Business in basic and acid steel billets and wire rods is comparatively good, and the volume of structural steel transactions is maintained.

★

Middlesbrough.—It is not expected that there will be any marked change in this area during August, when foundries close for the usual annual holidays and steel plant will be idle. It is impossible to sell pig iron abroad owing to the big difference in the prices quoted by foreign producers. There are indications that business may improve in the late autumn and by that time it is expected that some of the heavy stocks of iron and semi-manufactured steel will have been absorbed. In the meantime consumers are not committing themselves far ahead in the expectations that prices may be reduced. No interest is shown in foreign ore, blast-furnace coke, or scrap for steelworks purposes.

★

Workington.—Although sentiment in the North-West Coast hematite pig-iron market is cheerful, important business is small, and stocks continue to accumulate. Demand for special qualities, some of it from abroad, is fair, but that for ordinary iron is poor. Users who placed contracts last autumn still withhold delivery instructions and there is a decrease in the tonnage taken by the Midlands, Scotland and South Wales. The steel trade is short of orders, but the mills at Workington, which restart on Tuesday next, are to roll throughout August. After that, the outlook is uncertain.

★

Glasgow.—A good start has been made in some of the lighter branches of the iron and steel industry, but steel makers do not reopen till next week. Firms specialising in plant repairs have had an exceptionally busy fortnight, and there is a good deal of repair work still in progress. There has not been much business placed with the steelmakers during the holiday and conditions are likely to remain dull until after the completion of the English holidays. Sheet metal workers and firms engaged in light structural work in the Glasgow district are particularly busy and steady work seems likely for a long period in these industries.

★

Cardiff.—Conditions in the tinplate industry are slightly better, and production in the week ended July 16th was 46.48 per cent. of capacity compared with 43.60 per cent. the previous

Tinplate Industry Statistics

	Week ended July 17, 1937	Week ended July 9, 1938	Week ended July 16, 1938
Production—per cent. of capacity	71·75	43·60	46·48

	Week ended July 22, 1937	Week ended July 14, 1938	Week ended July 21, 1938
	Tons	Tons	Tons
Shipments	9,326	4,303	4,217
Stocks (warehouse and in vans)	1,518	5,240	5,153

	Twenty-nine Weeks ended July 22, 1937	Twenty-nine Weeks ended July 21, 1938
	Tons	Tons
Shipments	243,043	140,256

week. Foreign demand is very restricted and shipments at Swansea last week totalled only 4,271 tons compared with 9,326 tons in the corresponding period last year. The demand for sheets is inactive, and production is still in excess of current consumption, in spite of the large reduction in the number of furnaces in operation. Minimum prices for tinplates and sheets as well as for steel ingots and pig iron are nominally unchanged.

Textiles

Cotton (Manchester). — The general trade position appears to be rather better for there is less uneasiness regarding the European political situation, and a steady tone has prevailed during the past week. In certain quarters spinners and manufacturers have been encouraged by a slightly larger inquiry, but the aggregate turnover has not shown any real improvement. Buyers are still cautious and business has continued on a hand-to-mouth scale. It is still expected that the autumn will witness a revival. Prices have lately been firmer on reports of possible damage to the American crop by the boll weevil, but at the same time the statistical position remains distinctly bearish. At the end of the season the American carryover will exceed 13 million bales, while the year's consumption will probably be around 11 million bales. The total world carryover of all cottons is likely to be between 23 and 24 million bales, which is ten million bales more than a year ago. American and Egyptian yarn quotations have been steady but business has not broadened. A moderate cloth business has been done for export, but the Empire markets have provided rather more inquiry, while there have also been signs of slightly freer operations for the home trade.

THE COMMODITY MARKETS

THERE has been no pronounced trend this week in the commodity markets, and movements in prices were caused by events confined to individual commodities. Rubber continued to improve in price, in spite of a temporary setback due to the delay in fixing the export quotas for the year's last quarter. Grain prices advanced slightly and cotton also improved on reports of the activity of the boll weevil; copper rose to the highest level since the end of February, owing to the rise in the American domestic price. Tin and spelter, however, were both marked down, and maize and barley were also cheaper. Moody's daily index of American commodity prices rose from 146.8 (December 31, 1931 = 100) to 148.5 in the week ended last Wednesday, which compares with 140.8 a month ago.

Metals

Copper.—Standard copper prices improved by £1 7s. 6d. to £41 11s. 3d. per ton this week, reaching the highest level since the end of February. The rise was chiefly due to the rise in the U.S.A. domestic price to 10 cents, although a better demand has also appeared in this country. So far both in the United States and Europe the recent large purchases seem to have gone into purchasers' stocks and not directly into consumption. Consequently the market is now more dependent on an expansion in new orders for copper manufacture. This has not yet materialised but the market is hopeful that the coming weeks will see a revival in business.

★

Tin.—Tin has been comparatively stable this week and the standard cash price closed 5s. lower at £194 per ton; the dull appearance of the market was due to the lack of consumers' buying. The world's tinplate production in June, at 215,000 long tons, was the lowest monthly level for four years and production in the first half of 1938 reached only 1.41 million long tons, against 2.25 million long tons a year ago. As both the tinplate and automobile industries have reduced their output in recent months, world deliveries are believed to have been very small.

★

Lead and Spelter.—While spelter closed unchanged on the week at £14 3s. 9d. per ton, lead rose by 12s. 6d. to £15 6s. 3d. per ton. Apart from substantial purchases by European consumers, Russia and Japan, the more favourable American June statistics provided the chief stimulus for the lead market. Lead deliveries in the United States last month, at 35,300 short tons, showed an advance of 9,300 short tons on May, and although production increased by 2,000 tons to 35,000 short tons, lead stocks declined in June by 300 short tons to 163,300 short tons. This was the first decline since September last.

Grains

THERE was an advance in grain prices early in the week, some of which was lost in a later relapse, but compared with a week ago prices are higher by nearly 1s. per quarter. There has been a considerable demand from Antwerp, where stocks were replenished before the duty of 3s. per quarter was reimposed on July 21st. Otherwise the market has been quiet but steady. Favourable weather continues generally in Canada and the United States. Maize has been arriving in larger quantities from Argentina, and prices have tended downwards, but, compared with previous years, shipment from the Plate is still at low levels. The price of feeding barley, which has again weakened, is now at a level which makes this grain a close competitor with maize, but in view of the downward trend in both prices, buyers are adopting a cautious policy. The Russian crop of barley is reported to be one of the largest since the war and the bulk of the exports, amounting, perhaps, to three million quarters, may be shipped from the Black Sea during the autumn.

Other Foods

Provisions.—At the end of last week, bacon prices were again advanced by 2s. per cwt., and at the higher level demand has been firm. Dominio butters have been about 1s. per cw cheaper, while the price of Danish wa maintained. Egg prices fell by 6d. pe great hundred, English (15-15½ lb being quoted at 15s. 6d. to 16s. pe great hundred. The meat market ha been quiet.

★

Colonial Produce.—A steady de mand was shown at the tea auction and prices ruled firmly. Elsewhere, th markets have been quiet, and price for sugar, coffee and cocoa are un changed.

★

Fruit and Vegetables.—Increasin supplies of new potatoes brought further fall in values; new Kin Edwards sold at 6s. 6d. to 7s. 6d. pe cwt. The limited amount of firs quality soft fruit sold well, but the bul of the supplies cleared slowly at re duced prices.

Miscellaneous Commodities

Oils and Oilseeds.—The usu seasonal slackness in these markets ha been reinforced by the continuation favourable crop reports. Linsee especially Indian, is cheaper, an Egyptian cotton seed continues to fluc tuate at about £6 12s. 6d. per ton fo September positions. Linseed oil ha also weakened, but the price of refine cotton seed oil advanced to £23 pe ton, ex Hull. The demand for oil cake is normal and prices are firmly held.

★

Rubber.—The advance in rubbe prices was continued at the end of las week, but a relapse took place when was known that the International Rub ber Regulation Committee had no fixed the export quotas for the year last quarter. Most of the fall was late recovered and on the week prices im proved by ⅜d. per lb. to close at 7⅞d per lb. The Committee's decision is dis cussed on page 245.

★

Furs.—At the London summer fu sales, which were held this week at th Hudson's Bay Company's sales room there was a large number of foreig visitors, mainly from France and Ger many, and the demand was fairly brisk The supply consisted of a particularly fine selection of more than 100,00 "Persian-lamb" skins of South-We African and Afghan origin. Practicall all the lots were cleared and price advanced by 10-15 per cent. over th levels of the May sales. The marke improvement in sentiment, which wa of course, due to the better politic outlook in Europe and the revival i Wall Street, is also noticeable in th free fur market, so that rising fu prices for the next winter season ar generally predicted.

COMPANY MEETINGS

RICHARD THOMAS AND COMPANY, LIMITED

DEVELOPMENTS AT EBBW VALE

ADVANTAGES OF THE SITE

SCHEME FOR PROVISION OF NEW MONEY APPROVED

EXPENDITURE TO INCREASE EFFICIENCY

SIR WILLIAM FIRTH'S ADDRESS

The eighty-ninth ordinary general meeting of the shareholders of Richard Thomas and Company, Limited, was held, on the 28th instant, at Southern House, Cannon Street, London, E.C., Sir William Firth (chairman and managing director) presiding.

The Chairman said:—Ladies and Gentlemen,—With your permission I will take the accounts as read and proceed to anticipate some of the questions that must be uppermost in the minds of absent shareholders.

SHAREHOLDERS' QUESTIONS

Those of you who were present at the previous meetings and heard some of the questions put and answered will, I am sure, forgive repetition.

Why did we select the Ebbw Vale site?

Is it a good site geographically?

Can the heavy cost be justified?

Is the excess over the estimate due to careless estimating and careless supervision?

Does it spell ruin to our company?

Was there an ulterior motive behind the chairman's circular of February?

What are the dividend prospects for the future?

Should we agree to the financial scheme proposed?

Is it reasonable and fair that the preference shareholders should be asked to make sacrifices, and for both the preference and ordinary shareholders to agree to the holders of the new 100,000 "A" ordinary shares having three times the number of votes held by all other shareholders?

Do I consider it any advantage to have on the board directors drawn from competing companies?

A FAVOURABLE SITE

Ebbw Vale is a favourable site, because of its proximity to our own coal mines, where cheap and extremely good coking coal is obtainable and because it is well situated both for export and inland distribution. The site is approximately two and a half miles long, and its length makes it eminently suitable for the type of plant we have built. We have in sequence our coke ovens, blast furnaces, steel works, hot strip mill, cold reduction mill and finishing plant, with delivery sidings adjacent to the Great Western Railway.

The inter-departmental transfer costs are comparatively negligible. In time of national emergency it is less vulnerable than the East Coast. Good offices and labour and houses were available.

On the site stood an out-of-date steel plant and billet mill, which had to be demolished, but the cost of demolition was partially offset by the scrap recovered. In the centre of the site ran a small river and on either side of this river two slag heaps. The river had to be culverted and the slag heaps moved and/or levelled.

TRAFFIC ECONOMIES

The cost of this work made the site, on an acreage valuation, expensive, but we calculated that the interest charge on this cost would be more than offset by the traffic economies the site lent itself to. We chose the Ebbw Vale site because, socially, we thought it was a fault to build in a district where there was no unemployment and to neglect a district where there was grave unemployment. We were also anxious to make a good case for isolating the tinplate trade to Wales, its birthplace. We feared if we built the plant outside Wales it might result in other tinplate plant being built outside Wales, and the eventual removal of the tinplate industry from Wales.

THE TIME FACTOR

From a time factor point of view we have been exceedingly unlucky. If, instead of delaying erection while we endeavoured to persuade the industry to build a co-operative plant, we had proceeded with our programme twelve months earlier, we should have avoided the extra cost due to wage increase and abnormal demand conditions that raised the cost of machinery and buildings and foundation work, and we should have benefited from the 1937 conditions when demand exceeded supply, and to-day I should have been able to present to you a very different picture.

Nevertheless, taking the long view, the future standard of living and wages in this country are more likely to rise than fall, and the cost of building a few years hence is, therefore, more likely to be higher than lower, and I think the profits the new works will contribute in the interval will more than make good to the shareholders the cost of our bad timing. Preparing estimates for so huge an integrated plant is a very lengthy and complicated problem, and I am satisfied that the estimates were prepared with care.

UNFORESEEN DIFFICULTIES

What happened was that insufficient margin was allowed for wage increases that have taken place—in the case of labourers the wages have advanced 28 per cent.—insufficient provision was made for unforeseen site difficulties, such as unsuspected areas of rock-like concrete that we encountered in some parts of the site ten feet beneath the surface, on which there was nothing to indicate its existence. Insufficient allowance was made for the advances in the prices of structural steel and machinery, and no allowance was made by the experts for the abnormal delays we have experienced in obtaining delivery, which delays, we are told, are due to the re-armament programme. Another difficulty was the absence of experience of our contractors in the foundation work necessary for strip mill plant.

The American experts anticipated the cost would not be higher than in America, but in fairness to the American experts and the British contractors, it must be remembered that in America 25 similar plants have been erected and American contractors have, therefore, had great experience of this type of work and possess plant particularly suitable for this type of foundation.

EXCESS COST OF PLANTS

The excess cost for the total integrated plants over the original estimates approximates £2,600,000, but of this only £1,100,000 represents under-estimating, i.e. increased costs. The remaining £1,500,000 covers the cost of providing larger buildings than originally intended, to house additional processing plant, and the purchase of additional boiler plant, and the cost of a privately-owned railway, additional equipment for the orefields and the provision of additional transport facilities, such as siding and roadways, etc.

This £1,500,000 additional expenditure will undoubtedly increase the efficiency of the New Works, by making them more flexible and by reducing the production cost, and must not be counted as money lost or unwisely spent, although it is true it was spent in a period when prices were high. The integrated plant, when working to 90 per cent. of capacity, will provide direct employment for approximately 6,000 men. During erection it has provided employment for a still greater number.

ALTERED CONDITIONS

The only criticism that can justly be directed against your board for this additional expenditure is that it was embarked upon before the money was secured, and I must confess, in the light of subsequent events, it is difficult to satisfactorily answer such criticism, but at the time your board approved of this additional expenditure, trading conditions were entirely different from those now prevailing.

Viewed in the light of world conditions then and our then order book position, there was every indication that our old type plant and other properties would yield profits substantially in excess of the £2,138,000 we made in the year under review and there was every promise of such profits being maintained. In this atmosphere, your directors felt justified in embarking upon this additional expenditure. They did not anticipate, nor I think did anyone else, the sudden and almost catastrophic collapse of trading conditions in America, and the heavy fall in commodity values throughout the world.

POSITION LAST YEAR

If you will cast your minds back to the first six months of last year, you will better understand the then views of myself and my colleagues. The order book position indicated earnings for the year approximating £1,000,000 more than the figure given in the prospectus, instead of only £500,000 more, as realised. With regard to my circular letter of February, it is true by then business had tailed off and demand was less strong and the excess costs, over estimates, were apparent, but the effects of the American depression had not then been fully felt in this country. Our order book was still strong, and our current profits very satisfactory, and I remained firmly convinced that it would be possible to borrow from your company's bankers the money we required as payments fell due. I had no indication from them, at that date, to cause me to think otherwise. Even to-day, our total indebtedness to bankers does not exceed £1,345,000.

I have no desire to cross swords with stockbrokers, or to find fault with the sincerity of their calculations and valuations. It is obviously exceedingly difficult for them, without technical knowledge of sheet and tinplate production methods, to assess accurately the potential earning power of our new plant, but as an illustration of how wide of the mark stockbrokers can be in their valuations, the following facts are interesting:—

VALUATION AND EARNING POWER

Just before I was appointed chairman of your company in 1931, the Stock Exchange valuation of the then issued 3,120,346 preference shares was 3s., and the then issued 2,790,560 £1 ordinary shares was 1s., giving a total Stock Exchange valuation of our combined ordinary and preference share capital of £608,000.

In the six years ended March 31st last, your company earned sufficient to take care of the following items:—

	£
Wages and salaries	18,790,186
Interest on debentures and bank overdraft ...	1,130,830
Payments to railway and shipping companies, including freight on inwards goods (estimated at £1,700,000)	4,850,000
Distribution of dividends to shareholders ...	1,957,460
Earned for the Government	1,148,270
Retained in the business in the form of depreciation reserves, etc., and undistributed profits	2,538,780

If to this latter item is added the net proceeds of the premium on the new shares, which is also retained in the business, we have a total balance sheet improvement of £3,432,745.

THE NEW MONEY

With regard to the terms on which the new money is to be provided—when at the end of April it was found that the company's bankers were unwilling to entertain so large an advance as would be involved in the provision of the necessary money to complete our programme, exceptional measures had to be taken, and it was found that the only terms on which the money was available were those with which you are now all familiar, involving as they do the appointment of a control committee. This control committee will receive no fees, and will act in a fiduciary capacity and will not interfere with the general management of the business.

This condition regarding control is naturally one to which I have given great thought, but on reflection I find it is one to which I can agree without misgivings.

VALUE OF CONTROL COMMITTEE

The existence of such a committee, composed as it is of eminent persons, will, I am sure, be of great assistance to your board, and the best answer I can give to any question that may arise in your minds as to the effect which the imposition of control may have upon the dividend policy of your company is to say that, although the control has been imposed at the instance of the prior lien debenture holders, it will be of such a nature as to ensure the best interests of the company in the widest sense.

It must be realised that those providing the money were not seeking this investment—in fact, I do not doubt that they would have preferred to avoid it. It is not unusual when a large sum of money is brought into a business, whether as an investment or in circumstances similar to the present, for some measure of control to be attached to the new money and, inasmuch as the control will be exercised in the best interests of the company in the widest sense, I think it fair and reasonable in all the circumstances that the voting power should be vested in it.

RIGHTS OF PREFERENCE SHAREHOLDERS

I also think it reasonable and fair, inasmuch as the existing debenture holders have modified their rights of foreclosure, that the preference shareholders should waive their cumulative rights for a period of five years and exchange their tax-free rights for *pari passu* dividend rights with the ordinary shareholders up to 3½ per cent.

The investment by the Bank of England of £500,000 in ordinary shares at par increases the cover behind the preference shares, and on that count alone justified my board asking the preference shareholders to agree to the amendment of their rights.

There is another factor which has perhaps not been fully realised. Provision of the new £6,000,000 will give us (if we include the £250,000 set aside to take care of starting-up difficulties) an increase in our working capital of approximately £1,891,917 as compared with January, 1937, the prospectus date, because undivided profits and depreciation reserves at March, 1938, had increased our working capital as compared with January, 1937, by approximately £877,000, to which must be added the £1,014,903 provided for in the new scheme.

CALL ON NEW MONEY

This additional working capital may not be needed if trade is bad, and sight should not be lost of the fact that under the terms on which we are borrowing the new money we are not bound to take the whole £6,000,000 unless we need it—we have a valuable call on it—and further, I would call your attention to the fact that whatever money we take will be net money, i.e. free of all underwriting expense.

On the other hand, if trade is good and we do need it, we shall have the compensation of good profits to offset the interest and redemption charges. I welcome the appointment to the board of Sir Charles Wright and Mr James and Mr Beale. The fact that they are associated with other steel companies, even competing steel companies, cannot prove to our disadvantage. It should, indeed, strengthen co-operation in the industry.

THE OUTLOOK

With regard to the immediate future, I think the current year will be a disappointing one. We are carrying heavy standing charges on the incompleted works. The experts engaged to supervise operations are, instead, spending their time pressing for belated deliveries, and we are carrying heavy interest charges on the incompleted works.

In recent months demand has been small and our order book is unsatisfactory, although in the tinplate section it is 18 per cent. better than it was in July, 1935.

Since March our operations have been substantially curtailed and as a result our profits for the current year to date are disappointing, but we have during that period reduced our stocks by some £400,000 without loss.

The absence of new business has been partly due to world depression and general lack of confidence, but largely due to the liquidation of stocks held by customers not only in this country but all over the world.

It is very doubtful if normal trading conditions will return until conditions in America have greatly improved. When this improvement will materialise, I prefer not to venture an opinion, but one thing is, I think, certain. If the continuation of liquidation of world stocks proceeds at current rate, a substantial improvement in world demand, at a not very distant date, must surely mature because current consumption is in excess of current production, and I have no reason to suppose the demand for sheets and tinplates will not improve.

A PERSONAL STATEMENT

May I make a personal comment? Letters from some shareholders have suggested that, with inside knowledge, I have doubtless taken care to dispose of my personal holding in the company. My answer

is, that I took up over 200,000 of the 13s. 4d. shares and still hold them, together with several hundred thousand additional shares, some of which were bought at a still higher price, and that I still retain a large block of preference shares, and my personal loss is undoubtedly much larger than the loss of any other individual interested in the company, and rightly or wrongly, I still retain unabated confidence in the future of the company.

DIRECTORS AND STAFF

In conclusion, may I say a few words about our staff and my colleagues who have borne with me the responsibility and anxiety of managing this business, and the erection of this huge modern plant.

I include the directors who have retired to make room for the new directors. No band of men could have worked more assiduously or conscientiously to achieve success, or have been more loyal to the interests of the company, and to each other, and I doubt if any chairman of any company is fortunate enough to have such splendid colleagues, ready at all times to sacrifice themselves in the interests of the company. Our staff, as always, have been wonderful and if you consider despite the abnormal fluctuation in trading and financial conditions that has taken place during the year under review, you are entitled to criticise and blame the management, please believe I prefer that blame be directed to me.

Mr Cedric Thomas and Mr Latham have resigned from the board, but Mr Thomas will remain in the service of the company, while Mr Latham will remain a good friend and a good customer. Mr Phillips does not offer himself for re-election on account of his great age. He wished to retire two years ago, but I pressed him to stay until the Ebbw Vale plant was complete. Despite his age, he has a clear logical mind, and during my association with him has been of great help to me taking charge of all the legal formalities inseparable from the purchase of so many businesses, and giving me the benefit of his sound and seasoned judgment, which I shall greatly miss.

I now propose: "That the directors' report and accounts for the year ended March 31, 1938, as submitted, be approved and adopted."

Major L. Beaumont Thomas, M.C., J.P. (deputy chairman), seconded the resolution, and after the chairman had replied to questions and comments from shareholders, it was carried unanimously.

The retiring directors, Major L. Beaumont Thomas and Sir Edward Boyle, Bt., were re-elected, and the auditors, Messrs Peat, Marwick, Mitchell and Company, were reappointed.

A hearty vote of thanks was passed to the chairman.

Prior to the annual general meeting, class meetings of the holders of preference and ordinary shares and an extraordinary general meeting of the company were held to consider resolutions approving the scheme for the provision of new money.

At the meeting of the preference shareholders the resolution was defeated on a show of hands, and a poll was taken, with the result that the resolution was carried by 1,254,896 votes to 7,385. The chairman, in announcing the result, pointed out that that represented a 99 per cent. vote in favour of the scheme.

At the class meeting of ordinary shareholders the resolution was carried on a show of hands with four dissentients, and at the extraordinary general meeting of the company it was carried with two dissentients.

GOLD FIELDS RHODESIAN DEVELOPMENT COMPANY, LIMITED

INCREASED DIVIDEND REVENUE

MR D. CHRISTOPHERSON'S SPEECH

The twenty-sixth ordinary general meeting of the Gold Fiel Rhodesian Development Company, Limited, was held, on the 28 instant, at the Chartered Insurance Institute, 20 Aldermanbur London.

Mr D. Christopherson, C.B.E. (the chairman), who presided, sa that the profit carried down to appropriation account was £139,96 as compared with £263,066 for the year ended May 31, 1937. Wh comparing these figures, however, shareholders had to bear in mir that during the whole of the financial year under review, marke had been continuously in a more or less disturbed and depresse condition. It was in the April of last year that they had had wh we remembered as the Gold Scare, followed by the disturbing effe of the first proposal as regarded the N.D.C. Tax, which, when lat modified, had been followed by constant fear of European compl cations. All that, coupled with depressed American markets an low commodity prices, had operated against profitable realisatio of investments. Once again, however, it was satisfactory to b able to record that the revenue from dividends had shown an in crease—in fact, the Company's revenue from that source ha amounted to over £66,000, representing some 42½ per cent. o the total revenue for the year. As had been stated at previou meetings, it was the desire of the board to endeavour to increas that source of revenue to a more substantial figure.

THE AVAILABLE BALANCE

To the profit of £139,963 there had to be added a balance o £28,669 brought in from the previous year, and £25,000 transferre from reserve account, making a total of £193,632. After deductin £106,000 for depreciation reserve in order to permit of writing dow all the Company's investments to the market prices obtaining a May 31st, where that was lower than cost, there remained availab £87,632. The directors recommended that a final dividend of 5 pe cent., less tax, be paid, which would absorb £62,856, leaving £24,77 to be carried forward to the current year's accounts.

Investments at cost, less amounts written off, stood at £1,064,25 —a decrease of £9,295 as compared with the previous year. Thi was after having deducted the full £106,000 for depreciation. I would be of interest to shareholders to know that at the price obtaining at May 31st, the value of the Company's quoted invest ments much exceeded the figure shown in the balance sheet. Th cash resources placed the Company in a strong position, and woul enable them to take advantage of any opportunity that might occu of making investments holding out prospects of profitable business.

It was a matter of great regret that the directors had been unabl to declare an interim dividend of 5 per cent., as had been the cas during recent years, but he hoped shareholders would agree tha under the then existing conditions, which unfortunately had con tinued until the end of the financial year, the board had acted wisel in postponing consideration of a dividend payment for the time being. Had there been a marked improvement in market condition in April and May, enabling a greater profit to be made from realisa tion of investments, and making it unnecessary to provide for so large a sum for depreciation and reserve, there might, in that case, have been justification for declaring at the end of the year an interim dividend as well as the proposed final dividend. It was that which the directors had had in mind when they issued the notice in April last to the effect that consideration of the payment of an interim dividend had been postponed until it was seen more clearly what the final results of the year was likely to be.

CLASSIFICATION OF INVESTMENTS

It might interest shareholders to hear under what headings the Company's various investments could be classified, and what percentage such headings bore to the total, with a comparison with what such percentages were the year before. The figures were as follows:—Gold 68½ per cent., as compared with 64½ per cent. last year; other metals 4 per cent., compared with 8 per cent.; industrial 3 per cent., compared with 3 per cent.; holding companies 1 per cent., compared with 1½ per cent.; oil companies 1½ per cent., compared with 2 per cent., and land 9 per cent., compared with 8½ per cent., while cash and debtors, less creditors, were 13 per cent., compared with 12½ per cent.

Proceeding, the chairman gave details of the Company's principal shareholding interests in Rhodesia, on the Witwatersrand, in West Africa, Australia, Colombia and New Guinea. In California they still possessed their interest in the Golden Queen mine, where profits continued to be made, and development work held out promise of substantial additions to the ore reserves, while in Mexico the Fresnillo mine, though working under considerable labour and political difficulties, continued to make reasonable profits. Taking their portfolio as a whole, he thought it could be considered such as to offer prospects of their Company receiving substantial and, he hoped, increasing dividends, and, given an improvement in market conditions, should ensure an appreciation of the capital invested. Shareholders would not expect him to give a forecast of the profits at this early stage of their financial year, but there was encouragement in the generally improved outlook during the last two months. He thought they could reasonably say that both of Europe and the United States. The recent recovery in the United States had been somewhat remarkable, and a continuance, joined with improvement in commodity prices, should be an index of better and improving conditions in the business world generally.

In concluding, he would again like to express their sincere thanks and keen appreciation of the services rendered to the Company by their managers in South Africa, and their consulting engineer, Mr Carleton Jones and his staff. The work of these gentlemen had been of great value to the Company, also to Major Tulloch, their resident engineer, and the staff in Rhodesia for their unremitting efforts on the Company's behalf during the year.

The report and accounts were unanimously adopted.

THE VICTORIA FALLS AND TRANSVAAL POWER COMPANY, LIMITED

FURTHER EXPANSION

INCREASED DIVIDEND

At the annual general meeting of shareholders of the above Company held, on the 26th instant, in London, the chairman and managing director, Mr Arthur E. Hadley, C.B.E., presented a satisfactory account of the company's business for the year 1937.

The net profit for the year, after providing for taxation and all other requirements, amounted, he said, to £612,628 against £586,365. The full dividend of 10 per cent. had again been paid on the preference shares and the dividend on the ordinary shares had been increased from 12 per cent. to 13½ per cent. The reserve fund had been brought up to £500,000 by the addition of a further £100,000, being the same amount as in the previous year.

GROWTH AND DEMAND

The demand for power had steadily increased during the year, reflecting the activity of the gold-mining industry, the supply to which formed the basis of the undertaking. The way in which gold had maintained its position during the past few years had strengthened the conclusion that gold was the safest protection against the effects of economic upheavals and showed, if anything, a tendency to increase in value. The good position of the gold-mining industry augured well for the continued use of the company's installations and for considerable further expansion of them. The demand for power had increased during 1937 by 57,000 kw. and the units sold rose by 345 million units. The notified loads still to be met at various dates in the future were also greater than twelve months previously.

The forecast prepared from available data indicated that the annual rate of increase might be expected to continue at about 50,000 kw. per annum for the next four years, and provision had to be made to meet these requirements. To meet these demands the capacity of the Klip Station was being doubled by the installation of six generating sets, each of 33,000 kw., three of which sets should be at work during this year and the station practically completed by the end of 1939, when it would have an installed capacity of 400,000 kw.

NEW POWER STATION

Mr Hadley went on to say that by the middle of 1941 forecasts showed that the load will have overtaken the total installed capacity. As a result, arrangements had been completed with the Electricity Supply Commission for the erection of a further power station to be called the Vaal Station. This, in the first instance, would provide for an installation of 100,000 kw., and the work in connection therewith would be carried out by the Electricity Supply Commission and the company in co-operation. In order to meet the growth of business, estimates indicated that a further outlay of between two and three million pounds will have to be made by the company during the next few years and, in addition, large sums will have to be spent on renewals.

The policy of the company had been to devise a tariff which would give its consumers reductions in price progressively as the volume of business increased. In 1937 a very satisfactory reduction in the charges for power was made, the rebate being £185,000 higher than for the previous year.

The work of constructing the hydro installation at the Victoria Falls was completed early this summer, and, after trials of the plant, had been set to work by the Governor of Northern Rhodesia and had since been supplying satisfactorily the town of Livingstone.

MANAGEMENT OF STAFF

Mr T. G. Otley continued as general manager in South Africa, with Mr F. McCardle and Mr V. Pickles as the two principal officers under him, the board being thoroughly satisfied that the management was in good hands. In addition, Dr Bernard Price remained as resident director and adviser on matters in South Africa.

In the early part of this year one of the directors, Mr R. E. Shott, and Mr N. Brooksbank, the chief London engineer, visited Johannesburg to complete arrangements with the Electricity Supply Commission in connection with the new Vaal Station and to inspect the company's organisation, plant and equipment.

Mr Hadley asked the shareholders to authorise him to convey their appreciation to the staff in Africa and London for the way in which they had so successfully conducted the company's affairs during the year.

The report and accounts were adopted, and the retiring directors, Dr Bernard Price and Mr R. E. Shott, were re-elected and Messrs Cooper Brothers and Company were re-appointed auditors.

THRELFALL'S BREWERY COMPANY, LIMITED

FURTHER EXPANSION OF BUSINESS

The fifty-first annual general meeting of Threlfall's Brewery Company, Limited, was held, on the 27th instant, in London.

Major C. M. Threlfall, J.P., chairman of the company, in the course of his speech, said: The output and trading results of our breweries and licensed establishments compare favourably with those of the preceding year, and increased profits have again been earned. Business in this our jubilee year has continued to expand, although not to a sufficient extent to appreciably offset the increased taxation and higher costs and expenses we have had to bear. Every effort has been made to cope with the important problem of keeping expenditure within reasonable bounds, but all our essential costs have shown an upward trend, and, as the selling prices of our commodities are practically stabilised, we are left to bear these increased charges. Any variation in the sales of our beers is inseparably linked up with the question of general employment, and it is useless to obscure the fact that unfortunately during the past year there has been a downward trend as regards employment in the cotton trade upon which the livelihood of so many of our customers depends. However, the modern hotels we have erected in recent years have enabled us to counterbalance this and maintain our sales during the past twelve months.

Your company to-day is in an incomparably stronger position as regards its properties, which are the basis of our financial strength, than at any previous period, and the substantial figures shown in the report and balance sheet now before you undoubtedly may be considered satisfactory.

During the year under review we have been successful in obtaining permission to erect three hotels in new localities, and to rebuild and extend several of our older properties.

The gross trading profit for the year is £419,765, and there is a net profit of £311,324.

The report and accounts were unanimously adopted and a dividend at the rate of 20 per cent. on the ordinary shares, making 18 per cent. for the year, was approved.

Resolutions were also passed increasing the existing borrowing powers of the company by £500,000 and converting the shares into stock.

Orders for the publication in these columns of the reports of Company Meetings should be addressed to the Reporting Manager of THE ECONOMIST, 8 *Bouverie Street, Fleet Street, London, E.C.4.*

FURNESS, WITHY AND COMPANY, LIMITED

INCREASED PROFITS AND DIVIDEND

PROBLEMS OF SHIPPING INDUSTRY

The forty-seventh annual general meeting of Furness, Withy & Co., Limited, was held, on the 26th instant, at the registered office of the company, Furness House, Leadenhall Street, London.

The Lord Essendon presided, and in the course of his speech, said: Let me say at once that our hopeful anticipations of a year ago were not entirely fulfilled. It is true that we are able to submit to you a statement of account showing increased profits, and also to recommend the payment of an increased dividend on our Ordinary stock, but these results fall short of our expectations, due in part to the fact that freight markets experienced a general setback in the autumn of last year, from which there has not yet been any material recovery. In the main, however, the results are satisfactory. Comparatively speaking, the year has been a good one for practically all our enterprises, and it may be that we pitched our anticipations a little too high.

The profit and loss account shows an increased profit for the year, viz., £620,681, compared with £544,744. In the final result there is a credit balance on profit and loss account of £834,494, including £213,812 brought forward, from which £55,312 is due to the Preference shareholders, £350,000 has been transferred to depreciation account, and subject to your approval it is proposed to pay a dividend of 5 per cent., less income tax, on the Ordinary stock capital, which will absorb £217,500, leaving £211,681 to be carried forward to the current year. The dividend on the Ordinary stock compares with 3 per cent. paid in 1937, and in the circumstances I hope this will be regarded as a satisfactory reflection of the improved results achieved.

It is well known, in general terms, that expenses have increased in almost every direction, but I am sure it is not realised exactly what these increases mean to a company such as ours. It will therefore be of interest to stockholders to know that in respect of the fleets which are managed from this building (which include Shaw, Savill & Albion, Royal Mail, Manchester Liners, Cairn Line, and so on) the increase in operating costs, covering such items as fuel, wages, stores and insurance, compared with the level of costs a year ago, is at the rate of £275,000 per annum. This is necessarily an incomplete picture, as it is impossible to calculate what is the extra cost of dock labour and many other items of expenditure in the various ports at which our vessels load and discharge.

THE COMPANY'S SERVICES

As regards the various trades in which we are interested, the New York/Bermuda Service experienced only a moderate year. The service between the North Pacific Coast and the United Kingdom yielded improved results, and the refrigerating vessels engaged in the South American trade, which to a large extent are operated under long-term contracts, yielded earnings which are considered to be reasonably satisfactory.

The services to South America and South Africa from the United States, which are operated by the Prince Line, are, for the moment, in the shadow of political events which are entirely beyond our control.

The facts in regard to our United States Services more than ever justify the interest which we acquired a year or two ago in the Empire Trades operated by Shaw, Savill & Albion I am glad to be able to report that that company continues to do well and has fulfilled our expectations.

INSIDIOUS INFLUENCES

There are a great variety of insidious influences at work to-day which are undermining the position of British shipping in world trade, the precise nature of which can, in many cases, only be guessed at, but which all find an explanation in the real or fancied needs of individual nations. The urgent need of some nations to secure foreign exchange is, no doubt, one reason for this state of affairs; preparations for defence of the people, or protection of foreign trade in the event of another war, is undoubtedly another, and, of course, fear of the consequences of unpreparedness is ever present. In the midst of these considerations, it is not to be wondered at that shipowners sometimes find difficulty in maintaining a course consistent with the principles of freedom of action and judgment. There are so many divergent considerations that even those who have the best interests of British shipping at heart frequently look at the problem from different angles. In times of depression it is not unnatural that efforts should be made to restrict the supply of tonnage to the demand, but immediately there arises the fear that unless there is an agreement with foreign shipowners to act in unison, the British share of the world's carrying trade may be still further reduced and transferred to foreign ships.

The fact is that whilst shipowners' first duty is to operate their ships as a commercial venture, the public naturally looks askance at any weakening in the volume of British tonnage and any reduction in the British share of the world's carrying trade. Similarly, the shipbuilding industry has a very natural interest in desiring more and more ships to be built. Dominating the whole position is the indisputable fact that Great Britain must, at all times, have command of sufficient merchant ships to secure the continued life of the nation, and also to serve naval and military requirements in the event of another war.

A review of some of the important events of the past few years is not without interest. The first event I will refer to was the Trade Facilities Act, designed with the threefold purpose of providing employment, assisting the shipbuilding industry, and increasing the number of British ships. Then after a period of very acute depression, which brought tramp shipping to the verge of ruin, there was a tramp shipping subsidy which was in effective existence for the two years 1935 and 1936, and which cost the Government the comparatively small sum of £4,000,000, as against nearly £50,000,000 which has been spent in the support of beet sugar, cattle, milk, etc. More or less concurrently, there was the scrap-and-build scheme, which I personally still think was of greater benefit to the shipbuilding industry than it was to ship-owning. At any rate, it assisted shipowners to the extent of providing a means of building new ships in place of old ones, and at the same time reduced the total volume of British tonnage inasmuch as two tons of old shipping had to be scrapped for each new ton built. Arising out of the tramp subsidy, the industry itself put into operation a system of minimum freights in some of the bulk cargo trades. In 1936 overseas trade improved to a sufficient extent to enable practically all ocean-going tonnage to find profitable employment, and the tramp subsidy came to an end. In the autumn of 1937 the pendulum commenced its backward swing, with the result that tonnage is once more being laid up.

Confidence in the future and a revival of international trade would dispel some of the fears and solve at least part of the problem. In the meantime, however, each of the three major sections of the community which are most vitally concerned, viz., shipowners, shipbuilders and the Government, will each seek to find a panacea. That the Government have the matter closely before them is evident. Our shipbuilders (who, incidentally, have themselves done much in recent years to reduce competition within their own ranks by eliminating a number of redundant yards, and who are not at present able to build as cheaply as some of their foreign competitors) will do all in their power to encourage the building of new ships, and if I may quote from a recent address by one of our most prominent shipbuilders, Sir James Lithgow, it would seem that they have national requirements primarily in mind rather than the profit-earning possibilities of the ships. The quotation I refer to is as follows:—

"It remains for us to demonstrate the urgency of our problems, but from our own and the national standpoint, to be assured of public opinion awakening to the peril of attempting to run an Empire on a dwindling mercantile marine."

One cannot avoid the reflection that if British shipowners had, at their own expense, during the past few years built more ships on an over-stocked market simply for the sake of maintaining the percentage of the British Mercantile Marine in relation to world tonnage, the depression in the industry would have been even more acute and prolonged.

THE OUTLOOK

It may be thought from the tenor of my remarks to-day that I take a gloomy view of the outlook. That is far from being the case. That there has been a temporary setback is beyond all doubt, but the gap between unprofitable and profitable trading can quickly be bridged by a revival in international trade, as was demonstrated very clearly no longer than eighteen months ago. Most of the elements needed to bring about such a revival are merely waiting a return of confidence in the political sphere, and it is to be hoped that the very strenuous efforts which are being made by our Government to establish better relationships throughout the world will meet with the success which we all believe to be possible. Beggar your neighbour never did much good either to the beggar or the neighbour, and, in my view, active and prosperous trading amongst nations is one of the surest methods of achieving peace and restoring confidence, the lack of which is one of the greatest stumbling blocks to-day.

The report was adopted.

McDOUGALLS TRUST, LIMITED

ANOTHER SATISFACTORY YEAR

The fifth annual general meeting of McDougalls Trust, Limited, was held, on the 25th instant, at the registered office, 3 Thames House, Queen Street Place, London, Mr Kenneth A. E. Moore, chairman of the company, presiding.

The Chairman, in the course of his speech, in dealing with the results of the operating company, said the past year's trading resulted in a profit of £241,036, as compared with an average, over the seven years ended March 31, 1937, of £194,000 per annum. We therefore regard the result for the year ended March 31, 1938, as an exceptionally good one, the more so because from a managerial point of view it was a year of unusual difficulty.

In addition to all the ordinary problems and to the ever present competition, the management had to cope with rising secondary costs and wide fluctuations in the wheat market occasioned by wars, and rumours of wars, followed ultimately by a substantial decline in wheat prices arising from favourable harvest prospects. It is, however, a tribute to the underlying strength, stability and soundness of the business that we emerged from a year of such complexity with a very satisfactory trading profit.

Out of the profit of £241,036, McDougalls Trust, Limited, has received £202,000 by way of dividend, £4,500 is absorbed by staff bonuses, £12,000 is reserved for National Defence Contribution and £9,406 for income tax. The balance of £13,130 has been retained in the business, an addition of £15,000 having been made to the general reserve, the carry-forward being slightly reduced at £29,602.

As you will have seen from the balance sheet of McDougalls, Limited, the financial position remains very strong, and even after paying for the new buildings erected during the last few years at Millwall and Andover and for the plant and machinery installed in them, McDougalls, Limited, still has over £200,000 invested outside the business in trustee securities of the highest class.

NEW PACKING WAREHOUSE

I referred last year to our new packing warehouse at Millwall. This has now been in full operation for over a year, and I repeat the invitation which I then extended to our shareholders to come down and see it. We have taken the opportunity in the good times which have been our lot for some years past completely to modernise our packing and certain other plant and equipment at Millwall by the installation of the very latest automatic machinery, and the new arrangements have proved a great success.

Shareholders may be interested to learn that as a form of A.R.P. we have reconditioned much of the old packing plant replaced at Millwall and have installed it at our country establishments as some insurance against the possibility of our operations being hampered in London in the event of war.

During the past year new silos have been erected at our Andover Mill, which greatly facilitate the handling and use of locally grown wheat and enable us to take in large quantities at harvest time. This is not only useful to us, but is also a convenience and economy to local farmers, who, if they wish, can dispose of their wheat at once instead of putting it into stack or store.

Turning now to the accounts of McDougalls Trust, Limited, the net income at £201,973 is practically the same as that for the previous year. After payment of the preference dividend and an interim dividend of 4 per cent. on the ordinary shares and provision for income tax, there remains a balance of £104,689, after including the amount brought forward from the previous year. The directors recommend the payment of a final dividend of 4 per cent. together with a bonus of 2 per cent.—making a total of 10 per cent. for the year—which will leave a balance of £39,497 to be carried forward, compared with £37,817 brought in.

OUTLOOK FOR CURRENT YEAR

With regard to the prospects for the current year, I am conscious of the fact that of all forms of error, prophecy is the most gratuitous. In any case, it is impossible at this stage to give you any reliable forecast. I can say, however, that in the first quarter of its year the operating company has experienced a gratifying increase in trade at a slightly reduced but nevertheless satisfactory margin of profit. What the outcome of the rest of the year will be remains to be seen, but I can assure you that the business of McDougalls, Limited, has never been better equipped nor more virile than it is at present.

Many shareholders have recently received circulars from sources unconnected with any recognised Stock Exchange, offering to purchase shares in McDougalls Trust, Limited, and offering for sale certain other shares whose merits are no concern of mine. Before entering into such transactions, shareholders should consult their bank managers or stockbrokers.

The report and accounts were unanimously adopted.

CENTRAL COMMERCIAL PROPERTIES LIMITED

A DECADE OF PROGRESS

MR W. S. EDGSON'S REMARKS

The tenth annual ordinary general meeting of Central Commercial Properties, Limited, was held, on the 26th instant, at 80, Grosvenor Street, London.

Mr W. Stanley Edgson, F.S.I., F.A.I. (the chairman), said that this period completed their tenth year and it was with no mean pride that he looked back on the progressive success that had been achieved during the past decade. During the period under review circumstances had forced them to a year of consolidation which he felt sure shareholders would agree had proved most beneficial to the company and placed them in a stronger position than ever before.

A year of difficulty and uncertainty had forced home to them that a rainy day might set in. He did not, however, foresee any material setback in their particular type of investment and his considered view was that the best type of shop property would not further decline in value in the near future.

A SCRIP BONUS

Perhaps the most interesting part of his remarks was the recommendation to capitalise a substantial part of their reserves in the form of a scrip bonus of one in three to the ordinary shareholders.

A summary of the results of the last ten years' working shows that during the first six years the revenue amounted to £122,131, of which 21 per cent. was paid in taxation, 54.2 per cent. dividends, and £21,604, representing 17.7 per cent., placed to reserves. During the last four years the revenue amounted to £207,384, and after paying 67.9 per cent. in taxation and dividends, there was placed to reserves no less than £59,787, or 28.8 per cent.

Those reserves had largely been built up from profits on resales, and, in view of the fact that recent valuations had proved that there was a very substantial reserve indeed in the difference of the cost and the market value of their securities, the board had come to the conclusion that they were fully justified in capitalising some substantial portion of those reserves.

BOARD'S DIVIDEND POLICY

He wished to make it abundantly clear that the directors did not anticipate maintaining the same rate of dividend and cash bonus on ordinary shares. In fact, they aimed more to reducing the basic dividend to a constant 10 per cent., perhaps plus a cash bonus commensurate with each individual year's results, and for the coming year he had distinct hopes that any such bonus would at least bring the distribution up to the equivalent in amount that they would have received for the previous year. The intention was to discontinue annual scrip bonuses and to aim at building up still further over a period of years the capital and contingency reserves, as it was their endeavour to maintain at least the same rate of satisfactory progress that had been achieved during recent years&

THE BURDEN OF TAXATION

He viewed with considerable misgiving the alarming increase in both Imperial and local taxation. Whilst the nation might be forced to spend much money in re-armament in order wisely to preserve peace, he felt it most desirable that other forms of Government expenditure, particularly on social services and reconstruction works, should be severely restricted. He considered that now was the time when all Local Authorities and the Government should eliminate every possible for of "non-essential" expenditure so that not onlly might the steady and burdensome rise in rates be arrested but that there might be a reserve of public works upon which to embark when the re-armament programme began to subside.

A close study of the general conditions in both manufacturing and retailing sides of industry had led him to the conclusion that the present high rate of local and Imperial taxation was stifling expansion, curtailing fresh enterprise, and severely impairing the saving power of our great nation.

PROBLEM OF INSURANCE AGAINST WAR RISKS

He also expressed regret that the Government should not have thought fit to have commenced, even if only on the voluntary basis, a scheme for insurance of buildings against war risks. That problem was unquestionably a national one, which the country would have to face in the event of war, and it seemed to him that it would be only prudent to build up a strong national insurance fund during times of peace in order to give property owners, manufacturers and traders that sense of protection that they deserved.

The report and accounts were unanimously adopted.

EASTWOODS CEMENT, LIMITED

DIVIDEND OF 12½ PER CENT

The thirteenth ordinary general meeting of Eastwoods Cement, Limited, was held, on the 27th instant, at River Plate House, London.

Mr Horace Boot, M.Inst.C.E., M.I.Mech.E., M.I.E.E. (the chairman), in the course of his speech, said that the profit carried to the balance sheet amounted to £27,363, which compared with £37,018 last year, and the directors recommended a final dividend at the rate of 7½ per cent., less tax, making 12½ per cent. for the year. The results for the year might be a disappointment to some of the shareholders, but the position was already anticipated by the directors, having regard to the continuous rise in the cost of fuel, wages and all materials used for maintenance and constructional purposes. The long overdue adjustment in selling prices was delayed until December, 1937, in circumstances entirely out of their control. Consequently they stood to receive the benefit of only three months' improved trading, even had the higher selling prices been available. Earnings were further reduced by lower income from investments, and by an extensive overhaul of the kilns and coal mills, etc., during the winter.

As regards trading prospects, although the figures fluctuated from month to month in different areas, there was so far no diminution in total this year compared with the record deliveries reached in the industry for 1937, when the loadings for the home trade amounted to six and three-quarter million tons. There was again apparent a resumption in house-building activity, which indicated renewed confidence in the general position. The whole field of enterprise for furthering the consumption of cement in this country had not yet been fully explored, but users should bear in mind that, when specifying cement for any of its multifarious purposes, they were assisting in the expansion of the demand for coal, all of which was produced in this country. He felt confident that when their new Humber interests were firmly established, the policy of the board would be amply justified, and that they would shortly begin to enjoy the benefits to be derived from consolidating the sales production of the three Eastwoods cement works in the markets best suited to each, to the mutual advantage of all of them.

The report was unanimously adopted.

CHOSEN CORPORATION, LIMITED

SALE OF INTERESTS

An extraordinary general meeting of The Chosen Corporation, Limited, was held, on the 27th instant, in London.

Mr G. W. B. Portman, who presided, said that the agreement under consideration provided for the sale of the company's holding in Nurupi to the American Overseas Mining Investment Corporation for £345,000, payable in cash, partly in sterling and partly in foreign exchange, in London by August 31, 1938. The company remained the sole shareholder to all intents and purposes of Kapam K.K.K., the second of the Japanese companies, the liquid resources of which were estimated to be worth approximately £70,000.

In respect of the sales of its Nurupi interests and from Kapam the company would therefore be entitled on completion to a sum equivalent at current rates of exchange to £415,000 sterling. A deposit of 500,000 U.S.A. dollars, equivalent to upwards of £100,000, had already been put down in cash in London by the purchasers and was now held in joint names. There were other sums to which the company might become entitled under the agreement. It had been brought to the attention of shareholders on previous occasions that there had been disputes between Nurupi and the tax authorities in Japan, and large sums had been paid by way of tax which it was considered Nurupi should be able to recover. The agreement provided that any sums so recovered by Nurupi should belong to The Chosen Corporation.

Shareholders would expect some explanation as to how it came about that the directors were now placing those proposals before them in view of the fact that at the last meeting discussion had centred on a sum of £350,000. It had never become possible for the company to obtain possession or in any way to control the application of that sum. It was now practically impossible to get sterling out of Japan. Under the present agreement a large part of the consideration was in sterling. The balance was in foreign exchange, the market for which was now pegged, and the board had promised that that exchange would not be sold in such a way as to disorganise the market or create pressure on the rate.

On the resolution being put to the meeting it was carried by a majority of those present. A poll was demanded, which resulted as follows:—In favour of the resolution, 326,575 votes; against, 83,188 votes.

SOUTHERN KINTA CONSOLIDATED, LIMITED

SUCCESS OF CONSERVATIVE POLICY

The fourth ordinary general meeting of this company was held, on the 25th instant, in London.

Captain Oliver Lyttelton, the chairman, in the course of his speech, said that it would be seen from the balance sheet that the company's Government securities had been sold against the day, now close at hand, when the big part of the bill for the new dredge must be paid; £194,000 now remained to be found. When, in addition, taxes and the final and interim dividends had been paid, it would be seen that nearly all the surplus cash would have been used.

As to the new share issue, the financial policy of the directors for the last few years had been broadly to provide liberal depreciation reserves, full reserves for all known tax liabilities, and full reserves for bucket band renewals and running repairs. That conservative policy, and particularly the liberal depreciation reserves, had enabled them during the last two years to finance out of the company's resources an ambitious plan of plant reconstruction, the purchase of a new dredge, the acquisition of the two new properties, and so forth. The main items were: New dredge, £220,000; dredge reconstruction, £38,000; and purchase of property, £87,000.

It was therefore without the slightest apology that the directors proposed to increase the issued capital by 350,924 shares of 5s. each, or £87,731; that was one share in 10, plus 1,217 shares to make the capital into a round figure of £962,000.

Last year they increased their carry forward by £16,000, and they would use all or part of that sum, if necessary, in equalising their interim dividends.

As he had promised in the previous year, the directors had limited their additional remuneration to a total of £5,000. Under the Articles it would have been £8,200.

He thought that shareholders could now look forward to more stable conditions, but full prosperity could only be reached when there was an industrial revival in the United States. Their company, which was the largest individual producer in the British Empire, was well equipped, could make modest profits in bad times, and give prospects of excellent returns when times were normal.

The report and accounts were unanimously adopted.

BANK STATEMENTS

Imperial Bank of India.—Net profits for the half year to June 30, 1938, Rs. 39,52,300. Dividend of 12 per cent. per annum, tax free, absorbs Rs. 33,75,000; to reserve fund, Rs. 2,50,000; to pension fund, Rs. 69,000; to premises account, Rs. 2,50,000. Carried forward, Rs. 30,49,900, against Rs. 30,41,600.

Guaranty Trust Company of New York.—Statement, June 30, 1938, shows: Deposits $1,496,430,798·21, as compared with $1,446,430,628·38 on March 31, 1938. Total resources $1,816,207,890·46, as compared with $1,770,408,085·52 on March 31, 1938. Undivided profits $12,010,401·89, as compared with $11,840,362·51 on March 31, 1938. Capital and surplus remain unchanged at $90,000,000·00 and $170,000,000·00 respectively.

Bank of America. — Earnings, $12,321,000 in the first six months of 1938, or $3.08 per share for the half-year, compared with $10,007,000 for the same period last year, and $19,203,000 (or $4.80 per share) for the full year 1937. Dividends, $4,800,000 ($4,000,000). Capital funds, $112,231,000, as compared with $107,268,000 June 30, 1937. Deposits, $1,357,778,000, an increase of $77,058,000.

Manufacturers Trust Company. — Deposits, June 30, 1938, $619,824,134, and resources $737,811,929 against $592,002,055 and $709,748,291, respectively, on March 31, 1938. Net operating earnings for quarter ended June 30, 1938, $2,155,579, against $2,323,713 for the same period in 1937. After dividends of $233,913 on preferred and $824,959 on common, $840,573 was transferred to reserves, and balance used for amortisation and taxes.

Bankers Trust Company.—Statement, June 30, 1938, shows that cash now stands at $324,078,437 against $269,118,786 a year ago. Exchanges for Clearing House amount to $46,834,199 against $53,841,630, and U.S. Government securities to $399,353,059 against $401,066,208. Deposits $915,956,618 against $945,168,425 on June 30, 1937. Undivided profits have risen to $27,650,902 from $25,366,182 a year ago. Total assets $1,038,156,262 against $1,066,081,502.

Where Are the Workless?—II

The following charts show the recent course of unemployment in a number of industries and industrial groups. For each month the results are expressed as a percentage of the number of persons aged 16–64 insured against unemployment in that industry, as recorded by the Ministry of Labour in the preceding July. The percentages for 1936–37 (indicated by a dotted line) have been adjusted by the Ministry to allow for the change in the method of counting the unemployed, which was introduced in September, 1937.

Finance

GOVERNMENT RETURNS

For the week ended July 23, 1938, total ordinary revenue was £18,055,000, against ordinary expenditure of £14,824,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £112,790,000, against a deficit of £73,801,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On July 22nd, applications at £99 17s. 4d. per cent. for bills to be paid for on any day except Saturday of the following week were accepted as to about 32 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications for bills to be paid for on Saturday at £99 17s. 5d. per cent. and above were allotted in full. £40·0 millions of Treasury bills are being offered on July 29th.

War Debts Again

THE regime of War Debts, we have frequently been assured, is dead; but for four years it has obstinately refused to lie down, and in the last few weeks there has been a positive resurrection of interest. A fortnight ago Lord Samuel initiated a debate in the House of Lords with a frank advocacy of a resumption of payments by Great Britain to the United States—on a reduced scale, it is true, but on a scale sufficient to secure American acceptance. Several other peers supported Lord Samuel; and since then hardly a day has passed without an editorial in some newspaper, a rumour, or the denial of a rumour, of negotiations in progress, or a pronouncement by some weighty authority. The remarkable thing is not that interest has thus suddenly revived in a topic long dormant, but that every contribution to the discussion either asserts or tacitly and, perhaps, regretfully accepts the desirability of a resumption of payments.

To those who remember the mood of injured irritation and frustration with which the whole question was regarded in England at the time of the final default four years ago, this sudden revelation of a change of mind must come as a surprise. The default, it is true, was never considered on this side of the Atlantic to be either complete or permanent. It was the action of Congress, not of the British Government, that brought the token payments to an end, and the British Note that announced the decision to make no payment on June 15, 1934, spoke of it as the "suspension" of payments "until it becomes possible to discuss the ultimate settlement of inter-governmental war debts with a reasonable prospect of agreement." Have the intervening years brought any closer that prospect of agreement? In one respect it is very difficult to see any change. Neither British nor American public opinion has altered by more than a trifle the stand on principle which it took up four—or, for that matter, fourteen—years ago. It would be hard to find more than a handful of Englishmen who do not believe that the course we pursued from the Armistice to the default was justified on the highest moral grounds. The nation has in no sense a guilty conscience. On the other side of the Atlantic the tiny minority is of those who do not accept the moral justification of the case for payment in full. If those who coined the despicable epithet of "Uncle Shylock" thought to shame the American people into forgiveness of its debtors, they have completely failed.

But if there has been no retreat in four years from the narrow and windy eminences of principle then occupied, there has been a distinct tendency to leave them, as it were, in permanent garrison and to descend to the broad plain of practical possibilities to tackle the problem once again. The change that has happened in four years is that either country, without yielding its pretensions, would, nevertheless, now be glad to reach a practical compromise for the sake of finally burying, if not the debt itself, at least the problem of the debt. To the end of removing this irritating obstacle to understanding between the two nations (and let no one make the cardinal mistake of underrating its irritant power, especially in the United States) most people in Great Britain would be willing to pay something more than the nothing they believe to be the only just figure,

while United States opinion seems ready to contemplate a lower figure than that which it considers rightly due.

Many factors have combined to produce this concentration on the practical issue. The long negotiations for a Trade Agreement have naturally turned minds in this direction, though the negotiating Governments have from the start wisely decided not to complicate the already involved matters of tariffs and trade with bargaining on the thorny subject of debts. The inter-connection, however, is obvious. So, too, is the effect which the fear of war has had on the British view. It is altogether too crude to represent Great Britain as thinking only of putting herself in a position to borrow again if need be, since it is clear that America's decision, in a future war, to give or withhold financial aid to the other democracies will turn on issues far more momentous than whether they can produce the right number of debt receipts. But the darkening shadow of war inevitably encourages like-minded nations to draw closer together and to remove such causes of mutual irritation as exist between them.

The war debt problem is thus in effect rapidly being reduced to the practical one: How much? What is the highest figure within her financial capacity that Great Britain would be prepared to shoulder, and is this figure within bargaining reach of the lowest that America would be willing to accept? It is, perhaps, worth emphasising that this *is* the only question, since the ingenious chorus of those who claim to have found methods of painless payment has struck up once again. Unless the novel method would create an *additional* volume of trade between the two countries (that is, additional American purchases of British goods and services) it is merely a way of earmarking part of the flow of funds already passing across the exchanges. Thus the latest suggestion for payment by means of sterling travellers' cheques to be sold to American tourists would, indeed, supply funds for payment, but only at the expense of depriving the foreign exchange market of this source of demand for sterling. The effect on the pound sterling would be exactly the same as if payment were made by more orthodox means. The only practical basis for agreement is to consider how much could be transferred by the normal methods of international exchange. And it may be added that though the history of financial events since 1934 shows that something could be paid without imposing intolerable strain upon the exchanges (save perhaps in exceptional years like 1931, for which exceptional provision could be made), it also shows that nothing like the very large sums contemplated by the Mellon-Baldwin Treaty could be paid.

How much? If an honest attempt were made to answer this question, without any too Oriental eagerness to stake purely bargaining claims, it is not merely possible but highly probable that a settlement would be reached. The honest attempt would have to involve the abandonment of any belief on the British side that payments of the token order of magnitude would be acceptable. An offer of £3 millions or £5 millions a year would be regarded in Washington, in 1938 as in 1934, as derisory. On the other hand, American opinion, if it is in earnest about wanting a settlement, will do well to abandon the attempt to maintain any formal relationship with the inflated figures of 1919, or even of 1925. Even with the entire remission of interest, the principal formally due can barely be reduced to £500 millions, and no British Government could promise to pay as much as that.

The bargaining range is thus fairly clearly defined: £5 millions a year is less than the Americans can accept; £25 millions a year is more than we can offer. Somewhere between there is a figure on which both could agree. The opportunity may not be perfect for setting out on an intensive search for the golden mean; but it is never likely to be better.

Disunity in Poland

ON the direct road from Berlin to Moscow, and from Moscow to Prague, Poland is to-day, more than ever, in a key position on the map of Europe and the world. More than ever, the scheming diplomats of the Continent would like to know where, in their combinations, Poland stands. And more than ever, the answer is a cryptic one, not to be read in the external journeyings of Colonel Beck, who was last week in Norway, and before that in Latvia, seeking associates for a policy that is neither pro-German nor pro-Russian so much as anti-League. The answer must be sought from the domestic stirrings of the uneasy Polish people.

Eighteen troubled months have now elapsed since Colonel Adam Koc, under the terms of reference received from Marshal Smigly-Rydz, Inspector-General of the Forces, produced the "Political-Ideological Declaration" that was to have been the Magna Charta of Polish National Unity. The Declaration was based on the predominance of the Roman Catholic faith, the doctrine of nationalism, and the glorification of the Army. All the forces of the nation were to be dedicated to the strengthening of national defence and to raising the standards of Polish life. And, said Marshal Smigly-Rydz in his terms of reference, "the days of privilege are over."

This reference to privilege was the crux of the programme. In the nine years between the Pilsudski *coup d'état* of May, 1926, and his death in May, 1935, the Legionnaires who fought with Pilsudski for the recovery of Polish independence obtained a commanding position in national affairs, which they consolidated under the new Constitution enacted just before Pilsudski's death. They and their friends became "the élite."

The nation received with a scepticism which has since been justified the statement about the days of privilege being over. The general reaction to the Declaration itself was to wait and see, and, in the meantime, for many, perhaps the majority, to maintain an attitude of passive resistance to the governing regime. The Declaration, in fact, caused more stir within the governing regime than it did among the Opposition, and it was not long before Colonel Koc narrowly escaped a bomb attempt on his life, which was presumed to have been an "inside job." A few months later Colonel Koc retired into oblivion, and his Declaration has now been forgotten. The National Unity Camp which he created still exists, but its importance may be measured from the fact that Deputies belonging to the Camp recently elected Colonel Slawek as Marshal of the Sejm and Colonel Slawek was the Camp's bitterest opponent within the regime.

The Koc movement was thus killed by opposition from within and passive resistance from without, and no doubt President Moscicki and Marshal Smigly-Rydz are now sorry that they sponsored the movement and endorsed the Declaration. But responsibility for the failure was largely theirs, because the selection of Koc to "organise" National Unity was a mistake, and their failure to put any real substance into the words about the days of privilege being over deprived the movement of its only chance of arousing any popular echo.

The problem of Poland's political future is thus substantially where it was twelve years ago, after Pilsudski threw over the extremely democratic form of government which he and his followers felt had led only to chaos. It is true that since 1926 an oligarchy and an extensive bureaucracy have grown up; but an oligarchy is only a transient form of government, and the true Pilsudskists, now well past middle age, are steadily dying off. What is to take their place?

It need hardly be doubted that, given another ten years of peace, Poland will gradually return to more democratic forms of government—probably somewhere in between the extreme Liberalism of 1920-26 and the "directed democracy" which was Pilsudski's aim. Time may well show that the agonies and disunity (even within the governing regime) of the last three years were merely the birth pains of a new order which will evolve gradually. It is necessary to recall that, even under Pilsudski, Poland was never, in the Soviet or Fascist sense, a dictatorship. Pilsudski's idea, during the period of transition, was a strong centralised Government, with a Cabinet of experts, and himself as "the deciding factor." He would never have tolerated the electoral system which was enacted soon after his death. It is, in fact, a flagrant violation of the last State document Pilsudski signed—the Constitution of April, 1935.

There has been much talk since his death about a military dictatorship and totalitarianism, and it is probable that Colonel Koc toyed with the idea of a totalitarian system based on rubber-truncheons and bayonets—in short, a military-police State much as Germany, Italy and Russia now are. But the Poles would be about the most difficult people in the world to "totalitarianise." The police have been trying for years to teach and persuade the inhabitants of Warsaw to cross the streets at inter-sections and to obey traffic lights, but the task now seems to have been given up as hopeless. If Warsaw had one-hundredth part of the motor vehicle traffic of London or New York, the number of accidents would be appalling. It is much the same in politics. They form a National Unity Camp and then each member of it has his own ideas about what national unity means.

Both President Moscicki and Marshal Smigly-Rydz, during recent weeks, have disavowed any ideas about totalitarianism; nor was it, indeed, ever seriously thought that they would countenance such ideas in others. All the efforts of the leaders of the regime, with the President and the Marshal taking a prominent part, now seem to be directed towards improving relations with the peasants, who number—apart from the Ukrainians and other minorities—nearly 20 millions out of a population of 35 millions. The peasants' spokesmen have so far been adamant in insisting that any understanding with the regime must be preceded by a promise to restore their political rights and by the return as a free man of M. Witos, a former Prime Minister and the President of the Populist Party, who fled to Czechoslovakia in 1930 when the principal Opposition leaders were "purged." M. Witos still has a sentence of two years' imprisonment to serve. President Moscicki has recently been discussing with peasant representatives from Galicia the possibility of M. Witos returning to Poland, and it has been reported that an acceptable formula is now being sought. There are many who feel that politically M. Witos is a spent force; that he is simply being "martyrised" by exile; and that—especially in such a time as the present—he is more to be feared by the regime while in Czechoslovakia than he would be in Poland. If he would promise to recognise and support the present Constitution it might be good politics to allow him to return and even to make him Minister of Agriculture or Minister of the Interior. But M. Witos himself probably realises that by returning to Poland he would be conferring a favour on the Government rather than accepting one from them; and his terms may be stiffening in consequence.

A beginning—or perhaps gesture would be a better word—towards the restoration of political rights to the masses has just been made by the enactment of new laws for elections to municipalities and communes, and it is most likely that after the life of the present Parliament expires in 1940 a new and more liberal electoral system will be introduced.

The peasants are strong to-day because they are united; and they are united because they are in opposition. If they were asked to form a Government their unity would disappear almost overnight. There is no doubt that the peasants' strike in Galicia last August, during which forty or more lost their lives and several hundred were sent to gaol, made a deep impression on the Government; its effects can be seen in the subsequent economic legislation and agrarian reform. Under M. Poniatowski, the present Minister of Agriculture, land distribution has progressed faster in the last two years than it did in the previous ten; and the main efforts of the Government are now concerned with maintaining agricultural prices at the highest possible level and in promoting better living conditions among the peasantry. The latest step was the introduction of export premiums on grain and a processing tax on flour, the enactment of which may have been due in part to the rumours of another attempt by the peasants to "starve the towns" this August—and on a national scale this time.

An impressive demonstration of peasant solidarity and political consciousness was provided at a National Congress held in Cracow a few months ago, when nearly 1,000 delegates from all parts of Poland assembled. One of the resolutions then voted expressed grave dissatisfaction with the Government's foreign policy, and reiterated what the peasants have resolved on many occasions in the past—namely, a foreign policy based on wholehearted friendship and co-operation with the democratic powers, including Czechoslovakia.

The strongly pro-democratic sentiments of the masses have never, since May, 1926, been allowed to influence foreign policy, but this situation did not cause much concern while Pilsudski was in charge of affairs. The masses knew where he stood; they had full confidence in his judgment; and they knew he would never be overwhelmed by fear of Germany. They have not the same confidence in Colonel Beck, who has been foreign Minister since 1932, and whose influence on foreign policy since Pilsudski's death has probably been decisive. As the "guardian of Pilsudski's testament"—although no written testament has ever been known to exist—Colonel Beck appears to have considered himself above public opinion, and even above influential opinion within the regime. But his views about the League, his coldness towards France, his handling of the Danzig question, his extreme reticence and general air of mystery, have done nothing to win him the esteem of the masses; nor is Polish-German "friendship" regarded by them as anything but a temporary expedient. Good neighbourly relations with Germany are, of course, acceptable, but not at the cost of weakening Polish ties with Paris and London. It would be wrong to assume that public opinion would not assert itself decisively in the event of a war in which France and England—and perhaps eventually the United States—became engaged.

It would, indeed, be wrong to make any too rigid assumptions about Polish foreign policy in future contingencies. Wedged between the two military giants of Europe, Poland is necessarily an opportunist. Her primary instinct is self-preservation; and the methods must be changed with the changing identity of the major menace. But even beyond this inevitable waiting upon others, there is, in foreign affairs as in domestic, the uneasy equilibrium between those who are in office but not in unlimited power, and those who, without being in office, speak for the ultimate forces of the nation. In any future war Poland will do her utmost to be neutral. In whose interest she will be neutral is not decided. It may very well be that events, rather than Polish wishes, will decide it.

Sanctuary for Exiles

THIS week representatives of more than 30 nations, including the United States, have met in London to consider ways and means of assisting refugees from Germany and Austria. They have taken up the problem where it was left last month at Evian, after a conference called hurriedly together by President Roosevelt, when it seemed evident that the thousands put to flight from Austria since the Anschluss bade fair to break down the loose-knit structure of aid to refugees built up by the League of Nations, and by private organisations, and governments in the years since the war. Once more the resources of statecraft are to be tried and tested by one of the saddest by-products of contemporary political and economic systems. Lord Winterton has been appointed permanent President and Mr George Rublee, an American lawyer, Director of the inter-Governmental Committee, whose terms of reference are broad and whose aims are of the essence of humanitarianism.

The problem of refugees is not new. Since exclusive nationalism became the dominant note in Europe's politics millions of unhappy fugitives have sought new homes in foreign lands. The disintegration of the Turkish Empire and the clash of rising nations in the Balkans set up waves of migration in the generation before the war. The beginning of the mass flight of Jews from Russia can be dated even earlier, in 1882. But the aftermath of war swelled these movements to a new magnitude. In Russia, the Bolshevik revolution, the succeeding civil war and the dread accompaniment of famine drove upwards of a million refugees westwards to Poland, Germany and the Baltic, southwards to Roumania, Constantinople and beyond, and eastwards to Manchuria and China. In the Balkans, the wars of 1912, 1913 and 1914-18, and the defeat of advancing Greece at the hands of Turkey in 1922, threw frontiers into the melting pot, and brought Greeks and Bulgarians back to their nominal homeland seeking refuge. In Italy, political persecution began in 1923, and some 10,000 political refugees have since sought shelter, aid and employment abroad. In Germany, the gospel of racism and political hatred was enthroned five years ago, and more than 150,000 migrants have come to foreign countries for help.

The sad record of the post-war treks of the homeless and stateless of Europe is set out in the latest publication of Chatham House.* Sir John Hope Simpson shows with dreadful clarity how "the existence of refugees is a symptom of the disappearance of economic and political liberalism." Refugees are the consequence of closed and authoritarian economies. The nationalism which persecutes and expels them in one country denies them freedom of entry across the frontiers of others. They are the products of the pressure of population upon national resources deliberately brought about by restrictions upon international commerce. At bottom "the problem of refugees is the problem of economic and political adjustment."

This week's meeting in the Locarno Room at the Foreign Office cannot hope to solve the refugee problem in the only complete way by removing its causes. The Committee's terms of reference do not include the task of setting right a disjointed world. A great deal can be done, however, and has been done in the troubled years since 1918, to ease the distress of the migrants, and to overcome the difficulties of the communities in which they have sought asylum, by international co-operation, generosity and good sense. Indeed, it could almost be said that the problem embraced by fugitive Russians, Greeks, Bulgarians, Armenians, Italians and even Germans had been virtually solved in fact or *in posse*—apart from the tragic Russians in Harbin, Shanghai and Tientsin—when the flight from Austria heralded a new exodus impelled by rising anti-Semitism, blocked by the same savage sentiment in possible fields of migration, and exacerbated by the virtual confiscation by the Reich of Jewish property. At least, in Sir John Hope Simpson's words "on a broad view it may be said that the existing refugee population, with one major exception, the Russians in the Far East, is now distributed where final absorption could take place." And international Jewry were confident—before the events of this year betokened a new threat, not only to 350,000 Jews in Germany and 191,000 in Austria, but also to five million Jews in Hungary, Poland, Roumania and Lithuania—that they could save their persecuted fellows from dying in the wilderness.

How has the refugee problem been tackled so far? Broadly, the difficulties which confronted the League, governments and private bodies in the case of the Russians, Armenians and Germans, as they now confront the London Conference, were three: a refugee is an alien without a legal status or the shield and support of a protecting government; he commonly lacks food, clothing and shelter; and he needs a method of earning his living for the future. The first of these problems, legal and political status, has been the field in which the League of Nations has assumed some responsibility, though the last word has lain with the sovereign states themselves. The problems of relief and settlement have been largely left to private enterprise and philanthropic finance.

In 1921, Dr Nansen was appointed League High Commissioner for Russian Refugees; and the scope of the Nansen Office was afterwards widened to include Armenians, Assyrians, Assyro-Chaldeans, and Saarlanders. In 1933, a similar Commission, under, first Mr James Macdonald, and later, in 1936, Sir Neill Malcolm, was set up to deal with German refugees. The work of these bodies was mainly to secure international agreements for the legal protection of those under their care, and to assist in the co-ordination of relief and settlement. In 1922, the so-called Nansen passport gave some degree of legal status to fugitive Russians, and in 1927 a similar "stateless" document was proposed for refugees not under the Nansen Office, and actually granted in 1936 to refugee Germans. By agreement a status of refugeedom was evolved and defined. Both the Nansen Office and the Commission for German refugees are due to lapse shortly, but the continuance of their functions in some way was agreed by the League Council in May.

Clearly, the League's mission as guide, philosopher and friend must ultimately be dependent upon the readiness of private organisations to relieve and assist refugees and, still more in the long run, upon the willingness of governments to receive and recognise refugees, to grant them asylum, legal rights and permission to work. The League's responsibility can only be temporary. Voluntary bodies, and notably to the everlasting credit of their country, Americans, have done their relief work nobly; the Jews of the free world have shown their unfailing generosity towards their persecuted brethren; and the countries conspicuously exposed to refugee migration, such as France, Holland, Jugoslavia, Czechoslovakia and Palestine have responded with varying degrees of generosity to the calls made upon them. The liberal traditions of France have combined with her need for man-power in mine and factory to afford a home to 190,000 refugees, congregated for the most part in large cities, in Paris, Marseilles and Lyons, and now including close upon 100,000 Russians and, temporarily, some 30,000 Spaniards. Jugoslavia has hospitably received 28,000 Russians, while in Czechoslovakia the *Action Russe*, until it ended in 1929, gave aid and education to over 10,000 Russians. Among its 282,000 immigrants since 1920, Palestine has received some 30,000 German refugees; their settlement has been well planned and organised; but fears for the country's absorptive capacity and political troubles have set a strict limit to the numbers Palestine may welcome annually. Only in the Far East, where thousands of Russians are working as labourers—when they can get the work—at half the wages paid to Japanese, while their women walk the streets, has the problem been wholly unsolved.

The only final end to the problem of refugeedom is naturalisation and absorption; France has gained artisans; Holland has gained traders. The refugees of to-day, like the Flemings and Huguenots of the past, have contributions to make to the life of their new countries. Much of the greatness of the United States is historically based upon the talent and enterprise of refugees.

But absorption and assimilation are so slow and difficult that they could barely cope with the scale of the refugee problem as it stood before the *Anschluss*. Even liberal France warns that she has reached the limit; and vested professional interests in Britain are not disposed to be generous. The dimensions of the problem to come threaten to swamp the agencies which have so far spread the waters of migration relatively smoothly over new lands. One field has been practically untouched so far; that is, colonisation—except where refugees have been merged with existing schemes as in Palestine and Argentina. South America, North Africa, Australia, New Zealand, Madagascar, Kenya, the New Hebrides, and Angola have been suggested for settlement. But, since the cost of settling a family in a new land runs close to £1,000, there are clearly financial burdens to be borne as the basis of any extended scheme of settlement. Mass migration is impracticable, but planned infiltration adequately financed is clearly feasible; and the rights of Imperial Powers like Britain and France spell duties and responsibilities also. Responsibility lies heaviest upon the persecuting powers, and more heavily than ever upon Germany for her sudden expulsion of Jews this year without the wherewithal to make their way in the world. Private charity cannot cope with the new flood of fugitives. The nations must come together to check the flow by persuasion and argument; to canalise it by organised migration; and to run it to fruitful purpose by generous absorption and schemes of settlement. The rich and the powerful among the nations have a matchless opportunity to show that they have some element of those other qualities of mercy and charity which alone can truly authorise them to call themselves Great Powers in the world.

August the Inauspicious

THIS is the season when the thoughts and feet of British citizens turn towards other sea coasts than those of Bohemia. But the preoccupations of modern Bohemia are responsible for dragging at least their thoughts back to graver matters than holiday-making. We may be forgiven if, in the first days of August, we recall a sunny Bank Holiday week-end twenty-four years ago; and what came of it at last. We have no desire to crab the holiday spirit; but we feel inclined to break a lance with those who talk airily of "the end of the season," the dog days, and the general uneventfulness of August. For us, as for General Staffs and munitions works and the Foreign Office and the fighting Services and all the cables and wireless in the world, August is a horrid, an incalculably eventful month.

Consider the counts in the indictment of August since 1914. Of sheer and wilful ominousness it has been quite as guilty as any other month, and regularly. The landing at Suvla Bay and the taking of a National Register occurred in August, 1915. In the same month of 1916 Italy declared war on Germany, Roumania on Austria-Hungary, Germany on Roumania, and Turkey on Roumania; and Field Marshal von Hindenburg became Chief of the German General Staff. Next August, Roumania collapsed, China entered the war against Germany, the first battle of Ypres opened, and—causing other casualties—the U.S. Senate adopted the Constitutional Amendment which boosted bootlegging and raised the status of gangsters. In August of 1918, apart from the German defeat on the Western Front, the Allies (including the United States) recognised Czechoslovakia as an allied nation, and British troops landed at Archangel and Vladivostok, while the British Government issued its simultaneous Declaration to the Russian Peoples abjuring any intention of intervening in Russian politics.

The first August of Peace brought nothing more exciting than the collapse of Béla Kun's Communist regime in Hungary, a British battle or two with the Bolsheviks in Russia, the occupation of Hungary by the Roumanian army, proclamation of the Weimar Republic by the German National Assembly, and the first blows of the "Geddes axe" at the root of the Ministerial trees in Whitehall. As for August of 1920, the Straits were internationalised, Smyrna was given to Greece as an airy gesture (which brought a war a year or two later), the Habsburg Monarchy was split up, the first Little Entente alliance was signed, and the Polish army, with the help of General Weygand, routed the Russians in the Battle of Warsaw. By 1921, August had become quite humdrum: the United States convoked the Washington Conference on disarmament, the Spaniards were defeated in Morocco, the British Government's offer for the Irish settlement was published, De Valera refused it, and the United States signed separate Treaties of Peace with Austria, Germany and Hungary.

August of 1922 began in grand style: the Balfour Note on reparations and debts went off on the 1st; civil war broke out in Italy on the 4th; the British Air Force was expanded by 500 machines for only £2,000,000 (*O tempora!*); Britain ratified the Washington Treaties; an Allied conference on reparations and the proposed moratorium opened in London, while the mark shot downwards; the Bradbury Committee went to Berlin for the Reparations Commission; General Sun Yat-Sen, after his defeat in China, escaped on a British gunboat; British Orders-in-Council established a Government in Palestine; the President of the Dail died; Michael Collins (then head of the Irish Free State Government) was killed by irregulars in County Cork; and the Greek Army was annihilated in Asia Minor. That was an August, that was!

The next was milder, for only the bombardment of Corfu by the Italians took place, the Anglo-Japanese Alliance lapsed, the mark fell to 36,000,000 to the £, President Harding died, and Mr de Valera was arrested. In the dog-days of 1924 came the arrest of J. R. Campbell—destined soon to bring down the first Labour Government—the Dawes Agreement with Germany, the Ruhr

evacuation, and the outbreak of passive resistance by Swarajists in India. By comparison, August of 1925 was homely: nothing much, beyond the French war in the Jebel Druse, the seizure of power in China by an army commandant named Chiang Kai-shek, and a debt settlement or two. So in 1926, apart from Mexico falling under a Papal interdict over the Church dispute, a revolution in Greece oversetting General Pangalos, and large-scale military operations in China, all was calm and bright.

But in 1927 August got into its ominous stride again. The Conference on Naval Limitation collapsed, Sacco-Vanzetti demonstrations and bombs blew up all over the world, Fianna Fail decided to co-operate in the Irish Dail, and Lord Cecil resigned from the Cabinet over the Government's attitude to disarmament. By 1928 August was going full pelt: it began with Mr Baldwin's pledge not to introduce protection or taxes on food, warmed up with the death from wounds in the Jugoslav Lower House of M. Raditch, the Croat leader, and careered on to Venizelos's victory in Greece, and the signing of the Kellogg Pact in Paris. This was only the prelude to August of 1929, when the Hague Conference evoked Mr Snowden's famous gibe of "*grotesque et ridicule*" at the French; the Reparations Agreement was signed; massacres of Jews broke out in Palestine; and the Anglo-Egyptian settlement was framed. August of 1930 was the last of the calm post-war dog-days: Sir Otto Niemeyer heralded the world economic blizzard by telling the Australian Loan Council to economise; a revolution racked Peru, and murderous assaults broke out in India.

Summer fireworks went up again in August of 1931. On the 1st the Bank of England borrowed the £50 millions loan from France and the United States to buttress sterling; and they wound up that *entrée* with a sweet, on the 28th, of another £80 millions from the same two lenders. On the ominous fourth Germany imposed exchange control; on the 8th the Bank of England invited Prime Minister MacDonald to stablish British finances; on the inauspicious 13th the Cabinet coolly decided to balance the Budget; on the 17th the Japanese Government issued their ominous statement on the murder of Captain Nakamura in China; on the 18th the Layton-Wiggin Report recommending a short-term moratorium for Germany appeared; on the 19th Count Bethlen resigned the Premiership of Hungary after eleven years; on the 22nd came the British Cabinet split over a cut in unemployment benefits; on the 23rd the King returned to town; on the 24th the Cabinet resigned and Mr Ramsay MacDonald became first leader of the National Government, with Labour in opposition. Not a bad August bag.

And what shall we say of those other Augusts since then: of '32, when the Ottawa Agreements were concluded, with the £ at $3.60, and the Reichstag meeting under a Communist woman Speaker? Of '33, when the international loan was made to Austria, and Britain and France protested to Nazi Germany on the activities of Nazis in Austria? Of '34, when Hindenburg died in favour of Hitler, a German plebiscite was held, and Mussolini met his friend Schuschnigg at Florence? Of '35, when Italian men and *matériel de guerre* were crowding through the Suez Canal towards Ethiopia, when the League Council were being twisted by dissension over prevention of war, and when unhappy Austria was again in Nazi toils? Of '36, when war in Spain, barely a fortnight old, was still capable of being throttled by Britain and France; when the Treaty with Egypt was concluded; and when Palestine was racked again? Finally, of last August, when yet another undeclared war declared itself in the Far East, when submarine piracy broke out in the Mediterranean and caused the Nyon Agreement, when Mr Chamberlain penned his first *billet doux* to Signor Mussolini, when France suffered another politico-economic crisis, when Portugal broke off diplomatic relations with Czechoslovakia, when the Iraqi Chief of the General Staff was assassinated, and the British Ambassador to China and his staff were bombed and machine-gunned by Japanese aeroplanes?

Well, there is the tale of Augusts since 1914. It is scarcely a sedative; and the current month has opened with news of hectic fortifications on at least five European frontiers, with another war or rumour of war in the East, with energetic Air Raids Precautions, thunder clouds filling and looming over Central Europe, and the gloomy tinge of economic depression beginning to spread over our domestic landscape. Nevertheless, when we look back and contemplate what we have already survived, we feel that we can still hope to live, rather than die, by accident. August the ominous may, like the Fat Boy, try to make our flesh creep, to become August the 'orrible. But, whether stuck at our posts in London, or, like Rupert Brooke's "ordinary young man" in August of 1914, sailing beyond war's alarums and the ambit of Fleet Street, we shall refuse to be discountenanced by bogys, come they never so thick. For August, that brings the omens, recruits the nervous energy to dispel them. We may yet find ourselves shooting the annual rapids once more with accustomed adroitness and sliding into the smoother waters of another season of mists.

Topics of the Week

The State of Trade.—A few hours before Members dispersed for their holidays on July 29th, the Commons briefly debated the immediate prospects for British commerce and industry. For the Labour Party, Mr Alexander did well to emphasise the fact that, although the outlook was not so gloomy as it had seemed a month before, the existence of a sharp recession was unmistakable; there was no convincing evidence that the downward plunge which began last autumn had been finally arrested. It was many months before the Government was compelled by the precipitous nature of the decline, reflected in mounting unemployment and falling trade, to recognise the existence of depression. While Mr Stanley was quite justified in his reply to Mr Alexander in laying stress upon the more encouraging factors which have recently emerged, such as the slackening rate of increase in the adverse balance of trade and greater optimism in business circles in this country and in the United States, his concentration upon optimistic signs suggested that the Government was still hopeful of being absolved by the course of events from the necessity of drafting that policy for recession which has been conspicuously lacking from their programme during the past Session. Mr Alexander called for more vigorous action towards the freeing of world trade, but the information he sought about the Anglo-American Trade negotiations, which have still reached no conclusion, was not forthcoming.

* * *

Earlier in the day, Mr Chamberlain had denied that we were on the edge of a slump and disclaimed powers of "wizardry" sufficient to find new industries for Lancashire during the Parliamentary recess. No one expects any Government to perform miracles. But, in the present situation, when no concrete evidence has so far appeared to bear out the slightly better tone of business sentiment or the recent rally in Wall Street, and when depression has reached crisis dimensions in certain textile districts, the proper policy is surely to hope for the best and prepare for the worst. Public works may have been put out of court by the prior claims of re-armament; but this particular Government, without loving public works, have always been ready to take credit for the improvement of the recovery years. If that improvement was the result of policy—and of policy other than public works—why cannot some of the policies, notably cheap money, be tried again?

* * *

Promotion in the Services.—Mr Hore-Belisha is evidently not allowing the dragging survival of the Sandys affair to obstruct the progress of Army reform. The main changes of the past year or two have been directed towards the reorganisation of the Army to meet new tactical and strategic needs and towards improving the conditions of life and work for the men in the ranks. Now it is the officers' turn. Hitherto the profession of arms has had two outstanding disabilities. It has been very difficult for the young man without means to gain entry to the cadet colleges. And promotion has been very slow, carrying with it, for rich and poor alike, long years of subordinate duties, and for the poor a painful struggle to make ends meet. The matter has now become urgent, since it is no longer enough to rely on the supply of gilded youths, who rarely possess the talents for coping with the ever more complex problems of a modern army; and even this source of supply has shown signs of drying up. The new reforms consequently provide for increased and more numerous scholarships to Sandhurst and Woolwich, for more rapid and more certain promotion in the lower ranks, and for earlier and more selective retirement in the upper ranks. There are also small but welcome adjustments of pay. Similar reforms are also being introduced into the Navy and the R.A.F.—*mutatis mutandis*, since these services have not suffered so severely from some of the disabilities of the Army. It need hardly be said that reforms such as these are very welcome. Nobody in Britain would like to see the reproduction in this country of conditions such as prevailed in pre-war Germany and, to a lesser extent, in France, when an unfortunately large share of the talent of the country was automatically diverted to the services. But if we are to have fighting services they must have good officers, and it is foolish in the extreme to limit the range of selection to such an extent that the able are prevented or dissuaded from offering their services. The *carrière ouverte aux talents*, is, of course, a democratic principle, and an increase in the democratic nature as well as in the competence of the officers' corps can be expected from the reforms begun (but, we hope, not ended) last week. That will not be the least of their advantages.

* * *

Another War Scare?—People in many countries held their breath on Bank Holiday when it became known that fighting on a large scale—in which tanks, aircraft and heavy artillery were employed by both sides—broke out last Saturday and Sunday between Russian and Japanese troops in the border country where Korea, Manchukuo and the Soviet's Siberian Maritime Province meet, south of Vladivostok. For some weeks a dispute had been raging, accompanied by strong diplomatic action in each capital by the other—suspended since July 20th—about a hill near Changkufeng, to which both laid claim. Sporadic sniping and sorties took place, until one night the troops of General Blücher's Far Eastern Command seized the hill. They were later dislodged by Japanese troops; but last week-end the Russians seem to have resumed fighting. Reports differ on the engagements and their results, but it appears that the Russians have retired once more. Meanwhile, the Japanese Foreign Minister and Defence Chiefs have met, and the official spokesmen in Tokyo have made it plain that Japan does not want a war with Russia at a time when Japan's armies are hundreds of miles up-country in China, pressing on to Hankow, and when the scale of Chinese operations may be greatly enlarged. It is not generally known that Japan's crack generals and troops have not been in China at all during the last year of hostilities. They have been holding the Manchukuo-Russian frontier in wartime strength, for any emergency. How wise this was, even at the cost of defeats and disappointments in China, can now be gauged. General Blücher may have wanted to help China by creating a diversion of Japan's energies; or to embarrass M. Stalin by losing a battle to Japan; or to become dictatorial nominee of a Far Eastern Soviet legion that, in defiance of Moscow, defeated Japan's forces. The Japanese have wisely offered a truce, leaving the hill in a demilitarised zone; and we believe the Moscow authorities' statement that they do not see why a war should result. For, if it did, the temptation of Europe's dictators to fish in the Soviet's troubled waters—indeed, perhaps to poach in her European Slavonic preserves—might at the present moment prove irresistible.

* * *

Germany and Czechoslovakia.—While Lord Runciman's arrival in Prague on Wednesday was marked by evident Czechoslovak sympathy, relations between the Sudeten German Party and the Czechoslovak Government have taken a turn for the worse. This is partly due to a sharp outbreak of intransigence in the party, following Herr Konrad Henlein's words and activities on the platform with Herr Hitler at the rally of Germans from outside Germany held at Breslau at the end of last week. On that occasion Herr Hitler allowed himself the petty triumph of ostentatiously turning his back on the Czechoslovak flag. Herr Henlein then again demanded, on foreign soil, for his party the right to be a part of the National Socialist movement in another country. Secondly, however, the German military authorities have suddenly displayed a frenzy of warlike preparations.

EUROPEAN REPRESENTATIVE'S OFFICE: 8 KING WILLIAM STREET, LONDON, E.C.4

Member of the Federal Reserve System, the New York Clearing House Association and of the Federal Deposit Insurance Corporation

The former Austrian-Czechoslovak frontier, from near Bratislava up to Bavaria, is reported as being denuded of Austro-German peasants; whole villages as having been razed to the ground for aerodromes and artillery emplacements; and every available road and railway, together with vehicles, as having been virtually commandeered. In the old Reich, the Rhineland is being rapidly reinforced with new defence works, largely by Austrian and other labour; and hundreds of thousands of labourers are said to have been rushed up there in the last fortnight. The region and its highways are being closely patrolled and controlled. All Reich officials have been warned to be back from holiday by August 15th, and the harvest is officially to be garnered by the 16th. Clearly, if such important news is made freely available to the outside world, Germany thereby hopes to achieve something; but what ? Premonitions in Prague ? Panic in Paris ? Or largesse in London ? Perhaps Germany hopes to frighten the British Government, now that Parliament has risen, into paying away Czechoslovak integrity as another instalment for a peace wearing thin.

* * *

Meanwhile, M. Hodza has emphasised that the Draft of the Nationalities Statute is still open to discussion, both within the Coalition and by the Sudeten German Party; and the Government reiterated on Monday, after the Parliament had reassembled and been prorogued, their will to accord all concessions which did not imperil the integrity of the State or democratic rights. Lord Runciman's task as " adviser and mediator " will therefore be easy in the realm of language rights, and virtually impossible in the realm of ideology; for he has to reconcile antitheses, to try and bring an autonomous Nazi policy and world-outlook into conformity, in one and the same State, with a democracy of nationalities. On August 1st, for example, the Henlein Party published a demand for recognition of minorities as bodies corporate, presided over by a speaker with the power to veto almost every act of the State Administration. This kind of demand, like that for totalitarian powers over Jews and Sudeten German Social-democrats, shows that worlds lie between reasonable national questions and National Socialist claims.

Disturbances in Burma.—For a number of years Burma has shared the restlessness of an India with which she was yoked for a century before the grant of self-government sent these two unequally matched Asiatic countries on their separate roads towards the attainment of full Dominion status. This unrest is fully explained by the severity of the mental, political and economic revolution through which India and Burma are passing. But this social condition makes any community inflammable; and the Burmese tinder has unhappily been set alight, during the last few days, by what seems to have been a casual spark. The trouble began at Rangoon on July 26th with a fight between Muslims and Buddhist monks on account of a book, published by a Muslim, which the Buddhists denounced as insulting their religion. To judge by the author's name, he was Burmese, like his assailants; but most Muslims in Burma belong to the local Indian colony —which in practice has always been virtually a foreign element in the country, notwithstanding its long association with the British Indian Empire. On this account, a conflict which started as a clash of religions immediately took on a racial aspect and threatened to develop into a general assault by the Burmans upon the Indians in their midst. In Rangoon, where the disorders continued for several days, the toll amounted to about fifty deaths and nearly 400 hospital cases. Moreover, the conflagration took the road to Mandalay, in Upper Burma; and a detachment of British troops had to be sent there. Happily the flames seem now to be dying down, and moderation is being urged by the responsible leaders of both the two contending communities. Nevertheless, this is an unlucky false step on Burma's road to responsible government.

* * *

Bulgaria and Her Neighbours.—At Salonica, on July 31st, a new agreement was signed between the Prime Minister of Bulgaria, M. Kiosseivanov, and the Prime Minister of Greece, General Metaxas. The latter signed as President for the present year of the Balkan Entente, thereby committing not only his own country but her three partners, Jugoslavia, Roumania and Turkey. By this instrument, the States members of the Balkan Entente release Bulgaria from the military restrictions imposed upon her in the Peace Treaty of Neuilly: i.e. both the quantitative restriction upon the strength of her army and her armaments, and the geographical restrictions in the shape of the demilitarised zone along the Bulgaro-Turkish and part of the Bulgaro-Greek frontier. In return, Bulgaria undertakes not to seek to change, by any but non-violent means, the existing distribution of territory in the Balkans; and she further expresses her readiness to co-operate with the Balkan Entente in a spirit of good will—while still holding back from joining an association which exists, after all, for the express purpose of maintaining a distribution of territory which is to Bulgaria's disadvantage and is regarded by her as unjust. It is also expected that Bulgaria will now obtain across Greek territory that access to the Ægean Sea which was promised to her in the peace settlement, but which has never yet been actually arranged. In one sense, Bulgaria might appear to be getting something for nothing; but there is another sense in which the Balkan Entente may be said to be giving nothing away. For, as a matter of fact, Bulgaria has re-armed quietly already without asking leave—as has been done by all the other vanquished states on whom the victors in the war of 1914-18 succeeded in imposing a measure of unilateral disarmament. (Even Austria re-armed before her demise, not to speak of Hungary and Germany.) A lasting monument of Bulgaria's period of enforced disarmament is the system of compulsory civilian labour service which has been borrowed from post-war Bulgaria by Nazi Germany and which bids fair to become one of the established institutions of the modern world. The new agreement which ends Bulgarian disarmament *de jure* is largely the work of a Jugoslav statesman, M. Stoyadinovitch, who does not figure in the final ceremony. This agreement between Bulgaria and the Balkan Entente as a whole is, in fact, a sequel to the Bulgaro-Jugoslav agreement which was concluded in January, 1937. This is not the first time in the post-war period that the Balkans have set a good example to other parts of Europe.

* * *

Air Raid Precautions.—The melancholy story of delay in the execution of air raid precaution schemes due to disputes between the Government and local authorities about their respective contributions to the cost has happily and belatedly passed into a more hopeful chapter. The chief deterrent to local activity since A.R.P. became an approved policy at the beginning of last year has been uncertainty about the financial burdens likely to be involved; and last week's Home Office circular to local authorities, following upon the settlement in the spring of the percentage contributions that the Government were prepared to make, clarifies the position still further. To rank for grant, local expenditure on precautions must represent the incurring of new liabilities solely for A.R.P. The procedure by which authorities will stake their claims to central contributions by statements at the close of each financial year is laid down; and local bodies are requested to apply as soon as possible for grants in aid of expenditure incurred during the period of dispute since January 1, 1937, and in the current half-year. The position of public utilities is still unfortunately undefined; the circular states that expenditure on the protection of gas, water and electricity undertakings will not rank for Government grants in the ordinary way; and it is expected that the Bill embodying the Government's policy with regard to the utilities, who claim a right to special assistance in contrast to private businesses, will be introduced early next Session. Air raid precautions are making headway; plans for the evacuation of London are well advanced; and the chief cause for anxiety, now that the financial dilemma has been resolved, lies in the difficult problem of securing the rapid execution of a task of national importance through local bodies, with noticeably wide differences in the energy and efficiency with which they approach their new duties.

* * *

Trade Union Trends.—At a time when uncertainty about the prospects of both peace and prosperity is on the increase, the outline of trade union policy, provided by the agenda for the annual meeting of the Trades Union Congress, is of particular significance. Surprisingly, there is little reference in the programme to the present recession of trade or to plans to combat it. Less surprising, perhaps, in view of the unions' marked sense of discipline and their readiness to follow the law-abiding lead of their chiefs, is the absence of resolutions relating to the various controversial issues of industrial tactics which have from time to time loomed large during the past twelve months. The unions have fared very well since the T.U.C. last met, as the series of charts on page 302 analysing the recent course of wages amply shows. Collective bargaining and conciliation have brought the unions appreciable gains; and although depression has deepened and unemployment risen in recent months, there are yet no signs of an attack upon the positions won, in the shape of higher wages, by skilful negotiation. For the most part, the published resolutions reflect the unions' commendable concern with the improvement of existing social services. A proposal to secure the raising of the income limit for unemployment insurance from £250 to £500 a year, for instance, shows that the black-coated worker, whom inverted snobbery too often excludes from such discussions, will not be forgotten at Blackpool; and another to pool the surpluses of approved societies under the health insurance scheme, to make possible uniform benefits for all insured persons, touches upon an unfortunate anomaly. In general, controversy begins and ends with the resolutions which have been tabled on foreign policy, advocating arms for the Spanish Government, the boycott of aggressors' goods, and pressure upon the British Government to secure a stronger diplomacy. At the end we are left wondering whether the crucial question of the unions' participation in re-armament plans will be adequately ventilated at Blackpool; and whether any attempt will be made to thrash out an order of priority between the possible aims of union policy in the future, such as higher wages, shorter hours, and increased social and industrial amenities.

* * *

Calcium Carbide.—Five months ago the project of the British Oxygen Company to make calcium carbide in the Highlands was rejected by the Commons for the third and final time. This scheme, which was associated with a complementary plan to manufacture carbide at Port Talbot in South Wales, was thrown out, not because calcium carbide is not of vital national importance, but because Members were reluctant to approve the industrial defilement of Inverness-shire, disinclined to accept the proposals for preferential rating embodied in the Company's Bill, and disposed to favour the establishment of a factory in one of the depressed areas to use coal, rather than in the Highlands to use water power. Calcium carbide, which is employed to produce acetylene gas for welding purposes, is essential to various industrial processes used in the manufacture of munitions. At present it is almost wholly imported; and, on the demise of the Caledonian Power Bill, a committee was set up by the Government to examine the possibility of producing calcium carbide in this country. This week it is reported that a scheme for manufacture at Holywell in Flintshire, North Wales, has been submitted to this body. The proposed site has easy access to local limestone; and anthracite from South Wales is reasonably accessible by the cheap sea route. There is excellent bituminous coal at Holywell which, if carbonised at low temperature, could provide valuable by-products in the form of fuel, oil and tar, as well as " smalls " for generating power on the spot. North Wales is not easily vulnerable from the air, and the Special Area of South Wales, if not exactly near at hand, is at least in a position to benefit in some degree from the introduction of new industrial enterprise in the northern part of the Principality. The scope of the scheme is perhaps not wide enough to render its social significance considerable. Further details of the proposals would be needed before final judgment of its desirability could be reached. But, in view of the great importance of calcium carbide, the Holywell scheme seems *prima facie* to merit careful examination.

* * *

Pope and Duce.—It almost begins to look as though Signor Mussolini were fey, if we can take, as a symptom of that uncanny mental state, an apparent persistence in going out of one's way to look for fresh and ever more serious trouble. The Duce had barely carried out his hazardous predatory adventure in Africa than he plunged into the ever more dangerous adventure in Spain. The course of Spanish events has obviously defeated all his calculations; yet at this very moment Signor Mussolini elects to pick a quarrel with the Pope on the question of Race—as though he could not bear to listen to the congratulations which he has latterly been receiving, even from quarters that do not wish him well, for his supposedly Machiavellian skill in avoiding Hitler's egregious error of charging full tilt against Religion. The first exchange of salvoes between the Duce and the Pope on the subject of Race was recorded in these columns the week before last. The Pope made it evident at once that, on this issue, if the Fascists insisted on forcing it, he would take up their challenge. Since then the Duce has been doing his best to make a conflict unavoidable. While it is laid down that a colour bar is to be drawn rigidly between the Italian conquerors and the conquered natives of East Africa, the determination of the Fascist regime to apply the doctrine of Race in Italy, too, is being proclaimed in emphatic language by the Italian dictator himself. The Pope has retorted that " whoever strikes Catholic Action strikes the Pope, and whoever strikes the Pope dies." It is, indeed, likely enough that, if he does insist on a trial of strength, the Duce will find the Church relatively a far more formidable antagonist than eight years ago. In stressing a racialism taken at second-hand from a German National-Socialist armoury, he will be emphasising the, to Italians, unpalatable fact that the Axis is a partnership in which Italy is the junior partner. It would be an ironical result if Mussolini's conversion to Hitler's racialism put the Pope in the position of being the champion of Italian nationalism against Teutonic ideology.

The Bank has branches throughout New Zealand and conducts every description of Banking business with that Dominion.

Fortune of War in Spain.—Lord Bacon said that the conquistadores in Spanish America used to pray *Mi venga la muerte de España!*—"May death come to me from Spain! "—for then it would be slow a-coming. General Franco, Signor Mussolini, and their German, Italian and Moorish auxiliaries must by now be painfully familiar with the dilatoriness of all things Spanish. The conflict is now in its third year; and it is four months since General Franco and his Italian divisions, covered by incessant barrages from Italian and German aircraft, swept down from Saragossa to the sea, cutting landward communication between the Spanish Government's Catalan and Andalusian territories. That sweep also drove Mr Chamberlain, privately, to hasten and conclude the Anglo-Italian agreement for an Agreement; and the British Plan for withdrawal of alien volunteers has been quickly worked out and accepted in principle by the Spanish Government. But the volunteers can't go, because General Franco doesn't answer the British Plan, because he can't let his Italian allies go, because he hasn't yet won that crushing victory so necessary to his and Signor Mussolini's regimes. The Spanish Government's forces just refuse to be beaten. And the reason why the latest drive by General Franco and his Italian divisions from Castellon and Teruel towards Valencia has not succeeded is that, meanwhile, the Government forces from Catalonia have daringly forced the crossing of the Ebro and, taking the insurgents by surprise in the rear, have driven a nasty wedge into the thin strip which General Franco controls down to the Mediterranean. He has had hurriedly to rush reinforcements northwards from his front against Sagunto; halt the latter's advance; and let loose both the waters of the pent-up Ebro from upstream and the thunderbolts of all his German and Italian bombers on this Government offensive. It has now been halted, but not reversed. As fast as the insurgents win one battle, they have to weaken that front to stave off defeat in another. And the bombing of legitimately trading foreign ships goes on. So does this bloody commentary on the perversion of European statecraft persist.

* * *

Coal Commission.—The long-debated Coal Bill has now received the Royal Assent, and there remains the formidable task of giving administrative effect to its detailed and complicated provisions. Much of the responsibility for its operation will devolve upon the Coal Commission, which will be responsible for administering the main sections of the Act, both those relating to the nationalisation of royalties and those concerning the reorganisation of the coal industry through the amalgamation of redundant undertakings. Last week-end the Secretary for Mines announced the appointment of five members to constitute the Commission. Sir Ernest Gowers has been Permanent Under-Secretary for Mines and chairman of the Board of Inland Revenue; as chairman since 1930 of the abortive Coal Mines Reorganisation Commission, now to be absorbed by the new Coal Commission, Sir Ernest was an automatic and essential choice. Sir Felix Pole, too, was a member of the C.M.R.C. and his experience as general manager of the Great Western Railway and chairman of Associated Electrical Industries, Limited, specially qualifies him to represent the industrial viewpoint. Mr G. P. Hyslop is a consulting mining engineer. Mr W. M. Codrington is an insurance director and on the board of various overseas railways. Finally, Mr Joseph Jones, another member of the C.M.R.C., general secretary of the Yorkshire Mineworkers' Association, and this year's president of the Mineworkers' Federation of Great Britain, represents the miners' great stake in their industry's future. It is an impressive team and much can be expected from the new Commission—if only the changes made in the Bill by the Commons have left a loophole for really effective reorganisation.

Higher Excess Reserves

New York, July 22.—About the middle of February the Reserve Board and the Treasury resumed a positive policy of reflation. The release of $300 millions of gold in September, 1937, and the subsequent small open market purchases were described as emergency measures. In February, 1938, however, it was announced that gold (whether imported or domestically produced) would be admitted into the Reserve Banks (i.e. monetised as bank cash) up to $100 millions in a quarter; and in mid-April the entire Inactive Gold Fund, amounting to $1,183 millions, was deposited in the Reserve Banks, together with certain other gold items, making a total of approximately $1,400 millions. At the same time, required reserves were reduced by some $700 millions, or 13¾ per cent.

RESERVE BANK AND TREASURY ITEMS
($000,000)

	Feb. 9, 1938	July 13, 1938	Change
	$	$	
Bills discounted	11	9	+ 2
Bills bought	1	1	0
U.S. securities	2,564	2,564	0
Gold stock	12,756	12,979	+ 223
Gold certificates on hand	9,116	10,635	+ 1,519
Member Banks reserves	7,205	8,273	+ 1,068
Excess reserves	1,410	3,150	+ 1,740
Treasury deposits (Federal Reserve banks)	156	628	+ 472
Money in circulation	6,306	6,444	+ 138
Federal Reserve notes	4,125	4,134	+ 9
Silver certificates in circulation	1,085 (Jan.)	1,230 (June)	+ 145

The gold certificates deposited by the Treasury in the Reserve Banks increased its current account immediately; but these deposits were only gradually transferred to the reserve account of the Member Banks by the redemption of maturing Treasury bills. At the same time, all gold produced or imported was promptly transferred to the Reserve Banks.

The result was that between February 9, 1938, and July 13, 1938, the increase in the amount of gold certificates held by the Reserve Banks was just over $1,500 millions, while the increase in the total gold stock was just over $200 millions; not all the resulting funds had passed into Member Bank reserves, which had increased by $1,068 millions, the remainder being still held in the Treasury balance. The release of gold *plus* the reduction in gold requirements, however, had more than doubled excess reserves. The net effect of all these manœuvres is that total reserves are at a new high level, while excess reserves are just a trifle under their level of two years ago, owing to the increase in required reserves.

The increase of excess reserves in five months by $1,740 millions is comparable to the decrease of excess reserves by $1,500 millions in August, 1936, brought about by the first increase in reserve requirements; but never before has there been an increase of this magnitude in such a short space of time. It seems likely that excess reserves will continue to increase both because of gold production and imports and through the release of Treasury balances. The process, however, may not be continuous, as the Treasury may increase its balances with the Reserve Banks, by transferring deposits from the Member Banks, or by holding idle the proceeds of loans.

Loans at Their Minimum

The policy of expansion pursued by the Treasury and the Reserve Board has enormously increased excess reserves. Up to the middle of July, however, it had not merely induced no expansion of Member Bank credit, but had not even arrested its rapid contraction. Between February 9th and July 13th total loans and investments of the Reporting Member Banks dropped by about $750 millions; demand deposits, however, rose by $480 millions. Figures for two years are as follows:

REPORTING MEMBER BANK ITEMS
($000,000)

	Aug. 12, 1936	Aug. 11, 1937	Feb. 9, 1938	July 13, 1938
Total loans and investments	22,324	22,331	21,226	20,468
Loans for carrying securities*	1,119	2,057	1,329	1,216
Other loans	7,233	7,860	7,596	7,015
U.S. and guaranteed securities	10,657	9,385	9,348	9,235
Other securities	3,315	3,029	2,953	3,002
Reserve with Reserve Banks	4,855	5,122	5,617	6,737
Demand deposits	14,752	14,914	14,511	14,994
Time deposits	5,021	5,229	5,223	5,209

* Includes brokers' loans.

The greatest quantitative change between February and July was the rise of approximately $1,100 millions in reserves. The most striking change, however, was the persistent decline in loans, other than speculative security loans, which amounted to almost $600 millions in five months. Demand deposits have risen, as the increase in reserves has more than equalled the decline in total loans and investments.

The recent marked increase in speculative loans, combined with a general change in the business attitude towards inventories, suggests that the great loan deflation is nearing its turn. So striking was this episode that the figures have been carried back through the cycle of loan inflation and deflation. The twelve months between August 12, 1936, and August 11, 1937, approximately covers the "restriction" period, during which required reserves were increased and the Inactive Gold Fund was created. The subsequent eleven months have been marked by a policy of expansion, made up of gold desterilisation in September ($300 millions); open market purchases in October ($34 millions); limited gold monetisation in February ($100 millions); gold desterilisation in April ($1,400 millions); and the reduction of required reserves in April ($700 millions).

The table above shows that the net consequence of these two successive policies was a remarkable stabilisation of demand deposits in the Reporting Member Banks. The year August, 1936-August, 1937, saw a stabilisation of total loans and investments, achieved by an increase in loans and a decrease in investments; the eleven months August, 1937-July, 1938, have seen a contraction in loans and the stabilisation of investments, accompanied by a great increase in reserves.

The boom of late 1936 is clearly visible in the figures both for speculative security loans and for what proved to be speculative commercial loans, used largely, it may be supposed, for carrying inventories. The subsequent collapse of the price structure in the commodity and stock markets and the liquidation of inventories are likewise clearly shown in the loan deflation of the last eleven months—a deflation which the progressive expansion of reserves was powerless to prevent, although it succeeded in maintaining the level of deposits.

The Banks and Interest Rates

This sequence of events raises a number of theoretical questions. In the year August, 1936-August, 1937, demand deposits and total loans and discounts were maintained at a given level because the banks exchanged investments for loans. In the eleven months August, 1937-July, 1938, when loans were being rapidly repaid, the banks did not make offsetting purchases of investments, so that the total of loans and investments fell severely. Although the banks consequently suffered a loss of potential earning power, they probably considered that, at the existing rates on Government securities, the return was too low to compensate for the risk of capital depreciation.

If the banks had replaced repaid loans dollar for dollar by a purchase of investments, the deflationary consequences of loan repayments would have been mitigated, and the volume of deposits would have been maintained, without the intervention of the Reserve and Treasury authorities. They were deterred from doing so by the unattractiveness of the yield on the only type of asset available, and it seems to follow that a rate structure which the Member Banks consider "too" low is capable of exerting a deflationary influence, analogous to that exerted by rates which are "too" high.

France

Holiday Calm

Paris, August 4.—August is traditionally a favourable month for military operations. French public opinion is on the alert. Even if the risk of war can be ruled out as a result of the recent manifestation of the community of aims and policy between Britain and France, the fear of disagreeable surprises remains. But August is also a great holiday month, and nowadays, when paid holidays are the rule, much more so than it used to be. The consequence is that we are now enjoying a period of calm, such as France has not known for many years. The Stock Exchange is almost entirely inactive.

A similar calm characterises industrial production. The figures of output in the metal trades during the first six months of the year are as follows:—

(Metric tons)	May	June	First Six months 1937	First Six months 1938
Steel production	501,000	480,000	3,933,000	3,230,000
Pig iron	483,000	463,000	3,819,000	3,178,000
Half manufactured	79,000	83,000	675,000	556,000
Manufactured	830,000	334,000	2,711,000	2,066,000
Iron output	2,628,000	2,671,000	18,250,000	17,274,000

Coal production, on the other hand, shows a slight improvement on the 1937 figures.

Meanwhile, subscriptions to the new National Defence Bonds are coming in steadily. And subscribers will come forward still more rapidly when the public are fully aware of the liberal terms offered by the Bank of France for the rediscounting of this paper. In the field of manufacture for defence purposes, the large-scale output of military aeroplanes will proceed more smoothly when there are sufficient engines to equip the machines.

Fixing the Price of Wheat

The price of wheat for the 1938 crop will be fixed on August 25th. Many Radicals are demanding a price of 200 francs per quintal, compared with 140 in 1937, a rise which can be justified less by the volume of the crop, which, in fact, largely exceeds internal needs, than by the rise in the cost of living and in industrial prices. Political considerations, in view of the approaching Senatorial elections, the date of which has just been fixed as October 23rd, will have some bearing on the price finally fixed. The Opposition lay stress upon the fact that higher wheat prices will mean a further increase in the price of bread and the cost of living; and, moreover, it will be necessary to absorb the surplus of wheat, notably in the manufacture of alcohol, which can only be done at a loss.

Prices are still falling. Wholesale prices have now been falling for a month, as the following table shows:—

Wholesale Prices (1914=100)

	July 9th	July 16th	July 23rd	July 30th
General Index	**658**	**657**	**654**	**652**
Domestic products	689	683	677	673
Imported products	603	610	613	613
Foodstuffs	659	654	645	638
Vegetables	*767*	*748*	*716*	*692*
Meat	*572*	*577*	*588*	*593*
Sugar, coffee, cocoa	*613*	*614*	*616*	*615*
Industrial products	657	660	662	665
Minerals and metals	*749*	*755*	*755*	*761*
Textiles	*555*	*559*	*566*	*566*
Miscellaneous	663	664	664	665

The decline in the general index is principally due to the fall in the price of vegetables. The fall is probably temporary, but it is conducive to confidence and the stability of the franc. The number of unemployed on July 23rd was 346,834, against 350,511 on July 16th and 313,716 a year ago.

Bulgarian Credit and German Agreement

There is much talk in the financial press about a commercial credit of 500 million francs which is to be granted to Bulgaria and may be followed by similar arrangements with Roumania and Poland. These advances, which are made with the assistance of the Crédit National, are often presented as a parallel to the British loan to Turkey as tending to counterbalance German influence in the Balkans.

A new commercial agreement between France and Germany has just been signed in Berlin. Interest will be paid on the Austrian debts; the holders of Young Loans have been protected; and trade between Germany and the French colonies has been regulated in detail. Berlin considers that the volume of trade between the two countries (which is at present, however, very low) and the delivery of iron ore to Germany should be maintained.

Germany

Increased Tax on Profits

BERLIN, August 2.—After partly recovering from its collapse during the first half of August, the Bourse again declined last week. The realisation of shares and bonds to obtain cash for financing industry has been the rule for some time, and the unwillingness of the public to buy any kind of security has helped to depress prices. And now the taxation of profits has been sharply increased. This was, however, expected, and when it was announced on Saturday it had little effect on quotations, though the larger industrial companies will be badly hit.

The increase is in the corporation tax. This tax is levied on the net profits of joint-stock companies at a uniform rate (with some inconsiderable exceptions) of 30 per cent. Compared with depression times, its yield has increased more than that of any other impost, owing partly to the increase in its rate from 20 to 30 per cent. made in 1936, but mainly to the revival of company profits. The yield is now only exceeded by those of the income and turnover taxes and of Customs. In 1932-33 out of the Reich's gross tax revenue of Rm. 6,700 millions the corporation tax brought Rm. 106 millions; in 1937-38, out of Rm. 14,000 millions Rm. 1,553 millions came from this tax.

Thus, from realising one-thirteenth of the yield of income tax, the corporation tax has come to yield three-eighths. The rate of tax is now to be raised for 1938-39 from 30 to 35 per cent., and for the following two years to 40 per cent., except for company incomes not exceeding Rm. 100,000. The additional yield, according to unofficial estimates, will be Rm. 500 millions. In the case of the limited number of companies, mainly credit institutions or public land and mortgage banks, which at present pay 15 per cent., the new rate will be 17½ per cent. and later 20 per cent. The increase is for only three years, but it is more than likely that the term will be extended.

There has been considerable comment on the exemption of companies with small profits from the increased tax, regardless of their magnitude measured by capital or other standards. This provision introduces graduation, so far confined to the personal income tax. The corporation tax has always been a kind of flat rate income tax. The shareholder bears two income taxes, which, if he is rich and derives his main income from dividends, absorb a very large proportion of company profits. First the company pays 30 (in future 40) per cent. of its profits, dividends being correspondingly reduced. On the dividend received the shareholder personally pays according to the size of his income (less abatements for family), some 10 to 40 per cent. On personal income exceeding Rm. 130,000 no family abatement is allowed.

Taxation and Enterprise

The joint-stock company very often, however, pays out in dividends only a modest portion of its profits, and the undistributed part escapes personal income tax, though not corporation tax. A partnership or family concern which pays no corporation tax pays personal income tax on all its profit, but as the profit is usually shared by several persons, the maximum rate is as a rule escaped. If the large "voluntary social contributions" of companies, which occasionally equal the dividends they pay out, are added to the corporation tax, and to that part of the personal income tax which is derived from income in the form of dividends, it would seem that German corporate profits are very heavily taxed. How far, however, the total sum is an effective levy on profits, and how far it is merely an element in production cost passed on to the consumer is uncertain.

In the first quarter of the financial year 1938-39 tax revenue amounted to Rm. 3,671 millions, against Rm. 3,077 millions in the same quarter of 1937-38. The Reich is being assisted in its heavy expenditure from other quarters. The report of the now prosperous Labour Exchange and Unemployment Insurance Board for 1937 shows that, in addition to handing over Rm. 369 millions to the Reich (to meet liabilities accumulated during the depression), the Board lent Rm. 265 millions to the Reich motor-roads and provided Rm. 404 millions for paying off work-creation bills. Expenditure on unemployment relief was only Rm. 311 millions.

The cost-of-living index for July was 106.8, against 106.0 for June. Food prices have risen seasonally, and clothing prices continue to advance. The supply and the prices of vegetables and fruit are still unsatisfactory; prices of other foodstuffs are more reasonable, though a certain shortage of pork is expected late in the year. The number of cattle shown by the last census was the largest on record, but beef plays a secondary rôle in the nation's dietary, consumption of home-produced beef being about 1,000,000 tons a year, against 2,300,000 tons of pork. Mutton consumption amounts to only 40,000 tons.

Industrial activity in June showed a sharpish seasonal decline. The number of hours worked was 17.6 per cent. more than in June, 1936, while the May figure was 19.8 per cent. higher. Hours worked in iron and metals and in engineering increased moderately, but the index of employment in the consumption industries fell from 114 to 108 and the index for textiles from 114.2 to 106.

The Iron Industry's Difficulties

An official report for 1937 shows that of raw materials valued at Rm. 8,451 millions used in Germany Rm. 6,595 millions represented home-produced commodities and Rm. 2,977 millions imported goods, while materials to the value of Rm. 1,121 millions were exported. All these figures include scrap material. Ingot steel production in June declined slightly to 1,830,600 tons; and in the first half of the year was 11,024,100 tons, against 9,562,700 tons in the first half of 1937. One symptom of the present iron shortage, or rather of the abnormally high current consumption, is the wholesale tearing down of railings, the yield of which, in comparison with normal supply and demand, must be inconsiderable. After this had been done in public parks and gardens, it was announced that it would be extended to private property with the co-operation of the building police.

The export market for pig iron is reported to be still very dull, with sagging prices. Those who expected too much from the Steel Cartel's negotiations with representatives of the American industry have been disappointed by the cuts made in the prices of sheets and general purpose iron. The recent cut in the American domestic price altered the situation; and American price competition is again the steel exporting industry's chief problem.

Trade journals are commenting unfavourably on the British plan for a levy to subsidise coal exports. The *Deutscher Volkswirt* declares that "it would be an unpermissible simplification of the problem if England . . . attributed the setback in her coal exports entirely to the subsidies given by other exporting countries." The English plan is described in other journals as not consistent with the impending negotiations at The Hague.

Holland

Hopes of Recovery

AMSTERDAM, July 22.—During the last two weeks, in sympathy with Wall Street, the Amsterdam Stock Exchange has shown a pronounced improvement, although prices have risen far less here than in America. The principal gains were recorded by East Indian plantation companies, which derived benefit from the higher prices for rubber and sugar; in the latter case the result of the London sugar conference was also an encouraging factor.

The rise in prices has also brought indirect benefits to the mother country, which is closely linked to the colonies, both financially and economically. But the economic situation in Holland nevertheless leaves much to be desired. Numerous industries, particularly those catering for the home market, are still complaining about the public's lack of purchasing power.

Unemployment continues to be serious, and demands are becoming more and more insistent for governmental measures

to stimulate trade. In particular, it is suggested that the home market should be expanded by the abolition or reduction of excise duties and other kinds of taxation, which inevitably tend to curtail consumption. There are also calls for higher import duties in some instances where additional protection is considered imperative. It is significant that a Minister, Mr Goseling, stated at the recent congress of the Catholic Workers' Union that the Government are drafting far-reaching schemes for combating unemployment, which will be presented next session.

The decline in industrial prosperity is reflected in the annual report of the Philips Lamp Works. The number of workers employed by its Dutch factories fell from 19,500 in October, 1937, to 19,000 in May of this year.

Stagnant Capital Market

The low level of industrial activity has led to the accumulation of liquid funds in the money market, for which no use can be found, even at very low rates of interest. The yield on bonds continues to decline, but in spite of the abundance of cheap money, activity in the new issue market has come to a standstill.

This is partly due to the activities of the "Investors' Front," which advised the large-scale investors (insurance companies, savings banks, superannuation funds, and so on) to keep a portion of their funds uninvested. Largely for this reason, little progress has been made with the conversion of loans, as may be seen from the following table of conversion issues in recent months:—

1938	(Thousands of guilders)
January	1,692,478
February	113,169
March	87,932
April	4,730
May	4,179
June	690

Small as the conversion operations have now become, the issues for new money have lately been on a still smaller scale. Industrial enterprises, which ought to be absorbing the available funds, apparently feel no inducement to do so, and last month it was again public authorities who were responsible for most of the issues recorded. The efforts to place money abroad have been confined mainly to the introduction on the Bourse of some foreign securities, mostly American, South African or Canadian. In addition, an issue has been made for the municipality of Copenhagen and a credit granted to France.

Downward Trend of Exports

Foreign trade showed no improvement in June. Exports were again slightly lower than in the preceding month, this time by 2.3 million guilders. Imports, however, which were particularly small in May, advanced by 9.3 millions. The sharp rise in imports, coupled with the slight decline in exports, caused the import surplus to rise from 26,567,000 guilders to 38,204,000; it was, however, still lower than in June, 1937, when the figure was 44,998,000 guilders.

The following table shows the movement of imports and exports in recent years:—

	Imports			Exports	
	(In millions of guilders)				
	1936	1937	1938	1936	1937	1938
1st quarter	233	336	358	156	246	254
2nd quarter	234	410	344	163	286	245
3rd quarter	243	398	...	194	314	...
4th quarter	307	406	...	233	302	...
	Imports			Exports	
	(In thousands of tons)				
	1936	1937	1938	1936	1937	1938
1st quarter	4,508	4,847	5,152	3,137	3,789	3,555
2nd quarter	4,841	5,951	5,529	3,093	4,022	3,479
3rd quarter	5,407	6,591	...	3,347	4,081	...
4th quarter	5,602	6,124	...	3,961	4,131	...

England's share in Dutch imports dropped considerably during the first six months of 1938, from 626,000 tons to 444,000 tons and from 66 to 55 million guilders. Holland's exports to England also declined in weight from 734,000 tons to 615,000 tons, but their value was maintained at 112 million guilders, so that the surplus of Dutch exports over imports rose from 46 to 57 million guilders. The fall in Holland's imports from England is mostly accounted for by coal, iron and steel, tin-plates and miscellaneous minerals. It is striking that exports of vegetables to England declined in weight from 72,400 to 50,000 tons, but actually increased in value.

Switzerland

Exports Maintained

GENEVA, July 22.—Swiss foreign trade returns, particularly those for the second quarter, have been affected by the depression experienced in many other countries. During the first six months of the year imports reached a total value of 781,411,076 frs., compared with 929,717,565 frs. in 1937, while exports were valued at 618,442,052 frs., against 578,922,453 frs. Compared with 1937, the import surplus has been substantially reduced. The monthly figures for exports showed consistent increases over last year until June, when a reduction of nearly 6 per cent. was recorded.

Of the four chief industries, both branches of textile production continue to be depressed, while the position of the watchmaking and machinery industries improved further. For the first six months exports were as follows:—

	Millions of francs	
	1937	1933
Watches, etc.	95·2	109·5
Cotton goods	47·2	42·5
Silk goods	62·9	55·7
Machinery	82·6	100·7

There is now some slackness in the watchmaking industry, but so far its exports have been only slightly influenced by the international recession.

Trade with the United Kingdom was comparatively active until the middle of May, when it showed a tendency to decline. The figures for the five principal customers were as follows (in millions of francs):—

	Imports from		Exports to	
	1937	1938	1937	1938
Germany	194·7	176·5	89·0	96·5
France	122·3	104·3	70·2	61·0
Italy	56·9	52·6	40·4	45·0
United Kingdom	59·2	46·5	65·1	68·3
United States	60·1	65·4	50·8	36·6

During the same period, the number of unemployed has fallen from 95,722 in January to 48,500 in June, the latter figure being about 2,000 lower than in June, 1937.

Slightly Reduced Tourist Traffic

Adverse weather conditions and political unsettlement have had a restricting influence on the number of foreign tourists. Up to the end of April, the 6,000 hotels received 809,500 visitors, of whom 287,300 came from foreign countries, against 770,600 and 295,900 respectively during the corresponding period of 1937. The tourist traffic declined in May and June, and prospects for the summer season are rather unsatisfactory, since German tourists, who formerly constituted an important element in the total, are practically prevented from spending their holidays in Switzerland. As a result of this falling off, the earnings of transport undertakings are generally lower than last year.

There has been no change in the state of the money and stock markets. After the devaluation of the French franc, a certain amount of capital which had taken refuge in Switzerland was withdrawn, but the movement was not sufficient to prevent money from remaining very abundant.

Sun Life Assurance Company of Canada

(Incorporated in Canada in 1865 as a Limited Company)

Through its London Administrative Office, the Company pays every year to policy holders on Matured Endowment Policies, Death Claims and Annuities over

£2,000,000

Total Assurances in force on November 15th, 1937 in the British Isles

Letters to the Editor

Window-Dressing

TO THE EDITOR OF THE ECONOMIST

SIR,—The Macmillan Committee called attention in its Report to the practice of "window-dressing" by the clearing banks, and added:

> We are not aware that these practices serve any useful purpose. We think that they are not creditable to our banking system; and we recommend that they should be given up at once.

I have made an attempt to estimate the extent to which window-dressing has been employed by the clearing banks in each month since 1925. The results are shown by the heavy line on the accompanying chart.

The method employed is as follows: From the declared monthly totals of notes and coin in hand and balances at the Bank of England, deduct the amount of notes and coin held by the ten clearing banks only (the figures are given in the Macmillan Report for earlier years and later in the Bank of England's *Statistical Summary*). The result is the declared amount of the banks' balances with the Bank of England.

From this deduct the amount of bankers' deposits at the Bank of England for the corresponding period, and the result gives an approximate figure of the amount of "window-dressing" employed. It is only approximate, however, because bankers' deposits include the balances of banks other than the ten clearing banks, and must also include that part of the "stage army" which is being used by those clearing banks which make up their accounts on Wednesdays.

The figures show considerable variations from month to month, and there are usually peaks in December. There have also been marked changes in the amount of "window-dressing" employed on the average from year to year. The amount disclosed by my figures varies between £1 million in June, 1934, and £38 millions in December, 1927, and the most extreme fluctuation in any one year is from £2 millions in January to £29 millions in December, 1936.

It is clear that the banks as a whole considerably reduced the amount of their "*window-dressing*" in the years immediately following the publication of the Macmillan Committee's Report: the average monthly amount for the seven years 1925 to 1931 was about £24 millions, but it fell to a little more than £14 millions in the next three years, the average for 1934 being less than £12 millions. By 1936, however, the remarks of the Committee appear to have been forgotten, and the monthly average for the two years 1936 and 1937 was about £19½ millions.

The *Minutes of Evidence* of the Macmillan Committee show that Mr McKenna believed that there were no important changes in the short period in the amount of "window-dressing" employed by the banks (*c.f.* questions 7562-66). Sir Ernest Harvey, however, did not appear to agree with Mr McKenna on this point, and seems to have been aware of the changes which I have indicated. These changes are most important, because they show that, although the banks' declared cash ratios may remain constant, the real ratios may fluctuate considerably from month to month.

The usual explanation of the power of the central bank to control the lending policies of the commercial banks rests entirely on the assumption that the latter's cash ratios remain fairly constant. These figures seem to indicate that this assumption must be abandoned, and that the central bank has much less control over the commercial banks in the short period than is usually imagined, for a change in central bank policy may lead in the first instance only to a change in the amount of "window-dressing" employed by the commercial banks, and not to any alteration in their lending policies.

The Macmillan Committee stated that figures available to them suggested

> that the monthly "window-dressing" has the effect of increasing the apparent cash reserves of the clearing banks by at least £20,000,000 over the true average figure.

My own estimates show a much larger figure for the period considered by the Committee, and I have, therefore, made a separate calculation on the basis of the figures specially furnished by the banks to the Committee. The results of this are shown by the dotted line on the chart. It will be seen that the amount of "window-dressing" shown by these figures is smaller than my estimates for ten months in each year, but greater in June and December. It seems clear that for the purposes of the Committee, the banks adopted a different method of drawing up their accounts than that used for their ordinary monthly statements, but I have not received any explanation of the reasons which may have led them to do so.

I am, Sir,
Yours faithfully,
J. F. CAHAN.

London, W.C.1.

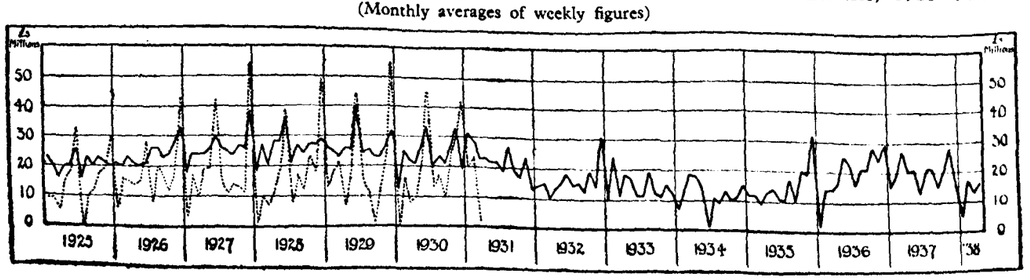
Banking and Trade Recession

TO THE EDITOR OF THE ECONOMIST

SIR,—The recent contributions to your correspondence on the above topic have left me a little puzzled about the position which would eventually be occupied by entrepreneurs if a policy of reflation were resorted to, as has been advocated.

If the recession is not allowed to materialise until the cost of labour falls, then the construction and renewal of capital goods will either be carried out at inflation levels, or else postponed until public works and other policies come to an end. If the former course operated, then industry would tend to become over-capitalised, and its products would have to bear a greater overhead charge on account of its fixed assets; a serious matter if trade declined for reasons outside our control, such as the diminishing of purchasing power in other countries.

Should those engaged in the capital goods industries, which absorb a large proportion of workers, resist the resumption of trading while wages and prices maintained their prosperity "ceiling," recession palliatives would be of no avail.



In either event, if the outcome were fewer cyclical depressions, but graver ones, then the problem of economic welfare, which arises side by side with that of wealth, would become more acute, since wage earners on a minimum subsistence level would find it more comforting to be offered bread for a whole decade than to be promised bread *and* a motor car for half the time and neither for the other half.

I am,
Yours faithfully,
H. V. SMITH.

Portsmouth.

AMOUNTS OF "WINDOW-DRESSING" EMPLOYED BY THE TEN CLEARING BANKS, 1925-1938

(Monthly averages of weekly figures)

Books and Publications

Germany Since 1888

THE notorious scarcity of first-class text-books on German economic history is often deplored by English students. German treatises on the subject nearly all tend to mix the record of fact with a great deal of theoretical speculation. Few historians would quarrel with Lederer's statement, which is the text of Dr W. F. Bruck's new book*: "There is no economic history without theoretical conceptions." But many have grown weary of theories which are given precedence over the facts; and look with some impatience for light on a subject which has remained obscure only because the relevant material has never been straightforwardly presented.

In these circumstances, it is unfortunate that Dr Bruck has devoted roughly the first quarter of his book to an involved, wordy and inconclusive discussion of theories of history. The body of the book, on the other hand, is a clearly written (if at times rather crowded) account of the growth of planned economy in Germany. Its leading thesis is the simple and illuminating argument that the present economic arrangements of the Nazi Reich are the outcome of a persisting historical tendency, rather than of a sudden break with tradition.

Dr Bruck's own experience as a Commissioner of the German Cotton Control Board in the war, and later as a departmental head in the Ministry of Economic Affairs, gave him a first-hand knowledge of *Planwirtschaft* at a critically important period of its development. His ability as an academic historian has enabled him to fit his knowledge into a wider scheme. He shows how the growing dominance of Prussia and the increasing tractability of the mass of the German people (due to a great extent, it is claimed, to ethnological developments) gave rise before the war to an assumption that the State was the prime mover in economic change. This became so deep-rooted that it influenced the development of German economic theory itself, and facilitated transition to a war economy which had in it the elements of permanence.

Under the direction of a few individuals like Walter Rathenau and Richard von Moellendorf (whose work here claims much belated attention), the later transition from the War-time system to the general process of industrial rationalisation which took place under the Weimar Reich was effected. Dr Bruck describes this phase in valuable detail, and proceeds to show how the whole system passed into the hands of the present regime because of the mistakes made by the Weimar politicians in the field of international finance.

There is an excellent description of the working of what the author calls "Finance Capitalism"; and it is emphasised that "the joint-stock bank in Germany was not merely a credit organisation but a politico-economic instrument." This fact is sufficiently well known, but there is probably no clearer account than this of its exact historical significance.

Dr Bruck's account of the way in which the present regime has tackled the situation which it found, as well as the economic tasks which it has created for itself, developing for these purposes an instrument which it found ready to its hand, is necessarily fragmentary. But it is fair, well balanced and penetrating, and provides a valuable last chapter to an important book.

The author has evidently been at much pains to make his subject clear to English readers. He has not only had to overcome difficulties of language, but also to allow for the fundamental differences of background between English and German historians. He has not wholly succeeded; but the ordered body of fact which this book contains is most significant for students of our times and of fascinating interest.

