house; æsthetic considerations are taken into account since they affect the market value of the property, but they are not regarded as an end in themselves. In fact, many building societies exercise a greater measure of selectivity in supporting housing projects than is commonly realised, and proposals for development are frequently rejected as being unsuitable. Such influence is to be welcomed, though it cannot be regarded as providing a guarantee to the borrower concerning the quality of his house, despite the common misunderstanding that some such warranty is implied in the transaction. Nor does it operate to establish general minimum standards of lay-out and construction. Nearly a thousand individual building societies carry on business in Britain independently of one another; competition in the movement is keen, despite efforts at co-operation, and clearly the influence of the societies upon building standards cannot be uniform or evenly exerted over all areas. Nevertheless, the best interests of building societies are at one with the best type of development, and the influence which they wield, however

incomplete and uneven, does work in favour of sound construction and good design.

Responsibility for housing standards is thus divided, and cannot be wholly attributed to any one authority. Possibly this diffusion itself constitutes an element of weakness, but we have seen that a number of positive factors are now contributing towards the achievement of improved housing standards. Reference has been made to increased public control, to the introduction of certification of buildings, to the growth of the house-owning public and to the influence of the building societies themselves. It remains to be added that the architect is now devoting increasing attention to estate and house development. The efforts of such experts as Sir Raymond Unwin and Mr Stanley C. Ramsey should help to fuse the somewhat scattered forces of progress, and to guide development along better paths. In housing, more clearly than in most other branches of economic activity, the mistakes of the past are evident for all to see. They serve as a lasting and sometimes painful reminder of the responsibility imposed on those who plan for the future.

The Future Demand for Houses

A NATION whose population, after two centuries of rapid increase, is reaching its maximum point, might be expected to reveal a slackened demand for houses. Great Britain, on the contrary, has for nearly six years enjoyed the biggest house-building boom of which there are records. This is the fundamental dilemma with which any attempt to forecast the future demand for houses is faced. The truth is that the governing principles of the economics of house-building are still largely unexplored. The average man (which includes the average builder) experiences in his own working life-time only one, or at the most two, of the long, slow cycles in which house building moves. Theoretical research is, for this reason, most inadequately supported by hard practical experience. Nobody knows what constitutes the demand for houses.

Nevertheless, many people have, from time to time, tried their hands at guessing. Perhaps the most authoritative and best documented guess was that made by the Registrar-General in the Housing volume of the Report of the Census of England and Wales, 1931. The Registrar-General was concerned to estimate the probable requirement of new houses in the decade before the next census in 1941. His figure for the net increase in the number of families arising out of "natural" causes, such as the excess of marriages over deaths, etc., was 771,000 in the decade. He allowed 300,000 houses for slum clearance schemes and

100,000 for the net replacement of obsolete houses outside the slums. (This last is a net figure; it represents the excess of houses demolished and replaced over the number of new dwellings coming into existence through the sub-division of existing houses). He further added 300,000 houses to relieve overcrowding and 200,000 houses to bring the percentage of vacancies up to the normal figure. The total estimate was therefore 1,700,000 houses in ten years, or an average of 170,000 a year.

At the time of the Census, the rate of building in England and Wales was, in fact, about 170,000 a year. But in the 6½ years between April 1, 1931, and September 30, 1937, the number of houses built was 1,823,677, or an average of about 280,000 a year. Thus the Registrar-General's estimate—an estimate which he regarded as a maximum, to be mentioned in the same sentence with the words "saturation point"—has actually been exceeded in less than two-thirds of the decade for which he was prophesying.

To criticise the Registrar-General's estimate would be both foolish and unjust. In point of fact, the remarkable nature of his estimate is that each of its specific items has been, if not correct, an over-estimate, and yet the total figure has proved woefully below the mark. The marriage rate has not taken any unexpected bound upwards, nor have deaths fallen off to any surprising extent. Less than

300,000 houses have been provided in replacement of slums—the total figure to September 30, 1937, was 163,274. It is doubtful whether other replacement has exceeded the net figure of 100,000, and the proportion of vacant property, though rising, is probably not yet back to the pre-war normal level.

The remaining item is the one of 300,000 houses to "be allowed for existing sharing families, to provide for the overcrowded amongst them and possibly others who might be expected to prefer separate dwellings were they available." The abatement of overcrowding in the statutory sense has hardly yet begun, since the total number of houses classified as being for this purpose is less than 6,000. But the major explanation of the enormous discrepancy between estimate and reality is to be found in that almost casual phrase about sharing families who might possibly be expected to require separate dwellings. They have in fact required separate dwellings in such enormous numbers as to upset all calculations.

The Registrar-General's estimate would have called for about 1,100,000 houses in the 6½ years. Since, as we have seen, his estimates under some heads have not been realised, the number of houses actually provided for the specific items in his estimate was probably under, rather than over, 1,000,000. The remaining 800,000 houses (at least) have been occupied by 800,000 families which have split off from pre-existing families, even though they were not suffering from overcrowding on any definition of the term. Considering that there were in 1931 only some 9,400,000 dwellings (in the Census meaning of the word), and rather fewer "families," this unexpected increase of 800,000 houses in less than seven years is a social phenomenon of the utmost interest. It betokens an amazingly rapid increase in the standard of housing of the people. The figure must conceal a very large number of cases in which lodgers have been dispensed with, adult children have become independent and the mother-in-law incubus has been removed—all of them presumably occasions of increased happiness.

When the phenomenon is examined more closely, it becomes even more surprising. It is a commonplace that the great majority of the houses provided in such profusion in the last few years have not been intended for the poorest section of the population. Fewer than 800,000 of the 1,800,000 houses built since April 1, 1931, have been of less than £26 rateable value (£35 in Greater London) and built to let. The remainder are either large houses or else small houses built to sell. This seems to indicate that it is the middle class and upper wage-earning class which have been spreading over such a largely increased number of houses. If so, the emergence of 800,000 new families in less than seven years is a remarkable occurrence.

Any attempt to set limits on the probable future demand for houses is necessarily governed by the question whether this extraordinary demand will continue. It is easy to establish that the present total rate of building cannot continue indefinitely. There are at present about 11,000,000 houses in the country. In the latest twelve months for which statistics are available, nearly 340,000 houses were built. This would be sufficient, if continued, either to double the present number of houses, or alternatively to replace every house now standing, in 33 years, and it can be confidently predicted that neither thing is going to happen. It follows that the rate of domestic house-building is certain to fall to some extent.

But to what extent? The answer very largely depends on the continuance of the marked falling tendency over the last six years in the number of persons per house that is conventionally acceptable. There will only be a small demand for private enterprise housing from other sources. The "natural" increase in families, due to marriages, etc., which has amounted to about 500,000 in 6½ years, will only be about 400,000 in the 13½ years to the Census of 1951—an average annual increase of, say, 30,000, as compared with the annual average of about 80,000 in 1931-37, and after 1951 there will be an annual decline. The speed of slum clearance and overcrowding abatement depends on political factors and, by the same token, offers little scope

for private enterprise building. The replacement of obsolete houses is a factor which is very difficult to estimate. There are still hundreds of thousands of old houses awaiting remodelling and sub-dividing, and every house so treated may provide from three to a dozen new dwellings, within the Census definition, without much benefit to the building industry. Indeed, if such remodelling occurs on a large scale, the net requirement under the head of replacement, as under that of "natural" growth, might well become a negative figure.

It follows from these considerations that the future business for the private enterprise section of the domestic house building industry depends almost entirely, after the immediately approaching years (and very largely even then), on the extent to which the British public can be persuaded to spread itself more thinly over a larger number of houses. The standard of living, in this respect as in others, has a secular rising tendency. All through last century, the number of houses usually increased, from census to census, at a faster rate than the number of inhabitants. But two points deserve careful notice. The first is that there were several decades (five out of thirteen) when the rate of increase in houses was smaller than the rate of increase in the population. And, secondly, there is no example in the century between Waterloo and 1914 of house building moving so much faster than the population as it has done since the war, and especially since 1932. The closest comparison is as far back as the decade between 1831 and 1841, when the population increased by 14 per cent. and the number of houses by nearly 20 per cent. Since 1931, however, there has been an increase of something like 17 per cent. in the number of houses (equivalent to over 25 per cent. in a decade), while the population has risen by a bare 2 per cent., and even the number of adults has increased by only a slightly larger proportion.

The social phenomenon which has created the building boom of the last few years is thus historically unprecedented. It may be that the British standard of living has now reached a point in its steady rise at which a further advance will be devoted to a further raising of housing standards. In that case, a continuance of the exceptional demand for houses can be expected. It would be more prudent, however, to assume that what was exceptional will remain exceptional. It is not difficult to find explanations for the sudden emergence of so large a demand for houses. The years 1932-37 were years of industrial recovery, in which the ordinary man was encouraged to feel himself in a position of relative economic security. At the same time, the great fall in the cost of food and clothing as a result of the world-wide agricultural crisis had given him a considerable margin of surplus income, and the existence of a cheap money policy, together with the development of the building society movement, placed large supplies of easily obtainable credit within his reach. Finally, improvements in transport, by making it possible for the large cities to expand into the countryside, crystallised the potential demand for housing into the specific desire for suburban villas. Can we count on finding all these factors again in combination in the future? Shall we experience industrial recovery together with low prices? Are we not just as likely to have either one without the other?

These are the questions that everybody connected with the building society movement would do well to ask himself. It is virtually certain that building cannot for long continue at its 1937 rate, and there are already unmistakable signs of some falling off in the residential section of the industry. It is also an uncomfortable fact that if the industry is to rely entirely on the sort of demand which has provided its staple fare for centuries past—namely the demand arising out of the growth of the population plus only the minimum amount of replacement—then the demand will be very small for the next decade or so, and will afterwards virtually disappear. If, in spite of this, there is to be any substantial amount of building, it can come only from a continuance of conditions which, as we have seen, are exceptional.

Society and the Societies

BRITAIN'S population has ceased to grow appreciably in numbers—indeed, it threatens to decline in the not very distant future. The people are, however, being rapidly re-distributed, and the building societies play no small part in their movement. In recent years there have been two distinct movements—a regional shift to the South-East of England, and more local movements, almost everywhere, from the countryside and urban centres to the new suburbs. New housing estates betoken new standards of living, new modes of transport, new sites for industry and commerce, new concentrations of population and new ways of life.

These movements, which are now engaging the attention of the Royal Commission on the Geographical Distribution of the Industrial Population, can be readily traced in the official population figures. Between 1921 and 1931, for instance, the population of England and Wales increased by 5.6 per cent., but the numbers in the South-East Counties rose by 10.8 per cent., in Greater London by 9.3 per cent., and in the Eastern Midlands by 7 per cent. Again, between 1931 and 1935, when the total population rose only by 1.7 per cent., the South-Eastern population increased by 3.9 per cent. and that of Greater London by 3 per cent. This movement has undoubtedly continued in the last two years.

Local movements are similarly visible. Between 1927 and 1936, the estimated resident population of Greater London rose from 7,810,000 to 8,756,000. Within the metropolitan conurbation, however, the population of twelve central boroughs fell from 1,675,000 to 1,426,000, and of the L.C.C. area from 4,550,000 to 4,141,000. On the other hand, Outer London, which constitutes the outside ring of Greater London, drew immigrants from nearer the city's centre, as well as from other parts of the country, and increased its residents from 3,260,000 to 4,435,000. A similar decline in the population of central areas, accompanied by an increase in the number of suburban residents, is also evident in other large towns. Even in the depressed areas, the urban centres are ringed round by new housing estates.

It is commonly held that population movements are initially due to changes in the geographical balance of industry and trade. But to say this is not to deny the considerable contribution which the building societies have recently made to the redistribution of Britain's population. Such movements cannot take place without the provision of new housing facilities; and these have been largely furnished through the building societies, together with the local authorities and the State. The housing required by the modern migrants is of two kinds. Cheap dwellings for working-class people have been largely provided since the war by local authorities, assisted by Government subsidies, though private enterprise has played an increasing part since 1934. Secondly, more expensive, but still reasonably low-priced, houses are required by salaried people and the higher wage-earners. The location and character of working-class houses are determined, within narrow limits, by the incomes of individual families. Indeed, many working people, in fact, find accommodation by "filtering-up" into old houses vacated by wealthier people moving into new residences. Middle-class houses, however,—in the financing of which the building societies have been largely concerned—must satisfy a relatively wide range of choice in situation, price and design; and no feature of modern life is more typical than the style of new suburban estates and the habits of their inhabitants.

It is fashionable, in some quarters, to decry suburbia. Yet the new housing estates represent at once the pretensions initially due to changes in the geographical balance of and aspirations of middle-class people. And the house-owners of the suburbs have at least found local habitations where their families may be immune from some of the discomforts, dangers and inconveniences of town-life under

modern conditions. The suburbs are themselves amenities. Those who can afford to seek their dwellings on cities' outskirts escape the growing discomforts of urban congestion, and bring themselves at least within distance of the greater amenities of the countryside, gardens and reasonably pure air. It is true that, despite the increased efficiency of transport services, they must accept the serious disadvantages of crowded daily travel. But the luxuries of a town house and a country cottage are available to only a small minority. The bulk of the new salariat and artisan home-owners seek the best compromise in a daily *pied à terre* removed from the urban throng and a permanent refuge at week-ends.

The truth is that modern suburbia, in the formation of which the building societies have very largely been instrumental, notably reflects the modern trend of our urban development. Unrestricted and unco-ordinated growth of towns necessarily involves increasing business congestion at the centres, increasing invasion of the countryside and increasing dependence upon transport facilities. Except for the very poor, few employees live near their work in the large cities, and economic necessity rather than choice compels the former to do so. The net effect is a growing differentiation between places of work, places of entertainment and places of residence; and there is no little danger that much of the civic liveliness and communal character of urban civilisation, characteristic of the later nineteenth century, may be thereby lost. Granted the social value of the amenities created in the best new housing estates, the disadvantages of suburban isolation cannot well be ignored. Time is spent in travelling and recuperation which might otherwise assist in the development of an organic communal life, and the problem becomes most acute in the far-flung suburbs. Formal patterns of social behaviour become accepted. Standards of competitive ostentation in gardens and motor-cars become the rule. But neither family nor communal life fully flourish in dormitory suburbs.

The national income has more than doubled since before the war. It has increased by 25 per cent. since the early twenties. The number of salary-earners has simultaneously grown, and the so-called middle-class has been correspondingly augmented. These are the people, together with the higher wage-earners, whose remuneration has notably increased since the war, who are populating the new suburbs. And their migration is facilitated by the building societies who finance their houses and the companies who finance their buying of motor-cars. They have canalised a powerful demand for higher standards in housing, living conditions and surrounding amenities. To a point, these requirements have been satisfied; suburban dwellers have escaped congested towns, though they are tied to the train, the bus or the tube. But some of them are also victims of a seemingly endless process of urban growth. Industry moves and towns grow; but there is but little conscious concern for the kind of social life which the new suburbs will eventually produce. For this reason, the suburban escape from the city streets has been only partly successful.

