The Actuaries' index of 151 industrial ordinary share prices fell slightly in the week to Tuesday, November 1st, when it stood at 63.1, compared with 63.7 a week ago and 63.2 a month ago. The corresponding average yields are 5.90, 5.85 and 5.95 per cent. We give

below a selection of the separate indices:—

Group (and No. of Securities)	Prices (Dec. 31, 1928 = 100)			Prices 1938 High
	Oct. 4, 1938	Oct. 25, 1938	Nov. 1, 1938

We are officially informed that the result of the election of a member to serve on the Committee for General Purposes in the place of Mr R. K. C. Maguire, deceased, held on November 2nd, was as follows:—Viscount Buckmaster, 1,311 votes (elected); Donald Stuart Savory, 566 (not elected).

New York

WALL STREET has passed an idle week, with turnover on a small scale, and prices lethargic, although on the whole firm. The fact-finding report adverse to a reduction in rail wages was received philosophically, and in spite of it industrials tended to harden on Monday on satisfactory business news. Easier conditions, however, soon returned. Rails recovered from the low levels to which they had fallen, but activity died down as the week proceeded, since the market adopted a waiting attitude pending the meeting of railroad executives on November 4th. Until its more exact implications could be known, the utilities scheme failed to have much effect on utilities. Steels improved on the whole, on the higher estimate of output and on reports of an increase in scrap prices, while in mid-week oil shares responded to the Standard Oil of New Jersey dividend announcement. The market was unmoved by the new S.E.C. rules.

By courtesy of the Standard Statistics Company, Inc., of New York, we print the following index figures of American values, calculated on closing prices (1926 = 100).

Paris

THE Paris Bourse like other markets began the month by consolidating the rapid advances made at the end of September. In the first week, hardly any trace was evident of the falls caused by the crisis. Subsequently, greater attention was paid to the domestic financial position than to international politics, though prices were not entirely unresponsive to day-to-day reports from abroad. Operators adopted a waiting attitude, pending the publication of the long-delayed financial and economic

decrees. While the market refused to move strongly one way or the other pending this news, the undertone throughout was quite satisfactory. The first week was comparatively active, local issues following international in favour as the franc became steadier. The feeling then became more reserved, and the stalemate continued as the month elapsed. Turnover was small, though prices continued firm. The results of the Senatorial elections and M. Daladier's speech to the Radical Socialist Congress were without marked effect. The four-day holiday and the approach of the financial decrees brought slight irregularity and featureless trading at the end of the month, but business was resumed with the knowledge that MM. Marchandau and Reynaud had exchanged portfolios while the Bourse remained closed.

Berlin

At the very end of September, quotations recovered with a bound, so that the losses not only of the crisis period but of many earlier weeks were regained. The improvement was checked later by some profit-taking, and quiet conditions soon returned, although prices continued firm. Some of the dullness was attributed to the shortage of funds caused by the new 4½ per cent. Reich loan of Rm. 1,500 millions, subscriptions for which were in some cases financed by selling industrial securities. Bank shares were in demand, but the chief feature of the month was the interest taken in mines, for which the Klöckner dividend increase provided a useful stimulus. Attention was also paid to colonial stocks, such as the German East Africa Company and Cameroon Railways. Shipping shares were in favour towards the end of the month. After being closed since March, the Vienna Bourse reopened on October 27th.

Amsterdam

THE Amsterdam Bourse last month provided no exception to the general tendency on the chief European stock exchanges. In the last sessions of September, it seemed to consume so much energy in regaining the heavy falls during the crisis weeks, that it exhausted its power to go much higher. The undertone, however, was satisfactory, and September's falls were more than overtaken. The first week of the month saw further gains, when prices were particularly responsive to changes in Wall Street, but some irregularity developed as the week progressed. The remaining weeks were uneventful, with a shrinking turnover and a return to

(Continued on page 290)

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield included is any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

the quiet conditions prevailing before the crisis. On balance changes in prices were unimportant. Towards the end of October tin shares provided an exception to the general dullness, and became temporarily active.

Canada

THE effect of the Munich settlement on the Canadian Stock Exchanges was almost magical and stocks immediately responded to public buying, which was more free than at any time for months. Although there have been some checks in the forward movement, the markets are still sound and fairly active and the outlook for an eventual further advance is considered good. Already by mid-October the ground lost in the slump at the end of September had been more than regained. Aircraft and munitions stocks are still popular, and public utility and liquor stocks obtained support. New interest is being evinced in the better newsprint stocks. The mining market felt the full impact of the slump, but has now recovered and base metal shares in particular are tending to rise despite occasional checks. The bond market sagged somewhat during the crisis, but on the whole remained surprisingly steady. Towards the end of October the tone in most sections was rather more irregular, but on the whole prices were well maintained. The Bureau of Statistics "Investors" index for common stock prices which stood at 101.5 on September 21st fell to 91.7 on September 27th; then it moved upwards to 105.0 on October 1st and touched 111.2 on October 12th. The Bureau's index for long-term Dominion bonds, which stood at 115.7 on September 17th, fell to 112.7 on September 27th, but recovered to 116.7 on October 13th.

Capital Issues

CAPITAL ISSUE TOTALS

It is hardly necessary to expatiate on the long-term merits of *F. W. Woolworth* shares. The offer for sale of 2,200,000 repatriated shares at 58s., however, has attracted more attention than any recent issue, and the "stags" filled in their application forms liberally in the hope of a substantial premium when dealings commence on Monday next week. The offer, incidentally, shows that the shares were acquired by Philip Hill and Partners, Limited, for 55s. 3.7d. per share. Issue expenses, including brokerage commissions, stamp duties (£63,800), underwriting commission of 1s. and over-riding commission

of 1½d. per share together absorb a further sum of 2s. 4.6d. per share, leaving a margin of 3.7d. below the issue price. On the same day, lists opened and closed for 85,000 6 per cent. £1 preference shares in *Ditchburns, Limited*. The major part of the proceeds are required to repay a bank overdraft amounting to £75,861. The issue is small for ready marketability, and the cover does not appear unduly generous. Particulars for information only have been published regarding the preference capital of *Express Dairy Company*, whose profits in recent years have been very satisfactory, and regarding the 5½ per cent. redeemable preference shares of *Superheater Company*, which has made rapid progress since 1933.

Required to repay bankers, £75,861. Lists closed at 9.5 a.m., November 1st. It is understood that 90 per cent. was applied for.

BY STOCK EXCHANGE INTRODUCTION

Superheater Company, Ltd.—Issued capital, 45,000 "A" 5s. ordinary shares, 480,000 5s. ordinary shares and 300,000 5½ per cent. cumulative £1

preference shares. Preference shares are redeemable 1940-75, or from 1950 on notice at 21s. 6d. Profits, after depreciation: 1936, £92,590; 1937, £129,438; 6 months to June, 1938, £73,064. Total net assets, £435,071. Purchase price, £431,150, in £300,000 unsecured non-interest bearing loan stock, 479,600 ordinary and 45,000 "A" ordinary shares.

Express Dairy Company.—Issued capital, 200,000 £1 ordinary, 200,000 6 per cent. cumulative £1 preference, 339,894 7 per cent. cumulative "A" £1 preference, and 100,000 7 per cent. £1 preference shares; also £25,000 5½ per cent. debentures. Total assets, end 1937, £2,461,698. Net profits after interest, depreciation, and tax: 1935, £94,966; 1936, £104,835; 1937, £116,257.

ISSUES TO SHAREHOLDERS ONLY

Central Wassau Gold Mines.—Issue of 120,000 1s. shares at par. Each share carries option on one further share at par at any time up to August, 1940.

Foyles Libraries.—Issue of 9,952 6 per cent. £1 preference shares to preference shareholders at par (one new share for every five held).

BY TENDER

Rugby Gas Company.—Sale by tender of £26,000 4½ per cent. preference stock; minimum price, par. Net revenue, 1937, £16,027 (before £4,196 loan interest). Sales of gas, 1937, 426 million cubic ft.; 10,433 consumers.

Woking Water and Gas Company.—Offer for sale by tender of 2,500 4½ per cent. £10 preference shares; minimum, £11 4s. Water rental, years to June 30: 1936, £48,098; 1937, £48,163; 1938, £50,359. Estimated population, 58,000. Net revenue, 1937-38, £26,810.

PRIVATE PLACINGS

Anglo-Transvaal Consolidated.—A block of 400,000 6 per cent. convertible £1 preference shares has been placed in London, at 25s. 6d.

Liverpool Gas Company.—This company has placed £190,000 3½ per cent. redeemable debenture stock.

Rugby Portland Cement.—This company has placed privately £150,000 4½ per cent. first mortgage debenture stock.

SHORTER COMMENTS

Company Results of the Week.—The report of C. N. A. INVESTMENTS, a new South African company, shows net profits of £90,846 for the year to September 30th, as compared with £93,019 for the initial period of 16½ months. The operating company, CENTRAL NEWS AGENCY, reports a satisfactory turnover in the various sections of the business. Most companies engaged in the heavy industries whose reports have been issued this week show considerable increases in profits. Another South African company DUNSWART IRON AND STEEL WORKS increased its production, and earned about £6,600 more at £46,302. The Sheffield steel makers SAMUEL OSBORN AND COMPANY earned 35 per cent. more at £80,994, but are repeating their 15 per cent. dividend. HORDEN COLLIERIES have maintained their profits, though trading conditions became more difficult in the later months of the year. During the year some £60,000

Industry and Trade

Anglo-Egyptian Cotton Agreement.—Preliminary reports of the terms of the Anglo-Egyptian cotton agreement have been received with mixed feelings in Lancashire. Messages from Cairo state that the agreement will permit an increase in the exports of Lancashire cotton goods to Egypt from 19.0 to 32.8 per cent. of her total imports. This quota is based on the quantity of Egyptian cotton purchased by Lancashire. As the agreement enables each exporting country to ship cotton goods in proportion to their average purchases of Egyptian cotton during the past three years, Lancashire is expecting some increase in trade. At the same time, disappointment has been expressed that the high tariffs which Egypt placed on Lancashire cotton goods at the beginning of the year will not be reduced. Yet another clause in the agreement apparently provides that Egypt's total cloth imports will in future be determined by the quantity of cotton piece-goods produced by that country. Consequently, an increase in Egypt's output of cloth will be accompanied by a corresponding reduction in imports. As a result of the high Egyptian tariffs, Lancashire has already suffered a severe decline in her trade with that country. Shipments so far this year were at the rate of 3,000,000 square yards per month, compared with 4,300,000 square yards per month in 1937 and nearly 10,000,000 square yards nine years ago.

net was spent on fixed assets. The severe fall in wool prices and drought in parts of Australia have reduced the net profits of NEW ZEALAND AND AUSTRALIAN LAND COMPANY from £127,039 to £56,523. The net realised price per bale averaged £13 17s. 9d., against £19 12s. 2d. All the rubber companies included in our table show substantial falls in net earnings. Thus BROOME have made net profits of £18,207, against £29,717, and LEDANG BAHRU are distributing 6 against 7½ per cent. The first report of FIRST RE-INVESTMENT TRUST shows gross revenue of £21,481 for the initial 14-month period. While the current price of the £1 stock units is 18s. 9d., their break-up value (based upon the valuation as at October 15th) is computed at 28s. 6d. FORTNUM & MASON maintain the 15 per cent. dividend, although net profits have fallen by nearly £28,000 to £58,967.

MISCELLANEOUS

Trust of Bank and Insurance Shares.—Distribution payable October 31st is 3.1101d. per unit net, making for year 6.5334d. net or 8.542d. gross, equivalent to a gross yield of 3½ per cent. on current price of 19s. ex div. Progress Report No. 6 shows composition of fund, and rates of dividend received. Policy of investing a larger proportion in this country has continued, home companies now comprising 74.94 per cent. of fund, against 71.52 per cent. a year ago.

First Re-Investment Trust, Ltd.—The initial report from August 14, 1937, to October 15, 1938, shows a balance of £15,123. Ordinary dividend 7½ per cent. for the period. Carry forward £1,638. About 80.7 per cent. of the original securities taken over have been sold, and the proceeds reinvested. Present holdings, 167 different investments, of which 79.7 per cent. in Great Britain and the Empire and 9.5 per cent. in U.S.A.

Dunswart Iron and Steel.—Profit for year to June 30, 1938, £47,851 (£45,166); depreciation £6,000 (£5,000); fees £1,550 (£1,184); taxation £3,275 (£4,234); final dividend 8 per cent., making 14 per cent. (same); forward £24,146 (£17,120).

Peruvian Corporation, Ltd.—Report for year to June 30, 1938, shows that gross traffic receipts have declined by £83,359 to £948,631; working expenses up from £798,097 to £804,044. After exchange, etc.,

net receipts are down from £220,021 to £131,909. Interest and miscellaneous receipts £11,133 (£11,647). Total receipts £88,626 lower at £143,042. Total deficit carried forward is raised from £1,041,691 to £1,243,390. A scheme has been formulated for extending the moratorium for three more years to December 31, 1941.

Financial News, Ltd.—The accounts to June 30, 1938, show a profit of £27,738, compared with £62,174. Tax and N.D.C. take £4,756 more at £7,418, and after depreciation and directors' fees, net profits are £18,647—a fall of £38,283. Ordinary dividend is 5 per cent., against 20 per cent. for 1936-37. Carry forward £93,085 (£90,228).

Sudan Plantations.—Gross profit, £582,560, after crediting £51,131 from reserve, against advances no longer required. To Gezira reserve, £45,000. After paying the 10½ dividend, £463,824 is carried forward.

General Motors Corporation.—Net income, \$5,368,000 in the September quarter against \$44,413,000 in the corresponding period of 1937. Earned net per common share, 7c. against 99c. Sales in the September quarter totalled 181,796 units, against 497,008 in the same period of 1937.

Joshua Hoyle and Sons.—Trading profit for year ended September 30, 1938, £138,000 against £164,541 before interest, depreciation and tax. Dividend 5 per cent. against 2½ per cent. in respect of the previous half-year, during which period the capital reorganisation became effective.

Rhodesian Anglo-American, Ltd.—Revenue for year to June 30, 1938, £874,860 (£867,899). General expenditure rose from £13,121 to £14,709. Tax £102,177 (£172,580). Fees £12,000 (same). Debenture interest £33,750 (£37,500). Ordinary dividend 15 per cent., as before, but absorbing £709,027 against £600,733. To general reserve £183,991 (£400,000). Carry forward raised from £329,442 to £332,079.

Horden Collieries.—Profits for year to September 30, 1938, £330,401, against £330,177. To depreciation £45,000 (£45,000). To tax and contingencies £50,000 (£50,000). Ordinary dividend maintained at 10 per cent. To reserve £20,000 (£20,000). Carry forward raised from £76,694 to £77,500.

The New Pig Contracts.—The British farmer is as prone as other people to procrastinate, and not all the appeals of the Pigs Marketing Board prevented the last-minute rush of contracts before the closing date of November 1st. The maximum number which the Board can accept this year (under the terms of the new Act) is 2.1 million pigs, but it was announced on Wednesday that it had received contracts for about 1.4 million pigs. In view of the steady decline in the number of breeding sows during the last two years, this total is perhaps not unsatisfactory, although it is believed that the prospect of cheaper feeding-stuffs decided many of the smaller farmers, who find it difficult to supply pigs at an even rate throughout the year, to risk the vagaries of the pork market. But it is doubtful if the bacon curers will regard the contract as a success, since they declared in 1936 that a minimum of 2.2 million pigs per annum was necessary for an economical throughput in their factories. Nor can the deficiency be made good to any great extent by purchases in the open market; the bacon curers are forbidden by the new Act to buy pigs except through the Pigs Marketing Board, which recently issued a declaration that it will on no account pay in the open market a higher price than that obtained by farmers for pigs supplied on contract. This declaration, if carried out, will undoubtedly remove what was to the contracting farmers one of the most unsatisfactory features of the

Martins Bank.—Sir Richard D. Holt, for reasons of health, has relinquished the chairmanship of the bank. He has been elected a deputy-chairman. Mr F. A. Bates has been elected chairman.

Van Ryn Gold Mines.—Total revenue year to June 30, 1938, £707,421, against £724,419. Expenditure £619,657 (£621,280). Gross profit £87,765 (£103,139). Tax £13,809 (£5,639). To writing off machinery, etc., £30,589, and £3,481 off township expenditure. Dividend 27½ against 30 per cent. Carry forward raised from £126,183 to £132,917.

Electrolux Corporation.—Consolidated net profit for nine months ended September 30, 1938, \$1,513,140, compared with \$2,153,893 for corresponding period in 1937. Net profit for third quarter, \$301,434, as compared with \$541,657 for same quarter in 1937.

Primitiva Gas Company of Buenos Aires.—The company's present contract with the municipality of Buenos Aires expires at the end of 1939. The company has, however, a constitutional right to operate without a municipal contract, as in fact it has done in the past. This matter has been considered for some time, and the recent vote of the Municipal Council in Buenos Aires now enables the question of a new contract to be discussed.

The Wall Paper Manufacturers, Ltd.—Profit for year ended August 31, 1938, after providing for taxation is £646,760, compared with £765,963 for previous year. Dividend on ordinary stock 10 per cent., and on deferred stock 12½ per cent., as before. Allocation of £79,208 is made in reduction of goodwill, as against £100,000; carry forward £304,234, against £303,705.

Jantar Nigeria Company.—Total revenue for year to September 30, 1938, £78,516, against £129,692. Mining expenses, £47,269 (£40,820); tax, £6,700 (£2,500). After other expenses, net profit £17,015 (£80,650). Total dividend, 15, against 65 per cent. Forward £3,393 (against £6,628 after crediting £11,000 tax provision not required). Output 474 tons concentrates (560 tons).

The London Assurance.—We are officially informed that the London Assurance has acquired a controlling interest in La Union Mercantil Insurance Company of Buenos Aires.

last scheme—the relatively higher prices paid for pigs bought outside the contract, but it will limit very considerably the competition which the Board will be able to offer on the pork market. The bacon curers are left, therefore, with a very considerable excess capacity, whose overhead costs will eat into their guaranteed margin between the price of pigs and the price of bacon.

* * *

The Terms of Trade.—The accompanying diagram shows the trend of the average prices of retained imports and domestic exports during the past eleven years, on the basis of the quarterly indices calculated by the Board of Trade. As the present indices, based on 1935, have not been recalculated for previous years, the new indices have been linked on to the preceding series, based on 1930. Although the two series of indices are not strictly comparable, changes in the terms of trade are clearly revealed by the diagram. Between 1928 and the middle of 1933 both import and export prices fell steeply, but the decline in the average price of imports, which consist mainly of raw materials and semi-manufactured goods, was much more marked than the fall in the average price

AVERAGE VALUE OF IMPORTS AND EXPORTS

of exports, which comprise chiefly manufactured goods. While average import prices rose gradually between 1933 and 1935, export prices showed little change during that period, when a large proportion of our resources remained unemployed. Between 1935 and the middle of 1937 both import and export prices showed a steep rise. In the second quarter of 1937, however, import prices again turned sharply downwards and the fall has continued to the third quarter of the current year. In contrast, export prices did not begin to fall until the second quarter of this year and their decline has so far been comparatively small. The terms of trade have thus again changed considerably in our favour since the middle of last year.

* * *

The Volume of Our Overseas Trade.—Owing to the close relationship between changes in the average value and quantity of our overseas trade, we have prepared a second diagram (also based on the Board of Trade's

indices) showing the trend of the volume of retained imports and domestic exports. It will be seen that the correlation between the average price of retained imports and the volume of domestic exports during the past eleven years has been much stronger than that between the volume of our imports and domestic exports. Although the volume of imports in 1937 was appreciably higher than in 1929, that of exports never recovered to anything like the pre-depression level. The main cause of the decline in the volume of our exports between 1929 and 1937 is thus to be found in the growing disparity between import and

VOLUME OF IMPORTS AND EXPORTS

export prices rather than in the displacement of British goods by those of other countries on the world market. The volume of both imports and exports declined sharply at the beginning of this year. But while the fall in the volume of imports and exports is a natural consequence of the reduction in domestic and world economic activity, the decline in exports was accentuated by the headlong downward movement in import prices which reduced the purchasing power of our customers. The volume indices for the third quarter are more encouraging, for they indicate that the force of the downward movement has been broken by the rise in commodity prices due, in a large measure, to recovery in the United States.

* * *

Processed Milk.—In his annual speech to shareholders, Mr Maggs, the chairman of United Dairies, made some interesting references to the trade in processed milk. It may be recalled that in 1932 duties were placed on imports of these products from foreign countries, of whom Holland and Denmark are by far the most important. These duties were later supplemented, firstly by a "voluntary" quota on foreign imports and, secondly, by an agreement between the English and Dutch factories over the selling prices of skimmed condensed milk. In order to enforce the prescribed minimum prices, the Dutch trade to this country was centralised in the hands of a few agents. In 1937, the British Government announced that it would not give effect to a recommendation by the Import Duties Advisory Committee to raise further the import duties, so long as the existing marketing arrangements continued to give satisfaction, presumably to the English firms producing condensed milks, which, for all practical purposes, arrange among themselves the size of the voluntary quota for foreign imports. Mr Maggs revealed that the recent increase in Dominion exports of manufactured milk to Great Britain was due to the very profitable level of prices in this country, and that the "principal Continental importing country" (presumably Holland) has now insisted that these prices should be fixed at a level to compete

with the Dominions' supplies. Consequently, Mr Maggs feared that a reduction in these prices might be inevitable.

* * *

The cure which Mr Maggs advocated for this, to him, undesirable state of affairs is the immediate execution of the recommendation of the Import Duties Advisory Committee, coupled with an undertaking by the Dominions to limit their exports to this country. This remedy will hardly commend itself to the general public, especially if they read another statement by Mr Maggs, that "the minimum prices of processed milks were arranged to cover the cost of manufacture at the English Milk Marketing Board's price for milk, which incidentally was increased by reason of the measure of protection afforded." It cannot be in the interests of the consumer that the Milk Marketing Board, having, as Mr Maggs himself points out, reduced the consumption of liquid milk by its policy of high retail prices, should also raise steadily the price of the best substitute—condensed milk. If overseas producers can supply us with processed milks more cheaply than the Milk Marketing Board, there seems every reason why they should be encouraged to do so, until such time as the use of these products has been supplanted by a satisfactory increase in the consumption of liquid milk. It is obvious that the present policy of the Board retards rather than hastens this development, which is essential for the health of the nation.

* * *

Shipping Freight Rates Lower.—The improvement in tramp shipping freights, noticeable in August and September, was not maintained in the past month. The deterioration is reflected in the fall in our index of shipping freight rates given below:—

The Economist INDEX OF FREIGHT RATES
(1898 — 1913 = 100)

	Average, 1913	Oct., 1937	July, 1938	Aug., 1938	Sept., 1938	Oct., 1938
European waters	110.0	181.3	106.2	103.8	107.7	110.5
North America	113.1	143.5	108.5	110.1	110.2	110.8
South America	123.4	148.6	119.9	124.8	121.3	113.8
India	106.3	177.9	112.3	110.0	113.7	112.7
Far East and Pacific	117.4	171.5	105.2	106.2	112.8	104.5
Australia	127.9	158.8	112.5	113.0	112.2	111.6
Total	116.3	163.6	110.8	111.3	113.0	110.6
1913 = 100	100.0	140.7	95.2	95.7	97.2	95.1

But, as the following more detailed analysis shows, the fall in freight rates was not general:—

	Index No.	Inc. or dec. Points		Index No.	Inc. or dec. Points
Home trade	96.8	- 2.1	South America:—	74.2	-14.1
Bay—outwards	132.1	+16.7	Outwards	153.5	- 0.8
Bay—homewards	137.1	- 1.6	Homewards	96.1	- 2.8
Mediterranean:—			India—outwards	129.4	+ 0.8
Outwards	76.4	+ 0.4	India—homewards	104.5	- 8.3
Homewards	124.1	+ 5.5	Far East, etc.	111.6	- 0.6
North America	110.8	+ 0.6	Australia		

The cause of the fall in freight rates last month is not far to seek. During the political crisis in September, business transactions were held up, and this has led to a decline in foreign trade in the past month. But, as commercial activity has increased again in recent weeks, the fall in rates last month does not necessarily portend a further deterioration on the shipping freight markets.

* * *

Wolfram and Antimony.—At the beginning of Japan's "Chinese incident," there was considerable fear that China, who has supplied two-thirds of the world's wolfram and seven-tenths of the world's antimony, would

be unable to maintain her exports of these metals. Consequently, there was an abrupt rise in their prices, which was, however, short-lived, since the war until recently interfered very little with Chinese production. But during the current year exports have tended to fall. Between the first eight months of 1937 and the corresponding period this year, exports of wolfram ore fell by 28,028 quintals to 100,463 quintals, and exports of antimony in all forms by 44,362 quintals to 68,846 quintals. The rapid progress of the Japanese armies in South China has now brought them within reach of the huge antimony deposits in Hunan (which supply some 95 per cent. of China's production) and of the most important wolfram deposits in Kiangsi, Fukien and Kwangtung. The market, however, has taken the news very calmly, and the price of wolfram continues to fluctuate around 60s. per unit, compared with 50s. in the summer, while the price of antimony is now quoted at £60 per ton, compared with about £52 per ton in the summer. It is probable that the requirements of the armament firms have been covered for some time ahead, while the industrial demand has slackened in recent months. Further, there is a feeling that, even if the Chinese mines are captured by Japan, exports will be continued in order to provide Japan with foreign exchange. The next few weeks will show if these expectations are correct. Meanwhile, the markets for these two metals are likely to be somewhat erratic.

* * *

Fall in Coal-Mining Profits.—The general recession in business activity has not left the coal-mining industry unaffected. The statistics for the second quarter of this year, published by the Mines Department this week, reveal a fall of 12 per cent. in the output of coal disposable commercially since the corresponding quarter of 1937. The proceeds per ton rose from 15s. 6d. to 17s. 2½d. between the second quarters of 1937 and 1938; but as costs per ton rose even more rapidly, from 14s. 7d. to 16s. 6½d., there was a reduction in the credit balance per ton, from 11.08d. to 8.18d. The rise in wages per ton, from 9s. 11d. to 10s. 9d., was only partly responsible for the increase in costs. An unsatisfactory feature of the latest returns is the reduction in the output per man-shift worked during this period, from 23.36 cwt. to 22.6 cwt. The changes in the profitability of the coal-mining industry and in the output per man-shift since 1927 are shown graphically on the accompanying diagram. It will be seen that after many lean years, the margin between costs and proceeds per ton began to widen in the last

quarter of 1935. The diagram also shows that the improvement in the industry's profitability was due to an increase in selling prices, revealed by the rise in the proceeds per ton. In the second quarter of this year the

COSTS AND PROCEEDS PER TON AND
OUTPUT PER MANSHIFT

margin between costs and proceeds was substantially reduced, partly through the fall in output, and partly through the decline in prices. This explains the efforts now being made to secure a better co-ordination of selling prices.

Cadmium—Supplies and Uses.—The world production of cadmium, derived from the treatment of zinc and lithopone plant residues and from fumes collected in lead and copper roasting plants, has, according to the American Bureau of Metal Statistics, increased from 4,200,000 lb. in 1930 to 7,800,000 lb. last year. Since cadmium is a good substitute for tin and a number of

countries lacking tin deposits have domestic zinc ores, it is worth their while to recover cadmium as a by-product in extracting zinc.

Cadmium, now largely used in motor bearings, has been diverted from electroplating for which cheaper substitutes are available. It is also mixed with bismuth for the production of low-melting bismuth alloys for electrical fuses, fuse plugs and solders. Cadmium strengthens copper without reducing its electrical conductivity. The well-known yellow pigments are made of cadmium. Being a by-product, the production of the metal ultimately depends on that of zinc, with which it is genetically associated.

Correction.—In a survey of the aluminium industry in *The Economist* of August 13th (page 329), we stated that the Aluminum Corporation of America controlled the Canadian Arvida works, one of the world's largest producing units. The Arvida works was actually started by the Aluminum Corporation of America; but we are informed that that concern disposed of all its foreign interests some years ago and that a Canadian company, Aluminium, Ltd., was formed to take over the Arvida works. Our attention has been drawn to the fact that the Aluminum Corporation of America (as distinct from its shareholders) does not hold any share in the Canadian concern.

INDUSTRIAL REPORTS

The latest reports from industrial centres remain quite encouraging, though the increase in the flow of orders to certain industries after the conclusion of the Munich Agreement is not being fully maintained. Even if allowance is made for the normal seasonal increase in the output of coal at this time of the year, the latest returns are not unsatisfactory. Indeed, the current output of coal is now not much smaller than a year ago; the quantity raised during the week ended October 22nd was 4,796,500 tons, compared with 4,883,700 tons produced during the corresponding week last year. The iron and steel markets are also stirring again, though business is still held up by the uncertainty concerning next year's prices. The improvement in the tinplate industry has been maintained and the trial operations at the new strip mills at Ebbw Vale are showing encouraging results. New business in cotton goods has been smaller, and the terms of the new trade agreement with Egypt have given little satisfaction to the cotton industry.

Coal

Sheffield.—The inland market is gathering strength, but there is still room for improvement. Industrial

steam coals are being taken up in larger quantities, and public utility undertakings are specifying increased tonnages. Household coal is moving more freely and business is up to winter level, although at the moment output is ahead of current requirements. Gas coal is in better demand. The market in coke is rather weak, and in spite of decreased production stocks are accumulating.

Export trade is unsatisfactory, there being very few inquiries. It is hoped that some benefit will follow the steps taken with the object of co-ordinating district export prices in order to check the tendency of one district to undercut another. Bunkering business continues very quiet. Prices for the inland and export markets show no change.

Newcastle-on-Tyne.—The better feeling on the North-East coal market is maintained, but forward inquiry has eased somewhat during the past week. The prompt position, however, is very steady; Northumberland steam collieries are fully occupied and, apart from smalls, they have little coal available this year. Durham collieries are also better placed; the seasonal movement will help the gas coal section, and shipments to Italy have increased. Patent oven coke remains a steady market.

Glasgow.—The market generally remains firm. Shipping business has shown an improvement, both Denmark and Germany taking a keener interest in this market; this has stimulated business in the East Coast districts, where most classes of washed nuts are now strongly held. The Lanarkshire and Ayrshire sections have been less busy on the whole, due to a slacker industrial demand and to a lull in public utility buying. The London trade has tapered off for the time being. Prices all round remain steady.

Cardiff.—There have been inquiries for relatively small supplies for delivery over next year, but the collieries have been depending almost entirely on their contracts for the disposal of their current production. Sized and washed smalls are relatively scarce and there has been no further appreciable accumulation of stocks of best large steam coal, but for practically all other qualities the supply is in excess of current demand. Both the coke and the patent fuel markets are also weak.

Shipments in the foreign and coastwise trades at the South Wales ports last week totalled 426,500 tons, compared with 457,500 tons in the previous week and 440,674 tons in the corre-

sponding week last year; during the ten months ended October they totalled 16.3 million tons, a decrease of one million tons from those in the corresponding period of 1937.

Iron and Steel

London.—The weekly report of the London Iron and Steel Exchange indicates that brighter conditions have developed in the markets and that the change is noticeable in practically all departments of the industry. The improvement is largely the result of the reduction in the stocks of Continental steel which have been weighing on the market for several months and also a broadening in the requirements of some classes of consumers. Transactions are still limited for the most part to delivery before the end of the current year, but there is a definite expansion in the number of transactions and in the tonnage required.

Stocks of pig iron have been greatly reduced in recent weeks and some of the large users have found it necessary to enter into fresh contracts to tide them over until the end of the year.

In the semi-finished steel section there has also been a notable improvement in the requirements of the consuming trades and most of the works are better employed than for some time past. There has been a considerable amount of activity in the special steel departments arising from re-armament demand.

In the finished steel section of the market the majority of the works are operating at about 60 per cent. of capacity and recently most of the mills have experienced a satisfactory influx of new business. New contracts do not often run beyond the end of the year and it is anticipated that, when the prices for 1939 delivery are settled, business will considerably expand. Although export demand is still restricted, a number of markets have shown more interest and prospects appear brighter than for some time.

Sheffield.—Without so far showing any really definite upswing, the tone of the iron and steel market is more confident than for many months. Business is still largely confined to small orders for early completion, consumers being unwilling to buy forward in present circumstances. Consumption of foundry iron is increasing, but the substantial stocks still held at furnaces are equal to all current requirements, and increased production seems unlikely to be called for at present. Forge iron is a slow market.

There is a rather better call for both East and West Coast hematite, but here also users are well covered by contract, and are unwilling to go beyond limited parcels for early delivery while awaiting some indication of prices in the New Year. The position in finished iron is unchanged, the best features being common and marked bars.

Basic steel billets are in better request, but acid qualities show a slower recovery. Business in wire rods, strip and stainless steel sheets is more active.

The industrial prospects in this area have improved, and it looks as though the trade setback is being overcome.

Output of steel is being increased, particularly of the more expensive kinds in which Sheffield specialises. More work is coming to the forges and rolling mills. The heavy engineering branches are busily employed, and the lighter sections are securing a steady flow of orders.

Middlesbrough.—Shipments of pig iron from the Tees during October amounted to 2,462 tons, of which 1,479 tons was sent abroad. Shipments of manufactured iron and steel amounted to 30,481 tons, which is an improvement on the previous month. Shipments of manufactured steel to foreign destinations have increased by approximately 8,000 tons.

At the end of October, the number of blast-furnaces in operation in this area was 17, of which five were producing hematite, 11 basic iron and one ferromanganese. The decrease in makers' stocks of foundry iron is slow but steady; hematite makers also are experiencing a better call from users, and whilst the volume of business is limited to early requirements, there is a better feeling generally regarding the outlook. It is anticipated that two blast-furnaces will shortly be relighted for the production of hematite pig iron, and it is thought that a new start in the production of foundry iron cannot be long delayed.

An official announcement regarding the price of pig iron and steel for next year is expected to be made towards the end of November. No change has yet been made in the official prices for heavy steel melting scrap and the restricted deliveries are being made at the existing quotations. Blast-furnace coke is inclined to be firmer with the prospective increase in demand. Foreign ore imports during October amounted to 79,215 tons, compared with 63,576 tons during the previous month. These deliveries are being made under old contracts and new business is not mentioned as works are well covered for some time ahead.

Cardiff.—The recently improved position in the tinplate industry is being fairly well maintained. Stocks both in this country and abroad are again normal, and forward bookings are more active than they have been at any other period this year. Some of the other re-rolling sections of the iron and steel industry are also a little more active, but the position in regard to the heavier branches is not yet materially changed. Very favourable reports are current concerning the trial operations at the new strip mills at Ebbw Vale.

Textiles

Cotton (Manchester).—The market has turned quieter. Numerous contracts have been arranged, but demand has been less active. Merchants at the moment are not disposed to commit themselves very far ahead. Decidedly narrow fluctuations have taken place in raw cotton prices. The absence of speculative operations has been rather striking, with indications of a smaller trade demand from spinners, although fair buying has taken place in South American descriptions. It is not anticipated that the American Government crop estimate on Tuesday next will be

much different from that of a month ago, when it was 12,212,000 bales.

Some spinners of American yarns have had a fair week, and in some quarters there has been an improvement in delivery instructions. Negotiations are still pending with regard to the renewal of the 42's American weft price agreement. Buying of Egyptian yarns has been irregular.

There have been indications of a falling off in the amount of cloth demand. Inquiry has been fairly persistent, but buyers have been less disposed to place orders. Makers have found it very difficult to obtain higher prices. Scattered transactions have been put through for India, but the total sales have been smaller than during the first half of October.

The reported terms of the new trade agreement with Egypt have given very little satisfaction, as apparently there is to be no reduction in the tariff.

Jute (Dundee).—Business has reverted to dullness in all sections of the jute trade. Prices of raw jute and of Calcutta goods have shown signs of weakness recently and buyers are holding off in the hope of still lower terms. Imports of raw jute into Calcutta so far this season are higher than they have been for some seasons past, which does not point to the short crop forecast officially in September. More than half of the estimated crop has already been received in the first four months of the season and it is generally considered that the yield of the crop will exceed 8 million bales, compared with the forecast of 6,696,000 bales. This quantity, with the carry-over of about one million bales, will not, however, be sufficient to meet the world's requirements and it may be that stocks in the hands of users, which have already been reduced to low levels, will be further depleted by the end of the season on June 30, 1939.

Spinners and manufacturers are still very busy on orders in hand, but there is very little fresh business coming in, and there are fears that producers will be compelled to accept lower rates after the New Year. However, by that time, there may have been an accumulation of orders which will enable sellers to maintain their production on the present satisfactory scale. The main adverse factor in the industry is the immense size of the stocks of goods in Calcutta, which it will take a long time to dispose of even at the reduced working hours of 45 per week, compared with 54 worked previously.

The price of Daisee-2/3 has been reduced to £19 5s. per ton and Tossa-2/3 to £20, November/December. Common 8-lb. cops are maintained at 2s. 3d. and 10-oz. 40-in. hessians at 2½d. and 8-oz. at 2½d.

THE COMMODITY MARKETS

The upward trend of the prices of sensitive commodities came to a halt last week, when movements showed considerable irregularity. This week the general trend was downwards. The downward movement was led by wheat, and in the absence of an

international export agreement its prospects remain unfavourable. Raw cotton was also marked down in price, partly as a result of the decline in demand. Rubber prices showed little change on the week, but the leading non-ferrous metals were slightly cheaper. Raw sugar, exceptionally, rose in price.

Price movements in the United States were also downwards. Thus, during the week ended last Wednesday Moody's index of the prices of staple commodities (December 31, 1931 = 100) fell from 144.9 to 143.4. A month ago the index stood at 144.4 and a year ago at 160.1.

Metals

Copper.—The price of copper fluctuated considerably this week and closed on Wednesday at £45 15s. per ton, a net loss of £1 2s. 6d. on the week. The demand has declined again in the absence of encouraging reports from the United States. Nevertheless, sales were well absorbed and thus steadied the market at the lower level. The immediate outlook is chiefly dependent on the trend of events in the United States. As, however, production outside the United States will rise quite substantially within the next few weeks, too much optimism is not justified.

Tin.—Tin prices also varied considerably, but closed on Wednesday only 5s. down at £211 15s. per ton. Sales have remained substantial, although the very low quota is now making itself felt in current supplies. The October tin statistics had an encouraging effect on general sentiment. According to Messrs A. Strauss and Company, Limited, the world's total visible supply on October 31st was 30,197 tons, a decline of 809 tons on

the month. This was the first decline in tin stocks since May last and as the visible supply includes the substantial tonnage shipped under the buffer pool quota, the decline in stocks indicates that the present quota would be insufficient even if the pool quota were available to the free market. Contrary to early expectations, the activity of the United States tinplate industry did not improve in October and covered only 25 per cent. of capacity. A rise in production, however, is expected shortly, as stocks of tinplate on the other side of the Atlantic have declined sharply in recent months.

Lead and Spelter.—Markets in these metals followed the general trend. The closing price of lead—£16 per ton—was 12s. 6d. down on the week, while spelter, at £14 11s. 3d. per ton, closed 17s. 6d. lower. Early this week there were reports from Mexico of a lead smelter strike. It was, however, quickly settled and had thus but little influence on the market. There is still no information on the progress of the cartel negotiations, but it is learned on good authority that they are still continuing.

Grains

WORLD shipments during the week ended on Wednesday have been exceptionally heavy and reports of the coming Argentine wheat crop have been increasingly favourable. Consequently, prices have declined, with buyers tending to hold off the market. Further rains have been reported in Australia, but the drought continues in Victoria, where the wheat crop may become a total loss. According to the *Corn Trade News*, European imports of wheat in the first three months of the current season were considerably higher than in

the corresponding period of previous seasons, in spite of record home crops. It is possible that some of the increase is due to purchases made at the time of the crisis. The maize market has also been dull, with large quantities afloat; prices of all varieties have tended downward during the week. Nor has much interest been shown in imported feeding barley, in spite of a scarcity of offers from Russia.

Other Foods

Provisions.—Trade in meat was generally slow, particularly for the fresh killed product. Egg prices registered a further rise: Danish butter rose sharply in price at the end of last week, while prices for Dominion butters were unchanged. The bacon market has been steady, with a small reduction in the price of English bacon.

Colonial Produce.—Sugar prices were advanced by 1½d. per cwt. on Monday and by a similar amount on Wednesday; the futures market has been firm during the week. Accra cocoa was easier before the weekend, but prices recovered early in the current week. With a quiet demand, business at the coffee and tea auctions has shown little change.

Fruit and Vegetables.—Potato prices at the Borough have been unchanged, in spite of large supplies. Trade in other vegetables was slow, nor was there a brisk business in fruit, except for oranges which were in short supply.

Miscellaneous Commodities

Oils and Oilseeds.—Business remains restricted and prices of most of these products have tended to fall. Business in new crop linseed is reported from the Continent at about £10 per ton for January loading; the progress of the crop in the Argentine is reported to be satisfactory. The price of linseed oil is barely steady at somewhat lower levels than last week, while cotton oil is about 10s. per ton cheaper. The demand for oilcakes is moderate at unchanged prices.

Rubber.—Prices have fluctuated within narrow limits; business is marking time pending the meeting of the Regulation Committee on November 15th. Prospects of an increase in the exportable percentage from 45 to 50 are being discussed, but the balance of opinion seems to favour the continuation of the lower figure for at least another three months.

Furs.—The London autumn fur auctions, which opened at the beginning of last week, did not change the general trend of fur prices. Compared with the spring sales in May last, prices of the majority of furs declined by 10 to 20 per cent., and a substantial part of the collections was withdrawn from sale. The auctions were chiefly attended by London merchants; Leipzig and Paris were also well represented, but the number of visitors from the other Continental countries and the United States was small.

COMPANY MEETINGS

IMPERIAL SMELTING CORPORATION, LIMITED

AGREEMENT BETWEEN EMPIRE ZINC PRODUCERS APPLICATION FOR INCREASE IN IMPORT DUTY

The ninth annual general meeting of Imperial Smelting Corporation, Limited, was held, on the 3rd instant, in London.

The Rt. Hon. Viscount Horne (the chairman), in the course of his speech, said:—Gentlemen,—The net profit for the year amounted to £103,327, compared with £257,092 in the preceding twelve months. With a sum of £70,620 brought forward, we had £173,947 available for distribution. As we have already informed you in the directors' report, we decided, owing to the depressed state of the zinc industry and the precipitous fall in the price of metal during the past financial year, to restrict the dividend payment on the 6½ per cent. cumulative preference shares for the half year ended 30th June to 1½ per cent., making the total distribution for the year 4½ per cent.

ZINC SMELTING

The unsatisfactory results of the past financial year were caused by a combination of circumstances which unfortunately affected adversely both sides of our accounts. On the revenue side we suffered a severe fall in the price of zinc, and on the expenditure side we had to meet an increase in wages, as well as rising costs for freights and raw material.

The average price of zinc fell from £22 12s. 7d. in July, 1937, to £12 19s. 11d. in June, 1938. Happily it has not remained at the latter figure. You are aware that zinc-smelting entails both a heavy consumption of coal and the employment of a large labour force, to which must be added the cost of transport. In all these categories costs have risen substantially. On comparing the relative costs of these items for the year ended June 30, 1935, with those for the year ended June 30, 1938, I find our expenditure has been increased by no less a figure than £125,000. Accordingly, it is plain that to the adverse effect on our revenue receipts of the low prices realised for zinc there has been added a considerable burden of rising costs. The incidence of these two factors in combination on our profits is evident from the accounts now before you.

Notwithstanding the high degree of efficiency attained in our plants, we have been denied success largely by factors outside of our control, and it becomes more and more evident that we have been endeavouring to carry on a vital industry with a degree of protection which has been inadequate, and in no way commensurate with the safeguards afforded to other similar British industries.

AN IMPORTANT STEP FORWARD

You will recall that when I last addressed you I informed you that the needs of the zinc-smelting industry in this country were under investigation by a Government Committee. As a result of their Report, the Import Duties Advisory Committee were requested by the Government to assist in promoting agreement between the producers of zinc in the United Kingdom and those in other parts of the Empire. I gladly acknowledge their zealous efforts towards this end, and the care and consideration which they have devoted to their task. As a result of frequent meetings and protracted negotiations, agreement between all the parties has been reached, and a scheme, supported by all the producers of zinc within the British Empire, has been formulated.

As part of this scheme, an application for an increase in the duty on imported foreign zinc, signed by all these producers, has been made to the Import Duties Advisory Committee, who have publicly announced that they have under consideration proposals for the variation of the existing arrangements governing supplies and prices of Empire zinc and the import duty on foreign zinc, and, in particular, for an increase in the present rate of duty.

As the scheme in question is now under consideration by the Tribunal, it would I think be improper for me either to enlarge or to comment upon it. I am, however, entitled to say that I am hopeful that we shall receive their decision at a reasonably early date. If, as I trust, this proves to be favourable, then an important step forward will have been taken, and as we have indicated in our report, a better foundation for the zinc industry in this country will have been laid.

I would remind you, however, that the zinc undertakings in the United Kingdom and in the Empire are part of a world-wide industry, and that reasonable stability within this industry could not be assured unless it were facilitated by a broader measure of co-operation among leading international producers. We are will-

ing, as I have indicated on previous occasions, to make our contribution to such an agreement, and the scheme now before the Import Duties Advisory Committee will, in my opinion, be helpful in providing a basis for more fruitful co-operation to the benefit of all interests both in the United Kingdom and abroad.

I propose now to pass in brief review some of the more important features of our associated activities.

THE NATIONAL SMELTING CO., LTD. IMPROVED METALLURGY LIMITED

Metallurgical practice never stands still and the necessity of enterprise and research are never absent from the minds of our officers. As a result of their zeal and ingenuity, it has become evident that some further improvements can still be made at the cost of furnace alterations. In view of the situation which we have been confronting for some time, it has required courage on the part of your directors to embark on any further capital expenditure, but our claims to protection have always been based upon the fact that our plant was as efficient as any in the world and, if we were not to incorporate the new improvements, we feared that our metallurgical efficiency might start for the first time to lag behind that which other producers might achieve. In view, therefore, of the importance of our industry to the defence of the country and in the expectation that at long last it may receive proper safeguards, we have taken the risk of committing ourselves to proceed with these changes. Moreover, considerable metallurgical progress continues to be made with regard to the vertical retort plant of Improved Metallurgy Limited, and we look forward confidently to increased output and recoveries through improvements in that process which is still comparatively novel.

Certain changes made in the furnace setting of one retort towards the end of the period under review gave an important increase in output and performance. The other fifteen retorts will be altered in a similar manner when they fall due for repair.

As a result of the modifications to which I have just referred and of important improvements devised by the American inventors of the vertical retort process, we expect an increase in furnace production and a gradual decrease in costs in the course of the present year.

SULPHURIC ACID

Production during the first half of the year was at a record level, but was deliberately lowered in the second half to accord with the decline in consumption following the general recession in trade. An increasing demand for acid has been experienced since the opening of our current year and stocks have now been reduced to a reasonable level.

MAZAK ALLOYS

There was only a small decrease in deliveries of our Mazak Alloys during the financial year as compared with those for the previous period. We believe that this comparative stability in a time of falling orders indicates the increasing importance of these alloys in the manufacture of special components.

LITHOPONE

The works of Orr's Zinc White Limited, at Widnes, have operated during the whole year satisfactorily and have been kept thoroughly up to date both as regards plant equipment and processes employed.

THE OUTLOOK

It will be apparent to you from the tenor of my remarks that the exceptional ill-fortune which we have encountered in the past year has been due to factors entirely outside of our control. He would be a rash man under present circumstances who attempted any forecast of the future. But if present political uncertainties were resolved, the prospects of general peace amongst the nations enhanced, and our industry given the safeguards enjoyed by other industries of less importance to the country, I would look with great confidence to the future.

Now that the Empire producers of zinc are in accord, we are encouraged to believe that after many anxious years a scheme on the lines at present under consideration by the Import Duties Advisory Committee will soon receive approval. The recent fall in prices has been arrested and indeed reversed. Signs are gathering which point to some revival of confidence in the United States of America with the prospect of growing industrial activity and an improved demand for raw materials.

We must hope that nothing will occur to check this recovery in the United States for its orderly and progressive development would contribute more than almost anything else to the restoration of commercial and industrial activity throughout the world.

The report and accounts were unanimously adopted.

UNITED DAIRIES, LIMITED

INCREASED SALES—EFFICIENCY IN DISTRIBUTION

The twenty-third ordinary general meeting of United Dairies, Limited, was held, on the 28th ultimo, in London.

Mr Joseph H. Maggs (chairman and manager director), in the course of his speech, said: The net profit brought into the balance sheet is £631,654, and it is now proposed to pay a final dividend on the ordinary stock of 7½ per cent., making 12½ per cent. for the year, and to transfer £100,000 to reserve.

I am pleased to be able to report that our sales increased by over £2,000,000 and our milk purchases by upwards of 6,000,000 gallons.

The improvement in retail milk sales which commenced in 1936 continued steadily until October, 1937. With the advent of the higher retail price in November, necessitated by the increased price paid to the Milk Marketing Board, a decline in sales per customer set in at once. This decline was not recovered when the retail price was reduced in the spring, and with the abnormal increase in price this July, a further marked decrease in milk sales took place. For the first three-quarters of our trading year our business was generally good, and on rising markets the demand for dairy products taxed all our factories to the utmost.

FURTHER INCREASE IN WHOLESALE PRICE

Notwithstanding the falling off in sales of retail milk and dairy products, the negotiations with the Milk Marketing Board for the new contract year, commencing October 1st, resulted in a further increase in the wholesale price of milk. Faced with increased production of milk and a falling off in consumption, and assisted with lower prices for cattle feeding stuffs, and the promise of additional financial assistance to the tune of about £1,700,000 by the Government, one might have anticipated that the Milk Marketing Board would at least have been content to accept the same contract terms as last year, but after demanding an increase of twelvence per 12 gallons, they ultimately agreed to accept fourpence, thus consolidating the extra price awarded them in July on account of the drought.

In the light of last year's experience, the distributors were unanimously opposed to any higher retail price than 7d. per quart, and the price has been stabilised at that figure for the whole year. This decision is bound to adversely affect our profits for the current year, as we expect to be retailing milk at a loss for the first six months of the contract, the additional profit on the summer milk coming into our following financial year.

The position of the home producer of processed milk products is far from satisfactory. Voluntary import quotas, which provide almost his sole protection against the world's surplus being dumped here, worked satisfactorily as long as supplies were scarce, but are now threatening to break down entirely.

The principal Continental importing country gave notice in August to terminate the minimum price agreement for milk powder. Since then that particular country has been persuaded to enter again into a minimum price agreement with home manufacturers, but this has had to be on the understanding that the prices fixed from time to time must be at such a level as to be competitive with imports from the Dominions.

LOW DISTRIBUTION COSTS

Much publicity has been given in the Press to a speech made by the Minister of Pensions—Mr Ramsbotham—last week, when he referred to what he termed "remarkable defects in the distribution" of milk, and went on to say "If the distribution of tobacco and cigarettes was organised on similar lines, smokers would need to be much richer or give up smoking altogether."

Well, we shall see what the Government, of which this gentleman is a distinguished member, has to offer to remedy this shocking state of affairs. As things are to-day, that is, with unrestricted competition in distribution, United Dairies has nothing to be ashamed of on the score of efficiency—indeed, I make so bold as to say that no product of the farm, not even tobacco, is distributed with greater economy and absence of waste than milk.

By and large, ours is a transport problem, but added to that is the cost of processing and the risks inherent in dealing with a highly perishable article. Now, from the London terminus, we collect, pasteurise and deliver in exact quantities to the hospitals and other institutions, for an all-in charge of 1¼d. per gallon, or .175d. per lb.; for the domestic consumer we take a can of milk, pasteurise, pack it in 100 glass bottles, and deliver twice daily for a charge of about one penny per lb. Incidentally, I may add, we pay the man who does the job a higher wage than any comparable distributive trade. The report and accounts were unanimously adopted.

LAKE VIEW AND STAR, LIMITED

CONSIDERABLY INCREASED PROFIT

The twenty-eighth ordinary general meeting of Lake View and Star, Limited, was held, on the 2nd instant, in London.

Mr John A. Agnew, the chairman, said that he was pleased to report that a profit of £482,031 had been made during the year under review, being £42,126 higher than that for the previous year. That increase was entirely due to the larger tonnage and higher grade of ore treated and to the improved rate of gold recovery.

Three dividends of 12½ per cent. each, amounting to £210,000, had been paid and declared during the year. After providing for amounts written off, and for British and Australian taxation, there remained a balance of £89,279, from which the directors had decided to recommend the payment of a final dividend of 12½ per cent., making a total distribution for the year of 50 per cent. That would leave £19,279 to be carried forward, an increase of £9,000 over the amount brought in from the previous year.

SATISFACTORY DEVELOPMENT RESULTS

Development work had been attended with excellent results, and, generally speaking, that applied to all the lodes worked throughout the year. The Minor lodes had again responded exceedingly well, and the importance of those lay not only in the tonnage they yielded but also in the improved grade of the ore exposed. They had obtained by cable the following information regarding the company's recent operations:—"In the Chaffers Section on the 2,360 ft. haulage level to Hannans Star 911 ft. south of the shaft, 48 ft. of ore has been opened up, averaging 7 dwts. per ton over a width of 5½ ft. This discovery is important as it is probably the downward extension of the No. 2 lode, which has not been worked below the 1,200 ft. level in this section of the mine.

"On the 3,530 ft. level the No. 4 lode winze, 250 ft. south of the Chaffers shaft, has been advanced 85 ft. in ore averaging 9½ dwts. per ton over a width of 4 ft., the full width not being exposed. In the Hannans Star Section 1,090 ft. south of the Chaffers Shaft, the 800 ft. level main lode was advanced 59 ft. in ore averaging 8 dwts. per ton over a width of 5 ft. No work on this lode has been done below this level.

"In the Associated mine on the 300 ft. level, a diamond drill hole has intersected the Tetley lode which averages 12½ dwts. per ton over a width of 23 ft. Everything at the mine and plant is operating satisfactorily."

STRONG ORE RESERVE POSITION

The ore reserve figures again revealed a very strong position. At June 30, 1938, those reserves stood at 3,589,000 tons of an average grade of 5.67 dwts. per ton, representing an increase of 174,400 tons, notwithstanding the fact that 619,919 tons had been mined during the year, averaging on treatment 6.28 dwts. per ton for a recovery of 171,345 ozs. of fine gold.

In the metallurgical section a new laboratory had been built and a great deal of valuable research work had been carried out. Perhaps the most successful results that had been obtained for many years were those connected with the effect of varying temperatures in the roasting section, and during the year an auxiliary system of flues was completed by means of which a better and closer control of the temperature was made possible. That, with the second Van Tongeren Dust Collector, had resulted in a better recovery from the cyanidation of the calcines and a complete elimination of fumes.

At the Associated retreatment plant 708,996 tons of residues had been treated, of which 113,743 tons came from the North Kalgurli dumps acquired last year. The plant had run smoothly throughout the year and, with increased filtering capacity, the recovery had been higher than during the previous year, in spite of the grade of the material treated being somewhat lower. Total working costs showed a fall of 5.26d. per ton, owing largely to reduction in mining costs of 4.8d. per ton, resulting from increased underground efficiency, especially in transport.

IMPROVED LABOUR SITUATION

It was very satisfactory to record that labour troubles had been comparatively few, with the result that both the company and the employees had gained by the non-interruption of operations throughout the year. The award of the Arbitration Court, whereby a penalty was imposed for all stop-work meetings or strikes which the Court could settle, was perhaps partly, if not entirely, responsible for that, and it was hoped that the large majority of the workers who had experienced the benefits arising from continuous work would in future not be led astray so easily by the small number who were willing to seize any excuse for a stoppage. The report and accounts were unanimously adopted.

BUENOS AYRES AND PACIFIC RAILWAY COMPANY, LIMITED

DIFFICULTIES OF THE ARGENTINE RAILWAYS

The ordinary general meeting of this company was held, on the 1st instant, in London.

Mr J. A. Goudge, C.B.E., the chairman of the company, who presided, said: In the report before you the board have to deplore the decreased results due to the severe damage to two of the most important crops we carry—wheat and maize. The net result of our operations is that we have been able to pay during the past year the interest on our first and second debenture stocks—five in all—and also one year's interest on the two stocks next in rank to these, namely, the Pacific 4½ per cent. consolidated and the Argentine Great Western 5 per cent. debenture stock.

Our great difficulty, of course, continues to be the question of loss realised on remitting home the pesos we earn in Argentina. I can sum up the exchange difficulty in a few words. Since our severe troubles commenced five or six years ago, out of a debit balance of £4,657,000 debenture and guaranteed interest not earned, I find that the loss on exchange amounts to no less than £3,949,000.

It is seven years since we were able to pay a dividend on our preference stocks, and eight years since the ordinary stockholders received a penny on their investment. Your board regretfully lay this statement before you, and before the Argentine public, who have a direct interest in appreciating the facts about their railways. I feel sure this simple recital of our position will come as a surprise to many of our Argentine friends.

It is not surprising, therefore, that we are all looking forward with great interest, if not anxiety, to the steps the Argentine authorities may be able to take to safeguard their own interests in the maintenance of efficient railway working. It is obvious that such a condition as I have outlined cannot continue indefinitely. We here can only manifest our confidence that we shall, as ever before, receive full consideration of our case, and a fair adjustment of our difficult situation.

We know that the Argentine Government have always appreciated the fact that the railways have contributed to the national life and development and are still vitally necessary to it. So we do not look forward without some grounds for hope.

The report and accounts were unanimously adopted.

BUENOS AYRES WESTERN RAILWAY LIMITED

WEATHER AFFECTS RESULTS

The forty-ninth ordinary general meeting of the Buenos Ayres Western Railway, Limited, was held, on the 2nd instant, at River Plate House, London.

Sir Follett Holt, K.B.E., M.Inst.C.E. (the chairman), said that it was distressing to have to give stockholders such a poor account of a year which had proved to be the worst that the railway had experienced in its half-century of existence. Not for forty years had less cereals been carried—as a result of severe frosts—the tonnage only reaching 450,000 against the million of the previous moderate year. The total of general goods carried was the lowest since 1905 when the system was one-half the size it now was.

The shrinkage of revenue, directly through cereals and indirectly through the general impoverishment of the producers whom they served, had been heavy. The management had done all that was possible to restrict working expenses, and although handicapped by the rise in the cost of fuel and materials, had succeeded in obtaining a reduction of £80,000, leaving the balance on operating at £314,000, or 41 per cent., less than in the previous year. In order to cover the debenture and note interest £100,000 had been transferred to net revenue account from the general reserve fund.

They had no doubt heard rumours that the Argentine Government was planning a policy for the future of the privately-owned railways. Although no concrete proposals had been made, the directors' advice were that there was no doubt that the Government, whilst being anxious to find a means to improve the position of the railways, was also desirous of evolving a plan to provide for their ultimate acquisition by the State. Up to a few years ago the beneficial results of all the capital and enterprise was shared alike by Argentine and Briton, but now the lion's share of the profit in the shape of the use and services of the railways was Argentine and the Briton's share had become almost microscopical. The whole position, therefore, had become completely out of balance, and it was to be hoped that it would be adjusted with that goodwill and understanding that had been for many generations the marked feature of the association between Great Britain and Argentina. The report was adopted.

BIRMINGHAM SMALL ARMS COMPANY, LIMITED

A SUBSTANTIAL IMPROVEMENT

The annual general meeting of the Birmingham Small Arms Company, Limited, was held, on the 28th ultimo, in Birmingham.

Sir Alexander Roger, the chairman, said that it was with real satisfaction that the directors recommended a dividend of 10 per cent., less tax, on the ordinary stock. Profit on trading and income from investments at £630,000 compared with £555,000 for 1937. H.M. The King had again honoured them by placing an order for another Daimler Straight Eight. H.M. The King and H.M. The Queen also owned and used Lanchester cars. The new Daimler Fifteen and the new Lanchester Roadrider de Luxe had completely justified their introduction.

Daimler buses continued to enjoy popularity and trolley buses were running satisfactorily in Belfast, Newcastle, Hartlepool and Derby. They had increased the export of Daimler and Lanchester passenger car and Daimler bus chassis deliveries overseas by 42 per cent. in value. They had maintained their relative position in new motor-cycle registrations, and the pedal cycle department had maintained its position in the high-quality market.

With regard to steel interests at Sheffield, the most strenuous efforts had been required resulting in a record output in peace time. Their companies had participated in the art of fine steel-making for 165 years, and it was their intention to keep in the van of progress.

Ordinary business had been adversely affected during the last six months, but it was their belief that a healthier position existed in 1938 than it did a year ago. Without doubt the rise in prices of raw material and the burst of prosperity which accompanied it had led to an inflated order book. To-day consumers were not carrying large stocks, and, consequently, fulfil orders which were reaching them to-day were for early consumption and short delivery. They were, of course, fortunate in being able to participate in substantial work under the Defence Programme, which should be continued for some time to come.

In conclusion, he said that so far as their group was concerned they looked with a considerable amount of confidence to another satisfactory year.

The report was unanimously adopted.

CONSOLIDATED AFRICAN SELECTED TRUST LIMITED

CONDITIONS IN DIAMOND MARKET

The fourteenth annual general meeting of Consolidated African Selection Trust, Limited, was held, on the 2nd instant, at 20 Alderbury, London.

Mr A. Chester Beatty (the chairman) said: Gentlemen, the net profit of £374,444 compares with £582,406 for the preceding year. The reduction reflects the decreased profit on our Gold Coast operations and the smaller dividends received from our Sierra Leone subsidiary company and on our shareholding in Cape Coast Exploration, Limited. The profits were lower in all these diamond mining businesses in consequence of smaller diamond sales.

The balance sheet shows that current assets exceed current liabilities by approximately £280,000.

The known diamond reserves on the Gold Coast and in Sierra Leone are sufficient to assure many years of production. In both colonies a great deal of work still remains to be done in prospecting and development of the diamond areas before their full extent can be ascertained.

At recent annual general meetings I have informed you of research which has been going forward with the object of extending the uses of diamonds for industrial purposes. The progress made during the past year has been very encouraging, and will, I believe, lead to a considerably increased use of diamonds in industry.

In regard to the diamond market, sales of uncut diamonds have been at a low level since the beginning of 1938, largely in consequence of the political uncertainty in Europe and the depressed state of business in the United States. I should point out that this period of restricted sales has extended well into our present financial year.

The influence of the demand for diamonds by the United States is an important factor in the prosperity of the diamond trade, and it is satisfactory to observe the marked improvement in business activity which has been taking place recently in that country. This factor, combined with an easing of the tension in European political conditions, is having a beneficial influence.

The report and accounts were unanimously adopted, and the payment of a final dividend of 4½d. per 5s. unit of stock, free of tax, was approved.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.
On October 28th applications at £99 17s. 3d. per cent. for bills to be paid for on any day except Saturday of the following week were accepted as to about 48 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications for bills to be paid for on Saturday at £99 17s. 4d. per cent. and above were allotted in full. £35.0 millions of Treasury bills are being offered on November 4th.

FINANCE AND BANKING

||
||
||

opposition save perhaps on the score of not going far enough. This is particularly true of Sir Samuel Hoare's Bill to amend the treatment of young offenders and habitual criminals and of the new (and previously unheralded) cancer campaign. Little objection is also likely to be taken, at least by the English members, to the batch of Scottish Bills, of which one is intended to centralise the administration of Scotland in Edinburgh and another to amend those peculiarities of Scots marriage law which have brought fame to Gretna Green.

The remaining Bills promised in the Speech are all of a more or less directly economic character. Agriculture has its usual batch of Bills, to deal, this time, with milk, poultry and wheat. The share-pushing Bill is promised, and though the Bill as a whole will be welcomed, the financial community will scrutinise carefully the amendments that have been made in the crucial but ill-drafted Clause 9. There are two other Bills whose purpose is to carry out recommendations made in Committee reports: one following the conclusions of the Cassel Committee on compulsory insurance and the other amending the Unemployment Insurance Acts in accordance with the advice of the Statutory Committee. The Miners' Welfare Levy is to be raised, to provide for additional pithead baths. And, finally, legislation would be required if the

Government were to approve the proposals for the re-organisation of the cotton industry that have been put before them.

