Imperial Bank of India.—The balance sheet of the Imperial Bank of India for June 30, 1938, bears some evidence of the way in which India has been affected by the recession. Compared with June 30, 1937, deposits have fallen from Rs. 831 to Rs. 818 millions, while cash credits and overdrafts have risen fom Rs. 203 to Rs. 226 millions. As a counterpart to these changes, investments have been reduced from Rs. 407 to 398 millions, while cash has shrunk from Rs. 217 to 163 millions. These changes reflect the normal fortunes of a primary producing country at the beginning of a recession. Deposits inevitably shrink, while farmers and others have to borrow more to bridge the gap left by their dwindling incomes. Even the decrease in the Imperial Bank's cash can be traced to a general change in the country's banking conditions, for during the same year bankers' deposits with the Reserve Bank fell from Rs. 316 to Rs. 197 millions, and the chief offset to this decrease was a contraction in the Reserve Bank's balances abroad from Rs. 175 to Rs. 12 millions. The plain truth is that the recession has temporarily, at least, given India a passive balance of payments, and this has led to some drain of funds from the country. Nevertheless, the Imperial Bank's cash does not compare unfavourably with that of previous years, and is also adequate in relation to its liabilities. The expansion in advances means that profits are well maintained, and the half-year's dividend of 12 per cent. per annum is the same as a year ago.

* * *

The New Roumanian Payments Agreement.—The sharp drop in imports from Roumania, amounting to 25.6 per cent., between the second quarter of 1937 and 1938, has necessitated a revision of the Anglo-Roumanian Payments Agreement. Originally concluded in 1936, the former Agreement earmarked the proceeds of sales of Roumanian goods to Great Britain in the following proportions: 35 per cent. for the service of the Roumanian Government debt, 5 per cent. for the liquidation of short-term credits, 5 per cent. for miscellaneous payments (dividends, insurance premiums, etc.), 5 per cent. at the disposal of the National Bank of Roumania, and 50 per cent. for outstanding and current trade debts. The Agreement thus laid down no specific allocation to new exports of British goods as distinguished from debts due in respect of previous exports. The recent decline in Roumanian shipments to Great Britain led to the danger of an accumulation of arrears due to British creditors, and as a stop-gap measure the National Bank of Roumania had to offer assistance out

£1,300 *instead of* £1,000

UNDER *The Distinctive System* of The Scottish Provident Institution the premiums are so moderate that at the usual ages for assuring the yearly sum charged elsewhere for a Whole Life Insurance of £1,000 (with profits) will here secure from the first as much as £1,300 or thereby with right to share in the surplus. The additional £300 is equivalent to *an immediate and certain bonus of £30 per cent.*, as large as can be looked for in other Offices only after many years.

FUNDS EXCEED £24,500,000

of its free exchange resources. A new and simpler Agreement has now been reached. Under it 20 per cent. of the proceeds of Roumanian exports to Great Britain will be placed to the credit of the Roumanian exporter, who can sell this sterling, for what he can get, to anyone in Roumania having payments to make in Great Britain. Forty per cent. is similarly placed at the disposal of the Roumanian exporter and can be sold by him, again at the best price he can get, to Roumanian importers of British goods. The remaining 40 per cent. is earmarked for the service of the Roumanian Government debt held in Great Britain, the liquidation of short-term credits, payment of trade debts due before August 1, 1935, and Roumanian Government purchases of British goods. Most of the special allocations in the former Agreement are merged in this last 40 per cent., but miscellaneous payments must now be met out of the first allocation of 20 per cent. New exports to Roumania now receive a special allocation of 40 per cent., which will now govern Roumania's ability to import from Great Britain. The new Agreement is not only simpler, but more elastic, for much of the exchange covered by it can now be bought and sold under the defined restriction at such rates as are obtainable in the market. It is, perhaps, a small step towards removing the restrictions on free trading in currencies.

British Fire Insurance in the United States.—A note in this section of *The Economist* last week gave details of the experience of British insurance offices in their miscellaneous American business in 1937. The following tables give similar information for fire insurance business. As with last week's tables, they are based on the official reports of the companies to the American insurance authorities and published by the "Spectator" of Philadelphia. Underwriting profits have been adjusted to conform with the British practice of allowing for an unexpired risk reserve equal to 40 per cent. of the current premium income, and the exchange is taken at $4.86⅔ = £1.

GGREGATE FIRE RESULTS IN U.S.A. OF TWENTY-ONE BRITISH FIRE INSURANCE COMPANIES OR GROUPS OF COMPANIES

Year	Premiums	Underwriting Profit	
		Amount of Profit	Percentage of Premiums
	£	£	
193	25,814,000	− 41,000	− 0·2
193	32,546,000	− 507,000	− 2·2
193	22,851,000	+1,430,000	+ 6·3
1934	24,314,000	+1,614,000	+ 6·6
1935	24,507,000	+2,471,000	+10·1
1936	24,711,000	+1,683,000	+ 6·8
1937	25,790,000	+1,625,000	+ 6·3

The results of 1937, it will be seen, were well up to standard, although not quite so good as in 1936. The 1935 experience was, of course, outstandingly good. The second table gives the results of the twenty-one British companies whose aggregate figures appear in the previous table:—

INDIVIDUAL FIRE RESULTS IN U.S.A. OF TWENTY-ONE BRITISH COMPANIES OR GROUPS OF COMPANIES

Company or Group of Companies	1936			1937		
	Premium Income	Underwriting Profit or Loss		Premium Income	Underwriting Profit or Loss	
		Amount	Per-cent. of Prem. Inc.		Amount	Per-cent. of Prem. Inc.

North Brit. & Merc.	3,293,000	+ 313,000	+ 9·5	3,430,000	+ 189,000	+ 5·5
Northern	828,000	+ 50,000	+ 6·1	854,000	+ 65,000	+ 7·6
Norwich Union	592,000	+ 22,000	+ 3·7	645,000	+ 30,000	+ 4·6
Phœnix	1,242,000	+ 72,000	+ 5·8	1,289,000	+ 89,000	+ 6·9
Prudential	475,000	+ 33,000	+ 6·9	584,000	+ 42,000	+ 7·2
Pearl	1,580,000	+ 82,000	+ 5·2	1,696,000	+ 79,000	+ 4·7
Royal	4,107,000	+ 340,000	+ 8·3	4,140,000	+ 419,000	+10·1
Liverpool and London & Globe	2,266,000	+ 177,000	+ 7·8	2,284,000	+ 240,000	+10·5
Royal Exchange	672,000	+ 33,000	+ 4·9	707,000	+ 45,000	+ 6·3
Scottish Union & National	673,000	+ 53,000	+ 7·8	664,000	+ 73,000	+10·9
Sun	837,000	+ 60,000	+ 7·2	887,000	+ 7,000	+ 0·8
Yorkshire	553,000	− 16,000	− 2·8	575,000	+ 5,000	+ 0·8
	24,711,000	+1,683,000	+ 6·8	25,790,000	+1,625,000	+ 6·3

Although there was a considerable diversity of experience, all but two of the offices showed an underwriting profit on their American fire business in 1937.

* * *

"Expanding the Credit Base."—An article in *The Economist* of August 20th, under this title, contained a table showing changes by quarters over the past six years in a number of the more important banking statistics. This table contained two small errors. The last four lines of the third column under the heading "Cash" should read as follows:—

1938—1st quarter	+ 8
2nd „	− 5
Twelve months	+ 6
Six years	+ 60

Those readers who have had occasion to use the table may wish to make the correction, which does not, however, affect the argument of the article.

MONEY MARKET NOTES

Foreign Exchanges

THE general course of sterling since a week ago is discussed in a Financial Note. On Thursday afternoon the New York rate remained steady at $4.82 13/16, with comparatively little business or intervention by the Control. Three months' dollars were quoted at 1¼ cents premium. French francs remained steady at Frs. 178⅝, with the three months' rate at Frs. 3¾ discount. There has been very little business, and while the French authorities were always ready to intervene, practically no support was needed. Guilders were quoted on Thursday at Fl. 8.39 and Swiss francs at Frs. 21.31. As is shown in a table on page 504, most European currencies have moved with the pound. The sole exception was the belga, which up to last Wednesday displayed a remarkable degree of strength against the dollar. The market never felt over-much faith in this strength, and on Wednesday and Thursday the belga suddenly weakened. In London, the rate rose from bel. 28.52 to bel. 28.67, while in New York the rate depreciated to the export gold point. It was difficult to find any specific explanation for this sudden weakness, either in London or in Brussels.

The Bank Return

THERE is practically no change in the note circulation or Reserve, and so in spite of the week's drop in bankers' deposits, it has not been thought necessary to add to the banking department's Government securities. The only change of note is the transfer of a further £4.4 millions into public deposits, and this is the main cause of the week's fall in bankers' deposits. The immediate cause of this week's rise in public deposits is the absence of any Treasury bill maturities on Monday or Tuesday, for these days fell exactly three months after Whitsun. Looking back, however, over the past three weeks, public deposits have risen from £20.1 to £32.2 millions, while bankers'

Proportion	25·2%	30·6%	29·7%	30·1%

deposits have fallen from £105.7 to £91.3 millions. The simplest explanation of this long-term movement is that

the Exchange Equalisation Account has been selling gold faster than it could reinvest the sterling proceeds.

*

The Bullion Market

As described in a Financial Note, the main demand for gold this week has been of an arbitrage character, and contrary to their previous practice the authorities on the whole encouraged this demand by allowing the price at the fixing to fall to parity with the American shipping price. Tuesday was the chief exception, but some operators were inclined to regard that day's loss to arbitrageurs as arising mainly from an inability to keep pace with the temporary recovery in sterling, and not to any deliberate attempt at a squeeze by the authorities. A fair proportion of this week's demand has been met by re-sales of gold bought forward last May, and this has afforded some relief to the authorities. There has been no big hoarding or speculative demand, and the forward market has been quiet. Heavy selling by "tired bulls" early in the week has prevented silver from following the dollar in its appreciation against the pound, and the week's prices are only ⅛d. per ounce up on balance. The main support to the market has been American trade buying, but India has bought a little. In the middle of the week there was also some Continental bear covering, and this helps to explain the past few days' rise in the price.

* Above or below American shipping price.
† At fixing.
The New York price of silver remained at 43 cents per ounce ·999 fine during the week.

London quotations have not been high enough to permit of profitable arbitrage against the dollar.

*

The Money Market

THE continued transfer of funds from London to New York is at last beginning to affect the supply of money, the more so as there is some evidence that the Exchange Equalisation Account has not yet re-invested in Treasury Bills the whole of the proceeds of its gold sales. As this week's Bank return shows, public deposits are running high, while bankers' deposits are low. The present technical position, in fact, resembles that which existed after the French repatriation of last May, though on a somewhat different scale. The present withdrawals from London have mostly affected overseas banks and similar institutions, usually described as "outside lenders," and so the shortage has been most noticeable in the case of bond-money. It has been noticed that American banks have been taking money off the market. On Wednesday up to one per cent. was paid for loans against bonds. On Thursday rates of ¾ per cent. were not uncommon, but some institutions were able to borrow at ½ per cent.

	Sept. 9, 1937	Sept. 1, 1938	Sept. 8, 1938
	%	%	%
Bank Rate	2	2	2
London Deposit Rate	½	½	½
Short Loan Rates:			
Clearing Banks	½–1*	½–1*	½–1*
Others	½–⅝	⅝–¾	½–¾
Discount Rates:			
Treasury bills	½	½	½
Three months' bank bills	17/32–9/16	17/32–9/16	17/32–9/16

* Viz. ½ per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity, ¾ per cent. for loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity, 1 per cent. for loans against other collateral.

Bill rates are nominally unchanged, but this week the markets have been ready to sell, while the clearing banks were buying less freely. This provides further evidence of the change in conditions. The clearing banks have had heavy demands for loans against bills, while their own cash is less plentiful. Conversely the markets expect a further falling-off in outside applications for Treasury bills at forthcoming tenders, and therefore think that they will secure a larger allotment themselves. This makes them all the readier to sell bills. There has been a certain amount of special buying of bills, both to help the market and also to invest the Exchange Equalisation Account's cash.

Investment

Markets and Politics.—The muddy maelstrom of politics still presents its impenetrable depths to the investor. Maelstrom would scarcely be an accurate figure to describe this week's events in Throgmorton Street, for movement is of its essence, and security values have at least not been plunged in the vortex. Amid the confusion of rejected offer and counter-offer, the continued silence from Nuremberg and the heart searchings of the average investor regarding a reasonable solution of the Sudeten problem, the markets have remained almost apathetic. They are, indeed, sick with the long deferment of hope. But Tuesday's dealings showed that a glimmer of relief, following the Czech Government's definitive offer, was sufficient to send the "bears" scampering to cover for a spell. But this mood has not endured. On Wednesday, business once more dried up, for the unresponsiveness of the Sudeten Germans to the Czech offer, followed by the serious rupture which developed in the evening, once again renewed the oppressive political atmosphere. At the moment there is no investment pointer, strictly so-called, which the investor can employ to divine the trend. Business has dwindled to exiguous proportions. The only determining factor lies in the political situation. And that cannot be resolved, at the earliest, until the oracle and arbiter has spoken at Nuremberg.

* * *

Company Meetings and the Press.—Mr Graham Cunningham (whose speech at this week's meeting of "Triplex" Safety Glass is reviewed on page 509) has done much in the past to enliven the proceedings at this company's meeting. This year, the chairman invited representatives of the financial Press to attend the meeting and allowed them to ask questions on equal terms with stockholders. This innovation, the chairman explained, was intended for the benefit of stockholders and the board, and he had an open mind about its success. Perhaps because his own speech had been so detailed, and because an important point of financial policy was raised at the outset of the discussion by a stockholder, the response to the invitation was comparatively modest. As a precedent, therefore, the idea is perhaps best regarded as not proven. But it raises some interesting matters of principle, apart from the particular occasion of this week's meeting. In the first place, the Press and the shareholders are not, and cannot be, on equal terms, for the former have no vote, and no right in law to attend. Moreover, the work of the Press is, or should be, largely to direct public attention to matters in a company's report, and to comment on the general state of its affairs, in advance of the meeting. If the function of forming investment opinion were to be left to the occasion of the meeting itself, freedom of preliminary comment might to some extent be affected. Further, directors are accountable at the annual meeting to their shareholders, who might resent the intervention of outside parties, however well-intentioned. They might be averse, for instance, from expressing their own views amid questions from the Press. They might, on the other hand, find disillusionment in the physical presence of an entity hitherto known through the printed page. Finally, the Press has occasion to differ in its view regarding certain companies, from time to time, and it would obviously be improper to allow a meeting

of shareholders to provide the occasion for airing differences of this sort. These are matters of principle, for consideration if an innovation were to be widely followed. But any measure designed to increase the amount of information available to shareholders—and the "Triplex" invitation to the Press had that object in view—is entirely to be welcomed.

* * *

Industrial Profits in August.—The number of company reports published in August is too small to offer a broad view of the trend of industrial profits, but the significance of a fall in earnings reported by 81 companies last month cannot be overlooked merely for this reason. Our record of industrial profits (for which figures for the past two years are shown below) provides no single instance of a fall since September, 1933, and last month's decline follows an unusually low rate of increase in July, 1938:—

INDUSTRIAL PROFITS 1936-38.

* After debenture interest. (*a*) Decrease.

The range of industries covered last month was fairly wide, and only 5 out of the 16 groups represented show an increase. Moreover, the shortfall itself was tempered by the good results of iron, coal and steel companies. Our figures confirm that the trend of profits has now been reversed.

* * *

Fine Cotton Spinners' Scheme.—In the spring of 1937 the directors of Fine Cotton Spinners hoped that the results of the Association would justify the publication of the long-expected capital reconstruction scheme. An improvement, it is true, was recorded in profits during the year to March last, and some degree of hope was expressed by the chairman at the meeting in May. Yet it may be doubted whether the "slimming process" which the directors now propose is sufficiently rigorous to provide a new and stable trading basis for the association. The circular frankly points out that the present charge for dividends on the preference and preferred ordinary stocks, both in arrears from March 31, 1931, is largely in excess of the present or prospective profit-earning capacity of the Association. That fixed charge amounts to £197,000 gross, and the effect of the scheme, therefore, must be related to earnings of such dimensions. Secondly, it is proposed to write down the share capital from £8,350,000 by £2,787,000, which, together with a sum of £751,947 from reserves, will suffice, in the directors' opinion, to reduce the book value of fixed assets to the proper level and to extinguish the debit balance at profit and loss, amounting to £212,538 at the date of the last accounts.

* * *

The effect of the proposed capital changes is summarised in the following table:—

Present Issue		Div. Arrears Gross	Proposed Exchange	Per cent. of Issue
	£	£		
5% cum. pref. stk....	3,000,000	1,050,000	£1,500,000 5% cum. pref. stk.	100
			£1,800,000 ord. stk.	44·30
5% cum. pref. ord. stk.	940,000	329,000	£940,000 ord. stk.	23·14
Ord. stk.	4,410,000	...	£1,323,000 ord. stk.	32·56
Present issued capital	8,350,000	Proposed issued capital.	£5,563,000	

Preference stockholders are asked to convert one-half of their holdings into ordinary stock, and to forego their dividend arrears. Compensation is provided by the transfer of £300,000 of ordinary stock to them (so that each holder will receive 10s. preference stock and 12s. ordinary stock for every £1 of preference stock now held) and by the formation of a preference stockholders' dividend reserve, amounting to £200,000, which will be earmarked from the balance of £340,075 remaining in reserve. The preferred ordinary stockholders lose their dividend arrears, and are asked to convert, £ for £, into ordinary stock, thus obtaining 23.14 per cent. of the new equity. Finally, ordinary stockholders, who have to provide the whole of the capital cut and also the transfer of £300,000 to the preference stockholders, receive 6s. new stock for every £1 held.

* * *

Effect of the Scheme.—The directors point out that a comparatively small improvement in trading results should permit the resumption of ordinary dividends. That is a matter of substantial prospective advantage for the ordinary stockholders, whose chances of obtaining anything, even on the most favourable assumptions, are utterly remote while preference and preferred ordinary dividend arrears remain to be satisfied. But at the prospective level of profits which the directors envisage the preference stock undoubtedly bears the brunt of the dividend burden, even after allowance for the dividend fund which is to be provided. At any normal level of earnings over £75,000, the preference stockholder will obtain less in the future than he would in the past, despite the award of 44.30 per cent. of the equity. Conversely, the preferred ordinary and ordinary stocks begin to rank for dividend when this point is passed, compared with £150,000 for the former and £197,000 for the latter under the old capitalisation. These points, moreover, take no account of the sacrifice of arrears. These anomalies are not corrected until the higher profit ranges of pre-depression times are reached, and if profits had been as satisfactory as this, the scheme obviously would not have been required. Finally, even on the assumption that the directors' maximum forecast of profits is realised, the resultant earnings on the ordinary capital would amount to no more than 3 per cent. on the ordinary capital. Such a rate of return is hardly compatible with a par quotation for the new equity, which a more drastic reduction might be expected to assure.

* * *

"Triplex" Safety Glass Meeting.—Three matters stand out in Mr Graham Cunningham's speech to the shareholders of "Triplex" Safety Glass at this week's meeting. In the first place, the company, although predominantly interested in the supply of safety glass to the motor industry, is not solely dependent upon that product or upon that industrial consumer. "Triplex" has developed an armament equity, by supplying bullet-proof glass and transparent resins—the latter to the aeroplane industry. Secondly, the market now has definite confirmation of the rumours, current some time ago, that the company has lost the Austin Motor contract, in the chairman's phrase "for the time being." He did not seek to minimise the importance of this loss of business (the extent of which, as a proportion of total turnover, was not disclosed), which appears to have occurred solely on the question of price. That another source of supply has developed on a scale sufficient to challenge "Triplex" is, of course, a matter of importance for its competitive position. But the third point suggests that the company is meeting the dual challenge of recession and of competition. Hitherto plate glass has been employed for the manufacture of safety glass. The company, however, has now developed a technique for toughening sheet glass satisfactorily, at smaller cost to the motor industry. This technical change, described by the chairman as having a "somewhat fundamental" effect upon the character of the company's output, may provide some reply to hotter competition of recent months. It would, however, be premature to construct a positive case for

the ordinary shares on the basis of this development alone, until the motor industry's prospects themselves are clearer.

* * *

Second Alliance Trust.—The latest results of the Scottish trust are in accordance with its steady record of recent years, for total income is 1 per cent. higher than in 1936-37. As the report itself emphasises, however, proper comparison of profits is difficult; for during the year £318,750 gross was subscribed by stockholders for 50,000 units, each consisting of two preference and one ordinary share, and in addition the debenture debt has been increased by £251,460. On the other hand, the new funds have been available for only part of the financial year; the last instalment on the new shares was paid in mid-March, and the balance sheet showed £24,700 of uninvested cash at the end of July. In 1936-37, moreover, total income included £9,000 arrears, while in 1937-38 only £1,000 was derived from this source. Since the latest year has not called for the repetition of the £10,000 provision for special tax reserve (which is still intact in the balance sheet), the ordinary stockholders fare better than the modest increase in total income would suggest. The following comparative table shows the allocation of profits in the past three years.

	Years ended July 31st 1936	1937	1938
	£	£	£
Income	191,318	213,859	216,519
Taxes	31,303	47,768	41,340
Other expenses.....	8,975	8,552	9,085

Issue expenses	163	772	1,676
Carried forward	11,026	12,330	15,000

† Of which 12 per cent. final dividend on £400,000 (against £350,000) ordinary capital.

While the directors have still maintained the substantial margin between ordinary earnings and dividends, they have been able to increase the ordinary dividend by 1 per cent. —the final dividend of 12 per cent., moreover, being payable on £50,000 of new ordinary capital. In view of the heavy fall in security values during the past year, a market depreciation of no more than 1.04 per cent. on the portfolio appears satisfactory. In each of the past three years £25,000 has been placed to the contingent reserve fund (and presumably used for writing down the book value of securities), and in 1937-38 this fund was further augmented by £168,750 share premiums. Although the latest accounts are made up to a recent date, they probably do not reflect the decline in industrial profits to any important extent. No information, however, is provided in the accounts regarding the distribution of the portfolio. The full employment of over £500,000 of new money during the current year should offset any decline in industrial earnings. The current yield of £5 2s. per cent. on the ordinary stock, which stands at 412, reflects its high status.

* * *

D. Gestetner Report.—The half-yearly report which showed lower net profits and announced the reduction in the interim dividend from 17½ per cent. to 15 per cent., had prepared the market for stationary or lower earnings for the full year. Hopes were revived, however, by the recent announcement that the 40 per cent. total dividend (on an increased capital) was to be maintained. The full report shows that profits have not kept pace with the growth of the ordinary capital, following the 20 per cent. free bonus declared a year ago. They are, in fact, slightly lower at £236,722, but as the company is sensitive to cyclical changes in business activity, and as its accounts are promptly made up to a date as recent as August 31st (and thus reflect almost a full year of industrial recession) these results may be regarded as satisfactory. Apparently the second six months of the financial year were somewhat brighter than the first, for the interim report last March showed a drop in net profits of about £4,500, arising from higher manufacturing costs, whereas total profits for the year are reduced by less than £1,000—a negligible proportion out of £236,722. The course of profits in the past three years is given in the following table:—

	Years ended August 31st 1936	1937	1938
	£	£	£
Profit	194,082	237,623	236,722
Depreciation	14,245	15,072	15,248
Taxation	16,500	30,000	35,000
Other expenses	8,655	8,942	8,748
Preference dividend	18,375	18,375	18,375
Ordinary stock:—			
Earned	*136,307*	*165,234*	*159,351*
Paid	100,406	129,094	161,367
Earned %	*51·4*	*54·9*	*39·3*
Paid %	35	40	40
Capital bonus %	12½	25	Nil
To general reserve	35,859	45,683	Nil
Special credits (net)	...	11,427	1,285
Carry forward	19,731	21,615	20,884
Ordinary capital (end-year)	286,875	322,734	403,418

After providing an additional £5,000 for taxation, earnings for the ordinary stock are reduced from £165,234 to £159,351, and the 40 per cent. dividend is thus not quite covered. No allocation is made to general reserve, which now stands at £65,000 as the result of the share bonus in 1937-38. This is only the second occasion in seven years that the directors have not declared a scrip bonus. The balance sheet reveals that stocks have risen from £94,114 to £109,961, while cash holdings are reduced by nearly £50,000 to £290,768 and amounts due from subsidiaries from £110,205 to £78,353. The company has a progressive record, and may be expected to secure a good share of available business, although its volume may not be expanding at the moment. At the current price of 27s. 6d. the 5s. units yield £7 12s. 6d. per cent.

* * *

Qualcast Progress.—Following the favourable results for 1936-37, the further increase in Qualcast's profits is satisfactory. In a preliminary statement, the directors announce that net profits for the year to June 30th last amount to £80,070, against £74,900. It would seem that trading in the first half of the financial year is largely to be thanked for this result, for the interim report last February showed that the tonnage produced in that period exceeded that for the corresponding six months of 1936 by 21 per cent. A slight recession in business, however, was noted at the time the report was issued. In the latest financial year the company has had full use of the cash subscribed for the share issue of February, 1937. Earnings for the ordinary shares cannot be calculated until the accounts are issued, but the board's distribution policy has in recent years been conservative, for roughly two-thirds of available earnings have been distributed. Although the year's dividend is maintained at 30 per cent., the 7½ per cent. interim dividend for 1936-37 was paid on £25,000 less capital. The new interest in Follows and Bate will presumably not have affected the 1937-38 accounts, since its acquisition was announced only at the end of last July. Qualcast make a variety of specialised light castings,

but its pre-eminence among lawn-mower makers is enhanced by this acquisition, and the company will in future control the world's largest output of lawn-mowers. The 5s. ordinary shares now stand at 24s. 4½d., to yield £6 8s. 6d. per cent. Their prospects depend, on the one hand, upon the level of costs (which in the metal trades show little sign of reduction) and, on the other hand, upon the effect of recession on demand. It is at this juncture, in fact, that the company's diversification policy is likely to prove useful.

* * *

Whitworth and Mitchell Position.—A considerable setback in profits was anticipated by the passing of the Whitworth and Mitchell ordinary dividend and by unsatisfactory news from the textile industry generally. Thus, the tenor of the full report brings no great surprise, but it does little to soften the blow of the non-payment of a dividend for the first time since the company became public. Trading profits, at £27,445, represent only 42 per cent. of those earned in the year to June 30, 1937, and though the 6 per cent. preference dividend has been paid in full, it was short-earned to the extent of £8,674. As we show in the following table, the carry forward has in consequence been reduced to a small sum. If net profits in the current year are no better, therefore, payment of the full preference dividend would necessitate a transfer from the general reserve fund, which stands at the high level of £160,000: —

	Years ended June 30th

† After crediting £636 profit on the sale of investments.

The chairman's review, which accompanies the accounts, states that the fall in profits is due, in the main, to the serious fall in cotton values, which entailed heavy provision against stocks. But an 11 per cent. reduction in turnover has also played its part. Lower trading activity appears to have been accompanied by sluggish movement of stocks, for although cotton has been written down, the book value of the total (the company uses rayon as well as cotton materials) has actually risen from £192,761 to £200,149. Meanwhile the company's liquid position remains impressive, for net liquid assets amount to £686,000 and represent well over half the balance sheet total. The directors have, in fact, been contemplating these large funds for which no profitable use can at present be found, but for the time the question of a return of capital to shareholders has been put aside. Only two months of the current financial year have elapsed, but present indications appear slightly more favourable. A year ago, demand was affected to some extent by rising prices, and their reduction has already brought some benefit to the company. The chairman reports that orders are better than a year ago, and it is reasonable to expect that unduly large sums will not again be required for writing down stock values. The immediate industrial outlook, however, does not encourage hope of a prompt resumption of higher profits. At present the £1 ordinary shares stand at 6s. 6d.

* * *

Odeon Theatres First Results.—While there is no standard of comparison by which the first results of this important cinema undertaking can be judged, the first preliminary statement seems reasonably satisfactory. Profits, after depreciation but before taxation and debenture interest, amount to £368,178 for the initial period (apparently of 54 weeks) to June 25th last. In the prospectus issued in July, 1937, an estimated annual profit of £460,000 was given, after £20,000 N.D.C. but before income tax. This profit estimate included £280,000 gross from the theatres directly owned by the company and £170,000 in fees and share of profits from the 71 cinemas managed but not directly owned. This latter estimate, however, was based on a full year's working, but certain properties were not in operation for the full year. The difference between the prospectus and the actual profits is sufficiently marked to suggest, though it does not prove, the possibility that expectations were not quite realised. After charging £60,000 for income tax and N.D.C., £94,630 for debenture interest, and £91,323 for preference dividend, the balance of £122,225 for the initial period represents just under 20 per cent. earned on the ordinary capital of £850,000. The latter receives 10 per cent., and the surplus provides £20,198 for reserve, £18,000 for writing off debenture discount, and £22,402 to be carried forward. The company's first results have been eagerly awaited in the market for a special reason. There are 1,465,000 6 per cent. £1 preference shares in issue, of which 499,850 were issued for cash at par, and the balance as part of purchase considerations. Permission to deal in these preference shares was obtained in the ordinary way over a year ago, but there was no actual market in them, since dealers decided not to do business until the first results were available. After a period in which the shares were quoted "0-⅝," dealings have now commenced at around 13s. 3d.—a somewhat anomalous quotation, compared with 6s. 6d. for the 5s. ordinary shares. Since Odeon Theatres owns or controls one of the largest cinema circuits in the country, and continues to grow, the full report will be awaited with considerable interest.

* * *

Modderfontein East.—For some time past, Modder East shares have tended to rise, apparently on the expansion in the monthly profits. The report of the consulting engineer provides an additional reason. He makes the important announcement that capital expenditure for the current year will amount to no more than about £20,000, compared with £121,000 during the past year. In such circumstances, a substantial increase in the rate of dividend may be in prospect; moreover, recent additions to the treatment plant will enable a still larger tonnage of ore to be dealt with. Last year the treatment of a larger tonnage of ore was accompanied by a reduction both in grade and costs, leaving the working profit a few pence per ton lower at 9s. 7d., but appreciably higher in the aggregate, as the following table shows: —

Years to June	Working Profit	Dividends Amount		Carried Forward	Ore Reserves Quantity	Value
	£	£	%	£	Tons	dwts.
1936	626,910	290,880	31½	157,610	5,514,300	4·6
1937	644,580	279,240	30	185,190	5,899,100	4·5
1938	662,250	279,240	30	145,670	6,329,100	4·3

Last year's outlay on plant, mentioned above, compares with £44,690 in the twelve months ended June, 1937. In order to maintain the dividend total at the previous year's reduced rate, a draft upon the carry-forward was accordingly necessary. Although development work, at 55,480 feet, showed a decrease of 10,120 feet as compared with that of 1936-37, the available reserves increased by 430,000 tons. The expansion in quantity would appear to be mainly due to the inclusion of ore not previously taken into account, as the material actually developed was no more than 22,600 tons in excess of the 1936-37 quantity. Dividend prospects have to some extent been discounted by the recent rise in the shares from just over £4 to the high level for 1938 of £4 10s.

* * *

Nourse Mines.—The operations of this old-established producer were of distinctly unexciting character last year. Owing to shortage of labour towards the end of the first half of the period, the tonnage of ore milled declined from 991,000 tons to 960,000 tons. The same factor, doubtless, was also responsible for a shrinkage in the quantity of payable ore developed. No appreciable

DIRECTORS:

PHILIP ERNEST HILL (Chairman).
LOUIS NICHOLAS (Vice-Chairman).
HENRY GREGORY.
J. STANLEY HOLMES, M.P. (Managing Director).
SIR ARTHUR HAROLD MARSHALL, K.B.E.
HUBERT A. MEREDITH.
GEORGE MORRISON (General Manager).

Points from the Prospectus:

(1) The Company was incorporated in 1928 to acquire the business of Beechams Pills, founded in 1842, and owns 98·89% of the Deferred Ordinary Shares in Veno Drug Company Limited as well as large holdings of Preference and Preferred Ordinary Shares in that Company.

(2) Since its incorporation, the interests of the Company have been greatly extended. "Beechams Powders" have been successfully marketed and the Company now controls the businesses of Yeast-Vite Limited, Phosferine (Ashton & Parsons) Limited, Natural Chemicals Limited ("Phyllosan"), The Cicfa Company Limited, Dinneford & Company Limited, The Iron Jelloid Company Limited, Holloway's Pills Limited, Phensic Limited, Prichard & Constance (Manufacturing) Limited ("Amami"), A. F. Sherley & Company Limited, and Lintox Limited.

(3) In July, 1938, the Company agreed to purchase 3,357,356 fully paid Ordinary Shares of 5s. each in Macleans Limited (out of its total issued Ordinary Share Capital of 3,400,000 Ordinary Shares of 5s. each) and since that date has agreed to acquire the remaining Ordinary Shares. The Company holds all the issued Ordinary Shares of Beecham Maclean Holdings Limited, and has agreed to re-sell to that Company all the Ordinary Shares in Macleans Limited so acquired by it and has also agreed unconditionally to guarantee the due payment of the dividend on the 1,500,000 5 per cent. Redeemable Cumulative Preference Shares of £1 each of Beecham Maclean Holdings Limited.

(4) The purpose of the present issue is to provide finance in connection with the completion of the purchase of the Ordinary Shares in Macleans Limited agreed to be acquired, and for the general purposes of the Company.

(5) The Profits of the Company for the last 3 years (as set out in the Auditors' Certificate appearing in the Prospectus) show progressive earnings and on the basis of those for the year ended 31st March, 1938 (after charging Expenditure on Development), the Directors are of opinion that the annual profits of the Company should be not less than £502,000. From this sum there must be deducted £215,000 (the dividend on 10% Cumulative Preferred Shares and dividend on 5% Redeemable Cumulative Preference Shares) and to this sum there must be added £120,000 (the estimated dividend receivable by the Company from Beecham Maclean Holdings Limited) leaving a sum available for reserves, redemption of 5% Redeemable Cumulative Preference Shares and dividend on the 9,600,000 Deferred Shares of the Company amounting to £407,000.

(6) **The above estimated profits of £407,000 are equivalent to earnings of approximately 34% on the Deferred Share Capital of the Company issued and now being issued, or should the 5% Redeemable Cumulative Preference Shares be redeemed out of profits by equal annual instalments, to earnings of over 31% upon such Deferred Share Capital, or over 10% on the issue price of the Shares now being issued at 7s. 6d. per Share.**

Copies of the Prospectus (upon the terms of which alone applications will be considered), and Forms of Application can be obtained on Monday from the

change occurred in the average results, but working profit fell by £19,590. Payment of dividends totalling 20 per cent., against 22½ per cent. for each of the three preceding years, left a slightly increased balance to be carried forward. The year's operations are summarised below:—

Year to June	Working Profit £	Dividends Amount £	Dividends %	Carried Forward £	Ore Reserves Quantity Tons	Ore Reserves Value dwts.
1936	351,430	176,320	22½	134,420	4,132,800	4·4
1937	293,810	176,320	22½	156,720	4,001,500	4·4
1938	279,390	156,730	20	158,140	3,852,900	4·4

An encouraging feature of underground work was the increase in the average value of ore developed, which rose to 5.3 dwts. as compared with 4.5 dwts. As the work was carried out mainly in the south-eastern section of the property, upon which the future of the company now chiefly depends, the results may be regarded as encouraging. The consulting engineer gives no hint regarding the outlook for capital expenditure. Last year's total amounted to £40,280 as against only £6,370 in 1936-37. On the basis of last year's dividend, the return on the shares is slightly under 10 per cent. gross.

* * *

The Week's Company Profits.—The reports received this week from 16 companies (excluding two for which comparable figures are not available) show total net profits of £1,071,000, a decline of 6 per cent. compared with earnings of £1,143,000 for the preceding year. Net profits of 1,735 companies, whose reports have been received this year, amount to £238,446,000, still showing an increase of 11 per cent. over the net profits of £214,656,000 in the previous year. The profit and loss accounts are analysed on page 528, and individual results are discussed in preceding notes and on page 513 under the heading "Shorter Comments."

THE STOCK EXCHANGES

London

SETTLING DAYS

TICKET	ACCOUNT
SEPTEMBER 20	SEPTEMBER 22

THE Stock Exchange brought forward from the close of dealings at the end of last week a feeling of rather greater optimism regarding the political situation. On Monday, it evaporated once again, only to be revived for a brief period around mid-day on Tuesday. The rupture in the discussions between the Czech authorities and the Sudeten German leaders, however, provided the signal for renewed nervousness. In terms of prices, the effect of the ebb and flow of politics has been small. The "bears" covered their positions when the tension was lightened on Tuesday, but in every section of the market price movements have been fractional, and the volume of business remains extremely small.

Gilt-edged stocks were sold at first, undated stocks showing the chief falls. Prices recovered promptly on Tuesday, when the best gains were registered by undated issues and War Loan took the lead. In mid-week, a sharp fall, which exaggerated the volume of selling, resulted from renewed discouragement, and losses reached one-quarter of a point. Further falls were recorded on Thursday. Business in home corporation and Dominion issues remained small but prices followed the general trend.

In the *foreign bond market*, European issues reflected changes in political sentiment, although even on Tuesday the best gains were not held. Chinese issues were steadier for a time, but renewed selling, reported to come from the East, occurred in mid-week. Brazilian issues were sold further.

Business in *home rails* was extremely small. A sharp drop in Great Western and Southern preference issues was only partially made good. Some slight falls in the guaranteed list were corrected in mid-week, and among the ordinary stocks, Southern preferred and Great Western recovered after early falls. Small business was reported in Argentine rail stocks and prices scarcely moved, but Cordoba first debentures fell sharply on sales from holders whose patience is becoming strained.

In the *industrial market*, as elsewhere, the cat still did not know which way to jump, and the market has no natural spring. Investors and professional operators alike were waiting hourly on developments in the international situation, and business remained at a minimum. While sentiment varied with political news, both prices and the volume of business showed small consequential changes. Iron and steel shares became a little firmer as the week progressed, though the decision not to alter export prices had no market effect. Cammell Laird responded to the interim dividend announcement. Coal shares followed a similar trend. Electrical equipment issues were irregular and inclined to weaken, though Crompton, Parkinson were firmer. Motor shares became steady, after an inauspicious start, A.E.C. being one of the better features, while the aircraft section was unexciting but satisfactory. R.F.D. were active owing to interest in the balloon barrage. Textile shares were irregular, Whitworth and Mitchell declining on the report, and Fine Cotton Spinners ordinary weakening after publication of the capital scheme. No special trend emerged in the brewery section, and provision and catering issues also lacked incentive. In the stores group, British Home Stores went ahead in mid-week. Among miscellaneous shares, D. Gestetner improved on the dividend announcement, while Imperial Smelting fell sharply on the preference dividend reduction. Triplex lost ground after the meeting, the loss of the Austin contract being the deciding factor. Reactions to the Odeon Theatres report varied: the debentures hardened, the ordinaries weakened slightly, and dealings in the preference started at around 12s. 6d. Shipping shares were uninteresting but fairly steady.

The *oil market* followed the general trend. A thoroughly dull start, in which the amount of business was at the lowest ebb for months, gave way to improved prices on Tuesday, though there was little increase in business except among the leaders. The improvement was not maintained, and prices weakened slightly in mid-week. *Rubber shares* remained as idle as ever, but prices were well maintained on the whole, and *tea shares* were equally lifeless. In both markets the amount of business was too small to test prices.

Mining shares provided no exception to the general feeling of caution and operators showed unwillingness to enter upon new commitments. While sentiment improved on Tuesday, the volume of business was hardly affected, and the undertone became a little less satisfactory. Kaffirs showed few special features, and failed to respond to the higher price for gold. Modder East rose in anticipation of the report. West Africans were more active than in recent weeks, the Ashanti August return helping the improvement. Little interest was taken in Rhodesian copper issues, though Roan recovered some of the ground lost on initial disappointment with the dividend. Lead-zinc shares were hardly affected by the lead control scheme.

ACTUARIES' INVESTMENT INDEX

As at Tuesday last (September 6th), the Actuaries' Index of 151 industrial ordinary share prices shows a trifling decline, standing at 63·3, against 63·5 a week ago, and 66·1 a month ago. The latest index, however, is only 0.1 point above this year's "low." The average yield of 5·97 per cent. is unchanged as compared with a week earlier, but a month ago it was 5·72 per cent. We give below a selection of the component indices:—

New York

WALL STREET has behaved erratically this week, and though movements one way or the other have not been large, they have generally lacked conviction. In America no less than in Europe politics have been the centre of interest, and beneath apparent inaction and the need to wait and see what happens, the market's nerves are tense. A noticeable improvement at the end of the previous week was not maintained, and Monday's closure for Labour Day helped to stifle the improvement. Better political news early in the week, however, failed to arouse any response and prices tended to sag, Tuesday's turnover being no more than 420,000 shares. The weakness of sterling intensified the general attitude of caution. A sudden upswing in mid-week, when both prices and turnover were better, appeared to lack any solid basis. Steel shares showed no pronounced features, although Bethlehem more than regained Tuesday's loss. The Iron and Steel Institute estimates steel activity at 39.9 per cent. of capacity for the current week, the holiday accounting for the decline of 4.1 per cent. as compared with a week ago. New York, Chicago and St. Louis Railroad were weak on the commencement of proceedings by bondholders.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values, calculated on closing prices (1926 = 100).

FORTHCOMING ISSUE

Beechams Pills, Ltd.—Lists will open and close on Wednesday next, September 14th, for an issue of 2,400,000 deferred shares of 2s. 6d. each, at 7s. 6d. per share. The issue will provide finance for the completion of the purchase of ordinary shares of Macleans, Limited, and for general purposes. The prospectus will show that, on the basis of profits for the year to March 31, 1938, the directors are of opinion that the annual profits of the company should not be less than £502,000. After providing £215,000 for preference dividends, and adding £120,000 (the estimated dividend receivable from Beecham Maclean holdings) the estimated profits of £407,000 are equivalent to earnings of approximately 34 per cent. on the deferred capital issued or to be issued, or subject to the operation of annual sinking fund instalments on the redeemable preference shares, to over 31 per cent., and over 10 per cent. on the issue price.

UNIT TRUSTS

Domestic Investment Trust (Second Series).—Managers, Domestic Trust Managers, Ltd. Life, 20 years. Initial portfolio, over 120 securities. Also extensive list of further permitted securities. Limits, 5 per cent. of fund in any one security, 7½ per cent. in any one corporation (other than trustee stocks), and not over 2½ per cent. of any one issue may be held. Initial service charge, 6 per cent.; annual charge, ½d. per each unit. Selling price adjusted up to 3d., buying price down to 1½d. Meeting may be called by holders of 10 per cent. of units.

SHORTER COMMENTS

Company Results of the Week.—BARNSLEY BREWERY have fully maintained net profits, and the directors repeat the 16 per cent. dividend. Gross profits on sales last year were £3,300 higher at £153,039. INDUSTRIAL FINANCE & INVESTMENT CORPORATION has been affected by economic and political difficulties, and net profits are £32,000 lower at £62,898. A sum of £40,007 (against £31,211) is required from profits for depreciation and losses on sales of investments. The first report of KAY AND COMPANY, ENGINEERS, since its introduction to the public, shows trading profits for a full year of £47,461. Earnings amount to £29,177 net, after setting aside £2,281 earned before acquisition. An interest in another engineering business is being acquired. A satisfactory rise in net profits, from £53,008 to £60,203, is shown by KETTON PORTLAND CEMENT, whose dividend rises from 12½ per cent. to 15 per cent. The heavy industries continue to provide good results. HORSELEY BRIDGE AND THOMAS PIGGOTT, LTD., have earned £74,476, against £57,569, though the 10 per cent. dividend is unchanged. Turnover reached a new record, although there was some difficulty in obtaining steel supplies in the first half of the year.

MISCELLANEOUS

Sir J. L. Hulett and Sons.—Net profit year to April 30, 1938, £81,270 (after placing £116,000 to depreciation and reserve). Dividend 6 per cent. and bonus of 1 per cent. free of South African tax, compared with a dividend of 7 per cent. a year ago. (For year to April 30, 1937, net profit was £81,522, after £107,829 to depreciation and reserve.)

(*Continued on page 516*)

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

Industry and Trade

Further Increase in Employment.—While evidence of the course of business activity during the next few months is still inconclusive, the employment and unemployment returns for July and August are certainly re-assuring. The rise in employment and the fall in unemployment during the past two months cannot be ascribed to seasonal influences. Our index of employment, adjusted for seasonal variations, rose from 109 (1935 = 100) in June to 110 in August. Similarly, the seasonally corrected index of changes in the total number of registered unemployed, which we have added to the table below, fell from 91·0 (1935 = 100) in June to 86·4 in August. While various changes in the unemployment insurance scheme and in the method of counting the unemployed render our new index of *unemployment* less reliable than the index of *employment* as an indicator of long-term movements, it reflects month-to-month changes more accurately than the latter, which is based, not on monthly returns, but on estimates subject to revision at the end of each year. The two indices will henceforth be printed each month; together they provide the best possible guide to the significant movements of total unemployment and employment. If allowance is made for changes in the method of counting the unemployed introduced in September last year, the number of registered unemployed on August 15th was 451,000 higher, and the number of insured persons in employment 320,000 less, than in the corresponding month last year:—

EMPLOYMENT AND UNEMPLOYMENT IN GREAT BRITAIN

* Method of counting unemployed changed in September, 1937.

Between July and August unemployment declined in all districts with the exception of South-Eastern and North-Western England and the Midlands. There was an improvement in the coal-mining, building, public works contracting and footwear industries. On the other hand, unemployment showed an increase in many important trades, including the cotton, woollen and worsted, iron and steel and engineering industries. The returns for September should indicate more accurately the direction in which the wind is blowing.

* * *

Recession in Coal-Mining.—The coal-mining industry has not remained unaffected by the slowing down of the wheels of industry. There is normally a seasonal fall in the demand for household and central heating coals in the second quarter of the year, but this year the decline was accentuated by a reduction in industrial requirements and in export business. The quantity of saleable coal raised in April-June was only 54·0 million tons, against 60·5 millions during the corresponding period last year, and exports were 1,972,000 tons lower than in the second quarter of 1937. The credit balance per ton in the second quarter, as estimated by the Mines Department, was 9d., against 1s. 11½d. in the first quarter and 11·08d. in the corresponding period of 1937. The reduction in the credit balance per ton was caused, in the main, by an increase in the cost of production, provisionally estimated by the Mines Department at 1s. 1d. per ton between the first and second quarters this year. The time lost through lack of business in the second quarter is estimated by the Mines Department at 10¾ days, compared with 3¾ days in the first quarter, and 4⅓ days in April-June, 1937. During the second quarter of the year, wages benefited from the exceptionally favourable trading results in the first three months, and the cash earnings per man-shift worked averaged 11s. 3d., compared with 11s. 1½d. in the first quarter and 10s. 9¾d. a year ago. Moreover, the agreements providing for holidays with pay became operative in most of the coalfields of the country in the second quarter, and in the month of June this new concession involved an additional charge in the Yorkshire coalfield of 2·73d. per ton. The industry was unable on a falling market to raise its prices. There was a further advance of about 5d. per ton in the declared average f.o.b. price of export coal, but this increase was due to long-period contracts, and the export trade now accounts for only about 22 per cent. of the national output, compared with over 35 per cent. in pre-war years. In the inland trade, the usual seasonal reductions in the prices of house coals became operative, and quotations for industrial coals were also lower. The average pit-head proceeds ar eestimated by the Mines Department to have been about 1½d. per ton less than in the first quarter. Contrary to experience in recent years, the coalfields wholly or mainly dependent on the inland trade suffered heavier reductions in credit balances than the export districts. For the month of June the audits for Yorkshire, Leicester, Cannock Chase and Nottinghamshire showed losses, and the Yorkshire credit balance for the second quarter was only £198,737, compared with £1·1 millions in the previous three months. Unfortunately, there are no signs of an early improvement, for the seasonal expansion in demand has so far been disappointing.

* * *

Aircraft Expansion.—The announcement that the British Air Mission to Canada has concluded an agreement for the manufacture, under a long-range programme, of bombers, and possibly of other aircraft in that country, represents a further step in the Government's drive to increase the aircraft "war potential." It is additional evidence, too, that the increase in the scope of the Air Force programme which was announced after the annexation of Austria, went a good deal further than was suggested by Government statements at that time. Like other expansions in the programme, it had a dual purpose. In the first place, it called for an immediate increase in output. And this necessity was largely met by the allocation of orders, to each of the principal manufacturers, sufficient to keep the industry working at full capacity for at least eighteen months to two years. For the first time since the initial expansion started, the industry is now satisfied that its productive capacity is being fully and smoothly used by the Government. At the same time, steps were taken to increase productive capacity. This is being done mainly by a considerable extension of the "shadow" factory system. In some cases new factories are to be erected. There is, for instance, to be a factory for the production of Rolls-Royce engines, of carburettors which will be managed by Standard Motors, of bomber aircraft which will be managed by A. V. Roe, and of "Spitfire" fighters which will be supervised by Lord Nuffield. In other cases existing factories are being extended—an example of this is the planned expansion of the Rootes airframe works at Liverpool. Finally, one or two of the aircraft manufacturers, such as Bristol, are expanding their own works with the help of Government finance. It is noticeable that Government finance, or the Government's guarantee, of any capital expenditure is playing an increasingly important part in aircraft output. The professional industry itself appears to be approaching the limit of its own unaided expansion.

* * *

Steel Cartel Prices Unchanged.—At its meeting in London on Tuesday, the Commission of Comptoirs of the International Steel Cartel, which regulates the export market policy for the individual steel producers, decided to leave present export prices unchanged. In view of the reduction of prices for thick plates a few weeks ago, it had been expected in some quarters that the prices of other products would also be lowered. The Commission, however, maintained that such a step would create uneasiness among consumers and that, moreover, there have recently been signs of an improvement in demand and of a diminution of American competition. With regard to the latter, it is to be noted that a resumption of the negotiations with the American steel producers is expected shortly, and it is possible that an Anglo-European delegation will sail to the United States in order to try to come to an agreement which includes the present outsiders. Moreover, the meeting of the Iron and Steel Institute, which will take place in New York at the beginning of October, may offer a further opportunity for a discussion of the world's steel position and of the future relations between the industry on both sides of the Atlantic.

* * *

The Oil Outlook.—Despite the maintenance of demand in the principal consuming countries at a level substantially in excess of that obtaining a year ago, prices of petroleum products on the world market have recently tended to fall. Petrol prices for shipment from the Gulf, for instance, are now almost 25 per cent. lower than at this time last year, while those of some of the heavier products have fallen even more severely. The proximate cause of the unsatisfactory trend of Gulf prices is to be found in a deterioration of the statistical position of the market in refined products. At 70,514,000 barrels, total stocks of petrol in the United States are now 3,466,000 barrels, or 5 per cent., above the level of a year ago, while stocks at the Gulf actually show an increase of around 27 per cent. Total American stocks of gas and fuel oil, moreover, amount to 147,646,000 barrels, an increase of 34,203,000 barrels, or 30 per cent., on the year. The growth of stocks on the American export market is not due to a decline in demand, for United States exports of liquid oil products (including crude oil) during the present year have exceeded the comparable total for 1937 by no less than 27 per cent.; shipments of petrol, indeed, have risen by almost 40 per cent. In short, the trouble is traceable to the tendency to over-production of finished products in the United States.

* * *

In the first half of the current year the throughput of the American refineries (570,757,000 barrels) was about 1 per cent. higher than in January-June, 1937. Although it has since been reduced below last year's high level, refinery activity—especially in those centres from which Gulf exporters draw their supplies—is still too high; and it is consequently impossible to work off the excessive stocks which are depressing the market. The crude oil position, however, offers a striking contrast. The regulation of output in those States which adhere to the Inter-State Oil Compact was responsible for a 3 per cent. cut in United States crude oil output between January-June, 1937, and the corresponding period of this year, and production is still being kept within reasonable limits. Thus, American stocks of crude oil now amount to no more than 285,137,000 barrels, against 309,669,000 a year ago. The decision to re-introduce the five-day week in Texas, discussed in *The Economist* of August 27th, on page 429, is further evidence of the determination of the authorities to defend the crude oil price structure by every means in their power. This is all to the good; for any general reduction in the price of crude oil might well result in the demoralisation of the oil markets. Moreover, a sufficiently drastic curtailment of crude oil production must ultimately bring about the required reduction in refinery operations. If this occurs, and if the gradual improvement in general business activity in the United States is continued, it should be possible to take a more hopeful view of prices than is justified at the present time.

* * *

Germany's Raw Material Imports.—The early months of 1938 brought in Germany an increase in

SHORTER COMMENTS

(*Continued from page 513*)

Beechams Pills Meeting.—At the meeting of deferred shareholders this week, Mr Philip E. Hill explained the importance of the Macleans Ltd. acquisition. Apart from dividends to be received, there should be a saving in expenses and benefit from pooling management experience. Announcing proposals for the new issue of deferred shares (to which reference is made on page 513), he reported that negotiations were in progress which might shortly lead to "interesting developments."

Foreign Government Bond Trust.—Distribution of 5·20d. per bond-unit, free of tax, or £5 18s. 0d. gross per cent. per annum on initial price of £1. This distribution has been made possible by the encashment of two coupons in arrears of the Roumanian Monopolies Institute Loan. No Greek coupons have been encashed.

Blakey's Boot Protectors.—Profit for year to June 30, 1938, £36,722 against £34,232. Tax and N.D.C., £12,715 (£10,400). Ordinary dividend, 15 per cent. as before, but on an increased capital. Carry-forward raised from £5,742 to £15,989.

Incorporated Accountants' Examinations.—The next examination of candidates for admission to the Society of Incorporated Accountants and Auditors will be held on October 31st, November 1st, 2nd and 3rd. Particulars and forms are obtainable at the office of the Society, Incorporated Accountants' Hall, Victoria Embankment, London, W.C.2.

Cammell Laird and Company.—Interim ordinary dividend 4 per cent., payable October 4th. This is the first interim payment for many years. For 12 years prior to 1935 no dividends were paid on the ordinary shares. Capital was reconstructed in 1932. Ordinary dividends for whole years: 1935, 3½ per cent.; 1936, 5 per cent.; 1937, 8½ per cent.

Imperial Smelting Corporation.—Final dividend on the 6½ per cent. cumulative preference shares is 1¼ per cent., making 4½ per cent. for the year, against the full 6½ per cent. for previous year, when 5 per cent. was also paid on the ordinary shares. This 1¼ per cent. payment will suffer no deduction for tax, owing to Dominion Income Tax relief.

Roan Antelope Copper Mines.—Final dividend on 5s. ordinary shares 10 per cent., making 20 (against 80) per cent. for year on a capital increased by a 200 per cent. scrip bonus in October, 1937; payable October 19th to holders as at September 23rd. The report and accounts will be posted October 7th, and the meeting will be held October 18th.

industrial activity, which had already reached very high levels in 1937. One result has been the shortage of labour, particularly of skilled labour, which has become very marked in the last few weeks; another result is reflected in the increased imports of industrial raw materials. The table below gives the imports into Germany (excluding those from Austria) of various raw materials in the first seven months of 1937 and 1938 :—

IMPORTS OF IMPORTANT COMMODITIES
(In Millions of Kilogrammes)

	1937 Jan.–July	1938 Jan.–July
Iron ore	14,467	13,581
Non-ferrous metallic ores	782	981
Pig iron, etc.	383	801
Semi-manufactured steel	141	199
Non-ferrous metals	265	286
Petroleum and tar	622	705
Rubber	73	68
Wheat	825	575
Maize	769	955
Vegetable oils	859	987
Oilcakes	50	120

There has been a very considerable increase in the imports of pig iron and semi-manufactured steel and of non-ferrous metals. The shortage of animal feeding-stuffs during the current year led to an expansion in the imports of maize and oilcakes, which are included in the table given above; imports of wheat, however, were smaller in the first seven months of 1938 than in the corresponding period of last year.

★ ★ ★

Shipping Freight Rates Steadier.—Following a headlong fall, from 169·8 (1898–1913 = 100) in September, 1937, to 113·7 last April, tramp shipping freight rates have shown a steadier tendency. Since April, the index has moved within narrow limits, and the figure for August, which, incidentally, was almost the same as that for the corresponding month of 1929, confirms reports of a slight improvement on the freight markets :—

The Economist INDEX OF FREIGHT RATES
(1898 – 1913 = 100)

	Average, 1913	Aug., 1937	May, 1938	June, 1938	July, 1938	Aug., 1938
European waters	110·0	178·7	109·2	107·3	106·2	103·8
North America	113·1	125·9	111·0	108·0	108·5	110·1
South America	123·4	154·2	132·3	127·0	119·9	124·8
India	106·3	180·2	111·7	111·9	112·3	110·0
Far East and Pacific	117·4	170·6	106·2	104·7	105·2	106·2
Australia	127·9	161·1	113·0	112·8	112·5	113·0
Total	116·3	161·8	113·9	111·9	110·8	111·3
1913 = 100	100·0	139·0	97·8	96·1	95·2	95·7

As the next table shows, the improvement was by no means general, rates on some routes registering a further fall between July and August :—

	Index No.	Inc. or dec. Points		Index No.	Inc. or dec. Points
Home trade	95·9	− 6·9	South America :—		
Bay—outwards	99·1	+ 1·9	Outwards	96·2	+10·7
Bay—homewards	137·1	+ 1·6	Homewards	124·8	+ 4·9
Mediterranean :—			India—outwards	94·7	+ 2·1
Outwards	76·9	− 3·7	India—homewards	125·3	− 2·5
Homewards	117·7	− 0·8	Far East, etc.	106·2	+ 1·0
North America	110·1	+ 1·6	Australia	113·0	+ 0·5

The improvement on the freight markets noticeable last month may be attributed, in part, to the previous rise in the prices of many primary products, but it does not necessarily portend a change of trend. The prospects of an expansion in international trade, which is essential for a sustained improvement in freight rates, are still uncertain. In the circumstances, the reluctance of shipowners to place orders for new ships is scarcely surprising.

★ ★ ★

A Lead Cartel.—No section of the economic community of the world suffered more from the depression of 1929-32 than the primary producers. With this experience behind them, the onset of declining prices and declining demand has this time resulted almost in a race among raw material producers to conclude agreements designed to speed-up the adjustment of supply to changes in demand. Such an agreement has just been concluded among a section of the lead industry which controls some 75 per cent. of world production outside the United States. The newly constituted Lead Producers' Association apparently includes the Australian group of mines, the Trepca group, the Burma Corporation, Consolidated Mining and Smelting of Canada, and American Smelting and Refining, which has interests in Mexico, Newfoundland and Australia. After reaching £37 per ton in the spring of last year, the price of lead has fallen sharply, and now stands at £14-£15 per ton. According to the latest issue of *Metal Statistics*, published by the Metallgesellschaft A.G., the world's smelter production and consumption of lead in 1937 were 1,691,700 tons and 1,722,000 tons, respectively. On the basis of these estimates there was no disequilibrium between output and consumption last year. Since then, however, production is believed to have run appreciably above consumption. As the Lead Producers' Association, with its present membership, includes only part of the world's output, it may find the adjustment of supplies to demand no easy task; but the market, in an optimistic frame of mind, has already raised prices by a few shillings per ton.

INDUSTRIAL REPORTS

THE flow of new orders to industry remains disappointing for this time of the year. Our Cardiff coal correspondent can discover no signs of the normal seasonal expansion in demand, and our Glasgow correspondent is no more cheerful. Similarly, the official report of the London Iron and Steel Exchange states that markets show no marked signs of an early improvement. Output of pig iron may have to be further reduced and stocks of semi-finished steel in the hands of consumers and producers remain substantial. A slight improvement in the demand for iron and steel products has been noticeable in the Glasgow district. Business in cotton goods and most other textiles remained dull. The political crisis in Czechoslovakia is partly responsible for the hesitancy of buyers.

Coal

Sheffield.—In consequence of the fall in demand, the output quota for the Midland (Amalgamated) District has been reduced by 5 per cent. to 50 per cent. of the standard tonnage. Domestic demand for industrial coal is slow. Considerable stocks of small coals are in hand and prices are inclined to ease. Heavier deliveries are being made to electricity generating plants, but coke and brickworks' requirements are small.

The market in house coal was very active towards the end of August, and it was impossible to fulfil all orders before September 1st, when prices were increased. Some of the South Yorkshire collieries advanced ordinary qualities by 1s. 8d. per ton, best by 2s. 2d. to 2s. 4d., and best selected by 3s. per ton. Other South Yorkshire collieries have not yet notified higher prices. Derbyshire collieries have raised prices for the winter season by about 2s. per ton and West Yorkshire pits by 1s. 8d.

Business in coke is quiet, and output is being reduced. Blastfurnace coke can be obtained at 20s. per ton at ovens for inland, and patent-oven coke, large and graded, at 27s. per ton at Sheffield depots, with lower prices by some non-federated makers.

Export trade is as dull as ever.

★

Newcastle-on-Tyne.—Inquiry on the north-east coal market is improving. Scandinavian countries are interested in steam coals and home demand for this class of fuel is much better. Durham manufacturing coal moves very slowly, but during the past week several cargoes have been sold to Germany for delivery over this and next month. Coal prices are unaltered.

★

Glasgow.—Shipments were down by 40,000 tons during the past week, and the total decline for the year to date is 1,427,000 tons, the present year's figure being 6,910,000 tons, against 8,337,000 tons last year. All markets have shared in this decline. Business is still moving quietly, and some collieries are on short time. Nevertheless, prices are being maintained, with nuts if anything firmer, owing to the reduction in the output of large coal. The London trade is not yet as brisk as it was in earlier months, and there has been a slower demand in most sections of the home market. Forward business is dull.

★

Cardiff.—There is no indication yet of the normal autumn expansion in demand. Sluggish conditions continue on the Cardiff coal market, and as contract commitments are insufficient to absorb current production, stocks are increasing. Shipments in the foreign and coastwise trades at the South Wales ports last week totalled 373,200 tons, compared with 422,600 tons the previous week and 458,822 tons in the correesponding week last year. Sized coals are relatively scarce, but supplies of other qualities are abundant.

Prices are nominally unchanged. In view of the heavy drop in the credit balance of the coalfield in the June quarter, and prospects of heavier costs, it is considered improbable that there will be any downward revision of the Control Board's prices in the near future. Coke is weak, and the patent fuel trade continues to languish. Reports are current on the market that the French authorities are taking measures to secure for Great Britain an effective import quota of 49.5 per cent., but they are not yet confirmed.

Iron and Steel

London.—The report of the London Iron and Steel Exchange indicates that the markets fail to show any marked signs of an early improvement. Although the volume of inquiry has increased, only a comparatively small proportion has led to business, and consumers in practically all branches appear to have adopted a policy of restricting their purchases to early needs.

There is a poor demand for pig iron, as some of the more important consuming industries are passing through a period of quiet trade and are able to satisfy their needs either from stocks on hand or from deliveries against contracts entered into some months ago. It seems likely that the production of some descriptions of pig iron will be further curtailed to bring it more into line with the restricted demand.

Conditions in the semi-finished steel department are disappointing and although inroads have been made into stocks, many consumers and some of the producers have accumulations on hand which stand in the way of the transaction of new business. Imports, however, are carefully controlled and a revival in the demand for finished steel would quickly be reflected in an improvement in the semi-finished section. Irregular conditions rule in the market for finished steel. The heavy steel makers have enough work in hand to keep them operating at a fair rate of capacity, but the amount of business coming forward is not sufficient to make good completed contracts. A few signs of increased activity are noticeable in the lighter sections of the trade, in which, however, there is a certain amount of unemployed plant. Export business is restricted but there has been a slight increase in the inquiry.

★

Sheffield. Stocks of forge and foundry pig iron at works appear to be ample for present requirements, and such transactions as take place are of small weight. Forward business is at a minimum. There is some inquiry for hematites, but generally users are well covered by contract. Business in bar iron is quiet, and the mills are working irregularly.

There has been further contraction in the demand for basic and acid steel billets, and a general easing in other sections of the market. Business in steel scrap is virtually at a standstill pending the outcome of the meetings to decide on the future of price control, which runs until the end of the present month. It is expected that the period will be extended to December 31st.

While in some of the lighter industries there is a good deal of short time, the heavy engineering and machinery branches are fully employed. Shipbuilding and armament work is increasing.

★

Middlesbrough.—As a result of the cessation of imports and the reduction in local production of pig iron, there is a more hopeful feeling. Small transactions in pig iron have taken place which, with deliveries to be made under existing contracts, are hoped to prevent any increase in makers' stocks. Rather more basic iron is being used at producers' own steelworks. It is expected that foundries which have been using the supplies of Continental pig iron purchased some time ago will enter the market for their requirements within the next two or three months.

Re-rollers are not experiencing any better demand, but finished steel is being specified a little more freely. Makers of heavy steel are well occupied and there is a slightly better request for lighter material.

★

Glasgow.—Conditions show little change this week. For all classes of material the slight improvement which has been in evidence lately is maintained. The tonnage on books is quite considerable. In this district makers of metal containers are particularly busy and makers of metal fitments for use in various types of institutions are also fully employed and have many months' work on books. Tube makers, who have had a very quiet time of late, report that they are finding new business slightly more plentiful.

★

Cardiff.—There has been no material change during the past week in the condition of the tinplate industry. Production is at 48.15 per cent. of capacity, compared with 77.25 per cent. during the corresponding period last year; and shipments last week totalled 3,387 tons, compared with 5,402 tons a year ago. Prices are nominally unaltered. The market for steel sheets is also quiet, and there has been no alleviation of the depressed state of the heavier branches of the industry.

Textiles

Cotton (Manchester).—Business has been overshadowed by the serious political situation, and in these circumstances merchants have not been prepared to enter into fresh commitments. Cotton prices have tended to sag, with the uncertainty concerning the effect of the second crop estimate by the American Government. Trade demand has been small. Advices relating to the crop in Egypt have been less satisfactory.

The yarn market remained dull. Users of American and Egyptian counts have purchased from hand to mouth. Practically all the mills in Bolton have extended the usual short holiday.

Business in cloth for foreign outlets has been decidedly featureless. There has been some inquiry, but merchants have been indifferent buyers, with most offers quite impracticable. Unemployed cotton operatives now number 123,752, against 116,964 a month ago.

★

Jute (Dundee).—The market has been under the influence of a "short crop" scare. According to the final forecast, the jute crop is expected to be 23 per cent. less than last year. The first returns estimated a reduction of 47½ per cent. and, although it was suspected that the estimates for the districts showing the biggest decreases had been published first, spinners here were impressed and bought fairly freely, paying as much as 15s. to 20s. per ton more. The value of Daisee-2/3 was rushed up to £19 17s. 6d. per ton for full group and £20 7s. 6d. was paid for good marks, but prices reverted to £19 2s. 6d. and £19 15s. respectively, October/November.

The rise in raw jute prices made no impression on buyers of yarns and cloth. They made no more inquiries and they were reluctant to pay any advance in prices. Spinners and manufacturers, however, were already in an unsatisfactory position in that they were compelled to accept prices which were insufficient to meet the cost of production. They therefore raised their quoted rates and 2s. is now the lowest for common 8-lb crops, while for 10 oz. 40 in. hessians 2¼d. is the minimum and 2d. for 8 oz.

Calcutta goods have shown only a slight change and buyers there have refused to follow any advance. The position of the Indian mills remains unchanged; two firms are still refusing to sign the agreement to restrict production, and stocks are increasing.

THE COMMODITY MARKETS

OWING to the crisis in Czechoslovakia, the commodity markets were subdued this week. Consumers were hesitant and prices drifted downwards.

Copper prices, exceptionally, showed a rise on the week, and lead prices were advanced on the news of the formation

COMPANY MEETING

BEECHAMS PILLS

INCREASE OF CAPITAL APPROVED

MR PHILIP E. HILL'S SPEECH

A separate meeting of the deferred shareholders of Beechams Pills, Limited, was held, on the 7th instant, at the Hotel Victoria, Northumberland Avenue, W.C., to consider a resolution increasing the capital of the company by the creation of 3,600,000 deferred shares of 5s. each; capitalising £600,000 standing to the credit of general reserve to be distributed as fully-paid deferred shares of 5s. each to the existing deferred shareholders; subdividing each 5s. deferred share into two deferred shares of 2s. 6d. each; and altering the articles of association so as to maintain the existing balance of voting power between the three classes of shares.

Mr Philip E. Hill (Chairman of the company) presided.

The secretary (Mr B. L. Hobrow, A.C.A.) having read the notice convening the meeting,

The Chairman said: Ladies and gentlemen, since we last met my co-directors and I have evolved the scheme to which I referred at our annual meeting, for making the deferred shares of the company a more marketable unit at a price within the reach of all classes of our customers and the general public. I wrote to you on August 15th giving full particulars as to how this was to be effected, and, judging from the numerous letters I have received from shareholders and others, and from the comments of the financial Press, the scheme appears to be generally acceptable.

PURCHASE OF MACLEANS LTD.

You will also have noticed from my letter that we have purchased the whole of the ordinary share capital of Macleans, Limited, the well-known manufacturers of Maclean Stomach Powder, Fynnon Salts, Macleans Peroxide Tooth Paste, and a large number of other pharmaceutical and branded products. I consider this acquisition as one of the most important made by this company, not only from the point of view of the dividends we shall receive from Beecham Maclean Holdings, Limited, the company formed by Beechams Pills, Limited, to hold these shares, but from the savings in expenditure which should result from the acquisition and the benefit of the pooling of the management experience of this highly successful business.

You will have seen from the notices sent you that the balance of voting power of the three classes of shareholders in the company has been maintained. Trading conditions continue to be satisfactory, and, as you are aware, we have just paid the same interim dividend as last year on the increased capital. Upon the proposals of the directors receiving your assent to-day, it is proposed to make an issue of 2,406,000 deferred shares of 2s. 6d. each, on attractive terms, almost immediately. Preferential consideration in allotment will be given to holders of shares of all classes in the company and its subsidiaries.

INTERESTING DEVELOPMENTS

During the past seven years your company has shown an expansion of business and profits, and there appears to be no reason why this progress should not continue. At the moment we have negotiations in progress which may shortly lead to interesting developments. The prospectus, when published, will give all the necessary information to enable shareholders to form their own views with regard to the attractiveness of the proposals.

The chairman concluded by moving the resolution, which was seconded by Mr J. Stanley Holmes, M.P. (managing director), and carried unanimously.

At a subsequent extraordinary general meeting of the company the proposals were also approved.

(*Continued from page 519*)

of a lead cartel. Tin and spelter, as well as rubber, linseed oil, cotton and wheat were marked down in price.

A similar trend was noticeable in the United States. Moody's index of the prices of staple commodities (December 31, 1931 = 100) fell from 143.7 to 143.1 during the week ended last Wednesday; a month ago the index stood at 146.0, and a year ago at 194.9.

Metals

Copper.—In spite of the political tension, the standard cash price for copper improved by 13s. 9d. this week to close at £41 per ton, though the turnover on the market was small. The comparative strength of the copper price level during the last few days is interpreted in market circles as a favourable barometer for the copper price outlook in the autumn.

★

Tin.—The price of tin fell by £2 to close the week at £190 15s. per ton. The demand for the metal declined further and on Monday the turnover on the L.M.E. reached the lowest daily level for a number of years. There are possibilities that a revival of the United States tinplate and automobile industries may help to improve the tin position in the next few weeks. At the moment, however, the situation is definitely unfavourable. According to Messrs A. Strauss and Company, Limited, the total visible supply of tin rose last month by another 1,216 tons to 30,717 tons; in addition, the world's invisible tin stocks are at present larger than for several years past, so that the total stocks of the metal must be at least as high as 45,000 tons. New supplies amounted to only 6,562 tons in August against 8,758 tons in July, a direct effect of the lower quota for the third quarter of this year. On the other hand, deliveries fell further from 6,854 tons in July to 6,107 tons in August, and reached the lowest level for several years.

★

Lead and Spelter.—While spelter declined by 6s. 3d. to £13 2s. 6d. per ton, lead improved by 8s. 9d. to £14 13s. 9d. per ton. The decline in spelter was due to a lack of consumers' buying, while the improvement in lead was the direct result of the announcement that a Lead Producers' Association has been formed this week with the object of regulating the supply to the demand. As far as can be ascertained, no definite restriction agreement has been agreed upon so far, but the market expects that the new lead scheme will be more or less on the same lines as the present copper scheme.

Grains

COMPARED with a week ago, wheat prices on Wednesday were 1s. 6d. to 3s. per quarter lower and the fall was most marked for near positions. Selling pressure from Russia and the Danube district, combined with the declaration of the United States Government of their intention to export 100 million bushels this season, had a depressing effect on the market, in which demand is very slow. The Federal Surplus Commodities Corporation has already bought some five million bushels and sold about two millions, at a loss estimated at 4 to 7 cents per bushel. Maize prices also declined during the week, but demand still remains poor, as this grain is barely competitive as a feeding-stuff with wheat and barley. Barley has been affected by selling pressure from Canada, Russia and Irak and compared with last week the price has declined by more than 1s. per quarter.

Other Foods

Provisions. — Dominion butters were advanced in price by 3s. per cwt. during the week and egg prices rose by about 1s. per 120. Elsewhere the markets were quiet. The trade in fresh meat was slow, except for pork; demand for chilled and frozen meat was good.

★

Colonial Produce.—After brisk sales at the end of last week, demand at the tea auctions has been somewhat less active, and prices weakened at the close. Other markets have been steady.

★

Fruit and Vegetables.—Heavy supplies of potatoes at the Borough were cleared with difficulty, but prices were unchanged. The market for vegetables was very slow after the week-end, but English apples and plums sold well.

Miscellaneous Commodities

Oils and Oilseeds.—In sympathy with the grain markets, prices for oils and oilseeds have tended to fall. Demand is exceptionally light and crushers are not inclined to enter into forward contracts. Plate linseed is again cheaper; private estimates forecast an increase of 10 per cent. in the area under linseed in the Argentine and weather conditions are reported to be favourable.

★

Rubber.—The market has been dominated by the political uncertainty, and very little business was transacted during the week. Compared with the previous Wednesday, prices showed a fall of ⅛d. per lb.; while demand is small, sellers are also reserved.

Rubber

In the following charts we present a number of facts about the rubber industry, with special reference to the United States, which last year consumed nearly half the world's output. All the statistics have been taken from "The Statistics of the Rubber Industry," by George Rae, D.Sc. (*Journal of the Royal Statistical Society, 1938, Part II*). The average prices shown are those of ribbed smoked sheet, London. The figures of consumption are net imports adjusted where possible for changes in stocks. The average age of cars in the U.S.A. is computed on the assumption that the oldest cars are the first to be discarded.

Finance

GOVERNMENT RETURNS

For the week ended September 3, 1938, total ordinary revenue was £11,154,000, against ordinary expenditure of £25,245,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £141,620,000, against a deficit of £86,780,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On September 2nd, applications at £99 17s. 4d. per cent. for bills to be paid for on any day of the following week were accepted as to about 37 per cent. of the amount applied for. Applications at higher prices were accepted in full. £45·0 millions of Treasury bills are being offered on September 9th.

Hope from Despair

EUROPE has lived through one of the most extraordinary and nerve-racking weeks of its history. Never can events have tripped so rapidly and so confusingly over each other's heels. Rarely can the emotions of the ordinary citizen have been so agitated, when black pessimism and nervous optimism have alternated in such fierce assaults on cool-headed judgment. Herr Hitler's speech seemed to the British public to have at least the merit that it slammed no doors, and the general mood was, as a result, a shade lighter on Tuesday morning. But the Sudeten riots in Bohemia, the proclamation of emergency powers by the Prague Government and the breaking-off of all negotiations between Czechs and Sudetens, caused a reaction, on Wednesday, to the most gloomy forebodings. Then, late on Wednesday night, like the clap of thunder that in the old classical dramas announced the arrival of the *deus ex machina*, came the utterly unexpected news that the British Prime Minister was flying on the morrow for a personal conference with Herr Hitler.

When events pile up on top of each other in this fashion, even the daily newspapers confront a new world with each edition. A weekly journal can make no pretence to do more than record the past and speculate upon the future—a future which may already be several layers deep in history before these words are read. When we wrote last week, doubts were arising about the firmness with which the British Government were holding to their declared position. These doubts were partly resolved by a statement on Sunday evening—twenty-four hours before Herr Hitler spoke—which made it even clearer than ever that in the event of a European war breaking out over the Czech-German quarrel, Great Britain could not stand aside. But some uncertainty still remained over the extent to which, for the sake of peace, Britain would herself go, and persuade those dependent upon her to go, towards the German demands. Herr Hitler's speech accordingly, though it left the way open for negotiation, gave no sign whatever that Germany was in a mood to abate any of her demands. On the contrary, they were enlarged to include "self-determination" for the Sudetens, who were repeatedly and emphatically promised the backing of the Reich. The Sudetens in Czechoslovakia immediately drew the obvious conclusion: they began to revolt against the authority of the Czechoslovak State. In less than twenty hours after Herr Hitler's speech at Nuremberg, a state of emergency, approximating to martial law, had been proclaimed in many of the Sudeten districts. An ultimatum from Herr Henlein having been left without answer by the Prague Government, the Sudeten leaders broke off all negotiations and declared that the famous eight points of Carlsbad were now no longer enough to satisfy their ambitions.

This, then, was the situation which held Europe breathless on Wednesday. The deadlock in Czechoslovakia was complete. News was coming in of fatal affrays in the Sudetenland, and though there were signs that the rulers of Germany were at the last minute hanging back when they saw the depth of the abyss before them, no man dared hope that Herr Hitler could long refrain from intervening while Sudetens and Czechs were killing each other, or that his intervention would not plunge all Europe into war.

Upon this almost wholly black outlook the announcement of Mr Chamberlain's flight to Germany burst, late at night, without the slightest warning or preparation. It has been revealed that the idea originated with M. Daladier, though he probably had in mind a joint descent upon Berchtesgaden. But no matter whose original brain first hit upon this very bold stroke, Mr Chamberlain deserves—and is receiving—the applause of the whole world for his courageous action. There is one statesman at least who does not let pride or ceremony overcome his desire for peace. Courage was, indeed, needed. Journeys to Berchtesgaden have not, in the past, had happy sequels, and Mr Chamberlain is running the risk of being told that he is really going to Canossa. But the threatened catastrophe of a general war is so appalling that the world is unanimously of opinion that Mr Chamberlain was supremely right in not allowing any consideration of prestige to prevent him taking the only step that offered any hope of averting it.

No one will envy the Prime Minister the very heavy personal responsibility that rests upon his shoulders. Nor is it useful at this moment to attempt to foresee the outcome; for this dramatic move has taken us out of the realm of calculable factors and carried us into a region where psychology and the mutual influence of personality will play an exceptionally important rôle. In this visit there are great possibilities. Through a sudden break in the clouds, the world has for a moment caught a shadowy glimpse of a new world in which Germany may come to live on terms of peace and understanding with the rest of the world. At the moment none can say whether this is reality or illusion. Herr Hitler has always held that Germany must be friends with England. He has not apparently understood what a stumbling-block his philosophy, his outlook and his methods place in the way of this consummation. It may be that the simplicity of method and the great compliment implied by this visit may profoundly modify his mental attitude—in spite of the venom of the Nuremberg harangue. On the other hand, a clash between the personalities of these two men on whom the eyes of the world are turned might have the direst results. For the moment we can only wait for the account from Mr Chamberlain's own lips which Parliament is to be summoned next week to hear.

But among these intangibilities there is one phenomenon that may be noted. The state of acutest tension under which the peoples of Europe—and not least those of Germany—have been living for the last few days has been suddenly relaxed. Yesterday war seemed inevitable; to-day, men and women everywhere are feeling that agreement can be made. It is difficult to believe that after this sudden fall in temperature, the peoples of the world can quickly be excited again to fever heat. And nations—even under dictatorships—do not go to war in cold blood.

This does not mean that the problems are solved. Even in the present atmosphere of great hope suddenly re-born out of great despair, it is necessary—all the more necessary—to sound a warning. The only agreement that is worth while having, the only one that will give Mr Chamberlain his honoured niche in history, is one that guarantees peace for more than a few weeks or months. An agreement that abandoned the Czechs would not merely be dishonourable, would not merely turn Mr Chamberlain's flight into an ignominious surrender, it would be short-sighted and contrary to the most narrowly conceived interests of Britain herself. The touchstone of any agreement must be this: does it put a stop to the method of expansion by brutal aggression? If it does, if the new settlement of Czechoslovakia (whatever it may be) is protected by real guarantees of its permanence, then Mr Chamberlain's work will have been well done. But if the Peace of Berchtesgaden turns out to be the rewarding of the aggressor in return for his mere promise to be good for a while, then we have merely gone a step further towards our own doom. "The stake the Prime Minister risks," says an American newspaper, "is his own prestige and the prestige of Britain. The world can only wait and hope that it will not be played in vain."

Britain's Recovery

FIVE years ago the Economics Section of the British Association performed a useful service by commissioning from a specially-constituted Research Committee a record of the changes produced in the economic structure of Great Britain by the Great Depression. This was published under the title of "Britain in Depression," and the Committee have now added to their meritorious labours by publishing a companion volume under the appropriate title of "Britain in Recovery."* The time is appropriate for an analysis of our recent recovery; obituaries should be published as promptly as possible after expiry has been ascertained. The enquirer will find in the British Association book all the facts and figures necessary for completing a picture of the Great Recovery of 1933-37.

It is very doubtful whether, as a nation, we realise how remarkable has been our economic achievement in the recovery period. It is certain that we do not make a tithe of the boastful noise about it that would be raised by many other countries with far less substantial justification. This is partly, perhaps mainly, the fault of the dominating influence that the unemployment figures have come to exert on the popular impression of the state of trade. The man in the street knows that there was a steep rise in unemployment between 1929 and 1932 and that not all of the increased unemployment has since been removed. He is, consequently, apt to believe that we suffered from a very severe depression and have only partially recovered.