* Social and Economic History of Germany from William II to Hitler 1888-1938. By W. F. Bruck. University Press Board, Cardiff, and Oxford University Press. 292 pages. 12s. 6d.

Shorter Notices

"Overseas Trade and Export Practice." By G. T. MacEwan. Macdonald and Evans. 384 pages. 12s. 6d.

A book by the Vice-Chairman of the Institute of Export, which sets out so clearly and comprehensively as this does the practical knowledge of the expert about the processes of international trade, scarcely needs even the prefaced praise of so high an authority as Lord Stamp to commend it to economists and business men. It is both a relief and a profitable excursion to escape from the somewhat rarefied atmosphere of commercial theory into the common-sense zone where trade is a matter of warehouses and actual commodities, where restrictions on trade are shown as actual events in the day-to-day business of exporters rather than as heresies or political instruments, and where, in short, the institutional fabric of world commerce is succinctly and intelligibly sketched. The method has, it is true, its own defects: the workaday approach to trade problems does not exhaust their implications; and sections given similar space differ widely in importance. But the book stands on a firm foundation of fact and information, and is smoothly rounded off by brief passages of sage advice to the trader.

"Patents, Designs and Trade Marks." By C. S. Parsons. Technical Press. 184 pages. 10s. 6d.

This book is designed to explain simply the nature and value of patents and the registration of trade marks, and to enable ordinary business men to understand in outline a subject which, in its legal guise, is difficult and technical. It includes a summary of last year's Trade Mark Amendment Act, and a non-technical digest of the Patents and Designs Acts since 1907. In the last resort, the business man must have recourse to the professional patent agent; but Mr Parsons has made it unnecessary for him to be entirely lost in the mazy details of this important body of law.

THE BUSINESS WORLD

The Empire's Balance of Payments

IN examining the forces which affect the value of sterling it is usual to begin with a study of the balance of payments for the United Kingdom. But it requires very little thought to show that this is not really sufficient. For there are a number of countries which keep their international reserves, or a large part of them, in the form of balances in London. Hence sterling will depreciate in terms of dollars if Australia is drawing on her London funds to meet an adverse balance, just as certainly as if the deficit had originated in Great Britain. What is really required is a consolidated statement for all the countries which keep their working reserves in London.

Unfortunately, this is yet another case where the inconvenient facts of the real world prevent us from placing the various countries into neat theoretical pigeon-holes. We cannot say confidently, for example, whether Argentina, or Canada, or Estonia does or does not belong to the sterling area. It is better, however, to have half a loaf than no bread at all. The British Empire constitutes a large fraction of the whole sterling area, so that its consolidated balance is of considerable interest. Through the courtesy of a leading finance house we are enabled to publish below what we believe to be the first estimate that has ever been made of the consolidated balance of payments of the Empire. As with most forms of statistical pioneering, the authors of these estimates would be the most anxious to insist that they are only first approximations, but a full measure of recognition is due to them for the boldness with which they have sketched out a path along which others may follow.

A consolidated balance for the Empire can be prepared by adding up the figures for the member countries, since the transactions between any two of them will then cancel out. (This would only be strictly true if the estimates for each constituent unit were compiled with the same accuracy. However, to strain at such a gnat when there are so many camels of estimation to be swallowed would be labour wasted.) Official estimates are available only for the United Kingdom, India and the Dominions. They have been collected in the League of Nations publication on the subject, and the only difficulty (save that of confiding in their accuracy) is to adjust them so that they apply to the same period. For Australia the returns are in respect of years beginning on July 1st, and for India, Burma and (since 1927) New Zealand, the official year begins in April. In the case of New Zealand the estimates have been put on a calendar year basis by using the relevant monthly figures for visible trade, and assuming that the other items could be applied without adjustment. The same procedure has been adopted in the case of Australia for the years since 1930, but for the earlier period the figures for fiscal years have been used. No adjustments have been made in the case of India and Burma.

Considerable difficulty was experienced in arriving at an estimate for the other parts of the Empire. Figures of visible imports and exports are usually available, but for the "invisible" items the authors had to rely largely on intelligent guesswork. To estimate the amount of interest and dividends they used two alternative methods, and adopted as their final figure the mean of the two results. The first method was simply a direct calculation based on such scanty data as may be available. The second depended on the assumption that the interest and dividend payments of each colony would be about the same percentage of the value of its total exports (including gold production) as in the rest of the Empire. The ratio to exports used for this calculation was the mean of the percentages for New Zealand, India and South Africa. The same method was also used to provide an estimate of payments for services and other invisible imports, for which no direct estimates were possible. This method, it will be seen, can only be rigorously justified by making very arbitrary assumptions, and could hardly be allowed to pass if it did not open the way for a preliminary estimate of what has hitherto been incalculable.

Table I shows the estimates of the balance of payments on revenue account. The general nature of such a table, and the principles on which it is compiled, are too well known to require further description. The only point which should perhaps be mentioned is that gold absorbed into private hoards in India has been treated as an import, and gold released as an export. So far as the effect on the exchanges is concerned, this is obviously correct and in line with the treatment of newly-mined gold.

The validity of these figures is, of course, entirely dependent on the reliability of the original data and of the methods used. Even in what should be the easiest case, that of the United Kingdom, there is a perennial controversy about the validity of the official calculations. For the Colonial group, the possible error is clearly enormous; in particular, the passive balance is probably over-stated, since it is hard to believe that so much capital could have been imported, even in a period of development. And the position of Canada is equivocal in a double sense. Some people would say that Canada does not belong to the sterling area at all, since so much of her reserves is kept in New York; and others might express polite scepticism about the official figures, which show a total capital export for the period of £332 millions.

Despite these inevitable qualifications, it is possible to make several interesting and important deductions. Thus it can be observed that in the years 1923-29 the positive balance of the British Isles was offset by the negative balance of the oversea countries; taken as a whole, the Empire had in this period no surplus on revenue account with which it could add to its holdings of gold or foreign assets. In the three crisis years both groups temporarily showed large negative balances. In the recovery period the final figure has, on the whole, been positive, but the rôles of the two groups have been reversed. It is now the oversea countries (and notably Canada) whose positive balances have been outweighing the mainly negative ones of the British Isles. The inclusion of the oversea countries thus supplies a partial explanation of the persistent weakness of sterling in 1923-29 (when the United Kingdom had a considerable positive balance on revenue account) and of its strength in 1933-37, when this had been replaced by a negative balance.

For a full explanation, however, we must also study the *movements of capital*. A great deal has been said and written recently about the vagaries of floating balances (under various aliases, such as hot money, refugee funds, vagabond capital and the like). But not all movements are of such an unstable and unrecorded nature. In Table II separate estimates are given for some important items.

The table naturally starts with the balance on revenue account, since this is the only source from which the Empire's *net* international assets can be increased. It is also possible, however, for a country to add to its holding of foreign securities by reducing its stock of monetary gold (or *vice versa*). The next group, therefore, sets out the amount of monetary gold released or absorbed. So far as they go, the statistics are very accurate, but annual figures are not available for the net amount of gold acquired by the Exchange Equalisation Account. This very important item has therefore been omitted; so far as the aggregate is concerned, however, we can take the average of the holdings on September 30, 1937, and on March 31, 1938. This gives a figure of £288.5 millions.

The third group in the table is a partial record of what may be termed "genuine" movements of capital. This has been compiled in part from the Midland Bank's statistics of new issues made for non-Empire borrowers on the London market, and in part from an estimate of capital repayments received in the United Kingdom (mainly by way of sinking funds) from countries outside the Empire. This latter estimate was arrived at by taking 38 per cent. of the total repayments for each year as estimated by Sir Robert Kindersley in *The Economic Journal* (December, 1937). The ratio of 38 per cent. was chosen to correspond with Sir Robert's estimate of the non-Empire proportion of Britain's total investments at the end of 1936. There is, however, no guarantee that repayments will be proportionate to capital outstanding, so that the figures can only be treated as first approximations. In some years they will be too high, because Sir Robert includes repayments out of loans refunded. Repayments from the Bank of France to the Bank of England during 1923-27 have been added in as a special case.

The last line is the inevitable residual item, the main constituents of which are given in the footnote. If we allow for the gold acquired by the Exchange Equalisation Account we arrive at the formidable total of £878.2 millions to be accounted for by the other components during the fifteen years. A substantial part of this is probably due to statistical inaccuracies, for we have been dealing throughout with estimates subject to a considerable margin of error, and this is where the errors collect. But a very large amount must also be due to the inflow of short-term capital from abroad. In the early years we "borrowed short in order to lend long"; now we offset these unwanted funds with additions to our gold stocks.

It will be apparent from the foregoing account that the compilers of this estimate have had to surmount a very large number of statistical obstacles, and that they have had to adopt a variety of ingenious shifts and devices to arrive at their aim. But the net result is no mere intellectual plaything; it is one of the most vitally important economic facts of the present-day world. The imperfections of the present estimate should serve as a stimulus to the Governments of the Empire to improve their statistics on this subject.

Plight of American Railroads

AMERICAN business depressions in the past have invariably been marked by two major events: extensive bank failures and extensive railway failures. The present depression has so far been unique, for in neither field have failures been extensive. Grave fears have been entertained for the position of the railways, but only one important system—the Erie Railroad—has in fact been forced into bankruptcy. Many of the companies, however, are in a serious financial condition, and the industry—as the passing of the Atchison, Topeka preferred dividend again showed last week—is chronically unable to equate revenue and expenses.

The deterioration in the railroad situation during the past year is clearly shown in the adjoining analysis of Class I steam railways' revenues and costs since 1928. In 1937, this group covered its fixed charges 1.14 times. During the first four months of 1937, the ratio was 1.08 times. But in the same period of the current year, only one-third of total fixed charge requirements were earned, although even at the depth of depression in 1932 four-fifths of the total was covered. During the first half of this year, gross revenues fell to $1,636 millions, compared with $2,087 millions for the same period of 1937. Net operating revenues fell from $299 millions to $70 millions in the same periods. And in May the Class I railways suffered a net loss after taxation and interest charges of $25½ millions compared with a profit of $1⅓ millions for May, 1937.

These, of course, are composite results. A clearer picture of the industry's plight may be obtained from further sub-division. Official figures show that, at the end of 1936, some 91 companies operating 69,712 miles of line out of a total of 260,000 miles, were in bankruptcy. Their capital expenditure on road and equipment amounted to $5,807 millions, and they had unmatured funded debt of $2,757 millions, and matured, but unpaid, funded debt of $530 millions. The only subsequent major addition to this number is the Erie, which has 2,426 miles of line. Among the bankrupt companies operating over 5,000 miles of line are Chicago, Milwaukee, St. Paul and Pacific (11,115 miles); Chicago and North Western (8,440 miles); Chicago, Rock Island and Pacific (7,532 miles) and Missouri Pacific (7,532 miles). The Rock Island, whose recent earnings are shown in the table at the foot of this page, illustrates the persistent adversity which has been typical of the group, both in depression and recovery.

Companies in unsatisfactory condition—the second category—are difficult to define, and marginal cases abound. Perhaps the most convenient test, however, is the regularity with which fixed charges have been earned in recent years. Baltimore and Ohio (for which earnings are given below), Atlantic Coast Line, Kansas City Southern, Missouri-Kansas-Texas, and Southern, have earned their fixed charges in two years of the past six years; Colorado and Southern, Lehigh Valley, and Nashville, Chattanooga and St. Louis in one year; while Central of New Jersey, Delaware, Lackawanna and Western, and Delaware and Hudson have failed in all six. New York, Chicago and St. Louis—the "Nickel Plate"—might be added to the list on the ground that it has a large bond maturity due on October 1st, and inadequate cash resources. By contrast, several of the companies cited above—Nashville, Chattanooga and St. Louis is an example—retain a strong cash position, and will be able to meet their bond interest, even if it is not earned, for some considerable period yet to come. Further, the Reconstruction Finance Corporation appears to be making every effort, despite the restrictions imposed upon it by law, to make advances to needy companies, with the object of preventing actual failure. The R.F.C. sought greater latitude for making railway loans at the end of the last session of Congress, but its efforts were prevented, partly by labour opposition when the companies proposed wage reductions. Many—possibly all—of the railways now in unsatisfactory condition might be saved from danger if the Corporation's powers were further liberalised, and if recovery develops.

Our third category—companies in reasonably satisfactory financial condition—needs little discussion. Such companies have not escaped falling traffics, but they have so far proved sufficiently strong to meet their consequences. Such companies as Chesapeake and Ohio in the east, and Atchison, Topeka and Santa Fe in the west, whose earnings records are analysed below, are typical of this class. But the line which divides it from less fortunately situated railways is perpetually shifting. Given a period of active business, many companies in straitened circumstances would at least achieve greater financial comfort—if not positive strength. Nor are the strong lines immune from developments in the railway industry generally. The earnings of Class I railroads in 1936 and 1937 demonstrate that a satisfactory volume of traffic is the first essential before the railways are to climb "out of the red."

But satisfactory traffics depend on something more than the fluctuations of a mere business cycle. Superimposed upon such trade movements, a secular change in the "catchment area" of railway revenues is in progress. In 1928, the Federal Reserve Board's index of business activity averaged 111 per cent. of the 1923-25 level. Last year, the corresponding figure was 110 per cent. But total car loadings in 1937 were 26 per cent. below the 1928 level, merchandise "l.c.l." car loadings 36 per cent. below, and the total, excluding merchandise, 23 per cent. lower. Admittedly, building activity last year was lower than in 1928; but even assuming that, for this and other reasons, 1937 was more difficult for the railways than a period of "normal" prosperity might be, a long-term decline in railway freights still appears to be in progress. Traffic is being lost to road and air services. Industrial decentralisation and changes in industrial technique have aggravated the traffic problem. In these circumstances, increased freight or passenger rates would merely speed the departure of traffic to the railways' competitors.

On the reverse of the medal, it is virtually impossible to adjust expenditure to falling receipts. Wages constitute the largest single item of cost, and they have been raised on several occasions in recent years. The railway "brotherhoods" remain implacably opposed to wage cuts, and their resistance to the proposed 15 per cent. wage reduction may next month be carried to the point of taking a strike vote. Should this happen, an Emergency Board may have to consider the vote—at a time which, from the stockholders' point of view, will be inconveniently close to the Congressional elections. Already, union regulations and working rules interfere with the attainment of maximum operating efficiency. Proposals to abandon unprofitable lines meet strong political opposition. Finally, there is little opportunity for savings in capital costs by way of refunding operations at a time when first-grade railway bonds already yield one per cent. more than industrial bonds, and when railway securities eligible for the portfolios of banking and other financial institutions become daily more restricted. And the whole complex of difficulty is ironically capped by the unworkable law governing railway reorganisation. Thus, the twin blades of falling gross revenues, and rigid—if not rising—costs have slashed American railway earnings. To-day, the companies lean more heavily on the Federal Government than ever before. Up to May 31st, the Reconstruction Finance Corporation had authorised loans totalling $689 millions to 76 companies, and had actually disbursed $573 millions. In addition, the Public Works Administration had advanced about $200 millions before ceasing, some months ago, to give further assistance.

The investment prospects for American railway stocks, it is clear, cannot be regarded as hopeful, even on the best assumptions regarding the possibility of business recovery this autumn. If the threat of strikes becomes urgent, rail stocks may experience a serious setback—which might, indeed, carry industrial stocks down some way with it. If wage questions are peacefully settled, if the much-heralded business recovery arrives, and if financial assistance from the R.F.C. is forthcoming promptly and effectively, American railways may hope for better experience in the next twelve months than in the last. But forecasting was never more difficult, either for the short-term operator or the long-term holder of American rail stocks. The latter, in particular, is becoming more concerned at the lack of an effective railway policy designed to secure the railways against the deteriorating tendencies of the past decade. In 1929, the Interstate Commerce Commission proposed wholesale consolidation of the roads. In 1932, a committee headed by ex-President Coolidge urged extensive amalgamations, the elimination of unprofitable services, regulation of competing transport services, the revision of bankruptcy procedure, freer lending conditions by the R.F.C., and revision of the methods on which rates are based. One of President Roosevelt's earliest acts was to appoint Mr Joseph B. Eastman as Railroad Co-ordinator. But the latter's task was hampered by the condition that employment must not be reduced.

In short, there are many plans, but no plan. If business conditions improve, the railway problem will become less intense—for a time. But unless a period of relief is seized to make extensive changes in operating conditions, the net effect will be merely to pile up further difficulties for the industry, and increased financial commitments for the Government in the next recession. The American railway market, at present, is rather dangerous territory for the British investor. But he would, nevertheless, be wise to study its significance. In the course of a few weeks the behaviour of rail stocks may become the dominant factor in Wall Street. And a shock to Wall Street, when industrial recovery is so delicately poised, would be far from welcome.

AMERICAN RAILROAD EARNINGS IN PROSPERITY AND DEPRESSION

The four American railway companies in the following table have been selected to show the differing intensity of depression upon earnings. Baltimore and Ohio operates 12,593 miles of line, and about 45 per cent. of its traffic consists of soft coal. Chicago, Rock Island and Pacific operates 7,532 miles of line. Its traffic is diversified, but agricultural freights are an important source of revenue. Chesapeake and Ohio has 3,106 miles of road. This company is preponderantly a soft coal carrier, while Atchison, Topeka and Santa Fe carries a diversified traffic over 13,226 miles of road.

Consumers' Co-operation in Great Britain—II

Co-operative Finance and Control

A preceding article in the last issue of The Economist *discussed the structure and organisation of the co-operative movement in Great Britain, which now claims a membership of seven millions and controls funds exceeding £300 millions. This concluding article, which deals with the methods by which the movement is financed and controlled, is, like the first article, very largely based upon the authoritative survey of the movement that has recently been published.**

THE unit in the edifice of the co-operative movement is the retail society, and from its individual members virtually the whole of the movement's vast capital is obtained. The movement's financial problem, unlike that of many joint-stock companies, is not to secure enough capital for its operations but how best to invest the large proportion of its resources which is surplus to trading needs.

The shareholding interest of individual co-operative members is legally limited to £200—and these shares are withdrawable. But the majority of the retail societies invite their members (and sometimes non-members) to subscribe loan capital, of which individual holdings are not limited by law. The societies have always made it one of their primary objects to encourage thrift; and they habitually act as bankers for their members' savings. The total capital of the retail societies in 1935 amounted to £198,146,861, made up as follows:—

	£
Share capital	135,745,524
Loan capital	34,007,929
Disclosed reserves	12,732,520
Cash balances, etc.	15,660,888
	198,146,861

Of this total (which, huge though it is, excludes the substantial hidden reserves of the societies) only 40 per cent. was needed to finance retail trading operations, the remainder being invested.

The retail societies put most of their surplus funds into the Co-operative Wholesale Society or the Scottish C.W.S., whose financial operations are consequently on a very large scale. As a condition of membership of the C.W.S., a retail society must take up not less than one £5 share (not necessarily fully-paid) for every two (individual) members. At the end of 1935 some £13 millions had been paid into the C.W.S. share account. But the retail societies also have money on loan and deposit account with the wholesale society aggregating, at the end of 1935, £6 millions and £54 millions respectively. The share, loan and deposit capital of the two wholesale societies in 1935 totalled £82,241,563, all of which was provided by other societies, with the exception of £997,962 invested in the S.C.W.S.

* "Consumers' Co-operation in Great Britain." By A. M. Carr-Saunders, P. Sargent Florence and Robert Peers, in consultation with a Committee drawn from the movement. Allen and Unwin. 556 pages. 15s. net.

Some phrases seldom ring true

"Nice day for a sail, Sir"

but

YOU CAN BE SURE OF SHELL

by individuals. The aggregate capital of the co-operative movement in 1935 may be summed up as follows:—

AGGREGATE CAPITAL OF THE MOVEMENT, 1935

Societies	Total Capital	Employed in Trade	Invested in Co-operative undertakings	Invested outside the Movement
	£	£	£	£
Retail	198,146,861	77,590,380	86,910,600	33,645,881
Wholesale	121,569,248	13,081,776	*7,500,000	100,987,472
Productive & Federal	6,800,000	†4,000,000	†2,500,000	†300,000
Totals	326,516,109	94,672,156	96,910,600	134,933,353
Adjusted totals‡	229,605,509	94,672,156	...	134,933,353

* Includes loans and advances to societies. † Estimated. ‡ Corrected for duplication.

It will be apparent that the movement is not merely a trading concern; for almost 60 per cent. of its financial resources is invested in non-co-operative funds.

Membership of the co-operative societies is virtually open to all, but a widespread membership, accepted on a basis of equality, does not necessarily guarantee actual democratic control. The authors of the authoritative survey under review devote a considerable proportion of their space to a discussion of the question how far the movement can be said to be democratically controlled. Detailed administration is in the hands of management committees, which display a fair degree of continuity, and of permanent officials who enjoy a noteworthy security of tenure. How far are these officials sensitive to the will of the members and how is that will expressed? Apart from the guilds in which some of the members are organised, the members may exercise their influence by the use of their vote and by their attendance at the business meetings. The first means is obvious enough: management committees are periodically elected by secret ballot of all the members, to whom they are ultimately responsible. In this sense the movement is highly democratic. The business meetings of co-operative societies have very little in common with the shareholders' meetings of joint stock companies; for the members of a co-operative society are customers as well as, indeed more than, shareholders. They demand a series of services and will judge the board by its efficiency in supplying those services. But the two sorts of meetings have the characteristic in common that the attendance is small in relation to the membership—a factor which must also tend to increase the influence of any organised body of members. On the other hand, it is generally the more progressive members, and those who are specially interested in the society's work, who attend the quarterly meeting, and the list of questions asked at a typical business meeting affords abundant evidence that at any rate a certain section of the membership always takes a lively interest in the doings of the management committee.

Control of the federal societies is exercised in much the same way. Thus the ultimate control of the two wholesale societies is vested in the boards of the retail societies, which elect their directors and are represented at their business meetings. In this case, however, the votes are allocated in proportion to the value of purchases; there is a danger, therefore, that the larger retail societies may exercise an undue influence at the expense of the many smaller societies. In the election of the directors of the wholesale societies, the votes cast are the result of group discussion. The successful candidates must, moreover, be known and trusted amongst the boards of the retail societies. In consequence, successful candidates tend to be able and honest, and capable of exercising control in the interest of the retail societies; but the system is not well adapted to the discovery of special enterprise or exceptional ability.

The general meetings, attended by representatives of the retail societies, afford an opportunity of examining the affairs of the wholesale societies and of criticising the administration. Opportunities of real discussion between delegates and the platform are, however, more restricted than in the case of the retail societies. For, since divisional meetings are the rule, none of the directors present at a particular meeting may have the requisite special knowledge of the matters raised. The authors conclude that democratic control is less obvious in the wholesale than in the retail societies; "and if democracy is taken to mean supervision by the rank and file co-operator it is indeed tenuous." "If, however, democratic control means control by the retail societies then it is true to say that this control is very real and is continually exercised." The conclusion is reassuring, for the federal societies are playing a role of growing importance. Democratic control of the retail societies would therefore be of little value without corresponding control of the federal societies.

There is much that is remarkable and praiseworthy both in the present organisation and condition of the co-operative movement and also in the history of its gradual unassisted growth from back-street beginnings to real eminence. None of its friends, however, would attempt to conceal that it has some inherent weaknesses or that many obstacles still stand between it and the full realisation of its aims. It is, indeed, of the utmost importance that the consumers' co-operative movement should be objectively studied, for in a world that is daily being faced with the choice between individualism, which may mean chaos, and planning, which may involve extremes of compulsion, co-operation stands out as "the only alternative scheme of economic organisation actually in existence in the country."

Finance and Banking

Gold Hoarding.—The gold rehoarding movement has during the past week acquired dimensions unmatched even in the dollar devaluation scare of the closing weeks of 1937. On Tuesday over £1,500,000 of gold was taken at fixing and almost as much was estimated to have changed hands in subsequent deals. On Wednesday the pace grew decidedly faster, and no less than £2,977,000 was dealt in at fixing, while the total turnover for the day must have been in the neighbourhood of £5,000,000. On Thursday the turnover at fixing amounted to £2,366,000 and at least another £1,000,000 changed hands in subsequent deals. This abnormal demand for gold has been fed by two separate sets of influences. In the first place, the international tension has had its customary effect on the nerves of Continental capitalists, whose purchases of gold have provided one of the main factors in the past week's dealings in the metal. Secondly, there have been influences of a more monetary character. Mr Morgenthau's prolonged discussions in Paris have revived rumours of a stabilisation of the currencies linked by the Tripartite agreement, and these rumours have in their turn drawn attention to the overvaluation of sterling. There is little or no belief in an early devaluation of the dollar in terms of gold, but in Continental circles there is certainly a belief in the likelihood of a return to the traditional sterling-dollar parity of $4.86⅔ as a preliminary to any stabilisation agreement between the two currencies. Consequently there has been a wholesale rush out of sterling and into gold or dollars.

* * *

One development which has probably intensified this rush has been the tactics of the Exchange Equalisation Account in refusing on certain days of this week, when the rush for gold was at its height, to sell metal on any terms whatever after the fixing. The knowledge of this refusal has probably stimulated the hoarding demand for the metal, though the motive underlying the authorities' decision has no doubt been the very reverse. Where gold has not been available Continental operators have bought dollars, and thus we have seen the dollar rate appreciating this week to $4.89 and the price of gold rising concurrently to 142s. 5d., the figure touched after fixing on Wednesday.

The authorities have provided all the gold required at the daily fixing, and have, moreover, done so at exceptionally low prices. On Wednesday and Thursday the price fixed was no higher than shipping parity with the dollar for the first time for four months. By this readiness to sell at arbitrage point, the official seller admitted by implication that sterling had fallen to its lower gold point and that shipments of gold to New York were desirable in order to support sterling exchange. Such arbitrage operations have in fact been arranged. They would have acquired much greater magnitude had it not been for the fact that the buyers at fixing have this week found it possible by resales to hoarders after fixing to earn greater profits than would have been yielded by the arbitrage shipment. The continued hoarding demand for gold has therefore militated to some extent against the supporting operations for sterling undertaken by the authorities in this country.

* * *

Exchanges and the Recession.—It is a well-known fact that there is always a time-lag between the exports and imports of the primary-producing countries. The cycle is that the exports of primary products are first made and paid for, and then the proceeds are spent on the purchase and importation of manufactured, largely consumers', goods. It follows that when a world recession comes, exports fall away at once, while imports continue for some appreciable time at their previous "prosperity level." Last year has been no exception to this rule, and this is why such countries as India and Argentina have recently been experiencing exchange stringency. On the other hand, the effect of this time-lag is only temporary, because eventually the contraction in exports leads to a corresponding contraction in imports. There are some signs that the present world recession is already reaching this stage. The rupee has lately become a little stronger, and at its present rate of 1s. 5 1/16d. is comfortably above its bottom statutory limit of 1s. 5 1/32d. It is also announced this week that the South African banks have reduced their rates for exchange on South and East Africa, the sight rate on South Africa being now £101 2s. 9d. in place of £101 3s. 9d. per £100 sterling. The free Argentine peso is also firmer, and this is directly ascribed to a recent falling-off in Argentine imports. The present policy of the Argentine authorities is to hold the free rate of 19 pesos to the pound, and they have been both buying and selling pesos with this end in view. Their object is to neutralise last winter's reduction in the exchange surcharge from 20 to 10 per cent., for a free rate of 19 pesos acts in effect as a surcharge of just over 18 per cent. In this way, imports from those countries with which Argentina has no trade agreement are kept down, which helps to make total imports conform to total exports. This possibility that the exchange stringency of these countries due to the time-lag is beginning to pass away is of some importance to the outlook for sterling. Most of the countries concerned are members of the sterling area, and any change in conditions which helps these currencies will *pro tanto* help sterling as well, although the reduction in the primary producers' imports is unfortunately likely to connote a reduction in the United Kingdom's exports.

* * *

Outside Money.—During the past four weeks an interesting change has occurred in the short money position. Loans against bonds from lenders other than the clearing banks have become decidedly dearer than they have been for years past. Before the turn of the half-year it was customary for the big discount houses to finance the bulk of their bond position with non-clearing or "outside" lenders at ½ per cent., i.e. at the same rate as that paid to clearing banks for accommodation against bills. Occasionally ⅝ per cent. or even more may have been paid but this was always an exceptional state of affairs. Since July 1st the ½ per cent. money has departed and the representative rate for outside money against bonds is now ¾ per cent., while ⅞ and 1 per cent. is often being paid both by the market and by the Stock Exchange houses which run a money book. At first the change attracted little notice, since it coincided with the turn of the half-year and was therefore regarded as a purely normal and temporary phenomenon. It is, however, showing unquestioned signs of permanence. The explanation of the change is probably to be found in three directions. In the first place, since the last issue, the Defence Threes, the market has been running a larger position in bonds. The impact of the July 1st call on this scrip was particularly apparent on the money position and we may expect a similar effect to follow the last call, which is to be made next week. Secondly, the clearing bank competition for deposits has attracted to those institutions a good deal of the money which formerly found its way directly from the outside lenders to the market. Such a development is bound to cause the outside money rate to approximate to that of the clearing banks—which for bond money remains at 1 per cent. Thirdly, the recent rush for gold has undoubtedly caused some encroachment on the liquid resources at the command of foreign agencies and other outside lenders in the London market.

* * *

British Oak.—It is announced that the Union of Canton, a Chinese insurance company under British management, has bought the shares of the British Oak—a non-tariff London company controlled by Spillers, Ltd. The British Oak had at one time a capital of £250,000, but reduced it in 1929 to £175,000. Subsequently, thanks to excellent new management, it prospered and made substantial profits in its fire, general and motor departments, though in marine it was less successful. Recently it had certain difficulties to overcome in consequence of unfortunate commitments in the film industry, and the shareholders subscribed a large amount of new capital, taking 1,000 shares at £180 per share. That addition to its funds put the company in a comfortable position, but presumably the directors decided that the hazards of insurance were more bother than they were worth, and so closed with this offer from China. The terms of the sale are not disclosed, but Union of Canton is an old and wealthy company with assets of over £6,000,000, a marine income of nearly £1,000,000, a fire income of nearly £600,000, accident £305,000, and a profit of £296,000. The British Oak will now "go tariff," and the marine department may perhaps be closed. It is interesting to see the control of a vigorous British company pass to Canton, and the change is, perhaps, an indication of how traders in the Far East regard the future.

* * *

China's Currency Position.—According to the report issued by the Currency Reserve Board last month, China has been more than able to control any inflationary tendency which a year of war would normally induce. The report states that since January of this year only 28,000,000 dollars of notes have been added to the circulation. Since November last the increase has been 102,000,000 dollars, but this has been offset by an adequate additional backing of specie and other reserves. The combined note circulation of the four issuing banks (which are—in order of importance—the Bank of China, the Central Bank, the Bank of Communications and the Farmers' Bank) totalled on May 29th, 1,705,322,789 dollars. The report claims that this total was backed by 1,113,852,182 dollars of specie which amounts to about 65 per cent. of the total, and negotiable reserves amounting to 591,470,606 dollars. (By the law of 1931 note

The OCEAN

issuing banks are obliged to hold specie reserve for at least 60 per cent. of their total note issues, while the remaining 40 per cent. must consist of realisable bonds.) While the note issue has increased, the addition in specie in the last six months has actually been greater than the note expansion. It would appear that China's currency position is remarkably strong. The behaviour of general price indices confirms that there has been no great inflationary tendency.

* * *

Argentine Finances.—It is reported that the Argentine Government is raising a loan in New York for the benefit of the municipality of Buenos Aires. The sum involved is $25 millions, equivalent to 100 million pesos, and the loan is expected to take the form of 4½ per cent. ten-year bonds. The price of issue is still to be announced, but inasmuch as last year Argentina converted most of her American debt on to a basis of approximately 4½ per cent. the issue price should be not much below par. The bonds will be a direct obligation of the Argentine Government, which will incidentally obtain $25 millions of foreign exchange; for the money will be re-lent to Buenos Aires in the form of pesos. The municipality needs the money for improvements and also for refunding short-term debt. It was unable to borrow in the Buenos Aires bond market, for all municipal and provincial borrowing is now subject to Government control, and, as last year the bond market was overloaded, the Government have fixed this year a limit of 150 million pesos to all such borrowing. Thus a very happy way out of the difficulty has been found. The City of Buenos Aires obtains the money it needs, the Argentine authorities obtain $25 millions of exchange, and the American bondholder obtains the security of the Argentine Government.

MONEY MARKET NOTES

Foreign Exchanges

THE foreign exchange market has been whipped into considerable activity this week by the world-wide rush into dollars and gold. Despite substantial sales of dollars against shipments of gold to New York, the U.S. currency has been persistently strong, and touched $4.89 on Wednesday and Thursday. Some profit-taking on Thursday afternoon caused a reaction to 4.89½. Swiss francs and belgas have appreciated with the dollar in terms of sterling. The movement in the case of the belga has been helped by continued covering of bear positions opened at the time of the recent speculative attack on this currency. Dutch guilders have been sold on a fair scale for conversion into dollars, and control operations have been apparent both in Amsterdam and in London. Despite these supporting operations the guilder rate has weakened to 8.96½, as against 8.95⅛ a week ago. Although the French franc is at present receiving the substantial support of a record tourist season in France, there has been some tendency for the franc to weaken, both in the spot and forward markets. In both directions official support has been available, but this has not prevented the spot rate from moving to 178⅜ and the three months' discount to widen to close on 3½ francs. The main selling of francs has been against purchases of dollars or gold and must be explained as part of the general rush to both these havens of hot money and not as the result of any sudden deterioration in the French financial position.

*

The Money Market

MONEY against bills remains in ample supply, but the accommodation against bonds shows signs of becoming scarcer. This point is discussed in a Financial Note. The Stock Exchange has been a somewhat better borrower, and on Tuesday some of the money houses had to go to their clearing banks for bond accommodation, for which they had to pay the customary 1 per cent. The banks are ready buyers of bills and the market has been a somewhat better seller following the 58 per cent. allotment obtained at last Friday's Treasury bill tender. The syndicate figure for Treasury bills remains at £99 17s. 5d. and at the discount rate indicated by this price much of the outside competition for bills is effectively repressed. Hence the larger percentage obtained last Friday. The full £40,000,000 on offer was allotted and thus payments for bills during the current week were £5,000,000 less than maturities.

The Bank Return

A FURTHER £4,471,000 of Bank of England notes were on balance withdrawn during the week to August 3rd, bringing the active note circulation to a total of £497,783,000. This is some £6,000,000 below the August holiday peak reached a year ago.

The effect of the increased circulation on bank cash was not neutralised by appropriate changes in the holding of securities. The item "Government Securities" in the Banking Department shows a fall of £1,090,000 over the week, while other securities are up by £643,000. Bankers' Deposits, however, are only down by £2,932,000 over the week, as Public Deposits have helped them to take the strain of the larger circulation and the net reduction in security holdings. These Government Deposits are down by £1,696,000, a movement to which the excess of Treasury Bill maturities has contributed. Bankers' Deposits remain at a comfortable level of over £113,000,000, but this figure will probably be appreciably reduced following the final call on Defence 3's which is due to be made on Friday of next week.

*

The Bullion Market

THE gold market has been more active this week than at any time since the culmination of the gold scare in June, 1937. The amount dealt in at fixing on the first three working days of the week amounted to nearly £7,000,000, almost the whole of which was supplied by the authorities. There has been substantial dealing after fixing, but for the most part it has represented resales of gold by dealers who bought at fixing, taking a view on the subsequent movements in the dollar rate. The authorities have kept their price at or near the dollar shipping parity, charging a premium of ½d. on Tuesday, but prices equal to parity on both subsequent days. With the authorities out of the market in subsequent deals and hoarding demands from the Continent keenly persistent, the price each afternoon has tended to rise to a premium above the dollar parity. The hoarding demand for gold has also been reflected in a considerable bidding for coins, which this week have risen to a premium of 5 per cent. over their bullion parity. The supplies of these, which were recently enlarged from a special source, show signs of diminishing again.

At the beginning of the week the firmness of the dollar caused the price of silver to rise ⅜ to 19⅝d. The advance, however, has not been maintained, and though buying by Indian bazaars is still reported, we are back again to a rate of 19½d. for spot.

Investment

Course of Share Values.—Wall Street has maintained its virtuoso performance during July with a second movement which may be described as *andante con brio*, compared with *allegro* for June. For the greater part of the month, many observers, including those who had missed the biggest speculative opportunity for at least two years, were actively discussing the timing, and extent, of the inevitable reaction. But Wall Street held its ground in determined fashion. Only at the end of the month, indeed, was there any sign that operators were becoming rather restive regarding the appearance of a convincing economic recovery in the United States, such as the market has been discounting for the past six weeks. So far, however, the reaction has been quite modest, and the volume of trading has usually declined on every sign of setback. The business community remains optimistic, and bases its reasoning on two main factors—the forecasting powers of the stock market itself, and the expectation, already partially fulfilled, of rising steel output during the late summer and autumn. Steel mill activity, indeed, has reached 40 per cent. of capacity this week, for the first time since November last year. What this achievement may mean in terms of third-quarter profits, however, is another matter. Second quarter earnings have already provided a salutary check to excessive optimism, and caution regarding the level of future profits is expressed by the steel industry. Meanwhile, London has discarded the ties which bound it to Wall Street late in June and early in July. Ordinary share prices, indeed, have reacted to only a point or two above the secondary trough established in March this year. That is not to say that London necessarily disputes the possibility of some recovery in the United States in coming months. Indeed, it has welcomed positive evidence pointing in that direction, and would be glad to have more. Rather it indicates a growing preoccupation with the current level of industrial activity and profits. In June, it was possible to detect a feeling of greater optimism regarding the British economic situation. But the publication of a series of depressing announcements, including the Courtaulds' and home railways' interim dividends, and lower brewing profits, have checked this improvement in sentiment. And at a time when investment support is reduced by holiday-making, when some increase in political unrest is apparent both in Europe and in the Far East, and when the industrial barometer registers "no immediate change" rather than "set fair," it is impossible to forecast any appreciable improvement in prices. Even Wall Street, which has been activated in recent weeks largely by faith, may place greater insistence in the near future on works.

Foreign Bond Movements.—As a result of the financial agreement with the German Government at the beginning of July, fairly extensive revisions have been made in the indices of foreign bond movements calculated by the Municipal and General Securities Company. Three bonds have been transferred from the undefaulted to the defaulted group. In addition, the Norwegian 4½ per cent. loan of 1921 has been eliminated through redemption. To show the effect of these changes in the composition of the index, revised figures for June are given in the following table. A link necessitated by the default on the Shanghai-Nanking Railway loan is also provided by the revised May figures. The total index of 108 bonds, at the end of July, was fractionally higher than a month earlier, while the index of undefaulted bonds fell by an amount almost equal to the rise in the defaulted list. The recovery in European issues was attributable largely to German and Austrian bonds, which, however, failed to maintain their best levels.

AVERAGE JANUARY–JUNE, 1934 = 100.

In the Far Eastern group, Japanese issues were conspicuously weak owing to the hostilities on the Russo-Manchurian frontier.

* * *

The bondholder's lot has not improved during the month. The service of the Turkish 7½ per cent. loans of 1933 and 1934, which has been met since 1936 as to 50 per cent. in foreign exchange and 50 per cent. in merchandise, will from November next, be covered entirely in Turkish pounds, to be applied to merchandise operations. It is stated that only half of the coupon due on November 25th next, will be payable, owing to delays in putting the new agreement into force. A new stratagem on the part of the Greek Government has also been reported. Certain holders of Greek 5½ per cent. Treasury Notes, which were issued in 1930, and specifically

secured against a portion of the Greek National Loan of 1914, had recently taken steps to sell the pledged bonds, in view of the cut in the interest on the Treasury Notes from the revised rate of 6 per cent. to 3 per cent. The Greek Government has countered this step by declaring that no funds will be provided for the service of any pledged bonds which may be sold. As a result, the legal rights of the Treasury Note holders affected have been rendered nugatory. Greece, indeed, persists in her refusal to pay more than 40 per cent. of contractual service. From this aspect, indeed, the note holders have received rather better treatment in the past than the long-term creditors.

* * *

By-passing the Stock Exchange.—In our issue of February 12th, this year, we discussed the growing importance of outside dealings, particularly in gilt-edged securities, and their effect upon the volume of turnover transacted within the Stock Exchange itself. The Stock Exchange Committee have recently taken steps to tighten up the dealing regulations, with the object of protecting jobbers against predatory extra-mural competition. Increasingly, the number of direct dealings, by which a broker can marry purchases and sales through the medium of the finance houses, has tended to curtail the volume of business available to the gilt-edged jobbers. Finely shaded prices and unremitting attention to switching have been necessitated by the difficulty of preserving satisfactory investment yields during a prolonged period of low interest rates. And where part, at least, of a jobber's turn could be saved, the advantages of outside dealings have been obvious and well exploited. There is no Stock Exchange rule which forbids a broker to carry out such dealings. But he is only entitled to deal directly with a non-member if he can secure better terms for his client than by dealing in the "House." In future, it is proposed to lay down categorical rules for the observance of this condition. The Committee suggest that a broker shall not be permitted to execute an order with a non-member until he has fully tested the market. A special form for marking bargains with non-members is proposed, on which will be recorded the name of the jobber with whom the broker tested the market before the outside deal was transacted. If necessary, the broker will have to substantiate the validity of the transaction before the Committee. By this means, the gilt-edged market should have full opportunity to compete on equal terms with outside dealers. The market, after all, provides the basis of prices on which alone outside dealings can be negotiated. And if the new rule has the effect of stimulating the jobber to quote fine prices, much of the outside business which has recently been done may be reattracted to the floor of the "House."

* * *

Capital Issues in July.—Activity in the new capital market last month was in contrast to the stagnation which prevailed earlier in the year. Public issues and offers to shareholders only for cash involved £14,681,000 of new money last month—a total which is almost the same as a year ago, though considerably lower than the June total, which included the second Defence Loan. The month's public offers have consisted almost entirely of fixed-interest stocks and preference shares. Our usual monthly table is given in the next column.

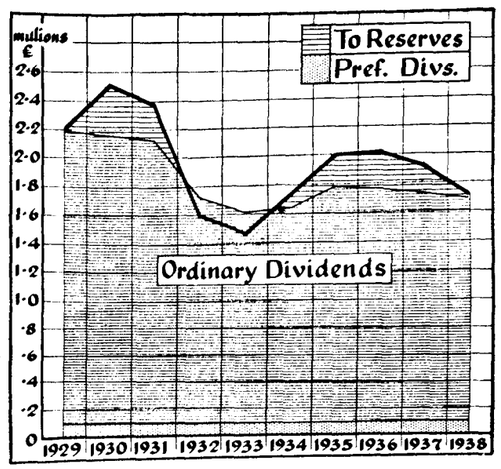
The month's issues were generally of a high quality and fairly large size, but only one of the public issues involved the subscription of more than £1½ millions of new money. Stock Exchange introductions, which are included in our "new basis" figures, were comparatively small.

Company Notes

Great Western Statement.—In the worst years of depression, when the Great Western Railway maintained its prior charges in the trustee list by drawing heavily upon reserves to meet the requisite 3 per cent. ordinary dividend, it paid interim dividends of one quarter of one per cent. The announcement, on the eve of the holiday, that the directors had decided to make no interim payment in respect of the first half of the current year, therefore, was interpreted in only one way—that the policy of 3 per cent. minimum dividends on the ordinary stock would not be maintained. The immediate consequence was a further fall of 3 points in the stock to 38½. The implications of the dividend decision, indeed, were considerably more disturbing to the market than the figures contained in the half-yearly statement. These showed that gross receipts from railway and ancillary businesses for the half-year were £306,000 lower than in the corresponding period of 1937. Expenditure on railway and ancillary businesses increased by £522,000, and net revenue from all sources fell by £818,000. Of the total fall of £283,000 in railway receipts, passenger receipts accounted for £25,000, goods train receipts for £250,000, and miscellaneous receipts for £8,000. The statement does not divide the increase in costs between wages and materials, nor—unlike the L.M.S. statement last week—does it provide any indication of the relative saving of direct operating costs arising from a smaller volume of traffic. Assuming that the company "breaks even" during the second half of the year, it is evident that the ordinary stock is already earning about 2½ per cent. And in view of the serious fall in goods traffics last half-year, and the company's apparent inability to cut its operating costs as the volume of business fell, this crude calculation gives an altogether optimistic picture of ordinary dividend possibilities next February. Holders of Great Western prior charges may have to content themselves with the maintenance of Chancery, rather than trustee status for the next decade.



* * *

Disappointing Guinness Profits.—The appreciable setback in profits reported by Arthur Guinness, Son and Company may be disappointing to ordinary stockholders who were expecting that extended operations at the new Park Royal plant would rectify the slight decline in profits in 1936-37. But the past year's fall—from £1,901,594 to £1,741,543—may well be associated with higher costs of brewing materials, together with a full year's National Defence Contribution, compared with a single quarter's liability in the previous year. The following analysis of profits shows that the 29 per cent. dividend, regularly paid since 1932, has been covered with a very slender margin of earnings during the past year:—

	Years to June 30 1936	1937	1938
	£	£	£
Trading profit	1,978,705	1,901,594	1,741,543

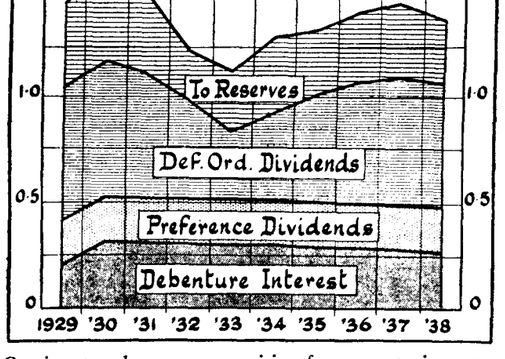
The chart below shows net profits available for dividends and distributions over the past decade:—

ARTHUR GUINNESS PROFITS—1929-38

For the first year since the depression, it will be seen, the company has been compelled to omit the usual substantial transfer to reserve.

* * *

A sidelight on the growing importance of Park Royal may be obtained from the official returns of exports of porter, beer and ale from Eire. During the company's latest financial year exports totalled 965,000 standard barrels, compared with 1,235,000 barrels in the preceding year. In the absence of any direct measure of consumption of the company's products in the British market, it is impossible to apply these returns as an accurate test of the output—quite apart from the profit-earning capacity—of Park Royal. Superficially, the latest results are disappointing for those investors who had expected the new plant to produce bumper results. But the company's experience last year (*vide* the Watney Combe Reid profits, discussed in the following note) has not been an isolated case. Guinness, with its national market, may well have been affected in greater degree by the rise in distribution costs—as distinct from the rise in brewing costs—than the majority of brewing concerns, with their defined territories and tied houses. After their further fall to 109s. 6d. (compared with the year's "high" of 125s.) the £1 ordinary stock units yield £5 9s. per cent.



* * *

Watney Dividend Reduced.—The reduction in the deferred ordinary dividend of Watney Combe Reid and Company from 19 per cent. to 18 per cent. depressed the brewery share market on the eve of the holiday. The appearance of the full accounts coincided with a further fall in brewery shares, and with the first significant setback in the beer output figures since recovery began. Trading profits reveal a setback of 2½ per cent., from £2,028,808 to £1,978,985. From the detailed profit and loss account it is evident that, in addition to increased manufacturing expenses (already charged in striking trading profits) the burden of rating and taxation has further increased. The following analysis shows that earnings for the deferred ordinary stock have been reduced from £962,480 to £887,219:—

	Years to June 30 1936	1937	1938
	£	£	£

The chart below shows the course of profits for the past decade:—

WATNEY COMBE REID PROFITS—1929-38

Consistent and generous provision for property improvements and contingencies has been a feature of the company's financial policy during the whole period.

* * *

The report records that a sum of £350,000 has been transferred from property improvement and contingency reserve in connection with further improvements to licensed properties. During the past year, however, the provision from revenue was reduced to £325,000—in fact, properties reserve and undistributed profits shared the fall in earnings equally with the deferred ordinary stockholder. By its improvements policy the company has been able to follow

OTARD'S EST. 1795
V.S.O.P.
LIQUEUR BRANDY
MATURED AND BOTTLED AT CHATEAU DE COGNAC

the shift of population into new districts, and to raise the standard of existing licensed premises to a high level. A review of the effects of this policy over the past four years is of distinct interest. In this period the company has set aside £1,325,000 to property improvements and contingencies reserve. But the reserve has, in fact, remained fairly constant. Meanwhile, the book value of properties has increased only by the modest amount of £119,000 to £14,580,254, despite the substantial expenditure on improvements. Although this policy of financing improvements from a satisfactory level of total earnings compels respect, however, it is evident that the directors do not intend to qualify their improvements programme in order to maintain a preconceived level of ordinary dividends. Hence the cut in the latest distribution, as a result of which the deferred stock units have fallen from 75s. to 70s. 3d., to yield £5 6s. per cent.

* * *

Associated British Picture.—The trading profits of Associated British Picture Corporation showed a comparatively small increase during the year to March 31, 1938, compared with the rapid strides recorded during the previous three years. Trading profits, including dividends and sundry income, increased from £1,265,829 to £1,302,778. But earnings for the ordinary capital fell quite sharply from £600,144 to £469,489, as a result, firstly, of the virtual doubling of the taxation charge, and, secondly, of the directors' decision further to increase the depreciation provision to £200,000. The board has observed its minimum assurance, made in the offer of new shares last January, that the final dividend would equal (or exceed) the 10 per cent. interim. The latest profits are analysed below:—

	Years to March 31, 1936	1937	1938
	£	£	£
Profit	926,483	1,265,829	1,302,778

Carried forward	88,998†	93,346	84,336†
Ordinary capital, end year	1,550,000	1,625,000	2,000,000

* Of which 10 per cent. interim on £1,625,000 and 10 per cent. final on £2,000,000 ordinary capital. † After writing off £39,631 issue expenses in 1936 and £11,623 in 1938.

The past year was eventful for the Corporation. Litigation regarding its interests in Metropolis and Bradford Trust is still *sub judice*. In October last year Associated British acquired a controlling holding in Union Cinemas through an associated company. This group of 165 cinemas is now managed by Associated British Cinemas. Finally, the resignation of the chairman, Mr John Maxwell, from his seat on the board of Gaumont British Picture Corporation has recently been announced. The position of the Associated British group is commonly reckoned the strongest in the British cinema industry, although the 5s. ordinary shares have not escaped the conservative investor's misgivings regarding cinema finance as a whole. The Associated British group itself has expanded at a rapid rate in recent years. Since 1933 its issued ordinary capital has been doubled, and its debenture and preference obligations, which totalled £3,900,000 in March, 1935, to-day stand at £5,367,000. The group's position, as presented in the consolidated balance sheet, appears satisfactory, although it would appear that it is at present working on a relatively small total of net liquid assets. At the present price of 13s. the 5s. ordinary shares yield 7.4 per cent. on the basis of a 20 per cent. distribution. In normal circumstances, and given the full fructification of the new capital, there seems good ground for expecting the maintenance of this rate.

Oceanic Steam Navigation.—The affairs of this company have long ceased to be of direct interest to the investor. But he will find food for thought in Mr Justice Simonds' judgment on the company's petition for sanction to a scheme of arrangement with its creditors. The scheme was, in essence, a domestic matter, largely of interest to the British and Northern Ireland Governments—the secured creditors—and unsecured banking creditors. It was proposed to allocate 2,525,784 Cunard-White Star shares out of the company's holding of 3,800,000 shares to the secured creditors, and to allot the balance to a realisation company, of which the "A" shares would be held by the secured and the "B" shares by the unsecured creditors. The company, in short, proposed to adopt the realisation company technique, for the Cunard-White Star shares at present have no market. This petition was opposed by shareholders representing the International Mercantile Marine Company, on the primary ground that it was *ultra vires* the company. Mr Justice Simonds held, in fact, that the company's memorandum included no power, as a going concern, to dispose of its whole undertaking, such as was contemplated under the scheme. Under Section 153 of the Companies Act, reconstruction of an existing company may be effected by winding up and selling the entire assets for shares in a new company, provided that proper provision is made for dissentient members. But the argument that this section conferred a new power on the company which was not specifically provided in the memorandum failed. The case, perhaps, is something of a legal *curiosum*, for the modern memorandum of association usually confers the widest conceivable powers upon the company. But it is, nevertheless, of importance in confirming the root principle that the corporate powers of a company must be defined and limited by its memorandum.

* * *

Tootal Broadhurst Lee Profits.—Reduced profits and dividends are common throughout the textile industry. Tootal Broadhurst Lee has been unable to maintain the excellent profits of 1936-37, but the total distribution on the ordinary shares has not suffered any reduction. Trading profits for the year to June 30th are, in fact, well above the 1935-36 level at £257,301, and compare with £295,661 for 1936-37 (both figures including the provision for staff bonus). The surplus available for ordinary and employees' share dividends and the staff bonus has been reduced from £190,351 to £155,573, and the ordinary distribution of 12½ per cent. (including the 2½ per cent. bonus) is covered by earnings of 16.4 per cent. Fairly considerable changes are shown in the balance sheet. Cash holdings have been reduced from £631,000 to £414,000, and debtors from £539,000 to £452,000, while stocks have advanced from £788,000 to £878,000, despite lower prices. It would seem, in fact, that the company was carrying distinctly heavier physical stocks at the end of June compared with a year ago. Appreciable additions to fixed plant and buildings during the year are presumably connected with the modernisation of the Bolton mills. The company is rightly esteemed for its progressive commercial policy. Even if it fares less favourably during the current year, it is reasonable to suppose that earnings would suffice to cover a 10 per cent. dividend, which in fact was paid from 1933 to 1936. The £1 ordinary shares, now quoted at 46s. 3d., would yield £4 11s. 6d. per cent.

* * *

The Week's Company Profits.—Bank holiday week may come to have a special significance for the investor. Although the number of company reports, analysed on page 308 of this issue, was no greater than 23 (excluding one company which issued its first report), their aggregate profits revealed a fall of 10½ per cent. from £5,356,000 to £4,801,000. This setback is due to fairly widespread reductions in net profits throughout the list, both for large and smaller companies. The total profits recorded by 1,660 companies during 1938 to date amounts to £233,105,000, an increase of 11¼ per cent. compared with the previous year's total of £204,301,000. This week's results are discussed in preceding notes and under the heading "Shorter Comments" on page 301.

THE STOCK EXCHANGES

London

SETTLING DAYS

TICKET	ACCOUNT
AUGUST 9	AUGUST 11

THE final stages of a three-week holiday account are rarely accompanied by active business. But there were special reasons for the slackness of interest in the Stock Exchange this week. A recrudescence of political nervousness, mainly arising from the Russo-Manchurian border dispute, but also based on European developments, is a faintly depressing factor. The Continent bids eagerly for gold, but appears to have sold gilt-edged. The aftermath of the railway statements still lingers, to the accompaniment of another batch of poor pre-holiday week traffics, and the latest brewery results have been followed by further falls in that group. Recorded changes suggest that while equity shares have gained a minute fraction, fixed-interest securities have declined no more significantly.

Limited interest in the *Funds* led to an initial reaction in undated stocks, although a certain demand was reported for the redeemable issues. Further selling of Old Consols on Continental account in mid-week led to renewed falls, and the market improved only temporarily. The poor response to the Stoke-on-Trent issue, which opened at 1¼-1 discount, also affected sentiment.

Japanese bonds were sold at the outset, on the disturbing news from the Russo-Manchurian border, losses of 2 points or more on successive days being recorded. Chinese issues were also reactionary, while German and Austrian bonds exhibited some nervousness. Brazilian bonds were steadier in mid-week.

★

Home rail stocks, assisted by bear covering, at first managed to hold the closing levels of the previous week, but further falls occurred in the guaranteed and preference issues. The latter were particularly depressed on Wednesday, following the publication of disappointing traffics, and falls of a point were general. Southern issues, however, held their ground, on the increased traffics. Among foreign rails, Antofagasta failed to hold an initial rise, and dealings in Argentine stocks were restricted.

Changes in prices of *industrial shares* were very small, with but few exceptions. The brewery share group, however, reacted further on the Watney and Guinness results, coupled with the setback in the June beer output figures compared with the same month of 1937. Steel shares were quiet; Hadfields reacted slightly on the maintained interim dividend, and some other leaders, including Whitehead and Tube Investments, were also slightly lower. Callender's Cable advanced smartly in anticipation of the merger terms with Crompton Parkinson. Aircraft shares were not active, although De Havilland rose, and motor shares were generally dull. Further falls were recorded in Triplex. Courtaulds again rallied, on the increase in American viscose yarn prices. Little variation occurred in shipping shares, and movements in the miscellaneous leaders, like Turner and Newall, Murex and Imperial Chemical Industries were small.

★

A sharp initial rise in Anglo-Iranian was one of the few features in the *oil share market*. The improvement, however, was not maintained, and most of the leaders were quoted a few pence lower in mid-week, Burmah in particular being affected by strike reports.

The appreciable reaction in the commodity led to reduced quotations for *rubber shares*. The volume of selling was not large, but support was withheld on the assumption that the commodity would not stage any major progress in the immediate future. Tea shares were unimpressive.

Although there was no great volume of business in *Kaffir shares*, the rush for gold brought some support for dividend paying issues, particularly from Paris. The July returns, however, did not prove of material interest to buyers. East Geduld staged a sharp rise at first, but reacted on profit-taking. Grootvlei were prominent among the developing mines. Gold Fields fell sharply on Wednesday, but Western Holdings recovered from a sharp fall. Rhokana improved, and the Burma Corporation dividend announcement was followed by a slight rally.

ACTUARIES' INVESTMENT INDEX

Little change on balance is recorded in the Actuaries' Index of 151 industrial ordinary shares during the past week. On Tuesday last, the index stood at 66·5, compared with 66·7 for the preceding week, and 67·6 a month ago. The corresponding average yields are 5·68, 5·88, and 5·72 per cent. respectively. Home rail stocks have recovered slightly from the year's low, recorded a week ago, and their present yield basis is 7¾ per cent. A substantial fall is recorded in brewery shares, following the reduced profits and dividends recently reported.

New York

IN Monday's session, Wall Street showed a slight reaction on a smaller volume of business. While the Far Eastern situation exerted some influence over dealings, the market rallied on Tuesday, although turnover remained comparatively small, judged by recent standards. Stocks improved further in mid-week, but the close was rather easier. In short, it has not been a significant week in Wall Street, except that the pause itself may have some bearing on the future prospects of the market. *Iron Age* states that steel activity has reached 40 per cent. of capacity this week, compared with 37 per cent. a week ago. It forecasts a higher rate in the autumn, accompanied, however, by a warning that third-quarter steel profits may be lower than for the past quarter, despite higher output. Perhaps the main feature of the week's dealings is the lack of public support, which has been awaiting some clearer evidence of setback than has yet occurred. By converse, professional dealing is sufficient broadly to maintain recent prices, and little stock has come on offer.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values, calculated on closing prices (1926 = 100).

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

Paris

At the beginning of the month the Bourse maintained the brighter conditions which prevailed in June. This promising opening, however, was followed by a heavy tone. Kaffirs were a firm feature almost throughout the month, and weakness in Rentes and local industrials was followed by some recovery. Business, however, was very quiet during the second fortnight, though at the end of July sentiment was encouraged by improved political prospects, hopes of a settlement in Czechoslovakia, and by recovery on Wall Street.

During July, the Bourse displayed no strong will of its own, but was content to follow Wall Street's lead. Outside influences, however, had more effect on sentiment than on prices, which generally moved within narrow limits. The first few days of the month again showed the improved prices and wider interest that had been evident during the latter part of June, but this impetus was soon lost, and turnover shrank, though prices continued reasonably firm. During the second part of the month the Bourse was in listless mood. Rubber shares were active most of the time. Quotations hardened in the expectation of the maintenance of the 45 per cent. quota, but some weakness resulted from the postponement of the Committee's decision. Philips Lamps reacted on disappointment with the dividend and report.

Berlin

Securities in July were weaker than in any corresponding period during the past five years. The advance of fixed-interest securities, which had reached their highest levels in March-April, was not resumed, and selling predominated, resulting in appreciably reduced quotations. The share market was irregular at first, and in the middle of the month became very weak. Indeed, on July 16th and 18th semi-panic conditions prevailed, with losses on single days of seven points or more. All groups suffered, but stable bank shares were least affected, although a temporary drop occurred in Reichsbank to 185. Industrials, however, were severely depressed. The collapse began with selling for Jewish accounts, and after prices had already fallen considerably the general public and speculators turned sellers. Owing to the expulsion of Jewish traders and members, against which no provision had been made, the Bourse functioned badly; and inconsiderable offers frequently led to heavy declines. Four days of substantial recovery followed the collapse, but prices subsequently sagged in a very dull market. Foreign bonds were generally weak. Scarcely any dealings were recorded in certificated dollar bonds. The nominal quotations were mostly unchanged, although Young loan advanced while Dawes loan reacted. The reichsmark tranche of Young loan remained virtually unchanged. The official index (1924-26 = 100) for shares for June was 110.49, as against 112.71 for May; bonds 99.98 against 100.03.

Canada

The Canadian stock markets, after a steady drift downward for several months, suddenly woke into activity in sympathy with the American markets in the third week of June. All the major groups of stocks have participated in the improvement. Farm stocks have been aided by the excellent crop prospects and lately there has been a lively boom in the stocks of aircraft and equipment companies likely to secure a share of British Government aeroplane contracts. Newsprint stocks have also risen on the improved outlook. Mining shares have been active and a strong upward movement in base metal issues provided a feature. Bonds have been firm, although prices have shown relatively little change. Except in gold shares the market became more irregular late in July under Wall Street's influence. The Bureau's "Investors'" Index, which stood at 94.7 on June 17th, rose to 103.4 for June 30th and to 107.0 for July 7th, but by July 14th had fallen slightly to 105.4. The index of the price of long-term Dominion bonds for the week ending July 14th was 117.8 as compared with 118.2 for the corresponding week of June and 115.0 a year ago.

PUBLIC OFFERS

Luton.—Issue of £500,000 3½ per cent. stock at £98½ per cent. Redeemable at par October 1, 1964. Proceeds for repayment of over £200,000 of short-term debt, and balance for capital purposes. Estimated population, 95,000. Rateable value, £684,570. General rate, 12s. 4d. in the £. Net debt, £2,456,275; per head, £25 17s. 1d.

UNIT TRUSTS

Cornhill Trust.—This Trust is making a further issue of 150,000 4 per cent. redeemable guaranteed debenture units, 1952 (to rank *pari passu* with existing 1,240,000 such units) at 21s. 3d. free of commission and stamp duty.

Industry and Trade

Reduced Coal Consumption in Shipping.—The fall in British coal exports and the growth in the substitution of oil for coal in ships is viewed with alarm by the coal-mining industry. For example, only 47 per cent. of the world's merchant marine tonnage now depends entirely on coal, against 89 per cent. in 1914. Moreover, the tonnage of steamers using coal has declined from 43,860,000 tons in 1914 to 31,579,000 tons in 1938. Coal has thus lost ground to oil both absolutely and relatively, though the change has been less marked in the British than in the foreign mercantile marine. A conference of coalowners, shipowners and others held in February, 1937, recommended that a committee should be set up representative of the shipping, coal and marine engineering interests "to examine the possibility in the national interest of obtaining an increased use of coal for bunkering purposes, and to formulate proposals designed to secure that object." The Committee, which was subsequently set up under the chairmanship of Sir Alfred Faulkner, has now issued a report. From a technical point of view, the Committee report, coal can be used by a substantial proportion of the mercantile marine fully as well as oil. In many cases, consequently, the relative price of coal and oil is the major consideration determining their use. "It is for the Central Council of Colliery Owners and the District Executive Boards concerned (the Committee points out) to consider whether the coal bunkering trade is of such importance to them and to the country that it must be maintained and increased, even if to do so lower prices have to be charged for coal for bunkers than at present." However, stability of price is in the Committee's view as important as reductions of price. As matters stand now, the Committee is convinced that the drift away from coal will continue.

* * *

The Bacon Industry Act.—On August 4th the old Bacon Development Board was succeeded by the new Board, set up under the Bacon Industry Act passed last month. The new Board has been enlarged to include five (instead of three) independent members; Lord Portal and Sir Francis Boys remain, and have been joined by Sir James Ross, Sir Nigel Campbell and Mr Farrow. The provisions of the new Act which relate to the regulation of sales and purchases of bacon pigs come into force on October 1st, but the start of the new contract period has been delayed until December 1st. The gap will be covered by temporary regulations to be issued shortly by the new Board. It will thus have taken almost two years to reconstruct the pig marketing scheme, which came to grief in January, 1937, largely because the price the curers offered for their supplies was insufficient to attract the requisite number of pigs. Under the new scheme the Government has guaranteed, for three years, that the price of bacon pigs shall be adjusted to differences in the cost of feeding stuffs and that the curer shall receive a standard price for his output of bacon. For the three years, therefore, pig producers and bacon curers are assured a satisfactory price for a certain number of pigs, increasing from 2.1 millions in 1939 to 2.5 millions in 1941.

* * *

The Rayon Outlook.—The heat wave has come none too soon for the rayon industry, whose stocks of yarn have been accumulating in recent months. Sales of staple fibre have been affected by the fall in the prices of cotton and wool, and production of all types during the twelve months ended in July was lower than in the preceding season. The outlook, however, has improved. The demand and, consequently, the production of rayon appear to have developed into a two-year cycle, and the industry has now reached the end of the bad year. The orders which are being booked both in this country and in the United States for spring deliveries reveal a better demand, particularly for filament rayon, the bulk of which is used in weaving. Contrary to expectation, the consumption of rayon in the stocking trade accounts for barely 10 per cent. of the total output in this country and for only 5 per cent. of the production in the United States; but even in this relatively unimportant section the outlook has improved, as the various price agreements have been working better. The export trade, however, remains very depressed, and the fortunes of the industry are dependent on the conditions in the British and American markets. A general increase in commodity prices would give an undoubted stimulus to the more hopeful sentiment now prevailing, but any improvement in the industry will now have little effect on this year's financial position of the companies concerned.

* * *

Still Too Much Cotton.—The new raw cotton season opened inauspiciously this week. Although the precise yield of the new crops is not yet known, it is already certain that total supplies this season will again be plentiful. According to the United States Department of Agriculture, the carry-over of American cotton on July 31st reached the high level of 13,500,000 bales, against 6,200,000 bales a year ago. Although some 7,000,000 bales of this total is held by the United States Government, against only 1,500,000 bales a year ago, the quantity available for the market will exercise a considerable pressure on prices. In 1937-38 world consumption of American cotton did not exceed 11,100,000 bales, a reduction of 2,000,000 bales on the year. In spite of its substantial reduction from last year's record figure, the new American crop will probably be sufficient to meet requirements at last season's level. Consequently, a substantial increase in consumption in the next twelve months would be necessary for a reduction in the carry-over. The position in non-American cotton is not much different. The carry-over of "outside growths" has risen from 7,100,000 bales on July 31, 1937, to 10,000,000 bales at the end of the past season. World consumption of non-American cotton last season amounted to 15,250,000 bales, a decline of 2,650,000 bales on the year. The new "outside" crop will almost certainly exceed 15¼ million bales, so that only a

major improvement in consumption can prevent the market for "outside growths" from being glutted during the current season. So far there is little evidence of a rise in consumption in the leading countries. The market, however, is hopeful that the maintenance of the recent improvement in commodity prices will help to raise the purchasing power of overseas countries and that as a result the export market for cotton goods will show an expansion. Under the influence of these hopes cotton prices have been marked up in the past two months. The uncertain cotton price movements of the past fortnight, however, seem to suggest that the majority of operators take the view that prices have advanced sufficiently for the time being and that more tangible signs of an improvement in demand must be available before a resumption of the upward movement is justified.

* * *

The Empire's Wool Cheques.—Australia, New Zealand and South Africa, the three large wool exporting Dominions, have now published their wool statistics for the 1937–38 season, ended on June 30th. The returns show an appreciable decline in receipts between 1936–37 and 1937–38. According to the National Council of Wool Selling Brokers of Australia, that Dominion's sales during the season reached 2,718,460 bales at an average price of £15 13s. 7d. per bale, producing an income of about £42,500,000, compared with £60,550,000 in 1936–37. In New Zealand the season's sales amounted to 629,671 bales at an average price of £14 6s. 9d. per bale, giving a total return of £9,028,000, against £15,345,000 in the preceding season. South Africa's disposals in 1937–38 reached only 731,486 bales at an average price of 9¼d. per lb., yielding, at the basis of 324 lb. per bale, an income of some £9,400,000, against £14,710,000 in 1936–37. Moreover, the quantity of wool carried over into the new season was substantially higher than a year ago. In Australia stocks on hand on June 30th were 235,701 bales, against 47,069 bales a year earlier. In New Zealand the carry-over totalled 44,840 bales, against last year's figure of 15,198 bales, and in South Africa unsold stocks, at 26,790 bales, compare with 11,912 bales at the end of the previous season. Although the new wool clips are believed to be lower than a year ago, at least in Australia and New Zealand, the increased carry-overs will keep offerings at a high level in the early months of the season, which, as experience shows, are usually of considerable influence on the price trend in the remainder of the season. In 1937–38 the sharp decline in the Dominions' wool cheques did not create serious difficulties, for most of the farmers found themselves in a strong financial position after the preceding record season. The position will be much more difficult in 1938–39, because by now the greater part of the reserves accumulated by the farmers in 1936–37 have been exhausted. The immediate outlook of the wool market, therefore, does not provide a favourable indicator for the purchasing power of the South African, New Zealand and Australian farming community.

Three Years of the Steel Pact.—The agreement between the Continental Steel Cartel and the British steel industry has now been in operation for three years. The understanding provided for the limitation and regulation of steel imports into this country, and for the participation of Great Britain in the total steel exports of Cartel countries on the basis of her exports in 1934. The first clause served to restrict imports into Britain so long as domestic supplies were plentiful in relation to demand; but during the period of steel shortage last year, Britain's purchases abroad exceeded the limit fixed by the agreement. Since the beginning of this year, however, efforts have been made to check the heavy flow of steel imports into this country. Owing to deliveries under old contracts there was some delay in the reduction of imports, but they have now been brought down to a low level.

BRITISH IMPORTS OF CARTEL STEEL PRODUCTS
(in Tons)

	Average 1936	Average 1937	Jan., 1938	March, 1938	June, 1938
Semi-finished products	52,784	52,462	118,160	82,795	15,097
Bars, angles, etc.	16,536	24,490	39,845	36,475	2,291
Girders, etc.	5,783	5,889	10,881	15,928	873
Hoops and strip	4,562	5,982	4,993	13,160	1,257
Plates and sheets	3,605	4,284	14,247	13,841	2,174
Wire products	3,880	3,438	2,004	2,524	2,757
Total	87,150	96,545	190,130	164,723	24,449
Total steel imports (including non-licensed)	123,555 tons	169,955 tons	308,735 tons	276,785 tons	60,911 tons
Cartel products as percentage of total imports	*71*	*57*	*62*	*60*	*40*

British exports have been subject to similar variations, the application of the agreement having been closely connected with domestic and world demand for steel. Recently, the European Steel Cartel tried to obtain certain alterations of the export agreement which would have resulted in a weakening of the British position on Empire steel markets. The proposals have, however, been declined by British producers.

Land Settlement Inquiry.—In his annual report published last autumn the Commissioner for the Special Areas drew attention to the high costs involved in the settlement of unemployed families on the land. The settlement of one family involves an average expenditure of about £1,250, of which about £800 should either yield a reasonable return or be recoverable, leaving about £450 per family as the amount of loss to the State. Further, the prospects of these settlements have been affected by the sharp rise in the cost of feeding stuffs and of equipment in the past two years, which has reduced the earnings, and therefore the expected repayments of loaned capital, of the settlers below the original estimates. The Commissioner foreshadowed in his last report a comprehensive review of these experiments in land settlement and he has now appointed a committee to report on the working of the schemes. The committee consists of Sir William Dampier, previously Secretary of the Agricultural Research Council, Mr Robert Cobb, a former president of the Chartered Surveyors' Institute, and Mr Walter R. Smith, a member of the Herring Industry Board, who was Parliamentary Secretary to the Board of Trade in the last Labour Government.

Shipping Freights Lower.—The month of July brought a renewed fall in tramp shipping freight rates. *The Economist* index, which stood at 96.1 (1913 = 100) in June, declined to 95.2 in July, which compares with 132.8 a year ago:—

The Economist INDEX OF FREIGHT RATES
(1898 – 1913 = 100)

	Average, 1913	July, 1937	April, 1938	May, 1938	June, 1938	July, 1938

Uncertain Trend of Wholesale Prices.—In contrast to the steady rise in wholesale prices during June, movements during July have been rather contradictory, and the latest figures, which relate to August 3rd, still show no definite trend. *The Economist* index of British primary products rose by 0.6 points during the past fortnight, due to increases in the prices of rubber, copper, tin and wool, which more than counterbalanced declines in cotton, maize and bacon; the complete index showed a slight fall of 0.3 points to 119.2. The index of primary products in the United States fell from 128.6 to 127.1, due to reductions in the prices of grains and cotton. French wholesale prices are again a little lower than a fortnight ago, while in Germany wholesale prices show an insignificant rise:—

The following table shows the movement of the various groups comprised in *The Economist* index of British prices:—

The Economist INDEX
(1927 = 100)

	Sept. 18, 1931	July 28, 1937	July 20, 1938	Aug. 3, 1938
Cereals and meat	64·5	92·6	83·6	82·9
Other foods	62·2	67·2	58·1	57·5
Textiles	43·7	70·7	53·4	53·5
Minerals	67·4	108·6	93·1	93·1
Miscellaneous	65·8	85·6	75·3	75·2
Complete index	60·4	84·7	72·2	72·0
1913 = 100	83·1	116·5	99·3	99·1
1924 = 100	52·2	73·1	62·4	62·2

The reduction in grain and bacon prices was responsible for the fall in the first group, while the fall in the prices of sugar and coconut oil outweighed, in the group of other foods, an increase in tea and coffee prices. Cotton was cheaper, but wool dearer, while metal prices were unchanged on balance. In the miscellaneous group, the price of linseed oil fell, while that of rubber continued to rise. In view of the rapid advance of prices in June, the uncertain trend of recent weeks is scarcely surprising. Consumers' stocks of raw materials have been appreciably reduced since the collapse of the boom at the end of March last year. Moreover, there are now more definite indications of an early expansion of business activity in the United States. Nevertheless, there are as yet no signs of a large-scale re-stocking movement by consumers.

* * *

The Canadian Textile Industry.—In January, 1936, the Government of Canada appointed Mr Justice Turgeon to investigate conditions in the Canadian textile industry. The origin of this inquiry was the sudden closing of a rayon mill of the Dominion Textile Company at Sherbrooke, Quebec, on the plea that it could not be operated profitably in face of the competition from Japanese imports. In his report, published a few weeks ago, Mr Justice Turgeon goes beyond this immediate incident and reviews both the past history and the present structure of the textile industry. He finds that the hours of labour are distinctly longer in Canada than in textile mills in other countries except China, India and Japan, and points out that the capital of most of the companies has been inflated by the issue of shares based on valuations made at times of high prices and by the unnecessary capitalisation of intangible assets such as "goodwill." He considers that the various trade associations which exist in the textile industry are primarily devoted to the maintenance of the protective tariff, for "whatever may be the expectation of others, those engaged in the industry assert quite candidly that they need a continued policy of protection in order to remain in business." Another example, in fact, of the tariff infant that refuses to grow up. Mr Justice Turgeon suggests that greater use should be made of the provisions which enable duties to be reduced by an Order-in-Council if the price of any article subject to protection is found to be unduly increased by agreement among those who manufacture it. He also urges that there should be an amendment of the existing law to make it clear that the managers of factories must, in such questions as the giving or withholding of employment, consider the interests of the community as well as those of the shareholders. That such a sense of responsibility to the community is desirable is undoubted, but it is difficult to see how it can be enforced by law.

INDUSTRIAL REPORTS

BUSINESS in most centres is still affected by holidays, and work in many factories and collieries remains suspended. The coalfields generally have had an exceptionally quiet week; exports continue to decline and the home demand has not yet revived. The London Iron and Steel Exchange has been closed on account of the holidays. The prospects of a large carry-over of raw cotton and of good crops this season are a bearish influence in the cotton trade. Wool prices remain firm, and spinners are hoping for a marked improvement in orders in September.

Coal

Newcastle-on-Tyne.—Shipments of coal and coke from the Tyne continue to fall below the levels of last year. For the seven months of this year there is a decrease of 569,513 tons, the total being 7,357,814 tons. The coal markets in this area remain quiet. Northumberland steam collieries continue to work under a system of curtailed production, whilst in Durham there is considerable idle time. There is little new trade but prices are not being reduced. Patent oven coke continues to receive more support from the export section, but inland demand is very slow.

★

Cardiff.—Nearly all the South Wales miners have taken advantage this week of the recently inaugurated system of one week's holiday with pay. The docks resumed work on Tuesday, but the stocks on the railway sidings are very heavy, and it is not expected that shippers will be greatly inconvenienced by the stoppage. Moreover, the collieries will be better supplied with empties next week than they have been at any period during the past twelve months. Shipments last week totalled 366,700 tons, compared with 400,600 tons the previous week, and 493,384 tons in the corresponding week last year. Market operations are very restricted and prices are nominally unchanged.

Iron and Steel

Sheffield.—Business in the iron and steel market has been all but suspended this week. Inquiry for pig-iron has been confined to insignificant parcels, and forward buying is entirely absent. Forge and foundry are neglected, and hematite requirements are easily satisfied. The finished iron position is unchanged.

There has not been much doing in acid and basic steel billets, but business in stainless steel sheets keeps up well. Prices have undergone no change.

★

Middlesbrough.—The position on the local iron market is quieter than recently, and it is not expected that users will show much interest until the autumn. Stocks of iron acquired previously have not yet all been liquidated. East Coast hematite pig iron is in no better request, export trade having practically vanished, and it is almost certain that a further furnace will be put out of operation within the next week or two. Prices are maintained at the official quotations which are understood to apply until the end of the year. Foreign ore is almost unsaleable, as the works have big stocks and are curtailing deliveries under existing contracts. Good Durham blast-furnace coke is offered at 27s. 6d. per ton, free on trucks at the ovens. There is no expansion of demand for semi-finished steel, whilst producers of manufactured steel report that specifications are coming in slowly. Heavy steel scrap is freely available at the official quotation.

★

Glasgow.—At several of the steel works repairs have not yet been completed, but most of the plants in this district are again operating and a good start has been made. Order books are fairly well filled and work on hand is sufficient to ensure regular employment for some little time, but new bookings are light. It is generally believed, however, that stocks in the hands of manufacturers have now been considerably reduced and that there will be a steady demand for all classes of material within a very few weeks.

★

Cardiff.—Operations are this week suspended in the tinplate industry and there has been no meeting of makers on the Swansea Metal Exchange. It is reported that the Llanelly manufacturers are contemplating the erection of a strip mill for West Wales. The undertone of the market has improved slightly and shipments at Swansea last week totalled 5,942 tons, compared with 4,217 tons the previous week, and 8,515 tons in the corresponding period last year. Production was also better before the holidays, but the rate of 48.95 per cent. of capacity compares unfavourably with that of 78.32 per cent. a year ago.

Textiles

Cotton (Manchester).—Operations have been somewhat affected by holiday influences, and spinners and manufacturers have expressed disappointment at the failure of demand to improve. Minor fluctuations have occurred in raw cotton prices, but sentiment remains bearish, as traders are impressed by the huge supplies which will be available during the next twelve months. On Monday next the United States Government will issue the first estimate of the crop for 1938-39, and this is expected to be about 11,500,000 bales. Spinners of American and Egyptian yarns have experienced a dull demand. There has been some talk of organised short time in the American section, but there are no indications of any official move by the Master Spinners' Federation. Inquiry in cloth has been of fair extent, but only a restricted business has been done. A small turnover has taken place for India, with scattered sales for Egypt, South America, the Continent and the Dominions. Moderate buying has taken place in home trade fabrics.

★

Wool (Bradford).—The wool trade has now entered upon the quietest period of the year, holidays greatly interfering with the usual routine of business. Overseas supplies are now arriving for the next series of London sales, and a fair quantity of Queensland new clip, comprising autumn shorn wools, should be available. The carry-over from the last series was considerable, and a larger quantity of wool than usual will be available for the September sales. Good weather is reported from Australia and South Africa and the new season is opening with every prospect of a good clip of wool. Manufacturing conditions in the West Riding are, if anything, slightly better, and by the end of September there should be a marked improvement in the running of machinery. After the holidays some mills are starting to work full time. Taking the wool situation as a whole and considering the period of the year, the outlook is more encouraging than at any time this year.

THE COMMODITY MARKETS

THE August Bank Holiday restricted business in many of the British markets during the past week, and there has been no definite trend. Cotton prices are lower, on the expectation of a large crop, and grain prices were also reduced for the same reason. Tin and copper prices were a little higher, due largely, however, to the small scale of offerings; the United States domestic copper price was raised to 10¼ cents per lb. The advance in rubber prices was checked, but was resumed later in the week. Moody's daily index of commodity prices in the United States stood at 146.8 (December 31, 1931 = 100) on Wednesday last, compared with 148.5 on the previous Wednesday.

Metals

Copper.—Copper fluctuated within narrow limits this week and closed at £41 13s. 9d. per ton, a net gain of 2s. 6d. on the week. The market was generally quieter, due partly to the holidays, but supported also by the greater reserve of both sellers and buyers. In the United States the domestic price has been again raised to 10¼ cents per lb., but following the new increase demand has slowed down. Nevertheless, the United States July turnover, at 122,812 tons, was the highest monthly turnover since October, 1936. The great bulk of these large sales, however, went into consumers' stocks or was exported.

★

Tin. — Tin closed £1 5s. higher at £195 5s. per ton. The demand, however, has remained poor and the present price level is largely dependent on the maintenance of the very limited offerings. The July statistics, published on Tuesday, showed the expected rise in stocks. According to Messrs A. Strauss & Company, Limited, the visible supply rose by 692 tons in July to 25,043 tons and as the Arnhem carry-over, which is not included in the Strauss figures, advanced simultaneously by 1,183 tons to 4,458 tons, the total advance in world stocks amounted to 1,875 tons. Part of this increase may be accounted for by the first intake of the buffer pool, and this view is supported by the rise in new supplies in July by 1,710 tons to 8,758 tons in spite of the lower quota. Tin deliveries in July, at 6,854 tons, showed a decline of 512 tons on the month, and were at the lowest level for years.

★

Lead and Spelter.—Lead declined by 13s. 9d. to £14 12s. 6d. per ton, while spelter declined by 6s. 3d. to £13 17s. 6d. per ton. The turnover of both metals on the L.M.E. was small this week, owing to the reserve shown by sellers. Home warehouse stocks of lead declined in July from 9,394 tons to 8,996 tons. Since the end of March these stocks have declined by over 3,000 tons. On the other hand, British stocks of zinc continued their advance last month and reached 24,574 tons on July 31st, against 23,160 tons a month before. No new reports of the progress in the zinc discussions have been received this week, although it is learned that the endeavours to form a cartel are being continued.

Grains

DURING the last week, prices for all grades of wheat have fallen by 3d. to 1s. 3d. per quarter. The absence of demand during the holidays, good weather for the European harvesting and selling pressure from Russia were all responsible for the weak market. Yields in North America are reported to be lower than was expected and the production in both the United States and Canada may be lower than the July estimates. Broomhall's second estimate of the European wheat crop is 209 million quarters, which compares with 192½ million quarters last year. The maize market has been quiet; a fair trade has been done in feeding barley, but at slightly reduced prices.

Other Foods

Provisions.—In view of the recent high prices of bacon, the Board of Trade granted at the end of last week an extra allocation of imports. As a result, prices were immediately lowered by 5s. to 7s. per cwt., and the market was temporarily disorganised. After the holiday, conditions were steadier and on Wednesday, English and Danish were quoted at 103s. per cwt. The markets for other provisions have been dull and prices unchanged.

Colonial Produce.—The recent rise in sugar prices was reversed on Tuesday, when prices were reduced by 1½d. per cwt. for all varieties. After a brisk sale at the end of last week, the tea auctions closed until August 8th. The demand for cocoa and coffee has been quiet.

Miscellaneous Commodities

Oils and Oilseeds.—Business remains restricted after the holidays. Encouraging prospects for the new linseed crop in the United States and favourable weather in the Argentine have helped to depress prices of all varieties of linseed. The price of Egyptian cotton seed continues to fluctuate; £6 12s. 6d. per ton has been quoted for September shipment of new crop to Hull, while October-December deliveries of the new crop are quoted at £6 11s. 3d. per ton.

★

Rubber.—The market was closed from mid-day on Friday until Tuesday, when prices were about ⅛d. per lb. lower than before the holiday. Some of the fall was recovered later and on Wednesday the market was steady, with standard sheet on the spot quoted at 7¾d. per lb. It is hoped that the American motor trade will operate on a considerably increased scale in September.

COMPANY MEETING

TEA CORPORATION, LIMITED

DIVIDEND OF 7 PER CENT.

The ordinary general meeting of the Tea Corporation, Limited, was held, on the 4th instant, at 31-32 Budge Row, London.

Mr H. Milner Willis (the chairman), after expressing regret at the death of Mr F. P. Robjent, who had been chairman for many years, said that the profit for the year under review amounted to £11,228, or nearly double that for the previous year, and they recommended a dividend of 7 per cent., less tax. It was a matter of much gratification that the Tea Export Control Scheme, which had completed its first term of usefulness on March 31st last, had been extended for a further term of five years to 1943. They fully realised the difficulties encountered by those controlling the scheme, and their thanks were extended to the various committees which had worked so assiduously to make it the success it had now become. Its continuance was an absolute necessity, and that fact had been fully appreciated, and beneficial results should be forthcoming.

Much important spadework was also being done by the International Tea Market Expansion Board, with the object of increasing tea drinking throughout the world, and encouraging progress was reported during the past year.

With regard to rubber, in common with most producers, they had been feeling the effect of the depression which had been ruling during the past few months. The International Rubber Regulation Committee, to whose past efforts the rehabilitation of the industry was largely due, had again had to encounter an unexpected blow to the industry, due mainly to the depression which had ruled in the United States and had had a serious effect on rubber absorption there. Stocks had risen rapidly, with the result that exportable quotas had had to be greatly reduced, and for the present quarter were only 45 per cent.

The position showed how essential was regulation, and the fact that the scheme was being extended for a further five years would give confidence that, with the revival of trade activity and considerable reductions in stocks which should result from the 45 per cent. exportable quota, a return to rubber prosperity seemed assured. With regard to the current year's prospects, it was impossible to forecast with any degree of reliability what the results were likely to be. Tea, of course, was their principal commodity. The statistical position of that product was sound.

The report and accounts were unanimously adopted.

SHORTER COMMENTS

Company Results of the Week.—Brewery company results show a uniform reduction. FRIARY HOLROYD reports slightly reduced net profits of £136,205, compared with £139,162 in the previous year, and the 13 per cent. dividend is maintained with the customary generous margin. Other brewery companies, including ALL SAINTS, COLCHESTER, and SHOWELLS all suffered some reduction in net profits during the year to June 30th, though not on a sufficient scale to affect ordinary dividends. KELSALL AND KEMP, like other textile concerns, have experienced difficult trading conditions during the past year. Profits have been reduced from £75,670, to £48,960, and the ordinary dividend is cut from 5 per cent. to 3¾ per cent. ANGLO-ALPHA CEMENT has quickly achieved a high level of profits, which amounted last year to £104,130, compared with £91,177 for the preceding year. JOHN GREENWOOD MILLERS reveals a sharp reduction in profits from £52,399 to £22,574, and the 5 per cent. ordinary dividend (against 12 per cent. for the preceding year) is not fully covered by earnings. GABRIEL WADE AND ENGLISH, the timber merchanting concern, have been affected by reduced building and furnishing activity. Profits fell last year from £109,196 to £82,726, but the 8 per cent. dividend has been maintained without difficulty. Reduced net revenues are shown by the latest investment trust reports, SECOND SCOTTISH WESTERN, in particular, showing a significant fall.

Tea Corporation.—At the annual meeting on Thursday, Mr H. Milner Willis emphasised the importance of the tea export control scheme, which has been extended to 1943. The statistical position of tea, which is the company's principal commodity, was sound, but the chairman was unable to forecast with any degree of reliability the results of the rubber business for the current year.

Ranks and John Greenwood Millers.—Ranks Limited offer to purchase for cash the 5s. ordinary shares of John Greenwood Millers at 6s., or alternatively to exchange one ordinary share of 5s. in Ranks Limited for every three ordinary shares of John Greenwood Millers, at the shareholders' option. Ranks Limited also undertake to purchase any preference shares in the latter company at 20s. up to July 31st, 1939. It is stated that the directors of John Greenwood Millers have accepted the offer, which they recommend to shareholders.

Qualcast, Ltd.—This company has purchased control of Follows and Bate, Ltd., of Gorton, Manchester. The present board of Follows and Bate will remain in office with the addition of two Qualcast directors, and the chairman of Follows and Bate, Mr W. H. Barnes, joins the Qualcast board. Both companies will operate as separate entities, technical resources being mutually available. The deal has been financed out of Qualcast's own resources.

The Course of Wages

In the following charts we show the net changes in full-time weekly wages in certain industries from 1928 to the end of June of this ye as estimated by the Ministry of Labour. The group designated "Engineering, etc." covers all metal trades other than the manufacture iron and steel. Pillars above the zero line indicate increases and pillars below decreases. Where the changes were nil or negligible, there ar of course, no pillars. It will be seen that all the industries shown below, except the textile industry, registered net increases in the fir half of this year. That we have now reached the peak may, however, be indicated by the fact that for the first time the June returns for industries showed a net decrease.

Finance

GOVERNMENT RETURNS

For the week ended July 30, 1938, total ordinary revenue was £13,035,000, against ordinary expenditure of £23,753,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £123,508,000, against a deficit of £82,372,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On July 29th, applications at £99 17s. 5d. per cent. for bills to be paid for on any day except Saturday of the following week were accepted as to about 58 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications for bills to be paid for on Saturday at £99 17s. 6d. per cent. and above were allotted in full. £35·0 millions of Treasury bills are being offered on August 5th.

CENTRAL AND SOUTH AMERICA

THE BANK OF LONDON AND SOUTH AMERICA, LTD., issues the following details relative to quotations for certain of the South and Central American exchanges. All these exchanges, with the exception of Paraguay, are related to the United States dollar, and the approximate sterling rates may be obtained by applying the dollar-sterling exchange rate.

*Bolivia** Banking exchange rate on London was 140 bolivianos per £ on June 22, 1938.

*Colombia.** Sight selling rate on New York was 180·05 pesos per 100 U.S. dollars on June 25, 1938. This rate applies to holders of permits buying in the "open" market.

Ecuador. Sight selling rate on New York was 14·80 sucres per U.S. dollar on June 24, 1938.

Guatemala. Sight selling rate on New York is maintained at one quetzal per U.S. dollar, but a commission of 1 per cent. is charged by the Central Bank for the sale of drafts.

*Nicaragua.** Sight selling rate on New York was fixed by the National Bank at 5·52$1_2$ cordobas per U.S. dollar (including 10 per cent. tax and 1_2 per cent. commission) on July 9, 1938.

Paraguay. Exchange is quoted on Buenos Aires; the sight selling rate was 70·75 Paraguayan pesos per Argentine "free" paper peso on June 22, 1938.

El Salvador. Sight selling rate on New York was 2·51 colones per U.S. dollar on June 29, 1938.

Venezuela. Sight selling rate on New York has been maintained at 3·19 bolivares per U.S. dollar since April 27, 1937.

* Exchange controls are operative in these countries.

‡ Tax free. (*a*) On larger capital.
§ Quarterly.

GAS LIGHT AND COKE COMPANY.—Interim ordinary dividend unchanged at £5 12s. per cent. per annum.

TRUST OF INSURANCE SHARES.—Distribution of 3·5177d. per unit, tax free, making 6·3592d. net for year.

HECTOR WHALING.—Results for the year to July 31st do not justify payment of interest on 8 per cent. participating redeemable unsecured debenture stock. Payment on the 5½ per cent. secured notes has been approved.

BURMA CORPORATION.—Final dividend is 4 annas per share (holders on London register being paid at rate of 1s. 5²⁹/₃₂d. per rupee, or 4·4765625d. per share), or 2½ per cent. free of Burman and British tax. This makes for year to June 30, 10 annas per share, or 16¹⁷/₁₈ per cent. tax free, against 18½ annas, or 12¹¹/₁₂ per cent. tax free for 1936–37.

BANK INSURANCE AND FINANCIAL SHARES TRUST.—Distribution payable August 15th of 3·4d. per unit, tax free (same rate as previous distribution).

INTERNATIONAL NICKEL COMPANY OF CANADA.—Quarterly dividend of 50 c. per share of common stock, payable September 30th. This is the same as for first and second quarters of 1938 and for each quarter of 1937, though in last quarter of 1937 25 c. extra was paid.

GENERAL MOTORS CORPORATION.—Quarterly dividend on common stock payable September 12th, is 25 c. per share (same as for first and second quarters). For third quarter of 1937 $1 per share was paid.

SHORTER COMMENTS

(Continued from 301)

Unit Trust Yields.—Fifteen Moorgate Unit Trusts, Ltd., announce that the published yields on all the Trusts they manage will in future be certified by their auditors, Messrs Brown, Fleming and Murray. (A note on Unit Trust Yields appeared on page 236 of *The Economist* of July 30th.)

John Greenwood Millers (1934).—For year to June 25, 1938, total income is £33,871 against £70,617. Tax and N.D.C., £10,624 (£17,280); expenses, £673 (£938); preference dividend, £14,117 (£14,518); 5 per cent. ordinary dividend, £12,906 (£31,719, or 12 per cent.). Forward, £2,958 (£7,407). Operating companies' combined profits, £24,355 (£58,369).

John Ismay and Sons.—Trading profit for year to March 31, 1938, is £1,251 lower at £43,837. Depreciation, £2,999 (£2,912); tax and N.D.C., £3,000 (£1,000). Ordinary dividend, 45 per cent. Carry-forward, £5,782 (£7,924).

William P. Bonbright and Company.—A declaration of solvency has been filed by this discount market firm, it having been announced on July 14th that the business would be discontinued.

Richard Thomas and Company.—A new private company, "E.V. Finance and Holding Company, Ltd.," has been formed to hold securities in Richard Thomas and Company. Nominal capital is £110 in £1 shares (20 "A" and 90 "B" shares). Representatives of the Bank of England are on the board. Objects include original subscription of £5,500,000 (or any lesser amount) 4½ per cent. redeemable prior lien mortgage debenture stock of Richard Thomas.

Brazilian Warrant Agency and Finance Company.—The scheme of arrangement submitted to the general meeting on July 27th was passed on a poll, 1,001 shareholders representing 1,448,491 votes being for, and 7 shareholders representing 1,000 votes being against the scheme.

Celanese Corporation of America.—Net profit (partly estimated and subject to audit) for second quarter of 1938, after charges, is $426,050 (against $114,275 in the first 3 months). Consolidated earnings and income for year to June 30th are $3,220,096; depreciation $1,338,029, and after this and other charges, net income is $1,557,446.

Radio Corporation.—For quarter to June 30th last, net profit is $1,087,000 or 2c. per common share (against $2,404,000 or 11c. per share a year ago). Half-year's earnings are thus $2,524,800 (7c. per share) against $4,647,386 (22c.) a year ago.

Man Power

NOW that Parliament has gone into recess the affairs of the State—and in particular the great problems of international diplomacy and re-armament—are in the sole charge of the executive. For three months neither stimulus nor restraint can be exercised across the floor of the House. In the circumstances, though we cannot hope to be free from recurring crises, no important change in the general direction of policy is to be anticipated. Unhappily, no real progress has yet been made at any of the international danger spots. The British plan for evacuating the volunteers from Spain is still held up by General Franco; Europe is alarmed by rumours of troop movements in Germany; while in the Far East, Russia and Japan all but launched into a new war. The need for preparedness in Great Britain is therefore as urgent as ever, and the defence departments must drive full speed ahead.

Of all the many aspects of this problem, that of the use of British man power appears to have been the least clearly thought out and has, indeed, been given little serious discussion. This is in part due to the deep political feeling aroused, in a country which values freedom as one of its most cherished achievements, by any suggestion of conscription. Other cogent reasons are, on the one hand, the apparent lack of precision in the Government's ideas about how our man power should be used if we were faced with the supreme crisis; and, on the other, deep-seated distrust of the Government's diplomacy, which has prevented any united national action in this matter.

As to the first of these points, it would seem probable that the threat of a new type of warfare which will involve the whole population is beneath the surface creating a new attitude towards national service. Certain it is that the great mass of people will look to the Government to tell them what to do, and a very great number would wish to be prepared in advance. If such a change is indeed taking place, it would only mean that British public opinion is falling into line with that of other democracies. On this matter, British opinion stands alone in suspecting that conscription is a weapon of autocracy or a sign of tyranny. In actual fact it was invented in the most democratic period of the French Revolution; it was used by the Americans in their war against England, and is to-day regarded not only in that country but in other democracies as a sign of equality of service. Nor can it be condemned out of hand as fostering militarism when it is remembered that compulsory service in some form exists not only in France and Czechoslovakia but in Scandinavia and in Switzerland, and that it has been adopted in some of the British Dominions. Indeed, it is one of the chief ways in which most democracies in the world give effect to the principle that the citizen has duties to the State as well as rights. In many countries it would be argued that a citizen army is a safeguard of democracy, while a professional army is an organism with class interests of its own, potentially dangerous to the democratic principle.

The dislike of compulsion for military purposes, however, is very deep-seated in England and is reinforced by doubts—which appear to be shared by the Government—about the nature of the next war. It seems unlikely that Great Britain will be called on to place large masses

of troops in a European theatre of war, and, in view of the air menace, it would be much more difficult to maintain them there than it was twenty years ago. On the other hand, we may be forced to evacuate large numbers of people from urban centres, to improvise new transport routes and policing and hospital arrangements, and we shall certainly have to set up very rapidly a centralised direction of our industrial efforts. For these reasons a national register of the population rather than conscription has been suggested. This plan sounds very well in theory, for it would clearly be an ideal state of things if everyone could be told what to do in a state of emergency. But the ideas of those who put the scheme forward are nebulous, and there is obviously no point in organising a costly and cumbersome register unless the Government is much clearer than it is at present as to how it should be used. There are limited groups of people, such as doctors, skilled engineers and others, to whom instructions should be issued as soon as a crisis arose in order to prevent the waste of skill and talent that occurred during the Great War. But the problem is to have a limited number of people trained in certain duties and others on whom responsibility would rest to give instruction, rather than to attempt in advance to appoint war stations for the whole nation.

The third difficulty in the organisation of man-power is suspicion of Government policy and the fear that to give the Government increased authority to instruct individuals to do this or that, would encourage Fascist tendencies in the State, and would be to some extent a condonation of a diplomacy which is suspected of being unduly favourable to dictatorship. But national service would not restrict the right of criticism; and experience in other democracies does not confirm the fear that it would encourage fascism.

From this general background two conclusions emerge. The first is that the case for compulsory service has not yet been made out, and that the Government is wise to hold its hand. The second is that we can only expect to get full value from voluntary service if the Government is able to enlist the active support of the Opposition parties in favour of whatever measure for enrolment of man-power may be necessary. An internal dispute over conscription would have a disastrous effect on British prestige abroad. A really impressive demonstration of the possibilities of voluntary service would be an encouragement to democracy everywhere.

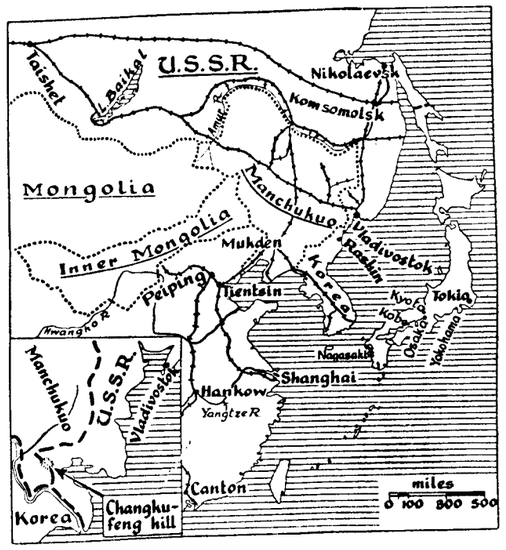
Stimulated by the menace of possible war, the voluntary system has in recent months shown gratifying results in Great Britain. Record numbers have joined the Territorials; and recruitment for the three regular fighting services has reached peak figures. In spite of inadequate preparation and in the face of a certain amount of muddle, volunteers for A.R.P. service already exceed half a million, and with more careful planning the numbers should, by the autumn, easily exceed the million required. In the present temper of the country, much more still could unquestionably be done in many directions if the public were taken into confidence and told what is really needed.

There is no likelihood whatever of this country becoming war-minded or of its policy becoming aggressive. But it is equally true that it would have a steadying effect on international politics if it were demonstrated beyond question that the people of Great Britain were ready forthwith to take whatever action might be needed to fit the country for the defence of democracy and international decency.

If this impression is to be given to the world, three things are needed. First the Government should take representatives of the Opposition parties into conference to consider with them how best the man-power of the nation might be organised to meet the possibility of war. Secondly, on the basis of agreed decisions, an immediate effort should be made to mobilise voluntary service to the fullest possible extent. Finally, in order to get the fullest possible response, the Government should seek to harmonise its international policy as closely as possible with the democratic sympathies of half—indeed, of probably more than half—of the nation. The last is perhaps the most important point of all. It is certain that in the last resort the nation will respond to the call; for behind all differences of policy there is a universal realisation that the British Empire is one of the two greatest bulwarks of freedom in the world. But a demonstration of unity now would be the most effective way of preventing war. The Government could, we believe, achieve this if it set about it in the right way.

Truce in the Far East

LITTLE hills have played big parts in history; and many decisive battles of the world have raged round a trifling eminence. This week we have been on the verge of another undeclared war about the little knoll of Changkufeng in the tangle of frontiers between the Russian Maritime Province, Japanese Korea and the equally Japanese Manchukuo. But on Thursday morning the welcome news was flashed across the world that a truce had been arranged; and we may, therefore, give thanks for another danger passed, if not removed.



After the Japanese militarists of the Araki school ran amok on the Asiatic mainland in the autumn of 1931, overrunning Manchuria and China's Northern provinces, the Soviet authorities, political and military, counselled caution and patience until the threatened Siberian, Outer Mongolian, Transbaikalian and Maritime regions of the Union should be economically and militarily susceptible of what was termed "self-contained defence." The seizure last year by Japan of the southern end of the old Imperial caravan route through Kalgan to Ulan Bator, capital of Outer Mongolia, and the extension of potential Japanese threats to Russia as far westwards as Lake Baikal, brought to a head this inflammation of Russo-Japanese relations.

In the intervening five years, the Moscow Government had cut its losses by selling the old Chinese Eastern Railway (formerly the eastern end of the Trans-Siberian line to Vladivostok through Manchuria) to Japan's puppet-state, Manchukuo; had doubled the alternative track from Karimskaya round the Russian side of the Manchurian border through Khabarovsk to Vladivostok; had begun an entirely new line, single-track, from Taishet, west of Baikal, across 2,500 miles of virgin country north of the Lake and hundreds of miles from Japan's new Asiatic frontiers, to Komsomolsk; and had made surprising progress in the industrial and agricultural development of these regions. The Red Banner (Far Eastern) Army was organised as an independent unit under Marshal Bluecher, complete with tank units, air force, and economic administration for food and munition supplies. Finally, and most remarkable, a large number of submarines—estimated at 18 ocean-going craft with 7,000-mile radius and another 50 to 70 smaller and speedier craft—were sent in parts by rail across Europe and Asia to the Russian Pacific ports of Vladivostok, Olga and Nahodka, where they now lie ready.

Moreover, successive expansions of the Red Army, and reductions of the conscript age, increased its effective strength from about 1,000,000 in 1933 to about 1,750,000 to-day. The Far Eastern Army has been raised to about 400,000 men, exclusive of trained police and customs guards; its air strength is about 1,000 planes, half of which are said to be modern heavy bombers based on the Maritime Province in underground aerodromes; and the entire self-contained organisation is balanced on three headquarters: Khabarovsk on the Amur river, looking west and south along Japan's borders; Chita in Transbaikalia; and, facing Japan's westward march, Ulan Bator in Outer Mongolia. This formidable defensive system is linked by triple lines of forts along the Russian frontiers, built at a cost of £93 millions; and it is reported now to be provisioned with food, fuel and munitions for a campaign of a year's duration. The new Turko-Siberian railway places all the resources of Kazakstan behind Marshal Bluecher; and a network of new roads, linking new factory-towns with the main railways, extends from the new industrial belt in the remote Urals to the new towns and harbours in the north of the Maritime Province itself. From this great military base, independent actions over a vast area can be waged with little fear of diversions or outflanking movements; and from the Maritime Province, the crowded industrial cities of Japan—Kobe, Yokohama, Tokyo, Osaka and Nagasaki—lie within a radius of 750 miles, i.e. within the aggressive compass of Russian heavy bombers, fully loaded.

Finally, the Sea of Japan, the bottle-neck of which, at the Straits of Tsushima, is Japan's shortest route to her Asiatic possessions, cannot be shut by the formidable Japanese Navy against Russian submarines. Thus, those dreaded craft, already outnumbering Japan's total submarine strength, may play havoc with Japanese transports, bearing her men or her much-needed materials, whether inside that sea, in its five sets of Straits, or beyond it.

THE FAR EASTERN TANGLE

On the Japanese side of the frontiers, the army in Manchukuo has been organised on a basis of about 120,000 crack troops and able generals, to whom have been added in the last strained six months another 175,000 Manchurian levies and less-trained soldiery. Since 1934, new railways and extensions of existing lines have been built, radiating through Manchukuo; strategic roads lead to frontier regions; and since the Japanese military authorities began their current war against China in July of last year, their formations have pushed out as far as the frontiers between Inner and Outer Mongolia, holding Inner Mongolia as another puppet-state. Rashin, a village on the Korean coast, has been made a naval station, threatening (and threatened by) Vladivostok. To China proper the Japanese militarists, led by General Itagaki, the War Minister, have already despatched 500,000 troops; and the various armies are divided, with long lines of communication and, in some cases, as far as 500 miles inside China. The flower of the Japanese Army in the north was until lately the Kwantung Army, headed by the Governor-General of Korea; and his recent recall by the moderate element in the Tokyo Cabinet, who feared his urgent demands for an immediate war with Russia, is said to have stimulated his colleagues in that army to precipitate, and independent, military action. This is an almost exact parallel, if true, to the events which unloosed the Japanese militarists on Manchuria in 1931.

Personal, as well as political factors, however, have been involved in the question whether border conflicts might be allowed to grow into a Russo-Japanese war. The Japanese extremists, anxious about the duration of the war in China and the help China still receives, emphasise three things: first, the weakening of the Russian morale by the recent purges (General Bluecher has only just returned to Khabarovsk from an "inquiry" at Moscow); secondly, the allegedly Russophobe sentiments of the British Government, which are expected to sway French counsels; and lastly, the reliability of the Italo-German-Japanese Anti-Communistic Pacts of 1936 and 1937. As to the last point, the German Foreign Minister this week assured the Japanese Ambassador in Berlin merely of "moral support" in a Russo-Japanese dispute. As to the repercussions in Europe as a whole, if the Japanese extremists had carried the day, in Tokyo as well as on the Asiatic mainland, it would have been because of their conviction that a war against Russia would rally all Japanese citizens to defend their "national existence," and would induce Germany to combine with Italy in a drive through Central Europe, thus opening the road to Russia across Czechoslovakia, Hungary and Rumania.

That such hopes should have been nourished shows the degree of desperation to which Japan's militarists have been reduced by disillusion. That disillusion arises from the vast and indeterminate campaign now on their hands in China. The spreading of that campaign into the wastes of Mongolia and Russia—wastes that will soon be as well defended by General Winter as by General Bluecher—did not appal the Napoleons of the Far East. It would assuredly appal even the most extreme military advisers of Western dictators, and this week's truce proves that second thoughts prevailed in Tokyo. On the other hand, it is now clear that, whether at the behest of Moscow or independently, the Far Eastern Army of the Soviet Union is ready to take that stand against Japan for which it was ill-prepared five years ago, and has resolutely been preparing. Indeed, that the Russians should have shown such militant resolution must have been responsible for the evident Japanese relief at the conclusion of a truce. It should not be forgotten—in London, Berlin and Rome as much as in Tokyo—that the Russian purgers as well as the purged have, during these five years, used one voice about Russia's need to face war in Europe and war in the Far East simultaneously. M. Stalin and Marshals Voroshilov and Bluecher, as well as the late Marshal Tukhachevsky, have long bent their energies to enable their country to face this evil contingency. It would seem that the strong stand taken by Russia has constrained even the jingoes of Japan to hesitate before the task of fighting both Russia and China at once.

Meanwhile the Russian and Japanese forces have ceased fire. They are to hold their present positions until a frontier commission, composed of two Russians, a Japanese and a "Manchukuan," has agreed to a line of demarcation on the basis of Russian, Chinese and Japanese pre-war maps. This reversion to a *status quo ante* has liberated Japanese energies for their aggression in China. Yet a lesson has been learned in Tokyo which may beneficently affect Europe as much as the Far East.

The Economics of Eire

THE Commission of Inquiry into the Banking, Currency and Credit of Eire, whose report has been issued this week, was appointed by the Government of what was then the Irish Free State in November, 1934. The report is dated March, 1938, so that the Commission's labours have extended over nearly three and a half years. Even for Commissions of Inquiry this is slow progress; but that the Commission has not been idle is apparent from the merest glance at the report. The Majority Report runs to well over 200,000 words, the Addenda and Appendices to about 150,000 words, and Minority Reports to another 60,000 at least. The Commission has put the widest interpretation upon its terms of reference, and the result is an encyclopædic—indeed, an altogether too encyclopædic—survey of every aspect not only of the banking, currency and credit of Eire but of its entire national economy.

This very remarkable volume* has been produced by no less remarkable a body. The Commission had twenty-one members. It was presided over by the Chairman of the Currency Commission. It included the permanent head of the Department of Finance, the Chairmen of the Industrial and Agricultural Credit Corporations, the Chairman of one bank and Directors of two others, the Professors of Economics of the three University Colleges of the country, a Roman Catholic Bishop, representatives of Labour, and finally, two external experts in the persons of Professor T. E. Gregory and Mr Per Jacobsson of the Bank for International Settlements. With a Commission of this varied—nay, variegated—character, to have produced a Majority Report signed by no less than sixteen of its members is an achievement that reflects the very greatest credit on the persuasive assiduity of the Chairman, Mr Joseph Brennan.

The Commission's warrant of appointment referred it primarily to matters of banking, currency and credit—but on these topics the Commission, for all its labours, has very few important recommendations to make, save for the all-important recommendation to leave things as they are. This is most clearly the verdict under the head of currency. The Commission is emphatic that the maintenance of parity with sterling is the only possible policy for Ireland. The commercial banking system is given an equally clear bill of health, and almost the only amendment recommended is that the Consolidated Bank Note Issue (some features of which are described in a Financial Note on page 331 of this issue of *The Economist*) should be allowed to lapse.

Great interest has been taken in Ireland in what the Commission has to say on the subject of a Central Bank. For years there has been strong pressure for the creation of some such institution to mark the nationhood of Ireland, matched by the equally strong pressure of the undeniable fact that, so long as the currency is convertible into sterling and the banks keep their reserves in London, there is nothing that an Irish Central Bank could do. The conclusions of the Commission bear all the earmarks of a compromise. The present Currency Commission (whose functions are virtually limited to the issue of currency and the holding of sterling assets against the notes issued) is to be renamed and its functions are to be enlarged. But the enlarged functions are not to include those usually attaching to a Central Bank. For example, there is to be no attempt to create a money market in Dublin, the commercial banks are not to be under the obligation of keeping reserve deposits with the new institution, and it is not even to take over the Government account from the Bank of Ireland. In short, the Currency Commission is to have a new title and a research department, and that is all. It seems to be an admirable solution of the problem, which should please politicians and bankers alike.

The tone of benevolent approval of present arrangements that characterises the chapters on currency and banking gives place to one of alarm when the Commission turns to the state of public finance. The reason for alarm lies not in the total of the debt (though the Report devotes much space to arguing the point) but in the relation of the annual debt charge to the Budget and in its rapid rate of increase. The expenditure of the State and local authorities is so high that something like 22 per cent. of the National Income has to be raised in rates and taxes—an alarmingly high proportion for a country in which there are so few large incomes. In these circumstances, whether the debt is large or small, it is not safe to increase it. But in point of fact, the debt has been increasing very rapidly. The gross total has risen from £13.9 millions in 1924 and £59.8 millions in 1932 to £85.4 millions in 1938. A steady increase at the rate of more than £4 millions a year in the indebtedness of the State, with a further £2 millions a year at least in the indebtedness of other public bodies is too much, when the national income is no more than £150 millions and the total collection of rates and taxes no more than £32 millions. If public indebtedness in the United Kingdom were increasing steadily by some £200 millions a year, which is the roughly comparable figure, a Commission of Inquiry would be fully justified in showing alarm—whether or not the increase were set off by assets of a more or less remunerative character. Increases in debt at this rate are clearly inflationary, and the Commission's conclusion, which calls for an end to debt increases and a beginning of debt redemption, is undoubtedly justified. It is more questionable, however, whether it would be possible to bring the era of borrowing to quite such a sudden end as the report appears to envisage, and provision might have to be made for a period of gradual transition.

The recommendations on public finance are the most forthright paragraphs to be found in the Report. But this is not the chapter that has provoked, and will continue to provoke, the greatest controversy. There is much more political dynamite in the comprehensive introductory chapter in which the Commission surveys the economic state of Ireland and assesses the results of the policies pursued by Mr De Valera's Government since 1932. The verdict, no less clear for being implied, is definitely unfavourable—and it is noteworthy that the Report is signed, without any reservation on this point, not only by the bankers and the economists, but by three eminent and avowed supporters of Mr De Valera. The evidence is, indeed, conclusive and fully documented. The Balance of Payments shows a deficit, and though the end of the "war" with England will bring some relief, three of the largest credit items—emigrants' remittances, British pension receipts and the yield of the Hospital Sweepstakes, together amounting to nearly half the total of exports—are either wasting or precarious assets. The National Income has shown a decline in money and an inadequate rise in real terms. The programmes of industrial and social development have only been financed by a considerable draft on the accumulated savings of the past. The agricultural policy, by encouraging the production of crops for which Ireland has no particular climatic or commercial advantages, has lowered the net product of agriculture and impaired its ability to export. The industrial policy has, indeed, increased urban employment; but only at the expense of raising the cost of living, which both directly injures the consumer and lowers the real national income and also indirectly prejudices the export trades. Ireland cannot possibly consume more than a fraction of the produce of her agriculture, or produce more than a fraction of her industrial requirements. All that policy can affect, therefore, is the margin between export and home consumption in agriculture, between import and home production in industry. To make small changes in these margins, policies have been adopted that have jeopardised the whole.

It is a formidable indictment, leading up to the major, though unexpressed, recommendation of the Report, that the main line of economic policy should be reversed. This will naturally be distasteful to Mr De Valera—so distasteful that he may well reject the whole Report on grounds of high policy. Indeed, the Commission might have achieved more of its purpose if it had been less sweeping and much more ready to make concessions to the human weaknesses of protectionism and self-sufficiency—or at least to recognise that these weaknesses are human. Fortunately, however, the conclusion of the economic "war," which has occurred since the Report was signed, provides a hopeful possibility of bridging the gap between Mr De Valera's policy and the Commission's recommendations. The end of the "war" does unquestionably blunt the edge of many of the criticisms in the Report and it will, for a time, lighten the economic outlook for Eire. But it changes nothing in the fundamental conditions within which Ireland must seek her prosperity, and of which the Commission has sought to remind the country.

If Mr De Valera were merely a time-serving politician he could use his recent agreement with London as an excuse for disregarding the whole Report. It would be a profound misfortune for the Irish people if he were to do so. But, fortunately, there is little reason to fear that he will so lower his stature as a statesman, for the recent General Election established his position so firmly that he is both enabled and compelled to look a long way ahead. The election on the political side and the end of the "war" on the economic have in combination given him an ample field for executing the difficult manœuvre of defending his past record against the Commission's criticisms while shaping his future policies in accordance with the hard realities to which the Report points. Mr De Valera will probably find it most practical to begin in the sphere of public finance, for the need of a definite plan is most urgent there, and it can be adopted with least offence to the vested interests. And from a determined attempt to put the finances of the State on a sound basis many other welcome modifications of the expensive policy of self-sufficiency would naturally flow. This will not be an easy course for Mr De Valera to take. It is certainly in the permanent interests of Ireland; and the ultimate test of his statesmanship will be found in the degree of his success in persuading his party to alter its economic course.

The Size of London

IT is the fashion to deplore the size of London. Among poets, social reformers and those born with the nostalgia for green fields, it has been the fashion for hundreds of years; when Cobbett gave the town the expressive epithet of the "great wen" (no article on London is complete without that citation), he was referring to a bloated megalopolis of almost a million souls. But in our own days the familiar condemnation of London's pathological size has been taken over from the *littérateurs* by the economists, the politicians, even the strategists. Official documents, one after the other, seek to persuade the public to do something about it, and a Royal Commission now sitting, though its formal title relates it to the Geographical Distribution of Industry, is, in fact, a Royal Commission on the Enormity of London.

London is too big. So much is agreed. But how big is London? That question, simple though it seems, cannot be briefly answered. There are three areas that can put forward strong claims to the title of London *breviter*. There is, first of all, the ancient city of London, with an area of 1.03 square miles and a population, on the night of April 26, 1931, of 10,677 housekeepers, caretakers, Lord Mayors and working journalists. Secondly, there is the County of London, Mr Herbert Morrison's domain. County Hall's writ does not run in the City of London; the legislature, doubtless foreseeing the danger of a Socialist County Council, has also refused to give it jurisdiction over the 159 inhabitants of the Inner Temple, the same number of denizens of the Middle Temple and the mysterious four persons who, on the same fateful night in April, 1931, were found on ground common to the two Temples. But if these little niceties of administrative law can be momentarily set on one side, the County of London can be said to have the respectable population of 4,397,003 persons in 1931 and probably about 4,100,000 persons to-day.

But it is almost as absurd to take the County as the City to represent what the ordinary man means when he says London. To the ordinary man, Golders Green, Kensal Rise, Barnes Bridge and Barking are all unquestionably in London, and well inside London. But they are all outside the County. The third area that can be called London is that familiarly known as Greater London. There is, let us hasten to add, no legal justification for such a title. Greater London is not an entity known to the administrative world. On the contrary, it enjoys the ministrations of 6 county councils, 4 county borough councils, 63 other borough councils, 30 urban district councils and even 4 rural district councils (this incongruous rustic quartette is not to be confused with the people who were apparently sleeping out in Middle Temple Lane on April 26, 1931). Indeed, there is not one single thing, save its name, that Greater London has both in common with itself and exclusive to itself. The origin of its existence is that its outer boundary is that of the Metropolitan Police District; but even there an exception must be recorded, for there is a separate police force for the City of London, the Inner Temple, the Middle Temple and the ground common to the two Temples.

Greater London owes its shadowy existence to the foresight of Sir Robert Peel nearly a hundred years ago. Sir Robert, by drawing a circle of about 15 miles radius from Charing Cross, doubtless thought to place under the watchful eyes of his "Peelers" all the territory that might conceivably serve as a breeding ground or hiding place for metropolitan criminals. But his action has had the by-product of providing the statisticians of to-day with something they can call Greater London. It has an area of 693 square miles and a population that was counted at 8,203,942 in 1931 and estimated at 8,474,900 in 1935.

Until the war, Greater London was a big enough area to include the whole of the metropolis. It is very doubtful if the same could be said to-day. There are many communities well outside the Metropolitan Police district whose whole life depends upon London. If Esher is sufficiently suburban to be included in London, so is Weybridge. Rickmansworth is almost, if not quite, as

metropolitan as Northwood, Epping, Romford, Dartford and Leatherhead cannot, on any rational basis, be excluded (two of them get their water from the Metropolitan Water Board, which does not supply even the whole of Greater London). When the London Passenger Transport Board was created to co-ordinate the transport of the metropolis is was found necessary to give it an area nearly three times as large as Greater London. Transport is, perhaps, the most vital function of a metropolitan area; at least, it transcends both in importance and in reality the artificial creations of political map-makers. A good working definition of a metropolitan area, in fact, would be that area whose transport is, or should be, considered as a unit. There is, indeed, one London transport area, that of the Metropolitan Traffic Commissioner, which is even larger than the L.P.T.B. area. But one or other of these transport areas must be taken as the most up to date and the most comprehensive definitions of London. Their areas are 1,986 and 2,419 square miles respectively (equivalent to circles with radii of 25 and 27¾ miles) and their estimated populations in 1935 were 9,517,000 and 9,862,500 respectively.

This, then, is London, a monster of almost ten million inhabitants. London is commonly regarded as the largest city in the world. But this is due to the statistical accident that a figure of the population of Greater London has been available for quotation for years past, while nobody has ever assembled similar figures for other conurbations (the heavy responsibility for the invention of this term does not rest on *The Economist*). If that geodetic irrelevance, the boundary between the States of New York and New Jersey, be disregarded, the New York metropolitan district will be found to have a larger population—in a smaller area—than that of London. For example, the eight counties of New York State and the four counties of New Jersey which lie roughly in a radius of 25 miles from the centre of the city, had a population of 10,509,294 in 1930—it is certainly more than 11,000,000 by now. Moreover, it must be remembered that New York, being on the coast, can expand over only about two-thirds of the full circle. In what has been unofficially designated the New York Metropolitan Area, with an area (2,514 square miles) comparable to the largest London area, but a considerably larger radius from the centre, there were 10,901,424 people in 1930 and are probably nearly 12,000,000 to-day. Even if we aggregate with London the whole counties of Middlesex, Hertfordshire, Essex, Bucks, Kent, Surrey and Sussex—which is certainly larger than the metropolitan area—we cannot add up more than 11,633,000 people in 1931. New York must have the dubious palm—but only by a leaf or two.

How large, finally, is London likely to grow? That, obviously, is a matter for speculation. But it is possible to throw some light on the question. At each successive census in the nineteenth century, the population of Greater London represented a higher fraction of the total population of England and Wales. In 1801, it was 12.6 per cent., a hundred years later 20.2 per cent. Thereafter, for two decades, there was a proportionate decline, and the increase, when it was resumed between 1921 and 1931, was no faster than in the nineteenth century. In fact, the increase in the percentage of Greater London's population to that of England and Wales was 0.9 in the decade 1921-31 (19.7 per cent. to 20.6 per cent.), while the average increase for the six decades 1841-1901 was 1.0 per decade. If, then, we assume that the increase continues at the rate of 1.0 per decade in the future, we should be making an allowance for London's growth which the estimated figures for the years since 1931 show to be amply generous to serve as a guess, not of London's actual future size, but of the upper limit of its probable dimensions. Applying these percentages (21.6 per cent. for 1941, 22.6 per cent. for 1951, and so forth) to the middle of Dr Enid Charles's three estimates of future population, we get a maximum figure for Greater London of about 9,300,000 in 1961. And if we make the further assumption that the present ratio of population holds good between Greater London and Greatest London (as we may christen the Metropolitan Traffic Area), we get a final grand maximum of about 10,800,000. That is about the limit of London's ambitions. And it is plenty big enough.

Topics of the Week

Air Raid Exercises.—The mock air raid by "Eastland" bombers upon "Westland," staged by the Royal Air Force last week-end over most of Eastern England, was on the largest scale hitherto attempted. About 900 machines were scheduled to participate; and so extensive was the zone of operations that all commercial aircraft bound to and from London had to make wide detours. Unfortunately, mist and rain clouds descended over most of the area on Friday and Saturday nights; the co-operating anti-aircraft units of the Territorial Army and Observers' Corps had to twiddle their thumbs most of the time they were on duty; and in the air, the exercises were not on the expected scale, owing to the weather. A higher proportion of attacking bombers was intercepted by fighters than in earlier exercises; and the defending machines were quickly off the ground owing to excellent co-operation between observation posts and R.A.F. aerodrome commands. The weather prevented adequate trial of anti-aircraft units, for some of the attacking bombers came down to 1,000 feet in raids. Certain important objectives in London were bombed. But the most alarming feature of the proceedings was the number of accidents. We cannot feel the same equanimity as an august contemporary, which found "grounds for congratulation" in the crashing of only three fighters and two bombers when "nearly 50" machines were in the air, at the time of recall to their aerodromes. The crews of the three fighters, which had to stay up till they ran out of petrol looking for an aerodrome free of mist, landed safely by parachute. Doubtless a 10 per cent. accident rate would only occur in equally bad weather; but it opens up vistas of an infinite regression in the strength of the R.A.F. On the other hand, the fog and the "black-out" over East Anglia and the Midlands show that enemy bombers would have to reckon, even in summer, with great handicaps above the soil of this country.

* * *

Britain and America.—The week has brought two welcome signs of the growth both in the desire for and in the practice of collaboration between Great Britain and the United States. An agreement has been reached between the two Governments for the common use of Canton and Enderbury Islands. These two tiny members of the Phœnix group in the Pacific Ocean, almost on the Equator, never possessed any importance until the establishment of an American-Australasian air service. Both Britain and America set up claims to sovereignty, and neither side has abated its claim in the present Agreement. But both have agreed to leave the question in abeyance, and in the meantime to use the islands in common. The Agreement does not cover questions of defence. But defence will infallibly arise when there are hangars and stores on the islands and there may be an opportunity for further practical collaboration in the future. As it stands, the Agreement fully deserves the hackneyed compliment of being a triumph of good sense. The second straw in the favourable trade wind was the public reference on Wednesday by the Secretary of Commerce to the growing recognition on both sides of the Atlantic of the interdependence of British and American prosperity. A remark made to the dock-side reporters by a Cabinet Minister returning from holiday is, of course, only a very small straw. But in the Coolidge, even in the Hoover, era it would have been impossible for any member of the American Government to make any such implied confession of America's dependence upon others.

* * *

The major issue of Anglo-American collaboration, however, remains that of the Trade Agreement. A fortnight ago, the negotiations had reached a difficult stage at which breakdown, or something closely resembling it, was not entirely out of the question. The concessions which the United States was ready to make for a real Agreement were already known and recognised as substantial. But difficulties were being encountered over the British *quid pro quo*. In large part, of course, the reluctance of the British negotiators was a reflection of their unwillingness to commit the Dominions. But on one item at least the consent of the Dominion most closely concerned is believed to have been obtained, but still London hesitated. The matter was referred to the Cabinet and as a result fresh instructions were issued, which are believed to have brightened the outlook. If report is to be trusted, this favourable turn was due to the personal intervention of the Prime Minister. When the Agreement is concluded, the success may be due as much to his recognition of the wide issues involved, as, on the other side, to Mr Cordell Hull, whose steadfast refusal to have any Agreement but a real and effective one has complicated, but has also most beneficially enlarged, the issue. But it would be dangerous to count any unhatched chickens. The Agreement has not yet been reached and there are many difficulties yet to resolve.

* * *

National Health.—In his preface to his annual report, the Minister of Health justifiably claims that it shows a record of steady improvement. He demonstrates the cumulative effect of such unsensational progress by some striking comparisons with conditions 100 years ago, when, for example, the average age at death was 20 in Manchester and 17 in Liverpool. And he shows a proper appreciation of the evils yet to be overcome by saying that our present position may seem equally incredible to our descendants, even though some of them may owe their existence to the measures now being taken. For on the purely health side the Ministry's main concern seems to be the improvement of maternity services. The Midwives Act of 1936 has been brought into effective operation throughout virtually the whole country; the services of qualified midwives are thus available to almost all mothers, irrespective of means, and 342 of the 365 responsible local authorities have also made arrangements for consultant services. The number of ante-natal clinics has only been increased by 28 (to 1307), but the percentage of expectant mothers who attended was 54 against 49; this rise was partly due to the publicity campaign launched in October, and the 1938 figures should show further improvement. Mothers and infants received 6,400,000 gallons of milk against 5,700,000, a reflection of the Ministry's circular on the subject. The most encouraging result of other measures was a reduction in the maternal mortality rate to 3.1 per thousand against 3.6 in 1936 and 3.9 in 1935. Infant mortality has been virtually stationary at about 58 per thousand for the last four years, and a new advance would be welcome on this front.

* * *

The Ministry of Health has many other duties besides those directly suggested by its title. The report provides, for example, a mass of statistical information about local authorities, which would be a great deal more valuable if it were more up to date. It is scandalous that so many figures should go no further than March, 1936. The Ministry would doubtless seek shelter behind the dilatoriness of the smaller local bodies; but even if it cannot enforce speedy returns, it could at least supply provisional estimates. Among other interesting facts we learn that over two-thirds of England and Wales is now under a planning scheme, though the effectiveness of the scheme shows, unfortunately, a very large variation; that in 1937 the average cost of a non-parlour subsidised house rose from £324 to £355; that the direct attack on overcrowding has begun in some areas, and is about to begin in others; and that on the second appointed day (April 1, 1937) about 144,000 persons were transferred from Public Assistance Committees to the Unemployment Assistance Board. A brief chapter is devoted to the new voluntary pension scheme established by what is generally called the "Black-coated Workers' Act." Up to the end of June, 1938, applications had been received from 164,753 men and 80,393 women. This is barely an eighth of the estimated number eligible, and, as the scheme is undoubtedly generous, it seems that the need is for greater publicity. The special concession by which men over 40 can become contributors expires on January 2, 1939.

* * *

The Toll of Industry.—The phrase "the toll of the roads" is familiar to everybody, and an energetic campaign is being waged to reduce it. Perhaps more would be done to reduce the toll of industry if fresh statistics became available at equally frequent intervals; the advertisers have taught us the value of constant repetition as a means of awakening public consciousness. The situation would certainly be disquieting enough to have news value, as is shown by the figures in the annual report of the Chief Inspector of Factories. In 1937 the total number of industrial accidents reported was 192,539, of which 1,003 were fatal. Both these figures are about 9 per cent. higher than those for 1936. The increase corresponds roughly with the increase in industrial activity, so that the position is not actually getting worse. But this is poor consolation when the figures are so large—it must not be forgotten that they apply to factories only, and therefore exclude such occupations as mining and transport. The remedy seems to be mainly the education of both employer and workman to appreciate the risks involved. The inspector devotes special attention to the question of the younger workers, with little experience of machinery. Too many employers expect them to show a degree of intelligence and foresight which the average lad cannot hope to attain. In this respect more consideration might effect a great improvement. But there is also the problem of the man who considers himself too clever to be caught, and is injured despite the utmost precautions which the law can enforce or the employer devise.

* * *

Spain and Europe.—"Seriouser and seriouser" is the news from Spain. The counter-offensive by the insurgents against the Government forces on the right bank of the Ebro has been held up by lack of material, by stubborn resistance, and by a clever and resolute diversion on the part of the Government forces, who crossed the river Segrè on Tuesday, thus threatening the insurgents' left flank on the entire north-eastern front. The insurgents' advance towards the Almaden mercury mine on the south-western Estremadura front is said to be continuing; but the main advance of the insurgents down the coast to Sagunto and Valencia has been halted by the Ebro diversion. Meanwhile, however, the British *chargé d'affaires* in Rome this week informed Count Ciano that the British Government had by now become aware of reported new Italian intervention. This apparently indicates the British Government's belated recognition of the reported landings at Vinaroz, on which questions were asked before Parliament rose. Then, Mr Butler said that the Government were unaware of them; which, with equally bland affability, is precisely what Count Ciano is said to have told our *chargé d'affaires* at Rome this week. The gravity of the situation is pointed by General Franco's suave postponement of comment on the British Plan which he has had for over a month, and which the Spanish Government accepted in principle within a few days.

* * *

General Franco and his alien allies are, understandably, in no haste to comment on the plan; for, as M. Léon Blum

reminds us in an article in the *Populaire* this week, the French Government, "to meet the very definite wishes of the British Government," strictly closed the French-Spanish frontier after June 10th in order to give the Plan a chance of success. Thus, General Franco and his friends were enabled—as many observers said they would be—unconscionably to delay a reply to the Plan, what time the British Government obliged them by forcing France to impose a unilateral blockade on the Spanish Government. This Anglo-French obstacle in the path of the Spanish Government is formidable; and yet the pampered and favoured insurgents have not won the victory they expected in these precisely gained weeks, despite the increased foreign help they obtained while denying it to their opponents. It is high time the French and British Governments recognised that they are under no compulsion to remain beggars and poltroons before General Franco, the Italians and the Germans. They can open the Pyrenean frontier. They can take military measures to protect their citizens' lives and property, wantonly destroyed on lawful occasions. Our own Government can, and should, at least clear themselves of the charge, heard with rapidly growing intensity among the French and British masses, that they now desire to hasten a rapid victory by General Franco at all costs in order to "settle the Spanish problem," and are pressing the French Government to concur.

* * *

The Czechoslovak Problem.—Lord Runciman and his helpers have been very busy in Prague, and the initial contacts and discussions have been brought to a conclusion. The next stage is to bring the views and personalities of the Sudeten German Party leaders and of the Cabinet once more into the realm of free discussion. Meanwhile, however, the virulent and often vicious campaign of hate and even of falsification in the official German press against Czechoslovakia has been whipped up to the point of frenzy. An example suffices: this week a quarrel between members of the Sudeten German Party and Sudeten German Social-democrats—both, therefore, Germans—ended in the stabbing of one of the Sudeten Party members. This, next day, was blazoned throughout Germany as evidence of the evil will of the Czech oppressors of Germans—not, as it was, of the passionate extremes to which Nazi fomentation has succeeded in driving even pure Germans themselves. One of the more disturbing features of the situation is the rate of growth in the Sudeten Party's Storm Troops, under a 27-year-old Commandant decorated by Herr Hitler—the F.S., or Free Defence Service—and the extent to which they are invading civil life in the Sudetenland by military methods. This has a familiar ring about it; as witness the Saar, Danzig and Austria. M. Hodza still faces the possibility of a split in his Coalition Cabinet over the wisdom of going even further to meet the demands of a militant, and now avowedly Nazi, Party for totalitarian powers over a large area and population within Czechoslovak borders.

* * *

Economics and Politics in the Sudetenland.—The importance of the economic factor in the Sudeten problem is now becoming more evident. The composition of Lord Runciman's delegation, with two economic experts in his train, has led the German press to detect a possibly Machiavellian British Government's move to encircle Germany economically or to freeze her out of Central and South-Eastern Europe. That is not so; and this journal has long pointed out that it cannot be done. But what is vitally important is to seek a solution of the political and racial Sudeten problem which will also provide economic betterment for that area. The region has for decades contained industries supplying peaceful products—paper, glass, beads, porcelain, textiles, woodwares—to foreign countries, especially southwards to Danubian Europe and the Balkans. Germany was never a significant consumer of these things, with whose production, indeed, Germany competed. The lot of the Sudetes is therefore scarcely likely to be improved by incorporation in the Reich; indeed, it is already better—for those in employment—than that of similar workers in Germany. But the unemployed in the Sudeten area are the result of the world-wide slump and high protectionism in South-East Europe; and the Reich's penetration of the south-eastern lands has severely hit those "cousins" in the Sudetenland for whose welfare the Nazis profess so much anxiety. Both the Sudeten German Party and the loyal and significant German Social-democrat Party led by Herr Wenzel Jaksch would be glad to see the lot of their unemployed members improved. But Herr Jaksch does not breathe out threatenings and slaughter against non-Nazi workers and employers; nor does he thereby arouse private boycotts of Sudeten goods in foreign countries. Yet he and his followers suffer, because the Nazis and Sudeten Party members lay the blame for unemployment on the Czechs. Certainly, the Czech and Slovak armaments boom is providing work in the Slav areas of the Republic; but not even the British Government would counsel the Czechoslovak Cabinet to move its armament firms into the Sudetenland, in view of the Henlein Party's demands.