A list such as this derives far more interest from its omissions than from its contents. One of the most notable omissions is the long-promised and hotly-debated Bill for the reform of the distribution of electricity. The failure to push on with it—taken together with the passive attitude with which the Government, in the matter of cotton re-organisation, are apparently prepared to consider, and to approve or reject, proposals, but not to initiate them—serves once more to illustrate the policy of giving industries just as much or as little legislation as they want. The present Government, in fact, seem to be anxious to avoid including anything in their legislative programme that would stir political passions. It says something for the condition of the country that such a policy of marking legislative time is possible. But there would be agreement between the Government and all the Oppositions that legislative dullness can only be justified if it is accompanied by incisive action in the sphere of administration. Whether or not this proves to be the last session of this Parliament, the General Election, when it comes, will be decided by the people's verdict not on the Government's Acts but on their actions.

Back to the Start in Palestine

IT would be barren, as well as captious, criticism to minimise the difficulty of the unenviable task with which the British Government are saddled in Palestine; yet, knowing, as we do know (and this is one of the few unquestionable facts), that time is of the essence of the Palestinian problem, we are struck with a chill of dismay on reading the Government's statement covering the findings of the Woodhead Partition Commission's report. It is truthfully headed "Statement" *sans phrase*, not "Statement of Policy"; for the most important admission in it is that His Majesty's Government are still without any policy of their own for Palestine. Once again the decision has been put off; and, as it would hardly be possible to appoint still another Commission, the stop-gap this time is a round-table conference in London, at which the Jews and some of the Arabs are to be invited to meet one another under British auspices. It seems a slender hope to expect that the parties which have proved irreconcilable for twenty years on Palestinian ground will be miraculously reconciled now by the geographical expedient of shifting the conference table from Palestine to London; and in the act of convening the London conference the Government have found themselves compelled to envisage the possibility of its failure. "If the London discussions should not produce agreement within a reasonable period of time, they will take their own decision in the light of their examination of the problem and of the discussions in London, and announce the policy which they propose to pursue." In other words, we are right back at the beginning again.

This is the more disturbing because the Government, in their new statement, explicitly accept the Peel Commission's major finding that procrastination can produce no result except to make the situation worse. On this major premise, the Peel Commission argued that an imperfect, rough-and-ready settlement executed immediately would prove less disastrous than a further investigation into what might be the best that could be done in a situation where this "best" was a rapidly wasting asset. They therefore urged the Government to cut the Gordian knot, without pretending that Partition could leave the cord intact. The Royal Commission's major premise was not within the

scope of the Partition Commission's terms of reference; and what they have done—with an expenditure of precious time which was undoubtedly required for a conscientious execution of their task—has been to demonstrate that their predecessors' knot-cutting proposal is impracticable. They have proved this exhaustively against the original proposal and two possible variations on it; and the result at which they have arrived—as it is summarised in the Government's statement—reads like a caricature both of parliamentary democracy and of academic scepticism.

One member prefers Plan B. Two other members, including the Chairman, consider that Plan C is the best scheme of partition which, under the terms of reference, can be devised. A fourth member, while agreeing that Plan C is the best that can be devised under the terms of reference, regards both plans as impracticable.

This reads like Fabius Cunctator's notes of a lecture by Arcesilaus!

"His Majesty's Government will therefore continue their responsibility for the government of the whole of Palestine"; and, as "it is clear that the surest foundation for peace and progress in Palestine would be an understanding between the Arabs and the Jews," they are prepared "in the first instance to make a determined effort"—(has it never been a determined one before?)—"to promote such an understanding." This leads up to the proposal for a London Conference, at which the Jews will be represented by the Jewish Agency and the Arabs by (a) representatives of the Palestinian Arabs acceptable to His Majesty's Government, and (b) representatives of neighbouring [Arab] States. The agenda is to include the question of immigration into Palestine, and there is a gleam of hope in that, since this question is the crux of the Jewish-Arab conflict. But can an effective London Conference be assembled on these, or on any, terms? Both the Woodhead Report and the Whitehall statement have been very ill-received in Palestine by Arabs and Jews alike. The Woodhead Report has already been rejected by the Jewish Agency as a basis of discussion. The Jews are also upset by the proposal to bring in the neighbouring Arab States, and are demanding that, if these are represented,

then the Jews of Poland and the United States ought to be represented too. On the Arab side, grave exception is taken to the Government's caveat that, "as regards the representation of the Palestinian Arabs, His Majesty's Government must reserve the right to refuse to receive those leaders whom they regard as responsible for the campaign of assassination and violence."

This caveat is manifestly aimed at the Mufti of Jerusalem; and if the Government's next step had been, not to call a peace conference, but to stamp out Palestinian Arab resistance by force of arms, it would have been reasonable to boycott a leader who is hostile and hitherto intransigent. But, in setting out to negotiate for peace, the relevant question is not "Do I like the man facing me across the table?" but "Am I dealing with the man who can effectively sign, seal and deliver peace terms on behalf of his people?" One must make sure of negotiating, not with nonentities, but with the real principals; and the right procedure is surely that which we followed in the Anglo-Irish negotiations of 1921. The opposing party must be left to choose their own representatives; and if anybody is to be excluded because he is unwilling to do business, his exclusion must come as the result of a difference of opinion between the extremist and his own colleagues, and not as the result of a British fiat. If, in 1921, Mr Lloyd George had excluded Mr de Valera *a priori*, he would never have been able to come to terms with Griffith and Collins. And what a mistake it was on Dr. Benes's part (as is now evident in retrospect) to insist on doing business with the Sudeten German "Activists" only, and to refuse, down to the last moment, to have anything to do with the Mufti of Asch. The Mufti of Jerusalem's position is comparable to Herr Henlein's, and perhaps he, too, already has Herr Hitler behind him. If the Government's policy is "realism," these are facts which it dare not ignore. Unfortunately, Mr MacDonald's statement in Parliament on Thursday seems to commit the Government to the exclusion of the Mufti.

With an eye to the future, we may touch upon some points in the very able Woodhead Report which are, and

will be, pertinent, even if the Report itself is rejected. The Partition Commission have done well in throwing cold water on the prospects of economically developing the Negeb and the Jordan Valley and of effecting transfers of land and population between the Jews and the Arabs; in grasping the nettle of Jewish immigration and land purchase; in pronouncing against the inclusion of Galilee in a Jewish state; and in pointing out the irreconcilability of the Permanent Mandates Commission's recommendation that "the Arabs should be deprived of as little as possible" with its simultaneous recommendation that "the Jews should be allotted areas capable of dense and rapid settlement and enjoying numerous economic advantages." The Report gives devastating expositions of the economic impracticability of Partition schemes A, B and C alike. But the cogency of these economic arguments does not mean that, in regard to Palestine, they are the last word of statesmanship. Our fundamental error all along, in dealing with the Palestinian Arab, has been to assume that he would behave like "the economic man" of the classical nineteenth-century English economists. But this *homo economicus* has never been more than an abstraction in England itself. Even a Scotsman does not behave like that up to one hundred per cent. Nor does the Zionist—brilliant man of business though he has shown himself to be. For the essence of Zionism, as its very name proclaims, has been to put sentiment above economics. The Zionists (and this is their glory) have rejected the flesh-pots of East Africa for the thorns and bullets of their historic Erez Israel. But to-day this Erez Israel is also the Palestinian Arab's national home; and you will not prevent him from fighting for it, though you may demonstrate to him till you are blue in the face that a business deal with the Jews is his only chance of achieving material well-being. Whatever happens in Palestine, one may be sure that economic facts and calculations will be overridden by political feelings. And if we cannot find room for two raging tearing nationalities in one small country, there is a terrible and imminent danger that one will expel the other by brute force.

Parliamentary Government

WITH tragic speed democracy has become Europe's greatest losing cause. In England parliamentary government still stands unshaken, but many voices are murmuring about its alleged inability to deal efficiently and with dispatch with the heavy burdens of defence and social service now laid upon it.

Englishmen have always been sceptical about the competence of governments. Burke said that "to provide for us in our necessities is not in the power of governments," and Bagehot himself, who first laid down the postulates of English parliamentary practice, was convinced that to extend the right to vote to the "lower orders" would be disastrous. They would demand with all the weight of their numbers concessions which it would be economically and administratively impossible to concede.

Professor Laski, the latest commentator on our constitution,* hastens to demonstrate the errors of these earlier sceptics. It has been found possible to concede far more working-class claims than Bagehot ever contemplated, in the form of shorter hours, higher wages, more education, better houses and social services, simply because of a very considerable increase in the national income; and the State has shown itself more and more competent in the provision

of precisely those "necessities" which aroused Burke's doubts.

Indeed, Professor Laski has scarcely any doubts about the competence of English parliamentary government to perform its tasks. To those who criticise the clash of parties as dissipating useful time and energy he replies in the vein of Bagehot himself. The root principle of parliamentary practice is the organisation of electoral opinion in broad party groups in support of programmes of proposed measures. After election the party with a majority of seats supports its leaders, who now constitute the Cabinet, in making their measures law. Only in this way could the King's government be carried on, when the calls made upon the State are so numerous and so technical; and the process would be paralysed by the introduction of proportional representation with its multi-party consequences. Talk of Cabinet dictatorship and members' servility is beside the point; the Government's supporters simply back the leaders they have chosen in the execution of a policy to which they have previously agreed, at least in general, as party adherents; and, if the Cabinet should depart seriously from its announced intentions, its followers will prove recalcitrant even to-day, as the incidents of the Hoare-Laval pact and of the first edition of N.D.C. have only recently shown. The chief rôle of private members,

* "Parliamentary Government in England." By Harold J. Laski. Allen and Unwin. 453 pages. 12s. 6d.

Government and Opposition alike, is to elicit a constant stream of information from Ministers about the policy and activities of their departments; to make sure by questions and in debates on the adjournment that government is conducted in the light of day.

Not that Professor Laski is wholly satisfied either with members or Ministers. As individuals, M.P.s play too little part in government; they might well constitute advisory committees attached to the various administrative departments, to keep Parliament in touch with their work rather than to criticise, and to examine the rules, regulations and orders issued by departments under statutory authority. In the Cabinet itself, now that the Secretariat has become permanent and an inner council of only a few Ministers has become customary, Professor Laski would ask for little change; and he disagrees emphatically with the view that the Cabinet has too much work to do. The crux comes when Ministers meet the permanent officials of their respective departments; unless they are possessed beforehand of a clear-cut policy, substantiated by persuasive detail, they must rely for both sides of every case on the civil servants, who, if they are worth their salt, have a definite point of view. If Ministers know what they want and possess those qualities of judgment and character commonly characteristic of Parliament's own selected leaders, this absence of expert knowledge need not matter at all, but it would never be wasteful, in Professor Laski's view, for Ministers to follow Mr Arthur Henderson's example, when he took to the Foreign Office a team of detached experts to advise and inform the Ministerial viewpoint.

It was the Civil Service which falsified the forebodings of Burke and Bagehot; and in a very real sense the permanent official is the core of democracy. Whitehall exists to serve the people—except perhaps the Treasury which exists to save money—and once more Professor Laski is reasonably well pleased. He is in no way worried by the problem of delegated legislation; delegation to officials is necessary in modern administration; and parliamentary watch and ward over rules and orders is quite feasible. The standard of efficiency, hard work and devotion to duty is high; but because the various grades are recruited from different strata of society, there is a stereotyping of attitudes towards society at large, and there is a lack of unusual ideas and heterodox ability. The crystallisation of methods and procedure, reinforced and in part occasioned by Treasury control, may be an awkward deterrent in new tasks, such as dealing with unemployment and Special Areas or speeding-up re-armament.

Professor Laski's conspectus is kind, just as warders are kind to prisoners condemned to die, for at the end he agrees with Bagehot—that democratic government cannot

proceed indefinitely, because the point will come when the workers will want more than the capitalists will or can concede. That point, says the Professor, is upon us, because the official Opposition has an overtly Socialist programme.

Here the Professor is probably as much of an alarmist as Bagehot was seventy years ago about the franchise. All parties, Conservative, Liberal or Socialist, are in the same boat in the democratic scheme; if they cannot reduce unemployment, improve health, foster nutrition or expand education, they lose the electors' confidence; and if the community cannot afford these things, all parties are still in the same boat. True, the Labour Party advocates nationalisation, but both Bagehot and Gladstone wanted to nationalise the railways. Even modern Conservatives have taken steps to socialise economic enterprise, and Labour's immediate programme is scarcely more sweeping, apart from its rhetorical flourishes, than, say, the plans of the "Next Five Years" Group. As long as Labour pins its faith to the practice of tolerance and liberty, the limit of its programmes, as Bagehot saw (though he misdated it), will simply be set by the rate of the nation's productivity.

Democracy has two fronts: one satisfying the wants and needs of the poor; the other increasing the national income to satisfy those wants and needs. In France the Popular Front saw only one side of their task; and there is always alarm in financial and business circles about the economic policies of Socialist administrations. Professor Laski, however, may rest assured; his arguments suggest that the Labour Party, with the City and the Lords against it, will have difficulty at the polls or in office; but Socialism rather than parliamentary government is in danger. As he himself says, "the only alternative to the talking shop is the concentration camp." His own survey has ably shown that, with goodwill and a touch here and a touch there, with regional reorganisation of local government, but no devolution which would be wasteful, and with more committees and institutions to keep members in touch with facts, fresh ideas and research, the talking shop can perform whatever task it is called to set its hand to; it can square the political circle by being at once popular and efficient. From the party to Parliament, from Parliament to Whitehall, and back to the citizens, representative government is a response to popular demand—it is government by consent. Much is heard nowadays about the driving-force of the enthusiasm and loyalty seen in totalitarian countries. But if we seek a faith that may move mountains we have it here at home. In the words of *The Times*, eighty-six years ago,

For to what, after all, are the statesmen of England to look for strength and national power, if injuries and offences rise against us, but to the enlightened resolution of the people of England to uphold the principles on which our own polity and independence are founded?

Africa's Needs

THE harsh overtones of European tumult have been heard in Africa. Germany's claim to colonies has sounded a warning note, and events in Danubia have created concern far away on the banks of the Congo, the Zambesi and the Orange River. Defence and strategy have once more become the watchwords of those who control the African continent, while debate continues fast and furious about the economic worth of African territories.

Europe has in any case a special responsibility for Africa's destinies. Virtually the whole of the continent is, directly or indirectly, under the governance of Europeans or men of European stock. European commerce and capital have radically reshaped the physical and economic environment of some 140 millions of native people. European systems of law and education, together with European

methods of transport and business procedure, have broken up the isolated tribal existence of African communities.

It is not simply as pieces in the pattern of diplomatic appeasement that the African colonies now merit special scrutiny. The notion that Africa is Eldorado to be divided among European nations to the profit of the successful claimants is illusory. The territories south of the Sahara supply less than a twentieth of both the world's exports and imports. The development of roads and railways and the exploitation of the region's special products, gold, diamonds, chrome ore, palm oil, groundnuts, cocoa and sisal, have cost over £1,222 millions of overseas capital. Further development will involve a large outlay, while the various territories are already weighed down by a heavy fixed-interest burden. The South African Union, the

Rhodesias and the Belgian Congo are dependent upon mines; in British West and East Africa mining is of growing importance. Mining attracts investment and industry and provides revenue. Let the demand for gold and other minerals appreciably diminish and African wealth is gravely precarious.

Nor is there any great opening in sub-Saharan Africa for the surplus populations of crowded Europe. The scattered peoples of the area live no more than 13 to the square mile. But the land is relatively under-populated because it is so largely tropical in climate and character. Less than 2 per cent. of its inhabitants, and these on favoured upland or southern sites, are of European stock.

Much current controversy about colonies is thus clearly beside the mark. Colonial territories are a weighty responsibility to their rulers rather than a rake-off in the Imperial racket. Three quotations from Lord Hailey's remarkable Survey of Africa South of the Sahara,* published this week, point this inescapable moral. "It is possible (the Survey says) that history . . . will be more concerned with the nature of the contribution which the European occupation will have made to the future of the African peoples than with the profit or loss which the African connection may have brought to Europe." Moreover, apart from those places where the predominance of mining enterprises renders the native necessarily dependent upon the white man's ways, the future of these countries "probably depends more on the general development of native economic activity than on the results of European enterprise." And, finally, "if the pace of internal development is to be quickened, it can only be as the result of assistance in the form of free grants from the Imperial Powers."

It was not the purpose of this Survey, which was begun five years ago, to point morals or to plan policy. In origin it was a response to General Smuts's appeal in 1929 for more knowledge about the problems of government and livelihood in Africa, and its object of lightening our darkness about the darkest of continents has been notably achieved. Language and population, topography, agriculture and husbandry, industry and mining, transport, education and public health: all these are comprehensively passed in review, together with the administrative problems to which they have given rise in the possessions of Britain, France, Belgium, Portugal and the South African Union.

The Survey's prime intention is to inform, but the moral nevertheless emerges. Life in Africa has been reduced to "flux and ferment" by the impact of European interests, incentives and ideas upon simple and self-contained communities. Many Africans now work for wages in industrial concerns. Others grow goods for the fluctuating markets of the world. Almost all have become acquainted in greater or less degree with the habits and satisfactions of so-called civilised existence. And the continent's future depends upon the skill and success with which adjustment to this completely new environment is achieved. The time when the only tasks of European Governments in Africa were to keep the peace and dispense justice has gone. The African may still benefit greatly from the rapid and radical changes now taking place; he may gain a higher standard of living and fresh social and cultural opportunities. But only a positive policy on the part of the European administrations which stand *in loco parentis* can pave the way to the achievement of these goals.

This is no new doctrine, for trusteeship is a slogan decades old, and the welfare of native populations was the fundament of the mandatory system whereby the former colonies of Germany in Africa were redistributed. But it has taken the stirring of Mediterranean Arabs, the rising of West Indian natives and the heart-searchings evoked by Germany's colonial claims to stimulate Imperial stock-

taking. Lord Hailey's Survey comes opportunely to provide the basis for understanding, and so solving, urgent problems of law and administration, taxation, land and labour, education and social services in the African colonies.

Everywhere the key question is the compromise to be sought between native and European ways. Present practice varies very widely. South Africa, Southern Rhodesia and the French possessions are governed directly by Europeans according to European models, though native advisory councils are employed. British West and East Africa, on the other hand, are administered indirectly, at least for local purposes, through the natives' own traditional tribal authorities, according to the plan of the late Lord Lugard. The ostensible aim of British rule—outside the sphere of the South African Union where industrialisation, urbanisation and racial prejudice seem to doom the native to dependence and segregation—is representative self-government under the guiding hand of European administrators. The French colonies, on the contrary, are designed to be ultimate parts of France itself, ruled by colonists with an infiltration of a trained élite of natives educated European-wise for their special rôle. Belgium has scarcely ceased to regard her colonies as State business undertakings, while Portugal aims to replace the legacy of past mismanagement in Africa by the gradual building-up of a corporate State in the colonial style.

Clearly the form of administration adopted will depend appreciably upon the place envisaged for the native in the colony's economy. In South Africa, where the native is primarily cheap labour, he is politically dependent; in West Africa, where he is farmer, producer, trader and sometimes clerk or even lawyer, in great part he governs himself. But the administrative problem is more than one simply of ordering different types of economy. Malnutrition is a chief characteristic of African communities; serious soil deficiencies have been enhanced by the settlement of groups previously accustomed to shifting their area of cultivation to rest the land; the overstocking of cattle has destroyed pasture; and the soil is gravely eroded. Standards of hygiene are low, and the breakdown of local isolation has spread malaria, sleeping sickness and venereal disease far and wide. There is need for new methods of mixed farming, irrigation and rotational grazing, for individual in place of communal titles to land, for "a scientific approach to the problems of health and material well-being," for social services on the widest scale. No native assembly or tribal chief, nor even a local council of Europeans, can marshal the knowledge and financial resources needed to execute the foundations of broad programmes like these.

This is the responsibility of Imperial powers themselves. The man on the spot must do the job, the European administrator, the European assembly, the native council or the tribal chief; but the Imperial Power must collate researches and information, through some such institution as the African Bureau proposed by Lord Hailey; must keep in constant touch with colonial problems by means akin to the African Council the Survey suggests; must above all furnish generous funds for development and evolve a centrally directed colonial policy. In the British possessions too much has been left to the devoted labours of the man on the spot; and too little has been known or done in London. Troubles in the West Indies have disclosed the dangers of this negligence, and they are implicit in the details of the African Survey. The future of Africa depends, as the Survey shows, upon the natives' own enterprise and social development. It is for the Imperial powers to provide the conditions and resources; to see to social welfare and agricultural regeneration; to furnish knowledge, guidance and financial aid. These are Britain's tasks to-day; and the tasks before, say, a Germany colonising afresh or an International Colonial Commission, such as many open-minded people have proposed, would be precisely similar. Europe must be prepared to pay heavily and with wisdom for its place in Africa.

* "An African Survey." Directed by Lord Hailey, under the auspices of the Royal Institute of International Affairs. Oxford University Press. 1,800 pages. 21s.

Topics of the Week

Overseas Journeys.—The most welcome item in the King's Speech on Tuesday was the announcement that their Majesties, on the invitation of President Roosevelt, would couple a brief visit to the United States with their proposed Canadian tour early next summer. No reigning British Sovereign has ever set foot on the North American Continent, and the Royal journey to Canada, which comes appropriately now that the Commonwealth's oldest Dominion has been enabled by the Statute of Westminster to sever the last formal links of its legal subordination to the British Parliament, would have been incomplete had the Royal party not consented to cross the only important frontier in the world never likely to have a Maginot line of its own. King George is Canada's King no less than Britain's, and it will be as symbolic head of the whole British Commonwealth, with which the United States has so many ideals and interests in common nowadays, that he will go to Washington. The days of dynastic diplomacy are long dead, and politically the visit of Mr Chamberlain to Paris next week may be more immediately significant than next summer's historic occasion. There are doubts in Paris about the implications of the British Prime Minister's new attitude to the dictators, and fears about the future of France's colonies in the face of German claims. It is more important than ever, as Mr Chamberlain himself asserted at the Guildhall on Wednesday, that the two great democracies of Western Europe should march together. Yet, even in a programme of appeasement which recognises Germany's predominance in Danubia, the shaping of policy in South-Eastern Europe cannot be entirely ignored, and the King of Roumania, who comes to London next week, has the qualities of shrewdness, determination and capacity which are likely to render his personal influence of decisive importance in the diplomatic destinies of that troubled region. In all these journeys goodwill and hospitality are closely intertwined with politics, and their outcome may be significant for the peace of the world.

Political Portents.—The interpretation of isolated election results is an art akin to astrology, and it would be a rash pundit who based a confident judgment about the state of public opinion upon the contests concluded at Oxford and Dartford. At Oxford, three weeks ago, the city was less excited than the University about the belated and ill-organised challenge of the Master of Balliol to the Conservative candidate; and the Labour candidate who, with a Liberal, stood down in favour of Mr Lindsay openly shared Transport House's disapproval of the united platform he had made possible. Conservative by prescription, Oxford remained so. Dartford was different. The Socialist candidate this week turned a deficit of 2,646 votes in 1935 into a majority of 4,238, in a contest in which both sides appreciably increased their poll. In both elections foreign policy was the key issue: at Oxford, Mr Chamberlain sailed home with a reduced majority; at Dartford he was defeated. Yet, foreign policy apart, the Dartford result was not surprising. The division had been Labour three times before; Mrs Adamson was confronted by a weak candidate who allowed her to get away with the accusation that conscription was the Government's policy; and an ambiguous social services provided Labour with ammunition. The political tide is still slack. Both sides are waiting for the Prime Minister to prove, or fail to prove, that appeasement is practicable. While they wait, defence deficiencies and Herr Hitler's minatory speeches are causing disquiet, and if the policy of appeasement does fail abroad the eagles will be gathered in great numbers round the carcass.

The New Deal in Retreat.—The result of Tuesday's elections in the United States is that the party of which President Roosevelt is the chief will have a majority of about 260 to 170 in the House of Representatives and of about 68 to 28 in the Senate. Nevertheless the election results are a definite setback for the President. For the first time since 1928 the Republicans have gained ground, and the turning of the tide is more important than the distance travelled by the first wave. Actually, the Republicans' gains have been larger than was expected. A gain for them of 50 Congressional seats would have been on the margin between a disappointing and a satisfactory result; in the event they have gained about 75 seats. Their most striking gains, however, have been in the contests for some of the State Governorships. Pennsylvania, Massachusetts and Michigan have lost their Democratic Governors, and the Senatorial contest in Ohio resulted in another Republican victory, while in the all-important State of New York, the racket-busting District Attorney, Mr Dewey, came within an ace of turning out the popular Democratic Governor Lehman, who in the past has received more votes in New York than Mr Roosevelt himself. Against all this, the Democrats can put only the capture of the Governorship of California. The reaction of this election on the President's position remains to be seen. It is as definite a rebuff to him as his failure to "purge" his opponents from the Democratic party. But the revival of an Opposition may have the effect of improving the coherence of the Democrats. And the closer the Presidential contest looks like being two years hence, the more impelled he may feel to be a candidate himself. Who his Republican opponent would be cannot yet be guessed. But the two Republicans who got the biggest share of the headlines were Mr Dewey in New York and Mr Robert Taft in Ohio.

Herr Hitler and the British Opposition.—There was a common theme in Herr Hitler's speech of Weimar last Sunday and in Herr von Ribbentrop's speech at Berlin on Monday, and since the same theme has been taken up simultaneously in the Italian Press, we may assume that it has been carefully thought out and that the proclamation of it has been preconcerted. The theme is that a totalitarian State can never know where it is, in dealing with a democracy. Totalitarian policy is "without change or shadow of turning"; democratic policy may be reversed almost at any moment by a general election. Therefore the goodwill of Mr Chamberlain and M. Daladier must be discounted in view of the always imminent possibility of their dropping out of office; while conversely the words of the present Opposition in Great Britain and France must be taken seriously in Germany and Italy because there is no knowing that Messrs Churchill, Eden, Duff Cooper, Greenwood and their French opposite numbers will not be as good as their word if and when they come into power. *Mutatis mutandis*, Herr von Ribbentrop applied the same argument to the deliberate misrepresentations of Germany with which he charged large sections of the foreign Press. The significant feature of Herr Hitler's speech was that he brought his denunciation of "the war-party" in the West in general, and in Great Britain in particular, into relation with the question of disarmament. "If the rest of the world speaks of disarmament, we are gladly ready, but under one condition: that first there is a disarmament of the war agitation." When the Fuehrer says that "in the authoritarian States it is taken for granted that there is no abuse and slandering of other nations, and no war agitation," we may gasp as we remember this year's German Press campaign against Czechoslovakia, and the similar campaign which is kept up, year in and year out, against Russia. But to catch

Herr Hitler out is much less important than to discern what he is after. And his latest attack upon the Opposition in this country—an attack in which Mr Arthur Greenwood's name has been added to that of the three other front bench members of Parliament whom he had previously named—looks like a hint, addressed to Mr Chamberlain, of the elements of a bargain. "If you want me to contemplate anything like an agreement for the limitation of armaments, then, as a preliminary condition, you must muzzle your Opposition." If Herr Hitler does want—and this would not be illegitimate in itself—to act in a way that will influence the course of British politics in the direction he desires, he would be wise to take Mr Chamberlain's advice as to how best to set about it.

Atatürk.—The great Turkish statesman who died this Thursday will go down to history as a genius of the same type and stature as Peter the Great. Like his Russian peer, President Mustafa Kemal Atatürk has achieved the superhuman task of converting a whole world to the Western way of life in the span of a single generation. Peter "Westernised" all the Russias; Kemal, in "Westernising" Turkey, has determined the destinies of the whole of the Islamic world; for what the Turks do to-day will be done by other Muslim peoples to-morrow. Atatürk was born and brought up in Macedonia as the subject of an Ottoman Empire which was a cosmopolitan State based on a dynasty and a religion; he leaves behind him a Turkish Republic which is a progressive national State on the modern Western pattern. He has been eminent alike as a statesman and as a soldier, in war and in peace. He had the courage to put himself at the head of a movement of national regeneration at the darkest moment in the Ottoman Turkish nation's history. In 1919 Turkey and the Turks were virtually under sentence of death. Turkey had fought and lost three wars since 1911. The Dardanelles, Bosphorus and Constantinople were commanded by the British Navy; the Arab provinces were shorn away; the Turkish nation's own homeland in Anatolia was being invaded by the Greeks with the blessing of the victorious, and apparently omnipotent, Allied and Associated Powers. In these circumstances, in 1919, Kemal Pasha (as he then was), dared the act of defiance which Herr Hitler dared seventeen years later. He challenged the verdict of the war of 1914-18 and extorted a revision of it from the victors. Unlike Herr Hitler, however, Atatürk announced his terms (in the so-called Turkish National Pact) at the beginning of his struggle and made a permanent peace on the basis of these terms as soon as he had attained them.

Military success did not tempt this great Turkish professional soldier into further military adventures. Having won the war, he addressed himself to the still bigger task of winning the peace; and in this, again, he carried the nation with him. The work of national reconstruction was started, in the old-fashioned heart of Anatolia, when "the Kemalist Movement" still looked a forlorn hope. Since 1923 this task of peace has been carried forward by the undivided energies of the nation and its leader. Under Atatürk's inspiration, and with his tremendous will power co-operating with the whole nation's will to live under the strenuous conditions of the modern world, Turkey has put herself through a social revolution in all spheres at once. A nation of peasants, soldiers and officials has taken on all the newfangled economic activities which, in Turkey, had previously been performed by the minorities and the foreigners. The Turkish woman has been emancipated; the peasant has been educated; the Latin alphabet has been substituted for the Arabic, and the Western for the Oriental dress; while the face of the land has been transformed by intensive road and railway building and the introduction of agricultural machinery. Who will step into the dead dictator's shoes and complete this work? That is a question which concerns others besides Atatürk's own countrymen.

The Rivals.—On Wednesday M. François-Poncet presented his credentials to the King of Italy and Emperor of Abyssinia, and next week should see the beginning of talks preliminary to a Franco-Italian settlement of the kind expected last April by the French and British Governments. Since then a number of events have combined to embitter Franco-Italian relations, of which Rome's support of Berlin and General Franco's slow advance are two outstanding examples. France, in fact, has had to woo an Italy who is steadily putting up the price of her goodwill. Last spring's thoughts of reconciliation were repelled by Signor Mussolini's remark at Genoa that "France is on the other side of the barricade"; and only four days ago the *Giornale d'Italia* saw fit grossly to abuse Italy's rival in writing that the French political atmosphere was responsible for the shooting in Paris of a German diplomat. From time to time French newspapers answer in kind, and such exchanges need not cause serious concern, for they would probably occur under any circumstances. What is really important now are the terms which the Duce will require of M. Daladier. A writer in *Relazioni Internazionali*, which has connections with the Italian Foreign Office, mentions reform of the Suez Canal regime (it is worth noting that this was not brought up by the Italians last April), the transfer to Italy of the Djibuti to Addis Ababa railway, and a settlement of the Tunis question, which is "more immediate than ever." In any case, the terms will be far stiffer than in 1935, and temperamental difficulties apart, there is likely to be a good deal of haggling behind the scenes. It will be interesting to see if Mr Chamberlain and Lord Halifax, when they go to Paris on November 23rd, can help matters along—for it is manifestly in their interest to do so. By that time the Quai d'Orsay should have in its possession Signor Mussolini's views, and the Quirinal in its possession Lord Perth's new credentials. A Three-Power peace in the Mediterranean would be something worth having for all concerned—provided it is not, in practice, a one-Power licence to do what it wants.

A.R.P. Reorganisation.—*Experientia docet*, and the Government have seemingly learned now that the criticism directed against their policy for providing protection against air raids, a policy tenaciously maintained for two years, was justified. The personification of their conversion is Sir John Anderson, now Lord Privy Seal and *de facto* Minister of Civilian Defence, whose committee's report convinced the Government on the eve of the September crisis, against their earlier stout denials, that the large-scale evacuation of industrial and urban populations would be imperative in the event of air attack. Hasty jerry-built trenches, too, were then pressed upon the public.

WILLS & TRUSTS

In acting as an executor or trustee, the Westminster Bank aims at putting itself in the position of a private trustee. It is therefore its practice to employ the family solicitor, if there is one, or any other solicitor the client may name; by such means the Bank succeeds in combining domestic tradition with business efficiency. A book showing the advantages of corporate executorship and the terms of appointment may be had at any branch

WESTMINSTER BANK LIMITED
Trustee Dept., 53 Threadneedle Street, E.C.2
Also in Piccadilly, Bristol, Liverpool, and Manchester

authorities for hasty improvisation; and Sir John's plans for energetic action now include, not only detailed evacuation arrangements and trenches, probably steel-lined, but also blast-proof shelters in the form of reinforced basements and cellars, though not, presumably, on the score of cost, bomb-proof accommodation on the Spanish model. It has not merely been learned that household precautions against gas and fire are not enough. The critics' long-standing condemnation of the utter inadequacy of the existing central control and supervision has been conceded; and Sir Thomas Gardiner has been called from the Post Office apparently to evolve a fully staffed organisation, not only in Whitehall, but also regionally for London and important provincial centres, to provide, say, Tyneside and Merseyside with properly focused schemes. A framework within which the local authorities can perform their essential services efficiently is seemingly being devised. Meanwhile, now as at the outset of A.R.P., finance and supplies remain bugbears which still threaten to undo the good work which is planned.

Protection of Essential Services.—When A.R.P. first became an issue much time was wasted by haggling between the Treasury and local authorities over their respective shares of the cost. The same process still continues as between the Treasury, utility and public services and essential industries. The principle laid down is that the undertakings should pay wholly for work which any "good employer" might be expected to undertake for the protection of his staff and property. In the case, however, of railways, gas, electricity supply, and other essential services whose vulnerable points might be the object of deliberate attack, provision of even partial protection is an expensive business. The Government is understood to have offered to pay 50 per cent. of the cost of necessary protection of a passive nature for such vital points, but the services concerned are not unnaturally standing out for more. In the case, for instance, of the railway companies it is impossible, with the best will in the world, to find out of current resources even half the cost of protecting their many vulnerable spots. Unfortunately, while the haggling goes on, work is held up. Apart from the provision of sandbags and so forth, the question arises of rapidly repairing essential plant in case of damage by enemy action or otherwise. Not only repair gangs but also stores of spare equipment adequate in peace conditions are likely to be quite inadequate in war. Much of the duplicate equipment required, for instance, in the case of electricity generation and transmission, is extremely expensive but takes a long time to make. Have the necessary reserve supplies been found; have they even been ordered? If such essential precautions should be expected while time passes in argument about the cost, the Government will have even more to answer for in the illm of home defence than is yet apparent. When we turn from passive defence to the "dungaree army" scheme for protecting vulnerable points by anti-aircraft guns manned by specially trained workers, the question again rises, what is actually being done to prevent a sudden knock-out blow to vital industrial plants and public services. The scheme might be intended for a remote contingency rather than a real and immediate danger, judging by the methods of execution proposed for it. It is sometimes difficult to believe that the authorities are taking the problem of defence against air attack seriously even now.

Cardinals and Dictators.—While the strife between the temporal Great Powers in the international arena holds our attention and fills our ears with its din, the deeper conflict between totalitarianism and the religions continues unabated. On November 5th *The Manchester Guardian* published an account of a secret speech on the technique of religious warfare which Herr Rosenberg is said to have made at the Nuremberg Party Rally in September; and the report has an authentic ring, for it is in harmony with what we know already of the Rosenbergian strategy. The Christian Churches are not to be directly

attacked and exterminated like Marxism, and this for three good reasons: they still have a hold on the German people; they still have a hold on the rest of the world; and direct attacks make the martyrs whose blood is seed. So they are to be enveloped and sapped by scientific siegecraft. The rising generation is to be absorbed into the Hitler Youth; the clergy is to have its financial sinews cut; and there is to be a "Fifth Column" of crypto-Nazi priests and pastors. This is the way to do it in the Old Reich; in Austria we may have to be more drastic! In Munich, at any rate, Herr Rosenberg will need all his skill; for here he has to reckon with Cardinal Faulhaber. In a sermon preached last Sunday the Cardinal reminded his congregation that, in its teaching on the relations between the individual and the State, the Church holds steadily to a middle way. At the acme of the Liberal era the Pope had had to vindicate the just claims of the community against the individual; to-day, when the pendulum had swung to the opposite extreme, the championship of the rights of the individual had become the Church's duty. The day before this sermon was preached by Cardinal Faulhaber at Munich, Cardinal Mundelein, of Chicago, was landing at Naples en route for the Vatican City. Cardinal Mundelein's plain speaking about Herr Hitler has not been forgotten in the Reich, and his arrival in Europe was the signal for a fresh attack upon him in Dr Goebbels' *Angriff*. In Italy, however, all parties co-operated in doing him honour, and the Italian dictatorship is apparently far more sensitive than its German partner to the goodwill of the Church and the respect of the outer world.

Just how insensitive to such feelings the Nazis have become is proved by the outbreak on Thursday of a new pogrom against the wretched German Jews. The occasion was the death of a German diplomat in Paris from a bullet wound inflicted by a Polish Jew. The assailant, a boy of 17, declared that he wanted to revenge the cruelties inflicted on the Polish Jews recently expelled from Germany who, it appears, included his father and mother. His motive is understandable even though it is inexcusable. What is both incomprehensible and unforgivable is that the Nazis should wreak their revenge on thousands of Jews who have doubtless been praying that none of their number should be rash enough to lift a finger against a Nazi. The attacks by uniformed Nazis are, of course, said to have been spontaneous. The German authorities can take the choice of being convicted of having instigated the pogrom or else of being incapable of maintaining elementary public order. In either case, the spectacle is disgusting.

Ozon Wins in Poland.—Sunday's election in Poland brought to the polls the surprisingly large number of 11,667,000 persons, or 67 per cent. of the electorate. This compares with 46 per cent. in 1935, and throws doubt either on the efficiency of the Opposition's boycott or on the actual strength of the Opposition parties. A number of factors, known and unknown, make it hazardous to draw the obvious conclusion that 67 per cent. of all the people in Poland support the Government: the known antagonism over foreign policy, the peasant unrest (serious only a few months ago), the fact that a number of the votes were polled for Ukrainian or Jewish candidates and are therefore beyond purely Polish consideration, the arbitrary method of nominating candidates from above without the presumptive electors having any say in the nomination or any real choice in the voting—these are some of the complications which obscure the true state of Polish popular feeling. As it is, the National Unity Camp (O.Z.N., or colloquially *Ozon*) received 162 seats out of 208 in the Sejm, Colonel Slawek, the apostle of reaction, was defeated in his constituency, and nothing need now prevent President Moscicki from altering the electoral laws in a more liberal direction. In September that was his declared intention, the aim being to bring back into political life the great Opposition parties and perhaps to pave the way for a return of M. Witos, the Peasants' leader;

but since Sunday's success (for at least on the face of things it was a notable success) he may change his mind and decide, after all, to dissolve all political parties and re-constitute the method of representation on an entirely new system. *Ozon's* victory is in part due to its patriotic appeal at a moment when the clouds are gathering in on Poland's horizon; and the military leaders will not be slow to press this advantage in any way which seems to them best.

Changes at Canberra.—The Commonwealth Government of Australia, reconstructed this week by Mr Lyons, appears to be safely united again. Just as defence expenditure unbalanced Mr Casey's budget, the issue of conscription or voluntary service threatened to upset Mr Lyons' Cabinet, for at the time of last week's censure debate a small but influential group of Cabinet Ministers, mentioned among whom were Mr Menzies, the Attorney-General, and Mr Hughes, the Minister for External Affairs, were reported to be on the point of resigning if their wishes were not granted. Chief among those wishes was the establishment of compulsory military service, from which Mr Lyons and others dissent, and Mr Menzies was reported to have designs on the Defence portfolio. But in the event the Prime Minister came out very much on top. Mr Menzies publicly denied that he had sent "a virtual ultimatum" to Mr Lyons; Senator MacLaghlan resigned from the Postmaster-Generalship as a protest, fully endorsed by the Prime Minister, against the suggestion that his chairmanship of the Hume Pipe Company, Ltd., was connected with the contracts between that company and the Post Office, and thus opened a way for Cabinet reconstruction; the motion of censure was defeated by 40 to 28, with no loss of Government votes; and on Monday Mr Lyons was able to announce the new Cabinet appointments. Few of them were unforetold. Brigadier Street goes to the Defence Ministry, and Mr Thorby goes to Civil Aviation and Works, thus placating the United Australia Party, which disliked his administration of Defence, without alienating the Country Party, of which Mr Thorby is a member. To make the reconstruction still more effective, and thus convince the critics of his earnest intentions, Mr Lyons has formed an "Inner Cabinet" of himself, Sir Earle Page, Mr Menzies, Mr Hughes, Mr Casey, Mr Thorby, and, on second thoughts, Brigadier Street: this is accepted by everyone in the Cabinet except Mr White, who has resigned, apparently because he was not included in it, but certain ambitions have clearly been swallowed. The censure debate showed that Mr Lyons does not lack his critics. In reply to them he has announced that the voluntary Militia ("a suicide club," was one Parliamentary comment) will be increased to 70,000 men, and that a number of new aeroplanes will be ordered. The Commonwealth Government is meanwhile engaged in the work of voluntary enrolment and preparation. In discussing the criticisms of incompetence over matters of defence, voiced loudly in last week's debate, it is worth noting that nearly £60 millions have been earmarked for defence purposes in Federal budgets since 1930-31—a considerable sum relatively to the number of Australians who have to find it, whether or not it is large enough in relation to the size of the territory they have to defend.

The New Czechoslovak Economy.—The citizens of straitened Czechoslovakia are settling down to the business of life with their usual fortitude: estimates of losses and plans for the future are already appearing in Prague. The Presidency is still vacant, and candidates are being tipped off by the half-dozen, but when the final choice is made Czechoslovakia's relations with the Reich will be fully restored. Relations with Poland are gradually returning to normal, the railways are working again, and an agreement of November 1st defined the new frontier. A joint commission is now working out the details of the Vienna "award." Taking the Slovakian concessions into account, reliable estimates put the Republic's total loss in tax receipts at between 56 and 58 per cent., over and above which there are the enormous liabilities incurred on forti-

fication and on mobilisation during the crisis. The cost of the mobilisation, up to October 27th, is unofficially put at not less than 500 million crowns (about £3,500,000), a good deal less than other private calculations had foreseen. According to these the mobilisation would not cost less than £500,000 per day, or about £15 millions for one month. In any case, it is clear that an immense bill must be footed before real reconstruction of the new Republic may begin. Meanwhile the Czechs are showing surprising zeal in cutting their new economy to its attenuated cloth: two projects mooted in Prague are the exploration of Slovakian mineral deposits and the building of a motor-road—of obvious value to the Reich—between Pilsen and Jasina in the Far East. Shipping on the Vltava and the Bohemian Elbe, which in 1936 amounted to 2,246,659 tons, including 703,878 tons of exported goods, is free of the temporary restrictions applied in September; and it appears that the "Adriatic tariff"—the preferential rates initiated under Francis-Joseph to help Trieste in its competition with Hamburg for Central European freights—still holds, at least in theory, although in fact scarcely any traffic is passing. Annual Czechoslovak freights handled by Trieste in recent years have averaged 450,000 tons, but a good deal of this is now in German hands and will either be retained in the Reich or sent via Hamburg. Much improved communications will also accrue to Germany; and it is anticipated that arrangements will be made for preferential freight rates between Silesia and Vienna, which under General Goering's Four Year Plan is to become a Danube port of first-class importance. If this works out, then Bratislava, which in 1936 had a share in Danube traffic of 703,878 tons, including 418,349 tons of foreign-produced goods, is likely to lose its place as a forwarding centre for trade between Northern Europe, the Danube basin, and the Balkans.

Cancer Campaign.—Seventeen per cent. of all deaths in this country between the ages of 17 and 65 are certified as due to cancer, which is the second most destructive of our fatal diseases. Last year more than 66,000 deaths were stated to be due to cancer, and just over half of these were of men and women over 65. The death rate from this malignant disease has almost doubled in a generation and, while this apparent increase is in part due to greater accuracy in certifying causes of death and in part to the population's rising age, there can be no doubt that the incidence of cancer, which causes untold suffering as well as death, is spreading. Prevention is still impossible but, although cures are not yet certain, much can be done by diagnosis and treatment; and not the least welcome item in the King's speech was the intimation that a National Cancer Service was to be instituted to end the present disgraceful state of affairs in which, by the confession of the Minister of Health himself, only one in every four of cancer's victims has a chance of proper care.

20 Lincoln's Inn Fields, London, W.C.2
Established 1844 Funds exceed £28,000,000

Early legislation will pool existing facilities for observation, treatment and after-care, and the intention is ultimately to provide a service of clinics, treatment centres and specialist hospitals sufficient to serve the whole population. This was done for tuberculosis under an Act of seventeen years ago, and cancer co-ordination is not the end of endeavour. Prevention in the case of this scourge is more than ever better than uncertain cure, and large sums of money might well be devoted from public funds to the researches into cancer's origins, still largely supported by voluntary contributions and private finance.

British Bicycles.—Cyclists and motor-cyclists scarcely figure so largely as motor-car owners and drivers in current road and traffic controversies. It is the motor-car which taxes our roads beyond their limit; and it is motor roads of some kind which are needed to solve our pressing problems of congestion and danger. Yet, both among the quick and the dead on our roads, the cyclists and motor-cyclists, whose latest steeds are now on show at Earls Court, outnumber the motorists. Last year there were probably between 10 and 12 million cycles in use in this country, and nearly half a million motor-cycles; private cars numbered 1,834,248. Of 6,633 persons killed, 1,416 were pedal cyclists and 981 motor-cyclists; only 315 were in other motor vehicles. Safety requires that the cyclist should, in present circumstances, submit to some regulation: rear lights and reflectors, cycle tracks and even registration to keep the infantile, senile and incompetent out of harm's way. But, in the long run, it would be more logical to take the motor-cars off our present inadequate roads than to remove the cyclists from the path of the cars. Pedestrians, over 3,000 of whom were slain last year, would agree, and it is with these, the most numerous users of the road, that the cyclists' closest sympathy really lies. It is true that at Earls Court cycles and motor-cycles are cheek by jowl, but the motor-cyclist is deserting to the motor-car class in thousands every year. There are

now fewer motor-cycles in use than thirteen years ago and at the peak in numbers in 1929 there were nearly 50 per cent. more in use than now. Pedal cycles, on the other hand, have increased in number until only Germany uses more.

Unemployment and Holidays.—The latest report of the Unemployment Insurance Statutory Committee recommends that it should be made impossible for insured persons on holiday to draw unemployment benefit. This step would effect a saving of some £400,000 a year, and the Committee propose that the Minister of Labour should be empowered to define holidays by regulation to facilitate the reform. The bar would be applied equally to paid and unpaid holidays, and, since it is hoped that paid holidays will increasingly come to be regarded as a normal incident of employment, insured persons taking holidays with payment would continue to pay insurance contributions in respect of their weeks away from work. It is clearly undesirable that insurance funds should be used to finance holidays taken by persons in work, but, although the necessary exceptions in favour of workers whose holidays are actually taken in the course of unemployment will be made, there will be hard cases if these recommendations are not applied carefully. The term "holidays" frequently serves as a euphemism for periods of involuntary idleness, and it is all important that holidays for the purpose of these regulations, in themselves quite logical, should be genuine.

"Germany's Trade Offensive."—We wish to draw our readers' attention to a letter to the Editor on page 322 of this issue of *The Economist*, which corrects an important error of fact in our last week's survey of the German trade drive in South-Eastern Europe.

Railroad Wages Uncut

NEW YORK, October 31.—The report of the Railway Emergency Board, appointed to consider the application for a 15 per cent. reduction in wages, recommended that the proposal should be withdrawn. It was argued that railway wages were not unusually high compared with other wages; that the immediate distress of the railroads was cyclical, and, in view of current trends, unlikely to last; and that a general

reduction would not specifically meet the needs of the poorest concerns. This report disappointed hopes but not expectations; few had imagined that the Board would recommend the reduction; but many had hoped that it would go beyond its terms of reference and present a programme of reconstruction. As it was, the report contained only general comments that would be useful in formulating such a programme.

But, in what the community believes to be a period of revival, hope dies hard. No sooner did the prospects of salvation by wage reduction fade than a new crop of rumours sprang up, to the effect that the railroads were to be rescued as part of an armament programme. Last week there were despatches (in no great detail) to the effect that utility expansion would be facilitated as part of a defence plan, and the conjecture that the railroads might be included was quite plausible. Indeed, the rehabilitation of the transport system is vital to national defence, just as, for that matter, it is vital to the peace-time economy generally under total pacifism.

Meanwhile, the motor industry dominates the scene, and it is expected to operate practically at capacity for the remainder of the year—and longer. The labour disputes that plagued the industry in September and early October have quietened down, apparently as a result of disciplinary action within the unions themselves.

Improvement Slower in September

The business indices of the Federal Reserve Board for September showed, as was expected, general increases compared with August, though not so large as the August increases over July or as those expected in October over September. This apparent slight check to momentum is partly attributable to the "war scare," partly to labour troubles,

and partly (purely statistically) to "seasonal adjustments."

	FEDERAL RESERVE BOARD BUSINESS INDICES		
	Sept. 1937	Aug. 1938	Sept. 1938*
Industrial production (total)	111	88	90
Manufactures	110	87	89
Minerals	116	95	97
Construction contracts (total)	56	66	76
Residential	37	53	55
All other	71	77	93
Factory employment	107.2	84.9	87.0
Durable goods	107.6	72.1	75.8
Non-durable goods	106.8	97.1	97.6
Factory pay-rolls	104.4	76.8	80.7
Durable goods	105.8	63.5	68.3
Non-durable goods	102.9	91.6	94.6
Freight car loadings	78	62	64
Department store sales	94	83	86
Department store stocks	77	67	67

* Preliminary.

Both types of building are now well above the levels of September, 1937, and non-residential contracts show an especially large jump in the month—presumably reflecting the spending programme. While residential building has been climbing steadily since the early spring, heavy or non-residential building showed only an uncertain movement before September. Building contracts let in September have now become steel operations, the current rate of steel activity being about 55 per cent. of capacity.

The upturn in business has been promptly reflected in employment and pay-rolls. The following table shows that unemployment was far more severe in durable goods industries than in non-durable goods industries, and that the durable goods were still lagging behind in September.

	FACTORY EMPLOYMENT	
	Durable Goods	Non-Durable Goods
July, 1937	108.6	109.9
August	108.3	108.9
September	107.6	106.8
October	105.4	104.7
November	99.8	101.3
December	91.9	98.1
January, 1938	83.7	96.0
February	81.0	96.4
March	79.0	95.4
April	76.2	94.1
May	74.1	92.9
June	71.9	92.4
July	70.7	94.5
August	72.1	97.5
September	75.8	97.6

The Role of the Share Market

So far none of the indicators of recovery, with the possible exception of residential building, shows so strong a rebound as the share market, though the earnings statements for the third quarter which are now appearing are not materially different from those of the first and second quarters. The index of manufacturing activity averaged 76 in the first quarter of 1938, 75 in the second quarter, and 85 in the third quarter—the same as in the final quarter of 1937. But the share market has followed the index of production only in the loosest way, evidently rating the period of lowest production as merely temporary, and being quick to discount the upturn the moment it appeared. The result is that share prices are only slightly higher now than they were at the end of June, although the entire recovery in production has occurred since then.

During the past summer the share market has appeared not so much as a mirror of improving business, but as an actual source of business improvement. On the whole, it appears that certain economic forces acting directly on, or manifesting themselves in, the security markets are capable of exerting a great influence on business activity itself. In the second quarter of 1938 there were two special factors which directly affected the security markets. The Inactive Gold Fund was monetised in April, and a large part of the proceeds was used for the retirement of maturing Treasury bills. In the absence of new issues, this manoeuvre created a kind of vacuum in the security market. At the same time, the modification of the tax on capital gains made investment in shares attractive to certain capitalists who had formerly been constrained, either to hold their capital idle, or to keep it in tax-exempt securities of the type which the Treasury was just then retiring.

Not only was the first clear manifestation of recovery seen in the share market, but the share market has been willing to

discount or envisage a degree of recovery beyond what has yet appeared in industry itself. It is likely that at any given time Wall Street is characteristically more bullish or more bearish than industry in general. A year ago it was far more pessimistic toward the business outlook than were business men or industrialists; at the present time it is far more optimistic.

France

M. Reynaud's Plans

PARIS, November 10.—The franc has been steady for six months. So has the Budget deficit. Accordingly, M. Reynaud declares that the problem has no monetary solution and is primarily economic. The deflation of M. Laval failed because a revival of business was hampered by the gold franc. The inflation of M. Blum failed because a revival of business was hampered by the forty-hour week. The solution, now that French prices are in line with world prices, lies in the abrogation of the forty-hour week. This will be facilitated by reflation; and the revival of business will remove financial and social difficulties. The drive to effect budgetary economies and increase taxation is thus a secondary feature, designed mainly as an earnest of goodwill to facilitate an expansion of credit. Such is M. Reynaud's scheme.

Experts like Professor Rist admit that the Budget cannot be balanced until one or two years have passed. Moreover, the annual deficit of 50,000 million francs includes 20,000 millions for military expenditure, which can be covered by loans, in the same way as in other countries.

In France the citizens have money; the great pauper is the State. There is plenty of money in the country; there is considerable internal purchasing power; and there is also a certain foreign demand for French goods due to the fact that French prices have been lowered by the devaluation of the franc. And moreover, there is a huge mass of expatriated capital, a great part of which is anxious to return home and to find there a moderate but stable return.

The real problem is to stimulate trade and to produce more efficiently. The object of the Government is then to increase transactions by purchasing and selling more both at home and abroad; and to increase and improve output, so that costs can be lowered.

The scheme has several important colonial implications. M. Mandel has announced that the production of cotton in the colonies will be tripled before 1943—an annual saving of 250 millions in trade with foreign countries. In five years enough coffee will be grown to cover the whole national needs—a similar saving of 15,000 millions a year. At present France imports fruit to the annual value of 600 millions and paper-pulp valued at 1,000 millions yearly. The production of fruit and wood for pulp is also to be developed; and, after four or five years, colonial products, the Minister of Colonies declares, should permit an annual saving of some 4 or 5 million francs.

The State of Opinion

M. Reynaud's scheme will have a good chance of success if politics are kept in the background. At the last Socialist conference M. Blum declared that he was not in favour of any exclusion of the Communists (as M. Daladier was at Marseilles before M. Reynaud went to the Ministry of Finance), but that he did not advocate a Socialist-Communist bloc, or any declaration of war against M. Daladier. Somewhat ambiguously, he called for a union of the vital forces of the nation. The forthcoming congress of M. Flandin's party, from which many members have resigned, will show the same confusion.

The Bank undertakes banking business in all parts of the world,
and with its numerous branches offers special facilities in Canada,
Newfoundland and the United States

In the factories the militants have lost much of their influence by inspiring too many strikes, the objectives of which were not very clear. Finally, the Stock Exchange, forewarned of the new schemes, has shown its approval by a strong rise in the public funds, in the expectation of conversion and in industrial share prices, in the hope of a revival in business. Now is the time for speedy technical rather than political steps, backed by M. Bonnet's peace efforts.

The decrees will be published on Sunday, and Parliament will not reassemble until the middle of December. Thus prolonged discussion of the Budget will be avoided, for the Government will be able to demand its speedy passage before the end of the year.

Wholesale prices are still steady, as the following table shows:—

	Oct. 1st	Oct. 8th	Oct. 15th	Oct. 22nd	Oct. 29th	Nov. 5th
General index	646	652	657	653	654	652
Domestic products	664	671	673	670	670	670
Imported products	615	619	627	623	626	619
Foodstuffs	628	634	637	635	635	635
Raw materials	663	668	674	670	672	667

In the week ended October 29th the number of persons out of work was 361,724, against 360,490 in the preceding week and 319,223 a year ago.

Finland

Slackening Activity

HELSINGFORS, November 7.—The decline in world prices has had a marked influence on undertakings mainly engaged in the export trade. There has been a severe fall in timber prices in spite of the principal exporting countries' joint decision to curtail production. Timber felling is likely to be appreciably reduced this winter, which will diminish the income of the rural population from the sale of timber and from lumber work. The sales and manufacture of mechanical and chemical pulp, cardboard, paper and similar goods have also decreased considerably, partly in accordance with international agreements; and, as sales are made on contracts with long terms of delivery, the fall in prices has not yet hit these industries with full force.

The falling off in general activity is clearly visible in the indices of exporting industries. The index of the volume of output of export trades was 146 for the third quarter of this year (1926 = 100), compared with 185 at the same time last year. The fall in the value of production was much greater: the index of value for the third quarter was only 117, as against 227 at the same time last year.

On the other hand, activity in the branches of industry supplying the home market has not yet been affected by the recession. The index of the value of output in these industries was 193 in the third quarter, the same as last year, while the volume index even rose a few points. Should the export decline continue, however, decreasing purchasing power will reduce home sales too.

A factor that has hitherto counteracted the effects of slackened overseas business is the building trade, which is still lively, both in the towns and in rural districts. The consumption of cement in the autumn was still rather larger than last year, when it was of record dimensions. Plans approved in the capital, which were below last year's level for a few months, were again higher in September than twelve months ago. The harvest, which is a very significant factor in Finland owing to its influence on the important purchasing power of the rural population, was in general satisfactory—although the autumn sowings, potatoes and root vegetables, yielded a worse crop than last year.

Changed Terms of Trade

Foreign trade shows a more and more pronounced tendency to fall away. The volume of exports, for instance, was 18 per cent. lower in September than last year, and the volume of imports 4 per cent. lower. The value of exports was 793.8 million marks, a drop of 24 per cent. compared with September, 1937. The value of imports, at 758.4 million marks, was about 10 per cent. lower than last year. Thus there was an export surplus of only 35.4 million marks compared with 213.7 millions in September, 1937, and 111.4 millions in 1936. In the whole period from January to September an import surplus amounting to 308.6 million marks has been recorded, whereas last year the import surplus in nine months was only 16.0 millions, and in three quarters of 1936 there was actually an export surplus of 649.2 millions.

The worsening of business is also visible in the smaller accumulation of capital. In the summer months the increase in deposits was considerably smaller than last year, and in August deposits made by the public were fairly generally reduced. This tendency continued in September—obviously influenced by a chance factor, the fear of an outbreak of war. Total deposits in the joint stock banks fell off during the month by 347.0 million marks compared with an increase of 25.6 millions in September last year. Deposits in savings banks and savings funds also fell; and the credits granted by the joint stock banks were reduced by 7.7 million marks, against an increase last year of 140.3 millions. The position of the joint stock banks thus displayed a tendency to become tighter, but it was still very easy, the surplus of deposits over credits at the end of September being no less than 1,611.7 million marks and total cash amounting to 1,314 millions.

The threat of war was reflected in the Bank of Finland principally by an increase in the note circulation. During the last week in September the notes in circulation increased by 148.8 million marks, compared with an increase of 80-100 millions in former years. At the beginning of October the notes in circulation fell off considerably, and are below the figures for the corresponding months of last year. As usual in the autumn, when seasonal credits are paid off, the credits granted by the Bank of Finland also fell. The note reserve increased from 205 million marks at the end of August to 318.7 millions at the end of September and 400.8 millions on October 31st.

Argentina

Legislation Outstanding

BUENOS AIRES, October 29.—The ordinary sessions of Congress closed on September 30th with a number of important Bills still pending, including the anti-dumping project. The Bills for the rebuilding and purchase by the State of the Argentine Transandine Railway and for the State purchase of the Córdoba Central Railway have passed the Deputies but not the Senate. On September 26th, the Upper Chamber voted the Bill reforming the railway law which was presented several years ago, and permitting greater co-ordination of railway services, but it has still to be considered by the Chamber of Deputies. It is expected that the Government will call extraordinary sessions during November.

How little Argentine internal business has been affected by trade recession is illustrated by the returns of the Clearing House in the city of Buenos Aires. Cheques cleared in the first nine months of the current year amounted to 28,449 million pesos, compared with 31,409 million pesos in the same period of 1937, 25,287 million pesos in 1936, and 23,442 million pesos in 1935. Even in September, the figures were higher than in the corresponding month of any of the last five years, except the boom year 1937.

Foreign trade in September followed the same course as in preceding months. Although exports have recovered from the lowest levels in volume, prices are now lower than earlier in the year, and there is scarcely any improvement in value. In September the value of exports was only 109,127,934 pesos, compared with 158,309,032 pesos in September, 1937. Imports were again high, being valued at 118,420,971 pesos, against 157,385,758 pesos in September last year. There was thus another import surplus of 9,293,037 pesos, bringing the total surplus for nine months to 61,736,536 pesos, compared with an export surplus of 751,137,942 pesos in the first nine months of 1937.

Farmers Want Guaranteed Prices

Prospects for the coming crops are still quite favourable. Frost occurred on one night in the middle of October in the Southern part of the cereal belt, but the crop was insufficiently advanced to suffer serious damage. There was a heavy frost in the Mendoza grape region on the night of October 27th, and great damage is reported to have been done to the vineyards; but, as it has been customary in recent times to destroy surplus wine stocks to prevent over-production, it is doubtful whether this should be regarded as a misfortune or a blessing.

On October 21st, the Ministry of Agriculture published its second estimate of the area sown with cereals and linseed. This is given below, together with the corresponding figure for last year and the average areas during the last 10 years:—

	(In hectares)		Average
	1937-38	1938-39	last 10 years
Wheat	7,778,000	8,350,000	7,730,690
Linseed	2,842,000	2,690,000	2,977,516
Oats	1,317,000	1,350,000	1,413,427
Barley	786,100	830,000	680,328
Rye	884,000	890,000	685,134
Birdseed	45,500	50,000	40,177

Despite the heavy and continued fall in the world's wheat prices Argentine farmers are sowing a greater area than usual with wheat. In defence of this it may be argued that in case of early misfortunes the land can be ploughed and sown with maize, as the season for maize is about four months later than that for wheat. Owing to the large world surplus of wheat, the price of maize in Argentina is actually higher than that of wheat.

One of the consequences of the fall in wheat prices is an agitation among farmers here for the restoration of basic prices for cereals which were abolished at the end of 1936. The price of 9 pesos per 100 kilos has been mentioned for wheat, while the present price is less than 6 pesos. The last time that the Government guaranteed the price of the country's chief source of wealth, the arrangement turned out satisfactorily and the State made a profit instead of a loss. This happy result might not be repeated and, with so many financial problems ahead, the Government is likely to be cautious before assuming fresh liabilities. The campaign for renewal of basic prices is an apt illustration of the danger of establishing a precedent and of how easily vested interests grow.

Hongkong

A Smashing Blow

HONGKONG, October 27.—With the news of the Japanese advance, the Chinese community here was dumbfounded when it learned that the Provincial Government had fled from Canton after arranging for the demolition of all Government buildings and public utility plants.

The Scorched Earth policy had been carried out with a vengeance. Canton, whose population was in normal times about 2 millions, is now a ruin and its inhabitants mainly coolies and beggars. On the Shameen, the foreign community is in a state of siege and, except for wireless, is cut off from all communication with Hongkong and the outer world. A similar situation now obtains in Hankow, where foreigners and destitute Chinese are the only living beings left. After the magnificent resistance offered by Chinese troops for over a year, the Chinese in Hongkong were confident that neither Canton nor Hankow would be captured without tremendous loss to the enemy.

The astounding collapse on the part of the defending forces has given rise to persistent rumours that a price has been offered and accepted, but although such rumours were often substantiated in the days of civil war, they can scarcely be credited to-day. It can only be assumed that Marshal Chiang Kai-shek has decided to consolidate his forces before incurring further losses and has taken the desperate course of destroying the two prize cities which he can no longer defend. The shock to Chinese morale in this colony is profound and, although hatred of the Japanese burns as intensely as ever, there is a general feeling that further resistance is futile. There is now talk of negotiating for peace, but until Marshal Chiang Kai-shek agrees to follow the example of Dr Benes, Japan is hardly likely to discuss terms.