If the man in the street looked, not at the returns of unemployment, but at those of employment, he would gain a corrective. If he could be shown the other economic indices brought together in "Britain in Recovery," he would discover that the truth is quite remarkably different from his conception of it. It is probable that the actual volume of the national output of goods and services was only some 7 per cent. lower in 1932, the worst year of the depression, than in 1929. Even this very narrow margin between prosperity and depression is somewhat misleading; for the total of wealth available to any community at any time is measured not by its output alone, but by its output as modified by the results of foreign trade. Between 1929 and 1932 the result of Great Britain's international exchanges turned sharply in our favour (though there was an increase in what the mercantilists, with their confusing terminology, call the "unfavourable" balance of trade). We continued to receive roughly the same volume of goods and gave considerably fewer of our own goods in exchange. Thus the physical total of goods and services available for the use of the community diminished by even less than the 7 per cent. fall in output. And since most of the reduction was concentrated in producers' goods, the volume of actual consumption by the people probably did not fall at all on balance, though the wage-earner in work gained at the expense both of the unemployed and of the classes dependent on interest and dividends.

These facts are remarkable enough. But they are less astonishing than the figures of expansion during the recovery period. If national output was only 7 per cent. below 1929 at the bottom of the depression, it was 20 per cent. above 1929 by 1937 (this is the figure reached as the conclusion of a lengthy discussion in the first chapter of the British Association book; it may be a little too high). Moreover, though the effect of foreign trade was to diminish the fall in 1929-32, it did not seriously impede the recovery in 1933-37. The real national income seems to have risen by about one-fifth in a single trade cycle, in spite of a very small rise in population and an increase in the *working* population that has only been moderate. British industry may have failed by 1937 to absorb a million or so of the unemployed who might have been absorbed; but there were four million more people at work in 1937 than in 1932. The British Association book is not concerned with the period before 1929; but, as Mr Keynes pointed out in an article in *The Times* this week, the pace of increase, not merely in total output but also in output per worker employed, has been many times faster in the last few years than between 1924 and 1929. He might have added that it is also well in excess (by all indications) of the average pace of *per capita* expansion in the nineteenth century.

Why has there been this truly astonishing burst of material progress in Great Britain, so soon after we were being written off as a valetudinarian nation? Can we pick out the vital element that gave the British economy such a sudden *élan?* Clearly it cannot be found merely in the normal recuperative influences of the upward phase of the trade cycle, though these have undoubtedly been very powerful; our recovery has been greater than that of most other countries, and greater also than most recovery periods in our own history. Everybody will have his own explanation, but most of them are very hard to reconcile with the facts. The protectionists, for example, will tell us that it was the tariff that did the trick. But how, then, explain the fact that the industries showing the most rapid expansion (as judged by the employment they provide) are not, in the main, protected industries? Of eight industrial groups listed in "Britain in Recovery" as showing "supernormal" expansion, five are from their nature insusceptible of tariff protection: the distributive trades; road transport; miscellaneous consumers' services; gas, water and electricity supply; and building. Another of the eight—motor vehicles, cycles and aircraft—received no additional protection. And the expansion of still another—the miscellaneous electrical industries—was clearly a secondary product of the expansion of the electrical industry itself.

Was the depreciation of sterling perhaps the cause of the striking recovery? Unquestionably it helped, and there is much evidence, accumulated over the past decade, that over-valuation of a country's currency represses its enterprise in a far more insidious manner than is superficially apparent. But complete acceptance of the theory that would ascribe the recovery predominantly to the departure from the gold standard is hampered by the fact that the export industries were among the last and slowest in recovery. Cheap money is another obvious explanation. Once again, it unquestionably helped. But once again, there are inconvenient facts. Cheap money ought to help the capital goods industries more than any others; but they have not been the fastest movers in recovery. Moreover, money to-day is almost as cheap as ever, but it has not prevented recovery from turning into recession.

Where, then, are we to find the clue to the mystery? For our own part we would put forward, not, indeed, as the exclusive cause, but as the chief one, a theory that has been mentioned more than once in *The Economist*. The British Association book quotes from this journal a sentence that will bear re-quotation: "Wage and salary earners . . . after buying their food, drink, tobacco and clothes, had something like £250 millions a year more left over in 1932 than in 1924-27." Since the rise in the price of food was comparatively slow in the early years of recovery, the figure of £250 millions would be higher in each succeeding year, at least until 1936. Here at least is a theory that fits the main facts: it explains the beginning of recovery and its concentration in the consumer's goods industries; it is confirmed by the fact that recovery withered away when the expansion of the consumers' purchasing power received its first serious check; and it fits in with the fact that the recession has appeared more clearly in the consumers' than in the producers' industries.

This is, we repeat, no more than a theory, though the one that appears to have the most *prima facie* justification. Whether or not the rise in British real incomes through the great fall in the price of imported food and textile materials was the largest single factor in British recovery, it was certainly one of the most important contributory causes. The practical applications of this truth are so obvious as barely to need statement. We must defend to the utmost the cheapness of our food supply, doing nothing by way of agricultural protection or otherwise that will reduce the purchasing power of the people. And we must think twice and thrice before we submit to price-raising schemes in such vital industries as steel and coal, which would have the inevitable effect of raising the prices of necessaries other than imported food and textiles. Price-raising, or at least price-maintenance, may sometimes be justifiable, but we ought, in the light of our recent recovery, to realise much more clearly than we do that every time the price of a common necessity is raised, either by protection at the ports or by monopoly at home, the scope for the expansion of British industry is reduced.

* "Britain in Recovery." Prepared by a Research Committee of the Economic Science and Statistics Section of the British Association (London). Sir Isaac Pitman and Sons, Ltd. 484 pages. 15s. net.

The Second-hand Car

THE traffic in second-hand cars, euphemistically called "used" cars in trade circles, is most frequently referred to as a "problem." This it undoubtedly is; but it is also a very important business. There is probably no other commodity, save perhaps a house, which passes into, and out of, the ownership of so many "final consumers" in the course of its working life. There is a trade in second-hand furniture and second-hand clothes; but no other second-hand trade (unless houses be again excepted) is as large as that in motor-cars, either absolutely or relatively to the first-hand trade. Although no accurate statistics about second-hand cars are available in this country, it is believed that their sales to users amount to some 700,000 annually, fetching perhaps £50 millions, as against some 300,000 new cars, valued at something over £60 millions; certainly the second-hand car represents a very important part of the business of a large proportion of motor dealers, besides being the mainstay of a not inconsiderable number of "used car specialists." More important still, the sales of new cars are intimately and increasingly linked with the state of the second-hand market. British manufacturers have hitherto taken little interest in the second-hand car, in which respect they are some distance behind their American colleagues; but there are signs that they are now beginning to appreciate the important bearing the "used" car market has on their own prosperity.

Of late the number of private cars in use in Great Britain has been increasing at the rate of between 150,000 and 170,000 a year; taking this in conjunction with the total new registrations, it may be said that approximately half of each year's output of new cars goes to increase the total of cars on the road and half to replace cars withdrawn from registration (though it does not, of course, in the least follow that the actual purchasers of new cars are also equally divided between those who did and those who did not previously own a car; in point of fact, most new car purchasers are already car owners). It is unlikely, however, that the total number of cars in use will continue indefinitely to grow at the recent rate; this means that the importance of the replacement market as a constituent of the demand for new cars will increase and the "problem" of the second-hand car will loom larger. The motor industry faces a difficulty that no other industry has ever had to bother about unduly; it must work out the economics of second-hand demand and second-hand supply.

The sale of motor vehicles is not a particularly profitable branch of trade for the majority of those engaged in it, a fact which can easily be verified by reference to the accounts of those firms which are public companies. As an industry, it is, like Gaul, divided into three parts—the main distributors whose business is essentially the sale of new cars of the makes for which they hold the agency; the small dealers; and the "used car specialists." The large agents usually either do not retail second-hand cars at all or else confine their attention to relatively new vehicles; their strength lies in their close contact with the manufacturer, elaborate showrooms and "after sales service." The small dealers sell both new and second-hand cars, but very many more of the latter than of the former; they have the advantage of being personally in close touch with their market. The "used car specialists" act as a general clearing house for cars and do a large part of their business with dealers rather than with the public, buying "trade-ins" (i.e. used cars traded by the public to the dealers as part of the consideration for new cars) from the main distributors who do not wish to concern themselves with "used" car sales, and selling to the small dealers who have found prospective purchasers.

The profit-margin on sales of new cars as such is high: main distributors usually receive over 20 per cent. The chief reason why, nevertheless, motor dealers as a whole do not make large profits lies in the lack of finality in their transactions caused by the second-hand car. Very few new cars are sold to people who do not already own a car and, consequently, in the vast majority of transactions, the dealer must accept a second-hand car in part exchange in order to sell a new car. This is not, however, the end of his troubles. To sell the second-hand car he has taken in part exchange—unless, as many of the larger dealers do, he knocks it down to a "used car specialist" at a very low price (involving a loss to himself)—he must accept another and even older car in part exchange. The process may have to be repeated yet again before he makes the final sale which clears the last second-hand car from his stocks. A second-hand car takes up storage space, and its value depreciates fairly rapidly.

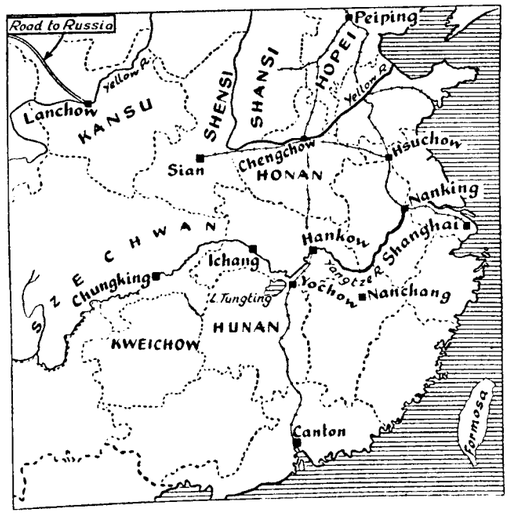
The possibility of effecting a deal, right through the cycle of transactions, depends on the part-exchange allowances offered by the trader, as the buyer is, of course, primarily interested in the actual net cost to himself of exchanging the older for the newer car. The profitability to the dealer of a cycle of transactions, and the possibility of offering a sufficiently generous allowance to sell a new car at all, thus both ultimately depend on what the last vehicle he takes in part-exchange will fetch. And this, in turn, in the absence of arrangements by manufacturers to support the market by buying up and scrapping old vehicles, is controlled by the number of persons wishing to become motorists and the price they are prepared to pay to do so. If and when the total number of motorists becomes stationary, the lower end of the second-hand market will become very weak in the absence of artificial support, and this will have repercussions right through to the first stage in the cycle of transactions, the sale of a new car.

Another aspect of the second-hand car problem is that, as the market depends ultimately on the position of supply and demand at the lower end of the scale, the best second-hand values are maintained for small cars of eight or ten horse-power, which, being the cheapest to run, are naturally the most in demand in the cheap second-hand market. High-powered cars, whatever the price they are sold at, are too expensive for the motoring masses to run, and in consequence depreciate very rapidly. This fact deters their purchasers from changing them annually for the obvious reason that if, as statistics show, the average life of a car in this country is just under eight years, the heavier the depreciation in the first year, the slower must be the fall in value in the remaining seven. The problem of increasing the sales of high-powered cars by supporting the second-hand price structure would therefore be likely to prove much harder than that of encouraging the buyers of new small cars to change more frequently.

The motor trade has always been highly competitive, and, partly because of the many stages through which every deal must pass before the last second-hand car taken in part exchange is disposed of, the ultimate profitability of any cycle of transactions is very difficult to gauge. Hence price-cutting has not unnaturally been rampant from time to time and has never been completely eliminated. With a view to stopping price-cutting, maximum part-exchange allowances are fixed by the Motor Trade Association, but are difficult to enforce; where enforcement is effective, maximum prices become standard prices, and no differentiation is made between the careful owner trading in a well-kept car and the careless owner. The difficulty of fixing prices increases as one descends the second-hand scale to the older vehicles, and, at the bottom, a second-hand car is only worth what it will fetch.

It is sometimes claimed that the ideal would be attained if motor traders offered exactly the same price for a second-hand car, regardless whether it were sold to them outright or taken in part-exchange against the purchase of a new car. This is, of course, a counsel of perfection; with the present distributive margin on new car sales, it would either encourage price shading, or alternatively, if the price were maintained, it would make the cost of buying a new car every year prohibitive, and would therefore tend to check sales. Price-fixing arrangements can, of course, only be successful under conditions where control is practicable; no price scheme will ever prevent a buyer from receiving an unauthorised discount from his dealer—the rock on which the N.R.A. motor trade code foundered in America.

Unfortunately for the possibility of ironing out fluctuations in sales, the purchase of a new car can almost always be postponed and the old car kept rather longer, a fact which makes the motor industry especially sensitive to cyclical movements in trade. If only a minority of all motorists can be considered to be buyers or potential buyers of new cars, the annual sale of new cars will clearly depend in the long run on the buying habits of this minority. The more frequently they can be induced to change their cars, the greater will be the annual sales of new vehicles. It is therefore to the interest of the manufacturers to make the cost of changing a car each year as low as possible, while increasing the loss on depreciation in the second and third years, i.e. to raise the trade-in value of a one-year-old car relatively both to the price of a new car and also to the value of an older car. Further, when sales are difficult in times of declining industrial activity, a more stable level will be maintained if the actual cost of buying a new car, i.e. the nominal price less the part-exchange allowance, is made as low as possible, while conversely a rather less generous scale of allowances should be enforced in times of expanding activity. But any such suggestions are difficult to embody in practical form.



Once it is generally recognised that the key to new car sales lies largely in the second-hand market, positive efforts may be made to control the second-hand price structure, which is at present treated by the manufacturers as though it were solely the concern of the dealers and the public. In the United States the Ford Motor Company has from time to time operated a scrapping scheme under which it bought up and destroyed old vehicles, and some years ago M. Citroën produced a very ambitious scheme on the same general lines. Not many months ago the whole motor trade of the United States co-operated in a "National Used-Car Week," which succeeded to a large extent in clearing the second-hand market and opening the way for increased sales of new cars. The technique of operating in the second-hand market has, however, yet to be developed. It will be necessary to learn what sort of volume of purchases will be required to raise second-hand prices under different conditions of the market, and how far, if at all, the raising of prices and scrapping of vehicles at the bottom end of the scale will result in a diminution in the total number of car owners, which would make the scheme a failure, and how far such a result could be obviated by arranging finance facilities for second-hand car buyers of very modest means. Both for practical men and for theoretical students, the economics of the second-hand market provide a fruitful field for inquiry.

The Importance of Hankow

(By a Correspondent)

WITH the development of the Japanese offensive against Hankow, the war in China enters on an important, and possibly decisive, stage. Yet, as the struggle draws near to its climax, interest in it in this country appears to be diminishing. This is mainly due, no doubt, to the European crisis. But it is also very largely due to a general failure to appreciate the strategic and political significance of Hankow for the great conflict in the Far East, and to the acceptance of a false analogy between the present and previous phases of the war. Because China was not crushed by the Japanese captures of Shanghai, Nanking and Hsuchow, it is assumed that the fall of Hankow, if it is lost, will be equally indecisive.

There are good reasons, however, for expecting the campaign now in progress in the heart of China to be much more important in its effects than any previous moves in the war. If the Japanese are repulsed, if Hankow becomes a "second Madrid," then Japan will have failed in her biggest effort to shatter China as an organised State, and her position will tend to become more and more untenable. If, on the other hand, Hankow falls, the Chinese defence will be subjected to a strain far greater than it has yet endured, and, if no assistance from abroad is forthcoming, it is even possible that the disintegration of China as an organised State may come about with startling rapidity, in spite of the national unity and courage which the Chinese have displayed up to now. In one way, indeed, Chinese propaganda has rendered a disservice to the Chinese cause, for it has been so successful in convincing foreign opinion that China must win the war, however many cities she loses, that hardly anyone now seems to think that China is in serious danger. It has become a commonplace that "time is on the side of the Chinese." But if the Japanese succeed in taking Hankow within the next two months, their stranglehold on China may be more quickly effective than the slow attrition of their own economy by "protracted hostilities."

Hankow is of vital importance because of its position as the hub of the Chinese wheel, as the essential junction of the main lines of communication by which the parts of China still free from Japanese invasion are held together under a central authority. Hankow is situated in the very centre of China, at the intersection of the great Yangtze waterway (navigable from Chungking to the sea) with the Peiping-Canton railway traversing China from north to south. The section of the Peiping-Canton railway north of the Yellow River has been lost, but the line is still held by the Chinese as far as Chengchow, whence there is contact by the Lunghai railway westward to Sian, the provincial capital of Shensi. From Hankow the Chinese Government thus has railway communication south to Canton, the main source of supplies from abroad, and north to Honan and Shensi provinces, while to the west it has access by river shipping to the mountain-girt province of Szechwan beyond the gorges above Ichang.

If Hankow were to fall to the Japanese, this system of communication, on which the unity and effectiveness of China as an organised State so largely depend, would be broken up. The northern provinces of Honan, Shensi and Kansu would be cut off altogether from railway communication with Canton, and the Chinese forces operating in North China would no longer be able to obtain military supplies from the south. They would become entirely dependent for supplies on the Urumchi-Hami-Lanchow road from the Soviet Union; this route, which is merely a dirt track, cannot compare with the railway as a means of munitioning, and, in so far as it sustained the North China armies, it would involve a political orientation towards the Soviet Union rather than a consolidation of Chinese unity under Kuomintang leadership.

A similar loosening of cohesion would result between Canton and Szechwan. Apart from the main connection by the Canton-Hankow railway and the Yangtze, Szechwan is in contact with the coast only by inferior roads through the

by the appearance of a bank loan of £491,915. The general growth in activity which these figures reflect may thus be marked by a further issue of capital in the future. A new holding of shares in an associated company, amounting to £70,000, presumably arises from the formation of Rotol Airscrews. The desire to bring the company's capitalisation into line with the assets employed was emphasised last week by Handley Page, whose 50 per cent. scrip bonus follows a 100 per cent. scrip bonus last December. In recent years profits have expanded rapidly, and the preliminary announcement shows that net profits last year, at £210,126, were more than twice those for 1936. A final dividend of 20 per cent., tax free, on £248,930 of ordinary capital, together with an interim of 10 per cent., less tax, on £124,465, represents about 65.2 (against 50) per cent. on the ordinary capital before last December's bonus.

* * *

Blackburn Aircraft was largely concerned last year in building up equipment to the required capacity and degree of efficiency, and the chairman refers to the year as one of the most difficult in the company's history. In view of the amount of preparatory work, the rise from £124,769 to £139,657 in total profits is satisfactory. Fixed assets have almost doubled and the gross value of stock has risen from £548,200 to £1,234,268, with a resulting increase in the depreciation provision. A bank loan of £321,881 is shown in the balance sheet. Aircraft components makers have also shared in the first real fruits of the expansion programme. Aircraft Components, who specialise in landing equipment, have earned £35,407, against £20,630 (for 13 months), and although the taxation provision is doubled, net earnings amount to 15.9 against 9.8 per cent. on the share capital. Surplus earnings are largely employed to write down patents by £12,000. Future expectations appear to be measured in the decision of the directors of Airscrew to distribute a 25 per cent. share bonus, for profits were sharply reduced from £40,200 to £22,415 for the year to March, and the ordinary dividend from 30 per cent. to 20 per cent.

* * *

International Tea Problems.—Sharcholders in International Tea Company's Stores at last Tuesday's meeting heard a full explanation of last year's further fall in profits (discussed on page 81 of *The Economist* of July 9th). Mr Guy Collier disclosed the interesting fact that many articles were being sold at a satisfactory rate of gross profit, and that price-cutting was confined to no more than half-a-dozen commodities. But the latter, which include butter and sugar, were precisely those which were handled in large quantities. In common with most members of the Multiple Shops Association, the company had entered into an agreement with the Shop Assistants' Union for an increase of wages in November last. Mr Collier estimated that the extra wages involved in 1937-38 would have represented another 3 per cent. for ordinary shareholders, while N.D.C., which appeared in the accounts for the first time, represented a further 2 per cent. in terms of the ordinary capital. Although the company's turnover is still increasing, it is unlikely that its old prosperity will be restored until profits margins are more satisfactory. The present state of competition in provision retailing lends little support for such hopes in the near future.

* * *

Powell Duffryn Prospects.—Mr. E. L. Hann discussed the position of the Powell Duffryn group and the prospects for the coal industry at large with commendable frankness at this week's meeting. Last year, Powell Duffryn Associated Collieries obtained an increase of £32,602 in profits, and paid increased participation dividends to Powell Duffryn Steam Coal and Welsh Associated Collieries. Mr Hann described this increase as "satisfactory," for costs of production had risen; the company's wages bill increased by £1,400,000 last year (of which part, of course, was due to increased output); and increased rail charges since 1933 had increased the cost of Welsh export coal by approximately 5½d. per ton. The Powell Duffryn group is closely interested in the prosperity of export coal business. And the contraction in demand this year is expected to widen the price differential between export and domestic markets. Those investors interested in companies serving the inland market may also note that Mr Hann forecast severe tests for the Selling Schemes during the next few months, since the Control Boards must accommodate themselves to falling demand. He refused to admit, however, the likelihood of a severe trade reaction. The group has effected considerable measures of internal reorganisation in recent years, but these cannot be expected to outweigh the adverse consequences of diminished home and export trade. A current yield of nearly 8¾ per cent. on Powell Duffryn Steam Coal ordinary shares obviously recognises this point.

* * *

Anglo-Ecuadorian Oilfields.—The announcement that the points at issue between Anglo-Ecuadorian Oilfields and the Ecuadorian Government have been settled was followed by a slight setback in the £1 ordinary stock units to 19s. 9d. The key to this reaction is to be found in a sentence of the directors' announcement, which points out that the effect of increased taxation under the new agreement will be serious, although the board thinks that, "provided crude oil prices are maintained, there is every prospect that the company will be able to continue the payment of dividends." The Ecuadorian Government have made it plain that allegations of misfeasance against the company were unofficial and unproven, and the company continues to enjoy the confidence of the Government. Thus, the directors' forecast, made last March, that confiscatory proceedings such as those in Mexico need not be feared, has proved correct. But the company's future burdens will, nevertheless, be substantially increased under the new contract. As from January last, the rate of royalty on crude oil production has been increased from 7 per cent. to 10 per cent. The company's import franchise has been cancelled, although some of the items which it imports into Ecuador will be placed on the free list. Finally, the exemption from income tax which the company has enjoyed hitherto is revoked, and it has been called upon to pay tax, at the rate of 8 per cent., for 1935, 1936 and 1937. It is difficult accurately to estimate the potential effect of these changes upon the company's earnings position. A rough estimate suggests that, on production proceeds for the year to June, 1937, the increased royalty would involve about £12,000, while the Ecuadorian tax liability might amount, at most, to about £32,000, assuming that it was assessed on the basis of net operating income. The payment of four years' tax liability will represent an unusual drain on the current year's available profits, but, subject to the course of the oil market, the increased charges would normally leave fair prospects for the stockholders. So far as they can be estimated, in terms of the 1936-37 profits, they would appear to represent less than 3 per cent. on the company's capital. But the settlement has political implications which oil shareholders generally can scarcely afford to ignore.

* * *

The Week's Company Profits.—Our usual analysis of profit and loss accounts on page 156 includes the results of 39 companies, apart from new concerns, or those for which comparable figures last year are not available. The latest net profits of these companies amount to £3,668,000 and show an increase of 5½ per cent. over the previous year, when they amounted to £3,475,000. The total profits of 1,554 companies analysed this year amount to £223,378,000 and show an increase of 12 per cent. over the previous year's total of £199,454,000. This week's results are discussed on page 139 under the heading "Shorter Comments."

* * *

Company Meetings of the Week.—Reports of company meetings will be found in this issue commencing on page 146. Mr E. L. Hann's survey at the *Powell Duffryn Associated Collieries* meeting is discussed in a Note on page 134. The difficulties experienced in making wheat purchases last year were discussed by Mr A. H. Dence at the *Hovis* meeting. Mr. E. Russell Polden reminded shareholders of *Amalgamated Dental* of the highly competitive nature of the trade, which the company endeavoured to meet by the sale of high quality goods and by organised research. Mr Horace Boot informed shareholders of *Eastwoods Flettons* that contracts for Government work and for investment and industrial building were engaging more of the company's attention than hitherto. At the *Covent Garden Properties* meeting, Mr Philip E. Hill discussed the recent purchase of properties costing £1,236,229, and reported that advantageous offers for certain of the company's properties had been accepted. Members of the *Trustees Corporation* were informed by Mr W. Sandford Poole at the annual meeting that most of the increased investment revenue had been derived from home securities. Sir Frederic Hamilton declared that developments in connection with Luipaards Vlei, the most important mining interest of *H.E. Proprietary*, were extremely encouraging. As the largest shareholders, they had no hesitation in approving the scheme for an extensive development programme which would cost £1,750,000. At the *Kuala Muda Rubber Estate* meeting Sir Francis M. Voules referred to the remarkable improvement in the rubber position since the middle of May. Sir Godfrey B. H. Feel disclosed that the *Thistle-Etna Gold Mines* would shortly increase their crushing capacity to 48,000 tons a year. Sir Reginald Wingate described the outlook for *Tanganyika Concessions* as brighter to-day than ever before.

THE STOCK EXCHANGES

London

SETTLING DAYS

TICKET	ACCOUNT
JULY 19	JULY 21

THE market this week has been much less assured. Gilt-edged and Kaffir shares have made some progress, but the course of industrial shares, home rail stocks and foreign bonds has been much less impressive. In part, Wall Street's irregular course may take the blame, but specific factors bearing on the London market included political restiveness, reflected from certain Continental centres, and a number of bearish industrial pointers, including a sharp fall in steel output in June, and the shock of the Courtaulds interim dividend announcement.

Undated *gilt-edged stocks* fell at the outset on profit-taking, but regained a firmer tone in mid-week, when the success of the Bournemouth issue assisted the market. War Loan led the recovery, and smaller gains were shown by Old Consols and Local Loans. These gains, however, were all lost in Thursday's reaction. New Zealand stocks continued an uneasy market, and fears that restrictions on remittances might be imposed led to a widening of quotations. Australian stocks were better, and the new 3¾ per cent. scrip reached par for the first time.

In the *foreign bond market*, further falls were registered in German and Austrian bonds, for the market was unwilling to take stock. By mid-week, substantial falls had been registered in Young 4½ per cents. to 39¼, and in Dawes 5 per cents. to 52½. Buenos Ayres loans received better support, but Brazilian bonds continued heavy. Far Eastern bonds staged a partial mid-week recovery.

*

Among *home rail* stocks, the approach of the interim dividend season caused a subdued opening, and small selling resulted in fairly sharp falls. The week's traffics produced a further fall, although prices closed above the worst. Despite the small volume of business, Argentine rail stocks made a slight improvement in mid-week.

The *industrial market* lost much of its impetus towards recovery, and though prices on the whole were not seriously lower, the tendency became more irregular than in recent weeks. Iron and steel shares weakened, particularly after the publication of the June output figures, but losses were not substantial. Coal shares were also dull, at lower prices. Interest in the electrical equipment section was centred in Crompton Parkinson and Callenders on rumours of a deal between the two companies. Both shares went ahead, but became more irregular in mid-week on profit-taking. Other electrical equipment shares fluctuated, but the tone was generally satisfactory. Electric supply issues were better than in recent weeks. Motor shares became firmer after a poor start, and aircraft issues similarly went ahead on Wednesday after the Bristol report, which made amends for the disappointing dividend. Courtaulds fell back slightly in anticipation of the interim dividend (discussed on page 132), dropped sharply on the actual announcement from 30s. to 29s. 9d. in Wednesday's "Street" market and fell further to 28s. 6d. on Thursday. Other textile issues improved slightly after early neglect. The shipping group brightened slightly after early dulness. Miscellaneous shares followed the general trend with dull conditions and narrow price movements. Beechams deferred responded to the news of amalgamation with Macleans, but reacted later.

*

Business in *oil shares* showed some signs of expansion in mid-week, but quiet conditions prevailed at first. News from Wall Street was the main influence, and Continental dealings were too scattered to affect prices. Turnover in rubber shares remained restricted. Quotations on Monday were mostly unchanged, and although a later tendency to weakness was soon reversed, firmer prices were not accompanied by any marked increase in business. Tea shares were quiet and irregular.

Though prices held up well, conditions in the *mining market* were dull, with little business passing except for a small revival in activity in mid-week. Kaffirs started the week more quietly than for some time past, but quotations were marked up moderately later, and there was some return of interest in developing mines. Rhodesian copper issues were irregular, and other base metal shares undecided.

ACTUARIES' INVESTMENT INDEX

A further slight rise on last week is shown by the Actuaries' Index of 151 ordinary share prices, which on Tuesday, July 12th, stood at 67·9, compared with 67·6 a week ago and 63·4 a month ago. The corresponding average yield on Tuesday last was the same as a week ago at 5·72 per cent. A month ago it was 5·99 per cent. A selection of the separate indices follows :—

New York

WALL STREET'S recovery is no longer so effective, and this week's movements have been more erratic than at any time since recovery began in June. Monday saw a moderate reaction, mainly on profit-taking, but there was also some slackening of investment interest. Then a pronounced rally, under the lead of steels, brought prices above those prevailing at the end of last week, and trading volume expanded satisfactorily. This upswing continued on Wednesday, partly on the inflationary interpretation of the revised Budget figures. The Dow Jones industrial index touched a new 1938 high of 139.90, but prices broke sharply in the last hour, bringing the index down 3 points. The worst feature of this setback was the rise in trading volume as prices fell. Steel shares were the most active group. *Iron Age* estimates output at 32 per cent. of capacity, but the market is paying more attention to the price structure and to the chances of reducing wages than to output. Steel shares

(*Continued on page* 138)

mountains of Kweichow and western Hunan; the Japanese capture of Hankow, especially if it were followed up by an advance to Yochow and the Tungting lake, where the railway first approaches the Yangtze, would mean the virtual isolation of Szechwan and a dangerous separation of Chiang Kai-shek's main army from the Central Government. For, whereas Chungking in Szechwan is the reserve capital, and most of the Government offices have already been moved there, Chiang's army cannot leave the railway by which it is munitioned; it must withdraw, not westward into Szechwan, but southward into Hunan.

Szechwan may be regarded as inaccessible to Japanese forces because of the deep gorges of the Yangtze above Ichang, which form a gateway of enormous defensive strength. But the province would be very susceptible to blockade, because practically all its trade goes down the Yangtze, and with Hankow and Yochow in their hands the Japanese would be able to bring strong pressure on Szechwan to break away and conclude a separate peace. If they were to be successful in thus dealing with Szechwan, the Japanese would have cut China in two along the line of the Yangtze, and they would have won the war as far as they can hope to win it.

For the invasion of China the Yangtze has proved Japan's greatest asset. It provides a waterway for Japanese naval power for seven hundred miles into China. The Chinese have tried to obstruct the ascent of the river by a series of booms, but at each stage the ends of the boom have been captured by Japanese landing forces covered by naval guns and the boom itself has been cleared. Once the booms have been removed, the river cannot again be closed behind the Japanese advance, and it is a line of communication that cannot be intercepted by guerillas as a road or railway can. With their cruisers and destroyers masters of an element on which the Chinese cannot operate (except by air attacks), the Japanese have been driving a wedge ever deeper between South and North China.

The desperate resistance offered to the Japanese advance on the lines covering Hankow and Nanchang shows that the Chinese commanders fully realise the supreme importance of repelling the invaders from these objectives. For a third time they are engaging the enemy in pitched battle, and their strategy does not suggest that they really share the belief of so many of their friends abroad that China can overcome Japan by guerilla warfare after all her key cities have been lost. The Japanese, on their part, have the strategic good sense to concentrate their forces against Chiang's main army and not to disperse them for "mopping up" while the issue in the vital war area is undecided. Despite the exaggerated publicity given to the Chinese guerilla units and the halo of romance which always invests exploits in this type of warfare, the experience of over a year's fighting in China does not suggest any need to revise the general principle that guerilla tactics may usefully supplement, but cannot be substituted for, regular military operations in a big war. In comment on the war in China much is made of the fact that, even in Hopei, the Japanese do not control the country away from the big towns and the railway lines, and this is quoted as evidence for the effectiveness of the Chinese guerilla formations, but their failure in the strictly military task of disrupting Japanese communications has been generally overlooked. "The measure of the ineffectiveness of the guerillas," writes a correspondent in *The North-China Herald* of August 17th, "was demonstrated during the Hsuchow campaign. At their will the Japanese moved large reinforcements out of Shansi, Suiyuan and Hopei into Shantung to concentrate on the capture of Hsuchow. These reinforcements moved by rail almost without hindrance." It is fairly clear that, if the guerillas have not had more success than this while the Chinese main army was still intact and fighting in strong positions, they are not likely to be more effective after the vital centre of national resistance has been lost, and it would be unwise to expect a miraculous salvation of China by such means, if Hankow cannot be held.

Topics of the Week

The Crisis in Czechoslovakia.—From the moment last Thursday week when Sudeten German deputies claimed that gendarmes had assaulted them in Moravska-Ostrava, events in Czechoslovakia have gone from one grave crisis to another. After assurances from the Government that the incident would be fully investigated, the Henlein party agreed the next day to continue negotiations on the basis of the "fourth plan," admitted even by the Reich Press to concede 90 per cent. of the Carlsbad demands. The week-end was tense with expectation of what Herr Hitler would say, the strain breaking out into occasional tavern brawls which were duly exaggerated by the Reich Press. On Tuesday, the day after Herr Hitler had declared at Nuremberg that "The Germans demand the right of self-determination," armed rioting, possibly on a concerted plan (though this has not been proved), broke out in North-West Bohemia, and crowds of armleted Sudeten Germans marched across their districts echoing that demand in song and slogan, attacking Czech gendarmes and civil servants, interrupting essential services and using firearms. The Government answered this disorder by proclaiming modified martial law (*Standrecht*) in eight departments, by which time the number of dead had reached fourteen, only four of whom were Germans. At six o'clock in the evening the Henlein executive, its headquarters by now moved from Prague to Asch, issued an ultimatum demanding removal of the military measures by midnight, failing which they "would not be responsible for the consequences." The Government did not comply, and all through that evening and during the night detachments of the Czechoslovak Army were moving up to the frontier. Although rioting continued on Wednesday, it was becoming clear that Czech counter-measures were proving effective, thus giving direct denial to the assertion vigorously disseminated from German quarters that the Government was no longer in command of the situation. Meanwhile members of Lord Runciman's mission had gone to Asch to try to persuade the Sudeten leaders to continue with the negotiations. In Prague, as everywhere else, the announcement of Mr Chamberlain's visit to Herr Hitler caused profound interest. The Czechoslovaks hope, as everyone hopes, that the Prime Minister's move is in the direction of honourable peace; but the march of events makes it only natural for them to suspect that any agreement that may emerge from the Berchtesgaden meeting will be at their expense. Herr Henlein's proclamation on Thursday evening, timed for Mr Chamberlain's arrival on German soil, demanding for Sudeten Germans "the right to live again as a free German people," and to "go home to the Reich," could only make the Czechs' suspicion the more justifiable.

* * *

More Democracy for Poland.—To hold parliamentary elections in the middle of an international crisis may seem to be in the tradition of Nero and his fiddle: yet it says much for President Moscicki's cool-headedness (and correspondingly little for Poland's democratic structure) that he has chosen this moment to make the Seym and Senate more representative of public opinion by decreeing an immediate dissolution of both Houses, which

were elected in 1935. Viewed in the perspective of recent happenings within Poland, the decision to hold fresh elections is not so surprising. The urgent question of Polish internal politics is whether, and to what extent, the heirs of Pilsudski shall seek a reconciliation with the peasants. One wing of the regime, to which both the President and Marshal Smigly-Rydz belong, believes in going half-way to meet the opposition. The irreconcilable wing will not agree to adequate concessions, and the election of Colonel Slawek, an irreconcilable, to the post of Marshal of the Seym last year showed that the Parliament had a majority of this opinion. The immediate objective of the Government is to liberalise the very reactionary electoral law that was passed after Pilsudski's death. The President's proclamation states that this will be the chief task of the new Legislature, which the Government will doubtless contrive to have of its own more liberal mind. It will also, presumably, be the only task of the new Legislature, since the apparent intention is to hold a second election after the modification of the electoral law, in which the People's Party will be invited to join. Whether this new orientation of the policy of the regime will go far enough to close the serious and widening rift in the Polish community still remains to be seen; but it is at least welcome news that the governing members of the regime are prepared to make an effort. The main reasons for this week's move are internal. But every step away from the authoritarian notions of the more reactionary legionaries towards the views of the peasants is simultaneously a step away from a pro-Nazi foreign policy to a pro-democratic foreign policy. Poland's gain in unity will also be Europe's.

* * *

Aircraft Strikes.—The increased pressure of work in factories producing parts and equipment for military airplanes has been marked in recent weeks by a series of minor strikes and disputes. The most important have been at Birmingham, Oldham, Dudley and Walsall, and there are some signs that the unrest has not yet ceased. In the main, the issue at stake has been the method of payment of wages. Workers have protested against the introduction of piece-rates in place of time-rates, claiming the result has been some reduction in the actual earnings of all but a few skilled artisans. Each dispute has been local in origin, but the meeting a fortnight ago of shop stewards from factories all over the country to discuss wages and conditions in aircraft manufacture revealed the existence of a determined and active minority organisation throughout the industry. It is clearly detrimental to the immediate and urgent interests of the nation that sporadic stoppages, on however small a scale, should hamper aircraft production—though the men's grievances cannot be dismissed as unreal. The underlying cause of the present situation is the failure of the Government, the employers and the unions (which mainly means in this case the Amalgamated Engineering Union) to work out long ago a co-operative plan covering wages and conditions in armament work. The recalcitrant party at the moment is apparently the A.E.U., though the union's chiefs are not in favour of independent local strike action of the kind which has lately become familiar, and strongly advocate full use of the existing procedure for negotiation before resort is had to direct action. In many cases employers have been reluctant to recognise the union's authority; and many of their employees have been non-union men, whose immediate grievances have led them to follow the lead of the active minority rather than the more cautious precepts of the A.E.U.'s central officials. In addition, although skilled men are commonly paid appreciably above union rates, other workers in aircraft factories have not fared so well in the speeding-up of production. The strikes have been relatively minor episodes so far, but it is now high time that all the engineering unions and all the employers realised that the interests of engineers and the engineering industry can best be served by the fullest and speediest possible co-operation in the planning of wages and production in arms factories.

* * *

Progress in Electricity.—There has been no more marked feature of the post-war period than the spreading use of electrical power. Since 1929 the pace of electrification has been strikingly accelerated; and in the eight years the annual output of electricity by authorised undertakings has more than doubled, rising from 10,294 million kwh. to 22,905 million kwh. last year. Not even the sharp reversal in the general trend of industry since the summer of 1937 has sufficed to arrest this expansion. Output last month, amounting to 1,679 million kwh., was just short of 10 per cent. higher than in August, 1937, while the quantity of electricity generated in the first eight months of this year was 6.6 per cent. more than in the same period of last year. Not only does the industry seem to be relatively impervious to cyclical setbacks, it also has the opportunity, despite the rapid and extensive progress already made, to make equally great headway in the future. A survey conducted by the Electricity Commissioners in 1935-36 showed that out of 12,880,000 premises in the areas supplied by 622 authorised undertakings, only 7,620,000, or about 59 per cent., were wired for the use of electricity. There are, however, certain factors which may tend to limit the industry's rate of progress. Some part of the success of electricity undertakings during the current period of bad trade, for instance, has been due to the surprising extent to which building activity has been maintained at a relatively high level. And, in the last resort, the industry's future must depend upon its price policy. The suppliers of alternative forms of light and power have recently effected appreciable improvements in the economy and efficiency of their methods of production and distribution and in consumers' equipment; they have increased the

BANKERS TRUST COMPANY

Incorporated with limited liability in the U.S.A.

attractiveness of their competitive tariffs. Electricity suppliers have not always done the same. Only this week, for example, in order to secure that trading results in 1940 should not show a loss, the London and Home Counties Joint Electricity Authority, which supplies Dorking, Leatherhead, Twickenham, Surbiton and Sutton, have announced an increase of 10 per cent. in rates and the doubling of hiring charges. This is, however, a special case; and, in general, it would seem that the cost of electricity to the consumer is still tending to fall.

* * *

Doings at Geneva.—The League of Nations has assembled for the nineteenth time, with a main object before it of interring Article 16, the instrument of sanctions, as decently as may be. Herr Sandler for Sweden and Dr Patijn for Holland began the burial ceremonies on Tuesday, and the procession of mourners has been disturbed only by China's last-minute effort to resurrect the deceased in an appeal to Article 17, a move that, in the circumstances, would mean automatic application to Japan of Article 16. It is perhaps a pity that Chinese statesmen should have chosen for their appeal a moment when circumstances will almost certainly prevent it from having a fair hearing. The League meets at a solemn moment; but the circumstances which attended its assembly might well have impressed an unpreoccupied observer. Forty-eight nations found it worthwhile to send delegates to the opening session, and a prime minister was the elected president. Methods of barbarism may prevail elsewhere: at least in Geneva responsible statesmen are not ashamed to say, as Mr de Valera said in his presidential speech, that "war settlements are almost invariably unjust, and this will be true in the future, no matter who may be the victor." Nor is the assembly mere façade: a core of international co-operation does remain. And should anyone doubt that it remains he might take a reminder from Mr Jordan, representative of New Zealand and the acting-president who welcomed Mr de Valera's election. "Stress of events," said Mr Jordan, "have not diminished the technical work of the League. On the contrary, this work, though far short of what was possible, has developed extensively, and in many respects beyond what was foreseen by the Covenant itself." The diligent spirit with which this "secular" work has been carried on, in spite of all discouragements over larger issues, saves from triteness the remark that if there were no League of Nations it would be necessary to invent one; and gives some hope that calmer times will see a renewed enlargement of the League's activities.

* * *

The Aland Islands.—It was announced on September 8th by the Foreign Minister of Sweden that the Swedish and Finnish Governments were in consultation over a certain modification of the present status of the Aland Islands under the international convention of October 20, 1921. The two countries' common purpose, Mr Sandler said, was to ensure the preservation of the main object of the convention, which was that the Islands should remain neutralised and demilitarised under the sovereignty of Finland. Since the conclusion of the agreement of 1921 the international situation had changed enormously for the worse, and it was therefore of paramount importance to the states on both sides of the Baltic that the Aland group of islands—occupying, as it does, a key position midway between Sweden and Finland, at the mouth of the Gulf of Bothnia—should under no conditions find itself in the hands of a Great Power in the event of war in the Baltic. It was therefore now the Swedish and Finnish view that the area of the demilitarised waters round the islands ought to be cut down on the south side far enough to make it possible for the Finnish armed forces to screen the islands from the danger of a lawless *coup*. Mr Sandler's speech has to be read in conjunction with the friendly visit which is being paid to Finland this week by the Swedish Chief of Staff, and with the fact that the naval command of the Baltic is now once more held by Germany. For years there have been rumours of a German intention to use this local naval supremacy in order to attack Russia via the Baltic. There have also been rumours that Germany had hopes of persuading Finland to lend herself as "a jumping-off ground" for a German expeditionary force which would attack not only Leningrad, but also a second, even more vital, piece of Russia's anatomy: that is, the railway running northwards, parallel to the Russo-Finnish frontier, through the Russian-ruled but Finnish-inhabited territory of Eastern Karelia, to Murmansk, Russia's only port on the open ocean that is ice-free all the year round. The present Finno-Swedish consultations make it clear to-day—if it was not sufficiently clear already—that Finland has no intention of being a party, willingly or unwillingly, to any aggressive designs.

* * *

A Precedent.—There is a second reason why the friendly and good-neighbourly understanding between Finland and Sweden over the Aland Islands is of peculiar interest in the present European crisis over the Sudetenland. The Aland Islands are a territory with a population which is 100 per cent. Swedish, but which historically has belonged to Finland. When Finland regained her independence from Russia in 1917, the Aland Islanders claimed the right of self-determination, too. In 1919 they held an informal plebiscite in which 9,735 out of 10,196 islanders entitled to vote are said to have voted for an *Anschluss* of the Islands to Sweden. A grant of autonomy to the Islands by Finland in 1920 satisfied neither the Islanders themselves nor their big brother Sweden; and the consequent tension between Sweden and Finland moved Great Britain, in the same year, to bring the case before the League, which, with Swedish and Finnish consent, appointed a Commission of Three (a Belgian, a Swiss and an American) to report on the rights of the case and to draft a settlement. The Commission pronounced that Finland's title to sovereignty over the Islands was incontestable, but that the Islanders formed a distinct group within the Finnish body politic, with special characteristics to be preserved and rights to be safeguarded. They laid down five guarantees which ought to be added to the existing Finnish autonomy statute; and they recommended that if—but only if—these guarantees were refused by Finland, a formal plebiscite should be held on the question of an *Anschluss* with Sweden. This story had a happy ending. The Finns did give the required guarantees; the Swedes did accept these as adequate; the new Finnish law, embodying the new guarantees, was placed under the supervision of the Council of the League of Nations; and, since then, the Aland Islands have been happy in having no history, while the relations between Sweden and Finland have changed from hostility and mutual mistrust to friendship and mutual confidence.

* * *

There is one passage in the Belgian-Swiss-American Commission's report of 1921 on the Aland problem which has so close a bearing on the Sudeten problem of 1938 that it deserves *quotation verbatim*:—

> To concede minorities, either of language or of religion, or to any fractions of a population, the right of withdrawing from the community to which they belong, because it is their wish or their good pleasure, would be to destroy order and stability within States, and to inaugurate anarchy in international life; it would be to uphold a theory incompatible with the very idea of the State as a territorial and political unity. . . . The separation of a minority from the State of which it forms a part and its incorporation in another State can only be considered as an altogether exceptional solution, a last resort when the State lacks either the will or the power to apply just and effective guarantees.

The whole world outside Germany will be of one mind in holding that Czechoslovakia in 1938, like Finland in 1921, has offered a discontented minority guarantees which go so far that they should put the "last resort" of secession quite out of court.

Special Areas and Aliens.—Within the very limited ambit of the authority of the Commissioner for the Special Areas in England and Wales steady progress is being made. Up to the end of last month, offers of contributions towards rent, rates and income-tax, authorised by the Special Areas (Amendment) Act of April, 1937, had been made to 63 enterprises to induce them to establish undertakings in the Areas. The trading estates in the Team Valley and at Treforest still regularly report increases in the numbers of established factories and projected tenants; and the experience and organisation of the trading estate companies are being employed to clear sites and found factories outside the actual estates.

* * *

An important feature of the trading estates' experience, in view of the efflux of refugees from Greater Germany, is the rôle played by foreigners in their development. On the properties of North Eastern Trading Estates, for instance, Germans, Austrians and other aliens (excluding offshoots of established Continental concerns) have set up plant to produce haberdashery, cycle lamps, lamp-shades, furniture, underclothing, knitwear, buttons and leather goods. Most of these concerns will employ no more than a score of workers at first, but at least four will employ about one hundred people. The chief difficulty aliens experience in starting business in England is lack of capital. Refugees cannot normally bring more than negligible sums out of their countries; and loans from the Special Areas Reconstruction Association and the Nuffield Trust are not available unless the individual can put up half the capital required. Yet it would seem that an influx of refugees building up businesses and employing British labour might contribute markedly to the prosperity of the Special Areas. Jewish exiles are anxious to make in this country goods, like cheap clocks and watches, fancy leather goods and Viennese knitted wear, which have hitherto been imported. It should not be beyond the power/of private organisation and finance to provide the means of establishing such concerns to the material advantage of Britain and British workers.

* * *

Anglo - Japanese Relations.—While rumours are running in Tokio that the present Japanese Ambassador at the Court of St. James's, Mr Yoshida, is to be removed for the offence of being too "pro-British," conversations are taking place in Tokio between the Japanese Foreign Minister, General Ugaki, and the British Ambassador, Sir Robert Craigie, over the damage to British interests in China that has been done by the Japanese in the course of their war of aggression in and against that third party. As he proved by his conduct of a number of delicate and long-drawn-out negotiations over the limitation of naval armaments, Sir Robert Craigie is a past-master in the art of conciliation. There are, however, some moral and psychological gulfs which cannot be bridged even by the ablest and most unwearying diplomacy, and it rather looks as though there were a gulf of this kind between the Japanese and the British points of view. Japanese opinion apparently bases its attitude almost entirely on the present strategical situation in Eastern Asia. In an Anglo-Japanese ordeal by battle in this quarter of the globe, Great Britain, so the Japanese calculate, would be virtually at Japan's mercy in present circumstances. Therefore, argue the Japanese, it would be "unrealistic" of the British to be too insistent upon the strict letter of their rights in China—even limiting the conception of British "rights" to the sphere of "British interests" in the old-fashioned narrow sense of British property, British lives and British trade. As for British indignation over Japan's conduct in and towards China, it would be simply fantastic, in the Japanese view, for Great Britain to allow herself to be affected by such "luxury feelings" in her dealings with a Power which (even if in British eyes an aggressor and an atrocity-perpetrator) is anyway now top-dog in Eastern Asia. The Japanese are, of course, notoriously bad psychologists; but it is nevertheless strange that, in dealing with us, they seemed determined to ignore the truth that in public affairs, as in private, people are never moved exclusively by material considerations. In this case, the voices of honour and conscience are the more persuasive because they speak the same language as the voice of self-interest when British interests are looked at on a long view and thereby seen in their true perspective. In the long run, the preservation of international order—which Japan is doing her best to smash—is a far greater "British interest" than the pieces of British property that Japanese looters may have carried off from Shanghai.

Defending the Empire.—The traditional importance of India in the structure of Imperial security is greater to-day than ever. The British Government this week announced plans to assist the Government of India in the urgent task of expanding and modernising the defences of India. The Indian army has fallen behind in up-to-date equipment; the strength of the Royal Air Force in India is reputedly insufficient; and India's coastal defences require improvement. In addition, the increases in soldiers' pay, parallel with those announced for the home army by Mr Hore-Belisha last March, and the rising cost of materials threaten to augment seriously the burden of defence expenditure upon India's overloaded Budget. The Indian Government are responsible for the maintenance, equipment, sea transport and part of the pensions of the British army in India. A contribution of £1,500,000 a year from this country was introduced in 1933 towards the cost of these items, on the recommendation of the Garran Committee. But, even so, defence charges account for not far short of one-third of Central and provincial expenditure together and more than half of Central expenditure alone. The increases in pay will entail an extra annual burden of £1,125,000; and, although India's fervent nationalists are now convinced of the need to strengthen their Government's defences, they are still of the opinion that the cost of maintaining forces whose rôle in war would be to a large extent Imperial rather than purely Indian falls too heavily upon the Indian Budget, to the detriment of expenditure on social services. The British Government have now decided to increase their annual contribution to £2 millions; to make a capital grant up to £5 millions for equipment and aircraft; and to transfer four battalions ultimately from the Indian to the Imperial establishment. The proposals still need Parliament's sanction, and are designed to take effect next April. The policy they represent would seem to be both just and wise. The Indian taxpayer will be rightly

South African Cabinet Changes.—General Hertzog has carried out his declared intention of bringing back into the Cabinet Mr A. P. J. Fourie, who was defeated at the General Election; and in so doing he has weakened his team by the loss of two Ministers, Mr J. H. Hofmeyr, for Mines, Education and Social Welfare, and Mr F. C. Sturrock, without Portfolio, who have resigned in protest at the way in which Mr Feurie has been nominated to the Senate as a representative of the natives. The *contretemps* was the greater by reason of Mr Hofmeyr's strictures on the Prime Minister's move. He asserted that the nomination was "a prostitution of the constitution," since he claimed, in disagreement with General Hertzog, that Mr Fourie did not have the close knowledge of native affairs required by the constitution in senators nominated to represent the natives. Mr Hofmeyr's charges were grave. He saw "one more safeguard" to native rights swept away. But an examination of Mr Fourie's record hardly bears out this strong speaking. Having gone in with General Hertzog on the formation of the United South Africa Party against the breaking-away of his leader, Dr Malan, Mr Fourie incurred the full onslaught of Nationalist displeasure when he contested his Cape seat at the General Election; and the fact that he lost a seat he had insisted on fighting against General Hertzog's advice and which he had previously held with undoubted native support, is witness to scarcely more than the success of Nationalist attacks upon him. The view that Mr. Fourie's nomination is a direct threat to the natives is thus at least non-proven. But it is impossible to ignore the charge of playing politics with the constitution especially when it comes from a man of Mr. Hofmeyr's standing and integrity. The Prime Minister would have been wiser if he had avoided all cause for suspicion. The question now at issue is whether the gaining of Mr Fourie is sufficient compensation to the Government for the loss of Mr Hofmeyr and Mr Sturrock, and for the consequent shock to Cabinet unity.

* * *

Health of London Busmen.—More than a year has passed since the sympathies of the general public were aroused by statements about the ill-health of London's busmen—and alienated by the calling of a strike at Coronation time. When the strike was ended, it was arranged that representatives of the Medical Research Council, the London Passenger Transport Board and the Transport and General Workers' Union should make a joint inquiry into the truth of these disturbing statements. They have not yet completed their task. But an interim report, published on Thursday, suggests that many of last year's allegations, however true they may have been in substance, cannot be substantiated in statistical detail. Mortality figures, for instance, do not show that busmen tend to live for a shorter time than other workers. Nor are hospital records very helpful. On the other hand, the conferences have agreed that bus drivers and conductors are more prone to gastric troubles than tramwaymen; and the report expresses the view that more precise research into the effects of irregular meals, nervous strain and noxious fumes is needed. Since the strike, agreed new schedules have improved working conditions on the buses; and it seems likely now that the villain of the piece is not the L.P.T.B. but London itself. Busmen may suffer more than most workers in the monstrous, overgrown, congested and uncomfortable metropolis because they are employed on oil- and petrol-driven vehicles and are chief victims of the stop-and-start flow of the traffic.

Trade Balances and Exchange Rates

New York, September 6.—The decline in sterling below the traditional parity has occasioned no little concern in Wall Street. While it is usually associated with the disturbed international political situation, the decline is also attributed to trade factors. In the last eight or nine months the United States has had an enormous export surplus, while England has had a substantial passive balance. Quite apart from war scares, these strongly diverging movements suggested pressure on an exchange relationship based on quite different trade conditions. Under former monetary practice this sort of pressure would have manifested itself in moving interest rates; under contemporary practice it manifests itself in the exchange rates. The world became familiar with the disadvantages of fluctuations in money rates; it remains to be seen whether the consequences of contemporary practice are preferable.

Prospects for the Autumn

Preliminary data for the month of August are now available. They indicate that the recovery in July persisted with about equal vigour in August, although the motor industry was in its annual transition period with production probably at its minimum. The residential building figures, though continuing to be most impressive, should be viewed with some circumspection.

The Housing Act passed last winter has provided a marked stimulus to speculative building, of which there was little in 1936-37. In the vicinity of New York, where rents were already tending to sag, the new accommodation is providing severe competition with existing accommodation. If the recovery extends in scope, an increased demand for accommodation, new or old, would be presumed. It is also possible that conditions in the vicinity of New York are not typical of the whole country; as there is some reason to imagine that the New York area is not gaining population, if not actually losing it.

In other words, while July and August have seen a vigorous out-of-season revival, Labour Day (September 5th) has not lost its conventional significance as the boundary between summer and autumn. Opinion is nearly unanimous that the summer revival will be continued in the autumn; the absence of unanimity is largely attributable to the lack of evidence yet of any increased retail consumer demand comparable with the rise in production. This is quite in harmony with seasonal expectations; but, seasonally, September is also expected to provide a marked quickening in retail trade.

Family Incomes

In recent weeks, three committees have submitted reports of unusual interest. The report of the committee of the National Emergency Council on conditions in the Southern States was mentioned in a recent letter (*The Economist*, August 27th, page 407). In the past week, two other reports were published: a report by a special committee which has been studying industrial relations in Great Britain, and a report on family incomes by the National Resources Committee. The report on industrial relations presented a picture which is almost idyllic in comparison with our own, but did not extend its inquiry into the reasons for the different state of affairs in the two countries.

The report on family incomes is perhaps the most elaborate study of the kind ever made; it includes, in addition to material taken from official sources, a detailed house-to-house survey of some 300,000 sample families. The report estimates that there are in the United States some 39,458,300 family units, of which about 10 millions are described as one-person families. The 29,400,000 family units, consisting of two or more persons, comprise about 116 million individuals, which would give an average of almost four per family group. Of these 29 million families, 14 per cent. receive less than $500 in 1935-36; 42 per cent. less than $1,000; 65 per cent. less than $1,500; and 87 per cent. less than $2,500. Ten per cent. receive incomes between $2,500 and $5,000; 2 per cent. incomes between $5,000 and $10,000; and 1 per cent. incomes above $10,000. The aggregate of these 29 million family incomes is given as $48,000 millions; and of this total the 42 per cent. with incomes under $1,000 receive about 16 per cent.; the 3 per cent. with incomes above $5,000 receive 21 per cent.; and the remaining middle group, about half of the total, receiving more than $1,000 and less than $5,000, evidently have 63 per cent. of the total family income.

Dividing the 39 million "consumer units" into equal thirds, the report states that the lowest third received incomes of less than $780, the middle third incomes between $780 and $1,450, and the upper third, above $1,450.

The lowest third (13 million consumer units) included 1,700,000 single men, 1,600,000 single women and 5,900,000 families of two or more. Of these 13 million units, almost 4,000,000 were more or less dependent on relief; the mean income of the lowest third was $471 for the year 1935-36; in the aggregate, this group received approximately 10 per cent. of the national income.

The middle third (incomes between $780 and $1,450 with a mean income of $1,076) receive 24 per cent. of the aggregate income. The upper third, with incomes from $1,450 upwards, is estimated to have received 66 per cent. of the aggregate income; and of this section 20 per cent. of the families were recipients of relief.

Regional Differences

The report remarks that the data make no adjustments for regional variations in the cost of living. But they do show important sectional differences in family income.

AVERAGE INCOME PER FAMILY

	Median	Mean
	$	$
New England	1,230	1,810
North Central	1,260	1,786
South	905	1,326
Mountain and Plains	1,040	1,363
Pacific	1,335	1,775

There is no discussion in the report of the influence of the so-called Negro question upon the distribution of family incomes; but the following calculations are revealing:—

	Median		Mean	
	White	Negro	White	Negro
	$	$	$	$
Southern Rural	1,100	480	1,535	566
Southern Cities, 2,500 and over	1,570	525	2,019	635
North Central Cities, 100,000 over	1,720	1,095	2,616	1,227

From these figures, it seems clear that actual destitution in the United States is to a very considerable degree associated with the Negro question.

France

Calm Continues

Paris, September 15.—The speech at Nuremberg was not interpreted as closing the door to continued negotiations under the auspices of Lord Runciman. After the clash between Czechs and Sudeten Germans, which followed the speech, and the Sudeten ultimatum, the hope here is that Prague may find it possible to make further concessions. The country remains quite calm, in spite of, or because of, the many measures of security which have been taken. The public funds are steady; and the 3 per cents. actually stand at their highest level for the last twenty months, while the 4½ per cents. are only between 2 and 3 points below their highest quotation this year. It must be taken into account, however, that the market is almost completely inactive.

The protracted dockers' dispute at Marseilles has been ended by agreement. It may be that union labour conflicts are pending, but the pressure of the foreign crisis is holding them in check.

The preliminary work of preparing the 1939 Budget is now completed, and M. Marchandeau, the Minister of Finance, will submit the draft to the Finance Committee of the Chamber in the next few days. It is expected that the ordinary Budget will be balanced; and there will be appreciable reductions in extraordinary expenditure.

The financial implications of the current international crisis are two. On the one hand, it is clear that expenditure cannot be drastically reduced. On the other, national sentiment has so hardened that investors will be ready to support the Government, and there is more spontaneous aid for the public finances than was previously evident. It may be that the Government will take advantage of this new atmosphere to embark upon a new financial effort.

Industry Slack

The preliminary index of production (not all the data are yet available) continues to be disappointing, and it is likely that the belated figures for July and August will show no appreciable improvement, because the taking of holidays with pay naturally caused some slackening activity. Actually the prospects of solving the industrial problem depend largely upon the trend of prices. In August, the course of prices was rather favourable, as a result of the marked decline of the price of foodstuffs, especially secondary cereals and vegetables. But prices usually tend to go down at this season of the year, so that any conclusion about the influence of prices now would be premature. And food prices have in fact risen again.

The Statistique Générale de la France has published its monthly figures of industrial changes:—

INDUSTRIAL PRODUCTION (1928 = 100)

	July, 1937	May, 1938	June, 1938	July, 1938
Mines	86	91	93	92
Chemical industries	97	98	100	...
Paper	172	153	158	148
Iron and steel	84	65	63	56
Engineering	88	78	76	73
Automobile	84	88	91	89
Building	64	61	61	62
Gas and electricity	125	134	135	...
Miscellaneous	108	108	107	...

In the motor industry, 18,840 automobiles were put on the road in July, compared with 18,690 in June and 18,595 in May. The figures for the spinning industry are as follows:—

	July, 1937	May, 1938	June, 1938	July, 1938
Spinning (average per spindle in kilograms):—				
Production	1,783	1,874	1,914	1,772
Deliveries	1,700	1,768	1,876	1,784
Stocks	1,593	2,241	2,254	2,243
Unfulfilled orders	4,746	5,523	5,551	5,520

BRITANNIC
ASSURANCE COMPANY LIMITED
(Established 1866)
Annual Income - - - - - £6,700,000
Assets - - - - - - £30,000,000
All classes of Life, Fire, Accident, Motor and General Insurances transacted
Chief Office: BROAD STREET CORNER, BIRMINGHAM

The latest figures show that the marked fall in food prices evident in August has been arrested, and the index has actually risen:—

WHOLESALE PRICES (1914=100)

Prices	Aug., 1937	June 1938	July	Aug.	Sept. 10
General index	590	652	652	646	644
Domestic products	602	685	673	670	668
Imported products	568	592	613	603	602
Foodstuffs	572	656	638	629	632
Industrial products	606	649	665	661	655

RETAIL PRICES (1914=100)

General index	615	698	698	695
Lighting and heating (1930=100)	105·2	117·8	118·2	121·6
Clothing	96·4	100·4	100·4	100·4

The number of bankruptcies in August was 255, against 416 in July and 472 in June; judicial liquidations and bankruptcies together amounted to 364, against 548 in July and 613 in June.

Germany

War or Peace?

[This letter was written before the announcement of Mr Chamberlain's intention to visit Herr Hitler.—ED., Econ.]

BERLIN, September 14.—Observers on the spot learned with surprise that the Fuehrer's final speech about Czechoslovakia at Nuremberg was read outside Germany with some relief. Such relief could only be justified if people outside Germany had feared the announcement by Herr Hitler of immediate measures by the Reich that would precipitate war. Actually, if Herr Hitler's speech is taken literally, he did announce the likelihood of such measures—but he did not announce that they would be taken immediately.

As it is, there are no really reassuring signs, except perhaps the significant reserve of the military, who are the conspicuously intelligent element in the population. There is always hope that the soldiers may impose caution, as it seems they did in earlier crises. But no one knows what German generals think to-day; and it is not unlikely that the civil Government may pursue a policy which, as much by muddling as by design, will tend to bring about war.

It is still not believed here that the Reich Government has decided upon the crude measure of a march into Czechoslovakia—that is, without a sufficient accumulation of plausible motives. Such motives are piling up; and it is likely enough that an invasion to preserve order (as in the case of Austria when Dr Schuschnigg arranged a plebiscite and summoned the leaders of Labour to help him) may soon be deemed necessary. Yet it is much more likely that partition of the Czech Republic will be virtually brought about without such overt German intervention as would give Prague's allies grounds for resorting to force.

Any solution of the Sudeten problem except by secession of the territories to the Reich seems, on the face of it, impossible. It would be possible to prevent this; and, after the Nuremberg threats, there is a good case for saying that it ought to be prevented, because the result would only be another similar problem, or set of problems, elsewhere in Europe. On the other hand, it is unfortunately true that any outcome other than secession will not really be a solution. The Powers may forbid Germany to make war; they cannot forbid her to make trouble. It was never in doubt that Germany's aim from the first was partition and annexation; nor that this was the wish of the Sudeten Germans themselves.

When Prague made concessions which would have more than satisfied the Sudeten Germans, *had they desired to remain within the Republic,* the pretence that they only wanted autonomy within the Czechoslovak State had to be abandoned. In fact, it was abandoned in Germany before Herr Hitler made his final Nuremberg speech—first when the Press was ordered to print dispatches, all dated from Nuremberg, declaring for partition (an English newspaper article provided incentive and text); and, secondly, when Herr Hitler made a general statement in favour of the right of "self-determination." He was most emphatic, addressing the Army on September 12th, in his announcement that "no negotiation, no conference, no agreement (*Abmachung*) gave us the natural right to unite Germans." He was expressly referring to Austria; and he added that the right was vindicated, "thanks to the soldiers."

Significantly, the only "agreement" in question at the time of the *Anschluss* was the agreement concluded between the Fuehrer and Herr von Schuschnigg to respect Austria's independence. What, we may ask, would be the use of a similar agreement about Czechoslovakia—were there any chance of such an agreement—if, "thanks to the soldiers," the agreement would merely lead to further disagreements and the vindication, as in Austria's case, of the natural right to unite Germans?

Faith and Reason

It is to be feared that, in these matters, the blunt-minded English people do not understand the Nazi psychosis, sometimes misnamed an ideology. The substance of this is that there are no limits to what may rightly be done in the name of unity, Aryanism, might, and other national values, real or ornamental. It is from this that the impressive single-mindedness of National-Socialism derives—the great thaumaturgy of doing-as-one-likes in pursuit of aims which, neither moral nor immoral, are always National-Socialist. From this single-mindedness also arise the apparent contradictions and anomalies of National-Socialist actions—the execution to-day of political enemies for shots fired in street riots six years ago, while shots fired on the other side are applauded; the impending trial of Austrian Separatists; and so on.

Actions like these are possible in other countries. A "Trotskyist" in Russia is, after all, no better off than a "Liberal" in the Third Reich. But there is one very profound difference. Outside of Germany people seek to justify their drastic actions on ostensibly logical grounds. They are apologetic and explanatory. It is not so in Germany. There is no pretence at logic. Thus it is quite natural for Herr Hitler, on the one hand, to emphasise as proof of his zeal for peace that he has made a self-sacrificing pact with Poland where there are many "Germans to unite," and abjured his old plan to recover the Germans in Alsace-Lorraine; and, on the other hand, to proclaim in the same breath that, "thanks to the soldiers," no agreement is binding. The ordinary statesman may say and do these things; but he will equivocate and try to explain. In Nazi Germany there is a "higher truth" which has nothing to do with the facts; and no Nazi statesman need seek to reconcile actual inconsistencies in statement or deed.

The position in Czechoslovakia seems to leave little room for hope. And the course of the negotiations so far suggests that failure was inevitable. In Germany we have seen within a month assertions that Lord Runciman did not want peace, his mission being to assist the British Government in its plan for an anti-German world war, and assertions that Lord Runciman openly sided with the Sudeten folk. In general Lord Runciman cannot expect the approbation of German history. For by his skill and persistence in persuading the Czechs to make concessions he has tried to "put Prague in the right." And, were the whole Carlsbad programme conceded, Prague would still, in German eyes, be in the wrong.

Bulgaria

Altered Terms of Trade

SOFIA, September 7.—Bulgarian foreign trade in the first seven months of 1938 was valued at 5,429 million leva. Exports were 2,790 million leva and imports 2,639 million leva. There was thus a surplus of exports amounting to 151 million leva. Compared with the same period last year, imports have increased in volume and fallen in value, while exports, on the other hand, have decreased in volume and risen in value.

The greatest increases in imports were in purchases of metals, oils, textiles and rubber. Machinery and pulp imports alone showed a decrease. The prices of imports, which are mainly industrial products, are now considerably lower than they were at this time last year.

There was a fall in exports of nearly all commodities, except tobacco, pigs, poultry, wheat, dairy produce, strawberries, colza and probably grapes. The greatest declines were in exports of haricot beans, maize, sunflower-seed and cattle. Nevertheless, because of higher prices prevailing in foreign markets for Bulgarian agricultural produce, the total value of exports was slightly higher than in the first seven months of last year. Haricot beans, maize, eggs, cattle and dairy produce showed the biggest increases in price, while hide prices fell considerably.

There have been certain marked changes in the geographical distribution of Bulgaria's foreign trade during the present year. Imports from Germany, Belgium, Switzerland and Sweden have fallen. Imports from all other countries have risen, especially from Great Britain, Italy, Czechoslovakia, Poland, France, United States and Hungary. Exports to Great Britain, Belgium, United States, Sweden and Denmark have fallen off, while exports to most other countries, and particularly to Italy, Germany, Poland, Hungary and Holland, have increased.

Dependence on Germany

The first and dominating place in Bulgaria's foreign trade is still occupied by Germany. The Reich supplies 49 per cent. of Bulgarian imports and absorbs 46 per cent. of Bulgarian exports; and is followed in the list of Bulgaria's customers by Italy, Great Britain and Czechoslovakia, in that order:—

Country	Imports (in million leva)	Exports (in million leva)
Germany	1,302	1,274
Italy	188	306
Great Britain	213	205
Czechoslovakia	159	226
Poland	168	176
France	108	57
Hungary	73	68
Switzerland	57	66
United States	83	35
Holland	33	79
Roumania	80	2
Egypt	14	58
Denmark	1	54

A number of factors are likely to improve the outlook for exports. Some increase in the prices of agricultural produce can be expected as a result of expansion in industrial output. Unemployment is falling. And an increase in demand in Central and Western Europe would undoubtedly exercise a very favourable influence on exports, enabling them to command better prices. The price factor will be of great importance this year because, owing to the rather small crops, exports will be smaller in volume than they were last year.

New Zealand

Exports Still Falling

CANTERBURY, August 26.—Foreign trade returns for the export year ended June 30th show that the decline in export receipts has continued. For the calendar year 1937 exports reached £NZ66,700,000, the highest figure yet recorded. For the year ended June 30, 1938, the value fell to £NZ61,900,000, the fall in wool prices being the chief factor in this decline. A comparison of the seasons 1937-38 and 1936-37 shows that receipts for wool fell by £NZ6,400,000 and for hides, skins and tallow by £NZ1,100,000.

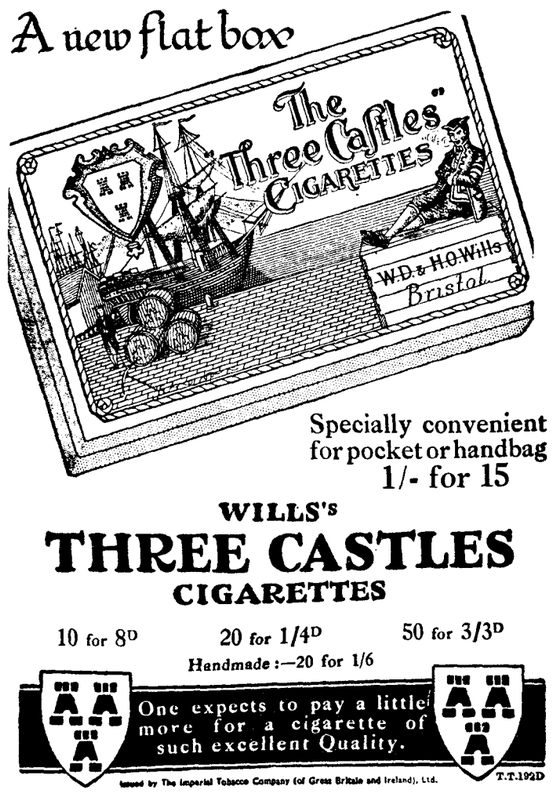
These decreases were offset in part by increases of £NZ2,600,000 in butter and cheese exports, and £NZ2,200,000 in chilled and frozen meat. It is a matter of some concern that the export prices of industrial raw materials, which usually rise and fall earlier than food prices, fell 40 per cent. during the year, the prices of animal foods continuing their upward trend. Should a fall in the prices of animal foodstuffs occur, a further decline in export receipts must follow.

Imports have been rising steadily since the lowest depths of the depression were passed, and they reached their peak in the year ended March 31st last, when they totalled £NZ58,060,000. Imports then dropped for the year ended June last to £NZ57,540,000. Over the complete year exports have fallen and imports have risen, and the export surplus has been reduced from £NZ14,540,000 in 1936-37 to £NZ4,380,000 in 1937-38.

In consequence, the export surplus has been insufficient to cover the amount of about £NZ10,000,000 required for interest payments, etc., abroad, and the funds held overseas by the banks, mainly for exchange purposes, have been reduced. The actual reduction in these funds from £NZ36,960,000 in June, 1937, to £NZ26,120,000 in June, 1938, indicates that the export of capital, which has been noticeable from these returns for some years past, still continues.

Slackened Business

Internal business conditions appear to have varied in recent years in close correspondence with the course of imports, (the first half of 1935 = 100), reached 150 for the first half during the past few months. An index of average bank debits (the first half of 1935 = 100), reached 150 for the first half of 1937 and fell to 140 for the first half of 1938.



Sales tax receipts in the latest quarter were also about 6 per cent. lower than in the same period of last year. Building continues to expand and has now reached pre-depression levels, but the Government's building programme is responsible for a large part of the increase.

While export prices have fallen, wholesale prices have been fairly stable. Retail prices have advanced slightly and wages have risen more rapidly. The index of retail prices is now 51 per cent. above its 1914 level, while the wages index is 70 per cent. above that level; but the wages index, being an index of weekly rates, takes no account of hours or holidays and understates the increase in labour costs in recent years.

Budget and Social Security

The last session of the present Parliament has been devoted mainly to consideration of the Budget and a bill embodying the Government's proposals for social security. Estimates for the present year were NZ31,710,000 from taxation (excluding employment tax, £NZ5,370,000), and £NZ35,840,000 for total revenue, while expenditure was estimated at £NZ35,790,000, leaving an estimated surplus of £NZ50,000. Other features of the Budget were the very high estimates for expenditure on public works in the present year, amounting to £NZ20,720,000, of which £NZ14,260,000 were to be found from loan money and £NZ6,460,000 from revenue. The public debt at March 31st last stood at £NZ290,200,000. The net increase shown for the year was £NZ2,530,000, but the new borrowings in 1937-38 amounted to £NZ7,450,000.

The social security bill, at present under consideration, provides for universal superannuation, an extension of existing pension schemes, and free medical, maternity and health services. Universal superannuation is promised for all persons over 65, without limit of income or property, who satisfy the required residential conditions. Superannuation begins in 1940-41 at £NZ10 a year and rises by £NZ2 10s. a year to a maximum of £NZ78 per year, which will not be reached until about 1970. The maximum rates for old age pensions, invalid pensions, miners' pensions and Maori War pensions are raised from £NZ58 10s. to £NZ78 a year. Widows' and orphans' pensions and family allowances are increased, and in future subsistence payments to the unemployed will be made from the social security fund. (The bill has now been passed by Parliament, after several minor amendments.—ED.)

Letters to the Editor

Family Allowances

TO THE EDITOR OF THE ECONOMIST

SIR,—The case for some system of family allowance is generally based on considerations of nutrition, of future population and of individual well-being. All schemes—as far as I know—except those emanating from our own "lunatic fringe," come up against a serious limitation; that allowances on an *adequate* scale are not economically feasible without (1) a substantial increase in the national income; or (2) a substantial change in the distribution of the national income as between the classes; or (3) a reduction of the general level of pure wages.

I believe that a scheme could be evolved which would achieve the social ends which are the objective of the Family Endowment Society, and would at the same time bring great economic benefit to the community at large, if the third of our limitations set out above was not regarded as paramount.

The basic principle of the scheme would be the entire abolition of unemployment insurance; the substitution of a system of payments to all members of the community of "allowances" on a scale similar to the existing scale of unemployment benefit; and corresponding revision downwards of all pure wages. The social benefits of such a scheme are as obvious as the titanic political difficulties in the way of its realisation. The economic advantages are less obvious, but would, I believe, prove to be of similar scale. The Labour Party has accepted in principle the desirability, and all other parties have accepted in practice, the inevitability of "Work or Maintenance." If a man cannot get work, he and his family must, nevertheless, be maintained.

In terms of general economic welfare, the marginal disutility of a man spending his time in active occupation instead of idleness is small; yet, from the point of view of the employer who has to pay him wages, the marginal disutility in employing him is great. How can one expect the maximisation of economic welfare in anything like an economically free community while this disparity exists?

I will not take up your space with any description of the economic effects of such a system on the relation *inter se* of prices, on the relative standards of living of different types of family, on unemployment, or on exports. I am sure that all your readers could do this for themselves as well as I could, and many of them much better. I believe that all the major effects would be beneficial except for (1) the dislocation during transition; and (2) the effect of raising the necessary funds.

As to the latter, I believe that, even if such a crude device as a general sales tax on consumption goods was used, the disadvantage would serve only to reduce in quite moderate degree the beneficial results which would flow from it. On balance, I believe that it would enable the free communities to rival in economic effectiveness the totalitarian States which at present so obviously and so lamentably surpass them.

Yours faithfully,

London, E.C.2. GEORGE WANSBURGH.

America and Britain

TO THE EDITOR OF THE ECONOMIST

SIR,—As a subscriber to your excellent periodical, I have been struck with what I think is a failure to understand the psychology of my country; so I submit the following, which may possibly be of interest.

It is, I believe, important for England to keep the United States as a friend. It is because I hope that she can do this, that this advice from a benighted, insular, and insulated Middle Westerner is offered. The surest way to lose the friendship of the *people* of the United States is to try too hard to get them to fight side by side with England in the Armageddon of the democracies.

Anglo-American friendship means little or nothing to the average voter in this country. The United States is not Anglo-Saxon any more. European immigrants, their sons and grandsons, care little for England; in fact, the British Raj means less than nothing to one conspicuous and powerful *bloc* of voters, the negroes; and our New Deal has welded the Northern negroes into a compact voting group.

So far nothing has been adduced to make the Middle West or the Pacific Coast war-anxious. We have seen aeroplanes fly very fast, but we cannot see anyone conquering this country merely because modern science has "destroyed" our "splendid isolation." We realise that our trade will suffer because of any European war; and there is no group of powerful individuals expecting to reap huge benefits because (1) they doubt if loans could be made to pay for the goods, and (2) the Administration (whoever is elected in 1940) will confiscate war profits. We do not think, moreover, that our trade would be improved by entering a war, on either side.

We are susceptible to the idealistic appeal; and there is a real sympathy and feeling of kinship with your people among those of our "upper class" who have not had unpleasant experiences with individual Englishmen. We share a common culture, and we teach English literature in those same colleges where young men and women vow never to fight in or support any foreign war. We do not fear invasion, as common sense tells us no one could conquer and hold this country, and we cannot see any of the European gangsters leaving their home grounds to engage us. We do not lie awake nights worrying about Japan starting a war with her best customer, although the Japs seem to fancy the bayonet as a sales argument. In brief, we feel secure, and I believe that if England were in our position her attitude would be just the same as ours.

In closing, one more word of friendly caution: petulant demands that we "take a stand" or "declare" ourselves will elicit a prompt and unfavourable reaction. The delicate flower of Anglo-American friendship must be carefully nurtured. I have indicated that I think too assiduous propaganda might injure that flower. I am so sure that it would be hopeless to try to sell us a front line position in a European war, that I hope your statesmen will not throw away in the attempt a friendship that can mean much to your country. If there is any hope for what we fondly call civilisation in a world turning brute, it is in such a friendship.

Chicago, U.S.A. Your obedient servant,

HARWOOD E. SMEETH.

POINT FROM LETTER

The Long-Term Budget Problem.—It is instructive to put the three "Ways of Escape," proposed in the study of "The Long-Term Budget Problem" in your June 11th issue to a practical test. "A reduction of the scale of expenditure by the State, not merely in the defence departments but over the whole field of civil expenditure" would mean that all those who work under the heading of "civil expenditure" would have less to eat, house, clothe or amuse them. "Appropriation by the State, through the medium of taxation or otherwise, of a significantly larger proportion of the national income than at present" would mean that all those who do not work under the heading "civil expenditure," and to some extent those who do, would have "significantly less" to eat, house, clothe or amuse them. "Discovery of some means by which the rate of increase in the productivity of the average individual can be greatly accelerated" is the most interesting "Way of Escape." Social investigators estimate that production could be ten times what it is at present. But if the possibility of production being increased, say, four times be accepted, then it follows that we must consume at four times the present rate. It is difficult to see any objection to this course.—*P. R. Masson, Birmingham.*

Books and Publications

Economics and Society

IN these two books* sixteen American professors of economics re-examine the trends of modern social economy, particularly in the United States. The authors recognise the necessity of evolving a method, at once logical and practical, of so regulating human affairs as to eliminate social and industrial stresses; and they realise the importance of objective and accurate diagnosis of contemporary ills.

Both books are valuable contributions to social and economic thought, albeit in very different ways. Professors Dixon and Eberhart, of the University of Pittsburg, attempt a complete survey of history from the social and economic angle from palæolithic times to the present day. This broad sweep through history endows their theme with a striking sense of perspective and, within its limits, such a survey is undoubtedly valuable.

After sketching in, somewhat impressionistically, the beginnings of society, Professors Dixon and Eberhart go on to discuss, clearly and concretely, the eras of Feudalism, Commercialism and Industrialism. The causes of the decay of Feudalism; the effects of the Crusades and the conquest of Constantinople; the significance of the Renaissance, the Reformation and the Age of Discovery; and the final elimination of feudal elements in the all-important Industrial Revolution, which paved the way for capitalism and its present *malaise*—all these are passed in skilful review.