The face of Britain is changing and, with it, the face of British society. And, so far, no one is responsible for the features which are emerging. The State is still, perhaps rightly, reluctant to influence industrial location. The powers and interests of local authorities in planning towns have been increased since the war, but are still short of the ideal. And, more locally, none of the agencies responsible for fashioning suburbia—the builders, estate companies or building societies—have any direct responsibility to consider the character and opportunities of suburban life. True, it is not their business; but it would be regrettable if the fullest opportunities of the new modes of living should not be realised when the physical supply of houses has been so readily provided.

Prudence

Investors who appreciate the advantages of a policy of Prudent Lending, consistently carried out for 88 years, and in a favoured area, are invited to ask for Investment particulars and Balance Sheet of the Principal West Country Society.

No. 16

The Trend of Business

THERE has been little change since last month in the main trends of British business activity. The deterioration on the world economic front and the downward trend in the volume of new civil investment for commercial purposes in the home market continued to offset the increase in direct and indirect defence expenditure. The seasonal expansion of activity this spring has consequently been less marked than usual. These tendencies are reflected in *The Economist* index of business activity, which is adjusted for seasonal variations. The index has declined almost without interruption from 113½ (1935=100) last September to 110 in February and 108½ last month. The index for March, moreover, is 2½ points below the figure for the corresponding month last year.

The downward trend of world production, trade, and prices has persisted. The decline in world trade is reflected in the further fall of our index of tramp shipping freight rates from 118.9 in February (1898-1913=100) to 115.5 in March. The volume of shipping laid up at the ports of Great Britain and Ireland has risen from 174,325 net tons at the end of December to 339,325 net tons at the end of last month. In June, 1937,

only 61,225 net tons were idle. The persistent fall in world prices is reflected in the decline of our index of primary products (September 18, 1931=100) from 143.1 on March 2nd to 137.8 on April 12th. The easing of political tension in Europe consequent upon the conclusion of the Anglo-Italian Agreement, and President Roosevelt's decision to come to the rescue of business by the resumption of large-scale Government expenditure, have led to an improvement in confidence. But even if this improvement is maintained, some time must elapse before it is reflected in the sphere of business activity.

As a result of the decline in world production and trade, there has been a further shrinkage in the volume of new business secured by British industry. Moreover, the persistent decline in new export orders since last autumn is now being increasingly reflected in shipments. Thus, our index of the volume of exports of British manufactures (1935=100) has fallen from 122½ last June to 101½ in February and 100 last month. A year ago the index stood at 120. As a result of the decline in export orders, the cotton and wool textile trades have relapsed into a condition of depression. The tonnage of mercantile shipping on which work was commenced declined from 368,000 gross tons during the second quarter of 1937 to 217,000 gross tons in the last quarter and 173,000 gross tons in the first three months of this year. Coal exports last month were again smaller than in the corresponding month a year earlier. In the case of machinery, however, where the time lag between new orders and their completion is substantial, a fall in export orders has not yet been reflected in shipments.

The industries on which armament expenditure is concentrated remain very active. Nevertheless, even in some of the metal trades, there is evidence of a slight contraction in activity. In the iron and steel industry, the steady expansion of home production, coupled with rising imports and declining exports, has resulted in a heavy accumulation of stocks. New orders, consequently, have declined. While output has been fairly well maintained so far, some curtailment of operations seems to be unavoidable in the absence of an early revival of new orders. Our index of domestic iron and steel consumption (1935=100) has fallen from 173½ last December to 155 in February and 143 in March. Nevertheless, the index for March is still appreciably higher than a year ago, when it stood at 118½. The extent of the actual reduction in consumption is probably somewhat exaggerated by the

index, as it is not adjusted for changes in stocks. Even in engineering there has been a further, if slight, increase in unemployment, due to a persistent decline in non-armament orders.

Activity in the building and contracting trades remains at a high level. The proportion of insured

persons unemployed in building and public works contracting last month was 1.5 per cent., and 4.6 per cent., respectively, smaller than a year ago. Although the weather last month was more favourable to outdoor work than a year ago, the latest unemployment returns point to sustained activity in these trades. The absence of a decline in building operations however, is largely due to the long time-lag between the inception and completion of buildings. The value of building plans passed by 142 local authorities last month was again lower than a year ago, the decline amounting to 12.4 per cent. Although these returns are by no means comprehensive, the persistent decline must ultimately lead to a contraction of operations.

The majority of other countries have also experienced a further decline in business activity. In the United States, the trend of industrial production remains indeterminate, though some improvement is expected later in the year as a result of President Roosevelt's new "pump-priming" measures. There has been a further deterioration in business activity in France, though the recent rise in the value of industrial securities indicates that a more favourable view of the future is now taken. Under the stimulus of increasing armament expenditure, activity in Germany is sustained at a high level. The recession in world prices is being increasingly felt in primary producing countries. In Canada, business activity has now fallen below the level of a year ago. In the Far East, China's trade remains dislocated. An increasing proportion of Japan's industrial resources is being transferred to armament work, with a consequent decline in commercial production and exports.

British Industrial Developments

The following reports on British industry cover, in most cases, the period to the middle of April. In the remainder they relate to the month of March.

COAL

While the coal-mining industry has been the last to recover from the depression, it has not been left entirely unaffected by the general decline in business activity. The volume of both domestic and foreign orders has shown a decline, though, in view of the contracts previously booked, this lull in new orders is as yet scarcely reflected in current output and exports. The output of coal rose from 20.1 million tons in February to 22.0 million tons in March, compared with 20.9 million tons raised in March, 1937. There is evidence, however, of an increase in stocks. For the first time for many months exports in March, at 2,966,000 tons, were slightly smaller than in the corresponding month a year earlier. Apart from the downward trend of demand due to the decline in domestic and export orders, the coal-mining industry is now faced with a seasonal decline in requirements for heating purposes. It remains to be seen whether the reduction in prices, which will come into force at the beginning of next month, will lead to an improvement in sales.

IRON AND STEEL

The steady expansion of home production of iron and steel, coupled with rising imports and declining exports, has resulted in a heavy accumulation of stocks. Congestion has been increased by the lull in the expansion of home consumption. The volume of new orders, consequently, has shown a serious decline. Even a few months ago it became apparent that, in the absence of a revival of new orders, some curtailment of production this spring was unavoidable. The output figures for March still show an increase over the corresponding month a year ago, though the margin has narrowed considerably, especially in the case of crude steel. The output of pig iron last month was 714,600 tons, compared with 693,300 tons in February and 680,300 in March, 1937. The production of steel ingots and castings was 1,115,800 tons, compared with 1,057,600 in February and 1,109,500 tons a year ago. Meanwhile, our monthly index of domestic iron and steel consumption, which is adjusted for seasonal variations, but not for changes in stocks, showed a further decline last month. After reaching 173½ last December (1935=100), the index has fallen without interruption. In March it stood at 143. So far there have been few indications of a sustained revival of demand. In the absence of such a revival, the industry may have difficulty in disposing of its output at the current rate of operations during the next few months.

GENERAL ENGINEERING

The engineering industry has been marking time in the last few weeks, with activity showing a slight downward trend. The proportion of insured persons unemployed in general engineering rose by 0.2 per cent. to 6.7 per cent. between February and March. Moreover, the percentage of persons unemployed last month showed an increase of 0.9 per cent. on the corresponding month a year ago. The industry is somewhat unsettled by the uncertainty concerning future Government policy. As Government contracts will probably have to be given priority, negotiation of private contracts is likely to be hampered in certain cases until the Government's policy, and especially its requirements, is more closely defined. The negotiations between the employers and the trade unions concerning the speeding-up of output in certain sections of engineering have not yet been concluded. In contrast to the slight decline in the activity of the industry, exports remain at a satisfactory level owing to the long time-lag between the placing of orders and their completion. Thus, exports of machinery rose from 35,723 tons in March, 1937, to 45,720 tons in the past month, and their value increased from £3,887,000 to £5,363,000. In terms of volume, exports in March were higher than in any month since July, 1930, and, in terms of value, since May, 1929.

ELECTRICAL EQUIPMENT

There has been little change in the position of the electrical equipment industry during the past month. The proportion of insured persons unemployed showed an increase of 0.2 per cent. between February and March in the case of electrical engineering, but a decline of 0.1 per cent. in the electrical cable and apparatus manufacturing section. In both sections, however, the proportion of insured persons unemployed last month was slightly higher than a year ago. Exports remain well ahead of last year's level. Thus, shipments of electrical machinery rose from 1,682 tons (valued at £278,981) in March, 1937, to 2,555 tons (valued at £402,764) in the past month. During the same period the value of exports of electrical goods and apparatus rose from £2,632,382 to £3,559,441.

AUTOMOBILES

The latest estimates of the Society of Motor Manufacturers and Traders indicate that the downward trend of the activity of the

private car section of the industry has not yet been arrested. The output of private cars and taxis declined from 28,449 in February, 1937, to 24,481 units in the corresponding month this year. On the other hand, the output of commercial vehicles rose from 8,468 units to 8,802 during this period. The improvement in the commercial vehicles section is ascribed mainly to increased Government purchases. Combined exports of private cars and commercial vehicles last month showed a slight decline in number, but an increase in value.

BUILDING

Operations in the building and public works contracting industries continue at a very high level. Thus, the proportion of insured persons unemployed showed a decline of 1.5 per cent. between March, 1937 and 1938 in the case of building and 4.6 per cent. in public works contracting. The sustained activity in these trades is largely responsible for the comparatively small decline in general business activity since last autumn. To some extent, persistence of the high level of building operations is due to the long time-lag between the placing of contracts and their completion. The persistent decline in the value of building plans passed, however, suggests that the present level of operations may not be maintained indefinitely. Thus, the value of building plans passed last month by 142 local authorities showed a decline of 12.4 per cent. on the corresponding month a year ago. It must be remembered, however, that these returns are not comprehensive, and are exclusive of Government contracts.

CHEMICALS

Chemical markets have continued quiet during the past month, owing partly to the unsettled international situation. New inquiries for industrial chemicals have been rather limited although contract deliveries are on quite a good scale. A very fair demand has been reported for fertilisers and interest in most wood distillation products has been maintained, with the exceptions of lime and wood tar. Only a small business has been transacted in dyestuffs. The demand for pharmaceutical chemicals is slow, although some interest has been shown in citric and tartaric acids. There is a good seasonal trade in refined coal tar, but demand is light for other tar products. The value of exports of chemicals, drugs, dyes and colours in January-March showed a fall of 7 per cent. from the corresponding months of 1937.

POTTERY

Employment in North Staffordshire and at Derby continued slack, but the Bristol trade showed a slight improvement. Unemployment in the industry as a whole fell slightly between February and March, but is still higher than a year ago. Exports of some varieties of tiles and of general earthenware were higher for the first quarter of the year than in 1937, but in all other sections exports were below the level of last year.

FOOTWEAR

Employment showed little change in March, and was fairly good. Short time was common at Bristol, Northampton and Leeds, while around Stafford there were more workpeople on overtime than short time. Exports in the first quarter of the year were higher both in volume and in value than in 1937; the increase was concentrated on the trade in men's shoes.

COTTON

Conditions in the cotton industry are generally difficult, and spinning production in March was estimated to have fallen further to 65 per cent. of capacity, against 70 per cent. in February and 92 per cent. a year ago. The decision of the Committee controlling the Medium Ring Price Agreement to reduce margins by 1d. per lb. has led buyers to look for a similar fall in price in other sections. Inquiries for piece-goods, especially from India, have increased, but prices have shown little change. The increase in the Egyptian tariff on heavy grey and white cloths and heavy printed and dyed fabrics and cabots, noted in *The Economist*, April 16th, page 156, has seriously disturbed these sections. Conditions in the home trade have somewhat improved and stocks have fallen.

JUTE

Unemployment in the jute industry showed a further increase in March, and approximately a third of those insured were unemployed in the middle of the month. Exports of jute manufactures fell from 34.8 million square yards in January-March, 1937, to 19.1 million square yards in the first quarter of the current year, while exports of jute sacks and bags amounted to 216,853 cwt., against 270,405 cwt. last year. Imports from India remain heavy, and the Indian jute mills continue to produce in excess of requirements.

LINEN

Flax sales are confined to current requirements, and prices are firm and unchanged. Yarns have received more attention, particularly damask and cambric varieties. There has been some expansion in cloth business, with increased shipments to Dominion markets, but sellers to the United States find it difficult to interest clients at present.

RAYON

There has been no material improvement in demand for rayon yarns from the weaving trade during the past few weeks, and there are still many looms standing idle. At the same time, the stocks of grey and finished rayon fabrics are assuming much more normal proportions and the outlook is considerably improved. Business remains fairly steady in the underwear trade, but rayon stocking business is still depressed.

WOOL

The industry generally continues depressed in all sections. The percentage unemployed in March showed little change from February, but was 14.5 per cent. higher than in March of last year; short time is being worked in most districts. Exports for the first quarter of the year are lower for all types of woollen goods than in the corresponding months of last year, and there are no immediate prospects of a substantial revival in the home demand.

AGRICULTURE AND FISHERIES

Spring sowing on arable farms is well advanced and germination is satisfactory; autumn-sown crops are doing well but need rain. The fall of lambs on lowland farms has been good, and mortality amongst ewes and lambs is reported to be lower than usual. The prospects for hill lambing are satisfactory. Pastures have begun to

grow, but are in some districts suffering from the drought. Milk yields are about normal and supplies of fodder are adequate. The night frosts over Easter have affected the early strawberries, and plum and greengage blossom is reported to have been seriously caught in some districts. The British catch of wet fish in March was slightly lower than a year ago, but that for the first quarter of the year showed little change. Owing to the better prices in January and February, the value for the quarter's catch amounted to £3.8 millions, compared with £3.5 millions in the corresponding months of 1937.

SHIPPING

The decline in freight rates continued, and *The Economist* index for March was 3 per cent. lower than in February and 16 per cent. lower than in March, 1937. There was some improvement in freights to North and South America, but the small Argentine maize crop is a depressing factor in the latter market. The latest returns of the Chamber of Shipping show that the volume of shipping laid up in the ports of Great Britain and Ireland increased from 61,225 net tons at the end of June last year to 339,325 net tons at the end of last month; the launching of new vessels ordered during the period of rising freight rates has stimulated the withdrawal of older ships.

RETAIL TRADE

The value of retail trade in March, according to the *Board of Trade Journal*, was 7.1 per cent. lower than in March of last year; some of this fall must be attributed to the difference in the date of Easter, and it is probable that the April figures will show an increase. The fall was least in Scotland (1 per cent.) and greatest in suburban London (11 per cent.). Sales of food and perishables fell by 1.2 per cent., and those of piece-goods, sports and travel goods and fancy drapery fell by 17 per cent., 19.2 per cent. and 11.1 per cent. respectively. The decline in all sections was most obvious in London.