Outlook for British Trade

The probable effect of the events of the past week on British trade in South China is difficult to assess. In the first place, no estimate can yet be made of the losses incurred

in Canton. The wholesale evacuation of the population before the arrival of the Japanese has no doubt saved a vast amount of personal possessions. The extent of damage to private property and to stocks awaiting shipment cannot be ascertained, but the destruction of a huge metropolis like Canton is bound to entail enormous losses, although not to the same extent as in the case of an accidental city.

Canton is, however, not the only centre to which Hongkong looks for its trade, and as long as the river is reopened and shipping communications restored, produce which would have normally reached Canton will probably find its way to Hongkong by other routes. Much, of course, depends upon the attitude of the Japanese authorities. Reports from Canton suggest that there is an air of sweet reasonableness about the Japanese officials in charge and, so far, there have been no atrocities such as occurred at the capture of Nanking. It is possible that foreign rights in South China will be respected in contrast to what has happened in the North.

But, whatever the future has in store, British opinion here is not tinged with the pessimism which prevails at home, and there is still ample faith in the recuperative powers of the Chinese, as well as in the commercial and economic advantages afforded by this colony. It is, perhaps, significant that, while the British border is within easy access of the country through which the invaders passed during the early stages of their advance on Canton, the number of Chinese refugees who sought the shelter provided by the Hongkong Government was never more than a few thousand, the majority of whom have now returned to resume their normal occupation. While these refugees were almost entirely peasants from the farms, there is no reason to suppose that a similar return will not obtain with the city dwellers evacuated from Canton. The Chinese cannot be idle, and no power on earth will stop them from carrying on trade even with the minimum of resources.

Social Services

The Budget of the Hongkong Government was introduced on the day after the Japanese had landed at Bias Bay. With the revenue for the current year at the highest level in the history of the colony and an estimated surplus of \$13½ millions, the Government had prepared the estimates for 1939 "on the assumption that the economic activity of the colony will be maintained at not far short of its present level." The policy of the present administration is to develop essential social services and to embark on a five-year plan of public works. The Governor warned the Council that increased revenue would be necessary to support and expand this policy and hinted that the community was quite able to stand additional taxation.

There would be little opposition to a progressive policy if it were not for the ominous growth in Civil Service pensions, which form an ever-increasing burden. The amount of revenue earmarked for pensions has increased 30 per cent. in the last two years, and, measured in sterling, has more than doubled since 1930. Increased efficiency in Government departments and the expansion of social services means more officials required from home, with increased expenditure in salaries and provision for pensions. Fortunately, the indebtedness of the colony is on a very modest scale, and out of a Public Works Loan of \$25 millions authorised in 1934 only \$14 millions has been issued, much capital expenditure having been financed from the colony's cash surplus.

Letters to the Editor

Economic Conditions in Palestine

TO THE EDITOR OF THE ECONOMIST

SIR,—From time to time there appear in the foreign Press statements on economic conditions in Palestine, which are obviously not based on facts but on assumptions and guess-work. It is to be regretted that an example of this occurs in your issue of September 24th, where the economic situation in Palestine is depicted as being far worse than is justified by the facts.

The major part of your correspondent's report discusses the number of unemployed in Palestine, starting with the rather curious assertion that

apart from matters which are entirely under the control or observation of the Government, such as the figures of imports and exports, it is impossible to get reliable statistics in Palestine.

The absence of reliable statistics would, of course, justify any description of the present depression; fortunately, however, since the foundation of the Government Office of Statistics, statistical information on Palestine has increased enormously; and these statistics (on banking, prices, road and rail traffic, consumption, building, tourism, production, etc.), which are, without doubt, reliable, enable us to judge the present economic position on more solid data than mere impressions.

True, the picture presented by the Palestine economy today cannot be very inspiring. But there are, even in Government circles, other views than those of your correspondent regarding the state of the Palestine economy, especially of its Jewish sector, during the crisis. Permit us to refer to a speech delivered by the Government representative, Mr J. L. Fletcher, Assistant Director of Customs, Excise and Trade, at the annual meeting of the Manufacturers' Association, on October 26th, as reported in *The Palestine Post*:—

He stressed that instead of becoming discouraged during the long period of unrest industry had been reorganised, new articles produced and new markets sought. He expressed confidence that when order would be restored in the near future the manufacturers would be able to reap their harvest.

With regard to the principal point raised by your correspondent—the number of Jews unemployed—he points out that

at the end of December, the height of the orange-picking season, when some thousands of Jews were temporarily employed, the Government estimate of unemployed Jews was 12,000.

In the first place, it should be said that orange-picking is not a temporary employment—but a seasonal one, i.e. the pickers have stable employment during the winter, just as plantation workers during the harvest season throughout the world. A portion of them is employed even during the summer. On the assumption that since the close of the orange season the number of Jewish unemployed must have increased, your correspondent states that there must be

some 24,000 Jews in need of stable employment in Palestine to-day. The probable number of Jewish working men and women in Palestine is about 100,000, which gives a percentage of twenty-four, in need of employment.

It is difficult to understand what this estimate represents and what it refers to. In the first half of the sentence the words "in need of stable employment" are used, and in the second half "in need of employment." If stable employment is meant, it is difficult to argue, since "stable employment" in a market economy cannot easily be defined. Migration of workers is a well-established feature of an uncontrolled economy, and even in a planned economy it probably cannot be totally suppressed, as the amount of employment in various areas is influenced by bad harvests and other natural forces.

But should the estimate refer to unemployment as ordinarily defined, an unemployment among Jews of 24 per cent. of the total number of Jewish labour force is extremely unlikely.

The workers who were set free by the contraction in the building trades (the only branch of the Jewish economy which has contracted substantially during the crisis) have been absorbed in transport (Tel Aviv and Haifa ports), in villages (increase in area of fruit-bearing citrus groves), in Government employment, etc. It is true that, from necessity, a part of these workers is also engaged in defence and security measures, yet this does not reflect any extraordinary instability, as there is reason to believe that employment will be found in other trades when the present disturbances come to an end.

Indeed, according to all information available, the number of Jewish unemployed has considerably decreased of late, and is reckoned at present to be below the figure of 12,000, given by your correspondent as the Government estimate for December, 1937.

Yours faithfully,
ECONOMIC RESEARCH INSTITUTE OF THE
JEWISH AGENCY FOR PALESTINE.

Jerusalem.

Germany's Trade Offensive

TO THE EDITOR OF THE ECONOMIST

SIR,—The interesting article on "Germany and South-Eastern Europe" in your issue of November 5th states that:

"Germany's requirements of oil amount to 30-40 million metric quintals per annum," but that "Roumania is not in a position to export more than about 7-8 millions."

It omits, however, to point out that the second figure is given in tons—i.e. that Roumania's export capacity is about 70-80 million quintals. In fact, Roumania can supply not one-quarter but more than twice as much oil as Germany at present imports.

On the other hand, it is worth noting that in time of war the oil requirements of a Great Power might, according to the estimates of two German authorities, rise to between 120 and 200 million quintals. Such figures are, of course, well above Roumania's present output.

London, W.C.1.

Yours faithfully,

B. S. KEELING.

[We are greatly indebted to Mr Keeling for pointing out a quite indefensible and very important slip.—Ed.]

Counting the Cost

TO THE EDITOR OF THE ECONOMIST

SIR,—I thank M. Josef Hrase for his letter from Prague published in your issue of November 5th. He states that 2,800,000 Germans and 700,000 Czechs have been transferred to Germany, and points out that this means a gain to Germany of 3.5 per cent. of her population and a loss to Czechoslovakia of 10 per cent. of her Czech population. As the German gain is based upon a large population and the Czech loss upon a comparatively small population, there does not appear to be much in this point. The point as to whether the occupation is "just" depends on the fact that these 2,800,000 Germans have been transferred to Germany, where they desire to be, without war.

Regarding the former German colonies question, it will be difficult; but there need not be "further demands upon feelings and susceptibilities" if it is approached in the spirit of Article V of the late President Wilson's Fourteen Points (Germany's case), e.g.

A free open-minded and absolutely impartial adjustment of all colonial claims based upon a strict observance of the principle that in determining all such questions of sovereignty the interests of the population concerned must have equal weight with the equitable claims of the Government whose title is to be determined.

Would not the appointment of an International Commission be the best way of ascertaining all these claims?

I am, Sir, your obedient servant,

London, S.W.7.

D. M. MASON.

Books and Publications

The Irish Problem

THE confusion into which Irish politics were plunged by the Parnell split and the turgid course which they ran during and after the War have tended to obscure for the younger generation the great constitutional struggles of the 'eighties on the Irish question, in which Gladstone and Parnell were the protagonists. Mr J. L. Hammond has performed the pious task of rehabilitating the reputation of the former of these two outstanding parliamentarians, and has performed it with complete success,* throwing, incidentally, much new light on the history of the long period covered by Mr Gladstone's life. When Morley was writing his famous biography many of the leading actors in the Home Rule controversy, for example Harcourt, Hartington and Chamberlain, were still alive, and a certain reticence was necessary. In the last thirty years many valuable biographies of these and other figures of the 'eighties have appeared, as well as a number of books on Gladstone and Parnell. Mr Hammond has made full use of this new material, and, in addition, he has had access to all the Gladstone papers and diaries and many other unprinted sources. The resulting study is a very valuable addition to the political history of the nineteenth century and forms an indispensable supplement to Morley's "Life."

Gladstone's interest in Ireland was first aroused when he visited the Continent in 1845 and had conversations with Guizot and other foreign statesmen. It was in that year that he wrote to his wife the remarkable letter about "that cloud in the West, that coming storm, the minister of God's retribution upon cruel and inveterate and but half-atoned injustice." And yet, curiously enough, he took practically no further notice of Irish affairs for twenty years, after which he made the solution of the Irish problem the main task of his life. Mr Hammond explains this indifference by the fact that Gladstone was fully engaged with finance and foreign politics, and that he believed that the Irish agrarian question had been solved by the famine. When, in the 'sixties, he realised that Irish agrarian grievances were still real, he decided that they must be remedied at whatever cost. In 1868, when he received the summons from Windsor to form his first Government, he paused in the tree-felling in which he was engaged, "looked up, and with deep earnestness in his voice and with great intensity in his face, exclaimed 'My mission is to pacify Ireland.'" From that moment he never looked back.

What would Gladstone's position have been among the statesmen of the nineteenth century if he had died in 1880? And what would have been the parliamentary history of the 'eighties if the Home Rule issue had not been raised? These questions are unanswerable, but it is safe to assert that the whole course of English and Irish history has been deeply influenced ever since by the titanic battles waged over Home Rule. Mr Hammond tells fully for the first time much of the personal relations behind the scenes of the actors in that great tragedy. The transactions between Gladstone and Mrs O'Shea are described in detail with abundant documents, and it is argued that Gladstone disbelieved the

rumours of the liaison between Mrs O'Shea and Parnell until shortly before the divorce proceedings.

Mr Hammond claims that the new documents now available prove three important things: first, that as early as the 'seventies Gladstone's chief colleagues knew that his mind was moving to Home Rule; secondly, that the suspicion that his actions in the autumn and winter of 1885 were ruled or influenced by the desire for office was absolutely without basis; and, thirdly, that Parnell went to surprising lengths in 1882 and 1883 in the hope of obtaining large Irish reforms without violence. Gladstone's relations with Chamberlain and Parnell are fully discussed, and his failure to avoid a breach with them is partly explained by the fact that in general he was far inferior in his handling of persons than in his handling of problems. "Almost all his failures in politics came from his want of skill and judgment for such purposes."

We have described the political drama of the 'eighties as a tragedy. What made it a tragedy was the nobility of the protagonists. Parnell was a revolutionary patriot with something almost inhuman in his contempt for his friends and enemies alike. Gladstone's Irish policy was animated by a high moral purpose. The problem, as he saw it, was to satisfy the self-respect of the smaller nation without endangering the security of the larger. He wanted Home Rule, not for what it did, but for what it was. He was a great democrat who believed that free discussion and self-government are essential to man's dignity and self-respect. He knew far less about the concrete problems of Irish economic life than J. S. Mill, Chamberlain or the Balfours, but his large imaginative understanding of the emotions of Irish nationalism gave him a confidence in action which all his contemporaries lacked. To do what he conceived to be justice to Ireland he set himself to break down the prejudices of English people and politicians, and he used the democratic machinery created by the second and third Reform Bills to introduce legislation which appeared revolutionary even to many Liberals. It is to the credit of the British electorate that they supported in such numbers a policy that involved, in appearance at least, the voluntary cession of a substantial portion of Imperial power.

It is impossible to resist the temptation to speculate on what would have happened if the 1886 Home Rule Bill had been passed and put into operation. Would Ireland have remained satisfied with the subordinate status which the Bill conceded, or would extremist movements have developed within the framework of Home Rule? It is important to understand, as Mr Hammond rightly emphasises, that Parnell and Davitt were moderates, and that the new Irish Parliament would have started under Conservative leadership. The cultural resurgence associated with the language revival and the literary movement might never have taken place if the pangs of unsatisfied nationalism had not remained unrequited, and the revolutionary activities of the Irish Republican Brotherhood, which awoke in 1916, would probably have failed to secure the opportunity for which that body never ceased to hope and which was so generously provided by the arming of the Ulster Volunteers. It is interesting to note, in view of recent events, that Gladstone was apparently prepared in 1886 to accord some special treatment

to the Northern Province, and that, even then, a united Ireland would have been very difficult to secure.

Some of the liveliest pages in Mr Hammond's book are those describing the failure of the Unionist policy of "killing Home Rule by kindness," which was adopted in the 'nineties as the alternative to Home Rule. In all justice, however, it must be said that much of what was done, especially the Wyndham Land Act of 1903, was of lasting benefit to Ireland, and made the task of the Irish legislature, when it was at last created, much simpler than it would have been if Home Rule had been conferred in 1886. Possibly the best time for Home Rule to have come would have been immediately after the Wyndham Act, and it will ever remain a matter of regret that the Dunraven proposal for devolution in 1904 was rejected by vain and disgruntled politicians in every party. When Home Rule did come, it came too late, and it came in the way that Gladstone, mindful of the Fenians and Invincibles, always endeavoured to avoid, as a concession to force and not to justice. It is at least arguable that if it had come in 1886 it would have come too early, in the sense that Ireland's economic problems would have been beyond the capacity of a native government. If Clío be impartial she must point to the pedestrian material reforms of the Unionist Government in the 'nineties as well as to the aquiline flights of the heroic figures of the 'eighties. But there can be no doubt in which decade was the greater nobility and in which the truer understanding of the nature of the Irish question.

The Future of British Farming

IN 1932, the National Government decided that something must be done for British agriculture. The result was a medley of subsidies and tariffs, of import quotas and producers' monopolies (miscalled marketing boards), designed to restore to individual branches of agriculture the level of profits enjoyed in pre-slump years. No attention was paid to the total effects of these makeshifts on the structure of British agriculture as a whole, and economists and farmers

looked in vain for a co-ordinated policy. A long-term plan of the lines along which British agriculture should, in the interests of the nation, be encouraged to develop is urgently needed; and this book* provides, in effect, a blue-print of such a plan.

The policy suggested follows naturally from a close and comprehensive description of the changes in our agriculture since the war. These changes have intensified the shift, begun in the nineteenth century, from the production of cereals and of meat fed on arable products to the production of milk for the liquid market, of eggs, fruit and vegetables. It is the consumption of these latter commodities which should, in the interests of health, be largely increased; and, further, it is in these commodities that the British farmer still has the greatest advantage over his competitors, who can supply us most cheaply, on the other hand, with staple foods, such as wheat, sugar and beef.

The conclusion of the argument is, therefore, that the Government should, in the main, encourage British agriculture to produce more and cleaner milk, and that assistance to cereal growers and graziers should be limited to price insurance schemes, on the lines of the barley and oats subsidy, in order to mitigate the worst effects of a severe fall in world prices. Those who think that such a policy would mean national suicide in time of war are directed to the second chapter of the book, where the opposite view is most effectively maintained.

The potential and desired increase in the consumption of milk can only be realised by a reduction in its retail price, aided by State subsidies for its consumption by infants and children. It is a pity that the authors of this book have ignored the problem of rationalising milk distribution (except for a brief statement on the need for setting up an independent Milk Commission), but presumably they considered these matters outside the scope of a book on agriculture. Further, their statement that two million cows could be added to our dairy herds without an increase in the marginal costs of milk production seems rather optimistic, in view of the steadily rising trend in agricultural wages and in the standard of cleanliness and equipment.

Yet it would be captious to quarrel with Viscount Astor and Mr Rowntree about these minor points, when they have given us such a readable and informative guide-book to the present state and future prospects of British farming. One can only hope that the British Government will take for their own the policy here suggested and carry it out with courage and imagination.

THE BUSINESS WORLD

The Fiduciary Issue

IN British currency theory, the Bank of England's fiduciary issue has always had a place of particular reverence, and tradition is rightly opposed to any capricious manipulation of its amount. In point of fact, however, the amount of the fiduciary issue has been altered many times since the Bank Act of 1844. When the Currency and Bank Notes Act of 1928 was in the Commons, a declaration was made on behalf of the Government of the day that the clause permitting variations from the figure of £260 millions was intended for use and not for ornament. There have been a number of changes since. For example, it was raised to £275 millions in August, 1931, and remained there until March, 1933. In December, 1936, it was reduced from £260 to £200 millions, to make room for £65 millions of gold taken over by the Bank from the Exchange Equalisation Account, which by then had become glutted with gold. It was noticeable that the Bank then kept in hand a margin of £5 millions. Finally, between November, 1937, and January, 1938, there was a temporary increase to £220 millions made with the avowed purpose of taking care of the Christmas expansion in the note circulation.

We have now once more reached November, and the general position of the Bank of England, including its gold stocks, note circulation, Reserve and Proportion, are much the same as a year ago. It is therefore natural to expect another increase in the fiduciary issue within the next week or two. Yet if the Bank of England's balance sheet is much the same as last year, in other respects our position has become drastically altered. For example, there have been the Exchange Equalisation Account's gold losses, incurred both last May at the time of the French repatriation and more recently during the crisis. And as a backcloth to all monetary discussions, there is the growing cost of rearmament.

The Economist of October 22nd estimated the Exchange Equalisation Account's gold losses for the six months to September 30th at £165 millions, and hazarded the guess that the Account was then left with £130 millions of gold. So long as no serious new pressure develops, that is an amount more than adequate to enable the Account to deal with short-term fluctuations in the foreign exchange market. But it is extremely doubtful if it would be enough to see the Account through another period like that of the crisis weeks. The question is, therefore, whether the authorities ought to await the onset of another such period of pressure, or alternatively to replenish the Exchange Account's gold during a period of relative quiescence and freedom from strain. Such a question practically answers itself. Pressure upon sterling arises mainly from a lack of confidence. If during a time of strain the authorities had to take special and obvious steps to replenish the Exchange Account's gold, the probability is that they would be taken as a sign of weakness and that the pressure on sterling would be intensified.

There is thus already a strong case for reversing the procedure adopted at the end of 1936, when the Bank took over part of the Exchange Account's gold. Then the Account had too much gold. To-day it holds enough, but no more than enough. And if it is the case that the authorities are contemplating an immediate seasonal increase in the fiduciary note issue according to the precedent

of a year ago, it might cause less disturbance to people's minds if the two operations were combined.

It might be suggested, therefore, that the fiduciary note issue be restored to its "normal" level of £260 millions. There is no very good reason to regard this particular figure as more appropriate than any other neighbouring figure, save that it happens to be the sum named in the Act of 1928, and a return to the *status quo* of as recently as ten years ago could hardly be regarded by even the most rigidly orthodox as an inflationary move. Of the £60 millions of gold thus set free, £40 millions might be transferred to the Exchange Equalisation Account—and since the £40 millions would be valued at the statutory price of gold, its market value would be about £66 millions. This would bring the Account's gold stocks to about £200 millions, which should be adequate for its foreseeable requirements.

The remaining £20 millions would, of course, be available to reinforce the reserve of the Banking Department during the period of high circulation over Christmas. If last year's precedent were strictly followed this £20 millions would be removed in January. But there would be a strong case for leaving this sum of gold as a permanent addition to the Banking Department's Reserve. This case arises out of the necessities of re-armament finance. The Treasury is financing more than £100 millions of expenditure out of borrowings this year, and the sum is likely to be larger rather than smaller next year. It must be one of the major objectives of credit policy to see that this programme of borrowing goes through smoothly. The banking system can be a powerful direct agent in absorbing the new loans. It is even more important that steps should be taken to see that armament borrowing does not raise the general rate of interest and further disturb the already precariously-balanced state of the British economy.

The mechanics of the matter are easily explained. On November 2nd the Banking Department had a reserve of £43.8 millions against deposits of £160 millions (including £109.5 millions of bankers' deposits). The Proportion was thus 27.3 per cent. The figure has been lower than this on many occasions in the Bank's history, but it is not an unduly large figure, and there might be ground for apprehension lest the Bank should be unable to initiate such further expansion as might be required.

The addition of £20 millions to the reserve would obviate this difficulty. If the Proportion were kept at about 27 per cent., the addition of £20 millions to the reserve would seem, at first sight, to permit an expansion in deposits at the Bank of about £74 millions. If this increase were, as it probably would be, mainly in bankers' deposits, which serve the joint-stock banks as cash, it might seem, again in theory, to make possible an expansion in joint-stock deposits of something of the order of £700 millions. In point of fact, the increases would not be nearly as large as these, since the joint-stock banks keep about half their cash in actual currency. If the Bank of England wishes the joint-stock banks to use an increase in their "cash at the Bank of England" as the basis for a credit expansion, it must also put an approximately equal amount of notes at their disposal, which would of course withdraw an equal sum from the Banking Department's reserve. The exact result emerges from an algebraic equation which the reader can

Hitler's Magician: Schacht

NORBERT MÜHLEN

PUBLISHED BY ROUTLEDGE

easily devise for himself. In round figures, the addition of £20 millions in the first place to the reserve would enable the Bank of England to expand the joint-stock banks' cash by £30 millions—or about 15 per cent.—without lowering its own Proportion.

The bearing of this figure on re-armament finance may also be worked out. Such an expansion in the joint-stock banks' cash could only be brought about by a purchase by the Bank itself of £10 millions of securities (i.e. the increase in the banks' cash less the increase in the fiduciary issue). The joint-stock banks themselves have in recent months been holding, for every £100 of deposits, approximately £10 of cash, £19 of call and short loans and discounts combined, £28 of investments and £43 of advances. If these ratios were adhered to, an increase of £30 millions in their cash would enable them to purchase £84 millions of securities, provided that there were a simultaneous increase of £57 millions in the supply of Treasury Bills, either those held directly by the banks or those held by the market and borrowed against from the banks. The final result of the whole process, on paper, is that an addition of £20 millions to the reserve of the Banking Department of the Bank of England would enable the banking system as a whole to absorb about £150 millions of additional Government securities. The total might be larger if the total of advances continued to contract; and, on the other hand, it would be smaller if reviving business created a reviving demand for bank credit. The task of the Treasury would be

facilitated not only by the direct purchases of the banking system but also by the heartening effect these purchases would have upon the gilt-edged market. In practice, of course, the intervention of disturbing factors is to be expected and the actual result would almost certainly diverge from that calculated here. But the figures are sufficient to illustrate the dimensions of the suggestion that is being made and of the opportunity it would present for maintaining cheap money for another year or more.

The chief objection to the proposal is that it might be interpreted in some Continental circles as the herald of inflation. To some extent, inflationary phenomena are unavoidable if we are to finance a large part of the armament programme by borrowing. But inflation, in the sense in which it strikes terror into Continental minds, is a long way removed from a country where unemployment is considerable and, at best, not falling. Indeed, there would seem to be a greater risk of slipping back into deflation if the requirements of the defence programme are allowed to encroach upon monetary ease. A procedure such as has been here suggested—a restoration of the fiduciary issue to its 1928 figure of £260 millions, £40 millions of the increase going to the Exchange Equalisation Account and the remainder going to enlarge the basis of the credit system—would be the surest way of demonstrating that the policy of the authorities is unchanged, that they possess the resources to carry it out and the determination to use them.

Milling Shares

FOR the general investor, the milling industry means two names—Ranks and Spillers. These are the Imperial Tobacco and Carreras, the Bass and Ind Coope of their trade, but they have hardly achieved the same investment distinction. This may seem something of a defect for our staple food industry, but it has never sought—or needed—the publicity which those who cater for the direct needs of consumers must exploit. Indeed, its affairs have usually been modestly hidden from the public gaze, and even to-day the industry retains strong dynastic characteristics, most striking in the case of the Ranks group.

But recent events have shown that large-scale changes in the organisation of the milling industry are in progress. In August over 90 per cent. of the ordinary shareholders of John Greenwood Millers accepted an offer from Ranks, Ltd., for an exchange of shares. And last week the directors of Hosegood Industries recommended their shareholders to accept a similar offer from Spillers, Ltd. These offers are discussed in greater detail below, and they clearly enhance the leadership of Spillers and Ranks in the milling industry. Meanwhile, public interest in the latter group has been stimulated by this week's offer for sale of 2,800,000 5s. shares, at 17s. 6d. per share, which have hitherto been in private family hands.

It would be misleading, however, to assume that the milling industry consists wholly of a few large individual units. When the Wheat Commission was set up in 1932, there were 487 millers operating 557 mills. At the end of July last year, 481 millers operated 562 mills. Thus, there has been no dramatic change in the general structure of the industry. But already in 1930, the importance of the large-scale mill was obvious. Of the 404 establishments which made returns for the 1930 Census of Production, as many as 276 employed less than 50 workpeople. But 57 employed 100 or more, and these mills were responsible for as much as two-thirds of the industry's gross output of £66,695,000. To take another test, of the 260 mills handling wheat, 93 were port mills, and 167 inland mills. But the port mills reported a gross output of £43,086,000, compared with £17,182,000 for the inland mills; they employed 155 workpeople on the average, against 42 for the inland mills; and their higher operating efficiency was reflected in a net output per head of £384, compared with £348 for the latter. Between 1924 and 1935, the average numbers employed in the milling

industry rose only slightly, from 29,102 to 29,897. But its increasing efficiency is reflected in a jump in net output per head from £357 to £391 over these eleven years.

To-day, it is the silo at the river estuary which characterises the industry, and not the water wheel. To take an example from this week's prospectus, Joseph Rank, Ltd., owns "six of the largest up-to-date flour mills in the United Kingdom," situated at Hull, London, Southampton, Barry Dock, Birkenhead, and Belfast, and each of them is adjacent to a waterway and to a railway. In recent years, Spillers has built new mills at Cardiff, Avonmouth, Newcastle, and made improvements at Birkenhead and London. Such establishments call for capital on a large scale. Since Ranks, Ltd., was incorporated in 1933, more than £4 millions has been employed for extensions and for financing increased stocks, and of this sum as much as £2½ millions has been provided from the resources of the operating companies. As a result, the group can now claim a normal yearly output of about 18 million bags of flour of 140 lbs.—say, 22½ million cwt., or nearly one-third of the net supply of home-milled flour for 1936–37. Again, the industry employs its fixed capital to high advantage. To quote once more from the Ranks prospectus (which is as informative technically as it is reticent financially), the group has an hourly capacity of 3,100 bags, and an annual output capacity of 18 million bags. These estimates imply that the mills run for 5,800 hours annually, or, on the assumption of 300 working days, over 19 hours out of the 24. In fact, the demand for flour is one of the most dependable of economic statistics. In the following table, the quantities of flour supply, computed in accordance with the Wheat Act of 1932, are set out in detail:—

FLOUR SUPPLY—UNITED KINGDOM
(In cwt.)

Cereal years (to July 31st)	Home-milled Flour	Imported Flour	Total Supply
1932–3	75,699,923	8,471,515	84,171,438
1933–4	74,242,993	10,655,279	84,898,272
1934–5	74,665,904	8,058,878	82,724,782
1935–6	76,090,025	8,461,813	84,551,838
1936–7	74,600,781*	8,334,439	82,935,220*

* Subject to slight revision.

A maximum variation of 2½ per cent. in the output of British flour mills in this quinquennium, which covered

the trough of depression and the pinnacle of recovery, provides striking proof of the stability of operations which the milling industry enjoys. It has extended its direct trading activities in the quest for economies, so that the grain trading organisations, like the Stock Exchange, have reason to complain that business is being by-passed. And while buying policy has become increasingly important as stocks under the control of the large millers have grown, it appears to have coped successfully with the gyrations in wheat prices during the past few years. Price fluctuations, coupled with keen competition in the provender and animal food trades, had some influence on the level of milling profits last year. But the leading concerns appear to have avoided serious price "squeezes" and inventory losses alike.

What does this industrial background mean in terms of profits, past and potential? The following table, which sets out the recent profits of Ranks, Ltd., and Spillers, Ltd., together with those of McDougalls, Ltd. (which specialises in self-raising flour) provides the basis for an answer:—

MILLING PROFITS AND SHARE VALUES

* Results not shown for broken periods. † To end October.
(a) Ordinary, 15.0 per cent.; deferred, 8.6 per cent. (b) After charging additional obsolescence provision, ordinary, 15.0 per cent.; deferred, 2.2 per cent. (c) Ordinary, 15 per cent.; deferred, 10 per cent.

Progressive earnings and a satisfactory "ceiling" for milling equity shares are apparent in this table, at least between 1935 and 1937. The latest results have been affected by factors which may well prove of a transient nature. For instance, the fear of a breach in the Millers' Mutual Association explains the decision last September to reduce the Ranks dividend for 1937–38 from 18 per cent. to 17 per cent. Perhaps the same uncertainty was reflected in the comparatively stiff terms which were accepted a month earlier by the majority of shareholders of John Greenwood Millers. Already that company had suffered severely from competition in the North-Western area, and the chairman, speaking early in August, saw "no immediate prospect" that earnings would be restored to the favourable level of previous years. These fears of unregulated competition, however, have proved groundless. The Millers' Mutual has closed its ranks, and the need for precautionary dividend cuts appears to have been removed. Indeed, the directors of Ranks, Ltd. (whose conservative financial policy, though not directly disclosed in the somewhat uninformative accounts which the parent company continues to publish, may be inferred from recent reports) now envisage the possibility of more generous distributions in future. Without any indication of the real profit-earning capacity of the group, it is difficult to translate such possibilities into percentage terms. Unfortunately, this week's prospectus does not

bring up to date the detailed information regarding Joseph Rank, Ltd., which was provided when Ranks, Ltd. was formed five years ago. This is a factor which must be put on the debit side in assessing the value of the shares, though reticence has its uses in concealing plums from shareholders, as well as useful information from trading competitors.

The business of Joseph Rank, Ltd., was founded in 1875. Spillers, however, traces its inception to 1837, and it has a long public history. The group suffered severely in the depression, and actually incurred a loss of £221,511 in the year to January, 1930. But there has been no cause for complaint during the past five years, in each of which 15 per cent. dividends have been paid on the ordinary and deferred stocks.

Two special factors may well affect their prospects in future. In July last the company disposed of its controlling holding in British Oak Insurance, which, it would seem, experienced certain special losses during 1937. These, in effect, were provided for in the Spillers' accounts. Secondly, the milling interests will be extended if (as their directors recommend) the shareholders of Hosegood Industries accept the offer made by Spillers, Ltd., last week. Hosegood Industries (which has an issued share capital of £1,013,291, compared with £700,000 for John Greenwood Millers) experienced a fall in profits from £106,972 to £82,318 for the year to June last, but maintained its ordinary dividend at 7½ per cent. out of earnings equivalent to 9.6 per cent. Ordinary shareholders (among them the directors, who with their connections, own upwards of two-thirds of the 2,425,295 5s. shares in issue) are invited to accept 8s. per share for one-half of their holdings, and, for the other half, one ordinary and one deferred share in Spillers in respect of every fourteen shares. On the basis of current prices (without allowance for accrued dividends) these terms imply that 28 Hosegood Industries shares, now quoted at 7s. 6d., and worth £10 10s. in all, would receive cash and shares in exchange valued at £10 16s. 3d. But, like the Ranks offer for

NOT "WHICH?" ... BOTH!

Straight pipes

- 'Kape' - 7/6
- 'K' - 5/6

System pipes

- De Luxe from 12/6
- 1st City from 12/6
- 'O' City from 8/6

For a real man-sized smoke, cool and comfortable with no weight on the teeth, there is nothing to touch a Peterson "System" pipe—ideal for feet-on-the-fender smoking. On the other hand the straight pipe has it for more formal occasions. So why not have one of each—the perfect combination?

PETERSON PIPES
KAPP AND PETERSON LTD., DUBLIN AND LONDON

John Greenwood shares, the proposed exchange comes at an opportune time for the absorbing company. Last year's Hosegood Industries results were affected by the fall in cereal prices, and also by the locking-up of £175,024 of capital in the new mills at Avonmouth, which should be finally completed next year. Hence, the advantage which is represented by the Spillers' offer might be less impressive at some future date, if Hosegood Industries' earnings position improves.

The general prospect for the industry, whose efficiency has been improved by new installations, and whose structure now consists of three dominant organisations—Ranks, Spillers, and the Co-operative Wholesale Society

—thus appears to be assured, provided that it avoids the perils of extreme fluctuations in cereal prices, as it has done in recent years. In fact, to-day's share prices appear to be in line. Ranks ordinary shares, at 17s. 6d., yield £4 17s. per cent., and carry the expectation of higher future dividends. Spillers ordinary, which have received 15 per cent. for the past seven years, stand at 58s., to yield £5 3s. 3d. per cent., while the deferred, at 46s. 3d., yield £6 9s. 9d. per cent. Some allowance may have to be made in current yields to cover the risk of war, and—on a longer view—a potential fall in population. But these are risks which equity shares as a whole must also face in some degree.

Finance and Banking

Argentine Peso Depreciation.—The Argentine Government announced last Tuesday that it had raised its official selling rate from 16 to 17 pesos to the £. The new rate has become immediately effective except for those who had already obtained import permits. These existing permits must be liquidated by the end of this year. A further decree published last Tuesday makes it obligatory to obtain permits for all imports into Argentina after December next. Both the depreciation of the official peso rate and the tightening up of the existing machinery of exchange control are indications of the serious deterioration which has occurred this year in the Argentine foreign trade and exchange position. The foreign trade figures for the first nine months of the year show an excess of imports amounting to 61½ million pesos as against an excess of exports of 751 million pesos in the corresponding period of 1937. Admittedly, there was a somewhat abnormal element in last year's exceptionally good figures, but it was not of sufficient magnitude to account wholly for the deterioration which has since occurred in the returns. The depreciation of the peso must thus be regarded as a conscious attempt to remedy the accumulating deficit of the trade balance. The change in the official selling rate has not been accompanied by a corresponding movement in the official buying rate, which remains at 15 pesos to the £. The margin of profit made by the Argentine Exchange Institute on its exchange operations has thus been doubled. That profit serves to feed the fund for stabilising and subsidising wheat prices in the Argentine, and if one may judge from the present trend of the wheat market, the fund is likely to require additional resources in the coming year.

The depreciation of the official selling rate has been accompanied by a steep fall in the free peso rate. This has declined during the week from 19.02 to 20 pesos to the £. Such a movement is a natural corollary of the alteration in the official rate, and an even steeper decline would have occasioned little surprise, given the narrowness and sensitiveness of the market in free pesos. It has not yet been finally decided whether the official depreciated selling rate will apply to the railway companies in the Argentine. During 1936, when the official rate was at 17, the railway companies were given a special concession by which they were able to effect their transfers in respect of dividends and purchases of materials at a rate of 15.75 to the £. That special concession lapsed when the official selling rate was brought back to 16. There is some ground for anticipating that the 1936 precedent will be followed now that the official selling rate has returned to 17 pesos to the £ and that the railway companies will be able to continue making their remittances to this country at the rate of 16 pesos to the £.

The Coming Insurance Bill.—The Insurance Bill forecast in the King's Speech will no doubt follow the lines of the Report of the Committee on Insurance pub-

lished in July, 1937. The Bill would probably have been produced in an earlier session but for the Sharepushing Bill, also in the charge of the Board of Trade, which was given precedence over insurance. Although the Committee was considering only compulsory insurance, the Bill is certain to affect forms of insurance other than motor car and workmen's compensation in mines, which are at present the only compulsory forms. The reason is that it is not possible to deal with the credit of insurers department by department, and it was made abundantly clear to the Departmental Committee that the third party and the workmen could only be guaranteed payment of their claims by revising the whole scheme of insurance security. If the Committee's advice is closely followed, as it probably will be, a scheme of licensing will be introduced based on a margin of solvency, and any insurer who is unable to get his solvency certified will not be allowed to transact compulsory business. This in effect will mean that all insurance companies and underwriters will have to produce a certificate of solvency. It will probably be found, too, that new regulations will be made for statistical returns to the Board of Trade, and Lloyd's underwriters, who have hitherto made practically no returns, may in this Bill be obliged to supply figures to the Board of Trade comparable in the mass to the statistics now sent in by the insurance companies. Life funds will in all probability be segregated, but it is probable that segregation of the assets of other departments will not be called for.

Gold Earmarking in South Africa.—The Reserve Bank of South Africa has this week instituted facilities for earmarking gold in its own vaults on behalf of other central banks or monetary authorities. Every month the Reserve Bank will notify the amount of such earmarked gold to the Customs authorities of the Union. The new departure may be said to owe its origin to the recent crisis, and to the interruption which it caused to the regular flow of gold shipments from the Cape to this country. During September and October these shipments fell to a weekly average of £300,000, as compared with an average weekly figure of £1,540,000 for the first eight months of the year. The newly-mined South African gold reaching this country is automatically sold to the Exchange Equalisation Account, and one may assume that the gold which during the crisis was retained in South Africa was none the less sold to the E.E.A. and earmarked for it at the Reserve Bank. Strategic considerations may give some extension to this practice. It will be recalled that in recent months some Exchange Equalisation Account gold was sent to Canada, while there have also been suggestions that an earmarked gold reserve has been built up for the E.E.A. in the United States. The extension of this principle of spreading the geographical risk is now, by all appearance, to involve the accumulation of a reserve in South Africa itself. During the weeks of crisis we saw the astonishing spectacle of gold bullion being exported—in modest quantities it is true—from this country to South Africa. Such ship-

ments were made on behalf of private interests who preferred the remoteness of Cape Town to the safe deposits of London as a refuge for their gold hoards. On the face of it the new practice of holding earmarked gold in South Africa has the attractions of simplicity, though it obviously raises large questions which will require careful consideration. The irreverent might ask with unseemly levity why one should not simplify matters still further by earmarking the gold in its original main reef formation.

October Clearing Bank Averages.—The further efflux of funds from London during the early part of October finds expression in the latest clearing bank averages, for deposits are £13.7 millions lower than in September. The counterpart to this movement is a reduction of £20.7 millions in discounts. Notwithstanding the month's increase in the floating debt, the average volume of tender issues of Treasury bills outstanding in October was £15 millions less than in September. These last two figures show how the efflux of funds was covered by gold sales by the Exchange Equalisation Account, which in turn increased its holdings of bills at the expense of those available to the banking system. This point receives further consideration in another Note on this page.

	Oct., 1937	June, 1938	July, 1938	Aug., 1938	Sept., 1938	Oct., 1938
Capital and reserves	132.5	136.0	136.0	136.0	136.0	136.0

Total assets	2,523.3	2,514.0	2,523.0	2,513.9	2,491.3	2,485.0

The authorities were able to manage matters so that, in the aggregate, clearing bank cash remained unchanged. On the average public deposits were slightly higher in October than in September, while the emergency increase in the note circulation at the end of September meant that the circulation was also higher in October. On the other hand, the banking department was holding more securities, and so bankers' deposits were on the average much the same in both these months. One point of interest, however, emerges. The fact that both bankers' deposits and clearing bank cash remain unchanged suggests that the banks' till-money was also unaltered, and therefore that little of the emergency currency still outstanding in October was held by the clearing banks. Investments and advances also remained unaltered between September and October. Therefore the October averages simply reflect that month's further withdrawal of funds from London.

It is now possible to review banking and monetary statistics over the whole period of the crisis. Comparing average figures for July and October, while the floating debt rose by £39 millions (thus being the usual seasonal increase), tender issues of Treasury bills were reduced by £44 millions, while the departments' floating assets rose by £82 millions. So far as the Bank of England was concerned, the note circulation was £3 millions higher in October, the Reserve £3 millions down, public deposits £11 millions higher and bankers' deposits £14 millions

lower. The increase both in public deposits and in the departments' floating assets are traceable back to the Exchange Equalisation Account's gold sales, and the net result of these and also of the October increase in the note circulation was the very moderate drop of £14 millions in bankers' deposits. This last is reflected in a drop of £10 millions in clearing bank cash, while the efflux of funds from London, which occasioned the Exchange Account's gold sales, led to a reduction during the same period of £52 millions in clearing bank deposits. To complete the picture, the contraction of £44 millions in the tender issue of Treasury bills—a further counterpart to our official gold losses—is paralleled by a shrinkage of £43 millions in the clearing banks' discounts and call and short loans combined. Extraneous to the main picture is a drop of £11 millions in advances, offset by an increase of £12 millions in investments. The net result is that the clearing banks have emerged from the crisis with the loss of £52 millions of deposits and £10 millions of cash. The Bank return of November 2nd, however, suggested that the latter loss has already been made good.

The Floating Debt.—This week's revenue returns show an increase of £19.2 millions in the floating debt. There is nothing abnormal about such a movement, as the Government had heavy dividend payments to meet at the beginning of November, so much so that the statement includes a sum of £3 millions borrowed on Ways and Means from the Bank. What is of more interest is the fact that, in spite of this big increase in the total floating debt, the volume of Treasury bills issued by tender has fallen by £5 millions. It follows, therefore, that the floating assets held by the Departments have increased by £21.2 millions. This big movement superficially appears surprising, for

COMMERCIAL SERVICE

The Bank has over 300 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

THE STANDARD BANK MONTHLY REVIEW, which is sent post free on application, gives the latest information on all South, East and Central African matters of Trade and Commercial Interest.

there is no evidence of any heavy gold sales by the Exchange Equalisation Account during that week. There is, however, a possible explanation. During the September crisis the Exchange Account made heavy purchases of Treasury bills originally issued by tender. These bills have since been maturing, and as they mature they are automatically replaced by tap issues of Treasury bills direct to the Exchange Account. To that extent the recent growth in the Departments' floating assets is only the outward and visible sign of what happened last September, and this conversion of tender Treasuries into tap bills does not in itself directly affect the money market. Actually the increase in the floating assets of Public Departments (which includes the Exchange Account) since September 24th is £56 millions. Part of that represents the early October gold losses, but a substantial portion must consist of the conversion of open-market purchases made during September. On the other hand, if all this week's offer of tender bills is allotted, the tender issue will increase. This, coupled with the belief that the September special purchases were as far as possible confined to October maturities, suggests that the conversion process may have reached its end.

* * *

Indirect Exchange Control.—During the last few weeks the authorities have reverted to their favourite method of controlling the pound indirectly through gold operations. The support of sterling through the sale of dollars was still in evidence from time to time, but it was the exception rather than the rule. For years the Exchange Equalisation Account has aimed at managing sterling as far as possible through purchases and sales of gold, but

during the critical months of September and also during part of October the large volume of the selling pressure made it necessary to operate also in the foreign exchange market. Now that conditions in the exchanges are calmer, it is no longer necessary as a rule to operate in dollars. The extent to which the authorities prefer to operate in gold rather than dollars is indicated by the fact that while they have allowed the sterling-dollar rate to fluctuate within a fairly wide range they have kept the price of gold relatively stable in relation to the American shipping parity. They were reluctant sellers of dollars, so that whenever there was a large demand the sterling-dollar rate moved against the buyers. On the other hand, they were willing sellers of gold, so that in spite of a large demand which arose at the fixing on many days the price of gold remained in the close vicinity of the American shipping parity. Consequently, on many occasions when banks had to make large transfers to New York, they preferred to do so by buying gold rather than by moving the rate against themselves by purchasing dollars in the foreign exchange market. The preference of official quarters for the indirect method of exchange control is easy to understand. Evidence of official support in the foreign exchange market is apt to give rise to a wave of pessimism and tends to accentuate the selling pressure. On the other hand, the official selling of gold does not convey such an unfavourable impression; since the demand for gold may come from hoarders or from arbitrageurs and it is not therefore a clear-cut indication of weakness of the pound. At times of sweeping pressure, however, the technical limitations of indirect control make it necessary for the authorities to revert to direct control.

MONEY MARKET NOTES

Foreign Exchanges

THE London foreign exchange market has had an inactive week, but there has continued a persistent demand for dollars which has had to be countered by fresh official intervention. The week's growth in the volume of business in the bullion market bears witness to this, for most of the gold dealt in has come out of official resources. Pending the announcement of the French Government's new financial proposals, there have been all kinds of rumours in Paris, including a fresh devaluation of the franc, and even a depreciation of sterling to \$4.50 as part of the Anglo-American Trade Agreement. The bare recital of these rumours places them in their proper perspective, but they suffice to explain a fresh movement of funds out of francs and into dollars; and, as usual, sterling as well as the franc, has had to bear the brunt of this

movement. There is also the possibility that Wall Street is acting as a stronger magnet to investment funds. The result is that, in spite of official support, sterling has fallen to \$4.74½. Spot francs are at Frs. 178½ and three months' francs at Frs. 3½ discount, but both these rates have been dependent entirely upon French official purchases of spot and forward francs. On Thursday the Argentine peso, reference to which is made in a Financial Note, was quoted at pes. 20.10 to the pound, which is a new high record.

The Bank Return

THE currency withdrawn at the end of the month has now returned, and the note circulation is much the same as it was a fortnight ago. The Christmas expansion is not due to begin until the end of the month.

Issue Dept.:	Nov. 10, 1938	Oct. 26, 1938	Nov. 2, 1938	Nov. 9, 1938
Gold	326.4	326.4	326.4	326.4
Notes in circulation	485.6	482.5	483.9	482.7
Banking Dept.:				
Reserve	42.4	43.9	42.5	43.7
Public Depts.	30.7	25.0	14.1	15.9
Bankers' Depts.	90.9	100.0	109.5	100.5
Other Depts.	36.1	35.5	36.4	35.5
Govt. Secs.	103.9	107.6	102.4	101.6
Discounts & Advances	8.4	4.2	10.4	11.1
Other Secs.	20.7	21.6	21.1	21.0
Proportion	26.8%	28.1%	27.3%	27.9%

There are no significant changes in the Banking Department. Government securities are lower than a week ago, so that the small amount of ways and means borrowing shown in last Saturday's floating debt statement has now been repaid. The very slight increase in discounts and advances does not point to any further use of the Czech credit. Bankers' deposits are exactly the same as a week ago.

TENOVA SOCKS stay up

Tenova socks are sock and suspender all in one piece. The band at the top, containing Lastex yarn, keeps them always comfortably up. And naturally, when the socks go to the laundry, the band goes too. For town, 3/6, 4/6, 5/6 and 7/6. For tennis, from 3/6. For golf, 7/6. For evening, 7/6 and 12/6. Obtainable from good shops for men.

TENOVA
self-supporting socks
Patent No. 323457. Reg. Design 748974

Investment

The Session and the Investor.—The new session promises to provide comparatively little of direct interest to the investor. Perhaps that is well, for at every phase of its deliberations, on defence and political issues, Parliament will have to take decisions which will vitally affect the investor's interests. The Stock Exchange during the past week has, indeed, been quick to take its improved tone from the Prime Minister's elaboration of his policy of appeasement, from his references to improving trade conditions, and not least from his insistence on defence measures. The background at Westminster, coupled with the revival of new issue activity, has acted as a mild tonic for the Stock Exchange, which sees in the immediate future no drastic re-armament measures (and no dire threat of control, in consequence, for the gilt-edged or industrial market), and a sufficiently favourable economic atmosphere, warmed by the trade winds from the United States, to anticipate a decisive check to recession, and possibly some modest improvement. The electricity supply shareholder appears to be safe from the attentions of Parliament, at least for the time being, for the reorganisation of the industry, as contemplated by the McGowan report, is not on the fixture list. The Cotton Bill also appears, so to speak, with a question mark. The major measure, therefore, consists of the Prevention of Fraud Investments Bill, which was introduced in July and was discussed in our issue of July 30th.

* * *

As a result of the pre-view, it takes first place in the Bills of the new session. It will be recalled that Clause 9 of the original Bill appeared to threaten those (including newspapers) who followed the *bona fide* but necessarily speculative art of offering investment advice. Under the original clause, any person who made any statement which he knew, or could reasonably be expected to know, to be false, misleading or deceptive, or who made any promise or forecast which he had no reasonable ground for supposing to be likely to be fulfilled or verified, laid himself open to penalties for fraudulent inducement. Under the

new clause (numbered 10) an offender must either know that the statements, promises or forecasts are misleading, false or deceptive, or must make such statements recklessly. The new form of words, in short, makes the commission of fraudulent inducement a positive or reckless act, and obviously represents a considerable improvement, so far as the *bona fide* investment adviser is concerned, over the old clause. The new Clause 9 refers to building societies and gives the Registrar of building societies power to demand books and accounts, and to issue orders, with the approval of the Treasury, to restrain any building society from publishing invitations to subscribe for securities in the society. This clause, although its powers appear to be widely drawn, is clearly directed against those societies, fortunately few, which exploit the public by offering dangerously high returns, and provide no effective building society service in the ordinary sense.

* * *

Wall Street and Roosevelt.—A reverse for the President has always meant a gain for Wall Street. And the market, which would have been satisfied with sixty Republican gains in the House of Representatives, found itself on Wednesday reading the news that seventy-three gains had been recorded, with more results still to come. As the results came in, its spirits rose. The Dow Jones industrial average jumped over 3 points, and turnover reached 3,100,000 shares—the highest level for more than a year. Similarly, the industrial and rail indices have reached the best levels for a year or more. In fact, it would be hard to imagine a more favourable conjuncture of political and economic news for the market than has occurred this week. On the eve of the ballot, Wall Street was spurred into new high ground by the publication of the Federal Reserve Board's index of industrial production for October, which showed an advance from 90 to 95 for the month. Steel operations also revealed a further vigorous expansion. According to the American Iron and Steel Institute's estimate, operations this week are at 61 per cent. of capacity, against 56.8 per cent. last week. In other words, the entire

The Money Market

MONEY is now as easy as it was last summer, and the crisis efflux of funds appears to have made no difference fundamentally. This is because the efflux has been offset by the withdrawal of bills from the market as the result of the Exchange Equalisation Account's complementary gold sales. It is noticeable, however, that with the possible exception of the American banks, the London offices of overseas banks are again ready to lend. Bond money was obtained at ½ per cent. on Thursday afternoon, and any attempts to secure more than ½ per cent. proved abortive.

	Nov. 11, 1937	Nov. 3, 1938	Nov. 10, 1938

Others	1½-5½	1½	1½-5½
Discount Rates:			
Treasury bills	1½	1½	1½
Three months' bank bills	17½-9½	17½-9½	17½-9½

* Viz. 1½ per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity. 5½ per cent. for loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

The banks have been ready buyers of late January and early February

Treasury bills at ½ per cent., and several of the banks were ready to take early January in spite of the fact that these bills only mature just after the end of the year. Discount houses are charging ½ per cent. for bills coming from their clients, but the effective rate in the market is no better than ½ per cent. Present indications are that this ease will continue until early December, when the banks are likely to reduce their purchases of bills in preparation for the end of the year.

*

The Bullion Market

THERE has been a fair demand for gold, particularly on Wednesday and Thursday. It was mainly of an arbitrage character, the bulk of it being against sales of dollars. There was a small amount of arbitrage against the belga, but this business has all along been restricted by the narrowness of the market in belgas. There has been some Continental demand for forward gold which has to be covered by spot purchases, but this is probably because the premium on forward gold is less than it was just after the crisis. The authorities have been the chief sellers and have

kept the premium steady at one half-penny.

* Above or below American shipping price. This week's calculations are based on a temporary parity, in which the war risk rate is taken as 1s. 3d. per cent.

† At fixing.
The New York price of silver remained at 43 cents per ounce -999 fine during the week.

In the silver market Eastern selling has been balanced by the normal American trade demand and also by Continental buying, possibly for coinage purposes. The results of the American elections are, if anything, a bear point for silver, but only on the ground that they are not likely to lead to a recrudescence of the silver purchasing policy. India has been operating both ways this week, and her attitude for the immediate future is uncertain.

industry now appears to have reached the pay point. The elections appear to have achieved one of the results most keenly desired by the market—the return of a sufficiently vigorous opposition to Congress to curb the New Dealers, coupled with the control of sufficient States to provide valuable assistance to the Republican Party in its preparations for the Presidential election in 1940. At the same time, of course, Congress will continue to spend with a liberal hand, assisting the forces of recovery which already have taken firm root. Whatever the elections may hold for 1940, there is no doubt that, on the shorter view, they are entirely to Wall Street's liking.

Railway Earnings Estimates.—It is doubtful whether the Sunday press will make the same splash with this week's traffics (which show a total fall of £82,000, of which £73,000 is due to the L.M.S. alone) as it did with last week's depressing loss of £254,000. Taking the two weeks together, it is possible to detect a very slight tendency towards improvement in recent returns, though it cannot affect the year's earnings in any measurable degree. The aggregate loss of traffics for the 44 weeks of the current year amounts to £5,103,000, of which £2,282,000 has been suffered by the L.M.S., £1,736,000 by the L. and N.E., £922,000 by Great Western, and £163,000 by Southern. On this showing, the railway unions chose an unfortunate time to present their claim for increased wages and improved conditions, which they estimate to cost £6½ millions in a full year. To this, the companies have replied that, if the complete year's figures for 1938 are no more favourable than they promise to be at present, they will seek some relief in labour costs. This statement has been received with satisfaction on the Stock Exchange, where home rail stocks have been far from cheerful for several weeks past. Actually, the weekly traffic comparisons since the beginning of October have been less serious than the bald figures suggest, for until that date the true fall in traffics was masked by the increased revenue due to the basic 5 per cent. increase in charges which came into effect in October, 1937. And the potential earnings position, though it cannot be described as favourable, is not so serious that it endangers the guaranteed stocks, which have not escaped the investor's suspicion recently.

As a general guide to earnings possibilities, it may be useful to bring up-to-date the estimates published in *The Economist* of August 13th. We have computed the potential fall in gross receipts for each line during the second half-year, on the basis of the recorded fall for thirteen weeks, and an estimate for the last quarter, based on the traffics of the last five weeks. For a measure of increased costs, due to prices of stores (whose rise should be flattening out) and higher wages (which affect the year's comparison only for July and half of August), we have taken a flat half of the increases recorded in the first half of the year, which gives a somewhat smaller estimated burden for L.M.S. and Great Western than our previous basis. The reduction in direct costs due to the lower volume of traffic is taken at one-third of the gross reduction in receipts, without any allowance for the effect of increased charges. The resultant of these figures, added to the reduction in net revenues for the first half of the year, gives a total estimated reduction for the full year, subject to changes in net receipts from ancillaries for the second six months. The results are given in the next column.

	(Amounts in £000's)				
	Second half-year			Reduction in net revenue first half-year	Total estimated reduction, full year
	Fall in traffics (estimated)	Increased costs	Reduction in direct costs due to lower traffic volume		
L.M.S.	2,250	520	750	1,496	3,516
L. & N.E.	1,500	525	500	1,780	3,305
G.W.	775	260	260	818	1,593
S.R.	60	225	20	574	839

These estimated reductions in net receipts suggest that 3½ per cent. may be earned on L.M.S. first preference stock, but that the L. and N.E. second guaranteed dividend may only be covered with the smallest of margins. For Great Western ordinary, earnings of about ¼ of 1 per cent. are indicated, and for Southern preferred stock approximately 3¼ per cent.

Argentine Railways and the Peso.—This week's bald announcement that the Argentine Government has decided to raise the official rate for remittances from the Argentine from 16 pesos to 17 pesos to the £ came as a surprising blow to Argentine railway stockholders. Second thoughts on the decision are perhaps less despairing, for it has been reported from Buenos Aires that the new rate will not apply to railway remittances. In existing circumstances, clearly, an increase in the already heavy exchange provisions which the companies are compelled to make would have dashed all hope of improved earnings. And as we go to press it is feared that even the maintenance of the railways' present exchange arrangements might be employed to secure rebates on certain freights. Possibly the best interpretation of the Argentine Government's decision is that which links it with the desire to assist the farmer. In view of this season's bountiful crops, low prices are inevitable. The exchange fund's profits, therefore, will provide means for subsidy payments (as in 1936, though they were not used), while reduced freights would aid the farmer, at the rail stockholder's expense. The market recalls that the concession by which the Argentine railways were permitted to remit at \$15.75 to the £ in 1936 was accompanied by rebates on maize freights. Until more definite news of the new exchange arrangements is received it would be misleading to offer any estimate of its effect upon individual lines. But it is worth noting that, if the railways were to experience the full burden of the latest depreciation, the cost would be of the order of £200,000 each for B.A. Great Southern and Central Argentine, and perhaps £50,000 or more for B.A. Western, on the basis of a reasonably satisfactory freight year.

Unit Trust News.—Two new unit trusts, the cessation of business by a recently formed trust, and moves to secure a more fully representative association within the movement, with a view to introducing collective publicity—these are among the week's developments in the unit trust field. By a coincidence, both of the new trusts are of a dual purpose type. The Trans-Atlantic Unit Trust is really two trusts, for it consists of a Canadian Series and a United States Series, both of which are governed by the same general conditions. The Trust has a life of fifteen years, with an initial service charge of 6 per cent. and a semi-annual charge of 1½ of 1 per cent. In each series, the underlying securities consist of no more than ten securities (with alternative panels of three additional securities). In principle, therefore, they hark back to the fixed panel of strictly limited scope. The range of choice in the United States list, for instance, appears to be directed towards the consumers' goods industries rather than the leading capital equipment stocks. Investors Income and Reserve Trust is the latest recruit to the ranks of the "15 Moorgate" group. The unit holder has the option of holding "Income sub-units" or "Reserve sub-

units" in the trust. Both are identically constituted, and are based on an initial portfolio of 175 securities, which is subject to a limited degree of flexibility. The "Reserve" part of the trust thus earns the same yield as the "Income" part, but two-fifths of the income which is attributable to it will be accumulated in a reserve fund, at interest, for the benefit of sub-unit holders. Thus, on the basis of an opening offered price of 21s. 3d., and dividends on the underlying securities in respect of the year to September 30th, the income units would yield £5 1s. 1d. per cent., and the "Reserve" units £3 0s. 8d. per cent. plus £2 0s. 5d. per cent. gross to reserve. The management group has experienced a demand for this type of reserve facility, although, for the average unit holder, whose purchases amount, say, to £200, the annual reserve provision would amount to about £4, on the basis of recent dividends. As a whole, the movement is following precedent in pursuing an active formation policy when market conditions show promise of improvement. But there is no precedent for a unit trust ceasing business within three weeks of its formation. That is the unhappy fate of First British Mutual Fund, whose features were criticised in these columns on October 15th. Cash subscriptions for units, it is stated, have been returned in full.

Company Notes

P. and O. Dividend.—The Peninsular and Oriental board has enjoyed a reputation for conservatism among the deferred stockholders in recent years. When a shipping company which has distributed only 4 per cent. in the two previous years increases the rate to 5 per cent. and declares a 3 per cent. bonus to boot, there is obvious cause for joy in Throgmorton Street. On Wednesday, P. & O. deferred jumped 2s. 3d. to 25s. 3d. on the declaration. Until the full report is available towards the end of the month, the real explanation of this surprisingly favourable declaration must lie hidden. At first sight, it would not seem that improved shipping earnings and the reduction in Suez Canal dues would account of themselves for so spectacular an increase. But some delayed advantage from higher freights was brought forward from 1936-37. The P. & O. accounts are made up to September 30th, but the voyage accounts are struck to June 30th. Hence, in 1937, the results did not reflect to the full the improvement in liner freight rates. All the subsidiaries paid ordinary dividends in respect of the year 1936-37, although in Lord Craigmyle's words, the board did not consider it wise to "press" the allied companies for higher dividends. But he did envisage the possibility of "somewhat larger distributions" under favourable conditions.

It will be recalled, moreover, that in 1936 a special transfer from reserves enabled the company to reduce the book value of the fleet by nearly £6 millions, and the provision for depreciation from current profits has since been stabilised at £885,000. Relief from the necessity for high depreciation allocations may in part explain the company's newly-found generosity. Before reaching any premature conclusions regarding the significance of the dividend, however, it might be well to recall that on the basis of actual earnings, the 4 per cent. dividend for 1936-37 was only covered to the extent of 1.7 per cent. It was, in fact, made up of £79,888 from actual earnings, and of £103,813 from income tax refund and non-recurring miscellaneous revenue. The latest dividend decision implies an increase of £287,514 in distributable resources, towards which the increased British India Steam Navigation dividend (from 5 per cent. to 6 per cent.) would provide only £9,572. The comparison itself suggests the possibility that, as in former years, special items may have played a part in the dividend decision.

R.M. and E.D. Payments.—Excellent progress in the difficult process of winding up the R.M. and E.D. Realisation companies is indicated by this week's announcements of forthcoming distributions of 3s. 9d. per R.M. share and 8s. per E.D. share. The latter was more generous than had been anticipated, and the shares improved to 10s. 1½d., while R.M. remained steady round 7s. 7½d. The funds from which these payments are being made presumably absorbed the cash surpluses available when the companies were put into voluntary liquidation, together with the greater part of the readily realisable asset items. The remaining amounts receivable by the Realisation companies from the liquidation of concerns in the R.M. group cannot be very substantial. Most of the properties have been disposed of either by way of transfer to the Anglo-Foreign Properties, Ltd., in exchange for shares or by a direct sale. The remaining items under these heads are of quite secondary value. The present price of R.M. Realisation represents 3s. 10½d., ex the pending payment. Since there are 1,000,000 shares in issue, the remaining assets are represented by a market capitalisation of £193,750. These consist of approximately 70,000 Union Castle ordinary and 325,000 Anglo-Foreign Properties shares. The proceeds of these holdings, together with the remaining odds and ends, are an open guess; they should at least cover the ex payment price, but whether by 1s., 2s., or 3s. per share will depend largely on the course of markets in the next year or so.

The ex-payment price of E.D. Realisation is equivalent to only 2s. 1½d., representing a market capitalisation for the 1,000,000 shares of £106,250. Against this there is a holding of 70,000 Union Castle shares, 40,000 of which may be subject to a contingent claim which, it is hoped, may not materialise. There is the holding of 130,000 shares in Anglo-Foreign Properties and the coaling interests which should produce a significant amount. There are also a number of difficult smaller items. In the aggregate, this bag should certainly yield a surplus over the ex payment price. As compared with R.M., the smaller holding of Anglo-Foreign Properties may well be balanced by a higher yield from the other components. There is, in fact, no very evident reason why the ex payment price of R.M. should differ materially from that of E.D. One of the problems that remains to be decided is the manner of dealing with the Anglo-Foreign Properties holdings. The issued capital of this company is £455,000. The objection to distribution in specie is that the Realisation companies have shareholders' lists running well into five figures, so that such a course would involve a vast number of trivial odd-numbered holdings. Other technical difficulties include the disposal of the "bits and pieces" of sundry minor liquidations, and odd items of property covered by incomplete or dubious title deeds. But the liquidators, who have been so conspicuously successful to date, may be relied upon to solve such problems, as they have solved so many others in the last four years, in the best interests of the shareholders.

Electric and Musical Setback.—The semi-luxury trades, for which the E.M.I. group caters, are among the first to be affected by industrial recession, but the drop from £361,280 to £135,517 in dividends paid by the Gramophone and Columbia companies to the parent company is of unexpected severity. The long-term holder of Electric and Musical ordinary shares will feel the more disappointed since the increased diversification of the group's productive activities has brought no stability of earning

power. Technical advantages, from the spreading of production over a wider range, have evidently been of small importance compared with fluctuations of demand as a whole. In the following table we have excluded from the 1937-38 earnings, as reported, the sum of £81,937, which according to the consolidated balance sheet arose from the profit on the sale of a radio interest by an associated company, but was included in the subsidiaries' distributions to Electric and Musical Industries:—

	Years to September 30th		
	1936	1937	1938
Gramophone companies' divs.	254,446	361,280	53,550†
Other divs. and income	112,052	112,133	103,912
Total income.....	366,498	473,413	157,462†
Expenses and fees	99,709	109,449	92,933
Income tax	20,000	50,000	...
Preference divs.	21,131	20,786	20,183
Ordinary shares—			
Earned	225,658	293,178	44,376†
Paid	221,344	217,716	105,229
Earned %	10.2	13.5	2.1†
Paid %	10	10	5
Carry forward	201,872	277,334	298,418†

† After deducting from dividends received, and including in carry forward, £81,937 profit on the sale of a radio interest.