No better introduction than this survey of the past origins of present discontents could be suggested for the symposium prepared by fourteen professors of the Graduate School of Business Administration at Harvard University. The ultimate theme of the Pittsburg professors, for instance, may be summed up in their own words:—

> **The Industrial Revolution solved the technical problems . . . but it created the much more difficult problem of the distribution of adequate purchasing power . . . the problem of industrialism has been the distribution, not the production of wealth. Social planning has become ever more urgent as the forces of technology have brought society at an accelerating rate from an economy of scarcity to one of potential abundance.**

And, following this very theme, the Harvard studies, severally, make no pretence of rigid consistency of thought, but, collectively, constitute a shrewd analysis of the significant social and economic problems of to-day, as they are illustrated in the American economy. Some of the papers deal with relatively domestic problems, such as those of accounting reform, the Federal debt, American agriculture and the rate-making of public utilities, the balancing of the Federal Budget and the development of new uses for agricultural products. Professor Slichter's suggestion that government, traditionally "a policeman and a judge, . . . needs to assume the new function of economic manager," summarises many of their implications.

Chief interest, however, lies in the contributions of more general application. Professor Donham, Dean of the Graduate School, opening the symposium with a thoughtful study of "Material Progress and Social Discontent," avers that

> business faces grave problems of transition . . . transition to an age of human understanding, in which advancement of scientific knowledge and increase in material efficiency shall not reign as sole gods.

This theme is echoed in the plea of Professor Gras (discussing price regulation) for "a policy of social justice."

Professor McNair contributes a brief but suggestive analysis of the trade cycle. He concludes, not very specifically, that there is a combination of diverse factors inherent in the capitalist system which tends to produce fluctuations; and he classes monetary influences and psychological factors as contributory causes. Interestingly, in view of Sir William Beveridge's recent paper to the British Association, Professor McNair is ready to support the theory that fluctuations in agricultural output may initiate disturbance in business.

To Professor Tosdal falls the task, implicit in a great number of the contributions which have gone before, of analysing the difficulties involved in the important problem of assessing consumer demand. Since feudal times producer and consumer have become more and more widely separated, and it is precisely the difficulties so created that are responsible for the fact that the technique of consumption lags behind that of production.

These are not works of uniformly outstanding importance. But they are representative to an unusual degree of the outlook of intelligent academic people in the United States upon society, its growth and organisation and the straits to which, at the height of its technical powers, it has currently come. And they are monuments to the industriousness of American professors.

* "Economics and Cultural Change." By Russell A. Dixon and E. Kingman Eberhart. McGraw-Hill Publishing Co., Ltd. 550 pages. 18s.
"Business and Modern Society." Edited by Malcolm P. McNair and Howard T. Lewis. Harvard University Press. (Oxford University Press.) 411 pages. 21s.

Shorter Notices

"The Battle for Peace." By F. Elwyn Jones. Gollancz. 352 pages. 8s. 6d.

Mr Jones, with the aid of the inimitable Horrabin, seeks to show the process of Fascist penetration at work. Sometimes he mistakes old and familiar processes of Imperial growth for what he calls "a new technique of aggression": the world and its frontiers have never been static. As the Rome-Berlin Axis appears more and more menacing to the populations of, in particular, Europe (Mr Jones declares) the supporters of peace in all countries, including (underground) the Fascist States are made alive to the danger. Peace knows no frontiers, not even German and Italian, and a great Inter-National Peace Front is possible, if not probable. This is the only way to save civilisation from the destruction of war. So, taking short cuts through a complex world, Mr Jones argues; his picture is grim, but his conclusion is full of hope.

"This Modern Age." By F. C. Happold. Christophers. 319 pages. 5s.

Mr Happold has set out to draft in simple terms a guide to the understanding of our own complex and confused times. He shows how its organisation has evolved from the satisfaction of primitive needs, how government has grown and how the relations between nations have been determined in the past. He unravels a tangled skein of history and economics, and shows at the end the England we know, its industry, commerce and finance, its political structure, its world setting and its social habits. His task has been enormous and the result of necessity sketchy, incomplete and somewhat elementary. But the book is very readable and may be more influential than more authoritative or expert works in persuading people to look beyond their noses for explanations of the lives they lead and justification for their hopes and fears.

BRITAIN IN RECOVERY

This book has been compiled by a Research Committee of the British Association, under the chairmanship of Professor J. H. Jones. It traces the effects of recovery on British industries, and provides a factual, authoritative survey of a vital period in the industrial history of this country. It should be read and studied by all interested in the urgent economic questions of the day. 484 pp. 15s. net from a bookseller, or 15s. 6d. post free from

SIR ISAAC PITMAN & SONS, LTD., Parker St., London, W.C.2

THE BUSINESS WORLD

Wheat in Abundance

THE long-term downward trend of wheat prices, born of human ingeniuty in devising means to increase the efficiency of cultivation and harvesting, has been a boon to mankind. But violent short-term fluctuations in the price of wheat, due to the vagaries of the weather, are an affliction which is one of the major causes of economic instability.

The unsettling influence of wide short-term fluctuations in wheat prices is revealed by the fact that, on the basis of average British import prices, the value of the world wheat crop, exclusive of U.S.S.R. and China, was of the order of £950 millions during the season ended last July, against £530 millions in 1933-34 and £1,100 millions in 1928-29. This instability has again been demonstrated by the course of prices during the past twelve months. Thus, the price of wheat on the Liverpool Futures market fell from 8s. 3d. per cental on September 13, 1937, to 4s. 8d. last Tuesday. A fall of such dimensions spells hardship for the farmers of the great wheat-exporting countries and causes unemployment among the industrial communities because of the shrunken purchasing power of the wheat growers.

The immediate cause of the collapse of wheat prices was Nature's unexpected generosity this year. But, as we pointed out in our last review of the wheat situation in *The Economist* of September 18, 1937, a slump in prices was to be expected. As a result of a series of crop failures and rising prices, the area under wheat had been steadily extended without bringing a corresponding increase in output. This year the area under wheat in the principal countries was actually 10 per cent. above the average for 1932-36. But it was not to be expected that we should have an indefinite continuance of sub-normal yields, and a normal yield was bound to produce a crop in excess of requirements at current prices. This is precisely what has happened. As the sharp recovery in wheat prices this week has shown, however, wheat has also its importance for war. It is only natural, therefore, that attention is focussed on this year's crop estimates by statesmen as well as farmers. In the circumstances it may be useful to examine the latest estimates of this year's wheat crops.

Although the actual yield of this year's wheat crop is not yet available, preliminary estimates give an indication of its approximate size in a large number of countries. The accompanying table shows the probable yield in the principal countries of the world, as given in the latest *Monthly Review of the Wheat Situation* published by the Canadian Ministry of Trade and Commerce.

Both Canada and the United States produced excellent crops this year, that of Canada being about twice the size of last year's harvest. The bountiful harvest in Canada and in the United States, indeed, was a major factor in the headlong decline in prices. Poor crops in 1935-36 and 1936-37 compelled the United States to import wheat. In 1937-38, however, she again exported over 100 million bushels, and supplies this season are appreciably heavier.

Europe's crop this year is expected to yield 82 million bushels more than in 1937. Roumania and Hungary—two of the principal exporting countries—have produced heavy crops. Among importing countries, Britain's output shows an increase of about 9 million bushels; the major increase, however, has occurred in France, whose crop is expected to be nearly 50 million bushels heavier than last year. Italy's crop is estimated to be 30 million bushels smaller than in 1937, but not as small as the poor harvest of 1936. Germany's crop is expected to produce a better yield than in any of the three preceding years, though there have been some doubts concerning the reliability of this optimistic forecast. Spain's crop is likely to be appreciably smaller and Poland's crop substantially higher. No striking change is expected in the smaller producing countries.

Among the remaining countries the outstanding feature is the increase in production in India. The crops of Argentina and Australia are provisionally given at about 250 million bushels and 150 millions respectively, but as the final yield of the crops in these countries depends on weather conditions in coming weeks, these provisional estimates are no more than guesses. In the absence of reliable information it is difficult to estimate the probable size of Russia's crop. Such reports as are available, however, point to a satisfactory harvest this year.

On the basis of these estimates, many of which have to be conjectural at this time of year, the world's wheat crop in 1938, exclusive of U.S.S.R. and China, is expected to yield 4,227 million bushels, an increase of no less than 401 million bushels over last year's harvest. As this is the biggest wheat harvest ever garnered, the collapse in prices is not surprising. Last year's crop, excluding the U.S.S.R. and China, was already in excess of world requirements; for the stocks in the United States, Canada, Argentina and Australia, the four biggest exporting countries—*plus* grain on the high seas—rose from 228 million bushels at the end of the 1936-37 season to 316 millions at the end of the past season. If world production reaches anything like the present provisional estimates, the carry-over at the end of this season may again reach the levels registered during the depression. In the absence of crop failures in Argentina and Australia and an appreciable downward revision of the estimates of other countries, prices can hardly be expected to rise—except in the event of war.

As we suggested a year ago, the wheat cycle has thus been reversed, not by an unusually high yield per acre, but by a normal yield on an acreage which was extended under the influence of rising prices in an attempt to offset the niggardliness of Nature during the past few years. The disastrous consequences of the vagaries of the weather provide a strong inducement to organise international control of cultivation and stocks. But the sources of supply are so widespread that this objective is extremely difficult of attainment, and there are no indications that a sufficiently comprehensive scheme will see the light of day in any near future. If, however, the world should be overtaken by war, wheat would immediately become a very precious commodity; and, in that event, the European nations would, of course, be thankful for Nature's generosity this year.

Measuring Company Earnings—II

Stable *versus* Fluctuating Profits

THERE is a tendency among many investors to-day, whether they are employing their own money or someone else's, to give special attention to securities whose service is dependent, directly or indirectly, on industrial earnings, and to invest for the long rather than the short period. In an earlier article we applied a simple method of measuring the long-term trend of profits to the last ten years' earnings of fourteen leading British companies, covering a wide industrial range. By calculating five-year moving averages of profits and expressing the results as index numbers with the earliest quinquennium equated to 100, we showed that the various companies fell into three main groups, according as their trend curve of profits was stable, retrogressive or progressive. We suggested that every investor, before purchasing a "seasoned" share, should decide into which group it fell; and that, other things being equal, he should be prepared to accept a lower immediate return on a "dynamic" share than for a "stable"—much less a "declining"—equity.

Broadly, the last contention is valid. It is recognised by market practice, though the market's classification of securities is frequently haphazard and unscientific. It must be admitted, however, that the use of moving averages to bring out trends has one considerable disadvantage—it obscures intermediate fluctuations, which may have a material bearing on the investor's problem. If a company could rely with complete certainty on earning profits which never varied by as much as a penny, then, in theory at least, all its shares, by whatever name it called them, would be fixed-interest shares and their yield (in theory again) would rightly approximate to that on gilt-edged securities. People will pay for stability, and a share with a flat trend may, consequently, have a higher investment ranking than one with a progressive trend whose earnings are susceptible to wide variations from year to year. And if two companies have the same general trend, the one with the smaller annual variations in profits can afford to have the higher gearing—i.e. the higher proportion of debentures and preference shares in its total capital. Finally, intermediate fluctuations may affect the relative attraction of a share at the moment of its purchase; for shares with more than average liability to variation tend to be dear to buy in prosperous periods and cheap, on their long-term merits, during a depression.

How can investors obtain a common measure of "liability to fluctuations" among different companies? Merely to compare highest and lowest profits, over a period of years, may give misleading results, as will be evident from the following table, which gives the last ten years' net profits of the largest British joint-stock bank and one of the biggest electricity supply companies:—

PROFIT FLUCTUATIONS

(1) Company and Year	(2) Net Profits	Five-Year Moving Average of Profits (pivoted on middle year) (3) Amount	(4) *1928–32 = 100*	(5) Amount by which Middle Year's Profit exceeds or falls below Moving Average

1934	2,292	2,238	*100*	54
1935	2,133	2,335	*104*	202
1936	2,468	...	...	...
1937	2,508	...	...	...
Totals (Cols. 3 and 5)	...	13,337	...	680
Col. (5) as % of Col. (3)	...	...	...	5·1%
N. Eastern Electric:—				
1928	574	...	...	...
1929	608	...	...	...
1930	643	612	*100*	31
1931	592	636	*104*	44
1932	612	660	*108*	18
1933	694	688	*112*	6
1934	728	738	*121*	10
1935	782	792	*130*	10
1936	844	...	...	...
1937	910	...	...	...
Totals (Cols. 3 and 5)	...	4,126	...	119
Col. (5) as % of Col. (3)	...	...	...	2·9%

The highest profit recorded by the Midland Bank during the ten years 1928-37 was £2,508,000 and the lowest £2,019,000. Profits thus fluctuated by £245,000 (10.8 per cent.) on either side of a mid-way figure of £2,263,000.

The highest and lowest points of N.E. Electric profits were £910,000 and £574,000, respectively, i.e. £168,000 (22.7 per cent.) above and below a mid-point of £742,000.

It would be wholly erroneous, however, to conclude that the "liability to fluctuate" was twice as great in the case of N.E. Electric as in that of the Midland Bank. The profits of the former, as our table shows, have a well-marked rising trend, while the trend of Midland Bank earnings is relatively flat. By "fluctuation" we mean, in fact, the extent to which the actual profits of any one year deviate from the trend line. If we take five-year moving averages

PROFIT TRENDS AND DEVIATION PERCENTAGES OF FOURTEEN COMPANIES

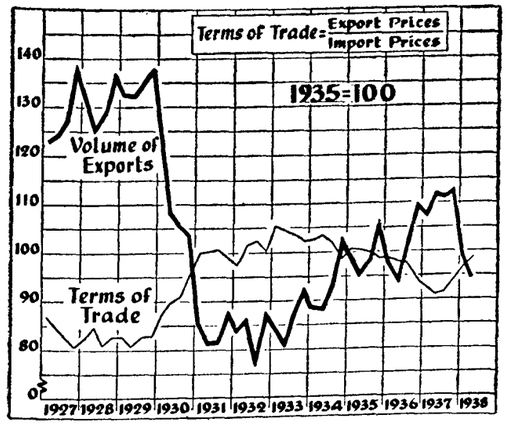
and pivot them on the middle year of each period [column (3) in the table on page 545], calculate the "deviation" of that year's figure from the average [column (5)] and, finally, compare the total of the deviation column with the total of the average column—then we shall have a more accurate measure of relative fluctuation. Whether the deviation from the trend, in any given instance, is *plus* or *minus* is immaterial; fluctuation is fluctuation in either case. The table shows that the "deviation percentage" of N.E. Electric profits, calculated in this way, is actually not twice as great as, but little more than half of, that of Midland Bank profits.

In the table at the head of this page we show trend index figures and deviation percentages for the fourteen companies, together with the current Stock Exchange prices of their ordinary shares, and their percentage income yields on the latest dividends. Broadly speaking, flat trends are generally associated with low fluctuation percentages, and retrogressive or progressive trends with higher percentages. That rule, however, is by no means invariable, and some of the exceptions are particularly significant for investors. The disclosed profits of J. Lyons have the best-marked upward trend of any of the "stable" companies in our list, combined with an extraordinarily low deviation percentage. This association of attractions for the conservative type of investor scarcely finds recognition in the higher yield obtainable on Lyons equity shares than on those, say, of Alliance Assurance and Midland Bank. The earnings of Imperial Tobacco, it will be seen, have as high a deviation percentage as those of L.N.E.R.—the representative of a depressed industry—but the trend of the two companies is very different. Vickers and I.C.I. come out with very similar deviation percentages, though the former covers a range of industries whose liability to fluctuation is proverbial. The two textile companies (Courtaulds and J. & P. Coats) have considerably higher percentages than the two representatives (Vickers and Staveley) of the "heavy" industries.

If one were to draw a discreetly practical conclusion from these figures it would be that investors should buy in depression shares with a long-term upward trend and a moderate to high deviation percentage. They are likely to be among the cheapest wares in the market, in such conditions. Generally, however, the methods of measuring trend and deviation outlined in these articles should be used merely as a preliminary to a much more detailed examination of individual companies, including their capital structure and technical prospects. They are avowedly rough and ready, but they give a sufficiently clear impression to enable the investor to decide, at least, which shares deserve further scrutiny for the particular investment objective he may have in view.



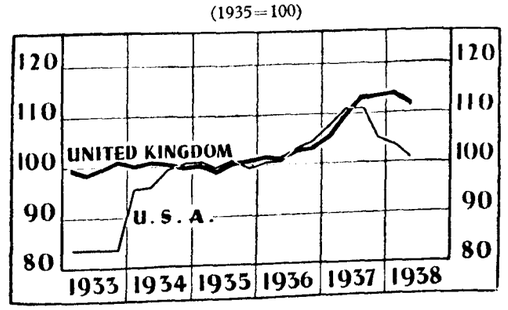
Is Sterling Over-valued?

THE very heavy pressure on sterling in the last few weeks has been due, in overwhelming degree, to the flow of capital funds from Europe to New York. But in addition to this capital movement there has also been a considerable volume of sales of sterling (or purchases of dollars) for more normally commercial reasons. In discussing the position of sterling, an article in this section of *The Economist* last week asserted, though without adducing proof, that the pound is over-valued in relation to the dollar. The present article returns to this particular point. Nobody would argue that the commercial over-valuation of sterling has caused the recent depreciation, in which it has played only a small part. But the fall in the pound would hardly be justified, and would certainly not be long enduring, unless it reflected a shift in the real relationship of the two currencies on the ordinary commercial plane.

In detecting and measuring over-valuation, the traditional method is that of calculating purchasing power parity based on a comparison of the internal prices and costs of the two countries. This method is useful up to a point, but its defect is that it yields results which are usually indeterminate and always subject to serious qualifications. The usual assumption is that immediately prior to our suspension of the gold standard in 1931, the pound was over-valued against the dollar by 10 per cent. If so, its fate in 1931–32 made it under-valued until the later depreciation of the dollar in 1933, and this period of under-valuation may be one of the reasons why we led the world, including the United States, in the subsequent recovery. Since early 1933, however, there is some evidence that the pound has been consistently over-valued, again by approximately 10 per cent. The evidence of internal prices, though significant, is by no means conclusive. For example, since December, 1936, British primary product prices have fallen by only 19 per cent. and American by as much as 33 per cent. This points to a growing over-valuation of sterling. On the other hand, the complete wholesale price index numbers have fallen by about 10 per cent. in both countries; the cost-of-living indices are in both countries much the same as they were in December, 1936; while American wages appear to have risen by 12 per cent., against an increase of only 7 per cent. in Great Britain. These last three pairs of indices do not suggest that sterling is any more over-valued than it was nearly two years ago. So far the indictment against the pound that it has recently become more over-valued only leads to a verdict of not proven. There is suspicion, but no conclusive proof.

There is, however, another and more direct line of approach to the problem, namely, a comparison of British and American export trends. The British position, *per se*, is illustrated in the following chart, which shows the trend over the past eleven years :—

TERMS OF TRADE AND VOLUME OF EXPORTS, UNITED KINGDOM



The thin line shows our "terms of trade," i.e., the average price of our exports divided by that of our imports. Obviously, the lower that ratio is, the easier it is for us to compete in the world's markets, since it means that our goods are cheaper in terms of the goods our customers have to sell. Hence it is no accident that the volume of our exports moves in inverse correlation to our terms of trade. The movement of the terms of trade since 1929, though technically in our favour (and, as an article on page 530 argues, very really in our favour) has limited the possibilities of the export trade. What is more significant at the moment is that the terms of trade have recently again started to move in the direction that limits our exports. The explanation is easy to find. Our imports are largely food and raw materials, whose prices have fallen heavily as the result of the recession. Our exports are mainly manufactured goods, and as is the common experience in a period of falling prices, these prices have lagged behind. Thus, comparing the second quarters of 1937 and 1938, our average import prices have fallen from 119.9 to 113.4 (1935=100). Our average export prices have risen from 109.2 to 111.9, this movement reflecting in part the continued upward trend of wages during the past year.

The vital question is how the recent trend of British export prices compares with that of American export prices. This is illustrated in the following chart :—

AVERAGE EXPORT PRICES, 1933–38

(1935=100)

This chart brings out the most fundamental fact of all. While British export prices have hardly fallen at all, and are still higher than they were a year ago, there has been a substantial fall in American export prices. The equality of 1935–36 has now disappeared, and there is the same spread as in 1933. In reality the spread is greater, for in 1933 sterling was quoted at a much lower rate in dollars than it is to-day. It is probably true to say that for the first time since 1931 American exports are on the average substantially cheaper than British exports. This is, of course, very largely the same phenomenon as was represented in the earlier chart, since the fall in the average

price of American exports is largely due to the large part played in those exports by foodstuffs and raw materials. But it is important to realize how differently a fall in primary product prices affects the two currencies.

It is equally a fact—again of fundamental importance—that the recent shrinkage in the volume of British exports has not been paralleled in the United States. A comparison of the second quarters of the past few years brings to light the following divergence :—

VOLUME OF U.K. AND U.S.A. EXPORTS (YEAR 1935 = 100)

Second Quarter	U.K.	U.S.A.
1935	95·8	86·2
1936	94·6	100·0
1937	112·0	129·8
1938	94·3	132·8

This increase in American exports is not entirely a question of relative cheapness. It also arises from the recent recovery in American harvests after several bad crop years, and American wheat exports have now been restored to their " normal " level of the 'twenties. There is also the world re-armament demand for metals. Thus, comparing the first half of 1937 and 1938, American exports of metals, etc., have only fallen by 17.6 per cent. in value, in spite of the much bigger decline in metal prices ; there must have been an increase in their volume. Copper exports, for example, have increased from 345 to 378 million lbs., or by nearly 10 per cent., in spite of the recession in world trade.

In addition to the recent shrinkage in the volume of British exports and increase in the volume of American exports, there is also the fact that American import trade has been hit by the recession : —

VOLUME OF U.K. AND U.S.A. IMPORTS (1935 = 100)

Second Quarter	U.K.	U.S.A.
1935	96·3	95·9
1936	102·9	107·2
1937	110·5	133·8
1938	104·4	81·3

Since last year there has been a drop of nearly 40 per cent. in the volume of American imports and after allowing for the fall in their average price, a still greater decrease in their value. The United States is, in fact, buying less from the whole world, and in particular imports from the sterling area have fallen heavily. In its turn the sterling area both acquires a passive balance of payments and also is able to buy less from Great Britain. Meanwhile, the world, including the sterling area, is continuing to buy on its previous scale from the United States. Our own imports, in fact, from the United States were £23.3 millions in the second quarter of 1937 and £26.1 millions a year later, whereas our exports fell from £7.5 to £3.8 millions. The table at the head of the next column shows some of the changes in American trade with sterling area countries. The enormous drop in imports, not only from England, but also from such countries as Australia, New Zealand, Denmark, Norway and Argentina is very significant. Meanwhile, exports are higher in every case with the sole exception of South Africa.

AMERICAN TRADE WITH STERLING AREA

(First half of each year : $ millions)

	Imports from		Exports to	
	1937	1938	1937	1938
United Kingdom...	112·2	51·4	207·7	255·6
Australia	33·9	3·7	31·5	35·8
New Zealand	15·1	2·6	11·1	11·4
South Africa	6·6	7·8	41·0	35·1
Denmark	3·8	1·4	8·1	13·5
Norway	14·8	7·0	10·9	12·7
Sweden	26·4	20·1	30·0	30·4
Argentina.....	86·4	20·7	39·9	49·5

There is no need to look any further for the immediate causes of the present commercial pressure upon sterling and the strength of the dollar. Is it also true to say that the pound is over-valued? The chart illustrating the trend of export prices in the two countries might be thought to answer this question definitely in the affirmative ; but this is not quite the end of the story. The fact is that British export prices are mainly the prices of manufactured goods. American export prices are a combination of primary product prices and unmanufactured goods prices, with primary products slightly predominating. Therefore, the present lower level of American export prices, and, indeed, the over-valuation of the pound itself, reduces to a particular case of a general economic proposition. This is that in times of recession, particularly in the opening stages, the primary producer is hit worst by a fall in his prices, whereas the manufacturer finds that he is unable to reduce his prices and so is unable to sell his goods. The present over-valuation of sterling against the dollar is, so far as England is concerned, nothing more than a particular though striking symptom of this general disease, and so must be regarded as one of the necessary and automatic consequences of the world recession. The extent to which sterling is over-valued is difficult to define. It depends whether it is thought best to measure British manufactured goods prices against American primary product prices or against those of American manufactured goods ; or whether it is thought best to attempt a compromise between the two categories of American prices, which differ fundamentally from each other.

The result of this examination is to reinforce our plea of last week for an elastic exchange policy. It is impossible to say what the " correct " value of sterling is, and all that can be done is to strive after a rate which gives neither country a persistent bias to its balance of trade. Such a rate clearly will not be immutable, for the terms of trade are continually varying upon both sides of the Atlantic. We must, therefore, pursue an elastic and, indeed, a frankly opportunist exchange policy.

Finance and Banking

Sterling's Vicissitudes.—The London foreign exchange market has been dominated this week by fears of war and by the varied fortunes of the bullion market. Broadly speaking, up to Wednesday evening the demand for dollars was reinforced by the feeling that it was safer to hold dollars than gold. Thus the British Control could no longer rely so much upon arbitrage dealings as an indirect means of support to sterling, and so had to depend more upon direct intervention on its own account. The course of sterling can be recited very simply. After closing at $4.81\frac{1}{8}$ on Saturday, the pound dropped on Monday morning to $4.80\frac{3}{8}$. Control support and a small amount of selling by arbitrageurs who had the courage to take advantage of the prevailing discount in the bullion market brought the rate temporarily back to $4.82 in a sensitive market, but the evening's close was $4.81\frac{1}{4}$. Limited profit-taking after Herr Hitler's Nuremberg speech raised the rate to $4.81\frac{3}{8}$ on Tuesday morning, but that day's ominous news gave rise to a fresh big demand for dollars, and in spite of heavy sales by the Control, sterling lapsed to $4.80\frac{1}{4}$. This downward trend continued in London during the whole of Wednesday. Gold that day was again at a discount, and this brought out a little fresh arbitrage support, but nevertheless the London close was $4.79\frac{1}{8}$. New York, however, was still dealing after the news of Mr Chamberlain's visit to Herr Hitler was known, and sterling was quickly bid up to $4.81. On Thursday's opening in London, Swiss sales of dollars raised sterling to $4.82\frac{1}{2}$, but by the end of the morning the rate was back to $4.81. Gold was fixed at a discount of 1½d., based on the old shipping parity without allowing for this week's increases in insurance charges. This brought out a certain amount of arbitrage business, and gold was bid up from 144s. 3d. to 144s. 6d. after the fixing, with reports that the Control was only selling at 144s. 7d. The reactions of this arbitrage demand were to create some demand for dollars, but the market was very erratic. Three months' dollars strengthened between Saturday and Wednesday from $1\frac{1}{4}$ to $1\frac{3}{4}$ cents premium.

* * *

Gold Cross Currents.—The London gold market has during the past week been the point at which many divergent currents emanating from a complex amalgam of fears and suspicions have met. The gold market, fed as it has been by business arising directly and indirectly from political tension, should, as a matter of course, provide a somewhat disturbed and confused picture in a week such as that through which we have just passed. The chief factor at work, until the dramatic twist given to the position by Mr Chamberlain's departure for Berchtesgaden, was the effect on the gold price exerted by the steady fall of sterling. The Exchange Equalisation Account has fought its retreating battle partly by direct sales of dollars in the foreign exchange market, and partly by helping to satisfy the whole of the effective arbitrage demand for gold to be shipped to New York. Within the limits of shipping and insurable facilities and of maximum permissible commitments the arbitrage demand for gold has been persistent. The conditions under which it operates were, however, severely disturbed on Wednesday afternoon owing to the introduction in the cost of shipping charges of a new and unsavoury item, namely, insurance against war risks. The rate quoted by most underwriters to arbitrage operators was 2s. 6d. per cent. The inclusion of this new factor reduced the London gold parity for shipment to New York, expressed, as it normally is, in terms of dollars, from $34.77 to $34.73½. The continuance of congested conditions in the arbitrage channels may be gauged from the fact that over the week to noon on Thursday no less than £13,931,081 of gold left this country for shipment to the United States. On the " Queen Mary " alone the gold carried amounted to the record figure of close on £11 millions. The result of this unprecedented concentration of gold on one ship was that quite fantastic rates were paid for reinsuring the normal marine insurance risk. The rate is normally 1s. per cent. under the floating cover policies; but the risk was reinsured at rates ranging up to thirty times the normal figure.

* * *

By far the most interesting feature of the gold market, however, has been the unexpected appearance of heavy reselling from holders of the hoarder type. This reselling has in the main been stimulated by imagined fears that in the event of war an embargo might be placed on gold exports from Great Britain, and that some form of sequestration of gold might even be resorted to. As the very emergency in anticipation of which many hoarders acquired their gold seemed to approach, they decided that dollar balances might after all prove a more liquid and desirable asset than bars of gold. It is this reselling which has during the past week largely fed the arbitrage demand for gold. It has done more. On certain days the Exchange Equalisation Account has been called upon to take up large amounts of gold both at the fixing and in subsequent operations. Hence the reason for the sterling price of gold falling at times to an appreciable discount under the shipping parity to New York. It should be added that the amount of gold thus being resold has not assumed proportions at all comparable with the rate at which gold was being hoarded at the beginning of the present political scare. The resulting sales of gold to the Exchange Account have certainly been insufficient to make good its current losses.

* * *

The Money Market and the Crisis.—The discount market has been affected by the crisis in two different ways. First, there was the fear of war, which it was realised might lead to an immediate increase in Bank rate and in money rates generally. This gave rise to a general reluctance to hold bills. The banks were not eager to buy, while the market became keen sellers. By Wednesday only one of the banks was buying, and its rate was ¾ per cent. for Treasury bills. There was also some special buying at ⅝ per cent., but this was confined to October Treasury bills. The longer-dated bills, which naturally carried a greater risk of loss, were quoted at 1 per cent. for Januaries and at 1¼ per cent. for six months' bills. On Thursday morning, after the announcement of Mr Chamberlain's visit to Berchtesgaden, one or two of the banks bought a little more freely, but only at ⅝ per cent. for October and ¾ per cent. for November Treasuries. The other influence on the discount market was that of the continued outflow of funds to New York combined with the Exchange Equalisation Account's gold sales. This has reduced the supply of money in London, especially as the Exchange Account has not yet been able to substitute Treasury bills for the whole of its gold losses. Evidence of this was to be found in last week's Bank Return (though not in this week's), in the high level of public deposits with bankers' deposits on the low side; and also in the fact that since the tender of August 19th tap issues of Treasury bills have only risen by £20 millions, which must be less than the full amount of the Account's gold losses. It is true that special buying has provided some additional relief, while the Exchange Account's need for bills probably explains why £3 millions was cut off last week's tenders; this last reducing the tender issue to £537 millions, compared with £555 millions three weeks before. Still, the depletion of money has outrun the reduction in the supply of bills, and during the past fortnight the syndicate has been able to lower its tender price from £99 17s. 5d. to £99 17s. per cent., and at the same time increase its allotment percentage from 36 to 60 per cent. Bond money has also been scarce as the result of the

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

THE STANDARD BANK MONTHLY REVIEW, which is sent post free on application, gives the latest information on all South, East and Central African matters of Trade and Commercial Interest.

outflow of funds to New York. The bigger houses were still able to borrow on Wednesday at ⅜-½ per cent., but some smaller firms had to take money from the clearing banks at ¾ per cent. On Thursday morning conditions generally in the money market pointed to greater ease, but it appeared that the *status quo* might not be completely restored for some time, even if there were no further external disturbances to contend with.

* * *

August Clearing Bank Averages.—Partly because of a slight narrowing of the credit base, and partly because public deposits were swollen during August by the final Defence Loan call and Exchange Equalisation Account gold sales, there has been a small contraction since July in clearing bank cash. The aggregate rates of cash to deposits, however, has fallen from 10.57 to 10.49 per cent., so that the decrease in deposits is not proportionate to the shrinkage in cash.

(In £ millions)

Clearing bank advances have at last begun to shrink in sympathy with the trade recession, the month's contraction being £9.7 millions. Call and short loans and discounts show little change on balance from July, but cheques in course of collection, etc., are £4.0 millions lower. The result of the contraction in advances is that in spite of the shrinkage in their total resources, the banks have been able to add £8.4 millions to their investments. The September averages will reflect the present transfer of funds from London to New York, and the attendant gold sales of the Exchange Equalisation Account deposits are likely to be lower, and cash will probably also show a contraction, as the Exchange Account has apparently not kept pace with its gold losses by acquisition of Treasury bills. Early in September, bankers' deposits at the Bank of England were definitely lower than in August.

* * *

"Black" Currencies.—Owing to the existence of strict exchange control, and the decline in the turnover brought about by the operation of clearing agreements, a number of exchange rates do not in any way indicate market tendencies. The official reichsmark rate, for instance, has actually appreciated in terms of sterling during the last few weeks in sympathy with the dollar, to which it has been pegged. To form an idea of the degree of pessimism prevailing in the foreign exchange market about the reichsmark and other controlled currencies, one has to follow the price quoted in the "black" exchange. Strictly speaking, it is not correct to describe the London market for reichsmark notes, lira notes, etc., as a "black" market. The term implies illegitimate dealing, and there is no British law whatever to prevent anyone from transacting business in London in currencies that are subject to exchange restrictions in foreign countries. Nevertheless, the leading banks are reluctant to deal, unless it is on account of some valued client. The bulk of the business is transacted by small banking firms, who specialise in "black" currencies. During the past week the ups and downs of the political outlook have resulted in lively fluctuations in the rates of "black" currencies. The price of reichsmark notes underwent a sharp depreciation from 37 to the pound at the end of last week to 41 on Wednesday. It recovered, however, by two points on Thursday on the news of Mr Chamberlain's journey to Berchtesgaden Similarly, Czechoslovak inland crowns, which depreciated to 265 on Wednesday, recovered to 260 on the following day. The accentuation of the crisis during the first half of the week also affected other "black" currencies such as the lira, the Hungarian pengö and the drachma. Admittedly the limited turnover in these markets tends to increase the sensitiveness of the rates; and it is also necessary to bear in mind that holders of "black" currencies are particularly anxious to liquidate whenever they sense political trouble, for fear of a complete cessation of demand. Nevertheless, the "black" rate provides a moderately reliable barometer of the market's opinion about the value of the respective currencies—certainly a great deal more reliable than that provided by the officially controlled rates of currencies subject to restrictions.

* * *

Interest-bearing Currency.—One section of currency reformers, those who revere the name of Silvio Gesell, have for years been preaching the doctrine that holders of bank notes should be induced to spend more freely by charging interest on the notes in the form of stamps which have to be periodically affixed to the notes if they are to retain their validity. Whether or not the scheme would work we have no means to judge, since, apart from the short-lived experiment of the small Austrian town Wörgl, it has never been applied in practice. On the other hand, the Czechoslovak National Bank has just inaugurated a novel system which may well be described as an inverted Gesell scheme, since the notes issued under it yield interest instead of being subject to interest. The notes are repayable in three, six or twelve months, but their holders are in a position to convert them into the ordinary variety of currency notes at any time before maturity. Curiously enough, the declared object of these inverted Gesell notes is the same as that of the Gesell notes: to attract hoarded notes from their hiding places, and to make them available for the requirements of trade. As a matter of fact, the new Czech notes are bound to become hoarded, since their holders will prefer to spend their non-interest-bearing notes so long as they have any, and retain the interest-bearing notes. The latter will thus tend to replace in stockings and safes ordinary notes which become available for the requirements of trade or of the Government. The scheme was adopted because the increase of hoarding, caused by political uncertainty, has necessitated an increase of the note issue. It is true that the replacement of ordinary notes by interest-bearing notes does not reduce the total note issue, but strictly speaking the interest-bearing notes are more in the nature of Treasury bills, so that the increase of their volume need not be regarded as an inflationary expansion.

* * *

Commonwealth Bank of Australia.—The latest report of the Commonwealth Bank, covering the year to June 30, 1938, takes as its main theme the impact of the world recession upon Australia. So far the main reactions have been a set-back in a few manufacturing indices and a sharp fall in Australian export prices from 80·9 last December (1927 = 100) to 71.0 in June. Carry-overs of wool and wheat on June 30, 1938, were also above the average. The most significant change is that the export surplus has fallen from £stg. 35 millions in 1936–37 to £stg. 12 millions in 1937–38. As Australia's annual external interest charge is £22 millions, an active balance

of £stg.13 millions has given way to a passive balance of £stg.10 millions. This has depleted London funds, those of the Commonwealth Bank alone having fallen from £stg.52.5 to £stg.44.3 millions during the year 1937–38. As a further result it has rendered the banking system a little less liquid, for the cash at the disposal of the trading banks is partially conditioned by the size of London funds. The trading banks also experienced during the six months to June, 1938, increases in their deposits from £A314·5 to £A315 millions, and in their advances from £A273·7 to £A284·9 millions. This last movement is the normal concomitant of the opening stages of a recession in a primary producing country, and the Commonwealth Bank report very wisely discusses the possibility of an extension of the recession. Here it argues that public works expenditure should be regulated so as to be relatively low in times of prosperity, with plans ready for expansion in times of depression. Unfortunately, public works expenditure was on a high scale in 1937–38, which the bank regards as a period of general prosperity. In the bank's opinion, this must affect the available funds for Loan Council operations and narrow the margin for any expansion in the programme should the recession become general and cause a falling off in employment.

MONEY MARKET NOTES

Foreign Exchanges

THE fluctuations of the New York exchange are described in a Financial Note. On Thursday afternoon sterling eased from $4.81¼ to $4.80⅞ in spite of selling by the Control and also by arbitrageurs. Wednesday's turnover in dollars was one of the largest for the past six months. French francs have remained very steady in an idle market at Frs.178⅛ for spot and Frs.3⅛ discount for three months. The French Control has had very little to do. Guilders have remained at Fl.8.92, with the Netherlands Bank buying guilders against dollars. Swiss francs have tended to move with the dollar. Belgas have been stronger this week. In London they fluctuated with the dollar, but in New York they have been comfortably within the export gold point. The recent gold shipments from Brussels to London are thought to represent gold sent here for safe custody. Three months' belgas stand at 53 cents discount, while the abundance of spot belgas is keeping the one month's rate down to 12 cents discount. Registered marks have again depreciated, the week's movement being from 59 to 63 per cent. discount, the latter percentage representing a rate of Rm.32.46 to the pound. The demand for travel marks must now be microscopic, while the desire to liquidate standstill commitments must have been increasing.

*

The Bank Return

FOR the second week in succession there is a slight drop in the note circulation. This is a purely seasonal movement, and at least shows that the demand for currency has not been affected by anxiety over the political outlook.

	Sept. 15, 1937 £ mill.	Aug. 31, 1938 £ mill.	Sept.7, 1938 £ mill.	Sept.14, 1938 £ mill.
Issue Dept.:				
Gold	326·4	326·4	326·4	326·4
Notes in circulation	488·1	480·4	480·1	478·6
Banking Dept.:				
Reserve	39·9	47·3	46·3	47·8
Public Deps. ...	12·5	27·8	32·2	21·6
Bankers' Deps.	108·4	94·7	91·3	99·6
Other Deps. ...	36·1	36·4	34·9	36·4
Govt. Secs.	109·1	102·1	101·3	98·5

Other Secs.	21·2	22·3	22·1	22·1
Proportion.....	*25·4%*	*29·7%*	*30·1%*	*31·2%*

This return also shows that the efforts of the authorities to restore to the banking system the proceeds of the Exchange Equalisation Account's gold sales, whether direct to the American authorities or through the London bullion market, have been more successful than might have been expected. Public deposits are £10.6 millions lower than a week ago, while bankers' deposits have risen by £8.3 millions. A more even distribution of Treasury bill maturities this week may account for part of this movement, but there is little doubt that it is also due to specific action taken to ease the banking position. This action has taken the form of special purchases of Treasury bills, and also of the five million under-allotment of Treasury bills a week ago. Other methods may also have been employed, and one way and another the authorities seem to have achieved a fair degree of success.

*

The Money Market

IN spite of the more favourable tone in the City, due to Mr Chamberlain's visit to Germany, there was no real change on Thursday in the money market. While the clearing banks are anxious to keep reserves in hand, overnight money has been easily obtainable. The banks, however, are still not anxious to buy bills, and only isolated transactions were reported. Market rates for Treasury bills are consequently nominal. This week's Bank return shows that the authorities have been able to put a certain amount of money back into the banking system, but on balance the banks are still a little less well supplied with funds than before the recent tension, and so the market finds no difficulty in appreciating their reluctance to buy bills.

	Sept. 16, 1937	Sept. 8, 1938	Sept. 15, 1938
	%	%	%
Bank Rate	2	2	2
London Deposit Rate...	½	½	½
Short Loan Rates:			
Clearing Banks	½–1*	½–1*	½–1*
Others	½–⅝	½–¾	⅝–¾
Discount Rates:			
Treasury bills	½	½	¾
Three months' bank bills	17/32–9/16	17/32–9/16	13/16–7/8

* Viz. ½ per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity. ⅝ per cent. for loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

The discount houses are equally anxious not to take up too many new bills, and in some cases their own customers receive the preference. Bond money was perhaps a little easier on Thursday, and the largest borrowers would obtain it at ¾ per cent. in the morning and ⅝ per cent. in the afternoon. The market generally still seems to desire to maintain a fair degree of liquidity and to avoid too many new commitments. Reference to the week's general trend is made in a Financial Note.

*

The Bullion Market

THE increase in insurance charges for gold shipments has had the effect of lowering the "American shipping price" parity. Thus, while judged by the old parity, the price of 144s. 3d. at Thursday's fixing represented a discount of 1½d., in reality it was impossible to determine any definite relation. The general impression was that the increase in insurance charges was equivalent to about one per mille or, say, 1¾d., which would make the fixing price somewhere about par. The real answer is that the new uncertainty of insurance charges provides yet another problem for the arbitrageur. Nevertheless, there was a certain arbitrage demand on Thursday, matched by profit-taking and Continental re-sales, with the authorities mainly content to hold a watching brief. The price was bid at from 144s. 3d. to 144s. 6d. after the fixing.

Date	Gold: Price per fine oz.	Gold: Prem. or Discount *	Gold: Amt. dealt in †	Silver, price per oz. standard: Cash	Silver, price per oz. standard: Two Mths.

„ 15 ...	144 3	1½dis‡	1,313	19 9/16	19 3/8

* Above or below American shipping price.
† At fixing. ‡ At old shipping parity, excluding any recent increase in insurance charges.
The New York price of silver remained at 43 cents per ounce ·999 fine during the week.

Silver prices have also risen in sympathy with the dollar. There has been a fair American trade demand, while the Bombay price advanced sharply on Wednesday from Rs.50 15as. to Rs. 52 4as. as the result of war fears. In London there have been some Eastern offerings and also some speculative re-selling, while India and the Continent have bought in addition to the United States. Prices eased on Thursday in sympathy with the rise on sterling. They are still thought to be above the American parity; but, as in the case of gold, the uncertainty over insurance charges makes it difficult to calculate the exact parity.

Investment

Markets and the Crisis.—The Stock Exchange this week has been at the mercy of the political storm, which reached its height on Wednesday. Investors may at least congratulate themselves that, in the circumstances, they have preserved a relative degree of calm. The fortitude of the average holder during the week has been remarkable, and it has well deserved its reward in the sharp recovery in all sections of the market—but particularly in the Funds—which occurred while the Premier was *en route* for Berchtesgaden on Thursday. His decision to visit Herr Hitler in person released the Stock Exchange from a degree of political tension which, had it gathered force for a few more days, might have become unsupportable. The Stock Exchange was not designed to provide normal dealings when Europe seems to be hovering on the brink of war, and on Wednesday this danger was real. Gilt-edged stocks experienced the worst falls since September, 1931. Tension was already acute on Monday, for as the Führer's speech approached, dealers took the only available precautions—to lower their prices, and to quote abnormally wide dealing margins. War Loan was dealt in at par before "bear" covering produced a slight rally. The immediate reaction to the Nuremberg speech was a slightly steadier tone, but incidents in the Sudetenland on Tuesday drove War Loan below par before it closed, rather uneasily, at 100. Yet the volume of selling still remained moderate. On Wednesday, however, the Sudeten ultimatum and its rejection by the Czech Government seriously shook the market. Throughout the gilt-edged list, jobbers were only prepared to deal on a wholly abnormal two-point margin, and they lowered their prices to the same extent. Business was marked in War Loan as low as 96. Appreciable Continental selling was reported, but sales by domestic holders were also significantly higher than in the previous two days, although some buying orders steadied the market later in the day. European bonds were more seriously affected, despite the support which they received from Continental sources, presumably for sinking fund purposes. The best home rail fixed charges also fell severely, but pressure on the industrial market was less intense. True, substantial losses were recorded by the leaders, and the *Financial News* index of ordinary shares touched a new low level of 78.2, but there was no evidence of widespread selling. The recovery on Thursday was as dramatic as its cause. Gilt-edged stocks were immediately quoted 2 to 3 points higher, and War Loan recovered to 99½. The initial gains in the European bond list, however, were not fully held. German 5 per cents., for instance, jumped from 43½ to 47, but later reacted to 46½, and the movement in industrial shares was comparatively moderate. In the accompanying table we set out the movement of leading fixed-interest and equity securities this week, with a comparison of their prices after the Austrian and Czechoslovakian crises of March and May. Two factors stand out in the week's record. The first is the sensitiveness of the gilt-edged market to hour-to-hour fluctuations in political sentiment. The second is the temperate response, in all the circumstances, of the industrial market.

* * *

Watchword for Investors.—The immediate investment prospect depends almost entirely upon the chances of success of Mr Chamberlain's efforts to seek solution of the Sudeten problem by agreement. In its initial response to the news the market has acted in a perfectly justifiable manner. It has corrected the steep falls of Wednesday, whose only reason—and it was a real reason at the time—lay in the fear of European conflagration. But it has not lifted prices to the point which would be justified by a positive amelioration of the European situation. That must be postponed, for the present, until the outcome of the Premier's discussions becomes clearer. The central fact for the investor as we go to press is that tension is no longer strained to breaking-point. He is—at least for the moment—no longer compelled to attempt to hedge the possibility of immediate war. But the time has scarcely arrived for the consideration of positive investment action, on the assumption that political difficulties will be removed. The investor, indeed, still has no better option—as he appears to have realised during the past week—than a well-diversified holding, with proper emphasis on domestic equities and a suitable proportion of sound gold shares. Such a portfolio, carefully acquired on its long-term merits, will not be lightly disturbed, if the alternatives are properly weighed.

* * *

Wall Street's Movements.—The hour-to-hour movements on the New York Stock Exchange this week have been feverish to a degree. Wall Street, of course, took the first impact of the Sudeten ultimatum on Tuesday evening and thus paved the way for London's trial of nerves on Wednesday. In the last hour on Tuesday a million shares were sold, with little regard for price, and the Dow Jones industrial average fell 5 points in the final hour of trading. Changes almost as violent were recorded on Wednesday, although the major part of the day's fall had been recovered by the close of dealings. In the following table we set out the hourly dealings and industrial share movements in New York for each day of the week, up to the close on Thursday:—

	Mon., Sept. 12		Tues., Sept. 13		Wed., Sept. 14		Thur., Sept. 15	
	Dow Jones average	Trading*	Dow Jones average	Trading*	Dow Jones average	Trading*	Dow Jones average	Trading*
1st hour	138·33	130	141·35	280	135·72	580	135·63	470
2nd hour	139·42	270	141·03	400	134·59	1,020	135·40	640
3rd hour	139·98	360	140·28	530	132·57	1,500	135·33	770
4th hour	139·82	450	139·89	630	131·17	2,290	135·19	890
Close	140·19	600	134·85	1,700	132·93	2,820	136·21	1,140

* Cumulative, in thousands of shares.

These hourly movements show that the market was at the mercy of every report and rumour until Thursday, when its recovery was consistent and widespread. Perhaps New York's capacity for alarm is greater than that of London, for on Tuesday evening, when the "ticker" was left behind by excited dealings at the close, the possibility of closing the exchange was under active discussion. The Paris Bourse has not experienced the same note of panic, and dull trading has resulted in net losses of tolerable dimensions. Amsterdam, whose bonds with New York are closer, was more disturbed, but, like the Berlin Bourse, it recovered partially in mid-week.

* * *

Insurance Share Index.—*The Economist* index of twenty-four insurance shares showed some improvement during the second quarter. The following table shows the course of the total index and of the component shares for 1936 and 1937, and for each quarter since June, 1937:—

Company	1936	1937	1937			1938	
			June 30	Sept. 30	Dec. 31	Mar. 31	June 30
Alliance	2,525	2,341	2,184	2,226	2,268	2,058	2,142

Caledonian	5,464	5,457	5,284	5,284	5,032	4,655	4,906
Commercial Union	4,870	4,490	4,571	4,354	4,354	4,136	4,408
Employers Liability	2,540	2,509	2,522	2,567	2,432	2,117	2,342
Equity and Law	5,909	6,986	6,428	6,428	6,517	5,604	5,439
General Accident	14,716	14,582	14,332	14,666	14,332	11,999	12,333
Gresham Fire	5,016	4,571	4,381	4,381	4,286	4,190	3,619
Guardian	3,793	3,548	3,436	3,384	3,384	3,128	3,487
Legal and General	13,716	12,944	11,913	11,749	11,475	9,836	10,929
Life Assn. of Scotland	3,932	3,792	3,828	3,638	3,590	3,447	3,400
London & Lancashire	5,676	4,962	4,769	4,692	4,616	4,231	4,308
London Assurance	3,293	3,172	3,153	3,056	3,056	2,668	2,814
North British and Mercantile	6,975	6,433	6,306	6,115	5,860	5,096	5,414
Northern	2,597	2,395	2,388	2,448	2,388	2,149	2,328
Phœnix	2,177	2,025	2,063	2,030	2,097	1,860	1,962
Prudential	3,669	3,369	3,213	3,261	3,261	3,069	3,309
Royal Exchange	5,499	5,090	4,990	5,052	4,805	4,436	4,929
Royal	3,366	3,129	3,054	3,011	2,925	2,753	2,925
Scottish Life	4,761	4,192	4,270	4,101	4,101	3,933	3,933
Scottish Union and National	5,490	5,352	5,028	5,176	4,880	4,584	4,880
Sun Fire	3,316	3,093	3,022	3,022	2,933	2,667	2,933
Sun Life	3,375	3,193	3,274	3,123	3,224	3,174	3,375
Yorkshire	4,091	3,762	3,711	3,504	3,556	3,401	3,504
Average	5,031	4,795	4,656	4,620	4,549	4,109	4,312

The group has not fully recovered the ground lost during 1937 and the first quarter of 1938, for the total index, at 4,312 (1913 = 1,000) is still lower than the end-1937 level of 4,549, and substantially below the high level of 5,111 recorded at the end of 1936. It would be interesting to know how far the improvement of 5 per cent. which occurred during the second quarter of the current year was directly attributable to buying on behalf of the several unit trusts which specialise on insurance shares, for it was appreciably greater than the improvement in undated gilt-edged securities and in bank shares over the same period.

* * *

John Brown-Petters-Westland Deal.—A complex series of transactions, involving John Brown, Petters, Westland Aircraft, and Brush Electrical Engineering, was announced at the end of last week. They are pivoted on the acquisition by John Brown from Petters of control of Westland Aircraft. John Brown, like Vickers, Harland and Wolff, and Swan, Hunter and Wigham Richardson, has thus added an air arm to its existing interests in heavy industry and naval armament. At the same time, the Yeovil works of Petters have been sold for a consideration of 600,000 ordinary shares to Westland Aircraft, whose productive capacity will be more than doubled, with space, moreover, for further extensions. John Brown's decision to enter the aircraft industry is evidently based on a substantial development programme at Yeovil, and it will provide further diversification for the parent concern, whose interests are already spread over mercantile and naval shipbuilding, and special steel. Secondly, Petters have agreed to transfer their oil-engine manufacturing plant to Brush Electrical Engineering at Loughborough, for £265,000, to be satisfied by the allotment of £200,000 5½ per cent. preference stock and £65,000 in ordinary shares, coupled with an annual commission on turnover for ten years. For some time Petters have been working towards the achievement of greater co-operation within

This amount has been dealt with as follows:—		
Miners' Phthisis—Provision on account of Outstanding Liability as at 31st July, 1937	£22,356 8 10	
Provision for Taxation	542,915 9 9	
	565,271 18 7	
	£975,786 18 7	
Dividends declared during the year—No. 63 of 27½ per cent. and No. 64 of 27½ per cent.	770,000 0 0	
Leaving a balance unappropriated of	£205,786 18 7	

The **Ore Reserve** has been re-estimated as at 30th June, 1938, and is as follows:—

	Available. Tons.	Value Dwt.	Width. Inches.	Unavailable. Tons.	Value Dwt.	Width. Inches.	Total. Tons.	Value Dwt.	Width. Inches.
South Reef	1,407,700	2·6	45·7	146,600	4·1	42·7	1,554,300	2·8	45·4
N.A. 6 and 7	668,100	2·8	43·6	130,300	5·5	42·4	798,400	3·2	43·4
N.A. 3, 4 and 5	292,200	2·5	43·4	92,500	2·7	45·9	384,700	2·5	44·7
N.A. 1 and 2	2,794,700	3·1	49·5	205,600	3·9	48·1	3,000,300	3·2	49·4
Main Reef Leader	2,145,500	5·8	54·5	113,400	5·0	61·3	2,258,900	5·7	54·8
Total	7,308,200	3·8	49·2	688,400	4·3	47·0	7,996,600	3·8	49·0

Compared with the previous year, the available reserve shows a decrease of 128,600 tons, the value being 0.3 dwt. lower and the width 1.5 inches greater. The total tonnage, however, has decreased by 733,400, a large tonnage of ore in shaft pillars at Nos. 1 and 2 Circular Shafts amounting to 572,700 tons, and previously classed as unavailable, having been transferred to available.

The full Report and Accounts (with Plan of Workings) may be obtained from the London Secretaries, A. MOIR & CO., 4 London-wall Buildings, E.C.2.

the oil engine industry—the directorate was linked with that of Mirrlees, Bickerton and Day earlier this year—and the transfer to Loughborough is expected to reduce operating costs. Petters will then become a holding company, under a changed name.

* * *

From the information published, it is possible to obtain some light on the resultant position of Petters, after giving effect to the different phases of the deal. It already owned 500,000 Westland 5s. shares (out of the total issue of 1,000,000 shares) and this number has been increased to 1,100,000. Of the latter, John Brown has acquired a controlling number, and the remainder are under option for a limited period. The 600,000 shares allotted in respect of the sale of the Petters' site represent a purchase price of £187,500, or 6s. 3d. per share. Presumably, therefore, the sale of control to John Brown has been arranged at a price at least equal to this. If the market price at the time of the announcement—7s.—is taken as a basis, Petters would hold £385,000 either in cash or in Westland shares, together with Brush Electrical shares, nominally valued at £265,000. These, together with other holdings, would impute a break-up value to Petters' ordinary shares even in excess of the improved price of 46s., assuming that holdings other than Westland were worth their book value. The proper valuation of the shares, however, depends less upon such calculations than upon the realisation of more satisfactory profits from oil-engine production than has been obtained in the past. And the immediate investment interest in the deal must be centred on John Brown's control of Westland, whose future development may well be more rapid even than in the past.

* * *

Calico Printers' Report.—The preliminary profits statement of Calico Printers was published a month ago. The full report, therefore, adds little to the particulars published in our issue of August 20th. Total profits amounted to £406,186, compared with £627,402 for the year to June, 1937. Maintenance, depreciation and repairs absorbed £367,228, debenture interest requires £128,000 and directors' fees £4,500, the latter sum comparing with £10,800 charged in recent years. A net loss of £93,542 compares with a profit of £116,174 for 1936-37. No comment is offered on the year's results in the report. The balance sheet, which contains a note that the preference dividend is in arrear from January, 1936, displays an essentially sound liquid position. Gilt-edged and other securities have increased from £1,408,172 to £1,609,820, though this increase is more than offset by a reduction in cash holdings from £853,717 to £579,376. The report, which is not remarkable for the volume of information which it provides, contains an additional complication. The directors have transferred £200,000 from the balance of £1,060,258 standing at the credit of depreciation account to capital reserve account. A net sum of £860,258 thus remains on depreciation account, which reduces the book value of fixed assets from £5,559,203 to £4,698,945. The disclosed increase in the capital reserve account, however, is from £1,000,000 to £1,100,000. In other words, a transfer from the fund amounting to £100,000 appears to have been made, although it is not shown directly in the balance sheet, nor explained in the directors' report. The Association's strong financial position has enabled it to meet a decade of difficulty with greater success than many textile concerns. But the absence of any dividend on the £2,010,736 of ordinary capital since 1929 suggests that ultimately the capital structure may have to be brought into relation with present-day earning power. If the outlook for the preference stock, now quoted at 6s. 1½d., is obscure, a price of 4s. 4½d. for the ordinary stock must surely be regarded as over-generous.

* * *

Lower Staveley Profits.—The reduction in the Staveley distribution from 12½ per cent. to 11 per cent was announced a fortnight ago, and a partial explanation of the fall in profits which evidently was responsible for the decision was suggested in our issue of September 13th. The 13½ per cent. fall in total profits for the year to June 30th from £835,646 to £723,725 is, nevertheless, somewhat disappointing. The report refers to a falling-off in activity in some departments in the second half of the year, but it lays no stress upon the gravity of this decline from the satisfactory level of the first six months. Recorded earnings include a profit from the sale of the company's interest in Markham & Co., Ltd., but no indication is given of its extent. Our suggestion that comparison with 1936-37 was somewhat unfair to the latest year appears to stand. In that year exceptional revenue was derived from Yorkshire Main Colliery, which distributed accumulated profits not assigned to the merger company, Doncaster Amalgamated Collieries. And it is to be presumed that the accident at the Markham pit adversely affected profits. As we show in the following table, stockholders are spared the full force of the decline in total profits, and the 11 per cent. distribution is covered by a greater margin than the 1935-36 dividend:—

	Years to June 30		
	1936	1937	1938
	£	£	£
Profit	594,634	835,646	723,725
Depreciation	207,791	242,042	234,812
Fees	6,558	6,667	10,345
Ordinary stock (tax free):—			
Earned	*380,285*	*586,937*	*478,568*
Paid	304,682	423,169	372,389
Earned %	*11·2*	*17·3*	*14·1*
Paid %	9	12½	11
General reserve	50,000	100,000	100,000
Carry forward	124,346	188,114	194,293

The allocation to general reserve is maintained at £100,000. The balance sheet shows continued progress in developing the company's products. Net expenditure on additions to fixed assets during the year amounted to £321,688, and the report states that the sodium chlorate plant, which had been delayed during 1936-37, has been completed. Some decline in turnover, at any rate towards the end of the period, is confirmed in the balance sheet by a rise in stocks from £592,819 to £709,088, and a moderate fall in sundry debtors. The company is interested in a variety of products, but in iron, building and road-making the outlook is less favourable than it was. A current gross yield of £7 9s. 6d. per cent. on so sound an industrial equity as the £1 stock units of Staveley Coal and Iron, which are now quoted at 40s. 7½d., seems reasonable.

* * *

Hawthorn Leslie Prospects.—In view of the nature of the company's work, the 108 per cent. increase in R. and W. Hawthorn Leslie's profits from £37,689 to £78,577 for the year to June 30th is a matter for satisfaction rather than surprise. The business includes naval shipbuilding, and the armaments programme has undoubtedly contributed largely to the latest results, despite the chairman's emphasis, a year ago, that the company was primarily equipped for mercantile shipbuilding and aimed at a steady flow of work. The financial year opened with a well-filled order book, and during its course the difficulty of obtaining materials has been relieved. Profits are struck after all expenses except directors' fees, and consequently the increase in the amount earned for dividend almost exactly corresponds to the rise in total profits. Some 16.4 per cent. has been earned on the ordinary shares, against 10.6 per cent. in 1936-37, but the amount ranking for dividend was increased from £358,275 to £537,413 by the 50 per cent. share bonus distributed in June. The 9 per cent. dividend is maintained on the larger capital, and is thus equivalent to 13½ per cent. on the old capital. The general reserve, which formerly substantially exceeded the issued capital, is now, at £270,000, equal to about half of it. A sum of £24,137 (i.e. £155,000 less than the amount absorbed by the bonus) has been put to reserve, and nearly £5,000 is added to the balance carried forward. Since the previous accounts were issued, the locomotive section has been combined with that of Robert Stephenson and Company, of Darlington. As a result, investments have been increased to £104,000, against £41,000, to reflect the acquisition of a holding of 481,250 5s. shares in Robert Stephenson and Hawthorns, Ltd., and fixed assets are £20,000 lower at £579,000. The maintenance of satisfactory profits seems assured. Stocks and work in progress have jumped from £1,180,000 to £2,115,000 gross, and a substantial increase in naval work is being carried out this year. At the current price of 15s. 3d. the 10s. shares yield £5 18s. per cent.—a return which seems reasonably assured for some time to come.

* * *

Odeon Report.—The full report of Odeon Theatres clarifies certain obscurities of the preliminary profits statement, discussed on page 510 of last week's issue of *The Economist*. The first accounting period runs from June 14, 1937, to June 25, 1938—approximately 54 weeks, and total income for this period amounts to £371,589. From the directors' report, it appears that this figure is struck after providing for "administration, depreciation, equalisation, reserve for repairs and renewals and amortisation of leasehold property." The amount of the latter reserve in the balance sheet is £37,956, and it is to be presumed that this balance bears some relation to the undisclosed charge on profits. Profits for 73 of the cinemas acquired by the company for the period from January 2, 1937, to June 14th of that year were placed to reserve. It is stated that the 86 "owned" theatres—their number has since been increased to 91—produced profits which were within 7½ per cent. of the prospectus estimate. Of the "managed" cinemas, however, as many as 27 were completed during the first accounting period, and certain of them were operating only for a few weeks before the accounts were closed. The directors consider that the first year's results are satisfactory, and that profits in a "full year"—to which the current year should approximate in the prospectus sense—should at least reach the estimate of £460,000. Of the available balance of £122,225, after tax and N.D.C., the 10 per cent. ordinary dividend absorbs £61,625, general reserve receives a transfer of £20,198 and the sum of £18,000 is written off debenture discount. The latter transfer will reduce the preliminary expenses, shown among the assets, from £188,640 to £170,640. Meanwhile, the balance sheet itself shows the result of the group's rapid expansion, for net liquid assets are no higher than £47,775, compared with a balance sheet total exceeding £5,000,000. It would seem, therefore, that if prospectus estimates are realised, the board may well lean on the side of caution in their dividend policy. The maintenance of a 10 per cent. dividend, in these circumstances, would permit an appreciable strengthening of the balance sheet. Meanwhile, the anomalies in the prices of the different classes of capital remain. The debenture stock, covered four times by earnings, stands at 83½, the preference stock, whose dividend was covered one and three-quarter times (reckoned cumulatively) at 13s. 6d.; and the ordinary shares, which receive 10 per cent. out of earnings of 19.8 per cent., at 6s. 1½d.

* * *

Eastwoods' Position.—The market had been prepared for the decline in Eastwoods' profits by the reduction in dividend from 15 to 12½ per cent., and, even in the normal course of markets, the investor's first reaction would not have been greatly modified by the full report. The 14½ per cent. fall in total profits for the year to March 31st to £78,532 is the third in successive years. And as the accounts are made up to March 31st they do not reflect the further deterioration in the building trades generally during the last six months. The following analysis of profits, however, shows that the ordinary shareholders do not bear the full consequences of the reduction in gross profits:—

	Years ended March 31		
	1936	1937	1938
	£	£	£
Profit	101,664	91,903	78,532

Profit on sales†	3,635	13,012	1,680

† Profit on sale of investments, transferred to investment and general reserves.

The directors have decided to make provision for N.D.C. from the existing taxation reserve, to which no allocation is made in the latest accounts. The net result is a reduction of only £6,000 in ordinary earnings, against a fall of over £13,000 in total profits. Last year the chairman explained at the annual meeting that the decline in speculative house building, coupled with the increases in industrial and public building, represented a beneficial tendency, since

DIRECTORATE

DR. H. PIROW (Chairman). SIR ABE BAILEY, Bart., K.C.M.G.
R. S. G. STOKES. G. CARLETON JONES. MAJOR C. S. GOLDMAN.
W. A. MACKENZIE. A. A. AURET. W. H. A. LAWRENCE.

Tonnage Milled, 1,935,000.

		Per ton milled.
Total Working Revenue	£2,496,976 4 2	£1 5 9
Total Working Expenditure	1,913,391 10 7	0 19 9
Working Profit	£583,584 13 7	£0 6 0
Total Profit for the year		£594,732 15 6
Balance unappropriated at 30th June, 1937		214,391 16 6
Forfeited Dividends Account		85 14 6
		£809,210 6 6
This amount has been dealt with as follows:—		
Net Expenditure on Capital Account for the Year	£89,148 7 0	
Miners' Phthisis—Provision on account of Outstanding Liability as at 31st July, 1937	1,688 17 7	
Provision for Taxation	201,343 7 3	
		292,180 11 10
		£517,029 14 8
Dividends declared during the year:—		
No. 56 of 12½ per cent., and **No. 57** of 12½ per cent.		311,900 10 0
Leaving a balance unappropriated of		£205,129 4 8

Ore Reserve.—The available ore reserve has been re-estimated, and is as follows:—

	Tons.	Value, Dwt.	Stoping width, Inches.
Main Reef	675,100	4.0	65.1
Main Reef Leader	3,888,500	4.7	51.0
South Reef	2,980,400	4.5	49.1
Bird Reef	3,640,400	3.2	80.0
Total	11,184,400	4.1	58.0

In addition, there are **1,079,900** tons of payable ore, of a value of **4.7** dwt. per ton, standing in shaft and safety pillars, which are not at present available for stoping.

Compared with the previous year, the available reserve shows an increase of **30,100** tons, the estimated stoping width is greater by **1.9** inches, and the average value is lower by **0.1** dwt.

The Full Report and Accounts (with Plans of Workings) may be obtained from the London Secretaries, A. MOIR & Co., No. 4 London Wall Buildings, London, E.C.2.

buildings of the latter type needed more materials in relation to space than houses. It would seem, however, that this factor has not operated to the benefit of the latest profits to any important extent. The company meanwhile continues to show a strong balance-sheet position, and the directors have distributed available earnings with their usual conservatism. The current yield of £7 13s. 9d. per cent. on the £1 ordinary shares at 33s. 9d. indicates the investor's doubts whether the group's profits are proof against any further decline in turnover or increase in trading competition.

* * *

Johannesburg Consolidated.—"Johnnies" shares have never recovered from the disappointment occasioned by the omission from the dividend announcement in July of the 1s. bonus which had been paid, in addition to the 3s. dividend, in the four preceding years. The sharp reduction in profits revealed in the report may be attributed in part to the lack of income from the company's diamond interests since the second half of 1937 and also to the much less favourable conditions for market operations throughout the year. An additional factor suggested by the report may be found in the provision which has been made for various contingencies. As usual, the holdings for which quotations are available are taken in the balance sheet at or below cost, and in the aggregate they show a large surplus over book value. An increase of moderate extent has been made in the portfolio, one of the items doubtless consisting in the provision of additional capital for the East Champ d'Or Gold Mining Company. The most striking features of the balance sheet comprise an expansion of £434,300 in cash and a decline of £231,200 in sundry creditors. The appropriation to reserve is lower than in recent years. A comparison of significant items in the accounts for the past three years is given below:—

	Year ended June 30		
	1936	1937	1938
	£	£	£
Stocks and shares*	6,075,080	6,204,110	6,375,550
Mining properties and advances	426,480	572,080	526,490

Carried forward	466,870	168,750	196,630

* At or or above market value. † Including dividend.

No specific reference is made in the report to the subsidiary gold-mining concerns. Shareholders in the Randfontein would doubtless have welcomed an elucidation of the position. Rand Leases, in the financing of which a participation was taken a few years ago, is described as having been "launched on a long and successful career." The outlook for the company's copper interests is considered promising. It is announced that the additions to the plant at the Rustenberg mine are now functioning satisfactorily; but platinum has, of late, fallen appreciably in price. On this point the directors observe: "Given any substantial improvement in business in America the market for platinum would respond quickly." The company's colliery interests should soon provide an additional source of revenue. Having regard to the position of the diamond industry and to market factors, the outlook for the current year must be regarded as somewhat uncertain. At a price of 47s. 6d. the shares yield 6¼ per cent. This is identical with the return based on the 1936-37 distribution at the price ruling a year ago.

* * *

Consolidated Main Reef.—Although the record quantity of 1,935,000 tons was treated last year, a small decrease in working profit is shown by Consolidated Main Reef, for the decline in average yield more than offset the higher tonnage and the small reduction in working costs. Taxation absorbed £201,340 as against £206,360 in 1936-37, while net capital expenditure amounted to £89,150, compared with £66,020. The payment of dividends at the reduced total of 25 per cent., against 27½ per cent. for the previous year, entails a draft upon the carry forward. Operating and financial results for the past three years are analysed below:—

	Working Profit	Dividends		Carried forward	Ore	Reserves Value
	£	£	%	£	Tons	dwts.
1935–36	686,540	374,280	30	215,880	9,688,700	4·4
1936–37	616,790	343,090	27	214,390	11,154,300	4·2
1937–38	583,590	311,900	25	205,130	11,184,400	4·1

The outstanding feature of the report is the decrease in the tonnage of payable ore opened up. Development work, totalling 86,610 feet was 25,340 feet short of the 1936-37 amount, but the quantity of payable ore opened up fell by 1,256,600 tons to 2,098,400 tons. The pay ore disclosed per foot of underground work last year amounted to only 24 tons as against 30 tons in the preceding year. The available ore reserves, however, show a small increase in quantity, while the material locked up in shafts and safety pillars, at 1,079,900 tons, has increased by 330,900 tons. These figures suggest that a large quantity of more or less developed material not previously taken into account has now been included in the estimates. Capital expenditure for the current year is expected to be reduced to £50,000. It would seem that the company should have no difficulty in maintaining last year's reduced rate of dividend.

* * *

New Modderfontein.—The 1938 report has been awaited with especial interest in the hope that it would throw some light upon market rumours (responsible for the rise in Government Areas and Modder Deep shares) of discoveries on the Black Reef ore body. The consulting engineer's report states that towards the end of the year drilling started from the surface near the southern boundary—that is, the boundary which adjoins the Modder Deep Levels (in liquidation), whose position has lately been improved by developments on the Black and Kimberley Reefs. The first drill was put down 739 feet through these two ore bodies, but failed to disclose payable values. A second hole passed through dolomite into Black Reef at 241 feet and from Black Reef into Kimberley at 312 feet. The upper bands of the Black Reef, the consulting engineer reports, were unpayable; but the remainder, together with 114 inches of Kimberley Reef—a total of 342 inches—assayed 3.1 dwts. Further prospecting is in progress. These ore bodies lie at shallow depth, and their extent is at present uncertain, the view expressed by the expert being that "it is unlikely they will be found to extend over more than a relatively small area in the southern portion of the property." Thus the official statements are far from confirming the extravagant stories recently in circulation. Comparative results during the last three years are given below:—

	Working Profit	Dividends		Carried forward	Ore Available	Reserves Value
	£	£	%	£	Tons	dwts.
1935–36	2,049,106	1,365,000	97½	206,940	7,736,500	4·5
1936–37	1,626,220	910,000	65	206,190	7,436,800	4·1
1937–38	1,335,530	770,000	55	205,790	7,308,200	3·8

A small decrease in tonnage milled was accompanied by a fall of 2s. 4d. in average revenue and a trifling advance in costs. Operating profit therefore fell enough to entail a further reduction in dividend, although taxation required no more than £542,920, as compared with £668,490 in 1936-37. The quantity of payable ore developed during the year, at 737,800 tons, compared with 1,104,800 tons previously, the average being 2.6 dwts. over 49 inches against 2.9 dwts. over 48 inches. As a result the ore reserves show a further contraction in both tonnage and value.

* * *

The Week's Company Profits.—Reports have been received this week from 21 companies, excluding three for which comparable figures are not available. These show net profits of £1,706,000, a decline of 13 per cent. as compared with £1,957,000 earned in the previous year. Much of this fall, however, is attributable to the Calico Printers' results. Net profits of 1,756 companies whose reports have been received this year amount to £240,152,000, and continue to show an advance of 11 per cent. over the total of £216,613,000 earned by the same companies in 1936-37. We analyse the profit and loss accounts in a table on page 575 and discuss the results in preceding notes and on page 574 under the heading "Shorter Comments."

SEPTEMBER 20	SEPTEMBER 22

MARKET movements in this critical week (which are reviewed in detail on page 552), have been led by the Funds. The latter are invariably sensitive to political tension, and this week their wide movements have accurately signalised the extreme fears of Wednesday, and the relief which the market felt on Mr Chamberlain's decision to discuss the problem with Herr Hitler in person. Movements and the volume of business in industrial shares have been on a smaller scale, though jobbers have naturally taken steps, on the one hand, to stem any extreme selling (of which, fortunately, there was no sign), and, subsequently, to mark quotations up in the hope that success would attend Mr Chamberlain's discussions. Thursday's handsome recovery was attributable partly to the latter factor, partly to "bear" covering, and partly to public buying. It was remarked, however, that buying was generally small in character.

Tension in the *Funds* was apparent on Monday, and despite a late recovery, falls of ¾ were recorded in War Loan and "old Consols." Opening encouragement on Tuesday did not last, and War Loan declined further to par, while Consols touched 72¼. On Wednesday, severe selling, on which jobbers lowered quotations in self-defence and quoted wide dealing margins of almost unprecedented extent, marked the increase in tension. Despite the recovery at the close, substantial falls, ranging up to 2½ points, were recorded on the day. These falls were practically reversed on Thursday, to the discomfiture of the "bears," on the Premier's visit. Detailed price movements in the gilt-edged and other markets will be found on page 552.

The gilt-edged market set the lead for the rest of the "House." *Home corporation* stocks, for instance, were to all intents and purposes nominal on Wednesday, but rallied smartly on Thursday. Difficult conditions also prevailed in the *European bond market*. After a certain degree of resistance (reputedly due to buying by their nationals), German and Czech bonds slumped from 4 to 5½ points on Wednesday, and did not fully maintain their smart recovery on Thursday. French railway bonds were also seriously affected.

Heavy falls in *home rail debentures* were due less to the traffics (although they were not favourable) than to the collapse of gilt-edged prices. In midweek, falls of up to 3 points were recorded by the debentures. The guaranteed and ordinary lists were more moderately affected, and improved readily on Thursday. Foreign rail stocks lost ground, although selling was small, except for Cordoba first debentures.

After making a show of indifference to serious week-end news, the industrial market's resistance broke on Wednesday, though a considerable part of these losses were recovered in early dealings on Thursday. The paucity of business, however, has hardly been changed. Even Wednesday's falls were largely a matter of precaution to discourage sellers, and the relief of feelings on Thursday was marked by a succession of small buying orders rather than "good" buying in the traditional sense. Iron and steel shares were a dull and weak market, and prices gave way before the general improvement on Thursday. Hawthorn Leslie responded to the good results. Weakness in the coal group was practically unrelieved. There were a few small rises in electrical equipment shares at first, but the entire list succumbed to Wednesday's weakness. Electric supply shares fell back on the 10 per cent. increase in charges in the Home Counties. Quite apart from general influences, motor shares were depressed by the August registration figures. Aircraft shares did not escape the universal uneasiness in the first half of the week, but declines were small. Petters went ahead on the John Brown deal (see page 553), until profit-taking brought a reaction. Hawker-Siddeley, which were a weak feature on Wednesday, recovered sharply on the following day. Brewery issues began well, but became sensitive to general conditions later on. Store issues were generally weak, but among provision and catering shares, United Dairies remained relatively firm. Textiles were more than usually friendless, but were correspondingly less affected by general market sentiment. Movements in the miscellaneous group were not consistent, though mostly downwards. Leaders such as Imperial Chemical Industries and Turner and Newall were highly sensitive on Wednesday, but recovered smartly on Thursday. Shipping shares were neglected and prices sagged.

Oil shares started fairly confidently, for Continental support helped to counteract the subdued tone of other markets. Prices were then lowered as a precautionary measure, and a little selling, accompanied, however, by some bargain hunting, was in evidence on Wednesday. The leaders were well supported in Thursday's recovery, though business did not expand greatly. The *rubber market* was too affected by political tension to respond to the Regulation Committee's quota decision or to the accompanying news of satisfactory American consumption in August. It did not escape the general weakness, though selling was not of large proportions.

Movements in the *mining markets* were rather more erratic than in other sections. Kaffirs, while fully occupied with international politics, managed to keep an eye on Paris and the Cape, and support from these quarters, combined with occasional bargain-hunting, checked the downward tendency in individual cases. With developing mines in the lead, there was a sharp recovery on Thursday, when the "bears" had sore heads to nurse. Rhodesian copper issues followed the general trend after showing good resistance on Monday. Base metals paid more attention to politics than to movements in commodity prices, and the maintenance of the tin quota, as expected, failed to arouse any interest.

ACTUARIES' INVESTMENT INDEX

International anxieties are reflected in the Actuaries' Index of 151 industrial ordinary share prices, which on Tuesday last (September 13th) had fallen to 62·6—the lowest for the year. A week earlier the index was 63·3, and a month ago, 64·8. The corresponding average yields are 6·01, 5·97, and 5·85 per cent. We give below a selection of the component indices of prices and yields):—

Group (and No. of Securities)	Prices (Dec. 31, 1928 = 100): Aug. 16, 1938	Sept. 6, 1938	Sept. 13, 1938	*Prices 1938 High*

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

New York

WALL STREET again proved no less sensitive to European events than London, and responded with considerable violence to hour-to-hour news. The sharp break in prices on Tuesday and Wednesday was accompanied by heavy selling, and erratic and contrary movements in the course of single sessions have been somewhat in contrast with London's movements. On Monday, industrials went ahead, the Dow Jones index rising 1.9 points, steel and motor shares in particular being strong. Favourable news included an estimate that the Labour Day loss of steel production had been caught up, and good trade news from Chrysler Corporation. While reports continued to be satisfactory (*Iron Age* estimating ingot production at 45½ per cent. of capacity for the current week), steels and motors shared in Tuesday's weakness (trade in General Motors being at one time suspended), and were in the forefront of Wednesday's erratic fluctuations. Railroads were sluggish, but were not indifferent to the general slump in Wednesday afternoon's session. Copper shares proved resistant in mid-week.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values, calculated on closing prices (1926 = 100).

Capital Issues

TWO new capital issues have braved the worst week in Stock Exchange history for several years. The *Beechams Pills* issue of 2,400,000 2s. 6d. deferred shares, at 7s. 6d., proved a prompt success—assisted doubtless by loyal support from existing shareholders, who were entitled to pink forms. The issue provides for the financial completion of the Macleans deal, which was described on page 378 of *The Economist* of August 20th, and for other purposes. The shares necessarily bear, in some degree, the speculative risk which is inseparable from the patent medicine trade, and the prospective earnings yield of 10 per cent. on the issue price, according to the directors' estimate, appears a reasonable basis of valuation. The *Harland Engineering Company*, on behalf of which an offer of preference and ordinary shares has been made at par, is a moderate-sized concern, which can claim a sound technical reputation. Neither issue is large enough to command a wide market, however, and its profits are necessarily subject to a fairly wide degree of fluctuation between different phases of the trade cycle.

PUBLIC OFFER

Beecham's Pills, Ltd.—Issue of 2,400,000 2s. 6d. deferred shares at 7s. 6d. Proceeds to complete Macleans, Ltd., purchase and for general purposes. Beechams' profits after development expenditure and depreciation, years to March 31: 1936, £424,511; 1937, £462,351; 1938, £501,963. Macleans' profits, years to June 30: 1936, £182,485; 1936, £302,893; 1937, £316,488. Lists closed 9.1 a.m., September 14th. At that hour some 8,000 applications had been received covering the issue approximately twice over.

OFFER FOR SALE

Harland Engineering Company.—Offer for sale at par of 140,554 6 per cent. cumulative 10s. preference and 340,370 5s. ordinary shares. Electrical machinery, etc., makers. Owns British Electric Plant Company. Combined net assets, £256,102. Combined profits after depreciation: 1935, £10,078; 1936, £17,334; 1937, £29,626. London Industrial Finance Trust take issue at total cost of 9·6s. per preference and 4·7s. per ordinary share.

ISSUE TO SHAREHOLDERS ONLY

Wilkes Berger Engineering Company.—It is proposed to issue 60,000 new 5½ per cent. redeemable cumulative £1 preference shares at par. Prudential Assurance take any shares not subscribed by holders, for 2½ per cent. commission.

Industry and Trade

Business and the Crisis.—With Europe's fate in the balance, it is scarcely surprising that business transactions are being held up. While there has been no panic among business men, the difficulty of planning ahead has led many buyers to hold their hand for the time being. Export business, naturally, has been severely curtailed. Consequently, there have been no indications, so far, of the usual increase in the flow of new orders to industry at this time of the year. As this week's industrial reports on pages 564-5 show, new transactions in the coal, iron and steel, cotton and wool textile trades were small in volume. It is clear, therefore, that, in the absence of an early and peaceful settlement of the conflict over Czechoslovakia, the hopes of a revival of commercial—as distinct from armament—activity this autumn may be disappointed. With a few exceptions, the commodity markets, on the other hand, were firm this week, partly as a result of the fall in the exchange value of the pound in terms of dollars and partly because of the favourable business news from the United States. Non-ferrous metals, cotton, linseed oil and raw sugar were all marked up in price. Wheat, exceptionally, continued to decline in price for reasons discussed in a leading article on page 544, though on Wednesday, when fears of war were at their height, prices were marked up sharply. But while the crisis has undoubtedly caused some dislocation of business, one of the features of the past week has been the calm and steadiness of business men in face of the biggest crisis since 1914.