* For method of construction and earlier figures (1924-1936) see Supplement to *The Economist* of July 25, 1936. Revised. P Provisional. † Annual indices represent averages of monthly figures.

Business Developments Overseas

BRITISH EMPIRE

AUSTRALIA.—The recent rains in the interior should assist the autumn sowing of wheat and improve the pasturage. The disturbances abroad have produced slight reactions, according to a cable from the National Bank of Australasia, but industry and trade building continue active and the Stock Exchange is little affected. Sales of wool are slow, and between July, 1937, and February, 1938, 330,647 fewer bales were exported than in the same months of the previous season, with a reduction of £A.13.4 millions in the amount realised; the deficiency was made good by increased exports of gold and dairy produce.

SOUTH AFRICA.—Business conditions remain quiet. Wholesale and retail turnovers in many lines are below those of the corresponding period last year; production in some industries has also fallen, but the general index of industrial employment for January compares favourably with that of January, 1937. The Budget has been postponed until after the General Election on May 18th; owing to the buoyant revenue, a surplus of £3½ millions is expected in place of the original estimate of £1.2 millions.

CANADA.—The official index of business activity (1926 = 100) fell from 115.0 in February, 1937, to 111.8 in January and 106.7 in February, this year. The output of minerals remains above the level of a year ago, but manufacturing activity has fallen well below that level. There has been a further fall in construction contracts. Both imports and exports were lower in February last than a year ago, and the active balance of trade fell by half compared with February, 1937.

INDIA.—In spite of a small increase in acreage, the all-India cotton harvest is estimated at 5.4 million bales, or 10 per cent. lower than the estimated yield for the last season. Sugar production is also expected to be smaller than in 1937, while the latest forecast of the wheat harvest is 10,184,000 tons, compared with an estimated yield of 10,145,000 tons in 1936-37. The Calcutta wholesale price index showed a slight further fall in March. Imports in March, 1938, rose by 280 lakhs and exports by 194 lakhs compared with the previous month; owing to a fall in the exports of gold, the favourable balance of trade fell by 218 lakhs to 19 lakhs.

EUROPE

FRANCE.—The latest available statistics point to a further decline in business activity. The official index of industrial production (1928=100) fell from 87 in January to 85 in February, a decline of 7.6 per cent. on February, 1937. The only indices to show an improvement between January and February are those relating to the chemical and automobile trades. Compared with a year ago, the decline in production has been very marked in the case of textiles, mining, paper and iron and steel. Wholesale prices have shown little change during the past four weeks. The formation of a new Government under the leadership of M. Daladier has given rise to an improvement in confidence, reflected in the increase of 12½ per cent. in the official index of the prices of industrial securities between March 19th and April 23rd. Unemployment has also shown a slight decline in recent weeks, the number in receipt of benefit having fallen from 404,257 on March 19th to 394,619 on April 16th.

GERMANY.—Industrial activity in Germany appears to have been well maintained, largely because of the sustained effort to increase military efficiency. Combined statistics for Austria and the former Germany are not yet available. The number of unemployed in Germany (excluding Austria) declined from 946,000 in February to 508,000 in March. A year ago the number of unemployed was 1,245,000. In the metal and engineering industries, in particular, activity remains at a high level. The weekly index of business activity calculated by the German Institute for Business Research declined slightly from 117.3 (1936 = 100) for the last week of February to 116.4 for the week ended April 2nd. In the corresponding week last year the index stood at 112.6. Retail trade also remains fairly brisk, turnover in January-February showing an increase of 8 per cent. over the corresponding period of 1937. There are indications that Austria's resources will be developed as speedily as possible.

SWEDEN.—General business activity continues at a slightly lower level than in the latter months of 1937. The output of steel, in particular, shows a fall from the peak of 107,000 tons in October last to 73,000 tons in February, and there has been a definite recession in the textile trades. The index of wholesale prices in February was 4.3 points lower than in the autumn of 1937. Although considerable increases in the grants to the defence services had been proposed in the defence Bill put before the Riksdag at the beginning of the session, the decision of the Government, after the Austro-German Anschluss, to speed up the re-armament programme was cordially received by all parties, and may serve to stimulate industrial activity.

BULGARIA.—Wholesale prices in January showed a slight further fall from the December, 1937, level, but are considerably

above those recorded in January, 1937; there was also a contraction in the volume of merchandise traffic on the railways and in the total monetary circulation. General activity, however, continues at a higher level than that in January of last year. Imports in January, 1938, were lower both in volume and value than in the corresponding month of 1937, while a smaller volume of exports returned a somewhat higher value.

NORWAY.—The index of industrial production in February showed an increase, largely seasonal, of 10.7 per cent. from the January figure and an increase of 8.9 per cent. compared with February of last year. Unemployment in February and March, 1938, was somewhat higher than a year ago. Wholesale prices fell slightly from February to March, owing to a sharp fall in the prices of some agricultural products. The freight market has been very depressed and the amount of shipping laid up has increased.

CZECHOSLOVAKIA.—There has been a decline in industrial activity and the index for January was 6 per cent. and 3.5 per cent. lower than those for December and January, 1937; the number of unemployed, however, remains smaller than in 1937. The value of imports in February increased from the January figure but was smaller than that in February, 1937; the reverse held for the value of exports, which was considerably higher than a year ago but smaller than the return for January of this year.

UNITED STATES OF AMERICA

Business activity has been marking time. Thus, the March index of industrial production calculated by the Federal Reserve Board (1923-25 = 100) is 79, the same as in February. Compared with March, 1937, however, the index for the past month shows a decline of no less than 33 per cent. There are no indications of any significant change of trend in April, a further decline in some industries having been balanced by a slight improvement in others. President Roosevelt's decision to come to the rescue of business once more by the resumption of large-scale Government expenditure and a policy of credit expansion is expected to bring about an improvement in business activity in the year. So far, however, there are no indications of an early and sustained expansion of the capital equipment industries, whose operations remain at a very low level.

LATIN AMERICA

ARGENTINA.—Owing to drought and damage from locusts, the current maize crop is not expected to yield more than 4.5 million tons, compared with 9 million tons harvested last year; exports of maize are unlikely to exceed 3.4 million tons, against an export of 9.1 million tons in 1937, and this shortage will emphasise the falling trend in exports. In the first quarter of 1938 the tonnage of exports was 65.4 per cent. lower than that recorded in the corresponding months of 1937, although the total value was only 53.2 per cent. less, owing to the higher prices. Among the agricultural products, the exports of oats, frozen beef, and canned beef were the only ones to show an increase on the figures for 1937.

BRAZIL.—Imports and exports showed a higher aggregate value in 1937 than in 1936, but the favourable balance fell from £9,000,000 (gold) to £2,000,000 (gold). Exports of coffee are not yet at a level necessary to compensate for the fall in prices, though there has been some expansion in sales since the price reduction in November last. Business generally continues quiet.

PARAGUAY.—The elections for the Chambers of Senators and Deputies have been further postponed until September 25th. The cotton and tobacco harvests are expected to be small and markets are generally depressed. The River Paraguay is very low, and transport will be very difficult unless heavy rains fall in Brazil.

THE FAR EAST

The index of business activity for Japan, published by the Oriental Economist, showed a fall of three points from December, 1937, to January, 1938, owing to recessions in the cotton and silk industries. Wholesale prices continued to rise in February, and the index topd at 245 (January, 1913 = 100), compared with 218 in February, 1937. The value of imports and exports during the first quarter of the year were 37 per cent. and 19 per cent. respectively below the figures for the corresponding period of 1937. The Stock Market remains uncertain, and Government disbursements at the end of the fiscal year kept the money market in a quiet condition. A revised Ordinance of the Finance Department came into operation on April 5th, by which the Government is enabled to control more closely the dealings of the banks in foreign exchange. The value of China's imports in February was 72.4 million standard dollars, against 85.4 millions in February, 1937; during the same period exports fell from 85.1 to 40.9 million standard dollars.

British Industrial Developments

The following reports on British industry cover, in most cases, the period to the middle of May. In the remainder they relate to the month of April.

COAL

As a result of the decline in domestic industrial activity and in international trade the output of coal is tending to decline. The quantity of saleable coal raised last month was 17.8 million tons, compared with 22.0 million tons in March and 21.7 million tons in April, 1937. Even if allowance is made for the fact that the number of working days in April was lower than in March owing to the Easter holidays, output still shows a decline which cannot be entirely explained by seasonal influences. In recent weeks, moreover, the output of coal has been running below last year's level. Exports last month, at 2.7 million tons, showed a decline of 0.5 million tons from the corresponding month last year. As a result of the decline in sales, the pressure on prices has shown a distinct increase, and their tendency has been downwards. There are no indications of an early reversal of the trend.

IRON AND STEEL

Despite the steady increase of stocks, the output of the iron and steel industry was well maintained until March. In April, however, there was a sudden decline in production. The output of steel ingots and castings last month was lower than in any corresponding month since 1935; it amounted to 938,600 tons, compared with 1,080,400 tons in April, 1937, and 984,200 tons in April, 1936. Calculated on a daily basis the output of steel last month was 6 per cent. below the level of a year ago. The output of pig iron in April, at 661,000 tons, though 19,700 tons lower than a year ago, was still above the level of April, 1936. The reversion of the steel duties to the higher level at the end of March has been followed by the re-imposition of the 3½ per cent. duty on foreign pig iron on May 12th. The increase in the steel duties resulted in a sharp reduction in imports of iron and steel, from 276,800 tons in March to 61,500 tons in April, compared with 88,500 tons in April, 1937. Exports of iron and steel, however, have also shown an appreciable decline, shipments last month totalling 168,300 tons, compared with 239,500 tons a year ago. Our index of domestic iron and steel consumption, which is not adjusted for changes in stocks, declined from 143 (1935 = 100) in March to 123½ in April. On May 19th the Foundry Pig Iron Producers' Association decided not to alter the prices of foundry and forge pig iron on July 1st, when the current price agreement expires.

GENERAL ENGINEERING

Activity in the engineering industry continued its gradual downward trend during the past month. The proportion of insured persons unemployed in general engineering showed a further slight rise between March and April, when there was an increase of 1.3 per cent. over April, 1937. The recession is a reflection of the progressive decline in the volume of new domestic and foreign commercial orders, which has not been fully offset by the increase in Government contracts. The negotiations for the speeding-up of armament work have not been progressing as smoothly as anticipated, for the trade unions are not prepared to surrender their rights without specific guarantees. Meanwhile, exports continue above last year's level, shipments last month totalling 39,619 tons (valued at £4,897,490), against 38,576 tons (valued at £4,111,082) in April, 1937. Imports fell from 13,151 tons (valued at £2,235,590) to 10,757 tons (valued at £1,823,712) during the past 12 months. The prospects for commercial work are not very encouraging, for there are no signs of a revival of domestic or foreign commercial orders.

ELECTRICAL EQUIPMENT

Activity in the electrical equipment industry is also tending downwards, though production still remains at a very high level. The proportion of insured persons unemployed in electrical engineering and in the manufacture of electric cables and apparatus showed a slight increase between March and April, when it was 2.0 and 4.2 per cent., respectively, higher than a year ago. Exports of electrical goods and apparatus fell from £1,090,108 in April, 1937, to £1,050,906 last month. Shipments of electrical machinery, on the other hand, continued above last year's level; exports rose from 1,502 tons (valued at £236,352) in April, 1937, to 2,140 tons (valued at £375,852) last month.

AUTOMOBILES

The March registrations of private cars were 7.5 per cent. lower than in March, 1937, and amounted to 35,470 cars; the production of private cars and taxis totalled 42,138, compared with 44,578 a year ago. The output of commercial vehicles, however, has increased compared with March, 1937, though new registrations at 7,871 were a trifle lower. Exports of private cars in the first few months of the year were higher by nearly 3,000 units than in 1937, and totalled 28,728 cars; exports of commercial vehicles were somewhat lower than in 1937.

BUILDING

Contrary to earlier expectations, activity in the building and contracting trades has so far been better maintained than in many other industries. In April, for example, the proportion of insured persons unemployed in building, at 12.7 per cent., showed an increase of only 1.3 per cent. over the corresponding month last year. In public works contracting the proportion of insured workers unemployed last month was actually 1.1 per cent. smaller than in April, 1937. Two factors which contributed to the continued buoyancy of constructional activity are the long time-lag between the inception and completion of buildings and the increase of Government contracts. While there are no indications of an early slump in constructional activity, the persistent decline in the returns of building plans passed by a large number of local authorities does not augur well for the future. The returns for April, relating to 143 local authorities, revealed a decline of no less than 24.1 per cent. in the value of plans passed from the corresponding month last year. The fall was most marked in the case of factories, shops and other commercial buildings. While these returns are by no means comprehensive, the persistent decline in the value of plans passed must, sooner or later, be reflected in a decline in activity.

CHEMICALS

Business in the home chemical market has been on moderate lines during the past month. Inquiries for industrial chemicals have been chiefly for small quantities to cover immediate requirements, but the tone of the market is quite good and prices are maintained. There has been quite a substantial business in refined coal tar for road making, but in other directions the coal tar products market is still quiet. A small but steady business has been transacted in pharmaceutical and other fine chemicals. Reports from the wood distillation industry indicate that there has been a good demand for most products, although acetates of lime and wood tar have been dull items. Overseas trade during April was disappointing, the value of chemicals, drugs, dyes and colours exported being £341,454 less than in April, 1937, whilst imports decreased in value by £219,078.

POTTERY

Exports of all types of products are generally lower than a year ago, with the exception of exports of earthenware to Canada. Unemployment has again increased, and the percentage for April, at 18.4, was a trifle higher than in March, and showed an increase of 6.7 per cent. over the figures for April last year. Trade at Bristol and Derby is fair, but employment in North Staffordshire fell off during the month.

FOOTWEAR

Conditions are little changed, and though short-time working is prevalent in all districts, the number unemployed in April was no larger than in March. Employment was fair in the Midlands and in London; slack conditions were felt in Bristol, Lancashire and Scotland. Exports in April amounted to 27,900 dozen pairs, compared with 30,800 dozen pairs in April of last year, but 131,100 dozen pairs were exported in the four months ending in April, against 124,500 dozen pairs in 1937.