If this profit (which seems to be of a capital nature) is included, the reduced dividend is covered by earnings of 6 per cent., but on the strict basis of current revenue, less than half the distribution on the ordinary shares appears to be covered by net profits. No significant changes appear on the parent company's balance sheet, though the consolidated statement presumably reflects the Rudge-Whitworth acquisition in the rise from £866,039 to £1,119,111 in buildings and plant, while liquid assets showed a corresponding fall. The manufacture of cycles is in the course of transfer to Hayes. Consolidation of the group's competitive position and the growth of its activities should normally assist the group to offset any further fall in demand. But, with the recent profit record in mind, it would be more than usually hazardous to attempt to forecast earnings prospects for the current year. Confidence in the possibility of long-term improvement is, however, indicated by a current yield of no more than £4 3s. 3d. per cent. on the 10s. shares, now quoted at 12s.

* * *

Cycling and the Investor.—From the investment aspect, the manufacture of pedal cycles (whose products are on exhibition at Earls Court this week) is not a clearly defined industry. It accounts for part of the activities of B.S.A., Associated Motor Cycles and J. Lucas—and that of secondary importance. From the results of the specialist producers, however, it is clear that the industry experienced a severe setback last year, owing to the general decline in economic conditions, and also to increased prices and costs since the summer of 1937. It has been reported that the output of Hercules Cycle for the ten months to October, 1938, amounted to 313,000 machines, against 570,000 for the year 1937, while it is estimated that home sales of cycles in the season which has just closed fell from 1,000,000 to 800,000. Exports have fared even worse. In the first nine months of this year, 388,435 complete machines were exported—a fall of 38 per cent. compared with the corresponding period of 1937, although the figure for January-September 1936 was exceeded. In the same period the value of cycle parts and accessories exported (and this item is, if anything, more important than complete machines) was reduced by £533,000 to £1,219,000. Meanwhile, the average export price has risen to about 59s. per machine against 54s. 6d. for the first nine months

of 1937. Rising costs have coincided with falling purchasing in such markets as India, South Africa and British colonies in Africa, which together account for more than half of the export trade. Even if allowance is made for a certain amount of over-stocking in the early part of 1937, the fact remains that demand has received a considerable check.

* * *

The number of public companies whose business consists largely of pedal-cycle manufacture is small, but the following table shows the adverse trend of profits recorded in two recent reports:—

Co. (and date of Accounts)	Total Profit	Earned for Div.		Ord. Divs.		Current	
		Prof.	Ord.	Unpaid	Paid	Price	Yield

† Six years' preference dividend paid; earned for ordinary after one year's preference dividend only, 10.9 per cent. ‡ Earned for "B" participating preference and for ordinary shares. * Not shown in accounts.

The Hercules Cycle and Motor Company is not known to the investor, but it is claimed to be the world's largest manufacturer of cycles. Since the annual output of Raleigh is approaching 500,000 machines, these two firms would seem jointly to account for well over half of the British output. Raleigh Cycle (Holdings) shares have fallen sharply from this year's "high" of 61s. 3d. to a low point of 32s. 6d., but they have since recovered smartly to 44s. The company has recently formed a new subsidiary—the Gazelle Company—to compete in the cheaper market. New-Hudson has a large interest in the export trade, and the latest fall in profits is comparatively moderate. But the market has been seriously disappointed with the Enfield Cycle setback. Meanwhile, the industry remains keenly competitive. It has made good use of deferred payment sales as a means of extending its market. It may be able to encourage new demand by price reductions and the recruitment of new classes of users. Moreover, the check to export business may be reversed if world trading conditions improve. But in the absence of these compensating factors, the industry would be compelled increasingly to rely upon replacement demand. And in cycling neither mechanical change nor social prestige affects the demand for new cycles in anything like the same degree as in the motor industry.

* * *

Imperial Airways Position.—With the change of operating scale attendant upon the rapid development of Empire air services, it is difficult to attach precise significance to the fall in the residual income of Imperial Airways from £408,206 to £311,623. The development of Empire route implies that Imperial Airways receive an increasing part of its income from public funds, in the form of subsidies and mail payments, but its exact bearing upon the financial results has never been disclosed. It may be surmised, however, that the costs of extended Empire services, in their first stage, has not been fully covered by the increased subsidies and grants, which for 1937-38 cannot have been less than £750,000 in total. During the year, miles flown rose by 19 per cent., and Empire mail and freight rose by no less than 117 per cent. to 4,858,244 ton-miles. The number of passengers carried on the Empire

routes is now approaching 10,000 annually; last year's figure of 9,661 was 20 per cent. higher than in 1936-37. The position of the European services, however, was unsatisfactory, for owing to the "continued and deplorable delay in delivery of the new landplane fleet," the number of passengers carried was only maintained at 52,444. But extension of the fleet is proceeding. The consolidated balance sheet shows aircraft and payments on account at £2,043,117 against £1,014,251, a substantial rise which was financed by the issue in June, 1937, of 1,000,000 £1 shares at 30s. Fleet modernisation is also reflected in the reduction in charges for obsolescence and depreciation, as shown below:—

	Years ended March 31		
	1936	1937	1938
Profit and other income.....	383,134	408,206	311,623
Obsolescence and depreciation	226,432	195,727	150,387
Insurance.....	24,496	35,745	51,969
Tax	38,000	30,000	5,000
Fees, staff fund, etc.	33,250	12,000	12,000
Ordinary shares—			
Earned	60,956	134,734	92,267
Paid	38,069	42,126	82,738
Earned %	11.4	19.4	7.8
Paid %	8	9	7
Contingencies reserve.....	40,000	95,000	10,000
Claims recoveries	Cr. 12,228	...	Cr. 1,205
Carry forward	59,618	4,713†	5,447

† After placing £60,000 to dividend fund, which received also £90,000 from contingencies reserve.

The dividend rate is reduced to 7 per cent. by the omission of the former cash bonus, but since it is payable on the increased capital of £1,623,869 it absorbs £82,738 against £42,126. A share premium account of £424,426 now appears in the balance sheet. As for the current year, the results depend upon the speed of development of Imperial and European services, Sir John Reith's administration, and, above all, the new subsidy scales. The revised Air Estimates show that subsidies and grants of all kinds for civil aviation will amount to £1,343,000 in 1938-39, against a final estimate of £811,000 for 1937-38. But after including mail payments and grants from the Dominions, the total prospective payments to Imperial Airways for the full Empire air mail scheme (which should be largely in operation this year) amount to £2,150,000 annually. The £1 ordinary shares now stand at 25s. 9d., to yield £5 8s. 9d. per cent.

* * *

Prices Tailors Report.—The satisfactory record of this multiple-tailoring business is once more emphasised by the full report for the year to June 30th. Final profits figures closely accord with the preliminary results, discussed in *The Economist* of July 30, 1938, although the £15,000 provision to contingencies reserve has been raised to £30,000. Total profits of the operating company for 1937-38 amount to £572,576, against £521,788 in the previous year, but in the latest year they include an undisclosed adjustment for stock depreciation which is not required, whereas in 1936-37 an undisclosed charge was made to cover stock values. The precise degree of improvement, therefore, cannot be ascertained, but the disclosed recovery is offset by increased provision for taxation, and earnings available for the Trust are practically unchanged at £271,416. This represents a rate of 155.1 per cent. (actual) on the £175,000 ordinary capital, which is wholly owned by the Trust company. In addition to the contingencies provision, a sum of £10,000 is again placed to renewals reserve. The carry-forward is thus £31,416 higher at £257,831 (instead of £281,353 announced in the preliminary statement). Prices Trust Company is, of course, paying 50 per cent. on the ordinary shares, compared with 45 per cent. for 1936-37. Fixed assets now stand at £1,121,339, against £1,044,116, and Sir Henry Price's speech, which accompanies the report, shows that during 1937-38 twenty-seven new depôts were opened. The number at the end of June was 340, and this total has

since been increased to 350, according to this week's prospectus for £650,000 4½ per cent. "A" mortgage debenture stock of Prices Tailors Properties. The group has enjoyed continued progress in recent years, and Prices Trust ordinary shares stand at 35s. 7½d., to yield £7 0s. 6d. per cent.

* * *

Sudan Plantations.—A fall of 24 per cent. in the total profits of Sudan Plantations is greater than the moderate reduction in dividend had suggested. But in view of the trend in cotton prices during 1937-38, when the London spot price for Egyptian cotton averaged around 2½d. per lb. less than in 1936-37, the fall is scarcely surprising. But for the price factor, the working results for the year would seem to be satisfactory. The crop was 4 per cent. higher at 200,106 bales, for the Gezira area provided 4.53 kantars per feddan, against 4.46 kantars in 1936-37, although the area under cultivation was only slightly higher. A satisfactory improvement in yield was also reported by the Kassala Cotton subsidiary, whose total profits for 1937-38 amount to £117,601, against £135,390 for the previous year. The parent company takes into its latest accounts the sum of £26,062 in respect of the subsidiary's earnings for 1936-37, as a contribution towards its total profits of £531,429 (against £697,994). The tax-gatherer, however, absorbed the benefit of the reduction in general expenses. Profits for the past three years are given below:—

	Years ended June 30		
	1936	1937	1938
Total profits	589,509	697,994	531,429
Expenses and staff funds	198,538	213,551	203,059
Depreciation	12,018	17,451	11,247
Taxes	33,681	40,000	57,500
Gezira reserve	60,000	60,000	45,000
Shares—			
Earned	285,272	366,992	214,623
Paid	247,500	309,375	247,500
Earned %	12.0	15.6	8.7
Paid %	10	12½	10
Special credits	112,545†	13,785*	51,131†
Carry forward	374,168	445,570	463,824

* Profit on sale of investments. † From reserves against advances to tenants no longer required.

The allocation to the Gezira reserve, which is used for the amortisation of development expenditure for which no compensation will be payable when the concession expires, has been reduced from £60,000 to £45,000. The dividend is reduced to 10 per cent. by the omission of the 2½ per cent. bonus paid a year ago, but it is short-earned. A transfer of £51,131 from reserves no longer required covers the deficiency and increases the carry-forward. The balance sheet again shows a satisfactory financial position. Surplus liquid assets now exceed £2½ millions, although the fall in cotton prices has resulted in a reduction in stocks from £2,119,000 to £1,798,000. A new holding of £776,000 of Government securities appears, and, despite a corresponding reduction in cash, the latter still stands at the impressive total of £1,263,000. Provided the yield of cotton is as high as in 1937-38, the outlook for the present year is relatively good. The Egyptian Government's estimate of the new crop is 7,350,000 kantars, as compared with 10,814,000 kantars harvested last season, and this position

* * *

The Week's Company Profits.—A heavy fall in profits is shown by the reports of 48 companies issued this week (excluding six for which comparable figures are not available). The net earnings disclosed show a fall of 13 per cent. from £4,839,000 to £4,198,000, but this result is not fully representative of home industry, since the list (on page 336) includes such companies as Electric and Musical Industries, Imperial Airways, Ste Madeleine Sugar, and a number of pastoral companies. The cumulative profits total for 2,085 companies during the year to date shows a rise of 9 per cent. from £243,349,000 to £265,348,000. The week's results are discussed in preceding Notes and on page 340 under the heading "Shorter Comments."

* * *

Company Meetings of the Week.—In this issue reports of company meetings will be found on pages 347 to 349. Mr Brendan Bracken, at the meeting of *The Financial News Limited*, tilted against those who argue that practical men gain little from "technical newspapers edited by theorists." Britain's painfully practical industrialists, he

pointed out, support their own technical Press and subscribe increasingly to English financial journals. Mr Bracken commended that example to the unconverted minority of their superior British competitors. At the extraordinary general meeting of *Beechams Pills*, Mr Philip E. Hill emphasised that the company should benefit materially from Eno Proprietaries' overseas connections and from close working association. Mr Norman Holden, at the *Phoenix Investment Trust* meeting, described the geographical spread of the Trust's investments, of which 48.74 per cent. are held within the Empire. Sir Vernon Thomson, at the *London Maritime Investment* meeting, was unable to reach encouraging conclusions regarding the immediate prospects for British tramp shipping, but he emphasised the importance of world trade recovery, led by the United States. At the *Trinidad Leaseholds* meeting Mr A. W. Rogers referred with satisfaction to continued success in developing the Forest Reserve field. The need for retaining, as far as possible, the specialised labour force, despite restricted operations, was discussed by Mr D. J. Ward, of *Pahang Consolidated*. Shareholders of *Jantar Nigeria Company* were informed by Mr Percy Tarbutt that the company's proved ore reserves showed a potential profit of over £500,000, with tin at £180 and columbite based on the price under the terminated contract. Mr W. Arthur Addinsell informed *Bukit Kajang Rubber Estates* shareholders that planting rights were available in respect of 247 acres. At the *Broome Rubber* meeting, Sir Lionel Smith-Gordon reported that the standard assessment for 1938 was 2,555,927 lbs., and should be increased next year to take account of young rubber. A new block of 1,000 acres would be planted next year.

SETTLING DAYS

TICKET ACCOUNT
NOVEMBER 22 NOVEMBER 24

THE Prime Minister's hopeful references and Wall Street's optimism, have provided the incentive for the London market this week. The volume of business has not been large, but the effect of the Woolworth issue has been to liberate a good deal of miscellaneous trade, and this has provided a hum of activity. But Wall Street must take pride of place, both for its intrinsic interest, and as a causal factor in the London market.

Interest in the gilt-edged market showed a slight improvement, although price movements remained restricted. Some institutional support was apparent at first, and once the Dartford election result had been digested, scattered selling subsided, and the firm tone was restored. In mid-week, the redeemable issues provided the feature, with rises of up to $\frac{1}{8}$. Subsequent movements were small on balance. Dominion issues opened firm, but interest was not maintained.

In the foreign bond market, Czech issues rose further, and German issues held an early improvement. Brazilian and Greek bonds were still affected by the lack of any indication of resumed service. Japanese bonds, after a good start, turned dull later.

*

The week-end Press devoted gloomy attention to home rail stocks, which opened badly. Subsequently, quiet demand led to an improvement, and after the better traffics had been published Southern issues—particularly the preferred stock—led the market in a

further recovery. Some estimates of current home rail earnings are given on page 332. Argentine rails opened firm, but the shock of the further depreciation of the peso hit all classes of stocks hard. On the hope that the companies would be exempted from the new rate, however, an appreciable rally occurred on Wednesday.

The tendency in the industrial market was towards firmer prices. As in recent weeks this was marked more by an improvement in sentiment than in actual trading, although business broadened a little in mid-week. Iron and steel shares were firm if unexciting. Thornycroft was particularly strong on the good report, but South Durham fell on the dividend cut. Unspectacular advances also occurred in the engineering section. Coal shares continued firm, Shipley being favoured. Electrical equipment shares were irregular, but Lancashire Dynamo advanced further. Motors made a mixed showing, and attention was paid chiefly to makers of the heavy vehicles, such as Dennis, A.E.C., Leyland and Albion. While changes in aircraft shares were small, prices remained firm. Imperial Airways were unaffected by the report. Textile shares tended to improve slightly, after early weakness. There was some recovery in brewery prices, partly on provincial support. Provision and catering issues were firm, with some gradual improvement in Tate and Lyle on dividend hopes. The tendency was rather irregular in the stores group, where the new Woolworth shares were the centre of interest, reaching at one time 1s. 1 $\frac{1}{2}$ d. premium. After an uncertain start, miscellaneous issues hardened, E.M.I. recovered towards mid-week. Ranks were dull before the new issue, and were unaffected by the open-

ing of the lists, though there was some activity in Philip Hill and Partners. The new Ranks shares opened, rather anomalously, at 3d. discount-par, but improved later. Early in the week P. and O. deferred rose on dividend hopes, reacted, and then went ahead smartly on the doubled distribution, though a further rise on Thursday was not consolidated. On the repayment announcements (discussed on page 333) E.D. Realisation rose 1s., but R.M. Realisation lost ground.

Oil shares showed a little all-round improvement, though it was not till mid-week that turnover increased and investment demand was confined less narrowly to the leaders.

Although it is not expected to make any definite movement until the Restriction Committee's quota decision is known, the rubber share market stirred very slightly on Wednesday, in the hope that the Republican gains in the elections would give an impetus to American recovery. The tendency in tea shares was variable, and the volume of trading remained at a low level.

In the mining market prices followed the general tendency, and improved after a dull start. A slight improvement in turnover, however, proved only temporary. Kaffirs were quiet, but quite firm, with a certain amount of local investment buying. In general, the lead came from Paris, as in the previous week. Central Mining fell on the interim dividend cut, and helped to subdue other shares. There was a little Cape support for the developing mines, especially Marievale. Rhodesian coppers were not specially active, but quotations hardened, Paris buying helping in mid-week. Base metal shares improved as the week progressed, but remained uninteresting.

New York

GAINS of 2½ points in the Dow Jones industrial average before the polls and of over 3 points after, provide a sufficient indication of Wall Street's economic and political optimism. On Monday, economic indicators, including the 5 point rise in the Federal Reserve Board index and the 4 per cent. jump in steel operations, dominated the market. On Wednesday, the striking success of the Republican party took the turnover up to 3,100,000 shares. U.S. Steel and Bethlehem both jumped \$3½, while Du Pont gained over 4 points. Rail stocks were also active, reaching the highest levels for a year. Despite the caution of some investors, who appear to question whether the 50 per cent. increase in steel operations during the last two months is not unduly exuberant, the general view, both of investors and "chartists," is favourable. The market continued active on Thursday, with turnover amounting to 2,180,000 shares. Wednesdays prices, however, tempted a certain volume of profit-taking, and the Dow Jones industrial average declined from 158.08 to 157.47, although rails were maintained. The eve of the Armistice Day holiday appears to have accounted for this temporary lack of decision.

Capital Issues

THE success of last week's offer of Woolworth shares has generated new interest in the capital market. It has been followed this week by the offer of 2,800,000 shares of 5s. in *Ranks, Limited*, at 17s. 6d. per share. This offer, though not so enticing to the "stags," received very satisfactory support. The growth of the undertaking and some considerations affecting the shares are discussed in a leading article on milling shares on page 326. The issue of further loan capital by *Prices Tailors Properties* takes the form of £650,000 4½ per cent. "A" debenture stock, at 98. This stock ranks as a first charge on properties valued at £803,561 and, after the existing 4 per cent. stock, as a floating charge on the remainder of the assets. The operating company has taken a lease of the properties on long-term, and its profits (from which rentals are payable) afford adequate cover for the service of the stock on the basis of recent years. Statements for information only have been published by *British Electric Resistance Company* and *Madras Electric Supply*, which has placed a line of 4½ per cent. notes.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

Industry and Trade

The Spindles Board.—The second annual report of the Spindles Board, published this week, covers the year ending in September, 1938. At the beginning of that year the cotton industry was more prosperous than at any time since the great depression, and barely 8 per cent. of the spindles in Lancashire were standing idle. At the end of that year the severe decline in exports and the shrinkage in home demand had brought the level of activity in the cotton industry to barely two-thirds of its estimated capacity, which had been reduced, through the operations of the Spindles Board in 1937, by the equivalent of about 3,250,000 mule spindles. During 1938 the Board has acquired, or agreed to acquire, a further 1.3 million spindles. The total of 4.5 million spindles thus bought by the Board represents about 11 per cent. of the equivalent mule spindles in the industry in September, 1938, and about one-third of the 14 million equivalent mule spindles which were standing idle at the same date. As there seems little possibility of a substantial revival in the exports of cotton piece-goods, the extension in August of the life of the Spindles Board for a further year was clearly a sound step. Possibly, by the time these provisions of the 1936 Cotton Spinning Industry Act

lapse in September, 1939, the industry may have put in hand more drastic schemes of reorganisation; the King's Speech, however, did not forecast any immediate legislation by the Government.

* * *

Improved Rayon Prospects.—During the last three months the prospects of the rayon industry in this country have decidedly improved. Although output in September was approximately equal to that in July, consumption had increased sufficiently to exceed, for the first time in many months, the current level of production, which is still, however, considerably below the maximum level of recent years. Trade in this country was seriously affected by the international crisis at the end of September, and even now buyers are still reluctant to commit themselves far ahead, while the export trade remains difficult. But the improving trend of domestic consumption is making itself felt and has been reinforced by a similar trend in the United States, where producers' stocks of yarn fell from a level nearly equal to four months' consumption in June to just under two months' consumption in September. The index of daily deliveries of rayon yarn, compiled by the Textile

(Continued from page 337)

acquired. Issue taken by Philip Hill and Partners at 17s. 3½d., including expenses. Lists closed 9.1 a.m. November 9; considerably oversubscribed.

BY STOCK EXCHANGE INTRODUCTION

British Electric Resistance Company.—Issued capital 500,000 2s. ordinary shares. Electrical equipment makers. Total assets £58,860. Owns also capital of Electric Products, Ltd. Combined profits before depreciation, bank interest, etc.: 1935-36, £8,791; 1936-37, £15,549; 1937-38, £17,242.

Madras Electric Supply Corporation.—Particulars of issue of £100,000 4½ per cent. registered notes, redeemable at par October, 1948, or from 1947 on notice. Messrs. Cohen Laming Hoare take issue at par less a 1 per cent. commission, and pay £425 expenses.

UNIT TRUSTS

Trans-Atlantic Unit Trust (Canadian Series and United States Series).—Managers, Unit Investments, Ltd. Life, 15 years, 10 securities in either series, with three further permitted securities in each case. Service charge, 6 per cent. (purchase price adjusted to 3d. up); annual charge, ½ per cent.

Investors Income and Reserve Trust.—Managers, Security Trust Managers, Ltd. Cumulative trust; 21-year life. Income sub-units and reserve sub-units (both based on same portfolio of 175 securities, and interchangeable by holder). Reserve part of Trust retains ⅔ for reserve, invested in Government stocks, etc., and accumulated, and from which holders may withdraw in cash. Initial service charge, 5 per cent. (price adjusted to 3d. up). Semi-annual charge, ⅓ per cent.

PRIVATE PLACINGS

Metropolitan Electric Supply Company.—This company has placed privately a further £750,000 3 per cent. debenture stock. From January 1, 1939, this will rank *pari passu* with existing £1,000,000 3 per cent. debenture stock.

SHORTER COMMENTS

Company Results of the Week.—A small rise in trading profits and the receipt of nearly £13,000 more from subsidiaries have raised **BRISTOL UNITED BREWRIES** net profits from £97,855 to £104,992. **BRISTOL BREWERY GEORGES AND COMPANY**, however, report trading profits of £325,832 against £332,698, while the increase in taxation resulted in a further—but moderate—reduction in net profits. Dividends and interest received by **DAILY MAIL AND GENERAL TRUST** fell in 1937-38 by £77,000, and the tax-free dividend has been reduced from 11½ to 8½ per cent. The majority of investment trust results show small declines in net profits. Companies associated with the pastoral industries have been severely affected by the fall in wool prices as compared with 1936-37 and by drought conditions in certain parts of Australia. **DALGETY AND COMPANY** are reducing their dividend from 8 per cent. to 6 per cent.; the report points out that Australian wool sales in 1937-38 were valued at £A44,045,757—a fall of £A16,506,815—although net production was higher. Similarly **AUSTRALIAN MERCANTILE LAND AND FINANCE COMPANY** have earned £52,000 less, at £66,232. **GOODE DURRANT AND MURRAY** are at present unable to pay off any further dividend arrears. **PATERSON LAING AND BRUCE**, however, report trading profits of £32,351 against £25,982. Production by **STE MADELEINE SUGAR COMPANY** in 1937-38 was affected by the strike, and fell from 53,773 to 43,872 tons, while profits have been further affected by a drop in the average f.o.b. sale price of sugar from £10 5s. 7d. to £9 19s. 3d. a ton. Net profits are in consequence less than one-tenth of those recorded for 1936-37. **JOHN I. THORNYCROFT** net profits are nearly £60,000 higher at £160,006; it is reported that the marine motor and motor boat sales (of which 68 per cent. were for export) were 60 per cent. higher, while sales of motor vehicles also increased. A sharp improvement in profits is shown by **BOULTON PAUL AIRCRAFT COMPANY**; total profits for the 9 months to July 31, 1938, at £50,766, are more than double those earned in the previous full year. Satisfactory progress is also recorded by **ARMSTRONG SIDDELEY DEVELOPMENT**, whose net profits are £592,611 against £532,929. **S. SMITH AND SONS (MOTOR ACCESSORIES)** trading profits were nearly £20,000 higher, but owing to increased taxation, net profits amount to £289,856 against £306,297. Net

earnings of **CRABTREE ELECTRICAL INDUSTRIES** show a decline to £91,203 for the latest year, against £103,084 for the previous 11-month period. The subsidiary, **J. A. Crabtree and Company**, made trading profits for the year to July 31st of £169,150 against £200,147. **JOSHUA HOYLE AND SONS** have experienced a setback, but a 5 per cent. dividend is paid for the year, against 2½ per cent. for the half-year during which the scheme of re-organisation became effective.

MISCELLANEOUS

Modder. Deep.—Liquidators' report for six months to September 30, 1938, states that fourth distribution of 6d. per share was declared during period, making 2s. 9d. to date. Profit for six months, £34,493. Surplus of cash, etc., over liabilities carried forward is £113,524.

Daily Mail and General Trust.—Profit for year to September 30, 1938, £268,968 (against £326,592). Ordinary dividend and bonus reduced from 11½ per cent. tax free to 8½ per cent. tax free; forward £111,673 (£120,934). Surplus of £29,856 on investments sold during year added to investments reserve, making total £920,527.

Edmundsons Electricity Corporation.—The operating results of the group in October, 1938, as compared with October, 1937, show an increase of 14 per cent. of units sold.

S. Smith and Sons (Motor Accessories).—Net profit year to July 30, 1938, £220,493, a decline of £29,892. Preferred ordinary dividend 21 per cent. for year and deferred dividend 50 per cent. for year as before. To general reserve £25,000 (£36,000); to patents £10,000 as before; to research, etc., account £27,000 (£25,000); carry forward reduced from £87,421 to £82,291.

John I. Thornycroft and Company.—Net profit year to July 31, 1938, £160,006, compared with £109,423; preference dividend £12,000 (£72,000 for six years); preferred dividend £18,750 (nil). Ordinary dividend 8 per cent., absorbing £24,000; to reserves £100,000 (nil); carry forward raised from £44,200 to £45,456; marine and motor boat sales rose by over 60 per cent.

South Wales Aluminium Company.—Negotiations have been completed for erecting a new aluminium works at Resolven, Vale of Neath, Glam. When completed, works will provide regular employment for 600 men. The company was promoted by Swiss interests in association with the British Aluminium Company and the Aluminium Company of Canada.

(Continued on page 354)

Economics Bureau, nearly doubled between June and July, and reached a record high level in August and September. Some, though not all, of this increase in deliveries must be ascribed to the rush of consumers to cover their requirements at the first sign of higher prices, which had been considerably reduced during the recent depression. But in both the United States and the United Kingdom, whose rayon industries are closely linked, the long-delayed improvement in consumption has at last materialised.

* * *

Fall in Unemployment.—The latest returns of the Ministry of Labour, which refer to October 17th, show that the number of insured persons unemployed fell by 18,000 between September and October, though there was an increase in the number wholly unemployed. The exchange of employment books in July has revealed that the total number of insured persons aged 16 to 64 in employment was then about 50,000 more than the Ministry of Labour had estimated. Consequently, the estimates of employment for the past year will have to be revised. In addition, the Ministry has now included, in the number of insured persons employed, 839,000 agricultural and domestic workers previously excluded; these have been excluded from the table here given in order to obtain comparable figures for our index of employment. On this

* Method of counting unemployed changed in September, 1937.

basis, our index (adjusted for seasonal variations) which rose by half a point between July and August, has remained unchanged during the last three months. Our index of unemployment, which is unaffected by these revisions, fell by one point between September and October; the seasonal decline in activity in the building, hotel and distributive trades has been more than counter-balanced by improved employment in the cotton, coal, iron and steel and motor vehicle industries. Compared with a year ago, however, the number of unemployed persons has increased by 442,000.

* * *

Chinese Exports of Tin.—We commented in last week's issue of *The Economist* on the probable effects of the latest Japanese conquests on the world markets for wolfram and antimony. South China is also an important supplier of tin, of which 6,937 long tons were exported in the first nine months of 1938. This level of deliveries shows a slight falling off from that in the corresponding period of 1937, but, on the other hand, the quantity of Chinese tin afloat on October 31st amounted to the very high figure of 1,299 tons, compared with 886 tons at the same date in 1937. As the centre of the Chinese industry

is in the province of Yunnan, in the extreme South-West of China, the trade in tin has hardly yet been affected by the Sino-Japanese war. Further, as Yunnan is within reach of the railway to French Indo-China and of the road to Burma, exports of tin may not be as much affected by the capture of Canton as that of other products. Even if Japan did eventually occupy the tin-producing areas, it is unlikely that the world market would be much affected. Japan is a heavy importer of tin from the Straits Settlements, from which extra supplies would be available for the rest of the world if Japan mobilised for her own use the Chinese exports.

* * *

Slump in Sheep.—Apart from the weather, sheep farmers had little to complain about during 1937. But since the beginning of the present year both lamb and fat sheep prices have fallen considerably below the levels attained in 1937. According to the Agricultural Market Report, lamb prices in the summer were 3d. per lb. and those of fat sheep 3½d. per lb. lower than in the summer of 1937, though the decline in prices seems to have been checked in recent weeks. Farmers have, as usual, ascribed the fall to an increase in imports, but with little justification, as the table below shows:—

BRITISH IMPORTS OF MUTTON AND LAMB

	Mutton		Lamb	
	1937	1938	1937	1938
1st quarter	233	301	1,415	1,482
2nd "	545	479	1,637	1,463
3rd "	394	498	1,146	1,208
Total, Jan.-Sept.	1,172	1,278	4,198	4,153

Further, prices of English mutton and lamb on the wholesale markets are at present about 1½d. per lb. lower than in 1937, while prices of New Zealand frozen mutton are barely 1d. per lb. lower, and prices of New Zealand lamb are actually a little higher than in the autumn of last year. The decline in sheep prices must therefore be ascribed largely to the increased home supplies, caused by the increase in the breeding flock and by an exceptionally low level of lamb mortality in the early months of 1938. The heavy fall in the price of wool since 1937 has also been a contributory factor in depressing the returns obtained by the sheep farmer.

* * *

The Treforest Trading Estate.—Slow but steady progress is being made by the South Wales and Monmouthshire Trading Estates, Limited. The total commitments of the company amount to about £800,000, and at Treforest and elsewhere in the mining districts some forty-seven factories have already been erected, and of these twenty-one are in active production. The main centre

of activities is Treforest, which lies between Cardiff and Pontypridd, but it has been the aim of the company and the Commissioner to disperse the location of new works as much as is practicable. Factories have been erected at Dowlais, Cyfarthfa, Llantarnam, Ynyswen, and Cwmbran. At the beginning of October the number of persons employed by these undertakings was 1,199, while in addition 862 were engaged in development work. Of the factory hands 682 (including 369 men, 227 women and girls, and 86 boys) are in employment at Treforest, 378 at Llantarnam, and 139 at Dowlais. It is confidently expected that employment will be substantially increased when twenty additional factories, now either in course of erection or projected, have been completed. The two largest installations are those of the British Coated Board and Paper Mills, covering an area of 120,000 square feet, and the Treforest Chrome Leather Works with an area of 36,150 square feet, while among the more recent projects are four factories each of 12,000 square feet. Goods in actual production include coated paper, fancy and toilet goods, steel reinforcement for concrete, dry ice, batteries, electrical switchgear, motor car pistons, roller skates and pressed steel stampings, telephone accessories, etc., all of which are helping to secure for South Wales a more diversified industrial system than it has had in the past.

* * *

Gas Consumption in 1937.—In *The Economist* for October 28th we gave a series of charts illustrating the recent development of the gas and electricity industries. While the output of electricity, as shown in one of those charts, more than doubled between 1927 and 1936, the output of gas varied very little in the decade, though there was a slight upward trend. The latest statistics for the production of gas, contained in the Board of Trade's annual return relating to authorised gas undertakings, show that this slow increase was maintained in 1937. The total volume of gas sold rose from 309,936 million cubic feet in 1936 to 316,400 million cubic feet in 1937. For the first time the total number of consumers exceeded 11 millions; the increase of 234,000 took place mainly in the class of prepayment consumers, using gas meters, although there was also a small increase in other classes. From the figures given in this annual return it is possible to calculate the volume of gas which the undertakings manage to extract from a given weight of coal. In 1925 one ton of coal provided 13,390 cubic feet of gas; by 1930 this figure had risen to 14,450 cubic feet, and by 1935 to 15,060 cubic feet, an increase of nearly 11 per cent. in ten years. In the last few years, however, this increasing efficiency in the use of coal has slowed down, and in 1937 the output from one ton of coal actually fell, though only very slightly, below 15,000 cubic feet. It would be interesting if the gas companies could provide an explanation of this relapse.

* * *

Difficulties in the Herring Industry.—The difficulties that have beset the herring industry during the last ten years are a combination of declining markets, out-dated equipment, onerous debts and acute rivalries between the local centres. The Herring Board is making valiant efforts to improve the industry's condition, but its task has not been made easier by the very poor catch of the present season. In the nine months ended in September only 514,435 cwt. of herring were landed in England and Wales, against a total of 773,874 cwt. in the corresponding period of 1937. Not only the quantity but also the quality of the East Anglian catch has been exceptionally poor, and the average value of the fish landed has fallen by more than

10 per cent. compared with the already low prices obtained in 1937. Stocks of cured herrings have increased, with the result that the Herring Board has now decided to close the curing season. Although the Scottish industry has fared somewhat better in the current season than the East Anglian, the heavy falling off in receipts will increase in all districts the indebtedness of the boats. It is to be hoped that the Board, which was reconstructed by the amending Act passed this summer, will press forward with its work of developing new markets and of re-equipping the industry.

* * *

Decline in Wholesale Prices.—*The Economist's* index number of British wholesale prices recorded a moderate decline during the past fortnight. The complete index has fallen by 1.1 per cent., and the primary products index by 1.3 per cent. American wholesale prices, on the other hand, remain firm. The complete Irving Fisher index number was unchanged during the week ended November 2nd, while during the past fortnight there has been a fractional rise in *The Economist's* index number of American primary products prices. There has been a slight drop in French wholesale prices.

The Economist INDEX
(1927 = 100)

	Sept. 18, 1931	Nov. 3, 1937	Oct. 26, 1938	Nov. 9, 1938
Cereals and meat...	64.5	90.6	69.5	67.3
Other foods	62.2	67.5	58.2	58.5
Textiles	43.7	62.0	54.4	53.6
Minerals	67.4	97.5	96.6	96.0
Miscellaneous	65.8	71.7	75.3	75.4
Complete index	60.4	79.7	70.0	69.3
1913 = 100	83.1	109.6	96.4	95.4
1924 = 100	52.2	68.8	60.6	60.0

Grain prices continue to fall, but the remaining food prices moved irregularly with no wide changes. There was a small but general decline in textile prices, while non-ferrous metal prices were also lower. In the miscellaneous group there were slight advances in hides and rubber.

* * *

Alcoa.—A Note on page 294 of *The Economist* last week referred incorrectly to the Aluminum Corporation of America. This should, of course, have read the Aluminum Company of America.

INDUSTRIAL REPORTS

THE improvement in the unemployment returns for October, issued this week by the Ministry of Labour and discussed on page 341 of *The Economist*, is reflected in this week's reports from industry. Better conditions are reported on all markets and orders and inquiries are increasing. The least satisfactory reports come from the coal industry, where the warmer weather has checked the demand for household coal. Both the wool and cotton textile industries are showing some improvement; unemployment declined during the past month and a greater proportion of machinery is in use. The output of steel has again increased, from 754,000 tons in September to 854,000 tons in October; the output of pig iron, which fell between August and September, rose in October by 39,600 tons to 469,400 tons.

Coal

Sheffield.—The inland market was generally firmer. The demand for household coal, which had begun to move rather more freely, was checked by the spell of unusually warm weather. Improving conditions in local industry are bringing a better demand for industrial steams. Gas coal is more active, and electricity undertakings are absorbing larger supplies. Coke demand continues poor, although slightly better than last week.

Export trade is quiet, loose steams being the strongest feature. Best hards and washed trebles are fairly firm.

*

Newcastle-on-Tyne.—The North-East market remains firm for large steam classes and certain brands of sized coals, whilst in other sections the position is fairly steady. Northumberland steam collieries are now fully employed and, apart from smalls, have very little free coal available this winter. The Durham market is improving under a better local industrial demand. Approximately 300,000 tons of gas and coking coals have been sold to the Hamburg Gas Works for delivery over next year at prices slightly below those now current.

*

Glasgow.—Market conditions show little change. Home trade is moving steadily, but export orders are scarce and business with London has not yet broadened. Fifeshire collieries are busy on contract work for Scandinavia. Prices remain about the same as last week. Outputs are well absorbed but the general position is less satisfactory than last year. Production in September, at 2,439,000 tons, was 147,000 tons less than in September, 1937. During the same period proceeds declined from £1,879,782 to £1,872,559; costs rose from £1,642,511 to £1,677,924, and profit per ton declined from 1s. 9.84d. to 1s. 7.05d.

*

Cardiff.—Business has been very quiet on the Cardiff market this week. Some inquiries have been received, but only for inconsiderable quantities, and the renewal of contracts by shipowners and other important consumers is still the subject of negotiations under the supervision and direction of the Central Council. Best large steams and

nearly all grades of sized coal are being readily absorbed, but some bituminous coals, ordinary smalls and coke continue inactive. The permit prices of the Control Board show little or no change. Shipments in the foreign and coastwise trades at the South Wales docks last week totalled 411,800 tons, compared with 426,500 tons the previous week, and 442,933 tons in the corresponding week last year.

Iron and Steel

London.—The improvement in the iron and steel markets has been maintained and there has been an expansion in business in practically all departments of the trade, says the official report of the London Iron and Steel Exchange. To some extent this is due to the requirements of the accelerated re-armament programme, but there has also been a revival in the demand for ordinary commercial purposes. The increased activity has been almost entirely confined to the home market, and overseas buyers continue to follow a cautious policy.

In the pig-iron section there has been a good demand from the foundry trades. Considerable tonnages are also reaching the steelworks and there has been a noticeable reduction in the heavy stocks which had accumulated at consumers' yards.

The demand for semi-finished steel has broadened and the works turning out this class of material have more orders than for several months past. Stocks at some of the consuming works are still unwieldy, but they are being steadily reduced and the outlook in this department has improved.

In the finished steel section, conditions are brighter and buying has become more regular. A few forward contracts are being placed, but there is still a tendency to limit commitments until the prices which will rule after December 31st have been fixed.

*

Sheffield.—The iron and steel market reflects the general trade improvement and there is a steady increase in the number of inquiries and a greater readiness to place orders. These orders are not large, but they are an indication of the better trend.

There is a fair amount of buying of foundry pig iron for early delivery, as existing stocks are being absorbed. Business is small in forge, but basic is in steady demand. The bulk of consumers of hematite are covered by contract to the end of the year, and, as existing quotations may then be revised, buying relates only to the next few weeks. The demand for special qualities shows further expansion. Finished iron is unchanged except for a slightly increased call for common and marked bars.

Business in basic and acid steel billets is improved, and wire rods show some revival.

Local industry shows a marked improvement, and a good deal less short time is being worked. Open-hearth steel production is being increased, and more furnaces are operating on stainless and the higher classes of steel. Some substantial orders from overseas are coming to hand, but the majority are from home sources.

Middlesbrough.—Whilst transactions in foundry iron for early delivery continue, makers' stocks are still falling and the rather better tone in the trade is maintained. There are now several hematite pig-iron furnaces in operation, two having been relighted this week. A good deal of the hematite in makers' yards is already sold, but delivery instructions are increasing, so that the statistical position is improved.

Producers of semi-finished steel are receiving more inquiries and more orders. Production of finished steel is increasing but the departments supplying shipbuilding material would welcome more orders. Steel plants are not working to capacity, but are better employed than a month ago. The heavy steel scrap position is unaltered.

Blast-furnace coke, owing to the increased demand, is slightly firmer, although the price is unchanged. Imports of foreign ore are on a better scale, so far, than in the previous month.

*

Glasgow.—The general improvement in the iron and steel trades is maintained. Rates of production have increased slightly and specifications received cover a wide range of sections. Sheet makers and tube makers in this district are particularly well employed, while bar re-rollers are somewhat better employed than in recent months. Sheet metal workers, machine tool makers and other manufacturing industries in and near Glasgow are working to capacity and have well-filled order books. It was announced this week that Messrs. Yarrow and Company, of Scotstoun, had secured an order for machinery and Yarrow water tube boilers to the value of some £300,000 for a new flotilla leader for the Yugoslav Navy.

*

Cardiff.—In the tinplate industry production has apparently become stabilised at the recently improved level, but shipments are increasing, and in the week ended November 3rd they totalled 6,411 tons, compared with 5,780 tons the previous week. Normal deliveries in the inland trade have been well maintained and stocks at warehouses and in vans have been slightly reduced. The heavier branches of the industry are also improving, and it is hoped that one of the idle blastfurnaces will resume operations before the end of the year. An exhaustive investigation is being made into current costs of production in order to assist the Iron and Steel Federation to determine the prices for 1939.

Textiles

Cotton (Manchester).—The quieter feeling in the market has continued. Spinners and manufacturers have received some useful orders, but leading buyers have been less disposed to purchase with any freedom. The situation in Lancashire is rather better than a month ago, but a large amount of machinery remains idle. Raw cotton markets remain slack. The American

(Continued from page 343)

Government crop estimate of 12,137,000 bales was rather less than expected and compares with the estimate of 12,212,000 bales a month ago. Larger quantities of material are going into the United States Government loan. The Egyptian Government has issued a supplementary forecast of the crop of 7,350,000 cantars, against 7,851,000 cantars at the beginning of October. The estimate was not so bullish as had been anticipated.

Demand in the yarn market has slowed down, and there is less activity in American and Egyptian counts. Conditions remain very irregular. Although the sales in piece-goods have continued to decline, a fair miscellaneous business has been done. Operations for Indian markets have been on a reduced scale. The reported terms of the trade agreement with Egypt have given no satisfaction whatever, as there has been no reduction in the duties. Some very fair contracts have again been arranged for South America, and a varied business has been done for the Dominions. Reports from the home trade have continued more encouraging. Further Government contracts are pending.

★

Wool (Bradford).—The outstanding feature of the Colonial wool trade is the remarkable steadiness of prices. The Australian clip is being absorbed well, with the home trade taking a fair proportion of the offerings. Although the cross-bred market has eased, consumption is well maintained, and wool continues to sell readily. Prices for tops are fairly steady, but merinos are slightly below what topmakers might expect in view of overseas sales. The prospects for the London sales, which begin on November 22, do not suggest any important change for either merino or cross-bred wools.

There is an improvement at the manufacturing end of the industry, and most woollen machinery is now in use. The West Riding unemployment returns are distinctly better than they were three months ago.

THE COMMODITY MARKETS

AFTER considerable hesitation early in the week, the general trend in commodity prices was upwards. Wheat improved in price on Wednesday, and the principal non-ferrous metals were also marked up. Sugar prices continued the rise begun last week; cotton and rubber prices have fluctuated within narrow limits, and show little change on the week.

In America, commodity prices also tended to rise, particularly when the election results became known. Moody's daily index of commodity prices rose from 143.4 (December 31, 1937=100) to 144.4 during the week ended last Wednesday, which compares with 144.8 a month ago.

Metals

Copper.—After last week's fall, the price of standard cash copper recovered by 17s. 6d., and thus closed on Wednesday at £46 12s. 6d. per ton. The demand continued to be smaller than of late, but the undertone of the market

remained satisfactory because holders showed no inclination to sell at lower prices. Reports from consuming centres both in Europe and the United States speak of rising orders for metal manufacture. As consumers are by no means well stocked, the continuance of this movement is likely to lead to greater purchases before long.

★

Tin.—Tin closed on Wednesday at £212 10s. per ton, a net gain of 15s. on the week. There was no change in the general position of this market. European consumers are buying regularly, and United States fabricators are showing a certain interest, although a major buying movement has not yet developed. The activity of the Welsh tin-plate mills has risen considerably in recent weeks and has now passed 50 per cent. of the potential output. In the U.S.A., on the other hand, preparations for the next canning season have not started yet, but the demand for tin has increased slightly owing to the greater automobile output. As new tin supplies are now well below current requirements, the outlook for the metal continues to be favourable, in spite of the delayed rise in American purchases.

★

Lead and Spelter.—Lead gained 8s. 9d. to close at £16 8s. 9d. per ton, while spelter gained only 2s. 6d., to close at £14 13s. 9d. per ton. Seasonal influences kept the demand at a low level this week, particularly in the case of spelter. A report not yet officially confirmed, that the lead restriction agreement has become effective, had little effect on the market.

Grains

WORLD shipments of wheat have been well maintained in the past week and have met with only a limited demand. Consequently, prices have sagged although there was a firmer tone on Wednesday and Thursday. Reports from the Argentine continue satisfactory, and harvesting is expected to start before the end of the month. The report that the United States will press exports of wheat on to the international market has had a disturbing influence on trade. Competition from cheap wheat and plentiful supplies continue to depress the maize market, and prices on the week are 3d. to 1s. 3d. per quarter lower, although American maize was rather firmer at the finish. There has been little demand for feeding barley, whose price has tended to sag with those of other grains.

Other Foods

Provisions.—Trade in butter and meat has been slow, and prices have tended to fall, although demand for chilled meat has been fair. The bacon market has been quiet, but prices have been maintained, except for the less important nationalities.

★

Colonial Produce.—Raw sugar prices remained very firm during the past week, and prices of refined have been advanced in three successive stages by 4½d. per cwt. It is now known that Japan has bought a large amount from Java. The demand at the tea auctions has been irregular and prices have tended to fall. The cocoa and coffee markets have been steady.

Fruit and Vegetables.—The warm weather has reduced the demand for potatoes, and although prices at the Borough have been maintained during the week, elsewhere values have tended to sag. The action of the Potato Marketing Board, who have raised the size of the compulsory riddle, will assist to maintain growers' prices. Trade in other lines has been slow, according to *The Fruitgrower*; supplies of cabbages were excessive, but the demand for cut flowers is improving.

Miscellaneous Commodities

Oils and Oilseeds.—Variable conditions prevail in these markets, but prices have generally moved downwards, in sympathy with those of wheat. Harvesting of the new Argentine linseed crop has begun in some districts; sales of the old crop are proceeding steadily and the exportable surplus has been reduced to about 175,000 tons. There is little demand for Egyptian cottonseed, but prices are steady on reports of reduced crop estimates. The price of linseed oil has also been maintained, but cotton oil is cheaper and is now quoted at £20 per ton ex Hull. In spite of a fair demand for oilcakes, prices have eased in sympathy with those of linseed.

★

Rubber.—Little business has been done this week, and turnover is not expected to increase until the decision of the Regulation Committee is known next week. Prices have varied within narrow limits, and the spot price closed on Wednesday at 8½d. per lb.

★

Furs.—The London autumn fur sales closed late last week in an unsatisfactory fashion, prices generally falling below recent levels. Since the close of the sale the undertone of the free market has remained erratic. The next silver fox sales will take place on November 22nd and December 12th. The next general London sales (the winter auction series) will begin on January 30, 1939, and will be preceded by a sale of Australian furs on January 26th. The following table gives the prices (per skin) of leading furs paid at the recent Hudson's Bay Company's sale, compared with the prices at the preceding sale and at the corresponding sale last year.

COMPANY MEETINGS

THE FINANCIAL NEWS, LIMITED

VALUE OF THE TECHNICAL PRESS TO INDUSTRY

MR BRENDAN BRACKEN'S SURVEY

Presiding at the forty-first annual general meeting of The Financial News, Limited, on the 7th instant, at Winchester House, London, C., Mr Brendan Bracken, M.P., the chairman, after stating that was proposed to pay a dividend of 5 per cent. on the ordinary share capital, said: We may derive some small comfort from the fact, that, despite a spate of difficulties, earnings on the ordinary share capital, before taxation is taken into account, amounted to 5 per cent.

BRITAIN'S TRADE

Referring to the prospects for 1939, the chairman said: He would not be a rash man who attempted to prophesy what may happen during the next financial year. The shocks and scares experienced during the last few months have made some persons pessimistic about the future of certain branches of Britain's trade. No intelligent person will deny that our exporters are likely to have to face competition from a new and rather ruthless character in some Central European markets. If our trade diminishes in those markets, let us not forget that we have ample opportunities of recovering any losses by building up sales in new, more stable, and wider markets.

During the past year the affairs, the much-neglected affairs, of some of the territories under British rule have been forcibly brought to the notice of the British people. Can anyone doubt that if those territories had received a tithe of the attention lavished on some of the precarious markets of Central Europe, many of our exporters could have little justification for pessimism? Surely the time has come for us to start our own trade drive instead of wasting valuable time in speculating on the ill-effects of the much-advertised trade drives of foreign States.

REASONS FOR OPTIMISM

The best way of helping our competitors is to generate pessimism. There are plenty of reasons for optimism. Even the so-called crisis has had its uses. If as a result of that recent flurry our complacency has been rudely disturbed, let us regard this development as a gain—a small gain. If energy takes the place hitherto occupied by complacency in our economic life, the future of our export trade will be much brighter. Perhaps we needed a good shaking up. We certainly got one. It will benefit us greatly if it induces us to pay more attention to our own vast and untapped territories, and to other markets available to reasonably priced British goods. This is the measure of the opportunities offered us. It is indeed a great measure. And let us remind pessimists that a British trade drive will be advantaged by economic, financial, and industrial resources which give the envy of our competitors.

If good bootmakers never cease to say that there is nothing like leather, we, as publishers of economic and financial papers, emulate them by saying that there is nothing like the service those papers offer to all engaged in industry, finance, and trade. It is sometimes said by unconsidering persons that practical men gain little from technical newspapers edited by theorists. The best answer to this argument, if it can be called an argument, is that Britain's painfully tactical industrial competitors are admirable supporters of their own technical papers and are also subscribing in greatly increasing numbers to English economic and financial journals. Our papers have any thousands of subscribers in foreign countries, and we commend their example to an unconverted minority of their superior British competitors. The services offered by the leading English economic and financial papers are essential to enterprising industrialists and advisers. Shareholders can help us by broadcasting these facts.

We regret that, owing to a printer's error in the report of the Meeting of THE CONSOLIDATED AFRICAN ELECTION TRUST, LIMITED, in our issue of November 5th, the title appeared incorrectly as CONSOLIDATED AFRICAN SELECTED TRUST, LIMITED.

LONDON MARITIME INVESTMENT COMPANY, LIMITED

DIFFICULT YEAR FOR SHIPPING

SIR F. V. THOMSON'S REVIEW

The forty-first annual ordinary general meeting of London Maritime Investment Company, Ltd., was held, on the 8th instant, at Winchester House, Old Broad Street, London, Sir F. Vernon Thomson, Bt., K.B.E. (chairman and managing director), presiding. The secretary (Mr O. A. Hall) having read the notice convening the meeting and the auditors' report.

The chairman said: Gentlemen, the directors' report and statement of accounts for the year ended September 30, 1938, having been circulated to the stockholders some days ago, they will, I hope, be taken as read. (Agreed.)

The net profit for the year was £33,541—about £3,500 less than the preceding year—and with the £12,102 brought forward from last year there was then available £45,644. After payment of the dividend upon the £500,000 5 per cent. cumulative preference stock, the directors recommend a dividend upon the £500,000 ordinary stock of 4 per cent., less income tax, for the year, and that the slightly increased balance of £12,707 be carried forward.

The company has no debts, debenture or otherwise, and has substantial cash resources. The accounts, read in conjunction with the report, show in the clearest possible form the position of the company.

VALUATION OF ASSETS

A valuation of the company's assets as at September 30, 1938, shows a depreciation of about 34 per cent. Fluctuations in prices are inevitable in these turbulent times, but this depreciation is mainly due to one large investment, of which stockholders know, formerly regarded almost as gilt-edged among industrials, the market price of which has fallen seriously in recent months. Since September 30th, however, the Stock Exchange value of that investment has risen considerably, with the result that, if a valuation of the investments were made today, they would show a depreciation of about 25 per cent.

Since becoming chairman of this company I always had in mind the old saying about having "too many eggs in one basket," but the board considered it was an excellent investment, as it undoubtedly has been for many years, and it would have been difficult then to find an equally good one. We hope the position will be restored.

PROSPECTS FOR SHIPPING

While we expect that the reports probably from most tramp shipping companies for the year 1938 as a whole will not be bad, that is principally because shipping in the early months of the year was still benefiting from the aftermath of the better conditions of 1937. For the last few months, however, the freight markets of the world, upon which tramp shipping depends, have deteriorated to such an extent that they are now mostly unremunerative, and many ships are now laid up. The outlook for British tramp shipping in the immediate future is far from encouraging.

The volume of world trade in 1938 seems likely to be nearly 10 per cent. less than that of 1937, and the fall in the prices of primary products like wheat, together with the lack of confidence among merchants arising from the international situation, are important adverse factors in any estimate of international trade prospects. Upon the other hand, trade in the U.S.A., where the downward movement commenced in the autumn of 1937, is now improving. It is much to be hoped that the recent downward trend in international trade will soon be reversed, having regard to the national importance to Britain of the export trades.

If there are any questions I should be glad to answer them as far as I can.

I now beg to propose: "That the report and accounts for the year ended September 30, 1938, as submitted, be received and adopted, and that the dividends as recommended therein be declared and paid."

Mr George M. Dodd seconded the resolution, which, in the absence of questions, was carried unanimously.

DIRECTORS' REMUNERATION

The chairman: The remuneration of the board of directors was settled by a resolution passed at the annual general meeting of the stockholders in 1914 at £600 per annum, and a further sum of £100 per annum for every sum of £100,000 capital for the time being paid up in excess of the then capital of £350,000. Since 1920, when the

capital was increased to £1,000,000, fees of £1,250 per annum have been paid. Recently doubts have been raised by the auditors as to whether upon the proper construction of the resolution the fees should be £1,200 or £1,250 per annum, and the directors now invite this meeting to confirm the construction hitherto put upon the resolution, namely, that these fees should be calculated upon a *pro rata* basis for increases of capital which are not multiples of £100,000.

Accordingly I propose: "That, for the purpose of removing doubts, it is hereby declared that the resolution passed at the general meeting of the company on November 10, 1914, shall be read as if the words 'a further sum in the proportion of £100 per annum' had been substituted for the words 'a further sum of £100 per annum.'"

The Earl of Coventry seconded the motion, which was unanimously approved.

The retiring director, Mr Percy Cross, was re-elected, and Messrs Fookes, Wyatt, Williams and Hickman, having been reappointed auditors, a hearty vote of thanks to the chairman and directors concluded the proceedings.

PAHANG CONSOLIDATED COMPANY, LIMITED

RESULTS OF A DIFFICULT YEAR

The thirty-second ordinary general meeting of the Pahang Consolidated Company, Limited, was held, on the 8th instant, in London.

Mr D. J. Ward, the Chairman, in the course of his speech, said: The year under review has been a difficult one. The first five months the company was allowed to produce 80 per cent. of standard output; in the next three months this allowance was cut to 56 per cent.; then cut again for the following three months to 43 per cent., and finally for the last month of the financial year to 25.5 per cent., with 7.6 per cent. for the Buffer Pool, and the tin price fell from £263 per ton in August, 1937, to almost £190 in July, 1938, and that is why our mines profit showed such a large decrease in comparison with the previous year.

We propose to pay the balance dividend on the preference shares, and 10 per cent. on the ordinary shares, making 20 per cent. for the year, and an extra 8 per cent. to the preference shareholders to which they are entitled.

The rapidity in the decline in the price of tin and the severe cuts in the rate of production allowed have made it a difficult year for the management, especially for a company engaged in lode mining. We have a large specialised labour force built up gradually since the slump of 1931, and our policy has been guided by our desire to retain this force, which, if dispersed, will take a long time to recreate. With this object in view, export rights of other mines have been purchased for 388 tons, and, when these rights became unobtainable at an economic price, it was decided to take advantage of the regulation under the Tin and Tin Ore (Restriction) Enactment to carry a stock of tin ore.

It is the intention of the board to continue the building up of stocks to the maximum figure permitted as long as restriction is retained at the present rate and rights are unobtainable. I regret to say that, owing to our heavy overhead charges and the present severe restriction, combined with the inability to export our stock, profits are not, at the moment, being earned.

SATISFACTORY DEVELOPMENT RESULTS

The general manager's report attached to the accounts gives full information on the important development work done during the year, and as a result of this the ore reserves show a satisfactory increase over last year and are the highest in the company's history. I am happy to inform you that since the close of the financial year there has been a most promising strike on the 1,100 ft. level of the Kabang Series—the lode appears to be the end of an important ore-body and not a mere patch. On the Myah South Lode, at the sixth level and about 300 ft. north of the Simons Lode line of strike, a strong and rich lode has been found. This lode is a member of the same series but not the same lode which traverses the Myah section. These two discoveries give scope for big developments. This morning we received a cablegram from Mr Baker to the effect that the Myah main lode had been encountered on the eighth and ninth levels.

As regards the immediate future of tin, prospects have improved considerably in the last few weeks and, should the American trade revival persist, we ought to feel the benefit early in 1939 by a more liberal production allowance.

The chairman concluded with reviewing the statistical position of the industry and the Malayan position in particular.

The report and accounts were unanimously adopted.

BEECHAMS PILLS, LIMITED

BENEFITS OF ENO ACQUISITION

An extraordinary general meeting of Beechams Pills, Limited, was held, on the 10th instant, at the Hotel Victoria, Northumberland Avenue, London, W.C., to consider a resolution increasing the capital of the company to £4,000,000 by the creation of 4,000,000 deferred shares of 2s. 6d. each, ranking as to dividend from such date or dates as might be fixed by the board or by the company in general meeting, and in all other respects *pari passu* with the existing 9,600,000 deferred shares of 2s. 6d. each of the company.

Mr Philip E. Hill (chairman of the company) presided.

The Chairman said: The purpose of to-day's meeting is to increase the capital of this company by the creation of 4,000,000 deferred shares of 2s. 6d. each, of which 2,500,000 are required for the purpose of exchange for the 4,000,000 5s. ordinary shares of Eno Proprietaries, Limited. The remaining 1,500,000 deferred shares will remain unissued, but will be available should any fresh developments arise. Your directors have no intention of issuing these shares at present. My colleagues and I are very satisfied with the terms of the acquisition of Eno's, and I am confident that we shall benefit materially through Eno's connections overseas and also from the economies which we are now effecting through the close working association now being established. The immediate benefit of the transaction will be considerable, and the ultimate result should satisfy us all.

I should like to take advantage of this opportunity to say something with regard to the current year's trading. We could not, of course, expect entirely to escape the inevitable effect of the crisis upon the country's trade, particularly overseas, but we have suffered probably less than the majority of traders. Business is now definitely on the upgrade, and we shall, I am sure, all be satisfied with the result of the year's trading and the dividend you will receive when the company's financial year ends. Talking of dividends, you will, of course, receive your second interim dividend in time to do your Christmas shopping.

The chairman concluded by moving the resolution.

Mr Louis Nicholas (vice-chairman) seconded the resolution, and it was carried unanimously.

A hearty vote of thanks to the chairman concluded the meeting.

TRINIDAD LEASEHOLDS, LIMITED

SUCCESS OF "REGENT" SPIRITS

The twenty-fifth ordinary general meeting of Trinidad Leaseholds, Limited, was held, on the 10th instant, in London.

Mr A. W. Rogers (chairman of the company), who presided, said that oil profits and other revenue amounted to £948,519. That, while showing a decline of £142,000 from last year, was greatly in excess of any other previous year's figures and was regarded by the board as very satisfactory. The short fall was due to various causes, chief amongst them being a substantial reduction in the quantity of black oils disposed of as fuel cargoes and bunkers and an increase in costs. In addition, exploration and exploitation work was carried out on a more extensive scale.

An interim dividend of 10 per cent. was paid in May, and the directors now recommended the payment of a final dividend of 17½ per cent. In the year under review they had incurred capital expenditure amounting to £898,503. That expenditure had been mainly on refinery extensions, additions to power plants, tankage, shipping and distribution facilities. New records had been obtained in various branches of their operations. He was pleased to say that a feature of the year's operations had been the continued successful development of the Forest Reserve field, where exploration and exploitation results had been most encouraging.

The improved sales in the United Kingdom of their "Regent" motor spirits reflected the steadily increasing public appreciation of the value of their products. Deliveries of "Regent" diesel oil had expanded considerably as a result of the growth of the number of vehicles equipped with diesel engines. Another side of their business which also showed a substantial increase was that of aviation spirit. Regular supplies were now being delivered to the Air Ministry and to important aviation undertakings. Working results for the first three months of the current year had been affected by the fall in prices and were somewhat below the average.

Their concern stood upon a solid foundation, and their policy was one of conservatism. It was all-important that that should be so. He added that he was retiring from the board of the company at the end of the year and was happy to feel that he left it in a good position and in good hands.

The report and accounts were unanimously adopted.

PHENIX INVESTMENT TRUST, LIMITED

THE CRISIS AND SECURITY VALUES

The twenty-fourth ordinary general meeting of the Phoenix Investment Trust, Ltd., was held, on the 10th instant, at 25-31, Moorgate, London, E.C.

Mr Norman Holden (the chairman) said that the total revenue derived from interests and dividends, less income tax, trusteeship and registration fees, amounted to £22,769, compared with £22,993 for the previous year. Management expenses remained at practically the same figure, but interest on debenture stock paid and accrued was increased by £995, due to a further £57,263 4 per cent. debenture stock having been issued during the year. The net revenue was down by approximately £1,180 to the sum of £13,915 17s. 3d. After deducting the preference dividend, and again recommending a dividend on the ordinary stock at the rate of 2 per cent. per annum, they were able to carry forward £14,061 9s. 9d.

With regard to the value of the investments, there was a depreciation of 34.31 per cent. compared with 21.86 per cent. a year ago. That was the natural result of a year of almost unparalleled anxiety and shock. Looking back, they might believe that the shadow of war was behind most of those anxieties and that for the last two years the increasing tempo of hostile preparations in Europe was causing apprehension in ever-growing circles.

As to the future, the board sincerely hoped that civilised public opinion, by its obvious condemnation of war, might be strong enough to insist on settlement of all matters without the resort to or the threat of armed force, but the positions in China and Spain were not reassuring. If war was avoided and the threat of war no longer oppressed the world, they might be at the beginning of a great world recovery.

An analysis showing how their investments were spread geographically—the figures being based on book cost, and not on to-day's valuations—was as follows: British Empire, 48.74 per cent.; United States of America, 11.83 per cent.; Hungary, 2.91 per cent.; Greater Germany, 7.83 per cent.; Russia, 3.25 per cent.; other European countries, 8.01 per cent.; South America, 17.13 per cent.; and China and Japan, 1.20 per cent.

The report and accounts were unanimously agreed to.

JANTAR NIGERIA COMPANY, LIMITED

COLUMBITE POSITION

The annual meeting of Jantar Nigeria Company, Ltd., was held, on the 10th instant, at Winchester House, London.

Mr Percy Tarbutt (the chairman) said that proceeds of tin and columbite sold during the past year, including stocks on hand, amounted to £77,751, as compared with £128,776 in the previous year. The difference was accounted for as to approximately £31,000 in respect of tin and £20,000 in respect of columbite.