* * *

Cotton Yarn Price Agreements.—Rumours on the Manchester Royal Exchange this week suggested that some of the price agreements in the cotton spinning industry were breaking down. It has been reported that one member of the American medium ring yarn pact has resigned, and that the other members have become restive as a large part of the business was secured by firms outside the agreement. Meetings of the committee have been held this week, and it is expected that a full meeting of members will take place within the next few days, when all the facts of the situation will be placed before them. The agreement covers about 75 mills, containing some 5,000,000 spindles. The committee of the 42's American weft agreement has also met, and the advisability of extending the scope of the coarse counts agreement to counts of yarn finer than 26's was discussed. Last Monday there was a general meeting in Manchester of the members of the Egyptian mule-spinners' agreement, and it was decided to renew the agreement for a further period of twelve months, despite the fact that three or four members have resigned. Recently, a firm in this section has been charged with breaking the agreement by accepting prices below the list rates, and it is reported that the company has been fined £2,500. As a result of the severe fall in demand, price agreements in the spinning section of the cotton industry are being severely tested.

* * *

Decline in Overseas Trade.—The trade returns for August are not as encouraging as the employment statistics, which were discussed in last week's issue of *The Economist*. Compared with August, 1937, the value of total imports declined by 14.4 per cent., that of British exports by 14.6 per cent., and that of re-exports by 21.5 per cent. Some of this decline in the value of imports may be ascribed to the fall in prices. But as there was one more working day in August of this year than in August, 1937, the value of imports and exports per working day has fallen by more than the percentages given above. Some comfort may perhaps be derived from the fact that the fall in the value of British exports between August, 1937, and the past month, at 14.6 per cent., is considerably less than the 21.2 per cent. decline registered in July. Compared with a year ago, the excess of imports over exports has been sharply reduced by the absolutely greater fall in imports.

(£ thousands)

	1936	1937	1938	Change between 1937 and 1938	Per cent.
August					
Total imports	66,056	86,648	74,131	– 12,517	– 14·4

Total exports	39,684	49,233	41,376	– 7,857	– 16·0
Excess of imports over exports	26,372	37,415	32,755	– 4,660	– 12·5
Transhipments under bond ...	2,524	2,969	2,749	– 220	– 7·4
Eight Months ended August					
Total imports	536,565	655,046	616,596	– 38,450	– 5·8
British exports	283,170	341,439	306,904	– 34,535	– 10·1
Re-exports	41,810	54,201	42,351	– 11,850	– 21·8
Total exports	324,980	395,640	349,255	– 46,385	– 11·7
Excess of imports over exports	211,585	259,406	267,341	+ 7,935	+ 3·1
Transhipments under bond ...	17,784	24,504	20,946	– 3,558	– 14·5

Our index for the volume of raw material imports, adjusted for seasonal variations, declined from a provisional figure of 113½ (1935 = 100) in July to 111½ in August, and the index for the volume of exports of British manufactures fell from 93½ to 90½. Comparing the eight months ended in August with the corresponding period of 1937, the value of British exports shows a fall of 10.1 per cent., while the value of imports, which were fairly well maintained in the early months of the current year, declined by only 5.8 per cent. There are no indications of an early reversal of the downward trend of Britain's overseas trade.

* * *

Overseas Trade by Commodities.—Quantitative changes in British imports have been somewhat irregular. Compared with a year ago, imports of seven of the eighteen

UNIVERSITY CORRESPONDENCE COLLEGE

(William Briggs Trust Ltd.)

66 BURLINGTON HOUSE, CAMBRIDGE

JOHANNESBURG CONSOLIDATED INVESTMENT COMPANY, LIMITED

(Incorporated in the Union of South Africa)

REPORT OF DIRECTORS.—To be submitted to the Shareholders at a Meeting to be held in the Board Room, Johannesburg Consolidated Investment Company, Limited, Consolidated Building, Fox Street, Johannesburg, on Tuesday, the 22nd November, 1938, at 11 o'clock in the forenoon.

ACCOUNTS.—1. The Company's Balance Sheet as at 30th June, 1938, and Profit and Loss Account for the year ended on that date, are submitted herewith.

PROFIT AND LOSS.—2. After making provision for taxation, for all ascertained and estimated charges and depreciation, and for contingencies, the profit for the year amounts to £720,380 2 6

To which is added the balance brought forward from the preceding year 168,753 5 8

Giving an available balance of £889,133 8 2

The Directors have transferred to Reserve Fund the sum of £100,000 0 0

And on 6th July declared a Dividend of 3s. per share, less United Kingdom Income Tax, the gross amount absorbed being 592,500 0 0

692,500 0 0

Leaving a balance to be carried forward amounting to £196,633 8 2

RESERVE FUND.—3. With the addition of the amount of £100,000 transferred from Profit and Loss Account the Reserve Fund now stands at £3,050,000.

VALUE OF SHAREHOLDINGS, ETC.—4. The Company's shareholdings for which market quotations are available are included in the Balance Sheet at or below cost and in no case above the market value at 30th June, 1938. The Directors have considered it prudent to provide against contingencies by writing down certain shares to below both cost and market value. Unquoted investments have been valued by the Directors on a conservative basis and in no case above cost. The Directors have also reviewed the other assets of the Company and made provision for contingencies where considered advisable. In the aggregate, the market value of the shareholdings shows a large surplus over the book value. The strong financial position of the Company has been maintained.

GOLD MINING INTERESTS.—5. The relations of the European workmen with the Mining Companies continued on a satisfactory basis, and such points of difference as arose were settled by friendly negotiations. A shortage of native labour was experienced in the first few months of the present calendar year. Although the position has improved, in all probability the shortage will recur and will be accentuated as more new mines commence operations, unless the supply of natives from north of latitude 22° S. can be increased. Every endeavour is being made to further arrangements in this connection.

GOLD MINING COMPANIES OF THE GROUP.—During the year ended 31st December, 1937, the Gold Mining Companies of the Group crushed some 12,316,000 tons of ore and produced 2,591,432 ounces of fine gold. The total value of the production was £18,275,364. There were employed some 7,900 Europeans and 65,000 natives.

The table below summarises the details from the reports and accounts of the Companies for the year ended 31st December last, and it also gives the figures of the previous year for comparison, except in the case of The East Champ d'Or Gold Mining Company, Limited. The programme of modernising and enlarging the works of that Company has been completed with the result that the present scale of operations cannot reasonably be compared with the past.

For the first six months of 1938 the working profit amounted to £161,273. Development is being conducted in a vigorous manner and recent results have shown improvement.

DIAMONDS.—6. The diamond trade, which was so active during the first six months of 1937, fell away during the latter half of that year, though the total sales for the year were well ahead of 1936. The first six months of 1938 have also been disappointing, but there are now signs of revival which it is hoped will continue to develop. The selling organisation continues to function satisfactorily and is a great source of strength to the market.

COPPER.—7. Copper had a wonderful period of prosperity during the first six months of 1937 and, as a result, Rhokana Corporation, Limited, made a total profit of £2,019,866 for the year ended 30th June, 1937. Dividends totalling 62½ per cent. were paid for that year. Prices gradually fell away subsequently; but, in spite of this, Rhokana Corporation, Limited, has recently intimated that its profit for the year ended 30th June, 1938, subject to taxation, is estimated at £1,950,000, not including its share of such dividend as may be declared by Mufulira Copper Mines, Limited, for the same period. The Rhodesian Anglo American, Limited, paid dividends totalling 1s. 6d. per share for the year ended 30th June, 1937, and an interim dividend of 6½d. per share has been paid for the year ended 30th June, 1938. The Nchanga Consolidated Copper Mines, Limited, was formed in March, 1937, and adequate finance provided. This rich property is now being opened up and the prospects are excellent.

Recently the price of copper has taken an upward turn and the outlook is promising, so that we are justified in regarding our considerable investments in copper mining companies with satisfaction.

PLATINUM.—8. The additions to the plant at the Rustenburg mine have been completed and the plant is functioning satisfactorily; the mine, however, has been somewhat short of native labour. Platinum, like most other metals, has been suffering from a fall in price and a weak market, but there are signs of a recovery, and given any substantial improvement of business in America the market for platinum would respond quickly.

COAL.—9. The equipment of the new section of Consolidated Collieries, Limited, is now nearing completion and the Colliery is again making profits. The Natal Cambrian Collieries, Limited, has repaid its debt and is making satisfactory profits, which will enable it to pay a first dividend at the end of its financial year. Phœnix Colliery, Limited, is making satisfactory profits and will soon be in a position to declare its first dividend.

ESTATES.—10. During the year most of the remaining stands on the Company's Johannesburg estates were sold, and the income from this source is not likely to be so great as it has been during the past few years.

SOUTH AFRICAN CARBIDE AND BY-PRODUCTS COMPANY, LIMITED.—11. This Company continues to prosper and for the year ended 31st August, 1938, paid 20·2 per cent. on its preference shares and 33 per cent. on its ordinary shares.

THE SOUTH AFRICAN BREWERIES, LIMITED.—12. The report of The South African Breweries, Limited, for the year ended 31st March, 1938, shows excellent results and the total distribution on the ordinary capital for the year was at the rate of 22½ per cent., free of tax.

COMPARATIVE STATEMENT OF RESULTS OF OPERATIONS, ETC., OF THE GOLD MINING COMPANIES OF THE GROUP

* Includes 5 per cent. Bonus out of Sales of Property.

OTHER GOLD MINING INTERESTS—The large areas in the Roodepoort District in which the Company is interested have been proved to carry the Main Reef series at a workable depth, but conditions have not been favourable for raising capital for new enterprises. It is hoped, however, that the time is not far distant when it will be possible to finance them, as they are among the few attractive areas underlain by the Main Reef series at a workable depth to the east of the Roodepoort-Witpoortje fault zone for the working of which provision has not yet been made.

Rand Leases (Vogelstruisfontein) Gold Mining Company, Limited, showed excellent results for the year ended 31st December, 1937; 1,018,500 tons were crushed resulting in a working profit of £375,904, and dividends amounting to 1s. 6d. per share were paid. It is expected that in a few months the additions to plant will be completed and the ore crushed raised to 145,000 tons per month. Development results during the year were satisfactory, and it is considered that the Company has been launched on a long and successful career.

Consolidated Murchison (Transvaal) Goldfields and Development Company, Limited, has not yet altogether surmounted extraction difficulties, but the position tends to improve.

Vogelstruisbult Gold Mining Areas, Limited, crushed during the year ended 31st December last 656,050 tons of ore and made a working profit of £155,524.

DIRECTORS.—13. In May last Mr J. H. Crosby resigned from his position as a Director of the Company and as Joint General Manager in South Africa. Mr Crosby had been with the Company for twenty-one years and the Directors wish to express their appreciation of his faithful service during that period. The Board also records with regret that Sir Reginald A. Blankenberg, K.B.E., resigned his seat on the Board after serving the Company in that capacity for twelve years.

In terms of the Company's Articles of Association the following three Directors retire by rotation and, being eligible, offer themselves for re-election; viz., Mr F. L. Johnson, Mr J. Friedlander and Rt. Hon. Sir Arthur S. T. Griffith-Boscawen, P.C.

OFFICIALS.—14. Mr G. H. Beatty has been appointed General Manager in South Africa and Mr K. Richardson has been appointed Consulting Engineer in South Africa.

ELECTION OF AUDITORS.—15. Messrs S. Thomson and F. Dix, the Auditors of the Company in Johannesburg, and Messrs Kemp, Chatteris, Nichols, Sendell and Company, the Auditors in London, retire from office and offer themselves for re-election.

By Order of the Board,
A. W. CHRISTIE, Secretary.

10 & 11 Austin Friars, London, E.C.2.
15th September, 1938.

A. W. CHRISTIE, *Secretary.*

commodities given in the first table have increased, including imports of raw cotton and petroleum; compared with the preceding month of July, imports of raw cotton and wool were smaller, but imports of petroleum, hides, wood pulp and rubber were larger.

Compared with August of last year, British exports are heavily down. Of the nineteen commodities included in the next table, exports of only two—iron and steel scrap and locomotives—showed an increase. Exports of cotton piece goods declined from 162,000 square yards to 108,000 square yards. Shipments of woollen piece goods showed a slight increase from the July figures, though they were still lower than in August of last year:—

BRITISH EXPORTS—MONTH OF AUGUST

Item and Measure	1936	1937	1938
Coal '000 tons	2,754	3,529	2,863
Iron and steel scrap tons	8,350	12,818	26,310
Pig-iron and ferro-alloys tons	10,056	14,231	4,241
Railway materials tons	21,137	23,838	11,653
Total, iron and steel manufactures ... tons	163,959	201,352	135,068
Textile machinery tons	4,248	5,858	5,331
Total machinery tons	28,243	34,723	33,869
Cotton yarns '000 lb.	11,685	13,577	8,967
Cotton piece goods sq. yds.	158,995	161,992	108,177
Wool tops '000 lb.	3,928	3,303	2,631
Worsted yarns '000 lb.	2,166	2,025	1,900
Woollen tissues '000 sq. yds.	7,907	8,377	6,443
Worsted tissues '000 sq. yds.	3,889	4,145	3,160
Linen piece-goods '000 sq. yds.	6,563	6,494	3,609
Leather boots and shoes doz. pairs	27,110	35,494	28,017
Leather cwts.	19,661	18,201	14,700
Paper and cardboard cwts.	290,185	393,353	255,148
Locomotives and parts tons	1,064	1,653	2,125
Motor vehicles and chassis No.	5,458	8,433	5,056

As there has been no noticeable improvement in new export orders, a further decline in the shipments of many commodities seems unavoidable.

* * *

U.S. Cotton Crop.—At the end of last week the United States Government published its second estimate of this year's cotton crop, the figure being 11,825,000 bales, against 11,988,000 bales forecast a month earlier. The forecast was slightly below expectations, but had practically no effect upon prices. The condition of the crop was given at 65 per cent. of normal, compared with 78 per cent. at the beginning of August, the deterioration being due to the ravages of the boll weevil. The yield per acre is now expected to be 214.1 lbs., against 217.9 lbs. a month earlier. World supplies of cotton are so enormous that the slight decline in the estimates for the United States has had little effect on the market. World consumption is at present running at a very low level, and there is every probability of a further increase in the carry-over at the end of this season.

* * *

Recession in Iron and Steel.—The iron and steel industry is making a valiant effort to adjust its output to the fall in demand. As the following table shows, production was further reduced between July and August. The output of pig iron and crude steel last month was lower than in any corresponding month since 1933, and imports have been severely curtailed:—

PRODUCTION AND TRADE IN IRON AND STEEL
(In thousands of tons)

Period	Production		Foreign Trade	
	Pig Iron	Steel Ingots and Castings	Total Imports	British Exports
1913—Monthly Average	855·0	638·6	185·9	414·1
1929 " "	632·4	803·0	235·2	364·9
1932 " "	297·8	438·5	132·7	157·4
1936 " "	643·5	982·1	123·6	183·8
1937 " "	708·0	1,080·3	170·0	214·7
" July	729·3	1,059·2	202·3	232·2
" August	714·0	987·7	213·4	201·4
" September	726·7	1,163·0	226·2	193·6
" October	769·6	1,133·6	220·5	206·9
" November	762·3	1,178·3	272·5	198·0
" December	783·8	1,103·8	288·3	196·8
1938—January	761·1	1,081·4	308·7	191·2
" February	693·3	1,057·6	230·4	156·7
" March	714·6	1,115·8	276·8	176·1
" April	661·0	938·6	61·5	168·3
" May	633·9	957·0	55·7	167·5
" June	541·5	776·1	60·9	150·9
" July	507·8	683·2	65·0	135·1
" August	443·0	658·9	50·6	135·1

Despite the sharp curtailment of output and imports, however, there are as yet no signs of a revival of demand, and stocks of a number of materials are reported to be still substantial.

* * *

Further Restriction of Wood Pulp Output.—A further restriction of output for export has been decided by the sulphite pulp producers of Finland, Norway and Sweden. The first curtailment, enforced in April last, provided for a reduction of exports by 20 per cent. during the current year. According to the new restriction plan, output for export will be stopped for eight weeks before the end of this year and for another seven weeks in the first half of 1939. Under this scheme the output of sulphite pulp in Scandinavia this year will be reduced to 70 per cent. of agreed capacity. This step has become necessary owing to the prolonged depression on the world's pulp markets, which began in the autumn of last year with the setback in the United States and the liquidation of unusually large purchases. Stocks at consumers' yards, at the pulp mills and at ports, although recently reduced to some extent, are still large, and sporadic offers of material assigned to banks are disturbing the market. An aggravating factor has been the cessation of Japanese purchases, due partly to the lack of foreign currency, which has particularly injured producers in British Columbia. The recent revival on American paper markets has not been sufficient to stiffen prices which,

JOHANNESBURG CONSOLIDATED INVESTMENT COMPANY, LIMITED

(Continued from previous page)

We report to the Shareholders that we have audited the accounts of the Johannesburg Office of the Johannesburg Consolidated Investment Company, Limited, dated 30th June, 1938, and have obtained all the information and explanations we have required. The Balance Sheet of the Johannesburg Office of the Company is, in our opinion, properly drawn so as to exhibit a true and correct view of the state of the Company's affairs in Johannesburg according to the best of our information and the explanations given to us, and as shown by the books of the Company in Johannesburg. We have also verified the securities in South Africa. The Company has kept proper books and records.

as the following table shows, are still considerably below the level of the end of last year.

WOOD PULP PRICES IN GREAT BRITAIN
(In £ per ton c.i.f.)

	June, 1936	June, 1937	Dec., 1937	Sept., 1938
	£ £	£ £	£ £	£ £
Chemical Grades				
Bleached sulphite (silk pulp)...	12–13	21–23	20–22	16–18
Bleached, sulphite (prime) ...	11½–12	19½–20½	18–19	10–10⅞
Sulphite, easy bleaching	8¾–9	17½–18½	16–17	8¾–9
Sulphite, strong	8–8¼	16½–17	15–16	7¾–8
Sulphite, easy bleaching	8⅞	15½	16–16½	10½–11
Kraft, prompt	8¼	...	4	6¾–7¼
Mechanical Grades				
Pine, 40 p. ct. moist, prompt	2⅛–2¼	3⅝–3⅞	3⅝–3¾	2⅝–2⅝
Pine, 50 p. ct. moist, forward...	2⅛–2¼	3⅝–3¾	3⅝–3¾	2⅝–2¾
Pine, dry, prompt	4⅝–4⅝	8⅞	8⅞–9	6¼–6¾

But the curtailment of output in the Scandinavian countries alone, unaccompanied by a cessation of forced sales and a substantial increase in the demand for paper, will hardly reverse the price trend.

* * *

Improvement in Coffee.—Coffee prices, which fell sharply between November, 1937, and April, 1938, have since registered an appreciable rise. The London price of "Santos Superior" has recovered to 33s. per cwt., after having been down to 27s. 6d. earlier this year. Even at its present level, however, the price is still 14s. 6d. per cwt. below that ruling before Brazil changed her policy in favour of free competition on the world markets at the beginning of last November. A further improvement is not impossible. World consumption of coffee is expanding, and the 1938-39 crop is expected to be appreciably smaller than last season's harvest. In the season ended on June 30, 1938, world deliveries reached 25,609,000 bags of 60 kilos. each, compared with 25,006,000 bags in 1936-37. In the first two months of the current season deliveries were 4,327,000 bags, an increase of 801,000 bags on the year and a record for that period. The new Brazilian crop is officially estimated at 21,873,000 bags, but private estimates expect a harvest of less than 20,000,000 bags, compared with 25,931,000 harvested in 1937. The mild coffee crops are likely to fall below 10,000,000 bags, against last year's harvest of 11,500,000 bags. The decline in new supplies of mild coffee this season may help Brazil to recover some of the ground lost to other producing countries in recent years.

* * *

Wholesale Price Fluctuations.—Fears of war were reflected during the past fortnight in an increase in the price of metals, but in spite of this the general level of British wholesale prices is lower. The complete *Economist* index has fallen by 1.1 per cent., while the British primary products index is 0.4 per cent. lower than a fortnight ago. On the other hand, the American primary products index has risen by 1.5 per cent., while the Irving-Fisher complete index is unchanged. There has been a fairly general rise in American prices, the chief exceptions being cotton, tin and coffee. French wholesale prices are slightly lower.

Complete index	60·4	83·0	70·4	69·5
1913 = 100	83·1	114·2	96·8	85·6
1924 = 100	52·2	71·7	60·8	60·1

Grain prices have continued to fall during the past fortnight, while meat is also cheaper. Cotton, wool and flax prices are also lower than a fortnight ago, but hemp and jute are unchanged. Non-ferrous metals are all higher, with the exception of tin. In the miscellaneous group there were decreases in hides and rubber.

INDUSTRIAL REPORTS

OWING to the fear of armed German intervention in Czechoslovakia and its probable consequences, many business transactions have been held up. The flow of new orders to industry, therefore, remained small, and generally new business was restricted to immediate needs. There has been some improvement in the demand for house coal, but industrial and export demand remained quiet. Inquiry for iron and steel materials has shown some increase, but actual transactions were limited in volume. Business in cotton and wool textiles was very quiet.

Coal

Sheffield.—There has been some improvement in domestic demand, although business in industrial sorts is not particularly active. Steam coal is in steady request. Collieries are making better time, and it is stated that a heavy tonnage has been disposed of to Australia. House coal is in better request and pits which did not increase prices at the beginning of the month have now done so, raising prices in the Sheffield district by 2s. 2d. and 2s. 6d. per ton, while one colliery has advanced prices by a further sixpence per ton on those made on September 1st. There is still a hesitant call for cokes and heavy stocks have accumulated.

Export business continues dull, but some inquiry is reported for best hards and cobbles. Bunker trade is poor.

★

Newcastle-on-Tyne.—The Finnish State Railways have placed orders for 32,000 tons of Northumberland screened steams and the Norwegian Railways for 40,000 tons of Durham screened steams. Apart from the business which is expected to come to this district under the trading agreements, there are few transactions. The Northumberland steam coal position remains quiet; a few collieries are well placed, but others would welcome more trade. The Durham section shows no improvement; foreign trade is extremely quiet, but it is expected that there will be some seasonal increase next month.

★

Glasgow.—There was a further decline in Scottish coal shipments during the week, the total being 213,000 tons, compared with 227,000 tons in the previous week and 248,000 tons in the same week last year. Shipments so far this year were 7,123,000 tons, against 8,585,000 tons in 1937. Export business generally continues quiet, and the only encouraging feature has been a brightening of demand from Denmark, chiefly for washed nuts. Home business remains fairly satisfactory, but in most districts the collieries are now working under their quotas and a fair amount of short-time is being experienced. The trend of prices for large coals is easy, but nuts remain firm owing to the restricted outputs. The London trade is moderate.

★

Cardiff.—Business on the Cardiff coal market is still inactive. Contract deliveries are well maintained, and shipments at the docks of the Great Western Railway Company last week totalled 376,400 tons, compared with 373,200 tons in the previous week. They were, however, nearly 75,000 tons less than in the corresponding week last year, and a considerable proportion of the week's output went into stock. Neither the grave political situation in Europe nor the strike in Australia have yet had any repercussions on the market. There are inquiries for sized coals for the Montevideo Electricity Works, and it is reported that the Portuguese Railways have now placed the whole of their order for the delivery of 220,000 tons during 1939 in Germany. Prices are nominally unchanged.

Iron and Steel

London.—The weekly report of the London Iron and Steel Exchange indicates that a brighter tone has been noticeable during the past week. This has been due principally to some increase in inquiry, which has followed the close of the holiday season, and to some expansion in buying. Consumers, however, are disinclined to commit themselves forward and most of the transactions have been for comparatively small parcels for near delivery.

Business in the pig iron market has been restricted, as not only have most of the important consumers covered their requirements for some time to come, but the demand for foundry products has declined during recent months. The stocks of foreign iron in this country, however, have been reduced and this has helped to give the market a better tone. The reserves of steel-making pig iron remain heavy, but apparently the tendency for stocks to increase has been checked.

In the semi-finished steel department of the market similar conditions prevail, but imports have been restricted and the large stocks in the hands of consumers have been materially reduced.

The demand for finished steel is irregular and is not sufficient to enable the producing works to operate on full time. Business in the lighter branches of the industry has shown a slight improvement of late, but there is still a considerable amount of unemployed plant. Export business shows few signs of expansion, although inquiry has broadened slightly.

★

Sheffield.—Taken all round there is a somewhat better feeling in the iron and steel market, though so far this does not translate itself into actual business on any substantial scale. There is next to nothing doing in forge iron, but a few limited parcels of foundry and basic iron are changing hands. Forward buying is almost entirely absent. Consumers of hematite are well covered by contract, and special qualities alone evoke any interest, these being in fairly steady demand. Business in finished iron has fallen to very small dimensions.

There is a slight upward movement in the demand for acid steel billets, but no improvement is yet noted in basic. Wire rods, strip and structural steel requirements show some improvement, while there is no falling off in the demand for stainless steel sheets.

The iron and steel scrap market remains inactive.

★

Glasgow.—New business has not been plentiful in the West of Scotland this week, but the feeling is general that buyers are holding back much important business. Work on hand, however, is still considerable and plants are regularly employed. Manufacturing concerns in this district are exceedingly busy, many of them having large contracts for works for various Government Departments, and much of their material is being obtained from local producers of lighter sections and plates.

★

Cardiff.—In the South Wales tinplate industry, production in the week ended September 3rd was at the rate of 48.70 per cent. of capacity, compared with 48.15 per cent. in the previous week, and 76.39 per cent. in the corresponding period last year. There was a little more activity in the export trade, where shipments totalled 5,505 tons, as against 3,387 tons the previous week, and 5,880 tons in the corresponding week last year; stocks in warehouses and vans have dropped to 3,514 tons, compared with 10,935 tons a year ago. The market for galvanised sheets is very restricted both for the inland and export trades, and the demand for motor car sheets and other partly finished steel materials is also disappointing. Prices are unaltered.

Textiles

Cotton (Manchester).—There has been increasing nervousness owing to political developments, and buyers and sellers have not been prepared to enter into negotiations of any importance. Indeed, business has been thoroughly disorganised. Raw cotton prices in Liverpool have been sustained by the further fall in the exchange value of the pound. The official United States crop estimate of 11,825,000 bales was rather less than expected. The condition of the crop was given as 65 per cent. of normal, against 78 per cent. a month earlier, the deterioration having been caused by the boll weevil. The figures had practically no effect upon prices.

The yarn market has been disturbed by rumours with regard to the price agreements. One member has resigned from the medium American ring agreements and there is uncertainty concerning the future of this pact. A mass meeting of Egyptian mule spinners has decided to renew the price agreement for twelve months. Demand for American and Egyptian counts has been for small lots.

A slightly better feeling has prevailed in the cloth section. Without there being any general activity, more contracts have been put through for India. Some useful orders have been reported in printing and finishing qualities for South America. Drills have attracted some attention for the Dominions. Buying for the home trade has been of limited dimensions.

★

Wool (Bradford).—The past two weeks have not witnessed any satisfactory development. Wool prices in Australia, where the new clip is now being marketed, have, if anything, moved slightly in favour of buyers, though prices are fully equal to the values obtainable in England for the partly and fully manufactured article. Last week there were considerable sales of average 64's tops in Bradford at 24d. per lb., but the present disposition is to await developments.

International tension is seriously affecting business. The improvement at the manufacturing end of the trade noticeable two to three weeks ago has not been sustained. It is significant that a Czechoslovakian firm has purchased a leading manufacturing business in the Huddersfield district.

The fifth series of London sales begins in Coleman Street, London, next Tuesday, and selling brokers have declared an available quantity of 94,000 bales. The indications are that prices will move slightly in favour of buyers, especially for merinos.

THE COMMODITY MARKETS

THE trend of the prices of many important primary products was upwards this week, both in this country and in the United States. The rise in the United States was due, in a large measure, to the continued expansion of business activity. The firmer trend of prices in the United States found reflection on the commodity markets in this country, where prices were given an additional upward twist by the depreciation of the pound in terms of dollars and, possibly, by purchases made as a precaution against contingencies arising from a European war.

Non-ferrous metals were all marked up, the market in tin receiving support from the decision of the International Tin Committee not to alter the output quota for the fourth quarter of this year. Raw cotton, linseed oil and raw sugar were also dearer than a week ago. Wheat prices fell early in the week, but rallied sharply on Wednesday. The wheat outlook is discussed on page 544.

The rise of prices in the United States is revealed by Moody's index for staple commodities (December 31, 1931 = 100) which rose from 143.1 to 145.6 during the week ended last Wednesday. A month ago the index stood at 141.7 and a year ago at 195.7.

Metals

Copper.—Copper remained remarkably steady and closed the past week at £41 8s. 9d. per ton, a net gain of 8s. 9d. At times there was some

COMPANY MEETING

D. GESTETNER, LIMITED

RECORD SALES

The ordinary general meeting of D. Gestetner, Limited, was held on the fifteenth instant, at Tottenham.

Mr Sigmund Gestetner (chairman and managing director) said: The sales last year, in spite of troubled world conditions, in the latter months of our financial year, constitute a record. This is particularly satisfactory because conditions in certain countries in which we are trading were so extremely difficult that a loss of sales in those countries was inevitable; but we have more than recouped that falling off in other markets. Incidentally, I would mention here that provision has been made for all our commitments and investments in what I would term the troubled countries.

The profit available for dividend is £11,000 down on last year. Reference to the profit and loss account will show you that this year we had only a small profit on investments of £1,285, compared with a profit on redemption of sinking fund policies, less loss on investments, of £11,428 last year.

We have again actively pursued our policy of research with results that have been appreciated by users of Gestetner products.

You will, no doubt, expect me to say something with regard to the outlook for the coming year. This is a difficult thing for me to do because apart from those general considerations arising out of the present tension and uncertainty which at this juncture are common to all businesses and affect nearly every country, the year covered by these accounts only ended a fortnight ago and obviously in so short a space of time we can have received no indications as to what the current financial period has in store for us. If I may judge the outlook from the standpoint of the spirit of our organisation, I can say at once that it has never been brighter and that right throughout our organisation the will and the enthusiasm are there to do better than ever before, in spite of any difficulties which world conditions may bring about.

Early in March we hope to have our usual interim report in your hands and that, I hope, will give you as much satisfaction as I feel this year's results have done. It seems to me fitting that we should, in conclusion, record our thanks to the entire staff of D. Gestetner, Limited, for their work in the past year.

The report and accounts were unanimously adopted.

(*Continued from page 565*)

evidence of armament buying, but on the whole the turnover of the London Metal Exchange remained comparatively small. The Copper Institute's statistics for August showed that there had been increases in both production and consumption, which resulted in a sharp decline in world stocks, from 523,196 short tons on July 31st to 494,524 short tons on August 31st. The increase in production was to be expected, as several of the large United States mines had resumed operations on August 1st. On the other hand, the rise in consumption came as a surprise, as August is normally a quiet month for the copper-consuming industry. Consumption in the United States advanced from 41,249 short tons in July to 48,071 short tons in August and the consumption elsewhere totalled 129,479 short tons in September, against 126,533 short tons in August. Possibly these increases reflect the armament purchases and the effects of the re-stocking movement in the United States. On Wednesday the domestic price of copper in the United States was raised by ¼c. to 10.25c. per lb.

★

Tin.—Tin prices improved by £1 15s. to close at £192 10s. per ton. The I.T.C. decided at its last meeting to maintain the quota for the last quarter of this year at 35 per cent. of the standard output for the free market, plus 10 per cent. for the buffer pool. This decision was in conformity with market expectations, and although it is likely to have a stimulating effect on tin prices later this year, for the time being its influence on the market will probably be limited, as consumers' stocks are known to be large.

★

Lead and Spelter.—No details regarding the new lead agreement have been received and it appears that the final details of the new restriction scheme have not yet been adopted. Nevertheless, the price of lead improved this week by 16s. 3d. to close at £15 10s. per ton, and the price of spelter also advanced sharply to close at £14 2s. 6d. per ton, a net gain of £1 on the week. This improvement was based on the hope that after the settlement of the lead restriction problems, international zinc discussions will take place, although no official announcement has so far been made. Consequently the rise in spelter this week appears somewhat optimistic.

Grains

THE serious international situation led to an advance in wheat prices on Wednesday last, following a decline on Monday and Tuesday. Compared with a week ago, prices of Manitoba wheat, for which there has been a fair demand from the United Kingdom, are up to 1s. per quarter higher, while other grades show small losses. The Dominion Bureau of Statistics estimates the 1938 Canadian crop of winter and spring wheat at 358 million bushels, which is in accordance with most private estimates. The September official estimate places the United States' spring wheat harvest at 251 million bushels, a reduction of 17 million bushels from the August forecast. Selling pressure from the Argentine led to a fall in the price of Plate maize early in the week, and there was a considerable shift in demand from American to Plate; as a result, prices hardened later in the week, but American maize still remains barely competitive. Business in barley is largely confined to Russia, whose prices again declined: parcels of Soviet barley afloat changed hands at 14s. 9d. to 15s. per quarter, c.i.f.

Other Foods

Provisions. — Dominion butter prices fell by 3s. to 5s. per cwt. early this week, with Danish little changed; the market has been quiet. Dutch and Irish bacon is a little dearer on the week; prices for home-killed meat were generally lower.

★

Colonial Produce.—Sugar prices were advanced by 3d. per cwt. on Wednesday for all types, and a brisk trade was done at the higher prices. The cocoa and coffee markets have been quiet, but a good trade was done at the tea auctions at higher prices.

★

Fruit and Vegetables.—Heavier supplies of potatoes at the Borough have been cleared with difficulty, and prices are lower on the week: best siltland King Edwards were quoted at 5s. to 5s. 6d. per cwt. The markets for fruit and vegetables have been quiet, and prices are hardly changed.

Milk.—The latest statistics published by the Milk Marketing Board, which are summarised in the table here given, show that liquid sales declined by 2 million gallons between July and August, when they were, however, 2.4 million gallons larger than in August last year. The total sales were considerably larger than a year ago, so that sales for manufacture increased by 5.5 million gallons. Owing to the increase in the value of milk products and to the rise of 2d. per gallon in the wholesale price of liquid milk, the pool price in August was 1.1d. per gallon higher than a year ago.

	Aug., 1937	June, 1938	July, 1938	Aug., 1938
Prices (per gall.)	d.	d.	d.	d.

Total contract	75·3	89·8	88·1	83·2
Used by farmhouse cheesemakers	2·7	3·5	3·4	3·3

Miscellaneous Commodities

Oils and Oilseeds.—The markets in these products were still affected by the political tension, but were rather steadier than during the previous week. A fair business was done in linseed at last week's low prices, from which some recovery was made; the new Indian crop is being quoted tentatively at £11 15s. per ton for March-April loading. Egyptian cottonseed has sold better and the price for this has also been advanced; refined cotton oil ex Hull is 5s. per ton dearer on the week. The demand for oilcakes is about normal for the time of year.

★

Rubber.—Turnover in rubber has been small in the past week, owing to the political situation; prices have fluctuated within narrow limits and show little change on the week. The decision of the Committee to leave the exportable percentage at 45 for the last quarter of the year was in accordance with the market's expectations, but the rise in price which this decision might otherwise have brought was overruled by the general nervousness.

Empire Miscellany

In the following charts we have assembled a number of statistics relating to the Empire, for which we are mainly indebted to a statistical summary prepared by Mr L. St. Clare Grondona (obtainable by post only, with diagrams, from 28 Victoria Street, S.W.1, price 5s.). For the purpose of these charts the term "British Empire" includes mandates and protectorates; as well as Dominions and Colonies. All the figures refer to 1936 except those of public debt for Canada, which is for 1935, and those of public debt in South Africa and Australia which are for 1937. It should be emphasised that the foreign trade statistics relate to total exports (f.o.b.) and total imports (c.i.f.)—that is, they include gold and silver, which is clearly important in the case of South Africa.

Finance

GOVERNMENT RETURNS

For the week ended September 10, 1938, total ordinary revenue was £9,452,000, against ordinary expenditure of £12,352,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £144,521,000, against a deficit of £87,124,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On September 9th, applications at £99 17s. 0d. per cent. for bills to be paid for on any day of the following week were accepted as to about 60 per cent. of the amount applied for. Applications at higher prices were accepted in full. £40·0 millions of Treasury bills are being offered on September 16th.

SHORTER COMMENTS

Company Results of the Week—VAUGHAN BROTHERS (DROP-FORGINGS) have issued their second accounts since the company was introduced to the public. Total profits for 1937–38 have been well maintained; they amount to £42,622, against £43,476 for the full trading year 1936–37. Satisfactory results are shown by SHEFFIELD FORGE AND ROLLING MILLS, whose trading profits are 37 per cent. higher at £38,378. A cautious view of the industrial outlook is, however, marked by a reduction in the dividend from 20 to 15 per cent. Another engineering company, VILLIERS ENGINEERING COMPANY, has also practically maintained the previous year's net profits, with earnings of £51,683. A decline of 6 per cent. has occurred in MAYNARDS, LTD. trading profit, a substantial increase in taxation provision resulting in a fall of £7,700 in net profits to £53,330. The 8 per cent. dividend is, however, maintained. Stability of earnings continues to be recorded by ARDATH TOBACCO COMPANY, whose net profits for the year to June 30th are £600 higher at £449,533. BRITISH LION FILM CORPORATION have converted a loss of £14,016 into a profit of £15,499, after charging £6,700, against £3,200 to write off studio equipment, etc. The assets of a company of renters, Ace Films, have been purchased from the receiver. A new sales record has been achieved by LINES BROS., LTD., whose trading profits at £80,345 are slightly higher than in 1936–37. Net profits, however, are £2,200 lower than in the previous year.

BANKS

Chartered Bank of India, Australia and China.—The directors state that, owing to the conditions prevailing in the Far East, they only feel justified in declaring an interim dividend for the half-year to June 30th last at the rate of 10 per cent., per annum, less tax. Interim dividends at the rate of 14 per cent. per annum, less tax, and finals at the same rate were paid by the bank for each year from 1931 down to 1937. Prior to the final for 1930, dividends were tax free.

MISCELLANEOUS

Association of Property Societies.—The Council will submit to a meeting of the Association proposals that for member societies: (1) minimum ordinary capital shall be not under 10 per cent. of purchase price of properties; (2) difference between first mortgages and 90 per cent. of purchase price shall be in redeemable debentures up to 50 per cent. of the margin, and the balance in preference and/or ordinary shares; (3) rates payable on securities issued shall be not over 5 per cent. for first mortgages or redeemable debentures, and fixed dividend on any part of share capital shall not exceed 5½ per cent.

Mann Byars & Company. — This company has sold its stock and goodwill to Campbells and Stewart and McDonald, the terms not having been disclosed. The decision to discontinue trading is subject to ratification at a meeting on September 23rd.

Riley Motors (Coventry). — This company's assets and goodwill have been bought from the Receiver by Lord Nuffield, who (when his purchase is complete), will resell to Morris Motors, Ltd., on terms of financial advantage to the company. Mr Victor Riley has been appointed Managing Director.

Roumania Monopolies Institute Bonds.—Hambros Bank and Lazard Bros. announce that they have been provided, through the Anglo-Roumanian Clearing, with funds to pay 65 per cent. of the August 1, 1938, coupon (overstamped as being in British ownership on May 4, 1936), on these 7 per cent. Bonds. Full contractual payment is being pressed for, and the banks are not prepared to recommend acceptance of the 65 per cent. Bondholders deciding to accept should apply for special listing forms.

Yokohama Specie Bank.—Net profit for year to June 30, 1938, Yen 16,672,028 (including Yen 10,484,426 brought forward). To reserve fund Yen 1,250,000. Dividend 10 per cent. per annum, Yen 5,000,000. Balance forward, Yen 10,422,028. Total reserve now Yen 137,150,000.

Vaughan Bothers (Drop Forgings).—Profit for year ended June 30, 1938, after depreciation, £43,147, against £43,738. To taxation £13,885 (£6,000). Ordinary dividend 20 per cent. for year, against 10 per cent. for previous 6 months. To reserve £4,967, making £20,000. Carry forward reduced from £5,640 to £5,425.

General Refractories, Ltd.—Progress Report, dated September 14, 1938, for January–June, 1938, states that diminished output of steel has been reflected in a reduction of sales of Refractories to the iron and steel industries. Demand from other markets has, however, enabled the total volume of sales, as compared with equivalent figures for 1937, to be maintained. Group's trading profits for first six months do not fall far short of those earned in same period last year. To conserve resources, no interim dividend is to be paid. An interim of 8 per cent. was declared a year ago.

Kamuning (Perak) Rubber and Tin.—Dividend 7½ per cent., against 12½ per cent for year. To depreciation reserve, £1,350 (£5,000). To estates contingencies reserve, £10,000 (£5,000). Carry forward, £25,335 (£26,442).

Ardath Tobacco Company.—Profit, after depreciation, tax, etc., for year to June 30, 1938, £449,534, against £448,937. Preference dividend £84,000, as before. Ordinary dividend 12 per cent. tax free, as before, absorbing £360,000. Carry forward raised from £245,833 to £251,367. No allocation to Employees Benefit Fund (against £25,000).

D. Gestetner, Ltd.—At last Thursday's general meeting, Mr. Sigmund Gestetner expressed satisfaction with the year's trading in certain markets, and reported that provision had been made for all commitments and investments in the "troubled countries."

British Lion Film Corporation.—Accounts for year to March 31, 1938, show net profit of £15,499, against a loss of £14,016. Written off equipment, etc., £6,700 (£4,200). Out of profits for past year, further £15,000 written off studio and equipment. Carry forward has risen from £12,433 to £12,932.

Vain Sacrifice?

AS we write, one of the world's historic dramas is unfolding before our eyes. For the second time the British Prime Minister is in conference with Herr Hitler, while, on the other side of Germany, elemental forces have been released which may disintegrate the State of Czechoslovakia unless a halt is promptly called from Godesberg, Warsaw and Budapest by those who have the power to control the storm. Mr Chamberlain's first task is to ensure that this call is given; for otherwise the fate of Central Europe will have passed beyond the pale of sober discussion or considerations of justice and right.

Seven days ago we were compelled by the time-table to write at the moment of the Prime Minister's first flight to Germany. Out of the despair of the preceding days, when it seemed as if nothing could hold the world back from the madness of universal war, Mr Chamberlain's flight seemed to offer fresh hope. To the peoples of every country in the world—not least to the patient German people—his descent on Berchtesgaden from the clouds relaxed the unbearable tension. What has happened in one short week has so far avoided a new Armageddon; but it has left the outlook for European security and European liberties greatly darkened.

It is necessary—so rapidly do events move—to recall the position as it stood a week ago. Under severe pressure from Great Britain and France, President Benes had produced his "Fourth Plan," granting to the Sudeten Germans rights of autonomous self-government wider than have ever previously been offered to a national minority within a sovereign state; and no secret was made in London and Paris of the opinion that this Plan represented a just basis for a peaceful settlement of the dispute. But anxiety was still expressed in Downing Street lest Herr Hitler was under-rating the gravity of British warnings against the use of violence.

It was against this background that the Prime Minister flew to Germany. The hopes thereby raised were based upon the very natural presumption that the Prime Minister's main purpose was to make it clear to Herr Hitler beyond any shadow of doubt that the use of violence would mean a world war. The situation was so grave, in that far-off time a week ago, that nobody wished to exclude the possibility of even greater concessions to the German demands—on the imperative condition that they contributed to a real and lasting settlement. "The touchstone of any agreement," we wrote last week, "must be this: does it put a stop to the method of brutal aggression?" The event has proved that Herr Hitler has been paid in advance. It will be shown in the next few hours whether there is any hope of obtaining the slightest counterpart from an elated, confident and dynamic Germany.

We are confident that the attitude of making further concessions only against real guarantees of an end to bullying represented the overwhelming majority of British public opinion a week ago. Mr Chamberlain's sudden return, after only three hours' talk with Herr Hitler, renewed apprehensions. But as late as Sunday, when the French Premier and Foreign Minister came to London to confer with the British Ministers, it seemed reasonable to suppose that the purpose of their talks was to determine what

compensation could be asked from Germany and offered to the Czechs in return for the territorial adjustments that were now clearly envisaged.

From Sunday onwards the disillusionment has been swift and universal, for, in one of the great political tragedies of the world, Czechoslovakia has been compelled to accept dismemberment without any assurances of security from Germany beyond those which Mr Chamberlain may be able to secure for her in his present talks.

THE PLAN

The Anglo-French Plan is still not known in its entirety, but enough was very quickly learned of its terms to reveal its general tenor. Czechoslovakia was to be pressed to hand over to Germany, without a plebiscite, all the areas inhabited by a predominantly German population—it is believed that this means all areas with a bare majority of Germans. This would involve the drawing of a new frontier by an International Commission, and provision would be made for the transfer of minorities on either side of this line or of persons who "opted" to change from one side to the other. In return for this surgical operation, the frontier of the new Czechoslovakia was to be guaranteed. Who, exactly, the guarantors were to be is still uncertain. According to earlier reports, the only guarantors (other than Germany and Italy, the value of whose guarantees would at least be questionable) were to be Britain and France, and Czechoslovakia was to break her alliances with France and Russia. If this were true, it would be conceding not merely the Sudeten demand for self-determination but also the quite illegitimate German demand to dictate the foreign policy of a neighbouring sovereign state. Later reports, however, suggest either that these earlier rumours were unfounded or alternatively that the plan has been changed. The essential point, of course, is whether or not Russia is to be in the picture. If Russia joins France and Britain in the guarantee, then the new Czechoslovakia, bleeding from amputation though she will be, will still have some of the attributes of sovereignty. If Russia is excluded, then Britain and France will, in effect, have abandoned Central Europe to Germany. For Russia is the only Power whose geographical position enables her to offer immediate aid; and if the Czechoslovakian State is left with no real independence, the road to the South East is opened wide.

It would be hard to exaggerate the astonishment produced in London by the knowledge that this was the plan that had emerged from the day-long deliberations of the French and British Ministers. On every hand, as one moved about the streets, and from people in every walk of life, one met with emotions varying from shame-faced realisation of the enormous price to be paid for peace to hot resentment.

In part, this feeling was due to the conviction, widely though not unanimously held, that amputation of the Czechoslovak State is not justice, but injustice. Much has been heard in recent days of the principle of self-determination; it is a principle which will always have a wide appeal to the British people. But it has never previously been held that, in drawing frontiers, no regard shall be paid to any consideration whatever except the language spoken by a bare majority of the inhabitants. There must always be some minorities somewhere; and it is no just accusation against any State that it contains minorities. If it were, not even the United Kingdom could escape condemnation; since a plebiscite in Tyrone and Fermanagh might well lead to secession. The only just accusation against a State is that it mistreats its minorities and, though the treatment of the Sudeten Germans in Czechoslovakia may not have been perfect, it has certainly been better than that accorded to any other minority in Central Europe. Secession of the Sudetenland involves for Czechoslovakia the abandonment of natural frontiers that have stood for centuries; the surrender of defences upon which a poor nation has lavished (and with what triply-proved justification!) enormous sums; the separation from their markets of a very high proportion of the country's industries; and the distortion of the country's transport system, to such an extent that the two largest cities will be cut off from rail communication with each other. Nobody who looks behind the specious plea of "self-determination" to the realities of Bohemia can believe that the surrender of the Sudeten territories was the right solution of the problem. The sacrifice demanded was one of expediency—not of justice.

It was not, however, this aspect of the matter that struck such dismay into so many British hearts on Monday and Tuesday. Even many of those who inclined to favour some cession of territory from Czechoslovakia to Germany were dumbfounded at the manner in which such a proposal was rushed forward. There was never any pretence of discussing the future of their country with the Czechs themselves; they were merely subjected to enormous British and French pressure to accept the plan. There was some talk of concessions that Herr Hitler was ready, or might be asked, to make. But the Czechs certainly did not know what they were, and in any case they clearly lay in the hypothetical future, for Mr Chamberlain's flight to Berchtesgaden did not secure even a momentary relaxation of German pressure. On the contrary, it increased. Herr Henlein was allowed to demand secession on the very day Mr Chamberlain landed at Munich. All the week the threats of the controlled German Press have mounted higher and higher. The German Army is now openly massed against the Czech frontier, and the German Government have not merely encouraged the formation on German soil of a "Freikorps" of Sudeten "refugees," but have allowed it to make armed attacks on the frontier. Against all this, no protest appears to have been made from London or Paris.

THE PRESSURE

The first request from Britain and France for acceptance of the Anglo-French plan met with a reply from Prague which, while not rejecting the proposal, suggested that the differences between Germany and Czechoslovakia should be dealt with in accordance with the German-Czech Treaty of Arbitration—a treaty that arose out of the Locarno Conference, was confirmed by Herr Hitler in 1936, and reconfirmed "on his honour as an officer" by Field-Marshal Goering as recently as March. This appeal to Czechoslovakia's international rights was disregarded. Within a few hours of its presentation, the French and British Ministers in Prague called upon President Benes at two o'clock in the morning and presented to him a joint request for acquiescence which was, in effect, an ultimatum—for one of its items constituted a definite repudiation by France of her duty under the Franco-Czech Treaty of Alliance. There are millions of British and French citizens who will never forget the humiliation of that midnight scene.

Faced with this overwhelming pressure, ringed by enemies, deserted by their friends, even the indomitable bravery of the Czechs gave way. They accepted the plan, stipulating only that the proffered Franco-British guarantee should have immediate effect. On Wednesday night the citizens of Prague were furious with indignation against France and England. The official spokesman in the more measured words of a noble address to the people said: "You shall to-day level no reproaches at those who have forsaken us in this hour of direst need. History will pass judgment on the events of these days."

With the Czech submission in his pocket, Mr Chamberlain has returned to Germany. But it is not only the fate of Czechoslovakia that is at stake. All the circumstances of the past week—the complete disregard by Britain and

France of that sanctity of treaties they have so often proclaimed; the cruel pressure upon the Czechs; the frantic haste; the neglect to make any protest against the open threats from Germany—all these can be interpreted in one way only. We too are not prepared, at present at all events, to resist the military pressure of Germany. So at least they have been interpreted right round the world. So they have been interpreted by incredulous British opinion. So they have been interpreted in Germany, and the steady crescendo of German demands, backed by a German-Polish-Hungarian combination and reaching as far as the total disappearance of Czechoslovakia, is the immediate and direct result. It is true that no formal British signature has been repudiated (save that faded signature on the Covenant of the League, guaranteeing the independence and territorial integrity of Czechoslovakia, along with those of Abyssinia, Spain and China). But for months the British Government have allowed the world to assume that Mr Chamberlain's speech of March 24th was a warning to Germany against the use of violence towards Czechoslovakia. When Sir John Simon repeated the formula four weeks ago, every newspaper in London interpreted it as a warning that a European war starting in Bohemia would involve Great Britain. If this interpretation was wrong, if the Government's real intention was that Great Britain and France would at a crisis acquiesce in the coercion of Czechoslovakia to avoid a war which might involve us, they should have said so. It will be very hard to disprove what now seems so clear: that Great Britain, too, changed her declared policies under threats from Germany. It is this realisation that has so confounded the country.

THE OUTLOOK

From the wreck of the hopes of a week ago, it is still just possible for the Prime Minister to save enough to make a new start with the reconstruction of European confidence. As we write, he is meeting Herr Hitler again; and both his supporters and his political opponents hope that at last he will stand firm. There are several stipulations that must be made even about the cession of the Sudetenland. There must, for example, be a decent interval of time to allow the Czech officials, the Czech troops and the Czech population to withdraw—an interval undisturbed by Press calumnies or troop movements. At the very least, there must be demobilisation on both sides, and preferably the interposition of an international police force. There must be a declaration from Herr Hitler that he has no more demands to make against Czechoslovakia. There must be arrangements for the protection of the Czechs and Socialists left in Germany. Not one of these conditions can with decency be abandoned. Then there is a second series of concessions that must be asked from Germany, if the new arrangement is to be the foundation of a really lasting peace. The peoples of the West will want proofs—not mere promises—that the Fascist powers do intend to abandon the policy of aggression; and the most convincing proof would be an immediate and complete cessation of intervention in Spain.

But far more important than the exact substance of the points on which Mr Chamberlain stands firm is the fact that he must stand firm on something. If the impression is created that Britain and France will never stand r ground, there is an endless prospect of sacrifices they will be called upon to make. Spain will be the first. If the democracies will not stand up to the dictators in the Czechoslovak problem, why should they do more than protest if the two dictators openly intervene on General Franco's behalf? After Spain, there may well be engineered revolts in the Moslem lands, with a dictatorial threat of war if we intervene. After that, self-determination for Malta. Then the colonies; then naval rivalry—the list stretches on indefinitely. And after this week, dare any man say these are impossibilities?

The alternative to giving way is, of course, to run the grave risk of immediate war. But if the risk of immediate war is one horn of our terrible dilemma, the virtual certainty of ultimate war is the other. And in a war next year, or the year after, we shall be weaker than we are to-day, however much we re-arm. For at best we are gravely weakening the most democratic country of Central Europe, and driving into isolation the colossal power of Russia in the East. In a war to-day, Germany would have to fight on two fronts. If we wait, she may choose a time when she has to fight on one front only and that towards us. And in the meantime her machine of re-armament, already turning faster than ours, will be fed by all the wealth of the Danube basin.

This journal may, perhaps, be granted the melancholy satisfaction of recalling that this appalling dilemma is not now first discovered in these columns. To all those who have been able to see clearly, the approach of this hour has been visible a long way off. The tragedy is that the British people have been allowed to remain so blind to their true interests and their real peril. The shock of awakening is now upon us, and it is necessarily painful. There is still a small chance that peace may yet be retained with real security for its maintenance. Even that course involves a mighty effort of courage and resolution on the part of the British people, comparable only with the effort they will have to make if the chance is lost and war descends upon us.

The Tram at its Terminus?

FOR many years the tramcar has been losing ground as the main means of urban transport. This year has seen several signs that its passing is being speeded-up. It is true that over 10,000 tramcars are still in service; and that trams remain the most important public service vehicles in Leeds, Sheffield, Birmingham, Glasgow and Blackpool. But they have been abandoned by many smaller towns; and are doomed in London, Bristol, Cardiff and Manchester.

Competition between tramcars and petrol-driven buses is now of considerably long standing. For a prolonged period of years the resistance of the tram to supersession by the bus was extremely strong—at least in large towns. It is true that trams and buses soon ran on complementary services in the same urban centres. But the tram's great carrying capacity and cheapness of fare fitted it admirably to serve crowded working-class areas where passenger "peaks" were high. Even now, the tramcar is firmly fixed in the habits and affections of the nation's army of workers. It is the tram which has plied from crack of dawn in industrial towns offering cheap workmen's fares. It is the tram which has carried crowds of children cheaply to school, or borne their fathers from crowded football matches on Saturday afternoons. And it is the tram whose terminus on the outskirts of grimy Northern cities has traditionally marked the end of civilisation and the moors' beginning.

Moreover, where vehicles to carry great numbers of people have been necessary, the capacious, steady and reliable tram has usually paid well, and often handsomely. This is still true to-day in big cities where local traffic conditions have not rendered the tramcar an intolerable obstacle and tramlines a grave danger; and especially true

in towns like Liverpool and Blackpool where the present rolling stock is up to date, embodying all the improvements in seating comfort which have made the bus so powerful a rival in popular estimation.

Nevertheless the tide has lately turned steadily in favour of the tram's competitors; and the ebb has been quickened in the past decade by the successful introduction in many places of the electrically-driven trolley-bus, which combines many of the virtues of both the tramcar and the petrol-bus. This handsome *tertium quid* has won striking popular favour in towns like Bradford, Huddersfield, Newcastle, Nottingham and Portsmouth; and it is being used in London to supersede the tram as the rolling stock comes up for renewal. The seating capacity of the trolley-bus is commonly slightly greater than that of the tram, and between 20 and 25 per cent. greater than the seating capacity of the petrol-bus. In London the figures are: standard petrol bus, 56 seats; standard trolley-bus, 70 seats; trams vary, and some seat 74, but the average number of seats is 67. The trolley-bus is quiet and smooth and as quick in acceleration as the modern tram. Almost everywhere where it has been introduced in place of the tram, the speedier trolley-bus has gained an increase in passengers, sometimes of up to 30 per cent. It is the view of the London Passenger Transport Board that there exists a marked and sometimes "revolutionary" public preference for trolley-buses over trams—though it must be remembered that the trams so far replaced in the Metropolis, like those abandoned in, say, Newcastle, were far from being up-to-date vehicles.

It is, however, doubtful whether, traffic considerations apart (a large and important qualification), there are decisive economic grounds for the abandonment of tramcars in large towns—i.e. the services which are still paying their way. The earlier replacements of trams by petrol-buses in small towns were, admittedly, justified by financial considerations. Trams were almost always uneconomic vehicles in towns where the distances travelled were short and the population was small. The capital cost of standards, wiring, tracks and their maintenance was high; and, since the large seating capacity of the trams was not fully used, their earning power was low at any level of fares.

Now the swing away from trams has spread from the small towns to the big cities—to the very places where the tram has provided its best service. As soon as the rolling stock of their tramway services needs renewal and the tracks require repair, which regulates the timing of any proposed change, authorities begin to debate the introduction of trolley-buses or petrol-buses. Their motive for doing so is not that the trams are being run at a loss. The chief considerations in large urban areas when replacement comes under discussion are traffic conditions, public amenity and public preference. Modern traffic in narrow and congested thoroughfares demands a mobility which the tramcar on its predeterminate tracks does not possess.

Although non-economic arguments, such as traffic congestion, may dictate the abandonment of trams, there are several financial considerations which may be advanced in favour of their retention. Established tramways are a considerable asset to local authorities; they pay rates on their considerable fixed equipment; they provide a consistent and appreciable demand for electricity; and they are responsible for the maintenance of the particular part of the roadway over which their tracks run. In small and medium-sized towns, where passengers are relatively few and distances short, the motor-bus will almost always be introduced, despite these drawbacks, because it is demonstrably the most efficient vehicle for public services in these conditions. In larger towns, however, where high seating capacity is imperative, the trolley-bus will usually be preferred. In many cases, the existing tramway standards and wires can be used by the new vehicle, which will also take over the electricity load of the trams. Road maintenance will become a public charge whether trolley-buses or petrol-buses are introduced.

Apart from these special considerations, the relative efficiency in economic terms of the trolley-bus and the petrol-bus is not easy to determine, since conditions and experience vary widely, and the trolley-bus is still in what may be called an experimental stage. Initially, a 70-seater trolley-bus may cost £2,500 if bought in quantity, and a 56-seater double-decked bus £2,250 to £2,325, against £2,500 for a tram. Generalising from incomplete figures of actual operating costs and gross receipts, which sometimes give conflicting testimony, it may be said that, in conditions where the tramcar has formerly given an efficient service, trolley-buses are more remunerative than petrol-buses, even though their fares (inherited from the trams) are commonly lower.

In Newcastle the average revenue per vehicle mile is calculated to be 19.4d. for trolley-buses and 14.4d. for motor-buses; in Nottingham the figures are 16.4d. and 13.4d. respectively; and in London 15.6d. and 13.5d., against working expenses of 10.0d. per car mile for trolley-buses, 11.3d. for trams, and 11.5d. for buses and coaches. The following table gives data, not always complete or strictly comparable, for a number of towns:—

(Per vehicle mile)

Town	Operating Expenses		Average Revenue		Ratio of Working Expenses to Gross Receipts	
	Trolley-bus	Motor-bus	Trolley-bus	Motor-bus	Trolley-bus	Motor-bus
	d.	d.	d.	d.	%	%
Birmingham	...	...	16·0	14·5	73·7	73·9
Maidstone	11·8	10·4	18·5	11·8	64·5	90·5
Walsall	10·8	9·7	16·8	12·5	65·0	75·9
Wolverhampton ...	10·1	10·9	15·0	12·7	67·0	85·7
Bradford	13·0	11·0	15·1	13·2	86·0	83·4
Ashton-under-Lyne	12·8	9·7	14·2	15·7	90·1	62·3
Portsmouth	10·6	11·2	15·6	14·0	68·0	80·0

The actual operating costs of petrol-buses may be lower—though in most places the tramwaymen (and therefore trolley-busmen) work longer hours than busmen for lower wages—but the trolley-buses' revenue per car mile is generally higher because of their greater seating capacity; and, on the whole, the ratio of working expenses to gross receipts is lower in the case of trolley-buses, on suitable routes, than in the case of petrol-buses.

On the other hand, the trolley-bus, more mobile than the tram, is less easy to manœuvre than the bus. Its acceleration and braking power are greater, but, tied to an overhead wire, it is not such a free agent. Yet the trolley-bus has a number of general advantages over the petrol-bus from the point of view of public amenity. Not least among these is its freedom from the fumes with which motor-buses, whether oil or petrol driven, defile the air breathed by urban workers. And the trolley-bus shares with the petrol-bus one advantage over the tramcar in the fact that its passengers can board and alight at the kerb.

The rivalry between the tramcar, the motor-bus and the trolley-bus for priority in urban passenger transport is still undecided. Clearly the issue must depend upon local conditions and local preferences; and, equally clearly, there is room for all three in many cities. The tramcar can still provide an economic and efficient service in highly populated areas; but modern traffic conditions are against its retention on a wide scale. Although up-to-date tramcars may meet the demand for comfort which rising standards of rolling stock on other vehicles have created, only revolutionary changes in traffic regulations could make the continued presence of trams tolerable in many of our city streets. It will be a long time yet before the tramcar is made one with the hansom cab; but, even then, it is the trolley-bus rather than the oil- or petrol-driven vehicle that seems likely to inherit its precise place in popular esteem.

Plastics: An Industrial Newcomer

THE part played by power in the advancement of material progress is well known. Most of us are fully conscious of the contribution made by water power, steam, oil and petrol, gas and electricity to the making of the world we live in. Few people are equally aware, in the same dramatic way, of the rôle of materials in this continuous process. Without iron, the steam engine could not have been invented, without copper the electrical industry could hardly have been developed. The multiple uses of timber, brick and stone, iron and steel, alloys, cement and ferro-concrete are obvious to every eye; but their full social significance is not always realised.

To the lay observer, therefore, the vast Building Trades Exhibition which opened at Olympia just over a week ago is of absorbing interest precisely because the great range of old and new materials now ready to the hands of builders and engineers, are there on view. The most remarkable and versatile of the materials which have only recently been pressed into service on a wide scale are the products of the plastics industry. Etymologically, a plastic material is one that can be moulded. But specifically the term is applied to moulded articles produced by the application of heat and pressure, from materials, natural or synthetic, of the resin group. Natural resins are obtained from plants and trees; and the best known are shellac, universally used for gramophone records, and bitumen compounds, used for battery cases and acid-proof tanks. The synthetic resins are purely products of the laboratory.

Many of the plastics have become familiar. The manifold uses of celluloid, for instance, have been well known for a long time. Casein has been used to make beads and buttons for many years. But most of the natural, and a large number of the synthetic, resins possess disadvantages in use. Celluloid is highly inflammable, and shellac gramophone records warp in the heat of the sun. What are called the "thermoplastic" variety of resins become plastic again when reheated; and years of experiment and research were devoted a generation ago to the search for a "thermosetting" resin which would undergo a chemical change in the process of hardening and never again be rendered plastic by the action of heat. This quest was actually successful as early as 1907, when Dr L. H. Baekeland heated a mixture of phenol, a liquid which can be derived from coal tar or synthesised from benzol, and formaldehyde. He produced a solid amber-like resinoid, which, when subjected to further intense heat, hardened and was no longer soluble or responsive to heat. In the event, however, although this process was introduced into the United States exactly thirty years ago, the widespread production and varied use of synthetic resins are developments of the last few years. It is only quite recently that industry as a whole has begun to realise the advantages of materials that have the advantage over wood of being susceptible to moulding and over metal of being lighter and (in most cases) cheaper. The extension of the plastics industry to produce ash-trays, billiard balls, ornaments, radio, telephone and switchgear equipment, gears for machine drives and instruments, components for motor-cars and aircraft, walls, table-tops, and all kinds of furniture is a comparatively new and remarkable departure. The world output of synthetic resins rose from a mere 13,000 tons in 1926 to something like 100,000 tons last year.

The outstanding trend has been the increased output of plastic mouldings, which more than doubled between 1933 and 1935 in the United Kingdom alone, rising from 73,000 cwts. to 147,100 cwts.; last year the production of mouldings was over 200,000 cwts. The moulding of synthetic resins is the key to much of the recent progress. The resin is ground to powder to which a "filler," commonly wood-flour, is added, together with pigments for colouring and, possibly, asbestos to increase heat resistance or mica where the resulting product is to provide insulation against high tension electricity. The mixture is placed in a heated steel mould and subjected to great pressure. The powder melts, coalesces and hardens, to emerge from the mould in no need of further finishing-off than polishing.

It is not the case, however, that those synthetic resins which are "thermosetting," or impervious to heat, have alone contributed to the expansion and consolidation of the plastics industry. "Thermoplastic" resins (i.e. those which will become plastic under the influence of heat, like celluloid, casein, cellulose acetate and the natural resins, including shellac) play an important part in the equipment of modern homes and factories. Shellac is still unchallenged as a material for gramophone records. Celluloid is still employed to take the place of ivory and bone, and in the manufacture of toys. And, in many cases, where the dangerous inflammability of celluloid (reported on adversely by a Departmental Committee just under a year ago) is deemed to detract too much from its merits, cellulose acetate is used instead. Cellulose acetate melts but does not burn, and is widely used in cinema and theatre decorations. Casein, too, finds growing employment. "Thermoplastic" in the crude state, casein can be hardened by the action of formaldehyde.

Nevertheless, while the consumption of these older plastic materials is being maintained or slowly expanded, the growth of the plastics industry is mainly due to the development of the synthetic and "thermosetting" resins. The bulk of the synthetic resins produced are of two kinds: the phenol-formaldehyde resins manufactured according to Dr Baekeland's method of thirty years ago and commonly called bakelite; and the urea-formaldehyde resins, similarly prepared, which were not commercially developed until about twelve years ago. The phenol resins can give exceptional mechanical strength and a high degree of insulation; and it is these which are employed so strikingly in the manufacture of engineering and electrical components, as well as for *bric-à-brac* and furniture. Until recently phenol resins could only be produced in dark colours, which was in large measure responsible for the development of the urea resins. These can be used to make articles of many colours, and are widely employed for ornamental mouldings, table ware, and decorative purposes generally.

These are the broad outlines of an industry which now shows signs of settling down rather than branching out in new and unexplored directions. But this account by no means exhausts the story of the industry. A great variety of transparent materials, for instance, have lately been produced, providing unbreakable substitutes for glass and excellent lenses. Transparent plastics are being used in aircraft manufacture; and cellulose acetate and other resinous materials are being used for aeroplane cabin roofs, gun turrets, windscreens, and navigation and landing lights.

At present the industry's attention is being concentrated on moulding technique rather than on the discovery of new uses or the production of new types of resin. After a period of remarkable expansion, during which prices tended to fall while output soared, the plastics industry is entering a period of consolidation in both method and organisation. A period of price-cutting, together with

changes in technique which involve heavier outlays for fixed capital, are reducing the number and increasing the size of the firms in the industry, most of which still confine themselves to moulding, purchasing their materials from a few large suppliers. Clearly, however, the industry's ultimate scope is still unbounded; any one of many lines of development may create a large new market, though the industry may be handicapped by its dependence upon imported raw materials. Yet, by and large, its immediate prospects depend upon the progress of the automobile and electrical trades. In 1935 the electrical industry consumed synthetic resins to the value of £490,000; and the motor industry was the second-best customer, taking resins to the value of about £325,000, or one-quarter of the year's total ontput. Since then, the motor industry's consumption has risen nearly 25 per cent. For the rest, the plastics industry depends in a multitude of ways upon the building and furniture trades. In other words, if the consumption trades of this country go on thriving, plastics will continue to prosper.

Topics of the Week

The Submission of Czechoslovakia.—This has been a week of rending anxiety and humiliation for the people of Czechoslovakia. Years of quietly determined preparation, of the building up of moral courage matched only by immense expenditure on the means of physical defence, have ended in the utter frustration of defeat without resistance. They cannot but be aware of profound bitterness against those who have connived at this defeat, a feeling none the less biting for the swift passage of events. On Sunday nothing had been thrown away. The Henlein party had been dissolved, its leaders had forgotten their courage in flight, and quiet reigned in all parts of the republic. Dr Hodza, the Prime Minister, had affirmed in calm words that Czechoslovakia would never accept either a plebiscite or any secession of its territory. But by Monday afternoon the Cabinet in Prague had realised what the British and the French expected of them: and they were not left in any doubt of the urgency of these demands. In Prague, as everywhere in Czechoslovakia, despair and the doubt which comes from ignorance of how things are going were mingled with thoughts cast to the great German armies standing round their frontiers, to the hasty buying of gas masks, to retreat, for Jews and democrats, from the frontier land, to the slowly dawning understanding of the disaster which had come upon them and which nothing now could prevent.

* * *

At five o'clock on Wednesday afternoon, after more and more urgent "advice" from London and Paris, in view of the new menace from Poland and Hungary, and when the Czechoslovak Cabinet's proposals for negotiation on the basis of the 1926 Czechoslovak-German arbitration treaty had been rejected, Dr Benes led his cabinet into submission. There can be few men who have suffered more mental anguish in the space of one week than Dr Benes and his colleagues. The evening in Prague was filled with the slow, uneasy movement of great crowds, the more reproachful for their dignified restraint, crying out against this dismemberment of their republic, against France and Britain, against all those who they feared had betrayed them or wished their downfall. The Bourse closed and a temporary banking moratorium was announced. On Thursday, the Government resigned and a new Cabinet with military participation was formed. But in the midst of these happenings there was broadcast over the wireless a statement which, for its dignity and courage, cannot be forgotten: "We are not a vanquished people," said the speaker. "We submitted in order to avoid greater losses, misery and bloodshed: often more courage is required to live than to commit suicide .... We face the future with our heads high." There could be no fitter epitaph to losers so gallant in defeat, no more secure testimony to Czechoslovakia's place in history or to the continued struggle of its people for their independence.

* * *

The Economic Structure of Bohemia.—For Czechoslovakia, broadly speaking, the secession to Germany of the so-called Sudetenland would mean the drastic unbalancing of an economy now more or less firmly poised between industry and agriculture. According to occupational figures issued after the general census of 1930, out of a total population of 14,729,536 the number of persons engaged in agriculture, fishery and forestry was 5,101,614, whilst the corresponding figure for industry was 5,146,937. The transfer of two or three million Germans to the Reich would entail a large subtraction from the figure for industry, but little appreciable change to the figure for agriculture. A glance at an industrial map of the Republic shows that a majority of both heavy and light industries (with the exception of armament-making which, however, draws a large proportion of its raw materials from minority areas) are in German or Polish minority districts, and drives home the inescapable conclusion that a mutilated Czechoslovakia would face grave difficulties in continuing as an economically independent state.

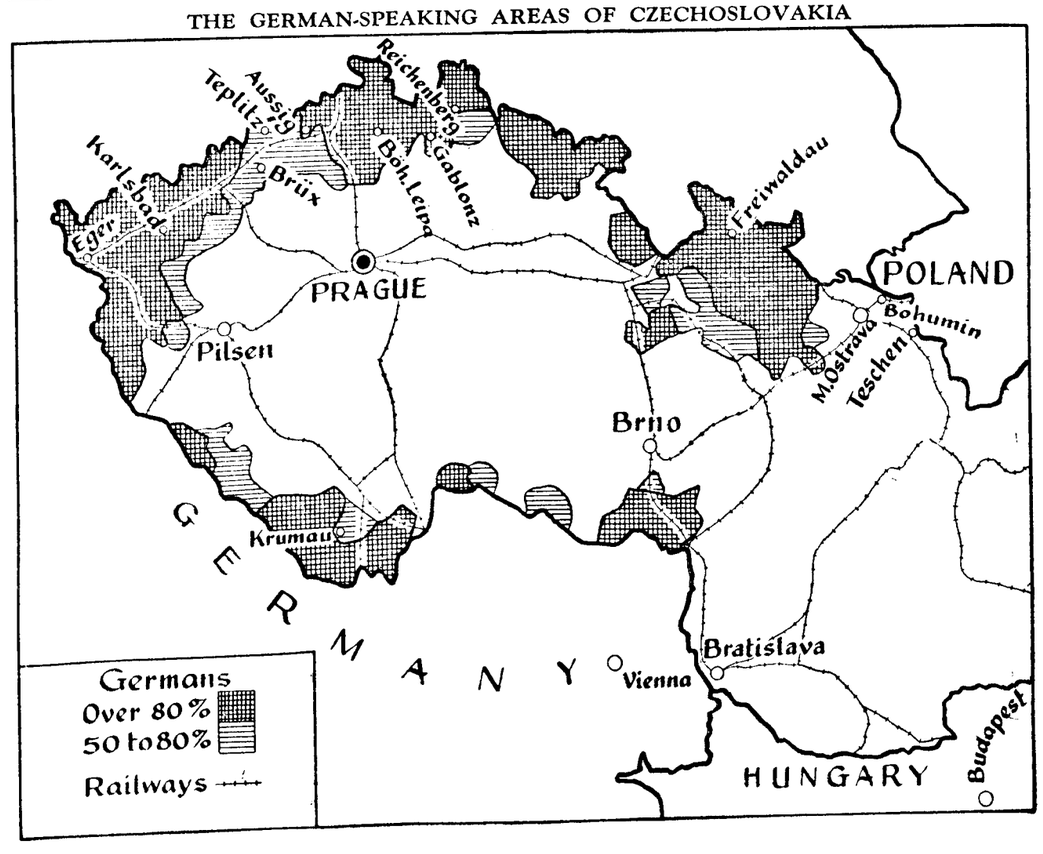
* * *

The people of the central plains of Bohemia and Moravia are by tradition peasants. On their borders lie the industrial towns. In Teschen, Bohumin and Karvina, the Polish minority area, coalmines and steel plants supply flourishing metallurgical industries with raw materials for the manufacture of machinery, motor-cars, and armaments, the armaments factories themselves being situated in Plzen and Brno, both of which are in the Czech area, though Plzen (Pilsen) is very close to the linguistic frontier. Continuing anti-clockwise round the frontier from Teschen, the heavy industries give place in the German areas of Troppau and Freiwaldau to the manufacture of textiles and chemicals. There are textile factories from Trutnov to Gablonz and Reichenberg, where they are joined by light industries such as brewing, jewellery and crystalware manufacture, and also by motor-car works. Sugar refineries using beet drawn from non-German parts of the country put in an appearance at Bœhmisch Leipa, until near Aussig, which is also a centre for the production of chemicals, textiles and china clay, the brown-coal mining area is entered. Westwards again, the district of Brüx, with a large percentage of Czech-speaking miners, has German concerns manufacturing toys, sugar and gloves. The Eger salient, the most easily demarcated German area, and embracing Karlsbad, Falkenau, Marienbad and Joachimsthal, produces porcelain, textiles and musical instruments. Southwards along the line of the Bohemian Forest there is a marked falling-off in industrial activity. Scattered glass-works, textile and toy factories, with paper mills near Krumau, are mostly operated by Germans.

* * *

This is a bare and incomplete recital, but it is enough to show that by ceding the German areas—and *a fortiori* the Polish areas as well—Czechoslovakia stands to lose virtually all its brown-coal deposits, a large proportion of its iron-ore wealth, very many of the established metallurgical industries, most of the textile and glassware factories, and most of the light industries such as toy and musical instrument-making which now serve as useful auxiliaries to the national economy. If the Magyar minority area in southern Slovakia were ceded to

Hungary, there would be a further loss of much mineral wealth. But beyond these colossal inroads upon the Republic's economy, there is another and equally vital point to be considered. Whether under Austrian or Czechoslovak rule, the Historic Provinces of Bohemia and Moravia have for seven centuries enjoyed economic unity. They have never been separated by any national frontier during that time. To suppose that the German industrial areas are artificially linked to the remainder of the provinces by an arbitrary political structure, and that they could be cut off without serious damage to themselves, is to show profound historical and geographical ignorance. Their communications, financial arrangements, and whole economy is contained within a tradition which secession must utterly sever. But if their economy would suffer from violent incorporation into the Reich, the damages which the remainder of the Historic Provinces must bear would be many times heavier. Little short of economic disaster involving radical readjustment would befall the large urban concentrations in Prague, Pilsen and Brno. Most of the banking and insurance companies, gathered in Prague during the last twenty years from all parts of the country, would be seriously affected: even the peasants would suffer, shorn of valuable urban markets. Communications by road, rail and river would take on an altogether different aspect, and it is only necessary to point out, as an example, the fact that the railway between Prague and Brno, the two largest cities of the Republic—as one might say London and Glasgow—runs through a German area for a part of its length, to realise how suffocating could be Germany's economic grip. It is not too much to say that those who force or connive at secession are taking upon themselves the responsibility for the economic collapse of an integral part of Central Europe.



* * *

Signor Mussolini and the Crisis.—The Italian dictator made haste to show his hand as soon as he saw that British and French wills were bending. On Thursday of last week he published in the *Popolo d'Italia* an open letter to Lord Runciman demanding a plebiscite in Czechoslovakia not only for the German element but also for all the other national minorities. He repeated this demand on Sunday and generalised it—out of a feeling which, as he claimed, was European rather than Italian—into a declaration that the only solution for Europe's present torment lies in "plebiscites for all the nationalities that want them." This is a queer declaration of faith from the holder—and holder down—of the South Tyrol; for, while it is true that Herr Hitler has publicly renounced, for all eternity, the ambition of liberating his own Austrian brothers the Southern Tyrolese, this particularly grievously oppressed German minority would jump at a plebiscite if it were offered one. Evidently Signor Mussolini has no fear that the South Tyrol question will be raised by the one man who could raise it in a way that would be awkward for Italy; and the ground for the Duce's confidence was made clear by him in the course of the same speech. "If a front is formed either for or against Prague, Italy knows on which side she will be." In other words, if there is war between Germany and the West European Powers, Italy will not be a neutral, but will be fighting from the outset on Germany's side. This pledge of military service can only have been made in return for the promise of a reward; and the reward can only consist in a promise of German help to achieve Italian ambitions in the Mediterranean at the expense of France and Great Britain, in compensation to Italy for the sphere of influence in the Danube Basin which she is now perforce ceding to Germany. The prospect is not one on which anybody but the Germans and the Italians can dwell with any pleasure.

* * *

Poland Asks for Her Share.—Having realised which way the diplomatic wind was blowing, the Polish Government took hasty steps last week to drop the incipient support of the Anglo-French interest which had characterised Polish politics in those crucial days before

THE GERMAN-SPEAKING AREAS OF CZECHOSLOVAKIA

Mr Chamberlain went to Berchtesgaden. As soon as it became clear that secession of the German areas in Czechoslovakia was really contemplated by the French and British Governments and that Herr Hitler would therefore get his way, the less unfriendly attitude to Czechoslovakia which had balanced the move away from German influence on Polish foreign policy was at once replaced by the old unyielding enmity. Official pronouncements declared that the Polish minority in and around Teschen must be accorded "an identical settlement" with that made for the German minority. Demonstrations at Katowice, Warsaw and Teschen itself resolved that "Teschen must return at once to Poland" and even declared a frontier with Hungary; and the tactics used further westwards were copied down to the "strengthening of frontier guards" and the moving-up of troops released from the annual manœuvres just concluded in East Poland. By mid-week it was clear that, failing a settlement for the Polish minority in Mr Chamberlain's plan, the Poles intended to have a Berchtesgaden of their own, and on Wednesday something approaching a Polish-Hungarian ultimatum was presented in Prague. Polish and Hungarian politicians have been in close consultation with the Nazi leaders, and one of the most immediate results of the Anglo-French weakness has been a virtual alliance between Berlin, Warsaw and Budapest. Overnight, the Nazi camp has gained two new inmates.

* * *

As always, Poland's attitude depended in the end on that taken up by Britain and France: as soon as it became apparent that the democracies were yielding to Herr Hitler's demands for the cession of Czechoslovak territory there was little else for Colonel Beck to do (even supposing his sympathies were not with Germany) than renew his good relations with the Reich and hasten to get what pickings he can from the carving-up of Czechoslovakia. Seizure of those pickings may bring troubles of their own. Polish claims extend specifically to the small (though industrially important) area comprehended by Teschen, Bohumin and Karvina; generally these claims may be presumed to extend some way across Moravian Silesia and eastwards along the southern slopes of the Tatra Mountains, which would form a magnificent frontier. But German eyes turned south-eastwards cannot ignore the value of Moravian towns next door to Teschen such as Moravska-Ostrava and Olomouc, both of which have negligible German minorities, nor the advantage of good communications across Slovakia to the Hungarian Danube. With the Poles astride northern Slovakia those communications might be menaced from the flank and the road to the Ukraine be no easier of passage than it is to-day. These and other calculations will not fail to have their full influence in Warsaw.

* * *

Hungary and Roumania.—Hungary has added her voice to the chorus. Magyar rights in Slovakia are being urged by Government and Opposition alike, both with equal strength if for different reasons. Admiral Horthy took advantage of his shooting trip with General Goering to fix up a visit to Berchtesgaden for M. Imredy, the Prime Minister, and M. de Kanya, the Foreign Minister, and they returned apparently full of hope that Germany's hymn of hate would include a Hungarian *obbligato*, if only in a minor key. What the Fuehrer agrees to do for the Magyar minority, and on what terms he agrees to do it, may well serve as an indication of what he intends shall be the next phase of the *Drang nach Osten*. Hungarian ambitions, like the Polish, are apparently not limited to the territory inhabited by the Magyar minority; a public meeting in Budapest on Wednesday was calling for the whole of Slovakia.

* * *

It would be strange if the significance of these movements were lost on a country like Roumania, which contains within its boundaries minority groups from all adjacent countries. Roumania continues to prepare for war. The Council of Ministers which met last week-end have placed under military control all industries connected with national defence; and the final stretch of the strategically important new railway line across northern Roumania is being completed as rapidly as possible. Sales of certain textile materials closely linked to needs of defence have been forbidden; and a Royal decree authorises the partial conscription of women for special work in time of war. In the last few weeks, until the flight to Berchtesgaden, the Roumanian attitude has been more and more clearly on the side of Czechoslovakia. If now the Czechs are to be abandoned, Roumania will only be obeying elementary prudence in reconsidering her attitude.