* * *

The best suggestion is that credits and more trade should be directed to the soundest Central and South-Eastern countries, to enable them to sell their primary produce for free exchange—not for marks blocked in Berlin. Thus the markets lost by the Sudetenland in these countries would revive and expand; all, that is, save Austria; and the economic distress in the Sudetenland upon which political "caterpillars of the commonwealth" have battened would be cut down, with reassuring results. This economic factor is as important to the domestic destinies of Hungary, Jugoslavia and Roumania as it is to those of Czechoslovakia. But if a beginning were made by France and Britain in the Czechoslovak case, it would extend, automatically, to the Danubian region entire, and should be a powerful agent for peace.

* * *

A Danube Settlement?—Ever since the Peace Settlements, the Little Entente Powers—Roumania, Jugoslavia and Czechoslovakia—have contained big German, Hungarian and other minorities; and the Permanent Statute of the Little Entente expressly obliges its signatories to take common military action if Hungary attempts by force to take back part of her former territory in the possession of any Little Entente Power. In the matter of minorities, Czechoslovakia has the cleanest record of any European State whose duties were defined by minorities clauses in the Peace Settlements. Now, perhaps as a result of the way in which the two Fascist dictatorships have ground their axes upon their own minorities, or of the fate of Austria and Danzig, or of the threatened position of the ally Czechoslovakia, the royal Roumanian dictator's administration has decreed far-reaching and most liberal minority regulations, affecting local government, languages, and education. By it, the lot of some 1,000,000 Magyars and 600,000 Germans, not to speak of Jews, is improved, and equality of citizens' rights is guaranteed. This move, so soon after the understanding between Bulgaria and the Balkan Entente (on which we commented last week), may precede a similar understanding between Hungary and Roumania, the latter acting for the Little Entente. The visit, however, of the Hungarian Regent, Admiral Horthy, accompanied by the Foreign Minister, M. de Kánya, to Herr Hitler at Kiel next week, and German play upon Hungary's traditional hatred of Czechoslovakia, place the Government of Dr Imrédy in a dilemma. The anti-Semitic policy in Hungary, introduced by the Darányi Government, has quickly assumed large proportions; but it has not availed to halt the growth in the indigenous Hungarian Nazis, who have now joined forces in one organisation; and many a pure Magyar begins now to ask: "Where do we go from here?" Here, again, increased trade with Britain and France—especially that kind susceptible of aiding Hungary's 2,000,000 landless peasants and their families—would have good effects even beyond the bounds of Hungary.

* * *

Mr Roosevelt's Campaign.—The last days of Mr Roosevelt's holiday cruise were marked by a series of victories for his candidates in the primary elections of the Democratic party in the different states. The most important of these successes was the renomination of Senator Barkley in Kentucky. Senator Barkley is the Majority Leader in the Senate and, as such, the President's chief legislative lieutenant. He campaigned on his loyalty to Mr Roosevelt and the New Deal and won by a handsome margin over a popular and powerful candidate, the incumbent Governor of the State, who belongs to the Conservative wing of the Democratic Party. The States of Ohio and Arkansas have also nominated Mr Roosevelt's candidates and if Idaho has not followed suit it is to be ascribed to the siren calls of the Townsend pension plan rather than to strong views on the split in the Democratic Party. Thus the President seems to be receiving the support of the electors in his attempt to refashion his party more to his liking. But local issues and squabbles within the local "machines" always affect the results of primary elections and it would be unwise to base too much upon a handful of results. A severer test will come if, as is expected, the President opposes the renomination of Senator George in Georgia and Senator Smith in South Carolina, for these are two avowed leaders of the Conservative Democrats, and their states are in the region where Conservative Democracy should be strongest. The President may secure their defeat, or he may cut their majorities so fine that other Southern statesmen whose personal position is not so strong will think again about the policy of opposition. What is clear is that by a policy of rewarding his friends, punishing his enemies and appealing judiciously to the people, who have always been his truest friends, Mr Roosevelt is pressing on with his campaign to convert the Democratic into a Liberal Party. Whether he will succeed; whether there will be a secession; what will happen to the reorientated party when it enters the fight with the Republicans and possible third or fourth parties; whether Mr Roosevelt himself will, in defiance of tradition, continue to lead it after 1940, and, if he retires, who will succeed—these are the questions that continue to lend interest and excitement to the American political game.

* * *

The Unwanted Trophy.—On Monday the "Queen Mary" set up a new record for the east-to-west crossing of the Atlantic. Since then the officials of the Cunard-White Star Company have been vying with one another in their protestations that this was no part of their intention; and they have repeated their refusal, now or in the future, to claim the Blue Riband trophy. Such an attitude to speed records is strictly logical, but perhaps for that reason a trifle too inhuman for the man in the street, who finds it difficult to believe that the company's statements are not pronounced with the company's wink. However that may be, it so happened that, through an accident of the tide at Southampton, there was on this occasion a real advantage to be gained by making a late start and saving a few hours during the trip; the "Queen Mary's" reserve of power was therefore rightly used to maintain her schedule. But normally the saving of time would be a negligible return for the very heavy cost, both in money and in increased vibration; for the resistance of the water increases so rapidly with the speed that an extra two knots requires over twenty per cent. more power. If an hour of the average traveller's time is really so valuable, then it should be saved by improving the facilities for embarking and disembarking. In years to come the creation of records will be even less justified, for those to whom speed is really valuable will save days, not hours, by transferring to the air service. Meanwhile the "Queen Mary" is still waiting to fulfil her true function, which is to provide a weekly service in conjunction with her sister ship, to be named the "Queen Elizabeth." The latter is, however, to be launched on September 27th, when her unprecedented length (we must not say her record length) will necessitate great precautions. She is likely to be ever faster, as well as more luxurious, than the "Queen Mary" It will be interesting to see how soon the state of the tide, or some other phenomenon, leads her to establish another accidental record.

* * *

Railway Wages.—The Railway Staff National Tribunal consists of a representative from each side, with Sir Arthur Salter as independent chairman. There is thus a strong presumption that any of its awards which are unanimous will be fair both to capital and labour. On August 4th the Tribunal unanimously rejected the claim, put forward by the National Union of Railwaymen, for an all-round increase in signalmen's wages. Its positive findings were limited to minor alterations in particular cases, designed to make each man's pay correspond more closely with the nature of his work. Thus it accepted the companies' claim that fewer marks should be awarded for work in automatic or semi-automatic areas; and it added two more grades at the top of the scale, where higher rates will be paid. In view of the fall in the railways' profits, no other result was to be expected on the main claim. But it is refreshing to see the question settled by agreement. In particular, the principle was laid down that the benefit of working economies secured in any one department is not the perquisite of the men employed in it. The consumer of railway transport may hope that part at least will accrue to him.

Rumpus in Bengal.—A pretty pass has been reached in the initial stages of Bengal's provincial autonomy. Something like a strike of Hindu representatives has paralysed the Coalition Government, composed of six Moslems and five non-Congress Hindus. The Legislature in Calcutta, on two nights this week, became, by act of the Congress Party in Opposition, and by permission of the Speaker, an emergency dormitory. One hundred slept in it, which is more than the number habitually put to sleep by the Mother of Parliaments. But the trouble has lain dormant for longer than two nights. The communal award resulted in a disproportionate advance to power by the Moslems, a small majority in the province; and these, with Hindu representatives of the castes scheduled for special representation, from a Ministry which, under a Moslem Prime Minister, Mr A. K. Fazlul Huq, enjoys a small but working majority. Outside the Legislature, however, Congress has been able to ally itself to disgruntled Hindu racial feeling, and this has temporarily healed those gaps between the various sections of Left-wing Hinduism in Bengal. Only last month the Congress Party in Bengal rapped one

WILLS & TRUSTS

In acting as an executor or trustee, the Westminster Bank aims at putting itself in the position of a private trustee. It is therefore its practice to employ the family solicitor, if there is one, or any other solicitor the client may name; by such means the Bank succeeds in combining domestic tradition with business efficiency. A book showing the advantages of corporate executorship and the terms of appointment may be had at any branch

WESTMINSTER BANK LIMITED

Also in Piccadilly, Bristol, Liverpool, and Manchester

of its leaders, formerly a mayor of Calcutta, over the knuckles for advocacy of programmes more extreme than the Congress Party desired; and there are signs that the Moslems and moderate Hindus will soon hatch a programme designed to satisfy the Bengalis' desire for economic improvement and agrarian reform. Even this, however, will not eradicate the problem posed by provincial autonomy in a region where Hindus are the landlords and the better educated aspirants to Government and Civil Service.

Mr MacDonald in Palestine.—Last week-end the Secretary of State for the Colonies paid a flying visit to Palestine, and was back in Malta, *en route* for London, before the news of his journey to Jerusalem was known outside "official circles." The *communiqué* published after the event frankly states that Mr MacDonald went to see Sir Harold MacMichael, the High Commissioner, because it was impossible for the latter, in the present state of Palestine, to come and report to Mr MacDonald. This frankness is much to be commended. The gravity of the situation in Palestine is no secret from anybody, and a visit to the spot makes all the difference to the understanding of any political problem—particularly when the visitor is a Cabinet Minister who can mobilise all the senior officials in the country to come into intensive consultation with him. The timeliness of Mr MacDonald's recent visit to Palestine has been grimly advertised by the Palestinian death-roll during the same week-end. On the road from Jerusalem to Jericho a patrol of the Black Watch fell among thieves and lost one soldier killed. Many civilians, men and women, have been killed. This Monday, the 8th, two bombs exploded in Tiberias—one of them in the Arab vegetable market, where it wounded nine people. These facts must have spoken to Mr MacDonald almost as eloquently as the High Commissioner himself. If he did not know it already, he will now assuredly be most acutely aware that the Royal Commission were abundantly in the right when they reported that time was not on the side of a happy ending to the Palestinian tragedy. This Monday evening, in Jerusalem, Sir Harold MacMichael broadcast an appeal for the cessation of acts of violence, with a warning that such acts would not promote, and might very well prejudice, the political purposes of those who committed them. Patience on the part of the Arabs and the Jews must coincide with firmness and precision on the part of His Majesty's Government, if chaos is to be avoided.

* * *

A New Anglo-Egyptian Agreement.—The happy success of the comprehensive Anglo-Egyptian Agreement of 1936 is being confirmed by the sequel, which has so far brought no recurrences of the old friction and a number of confirmations of the new friendship between the two Governments and peoples concerned. The visit which the present Prime Minister of Egypt, Muhammad Pasha Mahmud, has been paying to London within the last few days has ended in a new agreement in which several minor provisions of the major transaction of two years ago have been modified by mutual consent. The new accommodation for British troops in the Canal Zone is, after all, to be constructed by the British Government; and the costs are to be equally divided between the two parties. Agreements between British and Egyptian private interests seem to have been less easy to reach—for the respective cotton manufacturers in Egypt and in Lancashire, rather than the two Governments, are virtually the principals in the question that has arisen over the Egyptian tariff on cotton goods. On this matter, no agreement has been reached on the present occasion; but the negotiations have not arrived at a positive deadlock, since it has been agreed that a deputation from Lancashire is to go to Cairo in September in order to negotiate there with the Minister for Finance.

* * *

The Refugees Problem.—The Inter-Governmental Refugees Committee, consisting of the representatives of twenty-seven countries, held its first meeting in the Foreign Office in Whitehall on August 3rd. Forceful speeches were made by Mr Myron Taylor (United States) and by M. Bérenger (France). It looks as though the Committee's policy would be to make a friendly approach to Germany, on the hypothesis that the co-operation of the other countries of the world is essential to the success of her programme of expelling her non-Aryan citizens from the Reich, since the execution of this German design could, in the last resort, be stopped by a refusal on the part of other Governments to grant visas to any German citizen. At present, the Nazis believe that the civilised world is more concerned to save the non-Aryan victims of Nazidom from the fate with which the Nazis threaten them, than the Nazis themselves are concerned to avoid the odium of putting their hateful threats into effect. On this calculation, the Nazis apparently reckon that they can continue to secure a compulsory selective emigration of German citizens from the Reich, and can push other countries into financing this German scheme by forcing them to receive the refugees from Germany in a destitute state and to start them again in life at the expense of the receiving countries, while the German Government pockets the assets which it compels the refugees to leave behind. If it came to a trial of strength, the Nazis might have some unpleasant surprises; for a refusal to receive any more non-Aryan German refugees might not, after all, be the only recourse left open to the rest of us. An alternative would be to accept the refugees and to finance their re-settlement by earmarking Aryan German property abroad up to the amount of the non-Aryan German property confiscated by the German Government within the frontiers of the Reich. Or, again, many Nazis in foreign countries could be requested to return home.

* * *

Meanwhile, in the Reich, the Nazi screw is being given one turn after another. On top of the forced sales of non-Aryan businesses of all kinds, non-Aryan medical practitioners have just been singled out by having their diplomas cancelled as from September. At the same time, landlords are ordered to terminate, as from the end of September, all leases of consulting rooms and dispensaries, and even dwelling-houses, to the victims of the new decree. It is also announced that, at Nuremberg, the Jewish synagogue is to be demolished on the ground that the presence of a house of God (who is the oldest non-Aryan inhabitant of the universe) is incompatible with the sacred character of the holy city of neo-Aryan paganism. So, once again, the Abomination of Desolation is to stand in the place where it ought not. (Herr Streicher should remember the retribution that fell upon Antiochus Epiphanes.) While the German hyena gnaws the bones of his human victim, the Italian jackal hovers round to pick up scraps from the feast, in the hope of being mistaken for a big hyena himself. It is announced from Rome that foreign Jews are to be excluded from Italian schools, and that the Jewish "share in the life of Italy" is henceforth to be in the proportion of one Jew to every thousand Liguro-Calabrians. A newly started Fascist anti-Semitic review is, by order of the Italian Minister of Education, to be distributed to all Italian teachers, to serve them as a guide to Italy's new German creed.

* * *

Irish National Income.—The Report of the Irish Banking Commission contains, among a mass of other valuable figures, original estimates of the National Income of Eire. The figures have been calculated by Professor G. A. Duncan, a member of the Commission, and can be summarised as follows :—

ESTIMATED NATIONAL INCOME OF EIRE (£ million)

	1929	1931	1932	1933	1934	1935
Agriculture	54·5	47·7	38·8	33·3	32·3	36·3
Fisheries	0·4	0·3	0·3	0·3	0·3	0·3
Industry.....	30·5	29·7	28·7	30·2	33·1	35·1
Distribution	25·2	23·8	22·3	21·5	22·3	22·6
Personal service	28·1	28·2	27·7	28·9	30·3	30·3
Housing	10·7	10·8	10·9	10·9	11·0	11·3
Total home-produced	149·4	140·5	128·7	125·1	129·3	135·9
Income from abroad...	12·3	10·3	16·8	15·0	14·5	13·3
Total	**161·7**	**150·8**	**145·5**	**140·1**	**143·8**	**149·2**
Index Number (1929 = 100)	*100*	*93*	*90*	*87*	*89*	*92*
Real National Income (1929 = 100)	*100*	*102*	*103*	*104*	*106*	*107*

The last line is arrived at by the use of an index number of general prices calculated by Professor Duncan. The Commission comments at some length on the contrast between the movements of Irish National Income, which has fallen in monetary terms and shown comparatively little increase in real terms since 1929, and the movements in other countries, notably Great Britain. What is equally surprising about the figures is their small dimensions, especially since they represent gross national income, before provision for the depreciation of capital equipment. The ratio of population between the United Kingdom and Eire is about 45 : 3 or 15 : 1. But by these figures the ratio of national income must have been over 25 : 1 in 1929 and may be as much as 35 : 1 to-day. Without in any way impugning the excellence of Professor Duncan's work, these ratios inevitably raise the question whether his totals are large enough.

* * *

South African Caution.—It has never been possible to accuse Mr Havenga, the South African Minister of Finance, of being an irresponsible financier. Since the rise in the price of gold made his position the envy of his *confrères* throughout the world he has consistently budgeted for surpluses, and the actual results have always surpassed his estimates. The year 1937-38 has proved no exception to this rule, the realised surplus being £4,352,000 (or nearly 10 per cent. of the revenue), against an estimate of £1,500,000. But he is painfully aware that recession is sapping the sources of his revenue, while in the gold-mining industry, which is immune from the general disease, technical factors are producing a similar result. (These are discussed in an Investment Note on page 332.) In his Budget speech on Wednesday he therefore anticipated a Budget deficit in the coming year of £1,052,000 on the basis of existing taxation. He has relaxed the severity of his principles to the extent of using £400,000 of this year's surplus to fill part of the gap, but proposes to raise another £552,000 by reducing the abatement of income tax from 30 per cent. to 20 per cent. As the standard rate for a company is 2s. 6d. in the £, this means raising the effective rate from 1s. 9d. to 2s. For individuals the standard is 2s., and there are large allowances for families, so that the burden will still be very moderate. But the important point was Mr Havenga's insistence, even to the extent of imposing extra taxation, on a (very nearly) balanced Budget. He also delivered a homily on the dangerous rise in the national expenditure and the national debt, which, he asserted, tends towards dictatorship rather than Socialism. The remainder of the surplus is to be "transferred to loan account"—i.e. used to pay for capital expenditure that would otherwise have been financed by borrowing.

* * *

Substitutes for Oil.—Much ingenuity has been shown in devising substitutes for natural oil as a source of fuel for the internal combustion engine. Alcohol, benzole, synthetic petrol, petrol produced by low-temperature carbonisation, shale oil—the use of all these has been encouraged in more than one country. Yet the world consumption of substitutes amounts to only about 3 per cent. of the total for light motor fuels—the *Petroleum Times* recently estimated it at 2.39 million metric tons in 1936 and 2.83 millions in 1937, out of totals of 82 millions and 89 millions, respectively. The domination exercised over the world's total figures by the United States makes it more instructive, however, to consider the same paper's figures for some individual countries:—

(Thousands of Metric Tons)

		Alcohol	Benzole	Artificial petrol	Shale oil	*Total substitutes*	Total consumption	*Substitutes (% of total)*
Germany—	1936...	207	378	380	...	*975*	2,353	*41·3*
	1937...	210	430	800	...	*1,440*	2,640	*54·5*
France—	1936...	304	80	...	1·3	*385*	2,794	*13·3*
	1937...	153	80	13	1·5	*248*	2,827	*8·8*
U.K.—	1936...	7	210	113	28	*358*	4,660	*7·7*
	1937...	16	230	120	26	*392*	4,840	*8·1*

[redacted] to the consumer, or the treasury, of maintaining these industries is quite disproportionate. In one way or another they all receive assistance amounting to at least 100 per cent. of the value of the imported product, and in some cases to far more. For 17 European countries, whose consumption of substitute fuels in 1937 amounted to 2.3 million metric tons, the estimated burden was nearly £50 millions. But this is scarcely considered by countries striving for greater self-sufficiency in an essential war material. The German output is rising by leaps and bounds; Italy will shortly have two hydrogenation plants in operation at Bari and Leghorn; and Japan is working on a seven-year plan designed to supply the major portion of her requirements from Imperial sources by 1943.

Business Upturn

New York, August 2.—As was expected, the Federal Reserve Board's business indices for June showed no marked change from May, the two-point rise in manufacturing being due solely to the seasonal adjustment. It seems likely, however, that July will show a sharp increase over June, partly because there is considerable evidence that actual production was higher, and partly because the seasonal adjustment for July over June is about double that of June over May.

BUSINESS INDICES

(1923–25 = 100. Adjusted for seasonal variations)

	June, 1937	May, 1938	June, 1938*
Industrial production—total	114	76	77
Manufactures	*114*	*73*	*75*
Minerals	*115*	*91*	*91*
Construction contracts—total	61	51	54
Residential	*42*	*37*	*41*
All other	*77*	*62*	*65*
Factory employment—total	101·4	77·5	76·1
Durable goods	*97·8*	*67·2*	*65·1*
Non-durable goods	*105·3*	*88·6*	*88·0*
Factory payrolls—total†	102·9	69·2	67·0
Durable goods†	*104·6*	*60·5*	*57·7*
Non-durable goods†	*100·8*	*80·3*	*78·9*
Freight car loadings	78	58	58
Department store sales	93	78	82
Department store stocks	76	69	67

* Preliminary. † Without seasonal adjustment.

The severity of the decline is strikingly demonstrated by four comparisons:—

Factory pay-rolls in the durable goods industries in June, 1938, were only a little more than half what they had been in June, 1937.

The (unadjusted) figure of 58 for freight car loadings in the first half of 1938 was only three points above the average for 1932, the worst year of the depression.

Total industrial corporate earnings so far reported for the second quarter of 1938 were less than half the corresponding figure for the second quarter of 1937; for the railroads the proportion was even smaller.

The index of industrial share prices recorded a minimum of 98 at the end of March, 1938, which was almost exactly half of the peak figure reached 13 months before. At its highest point in July, however, the index was almost exactly 50 per cent. above the low point of the spring.

Unequal Incidence of Depression

Taken by themselves, however, these comparisons give a somewhat exaggerated picture of the situation. Generally speaking, the depression has been concentrated in the heavy industries, and elsewhere things have not been so gloomy. The decline in employment, for example, was twice as severe in the durable goods industries as in the non-durable. Department store sales from June to June fell only about 12 per cent., whereas the index of all manufactures fell 34 per cent. And although the prices of many agricultural commodities have declined, yet the farmers have experienced no depression comparable to that of the urban population.

Consolation may also be drawn from the fact that the contraction of loans described last week was relatively small compared with the catastrophic reduction of brokers' loans after the crash of 1929; thus the decline in the stock market, severe though it was, was not so disastrous in its deflationary repercussions. Even the decline in profits has been irregularly distributed, being greatest in the heavy industries, where the profits of 1937 were replaced by losses, and more moderate in the lighter industries. Thus 20 steel companies, which in the second quarter of 1937 earned over $69 millions, this year showed a total deficit of almost $10 millions. For the first six months a profit of $131 millions had become a loss of almost $15 millions.

The monthly indices show clearly that the characteristic feature of the first half of 1938 was stability at a low level:—

	Manufacturing Production	Residential Contracts	Factory Pay-rolls	Freight Car Loadings	Department Store Sales
1938—January	76	36	72	59	90
February	75	32	73	57	88
March	75	33	73	57	86
April	73	37	71	55	83
May	73	37	69	58	78
June	75	41	67	58	82

The most encouraging feature is the steady rise in the figure for residential contracts, which is now only one point below that of last June. The decline in department store sales reflects the slow pressure of continued depression.

Reduced Export Surplus

The June foreign trade figures show that the decline in exports is still proceeding rapidly, while those of imports show signs of flattening out. The month's export surplus dropped below $100 millions for the first time this year, and for the second time in the past nine months.

There have been striking changes in our foreign trade during the last two years, as the following table indicates:

MERCHANDISE TRADE OF THE U.S.

($000,000)

	Exports	Imports	Balance
1936—3rd quarter	580	604	— 24
4th quarter	721	654	+ 67
1937—1st quarter	713	825	— 112
2nd quarter	824	858	— 34
Total, 12 months	**2,838**	**2,941**	**— 103**
1937—3rd quarter	842	744	+ 98
4th quarter	968	656	+ 312
1938—1st quarter	828	507	+ 321
2nd quarter	764	453	+ 311
Total, 12 months	**3,402**	**2,360**	**+ 1,042**

Imports reached their peak ($307 millions) in March, 1937, and since then the decline has amounted to rather over 50 per cent. The peak in exports was reached in October, 1937, and in their case the decline is about 30 per cent., of which part is seasonal. Our merchandise trade balance in the year ended June, 1937, was passive by $103 millions; in the year just ended it was active by $1,041 millions.

France

Professor Rist's Review

Paris, August 11.—In his annual survey in the *Revue d'Economie Politique*, Professor Rist describes 1937 as a year of disappointments for France. The causes are held to be partly external, notably the American recession, but largely internal—the social troubles and the 40-hour week. The fall in revenue and the rise in the cost of living had wiped out most of what the workers had hoped to gain through social reform.

The year 1938, on the other hand, has brought a general improvement, particularly in foreign trade. Unemployment is decreasing, exported capital is returning. But France must choose between two fundamental economic programmes. She must either seek an increase in productivity through higher wages, or try to revive enterprise by restoring a sufficient margin between costs and sale prices.

A reduction in costs can only be secured through rationalisation of industry, which will require new capital, and therefore, according to Professor Rist, implies an energetic struggle against the Budget deficit and the borrowing policy of the State. Two other obstacles to business are mentioned —excessive national protectionism, particularly an unjustifiable revalorisation of agricultural products; and the gold sterilisation policy pursued by Great Britain (despite its abandonment in the United States), which removes a natural check to the decline in world prices.

The near future will provide a test of the influence of Professor Rist's views, for the Government will in a few days fix the price of wheat. There will be a second one in November, when, on the eve of the new Parliamentary session, the civil servants will put forward their claims for higher salaries.

Changed Attitude of Trade Unions?

The attitude of the trade unions and other elements of the Left is still uncertain. The continued existence of dissensions in the ranks of the Popular Front was proved at the national congress of schoolmasters, a body which holds a prominent position in the trade union world. The Secretary-General, M. Delmas, took up a firm stand against Communism and its warlike attitude in the affairs of Spain and Czechoslovakia.

He added that the trade unions must take into consideration the views and position of the peasants. He regretted the check to the policy of the Popular Front, and declared himself a supporter both of liberty and of the policy of the trade unions, including, if necessary, the mobilisation of capital. This support for an essential feature of a planned economy represents a certain offset to his attacks on the Communists, who are an important element in the unions. It is in direct contrast to the "liberal" thesis of Professor Rist, and suggests that the next crisis will not lead to a simple return to the old Popular Front.

Reduced Import Surplus

The latest foreign trade figures are in some respects very encouraging. The surplus of imports in July was 1,215 million francs, or less than in any month of the year.

(Millions of francs)

	July, 1937	June, 1938	July, 1938
Imports:—			
Foodstuffs	777	1,018	982
Raw materials	1,879	2,235	2,007
Manufactured goods	547	557	511
Total	3,203	3,811	3,500
Exports:—			
Foodstuffs	246	312	302
Raw materials	659	716	700
Manufactured goods	965	1,261	1,283
Total	1,870	2,291	2,285
Import surplus	1,333	1,520	1,215

Compared with July, 1937, exports of manufactured goods have increased and imports fallen, but the reduction in the import surplus compared with June is mainly due to lower imports of raw materials. For the first seven months the import surplus is about the same as last year, but allowance should be made for the rise in prices which followed the depreciation of the franc.

Another favourable factor is the increased receipts from tourists, due largely to the low level of French prices as expressed in gold and the facilities accorded to foreigners. One sign of the increased flow of visitors is the rise in the number of "autorisations" granted to foreign automobilists. In July this was 7,500, against 4,353 in July, 1937, when the total was swollen by the International Exhibition.

Nevertheless, the exchange market continues to be troubled by the persistent flight into gold and fears about international politics. The franc has consequently been very near to the official limit of 179 to the pound.

In the internal sphere most of the statistical evidence is mildly encouraging. The strong decline in the index of wholesale prices continued, all components being lower on the week; the complete index fell from 652 to 640. The number of unemployed on July 30th was 344,517, against 346,834 last week and 313,353 a year ago.

Germany

Further Collapse on the Bourse

Berlin, August 10.—The collapse of the Bourse still occupies the centre of the business stage. Last week share prices again fell heavily, and fixed-interest securities also reacted. This week both markets opened with a fresh decline, which yesterday reached almost panic dimensions in the case of shares, with falls of up to six points.

The public has not been enlightened as to the real cause or causes of this, for Nazi conditions, unusual setback. The commonest Press explanation, "the new international aggravation," is certainly incorrect, for the international situation, despite the Russo-Japanese clash, is not considered to be worse than usual. Jewish liquidation also seems to have played only a minor part in the last days. A good deal is said about the failure of the Bourse to function, and specific instances are cited. Thus the offer of a mere Rm. 5,000 of shares in the Reichsbank, of which the capital is Rm. 150 millions, caused a drop of two points. But the feeble Bourse mechanism could as easily have caused erratic rises as erratic falls, had conditions been favourable. Some part was certainly played by realisations of industrial holdings for general financing, and for taking over liquidated Jewish business interests. But the main factor is the unwillingness of the general public to buy. There is apparently something like a tacit "buyers' strike"; the only visible explanation is fear of new taxes.

This is, indeed, hinted at in officially inspired organs. In these one finds an intimation that the market is mistaken if it believes that the lower share quotations, and consequent increases in effective yields, will impede Government borrowing. New taxation is also spoken of, though no details are given. It is argued in some inspired quarters that the alternatives are, on the one hand, high share prices, liquidity, and a certain inflation; and, on the other, an uninspiring combination of Bourse weakness, Government borrowing for consolidation of debt, increased taxation, and depression of commodity prices.

Increase in Central Taxation

The familiar argument is again heard that industry revived after 1932 exclusively in consequence of Government initiative and credit-creation, which involved an increase in the national debt; and that therefore the Government can fairly claim an increased share in private profits. According to this argument, the relation between the Government and private business is similar to that between an enterprising individual who builds a factory and a lazy farmer close by whose land, in consequence, rises in value. The Government, like the factory-builder, wants to appropriate at least part of the unearned increment.

The **MERCANTILE BANK** *of* **INDIA**
LIMITED
Head Office: 15 Gracechurch St., London, E.C.3
Branches and Agencies throughout the East
EXECUTORSHIPS AND TRUSTEESHIPS ACCEPTED

The financial relations between the Reich and local authorities have been progressively altered in accordance with similar assumptions; and yet another adjustment or *Finanzausgleich* has now been decreed to carry the process a step further. The municipal beer tax is to be abolished on October 1st; the repayment of corporation tax levied on municipal utility undertakings has been done away with; and three-fifths of the yield of the property transfer tax will in future go to the Reich and only two-fifths to the municipalities. On the other hand, there are certain adjustments in favour of the States (designed to cover the increase in their expenditure due to the Four Years' Plan). They are to receive a larger share of the proceeds of the income, corporation, and turnover taxes, on which, since the law of 1936, they mainly depend.

The net effect of these and some other changes is the gain by the Reich of Rm. 385 millions of municipal revenue, the abolished municipal beer tax being added to the existing Reich tax. Even without the changes, the share in national income taken by taxation had greatly increased. In the following table the national income is given for calendar years, taxation for years from April to March:—

	(Millions of marks) 1929	1937
National income	76,000	68,500
Reich taxes	9,170	13,960
As a percentage of income	*12*	*20*
Reich, State and municipal taxes...	13,520	18,250
As a percentage of income	*18*	*27*

It must be remembered that the addition of numerous compulsory contributions, fees, and dues, and of special levies like the export subsidy would bring the tax totals to higher figures than those given. A Party organ states that in the business year 1936-37 the "voluntary social contributions" paid by 590 large joint stock companies amounted to Rm. 218 millions, which may be compared with the Rm. 354 millions paid by them in dividends.

Little Change in Business

The unofficial crop reports are good. Indeed, owing to the substantial carry-over from last year a storage problem has arisen. But there is still a certain shortage of wheat, and to reduce consumption the milling percentage of rye has been reduced. The explanation of this apparent paradox is that the former high percentage of rye was diverting consumers from rye to mixed rye-wheaten bread.

Railway traffic declined in June, but remained 5 per cent. higher than a year before. In June, 310,000 vacancies in industry and trade were unfilled. It is noteworthy that in the twelve months ended May, 1938, the percentage increase in the number of employed women exceeded that of men.

The official steel report for August mentions better world market prospects, and in July export orders showed an unseasonal rise. The last foreign trade return shows a sharp fall in imports of heavy iron and steel, which caused a rise in net exports. For the first half of the year exports of motor cars (private and commercial) represented 25.6 per cent. of all sales, against 21.4 per cent. in the same period of 1937.

Austrian firms and companies have been ordered to compile new balance sheets in terms of Reichsmarks, not merely by formal conversion from schillings, but by a complete revaluation of assets and liabilities. Existing shares may be restamped where an adjustment is necessary. The Reichsgericht has come to the important decision that the police may, by virtue of their general competence, and independently of infractions of the law, annul the right to trade.

Canada

Conservative Compromises

Ottawa, July 19.—On July 5th, 6th and 7th the Federal Conservative Convention chose a new leader, changed the name of the party from "Liberal-Conservative" to "National-Conservative" and evolved a new programme. The proceedings were reasonably harmonious and the only serious clash was over the plank about Imperial relations; this was eventually watered down to satisfy the representatives of Quebec and merely advocated consultation and co-operation with the other nations of the Commonwealth about defence problems.

The programme contains many obvious compromises designed to preserve party unity, and does not show any change in the outlook or philosophy of the party. The new leader, Dr R. J. Manion, is a Roman Catholic and a moderate protectionist, and is considered progressive in his views.

Excellent Harvest in Sight

All crop reports agree that prospects in the prairie provinces are by far the best recorded in the present decade for this stage of development. Ideal growing weather in July brought along rapidly grain crops which were already well rooted. Even in Northern Saskatchewan and Southern Manitoba, where the crops had previously suffered through lack of moisture, recent rainfalls have produced a marked improvement.

In some districts grasshoppers have done considerable damage and black stem rust has made its appearance in Manitoba and Saskatchewan, but fortunately a fair proportion of the wheat sown in these provinces is supposed to be rust resistant. Rust may yet take a heavy toll if weather conditions favour its spread, but the experts are now confidently predicting that the western wheat crop will be at least 300 million bushels (which would be double that of 1937) and may well exceed 400 millions.

Wheat prices have been tumbling downward as the result of the good crop reports which have come in not merely from North America but also from other countries. The Canadian Wheat Pool will probably have to fix a price substantially below the 87½ cents which it paid last year, as an advance, on deliveries of No. 1 Northern at Fort William.

Favourable Factors in Industry

The leading indices show no material change in business conditions, but the record for the first half of 1938 is considered satisfactory in view of the adverse influences which were operating. The Canadian index of business activity fell by 9 per cent. in comparison with the first half of 1937, while the corresponding decline in the United States was 31 per cent. Industrial production was 34 per cent. lower in the United States, but only 10 per cent. lower in Canada. In the week ended July 2nd the general economic index made its largest weekly advance for some months, but it then dropped back slightly.

Week ended	Car-loadings	Wholesale Prices	Bank Clearings	General Index
July 10, 1937	*78·0*	*87·0*	*96·4*	*109·7*
June 25, 1938	68·2	80·4	82·4	**106·0**
July 2, 1938.....	69·0	79·9	93·0	**109·1**
July 9, 1938.....	64·9	79·1	91·9	**108·1**

Since the beginning of July there has been a widespread and encouraging revival of confidence about the outlook for the second half of the year. This has been reflected in a brisk advance in share prices, which is still continuing. Three hopeful factors are contributing to this change in business sentiment—the prospect of good crops, which will raise the farmers' purchasing power; the probability of heavy British orders for aeroplanes and other kinds of armaments, which will benefit many lines of industry; and the stimulus to the building and allied industries which the low-cost housing scheme and public works programme of the Federal Government is expected to give.

Meanwhile the volume of retail trade is being well maintained. In June the sales of Canadian department stores were 7 per cent. higher than in May, though the index was still 3 per cent. lower than in June, 1937. Trade has now declined in the cities, but there is increased activity at holiday resorts, although the depression in the United States has reduced the number of tourists.

The figures for new construction in June were again disappointing, the value of contracts placed being $20,928,100, compared with $30,369,000 in June, 1937. However, there has been an improvement in the unemployment situation, as the employment index of the Bureau of Statistics reached 111.9 on June 1st, compared with 107.4 on May 1st and 114.3 on June 1, 1937.

Norway

Meeting of Oslo Nations

Oslo, July 28.—The chief political event of recent weeks has been the meeting held at Copenhagen on July 23rd and 24th between the Foreign Ministers of the seven Powers belonging to the Oslo Convention. The agenda of the conference included such items as armaments, air raids, sanctions and the League of Nations, all of which are topics of no less importance to small nations than to the big Powers. At the final session of the conference a memorandum was issued, which emphasised the joint interest of the seven Powers in the various questions discussed, and the necessity of adhering to the League and its leading principles. It also expressly maintained that the method of sanctions in the form employed hitherto would not be considered binding by the Governments represented at the conference. In the opinion of the conference, the memorandum went on to say, it would be in full harmony with the deepest interests of the League to give an unequivocal assent to the privilege of each of its members to judge and act individually in such matters.

Monetary Ease

Monetary conditions continue very easy, and, in spite of a slight contraction of bank deposits during May, the abundance of liquid funds is fast becoming a problem, and apparently a permanent feature, of the money market. This fact is clearly borne out by the great demand for Government and other first-class securities for investment purposes. While the average price of 4 per cent. Government bonds a year ago was somewhere about 95 per cent., buyers are to-day offering up to 102¼ per cent. without much hope of inducing sellers to come forward.

State revenue for the financial year 1937-38 will probably exceed that of the preceding year quite considerably, the surplus amounting to 53.5 million kroner for the 20 chief items. Of this amount, import duties account for 19.5 million kroner and direct taxes for about 9 millions. On the other hand, it is considered likely that expenditure will prove to be somewhat above the estimates, so that the net surplus will be below that of the preceding year.

Industrial Activity Maintained

According to the official index, industrial production during May was well maintained, the figure being 120, against 117 in April and 122 in May of last year. Unemployment figures indicate an appreciable improvement in the labour market, the number of unemployed being 10.7 per cent. lower on June 15th than on the same date of the preceding month, while the position was practically unchanged compared with last year.

Foreign trade figures for the first quarter of the year compared very favourably with those for last year, but it appears that the inevitable contraction on account of the world slump has at last set in. Thus, the total value of imports during the first six months of the year amounted to 595 million kroner, against 648 million kroner during the same period last year, while the figures for exports were 368 millions and 382 millions respectively. The excess of imports over exports consequently works out at 227 million kroner, as against 266 million kroner in 1937. As far as exports are concerned, it appears that the paper and pulp industries have suffered most from adverse market conditions and price movements, while exports of ships show an appreciable improvement.

Japan

One Year of Warfare

Tokyo, July 17.—The first year of the Sino-Japanese war has passed, and peace seems at least as far away as it did when fighting broke out in July, 1937. Indeed, if one looks back over the year one gets the impression of a stone thrown into water and causing wider and wider ripples. What the Japanese Army originally conceived of as a localised operation, designed to rivet Japan's political and economic grip on North China, has broadened in scope until the latest Japanese map of the prospective war zone stretches southwards as far as Hainan Island, and westwards to Ichang, far up the Yangtze River beyond Hankow.

The present conflict is thus proving no exception to the almost universal rule that wars last far longer than they are expected to. Japanese hopes that China would be reduced to complete submission within six months have been signally disappointed. And so have the hopes of the Chinese and their well-wishers abroad that the Japanese economy would not stand the strain of a prolonged war.

The two basic results of the war so far have been Japanese military superiority—on land, at sea and in the air—and Chinese solidarity. Add these two factors together and the sum seems to be a protracted war. Tokyo, like other capitals, periodically hums with rumours of secret pourparlers, or of possible foreign mediation. It is a matter of fairly common knowledge that the leaders of the puppet Government at Peking are in more or less regular communication with old friends on the other side of the battlefront; and this fact makes them natural intermediaries in unofficial soundings.

Overtures for Peace?

About the middle of June the new Foreign Minister, General Kazushige Ugaki, seemed to open a very small loophole for negotiation when he intimated, in an interview granted to the foreign Press, that Japan's decision not to deal with the nationalist regime might be modified, if there were "a serious change" in the situation. He declined to specify what he would regard as a "serious change." About the same time the Governments set up by the Japanese armies at Peking and Nanking issued a joint appeal to Chiang Kai-shek to cease fighting in view of the sufferings which the war had already brought to China.

It is quite conceivable that both General Ugaki's statement and the appeal of these Governments were related to tentative peace overtures. But even if these were really made, they seem to have borne no fruit; for the new War Minister, General Seishiro Itagaki, has just issued a most uncompromising statement to the effect that "Chiang Kai-shek must go" as a preliminary to any consideration of peace.

Of course, there is no absolute contradiction between the statements by the General who is in charge of the Foreign Office and his military colleague at the War Office. The elimination of Chiang Kai-shek might be the "serious change," at which General Ugaki cryptically hinted. But there is no sign that this elimination will take place in the near future.

Hopes of Dissensions in China

There is much speculation in the Japanese Press and in political circles about the possible future operation of divisive and disintegrating forces in China. Every report about hostility between the Kuomintang and the Communists, about disaffection with Chiang Kai-shek's policies in outlying provinces or among the provincial troops, about separatist tendencies among the ten million Mohammedans in the Chinese North-west receives widespread publicity. But as yet this seems to constitute wishful thinking. The only help which Japan has received from within China up to the present time (and this on a minor scale) is from the Mongols in Suiyuan and Chahar Provinces, who had been alienated by shortsighted landgrabbing policies of local Chinese militarists.

The belief has spread that the best way to strengthen the disruptive forces in China is to win a striking and decisive victory over the Chinese armies. This explains the decision to push on to Hankow without making any attempt to consolidate territory already under occupation, apart from holding the main railway lines. Travellers who have arrived here recently from North China are unanimous in their testimony that the writ of the Japanese and their puppet government in Peking simply does not run outside the main railway zones, except in Inner Mongolia and East Hopei. South of the Peking-Tientsin line a large area is reported to be carrying on under a local nationalist administration, virtually untouched by the Japanese occupation.

The extensive floods may or may not cause a serious delay in this programme, but the authorities are prudently preparing the public mind for a long war. On the anniversary of the first skirmish at Lukowkiao, on July 7th, appeals for endurance in the face of privation were as numerous in Japan as in China. One comfort after another is disappearing as restrictions on the use of cotton, petrol, iron, leather and other metals and raw materials multiply. A striking indication of the way in which the fruits of victory are blighted by the magnitude of the military effort involved is the present tendency to restrict Japanese exports to Manchukuo and occupied China, because neither of these countries can pay for imports in currencies of acceptable international value. It is these currencies which Japan needs in order to finance her essential war imports.

Letters to the Editor

Union Insurance Society of Canton

TO THE EDITOR OF THE ECONOMIST

SIR,—I wish to draw your attention to a paragraph under the heading "British Oak" which appeared in a recent issue of your paper.

The Union of Canton is described as a Chinese insurance company under British management, and later in the paragraph it is stated that "it is interesting to see the control of a vigorous British company pass to Canton."

It is necessary that I point out to you that the Union of Canton is not a Chinese insurance company. It was established in 1835, is incorporated in the British Colony of Hongkong, and is in fact the oldest British Colonial company in existence.

I am, dear Sir,
Yours faithfully,
H. C. GRAY,
London Manager,
Union Insurance Society of Canton, Limited.

Trading Estates

TO THE EDITOR OF THE ECONOMIST

SIR,—In your issue of July 30th you suggest that the scale of operations in the Team Valley Trading Estate and other trading estates is sadly small in comparison with the problem involved, and point out that the Team Valley factories employ only 1,100 workpeople, of whom more than half are women and juveniles, new entrants into a labour market glutted with elderly miners and other male workers.

Although your facts are perfectly true, I think that the sense in which they may be read will react rather unfairly toward those who have been responsible for the trading estates. Of the 54 factories occupied, none of them have been in operation for more than a year, and at least 40 have only been occupied since the beginning of this year. The month of June, for example, showed an increase of 14 factories handed over to their owners. It is recognised in industry that it takes at least two years for a factory to work up to anything like full production, and this is even the case with branch factories, let alone those which are new industries. About a year ago a census was taken of present and potential employment of Team Valley factories then let, and in almost every case tenants expected to double their existing employment within five years. These figures were not based on optimistic hope but on the tenants' actual works plans. The average employment per factory on Slough and other older trading estates is 75, and there is no reason to suggest that Team Valley cannot equal this average, for the factories are more or less of the same average size and denomination.

With regard to your expression of regret that half the workpeople are women and juveniles and that there is no opportunity for the middle-aged and elderly men, this can be dealt with in two parts. Firstly, the introduction of industries employing women and juveniles to an area which has been almost devoid of such employment can bring a measure of increased prosperity and purchasing power to the area, *vide* such towns as Leicester and Nottingham. Secondly, the North-East wants light industries to counterbalance the heavy industries, and, if it is to get them, must comply with the habit of light industry, which is to employ female labour. Such light industries fall into one of those periodical declivities which we know so well. I am sure that you will be aware that family purchasing power has become as important a measure as the purchasing power of the male worker, and that there are many families in the South who enjoy the fruits of an income of as much as £10 a week because the daughters and juvenile sons contribute.

I am, however, glad to see *The Economist* raising the question of the Special Areas. In the past year or so there has been a good deal of national complacency about the problem, and there has been so much national concentration of energy on foreign affairs that domestic policy seems to have been relegated to the background. The problem still exists, and it is up to those who realise its importance to maintain the interest of industry and of the public in it.

Yours faithfully,
London. PHILIP BAKER.

Banking and Trade Recession

TO THE EDITOR OF THE ECONOMIST

SIR,—I would certainly not hold that investors *as a whole* have suffered during the past six years. Indeed, it would be a dismal prospect for the average investor if six years of industrial recovery brought him no benefit. But the benefit lies in equities and marginal fixed-interest securities. Those investors who are dependent on gilt-edged and first-class debentures have had their incomes reduced as a consequence of cheap money, and, therefore, I cannot see how one can hold that a forced reduction of interest rates can do *no possible harm*. If one maintains that cheap money was partly responsible for the 1932-37 recovery, then one must surely admit that gilt-edged and debenture holders made a sacrifice for the sake of business improvement, and to ask for a further sacrifice as soon as business activity begins to decline seems more than a little harsh.

Yours faithfully,
G. E. ROSS.
London, E.C.2.

The Long-Term Budget Problem

TO THE EDITOR OF THE ECONOMIST

SIR,—Referring to the study of the long-term Budget position, which appeared in your issue of June 11, 1938, is it reasonable of me to suggest as a "way of escape" from the dire results of the Budget policy of successive Governments, as seen by Messrs. Falk, Balogh, Crowther, Hall and Henderson, that increased real wages and increased prices of raw materials might be a road worthy of exploration? Increased real wages and increased prices of raw materials should go far to increase the purchasing power of those whose standard of living affords ample scope for increased consumption which, once attained, will render unnecessary the destruction of "over-produced" commodities as practised at present.

To recognise the need for "the greatest possible production of goods and services" without first recognising the need and scope for increased consumption does not seem to be a practicable "way of escape." There must be in the British Empire some hundreds of millions of people whose standard of living is only just above starvation line—in the world as a whole there are perhaps 2,000 millions of such people.

Until manufacturers, as a class, see the possibilities of increasing the consumption of manufactured goods by paying relatively higher prices for raw commodities (at the same time increasing or maintaining their own profits by keeping their manufacturing plants working at, or near, full capacity to satisfy the demand thus created), I can see little to be gained by the recognition alone of the need for "the greatest possible production of goods and services."

Yours truly,
Port of Spain. FREDK. C. HARDING.

POINTS FROM LETTERS

Quick Frozen Foodstuffs.—Your article "Economics of the Tin-Opener" (July 2, 1938) presents striking evidences as to the change in dietary habits of the British people. In the United States vegetables and fruits are offered in fresh condition in the off-season through the medium of quick freezing. It is understood that production of this character is being started in England. The prospect in this field seems particularly large, especially as it has been proved that these foods possess all the health values, such as vitamins and the essential mineral salts, as well as the appeal to taste of the fresh garden article. In time of war a supply of these fresh foods within our borders would be of incalculable benefit.—*Lord Barnby, 54A Parliament Street, S.W.1.*

Banking and Trade Recession.—Perhaps you will explain or substantiate the apparent contention in your footnote to Mr. Ross's letter on July 30th (page 229) that the fixed-interest investor of to-day (at, say, 3½ per cent. per annum) is substantially not worse off, in real terms, than in 1928 (5 per cent. per annum).—*J. R. George, London, E.C.2.*

Books and Publications

A Gateway to Economic Theory

THE perfect introduction to the study of economic theory has not yet been written. The man outside the university or classroom who buys a book on economics usually does so because he wants to understand certain actual problems. How can his eagerness be made to survive the rigorous course in logical analysis which is necessary to achieve that understanding? The best books for beginners in economics have been written by experienced teachers. The tradition of economics teaching has a distinctively oral quality as the source of its inspiration. Can this oral quality of the classroom be recaptured between the covers of a textbook?

The problem is clearly one of method. How can realistic description and abstract analysis be combined in a single whole? Most elementary books have maintained their descriptive quality by following the lines of Marshall's "Principles." More recent advances in economic theory have been found better capable of exposition on the logical but highly abstract lines of analysis typified by Knight's "Risk, Uncertainty and Profit." Dr Benham's method is a combination of these two; and, despite his intention of writing a book only "for university students and those preparing for the examinations of the Civil Service and professional bodies," he nearly succeeds in providing the much more difficult general textbook* for which we are seeking.

The purpose of the economic system, Dr Benham argues, is to provide consumers' goods; and there are not enough consumers' goods to satisfy all wants. In *any* community, therefore, someone must decide which wants shall be satisfied; somehow or other a decision must be made about how the available means of production shall be used. This is the familiar "scarcity" definition of economics. Stated in this form it can lead the reader straight into the theories of value and capital without any of the dogmas about market conditions and private enterprise which are so popular among abstract theorists.

Indeed, Dr Benham concludes this section of his book by considering production under a dictator, and shows that he too—if he has willing subjects—will make decisions on the basis of a scale of preferences directed to the most economical use of resources. From this dictatorship the argument then passes quite logically to a modern capitalist economy—and by a way much more familiar to the ordinary reader than Robinson Crusoe's island, which has done duty in so many introductions to economics.

Unfortunately, Dr Benham has not himself fully maintained this line of exposition. He introduces his price concepts and market descriptions too early, and, in the latter part of the book, deviates too far towards the "Marshallian" method, so that his general line of argument tends to get lost in a series of separate chapters. Nevertheless, while this book is primarily what, after all, it is intended to be, a book for students working under a teacher, it is still the best and most up-to-date of any which have been offered to the general public.

For the class-room, the addition of a bibliography would undoubtedly be a considerable improvement. On some subjects, too, Dr Benham gives the barest lecture-notes, and further reading is essential. Moreover, the student should be encouraged to go to original sources as early as possible; where, for instance, does the author get his definition of "supplementary costs" upon which he bases his theory of profits? But these are defects which can be remedied in a second edition. In the main, Dr Benham has succeeded in doing what he intended: to bring within a single book the new facts and theories, knowledge of which is now demanded of students at their first examination.

These demands have changed considerably in recent years. The treatment of imperfect competition in terms of marginal revenue and marginal costs; the treatment of money as a liquid asset whose demand depends upon "liquidity preference" and the rate of interest; developments in the theory of diminishing returns and in the theory of large-scale production; the theory of "opportunity costs," scales of preferences and choice between alternatives; all these are ideas which the first-year student must now be able to handle. The changes in the London money market and Bank of England policy since 1931; the practice of a "cheap money" policy and exchange control; the growth of restriction schemes and protection by duties and quotas; all these are matters which he must now be able to explain. This book is the first to deal adequately with these new developments, and it should receive a ready welcome.

THE BUSINESS WORLD

An International Depositary

AMID the general decline in international economic relationships since the war, there has been one bright exception. The volume of the international trade in securities quoted on public exchanges has been commendably maintained. Between London and New York the flow of business is already considerable, and though the existence of such a large volume of liquid, or at least easily realisable foreign funds, has its inconveniences, it is undoubtedly to the good that there should be free inter-communication between the different capital markets of the world. The full participation of Continental centres, however, has been hampered by the fact that the great bulk of British, American and Canadian securities are in registered form, while the continental investor has a pronounced preference for easily negotiable securities transferable by delivery. The effect of this difficulty can be seen in the highly inadequate and unrepresentative list of international securities quoted, for example, on the Paris and Swiss bourses.

The idea of bridging the gap between the form of Anglo-Saxon securities on the one hand and the nature of the Continental investment demand on the other occurred many months ago to a group of London and Paris bankers, who, after long and at times intricate negotiations, have now succeeded in translating the idea into reality. The formation of the International Certificates Depositary Company by a consortium of British, French, Swiss and Belgian banks is an event the importance of which is not to be measured by the moderate capitalisation of the new institution, for it holds within itself the seeds of expansion and development into one of the foremost parts of the mechanism for international dealing in securities.

The first stage of the process from which the new company has emerged was to collect an international team of collaborators that would inspire the complete confidence in the new organisation, which must be the first and essential pre-requisite of its successful functioning. On this score, the following list of participants should meet the strictest requirements:

London: Glyn, Mills & Co.; Brown, Shipley & Co.; Helbert, Wagg & Co.; Samuel Montagu & Co. *Paris:* Mallet Frères & Cie; Hottinguer & Cie; Mirabaud & Cie; Maurice Rueff & Cie. *Switzerland:* Société de Banque Suisse; Crédit Suisse; Lombard, Odier & Co. *Brussels:* Cassel & Cie.

The next task was the formation of an organisation which would act as the agent for the conversion of registered shares or stocks into securities having the required bearer form for introduction on the Continental bourses. This organisation has now been formed. It will be known as the International Certificates Depositary Company, Ltd., and has been registered in London with an authorised capital of £200,000, of which £86,100 will be issued and £23,100 paid up. The whole of this capital is being subscribed by the participants mentioned above. This company may be compared to a cloakroom in which registered securities will be deposited and against which a cloakroom ticket will be issued. This ticket will be a deposit certificate in the form of a bearer document, to which coupons will be attached. These coupons will represent the claims to any future dividend payments or capital rights to which the holder may become entitled in respect of dividends or rights accruing on the underlying registered securities. Arrangements have already been made by which these bearer certificates will be quoted and made good delivery in the Stock Exchanges of Paris, Zürich, Basle and Geneva. The list of Exchanges will probably be extended in the course of time.

The Depositary Company is not the sole organism to be established in the creation of this new machinery for international dealing in securities. A nominee company is also being formed, in whose name the underlying securities will be registered. This nominee company will be responsible for the payment of the coupons, just as the depositary company will be responsible to the holder for the underlying securities. It would probably have been desirable to register the nominee company in this country, and thus centralise the whole organisation in London. For various fiscal reasons, however, it has been found preferable to register it in Switzerland.

The deposit receipts will be issued jointly by the depositary and the nominee companies, and will in addition be countersigned by Messrs Glyn, Mills and Company, who will act as bankers to the depositary company in London and in whose vaults the underlying securities will be kept. The depositary company will derive the major part of its income from the charge it will make on issuing its bearer certificates. The nominee company, for its part, will derive its revenue from a small *ad valorem* commission, which will be deducted from coupon payments. In addition, the nominee company will be receiving dividends on the underlying securities in one currency, say, dollars, and will be effecting payments on the coupons in another, say, French francs, and the consequent exchange transactions will presumably provide further opportunities for reasonable profit.

The organisation will have paying bankers in all important countries, at whose offices coupons will be paid. It will be left to these bankers to deduct from the coupon payments the tax appropriate to the country in which they operate. The new facilities will thus at least not enlarge the loopholes for evasion of taxes left by the laws of the countries concerned; the fears on this score felt in certain high quarters during the course of the negotiations that preceded the formation of the depositary and nominee companies have been satisfactorily allayed.

The basic idea underlying this new organisation is by no means novel. It has, for example, been applied for well over a century in the Netherlands, where there are at present over thirty depositary companies known as Administratie Kantooren, which issue bearer certificates in respect of about 130 registered shares, and whose certificates are quoted on the Dutch bourses. These companies have been largely instrumental in popularising American investments in the Dutch markets, and they have, in most cases, proved extremely remunerative undertakings for their sponsors. In this country there is the well-known example of the Westminster Bank, which issues bearer certificates representing shares of the Canadian Pacific Railway. Hitherto, however, the application of this idea has been limited, either to marketing operations in one particular market, as in the case of the Dutch companies whose certificates are only quoted in the Dutch bourses, or to one specific share as in the case of the Canadian Pacific certificates issued by the Westminster Bank.

The new venture, however, although it will in its initial stages work within fairly restricted limits, comprises in its organisation all the elements of elasticity and potentialities of development, which will enable it to provide an agency for a better international distribution of securities.

Except in so far as it will gain from increased stock arbitrage business, the London market, outside the participating firms, will at first play a somewhat passive rôle in the new mechanism, for it is the intention of the sponsors to concentrate first on the leading American securities. It will do so partly because it is in favour of dollar securities that market winds are blowing at the moment, and because it is for them that the greatest potential investment demand is to be found on the Continent. The dealing facilities which the London market offers for American securities make it unlikely that the bearer certificates of the depositary company will compete at all actively with the securities themselves, as far as this country is concerned. There has been no occasion, therefore, for the sponsors to request the Stock Exchange authorities here to take official cognizance of the new organisation, or to request an official quotation for such certificates as it may issue If, however, the international arbitrage in these certificates assumes sufficient dimensions, it is quite probable that a demand for their official recognition by the London Stock Exchange may arise, not from the new organisation, but from within the Stock Exchange itself

The formation of this new organisation deserves a success in keeping with the ingenuity and arduous labours which its sponsors have devoted to it. Its objectives let in a breath of fresh air into the fœtid atmosphere of this increasingly autarkic world. And it is in every way fitting that so great a part in this initiative should have been played by the merchant bankers of London, for it is among them that are to be found the best representatives of what remains of that liberal individualism by which the greatness of the city was built.

Brewery Share Prospects

BREWERY company reports issued during the past fortnight have provided unwelcome news for the investor. Reduced profits have not been confined to such leading concerns as Arthur Guinness and Son, and Watney Combe Reid; smaller companies, including Friary Holroyd and Healy's and Showells Brewery, also show a definite, though not serious, decline. The Stock Exchange has been engaged for many months past in discounting the approach of falling earnings, but its first response to these results has been to mark brewery shares down fairly sharply, on fears that worse may be in store.

The Actuaries' index of equity shares, based on prices at the end of 1928, shows that representative brewery (and distillery) issues fell by 22½ per cent. from their high level of 160.5 in mid-November, 1936, to 124.4 this week. This was less than the 27¾ per cent. loss on a general list of industrial equities over the same period. But in the past fortnight, brewery shares have fallen by as much as 2½ per cent., while ordinary shares generally have experienced only a minor reaction. The average yield of 5⅓ per cent. on brewery issues is, indeed, about one-quarter per cent. higher than the return on a mixed holding of industrials. What do these market movements signify? Are brewery shares already feeling the effects of depression, and fated to feel them more keenly still? Is the group likely to miss, for a spell, the invaluable support of the provincial investor, whose past faithfulness has been well rewarded in dividends and capital profits?

The investor whose confidence in the prospects of the industry may be wavering should first consult its earnings record during the past decade. He will find that it was by no means depression-proof. Indeed, the total profits of the eight companies shown in the accompanying table fell by 11½ per cent. between 1930 and 1932. But in the majority of cases the ordinary shareholder continued to draw dividends. A few companies maintained their ordinary share payments throughout the depression; the majority reduced their rates as net profits fell, and thus kept their reserve provisions relatively stable; and in only a few cases, such as Newcastle Breweries, was the impact of depression so serious that ordinary dividends were temporarily passed.

Such results, covering the most serious period which the industry has faced in post-war times, suggest that it should preserve an adequate foundation of profits even if the present recession is further intensified. There is no case, in short, for indiscriminate disposal of brewery share holdings. Hasty action based on the results of a single year, disappointing though they may be, deserves ill-reward; the long-term investor should be prepared to take broader views. It is worth while, in fact, to trace the industry's history since 1923, when it received a significant remission in duty. Brewery output increased by no less than 20 per cent. in the following two years. But from 1925 onwards, a secular downward trend in beer consumption set in which has been evident, apart from intermediate variations, in the output figures ever since. In 1925, production amounted to 20,863 standard barrels. The figure fell steadily to 18,811 barrels for 1930, and then, as the depression made itself felt, to 16,377 barrels in 1931 and 13,228 barrels in 1932. Opinions may differ about the precise effect of the increased beer duty imposed by the emergency budget of 1931 upon beer consumption, as distinct from the general effects of the depression itself. But a fall of 30 per cent. in output in two years is an experience which the industry would not care to repeat; "no change" in the beer duty has become a fiscal watch-word since the penny was taken off the pint in 1933.

Regular progress has since been registered in output, from 14,314 barrels in 1933 to 16,254 barrels in 1935 and 17,853 barrels last year. Here are two significant points for the investor. Although business activity, as measured by *The Economist* index, exceeded the 1929 level by 13½ per cent. last year, beer output was about 8 per cent. lower. Secondly, brewery profits were appreciably higher last year than in 1929, despite this reduction in output. The industry learned valuable lessons in economy during the depression. In particular, it reduced the number of breweries in operation from 1,502 in 1929 to 1,026 in 1937. So far, again, the impact of the current recession is scarcely visible in the output figures. It is true that the total in June was slightly below that of the corresponding month of 1937—a point which has not escaped attention after several years of consistent progress. But it is dangerous to infer too much from the results for any single

month, and in particular for an unseasonable month. The increase in consumption is naturally less vigorous than it was. Output in 1937 increased by 6.7 per cent. over the 1936 level; but for the first six months of the current year, compared with the corresponding period of 1937, the rate of increase has dropped to 3.2 per cent. Nevertheless, for a period in which the volume of unemployment was about 23 per cent. higher, on the average, than in the first six months of 1937, the industry's recession record is so far quite favourable.

Output is one thing; but profits are quite another. To-day brewing costs are appreciably higher than a year or two ago. Hops have been stabilised at £9 per ton under the marketing scheme. Malting barley was extremely scarce last year, when English malt cost 15s. per quarter more than in the preceding year; but there may be hope of relief from high malt prices this year, in view of the excellent barley crop prospects. Brewing sugar also stands at roughly the same level as a year ago. These items, coupled with wages, are the direct constituents of brewing costs, and are more or less common to all brewing concerns. Distribution costs, however, have also increased. Brewery company chairmen in recent months have dwelt, almost without exception, on the substantial increase in the sales of bottled beers, which, in many cases, has involved the extension of

† Tax free. (*a*) Capital bonus of 50 per cent. distributed 1934. (*b*) Before amalgamation with Samuel Allsopp and Sons in 1934, when ordinary capital was raised from £874,218 to £1,475,698.

bottling stores and the carrying of higher stocks. Local rates are increasing, and may increase further. To these direct charges upon trading and profit and loss accounts may be added another—provision for modernising and extending licensed premises. In particular, companies supplying the inner London area have undertaken considerable rebuilding in recent years, and have also erected premises in newly built-up areas. Watney Combe Reid is a typical example among the companies which have made generous provision for rebuilding and extending licensed premises in recent years.

These various items of costs do not, of course, affect individual brewery concerns in equal measure. We can distinguish, in the first place, between the local brewery, with its system of tied houses, and concerns which operate on a national scale, like Bass, Ratcliff and Gretton, and Arthur Guinness and Son. Other things being equal, the latter are likely to be more closely affected by changes in distribution, as opposed to brewing, costs. Again, among local breweries the investor may compare the records of companies which operate in areas particularly sensitive to cyclical changes in economic conditions—Newcastle Breweries is perhaps a good example—with those in other areas which suffer less from such changes—such, for instance, as Bristol Brewery and Georges and Brickwoods. Some of the local concerns also tend to concentrate upon a bulk beer trade—in the London area, for instance, Taylor, Walker may be a fair example. Finally, and superimposed on these various sub-divisions, the investor may trace the benefits and economies of amalgamation, as revealed by the profits of Ind Coope and Allsopp in recent years. We may briefly examine these types in turn.

Shareholders of Watney Combe received a clear indication in the latest report that they may have to share any further reduction in profits with the property improvement reserve, just as expanding profits have been shared since 1933. The "national" brewers obtain higher prices, but they sell on quality, and may face relatively greater distribution charges than local concerns. Shares of the standing of Bristol Brewery and Georges and Brickwoods, in the stable South and West, are tightly held on their impressive earnings record through depression and recovery. It would seem that such companies have secured appreciable operating economies during the past decade. In Newcastle Breweries the investor finds that comparatively rare thing—a highly-geared brewery share. Some gearing element is common to all brewery equities, for the industry's substantial fixed assets provide excellent security for prior charges. But in relatively few cases have fluctuations in earning power, within the space of five years, left ordinary dividends uncovered at the trough, and yet provided a 15 per cent. ordinary dividend (twice covered by earnings) in recovery.

Holders of shares in companies which cater largely for a bulk beer trade probably have closest interest in the prospects for beer consumption. Bottled beer business, as we have seen, has greatly increased in recent years. But the bulk beer trade is a "public bar" rather than a "saloon" trade, and the relative stability of profits of such concerns as Taylor Walker during the past three years may have been associated with relatively low profit margins and, perhaps, with some tendency for bulk consumption to fall off. In the long run, this latter factor is the all-important one. The industry is well aware that its market is changing. To-day, it is the glowing face of the athlete who smiles down from the beer advertisements. The industry, in short, is trying to cultivate a new generation which spends its week-ends in the open air and its evenings at the cinema, in its gardens in summer, and in seeking fortune from football pools in winter. By making licensed premises more attractive, by providing food and the popular amusement of the dart board, "the trade" is fighting back strongly in competition with these modern pursuits. But the heavy beer-drinker, even in the traditional beer-drinking trades like iron and steel and textiles, may soon belong to a past generation. Consumption per head, and therefore total consumption, may well show a declining trend in the future.

The long-term prospects for the industry, therefore, depend in no little degree on the achievement of further operating economies. A considerable increase in efficiency has already taken place, but it is hardly complete. A moderate fall in brewing profits among the smaller concerns might, for example, provide a favourable context for offers of amalgamation from larger companies. Ind Coope and Allsopp, to quote only one case, has done much, since the Allsopp business was absorbed in 1934, to effect further amalgamations within the group, but some time must still elapse before the full benefits are realised. But the expansion in the parent company's profits between 1935 and 1937 provides clear proof of advantages of prudent amalgamation. In the immediate future the industry's profits will be dependent upon the trend of consumption rather than costs, which may have been stabilised for the time being. Its experience in the worst of industrial depressions does not suggest that the consequences of any fall in consumption which is likely at the moment will be either disastrous or permanent. But the long-term outlook rests on the industry's power to offset any resumption of the secular fall in consumption by means of internal economies. And the balance of probabilities suggests that there is every reason for retaining sound brewery investments in this expectation.

Aluminium

EXCEPT for silicon, aluminium is the most abundant constituent of the earth's crust. It is twice as plentiful as iron, and possesses qualities which make it suitable for meeting a variety of needs. Yet aluminium is definitely to be classed among the newer metals.

The explanation of this apparent paradox is to be found in the difficulty of extracting the metal from its ores. Aluminium occurs most frequently in the form of silicates, which are an essential constituent of all common rocks and clays, and of various soils. But even to-day these cannot be commercially exploited, and the only ore which is suitable is also relatively scarce—at any rate in comparison with the abundant deposits of easily-worked iron ores. This is the oxide, which is found in an impure form in a clay-like substance called bauxite.

The first stage in the process of extracting aluminium from bauxite is to separate the oxide, or "alumina," from the other ingredients. This is done by treating the bauxite under pressure with a solution of caustic soda in water; the alumina dissolves, while most of the impurities do not, and can therefore be separated by filtration. The solution is then heated, and pure alumina is obtained as a white powder. With a high-grade ore, 2 lb. of bauxite give 1 lb. of alumina.

The alumina is then reduced to aluminium by electrolysis in a bath of cryolite (a double fluoride of aluminium and sodium). The cryolite is first melted in an electric furnace, and the alumina then stirred in. The process is carried out at a very high temperature, and it requires ten kilowatt-hours of power to convert 2 lb of alumina into 1 lb. of the metal.

This method of electrolysis was discovered independently by Hall and Héroult in 1886, and its nature has had a profound influence on the structure and location of the industry. The importance of cheap and abundant electricity is obvious—the cost of power may easily amount to some 10 or 20 per cent. of the total cost, whereas the raw material cost seldom exceeds 10 per cent. Large-scale production is necessary, and the tendency towards concentration of the industry was reinforced by the action of the original patentees, who secured control of much of the best raw material before their patent expired.

As a result, production in every country is now concentrated in the hands of a few very large concerns. The leading example is the Aluminium Company of America, which is not only the sole producer in the United States, but also controls the Canadian Aiavida works, one of the world's largest producers. In the United Kingdom, production is in the hands of the British Aluminium Company, Ltd., and the Aluminium Corporation, Ltd. The former company dates back to the earliest days of the industry; the latter is controlled by the Alliance Aluminium Company, the organ of the international cartel.

The table in the next column shows how little the possession of raw material determines the geographical distribution of production. Hungary, Jugoslavia and British and Dutch Guiana produce large quantities of bauxite, but export virtually the whole of it. Germany, Canada, Switzerland, Norway and the United Kingdom are almost entirely dependent on imports of the raw material, but have flourishing aluminium industries. Only the United States and the U.S.S.R. are more or less self-sufficient.

Nor, apparently, is it essential to have a large internal demand for the metal, as the Swiss and Norwegian figures show. The dominant consideration is usually the availability of cheap power. In the case of Germany, however, there have also been special factors at work, which have induced the State to encourage an increase in output from 33,000 tons in 1929 to 127,500 tons in 1937. For, although Germany has to import the raw materials, yet the cost of these is only some 10 per cent. of the final price. Hence in her search for greater self-sufficiency

she has found it very advantageous to use aluminium as a substitute for tin or copper—more especially as the raw material is obtained from Hungary and Jugoslavia under clearing agreements. In 1938 the German output is expected to reach 175,000 tons, which would make her unquestionably the foremost producer in the world, and might lead to substantial exports.

Italy has also made considerable strides towards self-sufficiency, by raising her output of the metal from 7,000 tons in 1929 to 22,900 tons in 1937. In that year she still had to import 3,400 tons, but permission has been granted to two leading producers to enlarge their plants. The United Kingdom imports substantial amounts from Canada, and smaller quantities from Norway, despite an increase in production from 13,900 tons in 1929 to 19,400 in 1937. British consumption in 1937 is estimated at 44,000 tons.

The production of aluminium has provided one of the most successful instances of control of an industry by international agreement. In 1932 the Alliance Aluminium Company of Basle was formed to regulate prices and production, with the producers in Germany, France, the United Kingdom, Canada and Switzerland as its leading members. Its price policy has been directed above all to securing stability. From 1932 onwards it made no alterations until the recent reduction to £94 per ton for domestic sales and £90 per metric ton for export (previously £100 in both cases). The Cartel deserves

£1,300 *instead of* **£1,000**

UNDER *The Distinctive System* of The Scottish Provident Institution the premiums are so moderate that at the usual ages for assuring the yearly sum charged elsewhere for a Whole Life Insurance of £1,000 (with profits) will here secure from the first as much as £1,300 or thereby with right to share in the surplus. The additional £300 is equivalent to *an immediate and certain bonus of £30 per cent.*, as large as can be looked for in other Offices only after many years.

FUNDS EXCEED **£24,500,000**

credit for refusing to follow last year's spectacular rise in the prices of other base metals. But it is more questionable whether the maintenance of a price of £100—very little below the average level of the years immediately preceding the slump—was justified during the depression years.

Thanks mainly to the restriction of output enforced by the Cartel, the large stocks accumulated between 1927 and 1932 have now been reduced to reasonable proportions. World consumption was actually in excess of world production for each one of the five years 1933–37, as may be seen from the following table :—

WORLD PRODUCTION AND CONSUMPTION OF ALUMINIUM
(Thousands of Metric Tons)

	1929	1933	1934	1935	1936	1937
Production	282	142	171	260	366	489
Consumption	276	158	227	307	407	*
Change in stocks	+ 6	−16	−56	−47	−41	...

* Not yet available, but certainly exceeded 500,000 tons.

World production in 1937 was nearly 75 per cent. greater than in 1929. The expansion of output in Germany was, of course, largely responsible for the increase, but there have also been several complete newcomers, notably the U.S.S.R. and Japan, whose outputs in 1937 were 45,000 tons and 10,500 tons respectively. But consumption has risen so greatly that there was no difficulty in finding a market for all producers, new and old. Plant that had been idle during the depression was brought back into operation, and plans are being made in many countries to raise output still further. As an example, the British Aluminium Company is doubling the capacity of its Lochaber works and erecting a third alumina plant to begin work at Newport before the end of this year.

The various properties of aluminium are obtaining progressively greater recognition. Most familiar is its lightness—it is only one-third as heavy as most metals. It is also very ductile, and can therefore be easily rolled into sheets or strips, cut into circles, extruded or drawn into a wide range of sections, rods, tubes, wires and rivets; each of these properties opens up a wide range of possible uses. Moreover, it resists corrosion and has a high electrical and thermal conductivity. Aluminium is manifestly very far from depending on a single use for its outlet. It is already widely employed in transport (including aviation), electrical goods, collapsible tubes, food-packing, household appliances, machinery of all sorts and in alloys with steel. Even this varied list is not exhaustive, but it serves to disclose one of the major advantages of the industry's strategical position; nearly all the consuming trades are themselves expanding, so that the consumption of aluminium will almost certainly increase, quite apart from the discovery of new uses.

One development which may prove to be of outstanding importance is the recent discovery of a new alloy. Ordinary aluminium suffers from the serious drawback that its structural strength is relatively low. But it has been found that the addition of 4·5 per cent. of copper, 1·5 per cent. of magnesium and 0·5 per cent. of manganese gives it a tensile strength equal to that of structural steel. Where low weight is more important than low cost such a material would be supreme; and even the cost factor is not so adverse as might appear from a simple comparison of the price per ton, for what is wanted is not a given weight, but a given volume, and steel is three times as heavy as the alloy.

The international cartel devotes considerable sums each year to research and the development of new or improved uses, which should increase consumption in the future. It has also shown that it can maintain a stable price for periods of several years, so that consumers can plan ahead on a reasonably firm basis. The trend of costs in a developing industry should be downwards, and the ultimate test of the cartel's policy will be the rapidity with which declining costs are reflected in the selling price. In short, whilst general slumps may bring periodical set-backs in the future as they have done in the past, yet the long-period trend of consumption should be steadily upwards.

Finance and Banking

The Gold Rush Goes On.—There has been no sign of abatement in the demand for gold this week. The amounts dealt in at the daily fixings have fluctuated between £1,519,000 and £2,356,000, while every day business after fixing has continued exceptionally active. The demand for gold can still be divided into two main categories, the one governed by international tension and the other by fears of a further depreciation in sterling *vis-à-vis* the dollar and by consequent expectations of a corresponding increase in the sterling price of gold. The purely hoarding demand for the metal is apparent in the continued bidding for gold coins, which this week has risen to a premium of 7 per cent. over their bullion value. The "exchange demand" for gold has up to now justified itself, since sterling has, on balance, lost further substantial ground in terms of the dollar. The New York rate in London this week has touched $4.87\frac{1}{8}$, which is well within the gold points of the traditional parity of the two currencies. The weakness of sterling would have gone further had it not been stemmed by Control operations, which at times have had to acquire massive proportions. Sterling has also been helped against the dollar by Japanese sales of the latter currency, effected against renewed shipments of gold from Japan to the United States.

* * *

The gold sold at fixing continues for the most part to be supplied by the Exchange Equalisation Account, and the authorities have throughout the week maintained a price representing a ¼d. premium over the dollar shipping parity. This has been done to limit arbitrage shipments to New York, the task of providing support for sterling being reserved for official operations. Nevertheless private arbitrage has found it possible by jobbing in the dollar, i.e. anticipating or postponing the covering sales of dollars, to arrange some moderate shipments which have proved profitable even on the basis of the officially controlled price for gold. During the week to Thursday, August 11th, £1,721,214 of gold was taken for export from this country to the United States, all of which represents private arbitrage operations. The Exchange Account has also been supplying gold after fixing this week, though a substantial proportion of the selling in the afternoon business has been provided by the market itself.

* * *

M. Rist Accuses.—Every year M. Charles Rist, the eminent French economist, contributes a preface to the annual review of the economic situation of France, compiled by the *Revue d'Economie Politique*. These annual appreciations of the French position are always read with great interest, both for the authority and candour of the views which they express. The latest of these has just appeared, and as a sober, not to say sobering, summary of the French economic situation it is an admirable document. M. Rist, however, closes his review by an accusation against the gold policy of Great Britain which cannot be allowed to pass without comment. He relates it to the subject of his preface by pointing out that one great obstacle to economic recovery to-day, whether in France or the world as a whole, is to be found in the "continuation of a policy of gold hoarding by Great Britain—a policy which has happily been abandoned by the United States." After using the familiar argument of the coincidence of rising prices and economic prosperity with an expansion of gold production in the nineteenth century, M. Rist argues that the exceptionally large current production of gold is being prevented from affecting the level of prices, and therefore world economics, by hoarding and sterilisation of gold in the British Exchange Equalisation Account. This accumulation of gold, he adds, goes far beyond the limit that might be justified by the need to provide a cushion against movements of hot money. The accusation appears a little inappropriately after a period of six weeks during which the Exchange Equalisation Account must have disgorged well over £50 millions of gold—mainly to compatriots of M. Rist. There might be something in the accusation if there had been the slightest evidence over the past year of monetary stringency in this country, or if there were any grounds for believing that lack of credit facilities played any part in the economic recession which became evident in the latter half of 1937. There were, of course, none, and M. Rist's own review of conditions in France shows that it is quite unnecessary for anyone to tell him that factors of a wholly non-monetary character can become decisive in determining the trend of the economic cycle. But the whirligig of time is having an amusing revenge when Frenchmen advance, and Englishmen have to rebut, the argument that the sterlisation of gold is responsible for all their ills.

* * *

Clearing Bank Statements.—The clearing banks' average figures for July are in the main dominated by customary seasonal influences. The cash figure has declined somewhat following the turn of the half-year and to £241 millions is £2.2 millions lower than in June. As the banks have, on the whole, been prepared to work on a somewhat lower cash ratio, namely, 10.26 against 10.73 per cent., this reduction in bank cash has involved no reduction in total assets. Money at call and discounts are both higher by £5.3 millions and £12 millions respectively, which reflects the normal seasonal expansion in the issue of tender bills. Investments have risen by £3.5 millions, while loans and advances are down by £500,000. There is the customary reduction in items in transit, which, as usual, were swollen in the previous month with the approach of the end of the half-year.

Irish Bank Note Issues.—The Irish Consolidated Bank Note Issue, which the Banking Commission recommends for abolition, was, in its present form, the creation of the Banking Commission of 1926. The position existing at the time the Free State was set up in 1922 was that five of the nine banks operating in its territory had note issues under the provisions of the Bankers (Ireland) Act of 1845. The Act of 1845 fixed a fiduciary issue of £6,354,494, and the banks could issue further notes against the deposit of gold or legal tender currency. The Free State Currency Act of 1927 withdrew the circulation of these sterling notes and set up the Consolidated Issue, in which all the banks, whether or not they had previous issues, share. The Chairman of the 1927 Commission was Professor Parker Willis, of New York, and the Consolidated Issue has several American characteristics. Thus the notes are uniform in appearance, irrespective of the issuer, and they are considered to be in issue when delivered by the Currency Commission to the issuing bank, even if they are held in the bank's till. They are also supposed to be specially secured upon liquid commercial paper. The total issue has been fixed at £6,000,000. But each bank has had to deduct from its share a sum equal to that proportion of its outstanding "old" (i.e. pre-Free State) notes, which is deemed to be attributable to the Free State. The result of this provision was that the average issue in the first quarter of 1938 was only £5,050,000, and not all of these were outside the banks. The Consolidated Bank Note Issue has thus been the inelastic smaller part of the total circulation of paper money in Eire, the Legal Tender Notes being in issue to almost twice the amount, in addition to an unknown amount of Bank of England notes. The restrictions on the issue, together with the tax of £2 10s. per cent. levied on the total issue (whether outside the banks or not), have limited the profitability of the notes to the banks. But no bank likes to lose its privilege of note-issue, and the Irish banks will be sorry to see their notes disappear.

MONEY MARKET NOTES

Foreign Exchanges

THE foreign exchange market has had another exceptionally busy week, with the main interest shifting rapidly from the dollar to the French franc and then to the belga. The dollar continued keenly bid until it reached the rate of $4.87\frac{1}{8}$ on Tuesday, but has since reacted to $4.88\frac{1}{2}$ owing to the combined influence of Control operations, arbitrage shipments to New York and some reconversion of dollars into sterling by interests who had made the reverse operation in recent weeks. On Thursday afternoon the dollar was appreciating again beyond 4.88. The French franc became suddenly offered on Tuesday, following the unexpected return of the French Prime Minister from holiday, and it needed considerable supporting operations by the French Control to hold the rate at 178.90, or as close as the rate can be allowed to approach to the published limit of depreciation, namely, 179 to the pound. Forward francs have weakened, the three months' rate going out to 5¼ frs., but Control operations, plus the exceptional narrowness of the forward market, have checked any appreciable expansion of speculative commitments in this direction. The rate has since recovered to 4⅞ frs. discount. Following the weakening of the franc on Tuesday, the belga had to withstand considerable selling pressure on Wednesday. For some time past this currency has benefited by the covering of bear positions and on Wednesday morning stood at its gold import point in relation to the dollar. At the close of the day it was very near gold export point. There have also been attempts to sell belgas forward and discounts have widened to 40c. for three months.

*

The Bank Return

THE customary post-holiday contraction in notes is shown in the latest Bank of England return, the circulation being down by £7,790,000. This is about £1,700,000 more than the contraction in the corresponding week of last year.

In the banking department there has been a reduction of £4,950,000 in Government securities, a movement which is to be read in conjunction with the seasonal return of notes from circulation. Public deposits show an increase of £9,805,000 over the week, a movement which may partly be connected with the seasonal income tax payments, but which must also be due in part to

Investment

Markets, Gold and Politics.—The London market has been a spectator in the stands this week rather than a performer in the arena of events. It has made nothing of the legacy of slightly firmer equity prices which it took over from the end of the three-week account. Indeed, the "bears" having covered, there has been little immediate incentive for the professional operator in one direction or the other. Investors have noted with approval the favourable character of the July unemployment return, though they do not, as a whole, appear to have revised their calculations of the timing, and extent, of the recession. On some grounds, perhaps, it may be possible to reach conclusions of passive optimism regarding the immediate trade outlook, if only on the premise that the rapid deterioration which occurred during the earlier months of the year has been checked. But the average investor is scarcely disposed to enter into the technical argumentation which this hypothesis involves. He has one eye on the gold rush, but has not indulged in any large-scale business in the Kaffir market. And he has the other on the political scene, balancing his relief at the Russo-Japanese truce against the restlessness of the Czech situation. The net effect of this week's rather vague pointers is a slight fall in industrials, arising from a general want of adequate support, particularly in such groups as iron and steel shares; quiet and slightly irregular conditions in the Funds; and firm, rather than excited, dealings in Kaffir shares. And so far as Wall Street has played a part in London markets, its slacker activity and slightly easier prices have assisted this trend. There is, in fact, no sparkle in the markets. And of some sections it might almost be said that there is no market sufficient to test quotations.

Outlook for Gold Shares.—For several months the position of sound Kaffir shares has attracted quiet attention from the serious investor who seeks to minimise the present-day risks of political disturbance, inflation, and trade depression. That the gold rush of the past fortnight has not stimulated the market into a blaze of speculative activity may be explained by the fact that Mr Havenga's Budget statement contained the possibility—though it was not seriously canvassed in the market—of a change in mining taxation. With this possibility removed, somewhat greater interest may develop in the mining market. Mr Havenga anticipates a slight falling-off in receipts from gold-mining taxation, which reached £10 millions last year, compared with estimates of £9,456,000. For the current year the estimate has been reduced by £606,000. Some of the heaviest producers of revenue have now passed their peak earnings, while the new mines have not reached a sufficiently advanced stage of production to offset the decline. Mr Havenga made the claim, which the industry will acknowledge to be reasonable, that taxation policy had encouraged the companies to mine a higher tonnage of lower-grade ore, and thus to produce steady returns over a longer period, rather than bumper profits at present. The same reasoning in terms of current profits, may well apply to the recent rise in the price of gold, assuming that it proves to be permanent. Major changes in the price, ever since the devaluation of the pound, have been accompanied by suitable adjustments of mining policy, with the object of working the lowest payable grade. Established mines have undertaken considerable plant expansion in order to increase their milling capacity, and since the major changes in Rand taxation were introduced in 1936, the more

recent heavy sales of gold by the Exchange Equalisation Account. Bankers' deposits have therefore failed to derive any benefit from the contraction of the note circulation and are, in fact, down by £7,346,000 over the week.

*

The Money Market

JUDGED by the outside rate for bond money, which in these days is the only truly sensitive indicator of money market conditions, the position this week has eased slightly. Whereas last week ¼ per cent. was readily paid for such accommodation, the prevailing rate this week has ranged between ⅜ per cent. and ¼ per cent. The extremely quiet conditions experienced in the stock markets have probably been responsible for a diminution in the demand for credit from that quarter and account for the fractional easing of the rate. The short loan position has also been helped slightly by buying of hot treasury bills by special quarters. Conversely, the active buying of gold in the London market and the satisfaction of this demand by official sales of metal is leading to an accumulation of funds in public deposits. This may be redistributed in the form of a further reduction in the issues of Treasury bills to the market. Last week's £35 millions of Treasury bills were allotted at an average rate of 10s. 1.8d. per cent. The syndicate applied at £99 17s. 5d. and obtained 40 per cent. of its applications. The low average rate shows that substantial applications must have been put in at £99 17s. 6d. These were presumably applications of an official or semi-official character, and it looks as though we are once again running into a period when renewal of permanent holdings of Treasury bills in special hands will provide the discount market with considerable competition at the weekly tenders. The imminent final call on Defence 3's is not expected to cause any appreciable change in the money position. The special buying of bills apparent this week was probably connected with preparations made to neutralise the effects of that operation.

The Bullion Market

EXTREMELY active conditions have continued to prevail in the gold market and since Friday of last week the amounts dealt in at fixing exceed £9,500,000. Subsequent operations have been almost as heavy. This exceptional activity is dealt with in a Financial Note on page 330. The silver market has remained quiet and has completely ignored a threat by Mr Lewis, member of the Foreign Relations Committee of the U.S. Senate, that in view of the policy being pursued by the Mexican Government, the United States might be forced to suspend the present arrangements by which Mexican silver can still be bought. This remark was made on Friday of last week and had an immediate effect on the Bombay silver market, but recovery followed so quickly that the movement was not followed in London. The spot price of silver has thus tended to follow fairly closely movements in the dollar appreciating to 19 1/16d. which was reached on Wednesday, but giving way ⅛ to 19 7/16d. on Thursday. Bombay stocks are still at an abnormally low level and current Indian buying is approximately adequate to absorb the small offerings which appear on the market. During the week to last Thursday, silver coins, amounting to £280,183, were imported into this country from France. This probably represents some of the Spanish silver, which in recent months has been finding its way to Paris, and part of which is understood to be sold in this country.

serious complaints regarding the incidence of taxation have been removed. The existing scales enable the industry to pass part of any fall in profits, arising from higher costs or a lower price, to the Union Government, by way of a reduced tax liability. It is not difficult, therefore, to make out a general case in favour of Kaffir shares, provided that the proper allowance for differences in life and grade as between various mines is observed.

* * *

Industrial Profits in July.—The 3.44 per cent. increase in industrial profits recorded last month was the lowest since the autumn of 1933. Some 181 reports were received, showing profits of £16,530,811, compared with £15,980,080 in the previous year. If the profits of rubber and tea companies are eliminated from the total, the improvement is reduced to 2.2 per cent. Although the breweries and distilleries group weights the month's results fairly heavily, owing to the inclusion of the Distillers Company's profits, the July reports provided a typical sample of industrial profits as a whole. Satisfactory features included a 13 per cent. advance in iron, coal and steel profits, but it is significant that eleven out of the twenty-three groups analysed showed a decline in net earnings. In the light of subsequent company results, the July figures may mark a turning point in industrial profits.

Building Society Expansion.—As a savings medium for the small investor, the building society movement is one of the most significant of our time. It was entrusted with some £656 millions by depositors and shareholders at the end of 1937, and stood second only to the Post Office and Trustee Savings Banks, whose deposits amounted to £727,635,000 at the end of June last. It may be noted also that Savings Certificates in issue amounted to £516,800,000 at that date. The technical and investment aspects of the 977 building societies which are now in operation in this country are discussed in customary expert detail in the Building Societies Year Book, the 1938 issue of which has just been published. This book is more than a work of reference on individual societies, for it contains invaluable statistics upon the movement as a whole and well-informed comment upon its recent growth and development. The survey of building societies in 1937-38 shows that at the end of last year total assets reached a new high level of over £710 millions, while the total of £136,800,000 advanced on mortgage was only £3,500,000 below the peak attained in the previous year. Since the movement has advanced, on the average, some £100 millions in each of the past ten years, mainly to house purchasers, and since total membership represents about one in ten of the population, the social and economic importance of the movement fully warrants the publication of this authoritative annual.

* * *

A New Building Shares Index.—The Building Industries National Council is to be commended for the compilation of a series of indices of building material shares, which is introduced in the latest issue of the Building Industries Survey. The index numbers, which are based on the average of mid-week quotations for 1935, cover bricks, cement, iron and steel, and paint, with a total index for all groups, each series being computed by means of a geometric average. In an accompanying article, the Survey points out that the course of equity share values provides a valuable and reliable indicator of business movements to follow, and the study of building share prices is intended to assist the task of divining future prospects in the building industry. Some interesting comparisons are presented between the movement of building materials shares and building plans, and a close degree of correlation is evident between brick shares and housing plans, and cement and iron and steel shares and industrial and non-residential plans. The value of the indices would perhaps be enhanced if the number of shares in each group were to be stated in future.

* * *

Railway Earnings Estimates.—To a series of thoroughly disappointing interim statements, the home rail stockholder must now add a batch of no less disappointing traffics for the first five weeks of the second half-year. In this period, the four companies have suffered gross losses amounting to £992,000, compared with £1,841,000 for the first 26 weeks of the year. L.M.S. shows a fall of £403,000 for the period, L. & N.E. one of £333,000, Great Western of £218,000, and Southern of £38,000. Analysed by classes, the traffics show that passengers have lost a further £37,000 in the past five weeks (despite the 5 per cent. increase in fares on holiday traffics this year) while general merchandise shows a fall of £761,000 and coal of £194,000. It is evident that, if this trend is maintained, the estimates given in our leading article of July 16th will prove too optimistic—as we pointed out at the time. And from the facts contained in the interim statements, somewhat better guidance can now be obtained regarding current working conditions. In the table on the following page, therefore, we have revised our earlier calculations.

* * *

To obtain a measure of the fall in traffic receipts during the current half-year we have applied the percentage fall recorded during the past five weeks to the third quarter traffics last year. For the fourth quarter, we have increased these percentage losses by 2½ per cent. to take account of the increase in charges from October last year. The estimated traffic losses recorded in the first column of the table, therefore, may be somewhat pessimistic if the railways are able to check the recent loss in traffics. For increased costs we have taken five-twelfths of the full year estimates for materials given in our earlier article, since certain items of cost are now falling. The item for wage increases is based, as far as possible, on the companies' official estimates and only applies for 1½ months of the period. The reduction in direct operating costs, due to the lower volume of traffic, is taken at a flat one-third of the estimated fall in gross traffics. This is a figure which bears some relation to the experience of the L.M.S. in the first half of the year, but it must necessarily be regarded as approximate. It is probable, however, that the companies will concentrate their attention on operating economies in coming months, although they may not achieve equal success in their task. The resultant of these figures, added to the net revenue losses for the first half of the year, gives an estimate of the total reduction for the full year, without any

allowance for changes in ancillary revenues during the second half of the year. The table follows: —

(Amounts in £000's)

	Second half-year					
	Fall in traffics (estimated)	Increased Costs		Reduction in direct costs due to lower traffic volume	Reduction in net revenue first half-year	Total estimated reduction, full year
		Materials	Wages			
L.M.S.	2,400	500	240	800	1,496	3,836
L. & N.E.	2,050	300	120	680	1,780	3,570
G.W.R.	1,235	200	95	410	818	1,938
S.R.	285	135	55	95	574	954

For the L.M.S. our estimate would correspond to earnings of approximately 3½ per cent. on the 4 per cent. first preference stock, and 4.4 per cent. on the redeemable preference stock. The L. and N.E. second guaranteed stock might barely earn full payment, but the first preference dividend would be uncovered. No earnings would be indicated for Great Western ordinary stock, while Southern preferred would show approximately 3¼ per cent. It is, of course, impossible to claim more than approximate accuracy for such estimates as these. Many quantities in the railways' equation are little more than unknowns. But they should give some idea of the potential order of magnitude of railway earnings during the current year, unless traffics take a new turn.

* * *

Ranks-Greenwood Merger Questions.—At the end of last week, shareholders of John Greenwood Millers (1934) were notified that Ranks, Limited, had made an offer to purchase their holdings, at the rate of 6s. in cash for each 5s. ordinary share, or alternatively by exchange of one Ranks' 5s. share for every three John Greenwood Millers' ordinary. This offer followed promptly on the publication of the latter company's report, which showed that the consolidated operating profits of the group had fallen from £58,369 to £24,355. The parent company's ordinary dividend was reduced from 12 per cent. to 5 per cent. for the period to June 25th last, and even this payment was not fully covered. In the absence of any comment either on the reasons for the fall in earning power or on the imminence of the Ranks' offer, John Greenwood Millers' shareholders had no option but to await the chairman's explanation, firstly, of the nature of the group's difficulties last year and, secondly, whether they were expected to endure. At Tuesday's meeting, Mr Bingham declared that the fall in the company's profits arose from trading conditions beyond the directors' control and that the board saw no immediate prospect of a return to the earnings level of previous years. It was evident from his account that conditions in the wheat market last year were unfavourable for the company. But it may be thought that such difficulties, even if inescapable for one year, would not represent a permanent impairment of earning power. "Unreasonable and wasteful" competition in the North-Western area and a "stoppage which occurred in the Irish demand through the Free State tariff," however, have lowered profit margins, and the chairman appeared to indicate that competition had been of a retaliatory character.

* * *

Clearly, shareholders of John Greenwood Millers cannot ignore the board's view that some permanent deterioration in earning power has occurred, although they may not be able to follow the directors' reasoning at every point. Hitherto it has been the distinguishing feature of the milling industry that internal competition, although keen, has not been allowed to develop to excess. That some reduction occurred in milling profits during the past year was clear in the Spillers' report for the year to January, 1938, while Ranks (Ireland) showed a reduction in profits, after depreciation and taxation, from £102,731 in 1936 to £82,991 for 1937. These pointers may have some relevance to the position of Ranks, Limited, whose latest profit figures cover the year to July 3, 1937. Last year the final dividend was declared on August 20th, and the report issued on September 28th. The advisability of exercising the option to exchange into Ranks' shares is to some extent dependent on whether that concern has been similarly affected to any significant degree. And at the moment no information is available on this important point.

* * *

Isaac Holden Report.—The sad record of textile profits is further depressed by the latest results of Isaac Holden, the woolcombing concern. Total profits for 1937-38 have fallen to a quarter of the previous year's level, and though they are higher than for the worst years of the depression, they show a serious setback in relation to earnings in recent years. The 6 per cent. drop in total profits in 1936-37 was attributed almost entirely to increased costs, but the latest figures suggest only too clearly the headlong decline in woollen activity last year. The company works on a commission basis, and profits depend mainly on the volume of business. Moreover, this fall in turnover has raised the cost of combing on the small amount of work done. Trading has, in fact, resulted in a small loss after taxation, compared with a profit of £33,061 before tax in the previous year. The course of trading profits and total income for the past three years is shown below: —

* After transferring £8,000 from taxation reserve. † Taxation charged, £9,500 in 1935–36 and £5,100 in 1936–37; not separately shown in 1937–38.

Investment income is approximately the same as in 1936-37, and although depreciation reserve receives £2,500 less at £5,000, the preference dividend is short-earned to the extent of £2,700. A 5 per cent. net ordinary dividend, however, has been declared, thanks to a transfer of £8,000 from taxation reserve no longer required, and a draft upon the carry forward. The balance sheet gives some indication of declining activity. Debtors and cash are £16,000 lower at £47,509, and the drop from £43,568 to £17,468 in creditors and taxation is much larger than the transfer from taxation reserve. While the latest results are disappointing, they may reasonably be explained in terms of trade conditions, and in the past profits have been sensitive to recovery. Reserves are substantial; the liquid position is as strong as in previous years; and dividends have been paid without interruption since the beginning of the century. At the current price of 31s. 6d., a yield of £4 7s. 6d. per cent. gross on the £1 shares demonstrates some confidence in the company's long-term prospects.

* * *

Associated British Picture Policy.—Many matters of controversy in the cinema industry are now seeking their solution before the Courts. In these circumstances Mr Maxwell's speech at the meeting of Associated British Picture Corporation this week was inevitably restrained.

For the greater part, indeed, it was a matter-of-fact review of the accounts, in the course of which the chairman was able to make the point that the group's position to-day owes much to its conservative financial practice in the past. For the current year, Mr Maxwell declared that the cinema results were already "well ahead" of the corresponding period of last year—a setback in February and March has apparently been made good since—and he forecast that record results might be shown for the year to March, 1939. Further consolidation, accompanied by saving on inter-group finance, has already been achieved. The board has formed the view, moreover, that its immediate objectives of policy have been reached. Further growth in the future is not ruled out. But, after the rapid progress of recent years, the time has come for the consolidation of the group, both in its operations and in its finances. The business, in the chairman's view, has become a large profit-making concern, well able to meet normal fluctuations in trade conditions. Shareholders will respect this statement of policy. All three departments of the group—film production, distribution, and exhibition—have made great strides in recent years. The group is the largest in the industry, and its finances may well be the soundest, although at present its liquid position appears to underline the desirability of a period of pause. For the investor, the important point is that this pause coincides with the earning—and continued promise—of record profits.

* * *

Rhodesian Copper Profits.—The issue of the June quarterly reports of Roan Antelope and Mufulira Copper Mines provides a complete picture of the Rhodesian copper companies' earnings during the year to June last. Roan Antelope's profits for the year, subject to taxation, amount to £1,574,000, compared with £1,790,308 for the year to June, 1937, while Mufulira Copper Mines' profits, on the same basis, amount to £968,000, compared with £649,998. These figures, together with those for Rhokana Corporation (set out in *The Economist* of July 30th, page 239) enable the investor to form a fairly close estimate of earnings, and potential dividends, for the companies. For convenience of working, all calculations which follow are expressed on a gross basis, although in their accounts certain companies provide for their full tax liability, and show ordinary share earnings and dividends on a net basis. The change, of course, does not affect the final results. In 1936-37 Roan Antelope set aside £200,000 to reserve from revenue, provided £20,000 for staff pensions, and increased its balance carried forward by approximately £115,000. If comparable reserve provisions were made in the current year, distributable earnings would represent approximately £1,240,000 gross, equivalent to nearly 25 per cent. on the increased capital. An interim dividend of 10 per cent. has already been declared.

* * *

A similar calculation for Mufulira suggests that, if a reserve provision of £250,000 is made—in the previous year some £226,750 was retained from profits—and the pensions reserve is maintained, distributable gross profits would amount to £706,000 approximately, of which £452,500 would be attributable to Rhodesian Selection Trust and £228,000 to Rhokana. Making a deduction of £12,500 for expenses, including directors' remuneration, the gross sum distributable on Rhodesian Selection Trust shares would amount to £440,000 on our assumptions, equivalent to 16.6 per cent. on the shares. Rhokana profits amount to £1,950,000, after provision for the mine provident fund, but without including any prospective dividend from Mufulira. If the estimate above is added to this sum, and £82,500 is deducted for preference dividend, it would appear that gross earnings for the ordinary capital would be in the neighbourhood of £2,095,500. If the directors decided to retain about £325,000 of available profits, as in 1936-37, distributable earnings would be equivalent to slightly over 70 per cent. on the ordinary capital. The shares received 62½ per cent. for 1936-37, and have received an interim dividend of 25 per cent. for the current year.

* * *

Canadian Eagle Position.—The report of Canadian Eagle Oil for 1937, delayed through the expropriation of the Mexican Eagle properties in March, is also out of date in a more important sense, for it gives no specific indication regarding the current trading position. So far as profits for 1937 have any relevance to the present position of the group, they were reasonably satisfactory. Total income from subsidiary and allied companies, less interest paid, amounted to £895,752, compared with £933,126 in 1936. After providing for oil trading and other expenses, and meeting the first preference dividend in full, a balance of £633,588 (compared with £667,067) is available to meet the participating preference and ordinary dividends. This sum, however, has been carried forward. The report explains that the appropriation of this balance has been deferred, for "the question of the obligations (if any) of the Canadian Company under its guarantee agreement is being referred to arbitration as provided by such agreement." The complicated provisions of these mutual guarantees, the first of which relates to sinking fund on each company's 7 per cent. first preference shares, and the second to participating preference dividends will, it is hoped, be clarified at the earliest possible moment. Shareholders may also hope that the chairman will give more explicit details regarding the present trading basis of the Canadian Eagle Company at the meeting next month. It is explained in the report that the present situation in Mexico has made it necessary for the Eagle Oil and Shipping Company—the principal trading subsidiary—to secure its supplies elsewhere," which it has done and is doing." This phrase suggests the possibility that the task of obtaining satisfactory substitute supplies has yet to be completed. Pending the publication of the arbitrator's report, the shares of each of the "Eagles" remain at the mercy of market rumour, such as that which obtained currency in mid-week that a settlement of the guarantees had been reached.

* * *

The Week's Company Profits. — The number of company reports received this week has shrunk to 18. These show that profits earned during the latest year amounted to £1,545,000, compared with £1,719,000 in the previous year, a decline of 10 per cent. Total profits for 1,678 companies whose reports have been published this year amount to £234,650,000, representing an increase of 11 per cent. over the preceding year's total of £211,377,000. The week's results are discussed in preceding Notes and under the heading "Shorter Comments" on page 337.

SETTLING DAYS

TICKET	ACCOUNT
AUGUST 23	AUGUST 25

THE volume of business in the London market has been poor this week, even judged by holiday standards. The new account opened with some show of firmness, assisted by Wall Street's strength at the week-end and by the improvement at the end of the old account. But slack trade was quickly apparent. For a time prices remained reasonably firm, but in mid-week nervousness regarding the outcome of the Russo-Japanese dispute combined with a further batch of depressing home rail traffics, easiness in Wall Street, and positive weakness in Berlin, produced a series of small losses in most sections of the market. On Thursday it was sentiment rather than the volume of business which improved—and then only at first—following the Russo-Japanese truce, although somewhat greater activity was evident in the Kaffir market.

Gilt-edged stocks improved at first, and minor improvements were common, following a quiet demand, in the first two days. Somewhat irregular conditions then ensued. Apart from initial dealings in the Luton loan, little interest was taken in corporation issues, and the Dominion list showed very few changes throughout the week.

Fluctuations in Japanese issues were the feature in the *foreign bond market*. The truce was followed by a moderate rally on Thursday, after a week of uncertainty in which the possibility of prolonged hostilities and fear of default depressed prices. Signs of improvement in the Brazilian coffee position encouraged a small demand for the bonds, and Paraguay issues rose on the report of the debt settlement.

★

Home rail stocks opened weak, preference and guaranteed stocks again being particularly depressed. A fairly smart recovery occurred on Tuesday, and was maintained at the opening on Wednesday. The publication of the holiday week traffics, however, undid these gains. Several of the marginal stocks, after opening a point higher, were a point lower on balance at the end of the day. Apart from some early interest in Cordoba issues, the Argentine rail market was almost idle.

More favourable unemployment figures had little effect upon *industrial shares*. Business remained small and prices moved irregularly downward, where they were changed. Continued lack of interest in steel shares caused small reactions of a few pence in prices. Coal shares remained dull, and but for an early rise in British Insulated Cables and Callender's Cable, electrical equipment shares showed no significant movements. In the aircraft share market dealings in Short Brothers "units" of five new preference and one new ordinary were the chief feature. The "units" opened at 13s., *nil* paid, and quickly rose to 16s. 6d. Motor shares were uncertain, Raleigh and Triplex being particularly weak, although the latter recovered slightly after the dividend announcement. Brewery shares staged a modest improvement at first, but failed to maintain their rise. Rayon shares were well supported, under the lead of Celanese of America and Canadian Celanese, and Courtaulds again improved on bear covering. Shipping shares remained dull, and the miscellaneous industrials were slightly easier.

★

Oil share prices were firm at first, but conditions remained quiet, and price changes throughout the week were of little significance. *Rubber shares* drew early encouragement from the behaviour of the commodity, but a small volume of selling quickly disclosed the absence of support, and prices turned fractionally lower.

Despite the continuance of the "gold rush" the *Kaffir market* attracted little increase in public support. Prices were firm at the opening and showed later improvement. But the Cape found little encouragement in Mr Havenga's budget, which provided only a modest stimulus to dealings. Marievale were active among the developing mines. Among the dividend-paying leaders, Rand Leases and the Geduld were active, while Crown Mines reached a new "high" of 17⅞. Diamond shares were easier, and the Rhodesian copper group recovered after a slight setback.

ACTUARIES' INVESTMENT INDEX

A further small fall is registered in the Actuaries' index of 151 industrial ordinary shares, which stood at 66·1 last Tuesday, compared with 66·5 a week earlier, and 67·9 a month earlier. The corresponding average yield calculations are 5·72 per cent. this week, 5·68 per cent. last week, and 5·72 per cent. a month ago. The following extracts from the component indices show that a further significant fall has occurred in brewery shares, while coal and home rail stocks are also easier.

New York

WALL STREET finished last week in excellent style, with a burst of activity in which 830,000 shares were traded in the short session and the Dow Jones industrial average reached its highest level for the year at 145.67. The market's behaviour this week has been much less determinate. Trading has been running consistently below the million mark. Early profit-taking depressed the averages slightly, and despite a strong closing rally on Tuesday, the market continued to lose ground. Even after the settlement of the Russo-Japanese incident, moreover, the market found no new rallying point. The week's business news is generally favourable. *Iron Age* reports that steel activity is still running at 40 per cent. of capacity, and anticipates improved business in the future. Department store sales in July showed a less than seasonal decline, while power output last week showed a much smaller fall compared with a year ago. These factors, coupled with more hopeful views regarding the railroad position (despite the wages deadlock) failed to encourage new buying, and rails shared the easier conditions with industrials. Bonds remain firm, and this week many industrial and utility issues have reached new high levels for the year.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values, calculated on closing prices (1926 = 100).

SHORTER COMMENTS

Company Results of the Week.—CABLES INVESTMENT TRUST net revenues have advanced from £229,349 to £240,841 during the year to June 30th. The ordinary dividend is maintained at 5 per cent. THIRD SCOTTISH AMERICAN TRUST net revenue, at £46,104, is but a few pounds different from the level of the preceding year, and the ordinary distribution is again paid at the rate of 19 per cent. ODHAMS' PROPERTIES net profits are slightly lower, but the ordinary dividend, payable to the parent company, has been raised to 12 per cent. ILLOVO SUGAR ESTATES have experienced a more favourable year; net profits amount to £31,778 compared with £20,912. MONTAGUE L. MEYER, the timber merchants, report a substantial setback in profits from the high level of the preceding year. Net profits for the year to March 31st amounted to £16,131, compared with £115,450 for 1936–37. Profits of HENRY HIGGS SON AND COMPANY, MECCANO, and NORTH CENTRAL WAGON have been well maintained.

MISCELLANEOUS

Broken Hill Proprietary Company.—Subject to audit, net profit (as cabled) for year to May 31, 1938, is £1,300,461, after £709,054 depreciation and £12,643 debenture interest.

Edmundsons Electricity Corporation, Ltd.—The results of the operations of the Edmundsons group of companies during June, 1938, as compared with June, 1937, show an increase of 6 per cent. of units sold. Results of operations of the group in July, 1938, as compared with July, 1937, show an increase of 8 per cent. of units sold.

Commercial Banking Company of Sydney.—For year to June 30, 1938, net profits were £365,975, against £342,041. Final dividend, 3½, making 7 per cent. for year, against 6½ per cent. To bank premises, £35,000 (£25,000). Forward, £118,476 (£119,232). Deposits at June 30th were £54,659,000 (£53,854,000); bills discounted and debtors £41,795,000 (£37,744,000).

Armstrong Whitworth Securities Company.—The directors have, on August 5th, repaid all the capital paid up on the 1,000,000 six per cent. first non-cumulative preference shares and the 1,100,000 four per cent. second non-cumulative preference shares, all of £1, in accordance with the special resolution and court confirmation.

Richard Thomas and Company.—The control committee have made the following appointments to the board: Mr J. E. James, chairman and managing director of Lancashire Steel Corporation; Colonel Sir W. Charles Wright, Bt., K.B.E., C.B., chairman of Baldwins, Ltd.; Mr S. R. Beale, chairman and managing director of Guest, Keen and Nettlefolds, and a director of John Lysaght, Ltd.; and Mr John Adamson, chartered accountant, a partner of McClelland, Ker and Company.

Chinese Imperial Government.—It is announced that coupons due September 1, 1938, on the 4½ per cent. gold loan of 1898 will be paid on that date by the Hongkong and Shanghai Banking Corporation.

John Ismay and Sons.—Discussing the year's results at the annual meeting held at Dagenham last Thursday, Mr John Ismay pointed out that production and raw material costs generally had risen, and that the prices of finished lamps had been reduced. Turnover, in fact, had risen and export sales had been nearly doubled.

Scottish and North Country Investment Fund.—Distribut on for half-year to August 5th, 4d. per unit, ax free, or £4 12s. gross per cent., against £4 9s. for previous half-year, p.a. on initial price of £1. The report shows the composition of the Fund; the largest groups are coal, iron and steel (14.5 per cent.); engineering (14.7 per cent.); and textiles (15.0 per cent.). The principal changes are described in the report.

International Nickel Company of Canada.—For second quarter of 1938, net profit was $6,618,486, or 42c. per common share (against $10,113,765 or 66c. for first quarter). For first 6 months of 1938, net profit is thus $16,732,251 or $1.08 per share, against $25,914,352 or $1.71 a year ago. Consolidated balance sheet as at June 30th shows current assets of $80,420,084 (including $41,605,955 cash) against $85,509,082 at the end of December.

Cables Investment Trust.—In year to June 30, 1938, income rose from £356,264 to £369,556. Tax and N.D.C., £11,310 against £7,537. Profit £240,841, or £11,492 more. Ordinary dividend, 5 per cent. (same); carry forward, £68,474 (£47,451).

Anglo-Alpha Cement.—For year to June 30, 1938, net revenue (after tax, depreciation, etc.) was £120,482 against £100,004. Fees, £2,923 (£3,000); debenture interest, £13,429 (£5,827). Dividend of 10 per cent., £104,130 (£91,177 or 5 per cent.). General reserve, £25,000 (£40,000). Forward, £24,819 (£30,784) after certain special credits and expenses.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

Industry and Trade

Encouraging Employment Returns.—The employment returns for July confirm the slightly more confident tone of recent reports from industrial centres which gave rise to the belief that the recession in British business activity has been arrested, at least temporarily. As the table below shows, the number of insured persons aged sixteen to sixty-four in employment in Great Britain rose by 38,000 to 11,371,000 between June 13th and July 18th. Nor can this increase be attributed to seasonal influences, for *The Economist* index of employment, which is adjusted for seasonal variations, rose from 109 (1935 = 100) in June to 109½ in July. The increase in employment between June and July is reflected in a reduction of 29,796 to 1,773,116 in the number of insured and uninsured persons aged fourteen and over on the registers of employment exchanges in Great Britain. Compared with a year ago, however, employment shows an appreciable reduction, and unemployment a substantial rise. Thus, if allowance is made for the changes in the method of counting introduced last September, the numbers of insured persons employed, and of registered unemployed, in Great Britain last month were 300,000 smaller and 448,000 higher, respectively, than in July, 1937:—

EMPLOYMENT AND UNEMPLOYMENT IN GREAT BRITAIN

* Method of counting unemployed altered in September, 1937.

Last month's improvement, however, was not general. An analysis of changes in unemployment by districts shows reductions in London, South Eastern, South Western and North Western England, as well as in Wales, but increases in the Midlands, South Eastern and Northern England, and Scotland. The reduction in unemployment between June and July was most marked in the cotton and distributive trades, in agriculture, textile bleaching, printing and dyeing, and in the tinplate, wool textile and footwear industries. On the other hand, there was a substantial increase in unemployment in the coal-mining, building and public works contracting trades.

* * *

Employment Since 1927.—The trend of employment in Great Britain since 1927 is shown in the accompanying diagram, based on the Ministry of Labour's estimates of the number of insured persons aged 16 to 64 at work (including agriculture). Allowance is made in these estimates for persons out of work through sickness and trade disputes; the continuity of the estimates was broken last September, when the Ministry of Labour changed its method of counting unemployed persons. Despite the appreciable decline in employment since last autumn, the number at work is still considerably higher than in 1929. While it would be rash to assume that last

NUMBER EMPLOYED IN GREAT BRITAIN

month's improvement marks a change of trend, there are some indications that the forces making for recession have lost momentum. But there is as yet no conclusive evidence of a revival in the autumn.

* * *

Egyptian Yarn Price Agreement.—Spinners of Egyptian cotton yarns in Lancashire have decided to renew the price agreement, which has been in operation for eighteen months, for a further period of twelve months. This scheme is being supported by the owners of 86 per cent. of the spindles concerned. It is reported that four firms have withdrawn from the agreement, but it is hoped that before the end of this month these firms will decide to continue to adhere to the scheme. A few days ago the committee administering the scheme decided to offer a rebate of 5 per cent. from the gross price of yarns to all customers undertaking to confine their purchases to members of the agreement. It is hoped by this method to force some of the outside firms into the scheme. Apparently, the response from customers has so far been satisfactory.

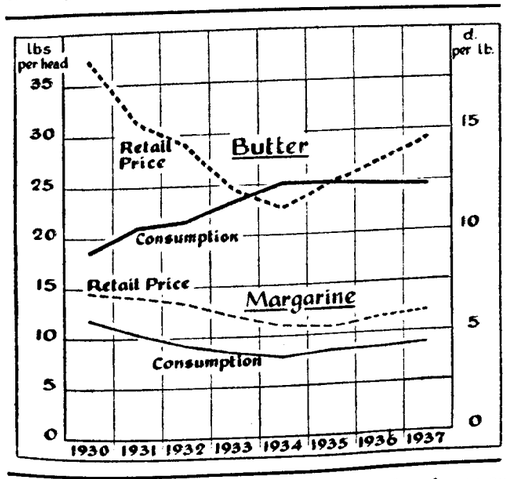
* * *

Prices of Primary Products.—The hectic scramble for primary products during the winter of 1936-37, culminating in March last year, was followed by a headlong fall in prices which continued, almost without interruption, until the end of last May. Early last June, however, the downward movement suddenly gave way to a revival. As the table below shows, the prices of the principal primary products, with the notable exception of wheat, are now higher than at the beginning of June, but all of them remain substantially below those quoted at the end of March last year. Price changes, however, have been far from uniform:—

PRICES OF IMPORTANT COMMODITIES

		March 31, 1937			June 1, 1938			August 10, 1938		
		£	s.	d.	£	s.	d.	£	s.	d.
Copper, standard cash	per ton	72	17	6	32	18	9	41	3	9
Lead, soft pig	per ton	31	15	0	11	6	3	14	0	3
Spelter, G.O.B.	per ton	33	12	6	11	17	6	13	16	3
Tin, standard cash	per ton	294	0	0	163	0	0	194	0	0
Cotton, Am. mid.	per lb.	0	0	8·09	0	0	4·29	0	0	4·79
Wool, Queensland	per lb.	0	2	7	0	1	11	0	2	0
Rubber, smoked sheet	per lb.	0	1	1 3/8	0	0	5 5/16	0	0	7 13/16
Wheat, nearest future	per 100 lb.	0	10	1	0	5	9	0	5	5
Sugar, centrifugals	per cwt.	0	0	9	0	5	1 1/2	0	5	3 3/4

The immediate cause of the sudden upward movement of prices last June was the growing belief of impending



economic revival in the United States, which normally consumes a large proportion of the world's output of primary products. The improvement was facilitated by the reduction in consumers' stocks during the preceding period of falling prices. But, as the hesitancy of recent weeks showed, consumers are not yet prepared to begin a large-scale restocking movement. Indeed, the movement of prices may be erratic until there is more conclusive evidence of recovery in the United States.

* * *

Supplies of Dairy Produce.—The Imperial Economic Committee's annual report on dairy produce supplies in this country contains a valuable collection of statistics and information. The latest volume* covers the calendar year 1937, when the prices of most dairy products were rising. As a result, the total value of British imports of dairy produce, pig and poultry products, at £117 millions, was £9 millions higher than in 1936 and £17 millions higher than in 1935. Imports of butter were slightly smaller in volume, but imports of cheese, milk powder, eggs and bacon were all larger. Owing, however, to the fall in the home production of these commodities, total supplies were less; the *per capita* consumption of eggs in 1937 is estimated at 156, against 158 in 1937, and that of butter at 24·8 lb., compared with 25 lb. in 1936 and 25·2 lb. in 1934 and 1935.

* * *

Butter and Margarine.—This recent fall in butter consumption has been compensated by an increase in the use of margarine. As the accompanying diagram shows, sales of margarine have varied directly with the price of butter and have been little affected by the comparatively small changes in the price of margarine itself. The fall in the retail price of butter from about 1s. 6¾d. per lb. in 1930 to about 11¼d. per lb. in 1934 brought an increase of 6½ lb. in the consumption per head; during these years, in spite of a slight fall in margarine prices, the consumption of margarine also declined from about 11.8 lb. per head to

7.9 lb. From 1934 onwards, when butter prices began to rise, sales of margarine showed a steady increase to 8.9 lb. in 1937. Nevertheless, the period of low butter prices has resulted in an increase in its use, partly at the expense of margarine; the average price of butter in 1937 was nearly the same as in 1932, but consumption last year was more than 3 lb. per head greater, while that of margarine was slightly lower than in 1932. But a further rise in butter prices, or another trade depression accompanied by a reduction in the purchasing power of the working classes, would undoubtedly cause the demand for butter to fall off and increase still more the substitution of margarine.

* "Dairy Produce Supplies, 1937." H.M. Stationery Office. 2s. 6d. net.

Increased Cobalt Supplies.—World production of cobalt, which has more than doubled in the past three years, rose sharply in the first half of 1938. Figures from the various sources of supply, so far as available, suggest that the world output of the metal reached a total of about 3.5 million lbs. in the first six months of 1938, compared with less than 2.5 million lbs. in the corresponding period of last year. The Rhokana Corporation in Northern Rhodesia, at present the largest producer, reported an output of 1,428,000 lbs. between January and June, compared with 1,047,000 lbs. in the same period of last year, and the output of French Morocco has also increased. Some years ago such an expansion in production (if it had been allowed by the International Cobalt Association) would have seriously affected the price, since the bulk of the metal was used as a pigment in the china and glass industries, where demand is limited. Recently, however, greater use has been made of cobalt in steel alloys, and the rapid re-armament has enormously stimulated the demand for this metal. Consequently, the remarkable expansion of the output of cobalt has proceeded simultaneously with a rising price level; the average price for the first six months of 1938, at 8s. 6½d. per lb., was 1s. 6d. per lb. higher than that in the corresponding period of 1937.

* * *

British Stocks of Metals.—The possibility of a revival in the demand for metals in the autumn and the political uncertainty in Europe have increased public interest in domestic stocks of metals, on which business on the London Metal Exchange is largely based. It is reassuring from these aspects that stocks have risen considerably in the past twelve months. On July 31, 1938, total stocks of copper in the official warehouses of the London Metal Exchange aggregated 36,537 long tons, compared with 31,529 tons on December 31, 1937, and 18,989 tons on July 31, 1937. Tin stocks advanced from 2,062 tons at the end of July, 1937, to 2,438 tons at the end of December, 1937, and 7,228 tons at the end of last month. Stocks of spelter increased from 20,469 tons at the end of July, 1937, to 24,574 tons at the end of July, 1938, after having been down to 19,852 tons at the end of last year. Lead stocks rose from 6,215 tons at the end of July, 1937, to 7,004 tons at the end of the year, and 8,996 tons at the end of July. At present stocks of lead, spelter and copper are at a more or less normal level, while stocks of tin are well above normal. There is therefore no immediate scarcity of supplies, and as the production of all these metals, except tin, is maintained at a fairly high rate and can be raised at short notice, the level of stocks in the official warehouses appears to be large enough to meet any revival in industrial demand.

* * *

American Cotton Crop.—At the beginning of this week the United States Government published its first estimate of the cotton crop for 1938-39. The forecast, at 11,988,000 bales, was nearly 500,000 bales more than expected, and when business was resumed in New York and Liverpool, prices declined about ⅛d. per lb., but since then part of the fall has been recovered. Last season, as the table below shows, America produced a "miracle" crop of 18,946,000 bales, but this year the area under cultivation has been reduced by 23 per cent. and the yield per acre is estimated at 217.9 lb., against 223.3 lb. in August last year. The Department of Agriculture indicates that allowance has been made, as in the past, for the probable

COTTON PRODUCTION IN THE UNITED STATES

	Production (In thousands of 500 lb. bales)	Crop condition on August 1st per cent.	Yield per acre lb.
1933	13,049	74	212·7
1934	9,636	60	171·6
1935	10,638	74	184·2
1936	12,399	72	197·6
1937	18,946	81	266·9
Forecast 1938	11,988	78	217·9

ravages by the boll weevil, but reports suggest that loss from this source will be slightly below the average. Much, however, still depends on the weather in the cotton belt during the next two months. In view of these statistics, there is every indication that supplies this season will be far larger than consumption, and that the carry-over next July will be the largest ever known. A period of relatively low prices for cotton may therefore be expected, although any important decline in prices may be checked by the possibility of a loan from the United States Government to the farmers. The granting of such a loan is mandatory if the price in Southern markets falls below a level of about 8.30 cents, or if the crop at any time should be estimated by the Government to exceed 13,000,000 bales

INDUSTRIAL REPORTS

TRADE in most centres is still affected by local holidays. There is, however, a better tone in the Glasgow coal market. More inquiries are also recorded in this area for steel and output shows a slight improvement. The estimate of the United States cotton crop has been a bearish factor in Manchester, where there are fears of a further fall in cotton prices.

Coal

Newcastle-on-Tyne. — Northumberland steam collieries working under a system of curtailed production are in a slightly better position, but it will take considerably more trade to provide for full production and clear some of the stocks. The Durham section is very quiet, collieries being fortunate to work a full week. Local industrial trade shows no improvement and buyers abroad have no interest in the market. Patent oven coke has a steady outlet to the Scandinavian countries, but owing to the lack of home trade most makers are curtailing production.

★

Glasgow.—The rather brighter market which has developed since the pit holidays is well maintained. In the export branch new business has not materially expanded from its recent meagre volume, but contract supplies are being taken up more regularly, and increasing stocks are a less common feature. Washed nuts are moving fairly steadily all round, with pearls fully booked up for some time ahead. Apart from one or two prime brands, however, round coal is freely available. There are more indications of a stocking movement in house coal, and washed nuts are finding a better outlet to the public utility undertakings.

★

Cardiff.—The Greek Pelopenese Railways have invited prices for the supply of about 29,000 tons of large coals or patent fuel, while the Thessaly Railway have inquired for about 5,000 tons of coal. The Greek Navy have asked for prices for about 8,000 tons. In recent years, Germany has made big inroads into the Greek market and has secured the biggest portion of these orders. Apart from this, demand on the Cardiff market has been slow again this week and there seems little likelihood of any early expansion in the volume of business. As yet, however, there was no sign of any general easing in prices and only in very few instances have sellers made concessions. Shipments, foreign and coastwise, were severely curtailed last week on account of the holidays. They amounted to 184,000 tons compared with 366,700 tons in the previous week and 235,269 tons in the same period of last year. For the current year to date exports from the South Wales ports totalled 11,588,339 tons, against 12,051,927 tons a year ago.

Iron and Steel

London.—Holiday conditions continue to influence the iron and steel markets and will be much in evidence for the remainder of this month, according to the official report of the London Iron and Steel Exchange. In many districts consuming works will close down for the annual break and deliveries of steel will be suspended. Business in the pig iron section of the market has been on a restricted scale for some time and the majority of users are working on their stocks. As a result new orders are scarce; but it is reported that inroads are being made in the heavy accumulations which have weighed on the market since the beginning of the year. The demand for some of the special descriptions of pig iron which are largely used by the heavy engineering works is well maintained.

The situation in the semi-finished steel department is not likely to show any signs of improvement until later in the year when the autumn demand begins to make itself felt. Considerable stocks exist at consumers' works and although these are being gradually absorbed they are sufficient in the present state of the demand to check new purchases.

There is an irregular demand for finished steel; but recently business in some of the lighter descriptions has been more active. In the heavy steel branches of the industry, production continues at a good rate and the works have enough in hand to keep them employed for some months. Export orders of importance are scarce; but lately there has been some expansion in the volume of inquiry from overseas markets.

Middlesbrough.—Business on the iron and steel market is extremely quiet as is usual during August, and five more blast-furnaces have been or will be put out of operation during the next few days. Shipments of pig iron from the Tees for the first nine days of August amounted to 1,197 tons, against 670 tons during the same period in July, one parcel being shipped to Scotland. In the steel trade it is almost impossible to get re-rollers to accept deliveries of semi-manufactured steel There has been some improvement in demand for lighter steel, whilst producers of heavy finished steel continue well employed. Owing to the reduced number of blast-furnaces now operating there is little demand for blast-furnace coke, and importations of foreign ore are considerably reduced. There is no demand for iron and steel scrap. Next week is the local holiday week and steelworks and foundries will be closed.

★

Glasgow.—Holiday conditions still influence the markets in some directions, but generally in this district there has been more business placed and inquiries are more promising. Steelmakers are busy and have booked a fair tonnage during the week. Demand for black and galvanised sheets also shows some improvement. Bookings of light structural material have been particularly good and include some valuable contracts for Glasgow firms. In almost all branches business shows a slight improvement over recent weeks.

★

Cardiff.—The tinplate trade was slow to settle down after the interruptions of holiday week. Export demand was weak and again little business was concluded; steel sheets were in slow request. The statistical position of the tinplate and sheet industry is shown in the accompanying table.

Tinplate Industry Statistics

	Week ended July 24, 1937	Week ended July 16, 1938	Week ended July 23, 1938

Textiles

Cotton (Manchester). — The United States Government's crop estimate of 11,988,000 bales was about 500,000 bales more than expected. It is quite evident that the crop has made a good start. The fall in prices has not been important, selling of futures being checked by the probability of a Government loan to farmers. It has been another unsatisfactory week for spinners. Only hand-to-mouth buying has occurred in the American section, and curtailment of output tends, if anything, to increase. In the Egyptian branch considerable interest has been taken in the change in the price-fixing scheme. A special rebate of 5 per cent. from the gross price of yarns has been made to firms who will undertake to do all their business with mills in the agreement. This decision has caused some confusion. Cloth demand has continued very restricted, and the turnover has again consisted of retail lots to meet the urgent requirements of buyers. In all sections of the market there is a distinct fear of lower prices, owing to the enormous supplies of raw cotton.

★

Jute (Dundee).—Business in the jute trade continues slow and the accumulation of orders for yarns and cloth over the holiday period has been small. Prices are well maintained, but spinners and manufacturers are still unable to obtain the higher terms so necessary to meet the recent advance in prices for raw jute, which have been fluctuating to some extent. No further progress has been made in Calcutta with the expected agreement amongst the mills for a restriction of production. Only a very small proportion of the mills are refusing to sign the draft agreement, and it may be that the other mills, merchants, shippers and brokers will boycott them in order to force them to co-operate with the majority. The prolonged controversy continues, with no sign of any immediate settlement, and all the time stocks of goods in Calcutta are increasing; stocks of hessians are estimated at 433 million yards, compared with 186 million yards on January 1st of this year, while stocks of sackings have risen from 82 million yards to 188 million yards.

THE COMMODITY MARKETS

THE downward trend of the prices of primary products continued during the past week, an indication that consumers are not yet prepared to start a large-scale re-stocking movement. Nevertheless, current prices still remain above those quoted before the upward movement in June. In retrospect the sudden rise of prices in June appears to have been in the nature of a false start, though additional evidence of economic recovery in the United States might well initiate a further spurt. Moody's index of the prices of staple commodities in the United States (December 31, 1931 = 100) fell from 146.8 to 142.5 during the week ended last Wednesday. A month ago the index stood at 146.0 and a year ago at 206.8.

Metals

Copper.—As a result of the holiday influences and the more reserved advices from the United States, the copper market was much quieter. The turnover on the London Metal Exchange this week contracted considerably and the standard cash price, at £41 3s. 9d. per ton, closed with a net loss of 10s. Nevertheless, the undertone of the market has remained firm and operators are looking for an improvement in the autumn. Whether this optimism is justified depends primarily on the trade outlook in the United States, which is at present still as obscure as ever in the last three months.

★

Tin.—Tin has fluctuated within narrow limits this week and closed at £194 per ton, a loss of £1 5s. on last week's close. There has been again very little demand on consumers' account, and although recently an increase in the activity of the Welsh tinplate industry has taken place, current consumption of tin is still disappointingly low. The I.T.C. appointed last week Mr R. G. Mills, a director of various companies dealing with Brazilian produce, as manager of the buffer pool.

★

Lead and Spelter.—Both metals moved in sympathy with the copper and tin markets. Lead closed 6s. 3d. down at £14 6s. 3d. per ton, while spelter lost 1s. 3d., to close at £13 16s. 3d. per ton. Turnover of both products was very small this week. Stocks of zinc in the United States fell from 3,500 short tons in June to 146,200 short tons in July. This fall, the first decline since August, 1937, was due to the increase in deliveries from 29,250 short tons to 33,800 short tons, while production fell by 430 tons to 30,360 tons. Even at the higher level, however, deliveries remained still well below the level of July, 1937, when they amounted to 49,700 short tons. The level of metal stocks in this country is discussed in a note on page 341.

Grains

WHEAT prices sagged further last week, and are generally 1s. to 1s. 9d. per quarter lower, particularly in the forward positions. The latest estimates of the American winter wheat crop are about 25 million quarters lower than the previous ones, which was not unexpected. The Canadian Wheat Board has fixed a flat rate of 80 cents a bushel, on the basis of No. 1, Northern, Fort William, as the price to growers for the 1938 crop. As there is no differentiation over the season, it is expected that there will be heavy marketings directly after the harvest. Maize prices also weakened at the close of the week; buyers are waiting for more definite information on prospective crops of wheat and barley. Barley prices also declined, with a slow demand and selling pressure from Russia; at present prices, barley is highly competitive with maize as a feeding stuff, a relationship which may be expected to continue in view of the short Argentine maize crop.

Other Foods

Provisions.—The meat trade has been dull and prices have tended to sag. The bacon market has been steadier, but prices of Dominion butter, after being firmly held early in the week, declined later by about 1s. per cwt. Eggs were dearer and English (15-15½ lb.) were quoted at 17s. to 17s. 6d. per great hundred.

★

Colonial Produce.—Spot sugar prices were unchanged during the week, but forward rates were reduced by 1½d. per cwt. Cocoa, coffee and tea prices were firmly held, against a moderate demand.

★

Fruit and Vegetables.—There was a good demand for the moderate supplies of English potatoes and prices were generally higher than a week ago. After a dragging trade over the week-end, demand for fruit and other vegetables improved; lettuces sold well and prices of English tomatoes rose to 3s.-5s. per 12 lb.

Miscellaneous Commodities

Oils and Oilseeds. — Markets generally are quiet and affected by the trend in wheat prices; the expectation of good crops of linseed in the United States and Argentine also has a depressing effect. Little business was done in this product, or in Egyptian cottonseed. The price of linseed oil has again fallen to nearly the lowest quotation of this year. The demand for cotton oil is quiet and that for oil cakes has sharply fallen.

★

Rubber.—The market has been dull and prices steady; standard sheet on the spot closed at 7⅛d. per lb., a gain of ⅛d. per lb. on the week. The increase in stocks outside the regulated area in June amounted to 1,727 tons.

COMPANY MEETINGS

WATNEY COMBE REID AND COMPANY, LIMITED

IMPROVEMENT OF LICENSED HOUSES

The annual general meeting of Watney Combe Reid and Company, Limited, was held, on the 11th instant, at The Windsor Castle Restaurant, Victoria, S.W.

Colonel O. P. Serocold, C.M.G. (chairman of the company), in the course of his speech, said: During the past twelve months active progress in the rebuilding and improvement of our licensed houses has been made, but we continue to be faced by problems arising out of the Town Planning and Ribbon Development Acts.

Rebuilding or improvement of houses almost always entails enlargement to meet modern requirements, and in future will have to be sanctioned not only by the Licensing Justices, but also by the Town Planning Authorities, which creates fresh complications. In many cases a further difficulty arises from the Restriction of Ribbon Development Act.

A new obstacle in the way of public house improvement has come to the fore recently when applications to magistrates for permission to alter licensed premises have been made. The Customs and Excise have urged that frequently alterations to existing licensed premises are really cases for new licences. In 1904 it was laid down that on the grant of a new on-licence the Justices must make it a condition that the applicants should pay to the State such sum as appeared to represent the difference between the licensed and unlicensed value of the premises. I think it is clear that monopoly value was intended to apply only to new on-licences. But the Customs and Excise are contending in many cases of alterations to licensed premises that a new licence must be applied for. The success of such a contention would be a grave blow at the policy of public house improvement. If a house requires additional space to bring it up to the standards set by modern requirements, and this can never be incorporated except by means of a new licence, brewers will not be able to improve their houses as they have done in the past.

ROAD ACCIDENTS

The teetotal propagandists have not lately been so active in many respects as they were in the past, but they are making as much capital as they can out of road accidents attributable to drunken drivers. They have been, and still are, doing all in their power to foster the idea that drink is one of the major causes of accidents, in spite of the fact that the official statistics give an entirely different picture. The Ministry of Transport's latest report on road accidents involving personal injury (fatal and non-fatal), for the year ended March 31, 1937, shows that those attributed to drivers under the influence of drink or drugs amounted to less than one per cent. of the total number of accidents.

In view of the movement in favour of holidays with pay now being taken up by the Government, it may interest you to know that throughout my long experience with this company and its predecessors this benefit has always been enjoyed by the company's servants.

The profit on trading account of £1,978,984 shows a decrease of £49,824 against last year. I am happy to say that this has not arisen from any falling-off in our sales, which have been maintained. It is mainly due to higher costs of materials.