Shipments of columbite were 90 tons less, and, in view of the ending of the contract, no value had been placed on the stock of this commodity remaining after allowing for shipments to the date of termination. The year's results showed a profit of £17,014, and the directors recommended a final dividend of 7½ per cent., making 15 per cent. for the year.

With regard to the columbite contract, on September 29th last the buyers advised the Board of their wish to terminate it, and to do so on three months' notice instead of six months'. The company's relations with the buyers had always been of the most cordial nature, and, in view of the fact that this had been the only outlet of any extent and that the buyers were overstocked, the directors had felt that it would be policy to accede to their request. When the contract terminated on December 31st next they would have shipped a total of 1,510 tons to the buyers, and he could not conceive the position arising where they would not require further supplies at some future date, but how soon this position would arise he was unable to say.

Of the year's output of 474½ tons of tin, 392 tons were extracted from reserves, leaving the proved tin reserves at 1,695 tons. In addition, there were 1,976 tons of low grade tin concentrates proved in the Kuru III property and 6,074 tons of columbite, giving a total reserve of 9,745 tons. Taking tin at £180 per ton and columbite on the old contract price, and working on normal outputs, the present proved ore reserves showed a potential profit of over half a million pounds.

The report and accounts were unanimously adopted.

BROOME RUBBER PLANTATIONS, LIMITED

NEW PLANTING AREA ACQUIRED

The fifth annual general meeting of the Broome Rubber Plantations, Limited, was held on the 9th instant at 19 Fenchurch Street, London.

Sir Lionel Smith-Gordon (the chairman), in the course of his speech, said that the profit for the year was £19,783. The directors proposed to pay a final dividend of 4 per cent., making 8 per cent. for the year. The standard production for 1938 had been assessed at 2,555,927 lb., of which 45 per cent. might at present be exported. As from January 1st next, their standard production should be increased in respect of the young Eldred rubber. In order to avoid reducing crop too drastically or building up an abnormal stock, they had purchased licences for 72,000 lb. of rubber. They were very pleased to be able to report that the general manager found all the properties in good condition and efficiently managed on the occasion of his recent inspection. They were particularly pleased with Eldred Estate and its extensions, of which property they would remember they only took over 2,000 acres on January 1, 1936, and 1,400 acres later in the year.

The Selangor properties were reported to be in the usual good order, and there was nothing in particular he had to say about them.

In previous speeches he had told them that they had embarked on a steady replanting programme so that areas which were uneconomic might be replaced with high yielding stock. As from January 1 next new planting within limits would be permitted. In those circumstances the board had decided not to undertake any further replanting for the time being, but to supplement old areas with new rubber planted on virgin soil.

Having regard to the success of the Eldred property, the general manager had carefully investigated adjacent jungle land, and had selected a 1,000-acre block, which had been approved, and the land taken up, plus an extra 10 per cent. to cover buildings, ravines, swamps, etc. They proposed to make a start on planting in 1939.

It was not the intention at the moment to raise further capital, but when market conditions were more favourable they proposed to make an issue and invite shareholders to subscribe on a *pro rata* basis.

The report was unanimously adopted.

BUKIT KAJANG RUBBER ESTATES, LIMITED

DIVIDEND OF 8 PER CENT.

The twenty-ninth annual general meeting of Bukit Kajang Rubber Estates, Limited, was held, on the 10th instant, at 7 Martin's Lane, London.

The Chairman, Mr W. Arthur Addinsell, said in the course of his address:—The period covered by the report was a perplexing one. We commenced with an export quota of 90 per cent., but it was soon evident that consumption was lagging, and the rate had dropped to 60 per cent. by the time our last quarter was reached. It has since fallen to 45 per cent., and unfortunately there has been no proportionate compensation in price.

Making allowances for this, and the erratic trade conditions in the United States last year, we are to be congratulated that we are able to distribute a dividend of 8 per cent. comfortably covered by the year's earnings. Such matters as crop returns, the average net price realised, and other details are, I consider, indicative of efficient administration.

The planted area has been increased by 60 acres under circumstances explained at our last meeting. The International Agreement includes provision for extensions to the planted area during the next two years. The planting rights available to this company will be in respect of 247 acres. We possess 907 acres of virgin jungle within our Rengo Malay Estate in Johore, which can be utilised for the purpose. About one-half will be opened next year, and the remainder in the following year. No difficulty should be experienced in planting and bringing to maturity the total of 247 acres from available funds. This operation will provide a valuable addition of young rubber.

The crop exported to date on account of the current year is smaller owing to the incidence of restriction—a position which cannot be regarded as satisfactory from a producer's point of view. I am confident that we can rely on the International Control Committee handling the situation in the best interests of all concerned. It is gratifying that stocks in this country are falling, and the trade index in America is moving in a favourable direction—so that there is justification for anticipating better times.

The report and accounts were unanimously adopted.

Finance

GOVERNMENT RETURNS

For the week ended November 5, 1938, total ordinary revenue was £17,525,000, against ordinary expenditure of £16,046,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £200,509,000, against a deficit of £127,099,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On November 4th applications at £99 17s. 4d. per cent. for bills to be paid for on any day except Saturday of the following week were accepted as to about 44 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications for bills to be paid for on Saturday at £99 17s. 5d. per cent. and above were allotted in full. £35.0 millions of Treasury bills are being offered on November 11th.

SHORTER COMMENTS

(Continued from page 340)

Leeds Permanent Building Society.—Advances during year to September 30, 1938, were £8,054,123, compared with £8,046,192. Number of investors' and borrowers' accounts now 251,054, or 10,001 more. Over £245,000 provided for tax and N.D.C., and as interest due rose from £1,036,933 to £1,145,623, profit is down from £272,232 to £238,663. Reserve fund receives £200,000 (same), and contingencies £20,000 (£55,710). Reserves £2,158,269; total assets, £40,204,250.

Crabtree Electrical Industries, Ltd.—Total income year to October 31, 1938,

£92,624, against £105,857 for period November 21, 1936, to October 31, 1937. Ordinary dividend maintained at 17½ per cent. Carry forward raised from £17,397 to £18,819.

Ansell's Brewery Company.—Profit for year to September 30, 1938, before tax, £706,911, or after tax, £580,911. Apparent tax provision of £126,000 compares with £107,750 the year previously when profits before and after tax were £711,485 and £603,735 respectively. Year's distribution is unchanged at 17½ per cent.

Dalgaty and Company.—For year to June 30, 1938, net profits were £132,374 (against £173,043) after taxation, and exchange differences of £93,941, against

£112,469. Ordinary dividend reduced from 8 to 6 per cent. To staff fund, £25,000 (same). Forward, £117,537 (£125,162).

Joshua Hoyle and Sons.—Trading profits for year to September 30, 1938, are £138,884, against £164,542, and net profits (after £15,000 for tax and £25,000 depreciation) are £46,481, against £70,148. Ordinary dividend 5 per cent., against 2½ per cent. for previous half-year. Forward £76,751 (£56,553).

Boulton Paul Aircraft.—Earnings for nine months to July 31, 1938, £50,766, against £24,705 for previous twelve months. After depreciation, development, etc., £25,334 forward.

OIL OUTPUTS

Lobitos Oilfields, Ltd.—Output of Peruvian Company for October, 1938, is 28,981 tons.

Trinidad Petroleum Development Company, Ltd.—Output for week ended October 22, 1938: 56,560 barrels. Total output, week ended October 29, 1938: 55,495 barrels.

Venezuelan Oil Concessions.—Total output week ended November 5, 1938, 1,356,685 barrels.

Tampico Oil, Ltd.—The total production from the company's properties in Mexico in October, 1938, was 3,853 barrels, in respect of which the royalty due to Tampico Oil, Ltd., was 289 barrels.

British Controlled Oilfields, Ltd.—Total output, week to November 5th, 1938, 11,884 barrels.

Trinidad Leaseholds, Ltd.—Oil produced during October, 54,528 tons; oil purchased during October from other companies, 65,241 tons.

Trinidad Petroleum Development Company, Ltd.—Output, week to November 5, 1938: 56,352 barrels; output, October, 1938: 246,503 barrels; deliveries, October, 1938, including purchased oil: 288,143 barrels.

The Attock Oil Company, Ltd.—Output October, 1938, 44,045 barrels.

Trinidad Consolidated Oilfields, Ltd.—Output for October, 66,902 barrels. Well No. 169 came into production on October 24th at the rate of 150 barrels per day.

The Trade Agreement

AT long last, the negotiations for a Trade Agreement between the United Kingdom and the United States have been brought to a successful conclusion and the Agreement, together with a Supplementary Agreement between the United States and Canada, has been signed in Washington. Unfortunately, the Agreement was not signed until nine o'clock, by British time, on Thursday evening, within an hour or two of the time when *The Economist* is compelled to go to press. All that is possible for this week is to record the most preliminary impressions and to postpone until next week that detailed and exhaustive summary and analysis to which the achievement of the two Governments is entitled.

The length of time that has been necessary to bring the negotiations to success is itself a guarantee of the real importance of the final Agreement. It would have been comparatively easy to put together a list of unimportant mutual concessions which would have enabled the two Governments to claim that they had succeeded in agreeing and to draw what political benefits might arise from that fact. That easy course was not taken; the major share of the credit for refusing to take it belongs, if report is to be believed, to Mr Cordell Hull himself, who repeatedly insisted that he would accept only

of all kinds, timber and the many varieties of machinery are the chief. It follows from the nature of an exchange such as this that the British contribution to an Agreement should consist of comparatively few large concessions, while the American contribution should be a large number of individually unimportant reductions. So it has turned out. The schedule of United Kingdom concessions covers only thirteen pages of the White Paper, while the American concessions require forty-one pages. The total value of the trade affected, however, is about the same on each side. Thus, the American imports of those British goods on which lower duties are now conceded were valued in 1936 at about £11 millions, while the American goods on which Great Britain is now to charge lower duty were valued at about £10,200,000. Thus the formula of reciprocity is punctiliously observed. Since the imports of the United Kingdom from the United States are far larger than the volume of trade going in the reverse direction, it follows that the concessions affect a larger proportion of our exports than of our imports. In fact, out of total United Kingdom exports to the United States in 1936 of £40 millions, about £17 millions' worth is and remains on the free list. Of the remaining £23 millions, £11 millions is given reduced duties, and the existing duty is stabilised on a further £6,000,000. This latter category must not be ignored, for it includes the stabilisation of the American duty on whisky at the low level to which it was reduced by the Canadian-American Agreement of 1935.

The equality of incidence of the concessions granted to direct trade between the United Kingdom and the United States is, however, of more formal and legal than real importance. The chief characteristic of British-American trade is that it is triangular. Indeed, two separate triangles are involved. In the first place, there is a physical triangularity of trade between Great Britain, the United States and the Colonial Empire. America sells much more to Great Britain than she buys, but she buys more than three times as much from the Colonies as she sells. Consequently, the Agreement has included provisions about this latter trade, mainly in the form of the stabilisation of the existing position. Since much the greater part of the Empire's exports to the United States enter duty-free, this stabilisation is again a real advantage.

The second triangle concerns the Dominions, especially Canada. In this case, there is not such a clearly-marked triangularity of actual movement. But in the great majority of commodities in which the United States is interested, she competes directly in the British market with the Dominions, and concessions accordingly cannot be granted to her without the consent of the Dominions, for which

they have to be compensated. This process has been carried further than might at one time have been thought possible. The British import duty of 2s. a quarter on wheat is to be abolished; the existing Imperial preference on tobacco is not to be increased until 1942, when a reduction will be considered; the duty on lard is abolished and the import quota for American hams is enlarged; there are important reductions in the preference enjoyed by the Dominions (i.e. largely Canada) on soft timber and apples. These concessions, it should be noted, are in addition to the stabilisation of duties on a number of American products (including motor-cars) and reductions on a variety of manufactured goods which do not meet with Dominion competition. For her agreement to these concessions, Canada is rewarded by the British Government's consent to the reduction of some of the preferences enjoyed in the Canadian market. This will enable Canada, at little cost to herself, to offer concessions to the United States and thereby obtain markets for her goods to replace those she will lose by increased American competition here.

This is the broad outline of a complicated and detailed measure. That it is a very substantial achievement admits of no doubt at all. That it goes quite as far as it might have gone is possibly open to rather more question. It is notable that the "concessions" made by the United Kingdom in hardly any case affect the direct interest of British producers; in most instances the "concession" is merely an undertaking to take more of the commodity in question from the United States and less from the Dominions. In so far as this is a voluntary breach in the unduly restrictive system constructed at Ottawa, it is all to the good. But if the British Government had dared to permit freer competition between American and British manufactures, say in motor-cars, an even more comprehensive agreement might have been possible.

Reflections such as these, however, must not be allowed to modify the full and sincere welcome that is extended to the Agreement. Its political significance can perhaps be exaggerated, and nobody in England will expect any sudden change in American foreign policy. But, clearly, this large step forward along the path which Mr Roosevelt and Mr Hull have deliberately chosen as a road leading to world pacification cannot fail to increase the closeness and the cordiality of the relations between the British and American peoples. And on the purely economic side, it is a very rare and infinitely refreshing sight to see an Agreement covering such a very considerable volume of trade and embodying hundreds of reductions of duties with not a single increase. It is a victory for sanity, for friendship and for common sense.

The Reynaud Plan

FRANCE has grown accustomed in recent years to being governed by periodic batches of decree-laws, issued by Governments acting under plenary powers granted to them by the legislature. Familiarity might have been expected to breed at least indifference; but there is little doubt that a very genuine and widespread interest was aroused throughout France by the publication of M. Paul Reynaud's plan of financial reform over last weekend. For a month after M. Daladier was granted plenary powers no decrees were forthcoming. The revelation, two weeks ago, either that there was no plan or that, if there was, the Cabinet itself could not agree upon it, would have led almost to despair, had it not been for the simultaneous appointment to the crucial Ministry of Finance of M. Paul Reynaud, the one financial expert in active politics who has established a reputation not only for knowing what he wants but also for being always right. M. Reynaud retired for five days into a silence whose

impenetrability was almost unprecedented in French politics, and when his decrees were published on Saturday their nature and contents were almost completely unknown to the French public, impatiently waiting to know its fate.

It is thus easy to understand the fact that the severe pages of the *Journal Officiel* were, on Monday, being snatched in the streets from the hands of the newspaper sellers. Indeed, the *Journal* deserves to be a best-seller, for the text of the decrees is prefaced by a General Report, signed by the President of the Council and the Minister of Finance, which is one of the most forceful and brilliant State papers that can ever have appeared in any land or tongue. This document is printed in full translation on later pages of this issue of *The Economist*, and the reader can be recommended, without reserve, to turn to it if he wishes to have a lucid and pitiless analysis of the plight in which the French national economy finds itself, an eloquent outline of what needs to be done if full economic health

is to be restored, and a logical defence of the measures now proposed to this end.

It is not very difficult to state what is wrong with the French economy. France, unlike other countries, has never recovered from the world depression. But, again unlike other countries, she is not faced primarily with a problem of unemployment. Indeed, the Report estimates the total of unemployment, including even partial unemployment, at no more than 8 per cent. of the working population, a lower figure than was attained in this country even in last year's full prosperity. The French problem arises from the very low level at which the volume of industrial production obstinately lingers. This low level of production is due to a great variety of causes. But there is no longer any doubt in competent quarters in France or elsewhere that the labour legislation of 1936 is very largely responsible. Production has been hampered both by the rigid application of the forty-hour week and also by the almost perpendicular increases in labour costs resulting from shorter hours, paid holidays, higher wages and the other excellently intended reforms of *l'expérience Blum*.

Coupled with the problem of production is the perennial disarray of the public finances. A state of deficit is normal in France. But the figures in the Report show that, out of a national income of Frs. 250 milliards, the State and other public bodies are spending Frs. 137 milliards and borrowing Frs. 55 milliards. These proportions are almost incredible—indeed, they are entirely incredible, for it is impossible to accept the assumption that the French national income is only about a quarter of the British. But whatever may be the exact proportion of the national income represented by public expenditure, there will be no dispute that it is far too large. And as a result partly of the paralysis of production, partly of the budgetary chaos, France has been suffering from an almost total stoppage of that flow of capital into productive enterprise which serves the body economic as the circulation of its life-blood.

If the analysis of France's troubles is easy, the prescription of a cure is far less so. Some things, it is true, clearly need doing. The rigidities of the forty-hour week must be removed, and it must be made possible once again for every French industry to produce as much as it can sell. The sound substance of the social reforms of 1936 must remain: the worker must be treated as an equal and his remuneration must be the first charge upon industry. But if social reforms are driven—as they have been in France—so far as to paralyse all industry, the worker is the first to suffer. Serious attempts must be made to reduce the borrowings of the State to an amount that can be handled without entirely draining the national savings or entirely disorganising the capital market. In these two directions, M. Reynaud has proceeded with vigour. The labour decrees, in effect, remove all restrictions on the hours of labour. Forty hours remains merely as the point at which overtime rates of pay become payable. On the budgetary side, he has imposed new taxation which is estimated to produce 8½ milliards and arranged for economies (mainly in public works) which will reduce expenditure by about 5 milliards. With a small allowance for increased receipts from existing taxes, the prospective total to be found in 1939 from sources other than taxation is reduced from 55 milliards to about 35 milliards, against which the Treasury, as a result of the changes made in the Bank of France's balance sheet, has a balance of 10½ milliards. It would appear that something of the order of 25 milliards will have to be borrowed. This is, on the Government's figures, a tenth of the national income; on this basis a corresponding figure in Great Britain would be about £500 millions. The budgetary problem is thus very far indeed from being solved; but it has been reduced to proportions that admit of some hope of successful handling.

Labour policy and budgetary reform, however, are only

two members of the necessary trinity. Without a renewed and increasing flow of capital into French industry and commerce they will serve no useful purpose. There are two main and conflicting methods of getting French capital—especially that part of it which has fled abroad—back into French industry. The first method is to try to persuade it to move of its own free and unhampered will; the second is to try to compel it. M. Reynaud has unequivocally and unapologetically chosen the former course. His whole plan is a logical attempt to persuade the French capitalist that France is a safe and profitable place for his money. He is promised, by implication, no further depreciation of the currency. The whole tenor of the General Report goes to show that the Government's wish is to increase profits and reduce State intervention in industry. The budgetary changes are arranged in such a way as not to penalise the rich. Half of the tax increases come from indirect duties, and of the half to be raised by direct taxes much the largest part is to come from a new flat-rate tax on wages and salaries. There is, it is true, an increase of the general income tax, but its importance may be judged from the fact that it is expected to produce only Frs. 750 millions, or about £4 millions.

This is a powerful and courageous list of inducements to the capitalist. Will he respond? A substantial response is absolutely essential to the success of the plan. For the actions to be taken by the Government itself are deflationary: approximately 15 milliards of budgetary deflation are offset by less than 7 milliards of credit creation by the Bank of France. The success or failure of the plan depends entirely upon whether it secures a flow of private investment larger by more than 8 milliards than was moving before M. Reynaud's advent. The immediate response has been favourable, but not overwhelmingly so. The French capitalist may point out that he has to take account of two factors which are not in M. Reynaud's control: the fear of war and the fear of political instability. On this latter point, the omens are not altogether encouraging. M. Reynaud has hitherto been regarded as, in his own person, a bridge between the moderate Right and the Left. But by his decrees he has broken down the bridge; they complete that fissure in the Popular Front that was opened by M. Daladier's speech at Marseilles. The alliance with the Socialists can hardly be expected to survive decrees which reverse *l'expérience Blum*, which tax the rich less heavily than the poor, and which can only be confirmed if the whole of the Right unites its votes with those of the Radicals—a combination which has in it none of the possibilities of permanence. France's heart, it has been said, is always on the Left; her pocket always on the Right. M. Reynaud has set the pocket against the heart; he may be right, but the struggle is too equal for there to be over-much confidence in its outcome.

There will be an almost universal desire—certainly in England—that M. Reynaud's plan will succeed, and there are strong grounds for hoping that it will do so. It deserves success not only because it is, at an urgent moment, the only plan that is in the field, but also because it is an honest and courageous attempt to reinvigorate the liberal system of free economy on which the democratic world has prospered. The alternative of a closed economy, with some form of exchange control as a symbol of compulsion, is not attractive—though it might very well be far less drastic, less difficult and less disastrous than is assumed in the somewhat denunciatory passage devoted to it in the Government's report. Indeed, the objections to exchange control are as much political as economic, since it is advocated only by the Socialists, who do not offer an alternative Government; and if M. Reynaud's plan of liberal economy fails, the alternative could be applied only after a serious modification of the French democratic process. These are the high stakes for which M. Reynaud is playing. We shall all be the gainers if he succeeds.

Science and the Nation

THE crimes committed in Germany in the cause of race during recent years have seriously impaired one important national asset at least. Scientists, doctors, economists and technicians have been dismissed and expelled. Famous institutions of research and learning have been crippled. The progress of the German nation, in industry, agriculture, medicine, education and administration, has suffered; and the loss to Germany occasioned by National Socialist campaigns against Jews and political enemies can be measured in marks off the national income, as well as in diminished culture, justice and humanity.

We in England are fully tolerant of our scientists and experts. Whether we make the best use of their skill and work is less sure. The question is urgent to-day because a widespread stocktaking of our economy is going on. It is true that this stocktaking is proceeding under the pressure of defence needs, but the state of industry and trade and the condition of the people are essential elements. And national wealth and welfare, like national defence, largely depend upon the application of researchers' findings to practice and policy.

The State's direct responsibility for harnessing expert knowledge to government is performed in two ways. *Ad hoc* committees and commissions are set up to elicit facts and make recommendations; and government departments have specialist officers and technical sections as part of their executive equipment. The definite and concrete problems of defence policy are passed in review by experts through the machinery of the Committee for Imperial Defence, but civil and economic policy is less well served. Neither the Committee for Civil Research, set up in 1925, nor the Economic Advisory Council which replaced it in 1929, proved very successful, and the problem of putting Cabinets in touch with the trend of specialist research and opinion upon large questions like, say, population and the trade cycle, has still to be solved. The need to create some body to co-ordinate (rather than conduct) all social and economic researches with obvious governmental implications, already proceeding in universities and institutions or specially planned, is clearly urgent.

The State's indirect responsibility for research, outside the field of immediate social or economic policy, is twofold: on the one hand, it stands nowadays *in loco parentis* to industry and agriculture, upon whose productive efficiency the nation's wealth depends; on the other hand, it represents the consumers of industrial and farm products who stand to gain, in cheapness or better quality, from improvements in productive technique. The machinery already exists. The Department of Scientific and Industrial Research was set up in 1917, and is managed by an Advisory Council of the Privy Council. The Agricultural Research Council, set up in 1931, is (like the Medical Research Council, established in 1930) supervised by the Privy Council and financed in part by grants through the Development Commission; its job is to co-ordinate researches actually administered under the Ministry of Agriculture through a variety of State research institutes founded during the last thirty years. State contributions in both cases are limited according to producers' contributions, the official view being that "the expenditure which is defensible in the national interest depends upon the degree to which industry generally is prepared to apply scientific method and advances in scientific knowledge."

The value of these organisations has been considerable, though Treasury caution and the apathy and suspicion of many firms and farms have drastically limited their scope. The D.S.I.R. has effected aggregate savings to industry amounting to very many times the money spent by the

State and private firms upon its work. "From six research councils alone, at the expense of less than £400,000 in all, have come researches which have made possible in practice a saving of £3,200,000 per annum." And the more general researches of the National Physical Laboratory and the Fuel Research Board have fathered a large part of the recent increase evident in industrial productivity. In the sphere of agriculture, again, inquiries sponsored in part by the State have enabled progress to be made in crop breeding, animal husbandry, the preservation of fruit, the control of disease, the testing of seeds and the drying of grass.

It is precisely because research activity is a method of expanding national wealth and taxable capacity that the State's rôle should be paramount. The principle of subsidising important industries, in addition to granting them something like a monopoly of the home market, has been recognised—in practice if not yet in doctrine. The onus upon the State and the protected industries alike to strain every nerve to improve their efficiency in the interests of the consumer, who may stand to lose appreciably by the abatement of competition, has enormously increased.

Actually, the research efforts made, measured in terms of pounds, shillings and pence, scarcely suggest that the State, industry and agriculture are doing their entire duty. Total expenditure on all kinds of scientific research in this country, private as well as public and industrial work, amounts to about £4,000,000 a year (according to a report by the Scientific Workers' Union), or much less than one-tenth per cent. of the national income, against one-half per cent. in the United States and a very rough estimate of one per cent. in Soviet Russia. Annual expenditure on agricultural research in Britain has been estimated at much less than one per cent. of the value of the output of the land, and expenditure on industrial research at much less than one-twentieth per cent. of net output. The estimated expenditure of the D.S.I.R. in 1936-37 was £657,850; of the Agricultural Research Council (which includes some other official researches) £79,510; of the Medical Research Council £195,000.

This is clearly not enough. The governmental contention that industry and agriculture, whose prosperity depends upon the results of research, must contribute very much more generously to officially sponsored researches, is unassailable; as it is, individual firms are afraid of giving secrets away and doubtful whether the immediate benefits of specific processes or improvements discovered will redound to them or to other firms. Among Englishmen rule-of-thumb is almost a law of nature; and the scientist, like the doctor, is commonly called in only when the disease is desperate. Highly organised industries, like the iron and steel trades, industries in the van of technical change, like the electrical trades, and bodies representative of sectional interests, like the National Farmers' Union, hold key positions in a process of education which may be crucial for England's economic future; and, to date, their duty has not been fully performed.

Nevertheless, the State's own primary responsibility is inescapable. There are three fields of research in this context: industrial, agricultural and socio-economic. Each should be furnished with a central council or committee to survey and collate work in progress and to map out desirable future researches. This body should not only be singly responsible for pooling ideas and information from all sources, but should also have the power to work out a programme of priorities according to which it would, as far as possible, allocate all the financial resources at its disposal between different research topics. It should not be merely consultative, but should have more administra-

tive status and authority in its own field than, say, the present D.S.I.R. or A.R.C. These bodies, which have done admirable work under difficulties, are clearly there to be adapted; to be given more power, on the one hand, to centralise the supervision and planning of research and the centralisation of results and, on the other, to furnish the Government with the material for fully articulated policy. Beneath them there should be practical research institutions to cover all obviously distinct and self-contained branches of research. This would involve an increase in the D.S.I.R.'s research institutes, boards and councils, as well as an extension and reorganisation of the present agricultural institutes. Apparatus for social and economic research might be similarly devised.

The whole field of research must be surveyed, somewhat on the lines forecast in their Bulletin for Political and Economic Planning's review of agricultural research, to be published next week. There must be contact and encouragement at every stage of scientific and social research; at the university stage where broad principles are investigated, often under a crushing burden of poverty; at the specialised institutions where practical problems are treated in their wider aspects; and, above all, perhaps—because the immediate usefulness of research work is here decided—at the contact stage where fresh discoveries and new techniques are applied to practical problems *in situ*.

Turkey and Her Suitors

"PULSE, 116; respiration, 20; temperature, 98.6." "Pulse, 88; respiration, 18; temperature, 97.2." As soon as fluctuating bulletins from Istanbul began to reflect the precarious state of the Ghazi's health, the same question rose to every mind: What happens when a dictator dies? Does his country go to pieces? Would the new Turkey return to the limbo whence the Ghazi rescued her? Would she degenerate into the prey for Great Powers which she used to be before the war?

In some ways the omens looked propitious for such a collapse. Not since the days when Abdul Hamid used to play off one Ambassador against the other had Turkey enjoyed so many attentions. Her years of post-war obscurity were over. No longer was the U.S.S.R. her only friend. Numbers amounting to a queue were on her doorstep—Englishmen, Frenchmen, Germans, and even Italians, each with cheque book in hand. If Atatürk's death caused her internal stability to waver, could she prevent them from pushing in and making themselves at home?

The reasons for their awakened interest are fairly obvious. Turkey has ceased to be a nobody since she became, first, the most prominent State in the Balkan Pact, then the acknowledged leader of the Middle Eastern quartet, and, last but not least, the re-arming Power who controls the passage of all warships, as well as of the bulk of Europe's oil exports, through the Black Sea Straits. Great Britain and France, moreover, have an added motive for cultivating her friendship, and that is, that she is, or ought to be, a *status quo* Power. For her declared aim is to transform herself from a backward agricultural country into a modern industrial State, and, if she is to perform this Herculean task, her chief requirement is a long term of European peace.

In the last few years Mustapha Kemal Atatürk has steered his State on a competent middle course between her suitors. Apart from Russia, who has been her friend ever since the two Governments, ostracised by the Allies, drew together in 1921, the first to woo her was Germany. Dr Schacht, profiting by the clearing system which the Turks had adopted to circumvent their lack of foreign exchange, began to offer for their produce prices far

So much for administration. Financially, the State should be responsible for the institution and bare maintenance of all this machinery, adequately staffed, with properly paid people. Most research work, apart from mainly theoretical or nationally important work, should be financed by industry as well as the State. Representative industrial and agricultural organisations might make compulsory payments; firms and farms might pay fees for services rendered; and research bodies could exact full payment for results on the introduction of new processes and improvements. Some indication of the feasibility of adequate financing is given by the estimate that a levy of one-tenth per cent. on the net product of industry and about a shilling per acre of productive land would meet all obvious research needs. Research, as the Scientific Workers' Union have urged, requires security for work in progress and funds for steady expansion year by year; together, the State and industry, by a bolder policy than in the past, can meet all its needs.

Cabinet Ministers and civil servants, like business managers, company directors and farmers, cannot, in the nature of their work, stand in the main stream of specialist research. They can, nevertheless, take steps to ensure, on the one hand, that research and technology march together and, on the other, that the findings of researches relevant to the pressing problems before them are readily available.

exceeding the world price level, only revealing at a later date that he intended to pay his debts in expensive German goods. Thus, by the time he crowned his exploit with a visit to Ankara in November, 1936, he had secured for the Reich 45 per cent. of Turkey's import and 51 per cent. of her export trade, as against only 25 per cent. and 18 per cent. in 1933.

The Turks, alarmed at a progression which threatened to produce a German stranglehold, reacted against their so-called benefactor. Turkish economists sometimes express gratitude to Germany for a process which enabled them to offer high prices to the indigent Anatolian farmer, and at the same time unobtrusively to foist the burden of payment on to the Istanbul consumer, who was obliged to give a fancy price for his German scissors or wireless set. But Turkish politicians began to shake their heads over the likelihood of German ascendancy. A domineering note which crept into the voices of certain German advisers in Ankara confirmed their fears. Hence Atatürk's move towards intimacy with Great Britain.

In 1936, the year of his advances, the British Government were delighted to respond. They had never before been on good terms with the new Turkey, at first owing to their sponsorship of the Greek landing at Smyrna, and later owing to the Mosul boundary dispute. But, once the Abyssinian war had revealed Italy as a rival on the Suez route, Britain was ready to cultivate friends in the Eastern Mediterranean. When, therefore, Turkey asked permission to re-fortify the Straits, the British Government sensibly turned the inevitable to good account and supported her request. There followed an Anglo-Turkish *rapprochement* which has prospered ever since, thanks partly to these outside influences, but largely to the Ghazi's liking for a well-chosen British Ambassador, Sir Percy Loraine. Almost every month brought a new manifestation of mutual goodwill. In the autumn of 1936 Turkish public enthusiasm ran high over a visit paid by King Edward VIII's yacht to Anatolian ports; next, Ankara refused a low tender from Messrs Krupp for re-fortifying the Straits and opened negotiations for the necessary armaments in Great Britain; next, a

British firm of engineers (Sir Alexander Gibb and Partners) were appointed consultants to the Turkish Government for all public works; next, Messrs Brassert secured the largest contract yet awarded under the Turkish five-year plan—that for constructing, at a cost of £3 millions, the new national iron and steel industry at Karabük. The crowning mercy—at least, in Turkish eyes—was the £16 millions loan agreement signed in May, 1938, of which £6 millions was to be devoted to Turkish armament purchases from British firms, the balance to commercial purchases sponsored by the Export Credits Guarantee Department. The Turks professed deep appreciation of a Government which, in making a loan intended largely for armaments, exacted no written promise in exchange; such trust, they averred, presented a sharp contrast to German tactics. "No matter what happens," their Ambassador told a Washington audience, "never will we be found in a camp opposing Britain." Relations could hardly have been more rosy.

Where the British were growing so popular, their allies the French could scarcely be left behind. So France, too, began to dance attendance. She was handicapped in that her Syrian mandate shared a frontier with Turkey, and in that she ruled a population of irredentist Turks in the Sanjak of Alexandretta. But it was decided in Paris that even the Syrian frontier must be jettisoned in order to secure the necessary harmony. With the acquiescence of her British partner, she threw over a League of Nations' settlement of the Sanjak question, and, early in July, 1938, signed the Franco-Turkish treaty whereby Turkish troops assumed virtual control of the area. To complete the manoeuvre, the French Government removed an unpopular Ambassador from Ankara, and, taking a leaf out of the Foreign Office book, appointed M. René Massigli, one of the ablest servants of the Quai d'Orsay, in his stead. Two months ago most observers would have said that Atatürk was firmly ensconced in the bosom of the *status quo* States.

But this estimate began to look too complacent when there followed, early last month, the news of a fresh loan agreement, this time with Germany, for a further £12½ millions to be expended on "industrial and military development." The deal was the first-fruit of a profitable round of visits paid by Dr Funk, Reich Minister for Economics, to Dr Schacht's former hunting-grounds, the difference between the two visitors being that the latter travelled equipped with all the prestige arising out of the Austrian and Sudeten acquisitions. Success is an attribute greatly admired in the Levant, and, though Germany may be the more feared, she is certainly also the more respected by most Turks on account of her recent bold behaviour.

Theories abound as to the motive which underlay this apparent *volte-face* in Turkish foreign policy. To some it appears as an inevitable capitulation to the pressure which Germany is able to exercise through her trade supremacy. To critics of the British loan it represents a first-class "I told you so"—a fresh instance of the uselessness of putting one's trust in dictators, or, alternatively, of the unchanging duplicity of the Turks. But the most probable explanation is, as almost always in international relations, the most material: the German loan represents no change in Turkey's affections; it simply denotes a sensible readiness to seize the day. Already, Atatürk had turned European rivalries sufficiently to account to secure, at a minimum cost to himself, £16 British millions and the Sanjak of Alexandretta. The acceptance of an additional £12 millions proffered by the other side in no way

thwarted him politically. The rival indebtednesses cancel though *Türk* heavily in pocket, he was no more beholden to many firms than if he had accepted nothing from anyone. The D.S.I.R. arrangement with Germany was, economically, more advantageous than that with Great Britain, for whereas Turkey needs none of Turkey's principal wares,

and the Anglo-Turkish clearing account is therefore often pitifully clogged, Germany claims that she is able to absorb any amount of Turkish chrome and currants and tobacco.

Thanks to several years of practice, Atatürk was a skilled side-stepper; he could be relied upon to ward off undue pressure by any one Great Power. But his death roused a fear, not only in Europe but in Turkey, that his successor—less revered, and therefore less firmly entrenched, at home—would not be able to reproduce his skill. The large supernumerary police force which patrolled Istanbul during his illness revealed his colleagues' nervousness lest disturbance at home should weaken their position abroad. But no such disturbances occurred. Less than twenty-four hours after his death, General Ismet İnönü, his former prime minister and intimate friend, had stepped into his shoes, and Turkey was forging ahead, serene as before.

The smoothness of this change did not surprise anyone who knows modern Turkey, but it cannot be taken as a guide to the future of all dictatorial regimes, for the Turkish system is a dictatorship with a difference—the difference being that the nation is fully informed as to the ultimate goal towards which its ruler is working. The Ghazi was sure of his aims; he had defined them; and his people shared them, without a trace of that fear (so discernible in the majority of dictatorships) lest he should gamble too high while pursuing some foreign adventure or personal whim. This element of certainty is bound to strike every visitor to Ankara. No one can fail to be impressed by the quiet confidence with which an official or business man refers to a new development which cannot mature for ten or even twenty years. The Turk of to-day looks further ahead than most people dare to do in Western Europe.

Here is convincing evidence of stability, and other signs point to the same conclusion. In the first place, the Ghazi listened to the advice of his lieutenants, and men like Ismet İnönü, Celal Bayar or Fethi Okyar, having helped to formulate his plans, have reason for taking personal pride in seeing them through. Secondly, only fifteen years have elapsed since the death of the old regime, and fifteen years is a small slice of a lifetime. Every Turk in a responsible position can remember what things were like before the republic; he knows that he is better off as he is, and is unlikely to jettison his new-won freedom from foreign interference by quarrelling over the succession to his leader. Thus, there is no reason why the new President should not be able to maintain his predecessor's balanced foreign policy. Upon the announcement of his election, prophets foretold closer relations with Germany, basing their judgment on the fact that Atatürk had dropped İnönü for the more Anglophile Celal Bayar just at the moment when the threat of German ascendancy made him turn towards London. But even if İnönü's affections lie in Central Europe, he is, after all, a man of common sense and, as such, is bound to realise that Turkish independence has more to fear from a strong Germany than from a strong Britain.

Turkish independence is İnönü's, as well as Atatürk's, darling child, for Ismet Pasha (as he then was) served as Chief of Staff to Kemal Pasha (as he then was) during the life-and-death struggle of the Græco-Turkish War of 1919-22, and after that he led the Turkish delegation at the Peace Conference of Lausanne in 1923. In these two ordeals he showed himself to be a first-rate statesman, as well as a first-rate soldier. Outwardly the new captain of the Turkish ship of state presents an almost piquant contrast to his old friend and predecessor. His manner is quiet instead of being domineering; his temper is ironic, not demonic. But anyone who has to do business with the new President of the Turkish Republic will soon strike, below the surface, on a character which is not less strong than Atatürk's for being less erratic. And so to-day, as yesterday, Turkey's fortunes are in capable hands.

FRANCE'S ECONOMIC CRISIS

The following is a translation of the General Report by MM. Daladier and Reynaud published in the "Journal Officiel" by way of introduction to the text of the Decree-Laws. The translation is by THE ECONOMIST and must not, therefore, be regarded as official.

GENERAL REPORT

TO THE PRESIDENT OF THE FRENCH REPUBLIC ON THE DECREES
ISSUED IN EXECUTION OF THE LAW OF THE 5TH OCTOBER, 1938.

Paris, November 12, 1938.

M. LE PRESIDENT,

The difficulties which we have to solve cannot be distinguished from each other; they cannot be given separate solutions. Undoubtedly there is a problem of production and prices, a credit problem, a labour problem. But these are only different aspects of one and the same problem—the French crisis. It is thus impossible, in the very interests of the task we are undertaking, to attack the evil which is oppressing our country without outlining a broad picture of the situation as it appears to an unbiased mind. To have a clear vision of the difficulties which we have to face is the preliminary, and necessary, condition of drawing up a complete, coherent and effective plan. We consider, therefore, that a detailed balance-sheet of our economy and our finances must precede the exposition of the measures which we are asking you to approve.

I. INVENTORY OF THE FINANCIAL SITUATION

The Financial Problem

The financial problem has been in existence for years; it is present in every mind. Budget deficits, Treasury difficulties, debasement of the national credit, these are evils deeply rooted amongst us, and their gravity increases in proportion to their continuance. The Governments which have followed one another in the last six or seven years have found themselves at grips with financial difficulties. Parliament, conscious of the need for a solution, has rarely refused them the means of finding one. They have all looked for the road to salvation with courage and sincerity. France has tried in turn budgetary deflation, fiscal severity, credit expansion. The remedies have varied; the disease, aggravated, remains. The reason is that the methods were incomplete or wrong. The financial problem is a whole which it is useless to try to split up in the hope of an easier solution. The facts of the problem are simple, but they must be considered in their entirety. The same national income bears the levies of all public bodies; one Treasury must defray all public expenses; one money market is called upon to supply the needs of the State and of the other public bodies. We must then bring face to face him who defrays the expenditure, be he tax-payer or investor, and him who benefits from it, be he the creditor of the State or of the local authority, or the beneficiary of the public services. From this confrontation it should be possible, having regard to the available resources, to secure the establishment of an order of importance and urgency among the national expenses. A financial policy is, above all else, a choice. Hence the necessity for a complete, lucid and honest inventory.

Reduced to these fundamental elements the problem becomes simple. It is reduced to two elementary questions: (1) What is the total of the national expenses? (2) To what extent can these commitments be met by levies on the national income or by mobilising savings?

The National Commitments

The national expenditure is not limited merely to the expenditure of the State, and appearing in the ordinary and extraordinary Budgets. It also includes the expenditure of the "Caisse autonome d'amortissement," the deficits of the big public services and, in particular, of the railways, the expenditure of the local authorities and of public establishments.

(a) Expenditure of the State

1. The total charges on the ordinary Budget may be estimated for 1939 at Frs. 64,500,000,000, a figure obtained

by abstaining from all new services and by making the most objective possible estimate. The following table shows the principal categories of expenditure composing the total, classified under two headings: military expenditure and civil expenditure:—

	Military Expenditure	Civil Expenditure	Total
	(millions of francs)		
1. Public debt.....		15,100	15,100
2. Terminable debt—			
Civil pensions ...	6,041		
War pensions and			
Soldiers' allowances	7,473	13,500	13,500
3. Public administration		170	170
4. Establishment	7,455	9,315	16,770
5. Material	6,500	1,400	8,000
6. Works	20	1,730	1,750
7. Subsidies.....	340	7,300	7,640
8. Miscellaneous	365	1,205	1,570
Total	14,780	49,720	64,500

A mere glance at this table makes it clear how difficult it is to realise important economies without proceeding to big reforms in the organisation and functioning of the public services. The public debt, the terminable debt and the expenses of the civil establishment represent 60 per cent. of the Budget total, and military expenses 22 per cent., that is, 82 per cent. represents expenditure which cannot be curtailed on the hypothesis of an administrative and financial *status quo*. The balance of the expenditure, 18 per cent. of the Budget, has for the most part an obligatory character, whether it is a question of subsidies or of maintenance works. It will suffice to quote the allocations for unemployment (1,100 millions), the State's share in the cost of public assistance (1 milliard), the upkeep of roads, etc. It is enough to say that, without a far-reaching administrative reorganisation, no appreciable relief can be obtained. On the contrary there is a risk that the rise in the cost of living will soon raise the problem of readjusting certain indispensable expenses; it is already raising the question of the proper adjustment of the salaries of the whole body of civil servants.

2. The extraordinary Budget as distinct from the ordinary Budget includes in the main the cost of carrying out the armaments programme which concerns the three defence ministries. Its amount will rise in 1939 to 25 milliards. To this military expenditure should be added the civil expenditure necessary for the execution of the long-term plans drawn up by several successive Governments: the Marquet plan, the plan of August 1936, the plan of May 1938. They represent, for 1939, in subsidy to local authorities, repayable advances, and public works directly carried out, a total charge of 3,500 millions. We must take into account, finally, a sum of 1,100 millions required for the administration of posts, telegraphy and telephones.

The total of extraordinary expenditure is thus 29,679 millions, an increase of more than one-third compared with 1938.

3. The expenditure of the Caisse autonome d'amortissement, which does not differ in kind from that of the Budget properly so called, should be added to the total State expenditure. It is estimated at 7½ milliards for 1939, of which 6 milliards is for the service of the public debt.

(b) Expenditure of Local Authorities and of the Public Services

These charges are essentially composed of (a) the expenses of the départements and the communes amounting at present to 30 milliards, of which 24 milliards should be added to the above figures, the remaining 6 milliards corresponding approximately to the cross-payments between the State and these authorities; (b) the deficit and the main-

tenance works of the industrial public services and, notably, the railways, the total for the latter being about 6 milliards; and (c) the expenditure on public works of the local authorities and the colonies, about 5,500 millions.

Thus, French public expenditure reaches the total of 137 milliards, which may be analysed as follows, in round figures:—

	Millions
General State Budget	64,500
Extraordinary Budget	29,500
Caisse autonome d'amortissement	7,500
Local authorities	24,000
Deficit and maintenance works of railways	6,000
Public works of local authorities and colonies, etc.	5,500
Total	137,000

The national income being estimated, on the most optimistic calculations, at 250 milliards, the public commitments easily exceed half of the income.

Means of Meeting Public Expenditure

A glance at this figure of 137 milliards is enough to show that it is not possible, in the present state of economic affairs, to balance public expenditure merely by making fiscal levies on the national income, because every policy of increasing taxes, applied to an economy suffering from grave anaemia, is doomed in advance to failure. These public expenditures constitute, in the present economic situation, an insupportable burden.

The ordinary receipts of the State and the public authorities can be estimated for 1939 as follows:—

	Millions
State—tax receipts	47,200
Other receipts	8,800
Total	56,000
Caisse autonome d'amortissement	7,500
Local authorities	22,000
Grand total	85,500

The 137 milliards of public expenditure are thus covered by permanent resources only to the extent of 85.5 milliards. The whole remainder is a deficit and must be borrowed. This deficit of 51.5 milliards is composed as follows:—

	Millions
Deficit on the ordinary Budget	8,500
Extraordinary Budget	29,500
Deficit of the local authorities	2,000
Railways (*)	6,000
Local and Colonial works (†)	5,500
Total	51,500

It is undoubtedly the case that certain of these expenses are not normally financed by borrowing. Nevertheless it is expedient that these expenditures, so far as civil works are concerned, should not reach a total out of proportion to the financial possibilities; and that they should be devoted to works that are really useful and, so far as possible, remunerative. In any case they will weigh upon the Treasury, aggravating the heavy obligations it already has to meet.

To the 51.5 milliards of the deficit of the different public budgets, ordinary or extraordinary, there must be added in 1939 other charges arising from the various forms of State intervention in economic life. Two big monopolies, the Wheat Board and the alcohol service, will have to finance the surplus crops harvest of wheat and wine, one to the extent of about 2 milliards, the other to the extent of about 500 millions, in spite of the yield of special taxes, often very heavy, which are appropriated to them. Certain industrial participations of the State will impose upon the Treasury new disbursements. The floating capital of the national

(*) The expenditure on primary maintenance amounts to 1,050 millions, financial charges to 3,800 millions; the loss on working, in spite of very energetic attempts which have been made for some months and have been intensified in recent weeks, amounts, if receipts are estimated on the basis of the 1938 traffic and if price rises are excluded, to about 1,200 millions. The total, for the Treasury, is, say, 6 milliards.

(†) Of which 1,500 millions is for the City of Paris and the département of the Seine.

(‡) The charges provided for 1939 are the following, under the heading of the civil works alone:—

	Millions
State	3,500
Posts, telegraphs, telephones	1,100
Railways	1,050
Local authorities and colonies	5,500
Total	11,150

aeronautical construction companies will have to be increased by nearly 500 millions as a result of the speeding-up of production programmes. The measures contained in a recent decree law for assisting the replacement of merchant shipping will entail a cost to the State of about 300 millions. Finally we must allow 1,500 millions of loans for the colonies and North Africa and 500 millions for advances to certain foreign governments.

In all, on the assumption of the legislative and economic *status quo*, the charges upon the Treasury can be estimated in round figures at 56 or 57 milliards, from which can be deducted 2 to 3 milliards in order to make allowance for funds available to the Caisse des dépôts et consignations and the Crédit foncier to meet certain operations.

Thus, we reach the figure of 54 to 55 milliards for the net total which it is necessary to borrow.

A system of taxation which is already extremely heavy levies more than a third of the national income (85 milliards out of 250) to cover the national expenses. The excess (55 milliards) has to be obtained out of savings. But it would be vain to hope that the nation could normally provide such an amount of capital for investments which for the most part are unproductive. Public expenditure of such a size is out of proportion either to the present income of the country or to its capacity for saving. We are thus led to the dilemma that many others before us have seen, but to which no positive solution has yet been given: does the financial problem arise because the expenditure is too great, or because the national income and the capacity to save are abnormally low?

It is our profound conviction that, fundamentally, the economic question is predominant. But we believe also that unsuccessful policies have profoundly aggravated the consequences of the continuous deterioration of economic activity. Public expenditure has multiplied, and this multiplication of expenditure cannot be explained by the armaments race alone, for it is antecedent to it and has not fallen off since. Actually, that part of the French population which creates wealth, which works for the future, is continually diminishing, while that part which, directly or indirectly, lives on the State is ceaselessly growing. There were 600,000 civil servants in 1914, 860,000 two years ago; today there are 960,000; soon they will amount to a million. To these officials should be added 500,000 railway workers (against 400,000 in 1936), 400,000 pensioners of the State, 200,000 of the railways, 300,000 active or retired officials of the local authorities. Likewise, there is a steady fall in the number of Frenchmen who are ready to bear the risks of enterprise and creation.

If the country wishes to rehabilitate its position, it will have to produce more in order to maintain its standard of living. That everyone should work more and that the State should spend less—for ourselves, we see only this formula for salvation; it is elementary, but it is inescapable.

II. The Economic Problem

The financial problem is thus dominated by—and is in fact the reflection of—the economic. All the efforts made to improve the French financial position since the depression have been fruitless in face of the failure to achieve first a solution of the economic problem.

In 1936 the hope was to increase the purchasing power of the masses and to bring about an expansion in the demand for the products of industry, which would itself have brought about a reduction in unit costs and eventually of the cost of living. Success would have been obtained if prices had not risen, if the increase in the purchasing power of the masses had been lasting and if production had increased. The gravest failure, from which the others follow, has been the persistently low level of production. Contrary to every hope and after many years of depression economic activity has shown no sign of revival and remains stagnant. Industrial production in 1938 is at a level 25 per cent. below that of 1930. Railway car loadings are 35 per cent. down. These conditions are all the more disappointing in the face of increased activity abroad. In England production has risen to 20 per cent. and in Germany to 30 per cent. above the 1930 level.

Certain special branches of our economic activity, which may be considered particularly indicative, betray even more definitely the state of affairs. The volume of manufactured exports has fallen 46 per cent. compared with 1930, and this figure would be much greater if our relations with foreign countries alone were considered and no account were taken of our empire, which is protected by customs barriers. Some of our export markets have been almost

completely lost. Exports of motor cars have diminished by 70 per cent., exports of cloth are down by 87 per cent., of cotton piece-goods by 94 per cent.

At home, the index of building activity has fallen by 40 per cent., while in Germany it has risen by 35 per cent. and in Great Britain by 100 per cent. This is particularly alarming. While France has stopped building, the English countryside is being covered with new houses.

France has been hypnotised by a concern for rent legislation. Instead of building large numbers of new houses and so forcing down rents and ensuring the health of the people, she has allowed insanitary slums to continue in existence at artificially reduced rents.

The unemployment statistics are also disappointing. There are 360,000 registered unemployed. Including those who are unassisted, there are probably 600,000 without work, or 5½ per cent. of the working population. If account is taken of about 2½ per cent. of partly unemployed, it can be said that 8 per cent. of the available labour supply is at present unemployed. A particularly sad result, when in the same period an additional 250,000 persons have been taken on permanently in various public services. Moreover, nearly 20 milliards of francs have been spent in great haste by the State and public authorities on public works, in addition to the great increase in national defence expenditure.

What can one conclude, except that the speculative purchases and turnover in stocks induced in 1936 by the fear of a rise of prices have been, taken together, without effect. Our successive devaluations, greater than those of the dollar and pound, have resulted in pure loss to the national economy. The home market has not been permanently enlarged. The disequilibrium between agriculture and industry has been accentuated, and purchasing power, which it was hoped to increase, has once again declined.

The Reason for the Low Level of Production

If production is insufficient, it is primarily because its possibilities of development have been paralysed. The forty-hour week, distorted into a five-day week, contrary to the intentions of its authors, limits our capacity to work. Its original purpose was to re-absorb the unemployed, since the maintenance of a constant volume of production in the face of reduced hours would automatically cause an increased demand for labour. But in fact it has since become clear that the wholly and partially unemployed were far from being a reserve of labour as large, or (what is more important) as suitable, as had been imagined. The idea of a reduction in the length of the working day had been entertained on the assumption that, as a result of increased efficiency of labour and more intensive use of machinery, the same output could be obtained with fewer hours of work. But the efficiency of labour has not increased and the hopes founded on technical improvement have not been realised. How could it have been otherwise, when the majority of factories and shops were closed two days out of seven? All the efforts at re-organisation that have been tried have failed. Sometimes it has been the authorities themselves who have intervened to prevent the introduction of new methods designed to lower costs. In every field where activity might be reborn enterprise has been restricted and discouraged. The creative spirit and the willingness to take risks have been weakened. This—let us not fear to say it—is the root of the evil, for it adds a sort of moral abdication to the material difficulties.

The Second Cause of the Economic Crisis: The Insufficiency of Credit

Let us not imagine that it would be possible in any economy as rigid as ours to bring about a real revival by the artificial injection of credit. Credit permits businesses to prosper, when the demand is present and when the right climate for healthy activity exists. We have said that this climate does not exist. But it must be noted that in the limited field in which the modernisation of plant would usefully have been envisaged, lack of capital has made this impossible.

For four years the State has absorbed the whole of our national savings, mainly for unproductive purposes. Despite all the artificial measures taken to reduce interest rates, to grant advances to traders and industrialists, the French loan market has become one of the dearest in the world. Everyone knows that in practice it is impossible to obtain mortgage loans at under 9 or 10 per cent. Everyone knows that if there is the slightest risk a private borrower cannot obtain capital at less than 10 or 12 per cent. Between 1928 and 1937 private issues of shares fell from 8.3 milliards of francs to 1.2, while private issues of bonds fell from 6.4 to

2.3 milliards. The drop is large enough, but would be even greater, if account were taken of the depreciation of the franc. This collapse of private borrowing is due to the scarcity of available capital, a scarcity due principally to constant appeals from what has become almost the one and only borrower, the State.

The Consequences of the Economic Crisis: The Vicious Cycle

The conclusion of this gloomy survey is that for several years our substance has been melting away. Despite tariff measures, the devaluations have not prevented a constant deficit in our balance of payments. Taking only one element, the balance of trade, it is to be noted that the deficit has not ceased to increase in real terms, rising from the equivalent of 325 metric tons of gold in 1935 to 460 in 1936, and 580 in 1937, in three years an increase of 83 per cent.

We have entered, in fact, into the vicious cycle of an indefinite rise in all prices. The fundamental fact which has raised the cost of living, and is raising it further, is the impoverishment of the country. The losses suffered during the depression weigh heavily on our retail prices, whether it be because, as a protection against international competition, customs duties have been increased to the detriment of the French consumer; or because devaluation has increased the prices of imported goods; or because the State, in the attempt temporarily to protect a large number of individual interests from the consequences of national impoverishment, has increased its expenditure, thereby rendering necessary, sooner or later, a recourse to inflation or to taxes, and consequently a new rise in the cost of living.

To-morrow, if we do not succeed in achieving a real increase in the production of wealth in France, we shall be unable to prevent the purchasing power of the working class—even if it be indefinitely swollen by the poisoned gift of nominal wage increases, coupled with diminished production—from being indefinitely reduced by a continuous rise of prices, which would implacably adjust the standard of living of the masses to the persistent inadequacy of the true income of the country. Rise of prices, rise of wages, devaluation of the currency—that is the vicious cycle in which our economy is being carried along. The problem, then, is not to choose between preserving or repealing the recent social reforms, whose generous inspiration nobody disputes. The problem is to prevent them from automatically dwindling to nothing, to prevent their benefits from evaporating in the high cost of living, to prevent employers and employed, in a country which is still poor, from having nothing to share but poverty.

III. The Remedies

The General Plan of Action

The restoration of our economy and our finances cannot be the work of a day. It requires years of effort, of careful organisation and sacrifices for all. This is the truth which we wish to place with all emphasis at the head of our programme of rehabilitation. However courageous and comprehensive may be the decree-laws, which have been prepared in ten days, they cannot provide remedies for the dramatic situation born of the deepest economic depression of modern times, of an arms race unprecedented in modern times and of the tremendous increase in public expenditure.

If we can induce the country to share our convictions in this respect, we shall have achieved the first condition of success. The French people must realise that only a decisive measure of reform will allow them to maintain both the standard of living and the supply of armaments. The facts of the situation are eloquent of the necessity for a ceaseless effort on the one hand and on the other of the slowness of the progress to be expected. Continuity and perseverance will be the bases of our recovery policy, which has to deal with problems far more difficult even than those which M. Poincaré had to solve between 1926 and 1928. Whatever the difficulties encountered, the Government, for its part, is determined to continue, without weakening, along the lines it has mapped out.

Our wish is to secure over three years the gradual restoration of the economic and financial equilibrium of France.

It would be fantastic to present forthwith a precise and detailed plan, for our programme, though always on the same lines, will have to be adapted to the general development of domestic and international circumstances. But it is possible to indicate forthwith the principal stages by which we intend to proceed.

The steps we propose to take immediately are as follows:—

1. To do whatever can be done quickly and without excessive disturbance in the way of a return to budgetary equilibrium;
2. To free the national economy and finances from the paralysing restrictions which are mortgaging the future;
3. To bring about, by a broad policy of lowering interest rates, the impetus which we hope will be continued by a return of confidence and a rebirth of enterprise.
4. To begin the more fundamental task of restoring healthy conditions.

This first stage only requires a delay of a few months. At the beginning of 1939 we shall put into force permanent measures to continue, in all spheres, the success of the work undertaken.

We plan, in effect, to make the year 1939 a period of adaptation and of consolidation of the first advances to be made. After 1939, still another difficult year of reconstruction, when no abandonment of the principles of prudence and good management can be envisaged. Not before 1941 can France hope to have recovered a stable and sure economic and financial equilibrium.

If we can continue our work of rehabilitation, we are convinced that the economic mechanism will work normally, that the public finances and the position of the franc will be restored to health, and that then without temerity, but with the boldness characteristic of the French people, we need have no hesitation about advancing further along the road of prosperity and progress.

IV. The Means of Securing Economic Recovery

We have already clearly defined our aims in the economic sphere. The national economy must be released from the strangle-hold of restrictive regulations and the suppleness, which is indispensable to its free movement, must be restored. Simultaneously, productive activity must be given an immediate stimulus by an increased flow of credit. In a word, the brake must be released and the motor of economic activity must be fuelled. This task must be completed by the preparation of a lasting balance, adapted both to the modern conditions of national life and to the structure of the French national economy. The measures to be taken can be grouped under two heads: (a) organisation of labour, and (b) organisation of production.

1. ORGANISATION OF LABOUR

The organisation of labour involves in the first place the elimination of everything which hinders its development. We know that the expansion of activity in certain branches of industry is hindered by the rigid nature of the law restricting working hours to 40 per week. It is consequently necessary to revise the restrictions which this law imposes on commerce and industry. We are not abandoning the principle of the social legislation of 1936, whose generosity does credit to its authors, but we stipulate that no enterprise should be forced to close down for two days a week if the demand for its products would enable it to work more. French men and women must understand that they are in a state of "economic mobilisation" during the execution of the plan, and that the toil imposed upon them is in the national interest.

This is the object of one of our most important new decrees. We are laying down the principle that work must henceforward be spread over six days a week, and we are giving the heads of businesses the right to call for as much overtime as is needed for production. The only formality which we still demand from them is that they should send a request for permission to work overtime to the Labour Inspector. The absence of a reply from the Inspector within ten days is equivalent to the granting of their request. Payment for the additional working hours thus obtained will be made at the standard wage rates plus a percentage which will not render the cost of overtime prohibitive.

It is often objected that not a single industry is in a position to work more than 40 hours per week. But what is an industry? It is quite true, for example, that the average number of working hours in the textile industry as a whole is slightly below 40 hours per week; nevertheless, numerous individual concerns, especially those working for the export market, are already working more than 40 hours per week. Again, in spite of the prevalence of unemployment in certain branches of engineering, an important motor manufacturing concern can only give delivery after an excessive delay. More than 10 per cent. of French workers in the large con-

cerns are already working more than 40 hours per week, in spite of the obstacles put in the way of all overtime working. And 81 per cent. of the same body of workers already work 40 hours per week. Moreover, in industries which are not subject to the 40-hour week the average number of hours worked per week is 45, notwithstanding the shrinkage of their market, due to the restriction of hours to 40 in other industries and the consequent reduction in the total wages paid in these industries.

The five-day week of eight hours per day, of which the first Prime Minister of the present Parliament himself declared that it was not the best method of applying the 40-hour week, has the enormous disadvantage of rendering machinery idle for two days out of seven, thus legalising, as it were, the amputation of one-sixth of France's industrial capacity. But if our production is to be increased by 30 or 40 per cent., how can this be done without an increase in working hours, given the fact that production could only be increased by 6 to 8 per cent. if unemployment were completely eliminated? It is clear that all branches of activity are inter-related. If industrial concerns are freed from the restrictions on working hours, the suppliers of these concerns will themselves have to produce more and, step by step, the whole industrial mechanism will be set in motion again.

We do not hesitate to say that the measures designed to increase the flexibility of the 40-hour week for the duration of our plan form one of the bases of our programme, and are as important as the price and credit policy from which they are inseparable. We believe that any plan which evaded this problem would be bound to fail. We admit that the sacrifices now demanded of the working classes must be accompanied by measures which guarantee them against abuse by employers. If we believe that it is necessary to restore the profit motive, the working classes must also be certain that the additional hours they agree to work will not give rise to excessive profits. In order to prevent this we have prepared a decree designed to tax the excess profits of limited companies. At the same time, as part of a long-term plan, we are attacking the problem of wages and unemployment. In this sphere, we have prepared decrees defining the status of workers' delegates, regulating the application of collective agreements and promoting vocational education and re-training, decrees which should provide still another guarantee of the improvement of industrial relations.

2. PRODUCTION AND CREDIT

There was no room for doubt in shaping the labour policy. But in formulating a policy of production and credit we had a choice, though we had no hesitation about the path dictated by the national interest.

(a) General Direction of Policy

Owing to the paucity of capital available in the market, exchange control has frequently been recommended as a means of putting the brake on the export of savings. This measure alone, it has been said, would make it possible to stanch the hæmorrhage of capital and then to proceed to the vast expansion of credit necessary to give an impetus to production and the growth of wealth. In support of this suggestion, which seems simple, the success and duration of the National Socialist experiment in Germany has been cited.

It is only too easy to dispel these illusions. Like all easy solutions, exchange control acts upon the symptoms rather than upon the cause. But can it be imagined that the cause will cease to operate when the consequences are eliminated?

Until 1936 capital left the country because the franc was over-valued and because it was only natural to discount an adjustment of the exchanges. Since then the flow of capital to foreign countries has continued because industrial activity has slowed down, profits have been jeopardised, and public finances have been unhealthy. For more than a year, however, though at the cost of considerable fluctuations in the rates of exchange, the flight of capital has ceased and gold movements, on balance, have not been unfavourable. We do not insist on the difficulty of applying exchange control in a country like ours, which is a market with wide international ramifications, a great empire with extensive frontiers, a land of liberty hostile to excessive regimentation. We confine ourselves to pointing out its probable consequences. At home the application of exchange control would lead to profound modifications in the realm of politics and economics; as far as our relations with foreign countries are concerned, our action has hitherto been in line with that of the great western democracies to whom we are linked by a thousand ties, of which the Tri-Partite Agreement signed on September 26, 1936, stands to-day as a symbol.

But is it really possible to believe in the advantages of exchange control in present conditions, when we have the task not of seeking salvation in a negative attitude (to prevent the outflow of capital), but of carrying out an active policy which would lead to the substantial and continuous repatriation for which our markets are waiting? What has to be done is to promote a return of prosperity in France by the return of capital on the one hand, and by the increase in production generated by the lengthening of working hours on the other. How can exchange control assist in the solution of this problem? To lock the stable door now is to give up all hope of a return of capital; and in the persisting disequilibrium of our economy with the inexorable necessity of securing a rapid inflation, in conditions of vacuum, the introduction of exchange control would have the double effect of precipitating a substantial depreciation of the franc abroad and a rapid increase in retail prices at home. How can one invoke the experience of the Dictatorships in Italy and Germany? Exchange control in the totalitarian States is designed, by severe restrictions, to increase the tension of the national energies for a constant effort. How would it be possible for France to continue her policy of freedom and *laissez-allier* in these conditions? The truth is that if the introduction of exchange control still has partisans, this is perhaps because, having not yet been tried, it has not yet failed. For ourselves, our mind is made up. France cannot allow herself the luxury of a new failure. We want neither a deceptive breathing space nor the terrible awakening which would follow.