* * *

Work and Wages.—The *Ministry of Labour Gazette*, packed as it is with facts and figures, is perhaps formidable reading for the layman. Yet it is always full of valuable information about matters of work and wages which closely concern the livelihood of the vast majority of people, and the current September issue is even more than usually revealing. Business has fallen away seriously since last autumn, and the question of how deeply working people have so far been affected is important, not only because of the immediate social consequences of depression and unemployment, but also because it is important to be able to assess the probable level of working-class purchasing power. According to the *Gazette's* estimates of net increases or decreases in weekly wages, there has actually been a net increase over all industries of £233,000 a week in the first eight months of this year. This is rather less than half the net increase recorded in the same months of 1937, when there was a boom; but, although the momentum in workers' wages generated by last year's activity, and in lesser degree by re-armament, has now probably come to an end, it clearly persisted for a long period this year. Against this must be set the rise in unemployment since the turn of the year, but even coal mining and iron and steel show net increases in weekly wages in the eight months of £2,000 and £17,000, respectively.

* * *

The latest figures, however, give little cause for optimism. It is true that the relatively small net decreases in weekly wages recorded in June, July and August were almost entirely due to falls in coal, iron and steel and cotton, and that, in general, increases, sometimes considerable, were still being recorded in most other industries. But, as the monthly figures of wage bills given to the Ministry by certain individual firms suggest, the rising trend, both in wage-rates and in the total of wage payments, has now almost entirely ceased. The Ministry's index of wage-rates for the second quarter of 1938 was 106, compared with 105¼ in the first quarter—the smallest increase since the end of 1936—and it is likely that the third quarter will show a slight decline.

* * *

The Outlook.—The question whether the next few months will see a recovery or a further fall in industrial activity can scarcely be answered favourably. *The Economist's* monthly Trade Supplement published with this issue shows several reasons for supposing that business will fall off still more, but none, except, hypothetically, recovery in the United States or perhaps intensified re-armament, for believing that business will revive. The major export trades are at present very hard hit. And Mr Colin Clark, who gained some reputation as a prophet just over twelve months ago by forecasting the forthcoming recession, expresses pessimistic views from his Australian eyrie in the September issue of the *Economic Journal*. Mr Clark believes that business activity moves with the shifting level of the national income, determined in its turn by the level of private investment, the course of overseas trade and the surplus or deficit on the Budget. He has calculated that private investment in the first quarter of next year will be about £35 millions below the fourth quarter of 1937. True, last year's high profits have still to be spent; war expenditure may rise; both import and export prices are likely to fall; and wages are not likely to decline steeply. But, in spite of these mitigating factors, the National Income will probably be considerably lower at the beginning of next year than it was at the end of last; and employment may well be lower next New Year than last January.

* * *

A Railway Centenary.—The London and Birmingham Railway was not the first English railway. Given statutory sanction in 1833 and opened as a through line between the two cities almost exactly one hundred years ago, it had been preceded eight years before by the Liverpool and Manchester, and even earlier by the Stockton and Darlington. Yet the celebrations of this line's centenary this week quite properly regard its opening as the pioneer step in passenger travel by rail the world over; and it was the first main line. The earlier railway projects had been primarily conceived to serve the freight requirements of local areas, though they soon, and in view of the time surprisingly, won numerous passengers. The London and Birmingham, which first ran into Euston Grove in September, 1838, made it possible for passengers to travel from the capital to Birmingham, and beyond to Manchester and Liverpool. It was more than a hundred miles long, and extremely costly to build by reason of the toll taken by disturbed landowners, the deviations made necessary by opposing interests, and the engineering works required by the undulating character of the country through which it ran. But it made handsome profits. At Euston, behind Hardwick's noble arch, the London and Birmingham had the first great London terminal station. In 1842 the London and Birmingham became by amalgamation the pivot of the London and North Western Railway; and to-day at Euston are established the headquarters of the London Midland and Scottish Railway, of which the L.N.W. is a chief constituent and which still pursues the progressive policy in passenger transport which the London and Birmingham began a hundred years ago.

* * *

The Covenant of the League.—In the Assembly of the League last Friday, Lord De La Warr made, on behalf of the Government of the United Kingdom, a statement of policy which was in effect one more confession of Anglo-French political bankruptcy. The League, he said, had tended to strengthen the sanctions article at the expense of the provisions devised for the specific settlement of disputes. This seems hardly a fair account of the dealings at Geneva with Japan's aggression against China and Italy's against Abyssinia. Had Lord De La Warr been a Chinese or Abyssinian spokesman he would surely have complained rather that the procedure of investigation and conciliation was drawn out—by a timid statesmanship which feared to plunge into effective positive action—long after the aggressor had made it obvious, by the most brutally effective action, that nothing short of military sanctions would bring him to a halt. Lord De La Warr was on firmer ground in saying that the Covenant had come to be regarded as punitive and as an instrument for maintaining the *status quo*, but here there is a distinction to be made. It is both salutary and essential that the Covenant should be punitive towards the aggressor, and if the aggressor dislikes the Covenant on this account the rest of us should value the Covenant all the more. *Pace* Lord De La Warr, "the real essence" of the Covenant lies in punitive action against an aggressor no less, though also no more, than it lies in the recognition of the principle of peaceful change and the prohibition of war until all means of pacific settlement have been exhausted. "Peaceful change" and "collective security" are correlatives. Neither is feasible except in unison with the other. The true indictment against Anglo-French statesmanship during the last twenty years is that France, with British acquiescence, has set her face hard against "peaceful change," and has thereby made "collective security" likewise impossible. (What we have been witnessing during the past ten days has, of course, no more to do with "peaceful change" than it has with "collective security.") We profoundly agree with the Lord Privy Seal that "there is nothing essentially wrong with the Covenant." What has been wrong has been the fatal mixture of intransigence and timidity with which the Covenant has been operated by French and British hands. But when Mr Chamberlain's colleague declares that "the present difficulties of the League are not permanent" we can only observe with a sigh that, in the present state of mind of the French and British Governments and governing classes, this profession of optimism sounds dismally hollow.

* * *

Mr Butler on Palestine.—In Palestine, on the 14th, ten Arabs were killed, and ten others wounded, in a motor-omnibus which was blown up by a land-mine, while three Jews were killed and one British police-sergeant was wounded by another land-mine which blew up their car. Thereafter, the tale of casualties in Palestine during last week-end mounted up to twenty-six. This was the grim Palestinian commentary on a statement made on the 17th to the League Council by Mr R. A. Butler on behalf of the Mandatory Power, in reply to the criticisms of British policy in Palestine in the Permanent Mandates Commission's last report. Mr Butler made the welcome announcement that, while the Government were still awaiting the Woodhouse Commission's report, they intended to reach a final decision in the light of it; that they had not altered their opinion that partition offered the best and most hopeful solution; and that they would do all in their power to expedite their decision. He contested the Mandates Commission's verdict that the mandate was now practically in suspense, but at the same time he admitted frankly that, in the matter of terrorism, the situation showed no improvement, and that the task of suppressing the terrorism was not likely to be accomplished quickly. In the discussion at the Council meeting a rapid solution was pressed for by the representatives of Poland and Roumania, two countries which approve the policy of the Balfour Declaration because, as they see it, it turns Palestine into a dumping ground for Polish and Roumanian Jews of whom the Polish and Roumanian gentiles are anxious to be rid. While Poland and Roumania are thus inclined to be critical of the Mandatory Power in Palestine for being too lukewarm in promoting Jewish immigration from Eastern Europe, we know from General Goering's lips that Germany is critical of us for trying to sit on the heads of the Arabs, and we may also suspect that Signor Mussolini's sudden anti-Semitic campaign is really a bid for Arab sympathies. If Great Britain is going to put Palestine in order, she has no time to lose.

The Spanish Government Fights Back.—Reports which have now been coming in for many days from the Ebro front in Spain provide an ominous pointer to possibilities elsewhere. General Franco's endeavour to push back

the Government forces across the River Ebro, an endeavour backed up by repeated heavy bombardment from the air and from the ground, has so far failed, although the effort to wear down the resistance of the Government troops continues. A comparison may be imagined between this success of defenders in relatively unprepared positions, and what would be the fate of attacks on a Maginot or Siegfried "line." In Spain, the insurgents have nearly all the aeroplanes and most of the cannon: yet infantry assaults after heavy bombardment had failed to reach substantial objectives until, according to insurgent accounts, some progress was made on Thursday of this week. It is not unreasonable to suppose that those gains would have been notably fewer, and hideously more costly, if the defenders had had the advantage of even a small portion of the military ingenuity which is now being displayed on either side of the Rhine. The lesson will not be lost on the ordinary man or indeed on the General Staffs. We trust it will also penetrate to the statesmen. The British Mission headed by Field-Marshal Sir Philip Chetwode, which is trying to arrange for an exchange of prisoners in Spain, having visited both Barcelona and Burgos without noticeable advantage to anyone concerned, returned recently to Toulouse, and on Monday last took up permanent quarters at Pau. General Franco refused the Mission's request that a number of political prisoners should be reprieved from execution "in order to create a favourable atmosphere." Like the Non-Intervention Committee, the Mission may be assumed to have hibernated for the winter. Meanwhile, the Spanish Government itself has decided upon "the immediate and complete withdrawal of all combatants fighting on the Government side"; and thereby may have done more for the cause of non-intervention than all other nations put together. The move, described in Geneva as "a masterpiece of tactics," is presumably a sequel to Dr Negrin's dramatic visit to League headquarters some weeks ago. The Spanish Government has asked the League to set up at once an International Commission to make sure that the proposed scheme, which is that worked out by the Non-Intervention Committee, will be fully applied. Besides relieving Italy and Germany of their main excuse for intervention in Spain, the Spanish Government hopes to secure for itself the formal right, hitherto disputed, to purchase arms in defence against invasion.

* * *

Commonwealth Relations Conference.—While the fate of European civilisation was being decided last week in Bavaria between the dictator of Greater Germany and the Prime Minister of the United Kingdom, an unofficial conference on the foreign policy of the United Kingdom and other states members of the British Commonwealth of Nations was taking place in New South Wales. This meeting, which is the third in a series that was first projected nine years ago, was attended by distinguished and representative students of international affairs and of intra-Commonwealth relations from Eire and South Africa as well as from Australia, New Zealand, Great Britain, Canada, Newfoundland and India. The gravity of the moment at which these discussions were held seems to have impressed forcibly upon the minds of all participants the hard fact of the solidarity of the world and the impossibility of insulating any part of the British Empire, not to speak of the Commonwealth as a whole. The keynote was given by the recorder of the Conference's proceedings, Mr H. V. Hodson, in the phrase that "the Commonwealth is a miniature world"; and from this thesis it follows that "the Commonwealth can find no adequate inspiration for its future progress from within itself alone," and that "it cannot prolong its life as an end in itself, but only as the means towards a still greater end." Commonwealth affairs and world affairs do indeed react upon one another in ways which are not always apparent to Commonwealth statesmen before it is too late to save situations that we cannot afford to see lost. For example, when, at an official conference held at Ottawa half a dozen years ago, Lord Baldwin and his colleagues took a long step towards turning the Commonwealth countries into a closed economic system, they presumably did not realise at the time that they were thereby promoting the ambitions of a Hitler who at that date was not yet in the saddle in Berlin. Yet, in retrospect, it is evident that an agreement which closed British markets to South-East European exports and drove a political wedge between the United Kingdom and the United States was opening the way for Hitler to establish that German supremacy over Central and Eastern Europe which he is in the act of completing this week; and it is further evident that this German mastery in Europe may affect the destinies of every member of the Commonwealth vitally by placing the European island which is still the heart of the Commonwealth at the mercy of a Germany which already contains about ten million more citizens of European race than all the states members of the British Commonwealth put together. The next meeting of the British Commonwealth Relations Conference will have no lack of international topics for its agenda.

* * *

The Australian Budget.—A deficit of £3,184,000 in the Australian Federal Budget will be met this year by an increase of taxation. This confirms the opinion of those who foresaw that the policy of financing relatively high re-armament expenditure out of borrowing, hitherto adopted by the Government, has obvious limits. Defence expenditure is to blame for the shortage. In 1938–39 £16,796,000 will be spent on re-armament, a rise of £5,265,000 on the previous year, and of this sum, £8,492,000 remains to be found out of revenue, after contributions from loan-money and the last year's defence vote have been made. Relieved of this need for defence expenditure the Federal Treasurer, Mr R. G. Casey, might feel fairly easy about the country's finances, for even without the new taxation estimated revenue is higher than in 1937–38; and a 12½ per cent. drop in average export prices during the year was made up by a greater volume of production. Expenditure for 1938–39 is put down at £93,136,000, compared with £85,963,000 in 1937–38, and revenue at £89,952,000, compared with £89,458,000 in 1937–38, the deficit being met by a 15 per cent. increase in company and individual income tax, yielding £1,400,000; a 4 to 5 per cent. increase in sales-tax; and an 11 per cent. increase in land-tax which will yield £135,000. Customs and Excise are estimated to produce about £1,600,000 less than last year, but the sole Customs amendment consists in an excise increase of 8d. per lb. on tobacco adopted as a means of raising the proportion of Australian leaf used in the making of cigarettes. Discussion of the Budget was accompanied by the announcement that the Loan Council was about to fix the terms of conversion for the Four Per Cent. Internal Loan, 1951-61; and this operation should provide an interesting indication of how public opinion regards the Budget. In his introductory speech, Mr Casey remarked on Australia's comparatively strong economic and financial position, and commented on the need "for very large increases of expenditure on defence and social services," adding that he hoped the Budget would be accepted "as a courageous effort."

* * *

There are, indeed, storm signals flying for a country so closely dependent on world conditions as Australia; and she would be wise to face the future with shortened sail. The latest estimates of the Balance of Payments prepared by the Commonwealth Statistician (which should, incidentally, serve as an example to the mother country) show clearly the change in atmosphere. In the twelve months to June, 1938, Australian exports brought in (on a preliminary estimate) £stg. 5 million less than in 1936–37, while imports and debt interest cost £21 millions more. On all current items together, a credit balance of £6.6 millions has been converted into a debit balance of £20.3 millions; and, if this latter preliminary estimate is later confirmed, it will be the worst result since 1929–30. The economic position of Australia is by no means alarming; but it justifies every caution.

More Births.—For sixty years the British birth-rate has fallen steadily. At present the population is reproducing itself at a rate of about 25 per cent. below the rate needed to maintain its numbers. The death rate has been strikingly reduced in the last two generations; but, though an appreciable reduction in maternal mortality might still be effected, mortality as a whole cannot be brought down indefinitely and, with a larger proportion of the population likely to be found in the higher age groups in future, any considerable further diminution in the death-rate is not likely to happen and an increase will soon be inevitable. With the gloomy prospect of sharply declining numbers in the not very distant future, it is a refreshing, though scarcely significant, event that the Registrar-General should be able to report that more babies were born last quarter than in any three months since the June quarter of 1932, and that the birth rate was higher in the first half of this year than in any six months since 1931. The natural increase of population by excess of births over deaths in the quarter ended last June was 45,080, compared with 33,957, 38,112 and 45,252 in the corresponding quarters of 1935, 1936 and 1937. These figures do not mean that the tide has turned. The rise in the birth-rate is far too small to change the main outlines of the picture of future population. And in any case it is almost certainly a reflection of the great prosperity experienced until the autumn of last year, and the natural expectation is that the next few returns will show further falls.

* * *

Planning in Practice.—Twice during the past few days a scarcely justified note of optimism has been sounded about the progress and prospects of town and country planning. At the Building Exhibition a week ago Sir Philip Sassoon, First Commissioner of Works, said that much of the ugliness of post-war urban development was due to the unavoidable haste to house and rehouse the people. Now, he declared, local authorities were alive to their responsibilities and the building industry was making a concerted effort to enforce minimum standards of taste and quality. Similarly, the Town and Country Planning Advisory Committee appointed by the Minister of Health four years ago reported on Wednesday that no drastic changes were needed in the existing protective legislation, which mainly consists of the Town and Country Planning Act of 1932 and the Restriction of Ribbon Development Act. It is indeed true that over 24 out of 37 million acres in England and Wales are now covered by planning resolutions, but the area actually and effectively planned is pitiably small. The Committee concede that firmer use of their statutory powers by local authorities is desirable: the present powers would be adequate if they were used thoroughly. But the Committee cannot escape the fact that thorough use of these powers is impracticable while authorities are unable or unwilling to pay to disturbed or restricted landowners the compensation laid down. Many of them will not face the payment of compensation at all; and it is fast becoming clear that, if the remaining amenities of life in town and country are to be maintained or improved, a drastically amended method of procedure is needed. Local authorities have neither the scope nor the financial strength to save the countryside or to replan Britain's towns. The Advisory Committee rightly say that on matters of major policy we must wait for the recommendations of the Royal Commission on the Distribution of Population. Building and planning are contingent upon the siting of industry and centres of employment. But the truth is that many new and pressing problems of society, ranging from air raid precautions to industrial location, are calling for some revision, both now and in the long run, in traditional ideas about the proper principles of administrative practice.

* * *

The Ages of the Workers.—The age composition of workers insured against unemployment is only less important to observers of industry than their total numbers. The Ministry of Labour have just published a sample inquiry made in July, 1937, into the distribution of insured men among various age groups. The preponderance of young men in the newer industries and of old men in the older trades is clearly shown. In the manufacture of electrical cable and apparatus as many as 44.7 per cent. of the insured males were aged between 14 and 24. In commerce, finance and distribution, all of which have grown notably since the last war, the percentage of males in this group was 43, against an average for all industries of 30 per cent. On the other hand, the industries with a high proportion of men aged between 45 and 64 were port transport (46·5 per cent.), blast furnaces (38·5), public works contracting (which includes an appreciable number of transferred unemployed miners) (37·3), and shipbuilding (34·4). For all industries the percentage was 24·8. A further striking fact was that unemployment was highest among young men in precisely the industries which employed fewest of them, namely, port transport, fishing and public works contracting. These were also the industries in which unemployment was highest among men over 45 years of age—in public works contracting over half of these older men were out of work at the height of last year's prosperity Clearly, the young men are moving to the trades and districts in which the prospects of steady work are brightest. The proportion of old men is highest in depressed areas and depressed industries; and the incidence of unemployment, very naturally, rises with age, varying in July, 1937, from 4·1 per cent. of the insured between the ages of 16 and 17 to 23.6 per cent. between 60 and 64. In London only 2·1 per cent. of the 16–17 group were out of work when the inquiry was made. But in Wales as many as 36·7 per cent. of men between 55 and 64 were unemployed. If any comfort can be taken from these rather gloomy figures, it is that appreciable adjustment is being made by transference and migration to the advantage of younger people. But the problem of the older men is still as grave as ever.

* * *

Unemployment and Paid Holidays.—The spreading practice of giving holidays with pay has given rise to new problems in the determination of the right of unemployed workpeople to insurance benefit. Just before the rising of Parliament in the summer Miss Irene Ward drew the attention of the Minister of Labour to the plight of certain engineering operatives on Tyneside. On taking their holidays, these workers were entitled under an agreement with their employers to draw credits accumulated over a period of time to cover the cost of their holidays and representing a proportionate share, week by week, of the sums previously drawn in wages. Miss Ward claimed that, in cases where the men had become unemployed before taking their holidays, these accumulated credits were reckoned as deferred wages and deemed to debar the men from drawing benefit for the number of working days they represented. The Ministry of Labour has now issued a

memorandum summarising recent decisions of the umpire on these disputed points. Where a man has been suspended from employment for twelve or more days in addition to the customary holiday or holidays, he is regarded as out of work and entitled to benefit on the days of holiday. On the specific point at issue, it has been ruled that holiday payments in the engineering industry must be regarded as wages, and that workers discharged before their holidays and receiving such payments *immediately* must be regarded as still receiving wages for as many days as the payment represents, and therefore not entitled to benefit for that period. If a man has come to be regarded, under the Twelve Days' rule, as discharged before he receives his holiday money, there is no disallowance of benefit. The right of the worker to draw benefit in these cases thus depends upon whether or not the holiday payment can be regarded as *continuous* with the weekly wage payments received before being paid off; and the umpire has suggested that, to clarify the matter, the lapse of no more than a week between the receipt of the last pay envelope and the handing over of the holiday money should be held to establish continuity when wages are paid weekly. The position has now been defined; the decision will scarcely satisfy either Miss Ward or the Tyneside engineers.

* * *

Transport in Northern Ireland.—The Northern Ireland Road Transport Board has attracted attention far outside its native province because of the unique nature of the experiment in transport co-ordination which gave it birth. The Board (which was the subject of two articles in *The Economist* of January 29 and February 5, 1938) is given a complete monopoly of all road transport for reward, whether of goods or passengers, outside the city of Belfast. From the start, however, any economic advantages that the Board may have had have been overshadowed by its very heavy financial losses. The loss on the first year's working was £94,048. In the second year, for which the report has just been issued, the net loss on working was £70,040 (after allowing £133,106 for depreciation) and the total loss, including interest on stock and loans was £162,229. Over the two years the Board has thus lost £256,277. In its second year the Board's energies were devoted largely to the acquisition of existing goods haulage businesses (the passenger concerns having been taken over in the first year). This has involved the purchase of 984 separate undertakings and 1,185 vehicles.

* * *

The ultimate success of the Board must depend to a large extent on whether it succeeds in obtaining a sufficient proportion of the traffic carried by former operators. So far as the goods side is concerned, the Board view the existing position with unconcealed alarm, and frankly state they do not see any prospect of establishing the freight undertaking on a sound basis unless and until steps are taken to amend the Road Transport Act in such a way as to prevent the legal evasion of the Act, which is now extensively carried on. Since the Transport Board was set up, many firms and individuals have carried more and more of their own goods, the Board only being given a monopoly of carrying by road for hire or reward. In addition, the Board states that many carriers, having sold their undertakings to the Board, are still carrying on haulage business under new forms. New lorries are being purchased with the money paid out by the Board as compensation, ostensibly for use by the individual owners in their own businesses, but in fact being used to carry goods at cut rates for farmers and traders, by the simple expedient of purchasing goods at an undefined price, and after the goods have been sold fixing their purchase price at the selling price, less the charge for carriage. The financial straits of the Board are necessarily a matter of grave concern to the Government of Northern Ireland, and two recent enquiries have been held, one of which revealed that strong disagreement on matters of policy between the Board and the railway companies had prevented any real co-ordination of road and rail transport on the lines envisaged when the Board was set up. It is clear, from the second year's report, that the whole question of transport in Northern Ireland will have to be thought—and fought—out anew.

Revival Analysed

New York, September 13.—With the passing of Labour Day it is timely to review the trends of the summer to see what light they may throw on the prospects for the autumn. It is now clear that the first sign of revival appeared in the index of residential building, which has risen uninterruptedly since February. The second sign came in the market for industrial shares, which, after falling to its lowest level at about the end of March, rose sharply in the third week of June and then advanced meteorically for about two weeks. Since then there has been little change; and the average of closing prices on Saturday, September 9th, was almost exactly the same as on June 30th.

The third index to show a pronounced upward movement was that of the prices of sensitive commodities; agricultural commodities began to rise in early June, advanced into July and then began to decline, losing their entire gain by early September; non-ferrous metal prices began to rise late in June, advanced sharply into July and have since held their ground. In point of time, the fourth index to move was that of production, which began to rise decisively in July and has continued to rise without interruption ever since.

So far the movements of the index of production have been dominated by steel output, but now production is increasing rapidly with the introduction of the new models, and it is almost certain that the index of production for September will be well above the August figure, which was higher than the index for July. With the increase in production, and the movement of crops, such subsidiary indices as car loadings and power production have likewise risen.

From this account, it would appear that the initial phase of the upturn was speculative, in the sense of anticipatory. That is, the rise in share values actually preceded the upward movement in the indices of business activity, with the single exception of residential building. It would also seem that much of the early increase in production was itself of a speculative or anticipatory character, representing the replenishment of stocks depleted by many months of liquidation. The term "speculative" implies no judgment about the soundness or unsoundness of the

The Rôle of the Share Market

It is always a moot question in American discussion whether movements in the share market exert a causal influence on business trends. In 1929 any sort of market disturbance capable of starting the liquidation of the huge structure of brokers' loans could not fail to cause a credit deflation of sufficient magnitude to impair the entire economic fabric. In that instance, the relationship between the stock market and the general economy could be clearly traced.

In the autumn of 1937, however, the relationship was far less clear. The market collapsed at a time when business activity was at a high level; when credit was cheap and abundant; and when the entire sum of brokers' loans was relatively small. While there was some deflation of credit attributable solely to the liquidation of these loans, it also was small. Yet the collapse of production was more severe than in the final months of 1929 and the whole of 1930 together.

The direct consequence of the stock market collapse in 1929 was physical, quantitative, deflation on an enormous scale. It would appear that the stock market collapse in 1937, on the other hand, produced a sort of deflation of confidence or entrepreneurial initiative. It is more than doubtful whether the collapse in 1937 can be interpreted as a demonstration of the uncanny foresight of investors deliberately appraising the extent of a forthcoming business recession.

It is difficult to avoid the conclusion that conditions within the market itself may be a positive determinant of economic trends. When the market was in a position to expand or contract the volume of credit through the brokers' loan account, this was clearly the case. But in 1937, and again in 1938, the influence of the market was independent of and apparently greater than its physical relation to the volume of credit. In other words, it may be persuasively argued that, while some sort of recession might otherwise have been looked for in 1937, the severity and depth of the actual depression was in large measure caused by (rather than its anticipation a cause of) the collapse in the market; and that this summer's recovery was to a considerable extent caused by (rather than a cause of) the convulsive market upswing in June. To the extent that this hypothesis is true, it implies that market appraisals are more subjective than formerly; and that even the reduction or virtual elimination of the brokers' loan account has left the market more speculative. Arguments of this type have long been advanced by those who contend that the market is too "thin" to serve the investment needs of our economy.

While this "thinness" has been generally recognised, no very satisfactory analysis has ever been made of the reasons for it. It was formerly believed that the erratic character of the American share market was due to the prevalence of margin trading; margin trading has almost disappeared, yet the market is more erratic than ever. It was sometimes attributed to manipulation; but the market is closely watched by the S.E.C. for evidences of manipulation, and few have been suspected or detected.

On the whole, the record of the last twelve months suggests that our share market, as at present constituted, is capable of exerting a deleterious influence on our general economy; and that the erratic deviations of the daily movements from, say, monthly averages are indicative of serious structural defects. However desirable in themselves, such reforms as the limitation of margin trading and the restrictions on short selling do not appear greatly to have ameliorated this condition.

France

The Entente and Foreign Policy

Paris, September 22.—Two motives are discernible at the root of the German offensive against Prague: the liberation of the oppressed Sudetens, as the popular pretext; and the intention to disrupt the French post-war system of alliances, the focal point of which is the military bastion of Bohemia. Both these intentions now seem to be accomplished.

As Anglo-French collaboration is more than ever a prime-mover of French foreign policy, Mr Chamberlain was in a much better position than M. Daladier to cut the Gordian knot. And an English commitment on the Continent (in the form of a guarantee of the new Czechoslovakian frontier) is some compensation to the French for this retreat, just as it also encourages the Danubian States in their resistance to the *Drang nach Osten*. It remains to be seen what policy France's ally, Soviet Russia, will now adopt.

The Anglo-French agreement may have important consequences in French internal policy. In the last two years the Left extremists have gained in strength, but in face of renewed danger from German aggression, French politics may gain in solidarity. But serious financial problems are still awaiting a solution.

The recent labour troubles, which were reminiscent of those which coincided with the beginning of the Spanish civil war, aroused only a slight response among the workers. More and more they are in favour of orderly trade union policy, and disposed to put industrial before political interests.

During the past month of international crisis the markets were completely calm. The franc merely followed the decline in the dollar rate of sterling. There was apparently no serious flight of capital; and what exodus there was may even have been balanced by repatriations. Appreciable withdrawals from the banks—especially in frontier regions—were met by the solid support of all the public banks; and no serious tightening of the money market has occurred.

It seems likely that fear of an aggravation of the European conflict led to an increase in subscriptions to the new bonds of the Caisse Autonome. These subscriptions are encouraged by the Government on the grounds that this form of hoarding is wiser than the accumulation of bank notes, since the bonds bring in interest. It is now possible that the State will decide to make its payments, from 1,000-1,500 francs upwards, by cheque, in order to ease the strain on the money market.

Last week's return of the Bank of France showed that the Treasury had still not had recourse to the new authorised advances. But the next return will show further borrowing. Public opinion will consider the foreign crisis sufficient excuse for this, all the more because M. Daladier can argue that for six months he was able to avoid any borrowing from the Bank.

French prices have maintained their recent stability. Last week the general index was 645, against 644, 641, 646, 644 in preceding weeks. This was again due to the falling prices of domestic products, the index of which declined *from 668 to 666*:—

	Aug. 13	Aug. 20	Aug. 27	Sept. 3	Sept. 10	Sept. 17
General index	**644**	**644**	**646**	**641**	**644**	**645**
Domestic products ...	667	669	670	664	668	666
Imported products ...	605	600	603	600	602	607
Foodstuffs	625	627	629	627	632	630
Raw materials	662	660	661	654	655	659

The usual seasonal increase in unemployment seems to have appeared. The number of persons idle this week was 338,255, against 337,798 on September 3rd and 308,178 a year ago.

Germany

International Crisis

Berlin, September 21.—The Czechoslovak crisis moves so quickly that comment is likely to be useless. On Thursday last week the Bourse reacted to the news of Mr Chamberlain's initiative with a recovery, followed by a fall on Friday, and then three days of comparative strength. Contrary to recent precedent, the market now moves in sympathy with foreign stock exchanges. So far as can be judged from restricted inquiries, British opinion here did not favour Mr Chamberlain's step, fearing that it would lead to an increase in the Reich's demands and intensify the already intolerable threats.

The attitude of the German Press, which writes no word on the matter without direct official orders, justifies this apprehension. The chief Party journal, which less than a fortnight back professed to stand for the Carlsbad programme, and only after Herr Hitler's Nuremberg speech had proclaimed for self-determination, that is, the annexation of

the Sudeten lands, added on Friday the demand that, independently of a settlement on such lines, Czechoslovakia should be "punished." On Saturday it demanded, and other journals followed suit, the "disappearance" of the whole Czech "travesty State." This may be a bargainer's condition, to be later abated as a magnanimous concession.

It has been emphasised from here—and required no political sagacity to see—that any settlement other than accession of the Sudeten lands to the Reich would be a settlement, but not a solution. The proposed international guarantees of future Czech independence are melancholy. It is to be hoped that the Czechs, surrendering their lands, will retain that wit which is often the only weapon of the feeble, and, accepting all of the conditions but one, will beg to be spared the threat of a British guarantee of their independence.

Good Crops

According to official reports average weekly earnings (not wage-rates) have continued to advance; in March, 1938, in the production goods industries they were 7.7 per cent. higher than in December, 1935, and, in the consumers' goods trades, they were 10.2 per cent. higher. The crops return is very good. According to the preliminary August estimate cereals yielded 24,510,000 metric tons, against 22,200,000 tons in 1937, and an average of 22,620,000 tons in 1932-37. The rye crop is 8,190,000 tons, against 6,920,000 tons in 1937; wheat amounts to 5,030,000 tons against 4,460,000 tons last year. On the basis of later partial data the cereal crop is now estimated at 25,700,000 tons, which exceeds that of the best post-war year, 1933, when it was 25 million tons.

These figures apply only to the old Reich figures. In Austria the cereal crop (excluding maize) is estimated at 1,780,000 tons, or nearly 8 per cent. more than last year's, and nearly 5 per cent. above the average for recent years. The combined crop of Greater Germany is about 27,800,000 tons, or 3,640,000 more than in 1937. Including a carry-over of 3 million tons the stock amounts to about 31 million tons, to which future imports must be added. Since consumption for all purposes in the new Reich is between 21 to 23 million tons, Germany is supplied for a much longer period than a single year.

Heavy Imports

The foreign trade return for August was unsatisfactory in many ways. Exports were low, and the import surplus was high. Import prices are rising, and export prices falling. Greater Germany's imports were valued at Rm. 509 millions and exports at Rm. 445 millions. The import surplus for the whole of Greater Germany was Rm. 64 millions, and for the old Reich alone Rm. 38 millions.

Imports into the old Reich, which in the two preceding months had fallen, increased substantially; and exports, which rose in July, fell in August, and were smaller in value than any month, with one exception, since September, 1936. They amounted to only Rm. 419 millions, against Rm. 541 millions in August, 1937. There was a notably large export of gold, amounting to Rm. 45½ millions, and gold imports were only Rm. 28 millions. Exports of manufactured goods were only Rm. 338 millions, against Rm. 428 millions in August, 1937. Detailed figures are as follows:—

Imports	July	Aug.	Jan.–Aug.
	Millions		
I. Foodstuffs	**144·7**	**152·8**	**1,308·7**
(*a*) Livestock	9·4	9·1	75·0
(*b*) Animal foodstuffs	34·9	37·0	298·1
(*c*) Vegetable foodstuffs	72·0	83·5	704·9
II. Industrial goods	**267·7**	**299·9**	**2,229·9**
(*a*) Raw materials	155·1	169·6	1,293·8
(*b*) Semi-manufactured	80·9	98·0	675·3
(*c*) Manufactured	31·7	32·3	260·8
Total (including others)	417·3	457·0	3,571·3
Exports			
I. Foodstuffs	**3·8**	**3·2**	**37·9**
(*a*) Livestock	0·0	0·1	0·9
(*b*) Animal foodstuffs	0·9	0·3	5·1
(*c*) Vegetable foodstuffs	1·3	1·5	16·5
II. Industrial goods	**435·4**	**415·5**	**3,402·0**
(*a*) Raw materials	46·2	43·6	354·9
(*b*) Semi-manufactured	31·5	33·7	261·5
(*c*) Manufactured	357·7	338·2	2,785·6
Total (including others)	439·4	419·3	3,441·7

The trade figures are plainly a sign of the political times.

Industrial Activity

The number of persons unemployed in the old Reich fell in August to 179,000, against 218,000 at the end of July. The number of employed rose to 20.9 millions, which is 1.2 millions more than at the same time last year. In Austria the number of persons unemployed fell in August by 124,000 to 151,000. Labour is still being imported into the old Reich from Austria, and many hundreds of Austrian women are now employed in North German textile mills.

Retail sales in the first half of this year were 7 per cent. higher than in the first six months of 1937. The number of dwellings completed in the first half of the year fell to 112,410, against 119,883 in 1937; but the number of permits to build increased by nearly 14 per cent.

Pig-iron production in August was 1,584,800 tons; and in the first eight months output was 12,166,800 tons, against 10,417,000 tons in 1937. The Hermann Göring ironworks are making rapid progress. The international tinplate cartel, of which Great Britain is a member, has been renewed until June, 1941, on the basis (for the prseent) of unchanged prices. The census of motor cars, motor cycles and commercial cars in Greater Germany for July shows that there are 3,364,503 vehicles in use. Motor cycles number 1,582,900, private cars 1,305,608, and commercial cars 382,837. Vehicles in the old Reich increased during the last twelve months from 2,827,870 to 3,241,852.

Despoiling the Fugitive

Revenue from taxation in August totalled Rm. 1,305 millions, against 1,080 millions in August, 1937. The increase, as usual, came mostly from direct taxes and taxes on business transactions. The Reich flight tax yielded the record high sum of Rm. 26 millions; if this monthly rate were maintained the tax would bring in Rm. 312 millions a year, or as much as the beer tax. The war threat of July-August accelerated the flight of the Jews, who in some cases known to your Correspondent left everything behind. As the tax is 25 per cent. on capital, the August figure indicates that Jews owning Rm. 104 millions fled in the space of one month.

The flight tax is levied almost exclusively on Jews, since Aryans removing permanently to abroad are business men, who escape the tax under a clause exempting persons whose purpose of removal is considered advantageous to the Reich. The tax is not levied simply on the amount of capital removed. In 1932-33 it yielded less than Rm. 1 million. Since then it has yielded altogether Rm. 340 millions, representing the flight of persons possessing Rm. 1,360 millions, almost all of which has been confiscated by booking as blocked assets which the fugitives will never see again. Spoliation of this magnitude was not witnessed even in the Middle Ages.

Holland

Exchange Fluctuations

AMSTERDAM, September 12.—Nervousness on the international exchange markets and an extensive demand for gold have been the features on which attention has been focused during the past four weeks. On the Amsterdam foreign exchange market the Exchange Equalisation Fund had to intervene on several occasions. The bare rates quoted for sterling in Amsterdam do not give much insight into the actual position, since they remained fairly stable, while the dollar rate and the price of gold registered considerable advances, as the following table shows:—

1938	Price of Gold	Amsterdam Exchange Rates: Sterling	Dollar
September 1	2,052½–54½	8·92–½	1·83–⅜
September 2	2,054½–57½	8·92–½	1·84–⅛
September 3	2,057½–75½	8·92–½	1·84–½
September 5	2,064–70	8·92–½	1·84–½
September 6	*National Holiday*		
September 7	2,067½–70½	8·93	1·85–⅜
September 8	2,068½–70½	8·93	1·85–⅜
September 9	2,066½–69½	8·92–½	1·85
September 10	2,069½–71½	8·92	1·85–⅜
September 12	2,073½–76½	8·92–½	1·85–½

This course of events gave rise to the impression, especially abroad, that Holland had linked the guilder to sterling, and should be regarded, to all intents and purposes, as a member of the sterling *bloc*. This was a mistaken view. The Netherlands did not revert to the gold standard when the guilder was devalued in September, 1936, as Belgium and France did, and Holland has since maintained a "floating guilder" with the object of retaining freedom of action in foreign exchange policy in the event of wide fluctuations in exchange rates.

The Guilder and Sterling

From the outset there has been no question of linking our currency with sterling. This, however, does not alter the fact that British currency policy has gradually become a more and more dominant factor in the economic life of the Netherlands. The foreign trade of the Netherlands has undergone considerable changes in recent years, and England not Germany is now our principal customer. This is clearly illustrated by the following table compiled by the Central Bureau of Statistics:—

VALUE IN MILLIONS OF GUILDERS

(excluding gold and silver)

	July	August		Jan.–Aug.	
	1938	1937	1938	1937	1938
Total imports	**120**	**122**	**116**	**1,015**	**936**
Including—					
Germany	*26*	*28*	*26*	*212*	*196*
Belgium	12	14	12	121	102
Gt. Britain	*10*	*9*	*9*	*89*	*74*
France	7	5	6	39	41
Neth. Indies	9	10	6	80	73
U.S.A.	11	11	12	83	109
Total exports	**78**	**98**	**90**	**733**	**666**
Including to:—					
Germany	*13*	*15*	*15*	*112*	*103*
Gt. Britain	*19*	*24*	*23*	*159*	*153*
Belgium	7	10	8	80	68
France	4	5	5	50	39
Neth. Indies	7	8	8	58	69
U.S.A.	2	4	4	40	20

If we add to trade with Britain our export to the other countries comprising the sterling *bloc*, it is made clear that our export interests, and consequently an appreciable part of the Dutch economy, are very intimately concerned with the sterling rate in Amsterdam. An unduly severe decline in the sterling rate would entail disastrous consequences for our exports. In view of this, the Government of the Netherlands are watching the course of sterling very closely.

On the other hand, the Government have to take a number of factors into consideration to determine their policy in monetary matters. There is no question of the guilder following the sterling rate blindly, and from the fact that sterling has recently been falling at about the same rate as the guilder, it should not be deduced that this will always be the case under all circumstances.

For a time the Netherlands Equalisation Fund operated by purchasing sterling at 8.92, while they were simultaneously selling dollars at 1.85§—evidently with the object of counteracting a further rise in the dollar rate, on the one hand, and maintaining the sterling rate, on the other. From this it may be concluded that the authorities did not want to allow the guilder to depreciate any further. Foreign exchange policy is of vital importance to a country like the Netherlands with extensive international interests, and it can safely be said that the Government cannot, and will not, pursue a policy of merely making the guilder follow the lead of sterling.

Roumania

Roumania's Position

BUCHAREST, September 13.—The political tension caused by the crisis in Czechoslovakia has been felt very acutely in Roumania. It has been the popular belief that this country would immediately follow France and Great Britain if they intervened to defend Czechoslovakia against any aggression by Germany. Hitler's speech at Nuremberg made a very unfavourable impression here. The *Universul* printed a leading article saying that the Hitlerite aspiration to take over the Germans in Czechoslovakia was irrational and contrary to the interests and sovereignty of the Czechoslovak State; it was, moreover, dangerous to Germany's neighbours.

Blocked Lei and Soya Beans

In 1935 the German firm I.G. Farbenindustrie had a blocked account in Roumania amounting to about Lei 600 millions. This was the proceeds of sales of aspirin, pyramidon, antipyrine and photographic supplies. According to the Roumanian exchange regulations such sums could not be deblocked except for investment in Roumanian enterprises, including building. The German firm then sought some advantageous means of deblocking this large sum; and, after a disappointing attempt had been made to cultivate and export to Germany peas and beans and other vegetables, which were found to take too much out of the soil, an expert was sent to China to study the cultivation of the soya bean. From the seed of this plant are produced an edible oil, butter, several chemical products, oilcakes for fattening cattle and, finally, a product which, in the United States of America has been called "Hard Gummi," used by some motor car manufacturers for making steering wheels.

It was necessary to choose, from among some thousands of species, that type of soya bean most suitable for cultivation in Roumania. It was also necessary to bring with the seeds the bacilli which contribute to the proper fertility of the soil. These bacilli were named in Roumania "radicines," since they affect the roots of the plant and form excrescences on them like small potatoes in which the radicines are lodged. During the growth of the plant they produce in the circulation of the sap a reaction by means of which the ozone of the outside air is drawn into these excrescences. There it remains until the harvest when the plant is cut off, leaving the roots with their radicine excrescences full of ozone which gradually dissolves and produces the effect of a manure, so that soya beans can be sown for three years in succession on the same land.

The soya bean was welcomed in Roumania. In 1936 the Farbenindustrie formed a company called Soya S.A.R. for the exploitation of this plant. Personal contracts were concluded with farmers, peasants and large landed proprietors, to whom seeds and radicines were distributed; and, when necessary, money was advanced for the cultivation of the bean, which is quite simple. At the moment of sowing, the radicines, which have to be cultivated in gelatine, are diluted in water, and the seeds are bathed in this liquid immediately before being placed in the ground. Thus the radicines go into the ground along with the seeds.

A German Industry

For the sowing of one hectare of land some 30 to 50 kilogrammes of seed are required. The crop yields about 1,500 kilogrammes per hectare when it is fair, 2,000-2,200 kilogrammes when it is good and 2,500-3,000 kilogrammes when it is excellent—as it was this year. The cultivator is paid at the railway station, against delivery of the goods, at 5 lei per kilogramme. The whole operation is extremely profitable for the cultivator, and the German company has attained its end and deblocked its lei credit account.

The company is at present running over 200,000 personal current accounts with the growers in the north of Bessarabia and in Bukovina where the sowings cover 65,000 hectares of land. The area sown has been reduced from 100,000 hectares this year as the company desired to employ only reliable growers. The whole of the crop is exported to Germany, where it is used to feed people and cattle—and, also, for various industries connected with war supplies.

Palestine

Severe Depression

JERUSALEM, September.—Monthly commercial bulletins published by the Government and supplemented by other official figures, show the extent of the depression from which the country is suffering. This depression is not, as is often suggested, solely a consequence of the Arab outbreak which Palestine has endured since April, 1936, although that outbreak has certainly made it worse.

To unprejudiced observers an approaching economic depression had been obvious for years. The fever of speculation, especially in land, and the consequent exaggeration of prices, has been coupled with immigration which, relative to the existing Jewish population, is without precedent in size. There was this immigrant population accustomed to a relatively high standard of living and anxious to retain that standard. A large influx of capital, much of which could not find remunerative employment, was a conspicuous feature. Anxiety in October, 1935, about the international situation gave the first shock to a precarious edifice, and from that day to this, apart from a few brief intervals, the situation has consistently deteriorated.

Statistical Axe-Grinding

Apart from matters which are entirely under the control or observation of the Government, such as the figures of imports and exports, it is impossible to get reliable statistics in Palestine. Every interested section of the population produces figures in support of its case. Unemployment is a case in point. The advocates of a larger Jewish population, who comprise practically all the Jews of Palestine, including the workers, shopkeepers, etc., who would appear to stand to suffer most from the competition of newcomers, make some attempt to minimise the recorded number of known persons unemployed. Many devices are employed, such as the exclusion from the count of married women, many of whom even in good times need or seek employment; the spreading of work among as many members as possible of the very powerful Jewish trades union, and the exclusion from the count of non-union workers.

The Extent of Unemployment

The Arab opponents of immigration similarly try to exaggerate the real figures of Jewish unemployment if they can, and at the same time give swollen totals of Arab unemployed. The Government, dependent on these two parties and advised by both, has to reach some conclusion on which it can act; while there is no clear definition of what is an unemployed workman. The Government has itself at different times made efforts to estimate the extent of unemployment among both Jews and Arabs, but its figures were at the best only approximations. A few years ago the publication of official estimates of unemployment was abandoned; but, at the beginning of this year, the Government began to record changes in employment in a small number of selected Jewish undertakings.

At the end of December, the height of the orange-picking season when some thousands of Jews were temporarily employed, the Government estimate of unemployed Jews was 12,000. This temporary employment has ceased and building, once the principal industry among Palestine Jews, is falling off month by month. There remain a number of relief works financed by Jewish institutions, and also extraordinary Government works, on which together some thousands of Jews are employed. A similar number is enrolled as temporary police. Taking this into account there must be some 24,000 Jews in need of stable employment in Palestine to-day. The probable number of Jewish working men and women in Palestine is about 100,000, which gives a percentage of twenty-four, in need of employment. This is a lower figure than that which prevailed in the similar crisis of 1927-29.

The British and Polish Trade Bank A.G., Danzig

Paid-up Capital: D. Gulden 5,000,000.--

Chairman: Sir William Grenfell Max-Muller, G.B.E., K.C.M.G.
Vice-Chairman: Józef Kożuchowski
Joint Managers: Stanisław Pawłowicz and Philip Frederick Rann.
Assistant Manager: Aleksander Kowalski.

The Bank was formed to facilitate Exports and Imports from and to Poland, including Danzig.

INQUIRIES SOLICITED

Chile

Rebellion and the Election

SANTIAGO, September 11.—The revolutionary outbreak on September 5th is symptomatic of the high state of excitement which characterises the present stage of the presidential election campaign. The facts were briefly as follows. On September 4th a parade was organised by the partisans of General Ibañez in which about 50,000 persons participated. The parade took place quietly and without any serious untoward incident. At midday on the following day, however, a group of about thirty Nazis took possession of the University of Chile, while another group of fifty occupied the premises of the Caja de Seguro Obligatorio in front of the Government Palace.

The rebels in the University were subdued by the police force and artillery in a few hours. The prisoners were taken to the Caja de Seguro Obligatorio as hostages, and the police advanced against the insurgents who had entrenched themselves in the upper floors of the building. In the clash that occurred in the Caja almost all the rioters were killed. It was one of the bloodiest uprisings ever recorded in the history of Chile.

On the following day the leader of the Nazi Party gave himself up voluntarily after writing a letter in which he declared that he personally assumed entire responsibility for the whole affair. He also disclosed the motives which induced him to endeavour to bring about a revolution (in which he counted on the active support of certain sections of the army) with a view to overthrowing the present Government and replacing it by a *de facto* Government headed by General Ibañez. The object was to ensure complete freedom in the coming presidential election.

As a result of these happenings, the Executive asked Congress for extraordinary powers, which were granted on September 12th for a term of four months, excluding the period from October 10th to 30th, and on condition that absolute liberty would be allowed for purposes of election propaganda. The election is to take place on October 25th.

It is not yet known what will be the fate of the candidature of General Ibañez. The General has been arrested under suspicion of having participated in the preparation of the *putsch*, but he insistently denies having had any knowledge of the intentions of the Nazi leader. The other two candidates are Pedro Aguirre Cerda, backed by the Popular Front, and Gustavo Ross, the candidate of the Right. It is premature to make any conjecture about the possible outcome of the election; the general opinion, however, is that the candidate of the Right will be elected.

Business Dull

The rising had no apparent repercussion on economic activities. Business continues normally, although it is dull. This dullness, however, is hardly due to the present somewhat strained political situation, but it is rather the consequence of the international economic situation. Yet, as was emphasised in a recent bulletin issued by the Banco Central de Chile, the international crisis has affected Chile only slightly. Its repercussions are observable only in mining production, which shows a considerable decline, especially in copper, and in foreign trade, where exports show a continued downward tendency in contrast to the rising trend of imports.

The value of exports in the first seven months of this year was 411.8 million gold pesos, against 638.6 million gold pesos in the same period of this year, while imports rose from 225.4 to 297 million gold pesos in the same period. Exchange rates in the free market have been maintained without large fluctuations at a level approximately 8 per cent. above the export rates fixed by the Exchange Control Board.

The building industry shows signs of recession compared with last year, but is still occupied at a relatively high level. Railway car loadings show some increase, though slight, compared with the previous year. The fluctuations in prices have been moderate; wholesale prices have remained relatively stable during the current year; the index of the cost of living discloses a similar tendency, the present seasonal rise being considerably less sharp than in previous years.

A factor of considerable importance is, undoubtedly, the relative stability of internal credit. Apart from the policy of some banks of tightening up somewhat the granting of credit facilities, credit operations by the commercial banks have been normal, without any tendency to restriction. Although the cash position of the banks to-day is not so favourable as in past years, when there were still enormous cash surpluses left over from the period of inflation, it is not to be expected that there will be any serious difficulty in financing the expansion of credit which always begins at this time of year, concurrently with the farmers' busy season. Re-discounts of the banks in the Banco Central continue to be very much cut down, but it is possible that they will be increased to a certain extent in coming months.

At the end of August the Minister of Finance sent to Congress the Budget Bill for the ensuing year. Income and expenditure are estimated at 1,635.8 million pesos, a figure only slightly higher than the probable total for the current year.

Canada

Munition Contracts

OTTAWA, September 3.—The harvesting of the Western grain crop has been proceeding under almost ideal weather conditions. It is practically completed in Manitoba; threshing is general in Saskatchewan and has begun in Alberta. Owing to the varied nature of the crops there is still a wide variation in the estimates of the yield of wheat, the range being between 300 and 350 million bushels. Since the price of October wheat has now fallen to about 61 cents per bushel (No. 1 Northern), almost 20 cents below the minimum fixed price, all wheat reaching the elevators is being delivered to the Canadian Wheat Board, which is practically the only seller. Later, as grain passes into other hands, it will be subject to resale. A limited number of farmers are holding back their wheat in the hope that prices may rise later; but others are accelerating deliveries, being afraid that the Government may reduce the minimum price. Harvesting in Eastern Canada has been hampered by wet weather but, generally speaking, the crops are above the average.

Public anxiety about the Canadian Government's own armament contracts has been heightened by an article written by Colonel George Drew, a well-known soldier and Conservative politician, about a contract concluded with the John Inglis Company of Toronto for the manufacture of 12,000 Bren machine guns, 5,000 of which are for the British Government. According to Colonel Drew the company holding the contract was organised in November, 1936, by Plaxton and Company, a Toronto legal firm with Liberal affiliations, under the name of the British Engineering Company. But, under a court order made in June, 1937, permission was given to use the name of the John Inglis Company, a bankrupt firm. The most curious feature of the contract is that the Government has agreed to lend to the company machinery from its own arsenal. Pertinent questions have been raised by Colonel Drew and others. Why was the contract let without tender? Why was it given to a firm which at the time possessed little more than four bare walls, while established firms, equipped with machinery, were not invited to bid? To whom was the stock in the reorganised company distributed? Who will get the profits which promise to be quite substantial? And why did the Government not attempt to make the Bren guns in its own arsenal?

Mr Mackenzie, the Minister of National Defence, has vigorously denied the validity of the charges made and describes the contract "as one of the finest ever signed in the public interest of Canada," but the *Financial Post* of Toronto and other papers have supported the demand for an investigation. And, as public opinion is disquieted, Mr Mackenzie King, the Prime Minister, has announced that a thorough judicial inquiry into the terms of the contract and the circumstances of its granting will be held.

Albertan Utopia

The Social Credit Ministry of Alberta, which decided not to submit evidence to the Rowell Commission on Dominion-provincial relations, has issued a long memorandum on financial and economic policy, proposing an inter-provincial conference to discuss the workings of confederation. The memorandum urges that Alberta's debt to the Federal Government for relief purposes should be cancelled immediately; that the remainder of the province's debt should be refunded at a rate of not more than two per cent.; and that the Federal Government should forthwith assume the costs of unemployment relief and old-age pensions, and give grants-in-aid for public health, education, mothers' allowances and the construction and maintenance of highways.

Claiming that the provincial governments are each sovereign within their own boundaries and should be free to control their individual policies, the memorandum suggests the establishment, under governmental control, of a provincial credit authority to supervise the administration of financial policy; the distribution of a social dividend supplementary to any earnings; the adjustment of retail prices to balance production and consumption; and State regulation of currency and credit with the chartered banks continuing to play their part under the jurisdiction of the Federal Government, but having their policy controlled by the provincial credit authority. The memorandum also advocates other radical measures for the beginning of a new social order.

The Ministry of Trade and Commerce has announced that the existing trade agreement with New Zealand will be extended until September 30, 1939, and that, in return for the removal of the exchange dumping duty on New Zealand butter, the New Zealand Government has agreed to limit shipments of butter to Canada to such proportions as will not unduly prejudice the interests of Canadian dairymen.

The St. Lawrence Waterway

President Roosevelt's recent support for the early construction of the St. Lawrence deep-waterway has produced in Canada a renewal of controversy. Mr Hepburn, Prime Minister of Ontario, immediately wrote a strong letter to Mr Mackenzie King, in which he said that Ontario could not be forced "to expend public funds in such an unwarranted manner or to place upon its people an additional burden of debt and taxation"; and he reiterated his belief that the completion of the waterway would injure the railways and damage Canada's public credit. He also maintained that Ontario had a "huge surplus of power" of which the Federal Government had forbidden export. To this outburst Mr Mackenzie King replied in a speech declaring that his Government would endeavour "to carry on the discussion of such questions, whether with the Government of the United States or of a province of Canada, in a manner befitting the importance of the issues at stake, and according to the wishes of the people of Canada as to how public business should be conducted."

Business conditions remain unchanged. The expected August improvement has been postponed by abnormally hot weather which has delayed much autumn buying. But, for the first time for several years, Canadian business will be stimulated this autumn by rural purchasing power in the prairie provinces; while purchasing power should be as good as last year in the Eastern provinces and British Columbia. Various industries will get more benefits from British armament orders; and the outlook for the newsprint pulp and lumber industries has definitely improved. Motor manufacturers are laying plans for an earlier and increased output of 1939 models; the demand for furniture and other household goods has been increased; and the decline in export trade also seems to have stopped. One great disappointment has been a serious shrinkage caused by the depression in the volume of summer tourist traffic from the United States.

The Crisis in Czechoslovakia

TO THE EDITOR OF THE ECONOMIST

SIR,—Parliament will have to ratify any arrangement made by the Premier, and we should all, therefore, try to clarify in our own minds at least some of the long-term implications. Experience now makes it plain how disastrous the consistent refusal of our Government to envisage "hypothetical cases" has been.

A few years ago certain Nazi friends of mine told me that if, in the event of frontier revision, Germany acquired minorities, the latter would not be allowed any political freedom, because this was incompatible with a totalitarian ideology.

For this reason, they added, and also because no State could reasonably be expected to destroy strategic frontiers, they were earnestly studying the transfer of populations (incidentally, at that time the burning questions were Polish Silesia and South Tyrol).

In view of what seems now under consideration, are Czech minorities to be left to their fate, and has not the German insistence on territorial revision strategical implications? If so, may not the suggested guarantee of a new frontier prove either a death-trap or just as empty as the French alliance with Czechoslovakia?

If we are to base a frontier revision plan on justice to minorities, are we prepared to advocate this for all cases (including ex-German colonies)? If so, should we not champion minorities in totalitarian and semi-totalitarian countries when, owing to rigid control, these have not the means of voicing their claims like the Sudetens?

By capitulating completely to methods totally at variance with our long-established principles, are we not in great danger of demonstrating conclusively that such methods are not only expedient but right in theory? In that case, is it reasonable to expect any real friendship and appeasement when our people are now so forcibly brought up against that fundamental clash of ideologies which totalitarian countries so vigorously stress and our Government has always tried to pretend was not there?

Are we to expect in the future any small nation, however industrious and well-run, to be liable to such violent politico-economic changes? Can this fail to prejudice efforts at economic collaboration and wider trade which our Government has been urging; how can any British trading concern take the risk?

Finally, are we prepared to deal with the flood of refugees, far surpassing the present problem, which must inevitably be created by each successive "arrangement" for the precedent of which we shall be responsible?

Yours faithfully,
M. ZVEGINOV.

Books and Publications

British Diplomacy

THE editors are to be congratulated on the skill with which they have compiled this volume of documents, old and new,* explaining (in so far as is possible by the documentary method) the foundations of British policy, from Pitt to Salisbury. It is a scholarly piece of research, illuminated by pointed historical introductions. To the observant reader the value of the book must lie chiefly in the comparisons offered implicitly page after page between the diplomacy of successive Foreign Ministers, from the end of the eighteenth century to the beginning of the twentieth century, and the much-criticised diplomacy of to-day.

As these great figures of other days pass in review, as one studies their dispatches and conjures up the personalities behind the dispatches, one recognises the master hands in a noble British tradition. Pitt, Canning, Castlereagh, Palmerston, Gladstone, Salisbury—they all made mistakes, all occasionally misjudged events. But in many critical issues their sagacity was far-seeing: they carried out their tasks, not as ignorant amateurs, but as professional students of affairs with a full knowledge of the European position and some understanding of human psychology. The editors do not display an undue favouritism. Their selection of papers is as objective as their brief comments on the writers. Their purpose appears to be first to emphasise the British point of view in major European problems, and then to show the striking continuity of ideas in British diplomacy.

It seems beyond doubt that all statesmen, from Pitt to Salisbury, accepted (though they variously interpreted) certain broad assumptions—the balance of power, the sanctity of treaties, the danger of extending guarantees, the value of non-intervention, the implications of what Castlereagh called "a system of government strongly popular and national in its character." It is true, as the editors point out, that Palmerston in his robust vigour was ready to interpret "non-intervention" in a sense which would have surprised Castlereagh and Canning; that Russell glorified the revolutions which Disraeli disliked; that Salisbury hated publicity and parliamentary control; that Gladstone preferred the concert of Europe to the balance of power. But these differences

> do not prevent us from seeing that there is a great similarity between the views of all these men despite the illogicality of their methods. There are times when Castlereagh is English, when Canning is European, when Palmerston admits the superiority of modern ideas, when Gladstone relies on the British fleet, and when Salisbury finds public opinion of value.

There is little that is new in even the latest diplomatic ideas. The principle of "collective security," a phrase now so glibly used on a thousand political platforms, was applied before the days of "splendid isolation." Even the idea of a League to enforce peace is almost as old as diplomacy itself. The younger Pitt, the strength of whose foreign policy was long under-estimated by historians, pointed out the danger of violent nationalism, and in a memorandum to Russia in January, 1805, on the security of Europe, he advocated a European concert, one of the objects of which should be

> to form, at the restoration of peace, a general agreement for the mutual protection and security of different Powers, and for re-establishing a general system of public law in Europe.

There is room for doubt whether Pitt, in a prescient utterance attributed to him by a foreigner, ever declared that Napoleon would meet with a check whenever he encountered national resistance, that Spain was the place for it, and that then England would intervene. But there is no room for doubt that this was Canning's doctrine. In Spain he intervened with a vengeance against the Napoleonic invasion. By every means in his power he helped the struggling Spanish juntas with money, arms and equipment, and sought to promote real national unity.

> We shall proceed [he said, with what to-day seems refreshing bluntness] upon the principle that any nation of Europe that starts up with a determination to oppose a Power [France] which, whether professing insidious peace or declaring open war, is the common enemy of all nations, whatever may be the existing relations of that nation with Great Britain, becomes instantly our essential ally.

It was during his period of office between 1807 and 1809 that Canning also framed his definite views for the future of Germany. In a document written on May 16, 1807, he pictured a Germany governed on federal principles and foresaw that its domination by Prussia, a military power, would be disastrous.

The period during which Castlereagh was in office was of vital importance in British diplomacy. In that period occurred the formation of the Grand Alliance, the defeat of Napoleon, the Congress of Vienna and the reconstruction of Europe, in all of which Castlereagh participated. His views on non-intervention are set forth in the famous State Paper of May 5, 1820, in which he defines the principle of non-intervention, the obligation on England to follow "a system strongly national and popular," and her refusal to interfere by force in the affairs of other States. This meant the end of that system of European co-operation which Castlereagh himself had done so much to promote. One passage deserves quotation:

> The principle of one State interfering by force in the internal affairs of another, in order to enforce obedience to the governing authority, is always a question of the greatest possible moral as well as political delicacy. . . . It is only important on the present occasion to observe that to generalise such a principle and to think of reducing it to a system, or to impose it as an obligation, is a scheme utterly impracticable and objectionable. . . . When the territorial balance of Europe is disturbed she [Britain] can interfere with effect, but she is the last Government in Europe which can be expected or can venture to commit herself on any question of an abstract character.

Palmerston's theory of guarantee is well expressed in his paper of May 10, 1841, in which he exchanges views with Metternich. Arguing against a guarantee by the European Powers of the integrity of the Turkish Empire, he says:

> When a single Power guarantees another, such an engagement does place the weaker Power in a situation of dependence upon the stronger. . . . But this effect cannot be produced in the same degree when the guarantee is given by several Powers; because it is probable that those Powers would all have different views and wishes; all these opposite and conflicting impulses would destroy each other. . . .
>
> The evil of a guarantee to the State to which it is given is that it leaves such a State to rely upon foreign aid for its defence; and then, when the moment comes when that aid is wanted, it may upon some pretence or other be withheld or it may arrive too late.

One of the most striking and sagacious and characteristic documents Palmerston ever wrote was that of January 11, 1841, in which he instructed Nicholas I in the obligations of the British Constitution.

The Russian Tsar had asked England, in effect, to enter with him into a secret alliance against France. Palmerston refused, and laid down "the whole doctrine of obligations by which a British Cabinet and Parliament can be bound." This paper is a model of courtesy, clarity and firmness. Had Nicholas taken Palmerston's warning to heart, there would have been no Crimean War.

The editors pay a good deal of attention to the application of what are known as Gladstonian principles in diplomacy, and quote the statement of these principles to which Gladstone committed himself in the Midlothian campaign. Though it may be true that the events of 1880-5 "cast an air of irony" on this statement, to read it again textually is to realise the fundamental truth of those broad principles which have far more poignant significance to-day than they had in 1879, when they were enunciated. "The principle of equality among nations lies, in my opinion"—concludes Gladstone in a passage that should be inscribed on the portals of every Foreign Office in Europe—"at the very basis and root of Christian civilisation; and when that principle is compromised or abandoned, with it must depart our hopes of tranquillity and of progress for mankind."

Of Salisbury it might be said that his resolute administration at the Foreign Office marked the end of "isolation." While Salisbury was certainly not averse from entente relationships, he shrank from binding alliances. His views are embodied in a memorandum (1901) in which he gives reasons for declining German overtures for the inclusion of England within the bounds of the Triple Alliance. The concluding sentences of this forthright document seem to be of the very essence of British statesmanship in foreign relationships. For good or for evil, British Ministers are disinclined to give anything away before their hands are forced. This is what Salisbury says:

> Several times during the last sixteen years Count Hatzfeldt has tried to elicit from me, in conversation, some opinion as to the probable conduct of England, if Germany or Italy were involved in war with France. I have always replied that no English Minister could venture on such a forecast. The course of the English Government in such a crisis must depend on the view taken by public opinion in this country, and public opinion would be largely, if not exclusively, governed by the nature of the casus belli.

It is an interesting speculation whether any British diplomatic papers of the past fifteen years, when they are disclosed to the world, will prove to have the same philosophic or reflective quality which characterises so many of the documents collected in this volume. Equally interesting will it be to discover how far, if at all, the decisions of contemporary Foreign Ministers have been based consciously on the lessons available in these historic parallels. The continuity in British foreign policy is no doubt largely instinctive. Certainly, there is little evidence in recent diplomatic action, or in the consequences that have flowed from it, either that any deliberate tests have been applied in the light of past history or, by way of compensation, that the diplomacy has been marked by any profundity of original thought.

BRITAIN IN RECOVERY

This book has been compiled by a Research Committee of the British Association, under the chairmanship of Professor J. H. Jones. It traces the effects of recovery on British industries, and provides a factual, authoritative survey of a vital period in the industrial history of this country. It should be read and studied by all interested in the urgent economic questions of the day. 484 pp. 15s. net from a bookseller, or 15s. 6d. post free from

THE BUSINESS WORLD

War Risks and Rates

IT is not easy to give a clear or accurate record of what has happened in the marine insurance market during the past ten days. The crisis caught underwriters unprepared. There has been much confusion, and it cannot be claimed for them that their handling of the situation has been masterly.

In a recent article in *The Economist* it was suggested that the basis on which war risks were being written was unsound, and when a business is being unsoundly managed a sudden crisis is apt to produce disorder and even chaos. Disorder and chaos were produced last week, and even now (though things are better) it is not certain that the market has reached an arrangement which will stand the working test.

The special feature of war underwriting in the last few years has been the inclusion of war risk at an additional premium on marine policies, as a result of which underwriters could not accept ordinary cargo risks without piling up a big war liability. When the threat of war became acute their books would already be loaded with war risks accepted at nominal premiums for sums that might not correspond to the lines they would naturally desire to run on the catastrophic risk of war. Their only protection was the right to cancel, on giving 48 hours' notice, all war liability on cargo that was not yet waterborne—the liability on cargo already at risk being inescapable.

That was the position of underwriters in the middle of last week; and on Thursday the 15th they all gave the 48 hours' notice of cancellation, leaving cargo which sailed after Saturday night uncovered. The underwriters did more than that. They cancelled the arrangement (which had for some time been in force) by which a committee fixed rates for war risks on various voyages; and in place of that arrangement they left the fixing of rates to negotiation between shippers and underwriters. It was also agreed that war risks must no longer be written in conjunction with marine. The underwriters appear also to have decided that every war risk must be written individually with the steamer's name and that no open covers (i.e. contracts covering, for a period, all the cargoes of a specified owner) should be accepted, but it is characteristic of the chaotic conditions that while some underwriters believed that this had been agreed, others thought not and held themselves at liberty to write open covers as well as specific risks. The result of all these changes was, for the moment, chaos in war rates, with one underwriter quoting £10 per cent. for a voyage on which his neighbour was satisfied with 5s. per cent.

The situation of merchants and brokers was clearly impossible. No merchant could anticipate the cost of shipment and no broker knew whether he was quoting his client the right rate. Towards the end of the week a meeting of brokers was held, and underwriters were asked to re-establish the rating committee, which had so hurriedly been abandoned, and to publish a scale of war rates which all underwriters would observe. It was hoped that this would get rid of the rate chaos and make it possible to arrange open covers by which a merchant would be able to look at least a few days ahead.

The underwriters on this request reconsidered their position. The rating committee was restarted and a scale of rates published; while at a brokers' meeting held at Lloyd's on Tuesday an arrangement was announced for the writing of open covers on war risks. That arrangement, at the time of writing, stands. Let us take separately the two points—the rate scale and the plan for open covers.

The scale of rates varies from 2s. 6d. per cent. on shipments of specie to the Continent to 80s. per cent. on shipments of merchandise from Shanghai. In view of the uncertainty, homeward voyages are rated considerably higher than outward, and the insurance of exports from this country costs a good deal less than the insurance of imports. Exports to United States Atlantic or Pacific ports are rated at 10s. per cent., while imports from Atlantic ports go at 20s. per cent. and from Pacific ports at 40s. per cent. The rate for exports to India and Australia through the Mediterranean is 30s. per cent. and for corresponding imports 60s. per cent. The reason for this difference between imports and exports is that imports will be so long in reaching the danger zone if war should break out, while exports are supposed to be moving away from it.

The open cover arrangements are somewhat complicated. The foundation of the scheme is that no war cover may be for a longer period than one month and that on every policy the underwriter shall be entitled to give 48 hours' notice. The cover will include all shipments which are declared and accepted by underwriters during the month, but underwriters will not be bound to accept declarations more than seven days before the date of sailing. The minimum rates payable will be the scale rates on the date the declaration is accepted *or* if a declaration is not accepted before sailing, then the scale rates on the date of sailing.

At some points the wording of this cover arrangement is obscure, and traders are particularly troubled about the necessity to declare within seven days before the date of sailing. The relative clause in the cover is as follows:—

> Warranted sailing within seven days of date of acceptance or held covered.

The effect of the wording seems to be this. A merchant will declare a shipment to his underwriter not more than seven days before the date on which the boat is expected to sail, and if she sails on the expected day he will pay premium at the rate current on the date of declaration. But if sailing is delayed and more than seven days elapse between the declaration and sailing, then the cargo is held covered but re-rated in accordance with the scale prevailing at some unmentioned date thereafter. Thus if the risk should be increased materially after declaration, cargo which does not get away within the seven days may pay double the rate charged on the day it was declared.

A deputation of Chambers of Commerce attended the Board of Trade this week to raise the question of war risks; and it is believed that one of the points which they were anxious to emphasise was the difficulty involved in this seven-day arrangement. There is no doubt about the difficulty, but underwriters consider two things imperative: (1) that the war risk shall be separated from the ordinary marine risk and (2) that they shall be able to adjust their rates as speedily as possible to changing conditions. From the underwriting standpoint both of these stipulations are necessary, and delay in shipment—whatever the difficulties involved—must be followed if necessary by a revision of rates.

Thus some greater degree of certainty seems to be emerging from the chaos of the beginning of the week. But to the insurance market, the trading community and the Government alike, the events of the past week should serve as a foretaste of the extent to which ordinary methods of doing business will have to go by the board in the event of war.

Rubber Company Earnings

DURING the past fortnight, the normal functioning of the investment markets has been impossible. Political uncertainty and the fluctuating risks of war have overruled rational investment calculations, from the gilt-edged market to the most speculative commodity shares. It is not surprising that rubber share quotations, in particular, have failed to respond to last week's decision to maintain the quota for the last quarter of 1938 at 45 per cent. Even before the political storm broke, business in rubber shares had shrunk to the lowest ebb, and share prices remained disappointingly indifferent to the improvement in the price of the commodity. Holders have not been tempted to sell; but few groups are at present attracting less support than rubber shares.

The need for investment analysis, however, is no less great in the indifferent market conditions of to-day, when quotations can easily get out of line with underlying economic facts. Of the latter, the two of prime importance for the rubber shareholder are prices and costs. Last year, rubber reached a high level of 1s. 1½d. This year, the price has ranged between 5d. and 8⅛d. per lb., and the average for the first eight months of 1938 is about 6¾d. On the other hand, during September the price has fluctuated on each side of 8d., and the International Committee's decision to leave the quota unchanged for the remainder of the year has at least helped to maintain this improvement. Assuming that no general disturbance to commodity prices occurs, it seems reasonable to base the calculation of potential earnings on an average price of 7d. per lb. for the full year, compared with 9⅛d. for 1937. The rubber shareholder may derive some consolation from the fact that the average for this year should be at least a penny higher than in 1930, when the trade cycle pendulum was also swinging downward. But in terms of profits, this is not the whole story. Some rise in costs is inevitable this year. Even in 1937, when the average release for the year was 83¾ per cent. of basic quotas, compared with 62½ per cent. for 1936, costs were frequently higher than in the previous year. The estates may be able to achieve some reduction in direct charges, but the average fall of 32½ per cent. in output between last year, and this is bound to have an appreciable effect on unit costs, since overhead charges must be spread over a smaller crop. Moreover, the dislocation of labour arrangements entailed by the 15 per cent. quota cut between the second and third quarters probably increased the rise. It is difficult to establish any fixed relationship between costs and output, but it is not unlikely that, on the average, costs may be 1d. per lb. higher this year than last.

If we assume an average price of 7d. for the commodity, and an increase of 1d. on the all-in costs recorded in 1937, estimates can be made of the earnings of rubber companies to the end of the year. In the accompanying table we give figures for 14 companies, whose financial years end on December 31st. These estimates take account of any additional profit from forward sales of rubber, in the twelve cases where the latter have been reported. These forward sales were effected at prices ranging from 9 2/5d. to 11 2/5d. per lb., and they have provided in several cases one-third to one-half of the estimated total profits for the year. Our estimates of costs, on an "all-in" basis, include depreciation, which in some cases was at a more than usually generous level last year. We refer later to the effect of any increase in rubber prices.

Taking Batu Tiga, the first company listed, as an illustration, it may be calculated that the company's all-in costs last year were in the neighbourhood of 5·2d. per lb. Assuming that costs increase by 1d., and the average realised price of the crop is 7d., the margin of profit on the company's estimated output of 1,600,000 lbs. is 0·8d. per lb. In addition, however, the company has sold forward 246,000 lbs. of rubber, at 10·7d. per lb., representing an increase of 3·7d. per lb. on the profits of this part of its output. The combined estimates represent some 4 per cent. on the ordinary capital, compared with 17½ per cent. for 1937. Subject to the reservation that charges for depreciation and staff bonuses may be reduced this year, our cost estimates seem reasonable. Even in the apparently extreme case of Malacca, whose total costs last year were of the order of 6d. per lb., this holds true. For the chairman declared last June, when rubber prices were in the region of 7d., that the profit on spot rubber was exiguous.

The valuation that the Stock Exchange is putting upon rubber shares, however, is such that most of the potential yields work out at between 3 and 5 per cent. (though the total range is much larger). Even when full allowance is made for the arbitrary factors in our estimates of earnings, these yields are very low. They could be justified only on two assumptions. The companies may, firstly, obtain substantial operating economies for which our costs estimates make no provision. Secondly, it may be argued that the earnings in the future will be swollen by an improvement in the price of rubber. To obtain a cross-bearing on this assumption, we have given the additional return on the ordinary shares, at their current prices, resulting from a rise of 1d. per lb.

RUBBER COMPANY EARNINGS ESTIMATES—1938

Company	Est. output 1938 (a)	All-in costs per lb.		Profit per lb., assuming 1d. rise in costs, and 7d. average price	Forward Sales	Add'l profit per lb. from Forward Sales	Earned for Ord. Shares		Dividend 1937	Ord. Shares		Yields based on

(a) On basis of 55 per cent. of standard assessments.

(b) Allowing for preference dividend.

in rubber, with a 45 per cent. quota. Even a twopenny rise in rubber, at the present rate of release, would not provide bumper returns on typical rubber shares. And such moderate changes in the quota as can be reasonably envisaged would have even smaller effects upon earnings. To take Pataling as an example, it may be calculated that while a 10 per cent. increase in the quota from the present level would result in a 22½ per cent. increase in profits, a rise of one penny in sales proceeds per lb. would provide a 70 per cent. increase. At the current level of output, and at the current profit differential, rubber company profits are highly responsive to changes in the commodity price (and, conversely, to changes in average costs). But that fact alone scarcely justifies current share prices.

Unless the rubber market stages a substantial recovery during the next twelve months, therefore, the investor must regard the average level of rubber shares to-day as over- rather than under-valued. In this connection, the trend of future consumption is of prime importance, particularly in the United States, whose imports represent over 50 per cent. of the world's crude rubber output. During the first seven months of this year, American absorption fell by no less than 43 per cent., compared with the same period of 1937; in the United Kingdom, there was an increase of 7½ per cent., and in other importing countries a fall of 10¼ per cent. For all importing countries, the total absorption for the period was 26 per cent. lower than in the first seven months of 1937. The rubber shareholder, indeed, must pin his hopes on the continuance of the improvement of American demand, which set in last May. The August consumption figure of 38,170 tons is far more encouraging than the average for the preceding seven months of 29,000 tons. It is evident, moreover, that the International Committee is determined to achieve a further reduction of stocks. World stocks at the end of July amounted to 556,039 tons. Assuming a regular rate of export production for the remaining five months of the year, additional supplies would amount to 250,000 tons. If all importing countries, other than the U.S.A., absorb 10 per cent. and the United States 40 per cent. less than during the last five months of 1937, total absorption for the period would be 316,500 tons; if the United States absorbed 20 per cent. less than last year, total absorption would be 354,000 tons. On the first hypothesis, stocks would be reduced to about 490,000 tons; on the second to 452,000 tons. If the restriction committee succeeds in reducing stocks to the equivalent of six months' consumption—which the second figure roughly represents—prospects for the maintenance and possibly of an improvement of the current price will be strengthened.

On the two assumptions that war will be avoided, and that American recovery will continue, the holder of rubber shares may already have seen the worst phase of depression. But each investor must test the validity of these two assumptions for himself. Further, he can scarcely expect recovery in the rubber share market, if it comes, to be rapid and spectacular. Already, the leading shares stand at levels which discount an improvement in earnings some considerable way ahead; that conclusion is clear, even if the most generous allowance is made for the necessarily approximate nature of our estimates. And there will be little inspiration from rubber company reports to September 30th and December 31st to encourage public interest in the shares, even if American demand and Mincing Lane continue to satisfy the best expectations.

Copper

WITH every year that passes, the whole group of non-ferrous metals fills a bigger rôle in world economics. The production and consumption of aluminium, copper, lead, zinc and tin have increased by leaps and bounds during the present century. Of all these metals, copper is the most familiar to the layman and the most important from the economic point of view. It is vital for the great electrical industry in all its ramifications; and it is this source of demand that has been mainly responsible for the great increase in the world's consumption from 512,700 metric tons in 1900 to 2,062,000 tons in 1937. But copper is also an important armaments metal, and its military use is not confined to brass buttons.

The copper world can be divided into three sections. First, there is the United States, which is both a producer and a consumer, though American productive capacity is more than enough to provide for the American demand. Secondly, there are the other producers, Chile, Canada, Northern Rhodesia and the Belgian Congo—none of them consuming more than a fraction of the copper they produce. Thirdly, there are the great industrial nations which are consumers of copper but have no important copper deposits of their own. This tripartite division of the market has undergone considerable changes since 1929. Both as a producer and as a consumer, the United States has lost ground relatively to the rest of the world. The American share in the world production fell from 53 to 36 per cent., and in world consumption from 49 to 32 per cent. The fall in American consumption has been due, of course, to the severity of the industrial depression in the United States, especially in the industries which use copper. America's failure to export that portion of her potential production which could not be sold at home, on the other hand, has been due to the development of copper deposits in other countries, especially Canada and Rhodesia, which can be worked at much lower costs than the American supplies. Indeed, it is probable that the United States would have started to import copper but for the imposition in June, 1932, of an import duty of four cents per lb.

In contrast to the United States, most of the other important concuming countries, except France, substantially increased their intake of copper between 1929 and 1937, partly because of the relatively greater measure of recovery experienced in these countries and partly as a result of the armaments race, in which America has only recently joined. As the accompanying table shows, consumption has doubled during the past eight years in the United Kingdom and has trebled in the U.S.S.R. and Japan. In the United Kingdom the marked increase in copper consumption has coincided with the rapid growth of the electrical and motor car industries. The decline in France's consumption between 1929 and 1937 is due to the prolonged industrial depression in that country. The relatively small increase in Germany is the result of deliberate policy, under which the use of copper, which has to be imported, has been curtailed as much as possible; this partly explains the enormous increase in Germany's consumption of aluminium, from 39,000 metric tons in 1929 to 132,000

Figures of production and consumption are derived from *Metallgesellschaft A.G.*, those of prices are annual averages of London Metal Exchange official quotations.

tons in 1937. According to the American Bureau of Metal Statistics, the United Kingdom consumed more copper per head of the population in 1937 than any other country in the world. On a *per capita* basis, Britain's consumption last year was 14.29 lbs. (7.18 lbs. in 1929), compared with 13.59 lbs. (18.42 lbs. in 1929) in the United States, 7.43 lbs. (7.33 lbs. in 1929) in Germany, and 6.29 lbs. (7.32 lbs. in 1929) in France.

The rapid increase in copper consumption outside the United States since 1929 has been satisfied mainly by Chile, Canada and Northern Rhodesia. Moreover, the productive capacity of these countries is so big that they found no difficulty in meeting demand, even in 1937, at prices substantially below the average for 1929. During the world-wide scramble for raw materials in the winter of 1936-37, the price of copper was temporarily pushed up to £78 per long ton on March 11, 1937, but the average price in 1937 was nearly 30 per cent. lower than in 1929. Nor, as the profit-statements of the principal copper mining companies show, has the reduction in prices since 1929 been at the expense of producers.

The success with which the supply of copper has been maintained at lower price-levels has a direct bearing upon the outlook for the industry's future. Apart from the re-armament demand (which, from its nature, takes little account of price factors) the future demand will depend on the relative prices of copper and its substitutes. The long-term trend of consumption for the non-ferrous metals as a whole is almost certainly upwards, but there are many uses for copper in which it has to compete with other metals, especially aluminium. The discovery and exploitation of new low-cost supplies, especially those in Africa, is thus a factor of the highest importance, which will be thrown away if prices are artificially maintained in an effort to protect high-cost producers.

Since the spring of last year, however, the problem of the industry has not been one of scarcity but of over-production, for the world-wide industrial recession has naturally led to a curtailment of demand, which was aggravated by the excessive purchases made in the preceding winter. The shrinkage of demand was reflected in the sharp fall in the London price of standard copper, from £78 per ton on March 11, 1937, to £32 10s. per ton on May 27, 1938. This fall took place despite the strengthening of the organisation of the industry by the international agreement concluded in 1935, under which production can now be more readily adjusted to demand. The agreement, however, does not include all the world's producers. The United States does not adhere to it, though the larger concerns in that country are understood to limit their exports to 8,000 short tons per month. Canada, too, though co-operating with the members of the agreement, does not accept output control by quota. But the curtailment of the output of the companies adhering to the regulation scheme (which produced, in 1937, 60 per cent. of the total production outside the United States) to 105 per cent. of standard tonnages at the beginning of December, 1937, and to 95 per cent. at the beginning of July this year, has prevented the accumulation of excessive stocks, while consumption, sustained by the growth of armament manufacture, has so far been fairly well maintained. Nevertheless, the copper market was depressed by over-production in the United States and by the consequent possibility of heavy American sales in Europe. The revival of industrial activity in the United States since last June was therefore quickly reflected in the London market, where prices rose from £32 10s. per ton on May 27, 1938, to £42 10s. per ton on September 21st.