COTTON

Another month of depression has been experienced in the Lancashire cotton industry. There has been a tendency for unemployment to increase, and production in the spinning and weaving sections has been further reduced. Buyers throughout the month have acted with extreme caution owing to a lack of confidence in current prices and nervousness with regard to the political situation. Raw cotton prices have tended to favour buyers. The statistical position is distinctly bearish, as it is anticipated that at the end of this season the carry-over of all kinds of cotton will be about 23,200,000 bales, or about 5,000,000 bales more than the previous record in 1932. The contraction in foreign trade is a serious matter. Exports of piece-goods in the first four months of this year show a decline of 25 per cent. compared with 1937, while shipments of yarn have fallen by 22 per cent. compared with a year ago. Inquiry in piece-goods for India has kept up fairly well and numerous miscellaneous sales have been arranged. Trade with Egypt has been thoroughly upset by the increase in the tariff. Practically nothing has been done for West Africa. Less satisfactory advices have been received from South America. Rather better clearances have taken place in the home trade section, but new business has not been of any importance. Conditions in the spinning branch have tended to become worse. Owing to rumours of there being a possibility of the price agreements being broken, buyers have held aloof. Spinning production is now 55 per cent. of capacity, against 65 per cent. a month ago and 92 per cent. same time last year.

JUTE

April exports of jute piece-goods were barely half of those in April, 1937, and totalled 24.9 million square yards in the first four months of the year, against 48.6 million square yards in the corresponding months of 1937. Exports of sacks in the same period totalled 290,000

cwt., compared with 362,000 cwt. in January to April, 1937. Unemployment continues to increase, and 36.3 per cent. of those insured in the industry were out of work in April.

LINEN

The prolonged drought is likely to be highly prejudicial to the new crop of flax. Consumption of flax is restricted, but prices are firm. Demand for yarns is mainly for immediate requirements, though spinners of fine sizes are doing a better trade. Exports of piece-goods were lower in April than a year ago; the exports for the first four months of the present year amounted to 19.7 million square yards, against 34.5 million square yards in the corresponding months of 1937.

RAYON

Rayon business has remained depressed during the past few weeks. The hosiery side is still relatively much better than the weaving trade, but both leave much to be desired. There are fair clearances of stocks of fabrics, but yarn stocks have been accumulating recently, and the manufacturing industry is still working very much below capacity. There has also been some curtailment on the yarn-producing side.

WOOL

Imports of raw wool were higher in March and April than in the corresponding months of last year, and imports for the four months January to April at 350 million lbs. were a trifle larger than in 1937. In spite of the better tone in the wool markets, the manufacturing side of the industry remains very slack; the percentage of unemployment was 21.2 in April, compared with 20.8 in March and 6.5 a year ago. Exports of woollen and worsted tissues in January to April were 20 per cent. lower compared with the same months of last year; exports of tops in April were also lower than in April 1937, owing to the disappearance of the trade with China. There has been some improvement in the home trade, but prices remain low.

AGRICULTURE AND FISHERIES

The slight break in the drought has enabled spring cultivations to be resumed in arable districts, but the cold weather has retarded growth. Pastures generally are in a backward condition, and farmers are pressing for higher milk prices to offset the extra cost of feeding which the lack of grass makes necessary. Hill lambing has been satisfactory and disease is less prevalent than usual, but prices for fat lambs and sheep continue to fall. Small fruit was badly damaged by frost in East Anglia, and pears and plums also suffered in most districts. The catch of fish in the first four months of the year amounted to 85.8 million cwt., compared with 5.9 million cwt. in 1937, but the value increased by 12 per cent. to nearly £5.2 millions.

SHIPPING

The Economist's monthly index of shipping freight rates fell by a further two points to 113.7 in April (1898-1913 = 100), compared with 150.3 in April of last year; the fall was largely due to the sharp recession in rates from India, since most other areas show a slight recovery from the March quotations. Tanker rates continued to fall. There is a general lack of confidence and no sign of any recovery in the near future.

RETAIL TRADE

The returns of the value of daily retail sales in April, given in the *Board of Trade Journal*, show an increase of 11.4 per cent. over the figure for the corresponding month last year. This increase, which follows a decrease of 3.7 per cent. in March, is mainly a consequence of the different dates of Easter in 1937 and in 1938. The increase was most marked in the sales of boots and shoes (21.3 per cent.), while there was also a considerable expansion in sales of women's wear (12.3 per cent.). Higher daily sales were experienced in all districts with the exception of Central and West London.

We regret that in the last Trade Supplement of April 30th the percentage decline in the value of retail sales was inadvertently given as 7.1 per cent.; the correct figure is 3.7 per cent.

* For method of construction and earlier figures (1924-1936) see Supplement to *The Economist* of July 25, 1936. † Revised. ‡ Provisional. § Annual indices represent averages of monthly figures.

Business Developments Overseas

BRITISH EMPIRE

AUSTRALIA.—Business activity continues at a high level and unemployment among trade unionists fell to 8 per cent. in the first quarter of this year. The building industry is well occupied and the expansion of the defence programme will involve an extra expenditure of £A.43 millions over the next three years. Rain is needed in most districts, except South Australia, and the shortage of grazing may have adverse effects on next season's wool clip. Export prices declined further in March, when the index was only three quarters of the level of March, 1937; wool prices, however, showed a firmer trend at the recent London auctions.

SOUTH AFRICA.—The soaking rains which fell in April have benefited the pastures, and given rise to more optimistic forecasts for the corn crops. The crop of citrus fruit is reported to be excellent; prices of hides have risen with a good demand, and the brief wool season closed with somewhat higher prices. Business generally seems to have improved from the low levels of the first quarter of the year, though conditions are not as favourable as in the spring of 1937.

CANADA.—The general index of business activity shows a rise from 106.7 in February (1926=100) to 108.8 in March, which compares with 118.7 a year ago. This small recovery in the index is the result of a number of contrary movements in the output of various industries. Exports of copper, gold and silver show a marked increase when compared with last February and with a year ago; mineral production as a whole was considerably higher than in March, 1937, and showed a recovery from the relapse of the last three months. Building permits also increased from the low level of February, but were still 47 per cent. lower than a year ago. The output of pig iron and steel increased during the month, but the output of newsprint continued to fall, and the seasonal rise in automobile production was considerably less than normal. The heavy rains in most of the Prairie Provinces towards the end of March have given the new wheat crop an excellent start.

INDIA.—The trade returns for March show that imports continue at a higher level than in 1937, while exports are smaller; the favourable balance for the month fell to 19 lakhs, the smallest since February, 1931. Imports for the fiscal year April, 1937-March, 1938, are valued at 173,46 lakhs of rupees, compared with 125,24 lakhs in 1936-37, when the accounts included Burma; on the other hand, exports showed a fall of 6.5 per cent. to 189,21 lakhs, and the balance of trade on merchandise account fell from 92,26 lakhs in 1936-37 to 30,57 lakhs in 1937-38. The third official wheat forecast places production at 10,184,000 tons, which is practically similar to the estimated yield of the last crop.

EUROPE

FRANCE.—The vigorous policy of the new French Government under M. Daladier has brought about a marked revival in confidence, reflected in the repatriation of funds, the success of the new defence loan, and the rise in the prices of industrial and Government securities. Some time, however, will have to elapse before this improvement in confidence is reflected in a revival of business activity. According to the latest statistics, industrial activity remains at a very low level, especially in the capital equipment industries. The official index of production (1928 = 100) declined from 85 in February to 84 in March; a year ago the index stood at 93. Production in the building, metal, textile, and chemical industries in March was well below the level of a year ago. The number of unemployed persons in receipt of benefit declined slightly between March and April from 401,096 to 393,054, compared with 371,413 at the end of April, 1937.

GERMANY.—In contrast to many other countries, industrial activity in Germany remains well above the level of a year ago, a reflection of the intense effort to increase her military preparedness. Combined statistics for Austria and the former Germany are not yet published. The index of industrial production calculated by the German Institute of Business Research (1928 = 100) rose from 121.0 in February to 124.8 in March, against 113.5 a year ago. The number of unemployed, as officially recorded, declined from 508,000 at the end of March to 423,000 at the end of April; a year ago the number recorded as unemployed was 961,000. Imports in March continued above last year's level, but exports were slightly lower as a result of the downward trend of international trade. The official indices of wholesale prices and of the cost of living show practically no change, but there is some evidence that the official indices may not be fully representative of the trend of prices.

HOLLAND.—The general index of industrial activity fell in March by 7.4 points to 81.5, compared with 93.8 in March, 1937. The share market remains depressed and there is little new investment. The unemployment percentage in March, at 28.2 per cent., was somewhat lower than in February and than in March of last year. Foreign trade continues to decline; the value of imports in April was 18.9 per cent., and that of exports 20.4 per cent. lower than in April of 1937.

DENMARK.—The index for industrial production (base 1935) rose by one point in February to 105, compared with 107 in February, 1937. Activity in the textile industry has increased, though the output is still less than a year ago; there was a further decline in building activity, the index standing at 81, compared with 84 in January and 93 in February, 1937. New wage agreements have now been obtained in most trades, by which an increase of 6 to 7 per cent. has been secured; the agreements are valid for two years,

unless large changes in the cost of living occur, when the agreements may be revised next March. Freight rates continue to fall and some 55,000 tons of shipping are laid up.

FINLAND.—Industrial activity is again at a high level, after a relapse during the winter. Unemployment is less than a year ago, and building plans passed in March for Helsingfors totalled 406,600 marks, against 152,700 marks in March, 1937. Imports in the first quarter of the year totalled 1,945 million marks, against 1,590 million marks in the corresponding months of 1937; the value of exports also increased by 200 million marks to 1,530 million marks. The volume of exports for the last ten months was somewhat lower than in the corresponding period of the previous year, while the volume of imports was considerably higher.

HUNGARY.—The disturbances in Europe during the current year have reacted unfavourably on the Stock Exchange, and there is little new investment. Building activity has fallen and unemployment is somewhat higher than a year ago. The Government has prepared a five-year plan for economic development, which involves an expenditure of 1,000 million pengö. This sum will be raised by a loan of 400 million pengö, and the remainder by the imposition of a capital levy on companies and on the larger fortunes. More than half of the total sum is to be spent on defence, while substantial amounts have been allocated for irrigation, agricultural research, land settlement, the reorganisation of farm debts and for developing the educational and social services.

UNITED STATES OF AMERICA

The general trend of business activity has remained slightly downwards during the past month. The index of industrial production calculated by the Federal Reserve Board (1923-25=100) declined from 79 in March to 77 in April; a year ago the index stood at 118. There are still no indications of an early and sustained recovery in the capital equipment industries, and many observers do not expect recovery to get under way before the autumn. On the other hand, it is not anticipated that industrial activity will decline very much further. Indeed, there are indications that the heavy stocks of semi-manufactured and finished goods accumulated last year are gradually being worked off. The recession in the United States is reflected in the sharp decline in imports, from \$296 millions in March, 1937, to \$173 millions in March, 1938. Exports, on the other hand, remained above last year's level; shipments in March totalled \$271 millions, against \$252 millions a year ago. The buoyancy of exports is due, in no small measure, to the heavy purchases by the United Kingdom.

LATIN AMERICA

ARGENTINE.—Argentine exports for April were even lower in volume and value than in the earlier months of 1938. With the contraction in purchasing power, imports are now beginning to fall from the abnormally high level of the last six months. Local grain prices are weakening on forecasts of a very large American wheat crop, but owing to the recent rains, the outlook for next season's cereal crops is excellent, as there is now ample sub-soil moisture throughout the agricultural zone. The President's Message to Congress on May 11th stressed the necessity for economy in the national finances, since the revenue for 1938 may possibly show a heavy fall from the previous year.

URUGUAY.—The wool trade still does not show the customary seasonal activity, and the markets for hides and wheat remain quiet. The allocation of import exchange for Great Britain has been reduced by £50,000 to £250,000 between March and April, while Germany's allocation was increased by £150,000 to £350,000.

BRAZIL.—The increased exports of coffee under the new marketing policy is more than offset by lower prices, and January closed with an import trading surplus of £704,700 (gold), compared with an active balance at end-January, 1937, of £731,400 (gold). Allotment of exchange continues controlled, and whilst business appears steady and normal, there is now a reduced volume of imports.

COLOMBIA.—The balance of trade is adversely affected by lower coffee prices and by recent heavy imports of textiles. The Government has introduced a Bill to increase the existing import duties on certain types of cotton yarns and cloths. These cannot affect British trade until next March, a year after the Colombian Government denounced the British Treaty of 1866. It is understood that conversations are proceeding on the subject of a new treaty. Business continues dull, but may improve now that the elections are over.

THE FAR EAST

The system of exchange restriction adopted by the Japanese Government in January has succeeded in reducing imports (excluding trade with Manchukuo and Kwantung) from 550 million yen in the two first months of 1937 to 307 million yen in the corresponding period of this year. This has only been achieved by a severe reduction in civilian imports and many industries are seriously hampered by lack of the necessary raw materials. In spite of the reduction in imports, the balance of trade remains adverse as the value of exports in January and February fell by 9 million yen compared with last year to 26 million yen. Some sections of Japanese opinion are favouring a depreciation of the currency in order that the severe exchange restrictions might be reduced. April imports into China, at 93.0 million dollars, were 6 millions lower than in March and 16.1 million lower than in April of last year; exports were valued at 56.7 million dollars, somewhat higher than in March, but considerably below the 79.8 million dollars exported in April, 1937.

UNITED KINGDOM

An Eventful Year

On the pages which follow we review, for the fourth consecutive year, the progress of unit trust affairs. It is noteworthy that after an eventful year, in which the investment markets have been subjected to a series of profound disturbances, the observer can still refer to progress within the movement. For since the major decline in security prices began early last year, the movement has coped with two major disadvantages—the lack of any immediate prospect of capital appreciation to exhibit in its shop window, and the possibility that, on a declining market, it might have to handle substantial re-sales of units from the public. On both counts, the interim verdict for 1937-38 is favourable.

Much of the discussion in this present survey is intended to analyse, in greater detail than has hitherto been possible, the problems of unit trust management during a period of recessionary markets. It follows in the line of our previous supplements, for we have again selected certain matters of topical interest with the object of providing, in the course of time, a conspectus of the development of the movement from youth to fuller maturity. Thus, in past surveys, we have examined such matters as the composition of fixed trust portfolios, the transition from fixity to the concept of flexibility, the detailed methods of flexible trust operation, trustees' responsibility, service charges and official inquiries. Much of this field may, to-day, be regarded as established knowledge, which does not call for re-examination on the present occasion.

But while it is broadly true that the investor is familiar with unit trust principles and practice, new developments of technique are still characteristic of a year in which leading industrial share prices have fallen over 20 per cent. There has been no evidence of any flood of re-sales of units to the managers. Problems of marketability, which according to many observers might have been expected to accompany a fall of this magnitude, have not arisen; the unit holder has behaved with a marked degree of stolidity. This fact has led us to present for the first time (so far as we are aware) a detailed analysis of the character and distribution of typical unit trust holdings. We have also extended the scope of our sales figures by introducing a new measure of turnover in units, which provides a clear guide to the volume of re-selling business since the movement started, and also for the latest year. It is believed that the information which we have assembled on these matters will give a useful indication of the order of importance of the problem of marketability, of interest to the unit trust managers and the wider investing public alike.