(b) Organisation of Production

The State is responsible for giving a general direction to the national economy. Its monetary and financial policies, therefore, are of decisive importance. The State must do its utmost to restore the doctrine of risk and profit as well as that of work and output. Apart from this, its rôle is one of guidance and it should, in principle, intervene only when the importance of the enterprises concerned is such as to involve the national interest. The important problem to-day is to restore flexibility to our hamstrung economy and to give it every chance to expand. Too much legislation obstructs the necessary process of continuous adaptation to changing conditions. The present system of price control is particularly characteristic in this connection; it hinders movements which are justified and sometimes even desirable and prevents both upward and downward adjustments. We intend to modify this rigid mechanism which, by a strange paradox, now excludes only foodstuffs, that is, those commodities whose fluctuations have the greatest effect on the cost of living.

(c) Credit Policy

In the sphere of production, the wise course is to try not to do harm rather than to do good. So far as credit policy is concerned, Government action predominates; credit policy is the corner-stone of economic policy. And the state of the currency is itself the basis of that policy.

We are convinced that the conditions necessary for an improvement on the capital market are to-day fulfilled. The franc is at a level where there is no question of the parity of prices in France and abroad. On the contrary, our industry is in a more advantageous position in this regard than that of any other country. We do not see anything that is likely to change this position or consequently to impede the substantial reduction of the rate of interest which we envisage.

The money market must be nourished in the normal manner by the gradual repatriation of capital. It will be supported by a liberal monetary policy. It will be eased to the extent that the financial measures, which we are taking to-day, and the growth of revenue consequent upon economic expansion, will diminish the State's need of loans. And, for what will remain of this need, we intend, as far as possible, to spare the long-term market by having recourse to the money market for the financing of public expenditure. While we are hostile to inflation, we are anxious to combine an expansion of credit with a reduction in interest rates. And our reward, as well as the criterion of our success, in a future which, we hope, is very near, will be to see this favourable development of the market taking concrete form in a lasting alteration of the cost of the public debt.

Finally, no action in the economic sphere will be effective if we do not also concentrate on the creation of what, for a State, is the real source of plenty and of strength: a young and large population. We propose here and now to take the first steps. The task will have to be completed to-morrow, for all the foundations we can lay will be useless if we show ourselves incapable of ensuring the perennial life of the country.

V. The Financial Programme

THE situation is clear. There is a disequilibrium, amounting for the State to 38 milliards, and for the other public authorities, whose uncovered expenditure is in fact guaranteed by the Treasury, to 17 milliards. Total: 55 milliards.

The first necessity in undertaking to cure a disease is to know that the disease exists. If the country does not realise the mortal peril which is lying in wait for it, how can it find the impetus necessary for success? What the French people must also know is that the French financial disequilibrium, profound though it seems to us to be, is a problem that can be solved with perseverance and time.

The financial reform which we are realising to-day is only a first step. We consider that the immediate object to be attained for the year 1939 is to balance the ordinary budget of the State, and to produce a significant improvement in the financial situation of local authorities and the great public services. To do all that is immediately possible in the sphere of budgetary economies, to enter upon a continuous effort to secure profound reforms of our administrative organism, to adapt our fiscal levies to the new value of the franc and to the level of prices—that is the task of to-day. Thanks to greater flexibility in the conditions of labour and to the new economic impetus, we shall benefit from increased revenues which will reduce the recourse to borrowing.

(a) REDUCTION OF PUBLIC EXPENDITURE

Our first word in this sphere is to affirm that we shall not make a unilateral denunciation of the contract between the State and the investor. It is true that the burden of the borrowings of the Treasury and the local authorities has become so heavy that the object of any policy of reform must be substantially to reduce it; but it would be fundamentally contrary to the goal we have in mind to have recourse for this purpose to measures of compulsion. Our policy is intended to result in an improvement of public credit, and we feel confident that if we are allowed to continue our work we shall be able to undertake conversions which will greatly lighten the burden of public expenditure.

Our budgetary effort consists of two essential parts; and it will be complemented by the economies which will automatically follow from the changes in the conditions of work in the public services.

(i) Expenditure on Works

After revising the allocations of the ordinary budget of 1939 to the amount of 500 millions, we have decided to act vigorously in strictly limiting expenditure on civil works to what is imperatively necessary in the general interest. It is impossible at one and the same time to continue the armament policy imposed upon us by the international situation and also a policy of great public works. No country can engage in such a gamble without deliberately sacrificing the welfare of the working masses.

The present large schemes of public works were started as a remedy for the inadequacy of private initiative. At a time when we base all our hopes on a re-birth of the spirit of enterprise we are justified in believing that commerce and industry will be able, far better than the State, to undertake such schemes as have a remunerative character. The repeated experience of the last few years has been that when the State raised 10 milliards to finance large public works, 20 or 30 milliards of private works were abandoned as a result of the rises in interest rates and prices; thus the State indirectly diminished the turnover of business. We do not suggest—indeed, on the contrary—that the programmes which have been drawn up are not in the general interest, but we declare that they cannot be carried out so long as the financial position of the State and the local authorities requires repeated recourse to borrowing.

The decision taken with regard to public works represents for the year 1939 alone a net economy of 2½ to 3 milliards, and the figure will be considerably larger in 1940. The question will arise in due course whether the execution of certain programmes now to be interrupted should not be resumed according to the circumstances of each case. Even now provision has been made for exceptional treatment of small rural works and of urgent cases.

(ii) The Reorganisation of the Public Services

This task is difficult above all others. Numerous attempts have been made for nearly fifteen years past to lighten the burden of our administrative machine. All these efforts have been in vain, as is shown by the uninterrupted growth of the services and the continuous increase in the number of civil servants. At first sight, administrative requirements are so complex, and the different aspects in which public authority shows itself are so numerous, that State intervention

seems to-day to be an inescapable phenomenon. Nevertheless, all enquiries reach an identical conclusion: many of the administrative bodies are not well adapted to their task. Old-established services have not succeeded in modifying their methods. New services have developed without comprehensive plan and have trespassed on the functions of existing bodies. There is thus no doubt that an effort to secure rationalisation must be made.

Frequent promises have been made to the country and public opinion will not allow its legitimate expectations to be once more disappointed. We reject the easy solution of an arbitrary reduction in all appropriations; its inconveniences arise from its very simplicity. The most useful and best administered services are penalised equally with the bodies which are too extravagant. Obvious anomalies quickly appear. The economies secured in this way have been large, but they have not lasted long and real relief has remained illusory.

We have chosen another method. A "Comité Supérieur de Réorganisation administrative," with five members, which will devote itself to this task, is the mainspring of the scheme. This committee will make searching enquiries in all the essential fields of activity of the public authorities; the administrative machines of the Ministries; armaments; transport; the various examples of State participation in business activity; the local authorities will be simultaneously examined with the sincere desire for reform. The conclusions of these enquiries will be embodied, before December 31, 1939, in simple decrees to bring into effect the proposals and reforms that will be elaborated.

As an immediate mark of our firm resolution to secure fundamental reforms in this sphere we are arranging that all departments of the public service will be subjected within the next three months to a provisional plan to restrict recruitment, which will be applied in the interim period before each service is enquired into by the committee.

(b) FISCAL PROGRAMME

This programme, amounting to about 10 milliards, consists of two parts: the first refers to direct taxation, the second to indirect taxation.

(i) Direct Taxes

We are setting up for 1939 an emergency tax based on a twofold idea:—

A general tax on all wages, professional incomes and remuneration of the French people will serve as a symbol of the common national effort. It will be at the rate of 2 per cent. without any deductions for lower incomes. The expected yield is 2,500 millions.

An increase of 30 per cent. in the scale of the general income tax voted on December 31, 1936, on the proposition of the first Blum Government. We expect from this 750 millions.

In addition, it is necessary to co-ordinate and adjust the scales of the different scheduled taxes (impôts cédulaires). These re-adjustments, which will be at the rate of 16 per cent. for all the schedules except that on wages, for which the rate will be halved, will produce 550 millions. A similar measure concerning personal property (valeurs mobilières)—the rates being fixed at 18, 27 or 36 per cent. according to the different categories—will produce 450 millions.

The stamp duties are slightly increased, stamped paper rising from 5 francs 40 cents to 6 francs (100 millions).

Total for direct taxes and stamps: 4,250 millions.

(ii) Indirect Taxes

The rates of most of our specific indirect taxes are no longer in proportion to the level of prices and of the currency. Moreover, the measures which we intend to take in the economic field provide a further reason for proceeding to an adjustment of these taxes. The revision of the duties on liquor, sugar, combustible liquids and several duties of minor importance, a slight customs duty on exports and imports, will produce an increase of yield of 2,400 millions. As a general rule the specific rates are increased by 15 per cent. on the average. The production duty is slightly increased, the general rate rising from 8.7 per cent. to 9 per cent. and the tax on professional services from 2.2 to 3 per cent. Together with several measures intended to improve the incidence of this tax, the yield expected is 750 millions. We also propose the adjustment of postal rates on the basis of an ordinary letter rate of 90 centimes (800 millions), an increase of the price of tobacco (500 millions) and, finally, a measure which will permit of an immediate increase in transport fares in Paris (150 millions). Total, 4,500 millions.

(c) PUBLIC CREDIT AND THE TREASURY

In the estimates that we make for 1939 we intend to remove everything that stands in the way of efficient manage-

ment. We believe that the State must deserve the confidence of the French investor and that it has no right, when it appeals to him, to conceal the truth, or to try to attract his money by legal or accounting fictions. It is as a sign of this wish for a healthy management of public credit that we wish strictly to define the conditions of public issues and at the same time to prohibit all new borrowings from abroad with the aid of the gold clause.

The solutions that have been adopted as concerns the balance sheet of the Bank of France are inspired by the same desire. If the balance sheet is drawn in such a way as to take account of the present value of the currency the situation it reveals is favourable; this will make it possible for the public to form a correct estimate of the position of our note issuing institution. The various existing items of provisional advances to the State are to be abolished. The Bank will create a new item of advances which will consist of the balance of the existing advances not repaid out of the proceeds of the revaluation of the gold reserve; the repayment of these advances will be eventually assured by the liquidation of the exchange stabilisation fund and the fund for supporting Rentes and by any further sums that may accrue when the reserve is finally revalued. Apart from this, only the permanent item of advances, which has appeared since the beginning of the century and was continued by M. Poincaré in 1928, will normally remain. This item was fixed in 1928 at 3,200 millions. In order to adjust the item of permanent advances to the volume of the budget, to the level of prices and to the value of the currency, we are raising it henceforward to 10 milliards.

This measure leaves a net credit of about 6 milliards which comes in the normal way to the State. The resources of the Treasury are thus large.

The remedies which we have enumerated have made it possible to release about 10 milliards of revenue and about 5 milliards of economies which will be gradually realised, if our scheme is carried out with tenacity and perseverance. The total can thus be put at 15 milliards. In view of our economic reforms, it is not excessive to add 5 or 6 milliards to this figure to allow for additional receipts of every variety in the revenues of the State, the public services and the local authorities. Since the total of these revenues reaches 100 milliards, the increase thus discounted is only 5 per cent.

About 20 milliards in all will thus be provided by normal efforts. The national savings will make it possible for us to finance the remainder (essentially consisting of the armament programme), either by short-term or by long-term borrowing. We wish to avoid, at all costs, draining the resources of the financial market. Thanks to the balance in the Treasury at our disposal, we are in a position to declare a policy of avoiding competition in demand for capital with industry and commerce and to dispense with appeals to the long-term market for several months.

CONCLUSION

To summarise: our plan has a threefold form:—

A more liberal price regime which, however, does not preclude a close watch being kept over retail prices.

A more liberal credit regime facilitated by an economic administration of the public revenues and by a vigorous budgetary reform, thanks to which private enterprise will be recompensed a hundredfold, in the form of capital standing ready for investment, for the exceptional fiscal sacrifices imposed upon it.

Finally, a more liberal labour regime; for price elasticity and credit expansion would be useless if at the same time the working class did not give their generous co-operation in the common task.

It is, then, to the confidence of the entire country that we appeal, to the investor as to the worker. There has been a long search for the technical formula which would put the seal to the indispensable moral unity of the French people. In the world of to-day, in a Europe which is forging arms by day and night, we do not believe that France can follow any other path than that which we have pointed out. As, henceforward, we climb this road, side by side, day after day, we shall all together feel the pride of belonging to a great people which is resuming its proper rank. These are the principles which have inspired the Bills that we submit to your approval.

Please accept, monsieur le Président, the assurance of our profound respect.

Le président du conseil, ministre de la défense nationale et de la guerre,

EDOUARD DALADIER.

Le ministre des finances,

PAUL REYNAUD.

Topics of the Week

Mr Chamberlain and Colonies.—At Walsall on Wednesday the Government's stock suffered no slump like the setback at Dartford last week; in the by-election the Simonite party retained the seat with its majority reduced only from 8,969 to 7,158. At Westminster, on the other hand, Mr Chamberlain has not been doing so well during the last few days. As Sir Thomas Inskip stated in a public speech on Wednesday, the persecution of the Jews in Germany has proved a distinct check to the policy of appeasement. And the pogroms of the past week, reinforced as they have been by official decrees of a calculatedly draconic character, have for the moment knocked the bottom out of any plans the Prime Minister may have had to do a deal about colonies, ours or those of other powers. With the prospect of ensuring peace by the Munich method of diplomacy attenuated—to say the least—by Herr Hitler's onslaughts on British democracy and by the tirades of Dr Goebbels's Press against British Imperial policy, the Government's failure to offer adequate earnest of their intention or ability to provide security by intensified re-armament stands out starkly. In the van of this week's harassing of the Cabinet have been the Conservatives themselves, which may render election results unrepresentative of Parliamentary trends. On Monday, questions elicited a promise that Mr Chamberlain would not arrange the transfer of colonies or mandates without consulting Parliament and the interests of the colonial populations. Later in the week, Britain's obligation to protect the colonies of Portugal was officially admitted; M. Daladier reassured his own critical followers by disavowing any intention of giving away colonies; and General Smuts declared that the Union would fight for South-West Africa.

Political Trends.—Meanwhile unrest about the whole trend of the Government's policy has grown among its supporters. On Monday, Mr Eden, proclaiming that "re-armament was more than a matter of arms," called for a Government more broadly based upon public opinion of all party colours than the present, and a bold policy to reconstruct national life as well as shoring-up national defences. In the wide sweep of his Baldwinesque peroration, Mr Eden placed the state of industry and trade, the Special Areas and the condition of the people on a par with more airplanes, more men and more guns; and thirty-eight adherents of the Government (three of whom withdrew their names later) signed an amendment to the Address supporting the Eden line. Throughout the week, up to Thursday's crucial debate on the question of a Ministry of Supply, the Churchillite guerrillas were busy, and the work left to the official Opposition was small. In all, it became clear that concessions from Mr Chamberlain to his followers, no less than to Herr Hitler and Signor Mussolini, were imperative. A compulsory National Register would be easy to concede; the Ministry of Supply, the pivotal requirement for speedy and efficient arms output, less so. Yet the hero of Munich had to walk warily; the coming shadow of a new Conservative bloc, with a broad and complete policy of defence and social reform, was cast across his path. True, no break-away yet threatened Mr Chamberlain's Commons majority, and a loyal band even organised a motion of confidence. True, too, the Labour Opposition looked askance at Mr Eden's proposed all-party alliance. But the Conservative party itself, and the Conservative Press, were openly ill at ease. The Prime Minister will leave for Paris next week with the iron in his soul at the ungrateful behaviour of Herr Hitler. Downing Street is not yet Eden End, but Mr Chamberlain's copyhold is much less secure than it was.

Godesberg and Munich. Yet even now, the Government is not prepared to set up a Ministry of Supply to lessen the gap in air strength with the speed all parties in the country now look for. The substance of the Government's defence against its critics in this matter is, in fact, a series of paper plans, shuffled and dealt without regard to their industrial operation. The latest, announced at the end of last week, was surprising. Hitherto, it has been common ground between the Cabinet and their critics that priority in aircraft production was to be given to bombers. Now, Sir Kingsley Wood announces that the highest priority is to be given to fighter machines. Once more, as in the case of air raid precautions, the Government has suddenly and drastically reversed a policy tenaciously defended very many months against all objections. This means one of two things: either the technical advice upon which the Government acts in the first instance is hopelessly inefficient, or else the Government, having no will to stick to the policy it believes to be the right one, is ready to be overpersuaded for political reasons. Either explanation is gravely disquieting and scarcely conducive to confidence in the present administration. In the case of A.R.P., technically new ground, there was some excuse: in the case of the air arm, there is none. Sir Kingsley added that 5,000 to 6,000 fighters were on order or to be ordered (the usual basis of counting in official censuses of arms progress), which means, on paper, more than a fivefold increase in our strength. Bombers, which have now lost priority in home production, are to be augmented from Canada under the scheme arranged some months ago by a visiting mission. A large initial order to be fulfilled by 1940 has been placed with the central Canadian company recently formed for the purpose, and the participating firms have undertaken to maintain a capacity to meet all potential orders for planes and components for the next ten years. But it is at home where the real delays and deadlocks in output have still to be completely broken down.

"Death to the Jews."—The death in Paris of Herr vom Rath on November 9th from shots inflicted by the young Polish Jew whose parents had been victims of German persecution, was followed, on and after the night of the 9th-10th, by systematic pogroms that threaten the very existence of the Jewish community in Germany. The thing was done in cold blood. Storm-troopers were, it appears, called up from their beds by telephone in the small hours and set to the work of burning synagogues, smashing and looting Jewish shops, and hounding Jews out of their homes. Everybody saw the outrages; almost everybody hated them; hardly anybody dared to protest.

Air Armaments.—Britain's weakness in the air relative to Germany was a fatal handicap at Berchtesgaden,

The German Government then proceeded to impose on the Jewish community penalties proportionate to the degree of their victimisation at the Government's own hands. For the crime of having been harried and looted, the Jews are to pay a fine of the equivalent of about £80 millions sterling; they are to make good the damage done to their property before handing it over to Aryan usurpers; they are not to touch the insurance payments due to them; and for the future they are to do no business in Germany, attend no schools or universities, and resort to no places of entertainment. They are expelled from co-operative societies; and in many cases they have lost their homes. Most Jewish vocational training centres are in ruins and those for whom they catered in concentration camps or flight abroad. Jewish shops and businesses must disappear or be sold to "Aryans" at knock-down prices; those few Jews who remain in "Aryan" employment now lose all right to pensions at six weeks' notice without respect of contract; and rigid restrictions limit their ability to buy and sell securities. What wealth remains to them will apparently be seized within a few months for the Government's coffers. Jews in Germany may no longer live as citizens; they are to be underdogs consigned to a mental ghetto, barred off by scorn and hatred, out of which none of them may pass and lift his head.

The Jewish pogroms have been accompanied by anti-Catholic outrages at Munich, where the windows of Cardinal Faulhaber's palace were broken last Saturday. And on Sunday the Nazis, unhindered by the police, broke up the tercentenary celebration of the erection of a religious monument. It is as though the devotees of Leviathan were determined to bring about a defensive alliance between all the faiths that agree in worshipping God and abhorring idolatry. Their friends in Italy have carried on the work by issuing legislation which implements the Fascist Grand Council's recent anti-Jewish decisions. The marriage of an "Aryan" with a "non-Aryan" Italian is prohibited, and marriages celebrated in contravention of this law are to be without civil validity. This modifies the Vatican Concordat, for Canon Law knows nothing of racial distinctions, and the Pope has already made his protest.

The barbarism in Germany has evoked vehement expressions of disgust in other countries. Such criticism was vocal in Great Britain last week-end, and this has lashed the Nazis into a fury which they have vented in a Press campaign against the British Empire and all its works. There has been an official British protest in Berlin against the insinuation in the *Angriff* that the British Opposition leaders whom Herr Hitler has "put upon the spot" are implicated in the murder of Herr vom Rath. In the United States the feeling has, if possible, been even stronger. President Roosevelt has taken the unprecedented step of publicly announcing that American opinion has been deeply shocked, and that he himself "could scarcely believe that such things could occur in a twentieth-century civilisation." The American Ambassador in Germany has been recalled to report. It is cheering that democratic sym-

pathy should have provided plans for immediate assistance: the Evian Committee on political refugees is to be convened, the British and American Governments are collaborating, and the Dutch Government, greatly to its credit, has already organised relief camps for those who have struggled out of Germany. The need for refuge is so acute that rumours are current that some really impressive action, such as the opening of facilities for large-scale Jewish emigration to British Guiana, is in mind. But perhaps the best comment is provided by another American, Mr La Guardia, Mayor of New York, who has ordered as guards to the German Embassy a picked Jewish contingent of the New York police. In mingling dignity with contempt, that is a suggestive reply to Germany's strange overture to "appeasement."

The Anglo-Italian Pact.—This Wednesday, November 16th, at Rome, two pieces of Anglo-Italian business were transacted. In the morning the British Ambassador, Lord Perth, presented to the Italian Foreign Minister, Count Ciano, new credentials accrediting him to King Victor Emmanuel as "King of Italy and Emperor of Ethiopia." In the afternoon the same two statesmen signed a declaration that the Anglo-Italian Agreement initiated last April had now come into effect. This agreement, in itself, consists of little more than an agreed schedule of British and Italian interests in and around the Mediterranean and the Red Sea, with a profession of intention to respect these interests reciprocally. Similar schedules were part of the Anglo-French Agreement of 1904 and the Anglo-Russian Agreement of 1907. They are a necessary supplement to any entente; but they cannot in themselves create an entente, and they are not worth the paper that they are written on if there is no real union of hearts. What then, to-day, are the real relations between Great Britain and Italy? On the day of this week's ceremony in Rome, Signor Gayda put it on record that the Anglo-Italian Agreement does not alter in any way the main lines of Italian foreign policy, of which the Rome-Berlin Axis remains the basis. In the House of Lords on November 3rd Lord Halifax told us that Signor Mussolini had always made it plain, from the time of the first conversations between the British and Italian Governments, that, for reasons known to us all, whether we approved them or not, Signor Mussolini was not prepared to see General Franco defeated. He had always made it plain, on the other hand, that he would assist, as he had been assisting, the work of the Non-Intervention Committee. In other words, the Non-Intervention scheme is a device for enabling Italy and Germany to make General Franco win in Spain with Anglo-French connivance; and we now know what Signor Mussolini means by his promise to respect the integrity of Spain and what Mr Chamberlain means by saying that a "settlement" in Spain has been arrived at, inasmuch as there is now no danger of the Spanish war turning into a general war. In plain terms, the Anglo-Italian Agreement is a deal at the expense of two other parties; the essence of it is that Great Britain condones Italy's destruction, by unjust and lawless force of arms, of the independence of Republican Spain, as well as the independence of Abyssinia. Is this a foundation on which any genuine Anglo-Italian friendship can be built?

An Airways Merger.—A further step in the re-organisation of British civil aviation was announced by Sir Kingsley Wood on Friday. The assets both of Imperial Airways and of British Airways—the two lines with regular overseas services—are to be acquired for a new public corporation which will in future be the vehicle for the Government's subsidies to the industry. The reason given for this change is that it is necessary as a consequence of the Cadman Committee's widely-applauded enunciation of the principle that Government subsidies should not be used to pay high dividends. Limitation of dividends, however, makes private financing onerous, while new development

will require a large volume of new capital. The burden on the Exchequer can be reduced to a minimum only if the civil aviation industry is enabled, by Government guarantee, to borrow at low rates of fixed interest. The plan as a whole is one that should be welcomed, though it has its dubious points. Civil aviation—at least the foreign services—is eminently fitted for conduct in a socialised form. In view of the virtual certainty that it will need continuous subsidising, the objections that might ordinarily apply to the provision of the capital of a trading undertaking in fixed-interest form (objections which are receiving additional point from the difficulties of London Transport) can be waived. There will, in effect, be a considerable equity in the new corporation's capital—a negative equity held by the State. It is a little more questionable whether a merger of the two businesses was entirely necessary for the execution of the plan. The history of Imperial Airways does not encourage the belief that there are no virtues in competition, and public duopoly is not necessarily less practicable or wasteful than public monopoly. There are distasteful elements also in the arrangements for compensation. If agreement cannot be reached, the price will be fixed by independent arbitration. There can be no objection to this in principle; but, in practice, the announcement of the scheme led to an immediate rise in the Stock Exchange quotation of Imperial Airways shares from 25s. 6d. to 29s. There are, it is true, reasons arising from the past relations of the company with the Government which encourage the belief that a price of 30s. or even more will be paid. But the only element in the situation which was not known to the market before Friday and could not enter into its estimate of the future was the Government purchase. It would be disastrous if the notion ever received currency that the Government always pays a fancy price.

Important Penal Reforms.—There are two Sir Samuel Hoares: one, author of the Hoare-Laval pact, member of the Inner Cabinet, henchman of Mr Chamberlain and rival to Sir John Simon for reversion of the Premiership; the other, descendant of Elizabeth Fry, Home Secretary, and zealous reformer. The latter's Criminal Justice Bill, long-awaited and published this week, may well shine in the coming session like a good deed in a naughty world. Drastic reforms, such as the Bill proposes, come only once in a generation, and much credit must go to a succession of permanent officials and Secretaries of State who have worked towards the day when opinion would be ripe to replace obsolete and often barbaric penal practices by new methods to cure the most obstinate of social disorders by education and special treatment for particular classes of offenders, rather than by indiscriminate punishment in harshly conducted prisons. Sir Samuel has chosen the time to act. Already the details of prison life have been ameliorated by administrative measures. Now a programme of legislative reform is designed to make the punishment fit the criminal with the object of preventing him from becoming a hardened offender with a life-long stigma upon him. For adults, new categories of penalty, based upon the recommendations of a departmental report on persistent offenders, give Courts of Assize and Quarter Sessions power to sentence persons between 21 and 30 to periods of "corrective training" in specialised prisons and persons over 30 to "preventive detention," and abolish the terms "penal servitude," "convict," and "hard labour," already rendered largely obsolete by the gradual introduction of humaner and more curative methods of prison organisation and routine.

For young offenders, by whose treatment any penal system stands or falls, an attempt is made to devise appropriate penalties as a *via media* between the present unsatisfactory alternatives of imprisonment and probation. There will be remand centres for offenders between 14 and 23, the upper age limit being notably high;

regional remand homes for children and young persons presenting problems needing supervision; Howard Houses or hostels for the residential control of young offenders; and compulsory attendance centres where young offenders may be compelled to spend their leisure evenings and half-holidays without breaking into their normal working lives. In addition, courts of summary jurisdiction will be empowered to pass sentences of Borstal training upon persons between the ages of 16 and 21. The consequences of these proposals, all *prima facie* steps in the right direction of safeguarding society by saving the offender from a life of crime, will depend entirely upon the way they are applied. Specialised penalties require specialised institutions with specialised curricula; the educative regimen provided for the different classes of offenders in prisons, remand centres, remand homes, hostels and attendance centres will be vital. The extension of the age limit for Borstal sentences will place an appreciable strain upon the wisdom of magistrates not always conspicuously sage. Finally, corporal punishment has happily been abolished, except for serious prison offences, but capital punishment, condemned by a free vote in the Commons on Wednesday, is to remain to provide (if we are to believe Mr Geoffrey Lloyd) a safeguard against resort to "lynch law" in the case of brutal murders.

Palestine.—It has now been confirmed in the House of Commons by Mr MacDonald that the Mufti of Jerusalem will not be acceptable as one of the Palestinian Arab delegates at the forthcoming London Conference on the Palestinian problem. Nevertheless, the Mufti himself has given the Conference his blessing. For this apparent paradox there is perhaps a twofold explanation. In the first place, the Arabs see, in the calling of the Conference, a negative victory for themselves. It means the end of the partition scheme and, by implication, the end of all idea of establishing a Jewish sovereign State in Palestine, even on a miniature scale. In the second place, we may guess that the Mufti counts on being effectively represented at the Conference by proxy; and, indeed, it would be difficult for the Government to exclude all the Mufti's partisans without reducing the composition of the Palestinian Arab delegation to an absurdity of unrepresentativeness. For all that, the Mufti should not be assumed to be the only important Arab leader. That would be far from true. Some of his opponents have been killed by his henchmen, others driven abroad. Among the latter is Fakhri Bey Nashashibi; and in a letter to the High Commissioner of Palestine, published in the Press, this influential Arab suggests that the Government would do well to secure the representation of parties opposed to the Mufti. As for the representation of the non-Palestinian Arab States, there is something incongruous in the exclusion of the Syrians and the Lebanese, considering that Palestine is, from the

Arab point of view, just a slice of Syria that has been arbitrarily lopped off. The ground given for the exclusion of these two Arab states is that they are not yet completely emancipated from the French mandate. In the four Arab countries that have been invited to participate, and specially in Iraq, the calling of the Conference has been hailed with relief; for all these now fully independent Arab States are in a dilemma. They do not want to exchange French and British whips for Italian and German scorpions; but at the same time they do not want to go on being whipped in public—and that is how they regard the present repression of the Arab insurgents in Palestine by the force of British arms. These non-Palestinian Arabs would no doubt welcome a compromise that would save their face by securing what they and the Palestinian Arabs would agree in regarding as the Palestinian Arabs' elementary rights. But we must not flatter ourselves that the Arabs' minimum demands will prove reconcilable with the Jews' maximum concessions. No doubt the first effect of the Conference will be to reveal the width of the intervening gulf. It remains to be seen whether British statesmanship will contrive to bridge it.

The Second Czechoslovakia.—Even Versailles conceived no frontiers so strangely shaped as those of the new Czechoslovakia, shown on our map on this page; but this unlikely product is the first-born of what might be called "geo-ethnological" power-politics—and as such it is not perhaps so surprising. The Republic is still adulterated by some hundred thousand Germans and Magyars. Well over one million Czechs and Slovaks live outside its frontiers. Internal rail communications are practically non-existent: and Ruthenians wishing to go to Slovakia will have to take horse and go over the mountains. Slovakia is denuded of Kosice and the important commerce of its riparian plain; as sizeable towns only Bratislava, with 123,000 inhabitants, and Ruzomberok, Zilina, and Nitra, each with about 20,000, are left. According to the 1930 census, which differed from that of 1910 chiefly by showing Jews as a separate nationality instead of as Magyars, Kassa (Kosice) has 42,000 Slovaks and only 11,500 Magyars, Ungvar (Uzhorod) 3,000 Czechs and Slovaks, 4,500 Magyars, and 6,300 Ruthenians, while Munkacs (Mukacevo) has 2,700 Czechs and Slovaks, 5,600 Magyars, and 6,500 Ruthenians. Nevertheless, all three towns are now in Hungary. Some idea of the magnitude of the Jewish problem in eastern Europe will be gathered from the fact that, in these three towns alone, there are 20,500 Jews. As agreed at Zilina on October 6th, Slovakia is to become an autonomous province with a Diet of its own linked to Prague by a common president and by the central Government's control of foreign affairs, national

defence, and communications. To the Federal Treasury Slovakia will contribute a proportion comparable with that paid by it to the Czechoslovak Treasury in 1937. In the north frontier alterations are now completed, in some small instances to the credit of Polish generosity; and in Prague a two-party system for Bohemia-Moravia, purged of all "undesirables," is already in course of formation. The German appetite seems still unsatisfied, for the Czechs are now reported to be facing new territorial demands. This "sixth zone" includes a suburb of Bratislava, the town of Theben on the Slovak side of the Danube, "for the purpose of building a harbour," and several small districts in Bohemia. These concessions would still further increase Bratislava's dependence on German goodwill for its economic wellbeing. What is to become of Ruthenia is not certain, but meanwhile Mgr. Voloshin's Government is carrying on its duties at Chust, apparently with the support of a contingent of the Czechoslovak army. The Poles at least would probably favour a *coup* by Hungary for the absorption of Ruthenia; and it seems that the chances of this are not yet past.

Mexican Oil and Land Decisions.—British and American oil companies which were appealing against the Mexican Government's expropriation before the Mexican Supreme Court recently had their appeal dismissed. The Court would not agree to consider it until a decision was made on the administrative recourse filed by the companies with the Ministry of National Economy. As this was only a technical point, the importance laid upon this dismissal by the Court is probably far less than the importance laid upon it by the Mexican Government, for it gives the Government an excuse for pointing out that the expropriated companies have not yet come to the end of their means of legal redress. While it is true that the policy of expropriation with due compensation can be justified up to the point of making sure that Mexico *resurgens* shall not be burdened by overmuch foreign investment and kept poor by the profits of her soil being constantly shipped overseas, beyond that point, where his policy becomes one of undisguisedly fleecing the foreigner, the President is likely to meet all the resistance of a hard-headed and hostile world. He would be wise to stop short of that point, and it seems that he is coming to appreciate this. During the past days the interest has shifted from the controversy over foreign oil companies to the controversy over foreign owners of Mexican land. Tension increased as inconclusive negotiations in Washington and energetic expropriations in Mexico went forward *pari passu*. Happily, however, an agreement on the question of compensation was reached on the 12th as far as United States interests in Mexican land are concerned. The value of the

expropriated American lands is to be determined before May 31, 1939, by two commissioners, one appointed by each government. On the latter date the Mexican Government is to make an initial payment of one million dollars, and this is to be followed by further annual payments of the same figure until the full amount of compensation has been paid up. Claims on which the two national commissioners fail to reach agreement are to be submitted to an umpire chosen—in accordance with the Gondra Pact—by the Permanent Commission at Washington that exists for this purpose, and the umpire is to deliver his awards within 60 days of the date of his being called in in each case. The United States Government is well pleased with this agreement; and though the outstanding oil question is not directly affected, it can at least now be approached in a more favourable atmosphere.

The L.C.C.'s Lambeth Walk.—Four and a-half years ago the London County Council declared that a scheme for the south bank of the Thames in Central London was long overdue. On Tuesday last the Council moved one step nearer to the realisation of a river-bordered open space and Lambeth Walk there by deciding to obtain powers of compulsory purchase from Parliament. Already practically all the area bounded by the river, Westminster Bridge Road, the Southern Railway and Waterloo Road has been acquired, including the Red Lion Brewery, the ancient shot tower and many wharves, but not the property of Jesus College, Oxford. It is necessary that all the area should be in one ownership if it is to be properly redeveloped; and it is just, as well as expedient, that the whole of the betterment that will accrue to the property should go to offset the cost of the improvement that will have caused it. The net cost of extending the present promenade in front of County Hall to beyond Waterloo Bridge, of realigning and widening roads, and indeed of making the South Bank a delight to the eye and a credit to London, is estimated at £1,629,000, of which property will cost in all £610,000, rehousing £194,000, and works £825,000. But this figure takes no account of the surplus lands that will remain in the Council's hands on the completion of the scheme. It may indeed prove virtually self-financing in the long run, as did that other great improvement, the driving of Kingsway through the slums of Clare Market, from which the Council now derives rents of

£146,000 a year in return for a net capital cost of £4½ millions. Some critics maintain that the present is no time to beautify London. But it is perhaps a barren pessimism that would deny Londoners a beautiful city and the money to enjoy it because of the grim need for underground shelters.

The Bressey Plan.—Sir Charles Bressey has passed into history as the author of a scheme to remodel the highways in and around London to meet the needs of the next generation's traffic. Sir Charles is not anxious that his report, published six months ago, should follow him. Turning on Tuesday last to the problem of putting his plan into practice, he expressed strong doubt whether its execution by the collaboration of the authorities concerned was even possible. Deliberations between the more than two hundred authorities affected, including districts as well as counties and boroughs, are indeed likely to promote delay tantamount to deadlock; each local authority is constitutionally determined not to further schemes which are not directly beneficial. Meanwhile development goes on around and across the proposed new routes; fresh housing estates spring up; and land values rise to raise the cost of the Bressey projects above the official estimate of £200 millions. Sir Charles suggested a way out. He would cut across fractionalism in the London region by setting up an Improvement Trust with few members and directive authority to impose the master-plan of his report upon planning and highway authorities, finance committees and spending departments. Here Sir Charles's eagerness to get the job done brings him into line with the planners who seek a single regional authority for the London area with executive powers. They too despair of the local authorities who, in the great complicated conurbation of the capital at least, have proved strikingly incapable of remoulding urban and industrial growth nearer to the general desire. Here also he joins the strategic experts who look upon clear exits from London as a first item among defence requirements. The planners are not wholly at one with Sir Charles because they regard his plan as designed to foster rather than check London's unhealthy growth; and the strategists would re-assess the particular importance of the different parts of his plan in the light of evacuation and war-time transport needs. But all are very properly agreed that action should be taken by some authority competent to do so.

The Causes of Recovery

NEW YORK, November 7.—Preliminary estimates of the index of production for October put the figure at 95, or five points higher than in September. This estimate is about the same as might be inferred from current automobile and steel production; and reaffirms the opinion that the hesitation of September was mere hesitation—partly due to war scare, partly to labour troubles, and partly, perhaps, to "digestion" of the rapid rise in July and August. From 77 in June to 95 in October is an almost explosive recovery—an ascent nearly as abrupt as the decline last autumn.

Yet, abrupt as it has been, it seems to be of a substantial character; and the index at 95 still represents a level far below prosperity. It is, for example, approximately the level recorded in the fourth quarter of 1935. The fly in the ointment is earnings. It does not appear that the earnings of the third quarter rose commensurately with the increase in the volume of production, though one should be cautious in generalising on the basis of such fragmentary data, and from a single three-month period.

Looking back at the genesis of the recovery, it is possible to enumerate a number of factors that seem to have been

influential. In point of time, the first index to show a decided upturn was residential building; and the upturn in residential building came immediately after the revision of the Federal Housing Act. While the most advertised feature of this Act was the sanction given to 90 per cent. instead of 80 per cent. mortgages on individual houses, the real innovation in the Act was the facility provided for building houses to let. It seems justifiable to believe that the Housing Act was a directly influential force in stimulating residential building.

The second factor in recovery, in point of time, was the release of the Inactive Gold Fund. Under that scheme, some \$1,400 millions of Treasury gold was monetised, and a great part of it put rapidly into the credit machine by the retirement of maturing Treasury Bills. The effects of this manoeuvre were (a) to increase bank cash, (b) to increase demand deposits in the commercial banks, and (c) to make a sort of vacuum in the investment market.

Probably certain psychological effects should also be taken into account. From conversations, it is hard to avoid the conclusion that the banking community never really understood the nature or function of the Inactive Fund. They were afraid of it; and the announcement of its abolition gave a sense of relief. Second among the psychological effects of the monetisation comes the beginning of the "inflation-mindedness" which dates from that period, and which has

become more influential this autumn. No matter what its ultimate consequences may be, the change last spring from "deflation-mindedness" to "inflation-mindedness" must probably be regarded as an important stimulating or enervating factor.

Taxation, Stocks and Expenditure

The third factor was the Tax Act, which became law about the end of May. This Act virtually abandoned the undistributed profits tax and modified the capital gains tax. It had the twin effects of allowing corporations a freer hand in their own spending programmes and permitting certain categories of individuals to invest in corporate securities, where they had formerly been forced by taxation into tax-exempt securities or idle cash. The Tax Act of May made shares more attractive as investments than they had been under the previous law; and it is at least a defensible opinion that this was a factor in the sensational share market advance that followed almost immediately. And the rise in the share market itself exercised a stimulating or encouraging influence on business.

All these three factors in recovery operated speedily. The Housing Act was almost immediately followed by an upturn in building. The release of the Inactive Fund caused an immediate increase in commercial bank deposits. The reduction in the capital gains tax made shares more attractive to individual investors, and the behaviour of the share market suggests that they were at once attracted.

Two other influences may be noted, both of them less tangible. Inventories were certainly reduced between December, 1937, and June, 1938; probably the reduction started earlier. There is good reason to suppose that, whatever the inventory position in general, a good many specific inventories were low enough to make their holders nervous, and therefore receptive to any factor suggesting the advisability of enlarging their stocks. And such influences as the rise in the share market, the reduction in steel prices and the first impact of the embryonic war scare on the non-ferrous metals were such factors.

The other intangible influence was the spending programme. Formally, this got under way only in the third quarter, but it actually began in the second quarter, or even at the end of the first. In its early phase, the distributions of Government money were largely in the form of farm benefits and increased outlay on relief projects. By the end of the third quarter, the programme was taking the form of non-residential building contracts and now there are signs that the revival of industry will soon cause relief expenditure to fall. The main impact of the spending programme may not yet have been felt, and it too has had an appreciable psychological influence.

The Role of Profits

A catalogue of causes like this is bound to be highly tentative and debatable. Some people would no doubt give much greater emphasis to the spending programme; others to the monetary factor; others to the "natural forces of cyclical recovery"; others to the flow of foreign capital; and still others to political prospects, labour relations and so on. The point is that the mid-year brought one of those abrupt reversals of trend which are characteristic of the American

economy, and whose analysis is always baffling and never completely satisfactory. At any rate the recovery seems to be genuine, in spite of its abruptness and in spite of the fact that its timing in mid-summer was unexpected.

The disappointing character of the reported earnings for the third quarter has given rise to a revival of the phrase "profitless prosperity." This term came into use in the middle 'twenties just prior to a period of very large profits, and is therefore somewhat suspect. Nevertheless, the question of the profitability of the American corporate economy is by no means answered. In any system largely based on mass production, it is scarcely to be expected that there will be much of a profit-margin except during periods of relatively full employment of the industrial plant. But such periods have, in recent years, been brief and infrequent, and the average earnings record has generally been mediocre. This is no proof that it will be so in the future, but, at the present time, one hears more doubts expressed about the profit margin than of the volume of employment in coming months. Yet, in the end, the profit margin must be the determinant of a continued and balanced recovery, since only a profitable economy is capable of maintaining its productive plant and equipment, or, in other words, its demand for capital goods.

France

[The French political and economic scene is entirely dominated this week by M. Reynaud's plan to bring about recovery. Since the Government's published decrees, as well as the official report on France's financial and economic situation which prefaced them, are dealt with *in extenso* on earlier pages of this issue, a letter from Paris would necessarily involve considerable duplication. Accordingly, no letter has been included.—Ed., *Econ.*]

Holland

A Warning Note

AMSTERDAM, November 13.—A group of prominent men, including Dr Trip, the President of the Netherlands Bank, and several directors of big Dutch banks, recently submitted a memorandum to Dr Colijn, the Prime Minister, emphasising the grave state of the country's finances. The stated deficit of 61 million guilders on the 1938 Budget should, according to them, have actually been recorded at a far higher figure, at least as high as 198 million guilders. Further, the group states that the national debt has risen by 1,380 millions since 1930, a portentous increase when set against the enormous decline in national assets and income. In addition, State expenditure is constantly growing, and the burden of taxation is in consequence increasingly heavy. This cannot, in the view of the group, but diminish employment and activity, and the memorandum comes to the conclusion that the pursuance of the present policy must necessarily lead to disaster.

All classes of the community, the memorandum states, are living at too high a standard. The nation fails to realise the disproportion between that high standard of living and the unsatisfactory economic and financial circumstances prevailing throughout the world. If the nation is not brought to realise this, and if it is not convinced by its leaders of the need to concentrate all its efforts on placing production once more on a remunerative basis and restoring sound State and municipal finances, the sacrifices to be made in the long run will become much heavier; and it is the poorer classes of the community who will have to shoulder the heaviest burdens.

On the whole, it was a recognised fact in the Netherlands that the country's finances were in none too satisfactory a state, as a result, in part at least, of the great expenditure entailed in coping with unemployment and augmenting the national defences. Nevertheless, despite the gloomy view taken by some people, it is generally considered that the Netherlands can well bear comparison with other countries on this score; and it is unfortunate that the above-mentioned memorandum should fail to suggest any precise means for solving the present difficulties. Under existing circumstances, a drastic reduction in State expenditure would clearly be quite impracticable.

Moreover, the memorandum probably presents an over-pessimistic picture of the situation. Encouraging reports have

been coming in from several quarters; and, according to an estimate of the Amsterdamsche Bank, for instance, the net profits of 360 Dutch companies during the past fiscal year rose by 57.8 million guilders, or 37 per cent., while their distributed dividends increased by 39.6 millions, or 51.1 per cent.

Recession Averted?

Other indications give the general impression that the retrograde movement which began in the autumn of 1937 came more or less to a standstill during the third quarter of this year. According to a publication of the Central Statistical Bureau and the Netherlands Institute of Economics, some branches of activity even showed a slight improvement, though most of them are of course still below the level of the corresponding quarter of 1937; and it should be remembered that seasonal influences are most beneficial to business during the third quarter of the year.

There has been a marked fall in unemployment, due partly to increased activity in the building trades. The various military measures taken during the crisis and the employment of some Netherlands abroad also affected the figures. While the metal industry and a few smaller trades report some progress, there has been a further setback in ship-building, and no pronounced change either way in agriculture. On the other hand, the foreign trade returns show that the decline in the value of exports has come to a standstill, and reports from shipping quarters remain fairly satisfactory.

There are two factors which have a definite bearing on the somewhat improved economic situation. In the first place, there is the increased expenditure proposed by the Government for armaments and the execution of public works, the stimulating effect of which has been further enhanced by the recent Budget, which provides for additional measures of this kind. Secondly, there has been the direct and indirect effect of the recovery, slight though it may have been as yet, in the United States. But monetary uncertainty in Europe still constitutes a disturbing influence. Employment is usually on the wane during the autumn and the first months of winter, so that any decrease in activity in coming months need not be taken as indicating a definite worsening of the economic situation.

More Exports

In September the value of exports was much higher than in August, amounting to 101,317,000 guilders, or 11.8 millions more than in the previous month. The value of imports, on the other hand, was almost the same as in August. In September some 2,086,000 tons were imported to the value of 116,904,000 guilders, compared with 2,043,000 tons, valued at 115,522,000 guilders, in August. Thus the import surplus was only 15,587,000 guilders, compared with 26,011,000 guilders in August.

Foreign trade in recent years is summarised, quarter by quarter, in the following table:—

	IMPORTS				EXPORTS			
	Value (In millions of guilders)				Value (In millions of guilders)			
	1935	1936	1937	1938	1935	1936	1937	1938
1st quarter ...	226	233	336	357	160	156	246	254
2nd " ...	229	234	410	344	159	163	286	245
3rd " ...	228	243	398	352	174	194	314	268
4th " ...	253	307	406	...	182	233	302	...
	Volume (In thousand tons)				Volume (In thousand tons)			
1st quarter ...	4,508	4,847	5,135	3,137	3,789	3,555	3,479	3,650
2nd " ...	4,841	5,951	5,523	3,093	4,022	3,479	3,650	3,650
3rd " ...	5,407	6,591	6,208	3,347	4,081	3,650	3,650	3,650
4th " ...	5,602	6,124	...	3,961	4,131	...	...	...

Quarterly trade with England has fallen appreciably. Imports from England have declined from 994,000 tons to 711,000 tons since the third quarter of last year, and exports to that country have dropped from 1,139,000 to 957,000 tons. The value of imports from England has fallen from 99 to 84 million guilders, if the third quarters of this and last year are compared, but since the value of exports to England fell far less, from 184 million to 180 million guilders, the balance of exports over imports in trade with England has actually risen from 85 million to 96 million guilders.

Poland

Government's Election Success

WARSAW, November 14.—The elections for a new Sejm (Lower House) on November 6th produced a poll of 11,844,704 out of a total electorate of 17,585,385, or 67.36 per cent. Only 45.9 per cent. of the electorate voted at the last

election in September, 1935. The figure of 11,844,704 includes, it is understood, a large number of unmarked or spoilt ballot papers. It also includes the votes cast by the German minority, which for the first time went to the polls as "A United German Front" to support the candidates belonging to the National Unity Camp, and all those who voted for the Jewish and Ukrainian candidates. Of the 208 Deputies elected, 161 owe allegiance to the National Unity Camp, five are Jews, fourteen Ukrainians from Galicia, and five pro-Government Ukrainians from Volhynia.

Making due allowance for unmarked ballot papers and what may be described as anti-Government votes, as well as for the fact that the principal Opposition parties (Peasant, Socialist and National Democratic) were not allowed—as they were in 1935—to advocate an electoral boycott, the result is nevertheless accepted by unprejudiced observers as a real success for the governing regime. The position of the Opposition parties, widely divided as they are, is probably weaker to-day than at any time since the Pilsudski *coup d'état* in May, 1926.

The "dynamic diplomacy" of which Colonel Beck, the Foreign Minister, has this year given several manifestations, has evidently found a full measure of popular approval; while the promise that one of the first tasks of the next Parliament, which meets early in December, will be to enact new electoral laws undoubtedly made a good impression. The duration of this good impression, however, will largely depend on how the new laws are framed, and then on how long the new Parliament lives. If it stays in for its allotted span of four years, the promise of electoral reform may not be worth much. The expectation at present, however, is that the new Parliament will be dissolved after passing the Budget for the next fiscal year and the new electoral laws.

Fresh Economic Problems

The popular acclaim with which the Polish public welcomed, early in October, the recovery from Czechoslovakia of "the lands beyond the Olza" with their mines, blast-furnaces and steel mills has now given place to serious economic study of the problems which the "rich dowry" has brought. As so often happens in history, the political preparations for an event are far in advance of the economic, and the newspapers are already recording economic discontent in Teschen-Silesia.

The position in regard to coal—with exports from Poland determined to a great extent by the Anglo-Polish Coal Marketing Agreement—is that the Polish production of 36.2 million metric tons (in 1937) may be increased by 7.5 million tons from the "redeemed" Teschen-Silesian mines. Polish steel production last year, which amounted to 1,450,000 metric tons, of which about 250,000 tons were exported, can now be increased by 550,000 tons from the Teschen district; while the pig iron production of 724,000 tons is increased by 480,000 tons—assuming in all cases that the Teschen mines and foundries will be allowed to maintain their output at the 1937 level.

But the further problem arises of equalising production costs, which in Teschen-Silesia—when it belonged to Czechoslovakia—were 30 per cent. below Polish costs in Upper Silesia. If the Czechoslovak market had been kept open for the coal and metallurgical output of Teschen-Silesia, the necessary economic adjustments would have been made easier, but it is understood that Czechoslovakia will import these commodities, as she may need them, only from Germany. Economists are accordingly sending out warnings that "within a few months our coal industry will be faced with a serious over-production problem."

Domestic consumption of coal fluctuates widely. In 1929, it was 31.5 million metric tons; in 1933, only 18.1 millions,

Money and Government

In this volume* Dr Paris recounts in a brief 115 pages of text and a further useful 70 pages of dates and reprints of laws, the main events in the monetary history of the United States since 1932. He gives a clear description of each stage of President Roosevelt's policy, from the banking crisis of 1933 to the de-sterilisation of gold in the spring of 1938. This book is an excellent compendium of facts, worthy to be put on the shelves beside Kemmerer and Hartley Withers. With an easy hand Dr Paris guides the reader through each Banking Act, each "fireside talk" and each international agreement.

But as a criticism of President Roosevelt's policies this book is not wholly reliable. Dr Paris's own point of view is at once too uncertain and too dogmatic to make his pronouncements on policy of any great value. On pages 33-34 he deprecates

fears that this pouring of gold into the United States may ultimately make this nation a dumping-ground for a commodity which will eventually lose its monetary value . . . it would be hard to believe that such a situation could ever come to pass.

Yet, on page 108, he warns his readers not to dismiss "too summarily" the same possibility—that the world may abandon gold as a standard.

Again, on page 8, the author quotes approvingly Dr Kemmerer's view that changes in the gold content of the dollar will affect commodity prices sooner or later. "Commodity prices," writes Dr Paris,

will lag somewhat behind the price of gold but unless sufficient offsetting factors develop, they will catch up eventually.

It is therefore astonishing to search in vain elsewhere in the book for any recognition of the efficiency of President Roosevelt's gold-price-raising policy; instead Dr Paris, in the teeth of his own principle, belittles the effect of that policy (on pages 105 and 106).

An explanation of Dr Paris's uncertain basis of criticism is not far to find. He nurses an unrelenting and uncritical hatred of any kind of governmental control of economic affairs. He pushes this attitude so far as quite intemperately to denounce exchange equalisation accounts as "dependent upon governmental whim" (page 114). He accuses economic planners (page 7) of aiming at State control of the "whole economic structure."

The weakness of this approach is that, lacking any sympathy whatever for anything that a government does, the critic is quite unable even to distinguish the worse from the better forms of State policy. "We do not know," complains Dr Paris on page 113, "upon what principle [the currency] is being managed." But it is also clear that he does not want to know. He makes no attempt to see the situation as the United States Government saw it from year to year, or to appreciate how they acted, sometimes successfully and sometimes not, with the set general purpose of smoothing out economic fluctuations and relieving the depression. Dr Paris's point of view ignores the fact that the exchange relationship between countries, the banking relationships between American individuals, and the relationship between the economic needs of the country and its actual production had all reached the point of utter breakdown, and that businessmen themselves were clamouring for the Government to provide a remedy.

Dr Paris does not comprehend that the art of government is the art of compromise; that without claiming omnipotence or universal knowledge, officialdom may effect good results by controlling some of the controllable factors in the economic situation; and that they may sometimes do this wisely, as well as sometimes with culpable foolishness.

Nevertheless, the author's ability in the exposition of

facts outweighs the pointlessness of his critical remarks, which are fortunately not many. He is especially good in his chapter on the silver-buying policy. But that chapter should have been used not to adorn a text on governmental interference with industry but as an example of private interference with government.

Shorter Notices

"Accounting for Economic Management." By D. S. Blacklock. Jackson, Son and Co., Glasgow. 8s. 6d. net.

This small and attractively printed book presents some interesting ideas developed as a result of the author's experiences in financial and cost accounting, backed by an earlier training in economics. It is not meant to be an exhaustive study of business management and accounting practice, but, as the author himself puts it, "a small haystack in which the experts can search for those brass tacks—valuable suggestions." The most prominent of these is what the author calls "differential costing," which he claims is more informative than "standard costings," more easily checked, and, most important, that it is applicable to non-standardised products and varying conditions of production. For his own illustrations of the system, however, the author maintains normal standard costs "under hypothetical and pre-determined conditions" as the basis, so that, in the case of variable material cost, the technique consists in analysing separately (a) the extra cost due to the extra quantity of a material used, (b) the extra cost due to the price of that material increasing, and (c) in cases of a group of materials, the change in the cost due to variations in the quantitative proportions of materials used. A similar technique analyses variable labour costs, "oncost," i.e. fixed costs and the remaining variable cost, and profit variation. As a study in accounting practice this is certainly a book to be read and examined, for it has many suggestive diagrams and statements in addition to its main thesis.

"Can Chamberlain Save Britain?" By Collin Brooks. Eyre and Spottiswoode. 247 pages. 7s. 6d.

Earlier this year Mr Brooks painted a foreboding picture of the perilous plight into which British industry, commerce, farming and indebtedness were plunging. Now, when there are signs that, in the economic field, the collapse upon which these oracular warnings were based has been arrested and the crisis Mr Brooks foretold at least postponed, this modern Cassandra has turned his attention to foreign policy. This book is a political pamphlet; it is pro-Chamberlain and anti-everyone else. The author calls for discipline and a simpler life, for appeasement on the Munich model backed by the economic and military might of Britain fully organised. Mr Brooks rightly says that there is no reason why wealthy Britain should not be stronger than the less well-to-do totalitarian States; and that gaps in our defences are fatal to diplomatic integrity; but his extreme partisanship rather mars the appreciable modicum of common sense which is simply and forcibly stated.

"The Gilds and Companies of London." By George Unwin. Third Edition. Allen and Unwin. 401 pages. 10s. 6d.

The late Professor Unwin was one of the most learned and humane of scholars. This book, first put out thirty years ago, is a classic in the roll of economic history, and with the same author's book on industrial organisation in Tudor and Stuart times, has blazed several new trails in the study of the past of the people. Mr F. J. Fisher has brought the appendices and list of sources up to date with care and skill, an essential addition; but the main body of the book still stands, as it did a generation ago, a monument of erudition—and of absorbing interest.

THE BUSINESS WORLD

Britain's Markets

TWELVE months ago an examination of the returns of British overseas trade in these columns provoked a comment on the "slight but perceptible tendency towards regression" which, after four years of steady recovery, was revealed by the trade returns for the third quarter of 1937. The rate of expansion in the volume of our imports and exports was, it was then noted, smaller than in the earlier months of 1937, though the increase in average values had been accelerated. In particular, the volume of our exports was affected; the increase in 1937 over the corresponding period of 1936 fell from 18.6 per cent. in the second quarter to 8.4 per cent. in the third, while the corresponding percentages for the volume of our imports were 7.5 and 5.8 per cent. respectively.

Twelve months ago the clouds of trade recession appeared on the economic horizon. In succeeding months

The Economist has reported the steady downward trend in British exports and imports. The decline in business activity in many industrial countries, notably the United States, the fall in commodity prices which affected the purchasing power of the raw material producing regions, wars in China and Spain and rumours of war elsewhere, have left their mark on Britain's foreign trade. Some of these changes are revealed in the tables given below, which show the geographical distribution of our imports and exports in the third quarter of 1938 and in the corresponding quarter of three earlier years.

Compared with a year ago, the fall in the value of British exports has been larger than the fall in the value of our imports. The greater part of this fall in our exports has been due to the reduced purchases of other industrial countries, such as the United States, France, the Netherlands

* Monetary Policies of the United States, 1932-1938. By J. D. Paris. Columbia University Press. 198 pages. 14s.

and Switzerland, which are important customers for British goods; our imports from these countries have been better maintained than our exports to them. The reverse is generally true of the group of countries including Scandinavia and the Argentine, whose exports to us are affected by our agricultural protection and whose purchases from Britain are partly regulated by trade agreements.

But apart from these general developments, there are the more limited changes in our trade with individual countries. The policy of exchange control recently adopted by Japan reduced her purchases from Britain to nearly one-third of the level ruling a year ago, while her exports to us have fallen by a quarter. The war in China has affected British imports and exports in nearly equal proportions, but the war in Spain has caused in the last twelve months a proportionately greater fall in our imports. The absorption of Austria into the Greater Reich has been followed by a fall, compared with 1937, of 58 per cent. in our imports from that province and a fall of 41.2 per cent. in its imports from Britain. As a result, perhaps, of the recent British loan to Turkey, exports to that country nearly doubled between the third quarters of 1937 and 1938, although British imports from Turkey fell by half. The lifting of the Anglo-Irish economic war has been followed by a marked expansion in our purchases from Eire, though our exports continue to decline slowly.

It will be seen that the Empire continues to absorb an increasing proportion of our overseas trade. Almost half of Britain's exports are now bought by British countries, compared with 44.4 per cent. in 1929. Only 40 per cent. of the value of our imports is drawn from the Empire, but this compares with 27.3 per cent. in 1929. The proportion of our exports bought by Europe has shown little change, but we have bought from the Continent a relatively smaller part of our total imports.

These details of our overseas trade are an interesting commentary on the effects of the trade policies of different countries, including our own. But beneath these individual fluctuations there are signs which point to a change in the governing trend of our trade, a change more welcome than that which was foreshadowed a year ago.

The total value of both our imports and exports in the

third quarter of 1938 had, indeed, declined more when compared with the corresponding period of 1937 than in the second quarter. But changes in value are a compound of changes in average price and changes in volume. As the table below shows, the rate of fall in the volume of our imports declined from 9.5 per cent. in the second quarter to 4.1 per cent. in the third, while the proportionate fall in the volume of our exports declined from 15.8 per cent. to 14.4 per cent. And, for

OVERSEAS TRADE IN EACH QUARTER OF 1938 COMPARED WITH CORRESPONDING QUARTER OF 1937

	Value Per cent.	Volume Per cent.	Average Price Per cent.
<i>Imports</i>			
1st quarter	+ 6.8	+ 4.2	+ 2.4
2nd "	- 11.7	- 9.5	- 6.3
3rd "	- 14.3	- 4.1	- 10.7
<i>Exports</i>			
1st quarter	- 0.2	- 7.9	+ 8.4
2nd "	- 13.7	- 15.8	+ 2.5
3rd "	- 15.7	- 14.4	- 1.2

the first time, the average price of our exports, as calculated by the Board of Trade, has fallen below that ruling a year ago. As our exports become more competitive in price their volume may be expected to increase, though it must be noticed that the fall in average import values was intensified in the third quarter of 1938; the margin between import and export prices—the terms of trade—has again increased, in spite of the fall in average export values.

It seems therefore, that the gleams of a trade revival, as seen through the medium of the foreign trade returns, are considerably less definite than were the shadows, a year ago, of the trade recession. And, while the depression of 1937 appeared as a normal phenomenon to economic theorists and students of the trade cycle, a revival in 1938, after barely a year of declining activity, must be regarded as an abnormality whose existence should be doubted until it is conclusively proved. But there are already signs that the sustained recovery in the United States, by lifting commodity prices, is gradually increasing the purchasing power of primary producing countries.

Arms and the Investor—I.

Outlook for Gilt-Edged

GILT-EDGED security prices, after falling heavily during the September crisis (when for a time special minimum price arrangements were in force among dealers on the Stock Exchange), and recovering a considerable part, although not the whole, of their decline after the signature of the Munich Agreement, showed signs of incipient strength last week. In the last few days, however, the trend has again been downwards. Altogether, the recent course of the market suggests that international politics are playing a larger part in the determination of prices than at any time since the Great War. The market naturally welcomed Mr Chamberlain's strong re-statement of his policy of international appeasement and ultimate disarmament. By the same token, it marked prices down when the unfavourable international reaction to the rabid persecution of the Jews in Germany suggested strong doubts of the practicability of any real and lasting *rapprochement* with a country whose leaders were so minded. Clearly, the market is right in regarding questions of peace or war and of the extent and speed of Britain's re-armament as major influences governing rates of interest in the next few years. Equally clearly, the market has not yet made up its mind on their solution; for both the rise of gilt-edged prices at the re-opening of Parliament and the fall this week would have been far greater if there had been either universal confidence in the success of Mr Chamberlain's appeasement policy or a general conviction of its impracticability.

If political factors could be ruled out, the outlook for

gilt-edged would in many ways be encouraging. Recent economic indices go some way to bear out the views of those commentators who prophesied that the trade recession which began in the summer of 1937 would be less deep and prolonged than its predecessor. Gilt-edged prices, which normally tend to move downwards in company with industrial share values in the initial phase of a cyclical depression, usually become firmer as recession immobilises industrial funds, and continue to rise even during the early days of trade recovery. Normally, therefore, a steady to firm market could be expected during the next few months, whether they were viewed, optimistically, as a probable first stage in industrial convalescence or, more pessimistically, as a secondary phase of a recessionary period.

If normal factors alone were relevant, moreover, the experience of the last six years might be regarded as reassuring testimony of the permanence of the regime of lower interest rates on which the War Loan Conversion operation of 1932 set the official seal. As the attached chart of the price of 2½ per cent. Consols since 1928 shows, the substantial appreciation in gilt-edged values which occurred between 1929 and 1932 has been fully maintained, for 2½ per cent. Consols, which before the War Loan Conversion operation were quoted at 66, are worth 72 to-day. Another long-term stock, 4 per cent. Consols, stood at 101 in June, 1932, and is now quoted at 107½, while 3½ per cent. Conversion, which were worth 93, now stand

at 99½. It is true that in the meantime 2½ per cent. Consols have been as high as 94½, while 4 per cent. Consols have touched 120 and 3½ per cent. Conversion has been as high as 112½. The suggestion, however, that the Treasury in 1932 had merely taken advantage of the low point of an interest cycle to effect a conversion scheme, has certainly not been borne out. The course of the market is at least as consonant with the view that, though interest rates are still liable to short-term fluctuations, something like 3 per cent. to 3½ per cent., instead of 4½ per cent. or more as in the 1920's, would be the characteristic yield basis for long-term British Government stock, in the absence of abnormal non-cyclical forces.

How far are those abnormal influences likely to affect the outlook in the near future? Obviously, if Great Britain were involved in actual war, a considerable rise in the rate of interest, with a corresponding fall in gilt-edged values, would be hard to avoid. Between 1914 and 1920 over £6,000 millions was added to Britain's national debt and the yield on 2½ per cent. Consols, which averaged 3.4 per

PRICE OF 2½ PER CENT. CONSOLS

cent. in 1913, was as high as 5.3 per cent. in 1920. To that extent, ownership of gilt-edged stocks to-day must be a gamble on the success of Mr Chamberlain's appeasement policy, if in fact there is no alternative to war in the event of its breakdown. The decision will ultimately depend on factors entirely beyond the gilt-edged market's control, and it may be more profitable, at this stage, to examine the problem rather in terms of the cost of the re-armament measures to which this country is already committed and its probable expansion under any practicable scheme of intensified defence preparation which falls short of war itself.