The changes in world production, consumption and stocks in the last year are shown in the following table, based on the figures of the American Copper Institute:—

	United States (short tons)	Elsewhere (short tons)
Production—		
January–August, 1937	670,498	888,664
January–August, 1938	379,744	837,589
Apparent Consumption—		
January–August, 1937	645,463	886,239
January–August, 1938	267,603	956,619
Stocks of refined copper—		
August 31, 1937	123,480	205,130
August 31, 1938	315,191	179,333

The experience of the United States stands in striking contrast to that of the rest of the world. While apparent consumption outside the United States showed a further increase between the first eight months of 1937 and 1938, this was insufficient to offset the drastic decline in the United States. Consumption outside the United States probably did not expand as much as the statistics suggest, for the figures have been swollen by a substantial increase in the war reserves of the U.S.S.R., Japan, Italy, Germany and, more recently, Czechoslovakia, which are not included in the figures of stocks. Nor, conversely, has consumption in the United States fallen as much as the figures suggest, for they make no allowance for changes in consumers' stocks, which have been allowed to run down during the past twelve months. The increase in aggregate stocks across the Atlantic, therefore, has been much smaller than the published figures of stocks indicate.

At the moment, most of the factors in the market seem to be making for an increase in prices. American demand is reviving, and there seems to be no immediate end to the armaments race. Rising prices could, of course, be checked by an increase in production. Hitherto, the leaders of the low-cost producers adhering to the international control scheme have been believed to be opposed to a rise of prices above £40 per long ton because of the possibility of an increase in the production of outsiders. But this figure is apparently no longer regarded as an upper limit. Mr S. S. Taylor, managing director of Rhokana Corporation and Chairman of the marketing committee of the producers co-operating in control, stated that the smaller producers would not be able to enter the market so long as prices did not rise above £45 per long ton. The past history of restriction schemes shows all too clearly that their weakness lies in the producers' inability to resist the temptation provided by a temporary excess of demand over supply and in their chronic tendency to under-estimate the degree to which increased prices will both transfer demand to substitutes and also encourage under-cutting producers. These are the dangers against which the control scheme will have to guard it is to succeed in its task of adjusting demand and supply.

What is your *Capitalised Value* to your family?

IF you listed all your personal assets and converted them into cash what would be the total? Now assuming from a safe investment interest on this amount could be obtained at the rate of 3½% per annum tax free, what income would this produce?

This is the test which you should apply to your own resources, so that you will know exactly what the financial position of your wife and family would be in the event of your death — a contingency which it is unwise to ignore. Most men are disappointed and not a little perturbed after this self examination.

THE "SAFEGUARD" POLICY

is specially designed to augment personal assets by providing an income (tax free and payable monthly) for your dependants in the event of death. If you survive the period of your family responsibilities the policy provides capital for your own retirement.

You are invited to make an enquiry for full details and for an illustration suited to your own circumstances. Rest assured you will incur no obligation by doing so.

Finance and Banking

The Rise in Discount Rates.—The discount market shortened sail on Friday, September 16th, when it reduced its price at the Treasury bill tender from £99 17s. to £99 15s. 3d. per cent., thus raising the average tender rate from $\frac{19}{32}$ to $\frac{1}{16}$ per cent. Compared with this, its previous reduction, amounting to a mere fivepence during the previous fortnight, was no more than the mildest of storm signals. That the market had accurately judged the situation when it decided to cut its price so drastically is shown by the fact that in spite of an under-allotment of £3,000,000 by the authorities, the syndicate secured a quota of 66 per cent. This is in sharp contrast with its quota of 36 per cent. three weeks earlier, when £99 17s. 5d. was paid. Another indication is provided by the reduction in total applications from £87.6 millions on August 26th to £55.8 millions last week. During the past two days the discount market has been swayed entirely by political sentiment. On Tuesday, when things were thought to look better, rates eased to $\frac{7}{8}$ per cent. for three months' bank bills, but the following day a change of view caused the three months' rate to harden to $\frac{15}{16}$-1 per cent., with four months' bills quoted at $1\frac{1}{16}$ per cent. and six months' bills at $1\frac{1}{8}$-$\frac{1}{4}$ per cent. Hot Treasury bills similarly hardened from $\frac{13}{16}$ to $\frac{7}{8}$ per cent. There has been a little more outside money about this week, but the clearing banks occasionally had to lend bond money at 1 per cent. The net result of the past few weeks has been to raise discount rates from $\frac{1}{2}$ per cent. to not quite 1 per cent., and Bank rate is now more effective than it has been for several years. Meanwhile the authorities have been busy restoring to the banking system the money abstracted by the Exchange Account's heavy gold sales. During the three weeks to September 17th, top issues of Treasury bills have risen from £294 millions to £334 millions, this increase denoting Exchange Account acquisitions; while in consequence the tender issue has shrunk from £555 millions to £537 millions, followed by a further decrease to £526 millions for the current week. In addition, there have been heavy "special purchases" of Treasury bills, which have further reduced the quantity of "tender" Treasuries held by the markets. In spite of this assistance money remains in request, and while the increase in discount rates has been moderate, the market has in all other respects attuned itself to the exigencies of the political situation.

* * *

Open Market Technique.—The measures taken by the authorities to offset the recent tendency towards greater stringency in the short money position have been sufficiently continuous to afford some interesting glimpses on the underlying features of the new open market technique. The problem facing the authorities was twofold. In the first place, they have had to neutralise the time-lag between the moment at which funds withdrawn by the flight of hot money from London are immobilised in public deposits at the Bank of England (through the intervention of the Exchange Equalisation Account) and the time at which they are redistributed by net repayment of Treasury bills. Secondly, the withdrawal of foreign refugee money causes a shortage of "outside" bond money, while the repayment of Treasury bills causes a relative increase in the supply of money seeking employment in the discount market; and this shift has to be compensated. Had the authorities pursued the ideal of complete insulation of the credit structure from the outflow of funds they would have tackled both problems. They have, however, concentrated on the first only and have left it to the mobility of short-term capital to effect the necessary adjustment required by the second problem. In order to neutralise the time-lag mentioned above, the authorities have undertaken substantial open-market purchases of Treasury bills. The evidence of successive Bank returns proves that these purchases have been effected on behalf of the Exchange Equalisation Account and not on behalf of the Bank. In estimating the effect of open-market policy a distinction must be made between purchases (or sales) of securities made on behalf of the E.E.A. or any other public department, which involve merely a transfer of funds between public and bankers' deposits, and purchases or sales by the Bank for its own account, which affect the total volume of deposits at the Bank. In this particular case, the objective being neutralisation and not expansion, the method actually chosen, that of making in the open-market purchases of bills on behalf of the E.E.A., was wholly justified.

* * *

It is interesting to note that the special buying of Treasury bills during the whole of last week and in the first part of this was restricted to such maturities as would be eligible for rediscount at the Bank of England if taken there on the initiative of the market. The latest rule applying to such rediscounting was that parcels of bills for rediscount should have an average currency of about 28 days. The special purchases of Treasury bills made this month have been for maturities up to the appropriate day of October, and at the beginning of this week the maximum dates were advanced to early November bills. Thus we have in effect had the old rules of rediscounting applied—but with two fundamental variations: the first that the purchaser was not the central bank but a Government department; the second, that the Bank went to the market and not the market to the Bank. The rediscounting was therefore done at market rate and not at a penalising official rate. It is true that on Tuesday the firm which always operates for the authorities in the discount market suddenly changed its tactics and bought hot bills—first at $\frac{13}{16}$ and then at $\frac{3}{4}$ per cent. There is, however, no assurance that these purchases were in fact on official account. The firm in question handles other than official business.

* * *

Arbitrage and Insurance.—The effect of the recent revision of war risk insurance rates, discussed in a leading article, is that the arbitrageur now has to solve a simultaneous equation, involving two unknowns, instead of a simple equation with only one unknown. His general practice has been to take a view on the exchange when buying his gold, and to cover his exchange as quickly as he could afterwards. He now has also to take a view on the cost of insuring his gold. Over the week-end this was a pure matter of chance, but more recently he has been able to base his calculations on a war risk charge of 2s. 6d. per cent. in place of the former charge of 6d. per cent. Even then he must remember that the new rate is only firm for shipments made within 48 hours. The effect of this is to reduce the American shipping price parity by very nearly 2d. per fine ounce, and in the table appearing in this week's bullion market report the premium or discount quoted is based on this readjustment. This new uncertainty has naturally been very disconcerting to the bullion market, and initially gave rise to a good deal of unfavourable comment. It has also helped to bring about a considerable reduction in the volume of arbitrage business, as is shown by this week's shrinkage in the amount of gold dealt in at the fixing. One consequence is that the authorities are now less able to rely upon arbitrage as an indirect means of support to sterling. So long as any uncertainty about the cost of shipment remains, the authorities will be forced to rely more upon direct intervention in the foreign exchange market.

* * *

French Government Borrowing.—Recently the pound has had all the limelight, while the franc has receded into the background; for the Paris exchange market has been relatively inactive and the franc's peg to sterling has been maintained without difficulty. It thus came as somewhat

of a shock to learn that the French Treasury had had to resort to fresh borrowing from the Banque de France, and the reason for this new borrowing was in no way calculated to mitigate the shock. While apparently there has been no fresh flight of capital from France, there has been a tendency to hoard currency. Withdrawals from the private savings banks during the first fortnight of September were Frs. 110 millions in excess of deposits, while between September 1st and 15th the note circulation of the Banque de France rose from Frs. 101.8 to Frs. 108.2 thousand millions. The natural consequence of all this is greater stringency in the money market, so that renewals of Treasury bills and subscriptions to National Defence Bonds have fallen away. The Treasury has thus been deprived of its usual source of funds just at the time when the international crisis is calling for fresh Government expenditure upon "indispensable measures of security." On September 20th M. Marchandeau, the Finance Minister, made a strong appeal to the public to cease to hoard, and he emphasised that no moratorium or restriction upon withdrawals from the banks was contemplated. He also asked for the prompt payment of taxes, even when the taxpayer was entitled to pay in several instalments. This frank avowal of the Government's difficulties may help to restore confidence, but in the meantime the wider discounts on forward francs indicate that these revelations have given rise to a certain amount of new perturbation.

* * *

Week-End Speculators.—The practice of speculation in spot exchanges over the week-end, which fell into disuse after the restoration of the stability of the franc in May last, has revived to a considerable degree during recent weeks. It is based on the usage that exists in the foreign exchange market, by which spot exchange is to be delivered only two clear days after the conclusion of the deal. Thus, spot exchanges sold on Friday are due to be delivered on Monday, while if the deal is concluded on Saturday the delivery is not due until Tuesday. It is always possible, however, to stipulate delivery on the following day, or even on the same day. Speculators are, therefore, in a position to sell spot exchange on Friday or Saturday and cover on Monday or Tuesday. Since during recent years most financial and political crises have occurred during week-ends, this method of week-end speculation is apt to become popular whenever the market feels that "there is something in the air." The practice is applied also mid-week, but not nearly to the same extent as over week-ends. During the last few weeks there has been a fair volume of such week-end speculation in spot sterling, and much of the positions created in anticipation of a week-end climax was carried forward on Monday or Tuesday through covering purchases of sterling to be delivered on the same day and sales of spot sterling to be delivered in another two days. A large part of the bear position in sterling that became such a prominent feature of the market towards the middle of September was created by such short selling of spot sterling. As a result of political developments during the past week much of this bear position has now been covered.

* * *

Gold for Eire. — One of the interesting consequences of this week's disturbed markets has been the announcement that the Irish Currency Commission has sold British Government securities to the amount of about £2,500,000 and bought gold with the proceeds. Normally, the reserves held against the Irish currency are kept in gilt-edged securities in London, and they amount to between £9 and £9½ millions. The policy of holding gold in Dublin has frequently been suggested and as frequently rejected, the latest rejection being by the Commission which reported last month. The present move should not be taken as an indication that the policy is being changed; it reflects no doubts about the credit-standing of the British Government or any underrating of the value of the link with sterling. It appears to be inspired merely by the desire to be protected against that closure of the London Stock Exchange which might occur at a time of grave political crisis. When the present period of disturbance is over, it is the intention to reconvert the gold (which will probably be kept meanwhile in Dublin) into securities in London.

MONEY MARKET NOTES

Foreign Exchanges

THE New York rate has fluctuated from hour to hour and even from minute to minute in response to the news and rumours of the day, and dealings have been rendered very difficult by the rapidity and frequency of these movements. The highest rate for sterling recorded during the week was $4.83\frac{3}{4}$ on Wednesday, but by Thursday afternoon the news of the resignation of the Czech Government had driven the rate down to $4.81\frac{1}{2}$. It is not thought that the British Control lost much gold this week. The report that the French Government was borrowing from the Banque de France shook the peg out of the Paris rate, and the French Control had to let sterling rise from Frs. 178⅛, where it had been successfully held up to Wednesday, to Frs. 178⅞ on Thursday afternoon. Three months' francs also weakened from Frs. $3\frac{7}{8}$ to Frs. 5 discount. Belgas continued to move in sympathy with the dollar, and the New York cross-rate has remained comfortably inside the export gold point. Guilders remain steady at Fl. $8.92\frac{1}{4}$. Registered marks are still weak at Rm. 32.45, equal to 62 per cent. discount. On Tuesday they were up to $64\frac{1}{2}$ per cent. discount. Generally, there has been less business in the foreign exchange market than last week; the absence of any stability in the New York rate has made dealings very difficult.

The Bank Return

THIS week's return provides some evidence of a general desire towards greater liquidity. Thus the note circulation is slightly higher, whereas a year ago there was a contraction. There has also been an increase of £3.0 millions in other deposits, which suggests that overseas and other institutions may be desiring to reduce their holdings of sterling bills and securities and augment their balances with the Bank of England.

	Sept. 22, 1937 £ mill.	Sept. 7, 1938 £ mill.	Sept. 14, 1938 £ mill.	Sept. 21, 1938 £ mill.
Issue Dept.:

Other Secs.	21·6	22·1	22·1	24·6
Proportion	26·7%	30·1%	31·2%	30·6%

Continued special buying of Treasury bills and the under-allotment at last week's tender have caused a reduction of £3.2 millions in public deposits. This reduction would probably have been greater had it not been for the past week's heavy excise duty payments into the Exchequer. Bankers' deposits, however, have only risen by £1.3 millions, for the chief counterpart to the contraction in public deposits is the increase in other deposits referred to above.

*

The Money Market

THIS week's Bank return only shows a slight increase in bankers' deposits, and money generally remains fairly tight. The general rate for bond-money has been $\frac{3}{4}$-$\frac{7}{8}$ per cent., and borrowers are still having at times to resort to the clearing banks, where they are charged one per cent. There has been a certain amount of special buying of the shorter Treasury bills at $\frac{3}{4}$ per cent. early in the week, and the longer Treasury bills at $\frac{13}{16}$ per cent. later in the week. As most of these bills were originally acquired by their sellers at rates of $\frac{1}{2}$ and $\frac{11}{16}$ per cent., their re-sale to the authorities only provides relief at the cost of a certain loss.

	Sept. 23, 1937 %	Sept. 15, 1938 %	Sept. 22, 1938 %
Bank Rate	2	2	2
London Deposit Rate	1/2	1/2	1/2
Short Loan Rates:			
Clearing Banks	1/2–1*	1/2–1*	1/2–1*
Others	1/2–5/8	5/8–3/4	3/4–7/8
Discount Rates:			
Treasury bills	1/2	3/4	13/16–7/8
Three months' bank bills	17/32–9/16	13/16–7/8	13/16–15/16

* Viz. ½ per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity. ¾ per cent. for loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

Discount rates have been variable. The banks have not been ready buyers, while on the other hand some people are ready to take a chance and run the longer-dated bills. Bills bought this week at $\frac{7}{8}$ per cent. yield a useful profit so long as they can be carried on $\frac{1}{2}$ per cent. money. The banks' buying rate is now $1\frac{3}{8}$ per cent., but discount houses are charging their customers $\frac{7}{8}$-$1\frac{1}{8}$ per cent. for three months' bank bills, while $1\frac{1}{16}$-$\frac{1}{8}$ per cent. was quoted on Thursday for four months' bills and $1\frac{1}{8}$-$\frac{1}{4}$ per cent. for six months' bills. Business in hot Treasuries has been very limited, as sellers are trying to get $1\frac{1}{16}$ per cent., while buyers will not pay less than $\frac{7}{8}$ per cent.

*

The Bullion Market

THIS week the Control has mainly been able to hold a watching brief. Up to Thursday, business at the fixing was limited by the difficulty of arranging arbitrage, for reasons explained in a Financial Note. Throughout the week there has been very little business after the fixing. The supply of gold has recently consisted of Continental sales, due to a desire to switch out of gold and into dollars. There has, however, been some Continental buying, while by Thursday arbitrage business had begun to revive, as some assurance was felt in the stability of the new war risk rates. It is, however, impossible to obtain general cover, and gold shippers have now to specify the exact amount involved and also the boat. After allowing for the increased cost of shipment, prices at the fixing this week have fluctuated within narrow limits on either side of parity with the American shipping price.

Eastern sales of silver have proved adequate to meet the Indian demand and current American trade buying. The change in war risk insurance rates has had some effect on the market. On Monday more silver was offered than could be readily absorbed

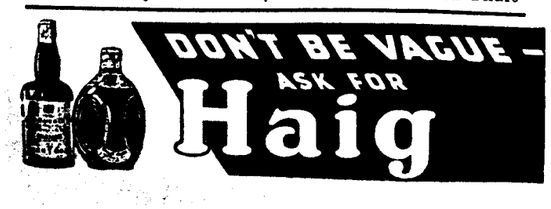
* Above or below American shipping price. This week's calculations are based on a "temporary parity," in which the war risk rate is assumed to be 2s. 6d. per cent. † At fixing.
The New York price of silver remained at 43 cents per ounce ·999 fine during the week.

and there was a sharp break in both the cash and forward price. Since then there has been a fractional recovery, but on Thursday it was estimated that London prices were just below the American parity.



Investment

Markets and the "Peace Plan."—The first professional duty of a Stock Exchange is to measure the importance of events in money terms. Judged even from this detached standpoint, however, it cannot be recorded that the week's political developments have brought much advantage. The expansion of investment interest, and improvement in prices has been too small and uncertain to offset the misgivings of many market observers regarding the manner in which a Czechoslovakian "settlement" has been secured, and its bearing upon more direct British interests. Dealing conditions were more normal, of course, than on the critical days of last week, but market sentiment earlier in the week was swayed by doubts whether the Czech Government would accept the Anglo-French plan, until Wednesday's official statement ended conjecture. But that fact did not release any new buying incentive. Indeed, Mr Chamberlain's second flight to Herr Hitler coincided with a marked renewal of caution in all sections of the "House." Confidence in a settlement is hardly marked, for instance, by the fall of 1¼ in "Old Consols" on Thursday, and most industrial shares were also slightly easier. It still remains true that there is no positive policy which the investor can adopt at this juncture. The main outcome of a disturbed week is that the market is not prepared to allow its inconclusive relief to develop into a broader confidence. The rebound from the lowest quotations recorded on Wednesday of last week, when the threat of war was clamant, has naturally been considerable. But it has also been largely technical. The average investor is not disposed to pay very generously for the prospects of security and peace at this stage.

Czechoslovakian Bonds.—In the absence of any official statement regarding the contents of the Anglo-French proposals for the future of Czechoslovakia—and, indeed, of any indication of their finality—the Stock Exchange has marked the prices of Czechoslovakian 8 per cent. bonds, and of the Prague 7½ per cent. loan, virtually to default levels. On Wednesday this week, when the Czech Government's acceptance of the proposals was still awaited, the 8 per cent. bonds fell fourteen points, to 55, while the Prague 7½ per cent. issue was nominally quoted around 45. The closure of the Prague stock exchange, and the imposition of a temporary moratorium for all banks and insurance companies necessarily have some bearing on the future service of Czechoslovakian obligations. It is unlikely that the investor would greatly esteem—even if it were granted—an undertaking on the part of Germany to provide some portion of the service on Czechoslovakia's debt, in return for any territory taken over in the Sudeten areas. But any change in the political and economic frontiers of the country must inevitably affect the ability—to say nothing of the willingness—of the Government to meet the service of the 8 per cent. issues of 1922 and 1924. Of the original sterling issue of £5,350,000 (of which part was taken by Amsterdam) some £3,930,300 is now outstanding. Together with the American *tranche*, of which $23,250,000 was issued, the sterling bonds rank as a first specific charge on the Customs and on the net profits of the tobacco monopoly. Regular interest and sinking fund service has been maintained. The City of Prague loan, which was also issued jointly in London and New York, is secured as a direct municipal obligation, with a specific mortgage on the electrical, gas, water and tramway undertakings owned by the City. Of the original issue of £1,500,000, some £544,550 is now outstanding. The political changes also have an obvious bearing on the security for Skoda Works 6 per cent. debentures, which were issued in London in 1930 at 95, and were quoted this week at 45-52.

The Week's Dividends.—The post-holiday reawakening of investment interest is always marked by a series of important dividend declarations. Politics apart, the investor has no reason for complaint with this week's budget of dividend news, which is summarised in the table on page 624. *Imperial Chemical Industries* has given a fitting lead, as the largest industrial concern in the country, by maintaining its interim ordinary dividend at 3 per cent. Some significance may attach to this decision, for when the interim was raised from 2½ per cent. to 3 per cent. last year it was accompanied by an explicit warning that it should not be read as an indication of a higher distribution for the full year. In fact, however, the total payment for 1937 was raised from 8 per cent. to 8½ per cent. Perhaps the optimistic investor may be impressed by the absence of any parallel announcement this year that the maintenance of the interim dividend does not provide any indication of the size of the final distribution. It would, however, be premature to count on the maintenance of last year's full dividend. The widely-spread industrial interests of the group make any estimate of profits unusually hazardous, for against the presumed expansion of those sections which serve armament needs, either directly or indirectly, there has probably been some contraction in the demand for fertilisers, dyestuffs and certain building materials. *United Steel Companies* ordinary shares responded with a rise of 10½d. to 23s. 7½d. on the satisfactory total dividend of 10 per cent., compared with 8½ per cent. for 1936-37. This distribution surpassed expectations. Although some moderate increase in earnings is suggested by the output figures of the areas in which United Steel operates, the report may show that the board has not exercised quite the same degree of conservatism which has been shown by certain companies recently. That, however, is a conjecture which the report must be left to prove.

* * *

The reduction in the total distribution of *Austin Motor* from 50 per cent. to 30 per cent. was comparatively well received. It was, in fact, less extreme than some quarters had anticipated, in view of the 13.7 per cent. fall in the registration figures for the ten months ended (like the company's financial year) in July. The current yield on the ordinary shrares, which have reacted to 25s., is approximately 6.4 per cent., and a return of this order still appears to take a relatively optimistic view of the prospects for the current year, although the management fees from the aircraft shadow factory should become increasingly important. By contrast, the maintenance of the *Rover Company* distribution at 15 per cent. (though it lacks the 2½ per cent. cash bonus paid last year) appears satisfactory. The previous year's total distribution of 17½ per cent., however, was nearly twice covered by earnings, and the latest distribution would thus be compatible with a considerable fall in profits. Finally, *Murex, Ltd.*, has a record of consistent expansion during the past decade which few companies could emulate. For the year to June, however, ordinary shareholders will receive the same dividend of 20 per cent., *including* 2½ per cent. cash bonus, as in the previous year.

* * *

Sheepbridge Increased Profits.—The Sheepbridge Coal and Iron report shows a somewhat unusual divergence from that of Staveley Coal and Iron, which was discussed on page 554 of last week's issue. To some extent, the comparison reflects unfairly on Staveley, which in 1936-37 received exceptionally high income from Yorkshire Main Colliery. But that fact should not be allowed to detract from the satisfactory results of Sheepbridge, whose profits have advanced from £280,521 to the new high level of £308,634. The two concerns have many points of similarity and are close, both technically and geographically. Perhaps the somewhat greater coal interests of Sheepbridge account in part for its superior earnings performance last year, which is analysed in the following table.

	Years to June 30 1936	1937	1938
	£	£	£
Profit	219,117	280,521	308,634

† Tax free. ‡ Allowing for further preference participation.

The profits include substantial dividends from the more important of the associated companies. In particular, Yorkshire Amalgamated Collieries raised its dividend from 5 per cent., tax free, to 5½ per cent., tax free. But the report also notes a marked decline in demand, particularly for pig iron, during the later months of the financial year, and one blast furnace has been closed down. The increase in stocks from £248,722 to £341,046 probably reflects this decline in trading. The ordinary shares, at 37s. 3d., have well maintained their advance when the dividend was declared three weeks ago, and their present gross yield basis of £9 5s. per cent. appears reasonably to discount the prospect of lower profits during the current year.

* * *

Cable and Wireless Position.—After the announcement of the lowest traffic index number on record for August, Cable and Wireless, Ltd.—the operating company of the group—has maintained its interim dividend at 1½ per cent. For 1937, the operating company distributed 3½ per cent., out of earnings of 4½ per cent. The Holding company has announced the payment of the interim dividend on the 5½ per cent. preference stock, which rose sharply on Tuesday, from 85 to 90. It would be premature, at this stage, to attempt any close estimate of the potential earnings of the group for the current year. The fact remains, however, that the average level of the traffics index for the first eight months of this year is no higher than 68.3 per cent. of the 1929 level, compared with 80.4 per cent. for the same period of 1937, and 78.9 per cent. for the whole of 1937. To prejudice the outcome of the flat rate Empire cable service, particularly since its introduction has coincided with a considerable fall in international trading activity, would be no less unwise. Yet, if the subsequent course of traffics remains unchanged during the remainder of the current year, it is possible that the actual net earnings of the operating company, after giving effect to the elimination of the beam rental and assuming that operating costs are

unchanged, might not exceed £870,000, compared with the standard revenue of £1,200,000. After allowing for the profits attributable to the Government shares, a net balance of £795,000 would remain. It is clear, therefore, that the £300,000 which was specifically set aside last year by the operating company to cushion the fall in revenue during the first stages of the scheme will be required. And even with its assistance, this rough calculation suggests that the residue available for the ordinary stock of the holding company may not greatly exceed 1½ per cent., unless operating economies are realised or unless its distributable income is assisted by reduced provisions and increased investment income, of which there may be an indication in the increased Marconi's Wireless Telegraph interim.

* * *

Harrisons and Crosfield.—The maintenance of profits during the year to June 30th has been greeted with satisfaction by the shareholders of this plantation management company. Profits, after providing for N.D.C. for a full year, amount to £333,870, compared with £329,014 (after transferring £25,000 to staff pensions) for the previous year. The dividend on the deferred stock is maintained at 25 per cent., and a slight addition is made to the balance carried forward. Profits during the past three years are analysed below:—

	Years to June 30

† After provision for N.D.C. * After £25,000 staff pensions.

To some extent, evidently, the company has been protected by the time-lag which separates falling produce prices from reduced income from investments. The valuation of the latter, however, is so conservative that, despite the sharp falls in tea and rubber share quotations last year, market values still showed a surplus, and the special reserve of £350,000 against investments remains intact. During the current year, evidently, the company will not escape the consequences of falling produce prices. In its own balance sheet, appreciable reductions in current trading items and increased cash holdings provide evidence of the setback in trade. The issue of the latest report provides the last occasion on which the deferred stockholder can exercise the right to apply at par for deferred shares to the extent of one-half of the additional dividend beyond 10 per cent. The decision not to increase the deferred capital beyond the authorised amount of £500,000 was taken at last year's meeting, and the balance of unissued capital will permit of the exercise of subscription rights, on this last occasion only to the extent of 779/1,000ths of the usual proportions. The need for the regular subscription of new money which this special arrangement has met in recent years, has been largely satisfied, for the company now finds itself with substantial liquid assets and a considerably expanded business. The deferred stock units are quoted at 81s. 3d. cum rights, and some significant reduction in their earnings during the current year must be expected.

* * *

Second Alliance Prospects.—Mr James Prain's speech at the second Alliance Trust meeting last week provided encouragement at many points. The chairman pointed out that, on a broad basis of comparison, the trust's revenue had been maintained last year. The increased dividend of 21 per cent. was covered by earnings exceeding 31 per cent.—the highest rate earned on the ordinary capital since 1930. And the board's conviction, marked by its decision to raise new capital last year, that "sanity will prevail in world affairs" seems to be unshaken. The two ancillary conditions, of cheap money and favourable investment opportunities, were satisfied last year, but the chairman did not attempt to disguise the probability that some shrinkage in revenue would occur during the current year. The time-lag between industrial recession and reduced industrial dividends is particularly short for American stocks, on which the company is already experiencing the consequences of falling industrial earning power. It is fortunate in this connection that the dividend on the company's £400,000 ordinary capital, which is preceded by £2,903,000 of prior charge obligations, is well protected by available earnings. Indeed, the ordinary dividend record is so good that investors will welcome the chairman's reassurance that he sees no reason for undue apprehension regarding the outcome of the current year. Such a steady earnings performance at least provides tangible compensation for the absence of any information regarding the distribution of the trust's portfolio.

* * *

Recent Colliery Results.—Several of the colliery companies whose latest results to June 30th are set out in the following table have one characteristic in common—they have become known to the investor only during the last two or three years. Only Manvers Main (whose profits last year showed the most substantial setback, as a result, presumably, of the labour troubles at Barnboro') has a long-standing investment record, for Hilton Main was incorporated in 1935, Cannock Associated in 1936, while Barrow Barnsley, until last year, was a subsidiary of Barrow Haematite Steel. In most cases, the setback in profits recorded during the past year is moderate; Barrow Barnsley has increased its distribution to 10 per cent. free of tax, but Hilton Main directors have shown noteworthy conservatism by reducing the ordinary payment from 13½ per cent. to 10 per cent. Our table of profits and share values follows:—

Company (years to June 30)	Total Profits	Ordinary Shares Earned	Earned	Paid	Price	Yield
	£	£	%	%	s. d.	%
Barrow Barnsley:—						
1937	116,920	58,053	19·9	10	23/9xd	8·42†
1938	100,917	45,730	13·7†	10†		
Cannock Associated:—						
1937*	177,568	141,181	11·3	10	23/9xd	8·42
1938	170,480	134,299	11·1	10		
Hilton Main:—						
1937	50,305	36,352	19·3	13½	19/4½	10·33
1938	46,424	32,325	17·6	10		
Manvers Main:—						
1937	160,323	84,391	12·2	5½	13/9	8·00
1938	117,547	62,810	8·7	5½		

* 55 weeks. † Tax free.

Colliery company directors are traditionally uncommunicative, and the reports of these companies, apart from paying tribute to the benefits of the selling schemes, and expressing concern at rising costs, tell the shareholder little regarding the work of the past year. The industry appears to have been relatively successful, so far, in

66 BURLINGTON HOUSE, CAMBRIDGE

countering the effects of recession. But some setback is suggested by the provisional ascertainment that the net credit balance per ton for the June quarter was 2d. per ton lower than for the corresponding quarter of 1937. The March quarter ascertainment, which showed a net balance of 1s. 11½d., was exceptionally favourable. But the situation has changed considerably since that time, and the coal shareholder, faced with the consequences of falling output and exports, and rigid, if not still rising, costs, is probably wise in valuing his holdings on the comparatively generous basis indicated above.

* * *

J. & F. Stone Position.—The reduction in dividend from 17½ to 10 per cent. prepared shareholders for a sharp decline in the total profits of J. & F. Stone, but the actual fall shown in the report was of the relatively moderate order of 10½ per cent., from £93,860 to £83,704. The company sells a variety of household electrical appliances and accessories as well as radio sets, but since the financial year to June 30th included some nine months of industrial recession, and was a period of considerable difficulty for the radio trade, such results are reasonably satisfactory. At the meeting this week, the chairman disclosed that the company actually succeeded in substantially maintaining its turnover. The reduction in the earnings for the equity, from £63,665 to £46,954, is, however, appreciably larger than the fall in total profits. Depreciation required £1,683 more at £7,900, provision for taxation has risen from £7,500 to £10,000, and a full year's preference dividend is payable. The net result is that earnings for the ordinary shares have fallen to 12.4 per cent., against 21.8 per cent., and the transfer to reserve has been reduced by £2,500 to £5,000. Dealers normally try to reduce physical stocks when trade falls off, and it is satisfactory to find that this company has apparently succeeded in doing so. Stocks at the end of June stood in the balance sheet at £128,000—a reduction of £23,000. The liquid position is, in fact, slightly better than a year ago, even if sums due from subsidiaries (which have risen from £273,000 to £337,000) are excluded. The consolidated balance sheet for the company and Chain Store Finance Trust shows that sums under hire-purchase agreements, standing at £430,029, account for just under half the total assets, while cash has risen from £71,096 to £113,154. There are unfortunately no special grounds for expecting greatly improved business in the current year, and while the chairman referred hopefully to the potentialities of television, he expressed the view that retail prices were not yet within the reach of the general public.

* * *

The Week's Company Profits.—Reports have been received this week from 37 companies, excluding one for which comparable figures of profits for the preceding year are not available. The net profits of these companies amount to £3,125,000, compared with £3,277,000 for the previous year, and thus show a decline of nearly 5 per cent. Total profits recorded by 1,793 companies for the year to date amount to £243,277,000, compared with £219,889,000—an increase of 10½ per cent. The profit and loss accounts are summarised on page 624 in our usual table, and the results are discussed in preceding notes and on page 609 under the heading "Shorter Comments."

* * *

Company Meetings of the Week.—Reports of company meetings commence on page 616 of this issue. The chairman's review at the *Second Alliance Trust* meeting is discussed on page 604. Mr Oscar Deutsch informed *Odeon Theatres* shareholders that since June 26th the results from the company's owned and managed theatres showed a material increase over those for the same theatres in the corresponding period last year, apart from the revenues from other theatres which were opened during the year. The chairman saw no reason to vary the prospectus estimate that a full year's profit should amount to £460,000. Mr Horace Boot, at the *Eastwoods* meeting, expressed the opinion that, although the unlimited construction of dwelling-houses could not be expected to continue indefinitely, plans already approved and under consideration, plus those known to be held in abeyance, should be sufficient to keep the building industry actively engaged. Mr W. J. Chinneck was able to report a steady expansion both of the volume of business and of profits earned by *Initial Services*. The results of the first two completed months of the current year, he reported, show an improvement over the corresponding period last year. Mr Walter Hillier explained to members of *Tangoel Rubber Estate* that the fall in revenue on last year was largely due to the increase in export duty.

THE STOCK EXCHANGES

London

SETTLING DAYS

TICKET OCTOBER 11 — ACCOUNT OCTOBER 13

AFTER responding in a cautious fashion to the belief that war might be averted through the Anglo-French plan, the Stock Exchange has become more nervous regarding the immediate future. Possibly the circumstances in which the plan was proposed and accepted are in part responsible for the failure of the market to stage a prompt recovery, which would undoubtedly accompany any assured contribution to peace. Both investors and professional operators have remained aloof, and neither the volume of business nor the extent of price-movements has marked anything more than a mood of relief, which itself seems transient.

In the *gilt-edged market* on Monday, more normal dealing conditions and margins were restored, but from the outset the volume of business showed little expansion, and improvements in prices were of a minor order. More substantial gains were recorded on Tuesday, when War Loan recovered ¾, to close at 100¾, but the absence of "good" buying was again noticeable. In mid-week, prices fluctuated on conflicting reports regarding the Czech Government's intentions, but after losing up to half a point at one time, the market turned steadier, only to lose further ground on Thursday, when uncertainty returned with Mr Chamberlain's second departure to Herr Hitler. Dominion stocks showed greater steadiness, Australian short-dated issues in particular responding to mid-week buying.

In the *foreign bond market*, Czech issues were heavily depressed, particularly on Wednesday, when the 8 per cent. loan fell a further 14 points. A comparable fall was recorded by the Prague 7½ per cent. issue. German bonds rose steadily during the first part of the week, but were easier in mid-week, and nervous on Thursday. Some improvement was reported in Far Eastern issues, after an inauspicious opening.

*

Home rail debenture stocks showed renewed falls at first, but recovered, together with gilt-edged, in mid-week. The traffics provided no stimulus, however, and the ordinary stocks fell further. Cordoba first debentures again became lively, after the recent selling.

The *industrial market*, like other sections of the "House," was moved entirely by sentiment, and not by business, and even its sentiment was never enthusiastic about the "peace plan." Business in steel shares remained small, but the United Steel dividend kindled some interest in the shares, and the market found a firmer footing in mid-week, only to ease again later. Electrical equipment issues improved on Tuesday, and then relapsed into quietude, while the supply group also failed to maintain its firmer tone. The Austin dividend was correctly anticipated, but apart from the improvement in the shares, and a gain in Triplex, the motor group failed to maintain its gains. Aircraft issues, however, remained firm after Tuesday's improvement. Some sharp recoveries, in the case of Guinness amounting to 6s. 3d., were recorded in brewery shares on Tuesday, and quotations remained firm on the following day. Textile shares showed small changes, and shipping issues also moved but little. A general improvement occurred in the miscellaneous group in the middle of the week, but the best prices, as we show in the table on page 602, were not held.

(*Continued on page* 608)

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of repayment is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

(*Continued from page 605*)

Dealings in *oil shares* began more confidently on Monday, though part of the improvement was attributable to "bear" closing. Business, in fact, failed to expand, and although the leading issues remained firm for a time, the limited volume of trading caused small and irregular price movements in mid-week.

Rubber shares began the new account in a more satisfactory style, and though business was very quiet, more rises than falls were recorded in the first part of the week.

The *mining market* shared the general preoccupation with the Czech situation. The steadier tendency on Monday was followed by a cheerful opening on Tuesday, but gave way to hesitation on Wednesday, disregarding the unofficial reports of the Czech acceptance of the Anglo-French plan. Kaffirs were supported by scattered buying orders on Monday and purchases from Paris offset dull conditions at the Cape. There were some further gains on Tuesday, but on Wednesday the market was very quiet. Spasmodic buying of Rhodesian coppers was reported, but interest was small. Turnover in the West African market was small, but prices, where changed, were mainly higher.

ACTUARIES' INVESTMENT INDEX

A further fall has been recorded by the Actuaries' Index of 151 industrial ordinary shares, which on Tuesday last stood no higher than 62·0 (Dec. 31, 1928 = 100)—the lowest level since 1933—as compared with 62·6 a week ago and 63·9 a month ago. The corresponding average yields are 6·07, 6·01 and 5·92 per cent. We give below a selection of the component indices of prices (several of which have fallen to new "lows" for the year) and yields :—

New York

WALL STREET'S movements remain sensitive to events in Europe. At the end of last week the market still believed that the situation was critical, but on Monday it found rather greater confidence and staged a brisk advance. The rise continued on Tuesday and business was vigorous, 1,200,000 shares being traded compared with 830,000 on Monday. On Wednesday morning reports that the Czech Government had accepted the Anglo-French plan caused a buying wave, but the pace became more sedate later, and in the afternoon the market was mainly influenced by good domestic news. Steels rose several points early in the week and improved further on Wednesday on reports of increased operations in the Youngstown and Pittsburgh districts. *Iron Age* estimates steel mill activity at 47.5 per cent. of capacity for the current week, as against 45.5 per cent. in the previous week, but states that new business is disappointing. Motors were helped on Monday by the settlement of the strike at the Detroit plant of Briggs Manufacturing, whilst on Tuesday Chrysler and General Motors registered big rises on favourable production reports. Rails were idle early in the week, but hardened for a time later on hopes that the President's conferences with company and union executives would hasten the settlement of the wage dispute. Coppers rose on Monday as a result of the price improvement. On Wednesday the market was impressed by very favourable reports of the Federal Housing Administration. The bond market was firm throughout the week, though on Wednesday trading in European bonds was nervous and on a small scale.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values, calculated on closing prices (1926 = 100).

Industry and Trade

Renewal of the Tinplate Cartel.—The International Tinplate Cartel is weathering the storm of the present slump more successfully than had been expected. There are few branches of the iron and steel industry where the contraction in output and exports since last year has been as great as in tinplate manufacture. In 1937 the industry experienced a period of unprecedented prosperity. World production totalled approximately 4.25 million tons, compared with the previous record of 3.7 million tons, and the exports of the five principal countries amounted to about 986,000 tons, compared with the previous peak of 928,000 tons in 1929. This year output has declined by nearly 40 per cent. and the volume of exports by about 30 per cent. Despite the strain which this curtailment has imposed upon the Cartel for the regulation of exports and prices, the agreement of 1934 has not only been maintained but was renewed last week for a further period of three years. No details of the resolutions adopted at last week's meeting of the Cartel have been published, but it is understood that they do not involve any material change in export quotas and that they re-affirmed the amended schedule of prices fixed last April. The problem created by the erection of tinplate works in Belgium has been solved by the allocation of the Belgian inland trade to the new plant, and it is expected that this may have the effect of reducing Belgian imports by about 15,000 tons per annum.

* * *

Since the Cartel was first established the British proportion of the combined export trade of the United Kingdom, the United States, Germany (including the Saar), France and Italy has been substantially reduced. In the five years 1927-31 the British proportion of the exports of these countries was 64 per cent.; in 1932, 74.7 per cent.; and in 1933, 61.5 per cent. Last year it was only 46.9 per cent. Under the original agreement 51,000 tons was allocated to France and the Saar, 16 per cent. of the estimated world total of 800,000 tons to Germany, and the balance in the proportions of 70 per cent. to the United Kingdom and 30 per cent. to the United States. This distribution has been altered in recent years by the admission of Italy with a quota of 39,750 tons and of Norway with one of 3,000 tons, and by adjustments affecting Germany on the return of the Saar and Italy on the temporary suspension of exports from that country during the Abyssinian War. In the current year, however, Britain's position in the export markets has improved. Between January and June British exports of tinplates were equivalent to 51 per cent. of the aggregate exports of the countries adhering to the Cartel. Moreover, it is expected that the potential competitive power of the United Kingdom in the world markets will be appreciably strengthened by the new strip mills at Ebbw Vale.

* * *

Collapse of Cotton Price Agreement.—It could scarcely be expected that the co-operation of Lancashire cotton spinners would stand the test of a severe fall in demand. At a meeting in Manchester on Wednesday the members of the ring spinners price agreement decided to abandon the pact. By undercutting the prices fixed by

ISSUES TO SHAREHOLDERS ONLY

Attock Oil Company, Ltd.—Issue of 300,000 £1 ordinary shares at 25s. each in proportion of one for every 5·666 held. To rank for dividend from January 1, 1939.

S. E. Opperman.—Issue of 300,000 2s. shares at 2s. 3d. each, in proportion of one for each two ordinary held, to finance extensions.

E. N. V. Engineering.—It is proposed to capitalise £50,000 of the reserve account shown in last balance-sheet at £75,000 and to distribute as bonus one fully-paid 5 per cent. preference share for every five ordinary shares held.

BY TENDER

Liverpool Corporation Bills.—Tenders will be received at the Bank of England Bill Office on September 27th for £1,000,000 Liverpool Corporation Bills dated September 30, 1938, and payable on September 30, 1939. Payment in full must be made not later than 2 o'clock on September 30th.

SHORTER COMMENTS

Company Results of the Week.—Profits of the COMMERCIAL BANK OF AUSTRALIA show an expansion from £247,435 to £262,384, and the dividend has been raised from 6⅜ per cent. to 7½ per cent. In the engineering group, LAYCOCK ENGINEERING profits have advanced from £19,804 to £40,890, but a substantially greater sum has been provided for taxation, and the dividend is raised cautiously from 5 per cent. to 7½ per cent. The results of S. E. OPPERMAN also show an improvement, from £8,777 to £17,502, but a reduction is recorded in the earnings of S. G. B. (DUDLEY) from £26,497 to £20,310. The board of PARNALL AIRCRAFT has declared a maiden dividend of 7½ per cent., which absorbs £33,750 from the latest year's profits of £66,787, while the balance is employed to wipe out the deficit of £22,066 brought forward, and for reserves. The full reports of DEBENHAMS and HARVEY NICHOLS confirm the preliminary profits figures discussed in *The Economist* of August 27th, page 423. The parent company's net profits have been reduced from £580,754 to £555,112. Increased profits are recorded by ALLIED INDUSTRIAL SERVICES, but reduced earnings are announced by CALTHROPS, HOSEGOOD INDUSTRIES, LEYLAND AND BIRMINGHAM RUBBER, and LINOTYPE AND MACHINERY. COHEN WEENEN, however, have almost exactly maintained their net profits at £58,127.

MISCELLANEOUS

Sir J. L. Hulett and Sons, Ltd.—Net earnings for year to April 30, 1938, £81,270 against £81,522. Ordinary dividend maintained at 7 per cent. For equalisation of dividends, £25,000. Redemption of notes, £10,000. Special depreciation of Tinley Manor, £10,000 against £12,000. Cane crops reserve, £25,000 against £20,000. Cash stands at £56,410 against £4,963.

Beecham Maclean Holdings, Ltd.—Mr Philip E. Hill, presiding at the statutory meeting of Beecham Maclean Holdings, Ltd., on September 20th, announced that the company had now acquired the whole of the ordinary share capital of Macleans, Ltd.

Cable and Wireless.—Index numbers, working-day average of comparable receipts, 1929 = 100. August 1938, 60·2 against 63·1 for July 1938, and 73·0 for August 1937.

Qualcast, Ltd.—The preliminary figures of this company were discussed on page 509 of *The Economist* of September 10th. The balance sheet at June 30, 1938, shows total assets £440,490 against £437,979 on June 30, 1937. Cash has risen from £44,744 to £60,102. Stocks and stores, £108,408 against £52,837. Debtors, £40,298 against £71,561. General reserve account, £100,000.

Laycock Engineering Company, Ltd.—Trading profit for year to June 30, 1938, £58,945 against £25,988. Tax and N.D.C., £17,354 against £5,484. Ordinary dividend raised from 5 to 7½ per cent. The board has opened a general reserve with a transfer of £15,000 from profits. Carry-forward reduced from £10,957 to £9,616.

S. E. Opperman.—Trading profit for year to July 31, 1938, £17,852 against £9,353 for initial period of 13 months to July 31, 1937. To depreciation, £2,872 (£1,872). To reserve for taxation, £4,000 (£1,500). Ordinary dividend raised from 8 per cent. to 17½ per cent. Carry-forward increased from £1,847 to £4,865.

Transvaal Output, Employment and Working Profits.—Gold output, August, 1938: Witwatersrand, 1,021,502 fine ounces; outside districts, 25,887 fine ounces; total, 1,047,389 fine ounces. Value for purposes of declaration, 142s. per ounce. Total output, July, 1938, 1,027,123 fine ounces. Number of natives employed at end of August: Gold mines, 318,074; coal mines, 17,047; total, 335,121. Total estimated working profit, August, 1938: Witwatersrand, £2,693,988; outside districts, £9,722; total, £2,703,710. Total working profit, July 1938, £2,618,059.

Parnall Aircraft, Limited.—The profit for year to July 31, 1938, amounted to £89,287, compared with £26,782 for preceding year. To provision for income tax, £22,500. To reduction of preliminary expenses account, £10,971. A debit balance of £22,066 brought into the accounts has been wiped out. The £33,750 available is to be utilised to pay a first dividend of 7½ per cent.

Leyland and Birmingham Rubber Co.—Net profits for year to June 30, 1938 £81,830, against £97,325. The latter figure is after reserving £22,450 for tax. Deduction for depreciation, etc., £22,247 (£27,778). Ordinary dividend 11¼ per cent., against 12½ per cent. To reserve £7,500 (£5,000). Carry forward raised from £30,615 to £31,445.

COTTON PRODUCTION IN THE UNITED STATES

	Production (In thousands of 500 lb. bales)	Crop condition on August 1st per cent.	Yield per acre lb.
1933	13,049	74	212·7
1934	9,636	60	171·6
1935	10,638	74	184·2
1936	12,399	72	197·6
1937	18,946	81	266·9
Forecast 1938	11,988	78	217·9

ravages by the boll weevil, but reports suggest that loss from this source will be slightly below the average. Much, however, still depends on the weather in the cotton belt during the next two months. In view of these statistics, there is every indication that supplies this season will be far larger than consumption, and that the carry-over next July will be the largest ever known. A period of relatively low prices for cotton may therefore be expected, although any important decline in prices may be checked by the possibility of a loan from the United States Government to the farmers. The granting of such a loan is mandatory if the price in Southern markets falls below a level of about 8.30 cents, or if the crop at any time should be estimated by the Government to exceed 13,000,000 bales

INDUSTRIAL REPORTS

TRADE in most centres is still affected by local holidays. There is, however, a better tone in the Glasgow coal market. More inquiries are also recorded in this area for steel and output shows a slight improvement. The estimate of the United States cotton crop has been a bearish factor in Manchester, where there are fears of a further fall in cotton prices.

Coal

Newcastle-on-Tyne. — Northumberland steam collieries working under a system of curtailed production are in a slightly better position, but it will take considerably more trade to provide for full production and clear some of the stocks. The Durham section is very quiet, collieries being fortunate to work a full week. Local industrial trade shows no improvement and buyers abroad have no interest in the market. Patent oven coke has a steady outlet to the Scandinavian countries, but owing to the lack of home trade most makers are curtailing production.

★

Glasgow.—The rather brighter market which has developed since the pit holidays is well maintained. In the export branch new business has not materially expanded from its recent meagre volume, but contract supplies are being taken up more regularly, and increasing stocks are a less common feature. Washed nuts are moving fairly steadily all round, with pearls fully booked up for some time ahead. Apart from one or two prime brands, however, round coal is freely available. There are more indications of a stocking movement in house coal, and washed nuts are finding a better outlet to the public utility undertakings.

★

Cardiff.—The Greek Pelopenese Railways have invited prices for the supply of about 29,000 tons of large coals or patent fuel, while the Thessaly Railway have inquired for about 5,000 tons of coal. The Greek Navy have asked for prices for about 8,000 tons. In recent years, Germany has made big inroads into the Greek market and has secured the biggest portion of these orders. Apart from this, demand on the Cardiff market has been slow again this week and there seems little likelihood of any early expansion in the volume of business. As yet, however, there was no sign of any general easing in prices and only in very few instances have sellers made concessions. Shipments, foreign and coastwise, were severely curtailed last week on account of the holidays. They amounted to 184,000 tons compared with 366,700 tons in the previous week and 235,269 tons in the same period of last year. For the current year to date exports from the South Wales ports totalled 11,588,339 tons, against 12,051,927 tons a year ago.

Iron and Steel

London.—Holiday conditions continue to influence the iron and steel markets and will be much in evidence for the remainder of this month, according to the official report of the London Iron and Steel Exchange. In many districts consuming works will close down for the annual break and deliveries of steel will be suspended. Business in the pig iron section of the market has been on a restricted scale for some time and the majority of users are working on their stocks. As a result new orders are scarce; but it is reported that inroads are being made in the heavy accumulations which have weighed on the market since the beginning of the year. The demand for some of the special descriptions of pig iron which are largely used by the heavy engineering works is well maintained.

The situation in the semi-finished steel department is not likely to show any signs of improvement until later in the year when the autumn demand begins to make itself felt. Considerable stocks exist at consumers' works and although these are being gradually absorbed they are sufficient in the present state of the demand to check new purchases.

There is an irregular demand for finished steel; but recently business in some of the lighter descriptions has been more active. In the heavy steel branches of the industry, production continues at a good rate and the works have enough in hand to keep them employed for some months. Export orders of importance are scarce; but lately there has been some expansion in the volume of inquiry from overseas markets.

Middlesbrough.—Business on the iron and steel market is extremely quiet as is usual during August, and five more blast-furnaces have been or will be put out of operation during the next few days. Shipments of pig iron from the Tees for the first nine days of August amounted to 1,197 tons, against 670 tons during the same period in July, one parcel being shipped to Scotland. In the steel trade it is almost impossible to get re-rollers to accept deliveries of semi-manufactured steel There has been some improvement in demand for lighter steel, whilst producers of heavy finished steel continue well employed. Owing to the reduced number of blast-furnaces now operating there is little demand for blast-furnace coke, and importations of foreign ore are considerably reduced. There is no demand for iron and steel scrap. Next week is the local holiday week and steelworks and foundries will be closed.

★

Glasgow.—Holiday conditions still influence the markets in some directions, but generally in this district there has been more business placed and inquiries are more promising. Steelmakers are busy and have booked a fair tonnage during the week. Demand for black and galvanised sheets also shows some improvement. Bookings of light structural material have been particularly good and include some valuable contracts for Glasgow firms. In almost all branches business shows a slight improvement over recent weeks.

★

Cardiff.—The tinplate trade was slow to settle down after the interruptions of holiday week. Export demand was weak and again little business was concluded; steel sheets were in slow request. The statistical position of the tinplate and sheet industry is shown in the accompanying table.

Tinplate Industry Statistics

	Week ended July 24, 1937	Week ended July 16, 1938	Week ended July 23, 1938
Production—per cent. of capacity	78·32	46·48	48·95
	Week ended Aug. 3, 1937 Tons	Week ended July 28, 1938 Tons	Week ended Aug. 4, 1938 Tons
Shipments	6,206	5,942	5,151
Stocks (warehouse and in vans).....	1,442	5,173	1,439
	Thirty-one Weeks ended Aug. 3, 1937 Tons		Thirty-one Weeks ended Aug. 4, 1938 Tons
Shipments	257,764		151,349

Textiles

Cotton (Manchester). — The United States Government's crop estimate of 11,988,000 bales was about 500,000 bales more than expected. It is quite evident that the crop has made a good start. The fall in prices has not been important, selling of futures being checked by the probability of a Government loan to farmers. It has been another unsatisfactory week for spinners. Only hand-to-mouth buying has occurred in the American section, and curtailment of output tends, if anything, to increase. In the Egyptian branch considerable interest has been taken in the change in the price-fixing scheme. A special rebate of 5 per cent. from the gross price of yarns has been made to firms who will undertake to do all their business with mills in the agreement. This decision has caused some confusion. Cloth demand has continued very restricted, and the turnover has again consisted of retail lots to meet the urgent requirements of buyers. In all sections of the market there is a distinct fear of lower prices, owing to the enormous supplies of raw cotton.

★

Jute (Dundee).—Business in the jute trade continues slow and the accumulation of orders for yarns and cloth over the holiday period has been small. Prices are well maintained, but spinners and manufacturers are still unable to obtain the higher terms so necessary to meet the recent advance in prices for raw jute, which have been fluctuating to some extent. No further progress has been made in Calcutta with the expected agreement amongst the mills for a restriction of production. Only a very small proportion of the mills are refusing to sign the draft agreement, and it may be that the other mills, merchants, shippers and brokers will boycott them in order to force them to co-operate with the majority. The prolonged controversy continues, with no sign of any immediate settlement, and all the time stocks of goods in Calcutta are increasing; stocks of hessians are estimated at 433 million yards, compared with 186 million yards on January 1st of this year, while stocks of sackings have risen from 82 million yards to 188 million yards.

THE COMMODITY MARKETS

THE downward trend of the prices of primary products continued during the past week, an indication that consumers are not yet prepared to start a large-scale re-stocking movement. Nevertheless, current prices still remain above those quoted before the upward movement in June. In retrospect the sudden rise of prices in June appears to have been in the nature of a false start, though additional evidence of economic recovery in the United States might well initiate a further spurt. Moody's index of the prices of staple commodities in the United States (December 31, 1931 = 100) fell from 146.8 to 142.5 during the week ended last Wednesday. A month ago the index stood at 146.0 and a year ago at 206.8.

Metals

Copper.—As a result of the holiday influences and the more reserved advices from the United States, the copper market was much quieter. The turnover on the London Metal Exchange this week contracted considerably and the standard cash price, at £41 3s. 9d. per ton, closed with a net loss of 10s. Nevertheless, the undertone of the market has remained firm and operators are looking for an improvement in the autumn. Whether this optimism is justified depends primarily on the trade outlook in the United States, which is at present still as obscure as ever in the last three months.

★

Tin.—Tin has fluctuated within narrow limits this week and closed at £194 per ton, a loss of £1 5s. on last week's close. There has been again very little demand on consumers' account, and although recently an increase in the activity of the Welsh tinplate industry has taken place, current consumption of tin is still disappointingly low. The I.T.C. appointed last week Mr R. G. Mills, a director of various companies dealing with Brazilian produce, as manager of the buffer pool.

★

Lead and Spelter.—Both metals moved in sympathy with the copper and tin markets. Lead closed 6s. 3d. down at £14 6s. 3d. per ton, while spelter lost 1s. 3d., to close at £13 16s. 3d. per ton. Turnover of both products was very small this week. Stocks of zinc in the United States fell from 3,500 short tons in June to 146,200 short tons in July. This fall, the first decline since August, 1937, was due to the increase in deliveries from 29,250 short tons to 33,800 short tons, while production fell by 430 tons to 30,360 tons. Even at the higher level, however, deliveries remained still well below the level of July, 1937, when they amounted to 49,700 short tons. The level of metal stocks in this country is discussed in a note on page 341.

Grains

WHEAT prices sagged further last week, and are generally 1s. to 1s. 9d. per quarter lower, particularly in the forward positions. The latest estimates of the American winter wheat crop are about 25 million quarters lower than the previous ones, which was not unexpected. The Canadian Wheat Board has fixed a flat rate of 80 cents a bushel, on the basis of No. 1, Northern, Fort William, as the price to growers for the 1938 crop. As there is no differentiation over the season, it is expected that there will be heavy marketings directly after the harvest. Maize prices also weakened at the close of the week; buyers are waiting for more definite information on prospective crops of wheat and barley. Barley prices also declined, with a slow demand and selling pressure from Russia; at present prices, barley is highly competitive with maize as a feeding stuff, a relationship which may be expected to continue in view of the short Argentine maize crop.

Other Foods

Provisions.—The meat trade has been dull and prices have tended to sag. The bacon market has been steadier, but prices of Dominion butter, after being firmly held early in the week, declined later by about 1s. per cwt. Eggs were dearer and English (15-15½ lb.) were quoted at 17s. to 17s. 6d. per great hundred.

★

Colonial Produce.—Spot sugar prices were unchanged during the week, but forward rates were reduced by 1½d. per cwt. Cocoa, coffee and tea prices were firmly held, against a moderate demand.

★

Fruit and Vegetables.—There was a good demand for the moderate supplies of English potatoes and prices were generally higher than a week ago. After a dragging trade over the week-end, demand for fruit and other vegetables improved; lettuces sold well and prices of English tomatoes rose to 3s.-5s. per 12 lb.

Miscellaneous Commodities

Oils and Oilseeds. — Markets generally are quiet and affected by the trend in wheat prices; the expectation of good crops of linseed in the United States and Argentine also has a depressing effect. Little business was done in this product, or in Egyptian cottonseed. The price of linseed oil has again fallen to nearly the lowest quotation of this year. The demand for cotton oil is quiet and that for oil cakes has sharply fallen.

★

Rubber.—The market has been dull and prices steady; standard sheet on the spot closed at 7⅛d. per lb., a gain of ⅛d. per lb. on the week. The increase in stocks outside the regulated area in June amounted to 1,727 tons.

therefore, uneconomic to transport lignite for any distance, and much of the output is used in the great power stations in Saxony and the Rhineland, which have been specially designed to use fuel of low efficiency. Some

GERMAN OUTPUT OF COAL AND LIGNITE
(Million Tons)

	U.K. Coal	Germany				
		Coal	Lignite			
			Rhineland	Central	E. Elbe	Total
1913	287	190	20·3	38·7	25·9	87·2
1929	287	163	52·8	71·3	47·4	174·5
1937	241	180	†	†	†	185·0

† Not available.

lignite is sold in the open market in the form of briquettes, but an increasing proportion of the total output is now used for the production of synthetic liquid fuels; the Union Rheinische Braunkohlenskraftstoff A.G. was formed in January, 1937, to produce motor spirit and Diesel oil from lignite. It is of interest to note that lignite is one of the few minerals of importance which exists in any quantity in the new province of Austria.

Boom in Vanadium.—Vanadium is one of the lesser known, though important, steel alloy metals whose importance as an armament metal is derived from the fact that the addition of a comparatively small quantity to steel not only increases its hardness quite remarkably, but also its resistance to strong torsional strains. Rhodesia is the principal source of supply, the only other producing countries being South-west Africa, Peru and, to a minor extent, the United States. Although recent output figures are only available for Northern Rhodesia, production is understood to have increased substantially. The British South Africa Company, the owner of the Northern Rhodesian mineral rights, has just announced that Northern Rhodesia's vanadium output amounted to 78,805 lbs. in July, compared with 47,788 lbs. in July, 1937, thus bringing the total output for the first seven months of this year to 461,834 lbs., against 268,003 lbs. in the corresponding period of 1937. In spite of the rapid expansion of output, vanadium prices have not suffered from the general setback in commodity prices, but as the price of the metal is privately arranged for each contract between buyer and seller, details of recent price changes are not available. The indications are, however, that the market in vanadium will remain firm in spite of the increase in supplies.

INDUSTRIAL REPORTS

THE flow of new orders to industry continues to be hampered by the political crisis. Exporters, moreover, were harassed by the difficulties of insuring war risks. Coal production is now running well below the level of a year ago; the quantity raised in the week ended September 10th was 3,985,000 tons, against 4,550,100 tons in the corresponding period last year. New business remained limited. The iron and steel markets were a little more active, but the volume of transactions is still small. The limitation of working hours in Indian jute mills, ordered by the Government of Bengal, has brought a ray of hope to Dundee manufacturers. In the cotton industry, the Board of Trade, with the consent of the Treasury, has extended the operations of the Surplus Spindles Board for a further period of twelve months from September 14. A more detailed account of the course of industrial activity is given in the *Trade Supplement* accompanying this week's issue of *The Economist*.

Coal

Newcastle-on-Tyne.—The steam coal section of the North-East coal market remains fairly steady with prices firmly quoted. Shipments are increasing and there has been some Scandinavian buying from consumers who have been holding off the market expecting a fall in prices. Durham coking and gas coals show little change; idle time is a common occurrence among collieries producing these grades, and apart from some seasonal increase in trade there is no indication of any improvement. Patent oven coke has a steady outlet in the export section but inland business is unsatisfactory.

★

Workington.—The coal trade is a little brisker, chiefly because merchants in Eire and Ulster are taking the last opportunity, before prices are raised next month, of increasing their winter stocks. Landsale, too, is somewhat better. But needs of industrial fuel are smaller on account of short-time working at the coking plants supplying the furnaces on hematite pig iron. Prices are steady.

★

Glasgow.—Though the political news has tended to put a restraint on new export business, this section of the trade has improved during the week. Danish buyers have been operating more freely, and there has also been more inquiry from Sweden. Business with Norway and Finland, however, remains dull. Germany is reported to be operating steadily on contract. The week's shipments were better at 221,000 tons, bringing the total for the year to date to 7,345,000 tons, against 8,835,000 at this date last year. Nuts are now all strongly held in the shipping market, the London trade moving steadily. Home business remains satisfactory on the whole.

★

Cardiff.—Business continues very quiet on the Cardiff coal market. The strained political situation in Europe has not produced even a ripple of new inquiries; on the contrary, the increase in rates to cover war risks on cargoes has had a restrictive effect. Shipments in the foreign and coastwise trades at the docks of the Great Western Railway Company last week totalled only 344,500 tons, against 376,400 tons the previous week and 436,814 tons in the corresponding week last year; and for the current year to date the decline in the volume of the foreign and coastwise trades amounts to nearly a million tons, or over 7 per cent. There are tentative inquiries in the market for a few cargoes of large and small coals for Australia. Prices are unchanged, and except for sized grades supplies are abundant. The depressed conditions of the patent fuel trade is shown in a further decline of output and exports.

Iron and Steel

London. — The weekly report of the London Iron and Steel Exchange indicates that markets have been overshadowed by the international crisis. The undertone has been firm and there are indications that overseas buyers have awakened to the risks of allowing their stocks to become depleted. In the home market more business has been moving in several departments than for some time.

Business in pig iron, while still well below normal, has shown signs of reviving, and in the case of foundry iron the stocks of foreign material which have been weighing on the market for many months appear to have been largely absorbed. As a result home producers are experiencing a slightly more active demand.

Trading in the semi-finished steel market, also, has developed greater activity, although there is still room for a considerable expansion. The process of the absorption of stocks is progressing steadily and there are indications that the usual autumn expansion in demand is approaching.

The situation in the finished steel section of the market is irregular. The heavy steelmakers have still a considerable tonnage of work in hand, but their reserve of orders has been greatly reduced. Conditions in the lighter branches of the industry have shown some improvement, but there is a fair amount of unemployed plant. The inquiry from overseas, however, has been on a larger scale than for some time.

★

Middlesbrough.— Having now liquidated the greater part of imported material, consumers of foundry pig iron are more inclined to negotiate for their future requirements, but as prices are fixed until the end of the year and stocks in makers' yards still substantial, there is no difficulty in obtaining delivery and no inducement to purchase forward.

Production of Cleveland foundry pig iron is intermittent and there is no reason for an increase. East Coast hematite production has been brought more into line with the lower level of demand. Consumers in the Midlands are still not taking full delivery under existing contracts. Some small parcels of special iron have been sold for export, and during the past week one lot of 900 tons has been shipped via Hamburg to Czechoslovakia, whilst a further parcel of 500 tons has been shipped to France. Shipments of pig iron from the Tees during the first 19 days of September amounted to 3,218 tons, compared with 1,889 tons during the same period in August.

No decision has yet been reached regarding the price of heavy steel scrap to be applied during the last quarter of this year, and it is understood that nothing will be decided until October. In the meantime, steelworks are restricting deliveries to the minimum. Imports of ore have been further reduced and the quantity imported into the Tees during the first 19 days of September amounted to 39,175 tons, compared with 64,175 tons during the same period in August. Blast-furnace coke is in small demand with the supply ample.

Semi-finished steel is in little request, and whilst heavy steel makers are fairly fully employed, they are anxious to have replacement orders.

★

Workington.— No sign of improvement in the North-East Coast hematite pig-iron trade can be detected. Though the number of furnaces in blast between Workington and Barrow is four fewer than in June, production is more than ample for needs and stocks are now estimated to exceed 100,000 tons. Deliveries, mainly to the Midlands, Scotland and South Wales, represent only an inconsiderable tonnage, and local consumption has decreased by a third. Any further curtailment of output is for technical reasons impracticable, but if the depression continues, the entire closing down of one of the plants cannot be prevented. Prices remain at the fixed minimum and it is stated that they will not be revised until the end of the year. Malleable iron is an extremely moderate trade at £8 5s. per ton, delivered at Birmingham, and a like statement applies to ferro-manganese at £18 15s. per ton, home, the output of which exceeds the quantity which can be marketed.

The outlook in the steel trade is uncertain. Orders on the books are fast being worked off, and new business is not sufficient to encourage the hope that the rolling mills at Workington may be kept in engagement for more than three weeks in four. Native ore, at 24s. 6d. per ton, f.o.t., is in diminished local request and none is being sent outside the district. Production has decreased of late.

★

Glasgow.—Markets are still affected by the present political situation and buyers are still holding back. At the same time there is some improvement, although individual orders placed do not involve any great tonnage. Heavy steelmakers have still much work on hand. In the lighter branches order books are not so well filled, but just recently there has been more business placed, although not sufficient to warrant putting any additional plant into operation. There is also a better demand for semis, but not of sufficient magnitude to keep the available plant in operation.

★

Cardiff.—The position in the tinplate industry is practically unchanged, and the sheet trade is relatively even more depressed. Production in tinplates in the week ended September 10th was equal to 47 per cent. of capacity compared with 77.46 per cent. in the corresponding week last year, while the black and galvanised sheet mills are operating at only about one-third of capacity. Under the renewed Cartel Agreement, prices in South Wales continue at 21s. 6d. per basis box except for certain markets, where 20s. 3d. per box is quoted, according to the reduction made by the Cartel last April. Galvanised sheets are stable at £16 15s. per ton for export. There are no signs of an improvement in the heavier branches of the industry.

Textiles

Cotton (Manchester).—The market has been dominated by political developments. Traders have been harassed to an increasing extent by the question of war risk insurance. Wide fluctuations have occurred in foreign exchange rates, and business has been carried on with much difficulty. Raw cotton prices have not shown much change. The American crop appears to be doing well. Stocks of raw cotton in Great Britain now total 1,164,278 bales, against 691,000 bales a year ago.

Spinners have bought more Egyptian cotton, probably as a hedge against the contingency of interference with the Mediterranean shipping route.

The yarn market has been unsettled by fears that the American ring price agreement might be abandoned. There has been more demand for both American and Egyptian yarns, but no important transactions have taken place.

There has been a larger inquiry for cloth, but although there has not been any general improvement in turnover, rather more orders have been booked. There has been more activity for India, while further buying has been recorded for South America. Useful orders have also been secured for Java and Hong Kong. There has not been much business passing for Egypt and the Near East, while purchases for the home trade remained limited. Some Government contracts are pending.

★

Jute (Dundee).—In consequence of a decree issued by the Governor of Bengal, the Indian jute mills will curtail their working hours to 45 hours per week from September 26th. An exception is made in the case of five small mills, which will be allowed to run 72 hours per week until they have installed 175 looms. The effect of this measure has been lost on the market by the political crisis, but prices have advanced steadily, if slowly, during the past ten days, and if political tension subsides, a more marked improvement should be seen in the jute industry. Buyers are uncertain how to act, but there is always a quiet business being done in most commodities and prices are tending to advance.

The Indian jute mills are steady purchasers of raw jute, which tends to keep up prices. Moreover, the official estimate points to a short crop this year, and the forecast may be more correct than hitherto, in view of the pains taken by the Indian Central Jute Committee this year to secure more accurate returns. The consumption of the Indian mills this season will not be less than six million bales, and they will require to purchase this quantity to prevent further inroads into their already reduced stocks; as other consuming centres are expected to require four million bales, world consumption may amount to ten million bales, against a crop officially forecast to yield 6,696,000 bales. The price of Daisee-2/3 is £19 per ton for the full group, and for Tossa-2/3 £20 is lowest, October/November.

Jute yarns are in better demand and spinners have raised their prices for common 8-lb. cops to 2s. 1d., with 10½ oz. 40 in. hessians 2⅛d. and 8 oz. 2d.

THE COMMODITY MARKETS

THE upward trend of prices noticeable last week has been reversed, both here and in the United States, but movements in the prices of individual primary products were far from uniform. Thus wheat prices, which were marked up sharply last week on fears of war, fell as suddenly when this danger receded. Non-ferrous metals, on the other hand, advanced in price with the improvement in American demand, spelter being also sustained by hopes of a revival of the international cartel. Most markets, however, are still swayed by political rather than by economic developments.

Moody's index of the prices of staple commodities in the United States (December 31, 1931 = 100) fell from 145.6 to 143.3 during the week ended last Wednesday. A month ago the index stood at 143.8, and a year ago at 192.6.

Metals

Copper. — After rising to £43 7s. 6d. per ton on more favourable news of the international situation, standard copper declined to £42 10s., and thus closed the week with a net gain of £1 1s. 3d. The undertone of the market has improved sufficiently in the last few days to weather the storm of very large profit-taking sales by speculators without major losses. Reports from United States consuming centres continued favourable this week, and it was not surprising, therefore, that the United States domestic price was again raised by ¼ cent to 10⅞ cents per lb. on Monday.

★

Tin. — The price of tin, after a rise at the end of last week, relapsed again on Tuesday, since when it has been stable at £195 5s. per ton, a net gain of £2 15s. compared with the previous Wednesday. In spite of the maintenance of the low tin quota for the remainder of this year, offerings of the metal are still plentiful. On the other hand, United States consumers are again asking for nearby delivery of tin, which suggests that their stocks are running

EASTWOODS, LIMITED

CONDITIONS IN BUILDING TRADES

The eighteenth ordinary general meeting of Eastwoods, Limited, was held, on the 21st instant, in London.

Mr Horace Boot, M.Inst.C.E., M.I.Mech.E., M.I.E.E. (chairman and managing director), in the course of his speech, said: To the net profit of £59,860 14s. 1d. we must add the amount brought forward of £15,300 15s. 5d., making a total of £75,161 9s. 6d. The directors now recommend the payment of a final dividend on the ordinary shares of 7½ per cent., making a total of 12½ per cent. for the year, leaving to be carried forward £17,161 9s. 6d.

The prosperity of the building trades must be measured by methods other than mere reference to the number of houses erected. The unlimited construction of dwelling-houses could not be expected to continue indefinitely, and plans already approved, coupled with schemes under consideration, and others known to be held in abeyance, should be sufficient to keep the industry actively engaged. The Eastwoods Group have already begun to transfer their merchanting interests to the Midlands and the North, where delayed housing construction may now be expected to proceed in conjunction with the Government re-armament programme.

We are most largely interested in the manufacture and distribution of bricks, and are the largest and oldest stock brick makers in the country. The continued popularity of the brick for all purposes of building construction is indicated by the total output for 1937, which exceeded eight thousand millions, and which may be expected to be even higher still for the year 1938.

The profit reduction is due to higher costs, increased taxation, and to reduced margins on the coal merchanting side, coupled with legislation which we cannot control. There were lower receipts from external investments in Government and other securities, and the previous year also had the benefit of certain non-recurrent profits.

The confidence of the public has been thoroughly shaken for several months past by political uncertainty and the rumours of war—most of which have been exaggerated, but the repercussions on trade are now reflected in the results obtained. I think, on the whole, we may shortly look forward to better times.

The report and accounts were unanimously agreed to.

TANGOEL RUBBER ESTATES, LIMITED

SATISFACTORY CONDITION OF PROPERTY

The annual ordinary general meeting of the Tangoel Rubber Estates, Limited, was held, on the 20th instant, at the registered office of the company, Fenchurch House, 5 Fenchurch Street, London, E.C., Mr. Walter Hilliers (chairman of the company) presiding.

The representative of the agents and secretaries (Messrs Rowley, Davies and Co., Limited) having read the notice convening the meeting and the report of the auditors,

The Chairman said: Gentlemen,—the accounts do not, I believe, call for any explanations; however, in case any of you may be asking yourselves why the balance on revenue account is smaller than last year, although the crop and the price realised are about the same, I would explain that the difference is due first of all in a large measure to the much higher export duty in Java this year, as against the previous year, and, furthermore, the amount debited to profit and loss account for replanting is larger; the necessity of buying certain licences is also, to a certain extent, a contributory cause.

As the report gives you the necessary details as to crop, the average selling price and also the forward sales, there is no need for me to specially refer to these matters.

The visiting agent's report as regards the condition of the estates is in every respect satisfactory.

I will now move: "That the directors' and auditors' reports and audited balance sheet and accounts to June 30, 1938, as circulated to the members, be taken as read, and that the same be and are hereby adopted, and that a dividend of 5 per cent. on the share capital of the company be declared and paid forthwith to the members on the books of the company at this date."

Sir Edward Rosling seconded the resolution, and it was carried unanimously without question or comment.

The retiring director, Mr Basil Worthington, was re-elected; and the auditors, Messrs Tribe, Clarke, Painter, Darton and Co., having been re-appointed, the proceedings terminated.

(*Continued from page* 613)

low or that industrial prospects are judged with more confidence.

★

Lead and Spelter.—The price of lead rose to £16 2s. 6d. per ton on Monday, but closed on Wednesday at £15 17s. 6d. per ton, a gain of 7s. 6d. per ton on the week. On Tuesday sales of lead on the London Metal Exchange reached the highest daily level in this year, but the market proved quite capable to absorb the supply without major losses. No new reports regarding the lead restriction scheme have so far been received, but the improvement in the value of building plans passed in August is a hopeful sign for the future consumption of lead. Spelter gained only 3s. 9d. this week and closed on Wednesday at £14 6s. 3d. per ton. The spelter position is discussed in a special industrial note on page 610.

Grains

THE wheat market has been dominated by the political uncertainties of the past week. Sharp price advances occurred on several days, but on Wednesday there was a relapse, as the prospect of war became less likely. The market was also helped by a semi-official statement that sales of Russian wheat have been stopped for the season. There has been a better demand for Manitoba wheat, for which prices have risen by 1s. per quarter or more during the week: the prices of other varieties are little changed on balance. The area sown to wheat in the Argentine is estimated at 20 million acres, against 17.6 million acres last year. Prices of maize and barley were also affected by international developments, and by the increase of the official quotations for war insurance. Maize prices, however, lost early in this week most of the gain recorded previously, but barley prices have remained 1s. to 1s. 6d. per quarter higher than in the middle of last week, largely owing to the absence of offers from Russia.

Other Foods

Provisions.—Dominion butter fell by 3s. to 4s. per cwt. on the week, but Continental prices were maintained, against a slow trade. Demand for chilled and frozen meat has been good, but home killed meat sells less readily.

★

Colonial Produce.—Sugar prices were raised by 1½d. per cwt. for all kinds at the end of last week, since when the market has been steady. There was a firm demand for tea, with prices tending to rise. The cocoa and coffee markets have been quiet.

★

Fruit and Vegetables.—Supplies of English potatoes have been heavy at the Borough, but prices were maintained. Trade in other vegetables and in fruit was very slow over the week-end, but improved on Wednesday, when there was a considerable trade at somewhat lower prices.

Miscellaneous Commodities

Oils and Oilseeds.—Business has been disorganised by the political uncertainties and by the revised insurance rates for war risks, and the volume of transactions in these markets has been very small in the past week. The demand for linseed has fallen and is now confined to Calcutta afloat. Egyptian cotton seed, quoted at £6 7s. 6d. per ton on passage to Hull, is firmer in price, as are most vegetable oils; the price of linseed, after a rise at the end of last week, relapsed by about 10s. per ton.

★

Rubber.—Industrial news from America continues to be optimistic, but the rubber market has been dominated in the past week by the political crisis. The price of standard sheet on Wednesday, at 8 1/16d. per lb., showed a gain of ⅛d. to 3/16d. per lb. on the week, but this rise reflected little more than a slight easing of the international situation.

Births, Deaths and Marriages in England and Germany

The following charts show the birth, death and marriage rates in England and Wales and Germany in 1913, 1928, and the period 1932 to 1937. In the case of marriages in Germany since 1933, the proportion of couples accepting State loans is indicated.

Finance

GOVERNMENT RETURNS

For the week ended September 17, 1938, total ordinary revenue was £12,370,000, against ordinary expenditure of £18,228,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £150,378,000, against a deficit of £89,293,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On September 16th, applications at £99 15s. 3d. per cent. for bills to be paid for on any day of the following week were accepted as to about 66 per cent. of the amount applied for. Applications at higher prices were accepted in full. £40·0 millions of Treasury bills are being offered on September 23rd.

L. M. S.

A Great Heritage

The London Midland and Scottish Railway is a fusion into one of 364 original transport systems, and it is the largest commercially-operated undertaking in the world. The genius of Stephenson was the touch stone upon which this vast organisation was originally founded; the placing of the steam locomotive on metal rails created the greatest revolution in transport that has ever taken place in history; and we can truly take pride in the fact that this was Britain's gift to the world.

Not only did railways originate in this country, but we were the first to develop them. The railways now forming the L.M.S. exercised a strong creative influence on social and industrial development during the last century. They soon obtained a pre-eminent position for comfort, speed and general efficiency for the handling of traffic, and to-day, welded as they are into one organisation, the efficiency of the undertaking has kept in step with progress in the civilisation which we enjoy.

The Minister of Transport stated in the House of Commons as recently as June 17th of this year: "Any Minister of Transport must speedily be impressed by the vital character of the railways as the transport core of the country and the high degree of efficiency and enterprise with which the railways are operated."

The building up of the railways has not been without trials and difficulties. Opposition based on the interests of individuals or on the lack of foresight on the part of authorities placed heavy additional burdens on the lines when they were promoted, and these have had to be overcome as well as possible. The official records contain luminous accounts of the early struggles.

But it is now universally recognised that the maintenance of an efficient railway system is a national necessity, and the London Midland and Scottish Railway, with its great heritage, is unceasing in its efforts to fulfil the transport requirements of the community. To-day the L.M.S. is not merely a railway company, it is a comprehensive transport system in itself; it employs every form of transport in its endeavour to provide efficient service. The history of the last 100 years is inevitably bound up with the railways now forming part of this great group; but it is equally certain that when the history of our times comes to be written the L.M.S. will earn an important place in the story.

Introduction

THE London Midland and Scottish Railway Company, created in 1923, under the Railways Act of 1921, is not merely, in point of size, the largest railway undertaking in the United Kingdom. It is by much the largest non-Government business enterprise in the United Kingdom, and it ranks among the greatest undertakings of any country in the world, with an annual revenue exceeding that handled by many sovereign States. Although its active interests are limited to an area bounded by Londonderry, Thurso, Swansea and Hamburg, it has outposts as far afield as Paris, New York, Chicago and Los Angeles. Its stockholders' capital (the whole of which received dividends last year), totals £414 millions, compared with £74 millions for Imperial Chemical Industries, Limited, £67 millions for Lever and Unilever, Limited, and £50 millions for the Imperial Tobacco Company (of Great Britain and Ireland), Limited—to name three of the largest non-railway companies of this country whose shares are familiar to the British investor.

Last year, the London Midland and Scottish Railway paid approximately £41½ millions in wages and salaries to its staff of 232,000 workers. Its 7,945 locomotives and rail motor vehicles travelled, in all, some 235 million miles, on a total track (including sidings) of 19,296 miles, whose renewal and maintenance involved the consumption, in the single year 1937, of nearly 97,000 tons of new rails and 1,663,000 new sleepers. Nearly 460 million passengers (including season ticket holders) travelled on the company's system last year, and over 140 million tons of merchandise were moved on it. Even the subsidiary and ancillary services of so vast an undertaking make a substantial contribution to the economic activity of Great Britain. The company, for example, is one of the largest employers of labour in the engineering industry and a leader in the hotel and catering trades.

The contribution of many of the constituent companies in the L.M.S. to the annals of railway development the world over has been epoch-making. The company incorporates the first railway on which steam power was continuously employed in the public service. In different capacities, on the engineering, financial and "diplomatic" sides, its pioneers — like the two Stephensons, Huish, and even Hudson, "the Railway King"—exercised a decisive influence in the drawing of the railway map of to-day.