The year has brought its innovations. Perhaps it is true to say that, at the first impact of falling security prices, unit trust managers, as a whole, were distinctly more apprehensive regarding the prospective volume of re-sales than the average unit holder. The question of marketability, at least, was implicit in the series of proposals to convert certain existing fixed trusts into managed investment trusts of the conventional company type. The story of these offers, and their subsequent experience, is described in a later article, which draws the unavoidable conclusion that, for the time being at least, the conversion movement is unlikely to be extended much farther.

If eclecticism is a sign of health, the widely differing types of unit trust formations during the past year may be regarded as a favourable sign. In total, they number no more than seven. But they include one fixed trust, of the early type, and flexible trusts holding bank, insurance, rubber and tin, brewery and industrial preference shares. In addition, the first "geared" unit trust has been introduced—an interesting but necessarily specialised variant of the usual flexible investment fund. Particulars of these trusts, together with the existing 72 trusts which had already been formed when our previous supplement appeared, are provided in our directory table of unit trusts, appearing on pages 12 to 19. Their features—and, in particular, those of the Cornhill Trust—are examined in a separate article.

It will be recalled that, in our last survey of the movement, we likened its position, at that time, to Mahomet's coffin, suspended between one state and another and firmly anchored to neither. During the period of five months from April to August, 1936, the Anderson Committee was conducting its inquiries. Its report, published in the latter month (which was summarised in *The Economist* of August 15, 1936, pages 312 to 314, and further discussed in last year's unit trust supplement) conceded that, subject to legislative control, the unit trust movement had substantiated its claim to positive investment advantages. The movement was gratified by recognition in principle, but distinctly anxious to have its statute as soon as Parliament could find time, for experience had shown that official investigation had been accompanied by increased sales resistance on the part of the investor.

The omission of any reference in the King's Speech at the opening of the present session of Parliament to the prospect of unit trust legislation, however, clearly suggested that the Anderson Committee's recommendations might be destined for the pigeon-hole. This assumption

was later confirmed by Captain Euan Wallace, then Parliamentary Secretary to the Board of Trade, in a debate on a motion seeking the amendment of the Companies Acts on December 15th last year. Captain Wallace introduced, in a pointed parenthesis, a reference to unit trusts legislation. His remarks may be quoted below:—

The report of the Department Committee on Fixed Trusts . . . has received very careful consideration from the Government and . . . its main recommendations can be summarised under two heads. First of all, it is proposed that all unit trusts should have trustees of recognised status, and secondly that particulars as to their constitution and accounts should be available to unit holders. It is only fair to say that all reputable unit trusts have trustees of recognised status, and it is fair also to say that the great majority of these trusts have already carried out, of their own volition, many of the Anderson Committee's recommendations. Organisations of the type which go in for mushroom farms and soya bean farms we hope to get into the share-pushing legislation; and, therefore, I do not wish to suggest that we have in immediate contemplation legislation dealing with unit trusts as such.

In set terms, it is clear that the question of special legislation to govern unit trusts will not arise, if at all, for a very considerable period. Perhaps it is not too much to

assume that the review of the existing Companies Acts which was officially anticipated during the same debate may even precede unit trust legislation; if so, past experience suggests that the movement will be fully mature when its legislative turn comes.

The statement that "the great majority" of the trusts had already carried out "many of the Anderson Committee's recommendations" perhaps applies with rather diminished force to the question of yield calculations. The development of the flexible trust has raised problems concerning the "true yield" on investment funds which did not reveal themselves when the Anderson Committee was deliberating, but which have since formed a topic for considerable discussion. We have attempted to clarify this issue in a special article in this present survey.

So much for the major topics which have been suggested by the events of the past year. In succeeding articles they are each examined in detail. For the convenience of readers who require to set them against the retrospective background of the movement, we have prepared an index to the main topics which have been discussed in earlier supplements, which appears on this page.

Unit Trust Sales

In the preceding article we summarised the main feature of unit trust business during the past twelve months by observing that no evidence had come to light of any flood of re-sales of units from holders to the managers, despite the substantial fall in security values last year. It is now our task to summarise the sales figures which, as in previous years, the various managers (to whom our thanks are due) have supplied to us for the presentation of total figures relating to the movement. In the case of one group, we have again been compelled to resort to an estimate which has been related as closely as possible to the experience of other groups.

For this year's supplement, however, we have extended the scope of our enquiry with the object of providing an indication of the rate of turnover in unit trust business. This is a matter which, in the past, has rested on conjecture rather than evidence. For this purpose we have computed not merely the net cash sum invested by the public in the unit trust movement (after deducting payments by the managers in respect of units re-purchased by them), but have obtained figures showing gross figures of sales (in cash terms) and the total cash involved in re-purchases. This information has been made available to us by the trusts concerned since the beginning of their operations, and—a matter of great importance—for the past twelve months. We must express our appreciation of the willing response which the various managements have made to our request for this extended information.

In our last supplement we published an estimate of the net value of sales of the seventy-two trusts in existence at the end of February last year, based on the information supplied to us, of £71,025,000. In our comment at the time we stated that the total looked "somewhat higher than

a priori considerations might have suggested." In re-working the figures with the fuller range of information now available, it is evident that our reservations were correct. Certain adjustments have, in fact, been called for in respect of the sales position last year. They arise, in part, from the inclusion last year of certain gross items which have now been recalculated net, from various differences in calendar dates, and in one instance from the adoption of a revised basis of calculation.

Secondly, the proper presentation of the sales figures this year is complicated by the five conversion operations which have taken place. We have consequently prepared two figures, before and after taking account of the conversions, first to preserve comparability with the previous year and secondly to present the actual position as at the end of March.

In the table at the head of page 5, total cash sales and cash re-purchases are set out, in a form which shows the net outstanding amount placed by the public in the hands of the unit trust movement at the end of March, 1937, the amount of sales and re-purchases during 1937-38, and the present position. These figures do not take into account the units surrendered in respect of last year's conversion offers. The estimates which we have been compelled to employ in the case of one group have been so framed that they do not in any way affect the conclusions regarding re-purchases. The latter are fully representative of the experience of the remaining groups, and the figures have been adjusted on a proportionate basis.

It will be seen, in the first place, that the downward adjustment of the sales figure given in our last supplement is of the extent of £3,885,000. The net amount (as recalculated) invested by the public in unit trusts at the end of

UNIT TRUSTS' SALES AND REPURCHASES

	Total to March 31, 1937 (72 trusts)	Year to March 31, 1938	Total to March 31, 1938* (79 trusts)
Cash sales	£75,070,000	£13,680,000	£88,750,000
Cash re-purchases...	7,930,000	2,650,000	10,580,000
Net cash sales	67,140,000	11,030,000	78,170,000

* Without allowance for conversions.

March last year was £67,140,000, being represented by gross sales of slightly over £75 millions, less re-purchases of nearly £8 millions. During the past year gross sales amounted to £13,680,000 and re-purchases to £2,650,000, leaving a net increment of funds in the hands of the movement by the investor of £11 millions last year. At the end of March, therefore, the net outstanding cash sales amounted to £78,170,000, after deducting re-purchases involving £10,580,000 from the total sales estimated at £88,750,000.

It now remains to adjust our total sales figures above to provide for the conversion offers accepted during the past year. The extent of the success of these offers is shown in an article on page 22. Our figures for net sales in the table above are shown without any deduction in respect of the units surrendered in exchange for shares in the five investment trust companies formed last year. We have computed the value of these units, at the prices ruling at the date of the conversion offers, and have employed the figure for the purpose of calculating the investor's residual interest in the unit trust movement, as if it represented a surrender of units for re-purchase by the managers. The net total of sales before this adjustment amounted to £78,170,000, and the value of units surrendered in conversion to £3,130,000. The net residual interest in the movement, after adjusting for these converted units, is thus £75,040,000—a figure which invites adjustment to £75 millions.

We speak throughout of the movement as a whole. It is scarcely necessary to say that certain groups have not shown a degree of expansion comparable with the total figures. Of the thirteen groups which are included in our estimates, it is perhaps permissible to say that less than half account for the bulk of last year's expansion. Certain groups appear to have lost some slight ground, although the fact can usually be explained by deliberate choice of policy. On this occasion, therefore, the total figures for the movement require careful interpretation, since they show, for the first time, an advance which is represented by the special progress of certain groups, steady business by the majority, and a certain degree of setback for a minority.

Before we proceed to analyse the significance of the figures given above, it may be useful once more to compare them with the progress recorded by other popular savings media. In the second table we have set out the figures for unit trust sales at the end of 1934 and 1935, and at end-March, 1937 and 1938, with the total shares and deposits in building societies, Post Office and trustee savings banks' balances, and National Savings Certificates in issue. The figures for these three items are to various dates, but mainly as at the end of the four years 1934 to 1937.

Although the unit trust movement was introduced to this country in 1931, its major growth has occurred during the

PROGRESS OF POPULAR SAVINGS INSTITUTIONS

	End 1934	End 1935	End 1936	End 1937
Net Unit Trust sales	20,750,000	45,800,000	*67,140,000	*78,170,000
Building Societies' shares and deposits	528,367,000	571,057,000	609,093,000	655,917,000
P.O. and Trustee Bank deposits	573,529,000	623,593,000	679,961,000	731,750,000
Savings Certificates*	393,036,000	391,450,000	390,093,000	385,860,000

* March of succeeding year.

past three and a quarter years. During that period it has attracted nearly £60 millions net from the investor, and on the whole these funds have been administered with prudence. A new movement on trial with the public, and under examination by official bodies, cannot afford to make mistakes. Some features of the movement have been reformed, and others might be revised even to-day. Nevertheless, the unit trusts deserve credit for attracting a volume of savings from the smaller type of investor which might have found its way to the Stock Exchange in any case, but was almost equally likely to respond to the share-pusher's importunities. That there was room for the movement is suggested by the continued advance of building society funds and savings bank balances. A considerable part, at least, of the movement's resources may well represent net new business for the Stock Exchange, and these funds have proved the reverse of volatile, despite the shaken markets of the past year.

There is, however, a tendency which, if not wholly objectionable, yet appears to deserve close attention by the movement. During the past year it has been evident that certain trusts have been publicised in outside brokers' circulars. It is, of course, impossible to prevent the appearance of any particular share or unit in an outside broker's list—or in an inside broker's list for that matter—and many of these recommendations may be entirely *bona fide*. There appears to be some evidence, however, that certain instances of this sort have occurred with the positive co-operation of the managers concerned, and that the broker's circular represented one feature of a general sales campaign. We do not suggest that such practices are necessarily venial, but there might be certain advantages if the movement as a whole were to consider whether its best interests might not be served by adopting the rule of certain groups by which business must be done through a London or provincial Stock Exchange broker or a banker.

The trusts substantially reduced the volume of Press advertising during the past year. By the courtesy of the London Press Exchange, Limited, we are again able to provide an estimate of the volume of Press advertising during 1937, with comparative figures for previous years. The estimates are based on a wide survey of the Press, excluding certain specialised publications, and it may be assumed that the figures cover 80 per cent. of the total. They exclude, of course, any estimate of expenditure on other forms of publicity, such as booklets, regular publications, and posters. The table follows:—

1935	...	...	£184,147
1936	...	...	£215,615
1937	...	...	£75,789

It would appear from the figures that those groups which have continued to advertise during the past year have to some significant extent reaped the advantage of the goodwill created in earlier advertising campaigns.

Re-purchases and Marketability

THROUGHOUT the preceding article we have been concerned with the net volume of sales. It is now proposed to consider the importance of the turnover figures, given in the table on this page, in closer detail. There are, of course, two aspects to the problem of marketability. The first is the ability, or willingness, of the managers concerned to make close prices, in large or small amounts, for

units tendered to them for re-purchase. In short, the first phase of the problem is the willingness of the managements to act as jobbers—a factor which clearly depends on their resources and the type of securities with which they deal. The second aspect is that of realisability. So far as the managers are unwilling or unable to act as jobbers in respect of re-sales, they are compelled to resort to the Stock

Exchange, to liquidate some part of the underlying securities of their funds. And when this happens, the bid quotation for the units must necessarily be lowered to a liquidation basis. We have explained the significance of this point in previous supplements when discussing the basis of prices for closed trusts. So long as the units are marketable, in the first sense, the bid price will include the return of an appreciable part of the initial loading charge. Even if the managers quote a shilling dealing margin this is normally true. And in the case of the Trust of Insurance group, whose shilling dealing margins are free of buying and selling commissions, it is obvious that the net turn to the managers does little more than cover the cost of the registration work and new certificates involved.

This distinction between marketability and realisability deserves closer consideration than it has hitherto received. On the basis of their experience on "black" days during the past few months, unit trust managers can claim that they have been successful in maintaining a free dealing market in their units. But obviously they could not hope to maintain such conditions if unit holders decided to sell on a large scale. And the significant fact about the unit trust history of last year is the high degree in which investors have retained their holdings, a matter on which our figures of re-purchases throw new and valuable light.

In the following table we have expressed these figures as percentages of the total cash sales to March, 1937, for the year to March, 1938, and for the total to that date:—

INDICES' OF SALES AND RE-PURCHASES

	Total to March, 1937	Year to March, 1938 (a)	Total to March, 1938 (a)
Total sales	100	100	100
Re-purchases.....	10·6	19·4	11·9
Net sales	89·4	80·6	88·1

(a) Without allowance for conversions

At the end of March, 1937, re-purchases had amounted, in total, to slightly over 10 per cent. of the gross sales. This figure, of course, presumably included sales by investors who decided to realise an attractive capital profit

Who are Unit Trust Holders?

In an earlier section of this survey it has been shown that the net sales (after deducting re-purchases, but before allowing for last year's conversion acceptances) of all the unit trusts in Great Britain amounted to approximately £78 millions at the end of March last, compared with £67 millions a year earlier. The significance of these figures lies in their background; for they relate to a period during which the average Stock Exchange value of ordinary shares declined, according to the Actuaries' Index, by 24½ per cent. The unit trust movement, by general admission, owed part of its success to the synchronisation of its nativity and adolescence with a rising market for Stock Exchange securities. Friends and critics alike have been exercised over the fortune it was likely to experience when the inevitable down-turn came in share prices. From this viewpoint, recent months have been a critical testing time, and it must be admitted that the movement has emerged from its ordeal in creditable fashion. That the investor increased the funds entrusted with the movement by only 16 per cent. last year, compared with 46 per cent. in the preceding fifteen months and over 100 per cent. in the calendar year 1936 is scarcely matter for surprise, though the repercussions of smaller net sales importance as advertising policy and management net earnings must clearly have been considerable. What is our opinion on such a matter is that the net total of funds invested in many unit trusts has increased at all in a year of acute Stock Exchange depression, and that actual encashments (which have I really noteworthy the "gilding" of some of the closed net Exchange depression; that the unit trust holder has involved the further "unwinding" rather than of instability. trusts) have been moderate by new purchases. So far, in a falling market, provided an element

on many of the units at that time, and also perhaps by certain nervous holders who had read more in the decision to hold a Board of Trade inquiry than it actually implied. Expressed as a percentage of the total sales during the past year, re-purchases show a considerable increase, which might be expected to result from the scissor-like operation of falling markets, in reducing new sales and increasing re-purchases. Yet, to the end of March last, total re-purchases represented slightly less than 12 per cent. of total sales since the inception of the movement.