A year ago I informed the stockholders that the price of barley had risen 4s. or 5s. per quarter above the year before. This rise had become 14s. or 15s. by October and was fully maintained throughout the rest of the year. All the same we faithfully maintained our obligation, entered into with the National Farmers' Union, as to buying our full quantity of English barley. The subsequent effect on the cost of malt has applied only to a few months of our company's financial year. The cost of other commodities in the manufacturing account also tends to rise.

In the report there is a proposal to take a smaller sum for the property improvement and contingency reserve. This does not mean that we hesitate in our policy of improving our public houses, but it does mean that prudence tells us that we cannot afford to go so fast as we have sometimes done. The resources of breweries are often spoken of as though they were unlimited. They are not.

The reduction in the bonus by one per cent. amounts to £32,000 less for the shareholders. The business itself will bear its share by a reduction of £25,000 in the amount allocated to property improvement reserve, and by a reduction of £11,000 in the carry-forward.

The report and accounts were unanimously adopted and a final dividend of 9 per cent. on the deferred ordinary stock (making 15 per cent. for the year) and a bonus dividend of 3 per cent. was approved.

ASSOCIATED BRITISH PICTURE CORPORATION, LIMITED

SATISFACTORY INCREASE IN PROFIT

The eleventh ordinary general meeting of this company was held, on the 9th instant, in London.

Mr John Maxwell (chairman and managing director) said that the most important change in the accounts was the increase in the share capital owing to the issue in January of this year of the remaining 1,500,000 ordinary shares of 5s. each at 14s. per share. The net proceeds of the issue had been used mainly in the repayment of floating debt within the group.

The trading profit for the year of £1,302,000 showed an increase of about £37,000 over the previous year and, having regard to a certain falling off of business during February and March of 1938, he regarded the result as very satisfactory. The directors recommended that £200,000 be reserved for depreciation, that £200,000 be added to general reserve—making that £2,625,000, which would represent a very solid buttress in the Corporation's financial structure—and the payment of a final dividend of 10 per cent. actual, less tax, on the ordinary shares, making 20 per cent. for the year.

Since the beginning of the business, 11 or 12 years ago, they had been constantly growing, and the rate of progress, particularly in the last three or four years, had been rapid. All three departments of the business—production, distribution and exhibition in cinemas—had expanded and had certainly kept pace with, if not outstripped, the rate of expansion in the trade generally. While he would not say that the Corporation could not go forward to any further progress, he did feel that it should be of interest to shareholders to know that the immediate objectives of himself and his colleagues had, to a large extent, been achieved, and their policy now would be directed mainly towards the consolidation of the present position.

With regard to the outlook, all three departments of the business were functioning successfully; the studios were extremely busy turning out an excellent quality of productions; the distribution business had had a better year than in the previous year. The results in the cinemas were already well ahead of last year and, unless some unusual happening should occur—and he did not anticipate that—the outcome for the year ending March next should again prove to be a record result.

The report was unanimously adopted.

JOHN ISMAY AND SONS, LIMITED

EXPANSION OF HOME AND EXPORT TRADE

ORDINARY DIVIDEND OF 45 PER CENT.

The fifth ordinary general meeting of John Ismay and Sons, Limited, was held at Sterling Works, High Road, Dagenham, on August 11th.

Mr John Ismay (chairman and managing director), who presided, said: Gentlemen, with your permission I will take the report and accounts as read. (Agreed.)

In considering the accounts, whilst I regret to point out that there is a small decrease in the net profit compared with the previous year—although we have maintained our dividend at the usual 45 per cent.—we would like to explain that this is caused through the cost of raw materials and production generally having gone up, and the fact that we have been able to reduce the prices of our finished lamps without in any way sacrificing the quality of the lamp. Actually the year's turnover has shown an increase on the previous year. Our sales of lamps have continued to expand both at home and abroad—our export trade having nearly doubled—and we have supplied more Dominion municipalities and supply companies. In the home trade we have also increased the number of supply company customers.

Our gas mantle sales continue to remain steady and were slightly in excess of those of the previous year.

We have finished our plans of extension and are now consolidating our business. During the year we have spent a considerable amount of money on development from which we hope to get the benefit in the future. I think we have every reason to expect at least as much net profits for the coming year as for this one.

I now move "That the report and accounts for the year ended March 31, 1938, be received and accepted and that a dividend of 45 per cent. on the ordinary shares be paid."

Mr T. S. Cornell seconded the resolution which, in the absence of questions or comments, was carried unanimously.

The retiring director, Mr H. C. Rawson, was re-elected and the appointment of Lieut.-Col. F. A. Cortez-Leigh, M.I.C.E., M.I.Mech.E., was confirmed. The auditors, Messrs James Worley & Sons, were reappointed, and the proceedings then terminated.

The Cost of Living

In all probability next year will see the introduction of a new cost-of-living index based on family budgets recently collected by the Ministry of Labour. In the following charts we show the courses of the current index and certain of its constituent series and of the prices of several foodstuffs in general consumption. In the top chart on the left-hand side we have plotted annual averages of the complete index from 1914 to 1937 and below it we show monthly figures over the two years to July 1st last. In both these graphs the base date is the original one, July, 1914. In the bottom chart on the left-hand side we have plotted annual averages of the constituent indices from 1928 to 1937 and here we have used 1924 as base year. It will be seen that food prices with a weight of 60 per cent. have a preponderant influence on the course of the complete index. It is almost certain that in the new index the weight assigned to food prices will be considerably less. On the right-hand side we show the course of the prices of various foodstuffs. These are plotted as index numbers based on 1924, but the actual prices are shown in addition.

Finance

GOVERNMENT RETURNS

For the week ended August 6, 1938, total ordinary revenue was £17,433,000, against ordinary expenditure of £21,468,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £127,544,000, against a deficit of £85,878,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On August 5th, applications at £99 17s. 5d. per cent. for bills to be paid for on any day except Saturday of the following week were accepted as to about 40 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications for bills to be paid for on Saturday at £99 17s. 6d. per cent. and above were allotted in full. £30·0 millions of Treasury bills are being offered on August 12th.

The New Joseph

ANYTHING that comes from the pen of Mr J. M. Keynes deserves and receives wide and respectful attention. But even his fertile invention has rarely opened a broader field for discussion than that laid invitingly before Section F of the British Association for the Advancement of Science in the paper presented (unfortunately *in absentia*) on Friday of this week. Since the days of Joseph, the subject of the storage of essential commodities has hardly received the attention it deserves. Of recent months, it is true, Sir Arthur Salter has succeeded in forcing into public prominence the immediate advisability of some storage of food and raw materials as a measure of defence against the risk of war. The Government have now formally adopted this policy and purchases of some essential commodities for storage have been made. Whether, as a result of these purchases, the sum total of stocks in this country has increased is doubtful. Indeed, the Government's storage policy can be criticised as both tardy and inadequate. But Mr Keynes is not concerned with storage merely as a measure of precaution against war, but as a permanent reform, looking to economic security in peacetime as much as to strategic security in wartime.

The private competitive system undoubtedly puts a discount on the accumulation of stocks of commodities. Holding charges are heavy—Mr Keynes estimates them at an average of 10 per cent. per annum—and in a competitive market the stocks that an individual producer could accumulate would be too small to have any effect upon the market. It is only when a market is monopolised that stocks are deliberately created and manipulated to equalise demand and supply and keep prices steady. But, as Mr Keynes justly remarks, such devices of price stabilisation are merely a part of the general policy of monopoly, and the presumption is that they are not conspicuously in the public interest. The extreme volatility of the markets for some of the basic raw materials and foodstuffs, however, is hardly a recommendation for free competition. There has only been one year in the last ten in which the highest recorded price of the year for rubber has been less than 70 per cent. above the lowest price of the year; the average has been 96 per cent. The fluctuations in cotton, wheat, lead and other commodities are not so extreme; but they are sufficient to lend considerable force to the accusation that "the price is always too high or too low and there are perpetual meaningless fluctuations in the plant and labour force employed."

It is Mr Keynes' contention that if larger stocks of these and other basic commodities were in existence the wide fluctuations of prices would be avoided. And since the community would unquestionably be the gainer by a greater measure of price stability, it should be worth the community's while itself to build up the reserve stocks. Now it is quite true, as Mr Keynes has no difficulty in showing, that the existence of reserve stocks of commodities would effectively prevent any arbitrary rises in price. But it is far less obvious that they would prevent unduly low prices. Indeed, the lesson of recent years is that prices tend to fluctuate inversely with the magnitude of stocks; and

even when they are held in the strong hands of Governments, with unlimited finance and the most compelling political motives for refraining from selling, the knowledge that these stocks exist has usually served to keep prices below the levels that would be sufficient to remunerate producers. The Canadian wheat farmer, for example, is grateful for the support to prices provided by his Government's purchases of wheat for stocks. But he would far rather there were no stocks at all.

The contention that a deliberate increase in the average volume of stocks of basic commodities would be of general benefit is, therefore, one that admits of considerable argument. Mr Keynes is on much less disputable ground when he claims that, given the volume of stocks in the world, it would be an advantage to us in Great Britain to have more of them physically located in this country. As a measure of defence against wartime blockade, the merits of the proposal are obvious. But even in peacetime much can be said, at least in theory, for the building up of stocks in British ownership, for our national interest is that of consumers, not of producers. To hold the world's stocks, or a substantial part of them, here and make England what she was—once more the world's warehouse—would mean buying when prices tend to be low and drawing on stocks when prices tend to be high. It would be the Joseph policy on a gigantic scale.

Joseph, however, had two enormous advantages in turning theory into practice. His business forecasting was perfect; and he operated in a totalitarian State. To suggest that some organ of the British Government, some bureaucrat sitting in Whitehall or in Thames House, should be equipped with the finance and the authority to become the world's supreme commodity jobber is to conjure up a prospect calculated to frighten even the most convinced believer in the excellences of the home Civil Service. Mr Keynes at least makes no such proposal. His suggestion is the less bold one that the British Government should offer storage to all Empire producers of specified raw materials, either free of warehouse charges and interest or for a nominal charge, provided they ship their surplus produce to approved warehouses in this country. The Government might further provide financing facilities at low rates of interest. But the ownership of the stocks would rest with the oversea producers, who would stand the risks and reap the profits of price fluctuations. As a defence measure this suggestion has considerable merit; it would be a relatively cheap way of encouraging the holding in this country of larger stocks than would normally be available. If Canadian wheat has to be held in store, there would be advantages, for which something might well be paid, in holding it in England near the market rather than in Canada near the prairie. Once again, however, the defence advantages are much clearer than the peacetime economic benefits. Mr Keynes is convinced that the existence of such arrangements would increase the aggregate volume of stocks, and he believes that higher stocks mean steadier prices; but neither proposition is self-evident.

The fundamental problem of raw material prices is one of adjusting supply and demand to each other. Supply fluctuates because of climatic changes or because of the time required to alter the volume of production of minerals. Demand moves with the trade cycle. Any proposal for lessening the fluctuation of prices must therefore be judged by the success it is likely to have in bringing supply and demand into closer adjustment. A policy of accumulating stocks is obviously useful in the short period when supply exceeds demand, since purchases for stock are themselves an addition to demand. But the weakness of all such proposals in the past has been that in the longer run they do not bring supply and demand closer together but drive them further apart. The support given to prices through the accumulation of stocks encourages the producer to postpone the necessary adjustment of his production to the volume of demand. The mere fact that stocks have been accumulated creates conditions in which they cannot be sold. Having originated as an attempt temporarily to increase demand, they remain as a permanent addition to supply. This, with depressing uniformity, has hitherto been the fate of virtually every project to stabilise prices by the public accumulation of stocks. The only exceptions that could be found would be cases in which the creation of stocks has been accompanied by the exertion of some positive control over production. This is, indeed, a necessary adjunct. The fact that restriction schemes have in the past been administered with the intention of creating a monopoly, with its corollary of monopoly profits, for the producers has rightly condemned them. But it should not be beyond human ingenuity to discover means of doing successfully in the general interest what has hitherto been done with indifferent success in one interest alone. And in any such system of commodity control, the public holding of stocks will play an essential part.

Danubia's Dilemma

POLITICAL and moral disarray has befallen all Europe beyond Germany ever since Herr Hitler threw his bristling mantle over Austria. That was only five months ago. Since then Italian pressure upon Jugoslavia has increased, in the hope not only of countering German penetration from what was once Austria, but also of reinforcing M. Stoyadinovitch's personal aversion from the Little Entente. Across the menaced body of Czechoslovakia, Polish and Hungarian authorities are discussing joint military action—once Czechoslovakia is assaulted—to secure and divide the reversion of Slovakia. Polish and Hungarian voices have long been urging on Roumania the desirability of a neutral no-man's-land between Germany and Russia, stretching from the Baltic to the Black Sea across Poland, Hungary and Roumania, and incorporating the Slovakian tail of Czechoslovakia once the head has disappeared in Germany's maw. Bulgaria, after well-nigh twenty years in subjection to the Treaty of Neuilly, has in the last few weeks, thanks to M. Stoyadinovitch's mediation, secured remission of that Treaty's penal terms, and is now in effect a freely re-arming member of the Balkan Entente. And finally, while the Little Entente States are about to reassemble to discuss separate overtures to Hungary, the Hungarian Regent, Admiral Horthy, accompanied by his Prime Minister, Dr Béla Imrédy, and Foreign Minister, M. de Kánya, are about to leave on an impressive State visit to Herr Hitler and his associates at Kiel.

These diplomatic storms centre round Czechoslovakia and Hungary. The two countries have been foes for twenty long years. Each has been during those years the centre of a system in Europe's diplomatic firmament: Czechoslovakia of the Little Entente, designed to resist Hungarian attempts at forcible revisionism; and Hungary of the revisionist *bloc*, which included first Italy, Bulgaria and Albania, and finally, with terrifying bulk and vigour, Nazi Germany.

The Czech problem is front-page news in all the Press of the world. The situation of Hungary, though perhaps equally critical, is less understood. Since the abolition of

Austria, Hungary and her people find themselves, after twenty years of unremitting struggle for treaty revision, in the position of the English King who began by exhorting the ranks behind him to charge, and ended by having to gallop like the devil towards the foe in order to escape the sabres of his own hussars. As the result of one dramatic act, the forces of Greater Germany—economic, political and military—are knocking at the door of Hungary. Germany promises stability to the Hungarian social and economic order, if it is articulated to the social and economic order of a vast and still-expanding Third Reich. She promises to shatter Trianon and the steel ring hemming in eight and a half million Magyars, as she shattered Versailles and St. Germain; to make the eight and a half millions into the twelve millions claimed by Hungary; to eradicate Jews and Jewry; to elevate the Magyar to pride of place—"the aristocrats of Central Europe"—in a Nazi system of confederate States. Berlin has already pressed the Hungarian Government to resign from the International Danube Commission, and promised to reconstruct it without French or British representation. Its agents dispense largesse and promises to Hungary's millions of landless peasants and their dependants. It holds, as a goad on the flank of the Hungarian Government, a domestic Nazi Party, recruited from visionaries and malcontents.

Dr Imrédy, by anti-Semitic laws, administrative and agrarian reform, an economic Five-Year Plan of re-armament and public works, removal of electoral abuses, introduction of the secret ballot for a reduced electorate, a capital levy, and the beginnings of a kind of Catholic Corporate State, has started with a flourish of dæmonic but paternalistic energy. The interest of his visit next week to Germany, together with the Regent and Foreign Minister, can be summarised in one question: Will he be treated to an interview, peremptory or polite, as was his unhappy Austrian colleague Dr Schuschnigg at Berchtesgaden a few weeks before the Austrian collapse?

Dr Imrédy is young but a realist. He is also an economist. M. de Kánya is an old and brilliant diplomat of the pre-war Ballhausplatz, an associate of Tisza and Berchtold. He lived through and learned the unhappy experience of Austria and Hungary before, during and after the war. Admiral Horthy is of M. de Kánya's generation, too. Before Herr Hitler was born he served Austria—an Austria which the Fuehrer has irretrievably buried. The visitors to Kiel next week cannot fail to be impressed by the evidences of Germany's might. But Admiral Horthy, if he nurses hopes of another Hungarian fleet as he christens the "Admiral Teggethoff," will assuredly recall the fate of Austria's army, of Vienna and of the remnants of the Imperial Service during the last five months. He may remember the existence of Italy, of the Mediterranean and so of Britain and France, when visions of a German-Hungarian Adriatic *imperium* are made to pass before his eyes. So, too, M. de Kánya may remember Aehrenthal's *coup* in Bosnia-Herzegovina in 1908, the growing ascendancy of Vienna over Budapest thereafter, because of Vienna's growing dependence, in turn, on Berlin; and what good came of it at last. And Dr Imrédy, one of the cleverest central bankers and finance ministers in Europe before he became Prime Minister, may cast a wary eye at the Berlin Bourse, at civil industry, and at that economic regimentation of life and labour in Germany which is the condition and counterpart of frenzied military activity. As a good Catholic he may ask himself whither it is leading Germany and whither it may lead her associates.

If Hungary can contrive to retain latitude for diplomatic manœuvre during the next few months she may not only see more clearly whither Germany is tending, but also what advantages for her can be secured in collaboration, like Bulgaria, with her immediate neighbours and in closer economic and political relations with Britain and France. Against this is the influence of Italy, evidenced by Signor Mussolini's pressure upon Dr Imrédy, a few weeks ago when he visited Rome, to link Hungary irretrievably to the Rome-Berlin axis. Accordingly, though a friend of both Germany and Italy, Dr Imrédy's Government finds itself almost as much "on the spot" as, say, that of Czechoslovakia or Spain. The hardened Magyar cynics over the age of 45 shrug their shoulders and say: "God save Hungary from another friendship like that of 1914!" But they also add: "We can only be sure of one thing: whoever rules Hungary, she is sure to be on the losing side if there is a war."

This pessimism is as misplaced as that which rules outside Hungary about her destiny. It may be as yet too much to hope that Magyars, Slovaks and Czechs will recognise the identity of their interests and destinies, as already the many and varied peoples (if not their Governments) have done in Jugoslavia, Bulgaria, Greece, Roumania and Turkey. But it is obvious that the three States of the Little Entente next week will have to consider the most reliable method of fashioning an agreement with Hungary which will release her from the servitudes of Trianon, as the Balkan Entente has released Bulgaria from those of Neuilly. Hungary, on the other hand, can only retain her highly prized national independence by drawing a line beyond which Nazi penetration must not go. There is thus, next week, both an opportunity and a danger. In the case of Hungary's dearest enemy, Czechoslovakia, the British and French Governments have, since May 20th, made it abundantly plain that they cannot be indifferent to forcible revisions of the European *status*. So far, they have tended to look on Hungarian independence as a lost cause. It is as risky an attitude as it is unwarranted. In default of moral, political and economic support by Britain and France, the strain of Germany's Danubian thrust may crush Italian, Polish and Hungarian hopes of a new Danubian edifice before the Czechoslovak structure is demolished to make way for it.

The Hungarian statesmen visiting Germany next week already appreciate the force of German stresses on their country's domestic political fabric. If landless Magyar peasants and unemployed workers believe in a Nazi Utopia along the Danube, shrewd and realistic Magyar leaders know that it spells helotry for the proudest, and most individualistic, people of Central Europe or the Balkan peninsula. But if this is to be avoided, they must be able to show the Hungarian people a still more excellent way to achieve national aspirations and well-being. Economically, Germany and Italy, who account for half of Hungary's foreign trade, are now unable to aid Hungary without exploiting her; and if they aid her to attain her national aspirations by military force, the price of helotry will assuredly be exacted.

When the graceful compliments have been paid next week, and the Hungarian statesmen return home, Britain and France, no less than the Little Entente States after their own conference, should immediately and actively canvass every possibility of developing that half of Hungary's foreign trade which still takes place beyond the ambit of the Axis Powers. That way, and that way only, can the new Danubia, already linked with the Balkan Powers, achieve peace and prosperity without becoming a closed Teutonic preserve. Finally, despite German suspicion of British and French intentions, such an outcome would best serve the real interests of Germany and Italy; for then the Danubian and Balkan peoples could be willing collaborators with Germany and Italy in the cause of welfare and peace. Among them, the Slavs—Czechs, Slovaks, Jugoslavs and Bulgars—fear the attainment of purely Teutonic aims. And the Germans threaten to become for the non-Slavs—Greeks, Roumanians and Hungarians—alien masters. Helots usually turn traitors, or nuisances.

Our Trade with the World

THE official returns of our overseas trade in recent months have not made pleasant reading. The accounts for July, analysed on page 384, furnish a reminder of the steady decline in Britain's commercial intercourse with the rest of the world. The value of imports last month was 13.5 per cent. lower than a year ago, but the value of domestic exports shows a fall of no less than 21.2 per cent. The only increase since last year is in the excess of imports over exports, which was 2.6 per cent. higher last month than in July, 1937.

Further light on the trend of events is thrown by the quarterly analysis of markets for our exports and sources of our imports, which is now available for the second three months of 1938. As the tables below show, our imports from, and our exports to, the majority of countries during the second quarter of this year were lower than a year ago, though the extent of the decline was by no means uniform. In addition to the usual statistics of our trade with individual countries, we have added percentages which indicate the magnitude of the change between the second quarters of 1937 and 1938. We have also added figures which show the relative importance of Europe, the Empire and other countries respectively in our foreign trade as a whole.

With one exception, this analysis of the distribution of our trade shows that the trend of recent years continued in the second quarter of this year. Since 1929—and more particularly since Ottawa and the abandonment of the gold standard—the Empire has taken an increasing proportion of our exports. In times not very far distant, Empire trade was far below that of our trade with Europe. To-day it is an easy first—the British countries together having taken just over 50 per cent. of our exports in the second quarter of this year. It is, however, of considerable interest that the proportion of our exports going to Europe has also shown some recovery. Indeed, the proportion is to-day the same as in 1929—whereas our sales to foreign countries outside Europe have fallen heavily. This latter group includes China, Japan and Mexico; but even the comparatively tranquil countries of South America have been disappointing, while our sales to the United States have slumped to a new low level.

Speaking very broadly, imports show a similar trend—the grant of imperial preference having raised the percentage of our imports from British countries from 30.8 per cent. in 1929 to 43.3 per cent. this year. But as between European and "other" foreign sources of supply our imports have shown a slightly different trend to the change in exports; for, whereas our purchases from Europe have continued to fall, our purchases from other continents have—after a drop in the early years of depression—remained fairly steady. Note, for example, the recovery in our purchases from the United States compared with the sorry record of our sales to that country. The only bright spot in this "non-European" table is Egypt and the Middle East. With this group our trade balance is better by over £4½ millions. In trade with South America we have bought less and sold less.

Taking Europe as a whole, the continued fall in imports means that the adverse balance of our trade with the Continent is less than a year ago. But there are some interesting ups and downs. Trade with the Scandinavian countries—in effect the trade treaty group—has been fairly well maintained; though Denmark has sold us slightly more and bought slightly less than a year ago. Trade with Russia has moved, as is to be expected, in an independent way—in this case in our favour, for imports have fallen and exports risen substantially. Trade with Germany has been surprisingly well maintained in the face of payment problems. In view of political difficulties and Germany's much-advertised attempt at self-sufficiency it will be a surprise to many to discover that Germany is Britain's best customer outside the British Empire—her purchases in the present returns having exceeded those of the United States. True, they have fallen heavily since 1929; but the fall has not been as great as the reduction in imports, which are down by £10 millions. Hence this significant little table:—

	Second Quarter of 1929	Second Quarter of 1938
Imports from Germany ...	£17·7 millions	£7·1 millions
Exports to Germany	9·3 "	4·7 "
Surplus of Imports	8·4 "	2·4 "

This surplus is the source from which Germany must pay her debts and finance her purchases of material from the other countries of the Empire. Whether these figures are cause or effect of the facts that Germany neither pays her debts nor has the funds to buy the materials which the overseas world is so anxious to sell, the statistics do not reveal; but they serve as a reminder that certain things cannot happen in the world of trade if a country will not accept imports. The European table shows that there has been some slight recovery in sales to Italy from the low level reached in the Abyssinian War.

The tables as a whole give an epitome of the economic history of recent years from which much may be learned. For example, trade with Argentina is down substantially; but far more on the import than on the export side. Indeed, in 1929, Argentina was our second largest source of supplies; to-day it is eighth in the list. Canada, on the other hand—which like Argentina has sold us less this year—has become a far more important factor in our economy. Again, trade with India—once easily first in the returns—has changed its course. We are still large buyers; but our sales have fallen by more than half since 1929—thanks to protection and public opinion in India and to competition from Japan India can more easily pay her charges to Great Britain; but at Lancashire's expense. Thus, the figures above are a gross total comprising many contrary tendencies, which makes it difficult to generalise. Clearly there is a general downward trend—partly as the result of lower prices; and in particular the material-producing countries have less to spend. But this is not—except in certain special cases—the result of reduced buying by Great Britain. We are even doing our best to keep the American farmer out of depression. We must therefore look deeper for ultimate causes; and one of them is unquestionably the sudden fall in the buying power of the United States.

There are not, however, on the surface any grounds for acute alarm about the future of British trade. Europe is already depressed as a trading region; the present setback is mainly to be sought farther afield where the movement of prices is all-important. It is too soon to prognosticate whether the depression in the commodity markets is lasting, and if so whether it will yet have more far-reaching effects on British overseas trade.

Sales and Cinderellas

CAREFUL students of the daily Press may have noticed in the last two or three years a new fashion in pictorial advertising. Its distinguishing feature is a collection of balloon-like shapes issuing from the mouths of certain *dramatis personæ* engaged in a play of human emotion—starting in a mood of despair and emerging in a blaze of social or professional triumph. The first picture is always of the furrowed brow, the drooping head, the balloon charged with words of suicidal gloom. The next will be more cheerful. The third perhaps a consultation among friends as to who shall tell the hero or the heroine the true facts. The fourth may be a visit to some specialist, who recommends (with the air of producing a novelty) a prescription long familiarised by expensive advertising to the entire British nation but unheard of hitherto by the hero or the heroine of the balloon drama. And, finally, the break in the clouds, the dawning of a new day, the ascent to triumph with love recaptured, popularity achieved, larger salary announced, greater responsibility accorded. The authors of these plays are no believers in a finish of Shakespearean tragedy.

You may perhaps have wondered sometimes who devised this drama of physical exhaustion, unpleasant smells, half-white cottons, greasy plates? Where does it all come from? To these questions the answer has recently been given by that amusing paper *The New Yorker*, in an article describing how an American citizen amassed in a few years a fortune of $25 millions out of the sale of an old-fashioned proprietary medicine that was not selling well. A conference was called to decide what new talking point could be thought of. It was attended by an old chemist who had for years been in the service of the firm, and it went approximately along these lines.

"The old master," said the chemist, "used to say it was good for halitosis."

"Hali what was that?" said the sales chief.

"Halitosis," said the chemist. "Latin for bad breath."

"Eureka!" cried the sales chief, returning Latin for Latin.

Now the word halitosis was at that time little known to the majority of American citizens. It is still unknown to some editions of the New English Dictionary and was added to that generous work the Concise Oxford Dictionary only in 1929 as "abnormally foul breath." But for all that it did the trick. It brought in the fortune of $25 millions. The sales manager's sound instinct had seized on it and he went away and worked out the story of a girl called Ernestine who had on the surface everything to

recommend her. She was good-looking, witty and charming. But she was a social failure. And why? Because without knowing it she suffered from that horrid thing, halitosis. "Ernestine shall henceforth sell our antiseptic." And, with her progress from shame to glory, she did.

Hitherto the mixture had been advertised in the old-fashioned "recommended by the medical faculty" type of advertisement, and there was some difficulty in persuading other interested parties of the virtues of the new style; but once they had allowed Ernestine a trial run opposition melted and Ernestine reigned alone. Heil Halitosis.

This Ernestine has now a large and thriving family whose members all talk in balloons and one and all tread the same path that she herself took. The English branch alone is extensive and socially very various. One of her sons is engaged in a commercial firm. After great early promise he somehow lost his snap, added the figures in the ledger up all wrong and was within hailing distance of the sack, when a kind doctor told him about you know what and within a month that managership of the Bombay branch was his. A daughter of hers, like Ernestine in her young days, simply could not get off, and at the tennis club dance we see her eyed askance by the young men, pitied by the other girls, a burden to herself. Told by a kind friend about the unfortunate chemical condition for which the scientific formula in advertising circles is b.o., and hearing by chance of Thingamajig she became so popular that at the winter whist drive you could not get near her for the boys. That lady, too, is Ernestine's daughter, who had asked a couple of neighbours to supper with self and husband and is first seen in an agony of remorse as the guests sniff and stare in a meaning way at the plates on which the chicken soufflé (with so much trouble spent on it) has been served at her table. She is told confidentially of Whatisit and at the last she sits —the regnant hostess of her native suburb—with her guests exclaiming, as guests will, "But, darling, these plates are clean."

Luckiest of all is the dear old family physician. He has what may be called a mass-production practice with no troublesome variety. All his patients suffer from the same complaint. To each the diagnosis is offered in the same scientific language, which never changes by a comma from one visitor to the next. There he sits, the happy man, finger-tips pressed together, reeling off the same old prescription for the same old malady at three guineas a nob, and never yet has he failed to effect a triumphant cure.

The truth is that Ernestine's family is working the Cinderella complex. Most of us, as we slave away at our monotonous jobs and endure the snubs and setbacks of outrageous fortune, know in our heart of hearts that we are Cinderellas; that we are really much finer and much abler and much more charming than the people who outshine us; and some little thing—we do not know what—is preventing our pre-eminence from being recognised. If only the fairy godmother would come along and show us to the world as we truly are, then the prince would worship us, the slipper would fit our foot and we should immediately be raised to whatever particular glory it may be that we most desire. In business or in love or in social life we should enjoy a spectacular success, and the £2,000-a-year job, the murmur of adoration, the envy of rival hostesses would be ours at once. It is because Ernestine and her children come as the fairy godmother and tell us what the trifling obstacle has been that they make these $25 million fortunes for their own parents.

It would be nice to end this article, as the advertisements themselves end, on a note of triumph. But a depressing thought intrudes. To make a fortune of $25 millions you need to sell an incredibly large number of bottles of disinfectant, and it is difficult to believe that all the people who fell for Ernestine and bought her wares had their hopes realised. There are, after all, only a certain number of vacancies at £2,000 a year in branches at Bombay and only comparatively few young men who look like Valentino and make love as he could make it. And while we joyfully congratulate the young folk who get their heart's desire by cleansing their breath or freshening their persons or regaining their morning energy, let us spare a thought for those less happy ones for whom the fairy godmother in the bottle or the bar of soap or the tin of liquid food opened no doors, provided no princes, fitted no glass slippers. There must still be some here and there who after months of soaping and doping continue to repel the men and infuriate the boss. *Vae victis.* Greek for Poor Devils.

Topics of the Week

Science and Welfare.—The scientist has not infrequently been regarded as a fiend whose activities ought to be suppressed. Sometimes the charge is a general one, brought by people who yearn for the fancied simplicity of an earlier age and who never write the word progress without putting it in inverted commas. But more specifically he is often accused of devising vile instruments of destruction for use in modern warfare, and it was this charge which Lord Rayleigh so effectively answered in his presidential address at the Cambridge meeting of the British Association. In a troubled world much research has warlike bearings, and some necessarily has direct warlike intentions. But Lord Rayleigh had little difficulty in showing that the development of such things as explosives or poison gas merely represented the application of scientific knowledge already discovered by people who had no idea of its subsequent uses. Many of these discoveries had proved of great value in peaceful fields, so that it was obviously absurd to cut off the supply of information at its source. The proper course was to see that it was subsequently applied in ways that would be beneficial to mankind, and here Lord Rayleigh frankly (and rightly) admitted that scientists as such could do very little. If the general body of citizens so arrange their affairs that preparation for war becomes a major industry, then they, and not the scientists, must bear the responsibility for the fact that scientific knowledge is applied to warlike ends. The British Association has, however, done what it can by setting up a special division to study the social and international relations of science. Such a body naturally receives our good wishes, but it is more likely to be successful in dealing with civilian questions than in humanising warfare. The supreme political problem of removing violence from international life cannot be solved by the scientific backdoor.

* * *

The Dominions and Foreign Policy.—So many vague generalities are spoken about the value of "Imperial co-operation" and "the mutual exchange of ideas" that the casual reader seldom gets further than the headlines when a speech on these topics is reported. Yet it is undoubtedly a subject of great importance, particularly in the field of foreign policy, and one which admits of no easy solution. Mr Menzies, the Australian Attorney-General, made this clear in his farewell statement to the Press. If he had stopped at that point his contribution might reasonably have been dismissed as "the usual high-sounding phrases which get you nowhere." But he advanced the matter one step further by setting out his view of the rôles of the various partners in rather more detail. Since London is, in fact, the centre, Dominion pride should in no way be offended by an arrangement whereby the Government of Great Britain in effect spoke for the whole Empire in large matters of international policy, but only after, as far as possible, inviting Dominion criticism and paying due heed to Dominion views; while the Government in each Dominion recognised that they should make an effective contribution to Empire policy and Empire security. Few people will wish to quarrel with this statement of policy, but it is still only a general policy, which has next to be translated into practice. The inevitable difficulties in the way of effective consultation are only too obvious. This fact makes the frequent overhaul of the machinery all the more necessary, and if Mr Hughes, the Commonwealth Minister for External Affairs, can substantiate his charges against the Dominions Office, then the matter should be put right immediately. He has, however, received little support from his colleagues in the Australian Cabinet. But difficulties will remain, even if television and wireless telephony should enable the Ministers in all parts of the Empire to join in a round-world conference. There is always the danger of excessive delay, particularly as some Dominions regard the Ministry of Foreign Affairs as a relatively unimportant post and would expect its occupant to consult the Cabinet at frequent intervals. But even if the machinery of consultation could be ideally perfected, that would not by itself, as is sometimes implied, create a common foreign policy. Even within the Commonwealth, the various Governments may be quite unable to agree on a common policy either because the interests of their countries are divergent or because they differ in political views. Clearly, the problems of reconciling independent sovereignty with common allegiance have not yet been solved. And they will not be solved by ignoring their difficulty, or pretending that they arise solely out of imperfect communications.

* * *

Manœuvres or Mobilisation?—The unwontedly lavish dissemination in Germany of official details about the calling-up of reservists, hasty fortification of frontier areas, manning of Rhineland and Czechoslovak frontier defences, and autumn manœuvres, neither reduces their ominous import, nor mitigates the unwisdom of operations which, in Europe to-day, look suspiciously like "rocking the boat." But it does, at least, demonstrate the Nazi leaders' desire to cow the London and Paris Cabinets into acquiescent submissiveness to German claims and designs in Central Europe—in Hungary as well as in Czechoslovakia. Moreover, the Nazis are no doubt trying to exert a little indirect influence upon the London-Paris axis, in favour of Signor Mussolini, with the aim of keeping the Pyrenean frontier "voluntarily" closed by France, to meet British requests, rather than "enlarge the risk of a spread of the conflict." (This time-honoured Italo-German process has long been known in America as "pulling a fast one" over the British.) Thirdly, the more extreme Nazi leaders are said this week to have been so alarmed, out of concern for power and Party as much as for patriotism, by the substantial and rapid slump on the Bourse and the dislocation of civil (and even certain sections of the re-armament) industry, that they urged upon the more responsible figureheads and the General Staff the need of "another Austria" as pabulum for popular perturbation. The prestige of the "first Austria" has only lasted this regime five months; and the only other available Austrias are now well outside all frontiers which, by the wildest stretch of imagination, can be said to be unfair to Germany proper. Since Herr Hitler abandoned in Rome, in favour of Signor Mussolini, all claim to the South Tyrol, there are "rats and mice and such small deer" like Danzig, (already Nazified), Eupen, Malmédy, North Schleswig and Memel; and there are, of course, Czechoslovakia and Hungary. Both the latter are now in the forefront of the German picture, Czechoslovakia in the current dispute, and Hungary in the State visit to Kiel next week. Perhaps surprises are, after all, despite professions by the official Anglo-French newspapers to view German manœuvres with equanimity, afoot. As Lord Palmerston said of Napoleon's tactics, the secret of Herr Hitler's successes is that he roars for a long time about what he will do next, then does it; and everyone gets so used to expecting it that, when it happens, they look upon it as an inevitable conclusion to a historical syllogism. They are therefore neither shocked nor surprised when it happens, but only relieved. Now that Germany is fortifying and levying semi-mobilisation in the Rhineland and Austria, what would not those, who hailed the military occupation of the Rhineland and of Austria as the removal of "obstacles to peace," now give to regain a tithe of the relief they then prematurely felt?

* * *

The Week in Czechoslovakia.—The extent and duration of the so-called normal German military manœuvres round the Czech frontier have confirmed the Czechoslovaks' belief that the Nazis aim thereby at overawing not only Prague, but also Paris and London, into granting such concessions to the Henlein Party as would in effect deliver the republic into the hands of the Third Reich. So far the German manœuvres have not shaken the well-tried nerves of the Czechoslovaks, already hardened to such demonstrations before May 20th; but they have, apparently, either as cause or accompaniment, served to stiffen the attitude of those lieutenants of Herr Henlein who have long been charged with the duty of negotiating with the Czechoslovak Coalition Cabinet—and therefore with Lord Runciman. These representatives of the Sudeten German Party on Wednesday threw back on the Coalition and Political Committee of the Cabinet the combined terms of the proposed Nationalities Statute, amended Language Law and Administrative Reform Bill, and stood pat on the "minimum" demands outlined in Herr Henlein's Carlsbad speech of April 24th and in the Party's memorandum to the Prime Minister, Dr Hodza, of June 7th. Thus, once again, utter deadlock—the position just before Lord Runciman's nomination—is reached between the concern of the Government to safeguard the State's integrity and the claims of the Sudeten Party, which, in a covering memorandum on Wednesday, went so far as demanding complete equality of *powers*, as well as of *rights*, between Sudeten Germans and Czechoslovaks. The first entry of Herr Henlein into the negotiations on Thursday, when he saw Lord Runciman, may help to resolve the deadlock. But it is hard to see what Dr Hodza, or Lord Runciman, or the combined British and French Governments, can do to meet all demands, short of urging Czechoslovakia to enter the Third Reich lock,

stock and barrel. The Sudeten claims are pushed higher, parallel with the assembling of forces on Czechoslovak frontiers. It is, therefore, clearly no longer an internal Czechoslovak, but an international European question.

* * *

In the political confusion, the economic factor is of growing importance, especially as civil industry is slowly running down in Germany compared with re-armament, and as the Sudeten's industries are wholly civil in nature. Their markets have been cut away by the German forced economic drive to the south-east, in which they have been unable to compete with heavy Reich subsidies. This, rather than any Czech discrimination, is the cause of their persistent unemployment; but other causes are the disturbing psychological effects on the Sudeten workers of unwanted Party drill and discipline, effects of Party-fostered fears, and the foreign boycott of the region's predominantly exportable products. The experience of Austrian industry should by now have shown the Sudeten employers and employees that a Third Reich which now contains and has to run Austria will have—especially in view of recent economic evidences in Germany—little left over to run the Sudetenland industries or to pay Utopian subsidies. Clearly, the Czechoslovak Cabinet has the right to take Sudeten protestations of loyalty at their face value and to ask how the Sudetens propose to run the area economically without depending either on German or Czech subsidies. This is a problem on which, we hope, the views of Lord Runciman and of his economic experts will be canvassed.

* * *

Aerial Deeds and Disasters.—Last week-end brought news of the first completed round flight direct between Berlin and New York. It was completed in fine style by the Focke-Wulf "Condor," a four-engined monoplane of conventional and familiar design; but the achievement was to fly an ordinary commercial machine, to which extra petrol tanks alone had been added, from Berlin non-stop to New York on Wednesday of last week at an average speed of 161 m.p.h. in just under 25 hours, and to fly back non-stop on Saturday at 207 m.p.h. in under 20 hours, thus beating the late Wiley Post's record. The same week-end provided, however, news of a train of aerial disasters. A Czechoslovak air liner on the way to Strasburg and Paris crashed in low mist on the hills of Baden just before reaching France, and in all 17 lives were lost. On Sunday it was reported that a Mexican air liner, missing since Friday of last week, on the stretch from Yucatán to Vera Cruz and Mexico City, had been found with all 11 occupants killed on the side of a mountain in the State of Vera Cruz on the isthmus between the Mexique Bay and the Caribbean. Here thickly wooded mountains rise among giant rain clouds, blown to and fro across the isthmus between the two seas; and, though flown by skilled Mexican pilots, the passage in fine weather is always bumpy. This air liner, caught in a tropical rainstorm, came to grief in almost precisely the same way as the Czechoslovak machine thousands of miles away in Europe. It is becoming obvious that, while machines and men have been developed to the pitch of perfection and the risks of commercial flight have by now been reduced to negligible dimensions, weather and atmospheric conditions are the last remaining obstacle to be overcome. For this, as both British and American official commissions of inquiry have recommended, continuous communication with the navigator throughout all weather and the whole passage, serving him with all information, is the next logical development. That, however, is a matter of capital investment on the ground. Not till it is done will the air be really safe.

The National Archives.—The establishment, on August 14, 1838, of the Public Record Office marked the tardy reform of one of the major scandals of British public administration one hundred years ago. Lurid details revealing the neglect in which the national archives were being allowed to moulder and decay had been disclosed by the inquiries of a Select Committee of the House of Commons of 1836. The dilapidating forces of nature, which included rats and other vermin as well as rain, hail and flood, were on occasion aided rather than checked by those into whose custody the records were committed. Soldiers and labourers found that useful supplements to their meagre pay could be had by supplying old parchments to glue makers, and their crimes were only exceeded by those of the State itself in selling Exchequer records to fishmongers for a few pounds a ton. The Record Commission established in 1800 cost the country vast sums of money and yielded in return merely a few printed volumes of very varying value. Nothing had been done to preserve the originals or to make them easier of access. So vexatious were the fees exacted by their custodians that historical research necessarily remained a privilege for the very rich and the very leisured. To this state of affairs the Act of August 14, 1838, for keeping safely the public records, brought a salutary reform. It led to the foundation of the present Record Office and so laid the foundation of our modern archive administration.

* * *

The Public Record Office took over and safeguarded the miscellaneous accumulations of past centuries, and has provided also for the continuing accumulations thrown up by the machinery of State. Its efficient discharge of these tasks makes it a much-frequented public department. Beyond the care and arrangement of the enormous and annually growing material in its charge, the Public Record Office has from the first pursued a publication policy to make thousands of documents available to scholars unable to visit Chancery Lane. The present policy of confining the publications of the Office to transcripts and summaries of important classes of State papers (Acts of the Privy Council, Patent Rolls, Close Rolls, Treasury Books, Domestic and Foreign State Papers, etc., and Lists and Indexes of other classes) was begun by Sir Henry Maxwell-Lyte, who became Deputy Keeper, under the Master of the Rolls, in 1886. His predecessors had issued, in the Rolls Series, a magnificent collection of mediæval chronicles and other documents which were not strictly State papers. The cumulative result of such work, a by-product of the national duty of maintaining the public records, has endowed historical research in Great Britain with a degree of State assistance afforded to no other branch of humanistic study. The Public Record Office, at its centenary, has an impressive achievement to its credit. To extend its utility by enlarging its existing facilities for research and by accelerating its relatively inexpensive and now severely rationed series of publications are two additional improvements now amply justified by one hundred years of good stewardship.

* * *

The Air Ministry in Mayfair.—The expansion of the Royal Air Force has swollen the Air Ministry to such gargantuan size that it has taken a whole new vast office-building in Berkeley Square merely to house its overflow. The Ministry's staff numbered 3,496 in the financial year 1937-38, and the current Estimates provide for a total of 4,406. The old accommodation at Adastral House has long been too small, and various branches have been widely scattered; the multiplicity of these offices alone was enough to produce some inefficiency. In September a number of these scattered sections will be concentrated under the new roof, notably the equipment staff and the supply staff. Headquarters will remain in Kingsway, but there will henceforth only be two main centres. The change has two main features of public interest. The first is the ominous evidence it provides of the rapid growth of the defence departments. Offices in Berkeley Square are by no means the same thing as huts in the parks, but they are alike in being symptoms of that painful public disease, elephantiasis of the bureaucracy. Secondly, the Air Ministry's new acquisition illustrates the strong trend towards the development of Mayfair as a commercial district. Distance from the previously accepted centres of commercial life is ceasing to be a drawback. The two centres of the Air Ministry, for example, will be two miles apart. The telephone will presumably bridge the gap. Indeed, the whole development of Mayfair can be said to be a delayed reaction to the invention of Mr Alexander Graham Bell.

* * *

Social Security in New Zealand.—The long awaited Social Security Bill of the New Zealand Government was introduced into Parliament on August 12th. The main proposals follow closely the preliminary description given by the Prime Minister as long ago as February 26th. Their comprehensiveness may be judged by the fact that the cabled summaries merely included provision for unemployment among "other proposed benefits." Indeed, apart from education, the Bill covers virtually the whole field of the social services, even to pensions for veterans of the Maori War (which are raised to 30s. a week). In some fields it is little more than a consolidating measure, but in others it introduces far-reaching developments. The feature which has attracted most attention is the granting of a weekly pension of 30s. to every man or woman who can pass a test as to residence and means. The qualifying period is ten years for those who were resident on March 15, 1938, and twenty years for subsequent arrivals. The means test provides for a deduction to prevent the total weekly income exceeding 50s. in the case of a single person or 80s. for a married couple. In 1940 a step is to be taken towards universal superannuation at 65 by the provision of a pension of £10 per annum *without* a means test; the annual payment is thereafter to be raised by 50s. each year until £78 is reached. The scheme also establishes a national health service under which everybody, irrespective of means, will be entitled to the services of a general practitioner; the patient may select his doctor in the same way as under the British panel system, and the range of services is also similar. Special sections provide for free maternity services, including 14 days in a maternity hospital, free hospital treatment, free medicines or drugs, and assistance towards the cost of specialist treatment. Other provisions include widows', orphans' and invalid pensions on a scale broadly similar to those for people over 60. Unemployment benefit is at the rate of £1 a week for an adult, with an extra 15s. for a wife and 5s. for each child under 16 years old.

* * *

The scheme has aroused determined opposition from the doctors, who do not approve of the proposal whereby the services of a general practitioner are to be made available to everyone. A ballot conducted by the New Zealand branch of the B.M.A. showed less than 5 per cent. of the profession in favour. One may perhaps recall the hostile attitude of the profession to Mr Lloyd George's Bill, and assume that some arrangement will be reached before April, 1939, when the scheme is to come into operation. A more general criticism is to the effect that the country cannot afford so imposing an array of services on such a generous scale. The finance of the scheme was discussed in detail in a leading article on page 174 of *The Economist* for July 23rd and in a Note on page 236 of the next week's issue. The total cost (not all of which, however, represents new expenditure) is estimated at about £16 millions in the first year. It is to be met partly by a special "social security contribution" to be levied on all incomes received by people over 16 at the flat rate of 1s. in the £. There is also to be a registration fee of 5s. a year for women and people under 20 and 5s. a quarter for others. These are expected to yield some £8 millions, but they replace a similar unemployment tax of 8d. in the £. The net charge to consolidated revenue is a subject of considerable dispute, but the exact figure for the first year is of less importance than the future possibilities. Unemployment is now at such a low level that the cost of this provision seems hardly to be mentioned by the disputants; but this will not always be so. And the present age composition of the population is highly abnormal, so that the £6 millions allowed as the immediate cost of the pensions is hopelessly misleading as a guide to what will be required in future.

* * *

The Colonial Secretary on Palestine.—On August 11th Mr MacDonald reported to the Prime Minister on his conference in Palestine with the High Commissioner and with the General Officer in command there, and on the same evening he made a broadcast statement to the public on the Palestinian problem. There was a ring of sincerity and good intentions in his words which must command sympathy from all parties. Yet his statement leaves us with some misgivings. True, he expressed a belief in that urgency for immediate action which was emphasised, more than a year ago, in the report of the Royal Commission. He told us that the work of the Technical Commission ought to be completed within a few weeks, and that, "after that, decisions must be reached with the least possible delay." He rather reluctantly agreed that the attempt to restore and maintain order is, and must remain, an impossible task until a definite policy has been decided upon and been put into effect. But what is the Government's policy to-day? It was on this capital question that Mr MacDonald faltered most disconcertingly in his speech. "The Government," he reminded his hearers, "have accepted, as the best and most hopeful solution," the partition plan which the Royal Commission urgently recommended more than a year ago now. "But," Mr MacDonald went on to say, "final decisions cannot be taken" until the Technical Commission has reported too. Does this mean that the Government have not yet decided, even in principle, on either the partition policy of the Royal Commission or any other of the diverse competing policies that have now been lying on the table for months and even years past? If, several weeks hence, the Government are really going to start from scratch in their treasure hunt in search of a Palestinian policy, then "the least possible delay" which must elapse before the reaching of any "decisions" can hardly fail to take a ghastly toll of lives at the present weekly rate of outrages. On the very day on which Mr MacDonald in London was rendering his account to the Prime Minister and public of the United Kingdom, there were four fights in Palestine between the Government forces and their adversaries, and in one of these military engagements three Arab peasant women "who came into the line of fire" were seriously wounded. Last Saturday the garrison engineer of Jerusalem, Captain J. S. Howe, was ambushed and killed in his car on the road from Jerusalem to Bethlehem. On the same day, a Jew and his wife were ambushed and killed while out

bicycling and their child of seven seriously injured. The Government must know what to do, and do it quickly. Procrastination will spell disaster for Palestine.

* * *

Poland and the League.—In Warsaw it has been announced that the Polish Government propose to withdraw the permanent delegate whom they have hitherto accredited to the secretariat of the League of Nations at Geneva. It is rumoured at the same time that Poland may refrain from again putting forward the candidature for the "semi-permanent" seat on the League Council, which she has held ever since the admission of Germany to the League, with a permanent seat on the Council, in 1926. The Poles will no doubt pat themselves on the back for their "realism" in getting off a sinking ship before she takes her final plunge. To get off a ship at any moment is always easy; but before we endorse the disembarking passenger's pretension to be a "realist," we must know whether the plank along which he is stepping ends in an unsinkable lifeboat or in a sheer drop into the ocean. If the group of Polish statesmen who at present hold their country's destinies in their hands believe that the League of Nations, with all that it stands for, is doomed, we wonder what exactly may be the alternative regime in Europe to which they are looking forward with such an air of complacency. Are they expecting that military hegemony of Germany, to which the Swiss Federal Council seem to be looking forward with profound apprehension? If this is the alternative to the League which the Poles, as well as the Swiss, see looming up over the international horizon, surely Poland, so far from being able to afford to smile, has far more reason than Switzerland to feel gloomy. The traditional neutrality of Switzerland might just conceivably be respected by an all-powerful Germany. But the post-war independence of Poland? Polish Corridor and all? If Poland escaped a fifth partition in a Europe in which Germany had established her mastery, that would only be because the Third Reich had a big enough appetite, and a sufficiently capacious maw, to swallow Poland whole instead of taking two bites at the cherry. For our part—and we fancy that this is the prevalent Anglo-French view—we do not believe that, if fresh disaster is brought upon Europe, a German military domination over the rest of us will be the outcome of it. If a unification of Europe under a German yoke is not practical politics—and, for this, the Poles may thank their stars—then the only alternative is the League in a more effective form than the present.

* * *

Hope Deferred in Spain.—Some hearts are sick with deferred hopes in Spain; others—among which are those of the British Cabinet—are only being searched. To the former category belong those of General Franco, Signor Mussolini, and—of the French. The insurgents and their Italian allies by air, sea and land seem as far as ever from that victory, crushing and complete, which will finally place the palm upon the tired brows of Signor Mussolini's "volunteer" warriors. Either that, or an armistice that gives victory to no side, must occur. Then, alone, can the "volunteers" quit Spanish territory. Then, alone, can they be repatriated without fear of leavening the Italian people's loaf with discontent and disillusion. Realisation of this has prevented General Franco from accepting the Non-intervention Committee's (British) Plan for the withdrawal of "volunteers" as speedily as the Spanish Government accepted it in principle nearly six weeks ago. On Tuesday his reply was received in London; and it is said to take strong exception to many vital features of the plan. This means that the committee will have to be convoked again to discuss both the contestants' replies. That will take more time; and then, we may be reasonably sure, dissentient sympathies will divide the committee and delay action. Meanwhile what has been making French hearts sick—and, surely, as many British as do not belong to men of stone—is that the Pyrenean frontier is still "voluntarily" bolted and barred by the French Government to the Spanish Government, though everyone has now been told from Paris that this was, and is, still being done at the express request of the British Government in another desperate endeavour to get General Franco and Signor Mussolini to let their "volunteers" go before winning a victory. If General Franco's reply is calculated merely to gain more time for that victory, it will be nothing short of monstrous favouritism of General Franco's cause if His Majesty's Government continue to press the French to discriminate against the Spanish Government. Indeed, if the British Government try to keep it up, they may provoke a first-class upheaval in France herself, at our very doors, and at a time when European tension would bid us beware. For the French workers, through the voices of MM. Blum and Jouhaux, have been declaring themselves restive about adoption of British policies to no purpose and to France's manifest peril.

* * *

The War in Spain.—All the time the conflict goes on. The insurgents creep forward on the Estremadura front; they are halted on the Teruel-Sagunto line; and they are trying to roll the Government forces back across the Ebro again. The Balearic bombers, now openly claimed as Italian by the Italian press, still rain death on the towns along the Spanish Government's Mediterranean littoral; and this week again they have killed a British wireless operator and wounded another British N.I.C. observer and sailors in attacks on British shipping. In this context a pretty passage-at-arms has been going on between the Foreign Office and the committee of shipowners trading to Spain. The questions were whether General Franco had undertaken to pay compensation for the results of attacks found by the new inquiry commission to be deliberately made by his aircraft; and whether the Foreign Office itself had presented to the shipowners terms for regulating future incidents of a final "take-it-or-leave-it" kind or only for discussion and amendment. The shipowners refused to treat with General Franco or the Foreign Office on the basis originally presented to them; and the Foreign Office announced last Saturday that the basis was only provisional and would be further amended, if necessary. This week, too, the Spanish Government under Dr Negrin resigned and was reconstructed with two new members in place of those who had opposed decrees assimilating the status of workers in armament and ancillary industries to that of soldiers. More hopeful, perhaps, than any other news of the week about Spain is the announcement of the agreement of both contestants to the despatch of a commission of three British officers headed by Sir Philip Chetwode to Spain to arrange for exchanges of prisoners and other persons detained by either side. But from this commission, the commission of observers to report on deliberate bombings of British property by the insurgents' aircraft, and the commission in France which is held ready to report on indiscriminate bombings of the civil population, to a truce in Spain is still a long step.

* * *

The Far Eastern Tangle.—The peace at Changkufeng has been signed and, despite Russian and Japanese rumours and mutterings to the contrary, kept for a week. It will probably be kept now for some time; the reason seems to be the unwonted sobriety with which the Japanese on this occasion have viewed all the contingencies. At the week-end there were reports of an ugly incident on the border which cuts Russian territory in the north of the island of Sakhalin from Japanese in the south; a Japanese Minseito M.P. and his companions are said to have been fired on by Russian guards. But Japan has now closed this frontier altogether. Meanwhile, while boundary commissions set to work in the Korean-Manchukuoan-Russian triangle near Changkufeng, the Japanese military authorities last week-end once more declared in Tokyo that their swords will not sleep in their hands until they have

built a Japanese Jerusalem in China's pleasant land, and hounded Marshal Chiang-kai-shek from power. China will be harried with redoubled Japanese fury to accomplish that end; and, indeed, this week thousands of people have been killed and wounded in the resumed Japanese air raids on Canton, Hankow, and other cities. The offensive up both banks of the Yangtse to Hankow has been halted until October, when the rains will have subsided and deprived the Chinese, so the Japanese account runs, of the opportunity to flood the low-lying terrain of approach; but skirmishing over a vast area is being kept up in Chinese guerrillas. Meanwhile the Japanese Finance Minister, Mr Ikeda, in a statement last Saturday, referred to Japan's desire to collaborate "with other Powers" in the economic rehabilitation of China after the war was over; and on Tuesday the Cabinet, in passing measures to prosecute the war with greater intensity, referred in their *communiqué* to the situation as it would emerge after the war and admitted that no plans could yet be made. At the same time, the Japanese have expressed a desire to carry the conversations begun with the British Ambassador for better relations a stage further; and the Japanese Minister in Paris has declared that Japan wants to improve her relations with France. Reading this with the record of events on the Russian border, are we to presume that Japan is beginning to repair her diplomatic bridges to the Western democracies? It is at least a hopeful sign.

* * *

The End of the McKenna Duties.—The McKenna duties come to an end on Saturday of this week. Originally imposed in September, 1915, and taking their name from the Chancellor of the Exchequer of the day, they are the oldest of our major protective duties. They were levied at a uniform rate of 33⅓ per cent. (with an Imperial Preference of one-third) on cinematograph films, clocks and watches, musical instruments and, pre-eminently, motor cars. The McKenna duties have not had a continuous existence, since Mr Philip Snowden removed them in 1924, but they were re-imposed by his successor in 1925. Nobody should imagine that the passing of these duties means a reduction in the imposts to be charged on films, clocks, organs and cars on coming into the country, for Treasury Orders have been issued under the Import Duties Act of 1932 and the Finance Act of 1938 imposing, from Sunday, exactly the same rates of duty as have hitherto been charged under the McKenna ægis. Indeed, the whole purpose of the change is to open the way for an increase in some at least of the duties, for the significant difference between McKenna duties and Import Duties Act tariffs is that in the latter case it is open to the industry to apply to the Import Duties Advisory Council for an increase of duty. Application will be made immediately by the Society of Motor Manufacturers and Traders, who are greatly perturbed at the increase in imports of Opel cars from Germany. It is highly probable that an increase in the duty on these small cars will be granted, on the charge that the German exports are assisted by subsidies and exchange manipulations. But we trust the charge will first be proved. The British motor industry would also undoubtedly like to have increased protection against high-powered American cars. This is an entirely different matter, since there is no question of unfair competition, and the existing protection of 33⅓ per cent. is not only high in itself but is in practice substantially increased by the rules in force for the valuation of imported vehicles. Fortunately, the imminence of the Anglo-American Trade Agreement probably provides a complete assurance that the demise of the McKenna duties is not to be made the occasion of an increase in the duties levied on one of the most important items in the list of American exports to Great Britain.

Recovery: Opinions and Facts

New York, August 8.—Opinion now seems to be unanimous that a decisive cyclical turn in our economy occurred in June. The most conspicuous evidence of this opinion has been the rise in common stocks. In the last two months the indices show a gain of over 30 per cent.; but among the lower-priced shares, advances of between 50 and 100 per cent. are almost general.

Supporting this opinion is the fact that Moody's index of the prices of primary commodities has advanced about 10 per cent., mainly owing to a rise in industrial materials; the markets for food grains have been weak, owing to the pressure of current supplies. This advance in raw material prices is attributed chiefly to a desire to replenish inventories depleted during the period of the buyer's market, which ran approximately from September, 1937, to the end of May, 1938.

The second principal factor supporting the opinion of the cyclical turn is the index of steel operations. The following table gives the estimates of the Iron and Steel Institute:

STEEL OPERATIONS
(Percentage of Estimated Capacity)

Month		Week ended	
July, 1937	78	June, 6, 1938	26
Aug. ,,	84	,, 13, ,,	26
Sept. ,,	76	,, 20, ,,	27
Oct. ,,	58	,, 27, ,,	28
Nov. ,,	38	July 4, ,,	29
Dec. ,,	25	,, 11, ,,	22*
Jan., 1938	29	,, 18, ,,	32
Feb. ,,	32	,, 25, ,,	36
Mar. ,,	34	Aug. 1, ,,	37
Apr. ,,	33	,, 8, ,,	40
May ,,	30	,, 15, ,,	39

* Includes July 4th holiday.

The average rate for the eight months, November, 1937-June, 1938, was approximately 30 per cent. of capacity, which was under half the average of the eight months preceding. The rise in the past month from 30 to 40 per cent. has all the appearance of a decisive change of direction. It is reported, however, that this rate is in excess of current consumers' demand, and represents to some extent a building up of stocks by producers who expect larger orders in future. In other words, the index of steel operations is the counterpart of the index of sensitive commodity prices; and in this instance both seem to reflect a change in anticipations as much as, or more than, a change in actualities.

In the industries which are closer to the individual consumer, reports of increased business are still more marked. July rayon shipments were double the June total; activity in cotton and shoe-making is higher, and the sale of motor cars, especially used cars, is said to be remarkably good.

Economics of the Motor Car

Except for the weekly index of steel production, no data are so closely scrutinised as those affecting the motor industry. While the secular trend in this industry has not been strongly marked in the last decade, the table shows that cyclical fluctuations have been very wide.

PASSENGER MOTOR CARS IN THE U.S. (Thousands)

Year	Home Sales* of New Cars	Total Registrations (December 31)
1923	*3,439*	*13,291*
1929	4,138	23,273
1930	2,538	23,233
1931	1,840	22,538
1932	1,064	21,066
1933	1,476	20,830
1934	1,995	21,744
1935	3,043	22,801
1936	3,459	24,246
1937	3,643	25,459

* Production less exports.

As early as 1923, production exceeded 3,400,000 cars, and that year's output has been materially surpassed only in 1929 and 1937. However, while there were some poor years before 1929, the recessions were short and comparatively small, whereas the decline in production between 1929 and 1932 was catastrophic. On the other hand, it will be noticed that this great decline in production did not cause a corresponding shrinkage of the number of cars in use. Similarly, the output for the calendar year 1938 may be estimated at about half that of 1937, but it is most unlikely that the number in use at the end of the year will be materially reduced.

In 1923 the number of cars produced was about 25 per cent. of the number in use at the end of the year; in 1937 it was about 14 per cent.; in 1938 the ratio will presumably be considerably under 10 per cent. The importance of replacement demand is clearly growing relatively to that for expansion.

The passenger car is essentially a consumer good, but fluctuations in its output are greater than in most consumption industries. For while the public shows great tenacity in clinging to its cars under the most adverse conditions, its capacity to defer purchase is almost equally great. Conversely, in prosperous times, its desire and capacity to acquire new cars is highly elastic.

The life of a motor car was formerly assumed to be seven years, but it seems likely that between a third and one-half of the cars on the road are beyond that age. The question of the demand for new cars in any given year is therefore only slightly related to the number of cars theoretically "worn out" in the previous year; it is rather determined by the prosperity of those persons who already have relatively new cars, and who have the means and desire to possess an absolutely new one. Because of the magnitude of the industry, this sensitivity of the demand to economic conditions makes good years better and bad years worse; and data on current conditions or expectations in the motor industry are therefore correctly regarded as highly important indices of general trends.

Negative Rates of Interest

A rather curious situation has arisen in the money market. While banks pay no interest on demand deposits, they are assessed one-twelfth of one per cent. on them for Federal deposit insurance. Since the gold desterilisation programme of April, no offer of Treasury Bills has brought a rate as high as that, and the banks are actually out of pocket in carrying Treasury paper of short maturity. This correspondence has previously mentioned instances of negative interest in the New York market, and it is clearly becoming a phenomenon of some significance, though of uncertain implications.

Although Congress is not in session, reports of proposals for the usual annual changes in Federal taxation are beginning to appear in the Press. Suggestions were made during the last session for ending the practice of tax-exemption on future issues of Government and local securities, as well as on the salaries of officials. The magnitude of the sums involved may be judged from these figures: about $60,000 millions of public securities (two-thirds Federal, one-third local) are wholly or partially exempt from income taxation; some 2½ million local government officials are exempt from Federal income taxation, and about a million Federal officials are exempt from State income taxation. It is not proposed that outstanding tax-exempt securities become taxable, but that future issues should be. According to dispatches from Washington, a comprehensive revision of Federal taxation is to be presented to the next session of Congress.

France

Renewed Pressure on the Franc

PARIS, August 18.—The pound has been weak against the dollar, and the franc has been weak in sympathy. Its weakness has, indeed, been greater, so that the sterling-franc rate has been very near to the official limit of 179 to the pound.

The reasons are not difficult to find. The French convalescence is uncertain and comparatively recent; rumours of a general currency realignment or of exchange restrictions receive a ready hearing in a country which in the last two years has proceeded from devaluation to devaluation; and fears of war find an equally ready acceptance. There is no panic, comparatively little nervousness, but the exchanges reveal a pressure, a small but persistent leakage, which is always dangerous in a market which has not the reserves of the City.

Social Difficulties

Meanwhile the internal industrial revival proceeds only slowly. The fundamental measures of recovery, such as the revision of the too famous forty-hour week, encounter stubborn resistance when applied, as in the case of the dock strike at Marseilles.

The Government seems to aim at avoiding social disturbances while Germany is menacing the frontier, but it may have to face an economic crisis, the political and social consequences of which might be even worse. For the time being, however, the Ministers declare that there is no need for Parliament to reassemble, as they have no intention of introducing exchange control.

Slight Rise in Production

The Statistique Générale has now published its monthly statistics of industrial production:—

(1928 = 100)

	June, 1937	April, 1938	May, 1938	June, 1938
General index	*88*	...	...	...
Mines	84	95	91	93
Chemical industries	106	98	98	...
Paper	192	142	153	...
Textiles	86	78	...	...
Leather	70	...	...	...
Iron and steel	85	68	65	64
Engineering	90	78	78	...
Automobile	78	67	88	91
Building	60	59	59	59
Gas and electricity	128	...	...	...
Miscellaneous	104	...	...	...

In the motor industry 18,690 vehicles were put on the road in June, against 18,595 in May and 12,922 in April. Both branches of the cotton industry report rather higher stocks than last year, but there is little change on the month. Output was slightly larger than in May.

Wholesale prices have declined, particularly in the case of foodstuffs, and the retail index also shows a fall:—

	June, 1937	April, 1938	May, 1938	June, 1938	Aug. 6, 1938
Wholesale Prices (1914 = 100):—					
General index	*537*	*619*	*644*	*652*	*640*
Domestic products	565	662	686	685	657
Imported products	487	543	570	592	608
Foodstuffs	529	623	652	656	613
Industrial products	545	617	638	649	663
Retail Prices					July, 1938
(1914 = 100)	*590*	*691*	*698*	*698*	*690*
Lighting and heating (1930 = 100)	100·2	117·4	117·8	117·8	118·2
Clothing	93·7	100·0	100·0	100·4	100·4

The figure for bankruptcies was 420 in July, against 472 in June and 455 in May; judicial liquidations and bankruptcies taken together numbered 542, against 613 in June and 567 in May.

Germany

The Bourse and the Press

BERLIN, August 16.—Share prices have again suffered a very sharp decline, and bonds have also been weak. The tacit and perhaps involuntary buyers' strike is still in force. Its main participants seem to be investors rather than speculators, but one can only make surmises on this and other features of the collapse; for, although it is now six weeks since it began, there are still no detailed reports in the Press and no serious analyses at all.

On matters which do not interest its official instructors the German financial Press gives copious and very able reports. Thus the analyses of conditions on Wall Street frequently run into columns. But even in special Bourse organs the vicissitudes of their own Burgstrasse are at times completely ignored. Reasons for the collapse are given briefly in the reports of the day's trading, but are confined to such explanations as a Far Eastern frontier incident.

Everyone familiar with the methods of official Press control concludes that the Government wants the decline to

receive as little advertisement as possible. It is unpopular, even if its effect is, in the main, only to transfer wealth from one pocket to another. And as the Government has injudiciously accepted responsibility for all mortal events, it suffers in prestige from every unpopular development.

Besides seeking to divert public attention elsewhere, the Government has also tried to stem the decline by denying the reports that new taxation was contemplated. As these had appeared in a journal in close touch with the financial authorities, this may well represent a change in policy.

Little Bank Support

A feature of the present decline is the inactivity of the banks. It appears that these have intervened to a moderate extent to support the bond market, which is of immediate interest to the Government, but hardly at all to support shares. This partly explains the almost complete absence of substantial temporary recoveries which usually interrupt prolonged declines.

The reason generally given is that the banks have not the necessary resources. If they buy bonds they can, in case of necessity, promptly recover the greater part of their value in liquid form by pledging them with the Reichsbank. But in a falling market a loan cannot so readily be obtained against shares, and to realise them might entail a substantial loss.

The great commercial banks are still undercapitalised. It had been expected that they would secure an adequate supply of fresh capital as soon as their shares reached par; but this was not done, and the level of their deposits has now been virtually stationary for five years. The banks' connection with industry, which they once almost dominated, has become slighter. Under National-Socialist company law, the Boards of Supervision on which the banks were so strong have been excluded from the immediate management, which has been transferred to the Directorates. The so-called failure of the Bourse to function represents in part merely the inability or unwillingness of the banks to intervene in the market for shares of those industrial concerns which they once virtually controlled.

Position of the Housewife

A shortage of foodstuffs is again noticeable, at least in Berlin. Householders often wait a long time to buy necessaries, and may then only get them by the familiar device, repeatedly declared illegal, of also buying things they do not want. The complaint is heard that "there is nothing in the market." Though this must not be taken literally, it is a fact that vegetables, fruit and eggs are obtainable only with some difficulty. This important topic is treated very much like the Bourse slump; it is not reported or mentioned publicly, and thereby the privation is supposed to be mitigated.

Partly with the object of relieving the general tension, there is now an official tendency to support the tenant against the landlord. Some time ago all house rents were brought under the "price-stop" system. A recent decree enacts that any termination of a tenancy from which the landlord seeks to benefit, even indirectly, is a violation of the "price-stop" law. As all notices to quit are to be regarded as designed to benefit the landlord unless the tenant has given the landlord some good reason, this virtually creates a permanent tenant right.

Further Fall in Unemployment

The number of unemployed (excluding Austria) declined in July by 74,000 to 218,000, which compares with 563,000 in July, 1937. In Austria the unemployed figure sank by 124,000 to 151,000. Statistical data for Austria, somewhat out of date, indicate a rapid increase of industrial activity, especially in the production of iron. It is estimated that the level of industrial production in May was 7 per cent. higher than in 1929.

New regulations have been issued about the use of iron, a feature being the rule that considerations of increased cost do not justify the use of iron for building purposes where it can be avoided. The number of houses and flats completed in the first half-year fell sharply as compared with the same period of 1937, while other construction increased.

The machine-tool industry reports quieter business, but has orders for months ahead. Sharp price competition is reported in the export trade in tools, hardware and other finished metal goods.

Reports of textile companies complain of the decline in exports, the foreign orders of some concerns being only a fraction of what they were a year ago. The production of "cell-wool," according to the journal of the trade, will this year reach 150,000-160,000 tons and in 1939 200,000 tons.

The last Hamburg and Bremen port returns have made a bad impression. Exports from Hamburg fell by 600,000 tons, or 14 per cent., compared with the first half of 1937.

Increased Note Circulation

Money was in demand last week on account of tax payments, but the market later became more liquid. There are, however, some definite signs of tightness. Thus in the first week of August only 28 per cent. of the end-of-the-month credits granted by the Reichsbank had been repaid, compared with 54 per cent. in the same week of last year.

Technical factors provide a partial explanation, but the increased note circulation is also partly responsible. A year ago a leading authority commented unfavourably on the fact that the amount of currency (including coin) outstanding had exceeded Rm. 7 milliards for the first time. At the end of July, 1938, the figure was Rm. 8,705 millions, and the incorporation of Austria cannot fully account for such an increase.

Denmark

Parliamentary Reform

COPENHAGEN, August 1.—The Government parties (Labour and Radicals) have reached an agreement with the Conservatives on the question of the new Constitution Bill. The number of members of the Rigsdag will be reduced to 205, of whom 69 will sit in the first Chamber and 136 in the second Chamber. Men and women will have the right of voting at the age of 23 (hitherto the limit was 25 for elections to the second Chamber and 35 for the first). The ordinary Rigsdag session will begin in November instead of in October, and the Budget Bill must be read for the first time not later than January 15.

A declaration was signed at Stockholm on May 27 by representatives of the Governments of Denmark, Iceland, Finland, Norway and Sweden adopting uniform neutrality rules for the countries of the North.

Increase in Urban Population

The population statistics for 1937 reveal a small, yet encouraging increase in the birth rate from 17.8 to 18 per mille, and at the same time a decline of the death rate The figures are:—

Live births	67,440
Deaths	40,442
Natural increase	26,998

In 1936 the natural increase was 25,499. The total population of Denmark is now estimated at 3,760,000.

The trend of migration showed no change last year. A steady stream of people moved from the rural districts to the towns, especially to Copenhagen, in search of less toilsome occupations. The provincial towns themselves contributed to the migration towards the capital, and altogether 22,667 people left the rural districts. The present emigration to overseas countries is about 9,500 people per annum.

The administrators of the fund to assist financially

NATIONAL BANK OF GREECE
Established in 1841

Head Office: Athens

Branches and Agencies throughout Greece

Affiliated Bank:
HELLENIC BANK TRUST COMPANY
139 William Street, NEW YORK

Capital paid up and Reserves Drs. 1,205,000,000

embarrassed farmers (which was established by an Act of April 1) have so far granted 12,537 loans for a total amount of 76.6 million kroner, and it is expected that the entire fund of 100 million kroner will soon be lent to distressed landholders.

An analysis of the income-tax returns reflects last year's favourable conditions in trade and industry, as the following figures of assessments show:—

	1937–38 (In million kroner)	1938–39	Increase
Copenhagen	1,393·1	1,435·4	3 per cent.
Provincial towns...	881·9	938·3	6·4 ,,
Rural districts ...	1,290·6	1,349·8	4·6 ,,
Total	**3,565·6**	**3,723·5**	**4·4 per cent.**

Out of a total of 1,328,102 taxpayers, 752,789 have an income of less than 2,000 kroner (about £90) per annum. A total of 24,011 receive more than 10,000 kroner (£450) per annum, and only 360 exceed the 100,000 kroner mark. The figures for capital show that Denmark has only 522 millionaires (in Danish currency).

Higher Exchange Reserves

The first half-year has been very favourable so far as the foreign exchange position is concerned, despite the fact that a number of products, including tea and certain groceries, have been transferred to the free import list. The net foreign exchange balances of the National Bank and the commercial banks now exceed 100 million kroner.

This continued increase of foreign assets doubtless reflects a certain reluctance on the part of manufacturers and merchants to embark on new ventures for the present. It is also partly due to the loan of 8 million guilders recently raised by the City of Copenhagen in Amsterdam. A possible source of future improvement is the co-operative dairies' forthcoming campaign to expand the sales of Danish butter on the British market.

The unemployment percentage for June was 16.5, against 13.9 in June, 1937, and 11.3 two years ago. The freight index was unchanged on the month at 123, against 168 in June, 1937.

Argentina

Trade and Budget Difficulties

Buenos Aires, July 23.—The trade recession through which Argentina is passing as a result of poor crops has entered its second stage. First, there was the big fall in exports and the accumulation of an import surplus. Now imports are declining and the Government's receipts have been adversely affected by smaller revenue from Customs duties.

In a recent message to Congress the Minister of Finance announced that he expected a deficit of 57,200,000 pesos in the current financial year. General revenue is estimated at 900.7 million pesos, while authorised expenditure amounts to 977.9 million pesos. The Government expects to save 20 million pesos by economies. In view of this serious situation the Government has asked for the patriotic co-operation of Congress in adopting urgent measures.

The following table suggests that the fall in exports has been checked, while imports are still declining:—

(In Argentine Pesos)

1938	Exports	Imports	Balance
January	145,993,968	145,801,423	+ 192,545
February	127,714,064	123,959,819	+ 3,754,245
March	118,578,386	144,403,619	−25,825,233
April	103,690,644	116,733,359	−13,042,715
May	110,173,828	110,831,148	− 657,320
June	106,048,680	105,561,480	+ 487,200
Total	712,199,570	747,290,848	−35,091,278

This year's import surplus of 35,091,278 pesos compares with an export surplus of 740,152,494 pesos in the same period of last year. Even in the first six months of 1936, when the country was suffering the effects of drought, there was an export surplus of 184,362,431 pesos.

The United States has overtaken Great Britain as a source of Argentina's imports, accounting for 134,986,793 pesos, or 19.2 per cent. of the total, against Great Britain's share of 131,981,142 pesos, or 18.8 per cent. In the first half of last year Great Britain supplied 19.8 per cent. and the United States 16.3 per cent. of the total. The increase in purchases from the United States is chiefly due to larger imports of motor cars and machinery. For although the value of all imports in the first half of 1938 was only 11.7 per cent. higher than in the same period of 1937, the figure for machinery and vehicles actually rose by 61.2 per cent.

Demand for Higher Protection

Argentine home industry has been hit by the recession, and there is an outcry against foreign dumping. A delegation of the Argentine Industrial Union was recently received by President Ortiz, who listened to their tale of woe. Special emphasis was laid on the plight of the textile mills owing to foreign dumping, especially from Japan, and to a lesser extent from Italy. Cottons, woollens and the stocking industry had all suffered. Other industries, including those making toys and electric lamps, had been affected, and the delegates asked for protective legislation.

Actually it is doubtful if Japan is so serious a competitor of Argentine cotton mills as local industrialists contend. As Argentina does not export cottons, her manufacturers have relatively a very small market, and it is improbable that they could produce efficiently prints and other cheap goods for which an enormous market is needed. As Japan is different from Argentina in race, religion, language, customs and political ideology, she has few sturdy champions in Argentina, and is thus liable to receive more than her share of blame.

The weather in the cereal zone has been unusually damp, and this has delayed the ripening of maize. The paucity of maize shipments is one of the chief causes of the continued low level of exports. The outlook for next season's crops is so far quite favourable, and the area sown with wheat is expected to be larger than last year.

Finland

Fall in Prices, Production and Trade

Helsingfors, July 27.—The fall in prices on the world market has forced prices gradually downwards in Finland. The decline has been most pronounced in the prices of the principal articles of export. The price index for exported goods, which rose to 126 in August, 1937, subsequently dropped to 99 in May and 95 in June. The index for imported goods has been affected rather less: it fell from 111 to 95. Thus the previous favourable relationship between import and export prices has disappeared.

The index of the prices of goods entering into Finnish wholesale trade has not shown such a marked change. After a rise from 90 to 104 it fell to 97 in June. The indices of retail prices and the cost of living moved still less. The latter rose from 100 to 109 at the end of 1937 and has since dropped to 106. The fall in prices has proceeded almost without interruption this year, and as yet there is no sign of its ceasing.

The recession in world trade has hit the Finnish export industry very hard. The markets for timber, paper, cellulose and other important exports are lifeless. In the absence of sales a large number of mills have stopped work or restricted their output. The decline is clearly shown in the following statistics of the volume of production:—

Indices of Production

(1926 = 100)

	Export Industries	Home Market Industries	All Industry
Second quarter 1937	184	166	**174**
Second quarter 1938	158	180	**170**
May, 1937	183	154	**167**
June, 1937	170	160	**165**
May, 1938	173	178	**176**
June, 1938	128	173	**153**

The recession is beginning to affect foreign trade. During the first half-year the volume of exports was 9 per cent. less than in the first six months of last year, and in the month of June the relative falling-off was as much as 19 per cent. The value of exports, however, was maintained considerably better, owing to the fact that exports are largely sold for delivery a long time ahead, so that the fall in prices has not yet exerted its full effect.

For the past six months the value of exports amounted to 3,550.0 million marks, against 3,426.2 millions in 1937, but the June figures show a reduction from 924.7 millions in the same month last year to 833.0 millions. For the whole of the half-year imports were nearly 7 per cent. larger in volume than during the same period last year, but in this case, too, there was a change in May and June; in June the volume of imports was nearly 15 per cent. less than last year. The value of imports in the first six months of the year was 4,114.3 million marks, against 4,128.1 millions in the previous year, while the figures for June were 699.7 millions a year ago and 897.8 millions last month.

Public Finance

During the first five months of the year State revenue came in rather more abundantly than last year, and amounted to 1,563.0 million marks, against 1,488.1 millions in 1937. The increase was mainly due to larger Customs revenue, but some other sources also showed an increase. On the other hand, the falling off in trade is reflected in the lower net receipts of the State Railways.

State expenditure also increased slightly during this period from 1,146.7 to 1,219.2 million marks. By means of the customary amortisation the National Debt has been slightly reduced from 3,452.5 million marks at the end of last year to 3,308.8 millions on the last day of June.

The state of the money market has continued to be easy, with deposits rising by more than advances. Prices have rallied slightly on the Stock Exchange, probably as a reflection of conditions in London and New York, but the volume of business continues to be small.

Latvia

Lower Export Prices

Riga, August 2.—In the first half of this year the foreign trade returns showed a considerable increase in the import surplus, as may be seen from the following table:—

(Million lats)

	First half, 1937	First half, 1938
Imports	107·5	110·9
Exports	103·5	94·1
Import surplus	4·0	16·8

The reduction in exports is mainly due to lower prices on world markets. The decline in the price received for timber has been particularly unfortunate, as this is one of Latvia's leading exports. The prices of flax, linseed and hides have also fallen. On the other hand, the market for butter and pig products has been strong, and the exports of these commodities have therefore shown a considerable increase over last year's figures. In the case of butter the volume of exports actually rose by 22 per cent., and the price was also higher.

The demand for imports has been very active, particularly for raw materials, agricultural and industrial machinery, chemicals and motor vehicles. This demand has been greatly stimulated by the Government's vigorous policy of public works. Imports of foodstuffs, however, have shown a considerable reduction.

Concern About Import Surplus

The import surplus has been engaging the attention of the Government for some time, and it is expected that measures will be introduced in the autumn to deal with the situation. However, the harvest prospects are thoroughly satisfactory for all crops except flax, where the outlook is only average, so that there is no reason to expect drastic measures to restrict imports. The demand for imports will in any case soon begin to decline, if only because the Government has decided to reduce its construction programme; one reason for this decision was the shortage of labour which has now become perceptible.

In his address at the annual meeting of the Bank of Latvia the recently appointed Minister of Finance described the proper development of foreign trade as his principal economic task. He said his objectives were to maintain the total volume of trade and to ensure that receipts from exports would be sufficient to maintain the value of the currency without recourse to accumulated exchange reserves.

To attain these objectives he proposed to summon a conference of all officials who dealt with questions of foreign trade. Meanwhile he announced that imports on a compensation basis would in future be forbidden. It is clear that the influence of the State on business will grow more rather than less important.

Budget Surplus

Revenue receipts were very satisfactory in the financial year 1937-38, which consequently closed with a surplus of 15 million lats. The year's revenue of 192.5 million lats compares very favourably with the figures of 163.4 millions for the previous year and 126.7 millions for 1931-32, the worst year of the depression. The receipts from customs, import licences and direct taxes all showed an increase on the year, but the State monopolies yielded considerably less.

The Government propose to stimulate the building of factories for the treatment of flax. The planting of this crop has recently been reduced owing to the lack of such facilities.

Greece

New Trade Treaties

Athens, August 5.—Foreign trade returns for the first five months of this year show that exports increased both in value and volume, but imports only in value. The import surplus was Drs. 2,578 millions, an increase of Drs. 180 millions compared with the corresponding period of last year.

New clearing and compensation agreements have been concluded with Jugoslavia and Czechoslovakia. An agreement has also been signed with Bulgaria for the reciprocal application of the most-favoured-nation clause to certain Greek and Bulgarian articles. A Greek delegation is at present in Berlin, negotiating a new clearing and compensation agreement with Germany, the largest buyer of Greek products. Negotiations for a new agreement will also be conducted shortly with Turkey.

The fact that the new British credit to Turkey is repayable in kind, and that French bondholders have agreed to the payment of the Turkish foreign debt service in exportable goods, has encouraged the hope that greater facilities will also be granted to Greek exports. In this connection it will be recalled that Greece's balance of trade with the United Kingdom is permanently and largely adverse, and that, in addition, considerable sums have to be transferred annually for the payment of the service of Greek bonds held in England. Greek estimates of the balance of payments with the British Empire in 1936—more recent estimates are not available—show a debit balance of £6,330,000 on a total of £8,250,000. A movement on the part of the British Government to increase the import of Greek articles into the United Kingdom or the British Empire would facilitate a mutually satisfactory solution of the foreign debt deadlock and increase British economic influence in this corner of Europe.

Public Finance and Social Policy

Gross receipts from revenues assigned for the service of the foreign debt for the first six months of 1938 show, at Drs. 2,066 millions, an increase of Drs. 103 millions over the corresponding period of last year. According to official figures, during the years 1936-38 an amount of Drs. 976 millions has been spent on the construction of roads and other technical works, and of Drs. 531 millions for the execution of hydraulic works. A further sum of Drs. 255 millions will be devoted to similar purposes up to the end of 1939.

Since August, 1936, when the present regime was established, we have the following social statistics: 384 collective bargaining contracts have been signed; the authorities have settled 41,374 of the 44,217 labour disputes submitted to their arbitration; work has been found for 6,150 war combatants; and, during the first five months of their operation, the labour offices have found work for 2,669 persons, out of 10,577 applicants. The compulsory adjustment of debts is officially estimated to have reduced the financial burdens of 650,000 peasants, whose total debits aggregated Drs. 10,000 millions.

An emergency law recently published compels all Greek shipowners to observe the terms of international minimum freight agreements to which the Greek Chamber of Merçantile Marine may have adhered. This measure is expected to enforce international co-operation and, at the same time, to meet complaints that Greek shipowners were accepting lower freights than their foreign competitors.

Good Currant Crop

The wheat yield is expected to be higher than in 1937—itself a very good year—and will probably cover 75 per cent. of the needs of consumption. The production of currants and wine will also show an increase, but the tobacco crop is expected to be smaller, owing to dry weather and to a restriction of the cultivated area.

To facilitate the export of currants the authorities have taken several measures aiming at a reduction of their cost to the foreign consumer. Foreign competition has, however, so reduced the market for Greek currants that these efforts to improve the quality and reduce the price are considered insufficient. They are to be supplemented by a scheme for uprooting vines against payment of compensation.

Letters to the Editor

German Food Prices

TO THE EDITOR OF THE ECONOMIST

SIR,—The following information regarding the actual cost of living in Germany now, as compared with 1935, provides an interesting sidelight on the practical results of Government control of food. The figures quoted have been obtained from trustworthy sources and apply to the average household budgets of skilled workpeople and the middle class.

Wholesale prices as shown by the accounts of a works canteen serving 1,000 employees compare as follows:—

	1935 Rm.	1938 Rm.
500 gr. meat	0·80	0·89
1 litre oil	1·00	1·35
1 kg. lard	1·70	2·20
100 kg. flour	35·75	37·00
1 kg. butter	1·40	1·48
1 kg. pastry	0·68	0·84
1 egg	0·11	0·11½
1 kg. salami (sausage)	1·80	3·20
1 litre wine	0·32–0·45	0·80–1·00
500 gr. Limburger (sausage)	0·32	0·52
100 lb. (metric) potatoes	3·00	3·00

Prices actually paid in the shops by householders in an important provincial manufacturing town compare as follows:—

	1935 Rm.	1938 Rm.
1 lb. sugar	0·40–0·42	0·39–0·42
do. preserving	0·39	0·38–0·40
1 lb. butter	1·25–1·65	1·60
1 roll, water, double	0·07	0·07
do. milk, single	0·04	0·04
Bread, whole loaf	0·50	0·50
do. half loaf	0·25	0·25
1 lb. flour, Type 405	0·25–0·28	Not available
do. Type 504	Not available	0·23–0·24
1 lb. margarine, rationed	0·90	0·65
do. free	0·90	0·90
do. 1st quality	1·10	1·10
1 litre milk	0·26	0·26–0·28
do. sterilised	0·33	0·33
100 lb. potatoes	3·50–4·00	3·20–3·80
do. middle-class families	4·00	5·00
1 lb. jam	0·42–0·45	0·32
1 lb. beef with bones for soup	0·80–0·90	0·87–0·91
do. for roasting	0·85–1·20	0·91–1·20
do. fillet steak	1·60	1·60
1 lb. roast pork	0·92–0·95	0·92
do. best quality	...	1·20
do. cutlet	0·95–1·15	1·05
1 lb. cooking fat	1·00	1·08
1 lb. beef suet	0·45	0·54

Metric lb. are to be understood in each case, a metric lb. being 10 per cent. greater than an English lb.

It is never easy to compare the standards of living in two different countries, and in practice it is purposeless because the standard of enjoyment derives from comparison with one's neighbours and the relation which exists between one period and another. But since comparisons will always be made, it would be safer to assume Rm. 20 = £1, because the majority of a German resident's budget is concerned with home produce or articles for which the price is not essentially different from 1930, while his income is still based on the 1930 wage-scales. Clothing represents the only important item for which luxury prices have to be paid if the former very good standards of the middle class are to be retained, but experience goes to show that the demand for clothing can be very elastic where the former standards were high.

Domestic wages, heat and light, rent and house repairs are virtually unchanged in cost.

Travelling has become very much cheaper as a result of special privileges which are so numerous that no one thinks of paying the full fare. Petrol costs about Rm. 1.80 per gallon, which is only slightly higher than in 1935 or even 1930, while cars have been reduced in price and the much talked of "people's car" will be sold at less than Rm. 1,000.

Thus from the purely financial point of view it costs no more to live in Germany now than it did three or four years ago.

Quality, however, has suffered in the process of stabilising prices and in some cases, e.g. flour, the former qualities are no longer available.

The Government have been wise not to attempt to cloak this deterioration in quality. Instead, they provide wireless programmes for the housewife to teach her how to use the available goods in the best way, as a result of which the standard of living for many families has actually improved.

"A READER."

[The ratio for the conversion of German prices into English prices suggested by our correspondent may be somewhat misleading, since there has been a material change in the relative price-levels of the two countries since 1931, when the exchange rate on a free market was last quoted at Rm. 20 = £1. On the possibly inadequate basis of a comparison of the movement of the official cost of living indices, a fair rate of conversion would be about Rm. 17½ = £1.—ED. *Econ.*]

Banking and Trade Recession

TO THE EDITOR OF THE ECONOMIST

SIR,—Mr G. E. Ross states that gilt-edged and debenture holders made a sacrifice for the sake of business improvement during the period 1932-37. There was, of course, nothing voluntary or meritorious in this "sacrifice." It was largely the obverse side of the business recovery medal. The alternative might have been further deflation and an overwhelming Budgetary burden, which might conceivably have led to default or the enforced reduction of interest on Government securities.

Incidentally, if a British Government should seriously consider deliberate monetary action leading to any appreciable further reduction in the long-term interest rate, it should alter the Trustee Act to permit—perhaps even to compel—trustees to invest a certain proportion of the trust funds in "equities." In order to avoid risks attaching to individual companies, *ad hoc* investment trusts might be formed under semi-official auspices, with one class of capital to hold ordinary and deferred shares in British and foreign companies; and the shares of such investment trusts might be regarded as trustee securities, provided that investment in the shares did not exceed the prescribed proportion of the trust funds.

Yours faithfully,

London, S.E. LAURENCE WILKINSON.

TO THE EDITOR OF THE ECONOMIST

SIR,—In suggesting, in your issue of August 13th, that "gilt-edged and debenture holders made a sacrifice for the sake of business improvement" in accepting repayment of their debts between 1932 and 1937 is not Mr Ross confusing the issue? The sacrifice was exacted when the Government relieved the Bank of England, and incidentally most other debtors, of the obligation to pay gold for sterling on September 20, 1931. Admittedly, this made cheap money possible—but that is another matter.

Yours faithfully,

A. C. DOBBS.

Killiney, Co. Dublin.

Trading Estates

TO THE EDITOR OF THE ECONOMIST

SIR,—The unfortunate omission of a whole sentence in my letter which you so kindly published last week entirely ruined the sense of my meaning. Discussing the reason for the introduction of light industries to the North-East Special Area, I was quoted as saying: "Such light industries fall into one of those periodical declivities which we know so well." This should have been: "Such light industries will definitely offset wholesale unemployment when heavy industries fall into one of those periodical declivities which we know so well."

I hasten to add that the error was due to faulty typography in my office and occurred through no fault of your own.

Yours faithfully,

London. PHILIP BAKER.

Books and Publications

Goodness and Gold

THE author of this book,* after a varied and successful career, is profoundly dissatisfied with his world. He is, he tells his readers—though careful not to imply anything about the creed of other members of his profession—"a banker who believes in God." And so, in the quiet of religious houses, withdrawn from the "unreal City," he has endeavoured to work out what actions are required to bring the present economic order into conformity with a divine conception of human relationships.

The result is a detailed study in monetary reform, differing from others of its kind in two respects. In the first place, reform of the financial system is not, for Mr Metz, the cure for all our ills; it can only eliminate the features that militate against stability and progress; it can provide the means of consolidation and growth. Secondly, the religious note in Mr Metz's book is no humanitarian appendage which, in the last chapter, identifies the age of plenty with the kingdom of God; it recurs throughout the book, expressing itself with a prophetic vigour in the most unlikely contexts.

There are three main forces which, in Mr Metz's view, are disruptive of the economic system: unrestrained competition; the controlling power of gold over the financial mechanism; and the absolute discretion afforded to individual banks in the allocation of their money income.

With regard to the first of these, Mr Metz advocates planning within the framework of capitalism. His second theme is also familiar: despite fiduciary powers, the present note issue is still tied to gold and, as a consequence,

> **"the absence of any correlation between the note issue and the type of asset which the productive elements in the country are in a position to give as a security for loans to the banking system, divorces the credit created by the Bank of England—based as it is upon that note issue—from the economic activities of the country."**

The keystone of Mr Metz's argument is in his analysis of the third "disruptive force," and it is here that he makes his most characteristic statements. The total quantity of money disseminated in the current prices of producing and distributing goods and services, i.e. the total of commodity money, is all, he says, that is available for the absorption of those goods and services by purchasers; and all current income must be spent to maintain the flow of money. Hoarding, investment in existing capital assets or insurance will check the flow, and the resulting deficiency of purchasing power can only be made good by banks buying securities or granting new loans for speculative purposes—activities which are limited by the controlling power of gold—or by the conversion of idle bank balances and money circulating with the turning-over of existing capital assets into commodity money.

While admitting that such an analysis is, to a point, logical, it is difficult to regard it as adequate, largely because it completely disregards the function of the rate of interest. Mr Metz, his theology apart, is a banker, and it is easy to guess how this omission, so damaging to his analytical structure, has come about. He conceives of the rate of interest merely as the rate of payment for loans, and especially for loans made by the banks. As such it is no more than one of the instruments by means of which the quantity of money is controlled: he can find no place for it in a scheme which is intended to be general and deals in quantities.

This is not to say that Mr Metz's book is valueless. Within the field of practical banking, Mr Metz writes thoughtfully and well. Consequently, it is those economists who are already versed in monetary theory who will derive most from Mr Metz's book, though they will undoubtedly be the first to dispute his more general conclusions.

Shorter Notices

"Slump and Recovery 1929-1937." By H. V. Hodson. H. Milford. 484 pages. 10s. 6d.

Any book which sets out to be a complete history of this eventful period is almost inevitably so full of detail that it can only serve as a work of reference. Mr Hodson is fortunate in having the ideal "excuse" for producing that excellent type of book which carefully renounces any claim to be such a complete history, and yet deals quite adequately with most of the topics about which we really want information. For he has based his book on the economic chapters which he contributed to the annual Surveys of International Affairs from 1930 to 1936. These have needed comparatively little adaptation, and therefore have the merit of showing us what a competent observer thought about the various problems *at the time*. It is also useful, in this autarkic age, to have a history which approaches the problem primarily from the international angle, though parts of it naturally make somewhat depressing reading. Mr Hodson deals tentatively with the connection between economics and politics in the international sphere. Certainly no study of the one can be complete without a study of the other. But it is difficult to establish any definite evidence on which is cause and which effect. The Manchurian invasion came some three years after the onset of depression, but it would be wild optimism to assume that the prosperity of 1937 will cause political reformers to improve in 1940.

"The Principles of Rational Industrial Management." By J. J. Gillespie. Pitman. 225 pages. 10s. 6d.

The writer is experienced in various branches of industry. He has strong words to say about the modern fashion and technique of business management, of warning as well as approbation. The pretences of so-called "scientific" management Mr Gillespie uncompromisingly attacks, though his substitute of "critically co-ordinative and, therefore, philosophic" management is not at first glance much more convincingly realistic. The psychological leaven of the book is interesting, if not wholly sound, and those interested in business management will read it with profit, though not always with agreement.

THE BUSINESS WORLD

Steel Prices in America

IN contrast to the British iron and steel industry, whose output last year far surpassed the pre-depression level of 1929, the industry in the United States had hardly recovered to its previous level of activity before it was overtaken by a fresh slump. The British output of crude steel in the first half of 1937 was 30 per cent. more than in 1929, but production in the United States was only 99 per cent. of the 1929 level. Moreover, there has been a violent setback even from the inadequate recovery of 1937; the output of crude steel in the United States dropped from 5,149,000 tons in May, 1937, to 1,806,800 tons in the corresponding month this year. While there has been some improvement in the industry's activity since the spring, it is still operating at only about 40 per cent. of its capacity, against an average of 72.5 per cent. in 1937 and 88.5 per cent. in 1929.

Such a sudden reversal would naturally cause dismay in any industry in any country; but the American steel industry's equanimity has been further shaken in the past year by an outbreak of domestic dissension. Thus, early last year, when the United States Steel Corporation gave way to the pressure of the Committee for Industrial Organisation by signing a labour agreement with it, the other companies felt aggrieved both by the content of the agreement and by the independent manner of its conclusion. Instead of following the Corporation's lead, they put up a stout and successful resistance to the attempts of Mr Lewis's organisation to unionise the whole industry. These differences on labour policy have had their reaction on prices, which were subject to a considerable amount of competitive shading in the early months of 1938. At the end of June, the United States Steel Corporation answered a number of minor reductions in individual products by the smaller companies not only with a sweeping reduction in prices but also by a radical modification of the system of pricing to which the industry has been accustomed for decades past.

THE AMERICAN STEEL INDUSTRY
(Circles are proportionate to share of production in 1937)

The pricing system of the American steel industry can only be understood by reference to American history, geography and law. The importance of geography lies in the size of the country and the long distances that necessarily separate the industry either from its raw materials or from its market. History shows its influence in the heavy concentration of steel mills in the Pittsburgh district and in the dominance of one large firm, the United States Steel Corporation. Pittsburgh has coal at its door, and its iron ore, though it has to travel the long distance from Minnesota, can come nearly all the way by water. But Pittsburgh is not favourably situated for many of the chief markets, which are scattered over a wide belt of the country from New England to Chicago. The United States Steel Corporation has hitherto always used the leadership in the industry which its size confers upon it to protect the position of Pittsburgh. For years Pittsburgh was the only "basing point" for the quotation of steel prices, and the price charged to the consumer was compounded of the basic Pittsburgh price plus freight from Pittsburgh to the point of delivery, irrespective of where the steel actually came from.

But this "Pittsburgh plus" system smacked too strongly of monopoly for a country that had enacted the Sherman Act, and under pressure from the Federal Trade Commission it was abandoned after the war. The system that took its place involved a number of basing points, varying in location for different products. But the spirit of "Pittsburgh plus" lived on, for the prices fixed for other basing points regularly exceeded the Pittsburgh price by differentials that roughly corresponded to the freight from Pittsburgh to the basing point. Thus, before the recent changes, the price of steel for delivery in Detroit was $4 per ton more than the price for delivery in Pittsburgh. Since the freight charge on automobile sheets from Pittsburgh to Detroit is $5.80 a ton, the difference in the net sum realised to a Pittsburgh mill on steel sold to Detroit, compared with steel sold for delivery in Pittsburgh was only $1.80 a ton (or $1.30 when the local delivery charge of 50 cents is taken into account). It should be noticed that the effect of these differentials was not to enable Pittsburgh mills to underbid mills located nearer the markets, since steel for delivery in Detroit was quoted at a uniform price whatever its origin. But the system did help to keep prices in other centres higher than in Pittsburgh, thus making it possible for Pittsburgh mills to compete in those centres without loss.

This is the system which U.S. Steel, with the rest of the industry following suit, has now abandoned. The price differentials have been eliminated or severely reduced, and there has been a tendency to increase the number of basing points. Since the result of the previous system was to make it possible for the Pittsburgh mills to compete in any district, the broad effect of the abandonment of the system is to penalise those mills, especially in the Pittsburgh district, which are a long way from their market. But this is only the broad effect, and in order to calculate the effect on individual companies it would be necessary not only to examine the location of their plants but to know the range of their products, the proportion of each to total production as well as the location of the markets for each product; above all, it would be necessary to know costs of production for each product in every centre of production. Nevertheless, the following particulars of the geographical distribution of the producing capacity of the leading companies, together with their last year's profit per ton on finished steel, provide an approximate guide to the effects of the change:—

U.S. Steel Corporation (1937 net profit, $7.00 per ton). *Location of plants:* Pittsburgh 39 per cent., Chicago 36 per cent., Ohio 16 per cent., Alabama 7 per cent., Pacific Coast 2 per cent.

Inland Steel Corporation (1937 net profit, $9.20 per ton). *Location of plants:* Chicago 100 per cent.

Bethlehem Steel Corporation (1937 net profit, $5.56 per ton). *Location of plants:* Maryland 27 per cent., Buffalo, N.Y., 25 per cent., Eastern Pennsylvania 19 per cent., Central and Western Pennsylvania 25 per cent., Pacific Coast 4 per cent.

National Steel Corporation (1937 net profit, $9.07 per ton). *Location of plants:* Detroit 62 per cent., West Virginia 38 per cent.

Youngstown Sheet and Tube Corporation (1937 net profit, $7.95 per ton). *Location of plants:* Ohio 69 per cent., Chicago 31 per cent.

Republic Steel Corporation (1937 net profit, $2.98 per ton). *Location of plants:* Ohio 75 per cent., Alabama 10 per cent., Buffalo, N.Y., 9 per cent., Chicago 6 per cent.

American Rolling Mill Corp. (1937 net profit $6.20 per ton). *Location of plants:* Ohio and Kentucky 57 per cent., Pittsburgh 23 per cent., Missouri 20 per cent.

Wheeling Steel Corp. (1937 net profit, $4.14 per ton). *Location of plants:* Wheeling, W. Virginia, 100 per cent.

Jones and Laughlin Co. (1937 net profit, $2.90 per ton). *Location of plants:* Pittsburgh 100 per cent.

It is hardly possible at this stage to gain a rounded picture of the probable effects upon the industry as a whole, since the recent changes have opened the door wide to intensified competition. The profits of the industry obviously depend upon the scale of operations that will prove possible for the remainder of the year and upon the possibilities of wage reductions. The novelty of the recent changes is that they throw into the melting pot the hitherto established relationships between the ability of the different companies, not so much to compete for business, but to make profits from it when obtained. Some idea of the penalty imposed on producers in different locations can be gained from the accompanying table. This shows the amount of freight "absorbed" by producers in the different centres in shipping automobile sheets to Detroit—i.e. the penalty imposed upon them in selling outside their own home districts. The differential between Pittsburgh and Detroit has been reduced from $4 to $2, with the result

FREIGHT ABSORBED BY MILLS

Mill Location	Formerly Shipping by Rail	Formerly Shipping by Water	Present Shipping by Rail	Present Shipping by Water
	$		$	
Pittsburgh	1·30	...	3·30	...
Chicago	1·10	0	3·10	2·00
Buffalo, N.Y.	0·70	*0·50**	2·70	1·50
Youngstown, Ohio	0·50	...	2·50	...
Middletown, Ohio	0·50	...	2·50	...
Cleveland	*0·10**	*1·90**	1·90	0·10

* Net gain.

that a Pittsburgh mill now has to sacrifice not $1.30 but $3.30 of its net receipts per ton when it goes into the Detroit market. The price in Detroit, which is a net importer of steel, is still—and quite naturally—higher than elsewhere. But between most other centres the differentials have entirely disappeared. Clearly it is going to be difficult for some of the companies to continue to compete in distant markets. The U.S. Steel Corporation, with its widely-spread plants, apparently calculates that it will gain competitively more than it loses, while many of the smaller companies whose producing centres are more concentrated will be hard hit.

The geographical distribution of the American steel industry has hitherto had a certain artificiality. Under the influence of "Pittsburgh plus" and its successors, new plant has tended to be laid down without full consideration being given to the real economics of location. If the new policy of "free-for-all" competition continues, there may be an intensified movement towards the re-location of the industry, in which the Pittsburgh district, whose natural advantage in the proximity of coal has lessened with the years, will be the sufferer. The rise in the importance of scrap as a raw material has increased the advantages of proximity to the big consuming centres, which are the chief sources of scrap supplies, and it would, therefore, be reasonable to expect an intensification of the tendency, long apparent, of the industry to move away from the Pittsburgh area, both westward to the industrial region of the Middle West round Detroit and Chicago and eastward to the Atlantic seaboard.

Any such speculations are still, however, premature. For the recent collapse of the price structure was born in part of domestic quarrels, in part of apprehensions of the Federal Government's announced anti-monopoly drive. The former may well be patched up and the latter may pass away with political shifts. The American steel industry has always in the past exhibited a remarkable power of cohesion. It may well be that the results of a period of less restrained competition will be so painful as to lead to a partial reconstruction of the edifice of price control now shattered.

Expanding the Credit Base

THE efforts of Mr R. F. Harrod, who in recent weeks has expounded his views in the correspondence columns of *The Economist* and, more lately, in an article in *The Times*, have brought the policy of monetary expansion prominently before the public as a means of countering the recession of trade from which this country, and the world in general, have been suffering for nearly a year. Mr Harrod's proposals have the merit of precision. They are that the Bank of England should purchase in the open market £10 millions of Government securities. As a result of these purchases, the cash resources of the joint-stock banks (in the form of balances with the Bank of England) would be increased by approximately £10 millions. Care should also be taken, by an appropriate modification of the policy of the Treasury with respect to the Floating Debt, to expand in the same proportion the supply of Treasury Bills available either for direct purchase by the joint-stock banks (thus swelling the total of their discounts) or for purchase by the money market and deposit as collateral for loans from the banks (thus swelling the banks' figure of call money). If this were done, an addition of £10 millions to the banks' cash would lead to an expansion of about £100 millions in their deposits. Most, if not all, of their increased resources would be directed towards the gilt-edged market, since the banks' total of investments would increase *pari passu* with the increase in their deposits. And purchases of securities on such a large scale by the banks would drive down the market rate of interest, directly so far as gilt-edged securities were concerned, and, by close interconnection, the yields obtainable on industrial securities. In this way private industry would enjoy the stimulus of being able to borrow for capital purposes at still lower rates of interest, and the security markets would receive the fillip of buoyancy in many of their most important sections.

BRITANNIC
ASSURANCE COMPANY LIMITED
(Established 1866)
Annual Income - - - - £6,700,000
Assets - - - - - - £30,000,000
All classes of Life, Fire, Accident, Motor and General Insurances transacted
Chief Office: BROAD STREET CORNER, BIRMINGHAM

Thus the suggested policy depends upon a chain of causation starting with the purchase of securities by the Bank of England and finding at least its proximate termination in the yield on gilt-edged securities. This is not the place to argue the merits of the policy advocated by Mr Harrod; but it is both of relevance and of interest to examine the record of the six years that have elapsed since the War Loan conversion of 1932 for confirmation or disproof of the technical assumptions on which the policy rests. During the whole of this period, Bank rate has stood so uninterruptedly at 2 per cent. that it has become almost ignored as a factor in the money market. Moreover, the departure from the gold standard in 1931 has removed many of the limitations that were previously placed upon the free exercise of credit policy. It would be hard to find in monetary history a period in which the policy familiar to all students of central banking under the name of Open Market Operations has had so free a field to prove its potentialities. What light does the history of these six years shed upon the technical practicability of Mr Harrod's proposals?

The figures mainly relevant to this inquiry are collated in the table below. The first column shows the rise or fall, quarter by quarter, of the sum of the Bank of England's gold reserves and its portfolio of securities. These two items have been taken together because an increase in the gold reserve, taken by itself, has precisely the same effect upon the cash resources of the joint-stock banks as the acquisition by the Bank of England of the same quantity of Government securities. Moreover, a gold purchase may be, and frequently is, offset, partly or wholly, by the sale of securities. Discussion of the credit policy of the Bank of England must necessarily spring from a consideration of the gold and securities taken together.

The second column shows the contemporary changes in bankers' deposits at the Bank of England. It is immediately apparent that there is very little agreement between the two columns. Both, it is true, have shown a generally upward tendency. But while the total of gold and securities has increased over the six years as a whole by £165 millions, bankers' deposits have risen by only £29 millions. Moreover, the coincidence in time has only been of the most approximate character. The biggest increase in gold-plus-securities was in 1936-37, when the rise in bankers' deposits was very moderate. The explanation of this is, of course, that the rise in the Bank of England's assets has been largely offset by the natural increase in liability items other than bankers' deposits. Thus between June, 1932, and June, 1938, there has been an increase of no less than £127.7 millions in the volume of notes in circulation. Since the increase in gold-plus-securities on this particular comparison is £152.7 millions, there remains only £25 millions (ignoring minor items) to be shared by Bankers' Deposits with Public Deposits (which actually show a decline) and with Other Deposits, which include the balances of clients of the Bank of England other than joint-stock banks of the United Kingdom and the British Government. It may be true that a *large* increase in gold-plus-securities will tend to be *immediately* reflected in Bankers' Deposits rather than in other items. But what is true of the short run is clearly not true of the long run, and it would be rash to base any policy that looks more than a very short time ahead on the assumption of any automatic relationship between the size of the Bank's portfolio and the volume of Bankers' Deposits.

The third column of the table shows movements in the total, as shown in the monthly clearing bank statements, of the joint-stock banks' "cash, notes and balances with the Bank of England." This is the true cash basis of the joint-stock banking system, and it will be seen that it is not exactly the same thing as Bankers' Balances at the Bank of England. Over the six years as a whole, it shows a rather larger increase, presumably reflecting the fact that the banks' till money moves in rough proportion to the total circulation. The difference between Bankers' Deposits and Cash is, however, so small that it can be ignored in any general discussion, especially since the annual movements of the two columns are very similar.

The next column shows the movements of the total deposits of the clearing banks. Over the six-year period as a whole, it will be noticed, the accepted theory is borne out, since the increase in deposits is not only ten times the increase in cash, but rather in excess of that proportion. But if the figures be examined year by year, the correspondence will be found to be considerably less close. In 1932-33, the increase in deposits was rather less than eight times that in cash. But in 1933-34, although cash was unchanged, deposits declined by more than £90 millions. This discrepancy was, however, put right next year, when an increase of £5 millions in cash was accompanied by a rise of £108 millions in deposits. But there are further discrepancies in the later years. To some extent, these variations in the ratio of cash to deposits can be explained by reference to the volume of discounts. Thus the drop of £91 millions in deposits, comparing the second quarter of 1934 with the second quarter of 1933, was clearly a closer reflection of the drop of £124 millions in discounts than of the unchanged level of cash. Similarly, the more than proportionate increase in deposits between the June quarters of 1935 and 1936 was accompanied by an increase of £88 millions in the average holding of discounts. This illustrates the necessity of inserting in any argument about credit expansion a proviso calling attention to the necessity of expanding discount portfolios *pari passu* with cash holdings. But the insertion of a proviso does not automatically make it possible to vary at will the volume of the floating debt which, in the short run, is necessarily dependent upon the seasonal fluctuations of revenue and expenditure and the timing of debt operations.

The next stage of the analysis is to compare the movements of deposits and investments. Here again the fundamental similarity is overlaid with considerable short-period divergences. In a period of active trade, when there is a brisk demand for advances, even a large increase in deposits may not lead to more than a very moderate increase in the banks' investment holdings. When trade is receding, however, this obstacle to the Open Market policy can be expected to be much smaller.

BANKING STATISTICS, 1932-38.

* Comparison affected by increase in Clearing House from 10 to 11 banks.

The final comparison is between the holdings of investments and the yield on gilt-edged securities. Over the period as a whole, it will be noticed that the purchase of 325 millions of securities has reduced the yield on Consols by only 0.65 per cent. Moreover, there have been years (1935-36 and 1936-37) when the yield has risen in spite of purchases by the banks. Conversely, the yield has remained very steady in the last twelve months, in spite of sales by the banks. Once again, it is clear that "other things" cannot be relied upon to remain equal.

The conclusion of this statistical discussion must not be misinterpreted as a disproof of the Open Market theory. On the contrary, it shows that, in the long run, the purchase of securities by the Bank of England does lead to higher clearing bank cash, higher deposits, higher investments and lower yields on gilt-edged securities. But the analysis does suggest two lessons. The first is that "other things" may inconveniently intervene to suspend the operation of the theory for quite long periods at a time. And the second is that the actual ratios between the different magnitudes may work out at figures considerably different from those theoretically assumed. Thus in five of the six years analysed in the table, the actual ratio of the increase in the Bank of England's holding of gold and securities to the contemporary increase in the clearing banks' investments has been 17.6, 58.3, 16.6, 121 and 372 per cent., and in the sixth year an increase in the former magnitude was accompanied by an actual decline in the latter. Not once did the ratio approximate to the theoretically assumed 11 per cent. It is possible that the Open Market theory would carry more conviction if it were not given such a deceptively precise arithmetical form.

Finance and Banking

Gold Turnover Dwindling.—The gold market during the past week has again been exceptionally active judged by normal standards, but the turnover has shown considerable diminution on that of the previous two weeks. The hoarding demand from the Continent has become a less important factor, and the bulk of the activity, both at fixing and subsequent operations, has represented transactions by arbitrage operators. The magnitude of these operations can be gauged from the fact that during the seven days to Thursday of this week £5,777,202 of gold was exported from this country to the United States. The appreciable reaction in the dollar has been duly reflected in the price of gold, which from last week's "high" of 142s. 9½d. fell on Wednesday of this week to 142s. 4½d. This reaction in the price caused considerable resales of gold, fed by the substantial jobbing position in the metal which had been built up both by London and Continental interests. It is interesting to note that this reselling has not found a ready counterpart with the Exchange Equalisation Account, and that it has consequently had to accept an open market price uncontrolled by the authorities and regulated wholly by the dollar shipping parity. It is in large part the gold thus resold after fixing which has provided arbitrage operators with the metal which has been engaged during the past week for shipment to the United States. On every day of this week the Control has supplied the bulk of the gold required at fixing and has also been a ready seller when called upon in subsequent operations. This readiness to sell and the unwillingness to buy gold after fixing suggests that the authorities still regard the pound as being inherently weak in relation to the dollar, and are framing their open market operations in gold accordingly.

* * *

French Swap Money.—During the last few weeks fairly substantial amounts of French sterling deposits have been converted into gold. Notwithstanding this, most London banks are believed not to have experienced any noteworthy decline in the total of their French deposits. This fact may appear perplexing at first sight, but it has a simple explanation. Simultaneously with the French buying of gold in London, a selling pressure on forward francs has developed, bringing about a widening of the discount. For the past fortnight the discount on forward francs has been between 5 and 8 francs for three months, while for short periods it has been proportionately even higher. As a result, it became profitable for owners of liquid francs to acquire sterling with the forward exchange covered. While after the devaluation of the franc last May the contraction of the discount was accompanied by the reduction of the amount of French swap money held in London, during the last few weeks the total of such funds has once more increased to a substantial size. Indeed, it seems that the increase in the volume of French swap money may have been roughly equal to the decline in the amount of French refugee balances through the purchase of gold. Consequently the grand total of French balances, including both refugee money and swap money, remained more or less unchanged. Towards the middle of last week the French authorities attempted to discourage the transfer of swap money to London by requesting French banks to confine their forward exchange operations to strictly commercial trans-

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

THE STANDARD BANK MONTHLY REVIEW, which is sent post free on application, gives the latest information on all South, East and Central African matters of Trade and Commercial Interest.

actions. The result was that in the absence of a demand for forward francs by the French banks, the discount widened further, since speculators found no difficulty in selling francs forward in London instead of Paris. And since the French banks were discouraged from buying forward francs through swap transactions, the rate had to widen until it became sufficiently attractive to induce non-banking owners of liquid francs to undertake swap operations. On Monday the discount on forward francs for one month widened to 3¼ francs, which secured a yield of about 22 per cent. per annum on swap money, a rate high enough to attract the attention of large business firms with liquid resources.

* * *

French Gold Market Control.—The French authorities have resuscitated an old law subjecting the gold market in France to official scrutiny. Operations in gold are not forbidden, but henceforth dealers, whether in gold coin or bullion, will be legally required to keep a detailed register of names and addresses of their clients and to hold this register at the disposal of the authorities. This new regulation is likely to discourage the small retail trade in gold which has been acquiring such considerable proportions in France recently, but since it cannot touch the big man's operations, which are almost invariably effected in some foreign market, it is questionable whether its invocation will do more good than harm.

* * *

Irish Banks' Returns.—The publication of the Report of the Irish Banking Commission (which was discussed in a leading article on page 312 of *The Economist* last week) has been most appropriately accompanied by the return of balance-sheet items of the banks operating in Eire for the June quarter :—

(Thous. £'s)

	June quarter, 1937	March quarter, 1938	June quarter, 1938		
			In Eire	Elsewhere	Total
Liabilities :—					
Capital, reserves, etc.	17,363	17,445	10,282	7,181	17,463
Notes in circulation	8,966	8,905	5,084	3,891	8,975
Current deposit and other accounts	164,247	161,345	117,824	44,802	162,626
Other liabilities	5,869	5,070	3,446	2,622	6,086
Total	196,445	192,767	136,636	58,497	195,133
Assets :—					
Cash and balances with London agents and other banks	12,950	11,997	5,681	7,685	13,366
Money at call and short notice	10,572	9,591	5	13,426	13,431
Bills	6,815	7,379	5,525	1,054	6,579
Loans and advances	69,641	72,586	47,587	25,638	73,225
Investments—					
(*a*) Government	77,719	73,474	3,720	67,115	70,835
(*b*) Other	10,756	10,103	3,612	6,215	9,827
Other Assets	7,990	7,633	3,206	4,661	7,867
Total	196,445	192,767	69,338	125,795	195,133
Excess of assets outside Eire over liabilities outside Eire	71,064	66,897	...	...	67,298

The effect of the termination of the economic war is apparent in the above table. If the figures of the June quarter are compared with those of the June quarter last year, it will be seen that deposits and the excess of external assets over external liabilities (the banks' "net sterling assets") have diminished, whereas if the comparison is made with the March quarter of the present year both deposits and net sterling assets have increased. This reflects the improvement resulting from the Anglo-Eire agreement, and it is not too much to expect that improvement to continue and increase. The expansion of loans and advances was caused by borrowing by the new protected industries and by farmers stimulated by rising agricultural prices. The increased demand for accommodation was financed by the sale of a substantial quantity of Government securities.

Credit Anstalt Liquidation.—Yet another important milestone in the liquidation of the Austrian Credit Anstalt *débris* is marked by the offer which has recently been made as a final settlement to bondholders of the Société Continentale de Gestion (Gesco). This company was formed after the Credit Anstalt crash in 1931 to take over, administer and liquidate the bulk of the foreign assets of the Credit Anstalt. The company took over these assets and issued bonds which were taken up by the foreign creditors—mainly joint-stock banks and private banking houses—of the Credit Anstalt. The Société Continentale de Gestion has accomplished its unusually complicated and difficult task with great efficiency. The bondholders have up to date received capital sums amounting to 65 per cent. of the original value of their bonds, plus interest at the rate of 5 per cent. per annum, since the bonds were issued. (The interest paid up to June 30th last amounts to 17.6 per cent. of the nominal amount of the bonds.) There can be no doubt that from the point of view of the foreign creditors of the Credit Anstalt the record of Gesco provides easily the happiest chapter of the sorry story of the liquidation. The company has now reached the point at which it must provide for its own liquidation and an offer has been made to bondholders in full satisfaction of the amounts still owing to them. The offer consists of a further cash distribution of 11 per cent. of the original amount of these bonds, which would bring capital cash payments up to 76 per cent. In addition, bondholders are offered a *pro rata* distribution of preference and ordinary shares in a Swiss company, the Société Continentale de Valeurs Bancaires et Industrielles, which is to take over the management of certain remaining assets of Gesco which for various reasons are not likely to prove realisable, in the near future. Already 96 per cent. of the bondholders have accepted the offer, and by the time the list for acceptances closes on September 15th it is hoped that an even closer approximation to unanimity will have been obtained.

* * *

Mediterranean War Rates.—Last week (a correspondent writes) the rating committee of marine underwriters issued some revised war rates for the Mediterranean voyages. The conditions governing this market are necessarily complex, but it would appear that the main change is this: cargo on vessels which are not regular liners pays 5s. per cent. instead of 2s. 6d. per cent. if the vessels call to load or discharge at any Mediterranean or Black Sea port. There is also a change in connection with vessels calling at French Mediterranean ports via the route west of the Balearic Islands. Another change is that Jugoslavian liners are now to be included in the nationalities insured at the ordinary rates.

* * *

Bank of New Zealand.—Copies have just arrived in this country of the full report of proceedings of the last annual meeting of the proprietors of the Bank of New Zealand. During the year to the end of last March, which is covered by the latest report, New Zealand enjoyed a period of active trade conditions, in which the banks found ample opportunity for the extension of their loan accommodation to trade and agriculture. The average advances for the six trading banks in the March quarter of this year were £6,699,000 higher than in the corresponding quarter of 1937 and represented 81 per cent., against 71 per cent., of the total deposits. In the case of the Bank of New Zealand, the increase in advances was from £22,862,000 to £25,803,000, 75 per cent. of the increase being accounted for by finance for farming and associated industries. Advances to the agricultural and allied industries represented slightly more than half the bank's total advances at the date of the last balance sheet. It was emphasised at the meeting that the trading banks of New Zealand have provided finance for farming industries to an extent that has few parallels overseas. Their stake in the industry is likely to increase further in view of the recent legislation for the relief of mortgagors, which has adversely affected the amount of mortgage money available and has diverted to the trading banks a considerable amount of finance which would previously have been obtained from private lenders. Banking practice in New Zealand has also been affected by the provisions in the new legislation, which has in many cases had the effect of converting overdraft accommodation from a demand liability to one fixed over a long period of years. The liquidity of the New Zealand banks, however, remains satisfactory, the position in this respect having been strengthened by the establishment of the Reserve Bank.

MONEY MARKET NOTES

Foreign Exchanges

THE main interest in the foreign exchange markets has been divided during the past week between French francs and dollars. Both currencies have been subject to intermittent, but heavy, control operations. After depreciating to 4.87¼ towards the end of last week, the weight of Control intervention sent the rate back to over 4.88, and, helped by substantial sales of dollars against shipments of gold to New York, a rate of 4.88½ was touched on Wednesday. Since then, the tendency has been for the dollar to re-appreciate, but whenever the London quotation has shown signs of going beyond 4.88, unmistakable official intervention has become apparent. The week, therefore, closes with the sterling-dollar rate hovering around this figure. The French franc adheres closely to its devaluation limit, the Control being ready to provide support at 178.90. Its operations at this figure have been considerable. Forward francs were heavily offered during the first part of the week, the three months' rate touching 7½ discount. There was a spectacular improvement in the forward rate, bringing it down to 5½ discount on Thursday immediately following M. Daladier's reassuring statement on the franc position. The improvement was due to obvious Control intervention, the market suggesting that as a piece of stage setting it was perhaps too obvious. The belga has throughout the week remained close to its gold export point to New York, and appreciable losses of gold have been suffered by the National Bank. On Thursday, the forward belga improved with the forward franc, indicating how close the psychological link between the two currencies remains. Guilders and Swiss francs have moved fairly closely with the dollar.

*

The Money Market

THE short-loan position remains substantially unchanged. It had been expected that the final call on Defence 3's, made on Friday of last week, would make itself felt in the shape of a temporary contraction of loanable supplies, but—as may be seen from the latest Bank of England return—the substantial movement of funds involved in this operation has been effectively neutralised. Bond money from other than clearing bank lenders is still in fair demand and commands ½ per cent. The clearing banks have an abundant supply of money against bills at ½ per cent. The banks continue to be good takers of bills at ½ per cent., but the market has been a somewhat reluctant seller following the allotment of only 30 per cent. of Treasury bills at the syndicate's figure of £99 17s. 5d. last Friday. The actual rate of discount shows that a substantial preponderance of the successful tenders must have been made at £99 17s. 6d., and these it may be assumed must have been of official, or semi-official character. In view of the importance of Exchange Fund operations both in the bullion and foreign exchange markets during the past week, the outlook appears to favour a continuance of small allotments and of a syndicate price of £99 17s. 5d. at the weekly tenders. There has been a continuance of special buying of hot bills during the week, which may represent the utilisation of Exchange Account sterling.

	Aug. 19, 1937	Aug. 11, 1938	Aug. 18, 1938
	%	%	%

*

The Bank Return

THE return of notes from holiday circulation is still proceeding at a somewhat faster pace than last year, the net reflux for the week to August 17th amounting to £7,370,000, or about £500,000 more than in the corresponding week of 1937. The total of notes in circulation is thus brought down to £482,623,000, which is about £8,000,000 less than at the corresponding date last year.

	Aug.18, 1937	Aug. 3, 1938	Aug. 10, 1938	Aug.17, 1938
	£ mill.	£ mill.	£ mill.	£ mill.
Issue Dept. :				
Gold	326·4	326·4	326·4	326·4
Notes in circulation	491·0	497·8	490·0	482·6
Banking Dept. :				
Reserve	36·8	29·7	37·5	45·0
Public Deps.	28·5	9·5	19·3	20·1
Bankers' Deps.	88·5	113·4	106·1	105·7
Other Deps.	36·5	34·7	34·5	34·1
Govt. Secs.	107·1	114·7	109·7	104·6

Other Secs.	21·6	21·8	21·5	22·0
Proportion	23·9%	18·8%	23·4%	28·1%

The effect of the return of notes from circulation on deposits is almost exactly offset by changes in securities held in the Banking Department, which on balance were £7,303,000 down on the week. The greater part of this movement is due to a reduction of £5,075,000 in Government securities, but discounts and advances also show an important reduction, namely by £2,776,000. This movement approximately completes the reversal of the substantial increase in discounts and advances which began in mid-June and which was evidently connected with special non-market financing undertaken by the Bank of England. These movements leave the total of deposits virtually unchanged, but bankers' deposits and other accounts are down by some £800,000, which is approximately the amount by which public deposits have risen.

*

The Bullion Market

ACTIVITY in the gold market has remained abnormal, and the amount dealt in at fixing during the week has amounted to nearly £8 millions. There was a considerable slackening in the demand in mid-week, and on Wednesday the turnover at fixing fell to about £600,000. On Thursday, however, there was a recrudescence in activity, and £1,436,000 changed hands. The hoarding demand for gold has very largely abated, and most of the past week's activity has been due to resales and arbitrage operations with the United States. The Control has sold gold readily, either at parity or at ⅛d. premium. The price of the metal has thus fluctuated closely with the dollar rate, falling to 142s. 4½d. on Wednesday and recovering to 142s. 6d. on Thursday. The market on Thursday afternoon became exceptionally quiet, holders asking for the price of 142s. 6½d., at which figure arbitrage was just out of reach.

* Above or below American shipping price.
† At fixing.
The New York price of silver remained at 43 cents per ounce ·999 fine during the week.

The silver market continues exceptionally narrow and fluctuations have been small. The only development of note has been the renewal of certain bear operations, which increased the premium on cash silver from ⅛d. to 7/16d. on Wednesday. There has been some selling on spot from the Continent, while most of the demand has come from the Indian bazaars and American trade quarters. On Thursday, however, both India and speculators were inclined to sell, and the price relapsed to 19⅜d. for spot, which compares with 19½d. a week ago.

Investment

Markets and Politics.—The commencement of Germany's large and extended military manœuvres has provided no bull pointer for the markets. On the whole, the Stock Exchange has done well, in a week of no little political disquiet, to have maintained its position. The chief feature of the week, indeed, is not the extent of price movements, but the dearth of business in either direction. True, the *Financial News* ordinary share index has declined from 85.1 at the close of last week to 83.3 on Thursday, but on a turnover of insignificant proportions. Bear operators, in particular, have noticeably held their hand, although it is difficult to estimate how far their restraint has been due to official indications of calm, both in London and Paris. But, as we show in a succeeding Note on the Berlin Bourse, the fact represents a victory for the democratic Stock Exchanges, whatever the reason. Nor has the British market received any particular economic favours during the past few days. Indeed, the record of substantial falls in steel output, motor registrations, export trade, and production during the second quarter of the year, provides a depressing batch of news. Yet, if the market were convinced that this represented the sum total of its burden, and if the political risk rolled away overnight, current share prices would rally vigorously. But few serious investors are ready to subscribe, at the moment, to either hypothesis. The effects of American autumnal recovery—if it comes—on British home and overseas trade will be diluted and delayed. In particular, the export trades must continue to bear the brunt of an overvalued pound, without much hope of prompt relief from lower costs or increased trading outlets. For the moment, however, the market is concentrating on the shorter view. Thursday's dealings, after the blunt reply of the Sudeten German delegates to the Czech Government's proposals, showed that it is capable of maintaining its poise despite the shadow of politics, but that it lacks any sort of positive support. It is a position of uneasy equilibrium which might be radically disturbed at short notice.

* * *

Berlin Bourse in Retreat.—The collapse of the Berlin share market, accompanied for the first time since 1931 by a steady decline in fixed-interest securities, is particularly noteworthy, writes our Berlin Correspondent, when viewed in connection with National-Socialist stabilisation theories and practices. In itself the decline in share quotations has not been extreme, nor was it very sudden, comparing in neither respect with the drop of 50 per cent. which occurred in six months in the first post-stabilisation years, with the Schacht smash of May, 1927, or with the fall accompanying the payments crisis of 1931. In fact, the word "collapse," used in Berlin and abroad, is justified less by the magnitude of the movement than by its unexpectedness, and for this the stabilisation programme may be held responsible. The National-Socialists, though they never expressly promised that Bourse fluctuations would disappear, did affirm that the "speculative" influences supposed to be behind them and behind commodity price changes had been eliminated; and they pointed to the mild Bourse fluctuation curves of 1933-37 as proof of the success of their policy. In this there was a certain confusion of ideas; for whereas "fair" or "natural" prices for commercial commodities could be named (in fact they were merely corrections of existing prices to meet particular interests), a fair value of securities from which Bourse quotations would never violently deviate could not be found even on paper. In effect, "stabilisation" meant that shares, as was entirely natural, should advance in step as corporate earning capacity recovered from the depression, and that they should never drop substantially, since a decline might indicate that the depression was returning or would return. In consequence, the present big decline surprised and discountenanced official circles; and the fact of it was kept from the general public; indeed, it is still better known abroad than in Germany except in immediately interested quarters.

* * *

In a free economy a heavy decline might have been expected before 1938. Bourse prices were very high, few important shares (shipping excepted) being below par, and many standing at 50 per cent. premium. The dividend yields, calculated at market prices, were low, often around 3 per cent., although the minimum yield on bonds was 4½ per cent. This high level of share quotations was in part due to distrust of the currency (the familiar "flight into real values"); but in part it was due to expectation of higher future dividends, since dividends have been allowed to rise as industry has become more active. The fall in quotations began simultaneously with expert, in part official, predictions that profits had reached or even passed the peak. For these predictions many reasons were given, among them the declining average efficiency of labour, and the enforced utilisation of out-of-date, long idle plant. Equally potent was the fear, since realised, that profits would increasingly go to the tax-collector. Enforced selling for Jewish accounts in early July brought all these apprehensions to a focus, and since then the decline has been continuous. Fear that profits would decline as a mere consequence of decreasing trade activity played little or no part; and to-day, after the event, there is no tendency to represent the collapse as the automatic precursor of depression, although in the past heavy Bourse falls in Germany, as elsewhere, were usually followed by depression. The automatism of the trade cycle seems in this respect to have disappeared. A government like the National-Socialist, for which prestige is the first consideration, is compelled to keep production and employment high; and there is little doubt that it has the power to achieve this, largely by unremunerative undertakings. If the predicted decline in industrial profits occurs it will not, therefore, be due to lack of work but to reduced ability to earn profits on an unreduced volume of production. How far the Bourse decline will go is hard to foresee. Even at the present low prices, dividend yields are not high enough to tempt buyers. But, as against this consideration, the Government, which has unlimited power, may easily desire to stop the decline; and emphatic denials of the alleged new taxation plans indicate that this is the official policy.

* * *

German Debt Service.—The Second Article of the Anglo-German Transfer Agreement, signed in London on July 1st, defined the future service on the "Dawes," "Young," Austrian 1930, and Saarbruecken loans, together with Austrian Government Credit Anstalt bonds and non-Reich debts. Detailed provisions for the execution of the Article (the effect of which was summarised in the table on page 78 of *The Economist* of July 9th) have now been published in a supplementary agreement signed in Berlin at the end of last week. The arrangements for the service of each of the long-term Reich, Austrian and Saarbruecken issues are similar in general character, subject to necessary modifications required by the terms of their issue and of the agreement. The service of certified "Dawes" bonds (bonds which were in the beneficial ownership of British holders on June 15, 1934) will be based on financial years expiring on October 14th. In each of these years the German Government undertakes to provide a sterling amount calculated at 7 per cent. on the nominal amount of all certified bonds, without any reduction in respect of bonds which have been, or may subsequently be, redeemed. Interest on "enfaced" coupons will be payable from October 15, 1938, at 5 per cent., and the balance of service moneys in each year will be applied to redemption by the purchase of bonds in the market on the part of the German Government or by drawings at par, plus any premium. As far as practicable, the amounts to be applied to redemption will be divided proportionately between the enfaced bonds of different currencies. Provision for redemption in respect of the initial period from April 15 to October 14, 1938, will be effected on September 15, 1939. On October 15, 1949, or on any subsequent half-yearly interest date, the German Government (having given six months' previous notice) will be entitled to redeem enfaced bonds in whole, or any part equal to or exceeding £1,000,000 at par, plus premium if any. In the event of such redemption, the subsequent service moneys will be proportionately reduced.

* * *

It will be seen that the effect of the agreement will be to provide 5 per cent. interest and a cumulative sinking fund of 2 per cent. on the "Dawes" loan. In the case of enfaced bonds of the "Young" loan coupons will be paid at 4½ per cent., and the 1 per cent. cumulative sinking fund will not operate until the year ending May 31, 1941. From June 1, 1941, the German Government may redeem enfaced bonds, or any part equal to or exceeding £1,000,000, at par. In general, the operation of the annual redemption provisions is similar to that of the "Dawes" loan, but drawn bonds will be due for payment on June 1st from 1941 onwards. The financial years affecting the Austrian loan of 1930 run to June 30th. The rate of interest on "enfaced" bonds (in British ownership on July 1, 1938) will be reduced to 5 per cent., and the 2 per cent. sinking fund will operate during the current year, the first drawn bonds (at par plus premium) being due for payment on January 1, 1940. The Saarbruecken loan of 1928 will receive interest at 4½ per cent., but the 1 per cent. sinking fund in this case will commence with the three months' period ending September 30, 1940, and subsequently will be effected to years ending September 30th. Finally, capital coupons of the enfaced Credit-Anstalt bonds maturing on and after September 1, 1938, will be paid in full in sterling, while holders of non-Reich debts will be entitled to half the sterling amount due, subject to a limit of 4 per cent.