In the following pages are related the story of the L.M.S.: the history of its construction and development covering more than a century; the outstanding characteristics of its component sections; the progress in technique, organisation and management since the amalgamation in 1923; the personalities who have guided its endeavours; and, finally, its prospects in the future and the part it may be destined to play in Britain's commercial, industrial and social organisation. Our Survey includes, also, a statistical review of the progress of each of the largest constituent undertakings at ten-year intervals from 1850 to the time of their post-war amalgamation, with a similar analysis for the joint undertaking in key years from 1924 to 1937. A complete record is also provided of the rates of ordinary dividend paid by the four most important constituent companies, from their earliest years onwards. Much of this historical material has hitherto been either unpublished or relatively inaccessible to the general student. It is hoped, therefore, that our Survey may combine interest for the general reader with utility to future railway historians.

Constituent Companies of the L.M.S.

THE first main line railway intended to employ steam locomotion for haulage of passenger and freight traffic in the world may be regarded as the birth of the London Midland and Scottish Railway of to-day. It is, therefore, appropriate to begin an outline of the company's history and growth by reference to the London and North Western Railway, the constituent which absorbed the original Liverpool and Manchester Railway, the world's first main line company.

After desperate opposition from local landowners the original Liverpool and

LONDON AND NORTH WESTERN RAILWAY

Manchester Railway was opened in 1830. To George Stephenson may be given the credit for its conception as a steam railway, for the "Rocket" proved, at the Rainhill trials of the preceding year, the practicability of steam locomotive traction. Although the capital cost far exceeded the original estimates, the Liverpool and Manchester proved a highly satisfactory financial investment, its estimated traffic receipts being but a fraction of its actual achievements. Briefly, the line, once completed, fulfilled the most optimistic hopes, both as to the service it offered between the two Lancashire towns, and the reduction it effected in transport charges between the Manchester area and the sea. The economic results of its success were even more decisive. They demonstrated to the whole world that a steam railway was a commercial proposition under suitable conditions, and loosened the purse strings of capital. Actually, a "Liverpool party" was active on most of the

early railway boards. Half the capital of the London and Southampton Railway in 1835, for example, is reliably reported as having been supplied from Manchester and Liverpool, and the latter city may claim to have played the lead in obtaining capital for the construction of the British railway system as a whole. Incidentally, it is significant that the profits of the Liverpool and Manchester Railway were, in early years, derived mainly from passenger traffic.

In modern days, when the centralisation in London of so large a part of the direction of Britain's economic and commercial affairs has provided a national problem of great magnitude, it is sometimes forgotten that, when the British railway system first began to take shape, its main arteries stretched out towards London from the north, rather than radiated from the metropolis. One might legitimately claim that the earliest important railway junction, and the original nodal point of Britain's first large railway system, was at Warrington, in Lancashire. From that town, southwards, was constructed the Grand Junction Railway, opened to Birmingham, *via* Stafford, in July, 1837. Economically built, at a cost of well under £20,000 per mile, the Grand Junction Railway in the early 'forties paid a regular dividend of 10 per cent., and as early as 1837 its shares (£90 paid up) were standing at £186. In the period from 1840 to 1845 it absorbed local lines in Cheshire and Lancashire, and by 1845 the Grand Junction Railway had become comparable in importance with the London and Birmingham Railway, with which it connected at the latter city.

Formation of the L.N.W.

The London and Birmingham Railway, whose Act received the Royal Assent in May, 1833, was not opened throughout, between Euston Grove and Birmingham, until September, 1838. On its completion, however, a passenger could travel by rail the whole way from London to Liverpool or Manchester, or even, in the following month, to Preston. The London and Birmingham was the world's first double track main line of over a hundred miles' length. Like its northern neighbour, it paid an average dividend of 10 per cent. from 1840 to 1845, inclusive. There were many expensive works on this railway —notably the Kilsby Tunnel—and the original estimates of £2,500,000 were far exceeded. The company's Act of Incorporation alone involved total payments of nearly £73,000. A little known provision in it was the power to prevent "the smoking of tobacco" in the company's carriages. Of Hardwick's Doric Arch at Euston much has been written. The works throughout were on the grand scale, typified by the station entrance at Curzon Street, Birmingham, where a board of directors sat, in addition to the London board.

The amalgamation of the London and Birmingham, the Grand Junction and the Manchester and Birmingham (a line opened in 1842, with a capital of £2,800,000), brought about the birth of the London and North Western Railway in 1846. The capital of the L.N.W., on its formation, amounted to the prodigious figure, for that time, of almost £23 millions. The length of this giant of the early Victorian era was 420 miles. Its earliest dividend was at the rate of 10 per cent., but the continued demand for new capital for extensions, acquisitions and improvements had reduced the dividend to 5¼ per cent. by 1850.

Amalgamations and Extensions

The L.N.W. was formed at a period when railway strategy was based, as a matter of course, on the theory that attack was the best form of defence. To preserve its territory from the encroachment of competing lines, the company was virtually compelled to adopt a continuous programme of extension and absorption. The Chester and Holyhead line, opened in 1850, included a number of unique engineering works, notably the Menai Tubular Bridge designed by Robert Stephenson (one of the largest engineering structures of its time), and the somewhat smaller tubular bridge at Conway. Politically, this link was of major importance, since it brought Ireland nearer by several hours to London. The Holyhead and Kingstown steamer service was actually operated by the Chester and Holyhead Railway from 1848 onwards, though it was not until 1858 that the line was finally absorbed by the London and North Western.

By the 'fifties of last century, Huddersfield, Leeds and Dewsbury in the north, and Northampton, Peterborough, Aylesbury, Oxford and Leamington in the south, had all been brought within the London and North Western's ambit. The Trent Valley line provided the company with a speedier route to the north, avoiding Birmingham. It also relieved a good deal of congestion; for before the opening of King's Cross Station the railway traveller from London to York entrained at Euston. Meanwhile, the metals were steadily reducing the gap which separated the London and North Western Railway from the Scottish lines centred on Glasgow. By 1847, the southernmost section of the Caledonian Railway from Carlisle to Beattock had crossed the border. The first through trains from London to Scotland, *via* Carlisle, began to run in 1848, over the metals of the Lancaster and Carlisle Railway, which was leased by the London and North Western in 1859 but not definitely absorbed until 1879.

Thus the project of a West Coast route to Scotland was brought to fruition. Its length of five hundred miles was originally owned by six different railways, and not until 1923 was it to pass under a single ownership, when the London Midland and Scottish Railway took over the whole system, from London to Aberdeen. The four hundred miles north of Birmingham, however, were all constructed to the designs of two engineers acting jointly. One of the early through passengers was Queen Victoria, whose journey was arranged at a few hours' notice at a time when telegraphs were not available. Although the speed on the royal run in no place exceeded 50 miles per hour, its average was as much as 35 miles per hour—a distinctly creditable achievement for a railway, ninety years ago.

The Era of Competition

Table I, on page 14, shows that, on the London and North Western system, the 'sixties and 'seventies were a period of steady growth. In the second half of 1859, the half-year's receipts first passed the £2,000,000 mark. In 1860, goods receipts overtook passenger traffic. During this period, however, expenses were rising somewhat disproportionately to receipts, owing to the inability of the company to digest all its recent absorptions. By the later 'sixties the position had improved. The competitive activities of the Great Western had been kept in check, largely owing to that company's difficulties arising from its mixed gauges. On the east, the Manchester, Sheffield and Lincolnshire (later the Great Central Railway) and the Great Northern had not succeeded in penetrating far into the London and North Western's preserves. The most formidable competition came rather from the rapidly growing Midland system, whose story is told on succeeding pages of this Survey.

Railway politics in mid-Victorian England have a significantly close resemblance to the power politics of Continental Europe to-day, but their outcome was usually one which modern Europe might profitably copy. For these competitive exertions were usually ended by agreement on joint ownership of disputed lines, or by granting running powers to one company over the lines of another. The London and North Western Railway had its full share of these arrangements. It reached Central and South Wales by means of mileage centred on Shrewsbury and Hereford, which was owned jointly with the Great Western Railway. By similar means it reached Birkenhead. Around Preston, Blackpool and Manchester it worked in close relationship with the Lancashire and Yorkshire. In the Lake District, its services were closely linked with the Furness Railway, whose headquarters were at Barrow.

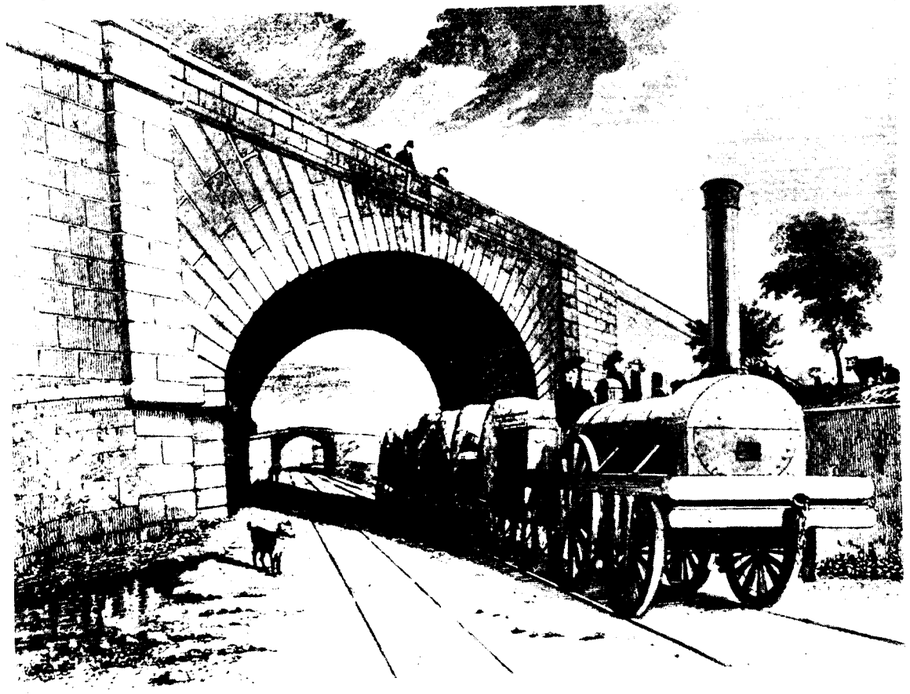
The era of rapidly expanding mileage had so far come to an end by the eighteen-seventies that the London and North Western Railway of that period was much the same system as that which amalgamated with the Lancashire and Yorkshire in 1922. In the intervening half-century, however, vast improvements were made in its organisation, technical development and potential capacities. For example, four lines were made available between London and Crewe, if one counts the alternative routes between Roade, Blisworth, Northampton and Rugby (though there remain to-day some small sections of double or treble track in the Lichfield-Tamworth area). Widenings were also extensive north of Crewe, and in the Liverpool, Manchester, Preston and Chester districts.

The year 1870 was one of considerable prosperity for the company, whose operating ratio was still as low as 47 per cent. As will be seen by a reference to Table I, however, the results for 1880 were even more satisfactory. By that time, however, the operating ratio had started to rise; until in 1921 it was as high as 83 per cent. As a guide to financial prosperity, however, the operating ratio must be related to the volume of traffic.

Abortive Schemes

Certain events during the last thirty years of the nineteenth century require special mention. The London and North Western arranged a close working agreement with the Lancashire and Yorkshire in 1862, and complete amalgamation was the object of a bill of 1872. The opposition of other railways, however, proved too strong, and the project was abandoned. Public opinion, indeed, was not yet ripe for the achievement of a policy which was only brought to fruition after the Great War, when the attitude of Parliament and the nation towards competition on the railways had been entirely transformed. It is, perhaps, not wholly unprofitable to speculate on the value of the savings which the projected amalgamation would have brought to the railways, and the whole country, in the period from 1914 to 1920, and the extent to which the financial position of the London, Midland and Scottish Railway would have been improved during the last ten crucial years if standardisation of rolling stock of these two lines had dated back to the 'seventies instead of to 1922. In all probability, again, certain duplicate routes would never have been constructed at all. An even earlier attempt was made, in 1851, to fuse the London and North Western with the Midland. Had it succeeded, British railway history would have been very different; for St. Pancras Station would never have existed and, in all likelihood, the difficult main line from Settle to Carlisle would not have been constructed.

The London and North Western Railway before 1923 proudly styled itself the "Premier Line." In many respects the claim was justified. Its coaching stock of chocolate and white (or "plum and spilled milk") was probably the finest advertising medium any British railway ever had. Its locomotives were black, but they were kept scrupulously clean. They may not, perhaps, have been wholly as efficient as those of some of its rivals—at any rate, if efficiency be measured by fuel economy. Their varied nomenclature, however, undeniably added to their attraction for the railway enthusiast and the younger generation. At the special request of King George V, the Royal Train still carries the London and North Western colours.



Technical Achievements

While the comfort of its rolling stock, the punctuality of its services and the excellence of its dining cars and sleeping cars did much to enhance the reputation of the London and North Western, in the more technical spheres the company did not lag behind its neighbours. It was early in developing eight-wheeled coaches in 1882, steam-heating and electric lighting in 1895, and the use of metal underframes and all-metal bogies from 1892. It was a pioneer, also, in the design of the corridor coach, and its 2 p.m. express to Scotland, for many years after 1893, was known as "The Corridor." As early as 1905, the company built special vans for motor car traffic. Its constituent, the Liverpool and Manchester Railway, had actually used containers in the eighteen-thirties.

Nor did the company neglect the development of freight traffic. Its famous marshalling yard at Edge Hill, Liverpool, planned in 1873, still remains one of the railway wonders of the world. The same remark applies also to its avoiding subway lines for freight traffic at Crewe, the nodal point of the L.N.W. and the site of its great locomotive works, in a position chosen by Trevithick in the days of the Grand Junction. Even to-day these works, with their potential output of two new locomotives per week, in addition to general repairs to existing engines, remain one of the largest locomotive works in the world. To the rail rolling mill at Crewe (closed a few years ago) all the British railways owe an important debt. This mill first demonstrated the practicability of the long 60-ft. rail, which has become standard for all the British railways only during the last ten years. The London and North Western, in fact, began to use 60-ft. rails in 1894. To Ramsbottom of the L.N.W., again, was due the inauguration of water pick-up troughs. Another special feature of the London and North Western permanent way was the use of a felt pad underneath the chairs in which the rails are set. Interlocking—an important step in the increasing safety of railway operation—was used by the London and North Western as early as 1859. The first railway travelling post office in the world left Euston in 1838.

All in all, the "Premier Line" with the "best permanent way in the world" will remain more than a memory to railwaymen and railway users of an age to know the pre-war London and North Western Railway, and the pride of its staff in their undertaking. It is time, however, to turn to the second of the great constituent lines of the L.M.S. —the Midland Railway.

RAINHILL BRIDGE

Liverpool and Manchester Railway

MIDLAND RAILWAY

The first section of the Midland Railway to be opened was a line between Leicester and Swannington in 1832. The Midland itself was formed in 1844, by the amalgamation of three railways which, by the standards of the time, were already large. They were the Midland Counties (opened in 1839), the North Midland (opened in 1840), and the Birmingham and Derby Junction Railway (opened in 1839). The first of these lines brought Derby into rail connection with Nottingham and Rugby, where contact was made with the London and Birmingham. The second stretched northwards from Derby to Leeds. It was joined at Normanton by the Manchester and Leeds—the earliest important section of the Lancashire and Yorkshire Railway—and the York

and North Midland. Thus Derby was the central point of the Midland at its birth; and it remained so until 1923. At Derby were established the locomotive, carriage and wagon shops, which to-day are still among the biggest railway workshops in the world.

The Midland Railway at its formation had a capital of almost £7,000,000. The North Midland line, constructed at heavy cost, accounted for more than half this sum. The merger company's growth was rapid. By 1850 total capital had increased to over £17 millions; for the company served the Midland counties, where the pace of industrial growth in the mid-nineteenth century was fast indeed. The aim of those who guided Midland Railway policy seemed to have no limits except the sea. In one case even that proved no barrier, when the Midland reached out to Londonderry. For the company's forward policy, at this period, George Hudson, the "railway king," was largely responsible.

Battle of the Gauges

Among early absorptions was that of the Birmingham and Gloucester, which had been opened in 1840. As that company was a standard gauge, and not a broad gauge, line, it was welcomed by the London and Birmingham, which allowed the Birmingham and Gloucester to use its station at Birmingham, the forerunner of the present New Street. At Gloucester were staged some of the bitterest scenes in the "battle of the gauges." The Great Western, with its 7-ft. gauge, was outmanœuvred by the Midland when the latter obtained control of the broad-gauge Bristol and Gloucester Railway—a daring move, since the Midland could not operate through trains into Bristol until the broad gauge had been changed to standard, in 1854. Beyond Bristol, however, further Midland progress towards Devon and Cornwall was effectively blocked by the 7-ft. gauge Bristol and Exeter, South Devon and Cornwall Railways, which were all within the Great Western's sphere of influence. The Midland, by constructing a line to Bath, was able at a later date to reach the English Channel at Poole, through joint ownership with the London and South Western Railway of the Somerset and Dorset line. That connection played no unimportant part in building up Bournemouth as a favourite holiday resort for the industrial towns in the Midland Counties, Lancashire and Yorkshire.

Space forbids detailed description of the network of lines gradually built up by the Midland in the South Yorkshire coalfield and the West Riding. The company reached Skipton in 1846, and, by absorbing a local line, touched the Irish Sea at Morecambe in 1852.

The Midland Reaches London

The year 1858 was an eventful one for the Midland. By constructing a line from Leicester to Hitchin, passing through Bedford, the company was enabled to use the King's Cross terminus of the Great Northern Railway. For the first time, it could successfully tap the London traffic. Such an arrangement, however, could not long remain satisfactory. Congestion and endless delays occurred in the bottleneck between Hitchin and King's Cross which passed over the Welwyn Viaduct and through numerous tunnels—a route still regarded as too expensive to widen. Consequently, after strong opposition, the Midland obtained an Act in 1863, authorising it to construct its own line into London, with a separate terminus. The resulting station of St. Pancras—a Gothic edifice with an adjoining hotel now used as the London Midland and Scottish engineer's offices—was regarded somewhat as an architectural masterpiece; but tastes have changed since 1868.

The building of the London extension in no way delayed the Midland's further penetration in other parts of the country. The preceding year had seen the company's arrival in Cottonopolis, and, soon afterwards, the company reached Liverpool, by taking a third share with the Great Northern and Great Central Railways in the Cheshire Lines Committee.

The natural tendency among the travelling public to think of railway competition in the terms of passenger traffic alone, and to regard a longer and more devious route as wholly disadvantageous, is not, strictly speaking, sound. A moderate differential in mileage means little in terms of heavy freight, and the Midland was primarily a freight line, with an extensive coal traffic. Competition between the various coalfields in Leicestershire, Derbyshire and Nottinghamshire had, indeed, been the genesis of its construction, and to this day the Midland Division of the London Midland and Scottish carries southwards an outstanding proportion of London's coal supplies. The Midland's chief disadvantage, in comparison with its rivals, lay less in its circuitous routes than in its heavy gradients. These were particularly in evidence on its Derby-Manchester line, on the extension from Settle to Carlisle, over Aisgill summit (completed in 1876), and on the difficult single-line section from Bath to Evercreech Junction on the Bournemouth line. Even the London extension line had a summit to surmount at Sharnbrook, near Bedford.

A Ubiquitous System

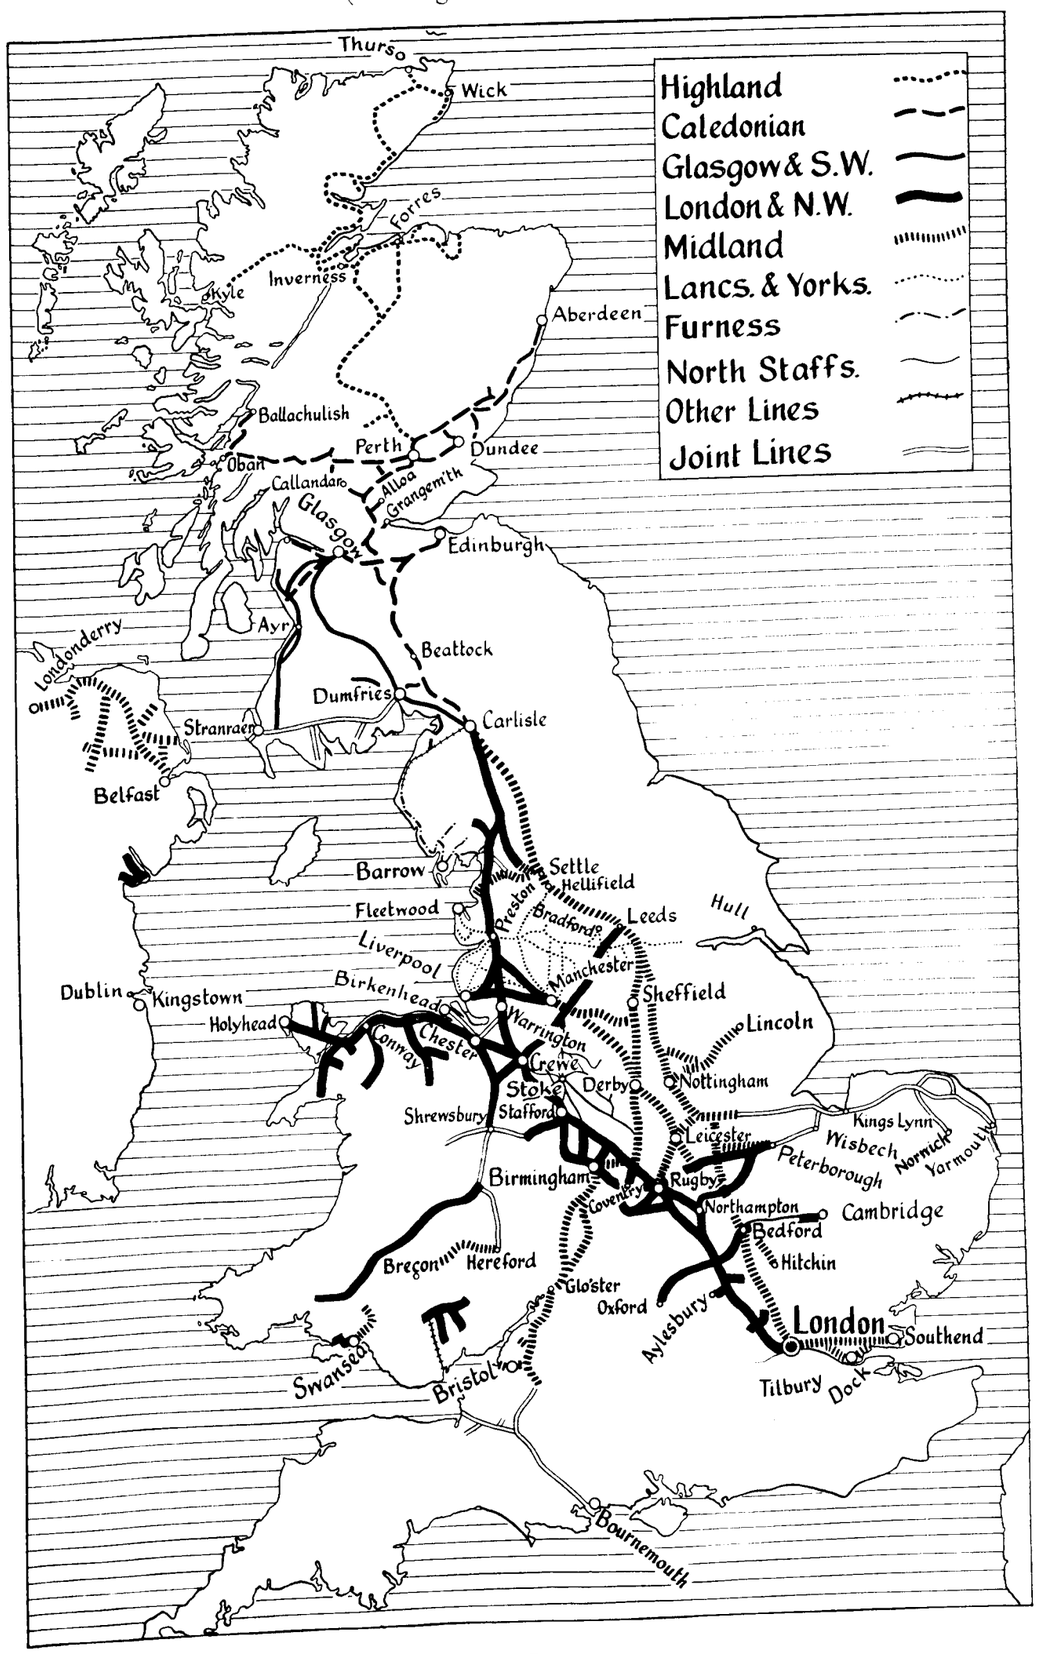
The Midland was nothing if not ubiquitous. By its incursion into South Wales over the Hereford, Hay and Brecon line, it tapped the valuable traffic of Swansea, with its anthracite coal, tinplate and other industries. The Carlisle extension linked the Midland with two of the Scottish railways. Through services were run from London and other English cities to Glasgow, over the Glasgow and South Western Company's metals, and to Edinburgh over the North British Company's Waverley route through Hawick and Galashiels. These routes were longer than the competitive West and East Coast routes, but they drew to themselves a faithful clientele. In particular, a traffic of no mean order was carried between the midland cities—Sheffield, Leeds and Bradford—and the two great Scottish centres of population.

Reference to Table II, on page 14, will show that in the last thirty years of Queen Victoria's reign the Midland Railway made steady progress, marked by a satisfactory dividend record. Although its operating ratio rose steadily (like those of all the other major British lines), from 48 per cent. in 1870 to 62 per cent. in 1900, the rate of dividend on its ordinary stock only once fell below 4 per cent., and on eleven occasions it was 6 per cent. or over, until in 1897-98, the company indulged in stock-splitting on a large scale. Its decision was largely responsible for an apparent increase of nearly £60 millions in its capital and, despite the able advocacy of Mr H. H. Asquith before the House of Lords, it cost the company over £100,000 in duties and costs.

Throughout the later years of the nineteenth century, the Midland's passenger earning power rose continuously. Midland coaching stock could be seen on all the coasts of Britain—even at Lynn and Yarmouth, which were reached over a line jointly owned with the Great Northern. By this means the company obtained a share in the fish traffic of Yarmouth and the fruit traffic of Wisbech, and developed a market for these products in Leicester, Birmingham and Nottingham. The East Anglian coast also proved a popular destination for holiday-makers.

Tourist traffic, indeed, was a speciality with the Midland from its earliest days. The earliest excursion train of which there is an authentic record was run on July 20, 1840, when the Nottingham Mechanics' Institution visited that year's Leicester Exhibition. Only a year later, one Thomas Cook organised his first excursion between Leicester and Loughborough; and founded the business which brought his name into prominence throughout the civilised world.

Twentieth Century Extensions



Unlike the London and North Western, the Midland continued its policy of extension, even after the turn of the century. In 1903 it acquired the Belfast and Northern Counties Railway (now known as the London Midland and Scottish Northern Counties Committee) and became a strong competitor with the Lancashire and Yorkshire and the London and North Western for the cross-channel traffic to Northern Ireland. The Midland system now included two gauges, for the Northern Counties lines had been built to the Irish gauge of 5 ft. 3 in. A third gauge was added a couple of years later, when the company, jointly with the Great Northern Railway of Ireland, took over the narrow gauge County Donegal lines. Westwards, the Atlantic Ocean now barred further progress, so the Midland turned eastwards yet again. Its last major acquisition was the London, Tilbury and Southend, an unusual line, with a history as long as its mileage was short. The Tilbury and Southend had two totally divergent interests: first, its suburban and holiday traffic to Southend, which provided all the problems of peak travel; and, secondly, its growing freight traffic as the sole railway serving Tilbury Docks.

Problems and Achievements

Such was the development of a railway whose policy frequently affected the whole British railway system. Its bold bid for popularity by abolishing the second class in 1875, was bitterly opposed by its competitors, who, nevertheless, were obliged, one by one, to follow suit. Many passengers to-day still remember the comfort and roominess of the pre-war Midland coaching

MAP OF THE SYSTEM

(Showing Constituent Lines)

stock, with its almost ornate upholstery, its clerestory roofs, and its rich, crimson exterior painting, lined out in gold and black. Yet, in certain technical respects, Midland stock was tending to fall behind that of some other lines before the war. Gas-lighted coaches were still being built at Derby almost up to the time of the amalgamation of 1923, and wooden underframes remained a feature of Midland design long after they had ceased to be used by other large companies.

On the locomotive side, also, the Midland, in its later years, with its heavy gradients, had special problems. The use of two locomotives to a train was a normal feature of Midland operating work, partly owing to the inadequate axle-loading capacity of the bridges on its main lines. Serious delays and congestion ensued, and revolutionary measures had ultimately to be taken to reorganise the carrying capacity of the line. Credit for the entirely successful solution of this problem is due to the genius of the late Sir Cecil Paget, whose familiarity with operating methods in America and France first suggested to his mind an English adaptation of the American dispatching system. It is no exaggeration to say that the resulting Midland control system, more than any other single feature, has revolutionised British railway operating methods. It has been adopted, also, on many Dominion and Colonial railways and French lines.

Up to its amalgamation in 1923, the Midland, which was managed, organised and operated from Derby, provided an example of the most centralised type of British railway organisation. Differences of opinion existed, and will always exist among railway engineers and technicians, on the relative efficiency of the Midland and other pre-amalgamation British lines. One thing, however, is certain: no company has left its mark more indelibly on British railway history.

LANCASHIRE AND YORKSHIRE RAILWAY

The third constituent company of the present L.M.S. system, the Lancashire and Yorkshire Railway, was, after the North Eastern Railway, the most important English line which had no terminus in London. Only those readers with first-hand knowledge of the industrial north of England have an adequate conception of the leading part played by that railway in the commercial progress of Lancashire and Yorkshire.

The "Lanky York," as it was familiarly known, had its origin in the Manchester, Bolton and Bury Canal Navigation and Railway of 1831. Its spinal cord, however, was the Manchester and Leeds Railway, which was opened after great engineering difficulties in 1841. Canal opposition was strong in the case of many early railways, and in this instance it was sufficient to defeat the original bill. The line, nevertheless, reached Leeds by means of running powers over the North Midland. Its capitalisation was high, even for a double-track line, at nearly £30,000 per mile. That the company, however, earned good dividends, ranging from 5½ per cent. to 8 per cent., in the early 'forties, was largely attributable to the difficulties of road transport in this district of the Pennine Range which it served.

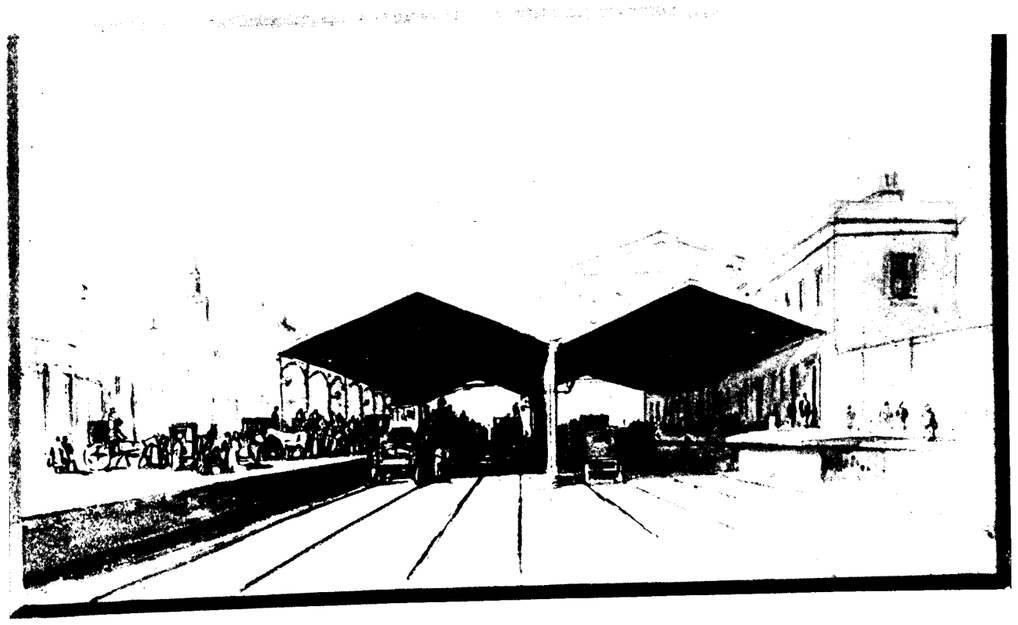
An Industrial Line

From its inception, Manchester was the nodal point of the line, and the headquarters of its activities. The title of Lancashire and Yorkshire Railway was taken in 1847, a year after amalgamation with the Manchester and Bolton Company. For some years the line had relied on the Liverpool and Manchester Railway for its Liverpool traffic, but absorption with the Liverpool and Bury in 1846 gave it an outlet of its own to the Mersey. In the east, the acquisition of the West Riding Union line carried Lancashire and Yorkshire metals almost from the Irish Sea to the Humber.

As reference to Table III (on page 14) reveals, capital expenditure per mile continued to be heavy throughout the company's growth. But while its mileage increased slowly, its receipts rose rapidly. The freight receipts per train mile of the Lancashire and Yorkshire, in fact, were far above those of the London and North Western and the Midland Railways during the period from 1870 to 1900. The company, indeed, was carried on the flood of increasing production of the textile industries. Busy and expanding towns like Blackburn, Preston, Burnley, Colne, Accrington and the Rossendale towns were served by railway systems which the Lancashire and Yorkshire steadily absorbed into its parent organisation. Jointly with the London and North Western (with which it so nearly amalgamated) the company developed Fleetwood as a port for a valuable passenger and freight traffic to Belfast, and for the fish traffic on which Fleetwood's facilities are now mainly concentrated. To the north, connection was made with the Midland's route to Scotland at Hellifield, while to the south the company penetrated to Sheffield, Pontefract and Wakefield. It was one of the many lines which tapped the South Yorkshire coalfield, and its access to Goole opened up a coal trade of considerable magnitude through that port, from which a large number of small steamers carried freight traffic across the North Sea to Germany, Holland and Belgium.

Increasing Capitalisation

The dependence of the Lancashire and Yorkshire on an almost wholly industrial area involved anxious times for the management in periods of trade depression. Yet even, in 1885, when the Chairman reported that the first half of the year had given the board considerable anxiety, the ordinary dividend was no lower than 3¼ per cent. Incidentally, the same speech mentioned a new cut off line to Blackpool, "for you all know that Blackpool is becoming the most popular seaside resort for our Lancashire and Yorkshire people and the traffic is enormous." Nevertheless, capital expenditure was increasing. In the succeeding year a shareholder complained that "since 1872 we have increased our capital account by £16 millions, and practically spent it on the same line, whilst I do not see that our net traffic earnings have increased anything at all." The statement was typical of many made at railway meetings at this time. The period of railway mileage expansion was fast coming to an end, and the period of intensive internal development—which still continues—was beginning. The operating ratio of the Lancashire and Yorkshire in 1870 was 46 per cent.; by 1890 it had risen to 56 per cent. and in 1913 it stood at 65 per cent.



Technically, the Lancashire and Yorkshire was a notable line. Its locomotive shops at Horwich were a famous training ground for railway mechanical engineers. Under the late Sir John Aspinall, a firm believer in electric traction, the company achieved pioneering distinction in the period 1903-04 by electrifying its line from Liverpool to Southport, and, later, to Ormskirk. The Manchester and Bury line, electrified in 1916, was unusual in its adoption of the direct current 1,200 volt third rail system. For the rest, a high degree of exactitude in railway operation was indispensable on a system which had to cope with dense freight traffic, short distances, heavy gradients and through running with many other lines. To ensure adequate and immediate superintendence, a remarkable control system, coupled with complete telephone equipment to all the main points on the railway, was inaugurated at Manchester.

In 1922, the Lancashire and Yorkshire was amalgamated with the London and North Western Railway, before the other constituent lines were grouped in the London Midland and Scottish Railway. The large part subsequently played by its chief officers in L.M.S. policy and management, is a tribute to the merits of the Lancashire and Yorkshire as a training ground for the qualities which make up a responsible, knowledgeable and resourceful railway official. For, on the Lancashire and Yorkshire, the demands of successful operation were too exacting, and the system of control too delicate, to allow any room for serious error.

CALEDONIAN RAILWAY

The Caledonian was generally regarded as the premier Scottish railway. If heredity counts for anything, the claim cannot be disputed, for the Caledonian's ancestors—the Dundee and Newtyle and the Glasgow and Garnkirk—dated back to 1826. The first important main line of what was to be the Caledonian system linked Carlisle to Glasgow and included the formidable Beattock bank, which still presents the London Midland and Scottish with one of its most serious operating problems. When the new line was opened over its whole length, early in 1848, it completed the west coast route to Glasgow. In the same year a branch was opened to Edinburgh. By means of a connection at Castlecary, the Caledonian (incorporated in 1845), made contact with the Scottish Central, which ran to Perth. Amalgamation with this line was consummated in 1865, and a year later the absorption of the Scottish North Eastern carried the Caledonian as far north as Aberdeen—beyond which it never extended. And the Dundee and Perth line, absorbed in 1863, gave it participation in the fortunes of the jute, shipbuilding and marmalade industries of Dundee.

The main outline of the Caledonian Railway, like that of its southern ally, the London and North Western, was complete by 1870. At that time its capital was about £22,700,000. Its dividends were always less than those of the larger English railways now incorporated in the L.M.S. systems, as will be seen by reference to Table IV on page 15. Its influence on Scotland's economic development, however, was

THE FIRST EUSTON STATION

considerable. Centred on Glasgow, it gradually evolved a vast suburban traffic on Clydeside. It largely fostered the iron, steel, shipbuilding, engineering and allied trades in that area, and it catered on a sumptuous scale for the tourist traffic on the Firth of Clyde. With other railways, it shared also in the development of the Stranraer route to Belfast. In the Highlands it pushed north-west to Callendar, Oban and Ballachulish. Its ports of Grangemouth and Alloa provided useful export and import routes for the heavy industrial area of Lanark, Airdrie, Coatbridge, Motherwell and Wishaw.

The "Caley" was a popular line with the Scottish travelling public, with its distinctive white panelled coaches and blue locomotives. The latter, incidentally, were furnished with a particularly effective hooter which was later to become "standard" on the L.M.S., after the American Press had taken good-humoured exception to the "Royal Scot's" shrill whistle.

The Caledonian was never overprosperous, and its operating problems involved a good deal of expense. Nevertheless, its locomotive stock was above the average of many more southerly lines, and its rigid attention to economy enabled it to face years of pre-war trade depression without losing the patronage of the passenger or trader. A lower average density of traffic per mile than that of many of the English lines forced it to keep its operating ratio at a comparatively low figure, but it catered well for the needs of the industries it served.

OTHER CONSTITUENT COMPANIES

Glasgow and South Western

The remaining constituent companies of the London Midland and Scottish Railway may briefly be described. In Scotland, the Glasgow and South Western Railway, with lines radiating from its St. Enoch terminus in Glasgow and stretching down the Clyde coast to Greenock, served the Firth of Clyde ports from Largs to Irvine, Troon, Ayr and Girvan. Its southerly main line passed through Ayr to Dumfries and Carlisle, where it exchanged traffic with the Midland. It also shared in the Stranraer route to Ulster. At the close of 1921 its capital expenditure was rather over £20 millions and its route mileage almost 450. Its locomotive stock numbered about 530, of which few units remain to-day. It played an important part in the development of the Clyde steamer services, the suburban traffic of Glasgow, the Ayrshire coalfield and the through services from England to Glasgow.

Highland Railway

In the far north, the Highland Railway was the trunk line from Perth to Inverness, Kyle, Forres, Thurso and Wick. It was almost wholly a single line in 1921, when its capital expenditure was about £7,500,000, its route mileage 484, and its locomotive stock 173. North of Inverness it had a railway monopoly. Sparse traffic, heavy gradients and snow troubles in winter involved the Highland in a hard struggle for existence. In 1921 it succeeded in paying a 2 per cent. dividend on its ordinary stock; but its track, coaching stock and stations were far below the standard of its southerly neighbour, the Caledonian.

Furness Railway

An important constituent line of the present London Midland and Scottish on the English side of the border was the Furness Railway, which was centred on Barrow and served the attractive Lake District. Its capital expenditure in 1921 approximated closely to that of the Highland, but its route mileage was only 115, and the total of its locomotives 138. A heavy ore and mineral carrier, it expended much energy on its docks at Barrow-in-Furness. A unique feature of its activities was its annual offer of a scholarship to enable one of its staff to enter a university. Physically, the Furness had serious problems in the maintenance of long viaducts over tidal estuaries. In times of trade depression its fortunes were precarious, though it succeeded in attracting holiday travel to the charming country it served. In 1921 it was just able to declare a dividend of 1 per cent.

North Staffordshire Railway

Further south was the North Staffordshire Railway, radiating in all directions of the compass from Stoke. By the end of 1921 this system had cost about £9,250,000 to build. Its route mileage was 206 and it possessed nearly 200 locomotives. Although it remained a local line, it had connections with five main-line railways. It served the local industries efficiently, and the pottery towns took pride in the preservation of its independence for nearly eighty years. Careful management and successful operation were revealed by its ability to declare a 5 per cent. dividend in 1921.

Such were the constituent companies of the present London Midland and Scottish Railway system, in addition to many smaller lines. At the time of the amalgamation, each railway had its own problems, its own *esprit de corps*, its own traditions and its own policies. The welding of them all into one great system was probably the greatest task in industrial organisation ever undertaken by a British company. Its inevitable difficulties were increased by the fact that a railway's staff must necessarily be scattered and cannot receive the detailed supervision applicable to the workers in a factory, or a series of factories. The remainder of our Survey shows how, and with what degree of success, the problem was faced.

A
Standard Revenue

All serious thinkers about transport in this country agree that it must cover its cost and leave a surplus for development. That is to say, transport must be self-supporting. The alternative would be to subsidise transport out of public funds, and that would clearly be undesirable.

The Railways Act of 1921 provided a new form of control of charges by fixation of a standard revenue or profit (before remuneration of debenture capital) which the charges should aim at earning, regard being had to all sources of revenue and not only that from railway charges. The scheme of the Act contemplated annual reviews at which, if the standard revenue were not achieved, the Railway Rates Tribunal would increase charges so as to reach that goal. If the standard were exceeded the Tribunal would reduce charges by an amount equal to 80 per cent. of the excess.

There was no State guarantee or pledge that this standard revenue would be realised, although it may at least be fairly inferred that Parliament in requiring the novel scheme of 1921 did not contemplate provoking or encouraging developments which would make it more difficult of attainment. This standard merely represented the upward limits to profits to be aimed at by the Rates Tribunal in fixing charges; but it did set up the standard which Parliament considered the railway was entitled to earn if it possibly could. Further, in the judgment of the Rates Tribunal on their annual review in 1937 it was stated "that the legislature . . . regarded the realisation by the amalgamated company of its standard revenue to be in the public interest."

The standard revenue of the L M S Railway is fixed at £20.6 million, or a modest overall return of 4.8 per cent. on the capital receipts of the undertaking. The actual net revenue of the Company in 1937 was £14.4 million, or a deficiency compared with the standard of £6.2 million. In fact, the L M S has not yet succeeded in securing its standard because the Rates Tribunal have been unable to adjust the charges to make this possible.

The securing of this modest standard revenue is in the interest of the community as a whole, because it lies at the root of all progress in railway transport (with its comprehensive national service). The only way whereby it can be secured is by expanding traffic by more passengers using the railway and by the business community despatching more freight traffic. The L M S Railway depends upon the public as much as the public depends upon the railway.

Progressive
National Transport

LONDON MIDLAND AND SCOTTISH RAILWAY

The Story since 1923

To discover the manner in which the L.M.S. solved its post-grouping problems is, in fact, to describe the organisation evolved in the last fifteen years. First, however, we may draw together the conclusions suggested by the history of the company's constituent lines, for the sake of the light they throw on the task of creating one body out of many members. The absorbed undertakings had widely differing standards, and some were bound to take more from the pool of amalgamation benefits than they gave. But they included some of the finest systems in Britain or in the world. In their evolution, geography had played some part—by imposing "short haul" conditions, for example. But competition, rather than topography, had given the Midland its heavy gradients. And the nineteenth century development of Britain's specialised and localised industries had played the most important part of all.

The L.M.S. system penetrated to every part of the country (except the extreme south-west and south-east), but its network of lines was closest in a relatively few areas where industrial density was greatest—the Midlands, Lancashire, Yorkshire, and South-West Scotland. In fact, the map of the constituent lines had been largely drawn by 1870—and the table in the next column shows clearly that subsequent development was intensive and not extensive.

For fifty years before the merger, the major component companies had been improving their existing lines and running more traffic over them, rather than extending them. Even the Midland, which more than doubled its length of line after 1870, already had its own route to London by that year, and apart from its Carlisle extension, its subsequent increase was achieved mainly by taking over lines already in existence. In fact, before the end of the third quarter of the nineteenth century, Britain's railway routes were almost as well established as her national drainage system. Their channels might be widened, but their direction was almost unchangeable. And it had been determined by the characteristic forces of the era of Britain's commercial supremacy, when competition was free, international trade was freer than ever before or since, and when increasing wealth and population were centred mainly in the north.

The L.M.S. came into its inheritance in a period of transition—of economic nationalism and depressed export industries, of increased costs and a higher wage bill. In 1923, the internal combustion engine had raised the highway road from the humble rôle of a feeder to that of a formidable competitor for the cream of railway traffic. Against that background the measures taken to solve the problem of unifications must be viewed.

PROGRESS OF THREE CONSTITUENT LINES
(1870=100)

	Total Capital	Net Revenue	Length of Line	No. of Passengers	Tonnage of Goods
LONDON AND NORTH WESTERN

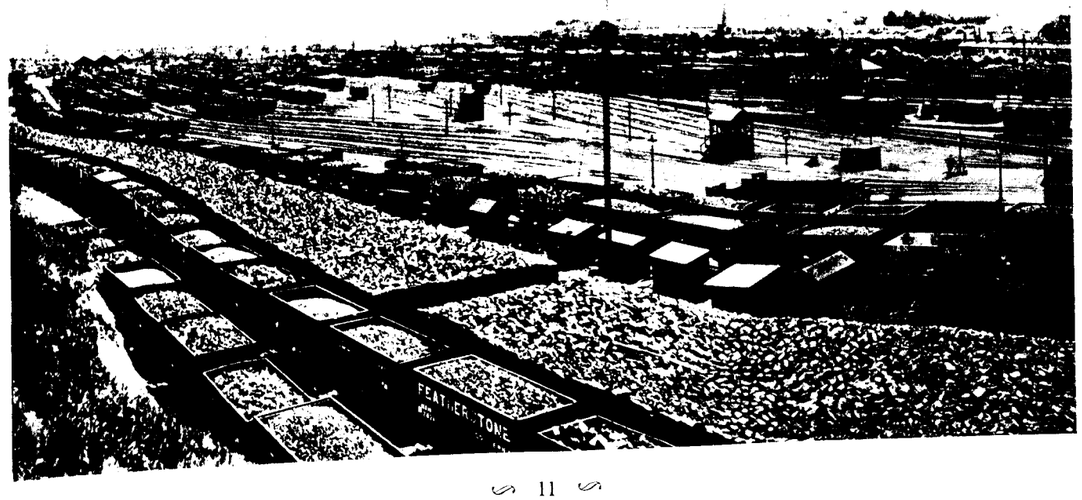
NA = Not available. * 1850–70 figures not available. Tonnage in 1913 was 242 per cent. of 1850 figure.



Problems of Organisation

The first problem to be faced was one of organisation—a matter of extreme difficulty in view of the wide variance in the traditions, practices and outlook of the larger constituent companies. In such a problem the interplay of human personality is always a major factor. One by one the chief officers of the constituent railways retired, and the appointment, in 1926, of Sir Josiah Stamp to the London Midland and Scottish (of which he became President and later Chairman) may be regarded as the landmark of the new organisation. Few questioned then, or question now, the desirability of having as the executive head of so vast a concern one who, with his detached viewpoint, could regard any differences of opinion or allegiance in completely unbiased perspective.

The system of organisation designed for the London Midland and Scottish is unique in the history of railways, though at least one American system approximated to it. Its outstanding characteristic was the creation of an executive committee consisting of the President, Vice-Presidents and certain other officers. Another unusual feature (which came later) was the combination of the operating and commercial departments under one Vice-President (who, in fact, had received his training as a mechanical engineer). On the whole, the organisation throughout the system has adhered more to Midland standards than to those of the other constituent lines, and the degree of centralisation is greater than on other British railway.

To-day, the operating work is organised divisionally from Crewe, Derby, Manchester and Glasgow, under the direction of a Chief Operating Manager in London. The Midland system of control has thus been extended to the whole system. Commercial work, which is also controlled from London (by a

MARSHALLING SIDINGS — **TOTON, near Trent**

dynamic Chief Commercial Manager), functions through district goods and passenger managers situated in the larger cities. Another noteworthy Midland feature which has been retained is the placing of locomotive running control under the Operating Manager—an arrangement which leaves the Chief Mechanical Engineer free to concentrate on design and workshop problems. For geographical reasons it was found desirable to appoint a Scotsman of long commercial railway experience as Chief Officer for Scotland.

Economies after Amalgamation

That far-reaching economies have been achieved since amalgamation is beyond dispute. A necessarily brief and cursory examination will serve to show the main directions in which they have been secured. In the matter of power units, the present standard designs of the London Midland and Scottish date from the appointment in 1931 of a Chief Mechanical Engineer trained at Swindon. During the last fifteen years as a whole, a virtual revolution has been effected with the construction of about 3,500 new locomotives. Although many pre-1923 locomotive types (mostly of Midland design) are still regarded as standard, there has been a wholesale slaughter of locomotives of the constituent railways, especially those of the smaller companies. By the close of 1938 it is probable that no locomotives of the North Staffordshire, the Glasgow and South Western or the Furness Railways will still be in active service. A similar fate has all but overcome the whole of the London and Nortn Western and the Lancashire and Yorkshire passenger express engines. Withdrawals of Lancashire and Yorkshire goods engines and of many Highland and Caledonian types have been very heavy, and hundreds of the older Midland locomotives have gone to the scrap heap. At the time of amalgamation there were no fewer than 393 London Midland and Scottish locomotive types; by 1938 this number had been drastically reduced to about 220, and this is now in course of being reduced further to 136.

Standardisation increases the efficiency of construction and repair shops, for it enables the time necessary for repairs to be reduced from weeks to days. Since 1923, the London Midland and Scottish locomotive stock has fallen by over 2,500 units. The number of units under or awaiting repair at the end of 1937 was but one-fifth the number in 1923, but the train mileage was considerably greater, and the average speed of passenger trains had increased; while coal consumption between 1923 and 1937 had fallen by several pounds per locomotive mile, and lubricating oil consumption had been progressively reduced. Expenditure per train mile had fallen, the average wagon load had increased and the number of engine miles per day had risen from well under 100 in 1923 to nearly 120 in 1937.

Limitations of Managerial Control

It is a routine task of railway management to watch the trend of operating statistics and to allocate capital and revenue expenditure so as to assist them. But certain factors are largely outside managerial control. For instance, if the proportionate tonnage of coal, minerals and other heavy traffics decreases, the average wagon load will fall, even though the actual loading per wagon may be improved. The loss of short distance traffic will increase the average haul, but with a tapering rate structure the average receipt per ton mile will fall, other things being equal. Abstraction of the higher valued traffics by road competition will bring about a lower receipt per ton mile. In all these cases, a railway can do little except pursue an energetic commercial policy and endeavour to obtain reasonably competitive conditions—a fair field and no favour. Usually, any improvement in service, such as the increased frequency or higher speed of trains, creates added expense. In passenger traffic it may mean more empty seats, the costly easing of curves and heavier fuel consumption. In freight traffic it may require a lighter train and the fitting of air brakes to a large number of wagons. Nevertheless, within the limits of operating control, the L.M.S. has achieved much. Expenditure on signalling has proved a fruitful source of financial saving. Few railways have given equally detailed attention to the scientific layout of locomotive running depots. It has now only twenty-nine motive power depots, the remainder being merely garages and dormy sheds (to use the terminology of road transport). Heavy repairs are to-day concentrated on the workshops. Goods station working has proved another fertile field for scientific analysis.

Efforts to reduce the dead weight load of rolling stock have been carried far by the London Midland and Scottish. In this connection, light alloys and the use of welding have played a useful part. The company's research staff have found productive fields of activity in water softening (to lengthen the life of locomotive boilers), in quick-drying paints (to cut down workshop time), and in anti-corrosion compounds. The development of the container system—the company has now 8,000 containers—owed much to London Midland and Scottish energy. At Derby, valuable pioneering work for the railway world was done in developing the progressive system of rolling stock construction and repairs, which has spread in major or minor degree to all the world's more important railways. Amongst the latest developments are the design of a shock-absorbing wagon and the decision, in co-operation with the London and North Eastern Railway, to set up a locomotive testing station at Rugby.

In the sphere of staff matters, the inauguration of a Staff College at Derby has been a unique event in British railway history. "Quota" and "On Time" Leagues, based on the football league tables, have stimulated the staff to obtain new traffic and punctuality records. A railway, above all things, is a human machine. However excellent its technical equipment, omission to consider the implications of this fact will entail loss and wastage.

Financial Results

The financial experience of the L.M.S. since the war, in common with all other British railways, has been a matter of pull-devil-pull-baker, with road competition and export trade depression in the Mephistophelean rôle, and the economics of amalgamation *plus* good management in the opposite part. The main outlines of the story, for certain key years, are given in Table V (on page 15), and the following figures will serve as an epitome.

1924 = 100

	1929	1932	1937
Total receipts	95	75	87
Total expenditure	95	80	88
Net revenue	98	57	82
No. of passengers	86	76	85
Passenger receipts	87	73	82
Tonnage of goods	94	74	88
Goods receipts	97	75	88

For some years after amalgamation, drafts were made, in aid of ordinary dividends, on sums received from the Government in respect of the war-time period of control, but for the last decade payments to stockholders have been strictly proportionate to net earnings. The L.M.S. ordinary dividend, which was as high as 7 per cent. in 1924, was no more than 4½ per cent. in the "good" year 1929. During the succeeding depression it fell to *nil*, and full dividends were not earned and paid even on the company's junior preference stock. In 1937, another peak year for British industry in general, the ordinary dividend was only 1½ per cent. Equity stockholders, it is clear, have fared worse than railway users and railway workers since the war.

Post-War Developments

Attention may be drawn to certain significant features of the last few years. It will be seen, by reference to Table V, that although large capital sums have been spent annually, total capital has remained comparatively stable. In fact, new capital expenditure has been to a large extent offset by the writing off of unremunerative assets and the sale of facilities no longer required, or has been saved by greater efficiency. As examples, one might quote the reduction effected in locomotive stock, the reduction in the number of steamers required to maintain services on the Irish Sea, the closing of workshops, etc. The industrial troubles of 1926, the year of the coal stoppage and the General Strike, left a mark on British railway finance which will never be wholly eradicated. The reliance of the railways on British coal, at that period, proved a serious weakness, seeing that their road competitors used imported oil. Much of the traffic lost to the roads in 1926 has never been recaptured. Meanwhile, the London Midland and Scottish has felt the full brunt of unemployment in several of its areas—Lancashire, Barrow and West Cumberland, Clydeside, Belfast and South Wales.

The interlocking of railway receipts between the four railways by pooling schemes, etc., increases the difficulty of comparing the incidence of unemployment in different areas on the fortunes of individual lines, but its results, from the railway point of view, have been beneficial. The same comment applies to the policy of large-scale railway investment in road transport enterprises, typified by the London Midland and Scottish holdings in the Birmingham and Midland, Crosville, Eastern National, North Western, Ribble, Trent, West Yorkshire and several other bus-operating companies in England, and in the Scottish Motor Traction and Alexander concerns north of the Border. On the cartage side, the London Midland and Scottish has over £500,000 invested in Carter Paterson and the Hay's Wharf Company, while its own road transport fleet numbers more than 3,000 motor vehicles.

The L.M.S. has given a good deal of attention to the development of its ancillary enterprises in recent years. Few steamship fleets have been more completely renewed since the war period, and very considerable savings have accrued as a consequence. Net receipts, which were only £20,000 in 1923, totalled £300,000 in 1937.

The working of the London Midland and Scottish docks, which showed serious deficits for many years (even in 1929), showed a profit of £35,000 in 1937. On the other hand, the company's hotels, restaurant cars, etc., in 1937 achieved only a net profit of £353,000, which was far below the results obtained in the first year of amalgamation, and that despite heavy expenditure on improvements, including complete reconstruction of the company's hotel at Leeds, which is now among the leading establishments of its kind in the country. Finally, the London Midland and Scottish has taken a prominent part in the organisation of railway air services, but the financial results have been dismal. The net loss during the last two years has been £60,000. Whether this stake in the future of civil aviation will prove really remunerative the future alone will show.

Famous Men

BEFORE concluding this survey of times past and present by a brief glance at the immediate future, we may pause, for a moment, to praise famous men. First among the builders of the L.M.S., as it exists to-day, was George Stephenson, the father of railways, to whose energy were due the construction of the Liverpool and Manchester Railway and the decision to use steam traction on it. His victory over Chat Moss, his powerful advocacy of railway schemes before Parliamentary Committees, his realisation of the need for a standard gauge, his foresight in perceiving the railway's potential role in Britain's social and commercial development — all these bring honour to his name among railwaymen of all generations. The work of his son was hardly less important. Many memorials still remind the present generation of Robert Stephenson, notably the Menai Straits Tubular Bridge. The son was largely responsible for the locomotive power of the early lines, while the father concentrated upon new railway schemes. To Captain Huish, one of the greatest of railway diplomats, the early London and North Western Railway owed much; and also to George Carr Glynn, its first chairman. Glynn was a member of the banking firm, which even to-day is closely linked with the London Midland and Scottish, and to him the origin of the Railway Clearing House, based on the bankers' clearing scheme, is popularly ascribed. Sir Richard Moon, chairman in the Jubilee year, was another outstanding London and North Western figure. Sir George Findlay, Chief Goods Manager at thirty-five, and for long General Manager (the author, incidentally, of the best text-book of the time on railway management), steered the London and North Western through many difficult years in the 'eighties and 'nineties. Other North Western names of repute include Locke, Trevithick, Cawkwell, Webb, the somewhat eccentric mechanical engineer, and Turnbull.

Midland Personalities

George Hudson, the railway king, set the Midland squarely on its expansive way; but the mainspring of its energies for many critical years was Sir James Allport, who joined the company in 1839, and, after a brief interval, returned as General Manager in 1853. To him the third-class passenger owes much. On his death in 1892 the Midland had attained maturity, and was largely the same system as in 1922. The name of Paget is reverenced by Midland men. Sir Ernest Paget was chairman from 1891 for over twenty years. The late Sir Cecil Paget, originator of the Midland control system, was a romantic figure in the twentieth-century railway world. To few men is it given to be an expert linguist, a great war-time administrator, a perfect chef, and a locomotive engineer of originality, with a flair for the solution of railway operating problems.

The L.M.S. is still fortunate in being able to draw on the advice, as a member of its board, of Sir Guy Granet, successively General Manager and Chairman of the Midland and Chairman of the L.M.S. His accumulated experience served the amalgamated organisation in good stead during its early years. During the last decade its path has been guided, with consummate ability, by a foremost British statistician and economist of his day—Sir Josiah Stamp, whose elevation to the peerage has recently been announced. The progress made by the L.M.S., in its multitudinous spheres of activity, refutes the argument that railway management should be separated from other activities of national life. The company and its constituents have been well served by many men who have played a distinguished part on the broader national stage, in the hundred years since *The Times* first announced that mails were to be despatched by the London and Birmingham Railway for Holyhead, Manchester, Liverpool and Carlisle.

Crewe North Junction

A Statistical Summary

The following tables, compiled from records treasured at Euston, afford a picture of the development of the complex and ramified railway system which, since 1923, has been known as the London Midland and Scottish. Tables I to IV show the growth of capital, revenue, mileage and traffic of the four largest constituent concerns at decennial intervals since 1850, when the amalgamations, characteristic of the 'thirties and 'forties, had already created the names which were to be familiar to railway travellers for another seventy years. The figures show that between 1850 and 1870 the great companies were rapidly extending their territory and scope, but that after 1870 their new capital outlay was devoted, with some few exceptions, mainly to increasing the traffic and earning power of their existing lines. Table V summarises the experience of the L.M.S. itself, under the same headings, in certain specially significant years since amalgamation. The remaining tables set out the rates of ordinary dividend paid on each line for every calendar year since the 'forties.

TABLE I: LONDON AND NORTH-WESTERN RAILWAY COMPANY

	1850	1860	1870	1880	1890	1900	1910	1913	1921

Present and Future Problems

IT is well that the servants of the L.M.S., high and low, lose nothing to-day by comparison with their most famous predecessors; for many major problems still face the company. The next few years should see the completion of a large programme of works financed under the Railways (Agreement) Act of 1935, at a gilt-edged rate of interest. These works include the complete reconstruction of the Euston terminus, and extensive improvements at Blackpool, Carnforth, Coventry and other towns. A steady flow of new capital expenditure will be required by other developments, notably the modernisation of engine sheds and signalling equipment and the probable installation of automatic train control over the higher speed main lines. Bottle-necks still remain on some of the busiest sections—for example, between Shilton and Attleborough and between Winsford and Hartford. And bridge reconstruction is far from being complete.

On the other hand, heavy capital expenditure is unlikely, after 1938, on rolling stock, workshops, steamers, hotels and docks. Much has already been accomplished in these directions; and ordinary maintenance and replacements will continue to be financed from current revenue, with the judicious use of renewal funds with which the London Midland and Scottish is adequately supplied. Throughout the years of depression the company carried out its annual quota of renewals, and, incidentally, benefited from the low ruling level of costs. If anything, the L.M.S. is ahead of its renewal programmes for way and works and rolling stock. For example, it is already taking electrically lit rolling stock out of service—a position which no other railway has yet attained. Even so, at the end of 1937 its renewal funds were only about £3,000,000 lower than the £12,000,000 of the pre-depression year 1929, and its general reserve and contingency funds, together, have been almost unchanged. On balance, an annual capital expenditure of about £1[illegible],000 may be looked for after 1938 (exclusive of the 1935 programme); but to some extent this will be offset by credits on sales and assets replaced. Nevertheless, the latest annual accounts show a total capital expenditure, in excess of capital receipts, of nearly £27,000,000; and sooner or later the question of "funding" some of this large amount will doubtless demand consideration.

Revenue Prospects

So much for the capital position. On the receipts side, in no year has the London Midland and Scottish, so far, attained the standard revenue contemplated under the Act of 1921, and in most years it has hardly approached that figure. Last year, when British industry as a whole was more active than ever before, gross receipts on the London Midland and Scottish Railway were 9 per cent. lower than in 1929, though the management had succeeded in reducing railway expenditure, in the meantime, by approximately 8 per cent. Prospects for 1938 have grown gloomier since March, owing to European political unsettlement and British trade recession. As a partial set-off, however, the company may benefit from expansion of Anglo-Irish trade and the speeding up of national re-armament.

To state that the prosperity of a railway is bound up with the prosperity of the area it serves is platitudinous and less than the truth. Irrespective of all pooling arrangements, the financial position of the London Midland and Scottish is a reflection of the state of trade throughout the country. The Middlesbrough blast-furnace worker is not served by the L.M.S., but is partial to a day's outing to Blackpool to see "t'illuminations." Barrow, Birkenhead and Clydeside build ships, and shipbuilding orders depend largely on the level of freights. L.M.S. hotels receive useful revenue from American and other visitors whose holiday plans depend on economic conditions in their own countries. And the immediate outlook is less favourable than it appeared a few months ago. Even if this year's receipts, with the help of the increased charges inaugurated last October, equal the 1937 total, costs of materials are likely to be higher than those of the preceding year, and any rise, irrespective of any [illegible] arising, will unquestionably be higher owing to the [illegible] reached in 1937 and [illegible] full twelve months of the year.

[illegible]e Possibilities

[illegible] further savings remain to be obtained after fifteen years of ceaseless endeavour? One must admit that the fruitful spring must soon be running dry. The ratio of railway expenditure to receipts varied only infinitesimally between 1936 and 1937, such movement as there was being adverse. Present prospects seem to envisage a rise in the ratio from 79.7 per cent. to over 80 per cent. this year. The annual railway expenditure of the L.M.S. has fallen by £10,500,000 since amalgamation, and by £4,500,000 since 1929. The fact that it has risen, however, by £4,400,000 since 1932 suggests that amalgamation economies have lately been of minor importance. Actually, it has never been practicable to distinguish amalgamation economies from those due to technical progress. For example, more adequate lubricating apparatus and improved locomotive design produce fuel economy and a longer annual engine mileage; and such economies will continue, year after year. Developments like the installation of automatic signals, a modern hotel, mechanical carriage cleaning, spray painting, all-electric signal cabins, a new steamer, a reconstructed station—like that obtained by the combination of Leeds (Wellington) and Leeds (New) into Leeds City—all these reduce the demand for labour, and labour reputedly accounts for over 60 per cent. of railway working costs.

This aspect is the more important since labour costs, in theory variable, have since the war been relatively rigid. All the British railways have complex agreements with their staffs for a guaranteed week and a guaranteed day. Their inability to lay-off permanent staff temporarily has been a social advantage, but a stockholder's disability. Against a fall of 12 per cent. in receipts in nine years, the maximum reduction in staff wages and salaries rates was 5 per cent. During the same period, the number of L.M.S. workers was reduced by 49,000, mainly as a result of [illegible] gamation, but by 1937 it had [illegible] by 15,000 above the minimum [illegible] 1933.

For the [illegible] road competition [illegible] more acute. The [illegible] the number of [illegible] is falling off. Legislation [illegible] begun to stabilise competition [illegible] from the public haulier; and pending measures may help to usher in a fairer degree of competition.

The conclusion must be that finality in the problems of the L.M.S. has not been reached, and probably never will be. But the day, it may be hoped, is far distant when the Empire's largest commercial undertaking will need to rely on Government aid or endeavour—a position to which a large number of the world's railways outside Great Britain have already descended. The management of nearly a quarter of a million of staff, scattered on land from Thurso to Swansea and Tilbury, can never be a sinecure. And immediate dividend prospects turn on factors beyond administrative control. But the foundations of future earnings—*esprit de corps*, facilities and motive power—have been soundly reconstructed since 1923. The rest depends on the future of British industry, trade and finance—on all that national well-being means in a powerful, wealthy and highly organised community.

ALLIANCE
ASSURANCE COMPANY LIMITED

Fire, Life, Accident, Burglary, Motor, Marine, etc.

Head Office: BARTHOLOMEW LANE, LONDON, E.C.2

IN CASE OF EMERGENCY
DIAL 999
ASK OPERATOR FOR FIRE, POLICE, AMBULANCE

IN CASE OF EMERGENCY

POLICE, Fire Brigades, and Ambulances are instantly available in case of emergency, but there is one essential service which cannot be enjoyed unless it has been secured BEFORE the emergency arises.

The burglar may be arrested, the fire extinguished and the injured succoured, but the COST of replacing stolen or damaged property can be recovered ONLY by means of suitable insurances effected before the event. Similarly, insurance can be applied as a means of making good a depleted income occasioned through sickness or accident.

In the face of the gravest emergency—fatal illness—the public services are unavailing, and your dependents must rely upon your resources, which should include substantial life assurances.

Are you, your family, and your business interests fully prepared for any emergency?

The C.I.S. transacts all classes of insurance at rates which will enable you to perfect your protection at little cost. Act to-day, to-morrow may be too late.

I.—INSURANCE AND THE PUBLIC

The Cost of Rose *v.* Ford

SINCE the House of Lords gave judgment in *Rose* v. *Ford*, the case has been studied with such minute care as very few judgments receive. And the more thoroughly it is examined, the more anomalous the position appears. The Law Reform Act of 1934 laid down that, after a man's death, "all causes of action subsisting against or vested in him shall survive against or for the benefit of his estate." Their Lordships held in *Rose* v. *Ford* that these words gave to the legal representative of a person negligently killed the right to claim on behalf of the deceased estate for the cutting short of the dead man's life. Before death the man had a certain expectation of life. That expectation was an asset. The asset had been negligently destroyed. His estate might recover the asset's value.

Common sense suggests the extreme difficulty of putting a cash value on a man's expectation of life, and the conclusion has been reinforced by every judgment delivered since *Rose* v. *Ford* and every award of damages given. The ordinary man is still puzzled by the initial problem of how the words of the Act can be made to mean what they now by law do mean. How can a cause of action which arises only after a man is dead be said to survive his death? Survival in common usage postulates (*a*) the concurrent existence of two things and (*b*) the continuance of one of the two things after the destruction of the other. Can a twentieth-century Englishman be said to survive Napoleon Buonaparte?

But, the House of Lords having spoken, the law is fixed, and insurance companies must put up with the consequences. They have had to face the fact that their third-party liabilities have been increased by an Act of Parliament which was not intended to increase them, because the Act turns out to mean something that the legislators never meant it to mean, or dreamt that it could possibly mean. The law is there and the insurance companies must foot the bill.

How much in the aggregate does the bill come to? How much extra are insurance companies and underwriters paying every year as a result of this legislation and the ensuing judgment? Exact figures, of course, are not to be had, but by putting two and two together it is possible to arrive at an estimate which (though it cannot be accurate) may be of some value as an indication of the revolutionary change which has been brought about. Let us start with the number of road deaths, which is an exact figure. In the year 1937 there were 6,633 people killed on the road. Not all of them were the subject of third-party payments; for some were killed in accidents to their own cars without any other vehicle being involved, and others were killed through their own negligence without any third-party liability falling on a motorist. But it is probably safe to assume that for more than half the deaths insurers would either be found liable or would prefer to settle out of court rather than fight the case. Let us take what is probably a conservative figure of 4,500 as the number on which a claim for negligence would be settled.

Now, it must be remembered that in *Rose* v. *Ford* cases there is no need to prove the interest of dependants. It is not necessary to show that the dead man left behind him a widow or orphans or an aged parent whom he had been

supporting. The damages for survival are not given because the dead man was a breadwinner, but because he was a living creature; and no matter what responsibilities he had been carrying or not carrying during his life, his estate can claim simply because he is dead. Thus there is a survival claim for every man, woman or child who is negligently killed. It will be reasonable, therefore, to assume that damages arise from many more road deaths under this Act of 1934 than under the old law, which previously had governed the right to claim damages and the amount of them.

If, then, 4,500 be taken as a likely figure for the survival claims in a period of twelve months, what is the aggregate amount for the whole country? That, obviously, is a matter for calculation, based on the average recovered per death, and here we touch the cardinal difficulty and absurdity of the whole business, since no one can say what is the cash value to any human being of his expectation of continued life. Some juries think one thing and some another, and His Majesty's judges appear to be quite as much at sea on this point as the laymen in the jury box. But towards the end of last year it was thought that survival was costing insurance companies about £300 a death. In a recent case which came before the Court of Appeal it was held that £90 was so ridiculously inadequate that a retrial was ordered with a view to the damages being increased. On the other hand, juries have been awarding damages of £1,000 and over. One judge has raised an arbitrator's award from £150 to £400. Another judge, in another case, has declared £150 to be the right figure. It is all very confusing, but if we take £300 or £400 as the average payment we shall probably not be exaggerating the current scale of damages.

On 4,500 deaths an average payment of £300 would give us a total for the year of £1,350,000. An average payment of £400 would give us £1,800,000. And it is difficult to see (in face of the judgments delivered and the opinions expressed by the bench) how the survival claims can on the average work out at less than one or other of these sums. Let us guess the total at £1,500,000.

If the total premiums paid for motor-car insurance in Great Britain were known, it would be possible to say what percentage of the insurers' income was being absorbed on this figure of £1,500,000 by the survival claims. But the home motor premiums are not separately recorded, and even the Departmental Committee on Compulsory Insurance could not find out what they amounted to in a year. It is probable, however, that the net premium income for home motor insurance, i.e. the amount received by the insurers after payment of commission, is not more than £18,000,000. It may well be less. But, taking the net income as £18,000,000 and the survival claims at £1,500,000, we have the remarkable result that 8⅓ per cent. of the premiums received for the insurance of cars in this country—insurance against accidental damage as well as third party—goes to settle survival claims which, until the Act of 1934 and the judgment in *Rose* v. *Ford*, had never been heard of, thought of, or dreamt of. By an ill-considered piece of legislation and by what must be regarded (from the insurers' standpoint, at least) as an unfortunate interpretation of a single clause in a single Act, British insurers have been forced to pay out this very considerable percentage of a premium income which, ever before the Act, left them at best with only a tiny margin of profit. Is it too much to hope that the mistake of 1934 will be put right in 1939?

Suicide and Public Policy

(By a Correspondent)

CLAIMS on life insurance policies seldom result in litigation because the policy is simpler, and the issue on which a claim turns is more clear-cut than in any other kind of isurance. Here lies Fred. He was alive and is dead. There's no more to be said.

When, therefore, a life policy comes before the courts on a disputed claim it is likely to attract a great deal of notice, and when the question on which the case is fought affects a large number of people who take life policies as security and the still larger number who put all their savings into life insurance, then the case becomes front-page news. The action of *Beresford* v. *Royal Insurance* was of such a kind. From the first court to the House of Lords it was followed with a very keen public interest which has (it must be admitted) developed into some public misgiving. If suicide while of sound mind invalidates a policy on the ground of public interest, how can anyone, whether he be the life assured or another party interested in the insurance, feel that the policy is what he has hitherto taken it to be—an unassailable security? That life policies should be unassailable is a matter of cardinal importance, and any reasonable method of avoiding this legal difficulty should be welcomed.

The change which common sense suggests is that suicide should by law be struck out of the category of crimes. Many devout folk regard suicide as a grave sin, and many others consider it as an act of cowardice. But other acts which are sinful and cowardly are not crimes, and there seems to be no reason why this particular deed should be distinguished and elevated to the criminal status.

If that simple reform were introduced the insurance difficulty would disappear; but it is not likely to be introduced, although on a plebiscite the present law would almost certainly be condemned. What alternatives are there? For those who lend on the security of policies there is always the possibility of assignment, and Lord Atkin in his judgment in *Beresford* v. *Royal Insurance* indicated in an *obiter dictum* that where a policy is assigned for valid consideration the objection of public policy would not interfere with a settlement, even though death resulted from the crime of the insured life. That is a specially valuable dictum, which makes the assignee's position a good deal more comfortable.

But lenders are not the only persons interested in this problem. The breadwinner who invests his life savings in life insurance is not less clearly concerned. What the middle-class man wants in his life insurance is complete security—the certainty that, however death comes to him the capital sum will be paid to his widow. He wants to know that payment will not depend on the opinion of his sanity taken by a jury, thirty years hence. It is, of course, possible for him to arrange his policy in such a way that the beneficial interest in it is his wife's, but that is not satisfactory, because the wife may die before him (in which case the policy goes as she has willed it), or he and she may part company before either of them dies, in which case the sum assured belongs to her. Handing the beneficial interest in a life policy to another is not a satisfactory device for a salaried member of the middle class.

Before coming to another possible method, let us try to state the position of a life office in this matter. First, and most emphatically, a life office does not want to resist claims merely because a court of law would be prevented on grounds of public policy from giving judgment in favour of the claimant. The offices are as anxious as the public that death claims should be easily and promptly settled. But there are circumstances in which an office might well say that the claim is not one that it should reasonably be asked to pay. A fire department does not feel bound to pay a claim due to deliberate arson committed by the insured. Why should a life office pay for a claim brought about by suicide perpetrated for the deliberate purpose of turning a life policy into cash? The problem may be stated thus: An office might wish to pay for suicide while of sound mind so long as the impulse to suicide did not spring solely from a desire to defraud the office.

Now, the law of public policy, if we understand it aright, does not make it illegal for an insurer to pay for suicide. It makes it impossible for a court of law, if the policy is sued on, to give judgment for the plaintiff. The dilemma of the insurance offices is simply that they could not in court fight the issue of fraud without winning on the issue of public policy. The defence they might feel justified in taking would be swamped by a defence they would prefer not to take.

As a way out of this dilemma, would it be practicable to put an arbitration clause into life policies—a clause which would enable the office to take the decision of an arbitrator on one point and one point only? The point at issue would be whether, when the insured life committed suicide, the dominant motive behind the crime was a desire to produce a claim on the policy. Was there a fraudulent desire to make a claim? The advantage of this method would be that the case would be kept out of the courts and so the issue of public policy would be avoided. It does not appear that an arbitrator who was called upon to decide the question of motive and nothing else would need to deal with public policy at all. He would investigate the facts and determine one point and one point only. If his award were against the office, the office would have to be content and refrain from appealing, and the arbitration clause would have to be worded in such a way that no appeal to the courts would be permissible. If the award went against the claimant there could be no appeal in any case, because the claimant would be bound to lose on public policy in court. The award would be final.

The number of cases taken to arbitration would be very small, but the life offices would, in the very exceptional case where they wish to resist a fraudulent claim, be able to resist without the unpleasant certainty of winning on an antiquated fragment of the common law.

Germany and the World's Insurance

(By a Correspondent)

IN view of the tendency of insurance to become a highly protected industry in many countries, it is remarkable that in Germany it ranks among the industries which are least controlled. German insurance is as international as that of almost any other country in the world. Many foreign offices do business in the Reich and many German offices do business outside German frontiers. In an environment of almost ferociously strict control they move with a noticeable freedom.

The strength of German houses and foreign insurers in Germany dates, of course, from many years ago. Until the war, the two groups grew in strength side by side. But it was the foreigners who, paradoxically, suffered least in the chaos which followed. The explanation is simple. During the inflation German citizens were anxious to do their saving and their insurance by means of policies which did not depreciate almost to zero within a few months of being taken out. Naturally, they chose policies in foreign currencies, chiefly sterling or dollars, and until German offices began to offer these facilities they went to the foreign companies for them. After the stabilisation of the Reichsmark, this class of policy was prohibited, and special measures were taken to encourage the conversion of existing policies in foreign currency to a mark basis.

Some figures from the latest available returns will give an indication of the strength of foreign insurance in the Reich to-day. At the end of 1935, some 61 foreign companies, including those in the Saar, were at work under the State administrative control imposed by a law of 1901 and amplified periodically since that date. Many other offices, concerned chiefly with marine insurance, escaped supervision. Of the 61 companies, 38 transacted fire business principally, 13 transacted life, six accident and liability, and four transacted other classes of business. Of the two groups together, 42 concerns had their head offices in London, 17 in Switzerland, six each in the U.S.A., Holland and Austria, and 21 elsewhere. The aggregate German assets of these companies at the same date was Rm. 295 millions, the German premium reserves Rm. 219 millions and the loss reserves Rm. 14 millions. Their capital investments in Germany, in order of magnitude, were: Rm. 109 millions on mortgages, Rm. 68 millions in securities, Rm. 38 millions in public loans and Rm. 24 millions in real estate. Policy loans in Germany amounted to Rm. 20 millions, and interest on German investments by foreign insurers, in 1935, to Rm. 15 millions.

On the other side of the medal, 101 German insurance offices were licensed abroad. Of these, 95 transacted business in Danzig, 48 in Memel, 34 in Holland, 18 in Belgium and France, 14 in Austria and Poland, 12 in Denmark, and so on, with Great Britain low in the list, with two offices. Outside Europe, Egypt and the Netherlands East Indies head the list with 10 offices, followed by Mexico and Turkey with eight, and numerous countries have smaller numbers. Numerically, there are more German offices working abroad than foreign companies in the Reich.

On a comparison of premium incomes, however, Germany is easily an importer of insurance. In 1935, foreign insurers under Government supervision received a premium income of Rm. 89.41 millions, while the foreign business of German offices only amounted to Rm. 33.36 millions. Foreign companies paid claims of Rm. 39.97 millions in Germany, and German companies paid out Rm. 20.35 millions abroad. The foreign companies' premium income was divided as follows: Rm. 43 millions on life assurance, Rm. 18 millions in fire insurance, Rm. 9 millions in motor insurance, Rm. 6 millions from liability insurance and Rm. 5 millions for accident insurance. The premium income of insurers outside the supervision regulations totalled Rm. 2.4 millions.

The table on the next page compares the life business of German and foreign offices in Germany.

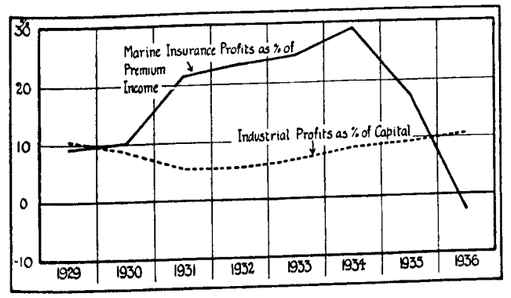
Term Group	1,719	1,050	104	60
Ordinary Group	12,321	1,460	108	66

In the preceding table, and throughout this article, Austria is counted as a foreign State. Foreign life business in Germany has been done exclusively by Austrian, Swiss and Italian companies. The collapse of the Vienna Phœnix Life Assurance Company and the transfer of its German business to a new German company, put Switzerland in the leading place.

The future of German insurance as an article of export and import lies with the world's legislators. In one respect at least its prospects are favourable. From the very beginning of currency control, insurance has escaped the severest restrictions. Though the liability on policies whose premiums are paid in blocked marks is met in the same species of currency, German offices receiving premiums in foreign currency or free reichsmarks are at liberty to fulfil their obligations in reichsmarks—apart from the effect of legislation dealing with the life assurances of emigrants. Given Germany's need for foreign exchange, this condition may conceivably continue in the future.