Re-purchases, however, are of two kinds—corresponding to the distinction which we have already drawn between marketability and realisability. Gross re-purchases are concerned with marketability in its widest sense. But net re-purchases, after deducting the amount of subsequent re-sales (to new purchasers) of units previously issued, and after allowance for any “position” which the managers may hold in their units, involve the realisation of underlying securities. We have, as far as possible, computed our figures to show net re-purchases, but it is difficult to define the proportion of gross re-purchases which are represented in the results. But even assuming that they consisted of net re-purchases, it is evident that the movement last year could have sold back to the market securities to the value of no more than £2,260,000, while it purchased securities to the extent of £13,680,000. The actual Stock Exchange business, of course, is likely to have been smaller than both figures, since they include certain re-purchases of units (which have subsequently been re-sold) in which the managers have been willing to take a temporary “position.”

The conversion operations last year—which are best treated as a special case—may have involved some market effect, so far as the liquidation of underlying securities for the surrendered units was concentrated in the industrial share market. But the extensive switching which the new trusts appear to have carried out brought an equal volume of new business to other sections of the market.

We have, unfortunately, no basis of comparing these results with the turnover of shares in established companies. But it is evident that the volume of re-selling to the managers by unit trust holders has not been extreme.

The managements may make the legitimate, if vicarious, claim that if all investors had been of the same mind as their own certificate holders, last year's Stock Exchange slump could not have taken place. If so, then it is important to ask what manner of men unit trust holders are, who have stood firm like Stonewall Jackson when the battle was going against them. To know that is one step—and an important step—towards wider knowledge of the anatomy of falling markets, which is an essential part of the solution of one of the most baffling problems of the theory of investment.

We are, therefore, the more indebted to certain unit trust managers who have courteously furnished us, at considerable trouble to themselves, with details of the distribution, at recent dates, of their issued units (and sub-units) between holders of different classes. This is the first occasion on which such information has been made public. In the detailed tables at the foot of page 9 we show the resulting figures for five fixed trusts—the First, Second, Third and Fourth British (with total figures for all four); the Universal Fixed Trust—the Foreign Government Bond Trust (a specialised flexible fund); and all funds in the Trust of Insurance group (with the exception of Cornhill Trust).

The analyses show, first, the proportion of the total number of holders, and secondly the proportion of the total units (or sub-units) of each trust, represented by holdings of 100 units or less, by holdings of over 100 but not more than 200, and so on, at 100-unit intervals up to 1,000 units, with larger intervals thereafter. They cover approximately 95 per cent. of the total units of the four Municipal and General fixed trusts, 97 per cent. of the Foreign Government Bond Trust, over 93 per cent. of the Trust of Insurance group, and the whole of Universal

SIMPLIFYING THE INVESTMENT PROBLEM

It has been the aim of the British General Group of Trusts to divide the various investments offered into easily-definable sections. Thus, one Trust caters for those interested in basic Commodities, another covers the great Industrial concerns; still another opens up the world of Rubber and Tin investment. In this way, the investor is offered a wide choice in a vast cross-section of British and Empire Industry.

BRITISH GENERAL FIXED TRUST

(Series A and C)

This Trust is designed primarily to increase Income Yield. SERIES A consists of the stocks and shares of 23 great organisations producing basic Commodities—Iron, Steel, Coal, Wool, and so on. These are all commodities which are of vital necessity to a world re-arming. The yield at 19s. 7½d., exclusive of cash bonuses, sales of rights and fractions, etc., is estimated at not less than £6 6s. 3d. gross per annum, based on the distributions of the last two completed half-years of the Trust. The Trust is fully cumulative, share bonuses being retained in the Trust.

SERIES C covers Industry. It consists of the shares of 27 leading British companies such as Railways, Motor Manufacturers, Tobacco and Transport undertakings, Gas and Electricity services. All these products or services are also benefiting, directly or indirectly, from the demands of national defence ; to such an extent, in fact, that the yield at 16s., exclusive of cash bonuses, sales of rights and fractions, etc., is estimated at not less than £6 3s. 9d. gross per annum, based on the distributions of the last two completed half-years of the Trust. The Trust is fully cumulative, share bonuses being retained in the Trust.

Trustees: The General Accident Fire and Life Insurance Corporation Limited
Managers: British General Fixed Trust Limited, 36-37 King Street, London, E.C.2

TRUST OF RUBBER AND TIN SHARES

“Autolykus,” of the *Financial Times*, says (8/4/38):—“For anyone who cares to put away a few hundred pounds as a speculation, with the hope of making 50 per cent. profit within 12 months, the Rubber market presents obvious scope for talent.” This Trust has a permitted portfolio of 85 rubber companies and 20 tin companies,

which has been selected and is supervised by some of the leading experts on Rubber and Tin to-day. Each company has been selected not only on account of dividend yield, but also as having progressive management which should ensure participation in the growth of world demand for these two vital products.

Trustees : Martins Bank Limited

Managers: Specialised Unit Trusts Ltd., 36-37 King St., London, E.C.2

Ask your stockbroker or bank manager for further details or
*Write to the Managers for the special Booklets of the British
 General Fixed Trust and the Trust of Rubber and
 Tin Shares, which are the bases of all transactions.*

BRITISH GENERAL FIXED TRUST

King's House, 36-37 King Street, London, E.C.2. Telephone: METropolitan 6531

FOR JUDICIOUS INVESTORS

ELECTRICAL INDUSTRIES TRUST

Electricity is the most vital of mechanised aids offered to civilisation and its quickened pace may be measured in terms of speed, efficiency, cleanliness and public health. In the industries concerned with the supply of electricity and with manufacturing electrical equipment there are good opportunities for enterprise and profit.

Electrical Industries Trust provides a means of investment in the share issues of forty-one of the best electric supply and equipment companies. Approx. yield, 4½% gross from dividends, plus 1½% from recurring bonuses and rights.

Trustees: GENERAL ACCIDENT FIRE & LIFE ASSURANCE CORPORATION LTD.

METALS AND MINERALS. TRUST

On the basis of the distribution to be made in respect of the last twelve months of the Trust, Metals & Minerals units at the price of 14s 6d. xd., (12 May) yield the equivalent of £5 10 8 per cent. per annum gross after the equivalent of £1 12 9 per cent. has been put to reserve to safeguard the investors, capital and to provide for equalisation of dividends.

Metals and Minerals Trust is concerned with the share issues of forty companies producing and investing in base metals, minerals, diamonds and gold undertakings.

Trustees: MIDLAND BANK EXECUTOR & TRUSTEE COMPANY, LIMITED

BRITISH INDUSTRIES FIXED TRUSTS

Reorganised and reconstructed, and with sound finance and a new confidence behind it, British industry is in finer shape than ever in its history. The check to speculation in commodities has mitigated the danger of a too rapid rise in cost of materials. The four Portfolios of this Trust give their certificate holders a wide-spread interest in the equity of our country's future.

An investment divided equally between all four Portfolios gives, at prices current 12 May, a yield of approx. 5½% gross per annum from cash dividends, plus ½% from share bonuses and rights.

Units or sub-units may be bought through any stockbroker or bank. Explanatory booklets (on which transactions are based) may be obtained on request.

Fixed Trust. The opening and present prices of the units are given for purposes of reference.

A supplementary table analyses the aggregate Municipal and General fixed trust holdings, together with those of the Foreign Government Bond Trust, in terms not of units, but of the value of holdings in pounds sterling. This table covers the same proportion of total outstanding certificates as the earlier unit figures for the same trusts, the values being based on the middle x.d. prices of the respective units as at the last coupon dates. This table appears at the foot of the next page.

An ingenious statistician might devise a lengthy series of instructive permutations and combinations from these figures. Our present objective, however, is to compare the distribution of ownership of unit trust certificates (which, *ex hypothesi*, show a high degree of resistance to selling during depression) with the distribution of ownership of company shares (which have been sold on a considerable scale in the past year). The following table summarises the unit trust figures in a manner which facilitates comparison with certain estimates based on a scrutiny of the share registers of ten large British companies made a few years ago by a private inquirer* and reproduced recently in *The Economist*:—

DISTRIBUTION OF TOTAL NUMBER OF HOLDERS

Holdings not exceeding	Municipal and General						Trust of In- surance Funds*	Univer- sally Fixed Trust
	1st British	2nd British	3rd British	4th British	Four Fixed Frustrs	Forgn. Govt. Bond Trust

appealed, in fact, to much the same type of clientele as the general trusts among the smaller investors, but to a somewhat more influential proprietor among the larger capitalists. Nevertheless, there is no single example in the table of a trust in which the small holders, of anything up to 500 units each, do not account for the major part of the total amount at stake. Here, the position differs significantly from that shown by an analysis of representative company shareholders. The inquiry to which reference has been made above did not evaluate the total capital represented by the smallest shareholdings, but made an exhaustive examination of the incidence of those which were very large indeed. It was found that from one-fifth to one-half of a company's capital might, not infrequently, be possessed by a handful of proprietors, each holding 50,000 shares or more. These gargantuan holders do not exist in the unit trust movement, where holdings of even 5,000 or more units are, to judge from the examples given in this article, almost negligible.

The conclusions suggested by our examination of the anatomy of unit trust ownership begin now tentatively to take shape. In a period of falling values it is the small investor who grimly holds on to his stock. That appears to be true both of the unit holder and the company shareholder. That very large company holdings are liquidated on a considerable scale, in a falling market, is almost equally unlikely; for they are held mainly for strategic and "family" reasons. The chief seller in the early stages of a falling market is rather the intermediate holder, whose shares are numbered in thousands rather than in tens of thousands. His attitude towards his holding is wholly impersonal, and he has both the inclination and the knowledge necessary to "play" a free market. But our figures show that holders of this type are of relatively minor importance in the case of the unit trust; and trust certificates will never have a free day-to-day market such as leading market stocks like Imperial Tobacco and Courtaulds enjoy. There is, further, some evidence that sub-unit holders have taken to heart the moral upon which the publicity material of the trusts has always insisted, and have come to view their holdings as a long-term investment—indeed, almost as part of their personal savings, like a savings bank balance, to be drawn on only in dire economic distress. If so, then the unit trust movement, which has a strong claim to rank as an element of stability in the first stages of a falling market, might conceivably enjoy a less satisfactory experience if depression were prolonged.

DISTRIBUTION OF MUNICIPAL AND GENERAL FIXED TRUSTS AND FOREIGN GOVERNMENT BOND TRUST BY VALUE

Foreign Government Bond Trust	314.6	210.4

Analysis of Occupations and Estates

An interesting cross-bearing on these conclusions may be obtained from the results of an investigation made by First Provincial Fixed Trust. Part of the information was originally published in *The Daily Herald* at the end of last year, and our thanks are due to both parties for permission to reproduce the figures in our present supplement.

The investigation consists of two parts. In the first, the managers of the group have made an analysis of registered holders by occupations. The distribution of total holders on this basis is set out in the following table:—

Occupation	% of Total	Occupation	% of Total	Occupation	% of Total
Spinsters	24.34	Doctors & dentists	2.00	Travellers	0.94
Married women	18.49	Manufacturers and	2.00	Agents	0.86
Gentlemen	17.67	merchants	2.00	Accountants	0.81
Widows	11.05	Farmers	1.68	Builders	0.76
Shopkeepers	3.97	Clergy	1.61	Solicitors	0.60
Engineers	2.97	Civil servants	1.37	Railway employees	0.17
Clerks	2.86	Army and Navy ...	1.25		
Artists and teachers	2.32	Bank officials	1.15		
		Manual foremen ..	1.13		

It will be seen that three of the four largest categories comprise holdings registered in the names of spinsters, married women and widows, and together these account for well over 50 per cent. of the total number of holders. Over 17½ per cent. of the total number of holders are recorded as "gentlemen," a description which may be presumed to include investors of independent means, retired persons, and perhaps a certain proportion of gainfully occupied men who might on a strict classification be included in the occupational categories shown, although they were not so described at the time their holdings were acquired. The impression presented by the table is that holders of the units in the First Provincial group are well spread throughout various social and occupational grades, and among the latter there is some tendency in favour of the smaller type of investor from the "salaried" and artisan classes. Since the occupational grades consist only of men, however, the second important fact which emerges is the preponderance of women among the total holders. We are informed that between 50 and 60 per cent. of the holders of units in this group have given instructions for the payment of distributions to the credit of their banking accounts. This fact provides a general indication of the substance of the holders concerned; it suggests that banking accounts are much more frequently to be found among unit holders than, say, among shareholders and depositors in the building society movement.

The second part of the investigation is distinctly original and instructive. The managers have analysed the personality recorded in 436 probates, which were forwarded to them for registration in respect of deceased estates. The results are analysed below, in the various personality grades, together with a percentage distribution:—

Value of Estates	No. of Probates	Percentage of Total	Value of Estates	No. of Probates	Percentage of Total
£50 or under ...	3	0.7	£1,001-£1,500	37	8.4
£51-£100	3	0.7	£1,501-£2,500	59	13.5
£101-£200	2	0.5	£2,501-£5,000	86	19.7
£201-£300	3	0.7	£5,001-£10,000	87	20.0
£301-£400	2	0.5	£10,001-£50,000	98	22.5
£401-£500	10	2.3	Over £50,000	11	2.5
£501-£1,000	35	8.0			
				436	100.0

Making allowance for the possibility that registration of probate more frequently affects the larger holdings, and for payments under insurance policies, the table provides much-needed information regarding the type of investor who holds unit trust certificates. It will be seen that out of the 436 probates examined, as many as 282 represented estates of more than £2,500. We have calculated a weighted average of the estates (based on the middle figure in each separate category and a limit of £50,000), which shows that the average value of the estates amounted to £10,700. This figure suggests that the average holder, reckoned in terms of wealth, is a person of some substance,—"comfortable middle class" might be as good a general description as any.

15 MOORGATE GROUP OF UNIT TRUSTS

These Trusts are managed by Fifteen Moorgate Unit Trusts, Ltd., a company closely associated with Dawney Day & Co. Ltd., merchant bankers, and are notable for their flexible management powers. Each spreads its funds over an extensive list of first-class stocks and shares and the portfolios taken as a group include 197 different securities arranged in carefully selected categories which cover virtually the whole field of prudent investment.