* * *

"Outside" Dealers' Association.—Obvious importance attaches to the registration, as a company limited by guarantee, of the Association of Stock and Share Dealers. It will be recalled that the Prevention of Fraud (Investments) Bill proposes to give power to the Board of Trade to grant recognition to approved associations of dealers in securities and to exempt the members of such associations from the licensing provisions of the Bill. This proposal follows naturally from the Bodkin report, which envisaged the possibility that associations of "outside" dealers might be formed, having self-contained disciplinary rules. Members of the Association which has now been registered must be wholly or mainly engaged in dealing in marketable securities; those not wholly or mainly so engaged may become associate members. Membership will be terminated *ipso facto* on any conviction involving fraud or dishonesty, or on bankruptcy or receivership. The general council will also retain power to expel, suspend, or censure any member whose conduct is considered improper. Applicants for membership must complete a statement (which, it may be presumed, provides some indication of the licensing rules which the Board of Trade may introduce when the Bill is enacted) showing names, nationality, business references, methods of business (principal or agent), and other relevant particulars. It is understood that members will be debarred from entering as principals into margin or option business with the public. In short, "gambling options" will be expressly forbidden. Further, country members of the Association will not lose the valuable privileges conferred by the register of country brokers of the London Stock Exchange, provided that the rule against public advertising continues to be observed. Although in some quarters of the "House" there is a disposition to regard the formation of the new Association as a further channel through which Stock Exchange business may be diverted, it would seem, at first sight, that the Association should provide an effective disciplinary organisation, commanding the adherence of the majority of "outside" dealers. The Board of Trade's task in examining individual applications for dealing licences should be correspondingly simplified.

* * *

Unit Trust Yields.—The Producers Investment Trust is the latest recruit to the ranks of unit trusts which are now publishing certified yield statements. Accompanying an analysis of the composition of the trust's portfolio on July 26th last, Messrs Peat, Marwick, Mitchell & Co., the well-known chartered accountants, certify that a yield statement estimated by the managers "is based on" the Trust's portfolio, and on dividends and cash bonuses declared or recommended by the respective companies "in respect of the last completed financial years for which such information has been made available." We have previously advocated—and we welcome this new adherent to the principle—that unit trust yields should be certified by accountants. There are, however, a number of technical points which arise in connection with such statements. The first is connected with the dividend rates adopted for the calculation. If the total dividend declared in the last completed financial year is taken, the yield calculation necessarily cannot reflect any changes, whether up or down, in any interim dividend which has been subsequently declared. In the case of Producers Investment Trust, for instance, the reduction in the Courtaulds interim distribution appears to be a case in point. There is a risk, therefore, that such a yield calculation, although formally correct by definition, might become somewhat divorced from current investment conditions. The second point, associated with the first, concerns the frequency with which certified yield calculations are to be published. On grounds of expense, unit trust managers may take the view that a calculation based on the portfolio at each distribution date must suffice for the investor's needs. But in a period between any two distribution dates in which dividends were falling—or, for that matter, rising—the time lag between the appearance of falling industrial profits and their reflection in certified unit trust yields might be further increased. Perhaps the first point might be met if managers were to adopt the conservative course of ignoring any increase in interim dividends declared since the last complete financial years of the companies included in their portfolios, but of taking account of any subsequent reduction in interim dividends. The second suggests, at least, that statements of certified yields should invariably be accompanied by the date of the composition of the trust to which they refer and, if possible, by a statement indicating whether the managers have any reason to apprehend a diminution—or increase—in the certified yield at the end of the current distribution period.

Steel Share Position.—In a dull industrial share market during this account steel shares have lost further ground. United Steel, which a fortnight ago stood at 22s. 6d., have fallen to 22s.; Guest, Keen and Nettlefolds from 24s. to 23s.; Dorman Long from 21s. 6d. to 20s. 1½d.; and Stewarts and Lloyds from 36s. 9d. to

OTARD'S EST. 1795
V.S.O.P.
LIQUEUR BRANDY
MATURED AND BOTTLED AT CHATEAU DE COGNAC

35s. 1½d. The steel industry is certainly experiencing a more serious recession than market observers expected even three months ago. The July output and export returns alike were very depressing. The incidence of paid holidays renders strict comparison difficult, but there is no doubt that even after full allowance has been made for the new holidays, steel output in July was running from 25 to 30 per cent. below the level of June, 1937, and that a further decline had occurred since June. The volume of exports in July, moreover, was 42 per cent. below that of the corresponding month of the previous year. Evidently the accumulation of orders placed when business conditions were more favourable helped to keep the industry fully occupied in the first few months of the year. But these appear to have been worked off. The industry now depends upon new orders, and of these there is chronic scarcity both in the home and export markets. There is no sign yet of any substantial revival after the holidays; many important consuming trades are depressed and the maintenance of rigid prices by the steel industry does not suggest the likelihood of any significant increase in orders.

* * *

At the same time, however, the steel share market already discounts a substantial decline in profits. On the basis of their last dividends (which, of course, represent the peak of profits in this trade cycle), the yields shown are considerable. Even armament shares such as John Brown and Hadfields yield over 9 per cent. and about 8¼ per cent. respectively. Stewarts and Lloyds yield over 7 per cent., United Steel, Baldwins and Colvilles yield 8 per cent., Consett Iron and Whitehead 8½ per cent., South Durham nearly 8¾ per cent., Guest, Keen and Nettlefolds 9 per cent. and Dorman Long 10 per cent. Yields of this kind evidently discount any recession of less than major slump dimensions. If the industry were faced, for the next two or more years, with a fall in demand of such magnitude that dividends had to be halved, then the group would be overvalued. But if the recession is, say, of a year's duration, with a fall in output of around 30 per cent., profits should still register a sufficiently high level to justify present share values. A moderate reduction of output, indeed, would imply some reduction in costs, for in 1937 the plants were working at an uneconomic rate. At the same time, the more highly-geared equities, such as Dorman Long, are evidently much more vulnerable in recession than shares such as United Steel. And industrially the armament steel companies are much less likely than the rest of the group to suffer serious reductions in profit and dividends. But although the present value of steel shares may be justified in the long run, the market is unlikely to strengthen while output is still falling.

* * *

Beechams Pills Finance.—An announcement in July foreshadowed the acquisition by Beechams Pills, Limited, of the ordinary share capital of Macleans, and also a scheme (to be placed before the shareholders in September) to make Beechams Pills deferred shares more conveniently marketable for the small investor. Details of the directors' further proposals under each heading have been issued this week, and they fall into two parts. It is proposed, in the first place, to distribute a capital bonus of two new deferred shares for every share held on August 31st by capitalising £600,000 (from the reserve which was set up when the company's subsidiary interests were revalued last year), and to split the resulting issued capital into 7,200,000 deferred shares of 2s. 6d., leaving 2,400,000 deferred shares to be issued. Thus the holder of one 5s. share on August 31st will become entitled to six shares of 2s. 6d. Secondly, to provide the further finance required for the acquisition of the Macleans 5s. ordinary shares (some 3,394,672 shares have been purchased, out of a total issue of 3,400,000 shares) it is proposed to issue the remaining 2,400,000 Beechams Pills deferred shares, at a price to be fixed by the directors. Existing shareholders of all classes will be given preferential consideration on allotment. The present price of 57s. 6d. for the 5s. deferred shares would correspond to 9s. 7d. for the 2s. 6d. shares after the bonus issue. According to the Beecham Maclean Holdings prospectus, Beechams Pills purchased the Macleans ordinary shares for 12s. 6d. each (plus interest) and were entitled to receive the final dividend of 20 per cent. for the year to June 30th. The net cost of the whole ordinary capital would thus amount to £2,109,600, after deducting expenses for the Beecham Maclean Holdings preference issue, which produced £1,496,500 gross. It is to be presumed, therefore, that a sum of the order of £612,500 remains to be found by Beechams Pills to complete the transaction. This sum would be covered nearly twice by the issue of the remaining 2,400,000 deferred shares on the basis indicated above. The computed benefit to Beechams Pills' profits of £120,000 per annum arising from the transaction would approximately maintain the ratio of earnings on Beechams Pills deferred, after allowance for the capital bonus.

* * *

Calico Printers' Loss.—The position disclosed in the preliminary statement of Calico Printers confirms the worst fears about the company's experience during the year to June last. After providing £367,228 for maintenance, depreciation and repairs, and £128,000 for debenture interest, the Association has experienced a loss of £93,542. From these preliminary figures, it would appear that total profits (presumably after directors' fees amounting to £10,800) amounted last year to no more than £401,686, compared with £616,602 for 1936-37. After deducting the credit balance of £83,351 brought forward from the preceding year and transferring £50,000 from general reserve (reducing the fund to £600,000), the resultant credit balance of £39,809 is carried forward. No dividend is to be paid on the preference stock, which last year received a payment in respect of the half-year to December, 1935. The ordinary capital has received no dividend for the past nine years. The Association has attempted, as far as possible, to offset the decline in British textile export business by establishing mills in China, India and Egypt. And throughout a prolonged period of sub-normal earnings, it has maintained an impressive liquid position and has not compromised its generous depreciation provisions. But at present the depression in the cotton textile industries tells its own tale. In particular, the investor need look no further than the trade returns for the explanation of the Association's adverse experience last year. For the first seven months of the current year, exports of printed cotton piece goods are one-third lower in volume, and nearly as much lower in value. That is the ultimate fact which the cotton industry—and its shareholders—must face.

* * *

The Week's Company Profits. The profits of 16 companies whose reports have been received this week amount to £750,000, compared with £670,000 for the preceding year. In view of the character of the list, however, it is difficult to attribute any special significance to the improvement of 12 per cent. which they show. Total profits for the 1,694 companies reporting this year record an improvement of 11 per cent. from £212,047,000 to £235,400,000. This week's results are discussed on page 382 under the heading "Shorter Comments."

London

SETTLING DAYS

TICKET	ACCOUNT
AUGUST 23	AUGUST 25

To outward appearance, conditions on the Stock Exchange have improved from nervousness to dullness this week. Actually, the market has remained on the alert for any sign of major political disturbance, and in the process has escaped more lightly than the Berlin Bourse. Turnover has remained very restricted, but it is at least of some significance that the bears have not been tempted to extend their operations. The market has limited power of resistance, however, and the maintenance of prices is the resultant of small day-to-day movements which might be disturbed if the existing tension in Central Europe were intensified. For the most part, however, it is difficult to find a specific trend. Sentiment has ebbed and flowed, but business has throughout been small.

The *gilt-edged market* was at first affected by political fears, and it required only a small volume of selling to produce fractional falls. Throughout the week, the volume of business remained extremely limited, and price changes were of little interest. Interest in home corporation and dominion issues was restricted.

An improvement in *Japanese bonds* was attributed to American buying, although the market revealed a rather over-sold position, and price movements seemed to exaggerate the volume of demand. Chinese issues also gained in mid-week. German issues were affected by the political situation, but rallied on the publication of the detailed agreement governing the future debt service (discussed on page 376).

*

After a gloomy opening in which dealings in preference and guaranteed *home rail stocks* were at times difficult, the ordinary stocks staged a recovery, despite the traffics. Prior charges, however, remained dejected. Absence of support for Argentine issues was followed by further small declines.

The *industrial market* opened uneasily, but in mid-week was able to balance small gains against losses. Steel shares showed further falls at the opening—in some instances of significant extent—but the market became steadier in mid-week, although price movements were small. Little business was transacted in electrical equipment issues, and prices reacted further. Motor shares were affected by the fall in the June registrations, but Raleigh Cycle was perhaps the weakest feature on Monday, with a fall of 3s. to 36s. An appreciable part of this loss, however, was recovered on Tuesday. Aircraft shares declined, and further small selling of brewery shares was reported. Textile shares moved to lower levels, but Courtaulds again showed their recovery powers in mid-week. Store shares remained dull, O.K. Bazaars being unaffected by the share deal. While the extent of the opening losses among the miscellaneous industrials was not maintained, further falls were not uncommon in mid-week, although they were roughly balanced by small gains. Beechams Pills deferred were active on the new finance proposals (discussed on page 378).

Small dealings were recorded in the *oil share market* but the leading shares lost ground. A late rally on Tuesday, however, introduced rather firmer conditions in mid-week. Recorded changes among rubber shares were few, for the amount of interest was almost negligible.

Gold shares were at first affected no less than other markets by political nervousness, but the tone, and also the volume of business, became more encouraging on later days. Among the speculative shares Western Holdings were erratic before and after the publication of the latest cable, while Marievale were active on Thursday. In mid-week buying of established producers led to improvements in Crown Mines—to a new high record—and in the Geduld. Small changes were recorded in the Rhodesian Copper group, but Trepca were at first sensitive to political fears.

ACTUARIES' INVESTMENT INDEX

A fall of 2 per cent. is registered by the Actuaries' index of 151 industrial ordinary shares over the past week. The index stood at 64·8 on Tuesday last, compared with 66·1 for the preceding week, and 66·7 a month ago, the corresponding average yields being 5·85, 5·72, and 5·86 per cent. The following selection from the component indices shows that coal, oil, brewery and steel shares have registered an appreciable fall:—

Group (and No. of Securities)	Prices (Dec. 31, 1928 = 100): July 19, 1938	Aug. 9, 1938	Aug. 16, 1938	Prices 1938 High

New York

WALL STREET experienced the first sharp reaction, after its prolonged and scarcely interrupted rise, at the end of last week. This week, it has recovered part of the lost ground, but without any apparent enthusiasm. It has been typical, on several days, that the gains recorded in opening dealings have not been fully maintained at the close. Turnover has been running at comparatively low levels, and the recovery at the moment appears to be largely of a technical character, without much significance as a pointer to the real trend. Motor shares have been a consistently good group, on hopes of the 1939 selling season. Building stocks improved on the upturn in residential building last month. *Iron Age* estimates steel activity at 41 per cent. of capacity, compared with 40 per cent. last week, although part of the increase appears to be due to building up stocks. There is evidence of price-cutting, and some authorities now estimate that the profit level for the industry will not be reached until activity represents 60 to 65 per cent. of capacity.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

Capital Issues

PROMPT success attended the issue of £330,000 5 per cent. debenture stock of *Odhams (Watford)*, on which payment of principal, premium and interest is unconditionally guaranteed by Odhams Press. The prospectus suggests that the company, which was formed in 1935, has established itself on a reasonable profit-earning basis. In view of its guarantee and relatively high yield, the stock may be useful for the general investor for mixing purposes.

PUBLIC OFFER

Odhams (Watford), Ltd.—Issue of £330,000 5 per cent. first mortgage debenture stock at par. Principal premium and interest unconditionally guaranteed by Odhams Press. Redeemable at 102½ by 1968 by drawings from 1943, or from 1945 on notice. Net assets, £650,994. Odhams Press profits after depreciation and interest: 1935, £349,403; 1936, £351,554; 1937, £340,192.

PRIVATE PLACINGS

Bigwood (Joshua) and Son.—This company is allotting 80,000 6 per cent. cumulative 10s. preference and 25,000 4s. ordinary shares in consideration of the acquisition at par of 80,000 (i.e. all) 7½ per cent. redeemable cumulative 10s. preference shares and 25,000 (i.e. one-half) 4s. ordinary shares in Laystall Engineering Company.

Lydenburg Estates.—In consideration of the acquisition of mining rights additional to those appearing in a schedule issued last June, 47,500 5s. shares are being allotted.

SALE BY TENDER

Bedford District Gas.—Offer for sale by tender of sufficient 4 per cent. redeemable preference stock (1958) to realise £56,530. Minimum price is par.

DIVIDEND ANNOUNCEMENTS

Rates are actual, unless stated per annum or shown in cash per share. Rate for previous year refers to total dividend, unless marked by asterisk to indicate interim dividend.

SHORTER COMMENTS

Company Results of the Week.—An appreciable advance in net profits, from £93,866 to £106,153, is recorded by STRETTONS DERBY BREWERY. The ordinary dividend has been increased from 35 per cent. to 37½ per cent. WILLIAM BAIRD AND COMPANY, the Scottish steelmasters, have published a very satisfactory report, which shows that net profits have increased from £283,088 to £380,064. The increased dividend, of 16 per cent. compared with 13 per cent., is covered with an appreciable margin. Progress is also recorded by BATCHELOR'S PEAS, whose net profits show an increase from £47,697 (for approximately 50 weeks) to £55,867. The 10 per cent. ordinary dividend, which is maintained, requires £20,000, but the balance carried forward has been increased from £11,197 to £22,607. TYNE-TEES SHIPPING profits are slightly lower at £47,496, but the traditional ordinary dividend of 5 per cent. is maintained.

MISCELLANEOUS

Joshua Bigwood and Son.—This company is acquiring the Laystall Motor Engineering Company, of Southwark, a new private company (with £100 capital) being formed to take over the business. To finance the acquisition, Bigwoods are issuing 80,000 6 per cent. cumulative 10s. preference shares and 25,000 4s. ordinary shares. Net trading profits of both companies for 9 months to April 30, 1938, are £18,807 before depreciation and tax.

Investors Second General Trust.—Sixth distribution (payable September 1st) is 4½d. net per sub unit. A year ago 5½d. net was distributed.

Third British Fixed Trust.—Coupon No. 9 (payable August 15, 1938) has been paid at the rate of 7½d., free of tax, per sub-unit. This makes for year £6 10s. 9d. (against £6 1s.) per cent. on initial price of 20s. 6d., from dividends and cash bonuses alone; distribution from sale of rights is at 10s. (against £1 11s. 9d.) per cent. net on initial price.

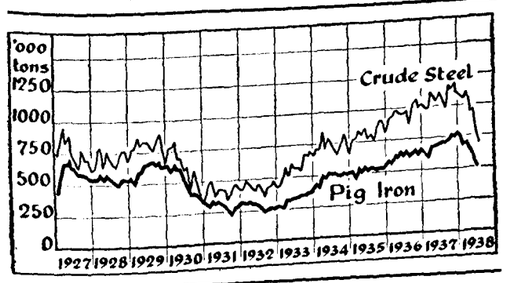
A. V. Roe.—It has been announced by Sir Kingsley Wood that this company has been entrusted with the erection of a factory costing £1,000,000.

Cables Investment Trust.—At the general meeting held on August 16th, Lord Pender disclosed that 32 per cent. of the companies' securities were in bonds, 17 per cent. in preference stocks, and 51 per cent. in ordinary stocks. It had been deemed wise to confine most of the investments to securities within the British Empire.

Railway Fares.—The Railway Companies' Association has issued a statement to the effect that there is no proposal under consideration for a further general increase in fares or season ticket rates.

Baird (William) and Company.—For year to May 31, 1938, profits (after contingencies) were £598,935 against £432,734. Tax and N.D.C., £181,000 (£110,000); ordinary dividend 16 per cent. (13 per cent.); depreciation, £65,000 (same); to reserve, £50,000. Carry forward, £169,396 (£121,674).

City of Saarbruecken 6 per cent. Sterling Loan of 1928.—Guinness, Mahon and Company announce that funds have been received for the payment in full of the balance of 20 per cent. outstanding on coupons due October 1, 1936.



"Brewery Share Prospects."—The price of hops quoted in this article in last week's issue should be £9 per cwt.

Mozambique Company.—Report for 1937 shows excess of African receipts over expenditure of £190,679 against £149,016. Rectification of inventories took £50,240 (£21,013); Caisse d'Emission net expenses, £4,016 (£427); European net expenditure, £40,616 (£32,058). Profits are thus £95,694 (£96,258). To reserve, £4,785; to State, £2,392; amortisation, £15,011 (£12,223). Remaining £73,506 to special reserve fund.

(*Continued on page 395*)

Industry and Trade

Lower Steel Output.—The downward trend in iron and steel production continued during the past month. The output of pig iron fell from 541,500 tons in June to 507,800 tons in July, and crude steel production declined from 776,100 tons to 683,200 tons. The severity of the decline in output is shown by the accompanying diagram. The output of pig iron and crude steel last month was lower than in any corresponding month since 1933. The extent of the decline, however, is scarcely surprising. It has long been evident that the hectic re-stocking movement of last year was likely, sooner or later, to force

a substantial curtailment of domestic output, in spite of the reduction in imports. The decline has been accelerated, of course, by the recession in general business activity. While stocks appear to have been appreciably reduced, there are no signs of any marked increase in new orders, partly because consumers expect prices to be reduced at the end of this year.

★ ★ ★

Cotton Industry Enabling Bill. — Representatives of other textile industries which may be affected by the proposed Cotton Industry Enabling Bill have been invited to participate in discussions which will take place in September. Mr Peter Bennett, the President of the Federation of British Industries, has been asked by the President of the Board of Trade to act as independent chairman in these talks. The Executive of the Joint Committee of Cotton Trade Organisations, at a meeting in Manchester on Wednesday, considered a number of points which had been raised by the opponents to the Bill, and a statement has been sent to the Opposition Committee with a view to removing some of the misunderstandings which still appear to exist. The Executive, however, unanimously affirmed the necessity of appointing a Cotton Board to administer the reorganisation scheme. This principle had been approved by all sectional organisations as the only satisfactory means of dealing with the problems likely to arise. On the suggestion of the opposition firms, however, the proposals have been amended to include "scrap and build" schemes for those sections that desire them. The Joint Committee emphasised that, as already announced, the draft Bill, when ready, would be published for the consideration of the industry. The Board of Trade will decide how the opinion of the trade is to be taken on it, and the Government's decision whether to introduce the Bill into Parliament will depend upon the reception it receives from the industry. A memorandum containing the views of the opponents to the Bill will be forwarded to the President of the Board of Trade this week-end.

★ ★ ★

An Apple a Day.—If an apple a day is a necessity for health, the latest figures published by the Imperial Economic Committee* confirm the view that the British people are not keeping fit. Owing to the poor home crop of 1937, they ate only 20 lb. of apples each last year, compared with 26 lb. in 1936 and 32 lb. in 1934, a year of an exceptionally good crop. Allowing an average of five apples to the pound (and excluding apples consumed as cider) each inhabitant had barely two apples a week in 1937, with none extra for Christmas and All Hallow's Eve; even in 1934, there were only three apples a week for each of us, with four extra for the major festivities of the year. Fortunately, this deficiency in supplies was partly made good by increased consumption of other fruit, mainly oranges and bananas, whose nutritive value is probably not very different from that of the much-advertised apple. Since the war, there has in fact been a steady increase in the British consumption of fruit of all kinds, which has been met mainly by increased imports of tropical and semi-tropical fruits and, to a lesser extent, by increased home production. Since the imposition in 1932 and 1933 of import duties on many types of fruit from foreign countries, supplies from the Empire have increased relatively to the total; in 1937, 61 per cent. of the total weight of fruit imports came from the Empire compared with only 33 per cent. in 1930; Palestine, the British West Indies and South Africa are now our principal Empire sources of fruit.

* Fruit Supplies, 1937; Imperial Economic Committee. H.M. Stationery Office. 2s. 6d.

★ ★ ★

Setback in Industry.—The Board of Trade index of industrial production shows a sharp decline in the second quarter of this year, thus confirming the setback revealed by *The Economist's* monthly index of business activity. In 1937, the official index rose by 1.9 per cent. between the first and second quarters; this year it registered a fall of no less than 7.8 per cent. Compared with the second quarter of 1937, the latest index shows a decline of 8.7 per cent. The incidence of the recession is shown in the following table:—

INDEX OF INDUSTRIAL PRODUCTION (1930 = 100)

Group	Year 1936	Year 1937	1937 June Quarter	1938 March Quarter	1938 June Quarter
1. Mines and quarries	94·4	99·8	100·5	104·0	89·4
2. Iron and steel	150·1	166·6	165·6	168·4	131·7
3. Non-ferrous metals	143·8	165·3	166·7	153·3	147·2
4. Engineering and shipbuilding...	123·3	136·3	138·2	132·7	128·8
5. Building materials and building	157·1	153·2	155·9	146·1	153·4
6. Textiles	126·4	129·6	135·1	116·9	106·4
7. Chemicals, oils, etc.	115·4	124·5	126·4	123·5	117·4
8. Leather and boots and shoes ...	120·7	118·9	121·3	119·5	109·7
9. Food, drink and tobacco	114·5	119·9	124·9	116·0	123·6
10. Gas and electricity	147·4	161·2	140·2	186·0	145·5
Total of manufacturing industries (2–10)*	129·4	138·3	139·1	136·9	127·3
Total of all groups (1–10)*	124·6	133·1	133·8	132·4	122·1

* Includes also various industries not specified above.

In spite of the increase in armament expenditure, which is largely concentrated on the metal trades, the indices for iron and steel and engineering showed a sharp fall between the second quarters of 1937 and 1938. The marked drop in the figure for textiles is a reflection of the shrinkage of international trade. In contrast, building activity was almost as high as a year ago, and the index for gas and electricity production actually showed a rise. The latest reports from industrial centres do not indicate an early change of trend, though the pace of the downward movement appears to have slowed down, at least temporarily.

Declining Foreign Trade.—The sharp downward trend in the value of British imports and exports continued in the past month. The latest returns show that the value of imports in July, at £73,393,000, was 13.5 per cent. lower than in July, 1937, and 3.3 per cent. lower than in last June. The value of exports, at £37,470,000, showed a decline of no less than 21.2 per cent. compared with the previous July, but compared with June it showed a small increase of 1.5 per cent. Re-exports were a third less in value than in the corresponding month of last year. As a result of the greater absolute fall in total exports, the adverse balance of trade showed a slight rise compared with July, 1937, but was less than in June of this year. Some of the fall in the value of imports may be ascribed to a shorter working month and to the fall in prices. It is noteworthy that the volume of imports of raw cotton and wool was higher last month than in July, 1937. As a result, *The Economist* index of the volume of raw material imports rose from 111 in June to a provisional figure of 113½ in July, which compares with 122½ a year ago. The index of the volume of exported British manufactures, which had risen to 101½ in June, fell back in July to 93½, approximately the same level as in May.

Overseas Trade by Commodities.—Although the value of the July imports was lower than in July, 1937, or than in the preceding month, there was considerable irregularity in the changes in volume. Cotton and wool imports were both larger than a year ago, and imports of cotton also showed a recovery, not shared by those of wool, from the low level recorded in June. Imports of sugar, lead and tin (unmanufactured) were also considerably larger than in either of the two months of comparison; on the other hand, imports of petroleum, of flax, hemp and jute, and of machinery were lower. Compared with a year ago, exports of all the commodities given here were smaller than in July, 1937, with the sole exception of locomotives. Compared with June, however, there was a welcome increase in the quantities of textile piece-goods exported and in exports of footwear.

Final Wheat Payments.—The cereal year of the Wheat Commission ended on July 31st, and the Commission has now announced the results of the year's working. Growers sold 24.5 million cwts. of millable wheat at an average price of 8s. 4.4d. per cwt.; in 1936-37, 23.7 million cwts. were sold at an average price of 8s. 9.9d. per cwt. In order to raise the average price to the guaranteed level of 10s. per cwt. (45s. per quarter), the Wheat Commission has declared a deficiency payment of 1s. 7.6d. per cwt. (10s. less 8s. 4.4d.) from which, however, they have deducted 0.6d. to meet administrative expenses. About 100,000 cwts. of the millable wheat sold are not eligible for this deficiency payment, since some wheat growers have elected to receive instead the oats and barley subsidy. The total payments of the Wheat Commission to the farmers will, therefore, amount to about £1,858,000, which, owing to the lower average wheat price, is somewhat larger than the £1,339,000 paid out in the previous season. The quota payment on the production of flour, from which the funds of the Wheat Commission are raised, averaged 1s. 2.37d. per sack during the season, and was paid on 71,220,000 cwts. of flour.

★ ★ ★

Quicksilver and Spain.—The new drive of General Franco's southern army towards Almaden, the world's largest mercury mine, has naturally brought uncertainty to the quicksilver market. While the Government troops will no doubt defend Almaden with the utmost vigour, as they have done successfully on various occasions in the past, the market is speculating on the future of supplies if the mines should fall into the hands of the insurgents. In the past, the large sales of quicksilver have been one of the most valuable sources of foreign exchange to the Spanish Government. As the heavy Spanish exports of the past two years coincided with record sales from Italy (the world's second largest producer), there have been ample supplies of the metal since the outbreak of fighting in Spain. In the first seven months of this year Britain's retained imports of quicksilver reached the record level of 1,696,911 lbs., compared with 1,614,947 lbs. and 376,160 lbs. respectively in the corresponding periods of the past two years. In spite of the great demand for quicksilver from the armament industries, which use it for explosives, scientific instruments and some types of paint, these net imports considerably exceed the current rate of consumption, and substantial stocks are probably available in this country. If the Spanish Government retains the Almaden mines, supplies will, of course, continue at record levels, but even if production were stopped, the market would not feel the effects immediately; it is known that the Madrid authorities have stored enormous quantities of quicksilver (possibly exceeding nine months' output) at the quicksilver port of Alicante. In the longer run, however, the possible occupation of Almaden by General Franco would be an event of decisive significance, because it would secure to the Fascist countries control over 85 per cent. of the world's quicksilver. Although the insurgents would probably sell quicksilver more or less freely in order to obtain foreign funds, the occupation of Almaden would probably lead to a revival of the Italo-Spanish quicksilver cartel, which had broken down at the end of 1936 as a result of the Spanish conflict. The effects of such a restoration of market control will, of course, depend on the cartel's price policy, so that it is useless to make any forecasts at this stage. The present price of £13 18s. 3d. per flask has been in force since the end of May, after a fall to £12 10s. 3d. in the Spring.

Fall in Commodity Prices.—Following the spurt in June and early July, wholesale commodity prices have tended to decline again. The slight setback is reflected in the indices shown below. *The Economist* indices for primary products in this country and in the United States registered a fall during the past fortnight, though both indices are still higher than at the beginning of June. But the complete *Economist* index, which, in addition to primary products, includes a number of semi-finished materials, has fallen to the lowest level registered this year. Similarly, the Irving-Fisher index of the general price level in the United States has declined to the lowest point this year:—

The Worsted Spinning Scheme.—A Note in this section of *The Economist* of July 30th gave some details of the scheme for the control of worsted spinning prices that has been drawn up by the Worsted Spinning Reorganisation Committee. In the course of this Note, the statement was made that "the present proposals do not contemplate the scrapping of plant." The Committee point out that this statement is open to misconstruction. No precise proposals, it is true, have at present been made for dealing with excess plant, and it has not been decided whether scrapping is the best procedure. But it is definitely envisaged that the trade committees now being elected shall consider the matter. The Reorganisation Committee, incidentally, point out that the figure given in our previous Note of between 300 and 400 worsted spinners in the country is no longer accurate; there are now between 250 and 275 firms in existence. The same Note made a comparative reference to the price-control scheme that has been in existence in the woolcombing industry for some years, and stated that it had recently "been making heavy weather." The Commission Woolcombers' Association desire us to make it clear (which we gladly do) that this nautical metaphor referred only to the greater difficulties that any such scheme inevitably encounters in a period of severe depression and that it did not imply any judgment on the benefits that the Association's members have derived from it or on its probable expectancy of life. The Association states that none of its members has, during its existence, accepted less than tariff rates.

INDUSTRIAL REPORTS

THE quieter conditions of the main industries during the second quarter of this year are reflected in the Board of Trade Index of Production published in this week's *Board of Trade Journal*. The index for the June quarter this year at 122.1 (1930 = 100) was 7.8 per cent. less than in the first quarter of 1938 and 8.7 per cent. less than the corresponding quarter last year. The decline in activity was widespread and of the separate group indices listed, that relating to gas and electricity was the only index which did not show a decline from last year. Further details of the index are given on page 383.

Reports from industrial centres this week are still influenced by holidays, but in many districts the volume of inquiry, particularly in the heavier industries, is increasing, though new business is still scarce. There has been no improvement in the cotton trade.

Coal

Sheffield.—Owing to the quieter industrial conditions the demand for industrial fuels is rather dull. Small coal is in good supply, with the demand steady. Demand for household coal is quiet, but orders are improving in anticipation of higher prices next month. A slightly improved demand for smalls from electricity works is beginning to show itself.

There is little change in export conditions, although some improvement is reported in forward inquiry. Despite reduced output all grades of steams are readily available. The bunker trade is very poor.

★

Newcastle-on-Tyne.—The Northumberland steam section in this area maintains the slight improvement noticeable last week; collieries are working more shifts and home consumers are taking a greater interest in the market for delivery ahead. Durham, on the other hand, is feeling the lack of home demand for manufacturing coal, and there is no improvement in the export section; consequently short time working is common among all groups. Patent oven coke is fairly steady in the export section, but the home section is feeling the decline in iron and steel activity and production continues to be curtailed.

★

Glasgow. — Preparations for autumn and winter demands are gradually improving inland market conditions. The only noticeable improvement in overseas business is a more regular delivery of contract tonnages, but overseas inquiry, mainly from trade-agreement countries, is expanding. As a rule large coal is readily available despite restricted output, but one or two qualities, such as First Fife, are steadily taken up, and the higher grades of home coal are in better demand. Washed smalls are firm all round, supply being limited and demand increasing, especially from the utility undertakings.

★

Cardiff.—The allocation of the Portuguese Railway order for 220,000 tons of coal, which is expected over the next week-end, is awaited with considerable interest on the Welsh steam coal market. During recent years South Wales has encountered keen price-cutting competition, principally from Germany, in this trade and South Wales exports have suffered in consequence. In the first six months of this year South Wales exports to Portugal amounted to 304,957 tons, compared with 471,849 tons in 1937, while over

(*Continued from page* 385)

the same period Germany's exports rose from 147,098 tons to 215,482 tons. New business continued to mature very quietly in all trades last week. Buyers encountered very little difficulty in covering their prompt requirements, but prices were unchanged. Shipments in the foreign and coastwise trades last week amounted to 323,900 tons, compared with 184,000 tons in the previous (holiday) week and 378,415 tons in the same period of last year. For the current year to date shipments at the South Wales ports totalled 11,912,239 tons, as against 12,429,973 tons a year ago.

Iron and Steel

London.—Production is maintained at a satisfactory level considering the amount of plant which has been closed down for varying holiday periods, says the official report of the London Iron and Steel Exchange. In many cases deliveries against contracts have been suspended, and the volume of new business has been restricted. The undertone of the market, however, remains firm, and there are indications that active conditions will develop in the early autumn.

The output of pig iron has been curtailed to bring it into line with the demand and to facilitate the absorption of the existing stocks, which in some districts are considerable. There are instances, however, where users have materially reduced their reserves and the balances due to them against their contracts, and this has given the market a more healthy appearance.

Business in semi-finished steel is limited and large stocks await absorption. It is reported, however, that some users have disposed of their Continental steel and are now working on British material.

Buying in the finished steel section has been confined to small parcels, but the important consuming industries continue to take up large supplies. The heavy steelworks have a good reserve of orders on their books and recently the demand for the lighter descriptions of steel has shown signs of improving. Export business in all descriptions of steel is irregular.

★

Sheffield.—The quiet conditions normal in August in the iron and steel market are operating, and the volume of business is unimportant. Forge pig iron is completely neglected, and only a few replacement orders for foundry are recorded. Demand for basic pig is moderate. Hematite users are well covered by contract, and are in the market only for special qualities, which are well taken up. There is little business in finished iron, of which crown bars are the weakest feature.

There is moderate buying of acid and basic billets, and demand for stainless steel sheets is maintained. Good business is being done in small bars, and structural steel shows some slight improvement.

Although the pressure at some of the steelworks has eased considerably, the heavy engineering and electrical sections have plenty of work on hand. The railway wagon repair shops are busy, but the small tool and cutlery trades are experiencing a less active demand.

Middlesbrough.—Very little business is being discussed as most of the local works are closed down for holidays. Where blast-furnaces are in operation these are being run on slack blast, and only in one or two cases is the production being converted into steel ingots to avoid the storing of cold pig iron and afterwards remelting. Some of the furnaces which went out of operation last week are damped down and have not been blown out, so that they can be brought into production in a few days. Steelworks and rolling mills are closed down and the opportunity is taken of effecting needed repairs.

The reduced imports of foreign ore are still above requirements and some of the mineral is going into stock. There is no demand either for blast-furnace coke or for iron and steel scrap.

★

Glasgow.—Production at plants in many industries in Glasgow and the West of Scotland is satisfactory. While new business placed with the heavy steelmakers is somewhat restricted, the reserve of orders on hand will cover some months' operations, and the situation is not causing anxiety. Makers of semis are likewise finding new business somewhat scarce, but it is understood that consumers' stocks are being absorbed and that stocks will soon be reduced to about normal dimensions, when more steady business may be expected. Sheet makers here are doing quite an important amount of business with users in the West of Scotland, and a fair proportion of the mills are now operating. Inquiries in almost every branch of the industry are numerous.

★

Cardiff.—Demand in the tinplate trade remained unsatisfactory last week although stocks held by producers were being slowly reduced. The annual Canadian order for about 1,000,000 boxes, which is usually placed at this time of the year, is expected shortly. Richard Thomas and Company have secured this order for several years past. Steel sheets continued in very slow request. The usual table of the statistical position of the tinplate and sheet industry is now given on our page of Commodity Statistics.

Textiles

Cotton (Manchester).—There have been no signs of any improvement in the market. Some business has been done, but buyers have not been disposed to operate more freely. Rather wider fluctuations have occurred in raw cotton prices. Weather reports from the United States have been favourable, and undoubtedly in most districts the plants are making good progress. The average price on the spot markets in the Southern States has been below the loan dead-line, and some announcement with regard to a new loan to farmers is expected at an early date. There are very few indications of an increase in world consumption.

The slack state of affairs in the yarn market has not been relieved. Only a limited business has been done in American counts. The decision to drop the price governed by the 56's weft agreement by ⅛d. per lb. has been important. This has been necessary owing to reductions in the prices of other uncontrolled yarns, and the parity has been upset. Naturally there has been some uneasiness as to the possibility of further changes. Home demand for Egyptian yarns has continued poor, but some contracts have been reported for the Continent. Sales of piece-goods have again been confined to odd lots. A miscellaneous business has been done for India, but bulk lines remain absent. Home trade buyers have displayed very little enterprise. Further contracts have been placed by the Government in heavy goods.

★

Wool (Bradford). A fair measure of business in wool is being done, and this is undoubtedly the healthiest section of the West Riding textile industry. There is a fair inquiry, especially for low crossbreds, but other qualities remain steady and firm with a moderate turnover. In a fortnight's time a new selling season will open in Sydney, and another big clip is expected. It is probable that when mills resume work next week there will be an increase of about 10 per cent. in running machinery compared with two months ago. Wool prices are firm, and no material change is anticipated when the next Australian season opens on August 29th.

THE COMMODITY MARKETS

BUSINESS has generally been restricted in most markets; consumers are apparently waiting for the appearance of a definite upward trend in the United States before committing themselves. Metals reacted to a slow demand by a fall in price, and grain prices continue to decline, with good crop reports and selling pressure from Russia. Moody's daily index of commodity prices in the United States fluctuated within narrow limits and stood on Wednesday at 143.1 (December 31, 1931 = 100), compared with 142.9 a week ago and 146.8 a month ago.

Metals

Copper.—Although standard cash copper closed above the lowest level of the week at £39 16s. 3d. per ton, the price showed a net loss of £1 7s. 6d. compared with a week ago. This decline appears particularly remarkable, as the July statistics, published this week, made a very good impression. World production showed a substantial decline and consumption a satisfactory advance in July, and world stocks fell during the month from 551,495 short tons to 523,196 short tons, the lowest level since the end of January last. Nevertheless, there are increasing doubts regarding the immediate outlook in the United States as a result of the slowness with which new orders for metal manufacture are being placed.

★

Tin.—Tin was also adversely affected by the easier Wall Street tendency and the continued lack of buying interest on behalf of United States consumers. The standard cash price lost £1 5s. and thus closed at £192 15s. per ton. The U.S.A. tinplate industry continues to operate at the very low

(*Continued on page* 389)

COMPANY MEETINGS

CABLES INVESTMENT TRUST, LIMITED

DIVIDEND OF 5 PER CENT.

The third ordinary general meeting of Cables Investment Trust, Limited, was held, on the 16th inst., in London.

The Rt. Hon. Lord Pender (the chairman) said: I will deal briefly with the figures which, I think you will agree, are satisfactory. Your directors have taken the opportunity of eliminating the item "Income accrued to June 30th" from the balance sheet, which has the effect of reducing the balance of £47,451 carried forward on June 30, 1937, to £17,633. The income received during the year amounts to £369,556, against £356,264. An interim dividend of 2 per cent., less tax, has been paid on the ordinary stock, and your directors now recommend a final dividend of 3 per cent., less tax, making 5 per cent., less income tax, for the year. After deduction of management expenses and making provision for debenture interest, the net revenue for the year amounts to £240,841, and after payment of preference dividends and ordinary dividends, the amount carried forward is increased by £50,841 to £68,474.

As at June 30th, the distribution of securities was as follows: 32 per cent. bonds; 17 per cent. preference stocks and shares, and 51 per cent. ordinary stocks and shares. The past year has proved to be another period of great political and economic uncertainty, and therefore one of considerable difficulty for those responsible for large investments.

Your directors have deemed it wise to confine the great bulk of your investments to securities within the British Empire, and to take whatever steps are possible to safeguard your interests against fluctuations in foreign currencies. In common with the experience of other investment trust companies, the market value of the securities, as compared with their book value, shows a considerable but not excessive fall in view of prevailing conditions. Substantial recovery in security values must remain dependent on a return to some degree of sanity in world politics, and to freer international trade.

As regards the outlook for the current year, it would appear likely that some reduction in income may be experienced, especially bearing in mind the heavier load of taxation, of which the Trust has not yet felt the full effect.

The report and accounts were unanimously adopted.

TREPCA MINES, LIMITED

AMALGAMATION APPROVED

An extraordinary general meeting of Trepca Mines, Limited, was held, on the 16th instant, at 20 Aldermanbury, E.C., to consider resolutions approving an amalgamation of Kopaonik Mines, Limited, Novo Brdo Mines, Limited, and Zletovo Mines, Limited, with this company, increasing the capital of the company and making certain alterations in the articles of association.

Mr A. Chester Beatty, the chairman, said that the proposals arose out of a request by the Yugoslav Government that they should carry their operations within the country a stage further by producing metallic lead, zinc and silver instead of exporting their production in the form of concentrates. The Government's request could be readily understood when it was realised how substantial a part of the cost of base-metal production lay in the secondary stages of smelting and refining and that hitherto that money had all been spent abroad instead of going to the benefit of the country of origin.

An arrangement had been reached with the Yugoslav Government, covering a period of fifteen years, with which the directors were well satisfied. Certain concessions in regard to taxation and foreign exchange had been obtained from the Government which would have the effect of providing added security with which they could look forward to the future, and also some reduction in their operating costs. The company had undertaken to erect within fifteen months a lead smelter and refinery of 12,000 tons annual metal capacity, to be enlarged by January, 1941, to treat the whole of their production of lead concentrates, and to erect within two years a zinc smelter of 10,000 tons metal capacity and a small zinc refinery.

They proposed as a first step to merge the three associated companies into this company by means of an exchange of shares. The proportions in which Trepca shares were to be exchanged for shares of the other companies were:—One Trepca share for every 4 Kopaonik shares, one for every 25 Novo Brdo shares and 2 for every 5 Zletovo shares.

The amalgamation would increase their issued capital by approximately 990,000 shares or, say, 22 per cent. At the same time it would increase their treatment capacity. He would say with confidence that, provided the prices of lead and zinc maintained a reasonable average level, the investment was one which they should have no cause to regret.

The resolutions were carried unanimously, and the scheme was unanimously approved at meetings of the three associated companies.

(*Continued from page* 388)

rate of 35 per cent. of capacity and unless there is an increase in activity United States consumers will hardly resume buying. In spite of the war, China has practically maintained last year's record rate of shipments in the first half of 1938 by exporting 4,470 tons of the metal, due to the fact that the whole of the Chinese tin is produced in the extreme south of the country, which is not affected by the hostilities.

★

Lead and Spelter.—Lead closed 7s. 6d. down at £13 18s. 9d. per ton, while spelter lost 13s. 9d. to close at £13 2s. 6d. per ton. On both markets there was an acute lack of buying interest, so that the turnover of the L.M.E. reached very low levels. Consumption of the two metals outside the United States has not improved of late and production is still in excess of requirements.

Grains

PRICES of wheat declined further, with only a limited demand and free offerings from Russia. In comparison with the end of last week, prices are down by 6d. to 1s. 9d. per quarter. Favourable harvesting reports continue to be received from the United States; the condition of the Canadian spring wheat was estimated at 82 per cent. on August 1st, compared with 91 per cent. in July, but the reduction was not unexpected and had no effect on the market. Larger offerings of maize from the Argentine, and a sharp decline in Argentine futures, have reversed the premium which this grain has held over American maize, and the demand for the Southern crop has consequently improved. But a further small decline in barley prices, due to large sales by Russia and limited Continental demand has kept barley very competitive with maize as an animal feeding stuff.

Other Foods

Provisions.—Bacon prices were reduced by 1s. to 3s. per cwt. at the end of last week, since when the market has been quiet. Prices of butter and hams were also lower, with a dull demand, while egg prices showed a small rise.

★

Colonial Produce.—Business has been quiet in the sugar market and there was a dull trade in coffee. After a good demand early in the week at the tea auctions, later prices were again lower, and the better demand for cocoa was not maintained.

★

Fruit and Vegetables.—Potato prices were little changed during the week, the larger supplies being well taken up. Imported and English apples met a brisk demand, but heavy supplies of pears did not sell readily. There was a good market for English peas and prices tended to rise during the week.

Miscellaneous Commodities

Rubber.—The market has been dull and little business has been transacted; prices moved within narrow limits and that for standard sheet closed unchanged at 7 7/16d. per lb. The latest statistics from America show that stocks there and afloat were unchanged during July, and consumption in July, at 32,209 tons, was only 1,580 tons above that for June.

★

Milk.—The latest statistics issued by the Milk Marketing Board, which are summarised in the accompanying table, show that the increase of 4d. per gallon in the liquid price for July raised the average price paid to producers by 2½d. per gallon, compared with June. Liquid consumption, after a fall in June, was a little larger in July in spite of the higher retail prices, and was 2.6 million gallons more than in July of last year.

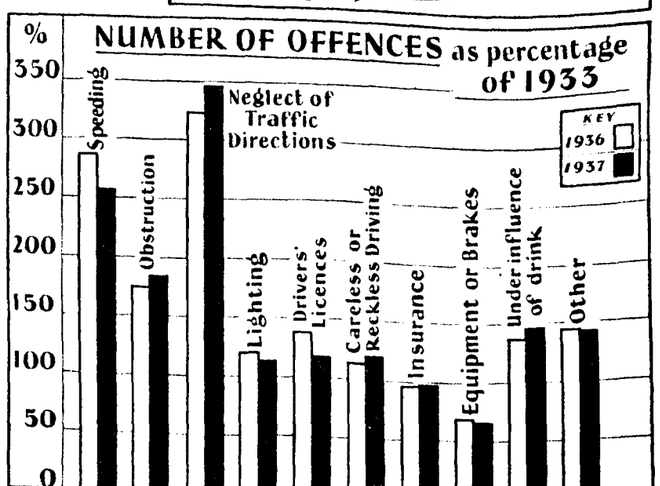
Motoring Offences



In the following charts we present the recent statistics of motoring offences in England and Wales. The figures include both offende dealt with summarily and those committed for trial. On the left-hand side we have separated the total number of offences into those dea with by written warnings and those dealt with by prosecution. In addition we show the number of prosecutions resulting in the endorsemer disqualification or suspension of driving licences. The graph of offenders per 1,000 licences shows the number of acts in respect of which person was charged with one or more offences, and not the number of separate offenders, since an individual may be included more tha once in respect of offences committed on different occasions. The figures of fines are the total amount imposed in each year (excluding costs On the right-hand side we analyse the principal offences showing their relative importance in 1937 and the changes since 1933. It shou be noted that the term " careless or reckless driving " includes reckless and dangerous driving as well as careless driving.

Finance

GOVERNMENT RETURNS

For the week ended August 13, 1938, total ordinary revenue was £11,718,000, against ordinary expenditure of £17,220,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £133,045,000, against a deficit of £82,295,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On August 12th, applications at £99 17s. 5d. per cent. for bills to be paid for on any day except Saturday of the following week were accepted as to about 30 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications for bills to be paid for on Saturday at £99 17s. 6d. per cent. and above were allotted in full. £35·0 millions of Treasury bills are being offered on August 19th.

SHORTER COMMENTS

(*Continued from page* 382)

Kern Oil Company.—A circular has been issued setting out results of discussions between the company and Chemical and Petroleum Investment concerning modification of the contract whereby latter company and others were to take up 3,750,000 shares, of which 2,750,000 at 4s. were under an option to be exercised by July 31, 1938. The following options for the 3s. 4d. shares at 4s. have been substituted: on 600,000 shares on each occasion under options to be declared by July 31, 1938 (already exercised), September 30, 1939, and September 30, 1940, for issue in 1939, 1940 and 1941, respectively. Chemical and Petroleum will place at board's disposal part of the shares issuable in June, 1939, for issue to Kern stockholders at 4s.

Scottish Bank Insurance and Investment Trust Units.—Third half-yearly distribution, to July 18, 1938, is 2·8872d. per unit *net* (against 2·8622d. a year ago). Progress report No. 3 sets out the Fund's investments, including the percentage earned and paid on the equity stock of each company. Holdings in bank shares are 22·23 per cent. of Trust Fund; insurance, 21·14 per cent., and investment trust, 54·86 per cent.

Sunbeam-Talbot, Ltd.—Messrs W. E. and R. C. Rootes (who hold the controlling interest in these and other companies) announce that Sunbeam Motors, Ltd., and Clement-Talbot, Ltd., will in future operate as Sunbeam-Talbot, Ltd. The engineers of the two companies have been working in close collaboration for some time.

O.K. Bazaars (1929), Ltd.—It is reported that Mr I. W. Schlesinger has resigned as chairman and director of this company and its subsidiaries, and that he has disposed of over 90 per cent. of his holding in O.K. Bazaars to a London financial syndicate. Mr Michael Miller succeeds Mr Schlesinger as chairman. It is understood that the remainder (equal to 7 per cent.) of Mr Schlesinger's holding has been purchased at 32s. a share.

Blades, East and Blades, Ltd.—This company is taking over the City printing business of Messrs Pearse, Morrison and Son, which will be carried on as before under the management of Mr H. Cameron Morrison.

Stephen Smith and Company.—Trading profits in the year to April 30, 1938, declined from £48,062 to £36,241, and total profits £11,809 lower at £45,831. Tax and N.D.C. require £13,189 against £16,133. Dividend, 12½ per cent. (same). Carry forward, £4,675 (£5,331).

MINES

Transvaal Output, Employment and Working Profit.—Gold output, July, 1938: Witwatersrand, 1,000,725 fine ounces; outside districts, 26,398 fine ounces; total, 1,027,123 fine ounces. Value for purposes of declaration £7 1s. Total output, June, 1938: 1,018,712 fine ounces. The number of natives employed at end of July was: Gold mines, 318,773; coal mines, 17,131; total, 335,904.

Trepca Mines.—At an extraordinary meeting held on August 16th which approved the absorption of Kopaonik, Zletovo and Novo Brdo, Mr Chester Beatty explained that the reason for the merger was the Jugoslavian Government's desire to have the smelting and refining carried out within the country. In return a 15-year agreement embodying some taxation relief and guaranteeing foreign exchange requirements had been granted. While issued capital would be increased by 22 per cent., treatment capacity would be 60 per cent. greater.

Rantau Tin Dredging.—The total amount of preference dividends since incorporation having exceeded 100 per cent., the preference shares cease to carry preferential rights. The existing 850,000 $1 preference and the 600,000 $1 ordinary shares will therefore be consolidated into a single class (1,450,000 $1 shares).

OIL OUTPUTS

British Burmah Petroleum Company.—Production of crude oil was 42,993 barrels in July, 1938.

British Controlled Oilfields.—Production for week ended August 13th was 12,847 barrels, of which Western Area, 10,055 barrels, and Central Area, 2,792 barrels.

Trinidad Petroleum Development Company.—Production for week ended August 13th, was 55,642 barrels.

Venezuelan Oil Concessions.—Production for the week ended August 13, 1938, was 1,073,122 barrels, of which Bolivar district 1,040,408 barrels, and Maracaibo district 32,714 barrels.

The Shape of the Trade Cycle

THE British Association annually suffers from the fact that its meeting falls in the silly season, when the news-hungry Press stands ready to dress in all the inaccurate glory of the headlines any scrap of scientific, semi-scientific or pseudo-scientific news that can be made to sound like a novelty in lay ears. Yet the contributions of the British Association's members to the advancement of their respective sciences are not for the most part intended to appear as exciting novelties. The business of the scientists assembled at Cambridge is simply to report work in progress, and much of their information is by its very nature meaningless to lay men. This is not to say that their researches are unimportant to people outside academic circles. Far from it. Year by year the experts' knowledge of the world we live in is widening, and nowhere is the tale of solid achievement more plainly registered than in the proceedings of the Economics and Statistics Section of the British Association. Our economists are hard and laboriously on the track of solutions for our most obdurate social problems.

Many, if not most, of these problems can be traced to the periodic fluctuations of industrial activity; and the trade cycle has naturally received its full meed of attention at Cambridge. Some of the most interesting papers were concerned with the after-effects of depression. Thus, Dr Marschak presented the results of investigations undertaken at the Oxford Institute of Statistics into the mobility of labour from distressed areas into more prosperous regions. Mr Tress's paper tackled the problem from the other end: that of establishing new industries in distressed areas rather than sending distressed persons to new industrial areas. But in each case the papers gave admirable demonstrations of the way in which scientific research can lay the foundations for effective action.

More important than the consequences of the trade cycle, however, are its causes, and for this reason Sir William Beveridge's paper on "Unemployment and the Trade Cycle" was, in the words of Lord Stamp, "of first-class importance." Sir William gave to his audience on Monday the results of three years' minute investigation of the course of unemployment during various cycles of trade since 1890. His conclusions were notable, for they revealed that these cycles (measured in terms of employment) conformed, not merely in general, but, to a greater extent than is usually believed, in detail, to a common pattern. In each case the first industries to plunge into depression were the export trades of textiles and metals. In each case the industries most seriously affected were the engineering, shipbuilding and constructional trades. And in each case consumers' goods industries were depressed last and least.

The most important of these three features, common to pre-war and post-war depressions alike, and discernible already in the pattern of our present recession, which may still be in its early stages, is the first. Textiles and tinplates lead us into recession—just as they lead us out again; and these are export trades *par excellence*. Sir William's own

explanation of this common factor in all the cycles he had studied was only tentative. In the main, our exports were exchanged for the produce of agricultural countries; and the periodic setbacks in exports which seemed to set in motion the cyclical succession of depression and recovery, affecting all industries ultimately, might well be due to changes in the terms of trade between industrial and agricultural producers, to harvest changes or movements in the prices of agricultural products. Sir William found extra support for this view in the discovery that ever since 1890 the turning points of the successive trade cycles (as measured by employment), from recovery to recession or from slump to revival, fell in this country in August or at the turn of the year, the harvest seasons of the two hemispheres. The key to the trade cycle might, he argued, be found in the farmers' fields.

It was not Sir William's intention to dogmatise. His figures related solely to employment or unemployment; they concerned only Britain. And the connection between the fact that certain export trades are always the first to feel depression and the hypothesis that harvest conditions may be in some way responsible is purely speculative. Exports shipped and sold to all the far parts of the Eastern and Western hemispheres are inevitably sensitive to the thousand and one disturbing factors, political and economic, which make for change in the world. The experience of the United States hardly confirms the correlation of agricultural malaise and the onset of recession; and, in any case, the rôle of harvests in economic development is almost as debatable as it was when Tooke argued that good harvests meant bad trade and Bagehot affirmed the exact opposite. On the other hand, the changing relationships between agricultural and industrial prices are clearly of crucial significance in the working of a world economy based upon the exchange of primary products for manufactures. Low agricultural prices relative to industrial prices mean small purchases of manufactured goods and slackened industrial activity; and, while high agricultural prices mean high exports of manufactures from the industrial nations and quickened industrial activity, they also bring with them rising costs of industrial production and an enhanced cost of living which eats into the purchasing power of the industrial masses. Sir William's plea for study of the relationships between individual prices in place of the traditional concentration upon the course of general prices was a valuable stimulus to constructive trade cycle research.

Sir William's researches have emphasised once again that the more the trade cycle is studied the more it seems to follow the pressure of forces which, if they are not wholly beyond the reach of human control, have at least enough of the inexorable in their nature to make the policies of Governments resemble the struggles of fish caught in the tides. Sir William pointed out that the trade cycle ignores politics; he might have added that it overrides economic policies.

It would be doing Sir William an injustice, however, to interpret his conclusion as fatalistic. The rhythm of the trade cycle is, indeed, powerful. But intensive research may yet lay bare its causes and prepare the way for their removal. And in the meantime there is much that can be done by the analysis of the economists and the prudence of politicians. If depressions cannot be entirely avoided, they can certainly be moderated. For example, if harvests are of importance in precipitating changes in trade then we may minimise their influence upon prices and purchasing power by, say, some such scheme of commodity storage as that proposed by Mr Keynes to the British Association last week. If it is established that certain industries, such as textiles and tinplate, are reliable forerunners of general changes in trend, then we can learn to base our policy on their movements and be forehanded in the application of remedies instead of wasting months in futile confidence talk. Above all, we can see that the institutions through which economic changes work themselves out function properly, and that our banking system is not forced, by lack of confidence in its soundness, to redouble deflation precisely when monetary expansion is most needed.

In all these ways, though we cannot yet cure the trade cycle, we can affect its shape and temper its disastrous consequences. It is a vast field for research and action, in which the economist and the statesman have a great deal yet to learn about extending their collaboration.

The Courting of Hungary

EVER since the Peace Treaties, Hungary has suffered from the bitter feeling of being left out in the cold, of being the Forgotten Man of Europe. But times have changed, and at the moment no country of the Continent is more prominently in the headlines. Half Europe has spent the week courting the Magyars. Admiral Horthy, the Regent, with his Prime Minister, his Foreign Minister and his War Minister, has been in Germany. In honour of the first head of any foreign State to visit post-war Germany, the Nazis have put on their best show; the decorations for Admiral Horthy have equalled those for Signor Mussolini in the spring, and the Hungarian visitor, like the Italian, has been assured that the Nazis will never, never dream of questioning the southern frontier of Germany's new Ostmark. All this, of course, is done with a purpose: Germany wants something from Hungary. What she wants is not Hungary's wheat and any oil that may emerge from the new discoveries, for she would get those in the normal course of trade in return for German manufactures. She wants a political and military alliance that will carry the long arm of the Reichswehr far down the Danube valley. She wants to outflank Czechoslovakia and be in a position to cut the long corridor that connects Prague with Roumania and Russia.

Into the middle of the love feast at Kiel came unexpected, perhaps even startling, news from Bled. In that little Slovenian town the Council of the Little Entente was meeting. For at least a year past the Little Entente, originally formed to encircle Hungary, has been trying to negotiate an agreed settlement with the Magyars. The chief difficulty has always been the treatment of the Magyar minorities in the three surrounding countries, and especially in Roumania. During the brief Goga interlude in Roumania, the negotiations had perforce to be entirely suspended. But since King Carol gave the policy of his country a more rational twist, and especially since the issue of the new and surprisingly liberal Minorities Law, the Hungarian negotiations have been taken up with renewed vigour. So much was well known. All the same, it came as something of a surprise to have their success announced right in the middle of the much-touted visit to Germany. This impression is deepened by the fact that both the contents of the agreement and the manner of its conclusion bear all the signs of last-minute haste. It was evidently decided both by the Hungarians and by the Little Entente that some purpose was to be served by concluding it now rather than a month hence—and that purpose, in the context, can only have been to remind Herr Hitler that the nations of Danubia are still independent.

The contents of the Agreement are of a provisional nature. The one point that appears to have been finally decided is that the Little Entente powers withdraw their objections to Hungarian re-armament. There is also a non-aggression pact between Hungary on the one hand and the three Little Entente powers on the other. This was initialed in Bled, but is not to be signed until the question of minorities is settled. The chief delaying difficulty on this point is the absence of an agreement on minorites between Czechoslovakia and Hungary. Czechoslovakia is already prepared to grant her Magyar minority at least as much as is granted by Jugoslavia and Roumania. But the Hungarians believe that by waiting to see what the Sudetens manage to achieve they may secure even more for the Magyars in Slovakia. This appears to mean that the non-aggression pact, which would prevent any attack on Czechoslovakia's rear, will not be formally in force during the crucial phases of the Sudeten problem.

The conclusion of this Agreement in Bled has been welcomed in Prague as a resurrection and reinforcement of the Little Entente. It has been welcomed in Rome for the precisely opposite reason. With such divergence of testimony, it is necessary to inquire very closely below the surface to determine its real meaning. That the Agreement and especially the circumstances of its conclusion are unwelcome in Berlin is obvious. No suitor likes to discover that the lady in his arms is accepting the propositions, however harmless, of third parties. But it would be very wrong to conclude that Hungary has joined an anti-German *bloc* or even that she is moving in an anti-German direction. In her situation, she cannot afford to. She is overawed by the bulk and might of her new neighbour and economically dependent upon her to an increasing degree. Before Hungary could join an anti-German *bloc* (assuming such a *bloc* were to be found in Central Europe) she would need to have not only the assurance of strong military support but very large economic concessions. The Little Entente is offering, and can offer, neither. From Hungary's point of view, accordingly, the new Agreement must be regarded only as an attempt to strengthen her bargaining power against the Reich. It will be used, at the best (at the best for Europe and Hungary, that is to say), to secure her neutrality; at the worst, to exact better terms for an understanding with Germany.

What, however, of the motives of the Little Entente powers? That the Czechs should be anxious to protect their rear is comprehensible. But the lead in bringing the negotiations to such a hurried conclusion was taken by Dr Stoyadinovitch, the Jugoslav Prime Minister, hitherto accounted friendly to Italy and flirtatious towards Berlin. It seems probable that, of all the countries concerned in the Bled Agreement, Jugoslovia has altered her policy most to achieve it. Save for Czechoslovakia, no country is more menaced by the Rome-Berlin axis and the annexation of Austria. Lying as she does on the dividing line between the Italian and the German spheres of influence, Jugoslavia is bound to suffer from the advance of either. Germany cannot expand far in the Danube or towards the Adriatic, and Italy cannot expand anywhere in Europe, except at Jugoslav expense. This obvious fact, together with the pressure exerted on Dr Stoyadinovitch by the strong pro-Czech and pro-French sympathies of the Jugoslav army and people, appears to be having its effect on his policy. First in the Balkan Entente's agreement with Bulgaria, now in the Little Entente's agreement with Hungary, Dr Stoyadinovitch seems to be trying to build up a solid *bloc* of the States from Prague to Angora threatened by the expansion of the Great Powers. Roumania, isolated both from Rome and from Berlin by the interposition of other States, but ultimately, because of her oil, at least as much threatened, is pursuing a very similar policy. It is pleasing neither to Italy nor to Germany. But it would be a mistake to call it anti-Italian or anti-German. It is merely a reassertion of independence.

The vision of a neutralised Danubia and a neutralised Balkans has, however, one conspicuous weakness. The collapse of Czechoslovakia would bring the whole structure down in pieces. Geographically, it would bring Germany to the edge of the Balkans. Morally, it would demonstrate that not even the best-armed and best-allied of these minor Danubian and Balkan Powers can stand against the might of Nazi Germany. For dreams of security in Roumania and Jugoslavia, just as in Britain and France, Bohemia is the bastion. This fact is very clear in Belgrade and Bucharest. But it would be rash therefore to assume that they would rush to Prague's assistance. The vital importance of Bohemia is clear enough in London and Paris, but it is only recently and after much hesitation and many backward glances that the Western Powers, with their infinitely greater strength, have begun to give definite warnings to Berlin. If we have hesitated, is it any wonder that the Roumanians and the Jugoslavs also hang back? They would like to find some way of ensuring Czechoslovak independence, but if the only way is by courting war with Germany, that is as poor an outlook for them as the fate against which the Czech bastion is designed to protect them.

Thus all eyes in Europe, from every quarter, are trained on the arena in Prague, where, in the merciless glare of present publicity and under the watchful eye of future history, Lord Runciman labours to achieve a settlement between Czech and German. The latest phase of his efforts is discussed elsewhere in this issue. His task is not so much, as is frequently represented, to persuade the Czechs to accord the Sudeten Germans an adequate measure of local autonomy, as to persuade Herr Hitler to leave Czech sovereignty untouched. It is Czech sovereignty, not Sudeten liberty, that is the cement of the structure of peace in Europe.

Weather to Measure

SOME day we shall doubtless learn first to predict and then to control the weather. The scientists will not, of course, be deterred from pursuing this ambition by any doubts of its wisdom or desirability; and we shall wake up some day to discover that we can mix our own weather, long before anybody has troubled to enquire what sort of weather we want. But already weather made to measure can be sampled indoors. Air-conditioning is a new industry rather than a new invention. Though it employs no startlingly novel processes, it collects many separate devices together and integrates them for a new purpose. Though it is a logical development of ventilation and heating, it is something considerably more than either. Air-conditioning proper involves both the systematic removal of foul air and the introduction in its place of air whose temperature, humidity and cleanliness have all been regulated to taste.

The different systems of air-conditioning vary in detail. But all of them include four main processes. The air must be cleansed of impurities; it must be brought to the desired temperature; it must have the proper degree of humidity; and it must be circulated into the rooms to be air-conditioned. Two of these four processes are familiar to everybody: circulation is achieved by mechanical blowers and suction fans; heating can be accomplished in a variety of immemorial ways, and the cooling of air is a commonplace of mechanical refrigeration. The other two processes—the cleansing of the atmosphere and the regulation of its humidity—are the chief novelties of air-conditioning. For each process there are two main alternative methods. Purification can take the form either of filtering the air or of

washing it. In the first case the air is drawn through a textile filter or a labyrinth coated with a viscous substance; in the second case it is passed through sprays of water. The regulation of humidity is more complicated, but just as essential for full comfort. The increase of humidity is easy and can be effected in the same process as washing. Humidity can be lessened either by the absorption or by the precipitation of excess moisture. The former method is to pass the damp air over some hygroscopic substance, such as silica gel or lithium chloride; but this has the disadvantage that the absorbing element has to be periodically replaced and dried out. The alternative method relies on the fact that warm air will absorb and retain a greater volume of moisture than cool air. The damp air is therefore cooled and the excess moisture is deposited as a dew. The disadvantage of this method is that the air is by now probably too cold for circulation, and it has to be brought back to the right temperature without allowing its moisture content to rise, a process that sometimes results in an uncomfortably cold atmosphere.

The precise regulation of the processes is therefore a matter of some delicacy, and the solution of the problems it poses is the main task of the air-conditioning engineer. Since many of the controlling factors can be adjusted, an efficient plant is capable of producing a wide range of conditions; but in practice this variability is seldom required, and the plant's flexibility is used rather to produce a standard atmosphere, despite changes outside.

It does not require a very fertile imagination to visualise a vast number of circumstances under which an air-conditioning plant would be extremely welcome. Installation is sometimes prevented by the technical difficulty of securing a sufficient degree of insulation from outside conditions. But for the most part the limiting factors are cost and unfamiliarity. The influence of the latter is to be seen in the greater progress made in the United States than in this country. There is admittedly more to be gained by installing such a device in a land where the seasonal changes are so severe. But, partly for that reason, the Americans had already become acquainted with the idea of creating an artificial atmosphere. Air-conditioning in summer is a natural corollary to the creation of hot-house conditions in winter by means of steam-heating.

In the domestic field air-conditioning is, however, a costly luxury. It has been installed, even in this country, in one or two expensive blocks of flats and a few private residences. In America it has not been much more widely adopted for domestic purposes, even by the rich. It is in industry and commerce that air-conditioning finds its main affiliations; and in some branches it has already made itself almost a conventional necessity. Thus it has become a standard feature of super-cinemas, where its advantages are obvious and its application is assisted by the absence of windows. It is also being used on an extensive scale in crowded stores, restaurants, hotels and offices. In the case of the first three the benefits may be measured more or less directly by observing the public response. In offices they are somewhat more intangible. But in any case the benefits depend upon the relative discomfort of the outer air; and they are inevitably less in a temperate climate such as Great Britain's than in more violent extremes.

Some of the advantages of conditioned air are, however, as valuable in this country as elsewhere. This is particularly true of cleanliness and of the absence of noise. In his home, the average Englishman could not be persuaded to seal hermetically all his windows and chimneys for any gain of temperature, humidity or even cleanliness. But in his office the average town-worker would welcome any device that would enable him to close his window. The great popularity of air-conditioned coaches on the American railways (where in the last few years they have become standard practice for long journeys) is to be attributed to the removal of noise and dirt rather than to any control of heat or humidity. In another branch of transport, ocean travel, on the other hand, air-conditioning's chief contribution is in the removal of humidity. The air-conditioned dining saloon on the new Orient liner "Orcades" adds greatly to the comfort of a meal in the Red Sea, even though the temperature is but little reduced. The "Queen Mary" also has an air-conditioning system, but the high cost limits the possibilities of installing them on liners which do not pass through the tropics.

In industry proper the advantages are both general and particular, and it is here that most progress has so far been made. The general increase in efficiency due to a more congenial atmosphere is as great for the manual worker in a factory as for the office clerk. But in some cases there are more specific reasons for its adoption. The traditional example is the cotton industry, in which the dampness of the Lancashire climate has long been supplemented or imitated by blowing a little steam into the weaving sheds—a primitive form of air-conditioning which helped the manufacturing process, even if it damaged the health of the operatives. More exact control is now possible, and has been applied in many industries besides cotton. Cardboard is most easily handled in a moist atmosphere, while rayon, sugar, flour, paper and many others require dryness. Foodstuffs, generally speaking, should not be exposed to excessive heat during storage, and there are many processes in the chemical industry which require precise combinations of temperature and humidity.

There was a time some five years ago when air-conditioning was cast in the United States for the rôle of the economic deliverer that was to uncover a vast new source of demand for the products of industry and carry the country back to prosperity in the 1930's, just as the automobile industry was the foundation of prosperity in the 1920's. This has remained a dream, and the industry, though growing rapidly, is still comparatively small. In Great Britain it is still smaller. Most air-conditioning installations in this country are required to meet individual requirements, and the industry is still largely in the hands of specialist contractors, who produce the designs and have the parts manufactured by general engineering firms. This fact makes it difficult to quote any figures for the size of the industry. But some idea can be gained from the fact that the total value of the output of air-filtering machinery, according to the Census of Production of 1935, was only £48,000, as compared with £28,000 in 1930, while the output of "ventilators, pipes, ductwork, cowls, etc., of sheet metal" was only £676,000.

The bespoke tailoring of weather is thus in its earliest infancy. There is unquestionably a market for small standardised air-conditioning units, of which there are already several in existence. These units, which can be fitted in any room where there is an electric plug, are naturally not as effective as a specially designed plant; but they perform the essential functions of replacing used air by cleaned fresh air. But the demand for these appliances will always be less in Great Britain than in the United States, for the Englishman, though he grumbles about his climate, very rarely suffers serious inconvenience from the state of the atmosphere he breathes. The future of the industry seems to lie not so much with the general householder as with the discovery of particular new uses by the constant research that is being applied to the subject. These range from installations in gas-proof shelters to self-contained cubicles for the use of sleepers in the tropics. As with most new industries, the price is as yet too high to permit of large sales, but research should do much both to remedy the grievance and to disprove the complaints that "manufactured" air is unhealthy or unpleasant when applied to small spaces. Meanwhile, the industry is in tune with the times; and it stands to be the gainer from Man's eternal discontent with his environment.

Public Opinion By Sample

ANY democracy is necessarily concerned with public opinion, since it is the voice of the people that is the ultimate arbiter of all political differences. But no other democracy, not even the Swiss with its referenda, has ever been so fully governed by public opinion as the American. Nowhere is the legislator more attentive to the news from his constituency; nowhere else are there so many and such frequent elections. Even the complicated mechanism of official elections, however, is not enough to quench the insatiable American thirst for precise measures of public opinion, and for many years newspapers have been in the habit of taking "straw votes" in the intervals between elections, and particularly when an election approached.

The name of the "straw vote" derives from the fact that it is intended to show which way the electoral wind is blowing, and its technique was, at the inception, extremely simple. The newspaper conducting the straw vote would scatter its ballot papers broadcast and count the replies received. In the most famous of these straw polls, that conducted before every recent Presidential election by the *Literary Digest*, several million ballot papers were distributed and returned, the addresses being taken in the main from telephone directories and automobile registration lists. These polls relied for their accuracy upon the size of the sample taken, and for many years they were surprisingly accurate. The *Literary Digest* correctly predicted victory for Mr Coolidge in 1924, for Mr Hoover in 1928 and for Mr Roosevelt in 1932. But in 1936, the simplicity of the method was its undoing. For the first time in American history, the division between the two major parties was in that year to a significant extent a division between social classes, and even in America, at least a third of the electors are unrepresented in lists of owners of either cars or telephones. The *Literary Digest*, correctly sampling the opinion of the upper two-thirds, predicted victory for Mr Landon. But Mr Roosevelt, with the support of the lowest third, swept the country.

The principle of the straw vote has survived this setback. It has done so because other samplers of public opinion began applying to the problem the principles of statistical method. The leader in this reform has been a body known as the American Institute of Public Opinion, of which the guiding spirit is Dr George M. Gallup, an advertising expert. Dr Gallup's main refinements have been two. In the first place, he realised that the sample of the public to be polled must be a miniature replica of the divisions of opinion in the community as a whole. It must be scattered across the country in proportion to the actual geographical distribution of the population; it must have the correct proportions of men and women, of town-dwellers and country-dwellers, of young and old, of rich and poor, of Republicans and Democrats. And secondly, he discovered that having properly balanced the sample, a very small sample would give a tolerably accurate reproduction of the opinion of the whole.

Based upon this formula, the Institute has for the past three years been taking regular polls on a great variety of subjects—an index to the results contains no less than 104 items, on some of which more than one poll has been taken —and it is claimed for the results that they are an accurate representation of public opinion in the mass. This is a claim that must, of course, be accepted with reserve. But it can at least be said that sampling is a familiar and established statistical technique. If the Institute's sample is correctly balanced (a matter of no little practical difficulty), and if the question asked is unambiguous (a danger against which the Institute takes what precautions are possible) there is a *prima facie* presumption that the result will be accurate. Moreover, whenever the result of one of the Institute's polls could be tested by actual election results, it has proved to be satisfactorily near the mark. For example, the Institute gave Mr Roosevelt a 56 per cent. majority in 1936, while the actual figure was 62½ per cent. Even this small margin of inaccuracy can be plausibly explained by the fact that, by the unanimous account of all observers, sentiment was changing rapidly in the President's favour in the last few weeks between the date of the Institute's poll and the actual election. Other elections have been much more closely predicted. The theoretical presumption of accuracy, coupled with the tested correctness of a few of the results, has been enough to persuade even the most responsible American newspapers to treat the results with respect.

If we may safely adopt a similar attitude of *prima facie* acceptance of their approximate accuracy, many of the Institute's polls are of outstanding interest. Here, for example, are a few on foreign affairs (the dates are significant):—

Which European country do you like best? (April, 1937.) *Answer:* England 55 per cent., France 11 per cent., Germany 8 per cent., Finland 8 per cent., Ireland 4 per cent.
[Finland merits a place because of her War Debt record.]

If England and France have a war with Germany and Italy, which side would your sympathies be with? (July, 1938.) *Answer:* England and France 65 per cent., Italy and Germany 3 per cent., neither side 32 per cent.
[Note the remarkably low proportion of indifferent persons.]

If another war like the World War develops in Europe, should America take part again? (November, 1936.) *Answer:* No, 95 per cent.

If there is another general European war, do you believe the United States can stay out? (January, 1937.) *Answer:* Yes, 62 per cent.
Same question (July, 1938). *Answer:* Yes, 54 per cent.

What nation or nations do you think will be responsible for starting another World War? (August, 1937.) *Answer:* Germany 30 per cent., Italy 27 per cent., Japan 19 per cent., Russia 11 per cent.

Should the war debts be cancelled and forgotten, or should they be reduced to a point where at least something might be collected, or should we continue to try to collect them in full? (February, 1937.) *Answer:* Collect in full 54 per cent., reduce 37 per cent., cancel 9 per cent.
Same question (March, 1938). *Answer:* Collect in full 47 per cent., reduce 42 per cent., cancel 11 per cent.

Do you think the peace treaty after the war was too easy or too severe on Germany? (August, 1937.) *Answer:* Too easy 41 per cent., too severe 30 per cent., about right 29 per cent.

Should the colonies taken from Germany after the World War be given back to her? (November, 1937.) *Answer:* No, 76 per cent.

It would be possible to multiply these examples many times over, but enough has been said to show the interesting character of the answers given, which must be at least presumed correctly to represent American opinion. It is clear that the people of the United States have formed astonishingly warm sympathies and antagonisms in the international dispute. But they still hope that these emotions can remain platonic. Of the people polled in October, 1937, 59 per cent. declared their sympathies with China rather than with Japan. But only 37 per cent. of this 59 per cent. (or 22 per cent. of the total) were prepared to go,

even in theory, as far as refusing to buy Japanese goods. On the other hand, the belief in the possibility of keeping out of a general war is, it will be noticed, significantly falling. As a final example in the foreign field, it may be mentioned that a majority of 73 per cent. in favour of an Anglo-American Trade Agreement was returned in March, 1938.

Questions on foreign affairs, however, provide only a small part of the material of these surveys. On domestic matters, the answers given demonstrate even more clearly the ability of a democratic electorate to hold a variety of mutually inconsistent views. Thus President Roosevelt has retained his popularity month by month. But only 41 per cent. of the voters would give the President more power than he now has, and 42 per cent. think he has too much power already. Moreover, when a poll was taken in April of this year on the question whether the best course for the Government to pursue to get the country out of the depression should be to increase spending on public works or to help business by reducing taxes, only 21 per cent. voted for increased spending—which is Mr Roosevelt's remedy. During the Supreme Court conflict, steady majorities of about 60 per cent. were returned against the President's proposals, but his own personal popularity suffered very little. Or, again, in the struggle between Capital and Labour, as represented in particular by the C.I.O., the public's sympathies are heavily with Capital and with the less militant brands of trades unionism. But the President's policy has amounted at times almost to an alliance with the C.I.O. The electorate's attitude is perilously close to that of keeping the President in office and forbidding him to pursue the policies he advocates.

It is unlikely that these contradictions and paradoxes are peculiar to American democracy. On the contrary, it is probable that Public Opinion at all times and in all countries has a large element of the illogical, even of the impracticable, in its composition. That being so, the question inevitably arises whether this new technique of ascertaining the will of the people week by week is likely to make for good government—even for good government of the people, by the people, for the people. Few of us to-day would join with Sir Robert Peel in describing public opinion as "that great compound of folly, weakness, prejudice, wrong feeling, right feeling, obstinacy and newspaper paragraphs." But very many would agree with Lord Bryce's words: "That conceit of his own goodness and greatness which intoxicates an absolute monarch besets a sovereign people also, and the slavishness with which his Ministers approach an Oriental despot may reappear in the politicians of a Western democracy. The duty, therefore, of a patriotic statesman in a country where public opinion rules would seem to be rather to resist and correct than to encourage the dominant sentiment." Resistance and correction will be impossible when the master's voice is made known daily and in detail. The new technique points to the triumph of the common man's opinion. But it also points to the disappearance of the long view, the abolition of the second thought, the annihilation of responsibility. These are dangers upon which it will be wise to reflect before we abandon ourselves to Government by Sample.

Topics of the Week

Franco Says No.—At long last General Franco has taken notice of a communication from virtually all the Powers of Europe, and his reply to the British Plan (which the Spanish Government accepted nearly a month ago) was published on Monday last. The delay has not served the sole purpose that would have made it excusable; for the reply is definitely unfavourable. It is true that General Franco accepts the withdrawal of volunteers in principle, and even advances from 3,000 to 10,000 the number which he is definitely prepared to release. But this withdrawal must be matched by an equal, not a proportionate, withdrawal from Government Spain, and it will be conceded only after full belligerent rights have been granted. By thus rejecting the two main elements of the compromise effected in the British Plan—proportionate withdrawals and the grant of belligerent rights only after an initial withdrawal—General Franco in effect, and deliberately, rejects the Plan. The meaning of his rejection, which was certainly decided upon on y after the fullest consultation with his allies, is made brutally plain by the reply given almost simultaneously in Rome by Count Ciano to the British enquiries about the persistent reports of the despatch of further Italian men and materials to Spain. Count Ciano did not try to deny these reports, he claimed only that they could not be proved; and when even the Palazzo Chigi cannot bring itself to deny charges, they can safely be assumed to be true. Still another indication of Italo-insurgent policy is given by General Franco's claim that, while the control of the Franco-Catalan frontier is tightened up, all supervision of the insurgent ports should be lifted. In short, and without diplomatic euphemisms, Rome and Burgos have no further use for "non-intervention," unless it is openly admitted to mean an international blockade of the loyalists together with unlimited gun-running for the insurgents.

* * *

If we were faced by General Franco alone, the British Government would doubtless now declare that they had had enough of this impudent foolery, and would be firm, as they have shown in Mexico that they can be. But British policy has been emasculated since the start of the Spanish affair by the fact that General Franco is merely pilot-fish for Signor Mussolini. Mr Chamberlain has staked his policy not only on achieving appeasement among the Great Powers but on achieving it through the intermediary of an Anglo-Italian agreement. Having in this way laid his cards upon the table, he can be finessed on every trick. And finessed he has been. Guided solely by the rightful desire for appeasement, misled mainly by their unwillingness to believe in the dishonesty of others, the British Cabinet have time and again been hoodwinked in secret and then induced to condone the deception in public. The significance of the twin principles of the British Plan does not lie in their practical importance—nobody believes that the peace of Europe or the fate of Spain turns upon a handful of volunteers or upon the precise date on which the insurgents are to be allowed to bombard, as well as to bomb, British ships trading to Spain. But these principles enshrine all that is left of the British Government's dignity. They are the remnant of the price that the Italians and the insurgents are asked to pay, for the saving of democratic faces, before they are given all they want. But the old game is to be played again. Since the lion can be made to express gratitude for the insults he swallows, let one more reef be taken in his tail. And the game will probably be successful once again. Since Mr Chamberlain has shown so clearly and so often that, in his mind, Spain is well lost for an Anglo-Italian agreement, there is all too much justification for the Labour Party's fears of further concessions. Appeasement is, indeed, an aim for which much would be worth sacrificing. But is it not about time we realised that we are not the only ones who need appeasement, and not the only ones who can be made to pay for it? Is it not time we realised that there is no Great Power in the world, and few small nations, who can less afford to be entangled in war than Italy? And is it not time we realised that even the most benevolent lion secures peace and appeasement by an occasional salutary growl?

Hours of Work in France.—M. Daladier's broadcast speech on Sunday has set the cat among the pigeons of the Popular Front. The Prime Minister's main purpose in addressing the nation was to call for a modification of the 40-hour week. He argued that its rigid application was holding down the level of French production to its present abysmally low proportions. The national income had fallen from 49 milliard gold francs in 1931 to 22 milliards in 1937, of which the State and local authorities absorbed 10 milliards. When other nations, particularly Germany, were working night and day on re-armament, France must at all costs increase her production. For this purpose, it must be made possible for factories to work longer hours. If they needed to work 48 hours instead of 40 in the week, they must be allowed to do so, without either submitting to endless negotiations or paying extortionate rates of pay for overtime. All this seems to the outside observer, and to many Frenchmen, to be eminently sensible. There is little doubt that the rigid manner in which the 40-hour week has been applied in France has been responsible for at least part of the decline in production (though to use that mythical currency, the gold franc, as a means of comparison, as M. Daladier did, is, of course, to beg a host of questions). It does not need profound economic insight to perceive that it will, at the least, be difficult for the workers to benefit from a measure that limits the amount of wealth that the community can create.

* * *

Unfortunately, however, the 40-hour week has become the chief symbol of the achievements of the first Popular Front Government, under the leadership of the Socialists and M. Blum, who are still M. Daladier's supporters though not his colleagues. So far from seeking the approval of his Parliamentary allies for his views, M. Daladier had apparently not even consulted his Cabinet, for his broadcast was followed by the resignations of MM. Frossard and Ramadier, the Ministers of Public Works and Labour. Their places were immediately filled by two other members of the same party, the Republican Socialists, but a storm broke from the Left, and particularly from the Trade Unions, which, had the Chamber been sitting, might have brought the Government down. Fortunately, M. Blum knows, if his followers do not, the dangers of a Governmental crisis in France at this perilous moment, and his influence is being exerted on the side of conciliation, while M. Daladier explains that he wants only a modification and not the abolition of the 40-hour week. The odds are that the immediate breach will be repaired, but the cracks in the Popular Front are obviously widening, labour unrest is again on the increase, and the outlook for the autumn session of the Chamber is not promising. Perhaps the most depressing lesson of the last few days is that a measure such as the 40-hour week, the economic repercussions of which are obviously important and possibly vital, cannot apparently be discussed with objectivity.

* * *

Science and Society.—The discussions of the British Association at Cambridge have provided food for serious thought as well as headlines for the Press. In the Agricultural Section, for instance, a series of important papers upon the technique and personnel of British farming provided new grist for the mills of policy, at a time when the rôle of agriculture in Britain's economy is still empirically decided by the pull-devil pull-baker of vested interests and the fear of war; and Mr Keynes's proposal for commodity storage gave an even more cosmic view. Last year at Nottingham, Mr H. G. Wells hovered in spirit over more sections than the Education one which he excited by an attack on orthodox teaching: blue prints for a planned society were the theme of a score of papers on diverse sciences. His influence, or that of ideas akin to his, has not passed. The power and responsibility of scientists to shape the society which depends increasingly upon them for its apparatus has been much emphasised at Cambridge. An entirely new departure in the form of a new Division to take as its province the social and international relations of science has been made. This body is seemingly designed to co-ordinate work in various subjects and various countries, in addition to sponsoring research. It will even be available to politicians and public men as a consultant. That the scientist should be made more aware of the world outside his laboratory is wholly desirable, that infant social studies should be coaxed, where possible, to the full status of sciences by sympathetic aid is commendable; and none would deny the value of synthesising the implications for Society of scientific researches. But there are dangers in rushing too precipitately from the half-light of the study into the full glare of day. The scientist *qua* scientist must not seek to become a politician.

* * *

Labour and Arms.—The skilled artisans of the key engineering industry have still to come to terms with their employers about the details of their co-operation in accelerated re-armament. Like a number of other important trade unions, the Amalgamated Engineering Union, in particular, are distrustful of the Government's foreign policy, and suspicious of proposals to interfere with trade union practices. This week the General Council of the Trades Union Congress have stated their mind on these matters. Their report for the annual T.U.C. conference next month explicitly repudiates the use of industrial weapons to achieve political ends. They themselves are uneasy about Mr Chamberlain's diplomacy, as they told him last May; but they are strongly of the opinion that trade union leaders should be guided by industrial, not political, considerations. It is not the business of the unions to impose political guarantees as a condition of co-operation in the manufacture of arms, or to seek to break down the Government's policy of non-intervention in Spain by strikes or embargoes. Proposals for political action will be urged upon the T.U.C. in September by a number of affiliated unions. They will receive short shrift from the General Council, whose policy, which is true to the traditions of the British trade union movement, will command a majority of the conference's votes. On the question of trade union practices, the Council's attitude is more nearly that of the recalcitrant engineers; they can see no more need for the dilution of labour in engineering than in building. And in building a joint arrangement between unions, employers and the Government for the speeding up of armament contracts has been working for over a year without any appreciable interference with trade union practices. Moreover, the Council will remind the conference that the Prime Minister has explicitly denied any intention of seeking powers to tamper with the unions' regulations. Indeed, one of his avowed reasons for rejecting proposals to set up a Ministry of Supply was the belief that re-armament would be expedited best by the normal process of collective bargaining. The separate unions will have the last word, since decisions in negotiation with employers are their responsibility. But the Council's view that

CHRISTIANIA BANK OG KREDITKASSE
OSLO

Direct correspondents throughout the country.
Offering complete services to banks and firms doing business on Norway.
Correspondence invited

political questions are, democratically, the business of Parliament will surely prevail. It is only a pity that Mr Chamberlain's foreign policy, so different from his election platform of 1935, is not more obviously the policy endorsed by the electorate, upon whose will Parliament's final authority should rest.

* * *

Progress or Deadlock in Prague?—All the visible signs indicate that the crucial phase of the negotiations in Prague between the Czechs and Sudeten Germans—crucial not only for these peoples but for the peace of Europe as well—is rapidly approaching. Each side has put forward its proposals, to be completely rejected by the other. Deadlock, however, has not yet supervened, since the negotiations continue. But the task of Lord Runciman as mediator is obviously one of the greatest difficulty, and the visit of one member of his mission to London on Wednesday naturally excited interest. To one school of thought it is a sign that complete deadlock is at hand. Another school sees in it an indication that Lord Runciman himself is about to put forward new proposals. There is, as yet, no whisper of substantial concessions from the German side, although Lord Runciman and his staff have been in constant contact with Herr Henlein and his lieutenants. On the Czech side, however, there is a welcome readiness to consider still further advances towards Herr Henlein's demands. It is reported that thoughts in Prague are beginning to turn back to the original draft of the Constitution for Czechoslovakia in 1918. This draft (which was never adopted owing to Slovak opposition) envisaged a semi-federal character for the Czechoslovak State. The country was to be divided into twenty-three administrative divisions delineated according to their geographical and economic unity and to be known as, in German, *Gaue*, or, in Czech, *Zuba*. In these *Zuba* the administrative officials were to be elected by the local population, not nominated from Prague. Their functions were to be predominantly administrative, but they were also to have certain limited legislative rights.

* * *

Whether a solution on these lines would please the Sudeten party more than the present proposals of the Government depends, of course, upon the exact boundaries of the *Zuba* and the division of functions between them and the Central Government. But it is at least a good sign that the possibilities of this abortive Constitution are being re-explored in the attempt to find a solution which will give the German citizens of the republic the autonomy they demand without opening the way for the impractical paradox of totalitarianism in a democratic State. The whole problem, however, continues to be debated in the dark shadow thrown by the continuous agitation of the German Press and the ominous massing of the German army. Indeed, in a very real sense it is true that the negotiations in Prague are irrelevant to the main issue, for it will be decided in Germany by the balance between Herr Hitler's ambitions and his prudence. The indications are not over-hopeful. Of the three possibilities—that Herr Hitler has decided to get the best terms he can without war; that he has already decided to risk a conflict; or that he has not yet decided—there is no symptom whatever of the first and many signs that could be taken to indicate the second. We believe it to be the opinion of every competent observer in Paris and London that the outbreak of war on the frontiers of Bohemia would sooner or later—and sooner rather than later—involve us all. If that is so, the clearer and more definite the warnings that are sent to Berlin from London the better for all of us, Germany included.

* * *

Berlin's Dress Rehearsal.—The alarm occasioned by the wholesale German mobilisation for autumn manœuvres has to some extent abated, though speculation is still rife about its possible diplomatic implications. The further news this week that all retired officers of the German Army who are under 65 years of age and formerly held ranks lower than major-general were to register with the police before September 20th was received calmly. The registration of retired officers was the practice in pre-war Imperial Germany, and is commonly part of the system of conscription. Similarly, the recent instructions to the young men of the military class of 1913, now aged 25, to register for further training might have been expected. The members of this military class have not done their full training, but only eight weeks' preliminary training before being put on the reserve, and the completion of their service is due. These steps were seemingly no more than routine, but their timing to accompany the disturbing spectacle of a whole nation set on a war footing for several weeks was hardly a contribution to international confidence, and it is not conducive to sound sleep o' nights to know that the means of executing an advantageous decision lie so very ready to the Fuehrer's hand.

* * *

The United States, Canada and Europe.—President Roosevelt and his Secretary of State, Mr Cordell Hull, do not weary of well-doing in their attempt to give leadership to American opinion on the great problems of international affairs. "No country where thought is free," declared the President of the United States in a speech delivered on August 18th on Canadian soil, "can prevent every fireside and home within its borders from considering the evidence for itself and rendering its own verdict, and the sum total of these conclusions of educated men and women will in the long run become the national verdict. That is what we mean when we say that public opinion ultimately governs policy." In stating some of the issues on which the democratic peoples of America and Europe must sooner or later make up their minds and, if necessary, take the corresponding action, the President, in speaking at the Queen's University at Kingston, Ontario, was reiterating what had been said by Mr Hull in a broadcast address two days earlier. The Secretary of State was re-stating the general principles which are already the creed of the Administration and which may eventually also become its practical policy, if and when these principles have been digested by the people of the United States.

* * *

The President, bringing a message from one of the two great democracies of North America to the other, was more specific. He pointed out that the Americas are no longer isolated from the Old World by the rapidly shrinking oceans, and that, whether they choose or not, their vast power and energy have made them "vital factors in world peace" and "a consideration to every propaganda office and to every general staff beyond the seas." This potent American factor in a world-wide balance of power is as welcome to the peoples and governments of the democratic countries of Europe as it is exasperating and discouraging to those whose schemes for lawless and ruthless aggrandisement, at the expense of the weak, all depend upon the possibility of "anæsthetising" and immobilising the democratic Great Powers on either side of the Atlantic. In the golden chain of democratic solidarity, Canada is an important link, because she is both a fellow North American country with the United States and a fellow State member of the British Commonwealth with the United Kingdom. In accepting the degree that was being conferred upon him, the President announced that, in respect of Canada at any rate, the solidarity of the democracies in resistance to aggression is already assured. "The Dominion of Canada," said Mr Roosevelt, "is part of the sisterhood of the British Empire. I give you the assurance that the people of the United States will not stand idly by if the domination of Canadian soil is threatened by any other Empire." Over this assurance the Press of the Third Reich is already gnashing its teeth.

Rent and Income.—How much better, or worse, off are we than our fathers? There is no question more intriguing or more difficult to answer. Habits and ways of living change. The index of the Ministry of Labour, for instance, which purports to compare the current cost of living with that of pre-war years, provides only a formal statistical comparison because, based as it is on family budgets of nearly a quarter of a century ago, it gives a preponderant influence to food prices. Nowadays, people devote relatively less of their incomes to food and more to other things than before the war. Contemporary family budgets are being collated by the Ministry with a view to finding out how working-class expenditure is actually distributed at the present time, and the index will be revised accordingly. Meanwhile, the Economic Committee of the Trades Union Congress have conducted a parallel inquiry into the share of working-class income absorbed by rent now and in 1914. Since the war a great programme to rehouse the people of Britain has vastly improved general standards of living accommodation and for the most part working people live in better houses than a generation ago. But rent remains a heavy burden, especially upon the smaller wage-earners. Between 1914 and 1936, the Committee report, rents (of controlled and decontrolled houses) rose 59 per cent., the cost of living 47 per cent. and wage rates 80 per cent. On the whole, therefore, while rents now bulk more largely in the cost of living, working-class incomes have tended to rise even more markedly; for similar accommodation rent absorbs a smaller proportion of the worker's income than before the war—though many workers may now be paying the same or a higher proportion of their incomes in rent or its equivalent, owing to the rise in the standard of accommodation.

* * *

On the other hand, a large and important section of the population has not fared so well as this. The average rate of unemployment has been considerably higher since the war than before, and this increased economic insecurity has been most conspicuous in the case of export industries where, in addition, wage rates themselves have risen less than rents. In these trades, the Committee suggest, the worker has been worse off than in the immediate pre-war period; his real income, if unemployment is taken into consideration, has been less, and the burden of rent has been exceptionally heavy. Over the whole range of industry, rent absorbs some 16 per cent. of incomes of between £3 and £4 a week, but takes between 20 and 40 per cent. of incomes of £2 or less. There is still a shortage of cheap houses to let, and in many cases slum clearance schemes have involved the removed tenants in heavy travelling charges. The Committee's survey draws attention to yet another facet of the distressful problems caused by the existence of groups of workers earnings wages too low to permit of their living healthy and secure lives.

Squalor in London.—It is not very easy to translate figures such as those contained in the T.U.C. Report into human terms. But the imagination is assisted by a remarkable report on housing conditions in one London Borough. Shoreditch is not typical even of poorer London. Its impoverished working-class districts are unrelieved by any middle-class residential area and in Hoxton it includes the most poverty-stricken part of all the Metropolis. Nevertheless, the squalid living conditions revealed by a survey initiated by the Shoreditch Housing Association are vastly disturbing. Here are men and women and, above all, children living in 1938 in conditions comparable to those brought to light by the famous inquiries into the slums of a century ago. The tide of social progress has washed over London and left scarcely a trace in Shoreditch. The survey investigated the homes of 400 school children selected at random. Over 38 per cent. were overcrowded and 75 per cent. were verminous. Washing and lavatory accommodation were in many cases little, if any, better than in the notorious slums of Early Victorian Manchester. Tumbledown tenements, damp basement dwellings, and children spending their days in the streets for lack of room at home or open spaces elsewhere make a tragic picture. Shoreditch is not representative, though in lesser degree these features can be found in many other places, and improvements are being gradually made. But the national health and physical fitness campaigns will not win many successes in Shoreditch so long as the dire poverty of its inhabitants perpetuates their unhappy lot. Low wages are the key to it all; and the children suffer most. This is the story that emerges from every inquiry into poverty. Nothing is plainer than that poverty, bad housing and malnutrition are all problems that can be tackled successfully only on a family basis—on a basis, that is to say, that takes account of the very varied financial burdens that fall upon families of different sizes and ages.

* * *

The German Navy.—The fact that Admiral Horthy's visit to Germany has had a predominantly naval flavour is, of course, a compliment to the Regent's past rank as Commander-in-Chief of the Austro-Hungarian Navy. The compliment was carried further in the choice of name for the new warship launched at Kiel by Mme. Horthy, for "Prinz Eugen" was the name of Admiral Horthy's wartime flagship. This is not, however, the only political significance of the name. To Englishmen Prince Eugene's title to fame is that he was Marlborough's ally at Blenheim. But to Germans he is the general (incidentally an Italian) who drove the Turks out of Hungary, and the moral of a valiant Leader uniting the German and Hungarian peoples against an Oriental danger was duly pointed in the speeches at Kiel. This tactful comparison of Kara Mustafa Pasha and his men with the Bolsheviks will be as gratifying to President Mustafa Kemel Atatürk as it will be to Comrade Stalin to hear himself cast for the rôle of the Unspeakable Turk.

* * *

The new addition to the German Navy is more than a historical compliment. In an article published last week in the German naval and military journal *Die Wehrmacht*, the chief of the Naval Operations Staff, Vice-Admiral Guse, intimates that Germany intends now to carry her naval construction up to the treaty limit which she imposed upon herself in concluding the German-British naval arrangement of 1935. In view of the proportional basis of the arrangement and of the formidable subsequent increase in the strength of our own Navy, which, by the terms of the arrangement, sets the pace for the German Navy's expansion, the 35 per cent. ratio which the arrangement assigns to Germany enables her now to build up a considerable fleet if she chooses. Presumably Germany's primary naval aim is to secure for herself a command of the Baltic, for this would enable her to achieve several objects in the event of another world war. She would be able to cut the maritime communications, via the Baltic, between Russia and the Western Allied and Associated Powers; she might be able to launch a naval expedition against Leningrad; and she could exert naval pressure on those northern neutrals—Sweden, Norway and Finland—whose territories, unlike Denmark's, she could not directly threaten overland. It may be doubted, however, whether Germany will push her naval construction to extremes, for

no Power—not even one with the Third Reich's far-reaching control over the life, labour and property of its subjects—can afford to launch out into an unlimited armaments race at sea, on land and in the air simultaneously; and Germany cannot afford to develop her navy at the expense of either her army or her air force. In submarines, however, there is every indication that Germany is using her capacity to the full. The Anglo-German Agreement allows Germany to build submarines up to 45 per cent. of the British tonnage, if corresponding reductions are made in other categories, and there is no doubt that this higher limit will be taken. Moreover, the agreement speaks of tonnage, and by concentrating on small submarines Germany can have a large number. The later years of the war and the post-war years saw a rapid increase in anti-submarine devices and tactics, and the indications are that the British Admiralty are not unduly worried about submarines in the next war. But whatever the exact degree of the menace, this new German submarine fleet (much larger already than in 1914) is obviously aimed straight at the food supply of Great Britain.

"Hanging the Kaiser."—Herr Hitler is a stickler for equality of rights. Nearly twenty years ago the Western conquerors of Germany took licence—which they soon ruefully regretted—to put on trial the fallen head of the conquered empire. So to-day the Austrian conqueror of his own fatherland has to demonstrate his equality of rights with "the Big Four" by putting on trial the head of the second of the two former Central Powers. At the beginning of this week it was announced in Berlin that a special court is to be set up in Vienna in implementation of a new "Law concerning the accountability of members of the former Austrian Federal and Provincial Governments and their helpers." The judges are to be appointed by Herr Hitler himself, and Herr Bürckel, the present Commissioner for Austria—beg pardon, we mean for the Ostmark—is to indict the accused in the name of the People. Action, it is officially announced, will be taken only against "the greatest law breakers," and unofficial commentaries add that this category includes at any rate Herr von Schuschnigg and Dr Schmitz (the former Mayor of Vienna). We believe that Herr Hitler will live to regret this step more bitterly than the Allied statesmen after the war had to regret the corresponding political and moral blunder which they contrived to wriggle out of at the eleventh hour. As for the former Austrian Chancellor, Herr von Schuschnigg is a martyr in spirit as well as in his external circumstances; and he can hardly lose by Herr Hitler's decision to advertise the truth. The more preposterous the injustice with which the trial is conducted, the more brilliantly will the prisoner's character and conduct be vindicated in the eyes of the world—and this not only outside the frontiers of Austria and Germany. In particular, there is one charge—that of having deprived the people of their right to express their opinions and of placing his own personal opinions before those of the whole nation—which will certainly leave its target unscathed; for this, at any rate, is a boomerang which will recoil, on a short circuit, to smite the hand that has thrown it. The official verdict will probably make little difference to Herr von Schuschnigg's ultimate fate, which will no doubt be determined, not by justice upon due evidence, but by a resolution of the two Nazi forces of passion and propaganda. Herr von Schuschnigg is a very brave man, who did his work in the face of a continuous threat of death for months and years on end before his Government was overthrown by an irresistible superiority of aggressive force. He will not be afraid of death now.

* * *

Japan's Choice.—The talks at Tokyo between General Ugaki, Japan's Foreign Minister, and Sir Robert Craigie, the British Ambassador, have so far yielded no result. The protestations and the policy of the Japanese are as far apart as ever. Repeatedly since last May, General Ugaki has given assurances that Britain's rights and interests in the Far East, which are the subject of these conversations, would not be violated by Japan; and in the last few days credible accounts in Japanese newspapers have laid stress upon the desire, not only of General Ugaki, but also of other Ministers, including Mr. Ikeda, Minister of Finance, not to antagonise the Western democracies in general, and Great Britain in particular, at a crucial stage of the increasingly difficult campaign in China. The merest prudence would seem to impose a policy of conciliation upon Japan. Her financial position is becoming worse under the weight of war-expenditure. Recent events on the borders of Manchukuo underlined the proximity of Russian military power. And the Powers associated with Japan in anti-Communist professions, Germany and Italy, are clearly not prepared to render their ideological ally more than moral aid. In China itself the war is not going too well for the invaders. Japanese troops have, it is true, gained ground near the Siao-Ho River, and their air-raids against the Canton-Hankow and Canton-Kowloon railways have put the line temporarily out of action. An augmented drive in the Yangtze valley, directed from Nanking instead of Shanghai, is rumoured. But the Japanese advance is, broadly, at a standstill, and the most important feature of recent operations has been a notable increase in guerilla action by the Chinese. In East Hopei some 10,000 irregulars are at work between the Great Wall and the sea, and the arrival of General Lu Chung-li, newly appointed from Hankow as Governor of Hopei, is expected to accentuate the harassing of the invader in a province where Japan is nominally in control. The Japanese Army can spare no men from the protection of the railway lines into Peking to deal with the guerilla menace.

* * *

In these circumstances Japan, while in no danger of overt military defeat, would do well to placate the Powers whose interests have been consistently flouted since the campaign began. So far, however, there has been no intermission in the continuous infringement of foreign rights. In the last few months, when General Ugaki has spoken of goodwill, and, finally, embarked on a campaign to educate Japanese opinion accordingly, the situation has in fact been made worse: shipping has been interfered with and foreign-owned railways seized. European rights in the International Settlement at Shanghai have been disregarded. This was the background of the talks which have hung fire: expediency and discernment have led General Ugaki to ask for Britain's goodwill and perhaps to seek the grounds for a bargain to wean Britain from sympathy with China; but militarism at the front and vocal nationalism at home have created a strong Japanese opposition to any concessions to Britain. General Ugaki is anxious to please, but his way is not clear. The wisdom of damping down Japanese arrogance and meeting the British claims is, in the eyes of many who believe Japan to be powerful enough now to take a strong line against Western "intruders," outweighed by the loss of prestige which might be involved. Common sense may yet prevail, and the tone in Tokyo is definitely conciliatory, but many influential groups in Tokyo and in the Army would rather save their faces than their skins.

* * *

Building Prospects.—In contrast to the sharp setback experienced by the iron and steel and textile industries, activity in the building and contracting trades continues at a remarkably high level. Indeed, building is proving to be one of the main supports of the general business activity of the country. The importance of the constructional industries rests on the fact that they employ some 10 per cent. of the total number of insured persons in this country; together with their numerous ancillary trades, they are an even more substantial sector of British industry. The future course of building activity, therefore, is of considerable relevance to the general business outlook, discussed in the Trade Supplement accompanying this week's issue of *The Economist*, especially as there are now

signs of a gradual decline in the volume of building. The proportion of insured persons, aged 16 to 64, unemployed last month was 3.0 per cent. higher than a year ago in building and 3.4 per cent. higher in public works contracting. Private construction is now gradually declining, though Government building in connection with the defence programme and building by local authorities appear to be well maintained, and expenditure on public works is not likely to be drastically curtailed in the near future. While a gradual decline in constructional activity must be envisaged from now on, there are no signs of anything like a serious slump in the near future. On the whole, therefore, the outlook for the building trades is still reassuring.

* * *

Civilian Defence Plans.—Since the New Year half a million volunteers have come forward to take part in air raid precautions. Twice that number are needed before the year ends; and in a letter to all local authorities last Saturday the Home Secretary suggested various devices to stimulate interest in a nation-wide recruitment campaign to be set on foot in October. Appeals in places of entertainment, displays in shops and the exhibition of sample shelters were among the means suggested by Sir Samuel Hoare. Expenditure on such publicity will rank for Treasury grants. The co-operation of Churches and the Press will be sought, and all the propaganda agencies to which we are now accustomed, including posters, will be brought into play. The crucial question is still whether the citizens of this country can by voluntary effort achieve the degree of efficiency in protection against air attack secured in other countries by more compulsory methods and by ruthless and arbitrary use of the same publicity devices. Can elected local governing bodies prepare and execute adequate plans of defence and provide their voluntary helpers with satisfactory training? Many of the initial obstacles have disappeared. It is no longer fatalistically believed that "the bomber will always get through." All parties and most persons are convinced of the urgency of taking serious and speedy thought for the possible war of to-morrow, and the earlier conspicuous delays on the part of local and central authorities in formulating schemes and providing equipment have been largely overcome. There are still gaps. There is leeway to make up in the provision of anti-aircraft equipment, though considerable progress is now being made. And there is still seemingly an absence of comprehensive and detailed plans for the protection of defined areas. First-aid, anti-gas and fire-fighting measures are not enough; and the surveys which have so far been made of shelter accommodation, like schemes for evacuating parts of urban populations, have been mainly tentative.

* * *

The specimen scheme submitted to the Home Office on Monday by a group of well-known scientists for the protection of the Borough of St. Pancras, with its three railway termini, its dense working-class area, and its scattered residential district, serves as an interesting and important example of what might be done. The evacuation of the young, the aged and the infirm to allotted areas; the establishment of small and scattered camps for the refugees' accommodation; and the cutting of tunnel shelters fifty feet down in the London clay, lit, ventilated, watered and equipped, at a total cost of £11 per head of population; together these proposals provide an integrated scheme for a particular place. It would be reassuring to know that all local authorities were ready and able to plan so thoroughly and, if need be, so expensively.

Overseas Correspondence

From Our Special Correspondents

United States

State Rights and Federal Powers

NEW YORK, August 17.—The legendary cavalier, mentioned before in this Correspondence, who mounted his horse and galloped in all directions, may again be cited as a symbol of American economic policy. On August 12 the National Emergency Council submitted to the President its report on the Southern states, recently described officially as the nation's "economic problem No. 1." This report illustrates the sectional or regional approach to current problems. In many, if not most, of our major problems, it is still an unsolved question whether the unit of effective effort should be the nation, the separate state, or the region.

Historically, since limited powers were conferred by the Constitution on the Federal Government, the economic and social units of government have been the several sovereign states. Until very recently economic and social legislation was exclusively the function of the state Governments, and even now this is preponderantly the case. For example, legislation relating to marriage and divorce is the prerogative of the state; even the regulations covering suffrage are matters of state law. The result is, of course, that there is an immense diversity of legislation on matters which, in any European country, would be deemed the unquestioned province of the national or central Government.

In recent years there has been a distinct tendency for the states to assert their sovereignty in certain matters. In spite of the Constitution, for instance, some states have made ingenious progress in the erection of restrictions tantamount to tariff barriers and other impediments to the "importation" of goods from other states. Some states have even established frontier guards at "ports" of entry to prevent the immigration of citizens from adjacent states. This movement has not yet assumed important proportions, but it has progressed rapidly in recent years, and seems to show a significant trend.

While this trend toward "state isolationism" has been marked, there has simultaneously been a persistent expansion of Federal legislation into areas formerly occupied exclusively by the states—for example, by the Social Security Legislation, by wages-and-hours legislation, etc. Indeed, one of the charges most commonly brought against the New Deal is that it is "erasing states lines," and that under it the Federal Government is "encroaching" on the states.

The fact is that the general Federal system, with its division of powers, was devised under very different conditions of transport and communication from those which have since developed, and the effective unit of government was then of necessity small. No less a statesman than Daniel Webster opposed the annexation of those areas now represented by the states of Washington and Oregon, on the ground that the region could never be represented in Congress because a representative could hardly reach the Federal capital after one election before he would be obliged to return to contest his seat for the next election, two years later. The so-called protectionist tendencies of the states and the alleged encroachments of the Federal Government on states' rights are both expressions of the difficulty of reconciling local interests with the facts of rapid inter-communication.

The Regional Point of View

Cutting across both these tendencies there is a definite trend towards sectionalism. Sectionalism or regionalism is no new phenomenon; but it is becoming more, rather than less, pronounced. In the original United States, the Potomac

River, as the boundary between the North and the South, determined the location of the capital at Washington. Increased sectional differences led to the war of the 'sixties, and a permanent political legacy of that conflict was the "Solid South," a distinct region. Economic regionalism was later recognised by the establishment of the twelve Federal Reserve Districts.

Some of the economic regions of the United States are quite distinctly marked—such as New England, the Solid South, and the Pacific Coast. Others, like the Wheat Belt, the Corn Belt, or the Mississippi Valley, are rather vague. But there can be little doubt that regional consciousness is now becoming an increasing reality. While the State is still the unit of political organisation and expression, the section or region is increasingly the unit of economic thinking. The Federal Government is moving in all these channels at once: its tendency toward centralised nationalism, its more or less grudging acceptance of state sovereignty, and its growing recognition of sectionalism, show that all three approaches to America's problems are being tried simultaneously.

The Plight of the South

The report of the National Emergency Council on the Southern States, itself an illustration of the regional approach, is a detailed economic and sociological description of a region of unusual national resources and widespread individual poverty. It makes no specific proposals, although it indicates the South's outstanding needs. To only a limited extent does it deal with the causes of present discontents. It is blurred by a certain chariness in dealing with the Negro question. The inclusion of Texas and Oklahoma with the Southern States militates against due emphasis on the historical causes of the present situation in the South, such as the impoverishment due to the Civil War and the break-up of a plantation and slave economy. Oklahoma was not then in existence, and Texas, although a member of the Confederacy, was never committed to the plantation and slave economy.

With August half over, it seems clear that the recovery, which first became statistically manifest in June-July, is spreading. The data for early August show a continuation of the upward trend. Coincident with this recovery a new factor has appeared—a sharp decline in the price of agricultural commodities. After successive years of more or less widespread drought, the growing season of 1938 has been well watered almost everywhere, and the result is large crops and low prices. Whereas in the early months of the spring one could describe the state of our economy as urban depression against a background of agricultural prosperity, now the decline in agricultural prices has introduced a new factor into what appears to be the early phase of an urban or industrial recovery.

France

M. Daladier's Move

PARIS, August 25.—In a month the "gold rush" has cost Paris 5,000 to 8,000 million francs of gold or strong currencies, and the money market, which supplies the Treasury with funds, has lost a similar sum. These are serious losses for a far from abundant Equalisation Fund, for a market in a state of convalescence and for a Treasury which must borrow at least 1,000 millions a week. The demand for gold in London and in Paris has now abated. But capital has again fled the country, and once more the question of the hour is how to stimulate its repatriation.

The Minister of Finance is officially optimistic. He has promised that the Budget for 1939 will be speedily drafted, and that it will be balanced. He has formally denied any intention of further devaluing the currency or of instituting exchange control. But none of these professions steadied the markets. The franc touched the official limit of 179 to the pound sterling, and accordingly, M. Daladier decided on a spectacular step.

In a broadcast speech the Prime Minister laid stress upon the stout defences of the franc. He cited the size of the gold [illegible] the recent increase in fiscal receipts and in savings stocks, deposits, and the mounting subscriptions to the Treasury bonds. Nevertheless, he pointed out, national income has steadily fallen from 38,000 million gold francs in 1914 and 49,000 millions in 1931 to 22,000 millions in 1937.

M. Daladier was forthright in his statement of the only remedy. "France must work more." The forty-hour week must be modified; and, as production rises, taxation must be reduced. All extra-Budgetary expenditure must be curtailed. Costs must be reduced and profits improved.

The Prime Minister's plan of action was welcomed both by the public and by the Stock Exchange, and the pressure on the franc was relieved.

Revision of the Forty-Hour Week

The outstanding feature of the speech was the proposal to revise the forty-hour week. The outlines of this proposal were: extra hours of work must be permitted according to the needs of particular industries up to a total of forty-eight hours a week in undertakings engaged in national defence work; and rates of pay for overtime must not exceed an average of 10 per cent., instead of 25 to 100 per cent., as has been demanded.

This proposal led to the resignation of two Ministers, M. Frossard, Minister of Labour, and M. Ramadier, Minister of Public Works. These posts were, however, immediately filled by two other members of the same Parliamentary group, M. de Monzie and M. Pomaret. On the whole, the reaction of the Left was not entirely unsympathetic. The mass of the workers have been very much impressed by the military efforts now being made by the totalitarian States, critical accounts of which appear every day in the Left newspapers, and at the same time they are anxious to combat the rising cost of living by working extra time and so increasing their earnings.

Great satisfaction was naturally expressed by the Moderates at M. Daladier's move. They emphasise, however, that the hoped-for increase in production cannot be sufficiently rapid to prevent the Treasury crisis which is threatening. There is something in this objection, though growing confidence caused by a rising trend in the index of production, accompanied by moderate economies in the drafting of the Budget, would place the Government in a position to have recourse to fresh financial expedients, such as the partial revaluation of the gold stock of the Bank of France.

The financial problem, say the optimists, is simply one of authority. If the Government can give proofs of its strength and determination, and so win general confidence, then it can solve the problem. Already, during the last six months, the Cabinet of M. Daladier has given two proofs of its determination: it has refused to support pensions for aged workers, and it has now insisted upon the modification of the forty-hour week.

Crisis or Confidence?

What will the next few days bring forth? The agitation aroused by the extremists is rather fictitious, though the Communists are calling for an extraordinary session of Parliament. The Radicals do not believe that this will be necessary, since, in their view, the proposals to modify the forty-hour week have been drafted by the Government so that they are not contrary to the existing law. Moreover, M. Blum, the Socialist leader, has declared that his party would not seek to exploit the present situation to the disadvantage of M. Daladier at a time of such great international tension. The possibility of a political crisis, however, is not ruled out. If the revision of the forty-hour week law is drastic, considerable opposition will make itself felt. On the other hand, if, as is more likely, the revision is only timid and tentative, there will be no immediate political repercussions, but equally there will be no important return of confidence, and the Treasury problem will become more acute. This is the reasoning of the pessimists.

Meanwhile, the markets have recovered. They were stimulated by the decision of M. Daladier. They knew that the opposition of the Left could have no serious consequences, since their social arguments can be countered by higher considerations of national security. Moreover, it was certain that M. Daladier would not provoke serious revolt, since, in his view, the collaboration of labour is as indispensable as the confidence of capital. The franc was then firmer at 178.40, against 178.90; public funds and French stocks found purchasers.

Germany

Bourse Recovery

BERLIN, August 24.—The decline in security prices touched bottom on August 17th. There followed three days of substantial recovery in share prices, with no change worth mentioning in bonds. Yesterday shares were again weak. Only after the collapse ceased was the enforced silence about it broken. That it embarrassed the Government is plain from

various reassuring official statements, of which the most notabie was the prediction of Herr Reinhardt, of the Ministry of Economics, contrary to earlier official views, that industrial profits would continue to increase for three years.

The Minister of Economics dealt with the matter inadequately and somewhat irritably, imputing some of the difficulties to foreign malevolence. He gave no new grounds for the decline, and did not admit that it was due to reasonable apprehensions about future developments. There is no doubt that the magnitude of the decline and its importance were exaggerated abroad, but for that the conspiracy of silence on the spot was largely responsible. The official index of share prices shows a decline between the high level of April and the third week of August from 114.83 to 100.74; and the fall in bonds was from 100.05 to 99.88. An independent average of the prices of twenty active stocks shows a decline from an April high of 139.46 to 116.42 on August 17th. But individual losses were much greater:—

	April, 1938 (high point)	August 17, 1938 (low point)
	(Fractions omitted)	
Vereinigte Stahlwerke	117	95
Mannesmann	122	99
Deutsche Waffen	200	137
Deutsche Erdoel	147	115
General Electricity	127	101
Siemens und Halske	215	178
Farbenindustrie	165	142
Harpener Coal	177	130
Salzdetfurth Potash	177	134
Daimler Motors	154	117
Waldhoff Cellulose	155	126
Norddeutscher Lloyd	85	60
Reichsbank	212	175

The official theory that shortage of money in industry was the main cause of the decline does not fit in with the fact that the volume of selling was small. The *Frankfurter Zeitung*, nevertheless, publishes a detailed analysis to show that the liquidity of industry is at an end. The banks' returns for July show a substantial increase in deposits. A rise of Rm. 450 millions in holdings of "Treasury bills and Treasury certificates" probably consists almost entirely of the new "delivery certificates," and corresponds to about one month's issue of these as shown by the last two Debt returns.

No Setback in Industry

The food position is still unsatisfactory in some respects, although meat consumption has increased. It is understood that a new central food authority is to be created. The innumerable bodies at present controlling or regulating prices, from the departments concerned—the Reich Nutrition Board and the Prices Commissar—down to the police, have failed in face of the pressure of insufficient supplies.

There is no sign so far of a setback in industry and home trade. The Königsberg Eastern Fair was a success. The Reichspost's last return shows increasing business. Retail trade turnover in the first half-year was 8 per cent. higher than in the same months of 1937. Official journals foreshadow a new drive to divert workers from commercial to industrial employment. In this respect the shortage of food and other goods is a favourable factor, since many trade employees and middlemen have been rendered superfluous.

Pig-iron output in July was 1,625,400 tons, and in the first seven months of this year 10,581,900 tons, against 9,055,700 tons in 1937. All reports agree that the expectation of lower Cartel prices, because of price cutting by outsiders, is leading steel consumers to hold back their orders. The rationing system now applied to iron and steel is to be extended to other raw materials. In the first half-year German pig iron and steel output exceeded that of the United States. Coal production in the first seven months of the year was 108,212,000 tons, against 105,180,000 tons in 1937.

Spurt in Exports

The credit balance of the old Reich in July on foreign trade account was Rm. 22 millions, after three months of debit balances. The improvement was seasonal, and was due, as in July, 1937, to a moderate decline in imports and a substantial increase in exports. But exports, as has been the case ever since March, were lower than in the corresponding month of last year. Exports of wholly manufactured goods were valued at Rm. 358 millions, against Rm. 426 millions in July, 1937. Imports of the new Reich, including Austria, amounted to Rm. 472 millions and exports to Rm. 470 millions. Gold imports (old Reich) were Rm. 25 millions and gold exports Rm. 21.5 millions. The details of the trade returns were as follows:—

	Millions of Marks		
Imports	June	July	Jan-July
I. Foodstuffs	**160·4**	**144·7**	**1,155·9**
(*a*) Livestock	9·8	9·4	65·9

II. Industrial goods	**397·1**	**435·4**	**2,986·7**
(*c*) Raw materials	45·3	46·2	311·3
(*b*) Semi-manufactured	28·9	31·5	227·8
(*c*) Manufactured	322·9	357·7	2,447·6
Total (including others)	**402·8**	**439·4**	**3,022·5**

Compared with June, exports to Europe and to overseas countries increased by similar amounts, and, proportionately, there was a particularly marked increase in shipments to South America. In Europe, the largest increase was in exports to Great Britain.

Holland

Guilder Steady

AMSTERDAM, August 15.—The gold rush has been taken calmly. The Exchange Equalisation Fund has, admittedly, had to intervene on several days and to reduce its purchasing rate for sterling. But the excitement did not give rise to any distrust of the guilder, as happened in the case of the French franc and the belga.

Nor was there the slightest sign of excitement on the Stock Exchange. The bond and debenture market remained quite steady, and new issues were well received. The so-called "Investors' Front" has modified its minimum requirements slightly: members now subscribe to issues of 3¼ per cent. municipal loans at par, whereas a yield of 3½ per cent. was originally the criterion for such loans.

In the past a flurry in the gold market and rising gold prices have led to some movement in share prices. On this occasion there was no sign of such a tendency. The rising price of gold failed to exert the slightest stimulus on Stock Exchange quotations, and the market remained dull and lifeless. If anything, the trend was slightly downwards, because of international political influences.

Gold Embargo Removed

Curiously, at the present juncture, the Minister of Finance has announced the withdrawal of the decree prohibiting the export of gold, which was proclaimed in September, 1936, when the gold standard was suspended. This does not imply a reversion to the gold standard, however, as the Netherlands Bank is not bound to release gold for export at a fixed price. In effect, there has been free trade in gold in the Netherlands for some time, since, on June 17, 1937, the Netherlands Bank was authorised by the Government to grant exemptions from the export prohibition in the case of gold coin and bullion.

BANK OF MONTREAL
(Incorporated in Canada in 1817 with Limited Liability)
Financial Agents of the Government of the Dominion of Canada in London.
CAPITAL PAID-UP $36,000,000
REST AND UNDIVIDED PROFITS $40,164,863
TOTAL ASSETS IN EXCESS OF $800,000,000
Head Office: MONTREAL
Sir Charles Gordon, G.B.E., *President.*
H. R. Drummond, Esq., Major-General The Hon. S. C. Mewburn, C.M.G., W. A. Bog, Esq., *Vice-Presidents.* Jackson Dodds, G. W. Spinney, *Gen. Managers.*
COMMITTEE: The Most Honourable The Marquess of Willingdon, P.C., G.C.S.I., G.C.M.G., G.C.I.E., G.B.E. (*Chairman*), F. R. S. Balfour, Esq., Sir Hardman Lever, Bart., K.C.B., Sir Frederick Williams-Taylor.
London Offices: 47 Threadneedle Street, E.C.2 (Edward Pope, Manager)
9 Waterloo Place, Pall Mall, S.W.1 (J. H. Pangman, Manager)
The Bank undertakes banking business in all parts of the world, and with its numerous branches offers special facilities in Canada, Newfoundland and the United States

Most of the statistics for the second quarter of 1938 justify expectations of a further recession, though the phase of prosperity has not yet wholly passed. There are, however, some encouraging signs: unemployment is still much smaller than it was some years ago; wages have risen and prices are falling; and higher dividends are being distributed. All these factors tend to maintain general purchasing power. Retail turnover, for instance, has so far been well maintained. The Government's plans for increased expenditure on public works and armament orders should also have a beneficial effect on business activity. On the other hand, the shipping position is far from satisfactory.

Falling Foreign Trade

The foreign trade returns for July, published by the Central Bureau of Statistics, show a decline compared with the corresponding month of 1937, in both imports and exports. Imports in July this year were valued at 120 million guilders, compared with 146 millions in July, 1937, and exports fell to 78 millions compared with 102 millions a year ago. The course of imports and exports during recent years is summarised month by month in the following table:—

(Millions of guilders)

	Imports			Exports		
	1936	1937	1938	1936	1937	1938
January	79	106	119	50	73	82
February	74	105	118	50	79	82
March	79	125	120	55	94	90
April	81	142	115	57	101	81
May	76	128	110	53	90	83
June	77	140	119	53	95	81
July	80	146	120	60	102	78
August	82	122	...	63	98	...
September	82	130	...	72	113	...
October	92	149	...	76	106	...
November	101	130	...	77	98	...
December	114	127	...	80	98	...
Total	*1,016*	*1,550*	...	*745*	*1,148*	...

The extent of the decline in foreign trade is clearly shown by the figures for the first seven months of this year. During that period imports were valued at 820 million guilders, against 892 millions in the corresponding seven months of 1937, and exports at 576 million guilders, compared with 634 millions. On the other hand, invisible exports play an important part in the Netherlands' balance of payments, and there are good reasons for anticipating that the current year will show a credit balance. Meanwhile, the trade figures are not encouraging.

Jugoslavia

Falling-off in Foreign Trade

BELGRADE, August 15.—The decline in Jugoslav foreign trade, which set in at the beginning of the year, continues, although it has not become more steep. Thus, while the total volume of trade for the first four months of the year was 4.8 per cent. less than in 1937, the total for the half-year is 4.5 per cent. less than a year ago. That the fall has been arrested is chiefly due to the increase in imports, in part from Germany, intended to diminish the swollen clearing debits. This is obvious from the decline in the credit against Germany from Rm. 14,350,000 on April 8th to Rm. 12,100,000 on July 31st.

Exports for the half-year, on the other hand, have fallen fairly sharply—11.67 per cent. in volume and 15.6 per cent. in value. The result is an import surplus of 258 million dinars, against an export surplus in the first half of last year of 400 million dinars. Exports amounted to 1,870,000 tons, valued at 2,388 million dinars, against 2,115,000 tons, valued at 2,800 millions in 1937. Imports were 610,000 tons, valued at 2,646 million dinars, against 498,000 tons, valued at 2,460 millions.

It is this decline of exports which has made traders here react favourably to the news of a renewal of Anglo-French interest in East European trade. It is felt that, without engaging large amounts, these two countries might be able to ensure this country against a further contraction in trade, and thus prevent a general recession. At the same time they could save Jugoslavia from being too exclusively dependent on the one market that is always open to her, though not on very favourable conditions, namely, Germany.

Openings for Britain and France

At the present moment there are many actual opportunities for increasing trade connections. First, the wheat harvest has been excellent, the surplus for export amounting to no less than 45,000 trucks; and the grain is of excellent quality. Of this surplus, 10,000 trucks have already been earmarked for Germany (5,000 for Germany proper and 5,000 for Austria), 10,000 for Czechoslovakia, 3,000 for Switzerland, and 2,500 for Italy, leaving about 20,000 trucks to be disposed of. In the case of Great Britain, larger purchases from Jugoslavia could not be detrimental, since Jugoslavia is bound by agreement to increase her imports from Great Britain proportionally to British purchases from her. Thus, in June, Jugoslavia bought goods from Great Britain to a value of 56.5 millions, compared with only 28.8 millions purchased from her by Great Britain.

Secondly, trade could be increased by exporting cattle to Palestine, Malta and other British Possessions in the Mediterranean. The British Mediterranean fleet could also be supplied. Neither of these possibilities could be considered as competition against the British farmer.

Resisting the Recession

Apart from the contraction in foreign trade, the recession is being resisted. State receipts are still satisfactory; they amounted to 4,798 million dinars in the first five months of the year, against 4,225 millions in the same months of 1937. The money market is liquid, and savings deposits amounted to 11,531 million dinars at the end of July, compared with 11,032 millions at the end of December, 1937. Car loadings for the first six months were 875,000, compared with 751,000 a year ago, and employment reached a new high level in May, when 742,144 insured workers were occupied, against 692,973 a year ago.

Heavy industries, mining and public works are making specially marked progress, although there has been some setback in the timber industry as a result of Germany's purchases from Austria since the *Anschluss,* and also in the textile industries, which had previously expanded particularly rapidly. Indeed, textiles now occupy the chief place among Jugoslav industries, with 60,200 employees at the end of 1937, out of a total of 425,000 industrial workers, or 680,000 insured workers altogether. The timber industry is second with 51,600 employees, and is followed by metal and machinery with 45,200, food and drink with 38,800, public works with 34,200, clothing with 33,600 and building with 32,600.

There have been several important developments in industry recently, which should help to combat a recession. One is the formation at Sarajevo of a new company, the Jugoslav Steel Company, Limited, with a capital of 600 million dinars, which is an amalgamation of four existing State enterprises—the Zenice iron works, the Breza coal mines, and the iron mines and foundries at Varesh and Ljubija. The new enterprise is thus a vertical combine capable of carrying out the entire metallurgical process.

The second is the putting into operation of an enlarged copper refinery at the Bor mines in Eastern Serbia, by which the capacity for electrolysing copper will be increased from 12,000 to 20,000 tons annually, and the Bor mines will be enabled to yield 2,000 kgs. of gold annually. The third is the merging of the four existing British mining concessions (Trepca, Novo Brdo, Zletovo and Kopaonik) into one concern, with the addition of fresh capital, to bring the total up to £2,570,000.

Japan

The Impact of War

TOKYO, July 11.—The Sino-Japanese war has now entered its second year. Comparisons of the following statistical data, at the outbreak of hostilities and twelve months after, provide some evidence to judge the general trend of economic developments under war-time conditions:—

	June, 1937	June, 1938
	(In thousand yen)	
National Debt	10,580,301	13,720,582
Bank of Japan's gold reserves (at new value)	1,356,485	801,286
Notes in circulation (monthly average)	1,390,086	1,656,017
Tokyo Clearing Banks:—		
Deposits	3,392,733	4,125,398
Advances	2,627,254	3,387,039
Money and Bill Rates:—	%	%
Day-to-day money	2⅞	2⅜
3 months' fine bills	4⅜	4¼

* Outstanding at the end of June.

Foreign Exchanges ..... yen =	1s. 2d.	28⅜c.	1s. 2d.	28⅜c.
Commodity Prices†:—				
Wholesale	189·3		202·2	
Retail	171·4		196·9	
Security Prices (Tokyo Stock Exchange Index)	160·9		147·2	

† Bank of Japan's index number: July, 1914 ... 100.

There are clear signs of strain, though no evidence of irreparably serious consequences is yet discernible.

Declining Trade

The declining tendency of foreign trade still continues, but the shrinkage is heavier in imports than in exports. In each of the past six months of this year the decrease in imports considerably exceeded that in exports; and the import surplus in the same period amounted to a manageable sum of 193.6 million yen, or less than one-third of that in the January-June period of last year. The comparison of the value of foreign trade in the first six months of this year and last is set out below:—

(000's omitted)

	First Six Months			
	1937	1938	Decrease in 1938	
	Yen	Yen	Yen	%
Imports	2,145,920	1,394,251	751,669	*35·0*
Exports	1,527,776	1,200,620	327,156	*21·4*
Total	**3,673,696**	**2,594,871**	**1,078,825**	**29·3**
Import surplus	*618,144*	*193,631*	*424,513*	*68·7*

The decline in imports is principally accounted for by raw materials; raw cotton and raw wool are between them responsible for over four-fifths of the total decrease. There are also notable decreases in imports of crude rubber and timber.

On the export side, the shrinkage spreads over the whole list, with the possible exception of machinery and timber. Among staple exports cotton piece-goods fell in value by 44.7 million yen and raw silk was down by 34.8 million yen.

Government Control

The list of controlled commodities is rapidly lengthening. The consumption of pulp, paper, flax and hemp, leather, timber, tannin, industrial salt, coal-tar by-products, soda, kali, phosphorite, and asbestos has been newly regulated. Maximum prices have been fixed for a wide range of textile goods, light chemicals, and rubber manufactures. The use of raw cotton has been further restricted; the production of cotton goods for domestic consumption has been absolutely prohibited, and unmixed staple fibre tissue will be manufactured as a substitute. The daily ration of petrol has been reduced since July 1st from 2 gallons to 1½ gallons for private cars.

According to the vital statistics recently published by the Bureau of Statistics, the growth of the Japanese population last year was close on the one million mark, after falling far short of that figure in the preceding year. The natural increase in 1937 was 972,510, or 13.67 per 1,000 of the population: the number of births was 2,180,589 (30.65 per 1,000) and of deaths 1,208,079 (16.98 per 1,000). In 1936 the natural increase was 871,523 (12.40 per 1,000), and the birth-rate and death-rates 29.92 and 17.51 per 1,000 respectively. The increase in 1937 is thus accounted for both by a higher birth-rate and a lower death-rate.

South Africa

Sharp Set-back in Exports

JOHANNESBURG, August 6.—External trade statistics for the first half of the year show that the world depression has caused what the Department of Commerce and Industries calls "a sharp set-back to the South African export trade, which, unless the present tendencies are reversed, will lose practically all the headway made last year."

Exports of South African commodities, other than gold and specie, amounted to £14.9 millions for the six months, which is £5.6 millions less than last year, and only £0.7 millions more than in 1936. For individual commodities we have the figures in the following table.

HALF-YEAR'S EXPORTS
(£'000)

	1937	1938
Wool	8,707	4,884
Diamonds	1,917	1,030
Fruit	1,773	2,122
Hides and skins	1,210	649
Wattlebark and extract	606	400

Gold exports show a slight decline, which is of a purely fortuitous character, since both production and price have been maintained. The export surplus is £2.9 millions lower than a year ago.

Record Gold Production

The gold-mining industry has set up more new records. The peak figures for production were reached in May with an output of 1,019,251 fine ounces of gold, valued at £6,919,136, but the June price was 1s. higher at £7 0s. 6d. per fine ounce, so that the aggregate value reached £6,939,101 despite a slight fall in production (1,018,712 fine ounces). For the first six months of the year the comparison with the corresponding period of 1937 may be set out as follows:

TRANSVAAL GOLD PRODUCTION

	January to June	
	1937	1938
	£	£
Tons of ore milled	25,269,150	26,163,650
Yield (fine ounces)	5,816,397	5,951,379
Revenue	40,018,674	40,368,506
Working costs	24,088,601	25,070,364
Working profit	15,930,073	15,298,142
Dividends declared	8,482,878	8,330,805

Satisfactory as the Transvaal's gold-mining operations have been in the first half of the year, there is every reason to anticipate that for the second six months the results will be even more impressive. Three new large-scale mines will then be producing, though their full capacity will only be reached next year. Two of these properties are already in operation—Van Dyk Proprietary Mines (of the Union Corporation Group) and the South African Land and Exploration Company—more familiarly known as "Sallies" (of the Anglo-American Corporation Group). The third—Grootvlei Proprietary Mines—will reach the production stage within a few weeks.