Broadly, defence expenditure for the financial year 1938-39—including Budget estimates and supplementaries—is £370 millions, of which, in round figures, £255 millions is to be covered by taxation and £115 millions by borrowing. Already it is known that the Air Force total will increase by about £80 millions next year. If the programme for all other services (including air-raid precautions) is not greatly increased beyond the present programme, something like £500 millions might cover total defence requirements next year. On the other hand, if the programme were extended and expedited, another £100 millions, making £600 millions in all, might represent the limit of practicable expenditure without putting the nation on a quasi-war basis. In either case, part of the increased expenditure of next year could, and should, be financed from taxation and, to a less extent, from economies in non-defence expenditure. The national revenue will be less buoyant in 1939-40 than in 1938-39, but there has, as yet, been no really considerable falling off in many forms of national consumption which contribute largely to the Exchequer, and although industrial profits appear to have passed their peak about the middle of this year, their decline is so far fairly moderate. If by increased taxation and economies it were found practicable to raise the share of total defence expenditure provided by taxation by, say,

about £50 millions net, the amount to be raised by borrowing would be approximately £200 millions a year on the more, and £300 millions on the less, optimistic of our two assumptions. If the additional amount raised by taxation and economies were £100 millions, the respective borrowing limits would be £150 millions and £250 millions. If the total normal national savings, under all headings, can be put at upwards of £400 millions a year, it is obvious that new gilt-edged borrowing on these dimensions can hardly be effected in any case without some resort to the weapons—restriction on non-Government borrowing and even a deliberate broadening of the basis of credit—which

to-day are at the Treasury's disposal. The higher the total of actual borrowing, the greater the prospect that, despite the cushioning effect of these expedients, there will be some rise in effective interest rates and the greater the likelihood that the Treasury, in fixing the terms of any issue, will give practical recognition to that tendency, since the dimensions of future interest payments will be of secondary importance as compared with the necessity of obtaining prompt and complete subscription of the new money. On the other hand, it is evident that, so long as even armed peace is preserved, the amount of new borrowing will be only a fraction of the total raised during the last war, and any rise in interest rates to the heights, say, of 1918-20 will be wholly improbable.

The evidence, altogether, supports the conclusion that, even if war is ruled out, Britain's re-armament programme is unlikely to be completed without some further fall in gilt-edged prices, though the decline may, if all goes well, be relatively moderate. Even a limited further depreciation in values would, of course, be a serious matter for the many institutions and trustees which are large holders of Government stocks. They have, however, one means of mitigating its ill-effects, which was not open to them five or six years ago. For some time after the War

Loan Conversion of 1932, the gilt-edged market was compelled largely to go "long," but more recently the Treasury has issued a number of "dated" stocks which allow investors a wide choice of maturities during the next thirty years. In the table on page 381 we show the present prices and yields of gilt-edged stocks (including issues guaranteed by the Treasury) according to dates of maturities on the usual assumption that those standing above par will be redeemed at the earliest, and those below par at the latest, date provided in the bond.

It will be seen that the yields obtainable vary from about $2\frac{3}{4}$ to $3\frac{1}{2}$ per cent. In some instances a moderate fall in prices might, by bringing the stock below par, postpone its assumed date of repayment. Even if investors choose to omit these stocks from their list (or alternatively to assume the later repayment date) it is clear that they have still an opportunity for spreading the time risk factor in such a way as to ensure the ultimate return of their capital intact, at any average date, broadly, from 1948 onwards. If, in fact, any decline in prices is limited to a few points, then the probability of repayments in the early 'forties reduces the "uncovered" period to four or five years. For "hedging" purposes, the possibilities suggested by this table deserve close consideration.

Finance and Banking

The Fall in Sterling.—Last Monday's sudden drop in sterling from \$4.75 to \$4.70, details of which are given on another page, was due to a combination of causes. The chief influence probably was a fresh flight of funds from Europe to the United States, inspired by the hardening of world opinion against Germany and the consequent reaction upon the international political outlook. This movement of funds may have been bigger than some people suspect. Simultaneously there was a sudden though temporary movement of funds back to France, inspired by the first impression of M. Reynaud's programme. This replenished the sterling resources of the French Control, and it appears that the French authorities decided to transfer part of this sterling into dollars. The British control made no attempt to resist Monday's drop in sterling, but on Tuesday it gave energetic support, and the market estimates that on that day it lost about £5,000,000 of gold. This week's Bank return certainly does not controvert this view. International support was also given on Wednesday. Granted that Monday's pressure was bigger than was generally expected, the British authorities must have been faced with the choice between immediate and sustained resistance and the course actually adopted, namely that of letting sterling fall to a point of natural resistance and then intervening. The latter alternative possibly minimises the Exchange Account's gold losses, but only at the cost of permitting a fall in the rate. On the other hand, with the exchanges so much at the mercy of political influences and capital movements, it is difficult to say that there is an appropriate rate for sterling, and \$4.70 may be just as good, or as bad, as \$4.75.

French Gold Revaluation.—Apart from the main purport of the new French financial changes, which are described in full elsewhere in this issue, the new convention between the Treasury and the Bank of France possesses certain points of technical interest. Briefly, the Bank's gold is to be written up from a basis of 43 to one of 27.5 grammes, nine-tenths fine, per franc, and the profit on this revaluation is to be applied to a reduction of the Bank's provisional advances to the Treasury. It is further agreed that the repayment of the balance of these advances shall ultimately be a first charge upon (a) the proceeds of the liquidation of the Exchange Fund and Rentes Fund; (b) the profit resulting from the immediate and conse-

quential revaluation of the Bank's *devisen* on the same basis as above; and (c) any profit from a future revaluation of the Bank's gold and *devisen*. It is further agreed that the State's permanent debt to the Bank shall be increased from Frs. 3,200 millions to Frs. 10,000 millions, the difference of Frs. 6,800 millions to be placed to the credit of the French Treasury forthwith. The profit on the Bank's gold holdings of Frs. 55,808 millions, as shown in recent returns, will amount to Frs. 31,455 millions. Thus, neglecting any profit on the Bank's *devisen*, the net effect on the Bank's position will be to raise its gold stocks to Frs. 87,263 millions; to reduce provisional advances from Frs. 48,134 millions to Frs. 16,679 millions; to raise permanent advances to Frs. 10,000 millions; and to increase public deposits from Frs. 3,451 millions to Frs. 10,251 millions. M. Reynaud will look to this last sum to help him through the next six months, during which he has promised to refrain from approaching the capital market. The memorandum accompanying this decree says that the basis of revaluation was fixed so as to correspond to an exchange rate of Frs. 170 to the pound sterling. This rate is chosen so as to leave some margin for a possible appreciation of the franc from the Daladier limit of Frs. 179. This decision is also an implicit recognition that France is virtually on the sterling standard; while a simple calculation shows that the French authorities have assumed the sterling price of gold to be about 147s. 6d. per fine ounce.

French Control Operations.—The recovery of the franc during the first two days of the week, following upon the publication of M. Reynaud's measures, provided the French authorities with an excellent opportunity to replenish their depleted gold and foreign exchange reserves. On Monday, they took full advantage of their opportunity. They rigidly resisted the tendency of the franc to appreciate as a result of the buying pressure caused by bear covering and some repatriations. Consequently, the inducement to buy francs at a rate close to the declared lowest level was strong. On the following day, however, the French control was unable to resist the temptation to give a visible display of the strength of the franc and allowed it to appreciate in relation to sterling. At one time, the sterling-franc rate was permitted to decline to 178½. Since M. Reynaud declared on Saturday that the franc would stick to sterling in all

circumstances, the appreciation of the dollar against sterling should not in itself have led to an appreciation of the franc. As soon as the franc had departed from its officially-declared minimum level, however, it became vulnerable, and the anticipation of political opposition to M. Reynaud's scheme produced renewed weakness on Wednesday. As a result, the French authorities, who had to support the rate, relinquished much of the foreign exchange acquired during the two previous days. Nor is this the only respect in which the tactics adopted by the French authorities are open to criticism. On Monday and Tuesday, strong buying pressure on dollars developed in London on French account, simultaneously with the improvement of the franc. To a large extent, this is known to have been due to operations by the French authorities, who, having bought sterling from French nationals, promptly resold it in order to acquire dollars. It is, of course, understandable that the French authorities should wish to build up a gold reserve in the United States, but it may well be asked why this could not be done without causing selling pressure on sterling in the open market. The technical co-operation between the members of the Tripartite Agreement can scarcely be adequate if such triangular transactions cannot be arranged behind closed doors in order to avoid disturbance to the market.

Irish Banks' Returns.—The returns for the banks operating in Eire for the September quarter, published by the Currency Commission, are as follows:—

	Sept. quarter, 1937	June quarter, 1938	September quarter, 1938		
			In Eire	Elsewhere	Total
Liabilities:—

Excess of assets outside Eire over liabilities outside Eire	69,082	67,298	...	...	63,672

The decline in the volume of deposits is to some extent the result of the flotation of the Financial Agreement Loan, which attracted funds from deposit accounts. The increase in cash probably reflects the desire of the banks to secure exceptional liquidity in the difficult period of the international crisis, and it will be observed that this additional liquidity was obtained by reducing the amount of money at call and short notice. The increase in loans and advances reflects the growing confidence caused by the resumption of normal export conditions following the Anglo-Irish agreement. The fall in investments is partly explained by the additional demand for loans, but it is also due to the persistent disequilibrium in the balance of payments, the existence of which is demonstrated by the decline in the banks' net sterling assets, which have reached the lowest level yet recorded. This matter was fully dealt with in the Report of the Banking Commission, whose anxiety is proved by the above statistics not to have been unfounded.

French Guilder Bills.—Activity in the gold market has recently been stimulated by operations arising out of the coming repayment of French Railway bills to the amount of 150,000,000 guilders placed in Amsterdam.

These bills, which were marketed last year by the Mendelssohn group, contained a gold clause giving the holder the option of taking repayment either in guilders or in gold at a parity of 48.89975 kilos of fine gold per 100,000 guilders. The present price of gold in Holland works out at about 48.66 kilos per 100,000 guilders and consequently every holder is exercising his gold option. A certain number of holders took advantage of the premium on forward gold which developed a few months ago to sell forward the gold to which they would become entitled on the maturity of the bonds. They have probably gained less advantage than those holders who are now selling in the spot market the gold taken by way of repayment, for the rise in the guilder price of gold over the past three months has been greater than the premium on forward gold which then obtained. Holders of these guilder bills have therefore earned the $3\frac{1}{2}$ per cent. interest at which the bills were placed, together with the yield on the guilder "swap" (for those outside Holland), and the premium of about $\frac{1}{2}$ per cent. flat on gold redemption. In the circumstances, it is not surprising that a new line of 100,000,000 guilders French Government bills placed with the same group at $2\frac{1}{2}$ per cent. for 15 months should be meeting with considerable success. The new bills, which are dated November 30, 1938, and will therefore provide part of the funds needed to repay the Railway bills maturing on that day, also have a gold clause, but in their case the optional gold parity is fixed at 48.33 kilos of fine gold to 100,000 guilders. Another rise of 0.7 per cent. in the guilder price of gold would have to take place before this option became advantageous.

British Insurance and the Pogroms.—There has been considerable discussion this week of the liabilities falling on British insurance concerns from damage to Jewish properties during the recent "riots" in Germany.

What is your
Capitalised Value
to your family?

If you listed all your personal assets and converted them into cash what would be the total? Now assuming from a safe investment interest on this amount could be obtained at the rate of $3\frac{1}{2}$ per annum tax free, what income would this produce?

This is the test which you should apply to your own resources, so that you will know exactly what the financial position of your wife and family would be in the event of your death—a contingency which it is unwise to ignore. Most men are disappointed and not a little perturbed after this self examination.

THE "SAFEGUARD" POLICY is specially designed to augment personal assets by providing an income (tax free and payable monthly) for your dependants in the event of death. If you survive the period of your family responsibilities the policy provides capital for your own retirement.

You are invited to make an enquiry for full details and for an illustration suited to your own circumstances. Rest assured you will incur no obligation by doing so.

LEGAL & GENERAL ASSURANCE SOCIETY LIMITED

Head Office: 10 FLEET STREET, LONDON, E.C.4.
General Manager: VERNON E. BOYS.
Established in 1836 Assets exceed £42,000,000
Branches and Agencies throughout the World.

Two aspects of the problem tend to dull the clear-cut outlines of legal issues involved—firstly, the alleged official inspiration and organisation of the outbreaks against Jews and their property, and secondly the announcement by the German authorities that the payments in respect of claims must be made by the insurance companies not to the insured parties but to the Government. The first is obviously a highly debatable point. The second seems at first sight to tamper fundamentally with the insurance contract, but since the direct claims will fall very largely on German companies it may be assumed that the will of the authorities will prevail over the subtleties of the legal position—that in fact the claims will be paid, and in the manner ordered by the Government. The liabilities of Lloyds' underwriters and British companies arising out of the direct placing of insurance against riot risks in Germany must be virtually nil. Formerly such business attained some magnitude, but it has been drastically reduced since 1933. The greatest liability to British insurance interests, indeed, is likely

to arise through the reinsurance here of riot risks underwritten by German and Swiss companies. In judging such claims the exceptional aspects of the riots which led to the damage and the deflection of the claim payments do not enter into consideration. The general principle is that the reinsurer's liability arises as soon as the direct insurer has paid. It is true that British reinsurers of riots and civil commotion risks in Spain have not yet paid, but in this case the clarification of legally established claims awaits a final decision as to which is the established Government of the country. No such complication arises from the anti-Jewish riots in Germany. Fortunately, the amount of German riot risk business reinsured in this country appears to be exceptionally small. For this reason, the German insurance companies directly involved may decide to waive their claims on reinsurers abroad. Their foreign reinsurance facilities are decidedly valuable to them and they may decide not to spoil this market by exercising the claims arising out of the abnormal occurrences of the past ten days.

MONEY MARKET NOTES

The Bank Return

THIS week's decrease in the note circulation is a normal movement for the middle of November. The Christmas expansion in the circulation is not due to begin until the end of the month. By this time last year, however, the seasonal enlargement of the fiduciary note issue, from £200 to £220 millions, had been announced, but no similar increase has yet taken place this year.

	Nov. 17, 1937	Nov. 2, 1938	Nov. 9, 1938	Nov. 16, 1938
	£ mill.	£ mill.	£ mill.	£ mill.
Issue Dept.:				
Gold	326.4	326.4	326.4	326.4
Notes in circulation	481.1	483.9	482.7	478.6
Banking Dept.:				
Reserve	66.8	42.5	43.7	47.8
Public Deps.	33.2	14.1	15.9	35.0
Bankers' Deps.	86.7	109.5	109.5	89.5
Other Deps.	36.1	36.4	35.5	35.0
Govt. Secs.	76.6	102.4	101.6	95.2
Discounts & Advances	9.0	10.4	11.1	12.4
Other Secs.	21.3	21.1	21.0	20.6
Proportion	42.8%	27.3%	27.9%	30.7%

In the banking department, the rise of £4.1 millions in the Reserve, due to the contraction in the note circulation, has been offset by a reduction of £6.4 millions in Government securities. This is the normal practice, and has the effect of keeping the total resources of the banking department at a constant level. The main movement this week is a change-over of about £20 millions from bankers' to public deposits. Public deposits usually have a rising trend during November, as cash is being accumulated in readiness for the War Loan dividend payment. This week the trend has been reinforced by discrepancies between the dates of Treasury bill payments and maturities.

Foreign Exchanges

AFTER remaining around \$4.73½ until the week-end, sterling rallied to \$4.75 early Monday morning, as the result of the repatriation of funds to France, following the announcement of M. Reynaud's programme. This rally was short-lived, for on the same day sterling dropped to \$4.70. Since then the rate has hovered around \$4.70 or a shade under, Thursday afternoon's quotations being either side of \$4.70½. Spot francs were firm early in the week at a rate which ultimately fell to Frs. 178½. This appeared too low a rate to some oper-

ators, who saw a chance of making a profit through sales of francs. The rate consequently rose on Wednesday to Frs. 178½, but strengthened again on Thursday to Frs. 178½. The repatriation movement is now less in evidence than it was early in the week. Forward francs, however, have been relatively strong, with the three months' rate at Frs. 2½ discount. There has been a marked appreciation of the Amsterdam rate from Fl. 8.74 to Fl. 8.65½. Originally this movement was in sympathy with the dollar, but it has lately been reinforced by purchase of guilders in connection with the repayment of a maturing Dutch loan to France. Belgas have followed the dollar, the spot rate falling from bel. 27.89 to bel. 27.81, while the New York cross-rate keeps well inside the gold point. Forward belgas were strong, except for a short time on Thursday, when they eased as the result of Swiss selling. One month's belgas are now quoted at par to a slight premium, and three months' belgas were for a time practically down to par.

The Money Market

THE renewed transfer of funds to New York and the temporary accumulation of cash in public deposits has made money a little less plentiful. Bond money was quoted every morning up to ½ per cent. instead of ¾ per cent., and

Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

cheaper afternoon money did not begin to emerge until a later hour than usual. A little money is already being lent into the New Year, at ½ per cent. against bills and 1½-¾ per cent. against bonds. The clearing banks were not buying bills quite so freely this week, but fair lines of January and early February Treasury bills were taken at ½ per cent.

The Bullion Market

THE weakening tendency of sterling naturally created a fair arbitrage demand for gold early in the week, and on Tuesday in particular there was a big turnover. In some cases those who need dollars find it better to buy gold at the fixing and re-sell in New York. The argument is that a direct purchase of dollars in the foreign exchange market may cause the rate to move before the purchase is completed; whereas a purchase of the gold at the fixing can be made at a determinate price. On Wednesday, gold touched its highest price since March, 1936. By Thursday the better tendency for sterling caused the demand for gold to ease.

Last Monday's depreciation of sterling stimulated the American demand for cash silver, and with supplies on the short side the London price strengthened, particularly after the fixing. This was reflected in the jump shown at Tuesday's fixing, when there was also a widening of the margin between the cash and forward prices. Wednesday's price is the

* Above or below American shipping price. This week's calculations are based on a "temporary parity," in which the war risk rate is taken as 1s. 3d. per cent.

† At fixing. The New York price of silver remained at 43 cents per ounce .999 fine during the week.

highest since last March's reduction in the New York price from 45 to 43 cents. It is noticeable that India has not followed this week's advance. Current London prices, in fact, are now only maintained by American buying, and as these prices are too high for trade or arbitrage purchases, there is at least a suggestion that recent American demand has been official.

Investment

Markets Waver.—It is doubtless true that some degree of technical reaction was to be expected from Wall Street after the vigorous advance of last week. But it is no less true that the anti-Semitic outbreaks in Germany at the end of last week and their official extension in the form of heavy "fines" sharply challenged the market's hopeful assumption that the policy of "appeasement" would have a favourable atmosphere in which to develop. It is fortunate, perhaps, that the London market has mingled hope with certain reservations on this question, and in consequence the resulting falls were not of a serious nature. Declines in gilt-edged reached their maximum of half a point on Tuesday, but they were due largely to the withdrawal of buying support, and to the opening of a number of "bear" positions. Throughout the market the former factor, of reduced support, was largely responsible for any reaction in prices, which was not attributable to any significant selling pressure. Some observers professed to detect foreign selling arising directly from the German decrees, but the general view was that such direct operations were small. As a qualitative factor in the relations between Germany and the rest of the world, however, the recent outbursts cannot be ignored, and not least by the stock markets. Even the imminence of the Anglo-American Trade Agreement did not produce any considerable increase in business from mid-week onwards, although it made for a welcome improvement in the tone. A weaker pound and an uncertain franc provide sufficient cause for the quiet condition of the investment markets, in which home rail stocks remain the Cinderella. And among industrial shares the prevailing mood is marked not by dramatic changes in prices—on the whole, movements have been extremely small—but by limited buying interest.

The Share-Pushing Bill.—The revised version of the Prevention of Fraud (Investments) Bill, which was the subject of brief comment on page 331 of last week's issue of *The Economist*, has created much less heart-stirring than the first Bill, introduced last July. It will be recalled that under the original Clause 9 of the Bill, a person inducing or attempting to induce another to invest money by a statement "which he knows or could reasonably be expected to know to be false or by a promise or forecast which he has no reasonable ground for supposing to be likely to be fulfilled or verified" would be guilty of an offence punishable with a maximum penalty of seven years' imprisonment. Apprehension was felt that the reference to "reasonable grounds" in the definition of the offence would expose the *bona fide* broker's recommendation of shares, or investment advice in the Press, to the penalties of the clause. As re-drafted in Clause 10 of the new Bill, the offence is now defined to penalise only those statements, promises and forecasts which are known by the maker to be misleading, false or deceptive, or the "reckless" making of such statements. This change of language brings the new offence into line with the definition of fraudulent misrepresentation which has long been accepted in the civil courts—a false statement made with knowledge of its falsity or "recklessly," that is, without caring whether it is false or true. In view of its history in the civil courts the introduction of the word "reckless" into the revised Bill sets up no new legal concept. Some investment advisers still feel concern that promises and forecasts remain within the scope of the offence of inducement. In particular, the fringe of speculative gossip in Throgmorton Street, which provides a useful incentive to business, is nevertheless close to the definition of "reckless," or at least not easy to defend from the charge. The onus, however, would presumably lie with the prosecution to establish any complete disregard of truth when such statements are made. The difficulty is that the worst type of share-pushing frauds have flourished in the past because adequate

weapons to proceed against fraudulent forecasts or promises, as distinct from misrepresentations of existing facts, have not been available under the criminal law.

"Outside" Dealings.—For the third time, the Committee for General Purposes of the London Stock Exchange has postponed its decision on the changes in the rules which passed their first stages on July 25th. To represent the various stages in this deferment of final ratification (which were recorded in *The Economist* of October 22nd and are now extended for four weeks) as due to any inefficiency, would be quite unjust. The postponements have provided the fullest opportunity for all shades of "House" opinion to crystallise on this important controversy of non-member dealings. It is somewhat ironical that it is not the rule itself which is new, but rather the particular terms of obedience which the Committee has proposed. Whether the effect of the rules for "testing the market" would be such as to reduce the volume of business available for the broker as well as the jobber is still a question of hot debate. Some observers suggest that the interests of private and institutional investors would in all probability be prejudiced under the new rules. Perhaps it is impossible, under the existing organisation of the Stock Exchange, to express any general intention to secure the best terms for clients and fair dealing for jobbers in the form of mechanical rule. If that is the conclusion, it has an important bearing on the perennial question of a Stock Exchange Charter.

Peru and Brazil.—The foreign bondholder gets many kicks, but a few ha'pence. This week the latter consist of the offer to resume service on the Peru 7½ per cent. (Guano) loan of 1922, of which £869,500 is outstanding. This loan has received irregular remittances since 1932. The Peruvian Government's proposals involve cancellation of interest arrears to the end of 1937, and the resumption of regular service as from June 1, 1938, at 4 per cent. plus a cumulative 2 per cent. sinking fund allocation. While the annual service moneys will only amount to £52,170, including sinking fund, the Council of Foreign Bondholders regards the terms as the best obtainable, and recommends acceptance of the offer. This Peruvian example might be observed by other debtors. A year has elapsed since Brazil suspended her debt service. In an interview last week President Vargas declared that resumption of the service based on the Aranha plan was impossible. Without attempting to condone Brazil's default, it is true to say that her trade figures confirm President Vargas's view.

To men in the fifties and sixties

It is not generally realised that for an annual premium of £47 : 12 : 6 (reducible by income-tax relief) a man aged 55 next birthday can effect a Whole Life Assurance of £1,000 with right to Bonuses under the Distinctive System of

Funds exceed £25,000,000

From January to June, 1938, the weight of all exports rose by 19 per cent., but their f.o.b. value fell by 2½ per cent. as compared with the first half of 1937, owing to the sharp drop in coffee prices. For the first six months of the year 40 per cent. more coffee was sold, but the proceeds were only 2 per cent. higher. A leading dealer has offered specific suggestions for relieving the present state of chronic default. He proposes that, after July next, the sums hitherto required for repaying the 4 per cent. stock of 1936 should form a nucleus for resuming some payment on the senior loans, and that a small part of the 8,600,000 bags of coffee now held as security for the 7 per cent. Realisation Loan 1930 should be released annually for the benefit of bondholders. It would be dangerous for the creditor to make the path of default easier by undue readiness to agree to beggarly terms, but in Brazil's case there is a strong argument for ending the *impasse* and working out a final settlement at a later stage.

Industrial Profits in October.—A decline of only 1.06 per cent. in the profits of 163 companies announced in October, compared with their results in their previous financial years, is more reassuring than the 10.31 per cent. fall recorded in September. But the movement in any particular month is always somewhat arbitrary, and the figures show, for the third month in succession, that the decline in industrial earnings still continues. The following table shows the recorded profits for each month over the past two years:—

Year and Month	No. of Cos.	Net Profits*	Inc. on prev. year	Year and Month	No. of Cos.	Net Profits*	Inc. on prev. year
1936		£	%	1937		£	%

Oct.	177	14,884,260	26.97				

* After debenture interest.

(a) Decrease.

Heavy industrial companies are still making a better show than miscellaneous industrial concerns. The low percentage fall recorded for October is, in fact, largely due to the satisfactory results achieved by the iron, coal and steel group, whose latest profits of £3,298,000 are 26 per cent. higher than those recorded in their previous financial years. The exclusion of this group would result in a 7 per cent. fall in profits for the remaining companies, and if shipping companies' earnings were also excluded the fall would amount to as much as 12 per cent.

"Flexing" the Fixed Trust.—In May, 1937, sub-unit holders in the British Empire "A" Fixed Trust were invited to exchange their holdings into the shares of a managed investment trust company. At that time *The Economist* pointed out that most of the advantages claimed for the offer would have been provided by an exchange into a flexible unit trust. The fate of subsequent conversion offers, and the relatively unfavourable market performance of the new shares, was examined on pages 22 and 23 of *The Economist's* Unit Trust Survey, published on May 28th last. It was, indeed, necessary to write off the conversion movement as a confession of

failure in principle and performance. In view of the special advantages of the unit method for the small investor, it remained surprising that no group, recanting its initial faith in fixity, was prepared to offer fixed trust sub-unit holders the opportunity to exchange into a flexible unit trust. The National Group (which last October sponsored an offer of conversion of National "A" Fixed Trust sub-units, which was accepted by less than one-fifth of the sub-units outstanding) has met this deficiency in a scheme for "flexing" the Universal Fixed Trust. A new trust, Universal Second Unit Trust, is to be set up, with a similar general portfolio to that of the Universal Fixed Trust, but with wide management powers. The latter, however, will be exercised only when considered desirable, and with the express approval of the trustee. Sub-units in the new trust will be available for exchange, free of cost, to existing sub-unit holders of Universal Fixed Trust, and also to the public. This offer, it is stated, would enable holders of some £4½ millions of sub-units to enjoy flexibility of management. Thus the offer is considerably larger in scope than any of the seven conversion offers made between May, 1937, and January, 1938. It is to be presumed that sub-unit holders who convert will pay a semi-annual management charge, since their initial loading charge did not cover management services.

Imperial Airways' Future.—On Monday last Sir John Reith made his first speech to the shareholders of Imperial Airways in annual meeting. But his thunder had already been stolen, three days earlier, by Sir Kingsley Wood in the House of Commons, who then announced an impending Bill to merge Imperial Airways and British Airways into a public corporation, financed by the issue of Treasury-guaranteed fixed-interest stocks. Shareholders were therefore more anxious to obtain light and assurances regarding the possible purchase basis for their shares than to discuss the achievements and shortcomings of the past. Sir John made the point (long apparent to the thoughtful investor) that the company's present position is neither commercially nor constitutionally satisfactory. The oil of Government subsidy policy has refused to mix with the water of private enterprise. Hence it is extremely difficult to divine the "fair and reasonable price" to be agreed for the undertaking, failing which the matter will go to arbitral award. Sir John assured his audience that the directors would seek the best possible terms for the shareholders, and that another meeting would be held before terms were agreed. The Stock Exchange response to the public corporation announcement was at first uncertain, but the shares later advanced from 25s. 6d. to 29s. Two points are relevant in connection with this valuation. First, it is only slightly below the price of 30s. at which, after much discussion, 1,000,000 £1 ordinary shares were issued in July last year. Secondly, it is clear that an equivalent amount of Treasury-guaranteed stock would provide a smaller return than the present 7 per cent. dividend affords on the shares. It may be argued, on the extreme view, that the shares have no income expectation apart from the subsidy. Last year the company received £535,000 in subsidies, which covered ordinary dividend, obsolescence and some £307,000 of general and operating expenses. Somewhere between the extreme view and the disingenuous suggestion that the Empire Air Mail scheme guarantees a 10 per cent. dividend return, the basis for settlement appears to lie. And shareholders who have hitherto received an average return of 4½ per cent. on their nominal capital would obtain somewhat more, on the basis of 30s. of Government-guaranteed stock (carrying, say, 3½ per cent. interest) per £1 share, although the optimistic speculators who bought the shares at 67s. 6d. in 1936 may well feel deflated.

Dorman Long and South Durham.—It would be unwise to draw final conclusions from the increased profits of Dorman Long and the reduced ordinary and "B" ordinary dividends of its neighbour, South Durham Steel

and Iron, until the full reports of each concern are available. First impressions of the Dorman Long figures, however, are decidedly favourable. Trading profits for the year to September 30th have increased from £1,388,026 to £1,498,517, and even after substantially higher provision for taxation (which in 1936-37 absorbed £152,208) profits have increased from £1,223,210 to £1,239,583. Dividends are maintained at 18 per cent. on the preferred ordinary and 10 per cent. on the ordinary shares. As in the previous year, £300,000 is provided for depreciation and £200,000 to general reserve. In short, the dividends are covered in each case with a generous margin of the order of 13 per cent., as in the previous year. Such results do not reflect the recent fall in steel output for the North-East Coast district to the same extent as South Durham Steel's reduced dividends. The latter concern is to pay 10 per cent. on the ordinary and 4 per cent. on the "B" ordinary—in each case a reduction of 3 per cent. During the year to September, 1937, output for the district amounted to 2,722,000 tons, and in the latest year to 2,530,000 tons. It would appear, from further examination of the figures, that Dorman Long fared extremely well during the first half of the year, to March last. During that period North-East Coast Steel output amounted to 1,469,000 tons, compared with 1,326,000 tons for the corresponding period of 1936-37, but in the second half of the financial year output was no higher than 1,061,000 tons, compared with 1,396,000 tons for the second half of 1936-37. Dorman Long, however, is an integrated concern, whose costs would not necessarily reflect market prices for steel-making materials. It is probable, therefore, that profit-margins have been favourable during the past year. But in view of the recent fall in District output, it is evident that the current year's results may be distinctly less favourable unless demand is encouraged. And despite the arguments of Sir Walter Benton Jones at the United Steel meeting last month, some reduction in steel prices may be the only solution for stimulating demand. The highly geared ordinary shares stand at 29s. to yield £7 8s. per cent.

Brewery Profits.—During October, brewery shares were affected by fears of increased taxation and by the threatened increase in rating liabilities under the "Robinson" decision. The latest brewery reports, although they reflect the consequences of recession and rising costs, have done something to correct this price weakness. The results of Bass, Ratcliff and Gretton and Ansell's Brewery are summarised below:—

Company years ended Sep. 30)	Total profits	Earned for prior charges	Earned for equity		Div.	Current	
			Amt.	Rate		Price	Yield
Bass, Ratcliff & Gretton—							
1936	1,403,573	849,334	584,512	26.1†	24†	115/-	4.6†
1937	1,474,681	873,883	611,185	27.3†	25†	(£1)	
1938	1,412,569	873,897	613,441	27.4†	25†		
Ansell's Brewery—							
1936	620,237	540,159	478,427	55.1	25	64/6	5.4
1937	758,688	647,966	586,235	36.3	17½	(£1)	
1938	754,160	625,142	563,412	32.2	17½		

† Tax free.

The 4 per cent. reduction in the total earnings of Bass, Ratcliff and Gretton is more than offset by a reduction in depreciation, and in consequence tax-free earnings for the ordinary stock are practically unchanged. Total profits of Ansell's are within ½ per cent. of the previous year's total, though in this case the increase in taxation further depresses earnings on the ordinary stock. These represent 32.2 per cent. on the increased capital of £2,000,000, on which in 1936-37 only the final dividend was paid. Some increase in the price of materials is reported, and although turnover reached a new record, and higher profits were recorded in the first half-year (*vide* the Holt Brewery prospectus), the cost factor evidently accounts for the small reduction in profits for the year as a whole. A decrease in total profits of less than 2 per cent. is shown by Peter Walker and Son, Warrington and Burton, whose revenue was £552,398 in 1937-38, while the profits of Northampton Brewery Company,

at £244,837, actually record a modest rise of £3,700. For a year of recession, the maintenance of brewery share dividends is welcome. But, for the future, fiscal and rating problems may play a larger part in the market performance of the shares, even if consumption is reasonably well maintained.

Aircraft Expansion.—Criticism may be levelled against the speed of rearmament, but no evidence of inertia is to be found in aircraft company balance sheets. Hawker Siddeley Aircraft have been compelled by the rapid growth of orders to make four important capital issues in three years, and a fifth is now being made. In 1937-38 alone, £2,603,000 gross of new money was raised (of which £2,000,000 was represented by an issue of redeemable preference shares) and a £3,500,000 4 per cent. debenture issue has been underwritten this week at 99. The temporary nature of these financial requirements to finance work in progress is emphasised by the fact that the new debentures will be repaid by 1946 at the latest. They will, in effect, be self-liquidating, and there will be no necessity to provide heavy amortisation out of profits. The consolidated balance sheet, available for the first time, shows that stock and work on hand amount to £6,398,000 gross or £3,658,000 net after progress payments. The growth of disclosed profits last year, however, is only of a moderate order. Total profits amount to £821,954, against £783,438, but as they represent only dividends and interest from subsidiaries sufficient to cover the maintained 42½ per cent. distribution, the real expansion of profits cannot be measured. Preference dividends absorb £100,289 net, against £145,000 net required in a full year. After allowing for the redeemable preference dividend, earnings on a slightly increased amount of ordinary stock are about 1 per cent. lower at 46.8 per cent. Rapid expansion is shown by Boulton Paul Aircraft. For the nine months to July 31, 1938, total profits amounted to £38,938, against £21,369 for a full year. The increased activity of the company, however, is marked by a rise in total stocks from £297,000 to £679,889. No ordinary dividend is being paid, though 9.7 per cent. actual was earned. A loss of £31,062 sustained by Airspeed (1934), Ltd., in 1936-37, was due largely to expenditure written off and losses of a special nature, and the profit of £35,827 for the latest year is in satisfactory contrast. Whatever may lie in store for the aircraft industry when re-armament is "completed," Sir Kingsley Wood's forecast of an £80 millions increase in the Air Force estimates suggests that satisfactory profits in the immediate future are assured.

The Week's Company Profits.—Brewery companies are particularly well represented in the week's profit and loss accounts, which are analysed on page 407, and some satisfactory results come from machine tool companies. Reports received this week from 47 companies (excluding four for which comparable figures are not available) show net profits of £5,393,000, against £5,618,000, a decline of 4 per cent. The cumulative profits total for 2,132 companies this year are £270,741,000, as compared with £248,967,000, the increase still being 9 per cent. We discuss the week's results in preceding Notes and on page 389 under the heading "Shorter Comments."

Company Meetings of the Week.—In this issue reports of company meetings begin on page 398. Sir John Reith's references to the future of *Imperial Airways* are discussed on page 386. At the *Argentine Great Western Railway* meeting, Mr J. A. Goudge pointed out that while the prospect of some capital rearrangement had come one year nearer, they were not yet in a position to present any sort of scheme. At the *Mitchells and Butlers* meeting, Sir William Waters Butler referred to the serious consequences for breweries of a recent decision in the King's Bench Division, as a result of which the cost of public-house improvement would become prohibitive. Their own company had spent over £1,000,000 in the past seven years on improvements and new licensed houses. Sir Edmund Davis, at the *South West Africa* meeting, referred to the transfer of sterling to England by arrangement with the German Government and the bankers in Berlin, and reported that £100,000 had been received. After discussing

certain aspects of the public finances of Australia and New Zealand, the Hon. Edmund W. Parker, chairman of *Dalgety and Company*, said there were indications that the price of wool might harden. Reviewing the prospects of *Sudan Plantations Syndicate* for the current year, Sir Alexander MacIntyre anticipated an average crop (although the area planted would be 167,000, against 168,000 feddans), and referred to the substantial rise in Egyptian cotton prices. At the *Kassala Cotton* meeting, the Hon. A. M. Asquith emphasised that the company was fortunate in having had a bumper crop in a year of poor prices. The chairman of *S. Smith and Sons (Motor Accessories)* discussed important developments in the corundum plug and in aircraft plugs. At the *Second Industrial Trust* meeting Mr W. Sandford Poole remarked that the setback in the investment valuation in the year under review had been only 22 per cent.

THE STOCK EXCHANGES

London

SETTLING DAYS

TICKET ACCOUNT
NOVEMBER 22 NOVEMBER 24

AFTER two days in which the market measured the practical politics of appeasement with a country whose leaders had acquiesced in measures of medieval severity against the Jews, the Stock Exchange managed to find some power of recovery in mid-week. The Jew-baiting was called off, but the major factor was undoubtedly the imminent signing of the Anglo-American Trade Pact on Thursday. Some early "bear" operations in the gilt-edged market were thereupon promptly reversed, and the tone of the market improved.

Fears lest the policy of appeasement might be prejudiced by the German excesses were rife on Monday and Tuesday. In the *gilt-edged market*, as elsewhere, the reaction in prices, limited to 1/8 on Monday and 3/8 on Tuesday in the undated stocks, was attributable less to any significant volume of selling than to the drying-up of buying support. Some "bear" selling operations were evident, and the closure of these positions was a contributory factor in the quarter-point recovery in mid-week. The slight improvement continued on Thursday.

In the *foreign bond* list, Peru Guano loan improved sharply on the new service arrangement (discussed on page 385), but that was the limit of interest in the South American list. German and Czech bonds were initially depressed on political nervousness, but recovered in mid-week. Far Eastern bonds remained heavy, and were no better than steady in mid-week.

★

Home rail stocks opened unfavourably, and although some buying support was prompted at lower levels, further falls followed on Tuesday, particularly heavy among the guaranteed stocks. The disappointing traffics prevented the market from sharing in the mid-week improvement, and once again the guaranteed and debenture stocks were singled out for attack. Argentine rail stocks were encouraged by the formation of the minimum grain price scheme.

Under the influence of bad news from Germany and Wall Street's reverse, the *industrial market* began the

week with an unsettled tone and a downward trend in prices. Sentiment improved towards mid-week, but the volume of business remained on a small scale. Iron and steel shares were dull to start with, Thornycroft being the most prominent among the exceptions, but prices hardened on the Dorman Long and Brown Bayley's Steel profits announcements. John Brown were supported on Thursday. Clarke Chapman were in demand in an otherwise irregular coal section, and similarly no pronounced trend emerged among engineering issues. Electrical equipment shares were irregular or slightly easier, and Lancashire Dynamo, after an initial advance, reacted on profit-taking. Motors on the whole were easier, the chief victims being the heavy vehicle group on the reduced Dennis dividend. Among aircraft shares, Hawker Siddeley fell at first on news of the debenture issue, rallied temporarily, and then turned dull again. Textiles made a mixed showing, though rayon shares hardened towards mid-week. Except for Bass, breweries lost a little ground, and Benskins fell on the reduced dividend. Tate and Lyle were again in some request in the provisions and catering group, but reacted on the 2 in 5 share bonus. Store shares led by Woolworth were lower early in the week, but an improvement occurred on Wednesday. Miscellaneous shares continued to show an uncertain tendency.

★

In the first part of the week, *oil shares* were depressed slightly by the absence of investment buying and the limited volume of professional support. The tendency then improved, as in other sections, and there was a little Continental buying, but prices eased again on Thursday. Rubber shares were as listless as ever, though such changes as occurred after the Restriction Committee's decision were downwards.

After a weak start, the *mining market* recovered a little on Wednesday, but turnover failed to improve despite the rising gold price, and the undertone became irregular again on Thursday. Kaffirs fell back generally on Monday, but there was some recovery later. Prices were helped by Paris support for the dividend-payers. The Cape bought developing mines (especially New Central Wits, and Western Reefs), but on only a small scale. Rhodesian copper shares rallied temporarily after

a disappointing start. Other base metal shares were irregular and featureless.

New York

THIS week Wall Street has been in orderly retreat. The causes, however, have been mixed. It was considered that the advance during the week to Novem-

ber 12th, when election buying was in evidence, was too rapid: the Dow industrial index advanced six points in as many days, and some profit-taking was only to be expected. But the downward movement was initiated by the anti-Semitic outbreaks in Germany, and fresh impetus was given to Wednesday's bad break by fears that the atmosphere would be further charged by a speech from Herr Hitler on Thursday, although he actually remained silent. Another contributory factor lay in the weakness of sterling, and sentiment was also damped by reports of a fresh anti-trust drive. Home business news, however, continued good, and at times exerted a welcome steadying effect. Steel and motor shares, which were well supported in the previous week, were the first to suffer in Monday's wave of profit-taking. Steel output for the current week is estimated by *Iron Age* at 62.5 per cent. of capacity, against 61 per cent. Aircraft shares were strong almost throughout the week, and resisted the downward trend. Rails and utilities did not escape the general weakness, and were a shade lower than at the beginning of the month.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

Industry and Trade

Britain's Industrial Production.—The volume of industrial production, as measured by the Board of Trade's index, fell by 4.3 per cent. between the second and third quarters of this year, compared with a decline of 2.6 per cent. during the corresponding period a year ago. The quarterly average of *The Economist* index of business activity, which is adjusted for seasonal variations, on the other hand, was almost as high in the third quarter of this year as in the second. Compared with the corresponding quarter in 1937, the official index for July-September shows a fall of 10.5 per cent., against a decline of 9 per cent. registered by *The Economist* index:—

BOARD OF TRADE INDEX OF PRODUCTION
(1930=100)

Group	1937			1938		
	Sept. quarter	Dec. quarter	March quarter	June quarter	Sept. quarter	
Mines	95.6	103.9	104.0	89.3	86.0	
Iron and steel	165.5	177.3	168.4	131.6	106.3	
Non-ferrous metals	173.7	166.2	153.3	147.4	142.8	
Engineering	134.9	135.3	132.7	128.8	122.4	
Building	160.3	148.3	146.1	152.5	148.7	
Textiles	127.5	125.8	116.9	106.4	106.3	
Chemicals, etc.	123.8	125.5	123.5	115.0	113.5	
Leather and shoes ..	110.6	108.4	111.6	102.2	97.9	
Food, drink and tobacco ..	120.3	123.2	116.0	123.5	123.0	
Gas and electricity ..	137.1	189.9	186.0	145.5	143.4	
Total of mfg. industries*†	135.6	141.5	136.5	126.8	121.3	
Total of all groups*†	130.1	136.4	132.1	121.7	116.5	

* Revised figures. † Includes also various industries not specified above.

With the exception of the indices relating to food, drink and tobacco, and to gas and electricity, all the group indices for the third quarter of this year are lower than a year ago. The fall has been most marked in the case of iron and steel, non-ferrous metals, and textiles. The indices for mines and quarries, and for leather, boots and shoes, exceptionally, are below the average for 1930. The figure for building materials and building, though 7.2 per cent. below that for the third quarter of 1937, is still 48.7 per cent. above the level of 1930. More recent information points to a revival in a number of industries, including coal, iron and steel, and textiles. It is probable therefore, that the Board of Trade's index of production for the fourth quarter will show an improvement.

The "Closed Shop" in Coal Mines.—Industrial relations have been more friendly in the South Wales coalfield during the past two years than probably at any other period in the history of the coalfield, due partly to the decline in rivalry between trade unions. Between 1927 and 1937 the differences between the South Wales Miners' Federation and the Miners' Industrial Union were often the cause of violent disturbances in the coalfield, but in January this year an agreement was reached by which the non-political Industrial Union was amicably absorbed by the Federation. This step has been followed in recent months by a similar agreement between the Federation and

the Monmouthshire and South Wales Enginemen, Boilermen, and Craftsmen's Associations. It is significant that both these mergers have obtained the sympathy and co-operation of the associated owners, who are now considering proposals for the establishment of a "closed shop" in the coalfield. The South Wales Federation contend that only an inclusive organisation can effectively assume the obligations of the miners under the Conciliation Board Agreement, and they have accordingly applied that membership of the South Wales Miners' Federation shall be made a condition of employment. In a memorandum which the Monmouthshire and South Wales Coal Owners' Association has addressed to the South Wales Miners' Federation, the Association agrees to the necessity for an arrangement that will deal "conclusively" with the question of non-unionism, but lays down the following conditions: (1) The exclusion of winding enginemen, colliery officials and technical staffs; (2) an agreement that none of the contributions to the Union collected by the employers shall be used directly or indirectly for political purposes, either of a local or national character; (3) the exclusion from offices other than those which are full time and fully paid of persons who are not in employment at the collieries; (4) the refusal of any financial support to workmen who have ceased work with or without notice before the Conciliation Board procedure for the investigation and settlement of disputes has been exhausted; and (5) an understanding that the South Wales Miners' Federation has, and will retain, complete authority to enter into and maintain agreements with the employers, so that if the Federation should become subject to the over-riding control of any other authority the agreement will be null and void. The miners are also asked to give certain assurances with the object of advancing the safety, welfare and prosperity of the industry.

It will be seen that the South Wales coal owners are prepared to consider favourably a "closed shop" in so far as it can be established on a locally autonomous, independent, and non-political basis. Their conditions are thus irreconcilable with the draft scheme for a national organisation of miners which is at present under consideration by the Miners' Federation, and which provides "that all the separate and individual miners' unions, together with their branches, now affiliated to the Federation, either direct, through a district, or through a group, be dissolved." The Executive Council of the South Wales Miners' Federation will, it is understood, submit in due course a recommendation on the Welsh coal owners' memorandum to a local delegate conference.

Overseas Trade Maintained.—The statistics for our overseas trade in October reveal no striking change compared with those for September. The values of British imports and exports improved slightly, but compared with the corresponding months of 1937 the decline in the value

(£28,000). Ordinary dividend reduced from 16 to 15 per cent. Carry forward reduced from £138,826 to £130,212.

Bowmaker, Ltd.—Trading profit year to October 31, 1938, £213,728 against £177,010. Interest £91,812 (£60,978). To taxation £30,434 (£21,843). Net profit £84,004 (£87,557). Ordinary dividend maintained at 10 per cent. To staff fund £2,000. To general reserve £25,000 (£30,000). Carry forward raised from £12,041 to £15,040.

Brown Bayley's Steel Works.—Net profit year to July 30, 1938, £154,449 against £138,368. Ordinary dividend raised from 10 to 15 per cent. tax free. To general

reserve £50,000 (£25,000). To obsolescence reserve £25,000 as before. Carry forward raised from £28,492 to £37,941.

Butler Machine Tool.—Report for year to September 30, 1938, shows trading profit £85,418 against £70,267 for period January 18th to September 30, 1937. To depreciation £11,000 (£9,234). Ordinary dividend 17½ per cent. against 10 per cent., equal to 14½ per cent. for full year. Carry forward £14,412.

Fine Cotton Spinners.—No dividend is recommended on the preference, preferred ordinary or ordinary stocks for half-year to September 30, 1938. (The rejection of the capital scheme is discussed in *The Economist* of October 8, 1938, on page 81.)

of British exports was the same both in September and October, while the value of imports showed a slightly greater fall in October. There was a welcome improvement

U.K. IMPORTS AND EXPORTS
(£'000)

	1936	1937	1938	Change between 1937 and 1938	
October

Transshipments under bond	23,310	30,976	26,649	-4,327	-14.0

in the value of re-exports, which was within 5 per cent. of the corresponding figure for October, 1937. The increase in the volume of raw material imports is reflected in the rise of our index, from a revised figure of 105½ in September to 106½ in October. The index of the volume of exports of manufactures, however, declined in October by 4 points to 99½; at this level it is still considerably above the low point of 90 reached in August of this year.

Overseas Trade by Commodities.—Compared with a year ago, the imports of almost all of the eighteen important commodities included in the table below showed a fall. Compared, however, with the preceding month of September, imports of all textile raw materials increased, together with imports of petroleum, iron and steel scrap

RETAINED IMPORTS—MONTH OF OCTOBER

Item and Measure	1936	1937	1938

castings has increased by 100,000 tons for the second month in succession; the output of pig iron, which fell slightly between August and September, increased in

LIVERPOOL

The port of the North—with easy access to the Midlands—just over three hours from London—and everything necessary to the smooth running of modern industry.

Labour, warehousing, power, transport (by ship, rail, road, air or canal) all "laid on"—in planned factory estates.

Build your factory in the ideal spot—Liverpool Corporation have sites available and can help to finance the cost of land and buildings

for industry

Write for the detailed, illustrated brochure "INDUSTRIAL LIVERPOOL," to the Town Clerk, Corporation of Liverpool, Municipal Buildings, Liverpool 2.

October by 40,000 tons. Imports still remain at the low level to which they fell in April of this year, but exports of British manufactures of iron and steel rose by 20,000 tons to 159,100 tons in October. Our index of iron and steel consumption, which is adjusted for seasonal influences but not for changes in stocks, rose by 10½ points between September and October, the first increase after a continuous fall from last December. This rise confirms the more hopeful tone which has appeared in the industrial reports during the last two weeks, although considerable uncertainty will persist in the iron and steel markets until the Federation has announced the prices which will rule after the end of December.

* * *

Increase in the Rubber Quota.—The Regulation Committee decided on Tuesday to increase the rubber export quota for the first quarter of 1939 from 45 per cent. to

50 per cent. of the basic allowances. The recent revision of the basic allowances, which takes effect on January 1, 1939, will raise world shipments by about 24,000 tons per quarter; this increase, combined with the rise in the export quota, will raise the level of exports from about 175,000 tons per quarter to about 215,000 tons per quarter. This higher level is slightly less than the estimated world consumption in the third quarter of 1938; consumption in the last three months of the present year is likely to rise further, and will probably reach about 230,000 tons. Provided, therefore, that consumption does not relapse, there should be a considerable reduction in stocks during the next quarter even at the higher rate of output, and reports from America indicate that consumption there is more likely to increase than to remain stationary. Consequently, the Committee's decision has met with approval from the consuming interests, although the London market was disappointed in its expectation of an unchanged quota.

INDUSTRIAL REPORTS

THE volume of new business in coal has declined a little; output, after a vigorous increase in the first three weeks of October, has also tended to decline. The tone on the iron and steel markets remains fairly optimistic, though many consumers are awaiting the announcement concerning prices in 1939 before covering their requirements beyond this year; the output figures for October show that any improvement in demand is likely to be quickly reflected in the activity of the industry as it can no longer be satisfied by drawing on stocks. Transactions in tinplates have been less active, though shipments last week showed a further increase. Inquiry for cotton goods has been fairly well maintained, but business was not on a large scale, owing to the low offers made by buyers.

Coal

Sheffield.—The general outlook of the market is rather more favourable, although business is below normal for the time of year. Industrial steam coals are in good request. Inland requirements are accounting for the bulk of the coal raised. Smaller grades are in full supply and the market is easy. Coking smalls show a good turnover, and good deliveries of smalls are being made under contract to electricity undertakings. Gas coal is in better demand, but the market in household fuels continues quiet. Coke is quiet, with heavy stocks on hand. There is not much doing in blast-furnace coke at 22s. 6d. per ton on rail at ovens. A slightly better inquiry exists for large selected patent oven coke. Graded coke for central heating is quoted at 25s. 6d.-27s. per ton.

Export demand is showing improvement, with better inquiry for both prompt and forward, best hards being a good feature. Singles and smalls are in little demand, and bunker business is slow.

*

Newcastle-on-Tyne.—The North-East coal market remains steady. Trade in Northumberland steam classes is well maintained and prices continue firm, particularly for large screened coals, which are now difficult to obtain for shipment over the next few months. Durham manufacturing coal receives more inquiry, but there are collieries who still experience difficulty in obtain-

ing sufficient trade from the export section to ensure regular working. Patent oven coke is a steady market, shipments abroad being good, but makers are unable to quote for any additional business owing to lack of export quota.

*

Glasgow.—The market has had a dull appearance this week. The Fife collieries continue to be busily employed on shipping account, but elsewhere there has been a noticeable slackening of new business, largely, it would seem, owing to a difference of ideas as regards prices. The Scottish trade with the London market has also fallen off, due apparently to the larger business done by London with other coal districts. Land-sale business is moving steadily on the whole, but is still causing disappointment in various directions. In general, ample supplies of all classes of coal are on offer, and prices show an easier trend.

*

Cardiff.—The executive and the Control Boards under the South Wales coal sales scheme have intimated a reduction of 1s. per ton in contract prices for export supply during 1939. The reduction applies to bunkers as well as to cargoes, and, although the Control Board's prices will operate as the new minima, it will remain within the power of the colliery owners to negotiate business above the minima when trade conditions are favourable. Ship-owners have been agitating for a reduction of 2s. 6d. per ton, and they are dissatisfied with the decision of the Control Board. Otherwise the market has been featureless. Shipments of contract arrears to Italy are active, and, although no purchases have yet been made for supplies to that country next year, it is confidently expected that they will represent a substantially larger quantity than this year's exports. Best large coals are a steady market and dry sized classes are scarce, but stocks of ordinary smalls are still heavy. There is a slight improvement in coke, but for patent fuel the demand is very slow.

Iron and Steel

London.—Moderately active conditions have continued to rule in the iron and steel markets and the brighter tone noticed recently has been well

maintained, says the official report of the London Iron and Steel Exchange. Most of the buying, however, is still limited to small parcels intended to carry consumers over until the end of the year and there has been comparatively little forward contracting.

In the pig-iron market this feature is particularly noticeable, but in the aggregate the volume of business is considerable. Some branches of the consuming trades are still short of orders with the result that the demand for certain descriptions of pig iron remains poor. The reduction in the stocks of foundry iron, however, has reached a point at which it is probable that more furnaces will be put into commission.

In the semi-finished steel section of the market business is quiet, although demand is more active than for some time past. As a result of recent buying the mills producing this class of steel have a good tonnage of orders in hand, and production appears to be increasing. The stocks of foreign semi-finished steel at consumers' works have been materially reduced and this has given the market a more confident tone.

The market for finished steel is fairly active, but somewhat irregular. There is a vigorous demand for structural steel, but the dearth of new shipbuilding orders has been severely felt by the steel industry. The export trade continues quiet, but shows signs of expanding.

*

Sheffield.—The recent improvement in the iron and steel market is maintained, but the volume of business shows only a small further expansion, and it is obvious that consumers are awaiting a decision on prices before entering into new contracts. At the moment buying is from hand to mouth. In pig iron there is a moderate demand for foundry, while forge shows a fractional improvement. Users of hematite are well covered by contract to the end of the year, and are doing little more than making replacements. Special qualities, however, are being well taken up. There is little change in finished iron, although there are rather better orders for common bars.

Basic steel billets are a better market, and acid billets also show some revival. Small steel bars are more active, and for wire rods and stainless steel sheets the market keeps up well. Demand for structural steel, on the other hand, has fallen off to some extent.

Demand for iron and steel scrap is fairly steady, but there still remain heavy stocks of imported material to be disposed of. Heavy foundry cast iron is well bought up to 75s. per ton, and fair quantities of steelworks cast iron are being called for. Heavy basic steel scrap is a rather quiet market up to 67s. 6d. per ton.

*

Middlesbrough.—Business for immediate requirements of pig iron continues satisfactory and the outlook is favourable. The output of Cleveland foundry pig iron is very much reduced, as this quality is only produced intermittently at week-ends, and stocks in makers' yards are slowly being depleted. The supply of East Coast hematite has increased, but satisfactory deliveries are being made from stocks, of which fair quantities are already sold.

Shipbuilding orders on the North-East Coast are few and departments usually producing shipbuilding material would welcome further business. Other departments are kept busy chiefly for home requirements. The production of steel is increasing, and this enables users of scrap to consume some of the material from stock. Semi-finished steel continues in better demand. An announcement regarding prices of iron and steel for delivery over next year would encourage further business. There is no change in the positions of blast-furnace coke and foreign ore.

*

Cardiff.—The course of business in the tinplate trade is not developing as favourably as was recently expected. Shipments last week were fairly active, but they represented deliveries under contracts, and the current volume of inquiry is very small. There is a slightly better tone in the heavier sheet market, and the output of ingot steel is increasing. Prices are unaltered, but, except for tinplates, reductions are expected in the next few weeks.

Textiles

Cotton (Manchester).—Inquiry has kept up fairly well, but spinners and manufacturers complain that most offers are impracticable. A rather firmer tone has shown itself in the raw cotton markets. The situation at the moment is extremely complicated by the policy of the United States Government. American cotton is losing ground to that grown in other countries, and the spinners demand chiefly South American and Indian descriptions.

Conditions in the yarn market remain unsettled. Only a limited business has been done in American counts. Despite four resignations, an effort is being made to renew the 42's web price agreement until the end of March. A comprehensive scheme to cover all counts and qualities is being drawn up by legal experts. Irregular buying has occurred in Egyptian yarns. Business in piece-goods for foreign outlets has been rather featureless. The reduced activity for India has continued, most of the bids being quite unworkable. A little business has been done in fancies for Java and Singapore. Only isolated transactions have been recorded for Egypt and the Near East. South America has again provided a very fair turnover in sheetings, limbrics, prints and sateens. Useful lines have been secured for the Dominions. Steady

buying has taken place for the home trade in a variety of goods, and some Government contracts have been arranged.

*

Jute (Dundee).—Although the prices of jute goods have occasionally shown a tendency to weaken, a fall has been prevented by the reluctance of sellers to make concessions. The Indian Jute Mills' Association is trying hard to obtain an amicable agreement amongst the mills in India, which would be preferable to legislation passed by the Government to continue the Ordinance limiting the working hours in the mills to 45 per week. Strikes have been reported at six of the Indian mills this week; as a result prices for Calcutta goods have shown a steadier tendency. If these strikes spread to other mills and continued for a time, the industry would be able to dispose of the huge stocks of goods, particularly hessians, which have accumulated in Calcutta during the past twelve months.

The Indian jute mills have lost heavily for some years past, and the low prices at which they have been willing to sell have affected prices in other producing centres, especially in Dundee. For the first ten months of this year 165,119,000 square yards of jute cloth have come in from India compared with 149,876,000 square yards in the same period last year and 119,611,000 square yards in 1936. In 1928, the total imports of these goods were only 28,000,000 square yards.

Dundee spinners and manufacturers are still quite busy, but there is a dearth of orders for forward delivery, so that prices may be shaded. Common 8-lb. cops could be bought at 2s. 2d., 10-oz. 40-in. hessians at 2½d. and 8-oz. at 2½d.

THE COMMODITY MARKETS

PRICE movements on the commodity markets were irregular during the week ended last Wednesday, though the depreciation of the pound was favourable to an advance. The recovery in wheat went a little further, and raw sugar prices continued their upward movement. After a slight improvement towards the end of last week, the price of American raw cotton fell back to where it stood a week ago. Rubber was marked down a little on the announcement of the increase in the export quota for the first quarter of next year. Among non-ferrous metals, copper, lead and spelter were slightly cheaper, but tin showed a further rise.

Commodity markets in the United States were steady. Thus, Moody's index of prices of staple commodities (December 31, 1931=100) rose slightly from 144.4 to 144.7 during the week ended last Wednesday. A month ago the index stood at 143.3 and a year ago at 149.8.

Metals

Copper.—Although closing 10s. above the lowest level, the price of standard cash copper ended the week 16s. 3d. lower at £45 16s. 3d. per ton. The political developments in Europe and the easier trend of Wall Street

induced buyers to show more reserve and their attitude was not changed on the publication of the October statistics. According to the Copper Institute, world stocks of refined copper declined from 457,454 short tons on September 30 to 424,711 short tons on October 31, a fall of almost 130,000 tons since the high level on May 31, 1938. Consumption in the United States increased by over 16,000 short tons compared with September and reached 69,827 short tons. Outside the United States the October consumption fell by slightly over 7,000 tons to 130,141 short tons, but even this level represented the highest October figure ever reached. Production showed the effects of the increased mining and smelting activity both in and outside the United States and advanced considerably to a new record level. The general influence of the statistics on the market was a bearish rather than a bullish one, as a greater decline in stocks had been expected and the rise in production is taken as a sign that the downward movement in stocks will soon be arrested.

*

Tin.—Unlike copper, the price of tin gained another £2 15s. this week, and closed on Wednesday at £215 5s. per ton. The total of home warehouse stocks exceeded last week for the first time for years the 9,000 tons limit. Nevertheless, the low production quota is affecting the market to an increasing extent, particularly as United States consumers are taking an increased interest in new purchases. As a substantial part of the available stocks (estimated at about 6,500 tons) is held by the buffer pool and pool sales are not expected at a level below £225 per ton, a further improvement in the tin price is quite conceivable.

*

Lead and Spelter.—Lead lost 10s. this week to close on Wednesday at £15 18s. 9d. per ton, while spelter lost 6s. 3d. to close at £14 7s. 6d. per ton. The daily demand was again unsatisfactory, due partly to seasonal causes and partly to the disappointing state of some of the leading consuming trades on this side of the Atlantic. Latest production advices indicate that the current output of both metals is still in excess of consumption. Unfortunately, nothing has been heard of late of the progress of the Cartel discussions.

Grains

THE fall in the dollar value of sterling during the last week and the improved demand for Manitoba brought a recovery in wheat prices ranging from 6d. to 1s. 9d. per quarter. The Argentine Government has fixed the minimum price for new crop wheat at 7 pesos per 220 lb. at Buenos Aires; offers of Plate wheat were temporarily withdrawn after this announcement. A considerable amount of business has been done in low-priced European wheats, mainly for animal foods. There was also an improved demand for Plate maize, whose price advanced during the week by about 1s. 6d. per quarter; little trade was done in American maize, whose price is considerably above those ruling for Plate grain. The depreciation of sterling also raised the price of Canadian barley, but demand is still dull.

COMPANY MEETINGS

MITCHELLS AND BUTLERS, LIMITED

TURNOVER OF BUSINESS MAINTAINED

HEAVY EXPENDITURE ON PROPERTIES

SIR WILLIAM WATERS BUTLER'S REVIEW

The fifty-first annual general meeting of the ordinary stockholders of this company was held at the White Horse Hotel, Birmingham, on the 17th instant, under the presidency of Sir William Waters Butler, Bart.

The Chairman, in moving the adoption of the report and accounts, said: Ladies and gentlemen, the turnover of the business last year equalled that of the previous year notwithstanding a decline in the country's spending power and that during the major part of the year unemployment in the Midlands increased and the cost of living was higher, but I am glad to say that both these figures now show signs of falling. There was, nevertheless, a decrease in the net profit earned of £77,102 consequent upon an unavoidable increase in the expenses.

This fall in profits is, of course, due to the much higher prices of brewing materials and coal; to increased charges for rates, taxes and licences, depreciations and debenture interest and, in addition, to a full year's National Defence Contribution having to be met, whereas last year we had to bear only half-a-year's contribution. This decrease in profits might have been reduced if we had bought cheaper brewing materials of lower quality, but we would not, as we are justly proud of the high quality of our products and to lower that quality, unless we are forced to do so, would be a very bad policy—which would naturally lead to a decrease in sales.

HEAVY EXPENDITURE ON BUILDINGS

You will note from the directors' report that since the last annual meeting we have increased the debentures issued by £535,000 in consequence of the heavy expenditure we have had to meet, and still have to meet, in the modernising of our licensed properties and the erection of buildings in connection with the new licences granted to the company in the growing suburbs of the City which have been newly-populated by the transfer of inhabitants from the crowded areas in the centre owing to the demolition of artisan dwellings and street widenings—public improvements which are likely to continue for some time to come. This transfer of the artisan population from the central parts of the City not only adversely affects the trading of our licensed houses in the areas denuded of population, but also entails a heavy expenditure in building new licensed houses in the outlying suburbs.