The Trusts, with their approximate gross annual yields, based on current sub-unit prices and the dividends paid last year are:—

Security First	7 %
Hundred Securities	6½ %
Investors 2nd General	7½ %
Investors Gold Share	9½ %
Provident Investors	6 %
Investors Flexible	7 %

An investment spread evenly over all six Trusts yields on the same basis (approximately 7%)

Full particulars of all these Trusts are given in the official handbook B61 which is the basis of all transactions.

The Year's Trust Formations

OF the making of unit trusts there is, as yet, no end. Since April last year, seven new unit trusts have been created, raising the total number in existence to 79, of which 52 are fixed and 27 flexible. Of the total, some 26 are closed and 53 are open. *Investors Gold Share Trust*, which was closed on February 10, 1937, was reopened as from March 7th last, with certain changes in its portfolio and method of operation.

Perhaps the development of greatest interest during the past year has been the introduction, by Trust of Insurance Shares, Limited, of a geared unit trust. The *Cornhill Trust* of Bank and Insurance shares and British Government stocks was created in October last year. It represents, at many points, a radical departure from familiar unit trust conceptions, and its method of operation requires more extended description than is possible in our directory on pages 12 and 13. The trust fund is not limited in total size, and consists of authorised British bank and insurance shares which the managers may select (together with gilt-edged), so constituted that the value of the investments exceeds two and a half times the nominal amount of any reserve and uncalled liabilities. The fund must include a proportion of gilt-edged securities, defined under the deed, which varies according to the total size which it has attained. This is the broad constitution of the fund itself.

The managers have power, secondly, to create £1 debenture units up to a nominal amount equal to 60 per cent. of the mean market value of the fund, which rank as a first charge for principal and interest, at 4 per cent. per annum, and for repayment at £105 per cent. on October 5, 1952. Such units may not be sold, in the first place, below £1, although they may be sold at a premium, which becomes payable to the trustees and is applied either to cash produce or to the capital of the fund as the managers may determine. For each debenture unit sold the managers are entitled to 6d. to cover costs of issue, including brokerage. The equity of the fund is represented by deferred units, which may be created up to the "net value" of the fund. Net value is determined by deducting

the nominal value of debenture units and accrued interest from the aggregate value of the investments and cash held by the trustees, and adding a service charge of 5/95ths of this sum together with such further sum as may be necessary to make a price for the deferred units which is a multiple of 3d.

The debenture units are guaranteed as to interest and capital (with premium on redemption) by Equity and Law Life Assurance Society. It will be apparent that their price is governed, not by an equity in the trust fund, but solely by market conditions and prevailing rates of interest on securities of similar character. At the original price of issue (20s. 6d.) the debenture units yield £4 0s. 4d. per cent. to redemption. The value of the deferred units, on the other hand, is determined by the residual equity of the trust fund, after deducting prior charge claims. In the case of the debenture units, the managers assume the function of jobbers, making sales of new units to the public, and marrying resales against further purchases when the units have been issued. It is reasonable to suppose that the average holder of this new type of security would be distinctly different from the holder of the usual trust units, and that the list includes a greater proportion of substantial long-term holders. It is important to realise, moreover, that the units may not, except under strictly defined conditions, be presented for repayment out of the trust fund. It is true that a holder of 10,000 deferred units may present them for repayment, but these units must be accompanied by the corresponding amount of debenture units determined by the proportionate relationship between the two issues.

The value of the debenture units, in short, is determined in a market maintained by the managers. Adjustments of their price are determined by movements in prevailing interest rates, by the matching of buying and selling orders received by the managers, and by the extent to which the latter are prepared, if the need arises, to run a book in the units. The standing of the management group and its associates suggests that marketability would be readily preserved under normal conditions. It might be conceivable

that, if interest rates were to rise very appreciably, the market value of the debenture might fall below £1, but the prospect of redemption at 5 per cent. premium in 14 years would limit the decline. It may be noted, moreover, that the managers are debarred from creating new units at a price below 20s. and that the offered price has for some time exceeded the issue price by 1s. 6d.

The essential problem in a geared trust, however, is to find subscribers for equity units. Clearly, a second charge on a trust composed of bank and insurance shares and gilt-edged, ranking after a 4 per cent. debenture (which may be issued to the extent of 60 per cent. of the fund), cannot be expected to provide an attractive initial return to the ordinary investor. Again, the effect of gearing necessarily tends to magnify, to some appreciable extent, the fluctuations in the underlying securities. Thus the deferred units of *Cornhill Trust* must be treated as a special category. They have, in the first place, been privately subscribed. Secondly, their initial yield is computed at no more than 2½ per cent. gross.

The deferred units, in short, are likely to appeal mainly to the investor who is satisfied with a low initial yield, linked with prospects of long-term capital appreciation and growing income. On a computation which the managers regard as conservative, a potential appreciation of no less than 150 per cent. has been suggested on the deferred units by 1952. It is clear, further, that this type of trust could only be adopted over a limited part of the entire investment field. If it were applied, say, to a portfolio of shares in industries where profits and share values vary widely between different phases of the trade cycle, the equity units would necessarily be an extremely volatile security. Indeed, it might be found that, in an extreme depression, the capital value of equity units in such a hypothetical trust might be uncovered. Such major fluctuations, however, seem unlikely to affect the *Cornhill Trust*, judging from the known behaviour of insurance and bank shares during the past fifteen years. But while the *Cornhill Trust* represents a highly interesting development, it seems unlikely that the geared unit trust will be applied over more than a limited investment field, in which the prospects of secular progress are most clearly apparent.

The remaining trust formations during the past year may best be considered in chronological order. In June last

year two flexible trusts were formed—the *Trust of Rubber and Tin Shares* and *Brewery Unit Trust*. The former is a specialised commodity trust, whose appeal to the more speculative type of investor may be inferred from the choice of an initial price for the units of approximately 2s. and a life of only five years. *Brewery Unit Trust* is of a more conventional character. While it is concerned mainly with brewery shares—the trust deed requires 50 per cent. at least of the fund to be invested in such securities from the permitted list—a number of companies in ancillary and catering trades are also available for investment. In November last year, when the conversion controversy was at its height, the *Keystone group* introduced *Keystone Consolidated Certificates*. This trust is of the uncompromisingly fixed character, with the sole exception that the managers can realise any security which they may certify as falling under specific disabilities, but re-investment of the proceeds is not allowed under the trust deed.

During the year the *Selective* and *British Transport Trusts* were taken into the *British Empire-Selective group*. *Proved Securities, Limited*, the managers of the *Trust of Bank, Insurance and Financial Shares* (with which the former trusts had been associated) subsequently introduced, in January this year, the *British Bank Shares Trust* and the *British Insurance Shares Trust*. These trusts are flexible, and have a twenty-year life, with power reserved to the managers to terminate the trusts after fifteen years. It will be seen from our directory table that after payment of the initial loading charge of 7½ per cent. no annual charges are payable by the unit holder. The *British Insurance Shares Trust* deed contains a provision (similar to that in *Metals and Minerals Trust* deed) under which the managers may set aside to a reserve fund up to one-half of any excess of gross income over 2 per cent. on the fund in any half-year. If such reserve provisions are made, they become part of the deposited property of the trust. No unit holder would be entitled to any particular part of the reserve fund, which would be applied to the benefit of the unit holders as a body, at the discretion of the managers.

The latest formation, *Domestic Priority Income Trust*, was introduced at the beginning of this month. This is one of four trusts—the others being *National "C,"* *Gilt-edged*, and *First Provincial "A"*—which is limited to preference

shares and fixed interest securities. But unlike these earlier
formations, it is of flexible type, the initial portfolio con-
sisting of 88 issues, while the permitted list includes as
many as 263 further companies. The general conditions of
operation are broadly similar to those of the other trusts
in the F.T.M. group.

Finally, reference should be made to the reopening of
the Investors' Gold Share Trust, referred to above.
Announcing this event on March 7th last, the managers
disclosed that no additional holdings of Government Areas

and Wiluna were to be made (these shares having been
included in the original panel), but that in their stead
Nourse and Gold Coast Selection would be purchased. The
proportions of the trust fund represented by the other
twelve securities will remain constant; but as new units
are formed, or the size of the trust changes, the proportions
of the two former shares (which have not been eliminated,
but will merely not be increased) and the two new securi-
ties will vary. These percentages will be notified half-yearly
to sub-unit holders.

Unit Trusts' Price Performance

IN our last supplement we provided a series of index
numbers comparing unit trust prices with those of repre-
sentative investment indices. On the present occasion we
have decided to extend these index numbers to cover a
group of twenty-four closed fixed trusts, a similar number
of open fixed trusts and a group of eleven flexible trusts.
There are certain difficulties and limitations attaching to

lating prices involves the sharp separation of closed from
open fixed trusts, since the former have, by definition,
been reduced to liquidating value, having shed in the
process a service charge and a price "turn" which may
amount, on a typical unit, to as much as 2s. 6d.

For the closed trusts, therefore, we have made a careful
adjustment, on the available data, to put all the prices
employed on a "closed" basis since the beginning of
1934. In the absence of this adjustment, an artificial fall
of the order of 2s. 6d. per unit would be involved between
open and closed prices. Few trusts, of course, have been
closed throughout the period of our index. The number of
closed flexible trusts is small and they have not been
included among the eleven flexible trusts, for which con-
sistent prices are available since June, 1936, and are
represented in the index overleaf.

We have based the two fixed trust indices on end-
December, 1935 = 100, and have re-worked *The Financial*

News ordinary share index and the Actuaries' Investment
Index of 151 ordinary shares on the same basis for com-
parative purposes. The former is a sensitive market
indicator and the latter a more stable investment measure.
For the reasons we have discussed, this double comparison
seems desirable, though it is possible in theory to raise
certain objections, as we have indicated. The last trading
day of June, 1936, has been selected as the base date for
index number of flexible trust prices, owing to the nature
of the sample, and *The Financial News* and Actuaries'
Indices have been recalculated on this basis.

In the accompanying tables and charts we present the
results of our calculations. The first table and charts com-
pare the price performance of closed and open fixed trusts
(end-December, 1935 = 100) with the movements of *The*

any conglomerate unit trust indices. In the first place, many
unit trusts are of a specialised character, and should, in
strictness, be compared only with a similarly specialised
investment index. Secondly, the variable composition of
flexible unit trust portfolios imports a difference between
price movements of the units and the movements of the
typical investment index. Thirdly, the method of calcu-

Financial News and Actuaries' Indices. The closed trusts rose less rapidly than *The Financial News* index between March, 1934, and December, 1936, but have fallen less steeply since. The correlation with the Actuaries' Index is closer during the recovery phase, but the trusts have fallen less severely during the past seventeen months.

Comparison of the closed trust index with the performance of the open fixed trusts (set out in the first table and second chart) is instructive. The closed trusts are

FLEXIBLE TRUSTS' PRICE INDEX
(June 1936 = 100)

mainly those formed in the earlier stages of the movement, and it is probable, as a broad generalisation, that they included a greater proportion of sensitive market leaders. These facts may together provide the explanation why the index of open fixed trust prices is consistently lower throughout than the close trust index. It is evident, however, that both closed and open fixed trust prices have not fallen to the same proportionate extent since the end of 1936 as *The Financial News* and Actuaries'

Unit Trust Conversions

IN the very week in which our last Unit Trust Supplement appeared (April 17, 1937) the first offer was submitted to sub-unit holders in a fixed trust to exchange their holdings for shares in a new managed investment trust company. During the past year, six offers have been made, including one subsequently withdrawn. The circumstances have stirred up no little controversy, and the results of the offers are highly significant.

In April last year, the managers of British Empire Fixed Trust, Series "A" invited holders to express a view whether they would be willing to consider a scheme for exchanging their sub-units for the shares of a managed investment trust company. It was pointed out that the new company would have an experienced personnel; that no additional holdings could now be obtained in the sub-units, since the fixed trust had been closed; and that permission to deal on the Stock Exchange would be sought for the shares of the new company. The details of the subsequent offer were discussed in *The Economist* of June 5, 1937, on page 576. This revulsion from fixity, for a trust which had been in existence 3½ years, out of a maximum life of 20 years, attracted comment. From the first, *The Economist* drew attention to the fact that if flexibility alone had been desired, an offer of exchange of the sub-units into the units of a flexible trust would have achieved the result. The scheme showed that the management company would make available to the new investment trust the due proportion of unexpired loading charges not in cash, but in future services. In addition, the fixed trust management company also undertook to "all purchases and sales of securities" for the investment trust company, acting under the instructions of the directors, on the basis of return commission. The company was thereupon launched with all the London company was thereupon launched with all the London with the exception of capital duty of 1½% per cent. Similar offers followed in respect of

Indices. The flexible unit trust index is based on end-June, 1936, prices, when security values had already staged a conspicuous advance, but their record appears to have been relatively more successful than that of the open (and newer) fixed trusts. Here again the flexible trusts, as a group, appear to have beaten the investment indices, but the claims of the managers, so far as they were concerned with capital values, may be somewhat dulled by the fact that the progress of the flexible funds is not more significant than that of the fixed trusts.

FLEXIBLE TRUST INDEX NUMBERS
(June 1936 = 100)

End Month	11 Flexible Trusts	<i>Financial News</i> Index	Actuaries' Index
1936—			
March	98.5	99.4	99.8
June	100	100	100
September	103.3	105.3	106.2
December	107.5	111.4	109.3
1937—			
March	104.8	105.2	104.1
June	102.2	98.3	99.5
September	97.8	95.2	97.2
December	91.4	85.9	88.9
1938—			
March	83.2	75.4	78.5
May 20th	85.7	75.2	80.1

Judged by these index numbers, it would appear that the unit trusts can claim that, so far, they have provided a stouter resistance to the setback in security prices than the leading equity share indices. Such resistance, of course, is not the *raison d'être* of the movement, though it is a factor which should in fairness be placed to its credit. Making all allowance for the defects in the indices, and for the limitations of the comparisons, there is yet a consistency in the general results which appears, at this stage of the market recession, to have some significance.

fixed trusts in the British Empire group, for the two Selective fixed trusts (whose management company had been acquired towards the end of 1937 by the British Empire group) and for the National Fixed Trust Unit "A." They were framed broadly in the same terms and their fate is set out in the following table:—

CONVERSION OFFERS, 1937-38

Offer dated	Fixed Trust	Managed Trust Co.	Max. shares to be allotted	Actual shares allotted	Prop'n of acceptances
1937					
May 31	Brit. Empire "A"	1st Con. Inv. Tst.	No. 1,795,000	No. 1,030,007	57
July 7	Brit. Empire "B"	2nd Con. I.T.	1,200,000	680,020	57
July 7	B. Emp. Cum.	3rd Con. I.T.	450,000	250,012	56
Sep. 15	B. Emp. Comprehensive	4th Con. I.T.	1,912,000	1,080,008	56
Oct. 13	National "A"	1st Re-invest. Tst.	1,312,000	245,007	19
1938					
Jan. 7	Select. "A" & "B"	5th Con. I.T.	*2,700,000		Offer withdrawn

* Joint offer on basis of three 5s. ordinary for each sub-unit. Other offers one share per sub-unit.