The future of German insurance abroad depends on the development of legislation in other countries. Present tendencies in this respect are not wholly encouraging. Exchange restrictions also play a restrictive part. Some of the most inconvenient regulations, however, may be, and very often are, surmounted by the creation of subsidiaries in the foreign country. It is well known that the Assicurazioni Generali of Trieste, the Swiss Reinsurance Company of Zurich and the Svea of Goteborg are all subject to German control through a large majority of the ownership of their shares. And restrictions on the transfer of funds weaken insurance offices only indirectly; for their losses and expenses are normally divided between the different markets more or less in the proportions of their premium incomes, and only exceptional experience in some particular market puts them in a difficult position.

Marine Insurance Experience

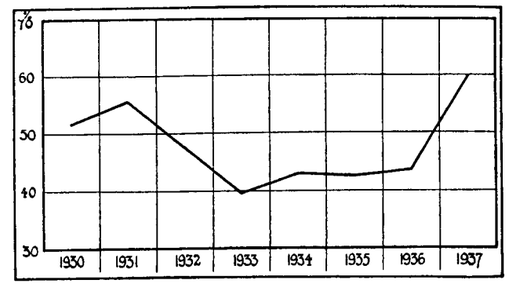


No other kind of insurance moves, as regularly as marine moves, in cycles of good and bad business. Other departments of a great office have their good times and their bad, but the marine underwriter is unique in that he seems always to be carrying about with him the seeds of the next depression or the next revival. At the present moment he is approaching, so he hopes, the end of a bad time and looking forward (though without certainty) to an upward movement of his chart of profit and loss.

In telling the marine insurer's story, a clear distinction has to be made between voyage accounts and time accounts. In the last six years the results of well-managed voyage accounts have, on the whole, been remarkably steady. The great slump in commodity prices which preceded and followed the economic blizzard of 1931 might and (on *a priori* reasoning) should have led to a deterioration of the moral hazard and a great rush of those claims which usually accompany a falling market. In the post-war slump of 1921 underwriters suffered badly from cargo which arrived on a falling market, consigned to an insolvent merchant, and there is a true story of a firm in some distant corner of the world who wrote to their London agents saying that they could not pay their account but were glad to be able to forward a large batch of insurance claims which would put London in funds. For some reason the slump of 1931 did not have the same result, and although their premium income fell year by year, underwriters with a good voyage show had consistently good percentages of profits throughout the depression. Four years ago, it is true, the figures began to reveal signs of falling off. But in the Abyssinian trouble war rates were reintroduced on cargo, and for three years the Rating Committee has been able to maintain a scale of rates which the market has always respected. Whether the policy of writing war risks at these low rates of premium is prudent may be doubted; but on a short view at least they are a welcome addition to the voyage premiums even though they may be helping to camouflage a real underwriting loss and so to depreciate the true marine rate below the paying level.

So far, however, underwriters have had no reason to be dissatisfied with the results of voyage accounts. In the time market the story is very different. Here there is no consistent record, but a tale of wide fluctuations from year to year—variations from very good years to very bad. The worst result of all awaits the names in their profit and loss accounts for 1936, which they will receive in 1939. It is unlikely that any time account will show a profit for 1936.

It seems to be one of the laws of the marine cycle that time underwriting is likely to be worse when general trade is good and better when general trade is bad. For this anomaly there are several explanations—the laying up of inferior steamers, greater care on the part of captains, greater willingness on the part of underwriters to combine and observe agreements, and—above all—cheaper repairs. When times are slack, when steel is cheap, when repair yards are short of work and ready to cut prices, then the underwriter's bill is enormously lightened. In the following graph we have attempted to show the relation between time underwriting and the state of trade, basing our chart of underwriting results on actual figures of carefully managed underwriting accounts and our chart of the state of trade on *The Economist* figures of industrial profits, which show year by year the results of company reports in every branch of industry except the railways, finance and insurance. The time figures for 1936 are estimated on the settlements made to the present moment:—



MARINE INSURANCE PROFITS

The relation in this graph between time underwriting profits and general industrial profits is remarkably interesting. At the beginning of 1930 industrial profits had begun to move down and time profits to move up. In 1931 industrial profits fell sharply and time profits have a quick upward curve. In 1932 and 1933 industrial profits drag along on a low level, while time move slightly upwards, and then in 1934 both curves, exceptionally, rise together. Henceforward time profits react quickly and industrial profits continue their upward movement under the stimulus of rising prices and increasing business activity. In the next graph we plot some second-year settlements (the heaviest year of a time account) made in the years 1931-37. Here the effect of repair costs is unmistakable—the sharp drop in 1932 and 1933 and the large rise in 1937.

At this moment the time underwriter is still paying for repair costs on a very high scale, and it is a question whether in the near future they are likely to rise still higher under the pressure of re-armament or decline because of the setback in general trade. Much will depend on what happens in that respect, but the market has now one great advantage. It is working under an agreement which is being faithfully observed by all time underwriters. It was decided last year that on all vessels of over £10,000 value an increase of 15 per cent. should be quoted on

SECOND-YEAR SETTLEMENTS

renewal, and if over the last four years a fleet did not show a profit of at least 40 per cent. the increase should be still higher. This year that agreement has been stiffened up, and it is beyond dispute that the rise in repair costs fully justifies the change. It is still too early to say whether the agreements will bring back a reasonable prosperity to the market, but on the whole the outlook for time underwriting may be said to be better than it has been since the reaction set in in 1935, though further increases in rates may be necessary before the economic level is once more attained.

General Results of British Offices

THE departmental results in 1937 were, on the whole, satisfactory and seem to have been rather better than in 1936. Heavier taxation and allocations to reserves had the effect, however, of reducing the net profits shown in the following table. In the life branch the net rate of interest fell by a further small amount, which is mainly accounted for by the increase in the rate of income tax in 1937. There was a substantial increase in new life business, but definite contraction in consideration moneys for annuities. In the fire and accident branches both premiums and underwriting profit increased, and to this result the United States experience largely contributed. Marine premiums also increased very substantially, but the underwriting results showed considerable deterioration.

In the annexed table, which gives the results in respect of all branches of insurance of twenty-two of the most important companies, the figures have been calculated on a uniform basis for all the offices. The reserve for unexpired risk, except in the marine branch, has been taken at 40 per cent. of the premium income of the year, which is the basis used by the majority of offices. It is not possible to use a uniform method of calculating underwriting profits in the case of the marine accounts, and the method of the company concerned has been followed. Special attention is drawn to the headings of each column; the calculations may differ from the published results of individual companies, as is only to be expected when various data are reduced to a comparable basis, and this fact should constantly be borne in mind. In arriving at the trading surplus shown in Column 2 all allocations to investment and other special reserves have been deducted, as well as amounts actually written off investments, which last year were in some cases substantial. Undoubtedly this method will operate somewhat unfairly in certain cases, but it is impossible from the accounts to distinguish between what may be regarded as an addition to free reserves and what is required by ordinary business prudence. Column 4 indicates the amount of the contribution to the net trading surplus derived from the operations of the life department. Such profits emerge from actuarial valuations, and in the majority of cases these valuations take place only at quinquennial intervals. It may be mentioned that some companies set aside the shareholders' proportion of surplus revealed at a quinquennial valuation, and, in each year of the new quinquennium, credit one-fifth of that surplus to profit and loss. This practice, however, is not universal. Hence the absence of any figure in this column for some companies which transact life business merely means that no valuation was due to be made. The Prudential is in a special position, since the life profits belong entirely to the "A" shareholders. The table is concerned only with the "B" shareholders, whose interest is confined to the remaining departments and who have no rights to any share in the surplus of the life and annuity department.

Of the twenty-two companies dealt with seventeen show specific allocations to meet the cost of N.D.C., presumably in respect of a period of nine months, and the total of these allocations amounts to £568,000, compared with a corresponding premium income of approximately £90 millions. Regarding 1937 as a year of normal underwriting experience, it seems probable that the demands of N.D.C. will require at least three-quarters of 1 per cent. of the premium income (excluding life assurance premiums). Column 2 of the table shows a reduction of £610,000 from last year, which is certainly more than accounted for by the cost to all the companies of N.D.C. Almost without exception the chairmen's speeches contained a strong protest against the fact that insurance companies were to be taxed for N.D.C. not only on their underwriting profits, which would be a justifiable assessment, but also on interest income on reserves, and this was considered very unfair compared with the treatment given to other trading concerns.

This protest has borne fruit, as a Government amendment was made on the third reading of the Finance Bill, limiting the amount of investment income assessable to

N.D.C. to 150 per cent. of the year's premium income (excluding life assurance, sinking fund and annuity business). Though this amendment does not go as far as was hoped, it is a welcome relief.

DIVIDEND POSITION

As will be seen from the table on page 8, 80 per cent. of the dividends were met out of interest earnings, which, it is very satisfactory to note, are more than maintained, in spite of an increase in the rate of income tax in 1937; excluding the Pearl, whose activities are mainly confined to life assurance, the figure is 86 per cent. It should be added that while the net interest earnings shown will not give effect to the recent increase of 6d. in income tax, tax at the present rate will have been deducted in a number of cases in arriving at the cost of dividends. By a policy of meeting the cost of a very substantial part of the shareholders' dividends from interest earnings, a considerable portion of the underwriting profits is available to augment the special reserves. In consequence the offices are in a very strong financial position.

A summary of the results of the same group of twenty-two companies is given at the foot of the preceding page.

II.—LIFE ASSURANCE

Life Assurance Results

THE latest returns made by the British Life Offices to the Board of Trade in respect of their 1936 accounts show that exclusive of industrial insurance policies there were 5,835,000 policies in force at the end of that year, representing sums assured plus existing bonuses of £2,061 millions. The total interest income in 1936 was £37,414,000 and the premium income £84,181,000; while the accumulated funds totalled £942,553,000. The adjoining table is compiled from the same official source.

NEW BUSINESS

(a) *Life Assurance.*—The table on page 11 shows the new sums assured, excluding industrial assurances, effected in each of the past two years by a number of representative offices. The Dominion offices are omitted, as the figures of their new business in this country are not made public.

While all four groups show further expansion, the greater relative increase amongst composite offices is chiefly due to the phenomenal advance shown by the Eagle Star, which was largely due to the great volume of group insurance business obtained.

(b) *Annuity Business.*—The immense increase in annuity business a few years ago was mainly due to the fall in income suffered by many people from the time that interest on War Loan was reduced. Latterly there has been evidence of some recession, and last year, as will be seen from the table below, there was a distinct falling off in the amount of business obtained. The Equity and Law has been very prominent in seeking annuity business, and in spite of a considerable reduction in its figures last year this office again heads the list. In view of the bold policy pursued in this branch by the Equity and Law it is gratifying to read that the directors are still well satisfied with the accruing results; they have consistently held the view that in recent years the basis of annuity business has broadened, and that on the average financial necessity was likely to counteract the well-known self selection of annuitants. Interest earned by annuity funds is virtually on a gross basis, and where mortality does not operate unfavourably, annuity business, under the terms at present offered, should prove definitely remunerative to the companies.

ENDOWMENT POLICIES
WITH HOUSE PURCHASE PRIVILEGES

SOME ADVANTAGES OF ENDOWMENT POLICIES

1 If you take up a policy at once, you can obtain it at a cheaper rate than you will have to pay in the future. "DO IT NOW."
2 You may be insurable now, but not insurable in the future, when an advance for House Purchase would prove of great service to you.
3 The Life Assurance comes into force immediately the first premium is paid; the policy is a sound investment even if the privilege of obtaining an advance is never exercised.
4 You can take out your policy now and defer the selection of the house until a suitable property is available.
5 The premiums paid under these policies enable you to obtain statutory rebate of income tax.
6 The policy entitles the assured to all the benefits of an ordinary Endowment Assurance Policy with the additional advantage of being available for House Purchase.

MORTALITY

So far as can be gathered from the Annual Reports and Chairman's Speeches, the mortality experience in 1937 did not differ very materially from that in the previous year. The obsolete O^M table is being steadily replaced by the $A^{1924-29}$ table as and when actuarial valuations fall due, and the ratio of actual to expected claims when published is assuming a more realistic appearance.

INTEREST

Following on a decrease in 1936 of 1s. 5d. per cent. in the average rate of interest, there was a further small fall of 1s. per cent. last year. These figures are not large, and it should be remembered that in both years there was an increase of 3d. in the rate of income tax. This result is distinctly encouraging from the point of view of bonus maintenance, and more favourable than would have been forecast by most people a few years ago. The actual average net rate earned, namely £4 1s. 5d. per cent., gives a very considerable margin over the rates of interest commonly used in assessing the liabilities; the margin is really greater, as actuarially the rate of interest should more properly be calculated, not on the life assurance and annuity funds, but on actuarial reserves, which are smaller. The increase of 6d. in the rate of tax for the current fiscal year will, by itself, operate to reduce the earned rates of interest; but there now seems less reason to anticipate a general and marked fall in bonus rates, in the earning of which the interest element is the most important factor under modern conditions. In considering the following table, it should be borne in mind that the net rates shown for any two offices are not necessarily strictly comparable owing to differences in bookeeping. Among other things, a good deal depends on the method of valuing the assets.

in an increase in the proportion of assets invested in mortgages and an increase also in debentures, preference and ordinary stocks at the expense of gilt-edged. The majority of companies showed a well marked increase in their proportions of ordinary stock investments, but the proportion held by the National Mutual shows a sharp fall in the year from 20.0 per cent. to 14.3 per cent. This fall no doubt reflects in part the large depreciation experienced last year, since that Society uses market values at December 31st for balance sheet purposes. The amount of depreciation or appreciation in stock exchange security holdings is not generally mentioned by the companies, but on the average last year probably saw a drop in the region of 10 per cent. of book values. The following table gives the average distribution of all the companies in each of the last five years:—

Life Office Valuations

THE Assurance Companies Act, 1909, provides that every office "shall cause an investigation to be made into its financial position, including a valuation of its liabilities" at least once in every five years. These investigations mark the occasion for the distribution of bonuses to policyholders.

The table on page 16 analyses the results of the valuations made at the end of last year, together with the corresponding data for the preceding valuation. In all cases where no allocation to shareholders is shown this simply means that the office is a mutual society and has no shareholders.

As will be seen from the notes which follow, there was, with two exceptions, practically no change in the rates of bonus declared in the ordinary branches of the companies. This result, which has been attained in spite of falling rates of interest and of a general strengthening in valuation bases, demonstrates remarkable resilience in bonus earning power. The distribution of the Commercial Union was on a slightly less favourable scale, but the Provident Mutual, whose previous distribution was made as at the close of 1932, and in view of the then economic crisis was frankly conservative, increased its rates of bonus. In the industrial branches of the offices doing this class of business bonus distributions were in general on the same scale as in 1936, with the exception of the Refuge, whose allocation to industrial policyholders was approximately twice that made in the previous year. While it might be unduly optimistic to regard present bonus levels as static, the outlook seems to suggest that the offices may find it possible to maintain bonuses at rates not greatly differing from their latest declarations, provided there is no major European conflagration.

AUSTRALIAN MUTUAL PROVIDENT SOCIETY

Established 1849 in Australia

73-76 King William St., London, E.C.4

Annual Valuations

Britannic.—Ordinary branch bonus 38s. per cent. calculated on the sum assured (same); as usual, the cost of the bonus, including shareholders' proportion, is well within earnings. In the industrial branch bonus additions will be made to premium-paying policies becoming claims by death or maturity before March 31, 1939. Such bonus additions will vary from 5 per cent. on the sum assured for a policy ten years in force to 20 per cent. for policies twenty-five years in force or longer.

Co-operative.—Ordinary branch bonus 36s. per cent. calculated on the sum assured (same), and in the industrial branch the satisfactory declarations of 1936 were repeated.

London Life.—Bonus reserve method used, assuming future compound bonus of 30s. per cent. (same) and future reduction of premium at 2 per cent., against 1¾ per cent. in 1936. The rate of bonus declared was again 35s. per cent. calculated on the sum assured and existing bonuses. In the reduction of premium class the rate of reduction for the third successive year is 3 per cent., but it is stated that this declaration must not necessarily be regarded as a regular rate of increase. The rate of reduction for many years prior to 1935 was 2 per cent.

London and Manchester.—The rate of bonus in the ordinary branch is 40s. per cent. calculated on the sum assured (same). The basis of allocation to policyholders in the industrial branch is unaltered.

Pearl.—The rate of bonus declared in the ordinary branch is 40s. per cent. calculated on the sum assured (same). In the industrial branch the rates are 16s. for each weekly premium of 1s. in the whole life class and 12s. in the endowment assurance class (same); the policies participating are those effected prior to January, 1931.

Prudential.—In the ordinary branch the rate is 46s. per cent. for whole life assurances and 40s. per cent. for endowment assurances; in the industrial branch the rate is 32s. per cent., calculated on the sum assured in each case (same). While the ordinary branch bonus rates are good, they are not outstanding; the industrial branch bonus rate of 32s. per cent. is, however, a remarkable achievement. The bases of valuation in the ordinary branch are unchanged. In the industrial branch the English Life Tables No. 10 replace the corresponding No. 8 Tables, and interest has been taken at 2¾ per cent. instead of 3 per cent. The cost of this change was in part met by sums of £1,200,000 and £800,000 set aside in 1935 and 1936 as additional reserves, but the total cost may be assumed to have been considerably in excess of this £2,000,000.

Refuge.—Ordinary branch bonus is 36s. per cent. on the sum assured (same). In the industrial branch the allocation to policyholders is approximately twice that made in the previous year, in spite of the undisclosed cost of setting up the more stringent reserves. For many years, however, the company has continuously strengthened its basis of valuation, and the much greater amount available to policyholders this year may be due to the fact that in 1937 a smaller added strain was incurred by the changes made than by those in previous years. If this is the correct interpretation, it would appear probable that future allocations to policyholders will be on a much higher scale than in the past and be related rather to the level of 1937.

Standard Life.—The rate of bonus was 42s. per cent. calculated on the sum assured and existing bonuses (same). Although this rate (which has been maintained for eleven successive years) definitely places the company among the "high bonus" offices, it is very well within earning capacity. To the pre-eminent services of the retiring manager and actuary, Mr Steuart Macnaghten, is generally attributed the enviable financial position and prestige of this office.

Wesleyan and General.—The bonus declared in the ordinary branch is at the rate of 38s. per cent. calculated on the sum assured (same). In the industrial branch the amount allocated to policyholders takes the form of an

WILL RETIREMENT MEAN RETRENCHMENT?

It need not. A small yearly investment in a Life Assurance Policy will provide you with a source of income on retirement. It will also make provision for your dependants in the event of your death.

There is no better medium at the present time than Life Assurance for providing for retirement and at the same time protection. The Income Tax rebate greatly enhances its attractiveness.

addition to the sum assured, equal to 2½ per cent. of the sum assured for policies of ten years' duration increasing by ½ per cent. for each additional year up to a maximum of 10 per cent. for policies of forty years' duration and over.

Triennial Valuations

Atlas.—The rate of bonus declared is 42s. per cent. calculated on the sum assured and bonuses (same).

Equity and Law.—Under the society's system of distribution the rate of bonus declared on any policy depends to a large extent on the rate of premium charged. The minimum rates are 45s. per cent. per annum on the sum assured for whole life policies and 42s. per cent. per annum for endowment assurances, with as much as 80s. per cent. per annum in some cases (same). This is the first triennial valuation of liabilities, the previous basis being quinquennial. For assurances the $A^{1924/29}$ table with interest at 3 per cent. has been used, and for annuities the $a^{(m)}$ and $a^{(f)}$ at 3½ per cent. In both cases the basis is the same as three years ago, but on this occasion it is stated that 3¼ per cent. has been used for endowment assurances under the society's house purchase scheme.

Quinquennial Valuations

Commercial Union.—Annuities were valued on the same basis as in 1932, but the basis of valuation of the assurance contracts has been altered from O^M 3 per cent. to $A^{1924/29}$ 2½ per cent. The cost of this change in basis is hidden in the trading surplus. Bonuses are declared on what is known as the contribution method and so vary with the plan, age at entry and the time a policy has been in force. In the first instance the cash amount to be allocated to each policy is calculated and the corresponding reversionary bonus found on the basis of the mortality and interest used in the valuation. The minimum cash allotted in any case is as at the last distribution 35 per cent. of the ordinary whole term premiums paid in the quinquennium. The reversionary rates of bonus, although slightly smaller than on the last occasion, are particularly good for endowment assurances.

Provident Mutual.—In the valuation for the quinquennium 1933 to 1937 the Provident Mutual abandoned the use of the familiar O^M 3 per cent. net premium method in favour of a bonus reserve valuation. For mortality the $A^{1924/29}$ table has been used with interest at 4 per cent. for with profits policies and "adequate provision" for future expenses. The future rates of bonus assumed in the valuation were those declared at the last distribution of profits as at December 31, 1932, namely, 40s. per cent. per annum for whole life assurances (increased to 45s. per cent. for attained ages not less than 65) and 35s. per cent. per annum for endowment assurances; these various rates are calculated on the sum assured. The effect of the change in method is to strengthen the reserves, as compared with the O^M 3 per cent. value, by £280,000. The rates of bonus declared are 5s. per cent. per annum in excess of the above rates reserved for in the valuation, and are as follows: 45s. per cent. per annum for whole life assurances (increased to 50s. per cent. for attained ages not less than 65) and 40s. per cent. for endowment assurances, these rates being calculated on the sum assured. This extra 5s. per cent. per annum is referred to as a special additional bonus, and it is stated to have been given in consideration of the fact that the average yield on the life assurance fund has been considerably in excess of the 4 per cent. assumed in the valuation. It is particularly pointed out in the Actuary's report that the basic rates of bonus assumed "may be expected to fluctuate on one side or other of the basic rate according as the experience of the association has, during the period under review, been more or less favourable."

Scottish Equitable.—In 1936 the close of the financial year, which was formerly March 1st, was altered to December 31st, and the results shown below for the past valuation period are in respect of four years and ten months. The former basis of valuation took account of mortality according to the $O^{M(5)}$ table, using O^M net premiums and taking interest at 3 per cent. On this occasion the new $A^{1924/29}$ mortality has been used with interest at 2¾ per cent. The change has entailed a certain cost which, being undisclosed, has operated to reduce the amount of trading profit shown in the table. The basis of bonus declared is at the satisfactory rate of 2 per cent. per annum calculated on the sum assured and declared bonuses (same).

Scottish Temperance.—The life assurance policies were valued by the $A^{1924/29}$ table, assuming interest at 2¾ per cent. compared with the O^M table, using 3 per cent. interest, five years ago. The cost of strengthening the reserves operates to reduce trading profits. For annuity contracts the bases of valuation were the same as on the last occasion, namely $a^{(m)}$ and $a^{(f)}$ tables with 3 per cent. interest. The carry-forward of £107,768 includes £35,166, being the necessary provision for bonus to policyholders under the deferred and accumulating bonus schemes whose policies are not yet entitled to share in profits. The rate of bonus declared is 2 per cent. per annum, calculated on the sum assured for endowment assurances and on the sum assured and existing bonuses for whole life policies (same).

Scottish Union and National.—The basis of valuation of the annuity contracts was unaltered, but in valuing the life assurance contracts the basis has been altered from O^M 3 per cent. to $A^{1924/29}$ 2½ per cent. The cost of the change is not given, but some indication of its amount is no doubt evidenced in the large reduction in the carry-forward and in the apparent disparity between the trading surplus shown in the table and the allocations to policyholders and shareholders. The rate of bonus is 43s. per cent. calculated on the sum assured (same).

III.—OTHER INSURANCE

Fire Insurance

FIRE insurance results last year were very satisfactory, and most companies obtained increased premium income, in spite of the absence or curtailment of business in Spain and the Far East, while underwriting results were even better than in 1936. The results of the last few years have been exceptionally favourable, but so long as trade recession here and in the U.S.A. continues, it is unlikely that the same level of success will be maintained. So far, fire losses this year are larger than in 1937, and it is reasonable to expect some reduction in the premium income. The following

British Industrial Developments

The following reports on British industry cover, in most cases, the period to the middle of June. In the remainder they relate to the month of May.

COAL

The output of coal has so far been fairly well maintained. Thus, the quantity of coal raised last month was 19.1 million tons, compared with 17.8 millions in April and 18.7 millions in May, 1937. Moreover, exports, after falling below the level of the corresponding month a year earlier in April, were higher last month than in May, 1937. The outlook, however, is less encouraging, for domestic demand for industrial purposes and export business have tended to decline. The recent reduction in sales for domestic purposes is seasonal. Prices have so far been fairly well maintained, though there are indications of slight reductions in certain grades.

IRON AND STEEL

The output of pig iron declined from 661,000 tons in April to 633,900 tons in May, the lowest level since February, 1937. Production of steel ingots and castings in May, at 957,000 tons, was 18,400 tons higher than in April, but, with the exception of that month, was the lowest output recorded since August, 1936. Imports of iron and steel showed a further decline last month, but exports remained almost unchanged. As a result of the contraction of domestic output and imports, *The Economist's* index of apparent iron and steel consumption (1935 = 100), adjusted for seasonal variations, fell from 123½ in April to 104½ in May; a year ago the index stood at 130. This index, however, does not take into account changes in stocks. Despite the recent reduction, the output of the industry remains substantial. As stocks of certain materials are still substantial, there has been no incentive for consumers to cover their requirements for longer periods ahead. The prolongation of the International Steel Cartel, announced last week, and the expectation of the conclusion at an early date of an effective agreement with the American steel exporting companies has strengthened the price structure in this country.

GENERAL ENGINEERING

The gradual recession in the engineering industry continues. Activity is slowly declining, and as the trend of new business is also downwards a further contraction of activity is probable. The negotiations between the A.E.U. and the employers are still hanging fire; but even if the volume of Government contracts increases, this is not expected to offset fully the shrinkage in commercial business. While the trend of activity is slightly downwards the industry still remains very busy, for the proportion of insured persons unemployed in general engineering in May, though 0.3 per cent. and 2.0 per cent. higher than the preceding month and in May, 1937, respectively, was still only 7.1 per cent. The gradual decline in the demand for machinery is reflected in the fall of imports from 12,605 tons in May, 1937, to 10,132 tons in the past month. Owing to the large volume of export business placed last year, exports in May, at 37,238 tons, were still 2,644 tons higher than a year ago. Exports are expected to continue at a fairly satisfactory level during the next three or four months. Among individual sections, marine engineers and manufacturers of prime movers and engines remain very active, but activity in the textile and agricultural machinery departments has slowed down.

ELECTRICAL EQUIPMENT

The electrical equipment industry remains active, though, like general engineering, the industry is experiencing a gradual recession. The proportion of insured workers unemployed last month was 5.3 per cent. in engineering and 9.0 per cent. in the electrical cable, apparatus, and lamp section; compared with a year ago, the unemployment percentages showed increases of 2.3 per cent. and 3.9 per cent. respectively. Exports of electrical machinery increased from 1,063 tons (valued at £192,083) in May, 1937, to 1,960 tons (valued at £330,997) in the past month. Shipments of electrical goods and apparatus last month also continued above last year's level, and, at £1,098,113, showed an increase of £25,880 over the figure for May, 1937.

AUTOMOBILES

Sales of new vehicles on the home market during April show a decrease of 5,472 compared with April, 1937, though some of the decrease must be ascribed to the fewer working days in April this year than in April, 1937. The total new sales for the seven months ended in April show a decrease of 10 per cent. compared with 1937, and output of private cars and taxis for April and for the seven months ended in April were 11 per cent. and 10 per cent. respectively lower than in the corresponding period of last season. The production of commercial vehicles fell by 8 per cent. in the first seven months of the season and by 6 per cent. in April compared with the corresponding periods of last season. The five months' (January-May) total of all motor vehicles exported shows that the numbers have increased from 40,000 in 1937 to 42,000 in 1938, whilst the value shows an increase of over £600,000.

BUILDING

Activity in the building and contracting industries remains at a very high level. The proportion of insured persons unemployed in building last month, at 12.2 per cent., was only 1.2 per cent. higher than a year ago, while in public works contracting the unemployment percentage was actually 0.5 per cent. smaller than in May, 1937. While the industry has no doubt benefited from the increase in defence expenditure, which involves construction of factories, aerodromes, etc., it is doubtful whether Government contracts would have been sufficient to make up for any marked curtailment in private construction. The returns of the value of building plans passed by a large number of local authorities have recently shown substantial decreases compared with the corresponding month a year ago. On the other hand, the figures for May, relating to 142 local authorities, show a decline of only 0.5 per cent. from the figure for the corresponding month last year. Plans passed for dwelling-houses and public buildings showed an increase, but those for factories and commercial premises were appreciably lower. There are still no indications of a marked recession in building and contracting in the near future.

CHEMICALS

Owing to the international situation, conditions in most sections of the chemical industry have been subdued during the past month. Business in industrial chemicals was quiet, although a little more activity was reported towards the close. Sales of weed killers and fertilisers have been below normal owing to the prolonged drought. Refined coal tar has been the only coal tar product for which any demand has been shown. Trade in pharmaceutical and other fine chemicals has been dull throughout the month. The value of exports of chemicals, drugs, dyes and colours during May was £243,139 less than in May, 1937, ammonium sulphate and painters' colours and materials showing particularly large decreases. Imports were £112,400 lower in value than in May, 1937.

POTTERY

Trade generally is quiet; unemployment fell slightly during May, and 16.8 per cent. of insured persons were unemployed on May 16th, compared with 18.4 per cent. in April. Exports for May were a little higher than in May, 1937; for the first five months exports of earthenware amounted to 208,000 cwt. and of sanitary-ware to 184,000 cwt., compared with 195,000 cwt. and 207,000 cwt., respectively, in the corresponding period of last year.

FOOTWEAR

Employment continues fairly good, and the proportion unemployed among insured persons, at 11.9 per cent., showed little change between May and April; a considerable amount of short time, however, is being worked in Bristol, Northampton, Stafford and Leicester. Exports for May were again considerably larger than last year, and for the first five months of the current year amounted to 168,357 dozen pairs, against 154,018 dozen pairs in the corresponding period of 1937.

COTTON

General conditions throughout the industry remain very unsatisfactory and numerous firms extended the usual Whitsuntide holidays; since the beginning of June, however, some spinners and manufacturers have secured a few more orders. Export trade in piece-goods has continued to be restricted, and shipments are now smaller than for the last 85 years. India buyers have given moderate support in bleaching styles and fancies. The higher duties have continued to affect adversely the trade with Egypt, and stocks in West Africa are moving off very slowly. Rather more active dealings have taken place for South America, the Dominions and the home trade. According to latest statistics, the number of unemployed in the cotton industry is now 126,549, against 107,887 a month ago and 53,850 at the same time last year. Spinning production is now 50 per cent. of capacity, against 55 per cent. a month ago and 92 per cent. at the end of May, 1937. Exports of cloth for the five months ended May amount to 639,791,000 linear yards, and during the same period shipments of yarn have been 52,507,900 lb., a decrease for each class, compared with a year ago, of 25 per cent.

JUTE

Unemployment continued to increase during May, when the proportion unemployed among insured persons rose to 37.2 per cent., compared with 36.3 per cent. in April and 21.1 per cent. in May of last year. Exports of piece-goods in May and in the five months ended in May were less than half of those in the corresponding periods of last year; exports of sacks and bags were also lower, though the fall was not so pronounced. The Government is helping the trade by a large order for 275 million bags, at the rate of delivery of 2 million bags a week. The problem of working hours in the Indian mills has not yet been settled, though the owners of only a very small percentage of looms are standing out.

LINEN

Flax prices have been maintained, but business for the home trade is very limited. Further bulk sales have been made to Germany by the Baltic Monopolies. There is more inquiry for yarns, but the difference between production costs and buyers' limits remains unbridged in both the yarn and cloth markets.

RAYON

Rayon business has continued in a depressed state during the past month. There is no evidence of cutting of viscose yarn prices below the agreement rates, but concessions have been given in grades wherever possible. The outlook amongst Lancashire and Yorkshire consumers is in some directions a little brighter than it was. The hosiery trade has been rather disappointing.

WOOL

Trade is very slow in all departments. The proportion unemployed among insured workpeople aged 16-64 increased slightly in May to 21.8 per cent., compared with 21.2 per cent. in April and 9.4 per cent. in May, 1937; a considerable amount of short time is being worked. Exports of tops, yarns and tissues were all heavily down in May compared with May of last year. Exports of woollen tissues fell from 5.4 million sq. yards to 3.5 millions, and those of worsted tissues from 2.9 millions to less than 2 million sq. yards. Markets for raw wool have been firm, but this confidence is not reflected in the later stages of the industry.

AGRIQULTURE AND FISHERIES

The break in the drought has brought on the corn crops, which are generally in good condition, though in some districts germination was uneven. The sowing of sugar beet and roots was delayed until the rain, but is now practically completed. There has been little growth on the pastures, and hay fields are expected to give a light yield; the acreage laid up for hay is also smaller than usual, owing to the shortage of keep. The additional 4d. per gallon in the wholesale price of milk for July will be welcomed by dairy farmers; fat lamb prices remain at low levels. The soft fruit harvest is generally very small, owing to the long drought and the late frosts. The British catch of wet fish amounted to 1.6 million cwt. in May, against 1.7 million cwt. in May, 1937; the value, however, increased from £1,003,000 to £1,145,000.

SHIPPING

The Economist's index of freight rates for May, at 113.9 (base 1898-1913), showed a slight rise from the April level; declines on some routes were more than offset by increases on others. The Plate market remains depressed, but there has been some recovery in rates to and from India. In view of the steadily declining volume of world trade, the prospects for an early revival in the level of freights or business are not hopeful.

* For method of construction and earlier figures (1924–1936) see Supplement to *The Economist* of July 25, 1936. r Revised. p Provisional. † Annual indices represent averages of monthly figures.

Business Developments Overseas

BRITISH EMPIRE

AUSTRALIA.—Rain still is needed in Victoria and New South Wales, but conditions in the other States are reported to be satisfactory. The next wool clip is expected to be light and the carry-over, at 100,000 bales, will probably be absorbed. Industrial construction and general business activity continue at a high level, but the anticipated reduction in the wool clip and the lower prices for wheat suggest that the value of exports in the latter half of 1937 may tend to decline. The Government loan of £10,250,000 was fully subscribed.

SOUTH AFRICA.—Although some expansion in orders occurred after the general election, business generally remains subdued. Wool prices have remained firm, and although there is little export business in hides, the local demand is good. The value of exports in April was £2.1 millions below the level of April, 1937, while imports fell by £0.5 million.

CANADA.—In contrast to the decline in the earlier months of the year, the index of the volume of business (base 1926) rose from 106.1 in February to 108.8 in March, and a further rise was recorded in the first weeks of April. The index of general employment for the whole of April, however, showed a small decline, and there was a fall in activity in the textile and newsprint industries. Over most of the prairie country the young wheat crop is making good growth, but rain is reported to be badly needed in Alberta.

INDIA.—Widespread rains during May were welcomed in all districts and standing crops are reported to be good. The latest estimate of the wheat harvest raised the total yield from 10.18 million tons to 10.50 million tons. The Indian Government issued during May a 3 per cent. Rupee Loan 1963/5 at 98 for 15 crores, which has been oversubscribed. Both imports and exports were lower in April than in March and in April, 1937, and amounted to 13,43 lakhs and 12,66 lakhs respectively.

EUROPE

FRANCE.—Despite the improvement in confidence resulting from the measure of political stability achieved by M. Daladier's Government, there has been, as yet, no decisive upturn in business activity. The official index of industrial production for April (1913 = 100) is 93, against 95 in March and 105 in April, 1937. During May the number of persons in receipt of unemployment benefit declined from 393,054 to 380,826. This was a seasonal decline, however, and was much less marked than during the corresponding month a year ago, when the number fell from 371,413 to 345,503. The value of imports in May was 3,878 million francs, against 3,877 million francs in April and 3,070 million francs in May, 1937. Exports last month were valued at 2,324 million francs, compared with 2,364 million francs in the preceding month and 1,761 million francs a year ago. There are no indications of an early and sustained revival in the capital goods industries. Activity in the building and iron and steel industries remains well below the level of a year ago. Wholesale prices, as revealed by the official indices, showed an increase during the past month. A rise in the value of Stock Exchange securities in the first half of May was cancelled by a decline in the second half.

GERMANY.—Despite some decline in export business, industrial activity in Germany continues well above the level of a year ago. The absence of any setback is due largely to the intensification of re-armament activity. The number of unemployed persons (excluding Austria) fell by 84,000 to 338,000 during May. The number of persons recorded as employed reached 19,850,000 in May, an increase of 450,000 on the month, due largely to the number of children leaving school, but in part also to the re-entry into gainful occupation of married women, pensioners, and workers formerly independent. Despite a decline of 65,000 during the past month, the number of registered unemployed in Austria was still 351,000 early in June. Coal production (excluding Austria) was 14.5 million tons in April, compared with 15.7 millions a year ago. Crude steel production, however, rose from 1,645,000 tons to 1,766,000 tons during this period. Imports of Great Germany last month were Rm. 516 millions, an increase of 8.2 per cent. over the figure for the previous month. Exports in May, at Rm. 465½ millions, were 3 per cent. higher than in April. There are no indications of an early setback in industrial activity.

BELGIUM.—Business activity continues at a low level; the general index for April (base 1929) at 67.1, was nearly one point lower than in March, and compares unfavourably with the figure of 90.9 in April, 1937. Imports in April amounted to Frs. 1,900 millions, against Frs. 2,446 millions in April of last year, while exports fell by Frs. 574 millions to Frs. 1,723 millions. Wholesale prices showed a further decline from the peak reached in January, 1938.

SWITZERLAND.—The fall in the number of unemployed from 66,000 at the end of March to 60,000 at the end of April was partly stimulated by the Government expenditure on construction work. Business activity generally continues at a high level, but the outlook is unsettled; the tourist trade shows a slight decline from last year and imports fell from Frs. 173 millions in April, 1937, to Frs. 124 millions in April of the present year. Exports continue to be well maintained. The exceptional dryness has delayed the crop growth and the sharp frosts in May seriously damaged the fruit trees and vines.

GREECE.—Favourable climatic conditions during May have improved the prospects of a satisfactory crop, especially for cereals. Industrial activity continues satisfactory, while inland trade was better than a month ago. Both exports and imports in April showed a slight recession compared with April last year. Demand for the principal articles of export—especially tobacco and currants—was not brisk in May, and wholesale prices generally tended to fall. Foreign exchange reserves declined somewhat, while conditions on the Stock Exchange remained satisfactory. Public revenue continues to increase.

POLAND.—Business activity remained at a high level during the first three months of the year; in April, however, the general index of production fell by nearly 2 points to 92.7 (1929=100), due largely to a sudden decline in the textile trades. Unemployment showed a seasonal decline in April and was lower than in April, 1937; the level of wholesale prices and the cost of living have been very stable for the last 18 months. The value of imports and exports continues to be well maintained.

UNITED STATES OF AMERICA

The downward trend in industrial activity persisted in May, but the rate of decline has slowed down. According to the Monthly Bulletin of the National City Bank, business men are not now expecting much change for the better until seasonal influences again become favourable in the early autumn. As a result of the drastic curtailment of output, stocks of semi-finished and finished goods were steadily reduced; nevertheless, they still appear to be substantial in many industries. Activity in the heavy industrials remains at a very low level, and the volume of new business is small. Machine tool orders in April were less than one-third of the figure for the corresponding month last year. Building contract awards were disappointing in April, but have shown some improvement in the past month. Residential contracts showed an encouraging contraseasonal increase during the first three weeks of May. Exports are still running above last year's level, the figure for April being $271.5 millions, against $264.6 millions in the corresponding month last year. During the same period, however, imports fell from $280.9 millions to $155.5 millions.

LATIN AMERICA

ARGENTINA.—The sharp recession in export trade has now resulted in the inevitable decline in imports; retail trade is poor in practically all lines. Wholesale prices continue to fall. The financial year closed with a surplus of 10.8 million pesos, but, in view of the recession in world trade, efforts are being made to reduce Government expenditure. Exports of linseed are expected to reach 645,000 tons in the coming season, compared with 539,900 tons exported last year; the cereal crops, however, yielded only a poor harvest.

CHILE.—The shortage of dollar and sterling exchanges has become more acute, due mainly to the serious decline in the value of exports, but the requisition of exchange for official purposes also lessens the supply available for merchandise imports. The value of mineral exports in the first quarter of the year was one-third lower than in the corresponding period of 1937.

ECUADOR.—The acute exchange stringency during the early part of May, caused in part by the surfeit of 2½ million German *Aski* marks, led to a decree establishing a complete control over imports, by means of permits. The Central Bank has suspended all dealings in foreign exchange, but it is rumoured that it intends to hold the sucre at the existing rate of 13.8 to the U.S. dollar. The cocoa crop is expected to be nearly one-fifth smaller than that of last year, and this, combined with the low prices of cocoa on the world market, gives rise to some anxiety.

THE FAR EAST

Japanese exports in April, at 217 million yen, were 9 million yen lower than in March and 46 million yen lower than in April of last year. Under the influence of control measures, imports fell to 265 million yen, compared with 337 million yen in April, 1937; the import surplus for the first four months of 1938 was 280 million yen less than in the corresponding period of 1937. The output of heavy industrial products has expanded, but business in other directions has been dull. Wholesale prices changed little in March and April, but retail prices continue to rise. The value of China's imports for the first quarter of 1938 amounted to 232 million standard dollars, against 318 million in 1937; the value of merchandise exports fell from 240 million standard dollars in January-March, 1937, to 134 millions in the same months of the current year.

UNITED KINGDOM

(Population, mid 1936, 47,098,000: Area 95,030 sq. miles; 244,000 sq. kms.)

(*a*) Old quarterly Board of Trade indices linked on to new indices; figures in italics based on old indices. (*b*) Annual figures relate to year ended September.
(*c*) Figure for 1938 is average of August-December. (*d*) Indices shown in last month of quarter to which they relate. (*e*) Daily average. (*f*) Monthly figures are averages of quarterly returns. (*g*) Average of weekly figures. (*h*) Annual figures are totals for financial year beginning in year shown. Monthly figures are cumulative.
(*i*) Average of 11 months. (*k*) Annual figures relate to end of year. (*m*) Average January to August; figures for September to December are not comparable owing to revised method of counting adopted in September, 1937.

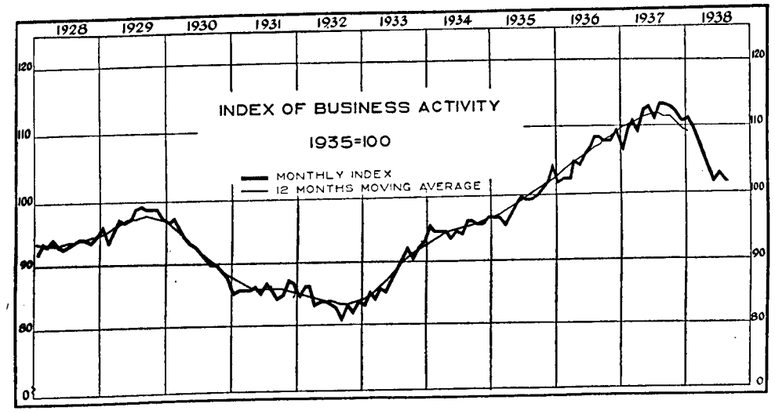
(a) Figures for 1937, and in the case of crops for 1937–38, are provisional. (b) Figures for 1934 and 1935 are subject to revision. (c) End of year. (d) End of season.
(e) Monthly figures are averages of quarterly returns. (f) Season beginning in April of year shown.

Printed in Great Britain by Eyre and Spottiswoode Limited, His Majesty's Printers, East Harding Street, London, E.C.4. Published by The Economist Newspaper, Ltd., at 8 Bouverie St. Fleet St., E.C.4.—Saturday, June 25, 1938. Entered as Second Class Mail Matter at the New York, N.Y., Post Office.



THE ECONOMIST
TRADE SUPPLEMENT

New Series SATURDAY, AUGUST 27, 1938 No. 20

The Trend of Business

THERE were indications in June that the force of the initial downward movement in industrial activity had exhausted itself. After falling without interruption from 113½ (1935 = 100) last September to 102 in May, *The Economist* index of business activity, adjusted for seasonal variations, rose to 103 in June. Although this improvement was not maintained in July, the index for the past month is no lower than that for May.

The lull in the decline of industrial activity, coupled with the market recoveries in June and July, have encouraged a widespread belief that a change in the long-term trend was imminent and that the autumn would witness a definite improvement. This argument—it was nothing more than an argument—was based on the fact that stocks of raw materials and finished goods had been appreciably reduced between September and May and that the expected revival in the United States, by lifting commodity prices, would set in motion a restocking movement in Britain **in the autumn.**

Although the position cannot be easily judged at this stage, the argument has not been conclusively substantiated by the course of events.

The rise in commodity prices, which carried *The Economist* index of the prices of primary products from 131.5 (September 18, 1931 = 100) on June 8th to 138.0 on August 3rd, has been followed by a slight setback, born partly of the less exuberant view taken of the business outlook in the United States. Moreover, though an increase in the flow of orders to British industry is still expected in the autumn, there have as yet been few indications that such a movement has actually got under way. There is usually a seasonal spurt in the volume of new business in the autumn. The important point is not whether orders will increase, but whether they will increase as much as, or more than, usual. Unless the international economic and political situation shows a material improvement within the next few weeks, there seems no reason why consumers should anticipate their requirements for a longer period ahead, which alone would give rise to a re-stocking movement of sufficient magnitude to bring about a revival of business activity.

There are no indications, for example, of an improvement in export business. As new orders are not immediately reflected in the export returns, an improvement in shipments can, in any case, scarcely be expected within the next few months. These have already fallen to a very low level, *The Economist* index of the volume of exports of United Kingdom manufactures having fallen from 113½ (1935 = 100) in July, 1937, to 93½ in the past month.

So far as domestic activity is concerned, the increase in re-armament expenditure has undoubtedly broken the force of the decline in new civil investment for commercial purposes in the home market. But this increase in re-armament expenditure, as is now recognised, has failed to compensate fully for the decline in new investment for commercial purposes. Even the metal industries, on which armament expenditure is largely concentrated, have experienced a substantial setback. The output of crude steel, for example, has fallen from a peak of 1,178,300 tons in November to 683,200 tons in July. Just as an expected shortage of steel a year ago led to a wild scramble for materials, the decline in consumption and the expectation of a reduction in prices at the end of this year is now prompting consumers to use up their stocks before placing new orders. The industry has thus experienced this year a de-stocking movement as violent as last year's re-stocking. Moreover, since many steel consumers confidently expect a reduction in prices at the end of the year, they are unlikely to increase their purchases materially within the next few months. Similar developments, though of less violence, are noticeable in the metal-using industries.

In contrast to the curtailment of output in the metal and textile trades, activity in the building and construction industries has so far been surprisingly well maintained. Indeed, the relatively mild recession in general business activity hitherto experienced is due in no small measure to the sustained activity of these industries, which represent a substantial sector of British industry. The maintenance of constructional operations at a high level in face of the decline in general business activity is due partly to the long time-lag between the commencement and completion of buildings and partly to the increase in construction for defence purposes. Even with these supports, however, a decline in the total volume of construction seems to have begun. Thus, the proportion of insured persons unemployed in July was 3.0 per cent. higher than a year ago in the case of building and 3.4 per cent. in public works contracting. There are no signs of anything like a slump in building activity in the near future, for the value of building plans passed by 140 local authorities in July was only 4.2 per cent. smaller than a year ago. Any serious decline in building would, of course, lead to a further marked contraction in general business activity.

Abroad, the United States appears to gain ground, though as the hesitation on Wall Street suggests, progress is not expected to be as rapid as it was generally believed some weeks ago. In France, industrial activity continues at a very low level, and there has been no improvement in Belgium, Holland, or Switzerland. Industrial activity in Germany is maintained well above the level of a year ago, but the slump on the Berlin Bourse is a reflection of the increasing difficulties in which private business is operating. Business in Scandinavian countries, though still at a high level, is showing a tendency to decline. Similarly, as recent export returns show, the British Dominions and most of the raw material producing countries are beginning to feel the effects of the decline in prices and in world demand for their products. So far, however, the recession in the majority of these countries has been slight.

British Industrial Developments

The following reports on British industry cover, in most cases, the period to the middle of August. In the remainder they relate to the month of July.

COAL

As a result of the decline in domestic business activity and international trade, the coal-mining industry has experienced an appreciable decline in demand, and output is now running below the level of a year ago. Thus, the quantity of saleable coal raised last month was 16.8 million tons, compared with 17.1 millions in June and 18.9 millions in July, 1937. Exports in July were only 3,056,000 tons, against 4,131,000 tons a year ago. Moreover, the quantity of coal shipped for the use of steamers fell from 993,000 tons to 835,000 tons between July, 1937, and the past month. The incidence of the recession in demand, however, has not been uniform, but Durham is the only district whose output during the first seven months of this year shows an increase over that of the corresponding period a year ago. The usual seasonal increase in demand in the autumn should bring about some improvement during the next few months.

IRON AND STEEL

The downward trend of activity in the iron and steel industry continued during the past month. The output of pig iron has already fallen from a peak of 783,800 tons in December to 507,800 tons in July; the production of crude steel, which reached its highest point last November at 1,178,300 tons, was only 683,200 tons last month. Indeed, the output of pig iron and crude steel last month was lower than in any corresponding month since 1933. The extent of the decline is scarcely surprising. It has long been evident that the hectic re-stocking movement of last year was likely, sooner or later, to force a substantial curtailment of domestic output in spite of the reduction in imports, which amounted to 65,000 tons last month, against 202,300 tons a year ago. Exports of iron and steel have also fallen, from 232,200 tons in July, 1937, to 135,100 tons last month. The decline in the domestic output has been accelerated by the reduction in general business activity. Although stocks appear to have been reduced, there are no signs of an early and substantial increase in new orders, partly because consumers expect prices to be reduced at the end of this year.

GENERAL ENGINEERING

The contraction in general business activity has not left the engineering industry unaffected, though the decline in its activity has so far been slight and appears to have been arrested, at least temporarily, last month. The proportion of insured persons aged 16 to 64 unemployed in engineering last month, though still only 7.7 per cent., was 2.9 per cent. higher than a year ago. The decline in domestic orders for commercial purposes and in new foreign business has thus not been fully compensated by the increase in requirements for defence purposes. Those sections of the industry whose output is mainly for defence purposes remain very active, but others show some decline in activity. The decline in domestic requirements of machinery is reflected in the reduction of imports, from 14,311 tons in July, 1937, to 10,730 tons last month. Exports have, so far, been well maintained, shipments last month amounting to 38,286 tons, against 38,772 tons a year ago. The buoyancy of exports, however, is largely due to the long time-lag between the placing of orders and their completion, a substantial proportion of current shipments representing delivery against orders placed last year.

ELECTRICAL EQUIPMENT

The past month witnessed a slight decrease in unemployment in the electrical equipment industry. Thus, the proportion of insured persons unemployed fell between June and July from 5.5 per cent. to 5.1 per cent. in electrical engineering and from 9.1 per cent. to 7.6 per cent. in electrical cable and apparatus manufacture. Compared with July, 1937, however, the proportion of insured persons unemployed increased by 2.5 per cent. in electrical engineering and by 4.0 per cent. in electrical cable and apparatus manufacture. Despite this slight increase in unemployment since last year, activity in the electrical equipment industry remains at a very high level. Exports of electrical machinery increased from 1,259 tons (valued at £222,391) in July, 1937, to 1,914 tons (valued at £398,259) last month. On the other hand, the value of exports of electrical goods and apparatus declined from £1,142,928 to £1,081,783 during this period.

AUTOMOBILES

New registrations of private cars in June, at 22,640 vehicles, were 25.9 per cent. below the record level of June last year; new registrations of commercial vehicles were also lower, by 18.0 per cent. The output of private cars and taxis in June amounted to 28,267 units, compared with 31,446 units in May and 36,490 in June, 1937; the production of commercial vehicles was barely changed since May, but fell by 1,931 units below the 10,244 vehicles produced in June, 1937. Unemployment in the motor, cycle and aircraft industries continues to increase slowly; the percentage of insured persons unemployed rose from 7.7 on June 13th to 8.5 on July 18th.

BUILDING

While operations in the building and public works contracting trades remain at a very high level, there are now indications that activity is tending downwards. Thus, the proportion of insured persons unemployed last month was 3.0 per cent. higher than a year ago in the case of building and 3.4 per cent. in public works contracting. According to the *Building Industries Survey*, housing activity is falling off in Southern England, but is stable in the Midlands and continues to increase in the North of England and in Scotland. Building by local authorities is expected to show a further increase, especially as the reduction in some rates of subsidy at the end of this year provides an inducement to complete houses as soon as possible. A further reduction is to be expected in industrial and commercial construction, though this curtailment may be compensated, for some time, by new Government contracts in connection with the re-armament programme. Expenditure on public works is not expected to show any significant diminution in the near future. But if building activity has passed its peak, there are no indications of a precipitous fall in the near future. The returns of the value of building plans passed by 140 local authorities last month, for example, show a decline of only 4.2 per cent. from July, 1937.

CHEMICALS

The home chemical market has been rather subdued during the past month, although there has been a fair amount of business for the time of year in industrial chemicals. Very little interest has been shown in coal-tar products, and reports from the wood distillation industry indicate that business is limited in most products and that stocks are accumulating. Business in acetates has been particularly dull. Business in pharmaceutical chemicals has been of a routine character, but about normal for the time of year. The Board of Trade returns for July showed a further reduction in overseas trade in chemicals, drugs, dyes and colours, as compared with July, 1937; the value of exports decreased by £482,106 and that of imports by £72,334.

POTTERY

Employment in North Staffordshire again declined slightly in June, but elsewhere there was little change; the percentage unemployed among insured workpeople, aged 16-64, rose from 18.4 on June 13th to 19.3 on July 18th. Exports of all types of pottery were lower in July than in the same month of 1938; exports of earthenware, however, rose from 40,838 cwts. in June to 47,614 cwts. in July, owing to an increase in exports to the Dominions.

FOOTWEAR

Compared with June, employment in the boot and shoe industry showed a small improvement in July; the percentage unemployed among insured workpeople fell from 17.7 on June 13th to 15.4 on July 18th. Some of this improvement must be ascribed to the incidence of the Whitsun holidays which swelled the June total; particularly in Norwich and North London, trade slackened further in July, and both unemployment and the amount of short-time worked increased compared with June. Exports showed a slight recovery from 22,910 dozen pairs in June to 31,364 dozen pairs in July, which compares unfavourably, however, with a total of 37,108 dozen pairs in July, 1937.

COTTON

Some surprise has been expressed at the decrease in the unemployment returns for July, but the figures are somewhat misleading; the number of unemployed recorded on June 13th was swollen by the incidence of holidays in several districts, and the larger number employed on July 18th must be considered as an adjustment after the holidays were past. The industrial situation in Lancashire is no better than two months ago, and output remains at about 50 per cent. of capacity, compared with 92 per cent. a year ago. Sentiment in raw cotton circles has tended to become more bearish. The American Government crop estimate of 11,988,000 bales was about 500,000 bales more than expected, and since the forecast was compiled, the weather in the belt has been generally favourable. Not more than a retail business has been done in piece-goods for foreign outlets, and exports of piece-goods during the current year are 29 per cent. below those in the corresponding months of 1937.

In part the slackness has been caused by the unsettled feeling in markets abroad and by nervousness with regard to the European political situation. In the weaving districts, curtailment of production continues on a considerable scale. It has been a very unsatisfactory month for spinners, and in spite of considerable restriction of output stocks have tended to increase at the mills; exports of yarn for the last seven months were 28 per cent. lower than in the corresponding months of 1937. In the American section the decision to cut the price of the 56's weft range of counts by nearly 1d. a lb. has had a very disturbing effect. In the Egyptian branch the price-fixing agreement has been renewed for a further period of twelve months. The Committee has announced a special rebate of 5 per cent. on the gross price of yarns to firms willing to undertake to do all their business with mills in the agreement.

JUTE

Business in the jute industry continued to improve during June and July; unemployment declined from 33.2 per cent. of insured persons on June 13th to 27.6 per cent. on July 18th. In part this improvement was due to a better export trade; exports of piece-goods rose from 4.6 million square yards in June to 5.2 millions in July, and exports of sacks increased from 59,148 cwts. to 94,033 cwts., which latter figure considerably exceeded the 79,471 cwts. exported in July, 1937.

LINEN

There is no change in flax prices; all grades are firm, but offerings are small. It is too early yet to forecast the prospects of the new crop. Both yarn spinners and cloth manufacturers report that the average limits offered for their respective goods are well below production or replacement costs. This has led to a curtailment in working hours and reduced output. The usual seasonal recovery in buying is not due till September.

RAYON

The brighter tendency in the rayon market noticed last month did not develop further, and demand is still slow, though the spell of fine weather assisted the depletion of stocks of woven goods. Business in most sections of the hosiery trade has been lifeless, and the trade in staple fibre has been small.

WOOL

The industry is dominated by the holidays and the volume of business is limited; unemployment has slightly declined, and on July 18th the percentage unemployed among insured persons, at 21.4, was 1.5 per cent. lower than on June 13th. Raw wool prices are firmly held and the home clip is selling well, but prices in the forthcoming season will depend largely on the extent of foreign demand. Quotations for tops and yarns are unchanged. Some largish orders in worsteds have been booked for the home trade, but export business is dull, though a little better than in June; exports of woollen and worsted piece-goods amounted to 5.1 and 3.0 million square yards, respectively, against 3.4 and 2.3 millions in June.

AGRICULTURE AND FISHERIES

Corn crops have made good progress and harvesting is in full swing in southern districts. Wheat yields are expected to be above the average, but barley and oats have not done so well. Haymaking was delayed in many districts in order to give time for growth after the long summer drought, and has overlapped the corn harvest; yields of hay will probably be low, and as the acreage laid up for hay on June 4th was 9.6 per cent. lower than last year, the total crop will be considerably smaller. The June 4th agricultural returns are discussed in a Note in this week's issue of *The Economist*. The British catch of wet fish in July amounted to 2,215,015 cwts., valued at £1.4 millions, compared with 2,140,551 cwts., valued at £1.5 millions in July of last year.

SHIPPING

The Economist index of freight rates declined further in July to 95.2 (1913 = 100), compared with 96.1 in the previous month and 132.8 in July, 1937. The Plate market remains very depressed and outward freights declined by 13.7 per cent. between June and July, though there was some recovery later in the month; the Mediterranean market also improved, with a decline in the tonnage available. A fair amount of chartering has been put through for the grain trade from the St. Lawrence, chiefly for August and September.

Business Developments Overseas

BRITISH EMPIRE

AUSTRALIA.—Unemployment showed a slight increase in the second quarter of the year, but still remains at a very low level. Building and the engineering and allied industries continue to be well occupied; the textile trades are less favourably placed, partly because recent additions to factories in some sections have apparently raised the capacity to a level which is in excess of the normal demand. Crops and pasture benefited from the June rains, but New South Wales is still in need of heavy rain. The preliminary estimate of the 1938-39 wool clip is 7 per cent. lower than the production in the season just closed; the sheep population has declined in many districts, so that a reduction may shortly be expected in the output of lamb. Butter production has been well maintained against a rising export price level.

SOUTH AFRICA.—Business conditions were generally unchanged in July. The bulk of the maize crop, estimated at 17.7 million bags, has now been harvested, but deliveries are restricted by the dampness of the grain; exports of maize are not expected to exceed three million bags, compared with 10.5 million bags last season. Overseas demand for hides and skins has been good, and prices for all types advanced during July. Fruit prices, however, have tended downwards, particularly for exported fruit; exports are larger than last year, due to the excellent crop. During the first half of 1938, the value of imports, at £48.2 millions, was £0.9 millions less than in the same period of 1937; in spite of a rise of £2.6 millions in the value of specie exported, the value of exports fell by £3.8 millions to £55.0 millions, owing mainly to the fall in the price of wool. Imports in July were valued at £7.8 millions, compared with £8.8 millions in 1937, and exports at £9.5 millions, a reduction of £2.8 millions, of which £2 millions was due to a fall in gold exports.

CANADA.—Business conditions were almost unchanged in June and early July. Stock prices showed a marked improvement, in sympathy with those of Wall Street, and prices of metals and rubber rose. On the average, however, wholesale prices tended to decline, owing to the weakness of grain prices. The value of building contracts awarded, while still below the monthly level of last year, rose from $18.6 millions in May to $20.9 millions in June, which represents a normal rise for this season of the year. Activity in the textile industry declined, but the lumber and newsprint industries experienced better trade. Intensive drought in the prairie provinces has affected the harvest prospects, and the official estimate of the condition of the winter wheat was reduced from 91 per cent. on July 1st to 82 per cent. on August 1st; even at this level, a large crop is expected of 275 to 300 million bushels.

EUROPE

FRANCE.—Despite the increase in defence expenditure and the stimulus thereby given to a number of trades, general business activity remains at a very low level. The official index of production, for example, is still more than 20 per cent. below the 1929 level. The number of persons in receipt of unemployment benefit fell from 362,899 to 344,517 during July. While a year ago the seasonal improvement was less marked, unemployment is still higher than at the end of July, 1937. The capital market has been a little more active in recent months, but owing to the lack of confidence new private investment remains at a low level. The building industry remains stagnant, and operations in June were 41 per cent. below the level of 1928. The output of the iron and steel industry in June was also appreciably smaller than a year ago. On the other hand, there has been some improvement in coal mining, and the output of motor cars in June was higher than in the corresponding month last year. Production of cotton yarn and tissues in June was slightly lower than a year ago, but deliveries of tissues were somewhat higher. Although the Government is making a new drive to secure an increase in industrial activity, the immediate outlook remains uncertain.

GERMANY.—Despite the recent decline in security prices there are no indications of an early slump in industrial activity. Some of the export trades have not remained unaffected by the decline in international trade, but the fall in export business appears to have been offset by an increase in employment of men and machinery in connection with the re-armament and public works programmes. The official index of industrial production for May is 127.0 (1929 = 100), compared with 117.9 a year earlier. The weekly index of business activity calculated by the Institute for Business Research, with 1936 as its base, has varied between 116 and 118 in recent weeks; a year ago it fluctuated between 112 and 114. There was a further fall in unemployment, from 292,000 at the end of June to 218,000 at the end of July, compared with 563,000 a year ago. Separate statistics for Austria indicate a substantial reduction in unemployment; the number of applicants for work at the end of July was 151,000, compared with 275,000 at the end of June and 273,000 at the end of July, 1937. While the expansion in Germany's industrial activity during the past twelve months has been most marked in capital goods, the index for the production of goods for current consumption also shows an increase.

CZECHOSLOVAKIA.—In spite of the difficult international situation, business generally did not deteriorate further in June; the general index of business activity in fact rose slightly compared with May, and unemployment was lower. The output of the iron and steel industry, after a considerable fall since last autumn, was a little higher in May and June; coal output has also been well maintained for the past few weeks. Foreign trade, however, declined in June, but imports and exports were equally affected and the balance remains slightly favourable. The textile industry continues depressed, largely owing to the lack of foreign orders, and the tourist trade has suffered from the political tension.

BELGIUM.—Iron and steel production recovered a little in June, after a continuous fall from last autumn; the output of pig iron rose from 177,000 tons in May to 192,000 tons in June and that of steel ingots and castings from 162,000 tons to 180,000 tons. The textile industry was rather more active in May, but relapsed again in June; the output of the coal mines continues to be well maintained, with only a small seasonal decline. The values of both exports and imports were lower in June than in the previous month, thus continuing the decline which has occurred rather irregularly during the year.

POLAND.—Business conditions showed a slight deterioration during June, particularly in industries working for export. The value of exports declined from 95.9 million zloty in May to 87.8 million zloty in June, at which level, however, exports were greater than in February, before the recent rise. Imports also declined in June, after the usual seasonal rise in the spring. These declines were reversed in July, for which month exports were valued at 95.8 million zloty and imports at 107.2 million zloty, compared with 98.8 million zloty in June. The output of coal is still high; after reaching a record level in March the output of the iron and steel industries has fluctuated round a lower level. Unemployment has fallen sharply during the spring, and was considerably lower in June than it was in the same month of last year.

UNITED STATES OF AMERICA

Evidence is steadily accumulating that the upturn in the prices of industrial securities in June heralded an improvement in business activity. *The New York Times'* weekly index of business activity has now risen without interruption from 81.6 for the week ended July 16th to 83.9 for the second week in August. There has been a definite improvement in many consumption goods industries and the volume of new business has shown an increase. The latest reports from the motor industry are also more promising, and the activity of the iron and steel industry has shown a steady increase, the proportion of the crude steel capacity of the industry in operation having risen from 32.5 per cent. in the second week of July to 42.8 per cent. in the third week of August. The expectation of an expansion of industrial activity is also reflected in the increase in purchases of raw materials, such as non-ferrous metals and building materials, and in the increase in machine tool orders. But although the improvement appears to be spreading to an increasing number of industries, the current level of activity remains very low. On the other hand, the latest reports suggest that the improvement will continue, at least during the next few months.

LATIN AMERICA

ARGENTINA.—Grain prices have continued their downward trend, and shipments are still on a disappointingly small scale, but the wool market is fairly active. The trade returns for June show that imports contracted further during that month, notably in textiles, machinery and vehicles. During the first six months of 1938, the United States displaced the United Kingdom as principal exporter to Argentina. A reorganisation of the National budget for 1938 is projected so as to cover all probable expenditure, and to allow for a revenue depleted by lower customs receipts and port dues; the Government proposes to take steps to effect economies. Reports are current to the effect that the Government may restrict importation from countries with trade balances against Argentina—a measure which might adversely affect countries such as the United States, Germany, Japan and Italy, but British exporters should correspondingly benefit.

BRAZIL.—Coffee exports in June reached one of the best monthly totals in recent years and continued at a high level in July. It is now estimated that the current crop of coffee may be considerably lower than the earlier official estimates. A feature of the Brazilian trade returns for April was the sharp fall in imports but, nevertheless, the balance of trade for the first four months of this year was adverse to Brazil to the extent of £3,925,000 sterling, whereas for the same period last year there was a favourable trade balance of £2,548,000 sterling.

CHILE.—A shortage of foreign exchange continues in Chile, but the basic "export" exchange rate is still 25 pesos per U.S. dollar. Both Chilean imports and exports were higher in May than in the previous month, but for the first five months of 1938, the recorded balance of trade in favour of Chile was only 100.2 million pesos (of 6d. gold), compared with 337.8 millions in the corresponding period of 1937; imports showed marked expansion and exports a heavy fall.

THE FAR EAST

Japanese imports in June and July were valued at 262 and 223 million yen respectively, which was in both months about 110 million yen less than in 1937; the value of exports was 217 million yen in June and 229 million yen in July. The balance of trade in June showed an import surplus of 45 million yen, which was only one quarter of that in June, 1937; there was a small export surplus in July of 6 million yen. The vigorous exchange control has succeeded, therefore, in rectifying the growing adverse trade balance, but many industries are, in consequence, short of raw materials. Wholesale prices, after a rise between May and June, have been stable during July. Chinese imports in July were valued at 67 million dollars, barely half of the level of July last year; exports, however, have been better maintained, and at 77 million dollars were only 11 million dollars less than a year ago.

(*a*) Old quarterly Board of Trade indices linked on to new indices; figures in italics based on old indices. (*b*) Annual figures relate to year ended September.
(*c*) Figure for 1936 is average of August-December. (*d*) Indices shown in last month of quarter to which they relate. (*e*) Daily average. (*f*) Monthly figures are averages of quarterly returns. (*g*) Average of weekly figures. (*h*) Annual figures are totals for financial year beginning in year shown. Monthly figures are cumulative.
(*i*) Annual figures relate to end of year. (*m*) Average January to August : figures for September to December are not comparable owing to change in basis adopted in September, 1937. (*n*) Period June 1-28.

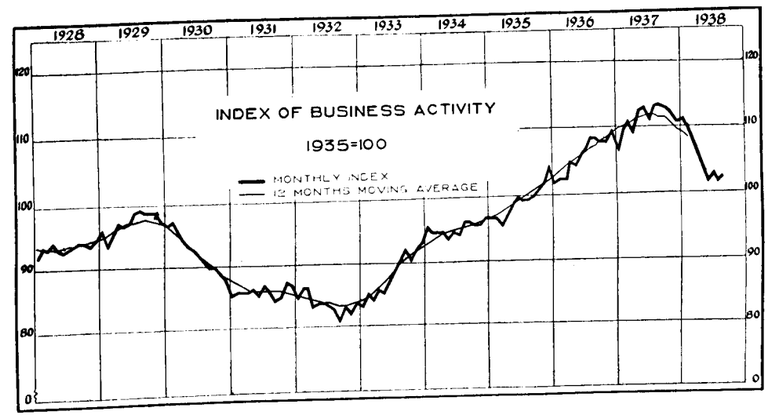
THE ECONOMIST



TRADE SUPPLEMENT

New Series SATURDAY, SEPTEMBER 24, 1938 No. 21

The Trend of Business

For the fourth month in succession, British business in general has been marking time at a level about 10 per cent. below last year's peak. *The Economist* index of business activity (1935 = 100) was 102 in May, 103 in June and 102 again in July. The new figure for August is 102½.

The index is, of course, a composite of fourteen subsidiary indices. Examination of these component series does not shed any more decisive light on the trend of business activity. In the past month, seven of the fourteen have risen, six have fallen and one remained unchanged; all the movements are small. The most important of the increases is in the index of employment which, after remaining unchanged from April to June (all the indices are corrected for normal seasonal variations), rose slightly in July and August. The behaviour of this index in the current recession has been peculiar. In the past, the volume of employment has been a good short-period indicator of the volume of general business activity. In the past year, however, while the complete index of business activity has fallen by 10 per cent., the index of employment has fallen by only 2½ per cent. The explanation may be purely statistical: the Ministry of Labour's monthly figures of employment are derived from an estimate of the total number of insured persons based on the July annual census. Since the figures of this year's census have not yet been issued, the estimate is based upon the conditions of thirteen months ago and may be in error. Or possibly the explanation is that the recession has been met more by short-time than by dismissals. Or finally, it may be due to the fact that many of the indices that have fallen most sharply either are subject to distortion by the increase or decrease of stocks or else relate to the superstructure of trading that is erected upon the fundamental basis of production (and the recession has hitherto been more marked in trade than in industry). But, in any case, this divergence between the full index and its most important components unquestionably increases the difficulties of interpreting the present situation.

There are, however, a number of factors which cannot be left out of account in assessing what the next few months hold in store for us. Among the unfavourable influences is the political crisis which brought Europe to the brink of war last week. The effect of the continued political tension is clearly discernible in the absence of the usual increase in the flow of new orders to industry at this time of year. Summer dullness is being prolonged by political uncertainty, and without an early replenishment of order books a further decline in commercial—as distinct from armament—work can scarcely be avoided.

Among the favourable factors is the gradual expansion of business activity in the United States, accompanied by the firmer trend of raw material prices. If this continues, it will be of assistance to British industry both through the direct psychological channel and also indirectly through the stimulus that rising commodity prices can be expected to give to the export trades. Unfortunately, however, there are signs that America's economy is not remaining unaffected by Europe's political troubles. The latest reports from across the Atlantic strike a note of hesitancy, which may well continue for some time. In the absence of a speedy settlement in Europe, the orders obtained by British exporters may therefore be further curtailed.

So far as industry in Great Britain is concerned, therefore, the most that can be said is that there are some reasons for anticipating a further decline in business (other than rearmament), whether for the home or for the foreign market, and no very convincing visible reasons for anticipating an increase. Re-armament orders may still rise; but the past year shows that they are not adequate compensation.

The economic activity of the world as a whole continued to decline at least until midsummer. The indices calculated by the League of Nations to show the trend of world industrial production (excluding the U.S.S.R.) and international trade were both declining up to the latest available figures. Industrial production has fallen from 107.5 (1929 = 100) in May, 1937, to 87.1 in June, 1938. The volume of international trade fell from 92.2 (1929 = 100) to 85.9 between the second quarters of 1937 and 1938. At the same time, world stocks of twenty-four important primary products have increased by 23 per cent. in a year, a reflection of the difficulty of adjusting supplies to a fall in demand.

The United States was one of the few countries which has been fortunate enough to register a steady improvement in business activity since last June. But the volume of new business appears to have shown signs of slowing down in some directions, and it is not clear how far this is due to, or could be cured by, developments in the international political situation. In Germany feverish efforts to increase her military strength have so far kept resources of men and machinery in full employment. In most other European countries, however, with the possible exception of Italy, increased armament expenditure has not compensated for a decline in commercial business. Scandinavian countries have so far managed to sustain activity at a high level, though the latest reports are less favourable. France, pre-occupied with labour problems and the political crisis, has made hardly any headway against the prolonged business depression. In Japan, activity has been sustained by her increased requirements of war materials in China. So far, the principal primary producing countries have not suffered seriously from the fall in prices and from the reduction in the volume of exports, though, in the absence of an early revival of world economic activity, the trend of the national incomes of these countries may be expected to be downwards.

Business Developments Overseas

BRITISH EMPIRE

AUSTRALIA.—The usual winter recession in trade and manufacturing is noticeable, but employment generally remains high, according to a cable from the National Bank of Australasia. Building activity remains at a high level, and bank clearings of the six capital cities in June, at an average weekly level of £44.8 millions, showed an increase of £3.8 millions on the figures for June of last year. For the financial year ended in June, 1938, imports of merchandise amounted to £111.4 millions and exports to £111.9 millions, compared with £90.6 millions and £117.3 millions, respectively, in the previous year. When allowance is made for the exports of bullion and specie, the favourable balance declined from £36.4 millions in 1936-37 to £11.8 millions in 1937-38. The provisional returns for July show a continuance of high imports and falling export prices: so far, these have not been reflected in wholesale or retail prices which have continued to rise slowly. The wheat crop in all states is reported to be in fair condition, although there is a deficiency of sub-soil moisture. Butter production is well maintained and exports to London still fetch good prices.

SOUTH AFRICA.—The Budget for 1937-38 closed with a surplus of £4.4 millions, most of which is to be utilised in repayment of loans. The railway budget for the past year also showed a surplus of £4.7 millions. Business activity is fairly well maintained, though there has been some slackening at Johannesburg and in retail turnovers in Cape Town, according to the Standard Bank of South Africa. Bank clearings in July in the seven major cities amounted to £90 millions, compared with £73.8 millions in July, 1937. Gold output reached a monthly record in July, with 1,027,123 ounces, valued at £7,241,217. The latest estimate of the maize crop, based on conditions at the end of July, gives a total of 17.7 million bags.

CANADA.—After falling three points between May and June, the Canadian business activity index rose slightly in July to 85.6 (1929 = 100). The prospect of the largest wheat harvest since 1932 is having a favourable effect on industry, particularly as the Wheat Board's initial payment is at the rate of 80 cents per bushel. Owing largely to the continuing fall in grain prices, the wholesale price index issued by the Dominion Bureau of Statistics declined from 80.1 in June (1926 = 100) to 78.6 in July.

INDIA.—The final estimate for the 1937-38 wheat crop is 35.6 million acres and 10.8 million tons, against 33.2 million acres and 9.8 million tons in the previous year. The area under the new cotton crop is estimated at 15,763,000 acres, an increase of 3 per cent. on the revised estimate of last season's crop. Owing to heavy floods, the jute crop is now estimated to be 23 per cent. smaller than that of last year. Imports of merchandise in July, at 11,04 lakhs, were 96 lakhs lower than in June and 308 lakhs lower than in July, 1937. Exports increased between June and July by 196 lakhs to 14,68 lakhs, at which level they were 268 lakhs less than in July, 1937.

EUROPE

FRANCE.—There are still no signs of an early and sustained business recovery in France. The stagnation of the capital market indicates that there has been no revival in new investment for commercial purposes in the home market. The number of persons in receipt of unemployment benefit declined slightly, from 344,517 at the end of July to 338,383 at the end of August. But unemployment remains above the level of a year ago; the number in receipt of benefit at the end of August, 1937, was 311,315. The political crisis, moreover, has adversely affected business transactions during the past few weeks. The level of wholesale prices, as measured by the official index, was almost the same on September 3rd as four weeks earlier. The prices of industrial securities, as in other countries, have fallen as a result of international political tension. Recent figures of industrial production are not available, but figures available for July indicate further recession in the mining, steel, engineering, and motor-car industries, and a slight improvement in building activity.

GERMANY.—Owing to the feverish efforts to increase Germany's military strength, her resources of men and machinery remain fully occupied. Moreover, as a result of the extensive manœuvres now in progress, the labour market has been depleted to such an extent that there are reports of a serious shortage of workers. Measured by the index of the German Institute for Business Research, which now includes Austria, industrial production rose from 126.9 (1928 = 100) in June to 129.2 in July. Owing to the transfer of economic resources from commercial to military purposes, the output of consumption goods in July was only slightly higher than a year earlier, although the figure for July, 1937, does not include production in Austria. The less comprehensive weekly index of business activity suggests that the high level of activity was maintained throughout August. The official wholesale price indices have shown little change in recent weeks.

DENMARK.—The harvest has been carried on under favourable weather conditions, and supplies of home-grown cereals are expected to be ample. Business activity continues at a moderate level; applicants for work numbered 86,600 in August, compared with 76,400 in August, 1937. The decline in activity in the building industry since last autumn is responsible for most of this increase in unemployment. For the first six months of the current year, imports were lower, and exports higher, in value than in the corresponding period of 1937, with the result that the excess of imports fell from 98.9 million kroner to 33.1 million kroner. The falling value of imports was caused mainly by lower prices, but there was a quantitative reduction in imports of mineral fuel and iron and steel.

LITHUANIA.—The more favourable weather in June and July came just in time for the crops; supplies of fodder for the coming season are likely to be considerably in excess of those of last year, when there was a shortage of keep for the livestock. Consequently, an expansion in the output of dairy products is generally expected. The building industry and allied trades are well employed, but sawmills working for export markets have had to curtail their output. Compared with the corresponding months of 1937, the value of imports in the first seven months of the current year has changed little, while that of exports has risen; consequently, an excess of imports over exports of 3.6 million litas has been converted into an export surplus of 8.9 million litas.

UNITED STATES OF AMERICA

Industrial activity continued its upward trend during the past month, though the pace of recovery is reported to have slowed down a little. The *New York Times* weekly index of business activity rose from 81.6 for the last week of July to 84.8 for the last week of August. So far the improvement has been most marked in the consumption goods trades, and the textile trades, for example, have appreciably more orders in hand than a few months ago. Sales of motor cars in July and August did not decline as much as usual during this period, and the comparatively low stocks held by dealers encourages the belief of an expansion of sales of 1939 models in coming weeks. Even the capital equipment industries are beginning to stir. Machine tool orders have increased, and residential building contracts placed in June, July and early in August were above the level of the corresponding period a year ago. Moreover, there has been a further improvement in the iron and steel industry; according to the American Iron and Steel Institute, the proportion of steel-making capacity employed rose from 37.0 per cent. in the last week of July to 47.3 per cent. in the current week. The latest reports on the progress of recovery, however, strike a note of hesitancy, which may be ascribed, in part, to the political crisis in Europe.

LATIN AMERICA

ARGENTINA.—Grain prices continued to sag under the influence of the good harvest in Canada, the large sales of Russian wheat, and the reported intention of the United States Government to subsidise wheat exports. European demand for Argentine maize has improved lately, but there has been only a poor demand from Europe for linseed. The activity in the wool market has subsided, and the tone has latterly been dull, as has also the market for hides. The foreign trade returns for July last indicate that the balance of trade for the month was unfavourable to Argentina to the extent of nearly 7,000,000 pesos, whereas in June there was a small export surplus. The United States maintained its position slightly ahead of the United Kingdom as the principal source of Argentine imports. Complaints have been made recently by the Argentine textile industry at the dumping alleged to be carried on by countries including Japan, Germany and Italy, and a Bill has been presented to Congress proposing the application of "compensatory" duties in cases where the dumping is proved, and where the goods are sold in Argentina at prices less than those operating in the country of production, provided such goods compete with Argentine goods. It is also proposed to institute a system of prior exchange permits for the imports of certain goods financed in the "free" market.

BRAZIL.—Although statements have recently appeared that the 1938-39 coffee crop in Brazil may suffer a sharp reduction as a result of adverse weather conditions and insect pests, it is believed that such reports have been greatly exaggerated, and that the eventual out-turn may be nearer the original official estimate of 21,873,000 bags. Business generally in Brazil has lately been slightly brisker, but the import market continues quiet.

CHILE.—There continues to be a shortage of foreign exchange in Chile, but the basic "export" exchange rate has been unchanged. After representations were made to the Government by Chilean cloth manufacturers in regard to the alleged dumping of German and Italian textiles, a Decree has been passed subjecting the importation of woollen goods (including those containing up to 5 per cent. of silk) to the licence of the Exchange Control Board. There was a sharp fall in the value of both Chilean imports and exports in June last, but for the first half of the year aggregate imports were some 34 per cent. higher than in the corresponding period of 1937, whereas exports declined by a similar percentage.

THE FAR EAST

The value of Japanese exports again increased slightly in August, to 259 million yen, compared with 229 million yen in July; compared with a year ago, however, exports were lower by 39 million yen, while imports, valued at 206 million yen in August, have fallen by the same amount. Since July 1st imports of raw cotton have been controlled by linking them to the exports of cotton cloth. Spinning companies are allowed to purchase foreign exchange for importing raw cotton to an amount proportional to their exports of cotton piece-goods. So far this regulation has depressed the export prices of cotton goods, which were already affected by the fall in world demand. The same system has been adopted for the rayon industry, with the addition of fixed maximum prices. Chinese imports in August amounted to 77.1 million dollars, against 55.5 million dollars in August, 1937; exports in the same period rose from 45.2 million dollars to 80.2 million dollars.

(a) Old quarterly Board of Trade indices linked on to new indices; figures in italics based on old indices. (b) Annual figures relate to year ended September.
(c) Figure for 1936 is average of August-December. (d) Indices shown in last month of quarter to which they relate. (e) Daily average. (f) Monthly figures are averages of quarterly returns. (g) Average of weekly figures. (h) Annual figures are totals for financial year beginning in year shown. Monthly figures are cumulative.
(i) Average of 11 months. (k) Annual figures relate to end of year. (m) Figures for January to August: figures for September to December are not comparable owing to revised method of counting adopted in September, 1937.