Less Favourable Treasury Position

National revenue has recently taken a turn for the better, after several months in which Customs and Excise collections had made a disappointing showing. For the four months of the Union's financial year, from March to July, the revenue at £9,835,130 is nearly £600,000 below the figure for the corresponding period of 1937. On the other hand, Government expenditure maintains its upward tendency, the July disbursements at £4,189,952 being £357,800 in excess of the expenditure for the same month in 1937; an increase of £113,000 in funds for the assistance of farmers partly accounts for the difference.

Estimates of Government expenditure for the year 1938-39, just presented to Parliament, amount to £42,845,988, an increase over the estimates for the previous financial year of £2,797,851. These figures exclude Railways and Harbours expenditure, for which the estimate is £39,092,909; this is £369,812 more than in 1937-38, though on Railways account the estimate is nearly £3,000,000 higher.

Eire

After the Agreement

DUBLIN, August 19.—The good effects of the Anglo-Irish Agreement have already begun to appear in Irish official statistics. Exports of all classes of agricultural products have increased, while prices have also shown an upward tendency. Moreover, bounties are no longer paid on exports, and the financial situation is thereby greatly eased. The effect of the Agreement on imports will not appear so rapidly, because no duties will be reduced until the Prices Commission have made a full investigation into all the relevant circumstances. It is impossible to foretell the extent to which duties will be lowered as a result of these investigations, but, if the experience of the Ottawa clause in the Dominions is any guide, it would be a mistake to expect any substantial reductions.

There is a danger that the improvement in the economic situation caused by the Agreement may breed a feeling of false complacency. In particular, it has become the fashion

in certain quarters to say that the warnings of the Banking Commission have lost their force and become out of date. While it is true that both the balance of payments and the Budget will benefit as a result of the Agreement, it is equally true that the greater part of the Commission's criticisms of recent public policy are quite unaffected. The recommendations about deadweight debt, land settlement, housing and the indebtedness of local authorities remain completely valid. Moreover, the difficulties in regard to the balance of payments are the result of factors in no way connected with the Anglo-Irish dispute.

These difficulties can all be summed up as unduly high costs. Recent figures of the building and baking trades demonstrate that in Dublin wages are higher and output per man lower than in England. Many capital goods are dear because of the prevailing protective policy, and municipal rates are very high. The agricultural producer is also faced with rising costs owing to protectionism and the fixing of minimum wages which many of the poorer farmers cannot afford to pay. The railways are in a deplorable condition and are dismissing numerous workers. Even the banks have been heard to complain that the fall in their profits is partly the result of a rise in operating costs. These problems are in no way solved by the Agreement. Nor are the problems arising out of the desirable but expensive housing programme which seems destined to involve the country in an annual increase of debt and taxation for many years.

Progress in Electricity

It is pleasant to be able to point to one publicly operated and controlled enterprise that is paying its way and at the same time serving the consumer at a reasonable price. The report of the Electricity Supply Board for 1937 shows that income exceeded expenditure by £410,952, while the average price per unit of current was reduced from 1.74d. to 1.69d. The number of units sold during the year increased by 25 millions and the number of consumers by 14,747. The Shannon scheme is an example of the development of the country's natural resources by the most efficient methods possible, and is in striking contrast to certain other industrial developments which rely on imports for many raw materials or else deflect agriculture into subsidised and less profitable directions. The correct policy for the future is to investigate the possibilities of further developments based on the natural resources of the country. The full utilisation of grass and peat are two problems on which money spent on research would be amply repaid.

The preliminary agricultural statistics for mid-1938 show that the acreage under corn crops and hay has decreased. The decline of 16,000 acres in the case of barley reflects the gradual removal of Guinness's business to England. Pigs, sheep, cattle and poultry have all increased in numbers, but the number of milch cows and heifers has slightly declined.

Letters to the Editor

Can Italy Feed Herself?

TO THE EDITOR OF THE ECONOMIST

SIR,—I should like to correct certain statements in the article "Can Italy Feed Herself?" which appeared in *The Economist* of June 18.

(1) The writer states that "now everybody knows that the *battaglia del grano* must be renewed again, and more vigorously." Absurd. The *battaglia has never ceased*—it is a continuous and systematic policy of cultivators and experts. Despite seasonal adversities, this year's harvest will be at least 70 million quintals (not 60 millions, as was stated). Improved methods have also raised the milling quality of the wheat so effectively that the addition of 10 per cent. of corn meal will enable Italy to meet all her needs until the next harvest, and the bread will be of a better quality than recently produced for a few months, containing as it did 20 per cent. (not 30 per cent.) of meal. Thus, as regards bread, Italy can already feed herself, even in a bad year.

(2) The writer also states, on better authority, that until the average annual production can be stabilised at about 85 million quintals, Italy must remain to some extent dependent on imported wheat, but he adds that such an output could only be attained by diverting land from other uses. He does not seem to know that *bonifica integrale* is both creating new land and raising the productivity of areas already in use. The reclaimed and improved land is mainly used for cereals and other crops, the output of which could, according to the article, only be expanded by invading land already in other use. It is true that some hill land has been devoted to wheat in a manner that might appear "uneconomic"; but here there is a social advantage in the increased security of peasants, who are guaranteed a remunerative price for this product of their mixed farming. This may be only a temporary advantage, because other crops and livestock are being brought under similar schemes.

(3) The increase in general production secured through the *bonifica* is undeniable—there are plenty of statistics to prove it—but the writer says that "since 1935 expenditure on *bonifica* has virtually ceased." This is a gross misstatement. In the years 1935, 1936 and 1937 expenditure was not only considerable, as before, but 100 million lire was added to the vote; and in September 1937 a further fund of 3,000 million lire was voted, while 686 million lire were still available from the previous vote.

(4) The writer must again have been drawing on his imagination when he stated that "Italy must have another 50 million olives, and it is suggested that half a million be planted each year," thus arriving at self-sufficiency "in a century," while "most of the new olives must be put down on land now occupied by other, but indispensable, crops." Actually, the olive policy is mainly concerned with improved methods of cultivation and extraction of the oil, which have already given satisfactory results, the yield in the Province of Leghorn, for example, rising by more than 50 per cent. This is to be supplemented by a programme of grafting and replacement of inferior trees, and a limited amount of new planting in proportion to the growth of population. For the full required quota of olive oil, production has only to be raised by a third, which can certainly be accomplished without planting trees by the million.

(5) The writer is also wrong in ridiculing the notion that sheep can be added to the intensively cultivated farms of Central Italy. This is being done extensively and without impinging upon other activities. Livestock, in fact, is the crux of the agricultural problem. Better production was partly limited by technical factors, but mainly by the economic insecurity of the producer caused by fluctuating world prices. A representative, non-profit-making board has recently been authorised to undertake the purchase and distribution of all imported livestock, for the purpose of stabilising domestic prices and improving quality.

(6) It is absurd to write gloomily about the "sacrifices" imposed by guaranteed prices and by the policy of insulating Italian agriculture from these shocks of a disorderly world. Guaranteed prices benefit the consumer as well as the producer, both by assuring steadiness of production and by giving the peasants a higher and more stable purchasing-power, which makes them better customers for industry, thus increasing and stabilising employment. And it should be noted that in Italy the consumer is protected by control of rents, retail prices and the charges of public utilities.

In conclusion, may I point out that for an agricultural country like Italy, a policy of autarky for the main industry is essential. Foreign purchasing power must be freed to buy the raw materials not available at home but essential to the life of any civilised community. It may seem paradoxical, but maximum self-sufficiency is thus the one sure policy which will enable Italy to take a more orderly and active part in international trade.

ODON POR.

Rome, July 24, 1938.

The author of the article writes: —

(1) It is true that the *battaglia* has never ceased. But victory has been declared so long and loud that the layman does not know this. The estimate of 60 millions was on weather reports, and at the time it was made was not a misstatement. Signor Por will be in a minority of one if he thinks that Italy can avoid wheat imports this year; for it is difficult to see how 77 million quintals (i.e. with the adulteration) can cover a demand expertly estimated at about 85 million quintals. If it is intended to supplement the harvest from stores of grain already in reserve, then imports will still be necessary in order to re-fill the silos.

(2) Land reclamation cannot "create" land, however desirable that would be. It is doubtful if the "social advantage" accruing to upland peasants balances their loss of livestock, since it was usually their custom, formerly, to grow sufficient wheat for their own subsistence.

(3) The money voted for reclamation in 1936 and 1937 had not been forgotten. But it appears that until spring, 1938, very little of this money was spent—in any case a very small proportion of what was spent in the halcyon years of 1928-34. There is, after all, a difference between voting lire and spending them. It would be interesting to know why it was that in September, 1937, "686 million lire were still available from the previous vote."

(4) The story of the 50 million olives is official. See a symposium "Agricoltura e Autarchia Economica," published by the official *Confederazione Fascista dei Lavoratori dell'Agricoltura*, pp. 234-7.

(5) The livestock board was appointed since the publication of the original article. Scepticism is permissible in view of the long record of failure which has met recent efforts to improve and increase Italian livestock.

(6) With all respect to Signor Por, the sacrifices are real. What do the factory workers of the North think of the wheat tariff? Macaroni and other farinaceous foodstuffs have just been subjected to a rise in prices due, it is explained, to the rising cost of grain. As the Rome correspondent of *The Times* reported on July 11th last:

> "The general rise in the cost of living has been noticeable in every household of late, and, as the housewives know to their cost, it is often impossible to obtain food except at prices considerably above the figures officially quoted as maxima."

So much for consumer-protection! Sacrifices are no less unpleasant for being called "price stabilisations."—ED. *Economist.*

A New Venture in Advertising

TO THE EDITOR OF THE ECONOMIST

SIR,—The social effects of advertising were exhaustively discussed about a month ago at the Glasgow meeting of the Fourth International Advertising Convention. Lord Horder has recently drawn timely attention in the House of Lords to the advertising of "quack" medicines. It may be of interest to call attention to one of the most revolutionary methods of advertising we have encountered. Not surprisingly it originates in the United States.

No unbiased student of economics can fail to realise the important influence exercised by American methods of research in the development of economic psychology in theory as well as in all spheres of daily life. The fact that we characterise modern achievements in advertising and propaganda as "American" seems to confirm this view.

The advertisement of one of America's leading distillers, appearing currently in various magazines and newspapers, runs as follows: —

> . . . . We do not want to sell whisky to anyone who buys it as a sacrifice of the necessities of life. Whisky is a luxury and should be treated as such. Fine whisky can play a pleasing part in the scheme of gracious living . . . . but only when taken in moderation and only after the bills are paid . . . . This statement may seem contrary to our self-interest. Actually it is not . . . . In the long run, we believe, it is a good business for us to say, "pay your bills first. . . ."

There will, of course, be much argument among the experts about whether the method adopted by this firm is likely to prove successful in increasing the consumption of their products. But, from a far-sighted point of view, the slogan "Pay your bills first" might serve the useful purpose of preventing the killing of the goose which lays the golden eggs, viz., the fleecing of the consumer who nowadays does not buy high-price branded goods solely to satisfy a real need. At least as far as housewives—the picked troops of the consumers' army—are concerned, this assumption apparently holds good.

A particularly interesting consumer's research investigation, conducted by the Marketing Department of the National Institute of Industrial Psychology, and the previous experience of this Institute, lead to the conclusion that

> the house-wife of to-day, in all classes, distinguishes no longer between luxuries and necessities, and is principally concerned with satisfying desires . . . . Each family comes to possess those articles which advertising makes them feel unhappy if they do not acquire.

Obviously, advertisers have come to a cross-road. On the one side, there is hardly a presidential address delivered at the advertisers' annual meetings that omits an emphatic hint that it is essential for the eventual success of each advertisement for it to be considered absolutely trustworthy and honest. On the other, Mr. J. Donald Adams, Editor of the *New York Times* Book Review, has stated that

> We observe a steadily mounting dishonesty in advertising copy that claims qualities for a product which even the chicken-brained must sometimes realise have not the slightest basis in fact.

These differences of opinion about the methods of advertising are only another illustration of the great change which is taking place in the economic structure all the world over. This question of advertising, and kindred consumers' problems, may open new fields of economic and social research, particularly for institutions which, like the National Institute of Economic and Social Research and Nuffield College, aim at combining the results of economic science with the economic demands of daily life.

Yours faithfully,
LEON ZEITLIN.

London, N.W.6.

POINTS FROM LETTERS

Coal at Sea.—The report of the Committee appointed to examine the possibility in the national interest of obtaining an increased use of coal for bunkering purposes attempts to impose arbitrary horse-power limits "in the range from 1,500 to 8,000 s.h.p." on the use of coal at sea. Reporting, as these limits practically do, that ships already burning coal should continue to burn coal is not helpful towards obtaining an increased use of coal. With modern methods there is no limit, high or low, of horse-power for a coal-burning ship. The Committee states that: "The price of bunker coal is the crux of the economic problem." It is not. The crux is the relative prices of coal and oil.—*G. Bowles, Secretary, British Coal Campaign.*

Banking and Trade Recession.—Cheap and abundant money and a banking system willing to follow the lead of the Government can certainly not by themselves put an end to the tragedy of depression. The disinclination of individuals to buy is a factor of vital importance. So far this factor is not under any form of control, and present monetary policy is therefore inadequate.—*Oskar Liebeck, London, N.W.3.*

10,000,000 WORKERS BELOW THE POVERTY LINE: this is the conclusion to which the author comes as a result of his careful analysis, based on official figures, with the help of the Trade Unions concerned, of the condition of the industrial working class in this country. The standard he takes is the well-known Rowntree minimum, and with respect to this he analyses the basic industries of the country.

He only deals with the worker in industrial employment and ignores the very large number of people in this country who exist on various forms of relief on even lower scale. But this conclusion is sufficiently startling, especially at a time when the rise in the cost of living and the threatened economic depression is drawing people's attention to such matters.

Books and Publications

Imperial Bankers

THE present decade is witnessing the centenaries of some of the famous Empire banks as well as those of the great British institutions, and it is meet that the opportunity should be taken of publishing a record* of colonial banking. Barclays Bank (Dominion, Colonial and Overseas) is itself of only post-war foundation, but its three major constituents, the Colonial Bank, the Anglo-Egyptian Bank, and the National Bank of South Africa, all have long and honourable histories. From these much can be learned, not only of the peculiar needs and difficulties of banking throughout a large part of the Empire, but also of the many economic vicissitudes of the scattered territories themselves.

The Colonial Bank received its charter in 1836. Originally it was a West Indian Bank, although later it extended its activities across the Atlantic to British West Africa. Its history is an enthralling story of doubloons and pieces of eight, of volcanoes and earthquakes, intermingled with more mundane controversies over the bank's right to issue notes. There are graphic descriptions of the Mount Pelée eruption of 1902 and the Kingston earthquake of 1907, when great gallantry was displayed by the bank's staff.

The history of the Anglo-Egyptian Bank, from its incorporation in 1864, was even more eventful. The bombardment of Alexandria, the finances of the old Khedival Government, Egypt's part in the Great War, and the extension of the bank's activities to Palestine, all find their place in this history.

Nor does the National Bank of South Africa lag behind in interest. Itself a merger of several banks, it lived through the South African War of 1899-1902, when it had to tread a perilous path between the contending forces—a path fraught with danger not to its personnel but to its specie. It saw the growth of the South African gold-mining industry, and the union in 1910 of the four South African Provinces. The economic benefits of the Union are brought out very clearly in this history.

In 1926 came the formation of Barclays Bank (Dominion, Colonial and Overseas). It was due to the vision of the late Mr Goodenough, chairman for seventeen years of Barclays Bank. It was a bold project, to link together banking interests spread over a large part of the Empire and serving the most diverse activities. Yet, though the history does not entirely make it clear, in this diversity lies the bank's strength.

A bank serving one territory and one crop is always at the mercy of that crop; and banking in primary producing countries is subject to wide seasonal influences. After the harvesting and marketing of the crop a bank may be swamped with deposits, while during the crop-growing season it is pressed to lend up to the limit of its resources. But a bank which operates in such widely separated territories, raising such different crops and enjoying such a variety of climatic conditions, may safely reckon that it will never have to lend up to the hilt everywhere at once.

Barclays Bank (Dominion, Colonial and Overseas) has justified itself not only in the history of its constituents, but also in its own briefer record. It has weathered the Great Depression and the peculiar vicissitudes of all the countries it serves. It has seen the Empire drawn closer together and acquire a loose but common monetary system based on the pound sterling. It has witnessed and has also approved of the Ottawa Agreements.

But the bank is not only celebrating its past history. A bank operating in Jamaica, Trinidad and Palestine cannot forget that fresh pages of its history are being written to-day. Fortunate, therefore, is it in its staff, of many nationalities and speaking many languages, but all able to serve the bank well in their various ways.

* A Banking Centenary. Barclays Bank (Dominion, Colonial, and Overseas) 1836 - 1936. Published for private circulation. A limited number of copies are available at the Bank's Head Office, 54 Lombard Street, E.C. 3, at a price of 7s. 6d.

"Le Problème du Contrôle des Changes en France." By Robert Verret. Librairie du Recueil Sirey. 180 pages. Frs. 40.

The fresh deterioration since mid-summer in the French financial position and M. Daladier's broadcast of August 20th, in which he urged the need of increased production and a sound currency, certainly impart fresh importance to the question of exchange control in France. Prophecies have, in fact, for some time been freely made, both in France and elsewhere, that the country, whether or not she desires it, is being pushed by the pressure of events in that direction. It is therefore of importance to learn what exchange control would mean to France, and so M. Verret's discussion of the question is extremely timely. M. Verret recognises the grave consequences of exchange control to a country with a Colonial Empire. He admits the French dislike for any form of control, and realises that France would thereby find herself aligned, in the economic sense, with the totalitarian States. Exchange control for France would also mean the torpedoing of the Tripartite Agreement and a further blow to M. van Zeeland's hopes. Nevertheless, France is rapidly becoming faced with the choice between the system of free exchange, in force to-day and firmly advocated by M. Daladier, and a system of exchange control. M. Verret has no illusions about the latter. There is no half-way house, no possibility of "contrôle souple" in place of "contrôle rigoureux et stricte." The latter would come to govern France—not only in the external field of exchange transactions but over the whole of her external economy. The results to French foreign trade would be serious, and in M. Verret's view there would be a slight increase in the cost of living. On the other hand, he holds that control could be applied in such a way as to stimulate production, and it is common ground that this is France's fundamental problem. Whether M. Verret is right both in his foreshadowing of exchange control and in his estimation of the likely consequences, time alone can show. But at least he has written a stimulating book upon a subject, which, though mournful in itself, badly needed discussing.

THE BUSINESS WORLD

Coal and the Investor

FOR most of the post-war period coal mining shares have been unpopular with investors. In the early and middle 'twenties wage disputes and strikes drew continuous attention to the industry's problems, and the relative calm of the late 'twenties was too short to restore confidence before the great depression began to cast its shadow. When coal shares really began to win favour, from about 1935, many investors hoped that the industry had overcome its troubles. Yields of between 7 per cent. and 9 per cent., which can now be obtained on representative coal shares, are not necessarily inconsistent with that view. But the results of Houghton Main Colliery and the reduced Hilton Main dividend, published this week, show that the industry is less profitable in present conditions of trade recession than a year ago. The question which the investor must decide is whether coal shares now face a spell of temporary recession or whether they may revert to their old condition of relative unpopularity.

Very broadly, the commercial history of the coal trade since the war can be divided into two phases, and a third phase appears to be developing now. The first period was one of downward adjustment after the war-time inflation. Prices were too high in the immediate post-war years, and so far as costs were lowered, either through increased efficiency or reduced wage rates, the consumer obtained the benefit. From 19s. 9½d. in 1923, the average price of coal fell steeply to 13s. 3d. in 1928, and profits amounting to 2s. 2d. per ton in 1923 were replaced by losses of 11d. per ton in 1928. A second phase followed, in which a "natural" stability at these new low prices was later reinforced by the Act of 1930, which deliberately set out to achieve stabilisation through district output quotas. In this second period, efficiency steadily improved—for example, the proportion of coal output cut by machines rose from 26 per cent. in 1928 to 55 per cent. in 1936; of coal mechanically conveyed underground, from 12 per cent. to 48 per cent.; and of coal cleaned before sale, from 25 per cent. to 43 per cent. But the effects of rising efficiency on costs were at first obscured by the over-riding influence of the depression. The satisfactory profits which began to emerge as the depression lifted took the investor rather by surprise, and coal shares came suddenly into better favour.

It seems probable, however, that in 1936 a third phase commenced, whose effects in turn were at first obscured by the over-riding influences of prosperity. In that year the miners made good their claim to higher wages, and thus set a limit to a series of cost reductions which had been in progress for many years. Ten years before, the industry had been compelled to yield, for the benefit of consumers, the fruits of any economies which it could achieve; now it was being compelled to hand them to the wage-earner. Advancing prosperity provided an easy and immediate solution of the problem in the form of a general increase of coal prices. Subsequently, pressure of demand drove prices far higher than was needed to cover higher wage rates alone. Coal mining profits in 1936 and 1937, therefore, jumped to levels unknown for years. But those were near-boom conditions. In the long run, it is possible that the check to cost reductions which occurred in 1936 may prove more significant than the jump in prices which, for a time, has yielded such good profits.

Recent movements both in costs and prices have been very substantial, and the delaying effect of long supply contracts has projected their rise well into the current year, although more sensitive commodity prices collapsed early in 1937. We show in the following table average production costs, proceeds, and profits per ton annually from 1932 to 1937, and for the first quarter of 1938 (the latest figures available) compared with the corresponding period of 1937:—

	Per Ton disposable commercially Production Costs	Proceeds	Profits
	s. d.	s. d.	s. d.
1932	13 8	13 10	0 2
1933	13 3½	13 6½	0 2½
1934	12 11½	13 4½	0 5
1935	12 11½	13 6	0 6½
1936	13 8	14 7½	0 11½
1937	14 7½	15 10½	1 2½
1st Quarter 1937	*13 9*	*15 6½*	*1 9½*
1st Quarter 1938	*15 5*	*17 4½*	*1 11½*

Though later figures are not yet available, the probability that current deliveries of coal are still being made at prices higher, on the average, than those of mid-1937 is suggested by the July, 1938, average export price of 21s. 3d. per ton, against the July, 1937, average of 19s. As recently as April, indeed, the chairman of Cortonwood Collieries declared that his company was then only running off its old lower-priced contracts, and obtaining the benefit of higher prices.

For the time being, therefore, profits are not suffering in extreme degree from the recession. Output has fallen off somewhat, but selling prices are higher, and even a sharp jump in costs did not prevent a material rise in profits in the first quarter of 1938. Investors, therefore, may reasonably expect fairly satisfactory colliery profits in coming months, despite the evident deterioration in trade conditions reported by the industry for some time past. They should realise, however, that this paradox is due to the operation of a time lag, and not to the enjoyment of any permanent immunity from lower prices on the part of the industry.

We have emphasised that the dominant factor in the industry's present position is to be found in rising costs, which are likely to prove more durable than rising prices—at least, on their recent scale. Of the industry's net costs of 15s. 5d. per ton, for the first quarter of this year, management, royalty, and sundry costs, which are relatively small, show little rise from the levels established in past years. Inevitably, the largest cost factor in coal production is wages, and wages have contributed most to the higher cost level. Compared with approximately 8s. 6d. per ton in the first quarters of 1934 and 1935, before wage rates were increased, wage costs in the first quarter of 1938 amounted to 10s. 2¾d. Undoubtedly, part of this increase is due to the lower efficiency of "marginal" mines and workers, which have been brought in to deal with peak demand. The same factor is reflected in the reduction of output per manshift worked in the first quarter of 1938 to 23.40 cwt., against 23.95 cwt. in the first quarter of 1936. With a reduced total output, some reduction in average wage costs can be expected with certainty. Savings will also be realised

on the costs of stores and timber, which rose from about 1s. 6d. per ton in 1935 to 2s. 3d. for the first quarter of 1938. Indeed, pit wood prices are already falling. But, though reduced pressure of demand should provide some savings in costs, the important points for the investor are first, that miners' wage rates have (with the general approval of the country) been advanced on the average by an amount equivalent to 1s. per ton, and, secondly, that the decline in efficiency due to the re-introduction of "marginal" labour and workings began to show itself clearly in 1937, when the output of commercially disposable coal amounted to only 217,037,110 tons, compared with 222,500,000 tons in 1930 and 239,300,000 tons in 1929. The industry's productive capacity would seem to have shrunk considerably during the past decade, to the accompaniment of a steady drift of labour away from coal mining. Consequently, costs begin to rise rather steeply when output exceeds a point which ten years ago would have seemed only moderately high. This cost factor could be corrected either by training new personnel or by increased mechanisation, but neither correction can be quickly applied. In present conditions, last year's rate of output seems to have represented the maximum which could now be achieved at any reasonable price. To supply home demand on the 1936 or 1937 level, together with exports on the 1929 level, would evidently involve serious—perhaps unsupportable—technical strain.

At any high level of activity, therefore, costs are now considerably increased, and even a moderate rate of output involves some increase arising from higher wage rates. Yet it is evident that a considerable downward pressure on prices may soon develop not only in the export trade but in the home trade too. Despite the high proportion of output which is still being delivered against old contracts there have already been substantial reductions in the price of many classes of coal for new business; and there is no ground for supposing that average prices will not fall further. When lower prices become effective, the effects of increased costs, hitherto masked, will begin to appear. Investors would accordingly be wise if they budgeted for the possibility of difficult profit-earning conditions developing next year and perhaps continuing for a period.

It does not follow that the British coal industry is necessarily condemned to another long phase of low profits, or coal-mining shares to a prolonged period of malaise. Recent price movements in the British coal trade, remarkable though they have been, differ very little from those of our chief competitors. This fact is evident from the following table of average export prices per ton for coal from this country, Germany and Poland:—

	U.K.	Germany	Poland
	s. d.	Rm.	Zl.
1936 year	17 0	9·4	15·5
1937 year	18 8	11·1	16·8
1937 January–July	18 1	10·3*	16·0*
1938 January–July	21 0	12·5*	18·8*

* January–June.

The rise between 1936 and the first part of 1938 is about 23½ per cent. for this country, 33 per cent. for Germany and 21 per cent. for Poland. German reichsmark prices may not be an accurate guide to true export values in terms of free currencies, but the figures do not substantiate alarmist reports of dumping on the part of Germany and Poland. If a cut in export prices has to be faced, all principal exporters will share the burden. Continental reports even suggest that such a prospect may bring some form of international coal export agreement considerably nearer than hitherto.

Nor need the difficulties of home business be long-enduring if the industry faces its problems in a spirit of broadminded determination. Manifestly, increased costs make the need for amalgamation yet more urgent. Output should be concentrated at the more efficient pits instead of being spread, by the present quota system, over as wide an area of the industry as possible. Neither the emasculated new Act nor the apparent mood of the coal owners provides much hope that amalgamation will be accepted with good grace. But the fact that some degree of compulsion is now possible, though it is still encumbered by obstacles, together with the difficulties which are to be anticipated from increased costs, suggests that some progress towards amalgamation may be achieved over the next five years. But, though five years would not be a long time in the history of a great industry, it is a long period for the investor. When, and if, amalgamations begin to provide evidence of a further increase in the industry's efficiency, coal shares will again have attractions. But for the time being they cannot be described as a progressive investment medium.

France's Oil Supplies

IN every country's defence plans, the safeguarding of oil supplies has come to be an object of the highest importance. The last war was largely fought and won on petrol; but the thirst for oil of the armies of the next war will be vastly greater than either the demand of 1914-18 or the peace-time consumption of the nations to-day. Every nation is therefore looking to its oil supplies. Of the Great Powers, America and Russia can supply their needs from their own production. Great Britain relies on her Navy to keep the sea-routes open. Germany has an eye on the oil of Roumania, but is developing the domestic production of synthetic fuels.

France, like Britain, depends primarily on imports of oil. On her own territory she is as devoid of petroleum as Great Britain. Despite intensive geographical exploration she has only one small producing field, which in 1937 yielded 72,000 metric tons of crude petroleum. Even this insignificant supply might be endangered in time of war, for the wells are situated at Pechelbronn, near the German frontier. The policy of prospecting is to be continued, but clearly little reliance can be placed on its success.

Nor is the outlook any brighter in the French Colonies. Oil sent from these to the mother country enjoys the same exemption from taxes as oil produced at home, but despite this encouragement and a vigorous prospecting campaign, the results to date have been disappointing. The new Moroccan Petroleum Company produces a modest quantity of crude oil in the Djebel-Tselfort region, but that is virtually all.

France does, however, have one important source of supply at least partially under her own control. Under the San Remo Agreement she was granted a one-fourth share in the Mosul concession, and this has been efficiently exploited by the Compagnie Française de Petroles. About a million tons of crude oil are shipped annually from Iraq to refineries at La Mède (near Marseille) and Gonfreville (near Le Havre). As the following table shows, this represents a sixth of France's imports of crude oil, or rather less than a seventh of her total imports of petroleum and its derivatives:—

IMPORTS OF PETROLEUM PRODUCTS
(Metric Tons)

	1935	1936	1937
Crude oil	5,621,612	6,008,739	6,151,728
Petrol (tourisme)	462,033	466,056	530,005
Petrol (other)	108,297	115,395	75,812
Fuel oil	293,641	397,381	627,574
Gas oil	117,816	178,363	215,428
Lubricants	105,443	98,585	88,012
Other products	57,737	46,812	60,187
Total	6,766,579	7,311,331	7,748,746

Apart from Iraq, France's chief sources of crude oil are the United States, Venezuela, Peru and Columbia. She obtains petrol from Roumania and Columbia; lubricants from the U.S.S.R. and Poland; gas oil from the United States, Iran, the U.S.S.R., Roumania and Venezuela; and fuel oil from the U.S.S.R., Iran, Roumania and Venezuela. Like the United Kingdom, France has insured herself against an interruption of communications by obtaining her supplies by way of the Mediterranean as well as across the Atlantic from the New World.

In view of the inadequacy of her domestic oil supplies, France has sought to strengthen her position in a number of different ways. Thus she has ensured that her imports shall be carried mainly in French bottoms, and shall consist predominantly of crude oil, so that at least the refining process shall be carried out in France. Importers are obliged to hold substantial stocks for use in an emergency, and she has vigorously encouraged the development of local substitutes for imported oil. These various policies deserve examination in detail.

The French tanker fleet has grown steadily since a subsidy was granted in 1935, and now has a total capacity of 450,000 gross tons, or more than double the German figure of 190,000 tons. The subsidy costs the Exchequer some 16 million francs (or only about £90,000) a year, and substantial results have thus been achieved at relatively small expense.

The establishment of refineries was advocated by the Supreme Council of National Defence as long ago as 1922. One of the reasons given was that crude oil is less inflammable than petrol, and therefore safer to transport. Another was that it is physically and chemically more stable than its derivatives, and so can be more easily stored. The policy was eventually adopted, and twelve large refineries were erected between 1929 and 1932. These raised the total capacity of French refineries to 7.9 million metric tons per annum, and made France virtually independent of foreign supplies of finished products. The balance of payments has incidentally been relieved of an annual charge amounting to some 700 million francs (say £4 millions).

There has recently been an interesting development in the French policy of storage. Importers had long been compelled to keep stocks amounting to at least 40 per cent. of the country's annual needs, but these had nearly all been held in vulnerable positions near the ports. In February of this year a law was passed to compel the importers to keep at least 15 per cent. of their quota in regions outside the frontier zone, which was defined as the area within twenty kilometres of the seaboard or sixty kilometres of any land frontier except the Pyrenees. The Ministry of National Defence has also recently authorised the construction of a pipe-line from the refineries at Donges, on the coast near St. Nazaire, to Montargis, 60 miles south of Paris. The line will be 280 miles long, will be laid a metre below the surface, and will deliver a million tons of petrol a year. The line is to be completed by 1940, at an estimated cost of 150 million francs, and will discharge into bomb-proof reservoirs.

The most interesting of all these devices to increase the security of the oil supplies in time of war is perhaps the French experience with substitutes for natural oil. France's coal resources are relatively poor, as her reserves have been estimated at 18 milliard tons, compared with 200 for Great Britain and 289 for Germany. In the past she has, therefore, felt little incentive to embark on large-scale schemes for the hydrogenation of coal, quite apart from the question of expense. A small but increasing quantity of aviation petrol of high octane rating has, however, been produced in regions at some distance from the potential war zone. Thus the annual rate of output of the Bethane works was raised from 2,573 tons in 1936 to 4,146 tons in the first half of 1937, and the corresponding figures for the Lieven works were 3,548 tons and 5,440 tons respectively.

This year's defence programme, however, reveals some change in the Government's attitude towards the production of synthetic oil. Three hydrogenation plants, using respectively coal, lignite and crude oil, are to be erected with a combined capacity of 180,000 tons per annum. The capital cost, however, is estimated at £35 per ton, and lack of funds may prevent the proposals from being carried into effect. If so, the loss to the country will be small, for the price is a very high one, and the contribution to national security almost negligible.

The traditional French policy has been to enforce the admixture of a proportion of alcohol in all petrol. Its object has been as much to placate the peasants, who were thus provided with a market for their surplus produce, as to increase national security. This was particularly the case in the depression years, when surpluses of beet and grapes were threatening to cause a collapse of prices. But the policy is proving very expensive now that agricultural products are fetching better prices. In 1936 the Treasury suffered a loss of 1,117 million francs on sales of 312,880 tons of power alcohol distilled from beet, corn and grapes; and even so buyers were only found by compulsion. The compulsory percentage has already been reduced, and a further cut may be necessary; the French admiralty has been granted complete exemption for vehicles operating in the port areas.

Another device has been to compel the owners of ten or more commercial vehicles to run at least 10 per cent. of their fleet on producer gas. There are over 4,000 small vehicles in use, and the champions of producer gas claim that operating costs are only one-third of those of equally large vehicles run on petrol. There may be a great future for this system, but as yet it is only adopted under compulsion, even though it carries with it a considerable remission of taxation.

French policy is, therefore, necessarily and consciously based upon the assumption that the sea-routes, or at least the Atlantic sea-route, will be kept open. The various policies that have been adopted are designed to protect the country only against a temporary or partial interruption of sea-borne supplies. They cannot do more. In this most vital section of the problem of defence the interests of France and Britain are identical, and, in the last resort, they rest entirely on sea-power and on the ability of the two countries to maintain communications across the Atlantic. They are fortunate indeed to have this possibility; for the only alternative open to countries without natural oil deposits is the enormously costly creation and maintenance of plants for synthetic production of oil.

She used to be comfortably off . . .

WIDOW, 52, requires situation urgently. Where child of 9 not objected to. Capable, good cook. write F, Box 208, Daily

EVERY year illness or accident leaves thousands of families to face the world alone. In most cases they are not well provided for. Few men are in a position to put aside money enough to maintain their dependants at a satisfactory standard of living in the event of death. It is only fair to your family and to yourself that you place this burden on broader shoulders.

Consider the

'SAFEGUARD' PLAN

which provides a guaranteed income of £3, £6 or £9 per week tax free for a period of years after your death and a cash sum, if desired, when the income commences. When the annual income ceases a cash payment of £1,000, £2,000 or £3,000 is made. If you survive the period of your family responsibilities it can be arranged for the cash sum to be payable to you.

An enquiry for full details and for an illustration suited to your own circumstances will cost you nothing; rest assured you will incur no obligation by doing so.

Finance and Banking

Gold and the Dollar. — With the exception of Tuesday, when a sudden new hoarding demand developed, London gold dealings have been on a smaller scale, while there is also evidence that the New York exchange rate is beginning to respond to arbitrage sales of dollars against gold purchases in London. The authorities have pursued their policy of keeping the gold premium just low enough to permit of arbitrage, thereby providing a measure of support to the pound. Throughout most of the month the London Control has used this indirect means to supplement its direct support to the pound. Fundamentally it makes no difference whether the Exchange Equalisation Account sells gold direct to the American authorities, or indirectly through the London bullion market. As a matter of pure technique the former method has the advantage of permitting more precise control, for the size of the arbitrage demand for gold in London cannot be pre-determined by the British authorities. Psychologically the latter method has something to recommend it, for it creates an apparently natural demand for sterling, of a kind calculated to exercise a steadying influence on the exchange market. Thus the authorities were probably right to pursue both courses simultaneously, especially when faced with such serious pressure on the pound. This week the rate has shown signs of settling down at $4.88, and there are suggestions that an attempt may be made to hold it there. Even at that rate, sterling is probably still overvalued, a fact which makes it more likely that the pound will at least not return to the higher levels current earlier in the year.

* * *

M. Daladier and the Franc.—The French Prime Minister's broadcast address last Sunday, and the subsequent events in Paris, reference to which is made on pages 403 and 408 of this issue of *The Economist*, have had a steadying influence on the foreign exchange market. At the end of last week the franc became firmer in anticipation of his speech, though this improvement may have been due in part to stage-management on the part of the French authorities. On Monday, feeling was inclined to be dubious, and three months' francs were offered up to Frs. 4⅜ discount. Doubts were then felt whether M. Daladier would achieve his proposed modification of the 40-hour week without causing a serious split among his supporters. Latterly a more hopeful view has been taken, and both spot and forward francs have been steadier. Some official support has continued to be needed, but on a much smaller scale than earlier in the month, and by Thursday morning three months' francs had improved to Frs. 3¾ discount. It is probably true to say that the August flight of capital has now for the moment been arrested, but there are no indications of any reversal of the movement. It is impossible to estimate France's net gold losses during the current month, but her unusually large tourist receipts must have greatly mitigated the effects of the recent capital flight. This makes it reasonable to assume that France still retains a good part of the gold recovered by her last May, and so her exchange position *per se* need not yet cause any anxiety. The Treasury position is less reassuring, but the real crux is whether M. Daladier will be able to bring about any improvement in production. Meanwhile, his refusal to contemplate fresh devaluation or exchange control has given satisfaction in the exchange market—tempered with some apprehension lest future events prove too strong for him.

* * *

Money Against Gold.—Since the Bank of England in May last removed the ban on bank loans secured by gold such business has assumed exceptional importance—far greater than the authorities can have envisaged at the time. The extension of bank accommodation against the security of gold has kept pace with the development of the forward market in gold, the ban on which was removed at the same time. The rehoarding demand for gold and the demand for forward gold which have arisen during the past three months have been the joint product of increased international tension and of renewed loss of confidence in the French currency position. The bulk of the gold bought outright has been paid for and deposited in London, and it therefore makes no call on the credit facilities of this market. But against their forward sales of gold, dealers and brokers have covered themselves by running spot positions in gold, and it is in the financing of these that the demand for credit facilities has its origin. The market for loans against gold is in no way stereotyped, as is the market for loans against bills or short bonds. The rates quoted are largely a reflection of the names concerned and of the periods for which the loans are taken. In certain cases forward sales of gold for periods of two and three months are being financed by day-to-day borrowing in the London market. Clearing banks are prepared to lend on such terms against gold at 1 per cent. The principle underlying such finance is questionable, as the intermediary dealers are in fact lending long and borrowing short. They might be seriously caught were an emergency to arise causing the day-to-day rate to increase substantially or, more important, leading to the withdrawal of their loan facilities. Much sounder is the principle followed by the largest operators in the market, who strive to arrive at an exact balancing of their commitments and tend to keep some equilibrium between the incidence of their forward sales and of their loans against gold. This involves borrowing against the metal for fairly extended periods, and it is in such loans that the differentiation between "good" and "not-so-good" borrowers becomes most apparent. The rates quoted for three months' money against gold may vary between limits as wide as 1⅛ and 2¼ per cent. The manner in which the security against such loans is handled also depends very much on the standing of the parties. In certain cases the lending banks may require the metal securing the loan to be deposited with them. In others they will be content with the weight notes and assay certificates.

* * *

For Hoarders Only.—Until comparatively recently, gold hoarding was generally considered to be bad form, if not a sin against the community. Last year's gold scare, however, revealed the difficulties that might arise from an inadequate demand for gold and a fall in its price. One of the consequences has been a subtle change in the attitude towards hoarding, and in the past twelve months a number of steps have been taken both by the authorities of different countries and by private institutions which, whether intentionally or not, have had the effect of facilitating gold hoarding. Some months ago the embargo on lending on the security of gold was removed; even earlier, the embargo on hoarding gold coins was abolished. Central Banks, with the notable exception of the Bank of England, have taken to catering for the requirements of the retail hoarder, by selling out their stocks of gold coins—at an attractive premium. The supplies of coins that are available were not sufficient to cover the demand by small hoarders during the recent gold rush, and the premium on coins against their bullion value rose to 6 per cent. In order to meet the requirements of those who could not afford to hoard standard bars of 400 ounces, the assaying firms have been engaged for some time in producing small bars, against a charge of 6d. per ounce, with a maximum of 8s. per bar. The bars of one kilo are particularly popular among small continental hoarders, but there is also a fair demand for quite small five ounce bars with a value of approximately £35 each. Needless to say, these bars are not good delivery in the market, and are only bought by dealers for the purpose of melting them down into bars of standard size, at the expense of the seller. For many reasons, the small bars are far less convenient than the coins for the small hoarder, and since the premium on coins has declined to 3 per cent. as a result of the lull in the gold rush, the small bars are likely to lose much of their recently-acquired popularity.

* * *

Export of Reichsmark Notes.—It will be remembered that during the post-war inflation vast quantities of mark notes were exported by the German Government, for the purpose of acquiring foreign exchange. Many dealers in the City are beginning to wonder whether the same expedient is now being repeated, although necessarily on a very much reduced scale. During the last few weeks it has frequently been noticed that packets of brand new reichsmark notes came to the London market, with the original Reichsbank wrapper. At the same time, remarkably large quantities of brand-new silver reichsmarks have also made their appearance. It is, of course, possible that the vigilance of the German frontier guards has been evaded on a large scale, and the desire to export capital from Germany has greatly increased in recent months since the renewal of anti-Semitic agitation; but the penalties are severe and the frontier guards are very vigilant. The absorbing capacity of the "black" market for these notes and coins is admittedly narrow, though not too narrow to make it worth while to embark upon the export of the "commodity" against which there are no customs duties or quotas. Part of the notes and silver money is presumably smuggled back to Germany, but a large part remains abroad as the permanent stock-in-trade of the various "black" markets. To that extent, Germany stands to benefit by the traffic, unless, of course, it is conducted by private individuals desirous of transferring their capital abroad. There is no speculative demand abroad for the reichsmark notes, which fail to attract the public even at a discount of 66 per cent. against the free reichsmark exchange rate.

* * *

Argentine Loan Withdrawal.—In *The Economist* of August 6th it was announced that the Argentine Government was raising a loan of $25 millions in New York, the money to be re-lent to the City of Buenos Aires. In that way the Argentine authorities would be supplied with fresh exchange, while Buenos Aires would be able to refund its short-term debt without resort to the local bond market. It is now stated in New York that at the last minute the loan has been withdrawn and will not be issued. No explanation has been given for this unexpected decision, but the loan had aroused some opposition in the Argentine Congress on the ground that the rate of interest was too high, and this may have been the deciding factor. In New York the proposed rate of 4½ per cent. was regarded as reasonable, and it is thought that Argentina would not do better elsewhere. Nor is the Argentine Government expected to make any fresh attempts within the near future.

MONEY MARKET NOTES

Foreign Exchanges

THE New York rate continues to be the subject of a tug-of-war between commercial demands for dollars and a flow of capital to New York, on the one hand, and official support, on the other hand. In consequence the spot rate has hovered either side of $4.88, the rate for Thursday afternoon being $4.88⅛. The market still believes that the rate will not be allowed to fall below $4.87, as such a movement would be regarded as the end of the Tripartite Agreement and would give rise to an immediate exodus from sterling into dollars and gold. Sooner than run this risk, it is thought that the authorities will continue to use their gold reserves to maintain the present rate. The pressure on the franc has diminished this week, but support has still been needed to both the spot and forward rates. Three months' francs, however, are now stronger at Frs. 3⅞ discount. Belgas are also stronger than earlier in the month. Since a week ago the discount on three months' belgas has narrowed from 50 to 30 cents, while, more significantly, the cross-rate with the dollar is now comfortably inside the gold export point. Guilders are steady to firm at Fl. 8.92¼. Early in August the rate was Fl. 8.96¼, but since then the demand for guilders has been such that the Dutch authorities were forced to let the rate down, although they still nominally maintain their link with sterling. Registered marks are weak at 56⅜ per cent. discount, equal to a sterling rate of Rm. 27.68. The holiday demand for travel marks is now at an end, apart from the fact that a lot of this year's tourist traffic was concentrated in France. Also the general demand for registered marks is now lessened by the special arrangements made between Germany and a number of other countries, under which three kinds of marks can be used for travel purposes. On the other side of the account, the liquidation of standstill and similar credits continues.

*

The Bank Return

THE holiday currency is still returning, and this week's drop in the note circulation is £3.9 millions. This has caused an equivalent increase in the Banking Department's Reserve, but, in accordance with the usual practice, this has been neutralised by a fresh reduction of £2.7 millions in Government securities. Thus there has been no enlargement of the credit base as a result of the contraction in the note circulation.

	Aug.25, 1937 £ mill.	Aug. 10, 1938 £ mill.	Aug.17, 1938 £ mill.	Aug.24, 1938 £ mill.

Proportion	25·6%	23·4%	28·1%	30·6%

Bankers' deposits, in fact, are £4.1 millions lower than a week ago. The main cause of this is a fresh increase of £3.9 millions in public deposits. Discrepancies between the dates of Treasury bill payments and maturities this week, further gold sales by the Exchange Equalisation Account, and last week's revenue surplus may between them provide the explanation. A small Government dividend payment is due on September 1st, and this may help to bring about some reduction in public deposits. Meanwhile bankers' deposits are a little lower than they were earlier in the summer. On the other hand, they are £8.8 millions higher than a year ago. Whether this is the result of a conscious policy or not is hard to determine, since the Bank's portfolio of securities, discounts and advances is £3.9 millions lower, and the increase in bankers' deposits is presumably due largely to the fall of £9.6 millions in the circulation.

*

The Money Market

IN spite of the week's decrease in bankers' deposits, money has become a little easier. Bond-money is more plentiful. During the earlier part of the week it was readily obtainable at ⅝ per cent., while on Thursday only ½ per cent. was paid in some quarters. It is difficult to explain this easier trend, and the view has been expressed that ¾ per cent. was

Investment

A Provisional Improvement.—The number of bargains marked in the Stock Exchange list is not the best measure of turnover, but the failure of the total substantially to exceed—and, indeed, occasionally to reach—the 5,000 mark suggests that, if the investor has felt slightly more confident this week, he has not attempted to translate sentiment into business. The Stock Exchange tone is firmer, but the bread-and-butter business of its members is still sub-normal. That the rally, mild though it is, has been widely spread from gilt-edged to home rail stocks (whose falls had been clearly carried too far) and from industrial shares to mining and commodity counters, at least suggests the operation of some general factors. It would, of course, be easy to exaggerate the extent of recovery. Indeed, the *Financial News* index of thirty leading ordinary share prices is only one-third of a point higher than at the end of last week, while the fixed interest index remains slightly lower. For general causes, the investor may point first to the political situation, where the tensions, though scarcely less acute, have found some degree of balance, and secondly to Wall Street. Politically, the situation may be slightly calmer than a week ago, despite the uncompromising situation in Spain and French unrest, but there is no assurance of the basic improvement which the investor so sorely needs. But in Wall Street's apparent determination to carry stock prices within measurable distance of the "highs" established at the beginning of this month, there is evidently ground for hope. Tuesday was the deciding day in New York, for turnover was encouraged by the further advance in steel activity—*Iron Age* estimates operations at 43 per cent. of capacity, compared with 41 per cent. last week—coupled with greater hope for new season business in automobiles and for recovery in building activity. Trading once again broke through the million mark, after several days of sub-normal turnover, and the Dow industrial average jumped 2¾ points to within three points of the August 6th "high." Even on Wednesday, despite the apparent slight reaction recorded in the Dow average, the majority of stocks continued to make slight headway, and rail issues, in the face of the wages problem, retained their gains quite creditably. Wall Street, therefore, has supplied the essential element to maintain London's confidence over another week, and its determination to anticipate autumn recovery has been well maintained against impressive profit-taking. If this determination continues, London should be able to count on further modest support. But it will hardly produce the positive stimulus which the market has obviously lacked in recent weeks.

Break in Home Rails.—The present situation of the railway companies—as their half-yearly statements clearly showed—is one of serious difficulty. But that fact scarcely justifies the almost pathological state into which the market whipped itself early this week. It is, of course, expecting much of any branch of the market to-day to show any effective resistance to continued selling, and on Monday home rail stocks were again the centre of a selling movement which had gathered momentum from the end of the last account. The consequences were inevitable. Great Western ordinary stock, for instance, lost 3¼ points on Monday, and the whole market has only recovered fractionally later this week. But substantial falls are by no means confined to the marginal stocks. In the following table we show the price movements of the leading debenture, guaranteed and preference stocks of the four companies over the last depression, last year and during the present month:—

	1930–35		1937		1938			
	High	Low	High	Low	Aug. 5	Aug. 22	Aug. 23	Aug. 24

* Ex dividend.

It is evident that the rot has spread well into the guaranteed list. In every case, present quotations are several points below the levels established at the end of the three-week holiday account, when the half-yearly results were known. The substantial traffic losses since the turn of the half-year—the four companies have together suffered a gross loss of £1,418,000 during the past five weeks, compared with a loss of £1,841,000 for the first 26 weeks—are largely responsible for the market's nerves.

* * *

The question, however, is whether the fall has not been carried too far, even in relation to the more pessimistic estimates of earnings for the current year and next. Some guidance on this point may be obtained from the revised estimates of earnings tabulated on page 333 of *The Economist* of August 13th. The following earnings cover calculations, worked out "cumulatively," are based on these estimates:—

"CUMULATIVE" COVER ESTIMATES, 1938

	L.M.S.	L.N.E.	G.W.	S.R.
First debentures	2·6	3·2	4·5	3·5
First guaranteed stocks*	1·7	1·2	1·5	2·6

* Allowing for service of other debenture stocks.

Clearly, the cover for all senior railway securities will be considerably affected by the reduction in net revenues for the current year. But the table suggests that none of the guaranteed stocks should be imperilled. Yields of nearly 4¾ per cent. on these cumulative issues, none of which were uncovered during the depression, suggest a loss of status, which, unless depression has come to stay in the railway industry, should be corrected in due course.

* * *

Radio and Television Shares.—The investor's experience of the radio industry during the past decade is not to be measured by the growth in licensed wireless receivers from 2,629,000 at the end of 1928 to 8,658,000 to-day. Superficially, the radio industry was a depression-resisting trade, for in 1931 and 1932 over 1,850,000 new licences were issued. But, throughout its life, its ability to earn profits has been at the mercy of two major factors: unpredictable technical change, and long-sustained price-cutting. To-day, the industry's prospects are scarcely easier to assess. On the radio side, it has almost completely exploited the home listening demand. Ever since 1934, new licences—and therefore new listeners' purchases—have fallen steadily, without benefit from industrial recovery. The industry is now catering largely for replacement demand and this, in turn, is also affected by two main factors. It is necessary, first, to convince the established listener that his set is obsolete. Simpler tuning devices and improved reproduction are obvious points which the industry (as this week's "Radiolympia" shows) seeks to turn to account. But replacement demand, as the motor industry will confirm, is capable of postponement if necessary. If popular purchasing power is affected by recession, a new wireless set may remain a mere desire, even though the listener's existing receiver is in a technically "obsolete" class—produced, say, four or five years ago. Adopting this basis, the industry might count on a potential replacement of, say, 1¼ million sets during the current season. Whether this turnover is achieved, however, will depend in no small part on the size of weekly wages envelopes during the early winter. And until the industry can offer some guarantee against the recurrence of ruthless price-cutting, such as characterised the earlier part of this year, the prospects of any substantial improvement in the industry's profit record (as shown in the accompanying table) must remain obscure.

* After deducting £20,000 earned before incorporation. † And capital bonus of 10 per cent. in 1935–36 and 400 per cent. in 1936–37.

This year, the possibilities of a new mass market for television receivers are attracting considerable attention. The industry has succeeded in reducing their price within the scope of the lower middle-class purse. Hitherto, this branch of the industry has been condemned, as radio was in its infancy, to limited programmes and expensive apparatus, coupled with the risk of rapid technical obsolescence. On both counts real progress has been made. But in reducing prices to the new levels, manufacturers appear to have forsworn the hope of making substantial returns on their heavy development expenditure. Current prices should cover costs, provided that demand fulfils the industry's expectations. But they do not promise a bumper return for the investor. Radio and television shares, therefore, must remain of interest mainly to the specialist investor, in close touch with the industry. Undoubtedly, the doyen of the industry is Electric and Musical Industries. In addition to the prestige of developing the transmission system now used for television, the company also has the advantage of industrial diversification, extending from gramophone records to bicycles. Until the results are known for the year to September 30th, however, consideration even of these shares may well be deferred.

* * *

British Investments in South America.—The latest of the annual computations of the *South American Journal* provides a rather less melancholy impression of the experience of British capital in South America last year. The total nominal capital invested in Latin-American countries at the end of 1937, computed from the securities quoted on the Stock Exchange, amounted to £1,154,785,293, showing a reduction of £6,220,782 compared with the previous year, and of £66,854,589 compared with 1931. This fall, apparently, is only partially due to redemptions, for the lack of business in certain securities has led to their elimination from the Stock Exchange lists. The average rate of return on the total capital amounted to 2.26 per cent., compared with 1.9 per cent. in 1936. Thus, the slight improvement in interest payments which set in from the end of 1934 has been maintained. But even last year, when the South American Republics achieved a degree of relative prosperity, the British investor was obtaining no more than half the average rate of return recorded in 1929. Again, the total nominal amount of capital which received no interest last year was as high as £496,507,685—equivalent to 42.9 per cent. of the whole, compared with about 20 per cent. in 1929. Contrasted with the experience of the United States, whose active post-war lending policy increased her financial interest in the South American Continent to about £951.6 millions, the British investor may

paid on occasions earlier in the month, only because borrowers could not wait to test the market further. This week's falling-off in the demand for gold may be one explanation, for substantial liquid sterling balances are still held on foreign account in London.

Discount rates remain as weak as ever. The banks are keen buyers of bills of all maturities after the end of this month, but the market is far from anxious to sell. Since the middle of June, tender issues of Treasury bills have fallen from £585 to £553 millions, and so the market is not now well supplied with bills. Confirmation of this is found in the fact that latter allotments have only been at the rate of £35 and £30 millions a week, and the market has also fared badly at the tenders. The Exchange Account's August gold sales foreshadow a further contraction in the tender issue of Treasury bills, and so no stiffening of discount rates can be expected.

The Bullion Market

ALTHOUGH the bullion market remains active, dealings in gold have been quieter this week. The chief buying has been for arbitrage purposes, and except on Tuesday there was little speculative or hoarding demand. The main change from the scramble for gold of the preceding weeks is a contraction in forward business. This has reduced the spot demand in the market, as there have been fewer covering purchases of spot against forward sales of the metal.

* Above or below American shipping price.
† At fixing.
The New York price of silver remained at 43 cents per ounce ·999 fine during the week.

In the silver market, sellers have been more willing to come forward, particularly early in the week. On Wednesday, when there was an entirely unfounded rumour that the Indian Government was about to sell, there was a fair amount of re-selling on Indian account, and prices dropped appreciably. Thursday's recovery was the natural reaction from this movement. There has also been some speculative Continental selling. Wednesday's price was put low enough to suggest the possibility of American arbitrage buying, but little if any has been noticeable, and any American demand has been of a trade character. By Thursday the London price was once more above the American parity. There was a fair turnover this week, but the tone of the market is uncertain.

consider himself fortunate, both in the circumstances of his original lending, and also in its subsequent fate. Of the British total, some £330 millions represents investment in Federal, State and municipal loans, which received 2.5 per cent. last year, compared with 2.3 per cent. in 1936. Railway stockholders received 1.65 per cent. on their nominal holdings of £493.3 millions of which practically two-thirds obtained no interest. Of the three largest groups, by countries, British interests in Argentina are put at £441,498,000, yielding an overall return of 2.91 per cent., and including 39.9 per cent. which received no interest. Brazilian investments are computed at £264,852,000, and their return at 2.52 per cent. Of this total some 15.4 per cent. received no interest last year. But of Mexico's £178,344,000, no less than 89 per cent. is at present forced to go without any return—an achievement only surpassed by Honduras, which is in complete default on all securities.

* * *

American Industrial Earnings.—American investors enjoy the advantage, as compared with British investors, of obtaining prompt indication of the affairs of the companies in which they are interested. In recent weeks they may have regarded this as a dubious advantage, for the second-quarter earnings statements have shown how serious the falling trend in profits has become. An analysis made in its August review by the National City Bank of New York shows that the net profits of 335 corporations, amounting to $209 millions for the first half of 1938, reveal a drop of 69.3 per cent. compared with the first six months of 1937. A comparable fall, amounting to 71.2 per cent., was shown in the second-quarter earnings of $101 millions reported by 275 manufacturing and merchandising corporations. Some leading examples are given in the following table: —

	Earned per Com. Sh.				Amt. earned for divs. ($ millions)			
	2nd Qr.		Half-year		2nd Qr.		Half-year	
	1937	1938	1937	1938	1937	1938	1937	1938
	$	$	$	$				
Celanese of America	1·03	*Dr.0·12*	2·11	*Dr.0·55*	1·69	0·43	3·44	0·54
Du Pont	2·01	0·69	3·31	1·31	23·82	9·88	39·84	18·94
General Electric	0·51	0·21	0·91	0·46	14·67	6·10	26·29	13·18
General Motors	1·46	0·52	2·44	0·65	65·73	24·79	110·54	33·02
Johns-Manville	1·95	0·10	3·00	*Dr.0·34*	1·79	0·21	2·81	*Dr.0·02*
U.S. Steel	3·43	*Dr.1·30*	5·98	*Dr.2·17*	36·17	*Dr.5·01*	64·74	*Dr.6·30*

Despite the evident difficulty of producing satisfactory earnings, it would be possible to over-emphasise the serious condition of American industrial profits. Producers of consumption goods, as usual, have fared least badly. Both General Foods and National Biscuit actually earned slightly more in the April-June quarter than a year ago. Corn Products approximately maintained its earnings. The improvement in Commonwealth Edison is as much as 4 cents a share for the second quarter. The decline in second-quarter earnings, according to the analysis of the National City Bank of New York, was only 3.7 per cent. greater than that shown by the same companies' first-quarter statements. Meanwhile, it is estimated that the point of positive earnings for the American steel industry may lie between production at 60 per cent. and 65 per cent. of capacity. And the steel industry is still about 20 per cent. (of capacity) below this level.

* * *

Hungarian State Loan.—Bondholders will recall that last September the League Loans Committee issued a memorandum governing the future status of the Hungarian State Loan of 1924. The bonds would in future rank for 4½ per cent. interest (against 7½ per cent.) and a one per cent. sinking fund is due to commence in August 1940. The loan, however, was secured by a general bond, under which the Council of the League of Nations appointed three trustees to receive and administer the service on the loan. Since the new arrangement was reached by the League Loans Committee with the Hungarian authorities, and not by a reconstitution of the general bond, the trustees had no option but to protest against the infraction of the general bond which it involved. A postscript to the affair has appeared this week. The League Loans Committee has announced the proportion of the bonds, in the different *tranches*, which have been presented for enfacement with the new terms of service. These vary from 90 per cent. for Italy, 91.5 per cent. for the United States, and 98.5 per cent. for Great Britain, to full acceptance by Czechoslovakia and Sweden. In consequence, the Hungarian Minister of Finance has requested the re-transfer to the Government of the pengö Treasury bills and other untransferred funds which were deposited with the National Bank from 1932 until July last year, for the account of the trustees. At the same time, the reserve fund for the maintenance of the service has been reconstituted, and a further sum of 7½ million pengö will be applied to purchasing bonds in excess of ordinary amortisation. It is understood that the trustees have communicated their protest against this action to the Hungarian Government, and that it has been found illegal to obtain the release of these sums on a *pro rata* basis.

* * *

Turnover in London and New York.—It is probable that, if more comprehensive figures of Stock Exchange business were regularly compiled in London, the British investor would regard their trend as a significant investment pointer. He might stop short of endowing the figures with the prophetic qualities which chart readers on the other side of the Atlantic ascribe to the course of share dealings on the New York Stock Exchange. But the record would provide a useful secondary indicator of investment tendencies. The movement in the volume of transactions on any setback in American stock prices, at the moment, is being closely watched, and the market expresses satisfaction when intermediate setbacks are accompanied by smaller trading. And in view of the close relations which have lately ruled between prices in Wall Street and London, an attempted comparison between the trend of dealings in the two centres is of some interest. To obtain any indication of turnover in London, it is necessary to make bricks with a minimum of straw. We have computed the monthly totals of markings recorded in the Official List from the beginning of 1936. The limitations of these figures, as a guide to the volume of business, are already well known, and for comparison with the New York record of share dealings they have an additional defect, for no distinction is made between fixed-interest and equity securities. These substantial shortcomings, it may be hoped, may one day be remedied.

* * *

In the following table we have expressed the volume of business in each centre as an index number, based on the average for the first half of 1936: —

INDICES OF TURNOVER JANUARY-JUNE, 1936 = 100

	1936		1937		1938	
	London*	New York†	London*	New York†	London*	New York†
January	102·8	154·7	115·0	135·0	64·6	55·6
February	116·4	140·0	115·0	115·6	69·0	33·4
March	92·5	117·4	106·7	115·8	72·9	52·9
April	78·8	91·2	96·0	79·6	63·1	39·4
May	85·2	47·4	72·4	42·7	65·1	32·2
June	80·8	49·3	73·5	37·8	57·3	56·1
July	90·0	80·0	74·3	47·7	59·8	91·5
August	80·3	58·8	67·5	39·6	...	...
September	94·5	71·0	68·5	77·9	...	...
October	126·7	101·2	77·3	117·1	...	...
November	123·3	116·0	77·3	67·3	...	...
December	89·0	111·8	54·8	65·4	...	...

* Based on bargains marked in S.E. Official List.
† Based on share transactions reported daily.

The spectacular improvement in turnover in New York has raised the index last month to treble the level at which it stood in May. If the markings figures are a reliable

guide, London, at least, has never been reduced to a mere third of the level of business recorded in the first half of 1936, but New York brokers were forced down to this basis during much of the current year. Indeed, the trend of dealings in New York throughout the period is much more febrile than in London. To what extent dealings in fixed-interest securities have contributed to the total volume of business here must remain a matter of guesswork. But their absence would probably have made an appreciable difference to the index.

* * *

Triplex Reduced Profits.—The sharp reduction in the Triplex Safety Glass ordinary dividend from 35 per cent. to 25 per cent. prepared the stockholder for a considerable setback in profits. The stock, indeed, has fallen further after the turbulent dealings which accompanied rumours (wholly unconfirmed in the report) suggesting that contracts had been lost and the company's leading position prejudiced. Trading profits for the year to June 30th have, in the event, been reduced from £250,820 to £167,789—a result which the directors consider satisfactory, since it shows some advance on the 1935-36 profits of £162,541. Mr Graham Cunningham, in his chairman's speech last year, was careful to draw attention to the fact that favourable legislation and booming car sales could not be expected to favour the company year after year. So it has proved. The company's turnover has declined at a time when rising costs were reducing profit margins. The ordinary stockholder, however, has escaped the full measure of last year's reverse, for while total profits, including appreciably increased investment income, have fallen by no less than £73,461, the amount earned for the ordinary stock is only £25,197 less at £112,590, as the following analysis shows: —

	Years ended June 30		
	1936	1937	1938
	£	£	£
Total profits	177,333	262,590	189,129
Depreciation, etc.	30,020	26,001	15,618
Taxation	40,000	75,500	40,000
Fees and employees' fund	14,113	23,302	20,921
Ordinary stock—			
Earned	*93,200*	*137,787*	*112,590*
Paid	91,500	131,250	90,625
Earned %	*61·1*	*36·7*	*31·0*
Paid %	60†	35	25
Profit on sales of investments	1,128	*Dr. 357*	...
Carry forward	6,168	12,343	34,308

† On £200,000 ordinary capital (raised to £500,000 in 1937 by bonus and cash issues).

The ordinary stockholder, in fact, has shared the reduction in profits with the depreciation fund and the taxation collector. To seek justification for reducing the depreciation provision, in a year of lower activity, is scarcely necessary, for land, building and plant, which originally cost £451,878, have already been written down to no more than £177,434. The balance sheet also shows that the large item of £462,945 for investments consists almost entirely of gilt-edged securities. These holdings arose from the ordinary stock issue of February, 1937, and they represent nearly half of the balance sheet total. Thus the company is amply—indeed, lavishly—equipped with liquid assets for its present needs. During the past year, the net cost of shares in associated companies has increased from £44,098 to £95,548, while cash holdings have fallen correspondingly from £125,452 to £67,041. These changes are presumably associated with the rapid growth of H. E. Ashdown (Birmingham). In present circumstances, however, the group may have less need to expand at the rate of recent years. In view of the 25.7 per cent. fall in motor registrations in June, Triplex ordinary stock, at 30s. 3d., yielding £8 5s. per cent., cannot yet be regarded as a recovery holding.

Debenhams' Reduced Profits.—The decline in purchasing power which has followed trade recession is reflected in the preliminary profits statement of Debenhams, Ltd. London store companies whose accounts are made up to January 31st generally maintained their profits last year. The Debenhams' results, however, relate to the year to July 31st, and thus provide a better guide to the recent trend of retail trading profits. The decline in profits compared with a year ago is significant rather than serious, for it amounts to no more than 3½ per cent., and it is in large degree attributable to the setback experienced by the important subsidiary, Harvey Nichols and Company. The latter company's total profits have fallen to £110,282, against £145,471, and its gross ordinary dividend payments (and rates) are reduced to £42,000 (7 per cent.), against £60,000 (10 per cent.). This dividend reduction, however, is smaller, absolutely, than the decline in Harvey Nichols ordinary share earnings from £99,565 to £52,583, and the rate of ordinary earnings is exactly halved at 9.3 per cent. The recent trend of Debenhams' profits is shown in the following table: —

	Years ended July 31		
	1936	1937	1938
Total profit	706,446	727,896	701,154
Fees and interest	148,183	147,142	146,042
Preference dividends	379,000	379,000	379,000
Ordinary shares—			
Earned	*179,263*	*201,754*	*176,112*
Paid	83,333	104,167	104,167
Earned %	*41·8*	*46·9*	*40·6*
Paid %	16⅔	20⅚	20⅚
Reserve	50,000	50,000	50,000
Carry forward	182,171	229,758	251,703

No dividend reduction is necessitated by the drop in total profits. Dividend distributions on the highly-geared ordinary capital have been properly conservative in recent years, and even in the latest year the 20% dividend absorbs only half the available earnings. Reserve again receives £50,000—a provision which has been maintained each year since the capital was reorganised, and with the latest year's increase the carry-forward now exceeds 50 per cent. of the present ordinary capital. The full accounts may be expected to show the effect of the sale of the Drages, Ltd., holding, while the chairman's comment upon the course of trade in 1938 will be looked for with more than usual interest at the annual meeting at the end of next month. At present Debenhams, Ltd., 1s. ordinary shares stand at 2s. 10½d., to yield £7 16s. per cent.

* * *

Broken Hill Proprietary.—The increased scale of operations in New South Wales, coupled with a high level of demand, enabled Broken Hill Proprietary to secure record results during the year to May 31, 1938. Steel production increased by 71,100 tons to 854,270 tons and pig-iron output was slightly higher at 674,520 tons. The output from the lead-zinc property at Broken Hill also rose. Net profits, at £1,300,500, show an advance of £117,290, but following the increase in capital, no increase in the rate of dividend is possible. Distributions totalling 2s. 6d. per fully paid share (with *pro rata* amounts upon the partly-paid shares) absorb £670,560, compared with £559,880 in 1936-37. A somewhat greater provision has been made for depreciation, but owing to the progressive redemption of the debenture issue, a smaller amount is required for debenture interest. For the second year in succession an appropriation of £600,000 is made to reserve and the fund now stands at £3,700,000. The proceeds of the new issue made last October appear to have been largely employed

in financing the Australian Iron and Steel concern, whose ordinary capital was acquired in October, 1935. A loan of £2 millions to this undertaking has been converted into an equivalent amount of ordinary capital. Consequently, a sharp contraction is shown in the amount of net liquid assets, which total £1,391,100, compared with £2,902,730 at the end of May, 1937. Additional plant was in operation during the second half of the company's financial year, and further extensions are in progress. But in view of the increased amount of capital now ranking (which will be further increased this year) there seems little prospect of any appreciable increase in the dividend rate, at least for some time to come.

* * *

Chosen Corporation.—The affairs of Chosen Corporation have a complexity of their own. It will be recalled that, in July, an agreement was signed for the sale of the Corporation's interest in Nurupi for a sum equivalent to approximately £345,000, of which £205,000 was payable in sterling and the balance in free foreign exchange, on completion. Secondly, on the ratification by August 31, 1938, of the agreement of December, 1937, relating to the liquidation of Nurupi, a further cash payment of £100,000 would have become due to the Corporation. Thirdly, any tax refunds due to Nurupi would belong to the Corporation. At the meeting at the end of July, when the sale of the Nurupi interest was approved, it was disclosed that the purchaser was the American Overseas Mining Investment Corporation. In the light of these proceedings, the Corporation's balance sheet is mainly useful as a record. But the report suggests that further complications in the liquidation of Nurupi have been encountered. It is stated that completion of the sale of Chosen Corporation's interest will be effected on the 30th of this month. Thus it will be possible to report to the annual meeting on the following day that the sum has been received. Accompanying the agreement is an arrangement whereby, in effect, the Corporation has a year's option to transfer its shareholding in Kapam K.K.K. for some £70,000, which has been put at the disposal of the Corporation. The ratification of the agreement of December, 1937, however, will apparently not be implemented, and the Corporation's rights to further payments will revert to the guarantee of May, 1936, under which some £12,119 has been received for the three months to September, 1937. The balance of sums which would have become due in the ordinary course under the guarantee are in dispute, and subject to negotiations. The public investor who may hold shares in Chosen Corporation has had a full share of excitement in recent years. And the latest hitch under the May, 1936, agreement suggests that it is not at an end.

* * *

The Week's Company Profits.—During the past week, reports have been received from 15 companies (excluding one for which comparable figures are not available), whose net profits amount to £791,000, against £808,000 for the previous year—a decline of 2 per cent. Net profits for the 1,709 companies whose reports have been issued this year amount to £236,191,000, an advance of 11 per cent. over the total of £212,855,000 earned in their previous financial years. The week's results are discussed in preceding Notes and on page 425 under the heading "Shorter Comments."

THE STOCK EXCHANGES

London

SETTLING DAYS

TICKET	ACCOUNT
SEPTEMBER 6	SEPTEMBER 8

FOR a week in which trading has been subdued, and the investor's problems are little nearer solution, the market has behaved satisfactorily. Price changes have been small, and it is difficult to discern the development of any new trend. But the tone, if not the volume of business, has shown some slight improvement, thanks to the assistance of Wall Street, and to the rather calmer outlook on European politics. New investment buying, however, has remained at a minimum.

Gilt-edged stocks opened with some show of firmness, and small support was followed by fractional improvements in the redeemable stocks. Undated stocks, like Old Consols, took up the running on Tuesday, and improved further in mid-week. National Defence Threes reached a new high of 100⅜ on Wednesday. Corporation scrips were not active, but prices improved slightly, and Dominion issues lost their early dullness.

The *foreign bond market* found itself short both of Chinese and Japanese issues, but it was the former which made the best progress, on demand which was reported to come from the East. Price improvements were well maintained, though they were less spectacular than Monday's advance, when the 1898 4½ per cent. issue jumped by 3 points. Some support for German Funding issues was reported, and the Potash loans recovered after a fairly sharp initial fall. South American issues were better in mid-week.

Heavy selling hit *home rail stocks* on Monday, and while Great Western ordinary and Southern Preferred fell 3¼ and 2½ points, respectively, the preference stocks showed comparable falls, which extended into the guaranteed list (as we show on page 420). Renewed weakness was reported on Tuesday, when stocks reached the lowest level for some years, but speculative purchases, once the traffics had been published, carried the market in ordinary and marginal preference stocks to higher levels. Some recovery in Argentine rail stocks was evident in mid-week.

In the *industrial market* this week, the same fairly satisfactory undertone has been accompanied by a small volume of business and fractional movements in quotations. An improvement in sentiment towards mid-week did not result in much broadening of activity, though prices were inclined to harden. Iron and steel shares were dull and inactive, the brightest spot being Indian Iron and Steel on the dividend announcement. Coal issues completely lacked buoyancy, and where changed at all were usually lower, the Bearpark and Hilton Main distributions having a depressing effect. There was little business in electrical equipment shares, but the group had a firmer appearance after early irregularity. Motor shares remained idle and uncertain, with narrow price movements. Triplex showed no definite response to the report, but fluctuated around 30s. Aircraft issues were generally firm but not active. Textile shares improved slightly after early uncertainty and neglect, while rayon issues, at first depressed, recovered later, the tone being assisted by the June output figures. The brewery section was one of the best in the market, support for a few favourites (Ind Coope in particular) being succeeded by an increase in investment attention. Tobacco shares became rather brighter as the week progressed. Provision and catering issues were generally dull, while stores were temporarily depressed on the Debenhams' and Harvey Nichols' results. Miscellaneous issues strengthened after an uninteresting start, Electric and Musical Industries gaining 6d. on Wednesday. Interest in shipping shares was confined to the leaders. The July traffic index caused a fall in Cable and Wireless issues, though the ordinary stock recovered in mid-week.

*

A dull start in the *oil shares market* was followed by a noticeably better tone late on Tuesday and on Wednesday, under the influence of American news, and there was even some expansion in the very small turnover. While the tone in rubber shares was quite steady, quotations responded grudgingly to the appreciable improvement in the commodity. Gains were small, however, and were confined to the leading issues. Movements in tea shares were undecided, and business was small.

The *mining market* behaved similarly to other sections, a better sentiment following a lifeless start. Though sharing in the mid-week improvement, Kaffirs by no means maintained their favoured position of the recent past. Developing mines, including Marievale, received the best support. Helped by Wall Street and the better metal price, Rhodesian coppers went ahead, though business did not expand far, and the best prices were not held. Interest in diamond shares revived in

mid-week, partly on Paris support for De Beers. Base metal shares were firm but rather featureless.

ACTUARIES' INVESTMENT INDEX

Though smaller than the drop shown in the previous week, a decline is again shown by the Actuaries' index of 151 industrial ordinary share prices, which on Tuesday last (August 23rd) stood at 63·9, against 64·8 a week ago and 66·7 a month ago. The corresponding average yields are 5·92, 5·85, and 5·88 per cent. While most groups are lower, a sharp fall is shown by home rails, and to a smaller extent by coal shares. A selection of the separate indices follows:—

Group (and No. of Securities)	Prices (Dec. 31, 1928 = 100): July 26, 1938	Aug. 16, 1938	Aug. 23, 1938	*Prices 1938 High*

New York

SENTIMENT in Wall Street this week has been erratic, though net changes have on the whole been for the better. The week began in unusually idle fashion, the turnover being no more than 400,000 shares—a situation transformed overnight, when the million mark was passed once more on Tuesday. Quotations advanced sharply, and though there was a marked reaction late on Wednesday, changes were small on balance. Steel shares were the brightest section, under the lead of Bethlehem Steel, on scattered indications of reviving demand. *Iron Age* estimates activity at 43 per cent. of capacity, against 41 per cent. a week ago. Rails were particularly firm, and resisted the mid-week reaction, railroads serving the Eastern States being best supported. Among industrials, General Motors went ahead. Rubber companies also were firm, but oil shares were less satisfactory than the rest of the market.

ISSUES TO SHAREHOLDERS ONLY

Amalgamated Roadstone Corporation, Ltd.—Issue of 75,000 6½ per cent. £1 cumulative preference shares at 21s. Profits, year to March 31, 1938, £54,230. Issue underwritten for £4,700.

Barton and Sons (1935).—Issue of 150,000 6 per cent. redeemable cumulative £1 preference shares at par. Underwritten for £10,000. New capital required for development and to complete purchase of 80 per cent. of Metal Frames share capital.

Trepca Mines, Ltd.—Issue of 1,683,791 5s. shares at par (four for every 13 held). To rank for dividend from October 1, 1938. Object of issue is to finance the construction of lead and zinc smelters in Yugoslavia. Underwritten for commission of 1½d. per share.

SHORTER COMMENTS

Company Results of the Week.—One of the most satisfactory of the week's reports is that issued by BRIGHTSIDE FOUNDRY AND ENGINEERING. Net profits amount to £90,851 against £69,502, and while the dividend is raised only from 22½ to 25 per cent. it is payable on £75,000 more capital. A falling off in export trade in 1938 has reduced LOCHGELLY IRON AND COAL net profits from £59,089 to £53,829, but the 10 per cent. dividend is maintained. While the reduction in net income of COMPASS INVESTMENT TRUST is quite small (net profits amounting to £23,010 against £24,357) and the dividend remains

(*Continued on page* 428)

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

Industry and Trade

Recovery in the United States. — Evidence is steadily accumulating that the sudden recovery on Wall Street last June was not without justification. Indeed, the Federal Reserve Board's index of industrial production for July, published on Thursday, reveals a marked expansion of activity in that month. After a precipitous fall from 117 (1923-25 = 100) in August, 1937, to 80 in January, 1938, the index (adjusted for seasonal variations) declined more slowly, reaching 76 in May; in June it rose to 77 and in July to 83, an advance of no less than 8.2 per cent. As previously, the improvement appears to have originated in the consumption goods trades, which reported better orders in June; moreover, there are indications that recovery is spreading to an increasing number of industries. If recovery in the United States is sustained—and there are no signs of an early reversal of the upward trend—hopes of an improvement in world prices for primary products are not likely to remain unfulfilled. And a gradual upward trend of world prices would provide a powerful stimulus to world trade and, consequently, to British export industries.

* * *

A National Price for Milk.—The Milk Marketing Board inherited from the days of unorganised marketing considerable geographical variations in wholesale milk prices in England and Wales. These variations represent, in the main, differences in transport costs between producing and consuming districts, and in the proportions of milk sold in each district for liquid consumption and manufacturing purposes. They were maintained in principle by the adoption, on the recommendation of the Milk Reorganisation Commission, of eleven separate regional pools; the Commission felt that a national pool price, while easier to administer, would cause too great a disturbance to the existing distribution of production. The Cutforth Commission recommended in 1936 that the existing differences should gradually be reduced, so that a national price, uniform except for transport charges, could be established. The Milk Marketing Board has, in fact, limited the regional variations to a maximum of 1d. per gallon; if the separate regional pool prices had been averaged in the accounting year 1937-38, four regions, all in the east of England, would have lost up to 0.61d. per gallon, while the remaining seven regions, in the west and north, would have gained by sums up to 0.35d. per gallon. Within both the Milk Marketing Board and the National Farmers' Union, the problem of national pool prices has recently been much discussed. Representatives of the western and northern districts urge that modern methods of transport have so improved that milk can be brought to London almost as cheaply from Devon as from Essex, and that under a national wholesale price a higher proportion of the production of their regions could be withdrawn from its unprofitable use in manufacture and transferred to the liquid market. Representatives of the eastern districts claim that nearness to the main consuming centres and the higher costs of these regions entitle them to a higher price which, if paid to other regions, would only stimulate the production of more milk for manufacture.

* * *

The Agricultural Census.—The preliminary results of the census taken on June 4th reveal no startling change in the major trends of agriculture in England and Wales. The arable acreage showed a further decline and the area under permanent grass a further, but smaller, increase. The total cultivated area thus continues to shrink slowly. The area under corn crops was larger than in 1937, but that planted with turnips and swedes, lucerne, small fruit and orchards was smaller. There was a considerable expansion in the number of young cattle, though cows in milk and calf were fewer. Sows kept for breeding declined by 5.2 per cent. since 1937, and there was a reduction of 15.2 per cent. in the number of pigs under two months.

AGRICULTURAL RETURNS OF ENGLAND AND WALES.

	1937	1938	Change
Total cultivated	'000 acres 24,780	'000 acres 24,695	% − 0·3
Arable	9,024	8,872	− 1·7
Permanent grass	15,756	15,823	+ 0·4
Wheat	1,731	1,829	+ 5·7
Other corn crops	2,301	2,480	+ 7·8
Sugar beet	307	329	+ 7·1
Other roots	633	619	− 2·2
Clover and rotation grasses	2,221	1,900	−14·5
Livestock	Thousands	Thousands	
Cows and heifers in milk and calf	3,068	3,049	− 0·6
Other cattle	3,551	3,609	+ 1·1
Horses	859	850	− 1·0
Pigs	3,635	3,349	− 2·4
Sheep	17,194	17,568	+ 2·2
Poultry	52,633	52,194	− 0·8
Workers	Thousands	Thousands	
Regular	536	510	− 4·8
Casual	96	79	−19·7

The steady fall in the number of workers on the land continued and the total number declined by 42,200, or 6.7 per cent., to 631,700. The fall was proportionately most marked in the case of casual workers.

(*Continued from page* 425)

at 2 per cent., the portfolio as at June 30 showed a depreciation of 32 per cent. below book values. WARDLE AND DAVENPORT show stationary trading profits, and net earnings are £1,000 lower at £21,318. Instead of a tax-free dividend of 4 per cent., a payment of 5½ per cent. less tax is being made. "NEWS OF THE WORLD" LTD. net profits have declined to £333,376 against £362,441, though no change is made in the tax-free dividend of 20 per cent. The year 1937–38 is referred to in the report as "one of anxiety," but circulation continued to increase.

MISCELLANEOUS

International Certificates Depositary Company.—The directors are Messrs A. Palache, chairman (Helbert, Wagg & Co.); Michael James Babington Smith (Glyn, Mills & Co.); John Grinnell Wetmore Husted (Brown, Shipley & Co.); David Keswick (Samuel Montagu & Co.); Christophe Philippe Mallet (Mallet Frères & Cie.); Philippe Hottinguer (Hottinguer & Cie.); Remi Boissonnas (Mirabaud & Cie.); Maurice Rueff (Maurice Rueff & Cie.); Albert Charles Nussbaumer (Swiss Bank Corporation); Joseph Straessle (Crédit Suisse); Georges Lenoir (Lombard, Odier & Cie.); Carlos Maisonpierre (Cassel & Cie.). An executive committee has been formed, consisting of: David Keswick, chairman; A. C. Nussbaumer; Maurice Rueff; and W. Lionel Fraser. Details of facilities, etc., will be available shortly.

Cable and Wireless, Ltd.—(Working day average of comparable receipts, year 1929 = 100). Index number July, 1938, 63·1, against 66·4 for June, and 73·4 for July, 1937. For monthly index numbers from January 1, 1930, see *The Economist*, July 23, 1938, page 187.

Transvaal Output, Employment and Working Profit.—Gold output, July, 1938, Witwatersrand, 1,000,725 fine ounces; outside districts, 26,398 fine ounces; total, 1,027,123 fine ounces. Value for purposes of declaration, £7 1s. Total output, June, 1938: 1,018,712 fine ounces. The number of natives employed at end of July was: Gold mines, 318,773; coal mines 17,131; total, 335,904. Total estimate working profit for July, 1938: Witwaters rand, £2,607,927; outside districts, £10,132 total, £2,618,059. Comparable figures fo June, 1938: Witwatersrand, £2,582,081 outside districts, £9,413; total, £2,591,494

Council of Foreign Bondholders.—The full sixty-fourth annual report for th year 1937 is now available. It is publishe from Council House, 17 Moorgate, Londo at a price of 7s. 6d. This publication con tains as an appendix to the survey of event in 1937 (discussed in a Note on page 238 c *The Economist* of January 21, 1938 particulars of the present position and pas history of the external debt of the separat foreign countries, and also miscellaneou statistical information.

Lochgelly Iron and Coal Company.—Net profit, after tax, for year to May 31 1938, £53,828, against £59,089. Ordinar dividend again 10 per cent. To reserve £20,000 (£25,000). Carry forward, £15,791

(*Continued on page* 440)

New Cotton Yarn Agreement.—At a meeting of owners of ring spindles using Egyptian type cotton in Manchester this week, it was decided to formulate a price agreement for this section of the trade. After discussion it was agreed to establish two price lists, one for counts of 46's and above and another for counts below 46's. In the first instance attention will be centred on the agreement for 46's and above. This branch of the industry is represented by about 70 mills, containing some 2,000,000 spindles. The decision to introduce a price agreement in this section is important, for spinners with mule spindles, already under a price agreement, are complaining that they are being undercut by spinners with ring spindles. It is understood, therefore, that no time will be lost in completing the arrangements for minimum prices for Egyptian yarns made on ring spindles. The whole of the fine spinning branch of the Lancashire cotton industry will then be controlled by price agreements.

* * *

Exports of British Footwear.—Exports of boots and shoes showed an improvement between 1936 and 1937. As the accompanying table shows, this improvement was maintained in the early months of 1938. The latest returns, however, show a reversal of this trend, for in both June and July exports were lower than in the corresponding months of 1937. This decline is all the more serious as the recovery staged in 1937 still left the volume of exports 39 per cent. lower than in 1929. Export business has been seriously affected not only by trade restrictions in foreign countries, but by tariffs imposed by the British Dominions. In the last ten years, many new factories have been set up in the various countries of the Empire, and have been given protection from imports both from the United Kingdom and from foreign countries. Lately, the Governments of both New Zealand and South Africa have again raised their import duties. A welcome reversal of this trend has been the reduction in the Irish duties on imports of boots and shoes from the United Kingdom, which came into effect as part of the Anglo-Irish Agreement. Hopes are also entertained that the forthcoming Anglo-American trade agreement may make possible a revival in exports to the United States.

* * *

A Lead Cartel?—The price of lead has shown a fairly firm tendency during the last few days, due to reports that an international lead conference is to be held in London next month with the object of forming a cartel. This report followed a statement, made by Mr A. Chester Beatty at the recent Trepca meeting, that co-operation on the lead market was desirable and to be hoped for. So far no details of the intentions of the sponsors of the lead producers' meeting are known; moreover, past experience suggests that the conclusion of a genuine international lead cartel will not be an easy task. The lead market is the only base metal market which has not been regulated by an international restriction scheme in the past ten years. The London lead market was controlled by a "lead pool" between the autumn of 1929 and the beginning of March, 1932, when the introduction of the British Ottawa duty led to its dissolution, but this pool never had any major importance. In July, 1935, the leading lead producers exporting to the European market agreed not to increase production without due notice, but this arrangement has had even less practical significance than the earlier pool agreement. As the forthcoming conference is unable to draw on past experience, it has a very difficult problem to solve, and it is by no means certain that it will be able to solve it.

* * *

Shellac.—After reaching the record level of nearly 315,000 packages at the height of the speculative operations in December, 1934, and January, 1935, shellac stocks in London have been reduced considerably, and amounted to 122,569 packages at the end of last month. The competition of synthetic resins, on the one hand, and the presence of large stocks of shellac in London, on the other hand, have steadied prices. The spot price of shellac (standard T.N.) at the end of June, 1937, was 49s. 6d. per cwt.; at the end of January, June and July of the current year it was 41s., 39s., and 40s. per cwt. respectively. Preliminary figures of Indian lac exports for 1937–38 are given below :—

(in cwt.)	1936–37 (actual)	1937–38
Shellac	496,940	409,726
Seedlac	261,822	187,484
Buttonlac	33,215	24,012
Sticklac	4,667	508
Other forms (mostly refuse lac)	37,320	43,441
Total	833,964	665,171
Value	£1,755,000	£1,215,000

Of the shellac exports, the United States of America took 140,912 cwts. in 1937–38 (156,288 cwts. in 1936–37), the United Kingdom 104,977 cwts. (144,942 cwts.), Germany 50,345 cwts. (49,516 cwts.), and Japan 36,982 cwts. (67,443 cwts.). Lac products, including shellac, have until recently found their principal outlet in gramophone records, while protective and insulating coatings constitute the next largest group of uses. It is in this category that applications such as varnishing the inside of shells, water tanks and tank steamers find a place. Shellac also forms the binding material for micanite and micafolium. Its re-armament uses are thus obvious. To stem the tide of competition from the synthetic resins, lac research conducted in India, in the United Kingdom and the United States is directed towards increasing the output and improving the quality of the natural product and discovering additional uses for the material either singly or in combination with synthetic resins. The outlook for shellac appears satisfactory, though the current price offers the producer little or no profit.

* * *

Lower Oil Output.—There have been reports from the United States this week that the Texas Railroad Commission, the oil control authority of the State of Texas, will re-impose the Saturday closing of the oil wells from September 1st. This decision will reduce oil operations in Texas (which supplies over 40 per cent. of production in the United States) to five days a week, Sunday closing having been in force since January. The curtailment of output in the United States was made necessary by the disappointing trend of consumption this year, as a result of which stocks of oil and oil derivatives have reached a dangerously high level. As the United States is responsible for nearly two-thirds of both the world's oil production and consumption, output restriction in that country will affect world production. According to *The Oil and Gas Journal*, world production of crude oil in the first half of 1938 reached 977,340,000 barrels, a decline of 8,050,000 barrels, or 0.82 per cent., from the corresponding period of last year. This decline was due to the fall of 22,110,000 barrels, or 3.6 per cent., to 597,050,000 barrels in the output of the United States. Apart from the United States, most of the leading producing countries, with the exception of Mexico and Roumania, have increased their oil output this year. It now appears unlikely that the world's output of oil in 1938 will equal production in the record year of 1937.

Dearer Platinum.—Last Monday the official price of platinum was raised by 15s. to £8 per fine ounce. The current price is £1 7s. 6d. per fine ounce above the lowest level of this year, which was in force between May 2nd and June 30th. The latest rise in prices was due to the revival of the hoarding demand for precious metals, particularly gold. Although the International Nickel Company of Canada, the world's leading platinum producer, pursues a price policy designed to sustain the vast increase in the regular industrial demand for the metal, the two recent increases are not without precedent. Late in 1936 and early in 1937, when speculators forced up the demand for, and the price of, platinum to an unreasonable level, the company for a time followed the rise in price, but ultimately reduced it sharply at short intervals, thus inflicting severe losses on the short-sighted bulls. The leading producers are unlikely, therefore, to allow the price to advance to a level at which regular industrial consumption would be adversely affected.

★ ★ ★

The World's Tobacco.—In 1936, the United Kingdom imported 37 million lbs. of tobacco, valued at rather over £4½ millions. The consumption in the United States in the same year has been estimated at 847 million lbs., of which more than half was smoked in the form of cigarettes. The steady increase in the consumption of cigarettes has indeed been the dominating factor in the tobacco trade since the war, and has been associated with a slow fall in cigar smoking. The consumption of cigarettes in the United States increased from 0·14 lb. per head in 1900 to 0·34 lb. in 1910, and exceeded 2 lbs. per head in 1925. By 1936 it had risen to 3·4 lbs. per head, when the consumption of cigars fell to 1·02 lb. per head from a peak of 1·87 lb. in 1920. These changes in consumption, which have occurred also in the United Kingdom, have brought considerable shifts in the type of tobacco produced, by stimulating the output of flue-cured tobacco, at the expense of fire- and air-cured varieties, which are used for cigars and pipe tobacco. India, China and the United States are the three largest growers of tobacco, as is shown by the table below which is taken from *Tobacco Intelligence*, a new quarterly just published by the Imperial Economic Committee.

The United States consumes two-thirds of its domestic crop, but, even so, exports four times as much as any other country.

INDUSTRIAL REPORTS

THERE are indications of a modest seasonal improvement in the volume of new business secured by industry, but the buying movement has not yet gained much momentum in the principal branches of activity. Many sections of the iron and steel market are still congested by stocks, while the expectation of a reduction in prices at the end of the year is also holding up business. There has been some improvement in orders for coal in anticipation of the usual autumn increase in prices, but export business remains dull. In the cotton trade, the uncertain outlook for raw material prices is adversely affecting turnover. The position of the principal industries as well as the general business trend are discussed in the Trade Supplement accompanying this week's issue of *The Economist*.

Coal

Cardiff. — The Cardiff coal market shows little or no change. Current inquiries are very restricted. As the collieries produce well up to their authorised quotas, stocks are heavy at the dock, railway and colliery sidings. Shipments have recovered from the holiday slackness and last week totalled 361,600 tons, compared with 323,900 tons the previous week. They are still, however, about 15 per cent. below the volume of trade in the corresponding period last year. The market in coke is weaker, and best and good foundry qualities have been marked down 2s. 6d. to 42s. 6d. and 32s. 6d. per ton, respectively. It is reported that 84,000 tons of the Portuguese Railways order for 220,000 tons for delivery between November, 1938, and March, 1939, has been placed in Germany, but that no decision has yet been reached in respect of the balance of 136,000 tons.

Sheffield. — Although the output of industrial coal has been restricted, it is fully equal to demand, and prices are barely steady. Public utility requirements are easily met, and there is a slight weakening of the demand for locomotive fuel. There is rather more activity in household coal, stocking orders coming along in the expectation of higher prices next month. Merchants expect a general rise of 1s. 8d. per ton (with perhaps half a crown in best qualities) on September 1st, when winter contract prices come into operation.

Coke continues in dull request. Large patent-oven and graded coke of apple and walnut sizes for local works realise 27s. per ton at depots.

Export trade is dull, with no indication of early improvement. Demand for bunkers is disappointing and there is next to nothing doing in coke. Prices show no further change.

★

Newcastle-on-Tyne. — Business is quiet on the coal markets of this area and, apart from a few small orders booked by Scandinavian consumers, there is little activity. Northumberland steam collieries are slightly better placed for prompt and forward delivery, home consumers taking more interest. Durham is experiencing a very quiet period, and in the absence of an improvement in the iron and steel industry, collieries producing coking coal are likely to have a difficult time. Patent-oven coke remains steady in the export section, but in the home market supplies are abundant.

★

Workington. — The output of the coking plants exceeds the quantity that can be marketed, and industrial fuel is not in good demand. As the Irish and local landsale markets are also quiet, most of the collieries are losing a shift a week, but prices are unchanged.

★

Glasgow. — The market is only moderately brisk, for while the seasonal tendency to expansion in demand is in evidence, the improvement is far from uniform. Declining activity in various trades at home and abroad seems to be offsetting the seasonal improvement. The collieries contrive to work fairly steadily, but only a reduction in the volume of production prevents stocks from accumulating. Round coal is freely offered for prompt shipment, and is slowly taken up, while washed smalls maintain a steady position, supplies being affected by the reduction in total coal output. Shipments are still running below the level of a year ago, and the reduction to date is now 1,343,000 tons, this decline relating to both export and coastwise business. In the home market the takings of various branches of industry are fairly active, but stocking of house coal proceeds slowly, and the public utility undertakings have on some days recently suspended deliveries, having accumulated adequate supplies for the time being.

Iron and Steel

London. — The weekly report of the London Iron and Steel Exchange indicates that the volume of inquiry and business shows a tendency to expand. During the next week or two, however, holiday conditions will still have an adverse influence upon business. There is a firmer undertone in the markets due to the belief that a revival in demand will take place in the early autumn.

In the pig-iron market, after a prolonged period of inactivity, consumers are showing slightly more interest and not only has there been some inquiry, but a few contracts have been placed for delivery in the third quarter. There are still considerable stocks of pig iron to be worked off, but these have been greatly reduced during the past few months.

The semi-finished steel market remains congested with accumulations of British and foreign steel, although the process of absorption has eased the situation. In some cases consumers have so far reduced the reserves in hand that the demand for British material has shown signs of improvement. The situation, however, is not likely to become normal until towards the close of the year as heavy stocks have still to be liquidated.

Business in the finished steel department of the market is quiet, for most consumers have covered their forward requirements and are working upon material received against existing contracts. Inquiry has broadened of late, particularly in the lighter branches. Export business fails to develop strength and overseas buyers appear reluctant to enter into fresh commitments.

★

Sheffield. — The volume of business in the iron and steel market shows no expansion, although here and there there are inquiries which suggest that business may improve after the holidays. Forge and foundry pig iron transactions are few and unimportant, relating chiefly to replacement. Stocks both at furnaces and works are heavy. Demand for basic pig iron has slackened. Business in hematites is quiet, but a few inquiries are reported. The finished iron position is unchanged.

Basic steel billet requirements are fairly satisfactory, but business in acid billets has eased. Small bars and stainless steel sheets are good features, and rather more active conditions prevail in structural steel. The general position, however, compares poorly with that of six months ago.

Few of the steel furnaces in this district are now working at capacity, although the demand for the more expensive makes shows no heavy decline. The heavy engineering sections of local industry are well employed, armament work accounting for much employment. Many of the lighter branches are now working short time.

★

Middlesbrough. — Steelworks resumed operations this week, but there was no large accumulation of specifications. Structural steel requirements are fairly heavy, but further orders to replace existing contracts would be welcomed. Semi-finished steel is in little demand, for the stocks which re-rollers have accumulated have not yet been used up.

There is a little more demand for pig iron as foundries in this area and users in the Midlands are resuming operations, but transactions are small and it is anticipated that business will be of a hand-to-mouth nature until towards the end of the year, when prices of pig iron and steel may be revised.

Iron and steel scrap business remains dormant, but in this case the official prices are about due for revision; the existing official prices only apply until the end of next month. Foreign ore imports are being further reduced. Blast-furnace coke is in abundant supply, with demand limited owing to the reduced number of furnaces in operation.

★

Workington. — The position on the North-West Coast hematite pig-iron market has deteriorated. The two furnaces lighted at Ulverston in April last year have been put out of blast, and there remain in operation between Workington and Barrow only six furnaces. Nevertheless, production is in excess of needs, and stocks, estimated to exceed 100,000 tons, continue to rise. Deliveries to the Midlands and Scotland are not considerable and those to South Wales represent a very meagre tonnage. Local consumption, too, has declined and it will fall further if, as is expected, activity slows down at the rolling mills at Workington and Barrow. Any revival, when it comes, must be of a halting character, for it will take six months at least to get rid of the iron lying on the ground. Prices are unchanged. The outlook in the steel trade is discouraging. Hardly any new business is being booked, and the mills are on short time. Native ore, at 24s. 6d. f.o.t., is in smaller request and one of the mines has been closed.

★

Glasgow. — Business is still quiet, but there are more inquiries on the market and makers and manufacturers in the West of Scotland are apparently receiving a very fair proportion of the resulting business. Here, as elsewhere, there is little business being placed by overseas buyers. Firms engaged in all branches of engineering in Glasgow are well employed and some important contracts have been placed within the past week with marine engineers and makers of machinery. A high rate of output is maintained in practically all branches in this district.

★

Cardiff. — Production in the tinplate industry continues at less than 37 per cent. of capacity, compared with over 67 per cent. in the week ended August 14, 1937. There has been a marked increase in shipments after the holidays, and in the week ended August 18th exports totalled 6,182 tons, against 4,964 tons in the corresponding period last year. Stocks in the dock warehouses have consequently been reduced by nearly 50 per cent. The market for sheets is quiet, but the number of furnaces in blast still remains at four, compared with six a year ago. Prices are nominally unchanged.

Textiles

Cotton (Manchester). — Business has been featureless and unimportant in all sections of the market. From a producer's point of view the position in Lancashire tends to become worse. Sentiment remains distinctly bearish. Only minor changes have taken place in raw cotton prices. Business has been at a deadlock owing to uncertainty concerning the policy of the United States Government in respect of a loan to farmers. Varied reports have been received with regard to the progress of the crop in America; the plants are doing well and high temperatures and dry weather are checking the boll weevil. Yield prospects have improved since the beginning of the month.

Dullness has again prevailed throughout the yarn market. Only occasional sales have taken place in American counts. There has been very little activity in Egyptian spinnings for home consumption, but useful orders have been secured for the Continent. The attempt to formulate a price agreement for ring spinners using Egyptian cotton is discussed on page 429.

In the weaving branch there have been more indications of weak selling by manufacturers. Cases have been reported of producers accepting very low prices in order to prevent the stoppage of more looms. So far as export trade is concerned, the contracts arranged have all been for small quantities. Regular styles have been purchased to a moderate extent for the home trade. Further contracts have been reported for the Government.

★

Jute (Dundee). — News regarding the new jute crop continues unsatisfactory, and sellers are maintaining their prices for the fibre at a fairly high level, much too high in comparison with the prices ruling for yarns and cloth. It is estimated in some quarters that as much as 25 per cent. of this season's crop has been damaged as the result of flooding in the jute-growing areas. It is variously stated in private forecasts that the yield of the crop will be between 8,500,000 bales and 9,500,000 bales, compared with 10 million bales last season, though the acreage has been increased this year by about 300,000 acres. The total area sown, under normal conditions, should yield over 11 million bales.

The Indian jute mills are still struggling with the problem of overproduction. Only two mills, owning one-half per cent. of the looms, are still refusing to sign the agreement drawn up by the Association. Prices for Calcutta goods have fallen because of the delay in concluding an agreement, and the excess production must lead to a further increase in stocks, particularly of hessians. The season for sackings is coming on and a reduction in stocks of these can be expected.

The price of Daisee-2/3 full group is now £18 17s. 6d. per ton and of Tossa-2/3 £19 15s., October-November. Substantial purchases have been made of Daisee, ex-warehouse Dundee, and for near shipment, and up to £20 has been paid for assortment. Business in yarns and cloth remains very quiet and prices are nominal.

THE COMMODITY MARKETS

AMERICAN commodity markets were firmer at the end of last week, but there have been no developments in the last few days. Grain prices were steadier, with smaller offerings from Russia, but the outlook remains bearish. Cotton prices have slowly declined, but rubber, copper and lead were marked up on the week. Moody's daily index of American commodity prices stood unchanged compared with last week at 143.1 (December 31, 1931 = 100); its fluctuations have been very small in the current week.

Metals

Copper. — After falling to £39 12s. 6d. per ton, standard cash copper improved substantially under the influence of the better Wall Street advices and closed the week at £40 7s. 6d. per

(*Continued on page 434*)

COMPANY MEETING

CHUNGLOON RUBBER ESTATE (1932), LIMITED

INCREASED CROP

A CHEAP PRODUCING ESTATE

The sixth ordinary general meeting of the Chungloon Rubber Estate (1932), Ltd., was held, on the 23rd instant, at Winchester House, London, E.C., Mr E. B. Ridsdel, chairman of the company, presiding.

Mr W. A. K. Igoe, representing the secretaries (Messrs E. B. Ridsdel and Company, Limited), read the notice convening the meeting and the report of the auditors.

The Chairman said:—Gentlemen,—The report and accounts having been in your hands for the past week, with your permission I will take them as read.

At the annual general meeting last year I directed your attention to the acquisition of the new area adjoining our estate. This property, consisting of 121.8 acres, of which 106 acres are planted, is now an integral part of our estate, and accounts for the difference in acreage as shown in this report, and the increase in the issued capital of the company by £4,000 to £29,077.

REDUCED COSTS

The increased acreage has had the effect of increasing our assessment by 49,000 lbs., and with last year's release averaging 82½ per cent., it will be obvious to you that the acquisition of the new property has been profitable. The higher output obtained has also had the effect of reducing the cost per lb. of rubber.

The crop secured during the year amounted to 346,988 lbs. of rubber, an increase of 107,265 lbs. on the crop harvested last year. Our f.o.b. cost for the year was 3d. per lb., and the all-in cost, including replanting expenditure, was 3.8d. per lb. These costs are really very good, and we must congratulate ourselves on having such a cheap producing estate. Of the crop harvested 318,898 lbs. were sold at a net price of 7d. per lb., as against 8½d. last year. This drop of 1½d. per lb. in the price realised was fortunately more than recovered owing to the increased export allowance.

After providing for all charges there is a net profit for the year of £4,845, out of which an interim dividend of 4 per cent. has already been paid. There remains the sum of £3,682, which, added to the balance brought forward, leaves us £5,802 to deal with. We now recommend the payment of a final dividend of 5 per cent., which will absorb £1,454, leaving £4,348 to be carried forward, as against £2,119 brought in. The liquid position is strong, as cash in hand, rubber stocks and sundry debtors, less creditors, total £7,836.

The estate is in very good order and the general running costs are exceptionally low. Our harvest this year represented the very fine yield of 504 lbs. per acre, and definitely marks Chungloon as a first-class estate. The 26 acres of young rubber planted last year are very healthy and growing well up to standard.

THE CURRENT YEAR

With regard to the current year, the release was 60 per cent. from April to June, and 45 per cent. from June to September. We hope the releases between September and March, 1939, will be more favourable, but you will quite understand that with such a small allowance as 45 per cent. very small profits can be earned with the current selling price of rubber.

I now move, "That the directors' report and statement of accounts for the year ended March 31, 1938, together with the auditors' report thereon, be and they are hereby approved and adopted." I will ask Mr de la Bère to second this resolution, but before putting it to the meeting I shall be pleased to answer to the best of my ability any questions you may care to ask.

Mr Rupert de la Bère, M.P., seconded the resolution, and it was carried unanimously.

The proposed dividend was approved; the retiring director, Mr R. de la Bère, was re-elected; the auditors, Messrs Fitzpatrick, Graham and Company, were re-appointed, and the proceedings terminated with a vote of thanks to the staff in the East and to the directors.

(*Continued from page* 431)

ton, a net gain of 11s. 3d. on last week's close. The demand of consumers on both sides of the Atlantic continues to be small and speculative activity has again lost much of its recent strength so that the movements of the market are small.

★

Tin.—The tin market was dull for most of the week, and on Tuesday the price fell back to £190 10s. per ton. On Wednesday, however, the better advices from the other side of the Atlantic helped to improve sentiment, and the cash price staged a rally to £192 10s., a net loss of only 5s. on the week. Although warehouse stocks in this country now exceed 7,600 long tons and are thus at their highest level for years, offerings of tin on the London Metal Exchange are very limited; demand is insignificant as a result of the very low rate of current consumption, so that the turnover on the tin market is showing a record low level.

★

Lead and Spelter.—Spelter closed 1s. 3d. down at £13 1s. 3d. per ton, but lead showed a rise of 8s. 9d. to close at £14 7s. 6d. per ton. The decline in spelter was due to the great slackness in demand, while lead was supported by reports of pending cartel negotiations and the publication of favourable American statistics. The cartel outlook is discussed in a special industrial note on page 429. According to the American Bureau of Metal Statistics, stocks of lead in the United States fell by 9,100 short tons to 154,200 short tons last month. Domestic production was reduced from 35,000 short tons in June to 31,500 short tons in July, while deliveries of the metal advanced simultaneously from 35,300 short tons to 40,600 short tons. The decline in United States stocks last month was the first major decline since September last, and followed a very small decline of 400 tons in the previous month. As far as can be ascertained, however, the favourable trend of these statistics has not been fully maintained in August.

Grains

THE wheat market was steadier in the past week and prices have fluctuated round last week's levels, without much change either way. Sales from Russia have diminished, and it is thought that the Canadian Wheat Board will not press sales with prices at their present levels, since they are paying 80c. per bushel to the growers. Sales in the United States are reported to be small in comparison with the size of the crop, as farmers are storing wheat with Government loans against a future rise. The low prices for Argentine maize early in the week led to renewed demand, and at the close, Plate again commanded a slight premium over American maize in near positions. Russian barley prices rose towards the end of the week owing to a withdrawal of supplies, but those of other varieties were little affected.

Other Foods

Provisions.—Bacon prices declined at the end of last week by 3s. to 4s. per cwt., since when the market has been firm. Danish butter rose sharply in price during the week, but other prices have changed little. The limited supplies of meat at Smithfield met with a slow demand.

★

Colonial Produce.—There was a better demand for coffee and the smaller supplies of cocoa, and prices of both tended to rise during the week; a better sentiment was also noticed at the tea auctions. The sugar market has been steady.

★

Fruit and Vegetables.—Potatoes sold steadily at unchanged prices. After a quiet trade at the end of last week, demand revived; English vegetables such as peas and beans rose in price, and plums, apples and pears were also in good demand.

Miscellaneous Commodities

Oils and Oilseeds.—After some recovery in prices early in the week, demand again slackened, and prices are little changed compared with a week ago. The linseed market continues to be dominated by the favourable reports of the new crops; refined cotton oil sells slowly at £21 per ton ex Hull.

★

Rubber.—After a period of quiet at the end of last week, demand improved and the price of standard sheet on the spot stood on Wednesday at 8⅛d. per lb., an increase of ⅛d. to ¼d. per lb. on the week. The demand, while not large, was mainly on manufacturers' account and speculative activity

The Long-Term Unemployed

In the following charts we present graphically some of the results of an inquiry by the Ministry of Labour into the age, duration of unemployment and geographical distribution of persons on the unemployment register on February 28, 1938. Except where otherwise stated, all the charts refer to persons on the register aged 18–64, who applied for unemployment benefit or allowances. The number of applicants at that date was about 95 per cent. of the total on the register. The first two charts on the left-hand side show the total numbers of male and female applicants divided according to duration of unemployment and the proportions of male applicants unemployed for different periods in September, 1929, and February, 1938. In the remaining charts we show the age and geographical distribution of men who last February had been unemployed for more than a year. The areas shown in the map are the administrative divisions set up by the Ministry of Labour, except that the area we have called "London and Southern" includes three of the Ministry's divisions, i.e. London, South Eastern and South Western.

Finance

GOVERNMENT RETURNS

For the week ended August 20, 1938, total ordinary revenue was £19,570,000, against ordinary expenditure of £12,497,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £133,045,000, against a deficit of £82,295,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On August 19th, applications at £99 17s. 5d. per cent. for bills to be paid for on any day except Saturday of the following week were accepted as to about 32 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications for bills to be paid for on Saturday at £99 17s. 6d. per cent. and above were allotted in full. £40·0 millions of Treasury bills are being offered on August 26th.

(*Continued from page 428*)

Brewers and Distillers of Vancouver.—Net profit for half year to June 30, 1938, $186,605 (after $84,371 depreciation and $87,375 reserve for income taxes), against $281,863 a year ago. Decrease entirely due to reduction in volume of exports on liquidation of inventories of American type whiskies. Cash stands at $1,017,680.

Ismay Board Changes.—Mr A. E. Somers, managing director of Bell Investment Trust, has been appointed to the chairmanship of John Ismay and Sons in place of Mr John Ismay, who becomes vice-chairman; the managing directorship of Ismay Industries, Mr Ismay remaining chairman; the chairmanship of John Ismay, Ltd., Mr Ismay remaining managing director; and the chairmanship of Britannia Electric Lamp Works, Mr Ismay remaining a director.

Strand Electric Holdings, Ltd.—Report for year to April 30, 1938, shows net profit £11,316, against £13,841. Ordinary dividend 10 per cent. for year, as before. Carry forward reduced from £2,864 to £2,684. The cost of removal to a larger factory and other special items have been written off out of current profits.

Association of Stock and Share Dealers.—At the first meeting of the council, held on August 23rd, Mr B. Sefton Turner was unanimously elected chairman. Messrs Wild, Collins and Crosse were appointed solicitors, and the appointment of auditors was left over for future discussion.

Houghton Main Colliery.—Profit for year to June 30, 1938, £107,971, against £137,868. Ordinary dividend maintained at 12 per cent. tax free. Carry forward raised from £21,381 to £44,203. (Last year £8,752 was written off capital expenditure, £10,000 transferred to reserve and £30,000 to reserve for future capital expenditure.)

Indian Iron and Steel Company.—Final dividend for year ended March 31, 1938, on ordinary shares of 2 rupees per share, making 35 per cent., free of Indian income tax, for the year. (For the previous year the final payment was 1 rupee, including a bonus of 4 annas, and the total distribution 20 per cent. tax free.) The capital now ranking is Rs. 2,45,18,620; for 1936–37 the 10 per cent. interim was on Rs. 1,81,15,840 and the final on Rs. 2,23,10,520. Gross profit for the year to March 31, 1938, was Rs. 1,73,00,000 (£1,297,500).

Brightside Foundry and Engineering Company, Ltd.—Trading profit for the year to June 30, 1938, was £118,192, against £89,787. Ordinary dividend 15 per cent. plus special bonus of 10 per cent., absorbing £43,750 in all (against 15 per cent. dividend and 7½ per cent. bonus, absorbing in all £22,500). To staff pensions £1,000 (same). To reserve, £39,881 (£40,000). Carry forward raised from £20,957 to £24,676. A later statement points out that the gross amount of work in progress is £139,236 more than last year. The net amount is less as they have been able to obtain larger payments on account.

John Greenwood Millers (1934).—By August 22nd, forms of acceptance of the offer by Ranks, Ltd., had been received from holders of more than 90 per cent. John Greenwood Millers ordinary shares. Remaining shareholders still have, however, the opportunity to sell on the same terms, but transfers must be lodged by September 2nd.

Chunglоon Rubber Estate (1932).—Addressing shareholders at the annual meeting on August 23rd, Mr E. B. Ridsdel drew attention to the fine yield last year of 504 lbs. per acre. It was hoped that the releases between September, 1938, and March, 1939, would be more favourable.

Port of London Authority.—The twenty-ninth annual report shows that the net register tonnage of vessels arriving and departing in 1937 was 62,645,758 tons, against 62,151,310 in 1936. The tonnage of goods was: imports, 36,704,160 (against 35,276,733) tons; exports, 44,643,644 (against 42,871,678) tons. In the year to March 31, 1938, total revenue was £6,132,425 (against £5,786,938), and expenditure £4,439,000 (£4,253,212). After stock and loan service of £1,757,161 (£1,534,340), deficit is £63,736 (£614). Carry forward £340,969 (£404,705).

United Kingdom Gas Corporation, Ltd.—This corporation has recently acquired control of the Hemsworth, Grimethorpe and District Gas Company and the Aspley Guise and Woburn Sands Gas Company.

DIVIDEND ANNOUNCEMENTS

Rates are actual, unless stated per annum shown in cash per share. Rate for previo year refers to total dividend, unless mark by asterisk to indicate interim dividend.

A Clear Warning

THERE was a crowd in Downing Street on Tuesday to watch Ministers assembling for their hurriedly summoned meeting. This is a small but an unfailing sign of critical times, for it is only when the tension in the atmosphere rises to crisis level that the Londoner is brought into the street. That a meeting of Ministers should be arranged at such short notice in August is in itself an unusual step. It denotes, at the least, a situation whose implications are so serious that responsibility must be spread over the whole Cabinet. It may even be taken to mean that the Prime Minister and his more intimately associated colleagues required the assent of the other Ministers to a development of British policy involving heavy new commitments.

It is not difficult to discover the reasons for this sudden accentuation of the crisis over the relations between Germany and Czechoslovakia. Within the last week a series of German actions has combined to produce the gravest apprehension. Perhaps the most serious of these items of news is the knowledge that Germany has recently made diplomatic soundings in Russia, Roumania and Jugoslavia about the probable attitude of those countries in the event that Germany should find it "necessary" to go to the assistance of the Sudeten Germans in Bohemia. The choice of capitals for the dropping of such ominous hints is curious; and it is possibly an indication that German diplomacy had more hopes of frightening than of isolating the Czechs. But the open mention of forcible intervention, taken together with the presence under arms of a mobilised German army, must inevitably be taken very seriously by the rest of Europe. At the same time that German diplomatic activity was adopting this sinister note, the attitude of the Sudeten German Party inside Czechoslovakia became noticeably more truculent. It cannot truthfully be said that Herr Henlein's reaction to the Czechoslovak Government's proposals became more unyielding, since he has never yielded an inch. But the note of defiance in the Party's speeches grew higher, and the issue at this moment of an instruction to the Party members to arm themselves for self-defence against alleged (and totally non-existent) "Marxist attacks" had all the earmarks of provocation. And like a chorus of fiends in the background, drowning every note of moderation, the German Press has excelled even its own previous efforts in making mountains of blood-curdling accusation of terrorism against the Czechs out of the merest molehills of tavern brawls. The peaceful German people is being whipped up to fury by statements whose content of truth is so infinitesimal that they rank as conscious falsehoods. This sudden increase of tension has been a deliberate act of the German Government. Every contributory factor to it can be traced to the action either of the German Government itself or of those under its control. Indeed, so far as the Czechoslovak Government is concerned, this week of rising temperature has seen the most far-reaching concession that Prague has yet made to the Sudeten claims, in the form of a suggested revision of the constitution to convert Czechoslovakia into a federal State. It does not, of course, follow because Germany has placed the possibility of imminent war upon the agenda of international discussion, that she means to make an attack upon her neighbour. It may merely be the German way of bringing forceful pressure to bear. This is, indeed, still the most likely interpretation. But the other and more sinister interpretation is not so impossible that it can be disregarded.

The British Cabinet was thus not lightly called together. The Prime Minister, the Foreign Secretary and the Chancellor of the Exchequer were in close consultation last week, with the result that on Saturday Sir John Simon reiterated and re-emphasised Mr Chamberlain's speech of March 24th, in which those whom it might concern were solemnly warned that Great Britain could not be expected to keep out of a war that might start over the Czechoslovak dispute. But the British Government did not want to confine its influence to a single speech, and the rest of the Cabinet were summoned to decide what more was needed. There may have been discussion at the meeting on the methods of the next step to be taken. But there is not the slightest sign of any disagreement on its content. The rulers of Germany are to be left in no doubt that the cause of peace demands from them something other than an intransigent insistence that Czechoslovakia must commit suicide. There is, indeed, every need for tact in conveying this message from Downing Street to Berchtesgaden. Germany must be treated, as she has so often insisted, as an equal and a sensitive equal. The Prime Minister in a memorable metaphor some months ago spoke of the nations being in the high mountains, where an injudicious word might unloose the avalanche. We are now looking over the precipice and it is no time for hurling defiance. Our words must be soft, but resolute and clear beyond the possibility of a mistake.

No mistake must be made, equally, about the fact that the people of this country stand behind the Government. Since the events of March, and especially since May 21st, British public opinion has been solidifying and hardening. Many of the old hesitations and perplexities are beginning to disappear. We do not, for example, hear so much to-day of the misleading question whether the British people are prepared to fight for Czechoslovakia; the ordinary man realises that very much more than Czechoslovakia is at stake. It is an inaccurate description of this change in British opinion to say that it is a growth of hostility to Germany. It is true that those who preached the doctrine of relying on German moderation are now utterly discredited and that the busy clique of highly-placed friends of Germany is now silent. But there is nothing in the present mood of the British people that is hostile to the just aspirations of Germany; there is no talk of encirclement; there is nothing that excludes the possibility of Anglo-German friendship. There is only a growing grim realisation that there will never be any security for the British people if nations are allowed to pursue their ends by the methods that Germany has used in recent months and is now threatening to use again.

It is thus the whole British nation that is sending a message to Herr Hitler—a British nation very conscious of its responsibilities and backed beyond question by the approval and at least the moral force of the Dominions and the United States. The message is neither a submissive plea for forbearance nor a defiant threat. It is the plain statement of a fact that is as unpleasantly ineluctable for the British as for the Germans. If Germany draws the sword she will, for the second time in a quarter of a century, find the world up in arms against her.

Aliens in England

THE responsibilities of a great and Imperial people know no frontiers. A flood tide of alien migration is beating upon our shores; and not least among the heavy burdens now laid upon the good sense and generosity of the British people is the task of playing a fitting and sufficient part in providing work and shelter for the victims of persecution in the old and new portions of Greater Germany. Already the conscience and the apprehensions of the nations have been aroused. Conferences at Evian and London have led to the creation of a permanent organisation to correlate all efforts to cope with a problem which has now grown too large for the voluntary bodies hitherto grappling with it. For nearly two decades these bodies, with the aid and advice of organs set up by the League of Nations, have done their admirable best; but now, with the fresh threat to the half-million Jews of Greater Germany and the forthcoming expulsion, ordered on Thursday of this week, of about one-half of Italy's 40,000 Jews, the task has got beyond their financial and administrative resources. The nations made no pledges at Evian or London; but the discussions made it plain that salvation for the refugees themselves and safety for the settled peoples of the world lay in the conversion of the present ragged flight into an ordered and regulated flow of migrants dispersed with foresight and charity into many lands. The policy of Britain and the British Empire is of paramount importance.

In the past, exiles have found ready sanctuary in Britain. Bloomsbury sheltered Karl Marx; Napoleon III made a home in Chislehurst; and this tradition of tolerance serves as a powerful attraction to the wandering Jews—and others—of to-day. Helpless and homeless they besiege our ports. Since the war and its aftermath set hundreds of thousands on the move, however, the watchword of Britain's policy towards aliens has been caution. Foreigners have often been suspect on political grounds; and a continuously high level of unemployment has made Governments disinclined to encourage the entry of fresh competitors into the labour market. Under the Aliens Order of 1920, foreigners entering this country to work must obtain a permit from the Ministry of Labour, unless their intention is to set up in business on their own account, or to become partners or directors in registered enterprises.

These permits, granted only after the Home Office has approved the desirability of the would-be immigrant on political and health grounds, are only given for specific jobs already obtained, and they are actually issued to intending employers, who must prove that every effort has previously been made to fill the posts with British workers, and give assurances that the remuneration offered to the alien is not less than would be paid to native applicants. In general, the Order has been interpreted with marked strictness, with the possible exception of domestic service. Nevertheless, the number of permits granted annually has risen conspicuously in recent years. In 1927 the number of persons, including adult dependants, admitted under permit was less than 8,000; between 1928 and 1934 the number never reached 15,000 in a single year; in 1936 it was 21,000 and in 1937 28,000. Similarly, the number of other aliens admitted to this country to study and for various miscellaneous reasons (apart from holiday-making), after ranging between 6,000 and 7,500 from 1928 to 1935, rose sharply to 9,500 in 1936 and nearly 11,000 last year.

Clearly the exodus from Germany after the establishment of Nazi rule five years ago combined with the improvement in trade and employment in this country during 1936 and 1937 to bring about some relaxation in the terms of entry imposed upon foreigners. Now the *Anschluss* has swollen the number of migrants; and economic depression has returned. The crucial question is whether, in these circumstances, a more lenient attitude towards the admission of aliens is possible without straining generosity to the breaking-point. Since the war, Britain's welcome to exiles has not been so cordial as that of, say, France. In 1921 the number of foreigners permanently resident and gainfully occupied in this country was only 142,725; by 1931 it had fallen to 111,000; and the numbers admitted annually to work under permit represent only a negligible portion of the total employed population. Many have brought skill and enterprise. Indeed, recent alien immigrants have probably provided work for more British workpeople than they number themselves. Some years ago, aliens contributed notably to the development of the manufacture of beet-sugar, artificial silk and motor tyres. More recently, not unimportant foreign concerns have been operating successfully on the Government-assisted trading estates; a large part of the famous German fur trade has been brought by exiles to Holland and England; and in journalism many of the most successful ventures of recent years have been due to aliens, many of whom brought no capital of their own and had to pass through the needle's eye of the Aliens Order into salaried employment. The rewards of a more generous policy towards aliens might be very considerable, even in material terms.

To open the door indiscriminately wide would be both impracticable and improvident. Well-defined conditions must of necessity be laid down. No allegiance owed by an immigrant to any foreign Power should be permitted to endanger the security of these islands. The standard of life must, where necessary, be protected against the competition of cheap labour; and immigrants cannot look to rates and taxes for their maintenance. In brief, the present principles of British policy can stand, but the details of their application might well be modified in order to enable Britain to play the part in European rescue work which her wealth and traditions of tolerance and freedom require. At present, for instance, a permit for an alien to enter Great Britain to work is granted only on the application of his prospective employer in this country and for a specific post. Unless an alien can produce such a permit, or unless he will give an undertaking not to engage in gainful occupation, he will be turned back at the port. This means that the destitute refugee must find someone who will undertake to employ him without having seen him—a serious difficulty even for domestic servants and an almost insuperable obstacle for others. The principle of the legislation would not be infringed if refugees and others who are under severe pressure to leave their own countries were allowed a provisional entry to this country and only turned away again when it had become clear beyond a peradventure that they could not find a livelihood here. Foreigners with special skills should be welcomed, not, as is the rule at present, excluded so that British workers can be trained to fill the gap. The fallacious view that there is a limited and inexpansible fund of work to be divided among all workpeople, and that aliens in employment therefore rob natives of their living, should not be allowed to determine official policy. Trade unions and professional bodies should certainly be called in to assist in the work of absorbing as many deserving exiles as possible; but their often narrowly restricted views about the interests of their members must not prevail. The last word is the Government's; and it should be generous.

But British responsibility is not limited to these islands. Britain is the heart of a great Empire; and that Empire, like all the countries of the New World, was brought to prosperous development by migration. The need for migration has not ceased; and Britain can serve as an entrepôt to receive and train settlers for the far outposts and as a general headquarters for the planning of their dispersion. The Overseas Settlement Board only a few weeks ago laid stress upon the need for emigrants, especially in face of falling birth rates in the British Dominions and the United Kingdom alike. Nor is it only the more sparsely populated parts of the British Empire that have need for emigrants. A recently published Report of the International Labour Office on Migration for Settlement concludes that in many other countries there are opportunities for immigration and land settlement not yet turned to account, while several crowded industrial countries have citizens to spare. Argentina and Brazil want agricultural settlers. Mexico and Australia need immigrants. Kenya is ripe for added settlement. To merge the flight of Europe's fugitives in the migration which the world's economy still needs is the merest common sense. By generosity and forehanded planning Britain, both at home and in the distant corners of the earth where her interests and prestige extend, can contribute notably to the cure of Europe's ills. It is not only in Heaven that, by so doing, she would be storing up treasure for herself.

Standards of Living

PROGRESS, the Victorian watchword, has in Georgian days lost a lot of its pre-eminence. Security, in large measure, has taken its place. The worker, since he was demobilised after 1918, has demanded, in all Western countries—that is, in all systems of capitalistic production, whether privately or publicly owned—security of tenure for his job, and stability of money income. To a large extent he has secured both; in Russia, Italy and Germany, as in England, France or Sweden. The employer in these countries—whether a State entity, public utility, individual owner of the enterprise, or association of shareholders—has, equally and equitably, demanded and obtained from the Government security of tenure for *his* job by means of protective legislation, and, accordingly, stability of money income, too. The protection of economic interests, "vested" as much for workers as for employers, is as evident in the Russian or German economy as in the English; for, in all three, the community of consumers is taxed, directly and indirectly, to provide security of tenure for the jobs, as well as stability for the money incomes, of workers and work-givers alike. Therewith, risk-bearing—once the proudest device in the escutcheon of individual enterprise, regularly touched-up *gules* by profits—has rapidly become dimmed. More and more, the bearing of risks—risks of unemployment and unprofitability alike—are being thrust upon the broad shoulders of the State and its organisations. But risks can only be shifted, they can rarely be removed; and the peoples of the Western world, of Russia as of England or Germany, are content to remain blissfully ignorant where the State itself has shifted the burden of those risks.

In fact, few citizens of Western countries ever ask: Who is, or makes, or runs, the State? Who pays for it they know; but the year-to-year variations in the individual citizen's share are so small that the citizen, at the most, merely grouses and pays his taxes, bears his reduced standard of living, his longer hours of work, or whatever contribution he is called upon to make. He thinks—in Russia as in England or Germany—that his taxes, or hours, or falling quantity and quality of consumable goods and pleasures, merely pay the upkeep of the Cabinet, the fighting and Civil Services, and the whole administration of the State. What he has not yet realised is that to an overwhelming extent in Russia, to an extent rapidly approaching it in Italy and Germany, and to a less extent in England, France, Sweden or North America, a steadily

and rapidly increasing proportion of his money income, that income stabilised for him by the State, has been statutorily earmarked for expenditure upon definite and State-decreed objects; and this, after all direct taxes have been paid. He pays, by order of the State, and quite apart from his indirect taxes, more for his bread, milk, sugar, alcohol, meat, potatoes, eggs, butter, cheese, etc., than he need. He has to do so because, in industrial Belgium as in agricultural Hungary, in Socialist Russia as in Fascist Germany or epidemocratic England, the Government for almost a generation has been primarily concerned to produce, not the greatest amount of consumable goods and services, but (as hunters preserve game to pursue it) the largest volume of work for idle hands to do. In this way, security of jobs and stability of money incomes have been bought at the price of foregoing some of the progress in standards of living, which the phenomenal advance in productive technique since 1914 would otherwise have permitted. The Western peoples have not perceived the exaction of this cost by their Governments; it has been spread, all but imperceptibly, over the nations as a whole. And Governments themselves, while compelled to levy on the trading world the price of protection for their own nationals, have neither been aware they were arresting the advance of their own citizens' welfare, nor even levying any cost of it on anybody at all.

Governments, in acting in this way, have been responding to a very clear call from their peoples. The old ideas of economics, and the old ideas of economic policy, were at fault in failing to recognise that, in the ordinary man's mind, security at the expense of progress is at least as attractive as progress at the expense of security. But we have now swung far too violently to the other extreme, and the time is overdue for a reaction. That the reaction is coming is shown most clearly by the increased attention being given, not merely in this country but in others, to problems of the standard of living. The last Assembly of the League of Nations adopted a resolution setting on foot an inquiry into "measures of a national or international character for raising the standards of living." This has resulted in the last few weeks in the publication of two reports* of outstanding interest. The International Labour Office has investigated the extent to which it is possible to determine the standard of living in a country and by means of four countries taken as examples—the United States, Poland, India and Japan—has demonstrated what an appalling degree of poverty still exists in even the richest countries and how little excuse there is for calling a halt to the march of material progress.

The second report, that prepared by Mr N. F. Hall for the Economic and Financial Section of the League, is a first attempt to sketch a conscious policy for raising standards of living. Mr Hall, whose work both as the former Professor of Political Economy at University College (London) and as a contributor to this journal is warranty enough for his qualifications, naturally treats his subject from an international angle; but he shows concern, not so much for the familiar system of international trade and division of labour, already gravely threatened, as for the future functioning of purely national economic systems when—as the Dodo told Alice before the famous caucus-race began—everybody must win and everyone must have prizes. Mr Hall, significantly, sees the same danger lowering over the totalitarian States' economies as over those of the democracies—though he neither uses this terminology nor neglects the differences of degree, if not of kind, that distinguish the incidences of that danger in all Western countries.

The author, while admitting, what so few nineteenth-century economists admitted, that different nations' standards of living can hardly be reduced to comparable terms, owing to traditional and cultural valuations or ingredients, makes an initial statement of his social views as an economist:—

> The benefits of modern knowledge and of capital—as distinct from capitalism—can only be obtained if there are substantial increases in consumption. It appears, therefore, not untrue to say that the maintenance of the economic and political security of prosperous nations and of wealthy individuals has come to depend to a very substantial degree on the prosecution of measures designed to give at least a minimum standard of *physiological* living to the masses of the people (page 12).

Having made this confession of faith, however, Mr Hall makes it clear that he is not one of those who commit the mistake of divorcing consumption from production and treating them as separate problems. On the contrary, "substantial increases in consumption" will only be possible if there are those substantial increases in production which would ensue if all our national and international capital equipment, labour and natural resources were more rationally ordered in a productive system. And, as a hint of the methods by which an increase in production can be achieved, Mr Hall suggests that much more attention should be paid to what, in the technical language of the economists, is known as the elasticity of demand. We have had a practical example in Great Britain since 1932 of the benefits that accrue to the whole national economy when the prices of the primary necessities of life are reduced. The demand for these commodities is inelastic; a fall in their price releases purchasing power for other commodities (cars and radio sets, for example) and the satisfaction of this additional demand gives an impetus to the whole economy. Clearly, efforts devoted to the reduction of prices such as these are likely to have a much greater effect than other forms of Government intervention to increase consumption. Mr Hall makes the useful suggestion that research should be devoted to the problem of choosing those points in the structure of incomes, prices, production and consumption at which the injection of Government assistance is likely to do the maximum of good. He emphasises the importance of a more equitable distribution of national income in this context, and also of the progressive development of social services. He also calls for further inquiry into the advisability of State action to educate consumers—and its limitations.

Mr Hall's memorandum is in general terms and is, as a contribution by an independent expert, of a tentative and preliminary nature. But it raises the important question whether the so-called "free" economies of the democracies in the West might not, even now, be better served by collective economic action among themselves than by, as it seems, a separatist aping, at far and ineffectual removes, of the totalitarian "political economy." Nutrition, hours of work and leisure, wage-levels, standards of living: the League and its organs have done excellent work as pioneers in these fields. But on the shoulders of the Western democracies' governors rests the responsibility for determining what particular risks to individual vested interests they and their peoples are prepared to run in the laudable effort to spread prosperity and advance standards of living. Until they assume that responsibility, they will not take counsel together to improve their common lot. They will go on preferring their particular and separate drifts into economic stagnation.

The least their thinking citizens can do to help them is to ponder the choice between Progress and Security, a choice which we know to be in the last resort inescapable, and which, we trust, the League and private economists such as Mr N. F. Hall will continue to clarify.

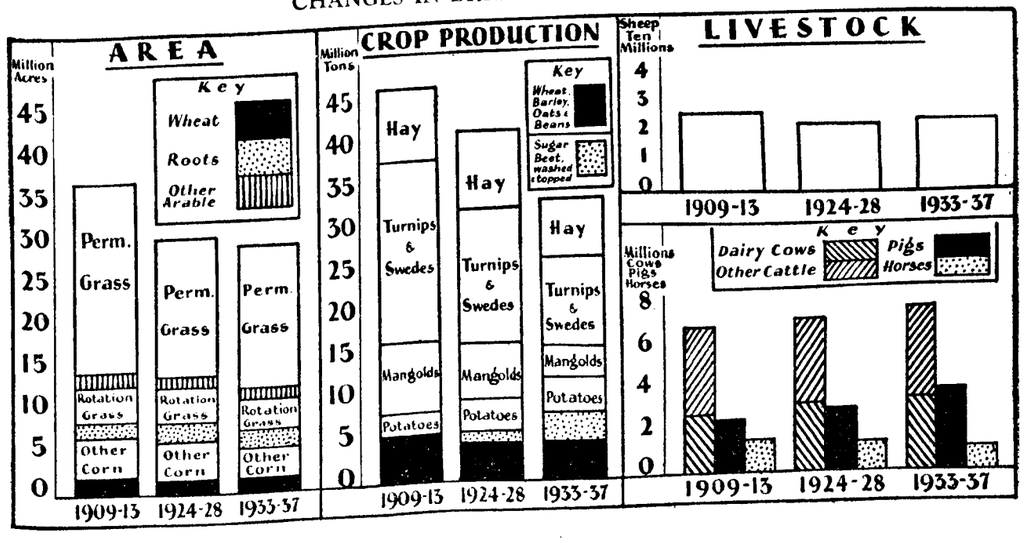
Britain's Changing Agriculture



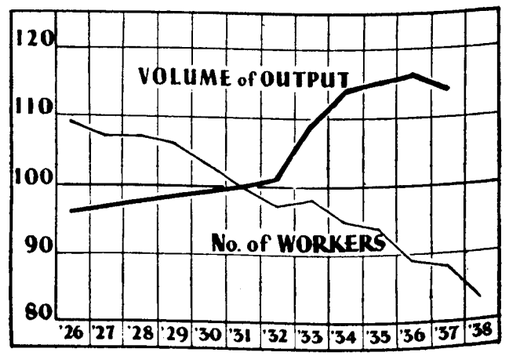
THE latest pronouncements on agricultural policy seem to indicate a refusal by the Government to be stampeded by the fear of war into forcing a hothouse expansion of British agriculture in all branches. Agriculture is to be assisted, but only in its progress along its "natural lines of development." Those who speak for the farmers seem to hold differing views on what constitutes the "natural development" of British farming. But a short answer, at least, can be found in a study of what, in fact, have been the actual directions of change in the industry during the last quarter of a century. For an industry which, above all others, is organised in small units both for production and, in the main, for distribution, there is a creditable volume of statistics available to illustrate the changes from year to year. Some of the more important of these figures have been reproduced in graphical form at the foot of the page. Three periods, each of five years, have been selected for comparison. The first is the years 1909-13, immediately preceding the outbreak of war. The second is the years 1924-28, representing the period of comparative stability between the immediate aftermath of the war and the onset of depression. The third consists of the last five years for which figures are available.