For a time the response to these conversion offers was fairly favourable. A regular proportion of well over half the sub-units in the British Empire group was offered for conversion. But after these operations the significance of the development became clearer. A poor response might involve a small investment trust, whose capital might not be readily marketable, and the price of whose shares would not necessarily be governed by break-up values. The formation of *ad hoc* secretariat companies showed that the existing managers of the fixed trusts would obtain a new interest of a type which would not have been available to them during the lifetime of the fixed trust, and in some quarters it was suggested that this might tend to limit the investment opportunities by the board.

The Fixed Trust principle has definite advantages over other forms of investment. The problems of the prudent investor are becoming increasingly difficult, because however carefully single investments are chosen, the risk of loss cannot be completely eliminated. On the other hand if a number of securities are selected with proper guidance and balance the risk is minimised.

FIRST PROVINCIAL "RESERVES" Trust

enables the investor to spread sums of £25 and upwards and to own a definite share in

50 British Industrial Companies

thus combining the greater safety of widespread capital with the regularity of income provided by soundly managed companies all chosen because of their Huge Reserve Funds, viz., £137,834,301.

Price: 16/3 per Sub-Unit (17.5.38). The yield last year per £100 was

From Dividends - - - - £5.15.0 gross

- There are no extra charges or commissions to pay.
- Stamp duties, etc., are included in the price.
- Sub-Units can be purchased by applying to any branch of the Midland Bank, or any Stockbroker.
- The Investor's capital is not tied up. Sub-Units can be realised at any time.

THE SYMBOL OF SECURITY

A NEW F.T.M. TRUST

THE DOMESTIC PRIORITY INCOME TRUST

An investment spread over the priority securities of nationally famous companies—stable securities chosen from Britain's most stable industries.

F.T.M. Ltd. present the Domestic Priority Income Trust, fully confident that it will be welcomed by all investors whose primary requirement is "Safety First."

The investments of the Trust comprise the Preference securities of a very wide range of companies carefully selected by the Managers from the most stable section of British Industry—the section supplying household needs. With the strong background of a continuing demand for their goods and services, companies of this nature are able to build up immense financial strength. The official booklet giving details of the Trust shows among other things that in the aggregate the companies in question have for a considerable period earned several times the amount required to pay the interest on these securities.

NAME

ADDRESS

The fears of a flood of fixed trust liquidation under adverse market conditions, on which the conversion appeal was partly based, had proved largely exaggerated. And, finally, the realisation spread that if only flexibility was required it could be achieved, in principle, no less simply by offering flexible units in conversion for fixed trust sub-units. These points, which we had voiced in our original criticism of the first conversion offers, centred with full force on the National "A" offer. Out of a potential issued capital of £1,312,000 (on the basis of 100 per cent. acceptance by sub-unit holders) the First Re-investment Trust was eventually formed with an issued capital of £245,007, indicating less than one-fifth assent. In January it was announced that the offers to Selective "A" and "B" certificate holders had been withdrawn.

It is unlikely, therefore, that the conversion movement will attempt a "come-back" in the near future. In the first place, the investor had discovered specific advantages in the unit method. Provided that marketability—and, in the last resort, realisability—is maintained, he can obtain the break-up value of the underlying securities. That is a positive advantage for the small investor. Secondly, he still tends to distrust flexibility, as a principle, though perhaps to a smaller degree than formerly. Some of the leading flexible trusts, of course, are well established in his estimation, but he is by no means tempted to exchange a fixed trust unit of reasonable merit for the unknown qualities and market performance of a share in an investment trust. Whether this instinct is right or not, the fact is in itself sufficient to check any further progress towards conversion. And the experience of the past year suggests that sub-unit holders who did not elect to make the offered exchange have, on the whole, fared relatively better, so far as capital values are concerned, than those who did. In the table at top of next column we compare the prices of the shares in the new investment trusts at the opening of dealings with the relative fixed trusts from which they sprang.

In short, to reverse the entire principle and method of unit operation by the formation of a series of managed investment trusts, particularly if their size happens to be smaller than the optimum, makes the worst of both worlds. It concedes a fundamental misgiving regarding the fixed

CONVERSION TRUST PRICES COMPARED

trust itself; but it fails to retain the specific advantage of the unit method. It would be interesting, in short, to have the result of an offer to vary a fixed trust into flexible form.

The first report of First Conversion Investment Trust for the period May 27, 1937, to April 25, 1938, has become available during the past few days. The trust took over securities valued at 24s. 4½d. per £1 unit of stock, the surplus being set aside to reserve. The latter has been charged with losses, less profits, on sales of securities (the bulk of which formed part of the underlying securities of the fixed trust concerned), which together with capital duty of £7,500 involve a net debit to reserve of £87,485, leaving a balance of £68,873 at the date of the balance sheet.

On the basis of middle market values, however, the portfolio showed a depreciation of 15.63 per cent. compared with book values of £1,057,951. If suitable allowance is made for capital duty, the break-up value of the assets represented respectively by the pre-existing units of the fixed trust and the present ordinary stock of the investment trust has declined from 22s. 3d. to approximately 17s.—a fall of about 23½ per cent. over the period, compared with a fall of 19 per cent. in the bid prices quoted for the British Empire "A" units.

Yield Calculations

FROM the earliest days of the unit trust movement, the problem of proper yield calculations has attracted controversy. It is natural that the average investor should respond to an attractive rate of return on his money, and it is no less natural that unit trust managers should be aware of the fact. But their policy has by no means been determined by yield considerations alone. Some managers, when the yields on first-class equities were in the region of 4 per cent. twelve months or more ago, frankly disavowed any intention of seeking a higher return at the expense of investment quality. Others have advertised returns which demonstrably could not be obtained without a fairly liberal admixture of shares of lesser standing. And during the past year, the question of "true" yield has occasioned lively debate in connection with the operations of certain types of flexible trust.

In essence, the problem of "true" yield has always involved the distinction between revenue, properly so-called, and income of a capital, or quasi-capital, nature. This distinction, for instance, was present in the mind of the Anderson Committee, which recommended (App. II, J) that the treatment of bonus shares, rights, and other non-recurring benefits should be disclosed in unit trust advertisements. The majority of groups have voluntarily adopted this recommendation by setting out the amount of these more obvious types of capital distribution in each coupon as it is paid. For the 100 per cent. cumulative trust, of course, the problem does not arise in the same form.

The assistance to be obtained from the inclusion of quasi-capital income in "sweetening" true revenue was, of course, recognised by certain fixed trusts when they included a limited number of mining shares, with a relatively short prospect of life, in their panels of investments.

In strict theory, part of the return from such shares should be set aside to provide a fund for eventual amortisation of a wasting asset, and this principle has been broadly recognised in certain trust deeds and in the constitution of the Unit Trusts Association. Again, it may sometimes happen that, through a change in dividend dates, a unit trust fund may receive two dividends from the same share during one distribution period, and to this extent it will then show a temporarily inflated actual return, compared with the "true" yield on the fund.

These points are matters of general knowledge to those acquainted with the working of unit trusts, whether fixed or flexible. The development of the flexible trust, however, has raised rather more subtle manifestations of the same problem. Flexibility implies management discretion within the limits of the trust deed. And during a period like the past year, when security values have been falling, and yields rising, the major attraction which the unit trust manager could adopt as a selling pointer was that of yield. It is important, however, that the nature of "true" yield and its distinction from actual distributions made by a given unit trust should be clearly realised. When the two are identical—or virtually identical, for even with the most scrupulous care, small divergences may sometimes arise—the unit holder obtains a return which accurately reflects the earning capacity of the underlying securities of the fund. But when the apparent yield on the cash price of the units, based on actual coupon distributions, is higher than the return from the underlying securities, there is clearly a case for investigation.

We may distinguish, at the outset, between a flexible fund in its early stages and a mature fund. When a flexible fund is growing fairly rapidly the increment of underlying

securities in a given period will represent a relatively high proportion of the total fund, and will thus influence the earnings of the fund in marked degree. The manager's choice of underlying securities will be subject to the limitations of the trust deed, as always, but within these limitations he may, if he chooses, so arrange his buying programme that each increment of underlying securities, as new units are created, includes a generous proportion of shares whose dividend dates are fairly near at hand. In a broad fashion, the market will have adjusted such securities to take account of approaching dividends in their prices; in principle, therefore, the latter will consist partly of the real capital payment for the shares, and partly of a sum representing the accumulated revenue which the share is about to shed in dividend.

A sequence of operations of this sort, when a trust is in its earlier stages of growth, would thus provide an opportunity for inflating the "true" earnings for the period by the distribution, in effect, of part of the real capital of the fund in the guise of "income." As the fund reached maturity, and newly-created units came to represent a smaller proportion of the existing fund, the scope for introducing this sort of distortion in the earnings position of the fund would, of course, be greatly reduced. The effective return would then be determined largely by the existing securities, and the amount of extra "cash produce" which might arise from relatively small purchases of new securities which were fairly full of dividend would usually be small. But for a growing trust it is conceivable that a marked difference might be obtained between the rate of return represented by the cash produce received on the underlying securities during the initial distribution periods, and the "notional" rate of yield which the underlying securities would provide when the fund was on a stable basis.

Where an appreciable divergence can be shown between the computed yield on the trust fund and the yield on the units calculated with reference to actual distributions, a presumption therefore arises that the managers, either by accident or design, have distributed more than the strict earnings of the fund during the latest distribution period or periods. A comparison of the two yields, of course, is a detailed task, but it is not fundamentally difficult. Most managers, in their booklets or advertisements, provide yield calculations according to various prices for their units. It is the true yield on the fund, however, which requires detailed calculation. At each distribution date, flexible trust managers publish the percentage distribution of the trust fund. For each of the shares included in the fund, yield figures must be calculated, based on their current prices, and the latest distributions for a full year. Such yields, of course, would be identical with those shown for industrial shares in our weekly table of active security prices and yields. The yield for each share is then multiplied by the percentage which it represents in the total trust fund. These sums are finally added together, and the total shows the weighted average yield over the whole fund.

It should be noted that this calculation takes no account of commissions and service charges, which are, of course, included in the cost of a trust unit. It might be expected, therefore, to show a higher yield than that on the trust units themselves. It cannot be denied, however, that, at certain periods during the past year, more than one flexible fund has advertised a yield figure, based on distributions, which has exceeded the "notional" yield on its assets, calculated in this way, by a very comfortable margin. It is impossible, for reasons which are already clear, to assure complete coincidence between the two yields. Yet it is obviously desirable that they should be as close as possible. In particular, any undue disparity is likely to generate the suspicion that a high yield is being deliberately contrived for sales purposes; and if it proves a successful "attraction," it tends to perpetuate itself, first, because the manager cannot suddenly reduce it, and secondly because he has the necessary new resources at his disposal. The greater the response to an inflated yield, the greater the power which is placed in the hands of the manager further to inflate the return in the succeeding distribution period by so arranging his new purchases of securities on a *cum* dividend basis. Because in principle such decumulation of capital is both misleading to the investor and also

unfair to those managers who would not purposefully follow the practice, it is highly desirable that, from the first, the manager of a flexible fund should frame a clear perception of the "notional" yield which is likely to be obtained on a trust fund of the particular type which he proposes to operate. Investment policy can then be associated with this return from the first. Additional safeguards, however, are also available. Many managers have the power to determine what constitutes "cash produce" under their trust deed, and sums received as dividends which are palpably of a capital nature could, without technical difficulty, be applied to the trust fund, for the benefit of certificate holders. As we showed in our Unit Trust Survey last year (page 10), special precautions have been devised by the Municipal and General investment funds and by Investment Trust Units both to avoid capital decumulation and also to determine cash produce: first in respect of dividends already received, and secondly in respect of dividends which are estimated to have accumulated on the underlying securities but remain unpaid at the trusts' distribution date.

It may be that trustees will in future feel themselves bound to take a closer interest in this question. Their authority would obviously be of the greatest value in providing a check to any abuse based on the exploitation of high yields. So far as these methods have been employed they have been strictly limited in scope. And there appears to be some evidence that even these occasional instances are being rectified. Managers can surely obtain little satisfaction from paradoxical situations in which the prices of their units have fallen and distributions on the underlying securities increased on the average, and yet their advertised yields are lower. This situation is surely proof that the originally advertised yield was not reliable.

So far we have examined the case where a trust fund is growing rapidly. Do opportunities for yield inflation exist when the fund is stable? The answer is that, for the majority of the trusts, they exist in principle, but are difficult to follow in practice. The managers (as we pointed out a year ago) could operate in all the permitted securities during any distribution period if they wished. They might so design their operations that they received no cash dividends, or by converse they might purchase all securities ripe with dividend and sell again *ex* dividend, and thus inflate their cash produce available for distribution. Unless, however, the fund, or a substantial part of it, is turned "inside out" during the period, the extent to which yield inflation is possible through buying *cum* and selling *ex* dividend is not likely to be large. In this connection, we may reproduce a statement made by the secretary of the Unit Trusts Association and published in *The Investors' Chronicle* (December 25, 1937). The secretary wrote:—

"I am instructed by the Council of the Unit Trusts Association to assure you that our members do not inflate yields by buying securities *cum* dividend and selling *ex* dividend, or by buying a preference share or debenture when there is a very good chance of several years' arrears of interest being cleared off."

This statement, of course, would not specifically cover groups which are not members of the Unit Trusts Association, although the majority would doubtless endorse its main points. Nor does it explicitly refer to *cum* dividend purchases (apart from sales) on the part of developing flexible trusts. It may be noted that where *cum* dividend purchases and *ex* dividend sales were open to exploitation they would involve considerable expense on the fund for commission, and would, in course of time, presumably attract the attention of the trustee.

It is satisfactory to find that the majority of the groups have not adopted practices which would expose them to criticism on the ground of unduly high yields. They might not always be able to claim that in no single operation had they been swayed by considerations of yield. But out of the 27 flexible trusts now extant, the more obvious instances of high yield represent a very small minority—and recent evidence that less emphasis is being placed on high yields is therefore to be welcomed.

"The Sign of the Best in Unit Trust Investment"

KEYSTONE UNIT TRUSTS

Offer the best possible means of investment in over 120 British Industrial Shares, and, at current prices, give the investor from Cash Dividends only (Bonuses and Rights are extra) a

Gross Yield of approximately:—

6½%

The new Summarised KEYSTONE HANDBOOK (setting out the basis of all transactions) will be sent post free by the Controlling Corporation on receipt of a postcard.