The most obvious and easily measurable fact about any country's agriculture is the number of acres devoted to agricultural purposes. This is shown in the left-hand diagram. The steady shrinkage of the total cultivated area has been deplored by every agriculturist for the past twenty years. In fact, however, it is less a sign of agriculture's decay than of urban encroachment on agricultural land, for new towns, suburbs, factories, bungalows, playing fields and aerodromes. The effective radius of the continuously built-up area of London alone has increased from 1913 to the present day from about six miles to about twelve miles, swallowing up something like a quarter of a million acres, and the same thing has been happening with the outer suburbs and with every town and city in the land. Much more significant than this fall in the total cultivable area is the shift, clearly shown in the diagram, from arable land to pasture land used for raising livestock. The amount of arable land has been falling all this century, and has only partially been arrested by recent legislation. The growth in livestock farming, on the other hand, has definitely accelerated in recent years.

The fall in the area under cultivation and the relative increase in permanent grass and in the importance of livestock are often cited as two sides of the same coin. That they are closely connected is obvious, but an increase in dairy herds and in pigs does not necessarily involve a decay in field crops and an increase in permanent grass. The largest European exporter of dairy produce—Denmark—is, in fact, largely an arable country; the increase of the animal herds during the present century has been accompanied by an increasing cultivation of corn and fodder crops. But in Britain it is true that livestock have increasingly been used as a substitute rather than as a complement, to arable cropping. Farmers have definitely changed from the one to the other. Indeed, one of the most striking changes in recent years has been the breakdown of such integrated systems of livestock and cultivation as did formerly exist. The type of meat which the public nowadays demands—lamb, veal and small beef joints rather than the cuts from the older and larger animals on which the prolific families of Victorian England were fed—is produced on good grass supplemented by imported concentrates and not the fodder crops of the mixed farm. Moreover, the pressure of lower prices has forced the arable farmer to concentrate on his cash crops. Thus the two varieties of farming have gone their separate ways. Livestock breeding is based on grass; while in arable cultivation, sugar beet, potatoes, vegetables for human consumption, and, since 1932, wheat, have been the favoured crops, at the expense of barley and beans, mangels, swedes and turnips. Even in the livestock division there has been a concentration on products that can be sold immediately for cash. Since the advent of the Milk Marketing Board there has been a decline in the farmhouse manufacture of butter and cheese and, particularly in the western regions, dairy farmers have preferred to send their milk into the Board's pool.

Partly as a cause, and partly as a consequence, the decline in arable cultivation and the change-over to livestock farming has been accompanied by a steady drift of rural workers from the land. Between 1925 and 1938 the number of regular workers employed on agricultural holdings fell by nearly one-fifth, and the fall in casual workers

CHANGES IN BRITISH AGRICULTURE



has been proportionately even greater. Livestock farming requires fewer hands per acre than arable farming, and the decline in employment is partly due to the fact that farmers, having made the change-over because of the greater profitability, or at least the greater steadiness of prices, in stockbreeding, have reduced the number of their employees. But the pressure has come at least as strongly from the other side, as is shown by the fact that the decline is concentrated on the younger age groups. Agriculture is, indeed, fast becoming an occupation for the elderly, and the boys from school seek other openings in towns and factories. Compared with urban life, agriculture suffers from comparative isolation, bad housing, long hours and low wages. The system of Wages Boards set up in 1924 has, indeed, succeeded in raising wages to about double their pre-war level, but even so they remain low by urban standards.

To the farmer who has to pay them, nevertheless, wages are a considerable burden, and the effort to economise labour lies behind many of the changes in British agriculture. It is shown not merely in the change-over from arable farming to stock breeding, but also in the considerable progress that has been made in mechanisation. This is seen at its most spectacular in the huge mechanised dairy farms and in the thousand-acre corn farms in East Anglia, where hardly a horse is to be seen. But on countless small farms, the milking machine, the tractor, the " grid," the oil engine and the motor car have worked a revolution, which would have gone even further but for the perennial lack of capital. A recent survey of East Anglian farms showed that in as short a period as the five years from 1931 to 1936 the value of output per man employed on the farms recorded rose by nearly one-half, and the volume, which is not affected by price changes, by as much as a quarter.

These changes in the efficiency of the industry are the vital factor that is usually ignored in special pleading on agricultural matters. It is so easy to point to declining acreage and the falling number of men employed and jump to the conclusion that agriculture is on the decline. So easy, and so fallacious. In point of fact, the Ministry of Agriculture's estimate of the total value of agricultural output in England and Wales in 1936-37 was £220,600,000,

Output and Employment in English Agriculture
(1931 = 100)

Index of output based on Ministry of Agriculture's estimates of output values at prices of 1930-31. Index of employment calculated from numbers of regular workers plus half number of casuals.

or only £14,600,000 less than the figure for 1925, and the fall is much less in proportion than the decline in prices. The same illuminating truth is represented most graphically in the accompanying chart, which shows the changes since 1925 in the *volume* of output (as estimated by the Ministry) against the changes in the same period in the number of men employed. In spite of the drift from the farms, the industry is producing more than a decade ago. The decline in the rural population is a matter of regret to many, as is the yearly total of acres from which the plough is withdrawn; and it is undoubtedly true that in many parts of the country the land has suffered from neglect and is now in poor condition. But against these regrets must be set the facts that the industry is steadily increasing its output, that those who have drifted away have gained the higher standard of living of the towns and that those who remain behind have also improved their condition. British agriculture is changing, but hardly decaying.

Topics of the Week

The New Czech Plan.—The European diplomatic crisis centres round Prague. But the happenings in that city have, in a sense, ceased to be decisive for the outcome of the crisis. A new plan by which the aspirations of the Sudeten Germans might be accommodated within a Czechoslovak State that preserved its integrity has been put forward, with the personal authority of President Benes himself and the blessing of the British Government, and at the moment that we go to press the answer of Herr Henlein is expected. That answer cannot be acceptance, but it may not be a total refusal to negotiate. For Czechoslovakia the content of these successive plans of constitutional reform is vitally important; the whole political life of the country for decades to come may turn upon their wording. On the German side, however, there is little sign of any serious attention being paid to them. Herr Henlein gives the impression of a subordinate whose master has not yet decided what instructions to give; he will accept no Czech proposals and put forward none of his own. Herr Hitler's attitude shows with the utmost clarity how much the Sudeten Germans are a pawn in a greater game. For if he wanted only to secure reasonable treatment for a minority that is already the best-treated in Europe he could have ordered Herr Henlein to begin negotiations with Prague long ago. If, on the other hand, Herr Hitler is determined to press the matter to the last dreadful issue, no plan from Prague, however reasonable, will be accepted.

In these circumstances the task of the Czechoslovak Government is to justify itself in the eyes of world opinion and world history fully as much as to persuade Herr Henlein to treat. The latest plan of local autonomy by cantons or *départements* is believed to follow very closely the outline given in *The Economist* last week, except that a larger number of local areas than the twenty-three then given seems now to be proposed. No information about the degree of autonomy to be granted to these local areas is yet available, and it may well be found that they will not have as full powers as, say, a Swiss canton. But how could they, in a State that is almost surrounded by a heavily armed and much larger neighbour which makes no attempt to hide its enmity to the whole conception of an independent Czechoslovakia? The opinion of the Czechs themselves, backed by foreign observers in Prague, is that the new proposals go to, and possibly beyond, the margin of safety. All the efforts of Lord Runciman's mission are bent on persuading Herr Henlein at least not to reject them outright, and the latest news is that Herr Henlein, at Lord Runciman's request, is journeying to see Herr Hitler at Berchtesgaden and presumably seek his permission to consider the Czech proposals. Hopes are not very high, but the Czech offer may be the last chance the Sudeten Germans have of preserving their own individuality, for they cannot be under any illusion that their successful " rescue " by Germany would leave them with a shred of the independence now offered them by Prague.

French Hours of Work.—The momentary *furore* aroused by M. Daladier's broadcast appeal for longer hours of work in the interests of French productivity and security has, as anticipated, largely died down. There are still growls to be heard from the trade unions, and the strength of the ties that bind the parties of the Popular Front has clearly not been increased. But there has been, and will be, no immediate political crisis. M. Daladier has made it clear that he had no intention of attacking the forty-hour week as such, but wished only to secure a more elastic interpretation of it; and he has also declared that he has no intention of abandoning his Socialist allies for new support from the Right. But he has equally continued to insist that longer hours and more work are necessary if France is to be saved. A Council of Ministers on Tuesday passed a decree, within the framework of the forty-hour week, which authorises unlimited overtime in defence industries and fixes for other industries a maximum week which, in most cases, works out at forty-three and a half hours, including overtime. This will seem to most people to be a small enough relaxation, in all conscience, and even these hours can only be attained by the payment of overtime rates, which in some industries are disproportionately high. The reduction of overtime rates was another part of M. Daladier's proposals, but since this would involve both legislation and, in some cases, the alteration of existing collective contracts, it may be more difficult to achieve. The events of the past fortnight have shown that the workers are beginning to realise that an increase in production, at reasonable cost, is vitally necessary, and that an extension of hours must play a part—though only a part—in such an increase. Very, very slowly facts are conquering theories in France. And one of the facts is that to insist on a larger slice of a smaller cake is not always the best way to riches.

* * *

Labour Policy.—The first of May may be by tradition Labour Day. September is by convention Labour's month. Within the next fortnight the Trade Union Congress, the Labour Party and—tell it not in Gath—the Communist Party will meet in conference, and the simultaneous onset of economic depression and the crisis in world affairs will afford a whetstone for the sharpening of the Labour movement's policies. Last week-end the president of the Amalgamated Engineering Union, in a speech defining the union's attitude towards re-armament, reiterated the engineers' disinclination to entertain proposals for dilution at a time of rising unemployment in their ranks. There can be little doubt that re-armament will loom large at the T.U.C.'s Blackpool meeting next week. Nor is it likely that the sentiment of the majority will be encouraging to those who still sponsor an attitude of intransigence. The present situation in Central Europe is sufficient earnest of the need for speedy and wholehearted co-operation between all parties in this field; and the perceptible stiffening of the British Government's attitude abroad has removed some at least of the political grounds for the unions' marked delay in meeting the Government's appeal for assistance.

* * *

The trade unions now stand at the end of a period of notable advance. In ten years their funds have doubled, according to the summary of the Registrar of Friendly Societies, issued this week; they now exceed £18 millions; and union membership has risen to 4,695,065, or 790,000 more than in 1927. This is a relatively small share of Britain's 13 millions of insured workpeople, and the unions' leaders will have to think hard about the rôle of working class organisation in the expanding industries, where at present they are weakest, in addition to working out plans to meet the effects of worsening trade upon employment and wages. The Labour Party, too, has thorny problems to solve, outside the sphere of world politics. By hook or crook it must shortly make some show of being a possible alternative to the present Government. This week, a resolution for the Communist conference at Birmingham offers the Labour Party unconditional support and loyalty. Mr Attlee and his colleagues will be duly suspicious of Greek gifts from Comrades Pollitt and Gallacher—just as the British farmers are likely to be sceptical about the Labour Party's own programme to restore British farming and, incidentally, win agricultural votes, announced in an open letter on Tuesday. The plan has borrowed much from the wisest proposals of agricultural reformers, but, like the Party programme of which it is part, it rests too much upon the familiar complicated and doctrinaire framework of Socialist apologetics to win wide popular support.

* * *

A Potentate Protests.—Lord Nuffield chose the occasion of the introduction last week-end of his new improved and cheaper Morris Ten to deliver more words in season to the powers that be. He was careful to congratulate Mr Chamberlain on his foreign policy, but in the field of fiscal policy he was less commendatory. Protesting against unfair competition from German cars exported to this country under subsidy, he declared that it was impossible for British manufacturers to compete without countervailing aid from their own Government; and he went on to utter a striking threat. If further burdens were placed upon the motor industry by taxation, he would " throw up his hand and walk out." Lord Nuffield is a power in the land, and his stature has not been diminished by the philanthropic disbursement of the Morris millions. Once before he clashed with the Government, over the production of military aircraft. That dispute is now happily ended and Lord Nuffield has lately been called upon to assume an important rôle in re-armament. His latest pronouncement is not, of course, to be taken literally. And in any case it is difficult to see what can or should be done about it. The absorption of the McKenna duties in the general tariff has

made possible measures against German dumping, but nobody, not even Lord Nuffield, can say with certainty how much of the cheapness of German cars is due to export subsidies and how much to economies of manufacture. And, although the total revenue of the Exchequer and local authorities from motorists in 1937-38 is estimated at £90,560,000 from all sources, it is by no means certain that it is for the manufacturer, very heavily protected as he is, to raise the alarm. The motorist who pays these sums for the use of inadequate roads is the direct sufferer; and while these disabilities undoubtedly tend towards caution in the buying of motor cars, there is no evidence at all in the trend of new registrations that Lord Nuffield is being taxed out of business.

* * *

Changing World Economy.—Last week Sir William Beveridge released the results of researches, providing a more sharply etched picture than hitherto of the structure of the trade cycles through which the economic life of the nations has swung unceasingly in modern times. Hard upon Sir William's revelations came a survey of World Production and Prices from the Economic Intelligence Service of the League of Nations, measuring *inter alia* the progress made in the output of foodstuffs and manufactures during the post-war years. From these data it is possible, as we slide into the trough of the third trade cycle since 1918, to trace the trend of economic development in our own times, underlying the periodic ups and downs of commercial and industrial activity. Between 1920 and 1937 the world output of foodstuffs per head rose 19 per cent., and of manufactured consumption goods 40 per cent. Since 1925, however, there has been no increase, though no falling back, in the *per capita* output of foodstuffs; and the production per head of manufactured consumption goods is now practically the same as in 1929.

* * *

Although world output per head of manufactured goods has risen by 2.2 per cent. per annum over the last 18 years, there has been little change, on balance, in *per capita* production in North America; and while Europe's output of foodstuffs has increased considerably since 1929, North America's has fallen back. World production reached record levels in 1937, but the quantum of world trade in that year was 3 per cent. lower than in 1929, reflecting, as the League's survey points out, "the decline in the proportion of commodity production internationally exchanged." There has been no check to technological advance in industry in recent years, and output per hour has risen steadily from 100 in 1929 to 119 in 1937. The severe impact of depression upon the United States of America emerges very clearly from an examination of these various statistics; and upon the course of events in that country, where the outlook is now brighter, the rate of world progress in the near future must appreciably depend.

* * *

The Church, the Jews and the Axis.—The detestable doctrines of racial hatred seem to be part of the price that Italy is paying for adherence to the Axis. Signor Mussolini's sudden proclamation of Italy's conversion to racialism, followed by a truculent defiance of the Church or any other power that might venture to oppose or even criticise his new departure, seemed likely to involve him in a head-on clash with the Vatican. From the dangers of such a conflict the Duce has hung back. Within the last few days the provisions of the 1931 Agreement regarding the Scope of Catholic Action in Italy have been reaffirmed, and there has been a withdrawal of the Fascist threat that membership of Catholic Action might be deemed incompatible with membership of the party. At a public audience given by the Pope on August 27th to pilgrims from Bavaria, France and Italy, he intimated that in Italy the strain had relaxed. But there is no relaxation for the Jews, and Thursday's meeting of the Italian Cabinet resulted in a decree expelling from Italy all Jews (a Jew in Italy apparently means a full Jew) who have entered since 1919, naturalised as well as alien. Thus does the cruel madness spread. In Germany, the State and the Church are still at war. Indeed, the Nazi State has struck the most direct blow at the Catholic hierarchy in Germany that it has yet ventured. On August 26th the Catholic Bishop of Rottenburg, Dr Sproll, was forbidden by the civil powers to reside in the Württemburg province of the Reich, in which his diocese lies. The bishop's unpardonable offence in Nazi eyes is that, on the day of the plebiscite on the *Anschluss* of Austria, he, alone among the voters in Rottenburg, abstained from voting, on the ground that, although he approved of the *Anschluss,* he could not be a party to returning deputies to the Reichstag who, in his belief, were hostile to the Catholic Church. This last Sunday there was read from Catholic pulpits throughout Germany a pastoral letter from the Catholic hierarchy of the old Reich, who recently held their usual annual meeting at Fulda (with the Austrian hierarchy making itself conspicuous by its absence). This letter uses plain words. The attack on the Church, the bishops warn their flocks, has become fiercer and bitterer than ever; and the aim is to bleed the Catholic Church to death, to destroy its influence among the people, to uproot Christianity itself, and to supersede it by a faith which has nothing to do with belief in God. The bishops declare that a point has been reached at which it is impossible for them to compromise.

* * *

Deadlock in Spain.—Speaking at Burgos last Sunday, General Franco stated that the war in Spain was over, bar the shouting. The recent course of military operations suggests that the insurgent leader was perhaps whistling to keep up his courage. The campaign to win back the ground on the Ebro lost to Government forces, rather surprisingly, a month ago, has made only slow and painful progress, despite the effectiveness of the insurgents' light and speedy tanks and the help they have received from their aviation. And on the Estremadura front in South-West Spain the insurgent drive towards the rich quicksilver mines of Almaden has been arrested, though a vigorous revival of the offensive is reported. Indeed, the marked feature of the war at present is the strong and resilient resistance afforded by the Government forces to the desperate attempts of General Franco, almost certainly reinforced on a large scale by supplies from Italy, to bring operations to a decisive end. The insurgents undoubtedly hold the offensive; but the net effect of their attacks is stalemate, apart from minor gains, while, at sea, the serious damage inflicted on Saturday upon a Government destroyer in the Straits of Gibraltar was no more than a casual episode. The inability of Britain's representative in Rome to obtain satisfaction from Count Ciano concerning the renewal of Italian intervention, despite four interviews in three weeks up to Tuesday last, is therefore significant. For Signor Mussolini, the only satisfactory settlement of the Spanish conflict—and a settlement there must be before the Anglo-Italian Agreement can enter into force—is victory for the insurgents; and operations in the field demonstrate quite clearly that General Franco cannot win in the measurable future without more assistance from his ally than even the pliant policy of the other Powers, now pre-occupied with other and more serious matters, could possibly tolerate.

* * *

Japan's War.—The efforts of the Japanese armies in China to obtain a firmer grip of their elusive prey have entered a fresh phase. There has been severe fighting in five provinces during the past few days, and the forecast drive against Hankow has proceeded on a wide semi-circular front. Early this week the Japanese War Minister, in a statement to the Press on Japan's aims in China, which were simply to impose economic solidarity upon the Far East, outlined the administrative problems which would be outstanding in China when Hankow, Wuchang and Hanyang had fallen. So far Hankow has not fallen, and

despite Japanese successes it is not certain that it will fall shortly, while Chinese guerillas have struck several powerful blows in the vicinity of both Peking and Shanghai. And the Minister seemed to be reconciled to the fact that the successes he forecast would not bring the war any nearer to an end. Meanwhile, it was reassuring to gather from General Itagaki's statement that the views of the Japanese Foreign Office, which are stated to be conciliatory towards foreign Powers, rather than the unbridled ambitions of the Army, were likely to have most influence in determining the administrative future of Peking and Nanking. The shooting down of a Chinese-American commercial airplane ten days ago, however, with the loss of a dozen lives, was evidence that old habits die hard; and the subsequent Japanese contention that civil planes fly over China at their own risk affords little ground for believing that Japan has any serious intention of becoming a good neighbour. True, the concession has now been made that, if planes intending to fly over Chinese soil will supply their description and proposed route to the Japanese authorities, war pilots may be persuaded to leave them alone. But no guarantee is given; and such incidents serve to show that, however sincerely the desire for more friendly relations with foreign Powers may be held in certain quarters at Tokyo, Japanese counsels are too divided, and too much determined by the military and militant men on the spot in China, for such pious aspirations to be translated into actual deeds.

* * *

The Milk Contract.—When an increase in milk prices was awarded to the farmers in July on account of the extra cost of feeding arising out of the drought, a note in *The Economist* (on page 680 of the issue of June 18) expressed a hope that this emergency measure would not become a precedent. That hope has now been killed by the issue of the contract milk terms which have been agreed upon by the Milk Marketing Board and the Central Milk Distributive Committee. This agreement provides for a uniform retail price during the year of 7d. per quart in London, which will provide the same average price as that which has actually obtained during the current year, with the help of the extra 4d. per gallon awarded for July. The present year will therefore see a still higher level of retail prices than that originally arranged for 1937-38, which was itself higher than in the previous year. The scale agreed upon for districts other than London gives a corresponding rise in retail prices; in rural districts and towns with less than 10,000 people, the 1937-38 contract provided for a retail price of 2s. per gallon for all months except December and January, when the price was increased by 2d. per gallon. The new contract, while prescribing 2s. per gallon for most of the year, raises the price to 2s. 4d. in the winter, and the winter season is to last for the three months of November, December and January instead of two months as previously. Of the increase prescribed in the new contract, the farmers will obtain 6d. per gallon in the summer and lose 2d. per gallon in the winter months, a net gain of 4d. per gallon on sales to the liquid market. In addition, some of the prices ruling for milk going into manufacture are to be slightly increased.

* * *

In these circumstances, the emphasis that has been placed in public announcements on the fact that there will be no increase in the retail price in London as compared with the present year is disingenuous, to say the least. In London, the emergency price-level of the present year is perpetuated, and outside London there are actual increases in price. It is still true that under the Milk Marketing Board the annual determination of price has resulted in a steadily higher average cost of milk to the consumer. This is bad enough; but the real state of affairs is masked when each year's price is compared merely with the preceding year's price. The facts upon which judgment should be based are that the price of milk in this country is the highest in Europe, while the consumption of milk in liquid form is among the lowest. The fact that the production of milk on the farm is nevertheless not an unduly profitable business is no sort of answer. It is more properly a challenge, and one which the present organisation of the milk industry conspicuously refuses to face.

* * *

Atlantic Flights.—The execution of the programme of Atlantic flights announced in the Commons on July 20th is not, after all, to prove plain sailing. Last Saturday, Albatross No. 2, a four-engined land machine, scheduled to take part in these experimental trips, broke its back while taxi-ing over the ground at the end of a successful test flight. The machine had been intentionally overloaded by 3,000 lbs. more than a certificate of airworthiness for passenger flights would allow, and the accident, which follows upon a similar mishap to Albatross No. 1 last March, has proved less serious than at first feared. Plans for Transatlantic experiments with land machines will, however, inevitably be delayed, and the next trip will be undertaken by a flying boat, Cabot, of the Short Empire class, in a fortnight's time. Also on Saturday the Air Ministry's Chief Inspector of Accidents reported on the accident to the flying boat, Cygnus, at Brindisi, on December 5th last. The machine was apparently taking off with the flaps on the trailing edge of its wings fully extended instead of being only slightly depressed; and Imperial Airways have issued very strict instructions to prevent any recurrence of this type of mishap. It is clear that the millennium of safe, speedy and world-wide civil travel by air has not yet been quite reached; and it would be folly to embark too precipitately upon the glamorous venture of regular Transatlantic services without investigating the possibilities by experiment even more minutely than has hitherto been done. The air link with the United States is almost upon us, and it will be widely welcomed. But its material advantages in the early stages are not likely to be so enormous that we cannot wait for its achievement until the margin of safety has been maximised.

* * *

A Splinter Union.—A legacy of last year's Coronation-time strike of London busmen has just fallen in. The strike was organised by leaders belonging to a minority movement among the transport workers, against the better judgment of the chiefs of the Transport and General Workers' Union, who in the end made a settlement with the London Passenger Transport Board over the heads of the busmen's leaders. Mr W. J. Brown, secretary of the Civil Service Union, always a diligent labourer in the vineyard of industrial controversy, then offered his services to organise a break-away union for the dissident and offended minority, and it is this body which has come sharply into the news during the last few days. The first step was the announcement by the L.P.T.B. that employees were not to wear the badge of any union other than the Transport and General Workers after September 1st. This instruction was opposed by the new National Passenger Workers' Union on the ground that it was contrary to the Trades Disputes Act of 1927, and pending legal advice the Board have suspended their ruling. It is ironical that a body representing to some extent extremist opinion among the transport workers, should base an appeal upon a statute commonly regarded as a reactionary restriction of

workers' rights. Actually, it is doubtful whether either the L.P.T.B. or the T.G.W.U. have any right to impose, directly or indirectly, the principle of the closed shop upon the employees. On the other hand, the T.G.W.U. is a powerful union led in most matters with marked skill and common-sense, and it is doubly doubtful whether London passenger transport workers are in any way wise to seek the representation of their interests elsewhere. In the end, however, the men themselves will decide between the two unions; and they will do so sensibly.

Palestine: No Change.—The harrowingly monotonous chronicle of outrages in Palestine has been lengthened by another couple of weeks. At Attolit, on the night of August 16th-17th, an attack by an Arab band on the gaol at a labour camp resulted in the wounding of a British Inspector and an Arab warder, and the abduction of a Jewish Inspector of Police, together with his wife, mother-in-law and three children (the children have since been released unhurt). On the same day, two British soldiers were killed and two wounded by the explosion of a land-mine, and an Arab villager was killed near Beisan. On the 17th, a Jew was killed with a stone in Jerusalem, and an Arab with a bullet in Haifa. On the 18th, two British soldiers were killed, and one officer and seven other ranks wounded, in an engagement near Acre; and the British Army's total losses in all actions fought in Palestine that day were six killed and twelve wounded. On the evening of the 19th, an Arab band descended upon Hebron, set fire to the local bank and post-office, and captured an armoured police car. A detachment of Black Watch and police were sent from Jerusalem and succeeded in driving the raiders out of the town. On the 22nd, four British constables in a car were attacked by Arabs, but managed to beat off their assailants with losses and were finally rescued by the arrival of a detachment of the Transjordan Frontier Force. On the same day, two Jews (one a woman) were killed and six wounded by rifle-fire while travelling in omnibuses. On the same day again, three Nazarene Arabs were found dead on the Acre-Safed road, with notices pinned to their bodies announcing that they had been "executed" (presumably for supposed treason against the Arab national cause).

* * *

On the night of August 22nd-23rd, a British officer was killed in a petrol-lorry that was blown up by a land-mine. On the same night, a survey engineer was killed in camp in the Jordan Valley. On the 23rd, a train was held up and robbed, only about eight miles from Jerusalem, and the police guard on board was murdered. On the 24th, the Assistant District Commissioner at Jenin was shot in his office and subsequently died of his six wounds. On the 26th, at Jaffa, in the Arab vegetable market, a time-bomb exploded, killing sixteen Arabs and wounding about thirty. The victims included a number of young boys, and the consequence was an outbreak of rioting and destruction directed against all Jewish and British persons and property within the reach of an infuriated Arab mob. On the 28th, there was an engagement in the Tulharim district in which eleven Arabs were killed. There are now armed Arab bands once again at large and in virtual control of outlying tracts of the country, and in addition to the murderous outrages perpetrated by both Arabs and Jews there is a systematic campaign of robbing banks and destroying telephone lines.

* * *

If this chronicle, which has been given from time to time in *The Economist* during past months, has seemed unduly detailed to any reader, it may startle him to learn how the figures add up. For the single month of July the total number of casualties amounted to 677, made up of 148 Arabs, 60 Jews and 2 British soldiers killed, and 256 Arabs, 202 Jews, 6 British soldiers and 3 British constables wounded. In the first three weeks of August, the total number of casualties amounted to 357, made up of 118 Arabs, 41 Jews and 15 British killed, and 71 Arabs, 86 Jews and 26 British wounded. These figures should be perpetually in the minds of those responsible for the Government of Palestine—which includes in the last analysis the whole British people.

From Our Special Correspondents

United States

Droughts and Prices

New York, August 21.—In any given area the annual supply of agricultural crops is a function of weather. In the United States, we have just passed through a drought cycle of almost Biblical duration. Of the seven years from 1931 to 1937 not one enjoyed what could be called favourable weather conditions. Of these seven years, 1931, 1933, 1935 and 1937 were years of limited drought, and 1932 was a year of fair but sub-average rainfall. The drought of 1937 was not so severe in the United States as across the Canadian border. The years 1934 and 1936 were marked by droughts sufficiently severe to be classed as catastrophic.

This long succession of poor or mediocre harvests had a considerable effect on prices. Demand for the products of these annual crops is relatively inelastic. During this drought cycle, the general trend of agricultural prices in the United States was upwards.

AVERAGE PRICES (BUREAU OF LABOUR INDEX)
1926=100

	Farm Products	Foods
1931	65	75
1932	48	61
1933	51	61
1934	65	70
1935	79	84
1936	81	82
1937	86	86

Other factors than the weather were operative; and substantial weight must be given to such episodes as the "slaughter of the little pigs" as one part of official agricultural policy, and the impounding of millions of bales of cotton as another—to say nothing of the programmes of acreage reduction, principally effective in cotton.

Some weight must also be given to international factors, including the changed relationship between the dollar and the pound in 1931 and again in 1933. But, on the whole, it is questionable whether all these extraneous influences taken together exerted as much influence on prices as the weather. The case of cotton might perhaps be excepted from this generalisation; more has been "done" for cotton than for any other commodity—and one result has been to increase the yield per acre.

Abundant Crops

The crop year 1938 has been a year of ample rainfall, and the effect has been visible in the abundance of the crops.

AVERAGE PRICES (BUREAU OF LABOUR INDEX)
1926=100

	Farm Products	Foods
March, 1937	*94·1*	*87·5*
End July, 1937	*87·7*	*86·5*
January, 1938	71·6	76·3
February, 1938	69·8	73·5
March, 1938	70·3	73·5
April, 1938	68·4	72·3
May, 1938	67·5	72·1
End June, 1938	68·8	73·2
End July, 1938	68·6	74·1

It will be noted that the Bureau of Labour Index of farm products for the end of July was slightly higher than for the end of April. This is the consequence of mixed price movements during the intervening period.

INDIVIDUAL PRICES (Dollars per Unit)

	Aug. 1, 1937	May 1, 1938	Aug. 1, 1938
Wheat (bu.)	*1·195*	0·85¼	0·69⅞
Maize (bu.)	*1·025*	0·59	0·55⅝
Cattle (cwt.)	*14·40*	8·65	10·75
Hogs (cwt.)	*12·00*	8·05	8·30
Eggs (doz.)	*0·21*	0·20½	0·22½
Butter (lb.)	*0·315*	0·26½	0·26¼
Cotton (lb.)	*0·1096*	0·0878	0·0861
Wool (lb.)	*0·435*	0·265	0·32

The typical annual crops (wheat and maize) are selling for only about half of last year's price, and prices have fallen since May. Cotton and livestock prices, although below last year's, are unchanged or have risen since May. The recent declines have been most marked in the prices of wheat and maize—September wheat fell in early August almost to 60 cents, and maize went below 50 cents.

Maize is not a cash crop; most of it is fed to hogs on the farm which produces it, and marketed, so to speak, as hogs. Wheat, on the other hand, is largely a cash crop; and the price of wheat is not only half what it was a year ago, but 20 cents lower than it was in June. The total wheat crop is about 5 per cent. larger than a year ago, but most of the increase is in spring wheat—the winter wheat crop is only slightly larger than a year ago.

It is clear that, compared with a year ago, the decline in prices is not compensated by a correspondingly enlarged supply. Accordingly, apparent total earned farm income is perhaps 10 per cent. less than last year; though, as an offset to this decline, the income is probably more evenly distributed than it was last year. It is still clear that the agricultural population has experienced no depression comparable with that suffered by the urban industrial population. If the present situation is compared with, say, the end of May, the decline is mostly in wheat, cotton, and maize; the fall in maize is partly compensated by the rise in hogs, and the fall in cotton is negligible.

Help for Wheat

The centre of interest is wheat. If the wheat crop is taken as 1,000 million bushels, at a price of 50 cents on the farm, the total cash value of the crop is $500 millions, which is, relative to the total national income, unimportant. Indeed, it is not even a very large element in the total estimated farm income of roughly $9,000 millions. But wheat is the cash crop of several states; its economic significance locally is greater than the gross figures would suggest, and its political significance is still greater. The surplus at present depressing wheat prices is of the order of 100 million bushels.

To meet this situation, the Government has two devices in operation, and one in prospect. The Government will lend to farmers on the basis of 75 cents a bushel (Chicago), although the September option is now under 65 cents. The machinery for lending has been slow in getting under way, and has not yet shown its effectiveness; and only farmers who have "signed up" are eligible for the loan. Secondly, the subsidy for next year will be doubled to about 26 to 30 cents a bushel as an inducement to farmers to enter the planting control schemes.

Finally, the Department of Agriculture is reported to have formulated a plan for exporting under subsidy 100 million bushels. This is open to the charge of dumping, but the plan itself has not been disclosed, and comment may be postponed.

France

Increased Hours of Work

Paris, September 1.—After a week of anxious negotiations, the leaders of the Popular Front groups with a majority in the Chamber accepted M. Daladier's proposals, fearing a political crisis at a time of great international tension. They realised, moreover, that any strong resistance to the proposed amendments to the 40-hour week would not be very popular, even with their followers. In the end, a decree was decided upon, fixing exceptions to the law which will enable a 48-hour week to be worked in concerns engaged on National Defence contracts, and sanction a 44-hour week in other industries according to their individual needs. Another decree will amend the procedure for authorising the working of hours in particular factories; and, finally, a special Bill will be laid before the Chamber to lower overtime rates of payment. The Government hopes, however, that agreements will first be concluded amicably between employers and employed.

This may open a new era for French industry, which was first paralysed for two years by the gold franc and then crippled for another two years by the 40-hour week. Prices have now been adjusted by devaluation; extra hours of work have now been authorised.

Credit and Confidence

There only remains the financial problem. One outstanding complaint made by business men is that money is too dear. This is a consequence of the scarcity of capital, which in turn is due to the enormous requirements of the Treasury. This year the Budget deficit amounts to something between 40,000 and 50,000 million francs; and the Government is borrowing 1,000 millions a week.

Some expansion of credit by the banks would in such circumstances be very opportune. Fear of a further flight of capital prevents the financial authorities from creating new credits just when this step is asked for on all sides to bring about a revival in business. Actually, the Government seems inclined rather towards a policy of economy and budgetary deflation, in order to provoke a return of confidence and the repatriation of capital. But the deficit on the ordinary Budget will again be about 10,000 millions this year and total Treasury charges will not be less than 40,000 to 50,000 millions. Economies, at least on the extraordinary Budget, and an increase in revenue receipts, secured in part by new taxes, will have to be appreciable if the franc is to be safeguarded and the Government's creditworthiness restored.

Meanwhile, the Minister of Finance is drafting the 1939 Budget which will be communicated to the Finance Committee of the Chamber on September 15th. If new taxation is decided, then Parliament will have to be summoned, since the power to proceed by decree will have expired. The Government, to pave the way for the loan which is urgently needed to replenish the Treasury, will probably announce their intention of making every effort to balance their Budget.

The franc recently registered a slight recovery. The firmness of M. Daladier seems to have diminished the demand for gold which accompanied the decline of the pound against the dollar. The French financial Press point out that the franc has sources of strength; foreign trade has improved; tourists are spending lavishly; and all these factors tend to assist the franc. But, meanwhile, the fear of an international conflict is paralysing the stock markets.

Higher Price for Bread

The Central Wheat Council has fixed the legal price of wheat for the next twelve months at 204 francs per quintal. This is, however, only a nominal price. The price actually paid to farmers will not exceed 176–180 francs, which is slightly more than a year ago, and may cause an increase in the price of bread of 10 to 15 centimes. The 1938 crop is provisionally estimated at 88 million quintals, or nearly 20 millions more than are required for home consumption. No decision has yet been taken about the surplus, though

it is likely that proposals to use it for the manufacture of alcohol, which is a costly process, will be shelved.

Coal output in July was 3,801,145 tons for 20.9 working days, against 3,892,446 tons in June for 21.7 working days, and 3,588,558 tons in July, 1937, for 21.1 working days. Thus, average daily production was 182,887 tons, compared with 180,805 tons in June, 183,077 tons in May, and 170,100 tons in July, 1937. The number of men employed at the mines was 249,084 at the end of July, compared with 248,794 at the end of June and 238,148 at the end of July, 1937. The production of coke in colliery plants was 348,817 tons in July, against 351,250 tons in June and 336,156 tons in July, 1937.

During the week ended August 20th, the number of persons unemployed was 340,295, against 340,674 in the preceding week and 310,220 a year ago.

Germany

Berlin, Prague and London

Berlin, August 31.—The aggravation of international relations due to the Sudeten-German dispute had no visible effect on last week's markets. The general public knew nothing of a fresh crisis. They could not know because it is always officially alleged, as it was again to-day, that crises are concocted by London (sometimes together with Paris) for unworthy ends. The Bourse did suffer a sharp setback last week, but this was merely a resumption of the prolonged decline; and so far this week shares are somewhat firmer.

If the Sudeten-German attitude is, as it is believed, the same as the attitude of the Reich propaganda organs, the position in Czechoslovakia is well-nigh hopeless. True, the Government has lately said very little, but the official Press campaign has been conducted with extreme violence, indicating that no practicable Czech offer would be accepted.

It is not quite clear why this state of affairs, which has persisted ever since the annexation of Austria, should produce a fresh crisis. The exhaustion of Sudeten-German (which means Reich) patience was announced long ago. The German manœuvres seem to have been the cause of the acute anxiety abroad. The affair has unfortunately done harm to Anglo-German relations. The attitude towards Great Britain is very hostile. Germans are told daily that London is expecting the Czechoslovakian question to provoke an anti-German war, and that Britain is encouraging Prague to be obdurate. This attitude will not change, propagandists here proclaim, unless the British Government champions, without any qualifications, the full Reich and Sudeten-German claims.

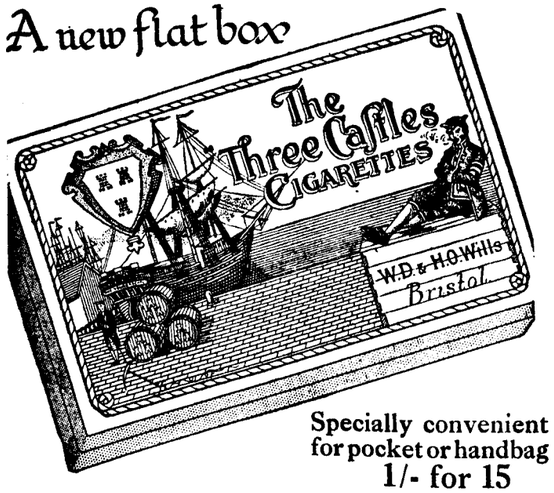
On the other hand, the foreign belief that Germany is seeking to precipitate a general war is probably mistaken. The parallel with Austria is not convincing; the *Einmarsch* into Austria was riskless and, moreover, in view of the sentiments of Austria's population and government, was the only means of annexation. The Sudeten-Germans may be able virtually to join the Reich without any overt breach of the peace by Berlin. To prevent such a move, the Prague Government would have to take internal measures of repression which would look bad and would probably not succeed.

The expert view continues to be that no general decline in business activity is foreshadowed by the Bourse decline, and that the Government has no particular financial difficulties to face. "The National-Socialist Government," says the Minister of Economics, "will never tolerate material hindrances to the execution of its great economic tasks arising from any kind of breakdown in financing. Where such difficulties arise, they will be promptly and drastically removed, even if a method or a system has to be altered." The last sentence does not refer to any major change in the long-term industrial, financial and currency policy to which the Government remains committed, but to minor adaptations and reversals which, at the expense of particular interests, have in the past provided ways of getting out of difficulties.

The Reichsbank's return for August 23rd, like the commercial banks' balance sheets, shows a large increase of deposits. Since deposits earn no interest, business has usually no interest in holding them, and the figures suggest a general search for increased liquidity. It is stated that this cash partly represents preparations for the next Reich loan, which is not, however, likely to come before October at the earliest. Despite the decline in home bond quotations, which began immediately after the March loan, it seems that the Reich has the power to obtain whatever medium-term credits it wants; and probably the Minister of Economics, in the speech quoted above, had this in mind.

Expenditure and the National Income

For the moment, talk of increased taxation has ceased. Referring to the need for "adapting expenditure to the capacity of the taxpayer, *plus* the loan-subscriber, short-term credit, and industrial finance," the *Deutscher Volkswirt* remarks: "It must be remembered quite half the national income is already appropriated for the financial needs of all the public services in Germany, and if the expenditure of publicly-owned earning undertakings are included, public authorities in 1937-38 controlled in one way or another approximately two-thirds of the national income." The journal admits that this rate of expenditure is made practicable only by enforcing cuts in consumption. Observation of German private life shows this diagnosis to be correct.



It is significant in this connection that a postal savings service, such as already existed in Austria, has now been established in Germany. There will be 47,000 offices and agencies, interest will be paid at the present standard savings rate of 3 per cent., and the withdrawal of up to Rm. 100 at sight will be permitted. The existing savings bank organisation comprises only 15,000 offices. The new system will cover the country more completely, particularly in thinly populated districts, and will, it is claimed, "extract much money from the stocking for economically useful purposes."

Industry Slackens

The report on employment in industry during July shows a moderate seasonal decline in the number of hours worked. The number was only 16.1 per cent. higher than in the same month of 1936, against 17.3 per cent. higher in June. As usual the production-goods trades showed improved figures; but the consumption-goods group declined. The manufacture of machinery was much more active, mainly on home account. This chimes in with a report from the German-Russian Committee, which mentions that inability to make prompt deliveries (machines being Russia's chief need) is one cause of the heavy falling off in Russian orders, which in the first half of this year totalled only some Rm. 8 millions. According to the same report the diversion of many Russian orders to the United States (which so far this year is first among exporters to Russia) resulted from German delivery delays. The Russian returns for this year (not up to date) show German deliveries behind even those of Belgium and Holland.

Ingot-steel production in July was 1,981,100 tons; and in the first seven months of the year output amounted to 13,204,400 tons, against 11,219,700 tons in 1937. The July figure is a new high record. The Pig-Iron Syndicate's report mentions a continued decline in export prices. It is hoped to bring the European and, if possible, the American firms at present outside the International Cartel, within the framework of the agreement. Meanwhile much is being written about American dumping. Coal output in the first seven months was 108,212,000 tons, against 105,180,000 tons in 1937.

The July census shows 3,364,500 motor vehicles in the Reich, including Austria, and the number in the old Reich has risen 15 per cent. in twelve months. Private cars alone numbered 1,305,600. The cutlery industry is in a state of crisis, owing partly to a decline in home sales and partly to a fall in exports, which normally take 60 per cent. of the cutlers' output; at present, on the basis of booked orders, the proportion exported is only about 40 per cent. In so far as it is not seasonal, this depression is due to excessive buying and stocking in the past in the fear that raw materials would be rationed.

Hongkong

City of Refuge

Hongkong, August 3.—Hongkong has always been used as a city of refuge for the Chinese of the Southern provinces when revolts and civil war have upset normal conditions of life in the interior. Until last year, however, it has never been called upon to shelter so great an influx of Chinese drawn from different regions of the country and composed of all classes. Dispossessed officials from Nanking and Shanghai, educationists from the various universities and schools of the Centre and North, merchants and manufacturers from Shanghai and Hankow, farmers and labourers from the neighbouring provinces, all these have flocked to Hongkong accompanied or preceded by wives, children and servants. No barrier has been raised against their entry, although when the rush of Chinese from Canton was at its height admittance was refused to anyone not in possession of at least $20. This does not appear to have been an effective check to keep out the destitute and, for all practical purposes, Hongkong has been open to all comers.

The consequence is that the Government of the Colony is now faced with the serious problem of housing the refugees. There are no statistics of the number of refugees who have entered the Colony during the past year and no means of ascertaining to what extent the poorest section of the resident population has been displaced to make room for newcomers. From various sources, however, it has been possible to arrive at fairly reliable estimates, and these show that just under 250,000 refugees have arrived in the Colony during the past twelve months.

It is stated that this summer about 30,000 people have been sleeping in the streets, a number some three or four times as many as in normal times; and it is estimated that of this 30,000 at least 9,000 are destitute and without any means of obtaining shelter during the winter months. The Government assumes that about 1,500 of these are able-bodied men, and proposes to provide housing accommodation for 7,500 destitute women, children and infirm men. Three camps of wooden hutments will be set up in different parts of the Colony, one to be for refugees who can afford a small contribution towards their keep.

The whole scheme will involve an expenditure of nearly one million dollars, of which $522,000 comes under the heading of capital, for the erection and equipment of the camps, and $367,000 is allocated as the cost of administration for one year. While the resident community are relieved that Government has at last decided to tackle the problem, they find much ground for criticism of the detailed plans. The camps are to be within the urban district, and their presence will be objectionable to permanent residents in the neighbourhood. It was generally thought that suitable sites could have been found in the rural area of the New Territories.

A stronger line of criticism concerns the cost of the scheme. The expenditure on building seems to contemplate permanent accommodation, while the estimated cost of feeding the refugees is on a considerably higher basis than that taken by the authorities in Shanghai. There is no lack of sympathy for the unfortunate people who have sought peace and security in Hongkong, but the taxpayer not unnaturally sees danger in the provision of free housing accommodation, which may attract many Chinese from outside the Colony, in addition to genuine war refugees.

Growing Trade

The trade of the Colony continues to expand. The figures for the first half of the year show an increase of 21 per cent. compared with the first half of 1937, and 62.9 per cent. compared with the first half of 1936. The following table shows the value of imports and exports for the period from January to June in each of the past four years:—

Imports
(000,000 omitted)

	1935	1936	1937	1938
	$	$	$	$
Merchandise	191	212	286	342
Treasure	24	19	6	7
	215	231	292	349

Exports
(000,000 omitted)

	1935	1936	1937	1938
	$	$	$	$
Merchandise	142	163	219	270
Treasure	38	109	18	110
	180	272	237	380

There have been a number of changes in the direction of trade, and a marked reduction in trade with Japan. The following table shows the proportion of imports provided by the principal countries trading with Hongkong:—

From	1935	1936	1937	1938
China	31·6	32·7	30·9	35·0
Japan	11·5	12·3	13·3	3·2
United Kingdom	6·5	6·4	7·1	7·8
U.S.A.	7·4	7·9	5·2	9·9
Germany	4·0	5·5	5·6	6·8

After remaining steady at about 9d. for a few weeks the Shanghai dollar has fallen away and (at the moment of writing) is under 8d. Exchange provided by the Chinese Government enabled the foreign banks to keep up the dollar, but support has now been withdrawn, and the dollar will presumably decline until further official assistance is forthcoming.

Exported Shoes

The report of Mr H. B. Butler to the International Labour Conference contains a reference to the cheap manufactures of Asiatic countries which is of more than passing interest to Hongkong exporters of rubber shoes. In the year 1937 nearly 5 million pairs of shoes, valued at £188,000, were shipped from here to the United Kingdom and, during the first four months of this year, a further 3,750,000 pairs were shipped.

The rapid development of this trade is causing anxiety to home manufacturers who, in conjunction with importers of Canadian rubber shoes, have approached the Secretary of State for the Colonies, with a view to imposing restrictions on the import of Hongkong shoes. While Hongkong exporters are quite prepared to discuss the question of a quota, they consider that the type of cheap shoe which is shipped from here supplies a demand which is not catered for by the high-grade shoe manufactured in the United Kingdom and Canada.

Mr Butler in his report argues that the cheap products of Asiatic factories have enabled natives of Africa and Asia to keep up their standard of living to a considerable extent, at a time when they could not possibly have bought European goods. The Hongkong exporters to the United Kingdom are inclined to apply the same argument to the poorer classes at home.

Letters to the Editor

Size and Efficiency in Industry

TO THE EDITOR OF THE ECONOMIST

SIR,—Theory suggests and experience confirms that concentration of power is inimical to the maintenance of democratic institutions, and that diffusion of industrial control is conducive to diffusion of power. On political grounds alone, therefore, there are grave objections to the trend of legislation, which has promoted concentration and centralisation.

For example, the transport legislation of 1930 and 1933 handicaps small hauliers. The big milk distributors receive better terms for the purchase of milk for manufacturing than the small, who are now, it seems, threatened by the establishment of district monopolies. The State has in many industries fostered rationalisation schemes which, beginning with the laudable object of concentrating output in the best plants, usually degenerate into devices for the elimination of the small units; the Finance Act of 1935 also encouraged rationalisation schemes by allowing contributions to them to be deducted from computations of profits for the purpose of income tax. The Central Lancashire Coal Owners' Association is concerned lest the new Coal Act should "transfer the tonnage at present enjoyed by the small colliery . . . to the 'efficient competitors,' who at the present in Lancashire at any rate, are unable to work their collieries as profitably as the small owners can theirs." The recommendations of the Report of the Transport Advisory Council concerning the control of road transport rates would, if given legislative effect, penalise the small haulier by preventing him from undercutting the larger.

Legislation which promoted industrial efficiency would be laudable; legislation which confuses efficiency with scale of operation is deplorable. In the first place, centralisation brings its own economic problems. To quote Mr A. G. H. Dent, Assistant Economist to the Central Electricity Board, at the Oxford Conference of Management Associations: "Large-scale organisations suffer from numerous diseases — committee-itis, departmental astigmatism, Napoleon complex, passing the buck. . . ." Mr Dent spoke also of "excess financial control," "accountancy myopia," "terribly impersonal" conditions, and the "fear and uncertainty of a square deal" which prevented efficient workmanship. Partial elimination of these defects may be possible, but elimination incurs cost.

We need perhaps to recall the advantages of small-scale enterprise: the personal initiative, flexibility, differentiation, the close association of effort with reward. It is possible, moreover, to underestimate the degree to which the economies of scale may be neutralised by small firms, either by the establishment of a separate common organisation to undertake the functions sometimes best centralised—buying, market research, advertising, transport—or by contracting out to independent specialists.

Modern proposals for industrial rationalisation not only ignore the political implications of centralised planning, but would also appear to misconceive the economic significance of technical processes. A large plant may involve lower technical costs than a small one, but it is not the more efficient if co-ordination of functions and adaptability to change are rendered more difficult. Standardisation may "reduce" costs—but it yields a different commodity: "efficiency" (like "waste") is meaningless unless referable to consumer demand. Complexities of large-scale management and diversity of demand prevent, therefore, the attainment only of *technical* optima. Further, the necessity of technical description produces misleading classifications of economic functions; the wisdom of designating as "shops" retail outlets (excluding chains and departmental stores) irrespective of size, class of trade or services rendered is dubious. The possession of common physical features relating to the commodity or place of business is not necessarily relevant; significance attaches only to the degree of competition between groups of retail outlets as determined by functions performed. Here size is a determinant: the small store renders services which the larger by its very nature cannot perform, viz., a social centre, individuality, exclusiveness, personal service, attention to individual preference.

But let us ignore all these considerations. If the small firm is indeed less efficient than the large, let them compete in conditions which favour neither. If "waste" is generated by the existence of "too many" small enterprises, let it be eliminated not by *arbitrary* limitations and restrictions on entry, which are clumsy and inaccurate if well-intentioned, and are not always well-intentioned, but by revision of the impersonal legal rules which govern the conduct of economic relations in order to maintain satisfaction of market demand as the criterion of waste and efficiency.

In England to-day democratic government and Industrial efficiency are not at variance. Where the big firm is more efficient than the small, it is a social benefactor. Where the small firm suffers no handicap, to discriminate against it is to further neither well-being nor good government. For there is no test of efficiency except consumer demand.

Yours, etc.,
ARTHUR SLABERDAIN.

London, W.C.

The Economics of Eire

TO THE EDITOR OF THE ECONOMIST

SIR,—Perhaps you will allow me to offer a few reflections suggested by your leading article upon the Report of the Banking Commission (*The Economist*, August 13th, page 312).

The labours of the Commission began, continued and ended during the "economic war" with Britain. The economic background which the Commission so elaborately surveyed and the economic policy of the Irish Government which it criticises were both profoundly affected by this quite abnormal environment. Trade obstructions and destructive tariffs have now largely disappeared as a result of the agreement, and, at the cost of £10 millions paid in cash, Britain's claim for roughly £5 millions per annum, or a capital sum of £100 millions, was extinguished. The millstone around Ireland's neck was thus removed.

All the figures for the balance of payments, the national income, the deadweight or other debt, were at once susceptible to most extensive modification—and naturally the policy of the Government in regard to them will also be modified. Ireland benefited to an extent wholly unforeseen by the Commission, and the symptoms and conditions of strain which affrighted them have given place instead to desirable prospects.

It is difficult to understand why the repatriation of Irish capital for productive enterprise at home should be censured —unless it be premised that there can be no productive enterprise at home. And, in dealing with the loss of sterling assets and its effect on the future balance of payments, insufficient emphasis seems to have been laid upon the prospective increase of the national income to be caused by their reinvestment at home, after the inevitable "lag." There have been war losses, of course, but these cannot be fairly attributed to a faulty economic policy.

The treatment of the problems of Irish currency policy is singularly incomplete. The wisdom of maintaining the link with sterling is obvious. But what of the crucial question of safeguards? What of the Irish pound if Britain for any reason should resort to an inflationary policy and currency depreciation, such as many people advocate, and which may possibly become inevitable? Is Ireland to let her abundant sterling assets be correspondingly depreciated? And if not, then when and where and how should she cry "halt"?

In spite of the strongly expressed view of at least one witness, the Report is silent on the topic of gold coin or bullion as part of the currency reserve and of the liquid resources of the Irish banks. It seems from its silence to be content that Ireland, alone of the nations of the sterling area and of the nations whose currency is linked with sterling, should deprive herself of the protection in financial emergency which a store of gold in reserve would confer. It is noteworthy that the distinguished Swedish banker, Mr Per Jacobson, of the Bank for International Settlements, in a special Appendix (No. 17) on the position of the Currency Commission, is silent as to the wisdom or unwisdom of its policy, to which he adverts, of not exercising its statutory powers to hold gold coin or bullion.

Yours faithfully,
HENRY HARRISON.

London.

Books and Publications

Prices in Theory and Practice

ECONOMICS is often defined as the science of prices. Yet a survey of economic literature reveals a good many deficiencies in the treatment of prices, especially on the factual side. These two studies* may therefore be welcomed as contributions to the task of filling in important gaps.

In one sense, as "Price and Price Policies" shows, the work will never be done. As long as industry is so diversified, so constantly changing, as at present, descriptive study, however minute and profound, must always be to some degree incomplete or out of date. The material studied is never quite the same for two days together. The Protean character of economic activity is clearly recognised by the editor in his introductory section, but he insists that "Questions of price resolve themselves into the diagnostic problems of industries at work." Their understanding is best achieved by "the way of concretion," and this method at least brings legislators and, we may add, economic theorists, nearer to reality than they could possibly be if they satisfied themselves with the working-out of abstract theories.

Accordingly, the automobile, the automobile tyre, gasolene, cottonseed, dresses, whisky, and milk are subjected to intensive examination by Professor Hamilton's associates, in the light of a single question: "What are the forces which have chiefly determined the price of this commodity?" The result is a mine of information which future economic historians are likely to work with gratitude. The student who runs and reads, however, has one objection: the book is about a quarter of a million words long. It would be absurd to ask for a short account of American industry; a brief study could not possibly tell us much that we should like to know. But the book is somewhat repetitive, with frequent digressions (such as the survey of labour organisation in the dress-making trades). Anything that affects output bears on price; but in studies of this kind only the close and immediate issues should be discussed.

When we turn to Professor Marget's book we are in a very different realm of discourse. The sub-title declares it to be "A Re-examination of the Central Problems of Monetary Theory," and the author is concerned with the question how far Mr J. M. Keynes' criticisms of the older Quantity Theory, and his own Fundamental Equations for the value of money, are valid. It is the first volume of a work to explore the field covered by Mr Keynes' "Treatise" and "General Theory of Employment"; the more controversial matters raised in those books will be dealt with in a promised second volume.

To attempt to pronounce judgment on Professor Marget's views would thus be premature; it is only proper to speak of his method and the single volume available to us. It displays an immense learning and a minute thoroughness. Professor Marget meets Mr Keynes' challenges to previously received doctrine on every point. This book is not only a timely defence of tradition; it is a study of the Keynesian school of thought that no student of monetary theory can afford to neglect.

Shorter Notices

"Success with Stocks and Shares." By John B. Gledhill and Frank Preston. Pitman. 135 pages. 5s. net.

This new guide answers the many questions likely to occur to investors not already familiar with the machinery of the stock markets and the factors underlying price changes. Those who think the world's markets have lately run according to a plan which might have been designed in his inimitable style by Mr Heath Robinson will be glad to find this book enlivened by a number of his drawings.

"What's What and Who's Who in Some World Affairs." By J. A. Sinclair Pooley. John Bale, Sons and Curnow. 265 pages. 5s.

This is a new venture designed to answer the questions of the man in the street about the chief events and facts in current world affairs. The author has the special knowledge and judgment of the skilled journalist, but his book of reference is not a specialised work. It is written simply and lucidly, giving details and dates of treaties, conventions and agreements and summaries of outstanding issues. No intelligent conversation can be complete without some such guide; and, although experts might perhaps criticise an occasional section here and there, while the march of time since the book was written may have altered the perspective of events, Mr Sinclair Pooley has done a useful job ably.

"Why Capitalism Means War." By H. N. Brailsford. Gollancz. 95 pages. 1s. 6d.

The labours of Mr Brailsford's pen have never been wholly in vain. Here the style and exposition are as forceful and clear as ever. The theme is familiar: war is an act of society, and the communities we live in are prone to war because of "their class structure and their addiction to a faulty system of distribution." The influence of J. A. Hobson is present at every step of an argument which, in spite of its oversimplification and unsophisticated summarising of economic processes, has light to throw upon the causes of contemporary international conflict and rivalry. Mr Brailsford's approach is sectarian and somewhat narrow; the validity of his solution, a Federation of non-sovereign Socialist communities, is not proven; but his sincerity and shrewdness are notable.

THE BUSINESS WORLD

Sterling Below Parity

THE pressure on sterling, which had steadily been gaining momentum for about a month, reached a temporary climax during the first part of this week. On Tuesday morning the dollar "looked sterling in the face again," but only for a second. The passing of the traditional parity of $4.86⅔ was made without a show of genuine resistance by the Exchange Equalisation Account, and within a minute or so of being called at $4.86⅞ the dollar-sterling rate was at $4.86½. Since then it has fallen, at one time to $4.84⅞, but thanks to persistent and quite considerable supporting operations on the part of the Exchange Account, and also to some profit-taking, it has subsequently recovered to about $4.86.

The essential feature to recognise in this movement is that it represents strength of the dollar rather than weakness of sterling. This is evident from the fact that such currencies as the guilder and the Swiss franc have either kept pace with the depreciation of sterling in terms of the dollar or have even fallen in terms of sterling. This has also been true of the currencies within the sterling group and of the French franc, which may be reckoned as coming just within the fringes of that group. There has been a world-wide movement to convert other currencies into dollars, and sterling has received most of the impact of that movement by reason of the fact that London is still by far the most important foreign exchange market in dollars.

The rush into dollars is a parallel of the recent hoarding demand for gold, and must be regarded as a product of the prevailing international tension. It is essentially a movement of short-term capital. To a small extent it has been swollen by some anticipatory commercial buying of dollars, but the experience of the market suggests, however, that this source of demand for dollars is playing a very minor part in the present activity. No doubt there is some solid commercial justification for the recent strength of the dollar. It is evident, for example, in the fact that the visible trade balance of the United States yielded an export surplus of $632 millions for the first half of this year, as compared with an import surplus of $146 millions for the corresponding period of 1937, while both the British and, as far as it can be calculated, the sterling area's, trade balance has been shifting appreciably in the other direction. But it is believed in the market that commercial requirements of dollars have this year been covered well in advance. This advance buying has normally been the practice ever since the dollar fell to a discount on its traditional sterling parity, traders feeling that there could be no risk in covering their dollars at around $5 to the £, even counting the slight cost of the forward operation. Such forward purchases of dollars have been extensively made this year, and, in retrospect, with complete justification. The incidence of the commercial autumn pressure on sterling has thus been well spread, and though it has undoubtedly made itself felt on the foreign exchange market during the past days of heavy pressure on sterling, it cannot be saddled with more than a negligible part of the responsibility for the heavy buying of dollars.

The movement of "funk money" into dollars has been accompanied by a considerable enlargement of the professional bull position in dollars. When a foreign exchange trend becomes as clearly defined as the trend in the dollar rate has been over the past few weeks, a day-to-day bull position in the currency is bound to develop. Every foreign exchange dealer sees to it that he ends his day with as long a position in the strong currency as the initiative left to him by his bank renders feasible. In many important cases that measure of initiative is decidedly elastic. It has been the sudden enlargement of this short-term bull position, quite as much as the more genuine movement of short-term funds to New York, which has contributed to the exceptional activity of the dollar market during the past week. A position of this kind cannot be run for any length of time, and in the latter part of this week, when the dollar had risen appreciably over its parity with sterling, there were signs that it was being rapidly liquidated—the immediate objective for which it had been built up having been reached. None the less, the balance of factors operating in the market has remained adverse to sterling and the position has called for continued vigilance on the part of the Exchange Account.

Both the broad principles and the mechanics of Exchange Account intervention during the past week have proved of particular interest. The strong barrage of intervention which had previously been put up to prevent sterling from depreciating below its traditional parity with the dollar had led to widespread anticipation that the tactics would be repeated when the emergency arose again, as it did at the beginning of this week. The arguments in favour of such rigid pegging are entirely psychological. There is no inherent merit in the old parity of $4.86⅔; it may bear little relation to what the economic parity of the moment may be. But this rate was the objective in anticipation of which a substantial part of the recent conversion of sterling and more or less allied currencies into dollars had been effected. It was a limit which most operators in the market had in mind when embarking on sales of sterling against purchases of gold or dollars, and with the approach of that limit it would have been reasonable to anticipate a natural reaction due to profit-taking. Such profit-taking has in fact occurred, but as yet it has found its origin wholly in the professional position. There is still no indication that any of the recent conversions of sterling balances into dollars have been reversed at the profit which the re-conversion would now yield. And it may be added that the decision of the authorities in charge of the Exchange Equalisation Account to allow the dollar rate to cross the traditional parity has probably postponed such re-conversions by arousing fears or expectations that the pound may be allowed to fall much further. It was noticeable on Tuesday how suddenly the selling of sterling gathered strength once the traditional parity had been crossed. Far from being a signal for profit-taking, it led to a sudden expansion in sales of sterling from the Continent.

To many Continental holders of sterling the former parity had appeared as a solidly entrenched line which the British authorities would defend vigorously. This figure once passed, there is no obvious rallying-point, no obvious rate to limit the riot of imagination that can be resorted to in viewing the possible extent of a further depreciation of sterling. There is probably substance in the opinion generally heard in the foreign exchange market this week that it would have cost the Exchange Equalisation Account less to hold the rate above $4.86⅔ than it has cost to hold it above $4.85. But this alone provides no adequate criticism of the policy actually followed by the authorities. They are better able to judge of the character of the selling to which sterling has been subjected, and to decide from this and from its weight whether the occasion calls for pegging *à outrance* or for the exercise of the more normal function of the Account, namely that of "ironing out" fluctuations.

The Exchange Account cannot be accused of impassivity or of lack of decision in its recent operations. It has operated as far as possible within the bullion market, providing gold on every day of the week at prices which have allowed arbitrage with the United States to work freely. The scope of such operations has, however, been insufficient to provide adequate support for sterling, and the authorities have in addition made heavy purchases of sterling against dollars in the foreign exchange market during the week. During the seven days to noon on Thursday no less than £9,203,282 of gold was taken for shipment from this country to the United States. Of this total, private arbitrage shipments probably account for rather less than half, the balance being gold shipped on official account and representing the counterpart of official sales of dollars in the foreign exchange market. The American authorities are evidently adhering to their policy of leaving no gold earmarked in foreign centres; as and when such earmarked stocks accrue they are shipped home as soon as possible.

The pressure to which sterling has been subjected during the past week has probably been the most severe that has been experienced since December, 1932. But the resources at the disposal of the authorities are immeasurably greater now than they were six years ago. The official policy of this country is not to prevent changes in the value of sterling, but merely to smooth out the more violent swings. True, it has been assumed that the existence of the Tripartite Agreement set narrower limits to the permitted fluctuations. But the successive devaluations of the franc have shown that quite considerable changes in the relative values of the three currencies are not excluded. And in any case, this week's fall in the pound sterling has neither been due to movements of British capital nor has it been engineered by the British authorities. In no sense is it an unfairly competitive depreciation. Fortunately, there is every sign that this fact is fully appreciated on the other side of the Atlantic. It would, indeed, be a tragedy if market movements were, at this moment, to disturb the relations existing between London and Washington.

Motor Shares in Recession

THE private motor business was one of the first to feel the depression. As long ago as May last year new registrations first dipped below the figures of the preceding year, and though for the rest of the summer the 1937 returns resumed their lead, the autumn showed conclusively that sales had turned downwards in the home market. During the first three quarters of the 1937-38 motoring year, every month has so far fallen below its 1936-37 record, and the figures of new registrations show an aggregate deficit of 14 per cent. up to the end of June. But even before the recession in sales set in, motor chairmen were already warning their shareholders that higher costs must eat into profits; and the last results of those companies which make up their accounts to December 31st—Ford, Morris and Vauxhall—confirmed those warnings. Does the industry's early reaction to the depression mean that its major troubles have now been faced and that it can settle down to comfortable sub-peak activity? Or are there still difficulties ahead?

Apart from fluctuations in the fortunes of individual makers (always an important factor in the industry) profits as a whole depend first on turnover and secondly on costs. Each of these factors can be assessed broadly from the available information. The gross revenue of the private motor manufacturers is derived from three main sources: home sales of private cars; exports of private cars; and sales of light commercial vehicles. The October-June totals under each head for the last three motoring years have been:—

	October-June,		
	1935–36	1936–37	1937–38
Home sales of private cars* ...	240,156	260,873	224,308
Exports of private cars	45,372	59,354	62,752
Total private car production...	278,192	308,994	275,357
Home sales of commercial cars under 2½ tons*	53,385	56,604	49,020

* Great Britain and Northern Ireland

No separate figures are available for exports of light commercial vehicles, but since total exports of commercial vehicles are lower, it is unlikely that exports of light vehicles have increased. The general picture is clear. A moderate recession in home sales of private cars is being partially offset by a well-maintained increase in exports. Total production of private cars, therefore, is not running far below the 1935-36 level, in numbers, while home sales of light commercial vehicles, on the other hand, have fallen more appreciably. Against this fall in physical turnover the investor must set the rather higher prices at which 1938 models have been sold. The Private Car Price Index computed by the Society of Motor Manufacturers and Traders rose to 50.5 for 1937-38, against 49.0 for 1936-37 and 49.8 for 1935-36. For commercial vehicles, there was a rather larger rise in the index to 63.5 for this year, against 60.2 last year and 61.6 for 1935-36. It would be incorrect, however, to assume that higher list prices have produced a higher average value per unit sold in the 1937-38 season, for the trend of recent buying has shown a marked preference for the smaller horse-power groups. No figures are available for the value of car sales, but some indication is to be found in the movement of the average horse-power of new registrations, given on the following page.

Some phrases seldom ring true

"Owing to the holidays we are working with a skeleton staff"

but

YOU CAN BE SURE OF SHELL

	1935 Year	1936 Year	1937 Year	1938 Jan.–May
Average h.p. of home sales	11·7	12·0	11·8	11·3

These figures reflect the prosperity of 1936 and the progressive and marked recession of 1937-38. This reduction in the average size of new cars seems quite sufficient to offset the nominal rise in list prices. It may, indeed, be assumed that the fall in units sold below the 1935-36 level has involved at least a corresponding reduction—and perhaps more—in the industry's gross cash turnover.

If this were the sole criterion of profits, the motor shareholder might be happier, for 1935-36 was an excellent year for the industry. But it is only a first stage towards the estimation of profits, which depend, secondly, on the level of costs. It is here that the trade recognises its chief problem. In the current year, sharp reductions have occurred in the price of the base metals required for the manufacture of chassis, in rubber for tyres and sundry accessories, and in leather and textiles for upholstery. But steel prices remain at their peak level; prices of special castings and pressings have not been appreciably reduced; and wages are still based on the increased rates of a year ago. Moreover, high machine tool prices are still a heavy burden on depreciation costs, while the expansion of plant, designed to cope with last year's peak outputs, now involves greater standing charges. The extent of the benefit of lower base metal, rubber and upholstery prices in the current year depends in any particular case on how far the manufacturer covered his requirements in advance at higher prices. But, even on the most favourable assumptions, it is fairly clear that those costs which have fallen are insufficient to offset the much more important items which remain at or near peak levels—steel, wages, machine tools and standing charges. The motor trade, to its cost, is a competitor with the re-armament trades for labour and many essential materials.

The conclusion can hardly be avoided that profits of the private car and light commercial vehicle makers must now be running well below those of any recent year. Lower profits, as reported by Ford, Morris and Vauxhall, so far cover only the beginning of the recession period, but these are a reliable pointer to what may be expected throughout the trade, except that accounts which cover twelve months of recession, instead of seven or eight months of recession combined with several months of peak sales, will, of course, be correspondingly worse. There are, it is true, certain temporary economies open to the trade at the outset of depression; in particular, existing models, if satisfactory, can be continued virtually unchanged in the new motoring year, thus saving the very material expense of new jigs and dies. Announcements of the industry's 1938-39 programmes, so far published, suggest that changes are in fact to be small this year. It is also possible that the newly emerging technique of making body and chassis-frame as one unit will ultimately yield useful savings. But this method of construction has not yet been adopted on a scale wide enough to affect 1938-39 profits, and in any case the expensive re-equipment which is necessary for the process will probably offset any initial economies. Moreover, the expedient of continuing existing models for a further year can only be temporary in an industry which is still technically progressive. Finally, the lists which are now being issued for the 1939 season reveal bold reductions in the price of cars in the popular classes, which seem not merely to give to the buyer the benefit of any possible saving in production costs, but even to discount the prospect of lower steel prices at the end of 1938. Conditions, in brief, are highly competitive in a market long used to vigorous expansion, but which now finds itself temporarily contracted.

The effect of such conditions on private car sales was traced in an article in *The Economist* of August 21, 1937. Not only does the habitual buyer of new cars extend his replacement period; in addition, he tends to replace a more expensive with a less expensive model. This tendency slightly relieves the pressure of recession on the popular car market by diverting to it a certain stream of replacement demand from the makers of more expensive and special models, but the pressure on the latter can be severe. As we demonstrated last year by means of a sample profits index, although popular makers' profits react quite sharply to a depression, specialist car producers' profits can rapidly be converted to losses. There remains, finally, the possibility that an individual maker may actually profit from the depression by designing a model to attract economy-seeking replacement demand from larger cars—as Standard Motors did with the "Big Nine" in the last depression. But it is too early to know whether any company will "pick a winner" of that kind to-day.

While these are the conditions in which the motor industry proper now appears to be working, allowance must be made for a new and special factor affecting profits—that of the Government "shadow" aircraft factories which are being operated (or are to be operated) by leading motor manufacturers. The report of the Comptroller and Auditor-General issued last April showed that, besides meeting the full costs of production, the Government would pay the companies managing the shadow factories £300 for every complete aeroplane turned out—£225 for the airframe and £75 for the engine. Although any individual manufacturer would have to share the £300 with others who had contributed parts from other shadow factories, it is clear that, on the outputs now planned, these shadow factory fees should make a very useful contribution to earnings. The fact that the Austin shadow factory is now in production may, indeed, have influenced the board in their decision to reduce the price of their 10-h.p. model by as much as £10, since, among their chief competitors in this class, the Ford and Vauxhall companies have no shadow factories, and the Morris and Standard companies have only recently begun work on theirs. It is also possible that the Alvis company may welcome its aero-engine works at this juncture, since by normal standards of judgment a manufacturer of luxury cars, particularly if its cash resources are rather low, might find present conditions distinctly difficult.

At this season of the year, when new models are coming on the market, not even the motor trade itself would care to forecast the fortunes of individual makers in 1938. The investor, therefore, must fall back on the general principles of motor investment. That he is rightly treating the whole group as a rather speculative holding in present conditions is shown by the yields offered on Austin and Morris shares. The shares of specialist manufacturers need to be treated with yet greater caution—even of one which has been so markedly successful as the Rover Company during the rising phase of the trade cycle. A time will come when motor shares will again be attractive for the general investor, but it is not yet in sight.

Finance and Banking

Germany's Private Gold.—The import of £1,250,000 of gold from Germany into Great Britain during the past three weeks and the rock-like stability of the Reichsbank gold reserve over this period have again drawn attention to the accumulation of a private and hidden gold reserve in Germany. It has been common knowledge for some years past that gold was being accumulated—at a very modest rate—in German reserves outside that of the central bank. That tendency has been accentuated this year, the figures of bullion movements published by the Statistische Reichsamt showing an excess of imports over exports of gold for the first seven months amounting to Rm. 94,500,000 or £7,900,000. Most of this excess represents the proceeds of export trade amassed in free devisen (as opposed to clearing credits) and converted into gold pending their subsequent utilisation. The gold in question remains in the ownership of the exporting firms—Farben Industrie, for example, has accumulated a substantial reserve—but the whole operation, from the conversion of devisen into gold to the re-export and re-conversion of that gold into devisen, is effected with the approval of the authorities. The tendency to keep such current balances in the form of gold rather than foreign exchange has been emphasised lately by the prevailing uncertainty in the foreign exchange markets, and it must be admitted that the policy has paid handsomely this year. The more recent tendency to encroach on those private gold reserves, which is evident in the recent exports to Great Britain, fits in with the experience of the commodity markets, where German buying has been especially noticeable in the past few weeks.

* * *

The Note Issue Profit.—Among the gems of information that lie hidden in the annual Finance Accounts of the United Kingdom is the profit transferred each year from the Issue Department of the Bank of England to the Exchequer. The annual amounts of such profits since the transfer was authorised by the Currency and Bank Notes Act of 1928 have been as follows:—

	£
1928–29	553,000
1929–30	2,420,000
1930–31	6,211,000
1931–32	3,109,000
1932–33	11,423,000
1933–34	2,660,000
1934–35	2,755,000
1935–36	1,448,000
1936–37	985,000
1937–38	Nil

The sting of this table lies in its tail. During the last financial year no profit could be transferred from the Issue Department of the Bank of England to the Exchequer, and since it is unlikely that the Department should have succeeded in exactly balancing incomings and outgoings, it is highly probable that it incurred a net loss. This loss, it is safe to presume, was incurred as a result of the operations of the Issue Department in the market for longer-term Government securities. The Issue Department is one of the principal "Public Departments" used by the Treasury for carrying out official operations in the gilt-edged market. In the last financial year public departments were called upon to take up the bulk of the 2½ per cent. National Defence Bonds, issued at 99, and subsequently marketed at prices which averaged several points under the price of issue. The resultant loss of this and similar operations has, it would appear, more than offset the income which accrues to the Issue Department from the securities held against the fiduciary issue. The profit of the Issue Department is agreed upon by the Bank and the Treasury, and the figure arrived at takes account of the capital gains or losses made by the Department during the year. The effect of those capital items is well brought out by the above table, which shows that the annual profits have fluctuated in fairly close correlation with the net movements in gilt-edged values during the years in question.

* * *

Blocked Mark Trends.—The weaker tendency of registered marks, commented upon by us a week ago has become more pronounced. As the following table shows, there have been heavy depreciations in the principal blocked mark rates during the past year:—

	1937 Jan. 1	1937 July 1	1938 Jan. 1	1938 July 1	1938 Sept. 1
	(Rates in Reichsmarks to the pound)				
Registered marks ...	26	23	23	26	29½
Credit marks	55	55	72	105	102½
Emigrant marks.....	55	55	74	122	134½
Security marks	58	55	74	122	134½

Note.—These rates are quoted by the Swiss Bank Corporation.

Registered marks represent the proceeds of standstill liquidations. The buyer may use them for travel purposes and in certain other ways, such as for the support of relatives in Germany. Travel marks are charged a licence fee of ten shillings per 100 marks, and after allowing for this, the current registered mark rate of Rm. 29½, as quoted between the banks, works out at a travel mark rate of only Rm. 24. If registered marks are used for other purposes, the licence fee is not payable. The "support" rate, quoted in the Press, of Rm. 27½, refers to marks bought for the support of relatives in Germany. There is also a special arrangement for limited dealings between Jews, and this is authorised by the German Government and the British Bankers' Committee. These marks are called Haavara marks, and the current rate is Rm. 27½. They may only be used for "support" purposes, and not for commerce and travel. Purchases are limited normally to Rm. 200 per month, and they must not be sold more cheaply than registered marks. This is why their rate is the same as the "support" rate. The last three rates in the table refer respectively to the liquidation of credits, the realisation of property and inheritances; to the recovery of their fortunes by those who have already emigrated from Germany; and to the withdrawal of the proceeds of the sale or redemption of securities. Purchasers of these marks can, broadly speaking, only use them for re-investment in Germany. Each transaction needs separate authority, being considered on its own merits, and the regulations have been progressively tightened. This, together with the natural disinclination to invest money in Germany, explains the heavy depreciation of these last three rates.

* * *

National Bank of India.—The reduction in this bank's interim dividend from 18 to 16 per cent. per annum, though disappointing to shareholders, can hardly be regarded as a surprise. Last April, in discussing Indian

The OCEAN
Accident & Guarantee Corporation, Limited
Head Office: 36–44 Moorgate, London, E.C.
FOR ALL CLASSES OF INSURANCE

banking trends, we reached the conclusion that there was some reason to expect a certain shrinkage in earnings. India is now experiencing the familiar difficulties of a primary producing country during a period of world recession, and to these must be added the dislocation caused by the war in the Far East. In a sense, Mr Langford James, the chairman of the National Bank of India, foreshadowed the possibility of a dividend reduction when he spoke at the Bank's annual meeting at the end of last March. He alluded to the growing competition of the indigenous banks and to the difficulty in obtaining an adequate return upon money employed in financing trade. He also said that in the bank's latest balance sheet deposits of £30.5 millions were off-set only by discounts and advances of £14.6 millions, while investments were as high as £15.3 millions. A further point made by him was that the Bank's income from investments would tend to diminish as securities bearing high rates of interest reached maturity and were redeemed out of money borrowed on a cheaper basis.

★ ★ ★

British Insurance in the United States.—The 1936 reports of the large British insurance companies recorded an aggregate increase in premium income in both the fire and accident branches, and the corresponding underwriting results were also satisfactory. As approximately one-half of the premium income in these branches is derived from the United States, the experience in that country greatly influences the aggregate results. Last year, as may be seen from the accompanying tables, encouraging results were secured by the British offices operating in that country, particularly in regard to miscellaneous branches of insurance. The figures in these tables are based on the official reports of the companies as furnished to the American insurance authorities and published by *The Spectator* of Philadelphia. Underwriting profits have been adjusted to conform with the British practice of allowing for an unexpired risk reserve equal to 40 per cent. of the current premium income. The exchange is taken at $4.86⅔ = £1. The aggregate results of eleven British companies or groups of companies in the miscellaneous branches are given in the following table. The profit ratio of 8.6 per cent. for last year is much the highest shown since the table was first compiled twelve years ago. Indeed, of the twelve years no less than seven have shown negative ratios, while the average yearly ratio works out at only 0.9 per cent.

AGGREGATE RESULTS IN U.S.A. IN THE MISCELLANEOUS BRANCH OF INSURANCE OF ELEVEN BRITISH COMPANIES OR GROUPS OF COMPANIES

Year	Premiums	Underwriting Profit	
		Amount of Profit	Percentage of Premiums
	£	£	
1931	24,953,000	− 168,000	− 0·7
1932	22,312,000	− 377,000	− 1·7
1933	22,613,000	− 16,000	− 0·1
1934	23,657,000	− 275,000	− 1·2
1935	22,795,000	+ 434,000	+ 1·9
1936	23,784,000	+1,320,000	+ 5·5
1937	25,491,000	+2,197,000	+ 8·6

The experience of the individual offices in the past two years is shown in the second table:—

INDIVIDUAL RESULTS IN U.S.A. IN THE MISCELLANEOUS BRANCH OF INSURANCE OF ELEVEN BRITISH COMPANIES OR GROUPS OF COMPANIES

Company or Group of Companies	1936			1937		
	Premium Income	Underwriting Profit or Loss		Premium Income	Underwriting Profit or Loss	
		Amount	Per-cent. of Prem. Inc.		Amount	Per-cent. of Prem. Inc.
	£	£		£	£	
Commercial Union	2,325,000	+ 96,000	+ 4·1	2,520,000	+ 186,000	+ 7·4
Employers' Liab.	6,926,000	+ 383,000	+ 5·5	7,158,000	+ 507,000	+ 7·1
General Accident	3,722,000	+ 428,000	+11·5	4,099,000	+ 287,000	+ 7·0
Liverpool and London & Globe	3,217,000	+ 191,000	+ 5·9	3,434,000	+ 537,000	+15·6
London & Lancs.	701,000	− 1,000	− 0·1	795,000	+ 20,000	+ 2·5
Norwich Union	85,000	− 15,000	− 18·1	45,000	− 11,000	− 25·2
Phœnix	2,312,000	+ 85,000	+ 3·7	2,537,000	+ 174,000	+ 6·9
Royal	3,129,000	+ 197,000	+ 6·3	3,541,000	+ 374,000	+10·6
Royal Exchange	523,000	− 92,000	−17·6	501,000	+ 71,000	+14·2
Sun	659,000	+ 35,000	+ 5·3	682,000	+ 37,000	+ 5·5
Yorkshire	185,000	+ 13,000	+ 6·9	179,000	+ 15,000	+ 8·2
	23,784,000	+1,320,000	+ 5·5	25,491,000	+2,197,000	+ 8·6

Much the most important of the miscellaneous branches are workmen's compensation and motor insurance, and the indication is that in both these cases the claim experience was definitely more favourable than in 1936, just as that year showed improvement on 1935. Similar figures for fire insurance results of British companies in the United States will be given next week.

MONEY MARKET NOTES

Foreign Exchanges

THE depreciation of sterling below $4.866 is discussed in a leading article on page 456 of this week's issue. As soon as the rate fell below $4.87 most operators came in as buyers of dollars, and though the Control gave vigorous support to the pound, the rate dropped on Wednesday to $4.85. There was a big turnover, which included a commercial demand as well as the general flight from European currencies into dollars. On Thursday sterling was steadier, rising at one time to $4.86 and then falling back to $4.85¼. There was less business in French francs. The Control held the spot rate steady at Frs. 178⅛, while three months' francs remained at Frs. 3⅞ discount. Guilders and Swiss francs were offered early in the week against Dutch and Swiss purchases of dollars, and depreciated respectively to Fl. 8.94½ and Frs. 21.33½. Latterly they improved to Fl. 8.92 and Frs. 21.30. The belga followed the dollar. Wednesday's worst London rate was Bel. 28.71½, but there was little business at this rate, and by the evening sterling had improved to Bel. 28.79. There was little further change on Thursday, but the belga is clearly an exception to the prevailing weakness of European currencies.

The Bank Return

THIS week's return shows the usual increase in the note circulation which occurs at the end of each month, but no attempt has been made to neutralise it by means of any addition to the Banking Department's securities. It has therefore helped to reduce bankers' deposits as well as the Bank's Reserve.

	Sept. 1, 1937	Aug. 17, 1938	Aug. 24, 1938	Aug. 31, 1938
	£ mill.	£ mill.	£ mill.	£ mill.
Issue Dept.:				
Gold	326·4	326·4	326·4	326·4
Notes in circulation	490·3	482·6	478·7	480·4
Banking Dept.:				
Reserve	37·6	45·0	48·9	47·3
Public Deps.	14·1	20·1	24·0	27·8
Bankers' Deps.	104·2	105·7	101·6	94·7
Other Deps.	36·5	34·1	34·1	36·4
Govt. Secs.	109·3	104·6	101·9	102·1

Other Secs.	20·8	22·0	20·6	22·3
Proportion	24·3%	28·1%	30·6%	29·7%

Public deposits are £3.8 millions as the result of the concentration of Treasury bill payments in the early part of the week. There is also an increase of £2.3 millions in other deposits. All these changes have combined to reduce bankers' deposits, which have fallen to under £94.7 millions. Treasury bill maturities and dividend payments by the Government and other authorities should quickly bring bankers' deposits back to a higher level, and this week's decrease can be regarded as a temporary movement.

★

The Bullion Market

THE lapse of sterling to below $4.866 has automatically caused a further rise in the price of gold, and Wednesday's price of 143s. 3½d. per fine ounce is the highest recorded since May, 1935. A slight premium over the American shipping price was maintained early in the week, but on Wednesday and Thursday the "fixing" price was at par. Consequently about three-quarters of this week's heavy demand was for arbitrage purposes, though apparently the whole of these purchases have not yet been matched by sales of dollars. There was a certain amount of hoarding and speculative buying, mainly of forward gold, though this was at once covered in the spot market. Most of this forward buying was against sterling and not against European currencies. On the other side of the account, there was a certain amount of re-selling, mainly of a profit-taking character, for a number of forward contracts entered into last

May have just fallen due. The authorities, however, remained the chief source of supply.

Initially silver rose in sympathy with the dollar, but by Wednesday selling by "tired bulls" had appeared, and so prices have latterly become easier. The

Date	Gold			Silver, price per oz. standard	
	Price per fine oz.	Prem. or Dis-count *	Amt. dealt in †	Cash	Two Mths.

* Above or below American shipping price.
† At fixing.
The New York price of silver remained at 43 cents per ounce ·999 fine during the week.

Continent has also been selling, but the London price has been low enough to stimulate American buying, mainly of a trade and arbitrage character. The American demand has been for "cash" and not for forward silver, and so the premium of the cash price over the two months' price has widened from ⅛d. to 1/16d. during the week.

★

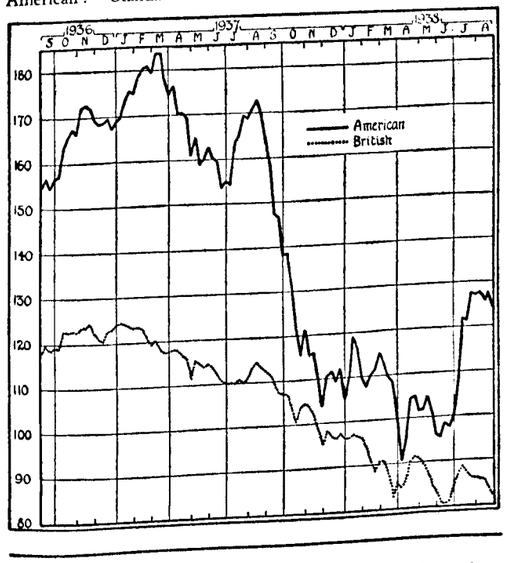
The Money Market

THE vagaries of the calendar meant that Treasury bills paid for on Monday and Tuesday of this week were 92-day bills, while those dated later in the week only run for 91 days. In consequence the earlier bills went one penny cheaper, and so the discount market concentrated its applications on those bills. Conversely, there were no maturities on Monday, this having been the case during the whole of August. The result was that by Wednesday there had been a temporary diversion of funds into public deposits at the Bank, and so the market was not quite so well supplied with money. Thus on Thursday bond money stiffened from ½-⅝ to ⅝-¾ per cent., though not much was borrowed at ¾ per cent. Government and other dividend payments fell due on Thursday, while the Treasury bill inequality also righted itself by the end of the week. This slight hardening in money rates may therefore be only temporary.

	Sept. 2, 1937	Aug. 25, 1938	Sept. 1, 1938
	%	%	%
Bank Rate	2	2	2
London Deposit Rate	½	½	½
Short Loan Rates:			
Clearing Banks	½-1*	½-1*	½-1*
Others	½-⅝	½-⅝	⅝-¾
Discount Rates:			
Treasury bills	½	½	½
Three months' bank bills	17/32-9/16	17/32	17/32-9/16

* Viz. ½ per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity. ¾ per cent. for loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

There is no change in the bill position. The banks remain keen buyers at minimum rates, but the market still cannot meet all their needs. The tender issue is again shrinking, as we predicted last week.



Investment

The Course of Share Values.—While the political clouds gathered during the first three weeks of August, the security markets commendably pursued their stoical course—if "course" is the right word to apply to a condition of sub-normal dealings and slight, though declining, movements in prices. When, at the beginning of this week, it was feared that the storm might break, the market inevitably

BRITISH AND AMERICAN INDUSTRIAL SHARE VALUES DURING THE PAST TWO YEARS

(July 1, 1935 = 100)

British: "Financial News" Index of 30 Ordinary Shares.
American: "Standard Statistics" Index of 50 Common Stocks

showed signs of greater nervousness. Yet it remained characteristic of the London market, at least, that the investor refused to indulge in panic. Perhaps his experience after March 11th and May 21st, when the market was able to overcome the consequences of acute political tension, has provided some hope on the latest occasion. Perhaps the apparent improvement towards the middle of this week corrected any incipient selling pressure which might otherwise have gathered to harass a market in no mood to take stock. And perhaps the "bears"—who at this juncture are no less nervous than the general investor—have themselves provided the right degree of technical strength to carry the market past the first impact of the latest crisis. All investors, however, would agree that the end of the month has provided no more than a breathing space. The market, having fallen less severely than during the critical days of March and May, has greater reason for self-congratulation, but perhaps less reason for expecting any appreciable degree of recovery in the immediate future. To anticipate the Nuremberg *Parteitag* as a bull point for the market would obviously be irrational.

★ ★ ★

The reaction of the investment markets to the tension at the beginning of this week is illustrated by the movements of representative gilt-edged stocks, foreign bonds, and industrial and mining shares during the past week. These, together with comparative prices at the end of the "mid-August" account, and after the March and May crises are given below:—

	1937		1938				
	High	Low	Mar. 14	May 23	Aug. 19	Aug. 26	Aug. 29	Sept. 1

OTARD'S EST. 1795
V.S.O.P.
LIQUEUR BRANDY
MATURED AND BOTTLED AT CHATEAU DE COGNAC

Monday's fall was most serious in the gilt-edged market, with inevitable accompanying weakness among Central European bonds. Industrial share quotations naturally fell, but to a relatively moderate extent and often without any appreciable volume of selling. Gilt-edged stocks are invariably the first to suffer from the flight into cash, for the market is a repositary for funds which can be liquefied at a moment's notice. September has been ushered in with relative calm, but the market has in no way relaxed its caution.

* * *

Wall Street and Industrial Recovery.—The London market, at present, has a double burden—first, to assess the political risk in terms of share prices and, secondly, to measure the industrial prospect. In May (as our Trade Supplement showed last week) the downward course of business activity since September last year was halted. But it is altogether too early, as the market realises, to translate a halt into a turning point towards recovery. The recession has proceeded too fast; but there is no conclusive evidence that it has been reversed. A contrast with the American situation is obviously suggested. The chart which accompanies the preceding note shows how doggedly Wall Street has maintained the "highs" which were recorded late in July, and fractionally surpassed early in August. The recording of three sub-peaks during the past five weeks is to be explained, of course, by the appearance of signs of industrial improvement which the market began to discount at the beginning of June. Of chief importance among them, the Federal Reserve Board's index of industrial production jumped from 77 in June to 83 in July. Residential building permits, computed by the Department of Labour, were 79 per cent. higher in July, compared with June—the increase itself is eloquent of the low level to which building activity had shrunk during the recession. *Iron Age* estimates that steel activity has risen further during the current week to 44 per cent. of capacity, compared with 43 per cent. a week ago. And the recent improvement in the automobile industry provides some encouragement for the new season models, now entering production. Thus three main pointers—steel activity, building, and automobiles—provide definite encouragement for the market. Its path, however, is not all roses. The railroad wages problem is little nearer solution and, even when it is solved, the major roads will hardly be able to carry out much re-equipment work. The slump in New York, Chicago and St. Louis issues (though largely to be explained by the revocation of the payment previously announced on the 4½ per cent. Refunding Bonds) is symptomatic of the nervous state of the rail market. Doubtless other problems will arise as the November elections approach. But there is, at least, partial evidence of the industrial recovery which the market anticipated so vigorously during June and July. Its next problem is to determine how far recovery is likely to continue during the autumn.

* * *

Foreign Bond Movements.—At the end of a month of increasing political tension, the level of foreign bond prices provides some negative consolation for the investor. The index of 108 representative bonds compiled by the Municipal and General Securities Company declined from 71.3 to 70.0 during August, a movement which may be accounted fairly moderate compared with the sharp falls—also largely political in origin—which were recorded in March and May. As the following table shows, undefaulted bonds were unchanged during August, and the defaulted group was, in fact, responsible for the fall in the total index:—

AVERAGE JANUARY-JUNE, 1934 = 100.

N.B.—Figures in brackets denote number of bonds included.

European bonds, with a decline of 3.7 points, and South American issues, both States and Provinces, head the list of falls. The considerable improvement in the Far-Eastern index, from 67.7 to 72.1, is due mainly to a sharp recovery in Chinese issues. A subsidiary index of Chinese defaulted bonds, computed on the same basis as the other component indices, jumped from 31.1 to 37.7 last month.

* * *

Capital Issues in August.—New issues last month accounted for even a smaller total than is usual during the summer holiday period. There were, in fact, only two prospectus issues in August—Luton Corporation, and Odhams (Watford). The following table shows that the total capital raised last month, amounting to £2,654,000 on the old basis and £5,192,000 on the new basis, was substantially lower than in August, 1937:—

Apart, indeed, from a certain number of issues to shareholders (including Short Brothers and Trepca Mines) the capital market has been almost wholly idle.

* * *

Dealings Outside the "House."—Reference was made in these columns last month (see *The Economist* of August 6th, page 288) to the development of outside dealings and to the Stock Exchange Committee's proposals to protect jobbers from their extreme forms. The Committee for General Purposes proposed to effect certain alterations to Rules 88, 89, 90, 200 (a), 20 and Appendix 43 of the Rules and Regulations of the Stock Exchange. Confirmation had been fixed for August 8th, but as a result of representations by an influential group of brokers, the date was put forward until October 17th, to give ample opportunity for "House" opinion to crystallise. The general object of the proposals is, in effect, to bring business back to the "House" by making it more difficult for brokers to participate in outside business. A broker at present must not execute an order with a non-member unless he can deal for his principal to greater advantage than with a member. Under the new rule, he would be required to test the market and specifically to establish that he could deal outside to greater advantage. The bargains would have to be marked on a special slip giving the time, the prices quoted, and the names of jobbers supplying abortive quotations. Secondly, a broker who does business for an arbitrageur who is on the Committee's Register of non-member arbitrageurs may charge not less than half the minimum scale of commissions on arbitrage orders. It is now proposed to limit this concession to business done with a jobber, and thus to exclude "broker to broker" bargains.

* * *

To the layman these changes may not seem of great importance. In the actual transaction of business, however, they are critical. Market prices, at any given moment, are the function of delicately opposed forces, many of which are purely psychological. In the view of many brokers, the testing process would affect the "inside" market, and hence the possibility of doing business "outside," to such an extent that much business would be lost. This view is even more strongly felt regarding the proposed modification of the commission concession in respect of arbitrage transactions. In this trade much depends on small margins, and some brokers fear that much business might be rendered impracticable. An unofficial committee of brokers has been formed to consider such aspects of the proposed rules, and it is in accord with precedent that this development should be regarded as constructive, since the committee traditionally responds to serious opinion within the "House." Broader matters are, of course, involved than the proposed changes in the Rules, important though they are. The growth of provincial dealing organisations, the recent formation of the Association of Stock and Share Dealers, direct dealings between large buyers and sellers, and the Government's anti-share-pushing activities are symptomatic of important changes in the nation's share-dealing machinery. It may be open to debate whether the drift of business away from the "House" can be corrected by such adjustments in dealing regulations as those now under consideration. Some observers, indeed, are urging that the situation is in many respects analogous to the beginning of the Road v. Rail struggle, in which a solution was unattainable except on a nationally conceived basis. The symmetry of the analogy lies in the fact that the "House" now, like the railways in the past, is too often called upon to carry uneconomic traffic, while other channels, with fewer responsibilities, are free to attract the cream of the business.

* * *

Staveley and Sheepbridge Dividends.—Staveley Coal and Iron and Sheepbridge Coal and Iron so habitually show a similar profits and dividend trend that the final declarations for the year to June last are at first sight surprising. Staveley's final payment of 8 per cent., tax free makes a total for the year of 11 per cent, tax free, compared with a distribution of 12½ per cent. (including a 2½ per cent. bonus) for 1936-37. Sheepbridge, on the other hand, announces a final dividend of 7½ per cent. on the participating preference and ordinary shares, making 12½ per cent., tax free, compared with 10 per cent., tax free, for 1936-37. The latter distribution took the market pleasantly by surprise, and the £1 ordinary shares improved from 36s. 9d. to 39s., while Staveley ordinary stock units declined from 45s. 3d. to 43s. 3d. The chairman of Staveley, however, explained at last year's meeting that the dividend received from Yorkshire Main Colliery during the year 1936-37 had been larger than normal, since the company had distributed certain undivided profits not assigned to the Doncaster Amalgamated Collieries, of which it now forms a part. It may be presumed, therefore, that the specific description of "bonus" applied to 2½ per cent. of last year's distribution marked the non-recurring nature of this payment. On this assumption, the actual dividend payment has been increased from 10 per cent. to 11 per cent., tax free. Current gross yields of £7 8s. per cent. on Staveley and £9 7s. per cent. on Sheepbridge suggest that the market is taking a cautious view of the profits for the current year. Sheepbridge is, perhaps, more dependent upon coal, while Staveley, among other interests, specialises on cast-iron pipes. In neither branch of activity would it be reasonable to count upon the maintenance of profits during the current year, but the records of both concerns over the past decade suggest that they should be able to preserve a satisfactory level of earnings.

* * *

Initial Services Profits.—This company is one of the distinguished few which did credit to the ill-fated issue boom of 1928, and throughout the decade it has made consistent progress. The depression had no adverse effect on profits, and recovery brought a satisfactory rate of expansion. The improvement in total profits during the year to June 30th last has in fact been almost as large, proportionately, as that recorded in 1936-37. In a preliminary statement the directors announce that profits amount to £305,156, against £277,693, while the earnings of the whole group are 12 per cent. higher at £330,128. New capital was subscribed during the latest year, and for about nine months the company has employed a further sum of £138,000 gross, the proceeds of an issue of 552,000 5s. ordinary shares to existing holders last September. It was then anticipated that the 20 per cent. dividend could be maintained on a capital increased by one-fifth to £828,000. Not only has this expectation been realised, but a bonus issue of one in ten is announced. This will absorb £82,800 from general reserve, which receives £32,800 out of the 1937-38 profits, against £50,000 from those for 1936-37. Earnings for the ordinary shares and the balance sheet position cannot be ascertained till the full report is available, but members have every reason to be satisfied with the results already published. The outlook for the current year is less clear, but the company conducts a specialised business which has shown dynamic qualities. Assuming the dividend is maintained on the larger capital, the 5s. ordinary shares yield £4 4s. 9d. per cent. at a current price of 27s. 9d. cum dividend and bonus.

* * *

Indian Iron and Steel Progress.—The results of Indian Iron and Steel for the year ended March 31st appear to be satisfactory, although a proper comparison with the 1936-37 figures cannot be made, since in that year the Bengal Iron Company contributed barely four months' earnings towards total profits. The advance in sales

proceeds from Rs. 2,74,08,871 to Rs. 5,08,71,812, however, is in itself sufficiently striking. It would seem that this improvement in gross revenue is due more to satisfactory selling prices than to expansion in physical output. Production of pig iron, in fact, amounted to 701,250 tons—falling short, owing to labour troubles in the summer of last year, of the 790,000 tons which had been expected. The company was fortunate in escaping the general tendency towards falling prices last year, for over two-thirds of its sales had been covered by forward contracts. Again, the increase of 65 per cent. in expenses, to Rs. 3,77,01,028, is comfortably below the 86 per cent. increase in sales. Depreciation and repairs, however, required Rs. 13,93,506, against Rs. 9,47,772, and after debenture interest, there remained Rs. 1,11,87,481 (equivalent to 45.6 per cent.) available for the ordinary shares, out of which a dividend of 35 per cent. free of Indian income tax is being paid and Rs. 25,50,000 placed to dividend adjustment account. This compares with earnings of 14.2 per cent. (or Rs. 28,68,955) on a smaller capital, which received 20 per cent. for 1936-37. Since the date of the previous balance sheet, the share capital has been increased from Rs. 2,03,23,940 to Rs. 2,53,05,620, following the issue to shareholders in June, 1937, of 4,19,468 Rs. 10 ordinary shares (the premiums on which account for most of the rise in total reserves from Rs. 27,48,780 to Rs. 1,44,36,597), together with the conversion into ordinary shares of £118,050 4 per cent. Convertible Second Mortgage Debenture Stock. Fixed assets have risen by 7 per cent., and the report points out that the capital extension programme has proceeded according to schedule. The prospects for a large increase in profits arising from the extra plant are more conjectural than a year ago. Demand has become less favourable in 1938, and although various concessions have already been made, there was a renewal of labour troubles last June. The Rs. 10 ordinary shares are quoted on the London market at 48s. 9d., to yield £11 9s. per cent.

* * *

The Week's Company Profits. Reports from only ten companies have been received during the past week (excluding two for which comparable figures are not available). These show total net profits of £1,184,000, against £658,000. This 80 per cent. increase, however, is entirely attributable to Indian Iron and Steel. Net profits of 1,719 companies whose reports have been received this year amount to £237,375,000, and show an increase of 11 per cent. over the total of £213,513,000 earned in the previous year. The week's reports are discussed in the preceding Notes and on page 468 under the heading "Shorter Comments," and are analysed on page 480.

SETTLING DAYS

TICKET	ACCOUNT
SEPTEMBER 6	SEPTEMBER 8

THE shadow of politics has hung heavily over the markets this week. Monday's news that a full Cabinet meeting had been called abruptly terminated the almost indifferent behaviour of the "House" to political fears in recent weeks, but even on this worst day of the week, selling pressure was not acute. The gilt-edged market was most affected, but investment industrials, although quoted at lower levels, were not subjected to any extreme volume of selling. After this display of steadiness to threatening news, most sections of the market made slight recovery as mid-week approached. The market remains calm, but it is not without apprehension regarding the immediate political outlook.

Initial falls in the *gilt-edged market* were greatest for the "undated" stocks. War Loan, in fact, lost ½, and "Old Consols" almost as much, on Monday. Some bear selling was reported, but a number of holders appeared to be converting their reserve funds into cash. A further reaction on Tuesday was followed by a rally, and the temper of the market so far improved in mid-week that small gains were recorded, although selling had not altogether ceased. Home Corporation issues recovered after a depressed start, but business in Dominion issues continued to decline.

German and Czechoslovakian bonds showed sharp falls on Monday and Tuesday, and failed to show any net recovery in mid-week. Appreciable falls were recorded in the Chinese list, and Brazilian bonds were also flat.

*

Relatively small offering of *home rail stocks* depressed prices at the opening, and produced a rather exaggerated effect upon prices. Selling of guaranteed and debenture stocks was resumed, and the bad traffics drove prices down further, before speculative buying helped the market from its worst levels. Little interest was recorded in Argentine rail stocks.

The gravity of the international situation resulted in a general marking down of quotations in the industrial market on Monday. Subsequently there was little change, the market continuing in uncertain mood. At no time was selling pressure extreme, and activity remained throughout at a low level. In the iron and steel section, Staveley and Thos. Ward hardened on Monday in opposition to the general trend, though the former fell in mid-week on the dividend reduction. Movements otherwise were irregular, Indian Iron and Steel failing to respond to the good profits, though Sheepbridge rose on the dividend announcement. Ransome and Marles were a weak feature. Coal shares were consistently dull. Electrical equipment issues were rather unsatisfactory, irregularity in mid-week following the opening fall. The motor section lacked special features, following instead the general market trend. Aircraft shares no longer offered special attraction, and in the main were a little lower. Textiles made a mixed showing. Tobacco issues were steadier in mid-week, while breweries remained weak, a little profit-taking aggravating the easier tendency on Monday. Provision and catering shares remained dull. Cook Son and Company (St. Pauls) fell sharply on the postponement of the preference dividend. While the volume of business remained very small, the tone in the miscellaneous section became brighter in mid-week. Shipping shares continued irregular.

*

With the amount of business still remaining low, the *oil share market* behaved similarly to other sections, a fall. In mid-week, some of the leaders rallied slightly, and turnover expanded a little. Though there was as little activity as ever, rubber shares were weaker on the whole, and sales predominated early in the week. Share quotations were indifferent to the mid-week rally in the commodity. Tea shares were steady, though there were some scattered realisations on Tuesday.

The *mining markets* provided no exception to the general trend, and though nerves were steadier after Monday's fall, a very reserved attitude was adopted, and it was only in mid-week that modest buying returned. Kaffirs broke sharply at the beginning of the week, but selling was limited, and on Wednesday Cape and Paris support assisted the improvement. Marievale soon recovered from Monday's setback. Rhodesian copper issues were occasionally resistant, but unexciting. Other base metals were quiet, but some interest was aroused by dealings in Trepca *ex* rights.

New York

WALL STREET took international politics more to heart than did most European centres, and the easier tendency that set in at the end of last week was followed on Monday by a sharp break. The declines, in fact, were the largest since March. The Dow Jones industrial index dropped by nearly 5 points, and selling pressure was quite heavy. Although later days saw some recovery, the volume of business dwindled to small dimensions. The steel and motor groups, which had led the improvement earlier in August, were the first to suffer last Monday, though they shared correspondingly in the later recovery. *Iron Age* estimates the week's steel production at 44 per cent. of capacity, against 43 per cent., while it is considered that part of the recent rise in production has been due to a building up of stocks. Rails improved on Tuesday on rumours (later denied) that a wage reduction had been agreed upon. New York, Chicago and St. Louis Railroad securities fell heavily on news of default on the 4½ per cent. refunding bonds. The market became firm but uninteresting in mid-week.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values, calculated on closing prices (1926 = 100).

Paris

THOUGH August provided no lack of local as well as foreign news, the Bourse refused to be stung into activity. The tone in the equity share markets was heavy almost throughout the month. During the first fortnight, the exchange problem dominated the markets; later, home and international politics determined the trend. Exchange-guaranteed rentes were the market favourites in the first two weeks, responding closely to changes in the foreign exchange situation, and occasionally moving in an opposite direction to ordinary rentes and domestic issues. On August 10th and in a few sessions after the 18th the Bourse was soothed by M. Daladier's announcements regarding the financial situation and the 40-hour week, although the resignation of two Ministers checked the improvement. Conditions deteriorated on a disquieting international outlook, though a cautious attitude rather than any selling pressure was maintained. Local and international stocks weakened last Monday; the falls did not persist, but the tendency was on the whole for prices to drift lower as the month ended.

Berlin

THE rapid descent of security quotations which began early in July continued, with only one noticeable recovery, in August. Although the volume of selling was never great, the absence of support produced very heavy falls, which gave the market a semi-panic appearance. International events had no visible effect on the market and Jewish liquidation was moderate, the selling being either by industrial holders who needed cash, or by the general public. The absence of buying support undoubtedly arose from fear of smaller industrial earnings and of new taxation. The recovery from the bottom levels recorded on August 16th was apparently due to a not unqualified official denial of taxation rumours. In the first half of the month falls of 4 to 6 points on single days were common, but these were mostly in high-priced specialities, and the leading heavy-industry, chemical, and textile issues, though very weak, generally suffered less. Declines in engineering shares were disproportionately heavy, but bank and shipping issues were less affected. Recovery, which began on August 18th, lasted only four days, and at the end of the week to August 27th, stocks closed little above the month's "lows." Home fixed-interest securities were weak, but average losses were small. The German section of Young Loan was steady at a little over 101. Converted dollar bonds were very weak. The official shares index (1924-26) for the week ended August 20th was 100.74 against 107.86 for July; bonds averaged 99.8 against 99.95 for all July.

Amsterdam

DURING the first part of August the Bourse was quite featureless. There was small attendance and less business, prices moving within narrow limits. Quotations hardened slightly, if anything, during the first week. Then, although activity continued at a low ebb, the tone became rather weaker, under the influence of international politics and the foreign exchange outlook. With the volume of business still failing to expand, the market continued to follow Wall Street's moods, though at no time were price movements important until quotations fell sharply—as in all other centres—on

(*Continued on page* 468)

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

Canada

THE improvement in the Canadian stock markets lost its momentum in mid-July. Although there was no definite setback, considerable irregularity developed. There was something like a boom in the stocks of aircraft and equipment companies, and western grains, construction and "wet" stocks were in good demand, but newsprint stocks were weaker and the general level of the market remained more or less stationary. But in view of the holidays, the underlying tone was encouraging. Towards the end of the second week in August there was a marked recession affecting many stocks, and although it was succeeded by a firmer tendency, little expansion of business occurred. The latter part of the month was rather featureless, until a sharp break occurred on the 29th under the lead of Wall Street, but prices rallied a little the next session. The mining market has been active, and some of the leading gold stocks made substantial advances. For the week ending August 4th the weekly average index of common stocks was 106·7 as compared with 135·7 a year earlier. The bond market has been firm, with a small volume of trading, and western provincial bonds have improved on the good crop prospects. The Bureau's index for the price of long-term Dominion bonds for the week ending August 4th was 117·4 as compared with 117 for the previous week and 115·2 for the corresponding week of 1937.

BY STOCK EXCHANGE INTRODUCTION

Colthorp Board and Paper Mills.—Particulars of an issue of £200,000 5 per cent. cumulative redeemable £1 preference shares. Repayable at 22s. 6d. by drawings 1939–48, or in entirety thereafter, or at 22s. in 1967. Messrs Helbert Wagg and Company have guaranteed subscription at par, for £5,630, out of which they will pay brokers' fees.

ISSUES TO SHAREHOLDERS ONLY

African Theatres, Ltd.—Holders of founders' and of ordinary shares are offered (one preference for one held of either class) 500,000 6 per cent. cumulative £1 preference shares at £1 1s. Right to convert (until March, 1940) three preference into two £1 ordinary shares on payment of 20s. for every three preference converted. A holding company, with 78 per cent. interest in African Consolidated Theatres. Profits before depreciation: 1935, £142,326; 1936, £192,064; 1937, £213,548. Net assets, £949,030.

PRIVATE PLACING

Montague Burton Estates.—The directors have placed privately £63,000 4½ per cent. first mortgage debenture stock.

BONUS SHARES

Initial Services, Ltd.—It is proposed to capitalise £82,800 from general reserve by distributing bonus shares to ordinary holders (as at September 14th) in proportion of one for ten held.

SHORTER COMMENTS

Company Results of the Week.—Net profits of GOLDSBROUGH, MORT AND COMPANY are only £A5,000 lower at £A191,343, but the extra provision of £A38,000 for income tax necessitates a reduction in the dividend by 1 per cent. to 7 per cent. Results of heavy industrial companies, this week, have been satisfactory. The small surplus available for PEARSON AND KNOWLES COAL AND IRON COMPANY dividends has been reduced still further, although total profits are £8,000 higher at £45,715. The subsidiary company, PARTINGTON STEEL AND IRON COMPANY, whose revenue is derived from the Lancashire Steel Corporation, has doubled the net profits of the previous year, total revenue being £131,221, against £97,745. The total income of TROJAN (HOLDINGS) amounts to £21,348, and shows little change compared with the previous period, which, however, covered 15 months. Dividends from Trojan, Ltd., were equivalent to £21,125 gross. Good progress has again been made by COWANS, SHELDON AND COMPANY, whose net profits amount to £46,743, against £31,060; the 10 per cent. dividend is unchanged.

MISCELLANEOUS

Pinchin, Johnson and Company, Ltd.—Interim ordinary dividend is maintained at 7½ per cent. The company states that for the first four months of the year sales were well maintained, but since May 1st there has been a moderate decrease, due to reduced consumption by certain home industries.

Broken Hill South, Ltd.—Net profit for year to June 30, 1938, £402,501, a fall of £365,815. Profits from mining declined from £664,803 to £276,159, but income from investments rose by £22,829 to £126,342. Dividend, 80 against 70 per cent.

A. W. Second Stock Trust.—The objects for which the company was formed having now been realised, a resolution for a members' voluntary winding up will be put to an extraordinary general meeting on September 22nd. The Armstrong Whitworth Securities Company capital reduction having been confirmed by the Court, the Trust has received £1,350,000 cash.

Richard Thomas and Company.—Particulars have been filed of 4½ per cent. redeemable prior lien debenture stock to secure £5,500,000 authorised July 28, 1938. The present issue is £1,620,410. The stock is a first specific charge on properties in Carmarthen, Glamorgan, Monmouth, Lincoln, Warwick, Middlesex and London and a first charge on various shares.

Ransome and Marles Bearing Company.—Final ordinary dividend 11 per cent., making 20 per cent. for year to June 30, 1938, payable on £700,000. Dividend for previous year 20 per cent. on £500,000. Net profits £153,528, against £166,351.

Pearson and Knowles Coal and Iron Company.—For year to June 30, 1938, total profit is £45,715, against £37,710. Tax and expenses, £10,785 (£10,222). Income, debenture and loan interest (the former being paid at 4, against 2½ per cent.) takes £36,166 (£25,846). Forward, £2,443 (after a special credit of £1,782), against £1,837.

Partington Steel and Iron Company.—For year to June 30, 1938, income is £131,221, against £97,745. Expenses and fees, £31,263 (£20,785); debenture and loan interest, £51,509 (£56,037); set aside for loan reduction, £40,000 (£20,000). Carry forward, *Dr. £55,747*, against *Dr. £64,196*.

Wiggins, Teape and Company.—For two quarters ended June 30, 1938, estimated net profits of company and its subsidiaries were £211,326, against £212,123 for corresponding period of 1937. This is after depreciation and profits applicable to outside shareholdings. After debenture interest and preference dividend (both gross) balance is £129,838, against £130,249. (Interest and dividends are payable after tax; no provision has been made in statement for any excess tax, or for N.D.C.).

Odeon Theatres Limited.—Profits to June 25th, 1938, after providing for depreciation and Directors' fees, £368,178. After deducting interest £94,630, preference dividend £91,323, reserve for income tax and N.D.C. £60,000, £122,225 remans to be appropriated. Directors recommend 10 per cent. dividend less tax on ordinary shares (£61,625), transfer of £20,198 to reserve, and discount on debenture issue (£18,000) to be written off, leaving £22,402 to be carried forward.

OIL OUTPUTS

Anglo-Iranian Oil Company, Ltd.—Output in Iran for June, 1938, 754,000 tons. Output for period January 1, 1938, to June 30, 1938, was 5,267,000 tons.

British Controlled Oilfields, Ltd.—Total output week to August 20, 12,413 barrels. Total output for week to August 27th, 13,358 barrels.

Trinidad Petroleum Development Company, Ltd.—Output week to August 20, 59,505 barrels. Output for week to August 27th, 56,709 barrels.

The Venezuelan Oil Concessions, Ltd.—Total output week ended August 20, 1938, was 1,150,367 barrels. Total output week to August 27, 1938, 1,209,617 barrels.

Industry and Trade

Slump in Cotton and Wheat.—In contrast to the majority of primary products, cotton and wheat are now cheaper than at the beginning of June. On August 31st the price of cotton (American middling) was 4.87d. per lb., compared with 8.09d. at the end of March, 1937, while the price of wheat (Liverpool futures) declined from 9s. 10d. per cental to 5s. 2d. during this period. As we suggested in our last surveys of wheat and cotton in *The Economist* on September 18 and November 27, 1937, respectively, a prolonged downward movement of prices was to be expected in the absence of crop failures this year. The area under wheat has been steadily extended in recent years under the influence of rising prices, without calling forth a corresponding increase in output. And, since the probabilities were against the indefinite continuance of sub-normal yields, the extension of the area was bound, sooner or later, to lead to an increase in output and a fall in prices. Although the wheat crops of the southern hemisphere are still unknown, this season's world wheat crop is expected to exceed requirements by a substantial margin. The measures which are contemplated by the United States Government to raise the internal price of wheat are described in our American letter on page 450. Last year's surfeit of cotton was due, in the main, to the bumper crop harvested in the United States. And as this season's crop, though smaller, is again expected to exceed consumption, which has been falling, the downward trend of prices is scarcely surprising. In order to prevent a further decline in prices the American Government, under the Farm Act, has decided to take over and hold part of the crop by giving farmers the choice between selling their cotton on the market or surrendering it to Government agencies against a loan varying from 5.30 cents to 10.75 cents per lb., according to quality. The resultant decline in supplies available to the market may, indeed, stem the downward trend of prices. But this palliative does not solve the problem of over-production, which has been aggravated by the American Government's price-raising measures.

* * *

Steel Prices on the World Market.—In view of the fall in the demand for steel by importing countries, it has been suggested that the Continental Steel Cartel should reduce its export prices. Such a step, it has been urged, would stimulate purchases and counteract competition from the United States in a number of products. Except for a recent reduction in the prices of thick steel sheets, the Cartel has so far refrained from a downward revision of prices, on the ground that a revival of consumers' demand will take place as soon as stocks are exhausted. An indication of recent changes in the export prices of representative steel products is given below:—

STEEL PRICES F.O.B. ANTWERP
(In £ (gold) per ton.)

	Dec., 1935	Dec., 1936	June, 1937	Dec., 1937	Aug., 1938
	£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.
Semi-products—					
Blooms	2 0 0	2 13 0	4 0 0	5 0 0	5 0 0
Billets	2 7 0	3 0 0	4 7 6	5 7 6	5 7 6
Tube strips	3 15 0	4 8 0	5 15 0	6 15 0	6 15 0
Finished products—					
Commercial bars	3 3 0	3 18 9	5 0 0	6 0 0	5 5 0
Joists	3 1 6	3 18 0	4 17 6	5 7 6	4 17 6
Angles	3 2 6	3 19 6	4 18 0	5 8 0	4 18 0
Hot rolled hoops	4 0 0	4 15 0	6 10 0	6 10 0	6 0 0
Sheets 9·5 mm. and over	4 2 6*	4 17 6*	6 2 6	7 2 6	5 12 6
Corrugated sheets 9·5 mm. and over	4 7 6*	5 2 6*	6 9 0	7 9 0	5 19 0

* 6·35 mm. and over.

The increase in prices in 1937 was substantial, and, in part, explains the strike of consumers. The only recent alterations have been a reduction in prices of 10s. (gold) per ton for the last two items. Although exporters are strongly pressing for a general downward revision of prices, the Cartel hopes that it will be possible to maintain them at the current level until early October, when a general revival of demand is expected. In some cases, a slight increase in purchases has recently been perceptible as a result of new orders for steel work and the desire of consumers to replenish their stocks. The majority of consumers, however, still pursue a hand-to-mouth buying policy in the hope of an early reduction in prices.

* * *

Recession in Export Trades.—While few branches of industry have remained unaffected by the recession in business activity, the set-back has been most marked in the export trades. With the exception of the iron, steel, rayon, lace and carpet trades, the industries in which the proportion of insured persons unemployed has increased by more than 10 per cent. between July, 1937, and July, 1938, are all dependent on export markets for a substantial proportion of their output. A list of these industries, together with the proportion of insured persons unemployed last July and the increase since last year, is given below:—

	Per cent. Unemployed in July, 1938	Per cent. Increase since July, 1937
Steel melting, rollings, etc.	24·8	14·0
Tinplates	40·9	29·4
Cotton	27·7	17·8
Woollen and worsted	21·4	11·7
Linen	50·9	34·4
Rayon yarn	16·6	10·4
Lace	20·9	13·2
Carpets	19·3	14·6
All industries	13·3	3·5

A number of these industries have sunk back into severe depression, which is reflected in the fall in exports. Shipments of Welsh tinplates during the first thirty-four weeks of this year were only 161,527 tons, compared with 271,571 tons during the corresponding period last year. As we show in a note on the fall in tin consumption, the setback in the tinplate industry has been world-wide, and was caused, in a large measure, by the accumulation of excessive stocks last year and by this season's poor vegetable and fruit crops which reduced the demand for tin cans. Exports of cotton piece-goods fell from 1,157.7 million square yards in the first seven months of 1937 to 818.1 millions during January-July this year. During

the same period, exports of woollen and worsted tissues declined from 73.4 million square yards to 53.4 millions, while shipments of linen piece goods fell from 54.8 to 30.7 million square yards. The cotton textile industry is at present operating at only about 50 per cent. of its capacity, and the position in the wool textile and linen trades is also much worse than a year ago. The setback in the carpet trade reflects the reduction in the construction of private dwelling houses and in expenditure on durable consumers' goods, which is also noticeable in the reduction in motor car sales. The majority of these industries would quickly benefit from a revival in world trade, but unfortunately there are as yet no indications of an early and sustained expansion in the international exchange of commodities.

★ ★ ★

Retail Trade in July.—Our *Trade Supplement* came too early in the month to include the usual monthly review of retail trade. The figures published in *The Board of Trade Journal* this week show that the value of the average daily sales of the firms included in the return were 3.6 per cent. higher in July than in the corresponding month of last year. The increase was most marked in Scotland, helped perhaps by the Glasgow Exhibition, and in suburban London; Central and West End London was again the only district to show a decline in sales. Daily sales of food and perishables, accounting for approximately 52 per cent. of the total turnover recorded, were larger by 4.5 per cent., and increased in every district except Central and West End London. Sales of other merchandise showed an average increase of 2.8 per cent. compared with a year ago, though there was considerable variation among the different categories of merchandise.

★ ★ ★

Gold Coast Cocoa.—The stocks of cocoa which accumulated in the Gold Coast during the farmers' "sales strike" were estimated in April of this year at about 220,000 tons. In order to prevent a rush of supplies to the markets after the end of the boycott, the Gold Coast Department of Agriculture introduced an Export Ordinance, under which monthly quotas for cocoa exports were to be fixed. For the four months, May-August, exports were allowed at the rate of 55,000 tons per month. With the shipment of 35,000 tons permitted in September, the accumulated stocks as well as the minor crop, will have been marketed by the end of this month. This fairly high rate of selling has not been without effect on the price of Accra cocoa; from a peak of 46s. per cwt. in March, 1937, it fell to 25s. per cwt. at the end of April, 1938, when the boycott was lifted. During the summer the price reached 22s. per cwt., but it has recovered somewhat in recent weeks. It is hoped that the report of the Commission which is now inquiring into the West African cocoa trade will recommend measures which will render the trade more stable and remove the misunderstanding between buyers and sellers which was one of the main causes of the recent selling strike of the cocoa growers.

★ ★ ★

Fall in Tin Consumption.—Tin, which has a smaller part in the armaments race than some of the other metals, has not remained unaffected by the falling-off in world economic activity. World consumption during the first six months of this year, as given in the statistical bulletin of the International Tin Research and Development Council, was only 80,900 tons, against 100,400 tons in the second half and 98,200 in the first half of 1937. Some countries, such as Germany, Japan and Italy, however, have absorbed more tin this year than during the corresponding period in 1937, but the three leading consuming countries—the U.S.A., the United Kingdom and the U.S.S.R.—have sharply curtailed their intake. In the past, tin has been less dependent on fluctuations in industrial activity than the other base metals, because it is the only non-poisonous base metal and is, therefore, largely used in the production of food containers. Tin has thus benefited in the past from the increase in the demand for cheap tinned food during periods of declining prosperity. This year, however, it was mainly the decline in the activity of the world's tinplate industry which was responsible for the fall in tin consumption. The world's tinplate output fell from 2,628,000 tons in January-July, 1937, to 1,630,000 tons in the corresponding period this year. The replacement of the tin container by other products, such as cellophane, glass, aluminium, artificial resins, etc., has made progress in the past three years, though this influence should not be over-estimated. The fall in tinplate output is due, in the main, to the accumulation of heavy stocks last year and to this season's poor fruit and vegetable crops in Europe and North America. Stocks of tinplate have already been reduced, but as the demand for tinplates is largely dependent on the size of the fruit and vegetable crops, it is unlikely to show an early and rapid increase. Although tin consumption prospects appear more encouraging in other branches of activity, such as the motor-car industry, world consumption of the metal can scarcely be expected to show a spectacular increase in the next few months.

★ ★ ★

Uncertain Trend of Wholesale Prices.—British wholesale prices have registered a fresh decline during the past fortnight, and this is brought into sharper relief by the firmer tendency of American prices. The decline in this country, however, is concentrated on the cereals and meat groups, where there has been a heavy fall in wheat and lesser decreases in maize and bacon. Non-ferrous metals and wool remain firm, while cotton and rubber are dearer. Thus British wholesale prices have mostly shown a fair degree of resistance in face of political uncertainty. Our indices are given below:—

Compared with a year ago, *The Economist's* complete British index number has fallen by 15.6 per cent., and that for primary products by 18.8 per cent. In the United States, the general index number has fallen by 12.3 per cent., but that for primary products by 24.2 per cent.

INDUSTRIAL REPORTS

THIS is the time of the year when the flow of orders to industry usually shows a seasonal increase. So far, there are no indications that hopes of a marked improvement in business in the autumn are likely to be realised. This week's reports on coal and steel are disappointing. The demand for coal remains poor; according to our Cardiff coal correspondent, new business shows no expansion and collieries are dependent almost entirely upon deliveries under previous contracts. Inquiry for iron and steel has shown some increase, but the volume of new business remains disappointing and few consumers appear to be willing to place orders for a long period ahead. The position of the cotton textile industry remains equally disappointing and the demand for wool textiles has not shown much improvement.

Coal

Sheffield.—The most active feature of the market is household coal, the demand for which has risen in anticipation of higher prices for the winter. Owing to the reduction in output, supplies of coal of best quality are not overabundant. Industrial steam coals move slowly, and there is a good deal of short-time working at pits. Coke supplies are substantial, with no improvement in demand. Prices generally are unchanged.

Export trade is dull, and new business is difficult to arrange. Bunker requirements are small, and very limited interest is shown in coke. The Egyptian State Railways and the Swedish State Reserves Board are in the market for heavy supplies of coal, but competition for orders will be keen.

★

Newcastle-on-Tyne. The coal markets in this district are quiet and, apart from the usual Scandinavian inquiries, there is no new business. There is considerable short-time working, but prices are not being reduced. Northumberland steam collieries are better placed with trade from the home market, but collieries producing coking coal in Durham are having a very difficult period owing to the recession in the iron and steel industry. Patent oven coke is shipped in steady quantities under Scandinavian contracts, but home trade is quiet and makers are still being compelled to restrict production.

★

Glasgow.—The market has failed to maintain its early post-holiday promise, business in both the home and inland branches being quiet. On the whole, prices are unchanged, but where regulations permit the trend is easier, an unusual development during this season. Stocks at importing depots abroad are now reported to be more normal, but while this may improve the outlook, any expansion of business seems to be held up by business and political uncertainties and by competition from Polish and German fuel.

Home industrial demand is only moderate, and even house coal is moving slowly, despite the likelihood of a rise in prices in the near future. Practically all classes of round coal can be had without difficulty, and nuts in most districts are also available for new prompt business.

Cardiff.—Business on the Cardiff coal market has shown little change during the past week. There have been inquiries for the renewal of contracts for supply during the last quarter of the year and extending over varying periods in 1939, but there is no apparent expansion in the current demand in spite of normally favourable seasonal influences, and collieries are therefore dependent almost entirely on their contract commitments. The period for the renewal of contracts for house coals covering next year has been extended to the end of September, but there has been no official intimation of any change in the colliery pithead prices for these and export coals.

Exports last week totalled 422,600 tons, compared with 361,600 tons the previous week and 388,770 tons in the corresponding week last year. It is understood that the French Government is taking effective action against the transfer of British licences for the importation of Continental coals, but the other important issues raised in Paris at the July joint conference are still, apparently, the subject of negotiation.

Iron and Steel

London.—The weekly report of the London Iron and Steel Exchange indicates that inquiry is expanding as the holiday season draws to a close. The volume of business transacted, however, remains disappointing and the works in all sections of the industry have materially reduced the reserve of orders upon their books.

In the pig-iron department buying is hindered by the existence of stocks in the hands of consumers, although these have been reduced considerably during recent months. The slight improvement in the demand has been maintained, but consumers appear reluctant to buy beyond their immediate needs.

The situation in the semi-finished steel department has improved somewhat with the liquidation of a good proportion of the heavy stocks which weighed upon the market, and there has been an expansion in the demand for British materials. At the present rate of consumption, however, it will be late in the year before the accumulations in the hands of users are absorbed.

New business in the finished steel market is irregular, but apparently the decline in the volume of business has been checked and hopes are entertained of a revival in the demand in the early autumn. The heavy steel works have still large tonnages to deliver against contracts, but fresh orders are badly needed. In the lighter branches of the industry, business has improved, but plants are operating below capacity. Export demand has been restricted and overseas buyers continue to limit their purchases to small quantities.

★

Sheffield.—Business in the iron and steel market continues at the low level of the last few weeks, and so far there seems little prospect of early improvement. With users well stocked with forge and foundry iron, and more than sufficiently covered by contract, there is no disposition to add to commitments. Such buying as there is relates mainly to basic iron, for which there is a moderately steady demand. Hematite sales are on a small scale, and forward business very limited. There is no change in the position of finished iron, and the mills are working spasmodically.

There is not much business in basic steel billets, and the demand for acid qualities has slowed down. The call for stainless steel sheets remains steady, and steel bar requirements are on a fairly satisfactory scale.

The market for iron and steel scrap is largely in a state of suspense pending the decision concerning the extension of the period of control, which was fixed to the end of September.

The output of steel ingots and castings in Sheffield fell by 39,700 tons to 94,100 tons between July, 1937, and the corresponding month of this year. It has to be borne in mind, however, that "holidays with pay" operated for the first time last July, affecting about 30,000 workers engaged in the Sheffield steel and allied industries. During the first seven months of this year output was 41,500 tons lower than during the same period of 1937.

★

Middlesbrough.—There is very little change to report on the local iron and steel market. Some small transactions are taking place, but buyers are only covering their early requirements and are not prepared to purchase for forward delivery.

East Coast hematite is being delivered against existing contracts, but the quantities are restricted. Export business is very slow. Shipments of pig iron from the Tees during August were about double those of the previous month, but were still small. Another furnace which was producing hematite pig iron has been put out of operation in the North-East area, leaving the number now producing this quality at six.

Deliveries of semi-finished steel are much below what is required to keep producers fully occupied. The heavy sections of the steel trade continue busy on orders, but there is a lack of demand for steel sheets, especially for export.

There has been no improvement in the demand for heavy steel scrap, and deliveries are held up for the time being pending an announcement regarding prices for the last quarter. Whilst the demand for blast-furnace coke is dull, producers of coke are doing business for export, which is relieving their position. Foreign ore imports continue to fall, the quantity imported during August being only about 80,000 tons, compared with a monthly average of about 200,000 tons during the latter half of last year.

★

Glasgow.—While steelmakers have still a good tonnage of uncompleted orders on books, the amount of new business placed is somewhat disappointing. Inquiries, however, are numerous and makers seem confident that more business will be forthcoming at an early date. The demand for semis is slightly better, but stocks at the works of many consumers are still above

normal, and it is believed that it will be a few months before this excess is worked off. The demand for both black and galvanised sheets is well maintained and re-rollers and sheet galvanisers are keeping a large proportion of their plant regularly employed. Jobbing galvanisers in this district are very busy.

★

Cardiff.—Since the stop week early in August and the consequent reduction in stocks, production has been improving slowly in the tinplate industry, and in the week ending August 20th output was at the rate of 48.57 per cent. of capacity compared with 36.76 per cent. in the previous week, and 77.57 per cent. in the corresponding period last year. Inquiries both for the inland and export trade are inactive. Although the world production of tinplates so far this year shows a reduction of about 40 per cent. from 1929, indications of an early recovery in the export trade are lacking. At Swansea last week shipments dropped to 3,193 tons, compared with 6,182 tons the previous week, and 5,719 tons in the corresponding week last year, and stocks are again accumulating in vans and in the dock warehouses. Prices are unchanged. The heavier branches of the iron and steel industry in South Wales are also less busy than they have been for the last two years.

Textiles

Cotton (Manchester).—The past week has brought no relief to spinners and manufacturers, and only a limited business has been done in all sections. Merchants are restricting their commitments as much as possible owing to the uncertain political situation. There has been a slight improvement in raw cotton prices, due to straddle buying in Liverpool and reports that the crop in America is being adversely affected by the boll weevil. An event of interest has been the publication by the United States Government of the terms of its loans to cotton farmers. Weather in the United States cotton belt has been favourable and there are very few indications of increased world consumption.

The yarn market was slack. All the mills in the Oldham district have extended the usual holiday stoppage. Trade in American counts has consisted of trifling lots to meet urgent needs and a poor turnover has been reported in Egyptian numbers. The basis for a price convention for ring spinners using Egyptian cotton has been decided.

Export demand for piece-goods has continued disappointing. Although manufacturers have been prepared to cut prices to secure orders, much difficulty has been experienced in bridging the difference between the prices offered and demanded. The rather better demand for home trade fabrics has been maintained.

★

Wool (Bradford).—The event of the week has been the opening of the new Australian selling season, the first sale being held in Sydney last Monday. A further auction took place at Adelaide on Thursday, and altogether the results are satisfactory. Since the opening of the new sales, Bradford representatives of buying brokers in Sydney have been seeking orders to operate on a basis of 21d. per lb., clean, Bradford, for 64's warp wool. Under present spinning and manufacturing conditions in the West Riding, prices are probably in line with what can be made for either tops, yarns or piece-goods, and it will require the full buying power of all sections of the trade, both home and Continental, as well as of Japan and America, to maintain last season's closing prices. A considerable volume of machinery is still standing idle or on short time, and there are no signs of a definite increase in consumption. Prices for partly and fully manufactured products remain steady.

THE COMMODITY MARKETS

MARKETS generally have been subdued by the political tension during the last week, which tended to depress both the volume of business and the prices at which it was done. Wheat prices declined further, owing to large offerings from Russia and uncertainty over the Government's wheat policy in the United States. Rubber, copper and lead were also marked down during the week, but prices of raw cotton and of other metals closed the week a little higher. Moody's index of daily commodity prices in the United States varied little during the week. On Wednesday it stood at 143.7 (December 31, 1931 = 100), compared with 143.1 a week ago.

Metals

Copper.—Copper fluctuated within narrow limits this week and closed at £40 6s. 3d. per ton, a net loss of only 1s. 3d. on the week. Supplies have been within normal limits in the last few days and at no time was there a selling pressure. On the other hand, the demand remained small and buyers showed little initiative.

★

Tin.—After falling sharply to £190 10s. in the early part of the week, the cash price for tin rallied to £192 15s. per ton and thus closed this difficult week with a net gain of 5s. Some speculative liquidations were noticeable at times, but the strength of the market has increased the confidence of many observers. There has been an increase in the activity of the Welsh tinplate industry, but tinplate sales both here and in the United States have remained disappointingly small. The greater activity of the automobile industry in the United States, however, is not likely to be reflected immediately in the current demand for tin, as most of the American consumers are fairly well covered with tin acquired at prices much lower than the present level.

★

Lead and Spelter.—Lead closed 2s. 6d. down at £14 5s. per ton, while spelter showed a net gain of 7s. 6d. to close at £13 8s. 9d. per ton. The demand for both metals and in particular that for spelter remained very small this week, but at the same time offerings were limited in view of the forthcoming international discussions.

Grains

THE wheat market has been dull, and prices are generally lower on the week by 4d. to 1s. 3d. per quarter. Large Russian shipments and uncertainty over the proposals of the United States Government to export wheat have dominated the market. Negotiations between American and Canadian officials on export policy are reported to be still proceeding. Little business was done in maize, and prices, where changed, were rather lower; the announcement that loans on old crop maize in the United States have been increased to 57 cents per bushel may help to prevent sales pressure after the harvest, if, as is generally assumed, the revised rate will also apply to the new crop. Barley prices have been steady and Russian shipments continue to dominate the market; at present prices, neither the United States nor Canada seem prepared to sell.

Other Foods

Provisions.—There was good demand during the week for chilled beef, frozen mutton and lamb and fresh pork; other fresh killed meat sold slowly. The bacon market was firm and butter prices rose by 1s. to 2s. per cwt. during the week; cheese and egg prices were also a little higher.

★

Colonial Produce.—At the tea auctions there was a brisk demand and higher prices were obtained. Other markets have been dull, and prices unchanged.

★

Fruit and Vegetables.—After a quiet week-end, demand improved and in all departments business was brisk in the middle of the week. Plums, apples, pears and oranges were higher in price, while prices of English potatoes were hardly changed over the week.

Miscellaneous Commodities

Oils and Oilseeds.—The trade in these products is dominated by the dull grain market and the unsettled political outlook. Little business has been transacted in the past week and prices, where changed, tended to be lower.

★

Rubber.—The political tension over the week-end brought rubber prices down on Monday, and though some recovery was made later, the spot price for standard sheet closed on Wednesday at 8d. per lb., a decline of ⅛d. compared with last week. There are better reports on automobile activity in the United States, but political uncertainties in Europe weigh heavily on the market.

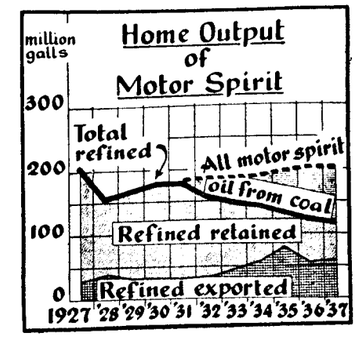
Britain's Oil Supplies



In the following charts we survey the sources of the United Kingdom's oil supplies. First of all, we show on the left-hand side how much crude petroleum is imported and where it comes from. Then we show the quantities of petroleum consumed by the refineries and the resulting liquid output. The difference between the throughput of petroleum and the liquid output is accounted for by waste and solid products. In the centre and in the upper part of the right-hand side we show the consumption of motor spirit and of fuel, diesel and gas oil, whether imported or refined from crude petroleum at home. Finally, we analyse home production of motor spirit showing the quantities refined from imported petroleum, whether retained at home or exported, and the quantities derived from coal.

Finance

GOVERNMENT RETURNS

For the week ended August 27, 1938, total ordinary revenue was £10,327,000, against ordinary expenditure of £11,884,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £127,529,000, against a deficit of £78,077,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On August 26th, applications at £99 17s. 5d. per cent. for bills to be paid for on Monday or Tuesday of the following week were accepted as to about 36 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications for bills to be paid for on Wednesday, Thursday, Friday or Saturday at £99 17s. 6d. per cent. and above were allotted in full. £45·0 millions of Treasury bills are being offered on September 2nd.

EXCHANGE RATES (Monthly Tables)

CENTRAL AND SOUTH AMERICA

THE BANK OF LONDON AND SOUTH AMERICA, LTD., issues the following details relative to quotations for certain of the South and Central American exchanges. All these exchanges, with the exception of Bolivia and Paraguay, are related to the United States dollar, and the approximate sterling rates may be obtained by applying the dollar-sterling exchange rate.

*Bolivia.** Sight selling rate on London has been 141·40 bolivianos per £ (nominal) since June 12, 1938.

*Colombia.** Sight selling rate on New York was 176·55 pesos per 100 U.S. dollars on August 8, 1938. This rate applies to holders of permits buying in the "open" market.

Ecuador. Sight selling rate on New York was 14·85 sucres per U.S. dollar on August 6, 1938.

Guatemala. Sight selling rate on New York is maintained at one quetzal per U.S. dollar, but a commission of 1 per cent. is charged by the Central Bank for the sale of drafts.

*Nicaragua.** Sight selling rate on New York for payment of imports was fixed by the National Bank at 5·52 1/2 cordobas per U.S. dollar (including 10 per cent. tax and 1/2 per cent. commission) on August 8, 1938.

Paraguay. Exchange is quoted on Buenos Aires; the sight selling rate was 70·60 Paraguayan pesos per Argentine "free" paper peso on August 12, 1938.

El Salvador. Sight selling rate on New York was 2·51 colones per U.S. dollar on August 10, 1938.

Venezuela. Sight selling rate on New York has been maintained at 3·19 bolivares per U.S. dollar since April 27, 1937.

* Exchange controls are operative in these countries.

Mediation Means What?

PLAN succeeds plan in Prague with bewildering rapidity. As each set of proposals is markedly more generous to the Sudeten Germans than its rejected and withdrawn predecessor, the rapid succession is presumably as pleasing to the Germans as it is alarming to Czech public opinion. With the fourth plan, which was handed to the Sudeten German Party on Wednesday of this week, the Czechoslovak Government declares that it has gone as far as it can without endangering the integrity of the State. The Sudeten representatives on Wednesday simultaneously accepted the plan as a basis of negotiations and declared that all talks must be broken off, by reason of an alleged assault by Czech police on Sudeten deputies at Moravska-Ostrava. This looks like the merest pretext for delay, and if maintained it would do the Sudeten cause great harm in the opinion of the world. Unfortunately, Lord Runciman was unable to bring this home to the Sudeten leaders, and as we go to press, there is still deadlock in Prague. But so small a hindrance must be capable of removal, and when it is out of the way a basis of negotiation will at last have been reached.

The new fourth plan of the Government goes very considerably further than the third plan, which provided for some twenty or thirty *départements* or *Gaue*, with considerable powers of self-government. It is now proposed that the sub-divisions of the territory of the Republic shall be both larger in area and have wider powers than was proposed before. There are to be three large German-speaking districts. One is to be at the head of the Bohemian salient, along the borders of Saxony, with about 800,000 almost entirely German-speaking inhabitants. The second, along the borders of Bavaria and Austria, will also have a homogeneous German-speaking population of about 700,000. The third, facing German and Polish Silesia in the neighbourhood of (and possibly including) Moravska-Ostrava, cannot from the nature of the case be so wholly German-speaking; its population will be about 500,000.

Each of these administrative areas—and, of course, those carved out of the rest of the country—will elect, by proportional representation, its own legislature, and appoint its own executive. In the division of powers, the principle to be followed is that only those services vital to the security of the State shall be centrally administered, including mainly the army, communications, the gendarmerie (local urban police being controlled by the new sub-divisions), and foreign affairs. These proposals come as close to the Sudeten demands as is possible without disrupting the Czechoslovak State. Indeed, it may be said that they meet all the purely Sudeten demands, those which are left unsatisfied being either the demands of Berlin (e.g. that the foreign policy of the country must be changed) or those of the Nazi Party (e.g. that a totalitarian regime, complete with Jew-baiting and concentration camps, shall be set up in the Sudetenland). No country in time of peace has ever made such far-reaching concessions to the demands of another.

No attempt has been made in Prague to conceal the fact that this new plan was only offered to the Sudetens

with great reluctance and under pressure from London. Nervousness and misgivings are naturally on the increase in Prague. What exactly, it is being asked, is Czechoslovakia getting in return for these painful and dangerous concessions to British views? The disquiet is not, indeed, confined to Prague. What exactly, we may ask in London, is the rôle of the British Government? Up to this point, nothing that Lord Runciman has done, or that the British Government have done, has been inconsistent with the rôle of a mediator. It was right to persuade the Czechs to go to the limit of safety. But now that that limit has been reached, surely they, and British public opinion, have a right to expect that the British Government shall say so and start putting an equal pressure on the other party to the dispute. Great Britain is, after all, mediating, not arranging the terms of Czech surrender.

This moment, when the mediator himself must give evidence of good faith if he is to carry his task to a successful conclusion, was chosen by *The Times*, which is frequently (far too frequently) taken to represent the views of the British Government, to suggest that the Czechs would really be better off if they ceded the Sudetenland outright to Germany. *The Times* never hesitates to deplore irresponsibility in others; but such a suggestion, at such a moment, inviting Germany to wait until she is offered more than she has ever demanded, cannot be ascribed to anything but monumental ineptitude or a deliberate intention to make mischief. A statement was promptly issued from the Foreign Office, saying that the suggestion "in no way represented the view of His Majesty's Government." But only part of the mischief could be undone, for the suggestion will still be taken abroad as representing the view, if not of the Government, at least of an influential section of British opinion. It will be harder than ever to convince Herr von Ribbentrop that the influence of the pro-German group whose view he accepts as British public opinion has declined, since March and May, to nothing. The effect of the suggestion has been bad, and may still be disastrous. In Prague (and elsewhere in the world) the natural reaction is that the Czechs have been tricked. All their concessions, it is said, have been in vain; they are, after all, merely to be thrown, with the utmost gentility, to the wolves. They would have done better to have stood fast from the start. And the British intervention, it is being said, was merely one more of those unquestionably well-intentioned efforts to push others into the breach, at no expense to Britain, which have built up the legend of perfidious Albion. On the German side, the suggestion is a plain invitation to intransigence; it has been so accepted at Nuremberg.

The Times blunder (we accept the charitable explanation), even though the Government's disavowal was prompt and emphatic, sharply illuminates the need for a clearer definition of British policy. If there had been no obscurity about British policy, and no suspicion of its intentions, no disavowal would have been needed. As it is, plain speaking is necessary. This is the function, above all others, of the House of Commons, and the Labour Party will meet with widespread support in its request that Parliament should be summoned—not to embarrass the Government, but to enable them to prove that their intentions are honest. What exactly was the meaning of Sir John Simon's speech, with its repetition of the Prime Minister's statement that Great Britain would almost certainly be involved in any war that started in Bohemia? Last week the world thought it knew. But now there are sceptical voices asking whether it may not mean that, to avoid a war in which we should certainly be involved, we are taking steps to hand the Czechs over to the Nazis. Almost certainly, that interpretation is wrong—but there is no room for "almost" in a situation where absolute certainty is required. Again, if our purpose is to procure a peaceful settlement, have we distinguished in our minds between one that will keep the peace this autumn and one that will keep the peace next spring? Autonomy for the Sudetens may merely mean a firmer basis for a German offensive next year. Have we thought of that, in urging the Czechs to make proposals that will create an autonomous Nazi Government in the Sudetenland which, on the occasion of some petty brawl, might easily send out an appeal for help *à la* Seyss-Inquart? Have we realised that we cannot expect the Czechs to agree to a solution they think dangerous unless we give them assurance of security? We cannot ask them to believe that their national existence is a reasonable price to pay for a few weeks of British security. If we have an interest (as we manifestly have) in a peaceful settlement, and if we are convinced that a peaceful settlement can only be obtained by concessions from the Czechs that endanger their safety, then we must be prepared to pay a price for what we want by putting our binding guarantee behind the new status of Czechoslovakia. If our intention, on the other hand, is merely to persuade the Czechs to surrender without fighting, let us abandon the hypocritical pretence of impartial mediation, and ask Lord Runciman to don the Swastika. But if, finally, our main interest arises from the growing realisation that there will be neither peace nor security for England in a world that is ruled by force and bluster, let us be very careful that we do not disgust and betray those whose interests run parallel with ours and that we do not encourage and reward the methods of policy that will, in the end, bring down the British Empire. On all these questions, doubts are rising. It is imperative that they should be allayed by clear words from London.

The Rôle of the Unions

THE Trades Union Congress met at Blackpool on Monday last under the ill-starred auspices of the European crisis, and its deliberations have reflected the surrounding malaise. The Congress is the authoritative assembly of the organised workers of the country; and its attitude towards the great economic and political problems of the day is second in importance only to that of Parliament itself.

The report of its General Council shows that, while its membership is still a very long way from its ideal of embracing every manual worker in the land, it has latterly been growing in numbers and resources. Its total membership in 1937 reached 4.7 millions, compared with 3.3 millions four years ago and 3.2 millions before the war. This figure has only been exceeded during and immediately after the war, when a great influx into the "organised" trades of the country took place.

The function of this important organisation is primarily industrial; but, quite inevitably, in the circumstances of to-day, its interest has been directed to political matters and in particular to the great question of peace and war. It is natural that trade unionists, in common with the whole British people, should be deeply troubled by the grave turn taken by events abroad. It is natural, too, that the T.U.C. should be obdurately opposed to all forms of Fascism, since no institutions have suffered more severely than trade unions from the spread of totalitarian doctrines on the Continent. The trade unions' suspicions of recent trends in British diplomacy have been shared by a considerable part of the electorate.

It is not merely in foreign matters that the unions are inevitably drawn into politics. In the domestic sphere also, their inextricably intimate relations with the Labour Party, which depends upon them for finance, local organisation, personnel and votes, makes it impossible for them to stand aloof from political matters. To-day, moreover, the political significance of the trade unions is enhanced by the lack of outstanding Parliamentary figures on the Labour benches of the House of Commons. It is, accordingly, the more important that the trade union chiefs should not overlook the fact that their primary responsibility lies in the sphere of industrial relations and social welfare.

In industry, indeed, as distinct from politics, the trade unions have not in every respect the same status as they enjoyed before the war when the industrial population was more closely knit in tradition and place. The development of their power and responsibility has been intensive in the fields they had already occupied before 1914, rather than extensive over the whole working life of the nation. The pattern of British industry has markedly changed in the course of the last twenty-five years: the old basic industries have declined in importance, while lighter industries, transport and distributive services have greatly expanded; and the trade unions, still firmly entrenched in the older trades, have not made corresponding headway in the newer ones. Out of 13½ million workpeople insured against unemployment and more than 18 millions included in the National Health Insurance scheme, less than 4½ millions are members of unions affiliated to the Trades Union Congress; and, although the Transport and General Workers' Union and the General and Municipal Workers' Union are now two of the three largest unions, the strength of the T.U.C. still rests to a large extent upon the miners, the railwaymen and the engineers.

The T.U.C. was established seventy years ago as an annual meeting of unions at which a common policy on questions of general interest could be evolved; and a Parliamentary Committee, transformed in 1921 into the present General Council, was instituted to give expression to the meeting's agreed views. Voting at the Congress is based upon the membership of the affiliated unions. To-day, the Mineworkers' Federation, the Amalgamated Engineering Union, and the National Union of Railwaymen number 1,202,108 out of a total Congress membership of 4,460,617, and together command over 26 per cent. of the votes; the two general workers' unions, whose expansion in recent years has reflected the changing balance of Britain's industries, control with their 1,016,359 members over 22 per cent. of the votes. Thus, these five bodies, out of a total of over 200 affiliated societies, wield roughly half the votes cast at T.U.C. meetings.

Even on the railways and in the mines, however, not more than 70 per cent. of the registered workers are members of affiliated unions; and, even after five years of steady progress in membership since 1934, only 1 in 3 of the workers insured against unemployment, or 1 in 4 insured against ill-health, is an affiliated unionist. Indeed, even at the peak point of membership in 1920, before strikes, political controversy and economic depression struck hard at the unions, only half the male workers and one-fifth of the women were members. To-day, in the food, drink and tobacco trades, in miscellaneous metals and among the two million distributive workers (despite recent successes in the grocery trades and in the North), unionism is slight; in the artificial silk industry, in hotels, restaurants, laundries and general commerce it is practically negligible. Workers in the motor manufacturing industry are almost entirely unorganised; and organisation in foundries and vehicle factories is sporadic and local. Even in building, the proportion of union members is low, because of the breakdown of organisation among building labourers. And in agriculture, trade unionism has fallen back to its former great weakness.

Bare figures of membership, however, are not an adequate guide to the influence of trade unionism. In many industries where the proportion of actual union members is small, wage rates and, to a certain extent, other labour conditions, are governed by trade union practice. It is none the less true that, while the T.U.C. speaks the political mind of Labour, it fails to include in its ranks the majority of industrial and other workers, especially in the new and growing trades. In part, the reasons are political; a number of semi-professional unions hold aloof from the T.U.C.; public servants have been forbidden by law to affiliate since 1927; and many working people are not prepared to sponsor the political activities of Congress. In newly-developed industrial areas, especially in the South, where no trade union tradition exists, a generation of workmen has arisen that has no acquaintance with unionism. The character of the labour needed for the new factories is different from the apprenticed personnel of the North and Midlands in the old days. The new machine-minders are not skilled in a particular trade; nor, accordingly, are they firmly attached to any particular industry. In consequence, what headway has been made in new areas has been made by the general workers' unions, and members' loyalty has not the solid support of a common training and skill. Yet collective bargaining remains the accepted and most satisfactory procedure for improving labour standards and obviating disputes. The movement has recently realised its clear responsibility to the relatively unskilled workers in unorganised trades. The general unions have attempted, with some success, to expand their membership, somewhat loosely, in these occupations. A new union has been projected, under the T.U.C.'s auspices, for domestic servants. Individual unions and the T.U.C. have co-operated with employers and the Government to attempt the application of trade board methods on a broadened base to the regulation of goods road transport and retail distribution where unionisation is difficult and the attainment of uniform wage standards is impracticable.

These are notable advances in the field which is the unions' own. The autonomous societies look to Congress for guidance; and the rival tendencies within the movement have, as it happens, been exemplified in the proceedings at Blackpool this week. Mr Elvin's Presidential Address was almost wholly political in substance, even when dealing with industrial subjects, and its denunciatory tone went far beyond the bounds of the formal and rhetorical confession of a Socialist faith which is to be expected on these occasions. Yet, despite Mr Elvin's lead, the discussions of Congress have been marked by a notable sense of responsibility and a clear willingness to realise the proper distinction between industrial and political action. On Tuesday, the readmission of Communists to the unions was once again rejected, without discussion, and the policy of the General Council in meeting with the Government to discuss co-operation in re-armament was approved. On Thursday, the General Council's view that industrial action should not be used for political purposes prevailed against proposals to influence the Government's actions with regard to Spain by means of strikes or boycotts.

This is unquestionably the right line of action for British Labour in its own interests. Foreign affairs and re-armament are matters of pressing and immediate importance; but they must be settled in Parliament. The strengthening of the industrial base of unionism and co-operation with the Government and other bodies in the prosecution of social and industrial reforms are much more obviously matters for the unions themselves to decide. The duty of co-operating fully in munitions manufacture has been rightly urged upon the Congress by the Council this week; but it is in these wider ways that the T.U.C. and its affiliated members can, in the long run, best make their peculiar contribution to national welfare, and justify their claim to be integral institutions of British democracy.

Germany's Economic Prospect

(By Our Berlin Correspondent)

THE recent heavy falls on the Berlin Stock Exchange, which seem to have been somewhat exaggerated by foreign comment, have led once again to suggestions that Germany is marching towards some undefined "breakdown" or at the least towards radical changes in economic policy to arrest "breakdown." The same opinion can occasionally be heard in Germany; but the great majority of informed natives and foreign observers on the spot, especially those who have witnessed the vicissitudes of German economic policies over long terms of years, expect neither breakdown nor complete reversal of policy. The National-Socialists themselves persistently affirm that the Third Reich is immune, not merely to economic breakdown, but even to cyclical setbacks. In view of the present high level of production and employment, that assertion is equivalent to predicting perpetual boom. The Bourse fall shows that there are some sceptics. The main cause of the collapse was unquestionably the increasing burdens on capital—of which taxes are only part—and the fear of investors both that profits would decline and also that the overtaxed shareholder would be allowed to retain still less of what he received for his own consumption.

That these tax fears were the root of the trouble was virtually admitted, after strenuous denials and attempts to put the blame on international unrest, when Herr Reinhardt, Secretary of State in the Ministry of Finance, published a qualified denial that there were any plans for increases in taxation. Plans were in fact ready; but the disastrous effect of the increase in Corporation tax (now double that of 1936) caused them to be withheld. The nervous note of Herr Reinhardt's utterance, and his demand that all discussion of tax increases should cease, showed how the wind blew. The securities fall was officially found unpleasant. It discredited the Third Reich abroad, aroused unwelcome surmises about purely political and diplomatic matters, and induced much loose talk of "breakdown" and "change of methods." Moreover, the fall of fixed-interest securities was obviously not helpful to the borrowing programme of the Government. But there is no evidence that the Government apprehended anything very serious. Since it had brought about the collapse by its precipitate methods, it has probably the power to stop it quickly; and the two recoveries of the market after August 16th were certainly due in the main to the denials of impending increases in taxation.

In meeting emergencies the dictatorial National-Socialist Government has the two great advantages that it has no economic policy based on principle and that it can act immediately to meet the exigency of the day. Its whole policy for six years, except for some enterprises such as the motor roads and the new Goering iron undertaking, which by their nature involve planning, has been one of hand to mouth, the essence of which is that, as soon as policies heralded as based on principle fail, or cause undue pressure in some particular quarter, they are abandoned or even reversed, counter-pressure usually being brought elsewhere. This has occurred in the field of food supply and agricultural policy. It was the attitude towards mechanisation in industry, which at first was violently opposed and even partly prohibited. There have been wide variations in the policy towards independent traders and petty industrialists, in the regulation of prices and in many other directions. This flexibility of policy knows no limits. And if the Government, having discovered that it must again increase tax revenue, and having thereby induced an unpleasant and unpopular securities crash, desires now to do without the revenue and to give the securities a chance, it can reverse its policy. Apparently it has already done so.

The two potential weaknesses in the German economic situation are public finance and foreign trade—the latter regarded less as a method of making payments to foreign countries than as an influence on the volume of industrial activity at home. That the Government is always short of money is admitted; the official debt returns have reflected the shortage of funds since financing by "special bills" was abandoned in March. The reduction in defence expenditure that was hoped for when the initial programme of rearmament had been completed has not materialised. The reason for this is probably the fortification of the Western frontier, the current cost of which is not known, but must be very large if, as is understood, a complete "Maginot Line" is being constructed. Money is also wanted for the works put in hand in Austria since the *Anschluss* and for civil commitments, many of which are half-finished. As a result of the March reforms in financial procedure, the disclosed debt of the Reich is now rapidly increasing. In June alone it rose by Rm. 853 millions, which is about £70 millions at the official rate of exchange. Most of this increase is in short-term debt. Thus the June return shows an increase of Rm. 504 millions in the liability for non-interest-bearing Treasury certificates. Most, if not all, of these are the "delivery certificates" with which contractors are now paid. This new borrowing device has not been a complete success. The "special bills," with which contractors were paid before the March changes, could be discounted to full value, but on the delivery certificates the contractor can only raise 75 per cent., and that at a higher interest rate.

The total Reich debt is now returned at Rm. 22,455 millions, which is Rm. 5,541 millions higher than a year ago, but neither figure includes the liability for "work-creation" and armament bills incurred down to March of this year. According to official statements, the current deficit is diminishing. This may well be the case, because the gross revenue of the Reich is rising and the subventions to States and municipalities are continually being reduced. The familiar statement that the National-Socialist Government has not greatly increased tax burdens (the Corporation Tax being the admitted important exception), and that the vast increase of revenue derives almost entirely from the trade revival, is not quite correct. The tax increases originally imposed to meet the emergency of the depression have never been removed. During the depression the original rate of the compulsory contribution to unemployment insurance was "temporarily" raised from 3 per cent. to 6½ per cent. Although unemployment has almost vanished this high rate is maintained. As a result, the Unemployment Insurance Board has been virtually converted into a tax-collecting body. The yield of public taxes in 1937-38, plus the saving on unemployment support, was, according to the official estimate, Rm. 10,200 millions more than in 1932-33. The yield of taxes to the Reich and local governments in the last fiscal year was Rm. 18,500 millions; the national income in the calendar year 1937 was only Rm. 68,500 millions. Germany is thus a very heavily taxed nation, and if, in spite of that fact, the Reich is still borrowing, the explanation is the extremely heavy expenditure. The Reich has always borrowed and got into debt in periods of prosperity and high revenue; it has practised economy and suspended borrowing only in depression times.

So long as the present very heavy burden of taxes can be continued, so long as the national income continues to rise, so long as the Government can borrow to meet its deficit, any setback in production and employment seems very unlikely. The present boom originated in finance, and can probably be maintained by finance. It is not abnormal or unprecedented; a similar system has been successfully pursued for still longer in Russia. In Germany, itself, industry was extraordinarily active during the great inflation, unemployment being for some time even lower than it is to-day. When National-Socialist officials claim that cyclical fluctuations have been eliminated, they foresee that for all visible time the Reich will have the financial resources to keep the pace up. But the whole self-generating process depends upon the ability to borrow. Already the Bourse fall has made long-term borrowing or the funding of short-term debt less easy than it was, although an inspired statement professed complete confidence that the financial programme would be carried through. The continuance of short-term borrowing depends, first, upon there being an ample supply of savings, and, secondly, upon their being regularly deposited with the financial institutions. There is no present sign of any interruption to this process, and the current increase of indebtedness is probably smaller than in the "special bill" years.

The other possible weakness in the whole structure lies in foreign trade. Industrial activity at its present level cannot be maintained without imported raw materials. Stocks of raw materials have recently increased (the position concerning essential foodstuffs is also a little easier), but the Reich is not appreciably nearer to supplying itself, and the volume of exports is therefore still a crucial factor. On the surface, the figures show a substantial deterioration in the course of the present year. Since April the total of exports has actually been lower than last year. The growth of the unfavourable trade balance has been limited hitherto by an improved relation between import and export prices. The prices of raw materials have fallen much faster than those of manufactured exports, with the result that a given volume of exports has paid for a larger quantity of imports. Recently, however, there have been signs of a fall in German export prices, which, if continued, will complicate the problem. The foreign trade balances are not, however, as bad as they seem. Part of the increase in the unfavourable balance is due to the incorporation of Austria into the Reich. Moreover, some of the invisible sources of income have been increasing; the shipping surplus was Rm. 412 millions in 1937, double the 1933 figure. The adverse trend of trade has not prevented the Reich from importing Rm. 94 millions of gold in the first seven months of 1938. Moreover, reserves were increased by the *Anschluss;* the expropriation of Austrian foreign securities yielded a very large sum, unofficially estimated at as high as one milliard marks. These reserves would not last long in a severe depression of international trade, but for the present there is no reason to anticipate any insuperable difficulty in securing the necessary supplies of essential raw materials.

Germany's economic structure thus has two factors of weakness, either of which might compel a reduction in the present high activity of industry. But both are at present purely potential. It is, in fact, quite impossible for the National-Socialist Government to contemplate a return to idle factories and to a host of unemployed. Thanks to the happy planlessness, to the wealth of resource open to a dictatorial government and to its ability to act immediately, many minor tendencies towards depression can be promptly met by the tried expedient of sacrificing some impeding interest—usually that of the consumer. Whether this policy of expedients will be successful indefinitely is a very open question. But in the meantime, anybody who bases his calculations upon an imminent economic decline is probably making a mistake.

Economics at Geneva

EVEN the closest friend of the League of Nations cannot delude himself that it stands to-day, on the eve of its Nineteenth Assembly, as high as it stood a decade ago. The League has not failed the world; but the world has sadly failed the League. The Foreign Ministers will go to Geneva on Monday; but they will go mainly in order to discuss with each other under the League's convenient roof the great drama that is being played out in Europe beyond the official cognizance of the League and its organs. The agenda, both of the Council and of the Assembly, is innocent of any suggestion that all is not perfect harmony between Germany and Czechoslovakia. The magnificent instrument shaped by the peacemakers in 1919 is not being used to preserve the peace they made.

If there is any consolation to be drawn from this tragedy it is that the less sensational parts of the League's work stand a better chance of receiving their fair share of attention. None deserves this attention more than the work done by the Economic and Financial Committees of the League and the corresponding sections of the Secretariat. Judged by both the quantity and the quality of its output of reports, memoranda, reviews, surveys and other printed documents, the economic side of the League's work is flourishing as never before. So rich, indeed, is the growth that the Council in May set up a Committee to co-ordinate the various activities then in progress. The report* of this Committee was published in July and provides a revealing and impressive summary of the work that is being done.

Without drawing any untenably rigid distinction, it can be said that the economic work of the League falls into three main divisions. There is, first, the collection, arrangement and exposition of information; this is primarily the function of the Economic Intelligence Service. Secondly, there is the active discussion of steps that can be taken by Governments for economic advancement, which must be left to the various committees on which the States-Members are represented. Finally, there is the great volume of economic work done within its special terms of reference by the International Labour Organisation. Though the Co-ordination Committee gave only a brief mention to the work of the Economic Intelligence Service—presumably because it found no need there for additional co-ordination—this is the branch of the League's work with which the independent economist or statistician is brought most closely into contact. The Year Book and the Monthly Bulletin of Statistics have become standard places of reference (to which, incidentally, *The Economist* is daily indebted). The series of annual volumes on special subjects, such as world trade, world production and prices, money and banking, balances of payments, etc., are monumental collection of facts gleaned from all over the world, with an added superstructure of the Secretariat's own estimates and calculations.

The Secretariat has always had the courage to go further than the mere compilation of official returns; and many discussions of economic problems would lose touch with reality, for lack of a quantitative measure, if it were not for such convenient approximations as, for example, the League's index number of the industrial production of the world. Further than that, the League's publications never

* "Report of the Co-ordination Committee on the Economic and Financial Questions contained in the Agenda of the Nineteenth Ordinary Session of the Assembly." Series of League of Nations Publications, II. Economic and Financial, 1938. II B.3.

lose sight of the economic wood for the mass of statistical trees. They are adept in the lucid marshalling of facts to make an intelligible picture. The latest report of the Financial Committee, to take only one instance, included as an annex a Note by the Secretariat, giving in twenty-five small pages a survey of the puzzling state of world business which for clarity and completeness excites the envy of the professional journalist. If any reader of these lines should consider this praise of the work of the Economic Intelligence Service too generous, he can be invited to read the latest edition of the annual "World Economic Survey"‡ which has just been published. The Survey, which is intended to be an epitome of the work of the Service, has been taken over this year by Mr J. E. Meade, of Oxford, and he has succeeded admirably in his task of setting out an impressive array of facts in palatable form.

An intelligence service, however excellent, loses the largest part of its usefulness unless it provides the basis for action. With the financial assistance of the Rockefeller Foundation, an inquiry has been proceeding under League auspices for some time into the nature of the trade cycle. This has already resulted in Professor Haberler's book "Prosperity and Depression," which was a collection and examination of the chief theories purporting to explain the phenomenon of business fluctuations; and Professor Tinbergen is now engaged on statistical research to test empirically the validity of these various theories. But, at the same time, a Delegation has been appointed by the Council to inquire into the practical possibilities of Government action to prevent or mitigate depressions. The world may hope that this marriage of practice and theory will be fruitful.

The economic activities of the League already mentioned make up a formidable list. But they are only the beginning. The agenda for this year's Assembly contains thirteen items of a specifically economic character, of which the Economic Intelligence Service and the trade cycle inquiry constitute only two. The remaining subjects for discussion vary greatly both in scope and in importance. But running through all of them it is possible to discern a thread of continuity. The economic work of the League is coming to be grouped round the central subject of the standard of living of the ordinary man. Nutrition, for example, under the hand of the League, has been converted from an abstract and imprecise noun into the name of a positive policy for human betterment. And on the main issue, that of raising standards of living as a whole, Mr N. F. Hall's report, reviewed in *The Economist* last week, is a beginning in a similar task of reducing a vaguely enormous, and enormously vague, subject to malleable proportions.

The economic efforts of the League have not merely a definite aim, in the increase of human betterment; but a method, which is itself an aim, in the increase of human freedom. There is hardly a section of the agenda which does not profess the direct object of increasing some aspect of liberty. The inquiry into the availability of raw materials is an attempt to enhance the freedom of access to the riches of the world. The constant investigation of exchange controls aims to restore to the world's liquid capital that freedom of movement which, more than anything else, has built up the standard of living of the Western world. And, finally, all the organs of the League and the I.L.O. are pressed into service for the tragically urgent problem of migration—the freedom of movement of Man himself.

Thus behind the pages of objective statistics the economic work of the League comes back to its high subjective purpose. The League was founded to secure the freedom and security, to enhance the material welfare, of the human race. The more it has been deprived of the chance to fulfil its political mission, the more urgently necessary it is that its work should be carried on in the economic sphere. Only part of the world pays heed to what is done in Geneva, and even in that part the practical obstacles in the way of acceptance of the principles worked out by the League are enormous. But it is pure gain that somewhere in the world the flame of human progress is being sedulously tended.

Family Allowances

A VIGOROUS campaign is being waged against malnutrition and ill-health. Physical fitness is the order of the day. One key position, namely, the proper nourishment of dependent children, has yet to be taken and consolidated. Children of school age receive education, milk, mid-day meals and medical services at the hands of the State, but something like a quarter of the nation's children belong to households whose weekly income amounts to 10s. or less per head. This is not enough to permit of an expenditure on food sufficient to provide for the physical efficiency of all members of the family.

Children are the chief sufferers from inadequate family earnings. Some 16 per cent. of a sample selection of households made in the course of a survey of the Merseyside eight years ago were living in what was defined as primary poverty; but more than 25 per cent. of all the children included in the sample fell within this impoverished group. The truth is that in its lower ranges the existing wage system does not provide adequately for the maintenance of dependent children. Wages, as the recent Report of the Unemployment Assistance Board emphasised, bear no necessary relation to family needs. A wage-rate sufficient to nourish a single man and keep him in good health may be inadequate to support a wife and one, two or three children properly: yet the wage remains the same for all. From the family standpoint every additional child is tantamount to a cut in the standard of living. The nutrition and physique of the children who will be the workers and citizens of the next generation are adversely affected.

It is for these reasons that the demand for family allowances, i.e. regular cash allowances in respect of each child, for so long as it is dependent, is receiving rapidly-growing support. They are advocated as an essential addition to our system of social services, which already recognises that the unemployed, the sick and the aged should be maintained in a state of physical efficiency; and the case for their provision has been cogently argued in the latest of the publications of that active propagandist body, the Family Endowment Society.*

This is not a matter which affects only the lowest-paid labourers. Mr Seebohm Rowntree has calculated that the barest physical needs of an urban family of five require at the prices of 1938 a regular weekly income of 57s. 6d.; the minimum standards suggested by a League of Nations Committee would involve the addition of another 5s. or 6s.; and the inclusion of bought bread in the minimum diet would add from 1s. to 2s. more. Lancashire's women weavers are still agitating for a minimum wage of 30s. a week, while the average weekly cash earnings of coal-miners in 1937 were less than 55s. 6d. Certainly the ideal way of providing for Britain's families would be to give a minimum wage of, say, 60s. a week to urban workers and 50s. to rural workers, who at present earn an average of less than 33s. a week. This solution is not feasible except in the very long run. And to attempt to fix an inordinately high minimum wage would accentuate the problem of unemployment. Some critics argue that it would be unfair to make payments for the maintenance of children and not for the upkeep of, say, motor-cars. Workers, according to this argument, should have nothing less than a living wage to spend as they please. This theory has good grounds in political philosophy, but "women and children first" is a principle of action appropriate to more than shipwrecks.

The provision of children's allowances is not a new and untried scheme. In this reform Great Britain lags behind many Continental countries and some of the Dominions. General schemes of family allowances are in force in France, Belgium, Italy, New Zealand and New South Wales; and allowances are provided in certain industries, especially coal-mining, in Germany, Holland, Luxemburg, Austria, Switzerland, Poland, Hungary, Czechoslovakia and Jugoslavia. It is true that in many of these countries the level of real wages is much lower than in this country; and that the traditional method of improving earnings in Britain is by the process of collective bargaining. Clearly, however, collective bargaining cannot provide properly, in present conditions, for the needs of all children dependent upon workers over the whole range of industry; and foreign allowance systems provide plenty of precedent.

There are four possible ways of providing family allowances. Their cost can be met by employers, by the State, by the State and employers together, or by a contributory insurance scheme. The obvious danger of industrial schemes, which are most common abroad, is that employers, obliged to make payments over and above wages to men with families, will find it financially advantageous to engage single men. In France and Belgium this obstacle is overcome by the device of equalisation funds; firms in the same industry or in the same region make payments (based on their wages bill or total number of workpeople, married or single) into a central fund, out of which children's allowances, ranging from 20 francs a month for one child in the least generous scheme to 140 francs a month for four children. Over 6,500,000 workers are now covered, and according to Dr Glass, the charge for family allowances, crèches, holiday camps, medical attention and birth premiums in the French system averages 2 per cent. of the wages bill. In the case of French railways and coal-mining, the allowances are paid without any equalisation fund; and this is usual in most other countries except Belgium.

French and Belgian trade unions favour the system of allowances, and their removal, once they have been instituted, would certainly involve the workers in serious loss. Prior to the introduction of allowances, however, the trade unions, like their British counterparts to-day, were fearful lest these payments would entail a corresponding diminution of wages. This is undoubtedly a danger when the payments are made by employers only. Moreover, while industrial schemes can be introduced piecemeal as each industry finds itself able to bear the new burden, where industries are depressed or ill-organised, the system cannot be introduced on an industrial basis.

Indeed, the case for family allowances ultimately leads to the demand for their introduction as a social service financed by the State. The health and nutrition of dependent children cannot be measured by the rate of earnings of their parents, or by the profit and loss accounts of particular industries. The State's interest in the maintenance of the community's physical resources is considerable, and to finance the children's allowances out of taxation, as is already done in the case of education and public health, may prove to be the only way.

A scheme financed by taxes would meet a national need by national means; and it would not depress wages. Payment to ensure a minimum of food for children is no more out of place in the State's duties than payment to provide them with schooling or medical attention. The all-important question is: What would it cost? It was calculated in 1930 that to pay 5s. a week for the first child and 3s. for each subsequent child to all parents below the income-tax level, would have cost £70 millions a year; to pay 5s. for every child would have cost £120 millions. The number of dependent children is now falling, and will continue to fall; a skeleton scheme might be introduced now at an estimated annual cost of £50 millions; and, if the scheme were to start with the second child, the annual charge would be even less. If it were to start with the third it would be even more economical; and if this were done the rate per child could be somewhat higher and so render real assistance where the shoe pinches most. In any case, the total cost would be small in comparison with a ten-figure Budget, or even with our annual expenditure on re-armament; and it might be eked out, if need be, by insurance contributions. This is perhaps no time to advocate expanding our expenditure on social services. But no item among those services is more important than ensuring the physical efficiency of the nation's children. The payment of family allowances would do something to increase and stabilise the demand for foodstuffs and the necessaries of life. And the return to the community (which now spends £285 millions a year as the consequence of ill-health, according to a recent speech by Sir Leonard Hill) in the shape of fit and healthy citizens would go far to cover the cost. The child is indeed father to the man.

Topics of the Week

M. Bonnet and Mr Bullitt.—Writing last week on the European crisis, we concluded that if Germany draws the sword she will "find the world up in arms against her." These words are rather strikingly borne out by the tenor of the two speeches that were delivered last Sunday at Pointe de Grave, near Bordeaux, at the unveiling of a monument commemorating the entry of the United States into the World War in 1917. On this spot the first landing of American troops on French soil occurred in that year, and from the same spot Lafayette sailed to help Washington in 1777. The two speakers this week were the French Minister for Foreign Affairs and the American Ambassador in France. M. Bonnet re-affirmed in the plainest terms, and with express reference to Czechoslovakia, the intention of France to execute all her international engagements. With obviously equal sincerity he re-affirmed at the same time the French will to peace and the absence of any aggressive intention behind the fact of Franco-American friendship. "What the French wanted was not American help in war—they did not want war. They wanted American help for the safeguarding and organisation of peace." Mr Bullitt, for his part, said that the Americans were vitally interested in world peace and that they hoped and prayed that they might remain at peace with every nation in the world, but that, if war should break out again in Europe, "no human being could undertake to state or prophesy whether or not the United States would become involved in such a war." This is, of course, almost the formula that was employed by Mr Chamberlain in his statement in March, which was reaffirmed by Sir John Simon

the other day. It is profoundly to be hoped that, during the next few critical and perhaps decisive days to come, Herr Hitler will lend an ear to his expert philological advisers (and such advisers are at his disposal, if only he chooses to consult them) who have a thorough knowledge of Anglo-Saxon. They will assuredly tell him that, in this trickily muffled and muted tongue, a refusal to guarantee that something unpleasant is *not* going to happen in a certain contingency may be almost tantamount to a warning that it *is* going to happen. There is, of course, a big difference between the present attitudes of the British and American peoples and Governments. But to a large extent it is a difference of degree and phase of development rather than of kind. Throughout the English-speaking world, under all flags and in all parts of the earth, an isolationism bred of a deep repugnance towards war is contending today with a growing belief that it will after all be impossible to avoid a reckoning with dictators who are deliberately making it impossible for us to have the economic, political and psychological conditions without which peace cannot be maintained even by the most pacific-minded democracies. Britain may have been forced, by history and geography, further along this road than the United States. But we are both moving in the same direction, and each nation is much further along it than it was in 1914.

* * *

Nuremberg.—The intoxicating sight of the pennons and swinging ranks of masses of men in obedience to unspoken domination grows annually more intense at the *Parteitag* in Nuremberg. The fervour does not wane among those who go to make the great display, nor the fascination stale; and everyone in Nuremberg, from the youngest and most ardent Hitler youth to sarcastic foreign newspapermen, feels it in his own degree. To-day there is something more. For if this year's magnificence has not—or not yet—unleashed a thunderbolt upon us and upon them, there remains, behind the acclamation and the gratuitous donning of laurels, a certainty which few can escape. These are *dies irae*: words which once might be set aside as necessary bombast can be set aside no longer: we are facing a simple threat of the worst things. Herr Hitler can tell his unnumbered legions that " Germany no longer fears blockade "; the conclusion foreign observers will draw will be different from theirs. We know that no country in the world can be unafraid of blockade. But the importance of Herr Hitler's words lies not in their relation to truth, but in their relation to his own and his people's mood. The peace of the world turns on the decision of one man. And that one man can talk only of how little he fears war.

* * *

Labour's Foreign Policy.—The impressive statement on British policy in Europe, issued on Wednesday by the General Council of the Trades Union Congress, the National Executive of the Labour Party and the Executive of the Parliamentary Labour Party, echoed the misgivings of a large section of the British public outside the ranks of these bodies. The words of Labour's leaders are eloquent and to the point:—

> The failure to recognise the indivisibility of peace is emphasised anew in the threat to Czechoslovakia. The fate of the world is involved in its outcome. . . . The British Labour movement has no quarrel with the German people . . . Peace is a living principle of the Labour movement, for its members are the common people who are the first to suffer and the last to recover from the ravages of war.

Yet, the statement continues, the facts must be faced. Britain cannot stand aside and

> the time has come for a positive and unmistakable lead for collection defence against aggression and to safeguard peace. . . . It is in the historic assembly of our democratic State that these principles should be reaffirmed with the utmost energy and determination.

This is no moment for party controversy. But it is in Parliament alone that Britain's duty and responsibility to stand firm against the blackmail of armed force and to honour her bond on behalf of world peace and international justice, can now be unmistakably asserted with the backing of the elected representatives of the British people. His Majesty's Opposition have called for the prompt summoning of Parliament. They are more than justified.

* * *

Re-armament and Industry.—The steps taken by the General Council of the Trades Union Congress earlier this year to work out, in consultation with the Prime Minister, general grounds for the unions' co-operation in the speeding-up of arms manufacture were approved by the T.U.C. on Tuesday by an overwhelming majority. Opposition came from the Amalgamated Engineering Union. Their view that co-operation should be conditional upon a change in the Government's foreign policy was rejected. The assembled delegates were emphatic that no unnecessary interference with trade union standards and regulations should be tolerated, but it was generally agreed that the need for the dilution of labour in armament factories must be determined by the actual supply available of the required skilled labour. The engineers' repeated contention that, having conceded dilution during the last war, they were victimised when the war ended, is not in fact true; kaleidoscopic and inevitable changes in the scale and pattern of industry, rather than bad faith on the part of Ministers or employers, were responsible for the difficulties they then experienced. To-day, they are busily at work making munitions, and they are agreed that more munitions are needed. It is the merest common-sense that they should co-operate fully in speedier production of arms.

* * *

Nor can the need for the dilution of labour in certain instances be definitively disproved by reference to the swelling total of unemployed workers. Many engineers may be idle, while there is still a shortage of particular types of trained, efficient and physically fit artisans. Existing resources must be used to the full before dilution is considered—and here the unions can lend an invaluable hand—but each problem in the organisation of labour supply must be settled according to the actual facts of the case. Unemployment has indeed grown markedly this year. The unions are inevitably disturbed because the Government has taken no positive steps to stem the recession and anxious about the plight of their members when the rearmament demand slackens. On the other hand, their proposals for a planned economy on the Socialist model, approved by the Congress on Wednesday, were not a strikingly constructive contribution to economic policy for the immediate future.

* * *

Changes in Poland.—Anglo-Polish talks held in London and Warsaw last week seem to be bearing early fruit in a shift of Polish policy that may possibly be of great significance. The only outward sign is that Colonel Beck has unexpectedly decided to visit Geneva for the opening of the League Council. In view of Poland's recent attitude towards the League this is a move of some importance. There are three main considerations that must shape Polish foreign policy at the moment: the inquiries of the German Government for information on the Polish attitude in the event of war in Central Europe, an ominous question which compels Warsaw to consider what its position would be if Czechoslovakia were to vanish into the German maw; the peasant unrest inside Poland; and fresh Nazi aggression in Danzig. The People's Party, the peasant organisation which is still probably the largest political party in Poland, has issued a manifesto declaring that the " situation in the country and particularly in the Polish villages has become tense to the highest degree," and demanding new elections and a democratic government, combined with an immediate return of M. Witos. The fact that this manifesto, evoked by long-standing dissatisfaction with the domestic policy of the Government and by a realisation of Poland's worsening agricultural plight, was allowed by the Government to be published shows that the governing regime is conscious of the necessity of making some concessions to the Opposition in domestic matters. And since the Peasant Party holds very strong views on the desirability of a pro-French—and, by extension, a pro-Czech—foreign policy, any growth in its influence must have a modifying effect on Colonel Beck's diplomacy. Another factor pushing Warsaw in the same direction is the unfortunate situation which is developing in Danzig. In the Free City (an ironic title nowadays) Nazi aggression has now put the treatment of Poles on the same footing as the treatment of Jews, and three vigorous protests, made by the Polish Government after the maiming of a Polish railway official, have gone unheeded. Jewish doctors have been forbidden to practise in Danzig, and although this ban has not yet been extended to their Polish colleagues, the Press in Poland is full of bitter words against the treatment of the Polish minority and of reproaches to the Polish Government for its pro-German bias. Even more disturbing from Poland's point of view are reports of German arms and ammunition being smuggled into Danzig. These events may have been contributory to Colonel Beck's decision to visit Geneva, but they fall into insignificance compared with the larger issue of peace or war in Central Europe. Poland, with her corridor to the sea cutting Germany in two, is the last country that can afford to be complacent about German expansionism. Hitherto, the pro-German bias of her policy has always been excused by the plea that, in default of a real lead from the Western democracies, the only alternative for Poland is to be anti-Russian. But it has also always been said that Poland cannot afford to be on the opposite side of any fence from Britain and France. Colonel Beck's tentative gesture towards dismounting on the Geneva side is to be traced directly to the signs of British firmness with Germany. We hope the significance will not be lost on Lord Halifax.

* * *

Danubian Manœuvres.—It is not only in Poland that the recent German inquiry, breathing the sinister possibility of war, has served to precipitate a few grains of policy out of the cloudy mixture of uncertainty. In Moscow, it is true, there has never been any confession of uncertainty, and M. Litvinoff appears to have assured the German Ambassador that Russia could be counted on to fulfil to the letter her treaty with Czechoslovakia. In Roumania and Jugoslavia, however, no such clear-cut reply could be given. But if the attitude of the Roumanian Government is to be judged from that of the Roumanian press, the effect of the German inquiry has been to intensify the friendly feeling towards the Czechs. Indeed, there is every indication that since King Carol's *coup* and the accession to the Foreign Ministry of M. Petrescu-Comnen, Roumania has been anxious to move, so far as she dare, within the Anglo-French orbit. The conclusion of a new Anglo-Roumanian Clearing Agreement, the discussion of further British trade concessions and King Carol's promised visit to London next month are all pointers in this direction. Whether this trend of policy would go so far as to lead Roumania actively to intervene on Czechoslovakia's behalf in the event of war is more doubtful. But it seems probable that the passage of Russian materials, conceivably even of Russian troops, through the Bukovina to Czechoslovakia, would be allowed. Roumania's attitude would thus be one of neutrality benevolent to the Czechs. Since Roumania and Germany nowhere share a common frontier, Roumania has nothing to fear from such a policy unless Hungary—the intervening State—is Germany's ally. And an attack by Hungary on Czechoslovakia is the one event which, by existing treaties, would put upon Roumania the obligation of armed intervention. The attitude of Jugoslavia is considerably less clear. At the time of the Bled Agreement, Jugoslav policy seemed to be moving in a sense favourable to Little Entente solidarity. But the conclusion of the Agreement was followed by the resignation from the Government of the Minister of War, who was known to hold pro-Czech views. Since his place and another Cabinet vacancy were filled by Croats, it is possible that the change was of domestic rather than of foreign significance. But it is enough once more to enshroud Dr Stoyadinovitch's diplomacy in mystery. With Jugoslavia, as with Roumania, the decisive fact would probably be the attitude of Hungary. If Hungary remained neutral in a German-Czech war, Jugoslavia would probably also keep out of the fighting. But if Hungary seized the opportunity to invade Slovakia, it would be difficult for the Belgrade Government, even if it wanted to, to keep the Jugoslav army and the Jugoslav people out of the fray.

* * *

Hungary is therefore in a sense the key to the Danubian puzzle. The Prime Minister, M. Imredy, has thrown some light on his country's attitude, in an interview with an English newspaper correspondent and also in a public speech. Hungary, it would appear, has given no political pledges to Germany. Her attitude is one of stout neutrality, charged with a certain venom towards the Czechs; and it is made clear that the implementation of the Bled Agreement depends upon a prior settlement with Prague on the status of the Magyar minority. M. Imredy showed a wholly praiseworthy anxiety to concentrate upon the domestic affairs of his country. Thus he announced not only the re-introduction of conscription, but also a far-reaching programme of social and industrial reforms. The urban worker is to be given family allowances and recreation facilities on the *Kraft-durch-Freude* or *Dopolavoro* model. For the peasant, much more ambitious plans are laid. Entailed estates of over 400 acres and other estates of more than 700 acres are to be divided into small leaseholdings; and an effort is to be made to solve the problem of agricultural debt. The necessary funds are to be provided by the State and raised in taxation. Since the first estates to be expropriated will be those most heavily in debt, the peasant will not be the only gainer from the move. If these land reforms are carried out as fully as M. Imredy announced they would be, the resulting change may justly be called revolutionary: the vast silent plains of Hungary will have thrown off at least a part of that feudal heritage which so long has starved both the peasant and the soil. Whether Hungary will be granted the tranquillity to carry out her reforms is an entirely different matter.

* * *

A Plea to the Powers.—When the Assembly of the League of Nations gathers at Geneva on Monday next Sir Neil Malcolm's report on refugees from Greater Germany will be laid before them. No more poignant sign of the troubled and distressful times in which they meet could be imagined. Sir Neil, whose tenure of office as High

Commissioner for German refugees lapses at the end of this year, shows how the *Anschluss* piled Pelion upon Ossa by adding Austrian to German fugitives, and thus creating a problem which can now only be solved by inter-governmental co-operation and the goodwill of individual countries. Indeed, it can only be solved, he argues, by generous relaxations of prevailing restrictions upon the right of immigrants to work. And it must be solved soon because there are still very many more than half a million Jews, Catholics, Legitimists and others within the frontiers of the enlarged Reich whose security of citizenship and property has recently been rendered more than precarious. Voluntary aid organisations cannot cope with exiles in these numbers, deprived as they commonly are of over 90 per cent. of their property.

* * *

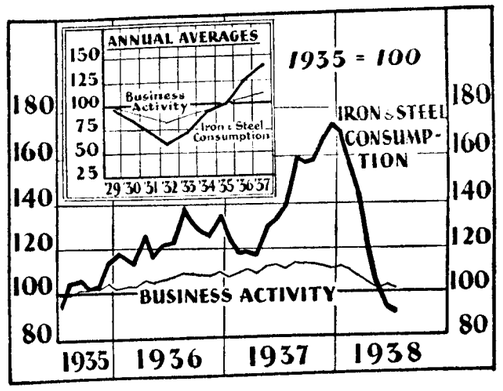
Sir Neil himself has something of value to contribute to the technique of absorbing as many as possible of these unfortunate aliens in the industrial and agricultural personnel of other countries; he has analysed those under his supervision in late months according to their special skills. By such methods Governments, employers and professional bodies could discover technicians and experts in many fields able to enrich the economic life of their new homelands and expand employment. But every week brings items of news that illustrate the formidable obstacles to freer migration. The immigration laws of Argentina are to be made more stringent because the volatile economy of that country has relapsed into severe depression once more, and many men are idle. And it is clear that the statement of the Zionist leader, Dr Weizman, in a speech at Antwerp a week ago, that no plan for Palestine could be acceptable if it restricted Jewish immigration and settlement, raises political issues of great difficulty. Yet there are signs that the tide is turning slowly in favour of freer movement. The expressed attitude of the United States is unmistakably more sympathetic than it was. And the introduction of a fully-fledged health insurance and contributory pensions scheme in Australia will, according to a new agreement, enable potential migrants from Britain to transfer to the Dominion the contributions they have already made to the British schemes, and so avoid incurring an appreciable and deterring loss. But these are the merest drops in the bucket —a bucket filled with the tears of a new Babylonian captivity.

* * *

Airplanes from Canada.—The devolution of some part of the responsibility for Imperial defence from crowded and vulnerable Britain to the distant and self-reliant Dominions has passed from the strategic into the industrial field. The British Air Mission, which recently negotiated an agreement with firms in the United States to supply aircraft to this country, announced in Ottawa on Friday of last week the conclusion of a long-term agreement with Canadian manufacturers. A number of Canadian firms will erect two central factories at Toronto and Montreal to produce bombers for the Royal Air Force; and a company will be formed to do business directly with the British Government. This agreement is not, like the American orders, simply a contract for the supply of a specific number of machines; bombers will be "on tap" for the R.A.F. from the new organisation for an indefinite period; and the Canadian supplies, together possibly with other types of military aircraft to be turned out by enlarged factories at Vancouver and Fort William, will be an integral part of the flow of British armaments. Meanwhile, on Wednesday, Mr Pirow, South Africa's Minister of Defence, announced a three-year plan to spend £5,000,000 on arms and equipment and a further £1,000,000 on coastal defence. The Union will draw most of its armament material from British factories; but the full fortification of Cape Town and Durban will represent a vital contribution by the South Africans to the co-operative provision of protection for the common interests of the Empire. The Dominions are wholly independent in their administration and policy; but the interdependence of the Commonwealth in matters of defence was never more marked.

* * *

Civilian Air Defence.—There have lately been important moves towards the enlistment of civilians in the work of national defence. Sir Kingsley Wood recently announced the formation of a Civilian Wireless Reserve, which will divert the energy and enthusiasm of scores of expert amateurs to the national advantage, and of the 7,000 volunteers needed, 1,000 have already enrolled. Last week the training of the recently formed Civil Air Guard began at all light aeroplane clubs that had recruited twelve members for the new scheme. Up to that time 19,759 men and 3,898 women had been enlisted for the Guard out of 30,726 applicants, and discussions between clubs and aircraft manufacturers show that the present supply of training machines will be adequate for winter purposes, when flying time is restricted by limited daylight. Ground training will accordingly be of primary importance during the early stages of the Guard's career; and the only obstacle to the satisfactory progress of a scheme which is likely to prove of notable benefit in numerous and diverse ways in the unhappy event of war is the shortage of instructors. At one flying field only 100 out of 1,500 recruits could be started in training last week; and the bottleneck is not eased by the comparative delay in organising ground instruction.



* * *

Fresh Food and Frozen.—Food storage is not only an indispensable piece in the pattern of national defence. Fresh fruit and vegetables, both necessary for good nutrition, are not readily available in a fully fresh state, even in peace time, to dwellers in overgrown cities; and at certain seasons of the year they are not available at all. The consumption of these and many other foods in preserved and stored forms has grown by leaps and bounds in recent years; and the Medical Research Council's answer to the question, posed by the Food Investigation Board, whether stored food is as nutritious as fresh food, is accordingly of much more than passing importance. Their judgment, contained in the Board's annual report published last week-end, is non-committal but on the whole encouraging. It is not possible, the Council say, to compare with any certainty the actual nutritive effects of the consumption of fresh and stored foodstuffs without a prolonged period of extensive clinical research and observation. Judged by analysis of their chemical constituents, however, stored foods would seem to lose little by comparison with fresh; and the Council are properly emphatic in stating that most preserved foods are superior in nutritive value to fresh foods gone stale, which is too often the diet of town dwellers. In the case of fruit and vegetables, important nutritive constituents tend to be destroyed by heat in both cooking and canning; but the latest methods of gas storage (whereby the fresh article is preserved in an atmosphere in which it can continue "breathing" as in its natural state) and quick freezing, applied with special success to peas and white fish in North America, have opened up promising avenues of experiment. The best solution for our problems of nutrition would assuredly be cheap fresh food for all the year round. But that is scarcely possible yet; and comparative researches into the value of foods preserved in different ways, by canning, bottling, drying and freezing, is in consequence imperatively needed.

* * *

Steel Consumption and Prices.—The accompanying diagram, which compares the course of *The Economist's* monthly index of new iron and steel available for consumption with that of general business activity, shows that the decline in demand this year has been as marked as the wild scramble for materials in 1937. Last year consumers, fearing a shortage of supplies, attempted to secure their requirements for longer periods ahead than usual; since the end of 1937 they have been anxious to reduce their stocks, placing new orders to satisfy immediate requirements only. Actual consumption of iron and steel neither increased as much as supplies last year

BUSINESS ACTIVITY AND DOMESTIC STEEL CONSUMPTION

nor fell as sharply as production and imports this year. Despite the severe curtailment of output and imports, however, stocks are believed to be still excessive, and, in the absence of a revival of demand, the industry may be compelled further to reduce its output. The industry is thus on the horns of a dilemma. Costs of production have risen as a result of the decline in output, and the industry, consequently, is averse to a reduction in prices, especially, it is contended, as such a move is unlikely to stimulate consumption sufficiently to prevent a fall in total profits. Although it is arguable that last year's increase in prices was not as extortionate as it might have been, they are, nevertheless, high compared with those of other products. For example, the Board of Trade's index of iron and steel prices (1930=100) stood at 138.5 last month, compared with its figure of 101.9 for all industrial materials and manufactures. Moreover, while the general index has fallen by 8.8 per cent. since August, 1937, the steel index is virtually unchanged. As the industry has been given a quasi-monopoly in this country, the pressure of individual producers for basing selling prices on costs of production—which means on the costs of production of the least efficient producers—is undoubtedly strong. The voice of the general interest is supposed to be represented by the independent Chairman of the British Iron and Steel Federation and by the Import Duties Advisory Committee. Past experience does not hold out much hope that it will be strong enough appreciably to modify the monopolistic instincts of the steel manufacturers. A depression is a testing time for the new organisation of the steel industry. It has not yet shown many signs of realising that the powers it has been given carry heavy responsibilities to the community.

Mr. Roosevelt's Purge.—President Roosevelt is doing nothing to lower the political temperature in the United States. To European observers there may seem nothing strange in the head of the executive expressing his opinions on the policies, and the men, that will shortly have to be judged by the electorate. A British Prime Minister, who is likewise head of the Government and leader of a party, habitually asks the electorate to vote for this candidate or against that, without anybody accusing him of betraying his trust or trying to be a dictator. But Mr Roosevelt's intervention in the current primary elections, by which the Democratic Party in the various states chooses its candidates for the November election, violates no less than three of the taboos of American political theology, and the resulting protest is shrill. It is a breach, in the first place, of the doctrine that the executive must not interfere with the process by which the legislative branch of the Government is constituted. Secondly, the Federal Government, even the national headquarters of the party, are not supposed to have any concern with the party elections in each state—almost in the same way as a French Socialist who happens to be President of the League Council would be debarred from expressing an opinion on the choice of Parliamentary candidates by the British Labour Party. And finally and most scandalously, the President has even shaken the sacred party loyalty by expressing his preference for a Liberal Republican over a Conservative Democrat.

* * *

Other leaders in the past have discovered that it is not always safe to disregard what are generally held to be the forms of polite controversy for the sake of a consuming idea. Mr Roosevelt himself made the mistake, at the time of his Supreme Court proposals, of thinking that if the country wanted him to carry out his ideas it would grant him the means to do so. He may be making a similar mistake at the moment. Hitherto, he has been relatively successful in those primary elections where his intervention took the form of asking support for his friends—the renomination of Senator Barkley in Kentucky is the chief case in point. But the President has now taken to attacking his enemies. One of them, Senator Smith in South Carolina, has already been re-nominated. Two others who have been directly attacked by the President, Senator George in Georgia and Senator Tydings in Maryland, face their primary elections in the next few days, and the omens are that one at least of them will have the support of the electors in defying the President. But the President's campaign will probably serve his purpose even if his opponents are returned to the Senate, for they will know henceforth that the Democratic label will not protect them from attack if they consistently oppose the President's policies. In this noisy struggle, the Republican Party doubtless casts itself for the rôle of *tertius gaudens*; but it is

receiving even less attention than the emergence of one more product of the lunatic fringe from that land of sunshine and nonsense, California.

Words and Deeds in Mexico City.—At the opening of the Mexican Congress on Friday of last week President Cárdenas made a speech which seemed at the moment to have been deliberately calculated to paralyse Mr Cordell Hull's patient and conciliatory diplomacy. In notes of July 21st and August 23rd the Secretary of State at Washington had asked the Mexican Government to accept arbitration in regard to the compensation due to United States landowners in Mexico who have been expropriated. Instead of entertaining this request, the Mexican President reverted in his speech to an earlier proposal from Washington for a joint investigation by the two Governments; but in the same breath he rejected the conditions with which this proposal had been accompanied. These were that, while the joint investigation was in progress, the Mexican Government should begin to set aside funds for an eventual payment of compensation for lands already expropriated, and that in the meanwhile no fresh expropriations should be carried out. These conditions seem reasonable, considering that the expropriations have been going on now for ten years without a penny of compensation having been paid up to date. President Cárdenas, however, rejected them both, on the ground that they cast an aspersion upon Mexican honesty. In the same speech he announced that the compensation payable to the foreign oil companies, whose properties have been expropriated *en bloc* this year, would not be large. This apparent intransigence on the Mexican Government's part is being outdone by Mexican labour, which has come out on strike against a mining company of United States nationality, in spite of the fact that in this case a collective contract between the company and its employees has been worked out to the satisfaction of the Mexican Government Labour Board. Meanwhile, the attempt of the expropriated British and American oil companies to obtain the protection of Mexican law against the Labour Board's award of an indemnity of £6,000,000 to their employees has failed. On Wednesday the Supreme Court ruled that the award must stand, although the men have not in fact lost a single day's work. It only remains to be seen whether the Supreme Court will evince any greater magnanimity or sense of justice in its judgment on the validity of the expropriation decree itself.

* * *

The present week has seen the publication of the Mexican reply to Mr Hull's note of August 23rd. After maintaining that Mexico has only done what a great many other sovereign States have likewise recently been doing, this note does accept (though this without agreeing to either of Mr Hull's two accompanying conditions) the proposal for a joint commission to determine the value of, as well as the method of paying compensation for, the expropriated lands. More than that, Mexico is now virtually accepting Mr Hull's subsequent proposal for arbitration; for, in his present note, President Cárdenas suggests that, in the event of disagreement between the Mexican and the United States Commissioner, a neutral member shall be selected from the Permanent Commission established in virtue of the Pan-American "Sondra Pact." In so far as this Note opens the way for judicial discussion of the quarrel between Mexico and the Powers, this is assuredly good news for Mexico as well as for the foreign interests concerned. The vehemence of Mexican xenophobia is easy to understand and even to sympathise with up to a point. It has behind it the whole impetus of the long delayed reaction of an oppressed native peasantry against a foreign exploitation which began, more than four hundred years ago, with the Spanish conquest. But to see that a passion is natural is not the same thing as to prove that it is righteous or even expedient. And, besides, the foreigner in Mexico in 1938 is not the man he was in 1521. The present English-speaking owners of the bulk of the present foreign interests in Mexico are most unlikely, in their present mood, to try to force upon Mexico conditions that would be condemned as flagrantly inequitable by instructed neutral opinion. But these same foreigners have, after all, done much for the economic development of Mexico; and they are no less entitled than Mexicans or other men are to receive a fair return for their labour. This is obviously a case for friendly discussion and compromise; and for such a settlement we hope that President Cárdenas has now opened a door on which Mr Hull has been persistently knocking.

* * *

French Labour Decrees.—M. Daladier's Ministry of Labour has found its course anything but plain sailing since the promulgation of the decrees relaxing the Popular Front's 40-hour week legislation. Although the C.G.T. has not been unreasonably violent in its condemnation, the decrees are not passively accepted, and particular objection is taken to the further suggestion that overtime pay shall not exceed 10 per cent. of the normal wage-rates. The Communists have seen fit to attack the whole principle of relaxations and in so doing have provoked an emergency meeting of the Council of the Miners' Federation to decide what steps shall be taken in defence of unity against Communist activities. At this juncture it is difficult to see what the Communists expect to gain from exacerbating industrial unrest, for with M. Blum leading the Socialists in quiet acceptance of what he seems to regard as the inevitable, and lacking as the Communists do the support of the C.G.T., they cannot hope to influence the course of events or even pose as martyrs on the altar of social progress. As things are, strikes and threats of strikes have occurred in several departments. A wage-cut of 19 per cent. made by jute employers in the Somme department was greeted by the striking of 14,000 men; Lille tramworkers came out at the week-end; and much disquiet is evident amongst 40,000 textile workers in the neighbourhood of Lille, Turcoing and Roubaix. The refusal of Marseilles dockers to work under new terms has forced into effect a decree requisitioning the port, and docking services will now, if necessary, be carried out by troops. In this uncertain atmosphere, with strikes of protest against the decrees occurring daily, it is a pity that M. Jouhaux, the leader of the unions, should be out of France. In Mexico he is almost as far from his flock as Mr Ernest Bevin is from Blackpool. But whatever signs there are of anxiety on the part of the French working-class, they should not be mistaken to mean that France is divided against itself on issues which in a crisis would be fatal to its strength. In spite of the demonstrations which several trade unions have conducted against the decrees, it is clear that sooner or later those decrees will be accepted as part of the price to be paid for national security.

* * *

In China and in Spain.—The Japanese continue their push towards Hankow, pitting their strength with varied success against the strong points of the city's southern and south-eastern defences, Teian, Matow and Kwangtsi. If they can force Matow they will be in a position to menace the Wusueh forts on the Yangtze river, or from Kwangtsi they can advance upon the Yangtze boom from the north, and in either case will be able to lend urgent meaning to the negotiations they are conducting with interested Powers for the marking out of a neutral zone within Hankow. If contradictory reports are discounted as far as possible, it seems that the Chinese are being forced back at all three points after costly resistance and counter-attack; and towards Teian the Japanese are already reported to be in possession of its key-defence post, Mahuiling. From Teian the road lies open southwards to Nanchang. Meanwhile in East Hopei and Jehol, provinces passed over by the Japanese and left far behind the lines, the waves of China's millions are flowing back across the desolation, causing loss to the invaders by guerilla fighting.

In Spain the Ebro sector is still the main sphere of action. Insurgent forces have done little better there than before Almaden in the Estremadura where dour resistance is disputing every attempt to advance. As earnest of that resistance, 2,206 Italians, the latest official figure of those killed in Spain, are to be commemorated in Italy, with others who may join their silent ranks, by an obelisk set in the Campo Mussolini at Rome.

* * *

The Antisemitic Campaign in Italy.—On September 1st the *Gleichschaltung* of Italian policy towards the Jews passed over from speech into action. On that day it was decreed that all persons of Jewish parentage on both sides who have settled in Italy or in certain of her overseas possessions since January 1, 1919, are to leave within six months, even if they are not Jews by religion, and even if they have acquired Italian nationality. Those who have acquired it are to lose it, in addition to being driven into exile. The only territories in Italy's hands to which this decree is not to apply are her possessions and conquests in East Africa, where a territory is to be set aside for the settlement of Jews from Italy. Estimates of the number of persons affected range between 47,000 and 70,000. On the next day the persecution was extended to all Italian Jews—now including the great majority who were domiciled in Italy before 1919. No Jew is to hold any sort of post—academic, administrative or menial—in any educational institutions under Government control. Those now holding such posts are to lose them on October 16th. More than that, no Jewish pupils, either, are to be allowed in future—with the single mitigation that Jews already studying in universities or in other institutes of higher education are to be allowed to finish their courses. At the Government's instance, the Royal Academy of Italy has appointed a committee to study the influence of the Jews on Italian life. The number of victims among the Italian university professors is stated to be 174 out of 1,864. On September 5th the Press received orders not to accept any more orders from Jewish firms.

* * *

For this sudden attack on the Jews there is no precedent in the policy of Fascist Italy, and it robs Italy of one of the historical glories of her pre-Fascist civilisation. In the 16th century the Grand Duchy of Tuscany shared with Holland and Turkey the distinction of being the first states in Europe to offer asylum to the Jews expelled from Spain and Portugal. It was these Peninsular Jewish refugees who made the fortune of the port of Leghorn. Later, under Austrian rule, the Jews also made the fortune of Trieste; and if Signor Mussolini were setting himself to make the Triestines regret the union of their city with Italy since the last war, he could hardly have hit upon a more effective means to that end. What is his motive? The publication and pictures of eleven blonds and blondes as "the ideal types of Italian manhood and womanhood" might seem to show that, like the introduction of the Prussian goosestep, this Antisemitism is just a piece of inverted snobbery in which the barbariser of Italy is modelling himself on the full-blooded barbarian of the "good neighbour" across the Brenner. But there is perhaps also a more serious and sinister purpose which may be inferred from the application of the decree to Libya. Throughout the Arab world, from Palestine to Algeria and Morocco, the Arabs are now up in arms against the Jews. Is Signor Mussolini posturing as a future leader of Arab Antisemitism, with an eye to entering into the heritage of France and Great Britain in North Africa and the Levant?

Revival in Building and Manufacture

New York, August 30.—The Federal Reserve Board's indices for July show a vigorous upturn in business during the month. This improvement has been continued in August, and supports the general view that there was a decisive cyclical turn at the mid-year. The most convincing of the indicators is that of residential building, which rose above the level of July, 1937.

BUSINESS INDICES

(1923–25 = 100. Adjusted for Seasonal Fluctuations)

	July, 1937	June, 1938	July, 1938*
Industrial production (total) ...	114	77	83
Manufactures	*114*	*74*	*81*
Minerals	*112*	*92*	*93*
Construction contracts (total)...	67	54	54
Residential	*44*	*42*	*46*
All other	*86*	*64*	*60*
Factory employment (total) ...	103·0	76·3	77·6
Durable goods	*100·1*	*65·2*	*64·9*
Non-durable goods	*106·2*	*88·1*	*91·3*
Factory payrolls (total)	100·4	67·2	67·5
Durable goods	*100·7*	*58·1*	*55·6*
Non-durable goods	*100·0*	*78·8*	*82·6*
Freight car loadings	80	58	61
Department store sales	94	82	85
Department store stocks	77	68	67

* Preliminary.

The impressive rise in the index of manufactures and in residential building amounts to nearly 10 per cent.; in both cases, however, there has been a substantial adjustment for seasonal variation, shown in the next two tables:—

INDEX OF MANUFACTURES

	(Adjusted)	(Unadjusted)
December 1937	79	75
January 1938	76	75
February 1938	75	76
March 1938	75	77
April 1938	73	76
May 1938	73	75
June 1938	74	75
July 1938	81	78

CAPITAL & SURPLUS.....$260,000,000

NEW YORK PARIS BRUSSELS HAVRE ANTWERP

For the past eight months our economy has shown unusual stability, and most of the recorded fluctuations have been caused by the making of seasonal adjustments in the uncorrected indices. The upward movement of the unadjusted index for July, although only half that recorded in the adjusted index, is perhaps the more convincing on that account. The building index similarly shows an upward trend in both indices:—

INDEX OF RESIDENTIAL BUILDING

		Adjusted	Unadjusted
December	1937	30	25
January	1938	26	22
February	1938	32	28
March	1938	33	35
April	1938	37	43
May	1938	37	44
June	1938	42	46
July	1938	46	47

According to the unadjusted index, residential building contracts have more than doubled since January, each successive month having shown a gain. Compared with the base years, the current index of building seems very low; but the years 1923-25 saw a building boom. Compared with May, 1937, the best month of the recovery period between 1932 and 1937, when the index was 52, residential building is now nearing the peak.

Between April and August last year there was a severe decline in residential building, while the trend of manufacturing was indecisive. In both indices, the seasonal adjustment obscured a downward movement that turned out to be cyclical in character, a fact particularly true in the building series. In the same way, in the first half of 1938, the seasonal adjustment in the building index blurred an upward movement that shows signs of being cyclical in character.

No Change in Trade Trends

Whether or not the present revival is cyclical and therefore likely to go on, it has not yet been reflected in the merchandise trade figures. The peak in imports came in March, 1937, when their monthly value was $307 millions. From this figure imports fell steadily to $146 millions in June, 1937, and $141 millions in July. Exports, which reached their peak in October, 1937, at $333 millions, then dropped steadily to $233 millions in June, and $228 millions in July. The export surplus in July was $87 millions, the same as in June. It is perhaps early yet to look for any decisive evidence of a change of trend in the trade figures.

It is not at all easy to say whether the recovery since June really betokens that the tide has turned. We have had a major recovery in residential building—from a very low level it is true, but the recovery has gone on for about six months. We have had a slight upturn in manufacturing, also from a very low level; it has so far continued briskly for some two months, and it materialised in mid-summer, when some falling-off in activity is normally expected. The import figures as yet show no response to these changes, although the prices of certain conspicuous imports, and notably of tin and rubber, do afford evidence of quickened demand.

Is it Recovery?

It is, perhaps, natural that the business and financial community should construe recent improvements as evidence of complete and early recovery, and that, in our extremely easy credit situation, they should discount their expectations rather generously. Nevertheless, it is important to bear in mind that so far the actual recovery, except in residential building, is recent and small. Corporate earnings and employment have not yet shown very marked signs of recovery. There has been only a small increase in payrolls and employment. The margin of profit in manufacturing is narrow; in the steel industry, for example, increased output was preceded by price cuts; and it is questionable whether the former has compensated for the latter.

In the recovery to date, no clear influence can be attributed to the spending programme, though that is not to say that it has had no influence. Many commentators, however, doubt whether the spending programme has exerted any perceptible influence yet, and expect its impact to be felt later in 1938 or even not until early 1939. The association of the upturn with the gold desterilisation of April is even more difficult to detect statistically, although one can make a plausible connection between it and the June spurt in the stock market, and thence, by psychology, with business activity. In short, one can make an almost equally convincing case by arguing that the revival was caused (a) by the natural forces of cyclical recovery, (b) by the spending programme or (c) by credit manipulation. We cannot yet give any of our questions a definite answer.

France

Calm in Paris

PARIS, September 8.—The attention of the whole country is centred on the Czechoslovakian crisis and the Nazi Congress at Nuremberg. The calling up of the reserves and the officers on leave has not caused any public panic. It is generally believed that Germany will not challenge Great Britain and that there is a large element of bluff in the measures recently taken by Berlin. On the other hand, the whole country is in agreement with the Prime Minister that, if the democracies should yield on the Czechoslovakian question as they did six months ago on the issue of the *Anschluss*, France would definitely have renounced her position as a great European Power, and there would be no hope of assured peace in the future.

The Stock Exchange, which is inundated by disquieting rumours, retains its full *sang froid*. Capital is not leaving the country; there is a cheerful tone in the public funds; and the markets tend to become firmer very quickly at the slightest sign of better news. In consequence, the franc remains steady against the pound in spite of continued financial and Treasury difficulties. It should be added, however, that the present very low level of share values and the inactivity on the Bourse which has been marked for many months may partially explain the market's apparent resistance to depressing tendencies.

Trade Union Dissension

On the other hand, many internal problems remain unsolved. The dockers dispute in Marseilles is still unsettled and the port has been put under military control. And there are a few strikes in other places. In the coal industry, however, the employers have reached an agreement with the trade union leaders to increase their output by 2,000 million tons in the period from September 1st to March 1st, which should reduce the present level of the trade deficit by some 500 million francs. This is the first application of the recent decrees drastically modifying the 40-hour week; and an increase of 6 per cent. in wages was agreed. Unfortunately, the miners declared that they were not in agreement with the step taken by their leaders, who in turn have protested against the introduction of political considerations into the question by the Communists. The conflict between the union leaders and their extremer followers may become serious.

Metal output was very disappointing in July. The number of furnaces in use fell from 80 in June to 75, compared with 101 in January and 107 in July, 1937. The production of pig iron and steel was as follows:—

	July, 1938	Average Fourth Quarter, 1937	Average First Quarter, 1938	Average Second Quarter 1938
	Tons			
Pig iron	419,000	690,000	575,000	475,000
Steel	419,000	685,000	583,000	494,000

Iron ore output was 2,583,000 tons in July, against 3,267,000 tons in January last and 3,135,000 tons in July, 1937. In the week ended August 27, 1938, the number of persons unemployed was 338,383, against 340,295 in the preceding week and 311,315 a year ago.

Better Fiscal Receipts

Fiscal receipts in July showed a slight improvement compared with those of June. But the June figures were appreciably worse than those of preceding months, as the following table shows:—

(Millions of francs)

	July, 1937	June, 1938	July, 1938
Direct taxes	685	427	815
Indirect taxes	3,185	2,864	4,170
Estate duties	20	15	24
Total (including extraordinary receipts)	4,186	3,840	5,377

Receipts during the first seven months of the year amounted to 24,780 million francs, a sum nearly up to the original Budget estimates, but 464 millions short of the revised estimates, which took into account the introduction of new taxes. The increase compared with the receipts during the first seven months of 1937 exceeds 5,000 million francs, and even taking into account increased taxation since then, this seems to indicate that some quickening of general economic activity has taken place.

Improved Foreign Trade

The August trade returns, compared with those of July, show some improvement. Exports have risen, and the import surplus is considerably below that recorded in August last year, as the following figures show:—

(In million francs)

	August, 1937	July, 1938	August, 1938
Imports:—			
Foodstuffs	781	982	933
Raw materials	1,877	2,007	2,233
Manufactured goods	519	511	472
Totals	3,178	3,501	3,709
Exports:—			
Foodstuffs	229	302	299
Raw materials	665	700	813
Manufactured goods	964	1,283	1,372
Totals	1,858	2,285	2,485
Deficit	*1,319*	*1,215*	*1,223*

Tourist receipts are very large, and with trade holding its ground, prospects for the stability of the franc are good. Moreover, wholesale prices show a renewed tendency to fall, though in part this is seasonal. The general index stood at 641 this week, against 646, 644, 644, 640 and 652 in the five preceding weeks.

Germany

Financing Industrial Enterprise

BERLIN, September 7.—The Bourse experienced a very substantial recovery last week. For the first time since June fixed-interest securities advanced appreciably. The dimensions of the fall in values during the past two months now appear only moderate. Twenty representative shares (all except two industrial and therefore sensitive), which averaged 133.24 at the beginning of July, and stood at the highest point in April at 139.46, at the end of last week averaged 123.48.

There is some cautious discussion of possible difficulties in simultaneously financing Reich and industrial enterprise. Owing to restrictions on private expansion, except when it is for Reich purposes, the two questions are really one. It seems that, if the capital market proper is inadequate, the creation of so-called capital which represents no real values will replenish the stock. If the Government, that is, cannot continue to float consolidation loans at the rate of the past three years, it will, in view of its vast expenditure, presumably be unable to restrict its new indebtedness to an amount that, in so far as it cannot be repaid promptly out of revenue, can be consolidated.

The increase of short-term debt by the new expedient of issuing delivery-certificates would—though not perhaps as conveniently as by the special bills method—make for private liquidity, now somewhat reduced. In connection with the new postal savings scheme, it is being pointed out that savings deposits substantially exceed those in savings banks proper. The full total in the middle of this year was Rm. 21,700 millions, and these, still increasing, are used to feed the Reich's funds. According to a calculation made by the Commerz-und-Privat Bank, out of the increase of Rm. 10,360 millions in all bank bond holdings since 1932, Rm. 5,774 millions were recorded by the savings banks, which at the same time increased their holdings of Reich Treasury certificates and bills.

In part, industry is still able to finance itself, but some branches have resorted to bank credit once more. Owing to the restriction of dividends, and, until recently, the saving in costs due to the high rate of activity, the internal finances of industry are strong. According to estimates published in the *Frankfurter Zeitung*, industry, by a process of writing down in excess of normal despreciation charges, has accumulated 3,000 million marks since 1932-33; and there are other hidden reserves concealed in balance sheets.

Reports about the harvests are in general satisfactory, but it has been announced that the usual official advance estimate of crops which in past years has appeared in the late summer, will not be published. The stocks of wheat and rye held over from past crops are large; and to help solve the storage problem, which is largely the consequence of heavy imports, a former ruling that mills must store minimum quantities has been reinforced. The tobacco crop amounts to about 70,000 tons, and is probably the largest since the war. The fruit crop, however, is disastrously bad.

Business Activity

Bankruptcies in August numbered 165, against 151 last year. The distribution of bankruptcies among different occupations seems to show that, according to rule in this country, State-aided industries flourish most. Engineering and building show fewer bankruptcies than last year, textiles and clothing more. Reports from Leipzig Fair were good, and there was an increased demand for goods of high quality.

Consumption of electricity in the first half of this year was 14 per cent. higher than in 1937. Railway waggon loadings in July were 5.1 per cent. higher than last year and there is congestion, aggravated by water conditions, on the canals. On September 1st some 2,173 kilometres of Reich motor roads were open for use. The Reichspost's quarterly return shows increased activity in the main departments; and a Deutsche Bank report states that business in the first half of the year increased.

According to Dr Ley there is a shortage of 3,000,000 dwellings, although 1,500,000 have been built in the past six years. This is to be made good. There is still a shortage of building materials, too, and in particular of cement; and the manufacturers of these materials are not inclined to expand their capacity, because they know that the abnormal demand for the construction of motor roads will not last.

While iron and steel output has risen continuously since 1932, the rise in the production of constructional steel ceased in 1936, and the net export this year is smaller than it was last. The official steel report for August states that home demand was extraordinarily high, and that it was hardly possible to place new orders. Export orders also increased slightly. Scrap iron imports rose. The wool agreement with South Africa, it is added, will soon be prolonged, and this will encourage manganese imports.

Exports of textile machinery this year have so far declined, but exports of machine tools have slightly increased. The proportion of alcohol in petrol has been raised from 10 to 13 per cent. A promising account of progress in synthetic fat production was given to Hamburg manufacturers by a scientific employee of the I.G. Farbenindustrie. The objective is the production of fatty acids by the oxidisation of

paraffin, a very old process for which Germany has previously lacked the necessary raw material, though six years ago the Farbenindustrie and the Standard Oil Company erected joint works in the United States. At present the import of fats costs some Rm. 400 millions a year, and of a total consumption of 1,968,000 tons a year home production supplies 48 per cent.

Bounties for Discharged Soldiers

Reich tax revenue in July totalled Rm. 1,316 millions, against Rm. 1,163 millions in July, 1937. A new law makes impressive provision for soldiers who have served long terms and qualified as non-commissioned officers, as well as officers. The right of long-term soldiers to official employment after discharge is so fully recognised that, even while waiting idle, they will draw the full salaries of officials of the rank they expect to hold. Long-service soldiers who choose private business careers will be given bounties, amounting usually to £800, but to nearly £1,000 if they take farms, and some £1,400 if the farms are near a frontier.

Money has been plentiful since the turn of the month. The September demand for the payment of taxes will be considerably increased by the recent raising of the rates of Corporation Tax. Once more, the Reichsbank return for August 31st shows an enormous expansion of credits and investments, the week's increase amounting to Rm. 866 millions, although 34 per cent. of the July-end credits remained unpaid. The circulation of all currencies is now Rm. 8,935 millions, against Rm. 7,097 millions a year ago.

Spain

Wartime Trade

Barcelona, August 21.—**In spite of the obstacles caused by the war the Customs Department has just issued figures of foreign trade up to September, 1937. These figures, in part provisional, make possible the study of the foreign trade of Government Spain during the first fifteen months of hostilities.**

The first thing revealed by the new figures is the enormously increased share of foodstuffs in Spanish imports. If we compare imports of foodstuffs during the first nine months of 1937 with those in the same period of 1935 we find an increase of 6.8 million gold pesetas—despite the fact that the 1935 figures apply to the whole of Spain and the 1937 figures only to the territory held by the Government. This can be explained by the fact that the insurgents have occupied the greater part of Castile, which has always been the granary of Spain, and the whole of Galicia, a cattle-breeding district which normally supplies the whole of Spain.

Mere figures give only a very superficial idea of the havoc wrought by the war. Large quantities of wheat are actually being exported from insurgent territory, while wheat has to be heavily imported for the needs of the area controlled by the Government. The Government is compelled, in order to alleviate the disastrous effects of the war, to exercise a strict control over all exports and imports, and succeeded during the first fifteen months of the war in keeping the surplus of imports down to 49 million gold pesetas, which is relatively small.

The trade figures are calculated according to the invoice amounts declared by exporters and importers plus freight or carriage to port or frontier station and insurance. Export values are based on domestic wholesale prices on the interior Spanish markets. All figures are expressed in gold pesetas. In the second half of 1936 (the first six months of the war) imports were valued at 124.1 million gold pesetas and exports at 122.2 millions. In the first fifteen months of the war, that is from July, 1936, to September, 1937, imports were 334.7 million gold pesetas and exports 285.9 millions. Detailed figures are as follows:—

Government Spain

	July, 1936, to September, 1937	
	Imports	Exports
	(Gold Pesetas)	
Live stock	191,407	4,954
Raw materials	97,620,454	41,195,889
Manufactures	120,405,991	50,258,085
Foodstuffs	116,439,908	192,996,306
	334,657,760	284,455,234
Gold	Nil	1,454,640
	334,657,760	285,909,874

The following are comparative figures for the first nine months of 1935, 1936 and 1937, respectively:—

Imports (Gold Pesetas)

	January to September		
	1935*	1936†	1937‡
Live stock	1,857,014	1,217,358	124,151

	398,688,407	392,711,236	163,725,593

* The whole of Spain. † The whole of Spain until mid-July, Government Spain thereafter. ‡ Government Spain only.

Imports from Great Britain fell from 63 million gold pesetas in the first nine months of 1935 to about 21 millions in the same period of 1937; but exports only fell from 80 millions to 57 millions. Investigating the reasons for the sharp decline in British exports to Spain, we find that shipments of machinery, tools, electric appliances and motor cars declined from about 25 million gold pesetas in twelve months of 1935 to 4 millions in fifteen months from July, 1936, to September, 1937; chemicals down from nearly 9 millions to 3.6 millions, and textiles from 2.7 millions to less than 300,000. The only increase was in Spanish imports of British foodstuffs, which rose from 3.2 million gold pesetas in the calendar year 1935 to 7.1 millions in the first fifteen months of the war. There was a remarkable increase in Australian sales to Spain, again explained by the high figure for foodstuffs, which jumped up from 123,193 gold pesetas in 1936 to 4.6 millions in only nine months of last year.

In trade with France, compared with nine months of the normal year 1935, imports last year fell only 21 per cent. and exports 15 per cent.; and there was an export surplus of about 8 million gold pesetas. Purchases of machinery, motor cars, oil and raw cotton from the United States have fallen to something like a fifth of their normal volume, and Soviet Russia has become a serious competitor to the United States in oil and cotton.

Imports from Russia

Formerly Russian sales to Spain consisted almost exclusively of petroleum and its by-products. During the war the position has changed. Imports from Russia between January and September, 1935, totalled about 9 million gold pesetas. During the first nine months of 1937 they jumped up to 25.5 millions, of which 13.8 millions represented petroleum and its by-products, 8.3 millions raw cotton, 1.6 millions chemicals and 1.7 millions foodstuffs. Spanish exports to Russia have increased relatively even more. From only 85,000 pesetas during nine months of 1935 they rose to 7.8 millions in nine months of 1937, of which 3.7 millions was accounted for by sales of metals and metal goods. Negotiations are now pending for the export of large quantities of Catalan textiles to Russia.

Imports of petroleum from Roumania in the first nine months of last year amounted to 7 million pesetas; and one of the few countries which, like Russia, has been able to increase its trade with Spain is Belgium, which sent eggs, condensed milk and dried vegetables to the value of 15 million pesetas in the first nine months of 1937. Similarly, imports from Holland and from the agrarian countries, Bulgaria and Poland, have increased very considerably; and of imports from Argentina in the nine months, amounting to 16.7 million gold pesetas, nearly 16 millions were accounted for by foodstuffs, and in particular frozen meat and corned beef. Oddly enough, both Germany and Italy are still doing business on a small scale with Government Spain.

Turkey

Diplomacy and Industrialisation

Istanbul, August 18.—The improvement in the relations between Bulgaria and the members of the Balkan Entente as a result of the Salonika agreement and the settlement of the Turco-French dispute over the Hatay has considerably cleared the political horizon. Turkish troops are now in the Hatay, and Adrianople will once more be garrisoned.

Extensive manœuvres in the South-Eastern corner of Anatolia, now officially called Dersin, have been arranged, with the object of suppressing the resistance still offered by Kurdish feudalism to the establishment of regular administration, and the building of roads, bridges and schools. At the same time, the industrialisation of Western and Central Turkey is proceeding at an accelerated pace, partly with British financial aid. The developments include large-scale exploitation of the coalfields, the building of an up-to-date port at Tshatal Agzi, the modernisation of harbours at Eregli and Trebizond, and the use of water power to generate electricity and save coal for export. The system of State monopoly is being extended and existing private enterprises are being bought by the Government.

There are difficulties in the way of securing a regular supply of skilled labour. At Istanbul, for instance, one factory employing five hundred workmen loses fifty men every month when they go back to their homes, and has to replace them with untrained workers. The problem is still more acute in the coal fields, where the miners work only sporadically, returning to their villages for sowing or harvest.

Large Import Surplus

Official trade returns for the first four months of 1938 show exports to the value of £T42,031,000, which is only a little below the record total of the corresponding period last year. Imports rose sharply to £T47,994,000, compared with £T29,255,000 last year, the previous highest figure. Thus there was an import surplus of £T5,963,000, which was in striking contrast to the export surplus of £T15,254,000 recorded at the end of April, 1937.

As usual, Germany ranked first in Turkey's foreign trade, taking 36.7 per cent. of Turkish exports and supplying 40.8 per cent. of Turkish imports. Germany's share, however, has fallen. Italy came second among Turkey's customers with 19 per cent. of her exports, while Czechoslovakia took 6.7 per cent. and Great Britain, ranking sixth, 4.1 per cent. Among exporters to Turkey, Great Britain, with 10 per cent. of her imports, was third at the end of April, after Germany and the United States.

Clearing Debts

There is a shortage of foreign exchange; and Turkey's indebtedness in various clearing accounts has increased. At the end of 1937 clearing debts amounted to £T71,995,163, against which must be set off Turkish funds blocked abroad (mainly in Germany) to the value of £T16,615,400, leaving a net debit of £T55,379,763. At the end of July last gross indebtedness on clearing account had risen to £T66,372,450, against only £T2,959,900 blocked abroad, making a net debit of £T63,412,550, an increase of about eight millions.

In view of the clearing position, the new Turco-German agreement has been warmly welcomed by Turkish exporters. But, however advantageous the prospect of selling goods to Germany at levels much higher than world prices may seem to the trading community, it is likely to keep Turkish trade in the old rut and make Turkey more than ever dependent on German economic policy.

Japan

Increasing Control of Industry

Tokio, August 10.—War-time control is being extended to a wider field, and the consumption of essential commodities is more and more rigidly regulated. The use of such things as copper and leather for other than military purposes has now been almost entirely prohibited by successive decrees. As a consequence of these regulations, many industrialists are obliged to curtail their operations radically or even to close their factories, and a number of employees are thrown out of work. The total number of unemployed in the controlled trades is estimated at over one million, the textile trade alone accounting for more than one-third of this figure.

To meet the situation, the Government is making efforts to encourage the switch-over of business to munitions, export, or substitute industries; to give aid to the training of the unemployed for new undertakings; and to find vacant jobs for displaced workers. The matter is not, however, so serious as it appears, for a shortage of labour is acute in the munitions and other ancillary trades, and labour shortage is also being felt in rural districts, where cotton mill workers, for instance, can readily return.

Foreign Exchange Fund

The export trade is increasingly suffering from a shortage of raw materials, primarily owing to exchange difficulties. To facilitate a liberal supply of necessary materials for export industries, the Government has now caused the Bank of Japan to release 300 million yen of gold from its specie reserve and to create a revolving foreign exchange fund at the bank. The fund is to be used principally for imports of raw materials needed for export industries, including, among others, raw cotton and wool. Those allowed to utilise the fund must within a certain period make refunds to the Account with the proceeds of export bills. At the same time, to ensure the effective working of the fund, all surplus sums at the exchange banks are to be concentrated in the central bank.

The gold transferred to the new Foreign Exchange Fund will be shipped abroad within a few months. The decrease in the bank's gold holding will not adversely affect the currency situation, for the bank still holds over 500 million yen of gold in its reserve, which is technically adequate to back the current note issue, the fiduciary issue having been raised to 1,700 million yen in April last year and the average monthly note circulation in recent months being 1,800 million yen. There is thus an ample margin of some 400 million yen.

Slackening Foreign Trade

Despite the continued unfavourable trend in foreign trade, the heavy export season has begun normally this year. Imports in July amounted in value to 208.8 million yen and exports to 211.2 million yen, showing an export surplus of 2.4 million yen. Compared with July, 1937, however, imports decreased by 150.5 million yen (41.9 per cent.) and exports fell by 71 million yen (25.2 per cent.). Raw cotton and wool still account for more than one-third of the decline in imports, though crude rubber and wood pulp continue to show notable decreases. Possibly except timber and machinery, all staple exports show considerable shrinkages, particularly cotton piece-goods and raw silk.

The Bank of Japan's index number of wholesale prices for July remained unchanged at 141.3 (1933 = 100), which is 6.5 per cent. higher than a year ago. The increases in textile prices are offset by the decline in the prices of metals and building materials. Apparently owing to Government price policy in fixing maxima on a wide range of goods a more hesitant feeling has developed in many of the commodity markets.

Better Feeling in Congress

Buenos Aires, August 27.—The political situation is very quiet, but important changes appear to be taking place below the surface. The expected reconciliation of President Ortiz with the Left, and with the Radicals in particular, is now becoming perceptible. The new administration's early cessation of the deportations of foreign industrial agitators to the land of their origin (in most cases Italy) has allayed a good deal of indignation, and a good impression was made by Presidential warnings to the provincial governments against constitutional irregularities. Friendly meetings of former antagonists seem to confirm the trend. Most important of all, there is a new spirit of co-operation visible in Congress, but the policy of conciliation has inevitably created some cleavages. Political divisions among the parties of the Right are appearing in the provinces and the moderate groups seem to be gaining ground.

Adverse Balance of Payments

It is a pity that in this atmosphere of political toleration the immediate economic outlook should give so little encouragement. To the partial failure of the country's most important crops has been added a fall in commodity prices. At the beginning of the year the price of wheat in Buenos Aires was about 12 pesos for 100 kilos; now it is little more than 7 pesos. The slump in exports which began a year ago has continued, and despite the corresponding decline of imports which has now set in, each month is recording a heavy adverse balance of payments. Although imports in July last were 114,381,836 pesos compared with 149,536,067 pesos in July, 1937, exports fell even further, being 107,640,595 pesos last July against 155,932,952 pesos in July, 1937, showing an import surplus of 6,741,241 pesos last month against an export surplus of 6,396,885 pesos in July, 1937. The import surplus for the first seven months of the year amounts to 41,509,358 pesos. Since payment for invisible imports requires an export surplus of about 500 million pesos annually, this makes a liberal policy difficult. In local industrial circles there are demands for further protective duties in the guise of anti-dumping legislation; and with the spectre of unemployment reappearing the Government has found it necessary to restict immigration drastically.

All the chief British-owned railways, except the Buenos Aires Great Southern (whose wheat zone is too far south to have suffered badly from the late frosts of last October and November) show big falls in traffic receipts, and a sharp rise in the price of coal from South Wales to the River Plate owing to lack of Argentine exports to provide homeward cargo, is another blow.

The decline in exports during the last twelve months is gradually being reflected in every sphere of economic activity, and with the present world glut of wheat there is little probability of an improvement coming through an early rise in cereal prices.

On August 23rd and 24th, the Chamber of Deputies debated and voted the bill providing for the rebuilding by the State of the Argentine Trans-Andine Railway at a maximum cost of 5,614,489 pesos and the purchase of the line by the State at £750,000 (8,625,500 pesos, 11.5 par exchange). On August 25th, the Chamber began debating the bill for the State purchase of the Córdoba Central Railway.

Letters to the Editor

Expanding the Credit Base

TO THE EDITOR OF THE ECONOMIST

Sir,—In your interesting article of August 20th, in which you discuss proposals that I have recently been making, you distribute the emphasis in a way which goes far to emasculate them. Assuming that the primary move is an enlargement of the cash base, you correctly show from past experience that a corresponding increase of the clearing banks' investments cannot be expected to occur automatically, still less an appreciable fall in the gilt-edged yield. There are a number of variables which we should have to assume constant.

My proposal, on the contrary, is that we should take an increase of the clearing banks' investments as one primary and explicit objective, and adapt our action with regard to the cash base and Treasury Bill policy in the way best fitted to secure that objective. This is very different from expanding the cash base and then simply hoping for the best.

I visualise a conference between the Treasury, the Bank of England and the clearing banks. It would there be explained that, in view of the trade recession, it seemed expedient in the national interest that the clearing banks should increase their holding of investments by some amount between, say, £100 millions and £300 millions with the object of influencing the long-term capital market. The precise figures might well be determined in the course of the experiment. The clearing banks would then explain what expansion in the cash base and in the quantity of other liquid assets available for this purchase would enable them to go forward.

Nor need the discussion end there. Even in the sphere of investments, the clearing banks might, if consulting their own immediate interests only, be biassed too much in favour of liquidity. The further purpose being to reduce the long-term gilt-edged rate, and the ultimate purpose to stimulate new issues, the choice among suitable investments should be guided by that, having regard to the way in which the market is normally influenced by the date of maturities and the net yields of stock, taking capital depreciation into account.

I do not think that this project need involve any sacrifice of legitimate banking independence. I take it that there must have been informal negotiations of some kind before Mr Chamberlain launched his great conversion scheme. Each bank would be absolutely free at the conference to define the limits within which it deemed co-operation to be consistent with its shareholders' and depositors' interests. It is to be hoped that the co-operation that could be secured on this basis would be sufficient.

I am, etc.,
R. F. Harrod.

Christ Church,
Oxford.

The Trade Cycle

TO THE EDITOR OF THE ECONOMIST

Sir,—We all have taken due note of the important results of Sir William Beveridge's trade cycle research announced to the British Association at Cambridge. More people than the small group of historians of economic thought may want to speculate on the fact that it was exactly 60 years ago, in 1878, at a meeting of that same British Association, that W. S. Jevons read a paper on "The Periodicity of Economic Crises and its Physical Explanation." In this paper he pronounced in support of the view that "the secret of good trade in Lancashire is the low price of rice and other grain in India":—

> Here again some may jest at the folly of those who theorise about such incongruous things as the cotton mills of Manchester and the paddy-fields of Hindostan. But to those who look a little below the surface the connection is obvious. Cheapness of food leaves the poor Hindoo ryot a small margin of earnings, which he can spend on new clothes; and a small margin multiplied by the vast population of British India, not to mention China, produces a marked change in the demand for Lancashire goods.

"Thus it is likely that crises may have an independent meteorological origin in the semi-tropical States of the Union." (Compare with this Sir William Beveridge's findings on the two critical seasons coinciding with the harvests of the Southern and Northern hemispheres!)

> But whatever be the area of the tropical and semi-tropical regions from which the decennial impulse comes, mainly India and China, no doubt, it does not follow that the extent of the commercial mania or crisis here is bounded by the variation of the foreign trade. The impulse from abroad is like the match which fires the inflammable spirits of the speculative classes.

One wonders what the feelings of that much-ridiculed sun-spot fanatic—whose spirit was surely present in Cambridge—must have been when, after 60 years, his view was vindicated, that the subject of the connections between harvest cycles and trade cycles is—

> full of important and mysterious facts, which stimulate the interest of the enquirer in a high degree. At the same time it is plain that sound conclusions can be reached only by most extensive analyses and comparisons of large series of facts.

I am, Sir,
Yours faithfully,
H. W. Singer.

University of Manchester.

Books and Publications

Soviet Shops and Shoppers

Two years ago Mr Hubbard published "Soviet Money and Finance," in which the Soviet planned economy was described in sufficiently broad outline to make intelligible reading for the layman. Indeed, there is no really reliable substitute for it in the English language. He has now followed it up with a book on trade and distribution in the Soviet Union*; and this time his exposition is hardly so successful.

In the field of distribution, the Soviet economy has passed through several stages during the last ten years. Each has involved drastic changes in the country's institutional structure. At first, private, State and co-operative trading existed side by side. Then came the period of the first Five Year Plan and the first half of the second, when a gigantic programme of capital investment, combined with revolutionary changes in agriculture, made the rationing of almost all consumption goods absolutely necessary. At the same time, private trading was completely crushed; and distribution, including the consumers' co-operative movement, became little more than a network of State selling agencies.

Retail trading outlets consisted, apart from a few large semi-autonomous department stores, either of "closed" shops, co-operative shops, or "commercial" shops. The closed shops were run by factory managements for their employees, or by separate bodies for special categories of the population, such as Red Army men, G.P.U. officials or Government functionaries. Most of the urban population were, in addition, obliged to be members of co-operative societies. This tying of the individual to specific shops enabled the managers of shops to know exactly how much of each commodity was needed to supply the legal needs of his clientele at fixed ration prices, and the consumer was virtually obliged to take anything which happened to be for sale, which was very little. There were also a few so-called "commercial" shops where all kinds of goods were sold, but at enormously high prices, determined by supply and demand. Money incomes were rising fast, though ration prices remained relatively fixed, and there was a gradual increase in the use of commercial shops as outlets for surplus income. The gradual removal of goods from the ration lists, as the supply increased during the second Five Year Plan, had the effect of transforming all retail trade into commercial trade. The new period of trading dates from the beginning of 1936, and the planning problems to which it has given rise are by no means yet solved.

The new problem which has arisen is how to plan the production of goods for the future when demand is no longer predictable, and when consumers are free to move from shop to shop and to vary their requirements. At present, the most important instrument of planned distribution is the turnover tax, from which the Government gets most of its revenue and by which it largely controls the prices paid by consumers. Mr Hubbard's new book describes in great detail the many wholesale and retail institutions and the changes through which they have passed; and he devotes a good deal of attention to the co-operative movement, which controls trade in the country villages.

He endeavours to assess the economic status of the peasantry and the urban workers, and to compare their living standards with those of previous periods. He estimates that the peasant is probably worse off now than in 1913 and the urban worker scarcely any better off than in 1928, before the beginning of the first Five Year Plan. His inquiry is confined to an examination of money wages, changes in the purchasing power of the rouble and the actual output of primary consumption goods. By these standards alone his reasoning seems to be fairly sound.

On the other hand, Mr Hubbard ignores a great deal, and passes over many things very lightly. In particular, he makes no allowance for the extent to which wants are now satisfied collectively, and thus gives the impression that the Soviet citizen satisfies all his wants through the retail shops. Communal kitchens, factory restaurants, club canteens, and restaurants in Russian living standards. So, too, is the enormous expansion in the provision of public amenities, parks, amusements, theatres, cinemas, sports grounds, hospitals, crèches, baths, etc., to say nothing of general and technical education.

In the last part of the book Mr Hubbard tries, on not very adequate grounds, to establish a most destructive criticism of the entire Soviet revolution. But his exposition of the actual struggles and conflicts in the Soviet Union during the last twenty years is much inferior to the more straightforward descriptive sections of the book. Altogether, this may be a standard work on its subject, but it is a sour treatise, none the less.

* "Soviet Trade and Distribution," By L. E. Hubbard. Macmillan. 381 pages. 12s. 6d.

Shorter Notices

"The Theory and Measurement of Demand." By Henry Schultz. University of Chicago Press. (Cambridge University Press.) 817 pages. 34s.

This is no book for the general reader; but the expert mathematical economist who appreciates the need to keep even the most abstruse findings of his theory close to the actual facts of the market-place will find it unique and invaluable. A mathematical theory of exchange and demand (which will not perhaps find unanimous favour) having been meticulously stated, the statistical data of observed movements in the prices of some fifteen articles (foodstuffs and raw materials) are correlated and presented according to the formulæ arrived at in the theoretical chapters; "the shapes, elasticities and time shifts of their demand curves" are determined and shown. The result is a remarkable synthesis of economic logic, factual research, statistical technique and mathematical virtuosity, leading up to a theory of the interrelations between the demand for different commodities, which is again checked statistically by the facts. Professor Schultz finds time to discuss the New Deal and to examine consumers' behaviour. Only the skilled and erudite will be able to read this book properly; but they will surely mark and learn its method and findings with great profit.

"The Machinery of Socialist Planning." By G. D. H. Cole. The Hogarth Press. 80 pages. 2s. 6d.

Prepared by Mr Cole for consideration by the New Fabian Research Bureau, this very practical little book is concerned with means rather than ends. The next Socialist Government will come into office with a plan of action; it will find the existing machinery of government already to hand. Mr Cole's object is to show how this machinery could be adapted to the purposes of Labour's plan with the minimum of drastic alteration. In a sense, the theme is simply reform of the administration; and, politically, the technique is that of the thin end of the wedge. In Mr Cole's bird's-eye view, the crucially important question of planning the use of the land and the growth of towns is almost lost from sight, but as a hand-book for optimistic Labour politicians, this book is well and shrewdly devised.

Books Received

The Theory of Prices. Vol. I. Arthur W. Marget. 624 pages. This book, published in the United States by Messrs Prentice Hall and reviewed in these columns on September 3rd (page 455), will be published in this country on September 14th by P. S. King and Son, Ltd., and the price will be 18s.

International Raw Materials Cartels. By W. Oualid. (Paris). League of Nations, International Institute for Intellectual Co-operation. 54 pages. No price stated.

Foreign Bonds. Compiled by Anglo-Continental Exchange, Limited. This is the July, 1938, issue of a list to be published quarterly, setting out the chief particulars (analysed by country of issue) of all loans floated outside the issuing country.

The Theory and Measurement of Demand. By H. Schultz. 817 pages. 35s.

Don't Pay Taxes. "Personacrat." The Committee for Equal Opportunity (New York). 141 pages. $2.00.

THE BUSINESS WORLD

Measuring Company Earnings—I

Profit Trends and the Investor

MODERN developments in the security markets are tending increasingly to emphasise the importance of long-term as distinct from short-term investment. Except in relatively brief periods of boom on the Stock Exchange, serious investors prefer to leave the making of quick "in-and-out" profits to specialists in that hazardous art. They are concerned rather to build up a well balanced portfolio of sound stocks which, over a reasonable period of time, is likely to combine satisfactory annual income with limited but durable capital appreciation. The progress of the unit trust movement affords striking testimony to the extent of this desire among private investors. But the trusts are only one of many institutions which employ diversified holdings of stocks and shares as a backing for long-term financial contracts.

In *The Economist* of July 16th last (page 126) we showed that, between 1925 and 1937, some thirty-eight of the leading British insurance companies had increased the proportion of their total assets held in the form of Stock Exchange securities (other than those of the British Government) from 33.8 to 50.0 per cent. Investment trusts of the older type are being compelled, by the pressure of international events, to divert a growing share of their resources from foreign bonds to domestic industrial stocks. The free reserves of big commercial companies are frequently invested in many of the leading market equities, as well as in gilt-edged. And the number of private trusts whose terms authorise investment in a wider range of securities than those in the official trustee list is steadily increasing.

The indispensable corollary of such a tendency is the development of a convenient, reliable and scientifically sound technique for assessing the long-term prospects of securities whose investment merits, whether they be debentures, preference or ordinary shares, are ultimately a function of industrial earnings. To an investor who intends, if all is well, to hold a share for ten years or more, the statement that the "yield," based on the last dividend and the current market price, is *x* per cent. has no meaning unless it is related to past profits and probable earnings to come. Even three-year comparisons of a company's results (which, for reasons of space, are all that can be given in a normal Press review) show only a small, and possibly unrepresentative segment of its recent history. Profits (or losses) are the outcome of continuous industrial operations. The prelude to any substantial purchase of industrial shares should obviously be a study of their fluctuations during a period long enough to include at least a complete trade cycle. The only satisfactory working substitute, in other words, for prophetic vision of a company's earnings in the next decade is a dispassionately critical review of its achievements in the last.

We propose, in this and a succeeding article, to describe certain tests which may serve as a foundation for the more detailed analyses which should precede investment in equities. We may suppose that we are a unit trust group, considering what stocks we shall include in a new portfolio; or a broker whose client has asked for a diversified list of recommendations for the investment of several thousand pounds; or a trustee of funds held for a minor who comes of age in ten to fifteen years' time. We are considering the merits of the following list of companies, each of which is an acknowledged market leader:—

Imperial Tobacco; Midland Bank; Alliance Assurance; J. Lyons; Watney, Combe Reid; Courtaulds; J. and P. Coats; London and North Eastern Railway; Vickers; "Shell" Transport and Trading; North-Eastern Electric; Staveley; Imperial Chemical Industries; and Crompton, Parkinson.

Here, certainly, we have a wide "spread" of industrial risks, and the companies are all big and well established. How can we test the "road performance," as it were, of so many different makes of financial cars? Let us take net earnings after expenses and overhead charges (but before debenture service and dividends) as our lowest common denominator of past achievement, and ten years as our minimum period of observation. We shall then obtain the figures shown in the table below.

From the table as it stands, obviously, only the broadest conclusions can be drawn. Most of the companies had declining profits in the earlier and rising earnings in the later years. Nine of the fourteen concerns registered higher

(f) After loan interest, but before sinking fund. (g) First four returns relate to 14 months to June 30, 1928; years to June 30, 1929 and 1930; and 15 months to September 30, 1931. Remaining figures show 12 months to June 30, in all cases.

profits in the last than in the first year shown. But no exercise of "judgment," based on cursory examination of a mass of figures of varying orders of magnitude, will give a satisfactory impression of the extent and significance of intermediate movements and the relative progress or recession of one company's earnings in comparison with another's. Professional statisticians in every branch of economic activity, however, are familiar with numerous methods of scientific measurement of data collected in "series" as these are. The simplest methods demand no special mathematical knowledge. They can be readily employed by the average investor, to yield surprisingly informative results.

For example, the average annual profits of Imperial Tobacco, in the five years 1928-32, were £9,603,000. For the quinquennium 1929-33 they were £9,252,000; for 1930-34, £9,177,000, and so on. If we calculate five-year moving averages on these lines, for all the fourteen companies, and equate the figures for the initial quinquennium, in each case, to 100, we obtain the following results:—

TREND OF PROFITS

(Five-year moving averages; earliest quinquennium = 100)

* To March 31 of succeeding year, throughout. † To June 30 of succeeding year.

The effect of a moving average is to smooth out intermediate fluctuations, while equation to 100 provides a common basis for measuring proportionate movements in earnings. The resulting figures show the trend of profits—the general direction in which earning-power has moved and, presumably, will continue to move, in the absence of any decisive change in underlying conditions. It is evident at a glance that our selection is decidedly a mixed bag, whose constituents fall into at least three groups (indicated by varying types of print in our table). Imperial Tobacco, Midland Bank, Alliance Assurance, J. Lyons and Watney are distinguished pre-eminently by the stability of their earnings. Their profits curve is relatively flat, and their shares, consequently, appeal most to the conservative type of investor who puts a gilt-edged type of security before prospects of substantial future capital appreciation. Courtaulds and L.N.E.R., on the other hand, reveal a retrogressive trend, on the whole, with a tendency towards a recovery in the latest period, while J. and P. Coats' profits have a downward trend throughout. Both Vickers and "Shell" were affected by the world depression, but their trend, on the whole, appears to be definitely progressive. The earnings of N.E. Electric, Staveley, I.C.I. and Crompton, Parkinson have followed more or less consistently a rising trend during the entire period, while Crompton, Parkinson is that *rara avis*—a company with "geometric" profits.

It may be worth an investor's while, clearly, to ascertain into which of these groups a given company falls before undertaking an extensive transaction in its shares. He may consider it reasonable, further, to pay a higher price (i.e. to accept a lower immediate income yield) for a share with an apparently rising trend than for one whose trend is stationary or declining. He cannot, however, entirely ignore the question of intermediate fluctuations, above or below the trend line, for reasons which will be discussed in a succeeding article.

A European Coal Cartel?

THE difficulties of coal mining are those of most raw material industries. Demand is subject to wide fluctuations which tend to make for instability of production, employment and prices. But, in contrast to many other raw materials, the secular upward trend of the demand for coal has become much less strong since the War, partly owing to the tendency to use it more economically, partly through the competition of water and oil as sources of power. Thus, in 1937, when the industrial activity of the world was greater than in 1929, the output of coal was barely as large. In addition, the efforts of former coal importing countries to render themselves less dependent on foreign supplies by developing their own sources of power have led to a reduction in coal exports, even in proportion to total production. World exports of coal in 1936, for example, represented only 9.0 per cent. of the total production, against 11.7 per cent. in 1929. Another factor which renders the coal problem more difficult than those of other raw materials is that coal is produced mainly in industrially advanced countries where wages, which form a very substantial proportion of the price, are both higher and less flexible than in countries engaged mainly in the production of raw materials. The competition for export markets, however, has in recent years exerted an almost continuous downward pressure on prices, which has inevitably been transmitted to wages.

The belief has long been widely held that these difficulties might be mitigated by an international agreement on working hours, and by a division of export markets and price control. Labour has been interested in the conclusion of an agreement designed to secure an improvement in the standard of living of coal-miners, while the coal owners have been attracted by the idea of marketing agreements and price control. As long ago as 1927 a committee of the League of Nations, composed of representatives of producers, consumers and workers, began to investigate the possibility of an international coal agreement. A few years later the British Labour Government, anxious to secure an improvement in the standard of living of the miners, made preparations for discussions between the leading coal exporting countries. Again, in June, 1933, the World Monetary and Economic Conference recommended that a meeting of the main coal producing and consuming countries should be convened within six months if the negotiations under the auspices of the League should be abortive. Since then, however, hardly any progress has been made. The International Labour Office has spent

WILLS & TRUSTS

In acting as an executor or trustee, the Westminster Bank aims at putting itself in the position of a private trustee. It is therefore its practice to employ the family solicitor, if there is one, or any other solicitor the client may name; by such means the Bank succeeds in combining domestic tradition with business efficiency. A book showing the advantages of corporate executorship and the terms of appointment may be had at any branch

WESTMINSTER BANK LIMITED

Also in Piccadilly, Bristol, Liverpool, and Manchester

much time in drawing up an international convention for reducing the number of hours worked in coal mines and in urging its ratification, but without success.

Although all previous efforts to secure an international convention have so far been fruitless, negotiations have recently been revived. At the end of July representatives of the coal mining industry in Belgium, Czechoslovakia, France, Germany, Holland, Poland and the United Kingdom—the countries which are responsible for about 75 per cent. of the world's total exports—met at The Hague in order to explore further the possibilities of an international marketing agreement. The Conference decided to sound the various Governments and national organisations and to hold a further meeting towards the end of September. Meanwhile, it may be of interest to examine the position in the export markets of the seven prospective cartel countries: —

COAL EXPORTS OF PROSPECTIVE CARTEL COUNTRIES

* First half, provisionally. † Since 1935, including the Saar.
‡ Including bunker coal. § Excluding the Saar.

Aggregate exports in 1937 were only 101.8 million tons, against 114.2 millions in 1929 and 120.6 millions in 1913. The most striking fact, however, is the severe decline in the United Kingdom's share of total exports, from 61.9 per cent. in 1913, to 53.6 per cent. in 1929, and 40.3 per cent. in 1937. The relative decline in British exports since 1932 has been almost entirely due to the increase in Germany's exports. Poland's share of total exports last year was slightly smaller than in 1929, but that of the smaller countries—Belgium-Luxemburg, Holland, Czechoslovakia —showed a slight increase.

As the next table shows, Britain's efforts to maintain her position in foreign markets by the conclusion of a series of agreements have merely altered the distribution of exports without preventing the decline in her share of total shipments: —

* Excluding Eire. † Seven months. ‡ Excluding Latvia and Estonia.

In recent years Britain secured a preferential position in a number of countries. Thus, under the agreements concluded with Scandinavian countries in 1933, Denmark undertook to take 80 per cent. of her imports of coal from this country, Finland 75 per cent., Norway 70 per cent. and Sweden 47 per cent. Similar agreements were concluded with Latvia, Estonia, Iceland, Germany, Eire, Argentina and, more recently, with Italy, and the British coal industry has also obtained preferential treatment in the Dominions under the Ottawa Agreements. In addition, an agreement was concluded with Poland—the most important competitor after Germany—which provided for a fixed relationship between the exports of the two countries from January, 1935. The agreement, however, was altered last January, Polish exports now being related not to those of the United Kingdom alone, but to those of the five principal European exporting countries.

The relative decline of Britain's share of world coal exports is due, in the main, to the fact that the margin by which the export price of British coal exceeds that of foreign coal is often larger than can be bridged by the comparatively higher quality of the former. It is difficult, however, to calculate precisely how far this divergence of prices is due to higher costs in Britain and how far to subsidies in other exporting countries. Coal exports are fostered by direct and indirect subsidies in no fewer than nine countries, some of which are anxious to obtain foreign currency, while others are intent on maintaining production at as high a level as possible. Germany subsidises her export trade by direct allowances derived from a general levy, by special freight rates, and by blocked mark discounts. Belgium grants direct export subsidies coupled with low freight rates. Poland grants special freight rates and, in addition, has concluded quota agreements with a number of importing countries. Forty per cent. of Holland's exports consist of coal from State mines, any losses being borne by the Treasury. Changes in the average export and pit-head prices of the seven countries between 1929 and 1936 are shown below: —

AVERAGE PRICES OF COAL PER METRIC TON

	Export price f.o.b.		Percentage fall in price (in domestic currency) between 1929 and 1936	
	1929	1936	Pit-head price	Export price f.o.b.
	s. d.*	s. d.*	%	%

* Converted at average rate of exchange. † 1935.
‡ Fall between 1929 and 1935. § Increase.

While comparison is rendered difficult by the changes in the composition of exports, in transport charges, and in the exchange relationships, the fall in export prices exceeded that in pit-head prices in Germany, Czechoslovakia and Poland, and was smaller in Belgium, France and Holland. In Germany, average export prices in 1936 were actually lower than pit-head prices. In Britain, on the other hand, both pit-head and export prices in 1936 were higher than in 1929.

At first sight, the prospects for the early conclusion of a European export cartel do not seem promising. The major difficulty is likely to be the respective quotas acceptable to Germany and this country. Is the industry in this country likely to accept permanently its reduced share of total exports? Supposing it did, is Germany even now prepared to be satisfied with her present share or is she intent upon increasing it still further at the expense of this country? In the long run it would seem to be to Germany's advantage to abandon, or reduce, her subsidies if she can be assured of a reasonable export quota and higher prices per ton. An insistence on her present policy, which has already prompted British coal-owners to demand an export subsidy, will only further diminish returns all round. Even if the seven prospective cartel countries could agree on the distribution of quotas it would probably be difficult for them—and this is all to the good—to impose upon the consumers in importing countries for any length of time; for an unreasonable advance in prices would not only stimulate exports from other countries, especially the United States, the U.S.S.R., Turkey, South Africa and Indo-China, but it would lead to an intensification of the development of the power resources in importing countries.

Thus coal is faced, internationally as well as nationally, with the familiar problems of excess capacity to supply a shrinking market. It is no easy task, in these circumstances, to hold destructive competition in check. It is in the general interest, however, that the effort should be made and adequately supported. It is certainly in the interest of coal consumers and taxpayers in the great coal-mining countries, for if an industry that is already impoverished is forced to sell its exports at a loss, the burden will inevitably fall upon the domestic market or upon the State.

The Pound and the Dollar

THE decline of the pound sterling, for the first time since the conclusion of the Tripartite Agreement, to a figure below the traditional parity with the dollar has naturally aroused interest all over the world. But there should be no mystery about its causes. It is due to a general exodus of capital from Europe to the United States, inspired by very natural political fears, and, as we show in a Financial Note, all the leading "free" European currencies are affected, with the single exception of the belga. Nevertheless, $4.86\frac{3}{8}$ had so generally been regarded as the Rubicon, that its crossing at once requires a new consideration of future monetary policy.

The old parity was regarded as the Rubicon because of the widespread belief that American opinion, and the Administration at Washington, would take very unkindly to any fall of sterling below this point. But this belief has proved to be mistaken. It has been declared in Washington that no particular merit is ascribed to the old parity, and that the present fall of sterling is not regarded as a competitive depreciation, which would constitute a breach of the Tripartite Agreement. No other view would, indeed, have been tenable. The pound's lapse is due to political events beyond our control; the great bulk of the sales of sterling has not come from British sources; and, so far from encouraging the decline, the British authorities have done their best to retard it. More than that they could not have done, for the recent pressure on the pound has been well-nigh irresistible. The statement of American policy has been of value, even though it has had only the negative virtue of removing what was thought to be a fixed point in an increasingly fluid situation. But even the certainty of uncertainty may be said to clear the air.

It must not be thought that the weakness of sterling is entirely due to capital movements. The pound is also weak for ordinary commercial reasons. A full consideration of the available evidence must be reserved for another occasion; but it can be said that it points strongly in one direction: namely, that the pound has for some time been over-valued in terms of the dollar. If it is true to say that the immediate result of the Tripartite Agreement and the franc devaluation of October, 1936, was to establish a fair degree of equilibrium round the pound-dollar-franc triangle, then subsequent exchange and price movements in the three countries have over-valued the pound against both the other currencies. It has indeed been over-valued against the dollar ever since American prices began to fall in the autumn of 1937. As a long-term view, therefore, and quite apart from the immediate pressure on the pound, $4.86\frac{3}{8}$ has ceased to be an appropriate rate. On this argument, the pound's decline below that rate is not competitive depreciation, but quite the reverse.

It is difficult—and unnecessary—to carry the argument to the logical conclusion of indicating what would be the appropriate rate. But London and Washington are certainly correct in their view that the rate of $4.86\frac{3}{8}$ no longer possesses any particular merit. The more important task to-day is to consider our exchange policy and also our ability to carry it out. The dangers of an uncontrolled fall of sterling are fully realised. A sudden collapse might disturb American public opinion at a time when the Anglo-American Trade Agreement is believed to be on the point of signature. It might also cause misgivings throughout the sterling area, and would certainly be a fresh cause of unsettlement in a world which is already in a nervous condition. It might, indeed, encourage still further the general desire to hold dollars or gold. For all these reasons the British authorities have made their efforts to retard and smooth out the decline, whether by encouraging arbitrage sales of dollars against gold purchases in London, or by direct sales of gold by the British to the American Control. At the cost of a steady sacrifice of part of the British gold reserves, a possible rout has been turned into an orderly retreat. This indeed is the declared function of the Exchange Equalisation Account.

The immediate question is how long we can stay the course. Last March our total gold reserves were £835 millions, at 140s. per fine ounce. Since then there has been the May repatriation of funds and gold to France, and, as off-setting influences, the August weakness of the franc and the normal influx into London of newly-mined gold. During August, however, the gold efflux to the United States was already beginning. The weekly returns of physical imports and exports of gold bullion for the five weeks to August 25th—that is, prior to the period of acute pressure—showed the following result: —

	£ million
Imports	11·6
Exports	22·5
of which to U.S.A.	14·8
Export surplus	10·9

These returns take no account of gains and losses through earmarkings, nor do they necessarily reflect the net change in British official gold holdings. Still, taking all these factors into account, it looks as if on August 25th our gold reserves were under rather than over £800 millions. This guess is based on a valuation at 140s. per ounce. A re-valuation at this week's price of 144s. per ounce would write them up by about £20 millions.

How much of this £780 millions or £800 millions could we spare? We must remember that a substantial part is earmarked against sterling and balances in London. Thus for 1937 the League of Nations estimates the central bank and similar holdings of fifteen sterling area countries in London at £250 millions. Then there are our own needs, if we are to maintain our cheap money regime. All these points bear on the vital questions of how much foreign short-term money there is in London, how much is going to New York, and how much gold it is likely to take with it. It is, however, possible to make a rough guess at how much gold we can spare. On March 31, 1937, our gold reserve amounted to £703 millions, and there was no suggestion then that they were in any way inadequate. On this basis we could easily stand a net loss of nearly £100 millions. Also the pressure to-day is falling, not only on sterling, but on all European currencies, with London acting as the pipeline. Our losses to the United States would thus be partially balanced by gains from the Continent, while we shall continue to receive each week's quota of newly-mined gold. At a very rough guess, we could stand a total loss to the United States of £150 millions. During the fortnight to September 8th our shipments to New York averaged £12 millions a week. At this rate we could stay the course for approximately 12 weeks.

Admittedly these calculations imply that we are pursuing an opportunist policy. The authorities are doing their best to regulate the pound's downward slide, but it is unlikely that they can reverse it until there is some change in the outside circumstances—either a relaxation of the political tension or an assured recovery in the United States accompanied by a rise in American prices. American recovery would help in a variety of ways: it would reduce the over-

THE BRITISH LINEN BANK

valuation of the pound, it would bring with it fresh American buying of primary products, which would improve the position of many of the countries in the sterling area; and it might lead to an increase in exports to America from the United Kingdom itself, which have fallen off very rapidly in the American recession. But if this is an opportunist policy, it is equally the only possible policy for us to follow. The dangers of an uncontrolled downward movement of sterling have already been mentioned. It is equally impossible to mitigate the over-valuation of the pound by a direct assault on the present level of British prices and costs. But the necessity for opportunism in the near future is no sort of excuse for pessimism, still less for any alarm. The present depreciation of sterling only appears serious by contrast with the preceding period of comparative stability. Actually a depreciation from $4.95 to $4.82 is no more than 2.6 per cent.—and it has been spread over nine weeks. Nor is it much greater than fairly recent depreciations of the dollar when sterling rose to $5.05. It only appears serious because of the $4.86⅜ complex. And any relaxation of the political tension will at once bring with it a backflow of funds to Europe. Our task then will be to bring about an orderly appreciation of sterling, and at the same time to recover the gold now being shipped to America.

All these considerations are necessarily based upon the assumption that there will be no European war. If that major premise can be safely made, it is possible to extract some good out of the present disturbances to the exchanges. The great gain is that the general belief in the sanctity of $4.86⅜ as the bottom limit to the fluctuation of the New York rate should now have received its final quietus. If the Tripartite Agreement were to be interpreted as imposing precise and rigid limitations upon the fluctuations of the exchanges, without regard to any change in circumstances, it would repeat the main weakness of the gold standard without possessing its offsetting advantages. The spirit of the Tripartite Agreement is that the three countries will keep their currencies within the range that represents a fair equilibrium. If the equilibrium shifts, so clearly must the exchange rates. If the events of the last fortnight have removed the last tenacious belief that equilibrium is bound up with any particular set of figures, they will have performed the service of clearing the way for a realistic understanding between the three countries on a working definition of what does, and what does not, at any time constitute a fair equilibrium between their currencies.

Finance and Banking

The Course of Sterling.—The past week falls naturally into three parts. Up to and including Monday sterling continued to decline, the total movement being from $4.85¼ on Thursday evening to $4.82⅛ on Monday morning. The big drop came on Monday itself, when the political news appeared less reassuring. During this period the British Control gave a fair amount of support, while the price of gold was also fixed low enough to encourage arbitrage operations, especially since arbitrageurs knew that so long as sterling continued to fall, they could buy their gold at a small premium and cover their exchange later in the day. There was also a speculative demand for gold, but part of the supply came from re-sales, the authorities only having to find the balance. On Monday afternoon the Control was able to bring the pound back to $4.82 7/16. By this time most operators in the market were if anything over-stocked with both dollars and gold. Tuesday witnessed the next phase, for the better political news of the day gave the British Control an opportunity to round on the bears of sterling. On that morning the Control sold dollars heavily both during and after the gold fixing, and quickly sent the rate up from $4.81⅞ to $4.83⅛. This robbed the morning's gold arbitrageurs of any chance of a profit, and created a salutary feeling of nervousness among all holders of gold or dollars. It is true that the rate came back to $4.81⅝, but it quickly returned to $4.82 5/16, and in spite of a very big turnover not much official support was needed. Thursday morning witnessed a very quiet market, with the rate up to $4.82¾. Again comparatively little support was needed, and it had become obvious that operators were a little nervous about increasing still further their already large stocks of dollars. It looks, therefore, as if Tuesday's bear squeeze has so far proved efficacious. The authorities are therefore pursuing with a fair degree of success their normal policy of smoothing out exchange fluctuations and making speculation dangerous, without attempting the impossible task of preventing a major movement in sterling.

Europe and the Dollar.—While it is natural to speak of the recent exchange movements as a depreciation of sterling, it would be much more correct to describe the past fortnight as having witnessed an appreciation of the dollar. Such a description is justified, because the compelling force upon the exchanges has been the general flight of funds from Europe, rather than from England, to the United States. It is also much more in accordance with the actual trend of the market. This is shown by the following table, giving the New York quotations for the leading "free" European currencies :—

	Aug. 24th	Sept. 6th	Intervening Change
	(Cents per foreign currency)		%
£ sterling	488¼	482 5/16	— 1·22
French francs	2·73⅞	2·70⅝	— 1·19
Swiss franc	22·92½	22·65½	— 1·19
Guilder	54·73½	54·08½	— 1·19
Belga	16·88	16·91	+ 0·18

With the single exception of the belga, all these European currencies have depreciated against the dollar to almost exactly the same degree as sterling; while these London quotations exhibit comparatively little change. This proves that the past fortnight's movement is really an appreciation of the dollar. It might even be said that it signals the *de facto* accession of France, Holland and Switzerland to the sterling *bloc*. The strength of the belga was not maintained after Tuesday, the closing date of the comparison in the table.

Gold Arbitrage Congestion.—The severity of the pressure on sterling has caused some congestion in the channels of gold arbitrage between this country and the United States. Such congestion can occur at two points: first, the insurance market has limits beyond which it is unwilling to arrange for cover against shipments of gold on any one boat; secondly, firms which undertake gold arbitrage business have a limit beyond which they are unwilling

to extend the commitments of this kind which they may have outstanding at any particular moment. In both cases those limits are being approached. In the marine insurance market the offering of sub-underwriting of gold risks this week has been a clear indication that the facilities normally granted by Lloyd's under floating policies are being severely strained. Some of the larger arbitrage dealers have also shown signs of holding off, as the amount of gold "on the water" on their account has reached the maximum which they are prepared to have open at any particular time. Every steamer leaving for the United States is carrying close on its full insurable complement of gold. During the week to noon on Thursday no less than £15,445,931 left this country for New York. In addition, gold has also left Holland and Belgium for the same destination. A substantial part of the shipments made from this country has been on official account. For example, virtually the whole of the £5,000,000 odd carried by the "Aquitania," which left on Wednesday, was Exchange Account gold. Private arbitrage has this week been tending to make increasing use of second-class and slower ships. This apparent paradox is explained by the fact that though the interest charge is an item to be reckoned in the total cost of a gold arbitrage transaction (and therefore the quicker the voyage the better), this item is more than compensated by the premium to which the forward dollar has recently risen. Against shipments of gold to New York the London arbitrageur must sell dollars forward—assuming he is doing the transaction in sterling. This week forward dollars for short periods—five to ten days—have been quoted at a premium of 2/100 cent per day. This is equivalent to an interest rate of 1½ per cent. per annum. Since the interest cost on gold arbitrage is generally reckoned at ½ per cent. per annum, it follows that the longer the shipment takes the more profitable the operation becomes.

American Swap Money Goes Home.—It is an open question which of the various types of "hot money" may be considered to have the highest temperature. Foreign money invested in securities may leave at a moment's notice owing to changes in Stock Exchange tendencies. Refugee money is liable to depart suddenly as a result of a wave of distrust arising from political or other causes. Swap money, on the other hand, may be withdrawn unexpectedly as a result of changes in relative interest rates or, what is much more frequent nowadays, changes in forward rates. This is what has been happening during the last few days regarding American swap money in London. It was transferred here in substantial amounts during the early summer, as a result of the contraction of the premium on forward dollars to between ⅜ and ½ per cent. per annum. Since London banks were prepared to pay 1⅛ per cent., and even 1¼ per cent., on three months' deposits, the transaction yielded to the American banks something like ¾ per cent. per annum. Considering that at that time reflationary measures in the United States had brought about a plethora of short-term funds, the American banks were only too keen to take advantage of the yield on swap money in London. The situation has undergone a change during the last few days owing to the widening of the premium on forward dollars to 1 per cent. per annum. As a result it has ceased to be profitable for Americans to keep swap money here, and the deposits are now being repatriated as and when they mature. Non-American holders of swap money in London have also taken advantage of the additional yield provided by the wider premium on the dollar. There can be no doubt that the swap money came to this market when it was least welcome and is now leaving when its departure is anything but convenient. This is what often happens, since, given reasonably stable interest rates, swap money is usually attracted by an appreciation of the forward exchange at a time of general buying pressure on the currency concerned, while it usually leaves in consequence of a depreciation of the forward exchange at a time of a general selling pressure. Thus the movements of swap money very often accentuate unwanted trends in the exchanges. One partial remedy would be for the banks to pay no interest on such deposits from abroad. Alternatively, the movement of swap money could be regulated by official intervention in the forward exchange market after the example of the French and other monetary authorities.