We have withdrawn from the property reserve account, which was established last year, the sum of £42,200 to meet expenditure not, in our opinion, adding to the capital value of licensed houses, and we are recommending to you to-day to add the sum of £50,000 to this fund from surplus profits, bringing the total up to £207,800.

We have also recommended, as previously, that out of the profits this year £12,000 shall be added to the pension fund of the company. The fund is vested in trustees and consequently does not appear in the balance sheet. The market value of the investments of the fund totals £335,556.

We have at present 168 pensioners on the books, the cost to the fund amounting to £14,141 per annum.

With reference to the granting of holidays with pay, this has always been our practice both with our workpeople at the Brewery and our employees at the managed houses, the two sections representing 3,800 persons. It may interest you to know that last year the cost to the company was approximately £17,180.

In addition to the recognised annual holidays each employee serving in the Territorial and other Home Defence Forces is granted leave of absence in order to attend camp for training.

EFFECT OF LEGAL DECISION ON IMPROVEMENT OF PROPERTIES

While, as I have already said, our expenditure necessitated by housing schemes and street improvements must, I fear, continue, I regret to say improvement of the accommodation provided by old licensed properties has received a severe check by a legal decision which has just been given by the King's Bench Division that licensing justices have no power to grant the necessary permits for alterations to be made which involve the incorporation of property not

hitherto licensed, even if they consider such alterations desirable and necessary.

The legal decision to which I refer was in connection with an application by a licensee for the sanction of the licensing justices to alterations to a licensed house at Weston-super-Mare, which was opposed in court by the Customs and Excise Commissioners who contended that the licensing justices had no power to give their sanction because the proposed alteration would involve the incorporation of an unlicensed property and that the application for permission to proceed should be by a request for a new licence for which monopoly value would have to be paid. The licensing justices had decided the reconstruction was necessary and desirable, but they were not empowered to grant the application. One realises the cost of monopoly value in such a case would be prohibitive as it would result in making the property unremunerative, and if it is to be charged in connection with the modernising and improving of licensed premises which daily becomes more extensive in consequence of public improvements, it practically means putting an end to the policy of public-house improvement, which has been so much desired and welcomed by licensing authorities and the general public. This would, of course, increase unemployment in the building trades and among bar-fitters and other allied trades, and would seriously affect architects and the other professional men who engage in such work.

To show how vast this expenditure in connection with the improvement and modernising of licensed premises and the erection of new licensed houses in the suburbs has become, we ourselves have expended a sum of over £1,000,000 in the past seven years.

Last year I said how fortunate our industry had been in that we had not been troubled with legislation adversely affecting the trade. This year we have escaped the troubles by legislation only to suffer the troubles of litigation—not of our own seeking—which may have even more damaging effects upon our trading than the lack of protective legislation against bogus clubs which we have been promised, but which has not yet been introduced by the Government.

PROBLEM OF THE BOGUS CLUBS

I refer to the promise which was made in the King's Speech in 1936 and again in 1937, that a Bill would be introduced to make better provisions for preventing the present abuses of the law relating to clubs. Magistrates and Chief Constables have long asked to be given powers to deal with bogus clubs but without avail. It is, therefore, very discouraging that any promise of legislation should have been omitted from the King's Speech at the opening of the present session of Parliament, and the more so, as from the statement of the Home Secretary replying to Sir Sidney Herbert in the House of Commons last week, it appears a vain hope that such a Bill will be introduced in the present Session. Meanwhile the evil grows.

As the number of clubs has more than doubled since 1905 and the number of on-licences has decreased by 25,152, the following statement in the *Birmingham Post* on Saturday last in regard to this question should be considered by the powers that be. It reads: "One fact at any rate is clear enough. The increase in drunkenness—or to be accurate in convictions for drunkenness—runs *pari passu*, with an increase of clubs, at the expense of public-houses."

As Sir Sidney Herbert told the Home Secretary in the House, the living of the licensed trader and the heavy taxation the Government draws from him are being eaten into by these bogus clubs.

And in addition to suffering this unjust and damaging competition the unfortunate licensed trader still awaits the fulfilment of the promised reduction of the heavy licence duties.

I can only say that if assessments are increased to such an extent as some Authorities appear to propose, no licensed trader will be able to gain a living, as it cannot possibly be offset by an increase in the present high price of beer, due to the Duty being still ten times the rate which was imposed before 1914. The public cannot afford to pay any more than the present price, and this was clearly shown by Mr Neville Chamberlain, when Chancellor of the

IMPERIAL AIRWAYS LIMITED

EFFECTS OF DELAYED DELIVERY OF AIRCRAFT

The fourteenth ordinary general meeting of Imperial Airways, Limited, was held, on the 14th instant, in London.

Sir John C. W. Reith, G.B.E., D.C.L., LL.D. (the chairman), in the course of his speech, said:—The year under review was one of transition from one major policy to another. The company's agreements with the Government, based on the carriage of passengers, surcharged mail and freight, were due to expire between 1937 and 1939. The Empire Air Mail Scheme, accepted in principle in 1934, provided for the carriage of letter mail without surcharge. This involved a great increase in activities and an alteration in the relative amounts of mail, passenger and freight traffic. The Empire Air Mail Agreement displaces other agreements for the operation of Empire services, leaving the European agreement to expire on March 31, 1939.

RESULT OF YEAR'S OPERATIONS

The gross profit of £296,824 is less by £97,217 than that of the previous year. This decrease does not represent a fall in the gross revenue, which for the year under review, including subsidy, amounted to the sum of £1,980,000, as compared with £1,729,000 for the previous year. The gross revenue per ton mile for the year 1937-38, however, at a figure of about 5s. compares with approximately 7s. for the previous year because of the decreased rate per ton of unsurcharged mail carried. Expenditure on the same ton mileage basis, but before charging obsolescence, was 1937-38 3s. 10d., 1936-37 4s. 8d. The fall in net revenue per ton mile indicated above fully accounts for the decrease in net earnings.

The board recommends the payment of a dividend at the rate of 7 per cent. on the ordinary shares of the company.

The European services have been operated under severe handicap. New aircraft were ordered in 1934, and at the general meeting last year it was reported that the first of them was then over a year late. Not one was delivered in the year under review, and in fact the first has only now been delivered—four years after the order. Instead, therefore, of having new aircraft, larger, faster and more comfortable than those of its competitors the company with its old aircraft has had to compete against the new aircraft of foreign companies and of British companies using foreign aircraft. And that is why the European services did not expand; in the circumstances it was satisfactory to have carried the same number of passengers as in the previous year.

As a result of unsurcharged mail more than twice the capacity was operated on the Africa route than in the previous year. Passenger traffic increased by 28 per cent. and mail loadings by 280 per cent. As to India, Australia and Far East services, only just over one month of unsurcharged air mail is covered, but during the year traffic from England to Karachi increased satisfactorily. Sixty per cent. more capacity was operated than in the previous year, and the same proportion of capacity offered was sold. Passenger traffic increased 48 per cent. and letter mail 75 per cent. The Bermuda-New York Service, which is operated by the company and by Pan-American Airways, began on June 16, 1937.

As mentioned earlier, European services have been severely handicapped by failure of delivery of aircraft ordered four years ago. The completion of the Empire Air Mail Scheme was delayed for the same reason, and the company is even now operating these services with assistance from aircraft that in normal circumstances would have been replaced with the more modern type.

THE FUTURE

In conclusion, the chairman dealt with the Report of the Cadman Committee, and then read the Air Minister's announcement of last Friday regarding the proposed formation of a public corporation to acquire Imperial Airways and British Airways, and concluded by saying: At this stage there are only two observations to be made. The Minister referred to the need in this company as well as in British Airways for large additional capital for development purposes. This is a matter which has had the board's attention for some time and which, in view of the assistance given the company by way of Government subsidy, has necessarily been discussed with representatives of the Government. Apart from any other issues involved, any alternative to the Government's plan would entail either a great increase in ordinary share capital or the creation of shares with rights ranking in front of the existing shares.

The second comment is that the board, whatever its legal powers under the Articles of Association, will not agree to any price for the sale of the undertaking without calling another meeting of shareholders.

The report was adopted.

Exchequer. He stated in his Budget Speech of 1933 that there must be some reduction in the retail price of beer as he could not wait any longer before taking some measure to safeguard the Revenue of the future, as the Beer Duty had palpably passed the point at which the law of diminishing returns begins to operate.

QUESTIONABLE CAMPAIGN AGAINST BREWING TRADE

I cannot bring my address to a close without referring to the unfortunate attitude which is being taken up by certain agriculturists in connection with the price of barley, who are furthering an abusive publicity campaign directed against the brewing trade. As I have stated before, the brewing trade has always done its best to aid the farmers, and it passes comprehension why they turn and bite the hand that feeds them.

The National Farmers' Union itself has freely admitted that brewers were doing their utmost with regard to home-grown barley and have expressed their satisfaction to the Import Duties Advisory Committee that such was the case. I am glad to hear that the Union dissociates itself from this questionable campaign. The brewing trade has nothing to fear if the truth be told.

And in this connection you will recall a shareholder questioned me at the Annual Meeting last year as to whether we were conforming to the gentleman's agreement made with Mr Neville Chamberlain when he reduced the Beer Duty in 1933. It was that brewers should raise the gravity of beers by at least two degrees and increase as far as possible the proportion of home-grown barley in the brewing of all classes of beer. I can affirm that your company has loyally carried out both these undertakings, notwithstanding the heavy increase in the cost of brewing materials.

THE FUTURE

I am afraid you will think I have presented a most doleful story this morning, but, after all, we must not forget that we are comparing last year's trading results with those of a year of real prosperity and of high wages. The profits of the brewing trade in 1937 were the highest since 1920-21, and we should find much satisfaction in the fact that we have maintained our turnover of that year. The general opinion appears to be that there will not be the recession in industrial activity this winter which at one time was feared, and I, myself, feel, as does the Prime Minister, that the general trading conditions of the country are improving and if the heavy costs we are fearing in connection with building improvements and assessments prove to be lower than at the moment it appears they may be, and brewing materials come cheaper than last year, our prospects for next year will be certainly brighter.

Ladies and Gentlemen, I have pleasure in moving the adoption of the report, and I will ask Mr Bainbridge to second it.

Mr Herbert W. Bainbridge seconded the resolution, which was carried unanimously.

ARGENTINE GREAT WESTERN RAILWAY COMPANY, LIMITED

CAPITAL SCHEME FORESHADOWED

The ordinary general meeting of this company was held on the 15th instant in London.

Mr J. A. Goudge (the chairman), in the course of his speech, said:—The heavy decrease in cereal business throughout the Argentine naturally resulted in reduced purchasing power for the products that the Argentine Great Western carries. Though that was not a serious matter, it is a continuing one; that is to say, there is still less money being spent on such commodities as wine, which is your great traffic.

The point of the report, apart from that, is that the moratorium was renewed with the concurrence of the Stockholders' Committee at meetings of the stockholders concerned. We still have to deplore the large amount of exchange loss which is being sustained on remittances from the Argentine. On that point, since the meeting of the Pacific Company, we have seen that an additional 6 per cent. is likely to be the result of the further depreciation of the peso.

We are, as you know, piling up a very large amount of accrued debenture debt. The prospect of some rearrangement of capital, I may say, has come one year nearer. But we are not yet in a position to lay any sort of scheme before you.

We have done, and we shall continue to do, to the utmost of our power, all we can to develop the district we serve. It is enlightened self-interest—to put it like that—but we must come to the point where capital will be short. I put it to the Pacific stockholders in the same way as I put it now by saying, can it be said that the Argentine Government are doing their best in their own interest if they fail to recognise that railway capital should be given a reasonable chance?

The report and accounts were adopted.

DALGETY AND COMPANY, LIMITED

POSITION IN AUSTRALIA

The fifty-fourth annual general meeting of Dalgety and Company, Limited, was held, on the 17th instant, at 65-68 Leadenhall Street, London.

The Hon. Edmund W. Parker (the chairman), in the course of his speech, said:—Economic activity in Australia during the past year has continued at a high level, despite the International situation and the great reduction in the wool cheque, but, of course, some diminution of prosperity must be looked for during the current year, owing to the natural sequence of a reduced spending power which is bound to follow. Without being unduly pessimistic, I therefore do not think that the Commonwealth is in for such a prosperous year as last. Money has to be found for National Defence and, as you may be aware, during the period under review the Government passed a National Insurance Scheme which will take a very large sum of money to finance.

The position of the Governments continued to improve in the financial year just ended. The Commonwealth Government revenue was raised substantially by a high level of Customs receipts, and a satisfactory surplus was recorded. Figures for all the States reflect a general buoyancy of revenue, partially offset by expenditure somewhat in excess of estimates. Nevertheless, surpluses were recorded in all States except Western Australia and Queensland, but even these deficits were less than those provided for in the Budget estimates.

In May last the Commonwealth Government floated a loan of £10,250,000 on the Australian market at £99 10s. for a term of 14 to 16 years, bearing interest at 3½ per cent., giving an effective yield to redemption of £3 15s. 10d. On the London market the Commonwealth Government floated a loan of £7,000,000 sterling, issued at £99 for 14 to 18 years and bearing interest at 3½ per cent. Various successful internal conversion movements were also carried through, all of which goes to prove that the credit of the Commonwealth still stands high.

There has been no alteration in the Exchange rate, which still presents us with a burden of magnitude. This year the cost of converting our overseas profits into sterling was £93,940. We have been able to absorb this in our profit and loss figures again without having recourse to our reserves, and this shows the very strong position of your company, which is something to be proud of.

NEW ZEALAND

New Zealand has again enjoyed a prosperous year, prices for the Dominion primary products, with the exception of wool, having been on a high scale, and this has resulted in heavy buying of imports. The trade figures for the year which ended on March 31st last reveal a drop of £5,671,000 on her £12,614,000 favourable trade balance of last year. Imports were valued at £58,065,000 compared with £47,621,000 for the preceding year, and exports at £65,008,000, as compared with £60,235,000. At the recent elections Mr Savage's Socialist Government was returned with practically the same majority with which it went to the Polls. How it will use its immense power in the handling of the country remains to be seen.

I regret to say that the price of wool was not maintained during the period covered by the accounts, and this, coupled with severe droughty conditions which have obtained in many parts of the Commonwealth, necessitating the provision of heavy reserves, has affected our results adversely, and I am sorry to say that the board has felt it incumbent upon it to recommend a reduced final distribution by way of dividend. However, the 6 per cent. for the year which is recommended is a fair return when you realise all the difficulties we have had to contend with both in the Commonwealth and the Dominion—more so in the latter where our expenses have increased as the result of recent legislation, and even now we do not know quite where we are. It behoves us then to make provision for lean times, and I can assure you that everything is being done in that direction that can be done, and your company to-day stands on very solid foundations. There are indications that the price of wool may harden—the opening of the new season's sales having shown a rising tendency, and it is hoped that this movement may continue.

From all points of view, and particularly from that of the Australian wool grower, the 1937-38 wool selling season was one of the most disappointing experienced for many years. Lower levels of value have ruled before, but seldom has a season opened with brighter prospects and been so consistently disappointing throughout the selling period.

The report and accounts were adopted.

SECOND INDUSTRIAL TRUST, LIMITED

SUCCESSFUL RESULTS—INCREASED DIVIDEND

The twenty-seventh ordinary general meeting of the Second Industrial Trust, Limited, was held, on the 16th instant, in London.

Mr W. Sandford Poole (the Chairman), in the course of his speech, after giving an exhaustive review of conditions at home and abroad, said:—I think you will agree that the accounts we submit to you to-day are quite as satisfactory as could be expected.

Dividends and interest received during the year, after provision for the National Defence Contribution and income tax, amounted to £59,996, as compared with £61,551 a year ago, a decrease of £1,555. An interim dividend of 1½ per cent. was paid on the ordinary shares in May last, and we now recommend a final dividend for the year of 3½ per cent., making together 5½ per cent., compared with 5 per cent. last year. This leaves to be carried forward £22,997. Last year we wrote off the commission on the issue of debenture stock made in April, 1936. This year we have increased the dividend by ½ per cent. and the carry-forward by £4,918.

The setback in our investment valuation during the twelve months was only about 22 per cent. The actual depreciation on our portfolio, before crediting the reserve and the carry-forward, was about 16 per cent. Fluctuations in values occur for a variety of reasons which often have no direct bearing on intrinsic values. Under the stress of grave political events superimposed on a trade recession, market quotations for securities, naturally, have slumped. A trust company which is under no necessity to realise at any given date can, to a certain extent, ignore fluctuations in market quotations, although it is, of course, comforting when one is able to announce a surplus.

In times like these it is not safe to assume the rôle of prophet. There are not wanting possibilities of improvement. It is to be hoped that when we meet next year the general outlook will be brighter. It is, however, only fair to state that I fear the report to be laid before you in twelve months' time may reflect some reduction in revenue, although, unless the unforeseen should happen, the amount of the reduction should not be serious.

The report and accounts were unanimously adopted.

S. SMITH AND SONS (MOTOR ACCESSORIES), LIMITED

RECORD TRADING PROFITS

The twenty-fourth ordinary general meeting of this company was held, on the 17th instant, in London.

Mr W. Henderson-Cleland, M.C. (the chairman), said that the balance sheet again revealed a strong financial position. Bearing in mind the circumstances of the past year, it was a matter for satisfaction that the trading profit showed the record figure of £360,645. Part of the increase had been set aside in depreciation, and the substantially larger charge for taxation meant that the net profit was reduced to £220,492 as compared with £250,385.

In their motor accessory group their position had been more than maintained with the motor car manufacturers and their instruments had been supplied to a larger number of motor car manufacturers than at any time in their history. Owing to the slight falling off experienced in the number of motor cars sold during the year, there had been a relative falling off in their sales of motor accessories for the period. The K.L.G. Sparking Plug Company had made considerable progress during the past year, and the new corundite plug had justified their expectations, while their aircraft plugs had maintained their pre-eminent position.

As to the future prospects of the company, although the first three months of the current year showed a decrease in the company's turnover, he was not pessimistic as to the prospects for the current year. The motor car manufacturers were busier than they had been for months past, and there was consequently a larger call for their instruments and equipment. Orders had been secured for the supply of one or other of their various jacking systems as standard equipment to nearly all British makes of cars. The prospects of the K.L.G. Company for the current year were better than ever before, and the important development in the corundite plug and in aircraft plugs had been so far-reaching that orders in hand ensured that factory working at full capacity for many months to come. Business in the Clock Group had been maintained during the past year, and in spite of the falling off in general trade during the first few months of the current season, their sales of both electrical and mechanical clocks had been maintained.

Mr A. Gordon Smith (managing director) seconded the adoption of the report and accounts, which was unanimously approved.

SUDAN PLANTATIONS SYNDICATE, LIMITED

SATISFACTORY RESULTS

The thirty-first ordinary general meeting of the Sudan Plantations Syndicate, Limited, was held, on the 17th instant, at Winchester House, Old Broad Street, London.

Sir Alexander MacIntyre (the chairman and managing director of the company) presided, and in the course of his speech said: The gross profits for the year amount to £582,560, and there is a net profit of £265,754. The directors recommend the payment of a dividend of 10 per cent. for the year. All cotton seed has been sold, and our sales of cotton have been quite good considering the lower prices ruling for cotton throughout the financial year. Sales of cotton have been larger than in the previous year, and we are continuing to develop sales by auctions at Port Sudan. We have constructed stores, sampling sheds, buildings and offices to facilitate the work in connection therewith. With the much larger production of cotton in the Gezira it is hoped that as time goes on more buyers will avail themselves of these auctions.

With regard to effecting forward sales by means of futures contracts, the Liverpool Cotton Association has produced a new contract called Giza 7 No. 2. While this contract in some ways is an improvement on the old one, it still penalises Sudan-grown cotton as compared with that grown in Egypt. I think that it is much to be regretted that a contract of a wider character cannot be evolved embracing all varieties and grades of Egyptian type cottons.

At present those who wish to provide cover for any substantial quantity are compelled to effect these covers in American growths where there is a free market, but this is not satisfactory.

The cotton crop produced in the Gezira for the past season was an excellent one, giving the high yield of 4.53 kantars of unginned cotton per feddan. Zeidab also gave a good return of 4.06 kantars per feddan, and all the crop has been sold.

With regard to the prospects for this season, the effective area planted amounts to about 167,000 feddans as compared with nearly 168,000 feddans last year. The crop is rather later than usual, but the latest cable from our manager indicates that in spite of all the difficulties encountered, if weather conditions, which are now favourable, continue, an average crop may be expected.

The results for the coming year must, to a large extent, depend on the final yield in the Gezira and on seed and cotton prices, and it is too early now to predict what these are likely to be. It would appear that America will have an average crop of about 12,000,000 bales as compared with 18,000,000 bales last year, and that Egypt will have the very much reduced crop of about 7,500,000 kantars as compared with 11,000,000 kantars last year. Prices of American cotton have recently risen somewhat, and the price of Egyptian cotton has risen substantially. If existing prices are maintained this should materially help our profits.

The report and accounts were adopted after some discussion.

KASSALA COTTON COMPANY, LIMITED

The fifteenth ordinary general meeting of the Kassala Cotton Company, was held, on the 17th instant, in London.

The Hon. A. M. Asquith, D.S.O. (the chairman), in the course of his speech, said:—Regarding the year ended June 30th last, the outstanding points are that, as compared with the previous year, we had nearly 7,000 more acres under cotton and the exceptionally high

demand at the tea auctions improved during the week, but was still only fair.

(Continued from page 394)

Other Foods

Provisions.—Bacon prices were marked down by 2s. to 5s. per cwt. at the end of last week, but trade has remained slow. Colonial butter prices were also reduced, but European types were little changed in price. The trade in meat has been dull, and some of the home killed supplies have arrived out of condition owing to the warm weather. Heavy supplies of eggs caused a fall in values.

Colonial Produce.—Refined sugar prices were advanced by 1½d. per cwt. at the end of last week and again on Monday, in sympathy with the firmer tone in the market for raw sugar. The market for cocoa was steady with some improvement in prices of Accra. The

Fruit and Vegetables.—Heavy supplies of green vegetables were not cleared over the week-end, even at very low prices. All types of tomatoes were in brisk demand during the past week. The London potato trade shows little change, but the provincial markets report improved prices to growers since the size of the riddle has been raised.

Miscellaneous Commodities

Oils and Oilseeds.—These markets have improved during the past week, partly in sympathy with the better tone in the grain trade. The Argentine

yield of over 4½ kantars per feddan. On the other hand, in contrast with 1937, cotton prices were low throughout the year and particularly during the months February-June, when our cotton auctions are held at Port Sudan. We sold a good part of our crop at and immediately after those auctions.

Cotton and other profits at £107,521 are down by £25,366; the reserve against advances to tenants no longer required brought us in £7,689 more than last year; and we show a profit, subject to directors' percentage, of £33,503, which compares with our profit of £49,039 in 1937. We were fortunate in having a bumper crop in this year of poor prices. We propose, if you agree, a dividend of 10 per cent., payable to-morrow.

As to the growing crop, it is always too early at the date of our annual meeting to make any sure forecast. Our area under cotton at 38,639 feddans is practically the same as last year. Generally speaking, the amount of the rainfall and its incidence have been quite exceptional this season, and conditions have been such as to make more than usually heavy demands upon our Sudan staff and upon the tenants. Blackarm can be found throughout, but according to our latest advice the cotton appears to be throwing it off. Our latest reports are that our stand of cotton is not bad and that, granted a continuance of favourable conditions, a fair average crop may be obtained.

The report and accounts were unanimously adopted.

SOUTH WEST AFRICA COMPANY, LIMITED

The ordinary general meeting of the South West Africa Company, Limited, was held, on the 17th instant, in London.

Sir Edmund Davis, J.P., the chairman and managing director, in moving the adoption of the report and accounts, said:—In the profit and loss account there is a balance profit of £129,055 (an increase of nearly £30,000 over last year), to which we have added reserve for income tax not required, £9,029, and deducted percentage of profit due to directors, £5,602, which leaves a balance of £132,482 carried to the balance sheet, being £21,600 more than last year. There has been during the year under review a considerable increase in the receipts under the heading "Ore Sales Account," due to the larger tonnage we have disposed of during the period covered by the accounts. For the current twelve months we do not anticipate disposing of as much tonnage as we produced during our financial year just closed, though I am able to estimate that the profits to be realised on sales, together with the dividends on our investments and the amount likely to be transferred from land sales suspense account in the current financial year, will be such that the balance of profit for the year should be sufficient, leaving aside the question of any carry forward, to warrant the declaration of a dividend of 5 per cent. with a bonus of 10 per cent.

At our last ordinary general meeting I stated that through the good offices of the German Government and our bankers in Berlin we were able to transfer a large amount of sterling to this country, and to-day I am able to inform you that the whole of the £100,000 has been received.

Summing up the position of the company to-day, our investments, which at June 30, 1937, had a value of £597,330, at June 30, 1938, had a value of £684,684, and on the 15th instant had a market value of £693,768. Our Abenab Mine, which stands in our books at over £10,000, should, in our next accounts, stand at practically nothing.

The report and accounts, with the recommendation of a dividend of 5 per cent. and bonus of 10 per cent., were unanimously adopted.

Government has fixed a minimum price for linseed at Buenos Aires of 13 pesos per quintal, and this announcement helped to improve linseed prices, but the bulk of the English demand is still concentrated on the Indian crop. Trade in Egyptian cottonseed is quieter, but the price of linseed oil gained 17s. 6d. per ton on the week.

Rubber.—The rubber market was inactive over the week-end, with a slowly declining price level. The decision of the Regulation Committee is the subject of a Note on page 394. The immediate reaction of the market to the news was to mark prices down by a further ½d. per lb., but some of this decline was later made good. The October consumption in the United States, at 40,333 tons, represents the highest daily level since September, 1937.

Estimates of Defence Expenditure

We present below a number of estimates comparing the defence expenditures of the Powers. The principal sources are Foreign Policy Reports (New York), October 1, 1938, and *The Economist* Armaments Supplement, October 19, 1929. The estimate of German expenditure in 1938 is based on the official rate of exchange.

GENERAL NOTE
* Germany includes Austria in 1938
† " " Austria-Hungary in 1913

GOVERNMENT RETURNS

For the week ended November 12, 1938, total ordinary revenue was £15,347,000, against ordinary expenditure of £13,076,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £198,239,000, against a deficit of £124,763,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are normal length bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.
On November 11th applications at £99 17s. 4d. per cent. for bills to be paid for on any day except Saturday of the following week were accepted as to about 52 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications for bills to be paid for on Saturday at £99 17s. 5d. per cent. and above were allotted in full. £35.0 millions of Treasury bills are being offered on November 18th.

OIL OUTPUTS

Anglo-Ecuadorian Oilfields, Ltd.—Output for October, 1938, is 23,392 tons.

British Controlled Oilfields, Ltd.—Total output for week ended October 22, 1938: 11,618 barrels. Total output week ended October 29, 1938: 11,323 barrels. Total output week ended November 12, 1938, 11,939 barrels. Total output for October, 1938, 52,238 barrels. Shipment for October, Western area, 38,487 barrels.

Dacia Romano Petroleum.—Gross output for October: Dacia, 1,590 tons; Perimeter X, 2,463 tons; Starnaphtha, 300 tons.

Kern Oil Company, Ltd.—The total output, October, 1938, 250,909 barrels, or approximately 35,844 tons.

Phoenix Oil and Transport Company Ltd.—The gross production of crude oil of the Phoenix Group for October, 1938, was 51,825 tons.

Venezuelan Oil Concessions, Ltd.—Total output week to October 22, 1938: 1,363,899 barrels. Total output for week ended October 29, 1938, was 1,326,663 barrels. Total output week to November 12, 1938, 1,336,419 barrels.

British Burmah Petroleum Company, Ltd.—Output of crude oil, 50,482 barrels for October, 1938.

Trinidad Petroleum Development.—Output week ended November 12th: 55,293 barrels.

The Railway Problem

WITH an unexpected suddenness and a breadth of claim that would do credit to any dictator, the four railway companies have sprung a surprise on the public. They have resolved to ask Parliament and the public for nothing less than the complete removal, in the course of the present session, of all the restrictions imposed by a century of railway legislation on their freedom to charge what they think fit for the carriage of merchandise.

This claim is founded on the unequal legal position of the businesses of carrying goods by road and by rail. There can be no doubt that the railways have suffered very heavily from the competition of road transport almost ever since the war. It is this, more than anything else, that has prevented them from ever earning the standard revenue to which the Railways Act of 1921 morally entitles them. During the recovery years the railways' revenue showed a substantial increase, and though it never came within bow-shot of the standard figures its buoyancy was enough to tempt the companies to believe that they could safely undertake a general increase in charges. But the results of the 5 per cent. increase that came into effect on October 1, 1937, have been disappointing. Whether as a result, or as a coincidence, the year that has passed since the increase came into force has seen a renewal of the diversion of traffic to the roads. The present move of the railways is a tacit acknowledgment that there is no hope of

adequate revenue for them from general increases in rates.

Whether the railways would have been able to put up a significantly better fight against road competition, if they had not been handicapped by the legal restrictions on their power to alter the rate schedules, can only be guessed at. It is certain that some traffic would in any case have been lost to the new method of transport, which has some undeniable natural advantages over the railways. But it is at least *prima facie* reasonable to suppose that the loss would have been far smaller if the railways had been able to compete more directly. The system of railway rates took shape when the railways had a virtually absolute monopoly of all land transport. Accordingly, it imposed on the railways not only a complicated and rigid classification and a cumbrous technique of alteration, but a prohibition against giving "undue preference" to any particular trader or traffic. It was bad enough for the railways, with the advent of motor transport, to have to share the transport business of the country with a competitor. But it was worse still for them that the new competitor was in a position to take the cream of the highly remunerative traffic and leave them the skim milk. Road transport contractors, unlike the railways, are under no statutory obligation to accept for carriage whatever is offered to them. Unlike the railways, they are under no statutory obligation to charge high rates for

certain classes of traffic and low, possibly unremunerative, rates for other classes. Unlike the railways, they are free, at a moment's notice, to quote special rates for particular classes of traffic, or to particular traders.

Since the rise of road transport, the railways have tried several methods of meeting this new competition. One line of attack may not unfairly be described as attempts to restrict the growth of the new industry. It was largely owing to the insistence of the railways that the licence duties on lorries and passenger vehicles were raised to figures which are assessed to represent the value they derive from the public highway system. The railways also had a hand in imposing on road transport the system of limited licences which has already virtually stabilised the number of passenger vehicles and considerably limited the freedom of the goods haulage branch to expand. Quite recently, statutory definitions of working conditions in the industry have been laid down, and though they are not yet perfect in form or perfectly observed, they undoubtedly add to the financial burdens of road hauliers. Finally, the railways have frequently suggested that a system of classified and statutorily determined rates, like their own, should be drawn up for the road transport industry. The latest such suggestion was made by the Transport Advisory Council in July, 1937; but nothing has come of the suggestion. All these are the legitimate devices that have been adopted by the railways to impede the free expansion of their competitor. In sum, however, they have not succeeded. Moreover, it is at least questionable whether the community would be well served by a restriction of road transport severe enough to solve the railways' problem.

The second method adopted by the railways was to attempt to secure control of the infant road transport industry by buying it up. Since they were given the legal right to acquire shares in road transport concerns, the railways have been active purchasers. But though their stake in the road transport industry is now very considerable, it has never given them sufficient control to prevent the industry as a whole from taking traffic from the railways.

This week's manifesto marks the beginning of a new method, and a tacit recognition that the various policies of restricting and controlling road transport have failed. Since competition from the roads cannot be inhibited, the railways argue, let it be faced on an equal basis. Since the road transport industry cannot be subjected to legal restrictions on its freedom of charging, equivalent to those resting on the railways, let the railways be released from their bonds. Since the lorries will not play the game according to the rules imposed by nineteenth-century legislation, let there be no rules. It is impossible to gainsay the elementary justice of the railways' case. The restrictions are no longer in the least necessary to protect the public against a ravening monopoly. If the choice is in fact limited to one between equal competition for both forms of transport and continuance of the present inequality, the railways' case is unanswerable.

In a vitally important matter such as the transport system of the country, however, it is impossible to reach a conclusion merely on a contemplation of the ethical principles involved. It is equally necessary to inquire into the probable practical consequences of granting the railways' request. The bulky, cheap raw materials of industry, which are charged low rates by the railways, are the commodities which would have the greatest difficulty in escaping to the roads if railway transport became too expensive. If the railways, having secured their freedom, began to look for rates that could be raised, these are the rates that would catch their eyes. But a large part of the industry of the country has been built up on the assumption of the lowest possible transport charges for bulk commodities, and the removal of the assumption might do far more harm to the community than benefit to the railways.

It is probable, however, that the railways would use their freedom less to raise rates than to lower them where competition demanded, since they require a larger volume of traffic rather than a higher average rate. The reference in the Memorandum to the necessity of repealing the present requirements relating to "classification, publication and undue preference" suggests that they are rather thinking of being able to undercut the road hauliers for particular traffics. The rate quoted for a given kind of traffic between two given points would depend less on the distance than on the nature of the competition. Local rate wars would become familiar, and the railways would use their large financial resources to drive out of business, even at a temporary loss, competition which they considered to be unfair. In short, the present relatively orderly system of railway rates would be replaced by one as chaotic as now exists on the roads. Rates would vary from place to place, from time to time, perhaps even from customer to customer. Such a state of affairs might possibly be in the interests of the railway companies. It is doubtful whether it would be in the interests of the community. Indeed, the companies admit as much when they speak of the grant to them of full competitive freedom as the preliminary to a new and equal system of control, imposed equitably on both parties.

The possibility must, finally, be recognised that a regime of unfettered competition might not be in the financial interests of the railways. Cut-throat competition might, in fact, cut throats, and each competing system of transport might, in effect, succeed only in preventing the other from earning a proper return on its capital. In this case the community would, indeed, get cheap transport. But it would also find that it was slowly consuming one of its most valuable fixed assets, its transport system.

For these reasons, it seems to be at the least doubtful whether a change which would be no more than fair to the railways would not also be less than fair to the interests of the community. And if the proposed regime of unfettered competition is advocated only as the preliminary to a new system of equitable and co-ordinated control, would it not be far better to proceed as quickly as possible to that new system, without the potential dangers of the intervening anarchy? It is not possible, at the end of this article, to embark on a discussion of what would be involved by such a system. It is obvious, however, that the process of the co-ordination of transport must follow one of two courses, which can be called negative and positive. The community can either impose a complicated set of restrictions on two transport systems which are otherwise in competition, with the object of seeing that they compete on fair and equal terms and that there is the least possible amount of unnecessary duplication of costly facilities for carrying the community's goods. This would be the negative method; it would move by the technique of prohibition. Its advantage would be that it would impose the smallest burden of administration and responsibility on the state; its disadvantage that it would necessarily be, to some extent, both restrictive and wasteful. The positive method would be to ensure some degree of community of financial interest between the two forms of transport, so that the interest of each would cease to be to steal traffic from the other, and become that of assisting in carrying the traffic offered at the lowest social cost. In its extreme form, this is the probably chimerical proposal of the nationalisation of all transport. But it has more moderate forms, such as the interesting suggestion, recently made, that the fixed charges of maintaining the capital equipment of the whole transport industry should be pooled and become a first charge on all traffic, however moving.

These brief references are no more than an outline agenda for discussion. The railway companies have done the community a very great service in bringing the agenda forward and presenting it for urgent public debate.

A Democratic Resurgence?

THESE are the post-treaty days after a war that was won and lost without a battle; and the aftermath of all wars is political *malaise*. From Berlin a new Versailles is being unfolded, article by article, while the German Jews lie prostrate beneath hammer-blows beyond even the imaginings of a Theodosius. In Czechoslovakia a gallant and resigned people is licking its wounds. In France, M. Daladier stands uneasily at the centre of a hurricane of dissension and doubt.

In England, too, the price of peace has been political unrest. There are people of all parties and opinions who are critical of the policy which is being officially pursued. Discontent is rife at question time in the Commons and, though it still shuns the division lobbies, it dominates the floor of the House. It came into public view at Dartford and swept all before it at Bridgwater. In matters of defence and diplomacy the Government's critics are legion.

The ferment in the country is unmistakable, but it is easier to say what it is not than to say what it is. The call for new men, new measures and new methods is not a party cry. In Parliament, Mr Churchill's appeal for hostile Conservative votes a week ago to shake up the Government simply caused the ex-First Lord of the Admiralty to declare his continued loyalty to the Cabinet he had lately left; and Mr Eden, who voted with the Government on the crucial issue of supply, has never ceased to combine affirmations of his party faith with the widest criticisms of his party's policy. At every attempt to transmute the dissatisfaction so widely felt into a party attack on the Government's tenure of office, it seems to vanish.

Perhaps for this reason there is very little sign that the official Opposition is marching forward. The Labour Party is as suspicious of the new trend in politics as the Prime Minister himself. They are in the van of the campaign for new policies, and they have banded with the Co-operative Movement to trumpet their indictment of the Government's diplomacy nation-wide. But, at the by-elections, Transport House has damned united action against the Government with faint disfavour; and it may indeed prove a clear sign of Labour's failure as an Opposition, and therefore as second guardian of the public conscience, that they decided on Wednesday not to have any truck with an anti-Government movement organised on any but exclusively party lines. They remember MacDonald and 1931 too well; and like the Bourbons they may suffer for their over-strict memory.

The persons of the immediate drama are three, and they mirror three separate trends, none of them party trends. Mr Vernon Bartlett, whose attractive personality, expertise in foreign affairs and appeal to sentiments beyond and deeper than party pigeon-holes won him a resounding victory in a record poll at Bridgwater, is a symbol. Ever since the National Government took out a long lease of life in 1931, certain criticisms of its policy in foreign affairs have been matters of moral principle for many people both within and without the Opposition groups; the League of Nations, good faith and collective security were firmly rooted among the people, as distinct from their parties, when the Peace Ballot swept Sir Samuel Hoare from the Foreign Office three years ago. It is this steady view that opportunism in foreign affairs has been Britain's undoing which Mr Bartlett caught and canalised. An independent progressive candidate can rouse the best in English politics, even though the official Opposition can apparently make little headway.

Mr Churchill, too, takes his stand in the foreign field.

He has stood for a strong League and a strong Britain ever since the shadow of the swastika first fell across the face of Europe five years ago. It is because of his towering stature as a Parliamentarian that his personal campaign for strength at home and justice abroad has taken on a national guise, and it is a sign of his insight into the country's mind that he and his scanty cohorts now find themselves associated in the present discontent with a host of diverse groups. Yet Mr Churchill can no more capture the Conservative caucus now than he could over India. The Left Wing progressives have political strength *in posse*; parliamentarily they are weak. The Churchillites are parliamentarily powerful; politically they are submerged in the party stream. Nor are the two groups in double harness. So far Mr Chamberlain is safe in his afflictions.

It is probably Mr Eden who holds the key to Mr Chamberlain's and the country's future, and it is he whose name and supposed intentions are on every lip. It was as Foreign Secretary that he made his bow as a statesman, and it was as critic of the policy which was to lead to Munich that he resigned in February. On foreign affairs, he stands with Mr Churchill and the progressives; on defence, too, he is in general line with the critics who call for more forthright re-armament in terms of both men and materials. But foreign affairs and defence are not the whole of policy; they can never lastingly unite persons and parties whose views about other and deep matters of life and livelihood differ widely. The platform which Mr Eden has propounded, only in tantalising outline, up and down the country since August is as broad as the nation's needs.

If we in this country desire to work for peace we must see whether we command the three essentials required to play our part—unity, strength and a sense of justice.

We must, says Mr Eden, make

a nation-wide endeavour to win for our own people, not only security of defence, but also security of employment in the factory and on the land, not only the will to provide anti-aircraft guns, but also the will to acknowledge and resolve the problem of the Special Areas, the faith that democracy can achieve these things, the realisation that if it will not try, it cannot survive.

Mr Eden has called for a new Government of all the parties, but he is still a Conservative. If he is to win his cause it is his party that he must capture; for the new Jerusalem cannot be built overnight in the wilderness. He is well placed strategically to forge a new Tory democracy—in shorter time than Disraeli—one that will win, as he wishes, the support of others, Churchillites, progressives and men and women in all sorts of streets in this time of emergency. As one who believes that "democratic liberties are the foundations of progress," Mr Eden presumably does not desire the complete abnegation of free and constant criticism, even in national unity.

He may fail. He may have no proper plans; they certainly have not been clearly defined. But his broad social plea is what probably a majority of the people have vaguely been waiting for—if it can be translated into deeds. Mr Eden is right when he says that organisation for defence is

THE ECONOMIST
BY AIR
SEE PAGE 434

not *sui generis*. It is probable that we have failed to solve the problems of malnutrition, unemployment, poverty, road dangers, transport disorganisation, industrial decay, urban overgrowth and public ill-health for precisely the same reasons as we have failed to produce airplanes, artillery and air-raid protection. The current need is not simply for emergency expedients, but for a renaissance of courage, initiative, intelligence, energy and leadership. If we are to save our democracy it must be made socially worth saving; and the mainspring of success in either case is the prosperity of trade and industry and the health and happiness of the people. Organisation for peace and organisation for war are of the same order.

Mr Chamberlain does not see matters so clearly. To him, for example, a Ministry of Supply is a wartime organisation; therefore it cannot be used in peace; and the critics of the Cabinet's defence policy are to be fobbed off with a consultative committee of business men with no executive power to organise the supply and distribution of materials, the allocation of contracts and the output of arms. The committee's personnel may be sound and wise; contact with, say, a Lord Stamp could not but be salutary for the defence departments; but by its nature such a body can only be a further delaying factor in the flow of defence production. If the business men are needed, they

should be put in charge. Nor is this an armchair opinion of metropolitan politicians; it is supported by evidence from all over the country. The view of the Leeds Chamber of Commerce, noticed quite casually, is practical and to the point:—

The experience of Leeds engineering firms in regard to the re-armament programme does not support the view that the time for a Ministry of Supply has not yet arrived. At the present time the defence departments have not the facilities for mobilising the munition-making resources of the country.

This is surely the authentic voice of common sense.

There, in one instance, is the crux of the Government's failings, the gravamen of Mr Eden's challenge and the foundation of the criticisms which are notably gathering momentum. We must state our needs boldly, for defence and social service alike, and we must furnish at once the measures, machinery and men required to meet those needs in full. Lacking leaders with imagination and confidence, we are in danger at home no less than abroad. Yet this condition surely cannot endure. The wind of discontent is blowing from many quarters, but it is wholly a cleansing wind, and we cannot suppose that British democracy will finally be found wanting. With Milton "we cannot set so light by all the invention, the art, the grave and solid judgment which is in England."

Visitors to Paris

A TWO-POWER meeting between British and French Ministers was the right next step after the four-power meeting at Munich. Events, however, have been moving so swiftly that the scope, agenda and prospect of these Anglo-French talks have all changed profoundly since the date, only a few weeks ago, when the British Ministers' visit to Paris was arranged.

If the outlook had remained what it appeared to be on the morrow of Munich, it might have been supposed that the Paris conversations would be largely, if not mainly, concerned with the question of handing over to Germany certain tropical African territories on certain conditions, while the second point would have been the question of linking up "appeasement in Africa" with a limitation of armaments in Europe. To-day, neither of these points is practical politics. The possibility of handing over native African populations to Nazi rule—even under the strictest stipulations for safeguarding their welfare—has been put out of court by the present unprecedented orgy of persecution in Germany against the Jews. Nazi racialism has always been a stumbling-block in the way of any satisfaction of Germany's claim to colonies; but previously it could not quite be taken for granted that the policy of victimisation applied against the Jewish minority in Germany would be extended by the Nazis to the native African populations of tropical territories that were obviously not "White Man's countries" in which Germans might be tempted to try to supplant the existing African inhabitants. This latest outbreak of Nazi racialism, however, has been so violent and so insane as to have made it morally impossible for the rest of us to expose any native populations at present under our charge to the awful risk of being treated as the Jews in Germany have been, and are being, treated this autumn. In short, "the colonial question" is no longer "actual"; and that in itself would have made an agreed limitation of armaments less practicable, since some satisfaction of Germany's territorial claims in Africa would have been the consideration in return for which Herr Hitler might, perhaps, have been induced to accept a limitation of armaments on a ratio that would spell security for us.

Meanwhile, there is a growing belief that he would not anyhow have contemplated, and certainly will not now contemplate, an agreement to limit armaments except on terms which would leave him with a decided permanent superiority in the air over the two West-European Powers combined. So disarmament, like the colonial question, is out of court.

What, then, are the prospects to-day of carrying forward the policy of appeasement between Great Britain and France on the one hand and Germany on the other? This, after all, is the capital question on which all other questions hang. The only visible mark of any advance along this main road is the draft of a Franco-German Pact on the lines of that Anglo-German Pact to which Mr Chamberlain and Herr Hitler put their names at Munich "the morning after." The formula is that of the Kellogg-Briand Pact: the parties agree not to seek a settlement of their differences with one another except by peaceful means, and on Wednesday, while Mr Chamberlain and Lord Halifax were on their way to Paris, it was officially announced that Herr von Ribbentrop himself will shortly go there to sign such a declaration. The Kellogg-Briand Pact is not exactly strengthened by being reduced from a multilateral to a bilateral instrument; and, apart from that, there is the crucial question of defining the scope of the term "differences." Would the French (or British) party to such a pact be precluded from counting, as a "difference" between himself and Germany, any dispute that was not confined to national "interests" in the narrowest sense? Would Germany be able to maintain that the fate of Spain, or of the Jews, or of the League of Nations, could not give rise to any "difference" between herself and Great Britain or France, and that therefore in such matters, *pace* her pacts with the two West-European Powers, she was still free to impose her will by that ruthless use of force which her rulers have been glorifying since "the peace of Munich," no less than before it? Also, has even such a pact its price—payable by the non-German party? Was it part of Herr Hitler's terms to M. Bonnet, in the recent Franco-German negotiations, that

the French Minister for Foreign Affairs should secure the passage of two decrees that are said to have been rejected by his colleague the Minister for Justice? One of these abortive decrees was apparently to have empowered the French Government to prosecute on its own initiative French newspapers which published things annoying to foreign governments; the other was to have empowered them to try *in camera* cases at law in which foreign governments might have incurred odium.

In any case, whatever the prospects and implications of a Franco-German Pact, joint appeasement will presumably have yielded precedence to common defence as the main subject of the Franco-British talks in Paris this week. And, since the events of September, common defence for Great Britain and France has come to mean holding the line, running from the Mediterranean to the North Sea, along which France and the Low Countries march with Italy and Germany. The post-war French system of maintaining a general European balance of power against Germany seems to have completely collapsed. In so far as Roumania and Yugoslavia are still looking westward for support, their eyes to-day are turned towards London rather than towards Paris. Having surrendered the key-stone of their East European policy—the French military guarantee of the post-war frontiers of Czechoslovakia—the French seem, at least for the moment, to have abandoned all attempts to construct a second East European line of defence; and this extreme revulsion from intransigence to defeatism in regard to the countries between Germany and Russia must mean, in its turn, that the Franco-Russian Pact is now in a state of suspended animation.

But if Western Europe is to defend itself out of its own local resources, the political and military future of Spain becomes the capital question; for General Franco's Spain threatens to give Germany the same stranglehold on France that M. Benes's Czechoslovakia originally promised to give France on Germany. If General Franco is made first to win the Spanish War and secondly to place a Spain reunited under his rule at the disposal of the Berlin-Rome axis, then France will be almost desperately encircled. She will have another frontier to defend along the Pyrenees,

and at the same time she will be in mortal peril of seeing her communications with North Africa intercepted. This would mean that she would have to meet a seriously increased military commitment in Europe with a seriously diminished reservoir of military man-power.

This is a prospect of intimate concern to us in this country. For if France has an additional frontier to defend, and if at the same time she can no longer count on being able to bring in African troops across the Mediterranean, she is bound to point out to us that the Channel, at any rate, can presumably still be kept open by the combined strength of the British and French navies, and that, if the African reservoir of man-power is cut off, the only alternative source of supply is to be found in Great Britain.

Here is a concrete military question which will, we hope, have been thrashed out before the British Ministers return to London. Anglo-French policy in regard to Spain has a direct bearing on British domestic policy in regard to man-power. It has been officially declared that, in another war, a great British conscript army would not be despatched to the Continent in any circumstances. Such declarations in advance seem rash, for war is notoriously an exacting master, whose demands can neither be refused nor be forecast. But there is one thing, at least, that can be foreseen quite clearly to-day; if the whole of Spain to-day becomes an appendage of the Rome-Berlin axis, then in another war a great British conscript army will infallibly have to go to the Continent, whatever British Ministers may previously have said to the contrary. Since we could not afford to see France overwhelmed, there is no limit to the effort which we should be compelled to make for the sake of saving France from destruction. This pressing dual topic of Spain and man-power may well turn out to have been the main topic of discussion in Paris this week, since it has become so apparent that Britain can make no progress with Germany and France can make no progress with Italy. Perhaps M. Daladier will succeed, where the House of Commons has failed, in impressing upon Mr Chamberlain that Great Britain has lost the ability, which she had until yesterday, to ensure her own safety by limited commitments of men or money.

Milk Policy

IN the course of the last five years milk has been the subject of reports by two Reorganisation Commissions, of four Acts of Parliament, of an Agricultural Marketing Scheme, of about £4½ millions in State subsidies, and of numerous reports by the Consumers' Councils, the Food Council and various other bodies, political and economic. As a result of this publicity, it is now common knowledge that milk is a highly nutritious food, particularly valuable for growing children, that most of the growing children in this country do not drink nearly as much milk as, for reasons of health, they should, and that the main obstacle in the way of increasing the consumption of milk is its high retail price. The last Reorganisation Commission, the Consumers' Councils, the Food Council and most private inquirers believe that the price of milk could be considerably reduced by a reform of the distributive system; they consider that the existence of many small units, with overlapping rounds, has led to unnecessarily high costs, and that this situation has been aggravated by the action of the Milk Marketing Board, which in prescribing minimum retail margins has limited competition to the offering of more elaborate services. It is also generally agreed that the quality and cleanliness of milk could be improved, and that costs of production could be considerably reduced by the

elimination of certain cattle diseases and by better management of grassland.

Nearly eighteen months ago the Government issued a White Paper which foreshadowed the setting-up of a Milk Commission, independent both of the Milk Marketing Boards and of the distributors, to whom would be entrusted the task of rationalising the distribution of milk and of exercising a general supervision over all branches of the industry. In the text of the Bill, which was published last week, the Milk Commission duly appears; it is to consist of nine persons, with no financial interests in milk production or distribution, who are to be appointed by the Ministers concerned. Expert opinion is to be provided by Milk Advisory Committees composed of representatives of the different interests affected. It is specifically laid down that the Commission will have powers to regulate the hours and number of milk deliveries, the grades by which, and the containers in which, milk and cream are to be sold, and its regulations will be enforced by monetary penalties on offenders. The Commission is not, apparently, to be empowered to fix prices for sales either by producers or by distributors, as long as the parties concerned arrive at an agreement, but if the Milk Marketing Boards and the distributors fail to agree on the terms of any contract the

Commission will act as arbitrator. On the distributive side, the Commission's powers are meagre. It will not be able to initiate any schemes for the reorganisation and consolidation of milk rounds, whose extensive overlapping is one of the main reasons for the present high distributive costs. The Commission can only approve, or disapprove, such local schemes, not exceeding ten in number, as are submitted to it by groups of distributors representative of the majority of such interests in the areas concerned. These schemes must provide, *inter alia*, for the payment of compensation by the survivors to those whose rounds are extinguished. No one will dispute the necessity to pay such compensation, but the combination of voluntary initiative on the part of a majority of existing distributors with payment of compensation exclusively by the survivors, is likely to turn the new experiments in rationalisation into the mere confirmation of existing local monopolies, with little prospect of lower retail prices.

It is hardly surprising, even if deplorable, that the Government should be unwilling to grasp firmly this nettle of distributive reorganisation, for it undoubtedly holds many political stings. To enforce larger and rationally planned rounds will put out of business, to the apparent advantage of their stronger competitors, many of the small retailers, whose rounds represent to them considerable capital investment, much hard work and a secure livelihood. The benefits which can be derived from the consequent cheapening in the price of milk, while real, will be diffused gradually among the whole community of consumers, while the dislocations involved will be immediate, obvious and, for the few directly involved, very extensive. The producer-retailers, who would be most affected by a vigorous policy of rationalisation, number more than 50,000; in their campaign against the very mild proposals of the present Bill they will have the support of the Milk Marketing Boards, of the National Farmers' Union, of small shopkeepers throughout the country and of a large section of the Conservative Party. It is, therefore, likely that these provisions of the Bill, inadequate as they are to secure a real cheapening of the costs of distribution, will be further whittled down during the legislative process.

The powers of the Milk Commission to regulate the methods of distribution—as distinct from the powers to experiment with rationalisation—are likely, therefore, to be its main weapon in the battle for cheaper milk. If wielded with discretion and determination, they could have a not unimportant influence, particularly if the fixing of minimum distributive margins is abandoned, as recommended by the Cutforth Commission. Much will depend on the composition of the Milk Commission and on the support given to it in its early and unpopular years by the Government and the other interests of the milk industry.

In other respects, the Bill follows closely the more detailed proposals of the White Paper. The Commission will

take over from the various Marketing Boards the schemes for providing cheap milk for school children, and the State will continue its grants to cover the cost both of the present schemes and of their future extension to infants and mothers. The quality premiums paid to producers of graded milk are to be increased for the next two years; their level thereafter is to be determined by the Milk Commission in the light of the progress made. Minimum prices for milk manufactured into butter and cheese remain, though on a somewhat altered basis. These prices are already fixed for the years 1939-41; for subsequent years they will be fixed in consultation with the Milk Commission. On the recommendation of the Committee for Animal Diseases, local authorities are given powers to enforce compulsory pasteurisation of milk sold retail in their administrative areas, but there is neither inducement to the local authorities nor compulsion of them to use their powers. This, again, in spite of the timidity with which it pursues the national interest in a safe milk supply, is a measure which will be opposed by representatives both of farmers and the small retailers, since a pasteurisation plant is very expensive unless it deals with larger quantities of milk than are handled by the majority of producer retailers. The Bill provides, also, for the exemption from pasteurisation of T.T. and certified milk; further, retailers drawing more than four-fifths of their milk supply from a single herd will be exempt from the scope of a pasteurisation order for three years after it has become effective. Another clause allows the Board of Trade to regulate quantitatively the imports of milk products, other than butter and cheese, if it considers such regulation necessary to ensure a stable market. Official and public regulation by the Board of Trade, the head of which is directly responsible to Parliament, is probably preferable to the present system of "voluntary" import quotas and price agreements enforced on foreign importers by a threat of higher duties in the event of non-compliance. But since all forms of condensed and powdered milk, which are largely consumed by those who cannot afford fresh milk, already pay heavy duties, there seems no reason why we should continue to hamper trade with yet another quota.

The Bill, in short, provides for the unimaginative continuation of the present methods of improving the quality of milk and of increasing its consumption. The first must necessarily be a slow process, but it has been well started in recent years and should continue at a reasonable pace in future, with advantages accruing to both producers and consumers. The planned extension of the cheap milk schemes can only be heartily welcomed, but, unless the Government appoints an exceptionally energetic and far-sighted Commission, the increasing numbers of Britain's population who are neither infants, school children nor expectant mothers are likely to continue paying to the existing milk trade what, compared with other countries, is a high price for a small quantity of milk.

the proportion of it now accruing to the country for whom the concession is designed.

The reception of the Agreement in the past week, on both sides of the Atlantic, has been uniformly favourable. If particular industries consider themselves badly used, their complaints have been lost in the chorus of approval. In part, this unanimity of praise for the Agreement is due to the mere fact that two such important trading countries have been able to reach agreement in such a complex matter. In the main, however, it is the reflection of genuine surprise at the wide extent of the concessions that have been made on either side. An even more comprehensive Agreement could, it is true, be imagined. But it is very

much easier to imagine the tame acceptance of a job-lot of unimportant alterations. This is, in fact, all that was widely expected when the negotiations began, and the pleasure is all the greater to discover that substantial concessions have been made to almost all the important items of trade passing between the two countries.

The assessment of the practical effects of such a detailed Agreement is necessarily, at this stage, a matter of guess-work. The practical effect of a concession is not necessarily to be judged simply by the amount of reduction in duty. For example, linen piece-goods, which are one of the most important British exports to the United States, receive substantial reductions in duty. On some varieties of table damask the existing duty is cut from 45 per cent. to 25 per cent. But as can be seen from page 15 of the Supplement, nearly two-thirds of America's total imports of table damask already come from the United Kingdom; moreover, the domestic competition is less than in other lines. It may be, therefore, that the practical effect of this large cut in duty will be less than that of some smaller reductions which nevertheless provide a decisive increase in British competitive power. To judge by the volume of trade already passing, however, the chief gainers among British industries are the textile industries—cotton, wool, linen and lace. Linen is perhaps the chief beneficiary, since no less than a third of its exports go to the United States, while for cotton piece-goods and woollen tissues the American market is of smaller, though still considerable, importance. The welcome given to the Agreement should, accordingly, be at its strongest in Ulster, and hardly less so in Yorkshire and Lancashire. Scotland, too, gains from the conventionalisation of the whisky duty, since there was reason to expect an increase; nearly half of all our exports of spirits goes to the United States. Broadly speaking, then, the benefits of the Agreement have been distributed where they were most needed, in the industries which have lately again become depressed and are out of the main stream of armament activity. The concessions can hardly fail to expand their export trade.

It is more questionable whether there will be a corresponding increase in British imports. Very few of the concessions made to the United States will result in any category of American goods being placed in a more favourable competitive position *vis-à-vis* the domestic producer. Most of the agricultural products affected are not grown in this country, or where they are, the domestic producer is already safeguarded. In these cases the effect of the Agreement will largely be to divert a certain quantity of trade from Dominion (largely Canadian) to American hands, without increasing the total volume of imports. Among manufactured goods, most (but not all) of those to which concessions are granted are varieties that are not widely manufactured in this country. On the whole, it would seem probable that the Agreement will have a larger effect on British exports to the United States than on the total of British imports. Whether the effect on the total of British exports to all countries will be different from that on exports to the United States depends largely on the terms that have been agreed between the United States and Canada. It is known that we have surrendered some of our preferences in the Canadian market, and it may be presumed that, since Canada is a net loser by the British-American Agreement, she will be a net gainer by her own agreement with the United States, i.e. that the concessions she has given to the United States will be at our expense rather than at her own.

Whatever may be the precise effects, however, there cannot be any doubt that a series of Agreements which lowers hundreds of duties without increasing a single one will increase the general volume of trade moving round the various British-American triangles. The reductions comprised within the schedules are granted not merely to the

signatories, but also, in general, to all other countries, under the most-favoured-nation clause. On the British side, there is no exception to this rule, and the table on pages 11 to 14 of the Supplement makes it possible to estimate which third parties will benefit from the Agreement. One or two of the concessions on American manufactured goods will be of benefit to German goods already entering the British market—tools, medical and dental appliances, some varieties of office machinery, sewing machines and textile machinery in general are examples. But, as is shown by the last column of the table to which reference has been made, many other countries will also share in the benefits. France, for example, occurs fourteen times as an important supplier to the British market of goods on which a concession has been given, and Argentina gains from several of the reductions of duty on agricultural produce, notably from the abolition of the duty on wheat, for which she is, with the United States, our largest foreign supplier.

On the American side, most-favoured-nation treatment has one very important exception. Owing to discrimination against American goods, Germany is excluded from sharing in concessions granted to other countries. This means that where a concession is granted to the United Kingdom relating to a commodity in which the British supplier has to meet competition from Germany in the American market, the concession establishes a preference for British goods relatively to the German, and its value is thereby enhanced. The table referring to Schedule IV of the Agreement, on pages 14 to 16 of the Supplement, shows how very important this matter is. In item after item of those included in the table, Germany is a serious competitor of the United Kingdom. In many cases, the German sales are greater than the British, and for the table as a whole the American imports from Germany amount to \$11 millions, as against about \$80 millions from the United Kingdom. Moreover, Czechoslovakia occurs sixteen times in the list of other important suppliers, and many of these cases doubtless refer to the products of industries now incorporated in Germany. So long as Germany continues to be excluded from most-favoured-nation treatment by the United States (and the prospects for a change do not appear bright at the moment) there will be a fruitful field for the expansion of British trade. This fact, more perhaps than the political aspects of the Agreement, accounts for the very hostile reception it has had in Germany.

Close analysis of the details of the Agreement undoubtedly enhances its stature as a purely commercial bargain. But that is not the only standard by which it must be judged. There has been a very notable tendency for American commentators to lay far greater stress on its immediate political significance than has been done in Great Britain. That is all to the good; and in American minds the Trade Agreements Act has always been regarded as one of the chief weapons of American foreign policy. That Great Britain has fallen in with American ideas of how world appeasement can be most profitably advanced—and has done so, what is more, not in the grudging mood of one who makes economic concessions for political ends, but in a genuine spirit of give-and-take for hard-headed business reasons—cannot fail to carry further the growth of Anglo-American friendship.

The immediate effect of the Agreement is not to be measured in terms of a diplomatic reinforcement, still less of a strengthening of the military or economic defences, of either of the signatories. But its long-term effects in the purely political field can be negatively assessed by imagining the derisive joy in certain European capitals and the profound depression in others that would have been produced by a failure of the negotiations. To have brought to birth not merely an Agreement, but such a good Agreement, is a decisive act of economic statesmanship.

The Trade Agreement

A SPECIAL supplement included with this issue of *The Economist* contains a considerable volume of information which will be useful in assessing the precise importance of the Trade Agreement concluded last week between the United Kingdom and the United States. The supplement provides an analysis of the nature of the trade between the United States and the various members of the British Commonwealth of Nations; it summarises the terms of the Agreement, and gives, for about half the items in the two important schedules—all the items, that is to say, that can be separately identified in the trade returns—such facts as are necessary to compare the new rate with the old and to ascertain the volume of trade passing and

Topics of the Week

Dissension in France.—The French working class has replied to M. Reynaud's decrees by declaring its opposition to them. Around Valenciennes alone, about 25,000 metal workers had left work by Wednesday; and they had occupied a number of factories. To-day, throughout France, there are demonstrations of protest against the sacrifices imposed by the decrees, and the Government will be fortunate indeed to come unscathed out of these attacks on its wisdom and authority. After the Radicals and their kin had shown uncertainty in venturing to support the decrees, it was scarcely surprising that M. Daladier should find urgent opposition further to the Left. But for all the uncertainty even among those who might be expected in any case to support him, for all the narrow escape he had in getting his demands through the Chamber's Finance Committee—done only by an undignified threat to call off Mr Chamberlain's visit—the key to his difficulties lies with the *Confédération Générale du Travail*. Meeting at Nantes (this is the conference season in French politics, unfortunately for the Government), the trades union congress unanimously condemned the decrees as amounting to social regression, and M. Jouhaux improved the occasion by dwelling on the use of the general strike. At this present moment, when the political situation cries out for a semblance of national unity and the smooth and rapid working of a great re-armament programme, it matters comparatively little how the Chamber receives the Government's proposals; what does matter, and matter most profoundly, is how the working class receives them. Even allowing for the immense influence of the Socialist and Communist parties, each of which may be counted on to express strong opposition to the decrees, it is the C.G.T. which holds the vital key. If the trade unions mean to work under M. Daladier, then the Government will win its way; if the trade unions fight, then the Government will fall. The issue is now beyond the bounds of party politics; on the manner of its resolution depends very much more than the forty-hour week.

* * *

Deadlock in Spain.—General Franco has fought his way back to the Ebro after seven counter-offensives in three months of hard fighting, and further to the north he has managed to hold up the Republican raid across the River Segre without loss of more than a few miles of territory. Yet the Republicans fought a rearguard action with their backs to the river which in its way is comparable with the British withdrawal from Gallipoli, and brought themselves off without serious casualties or loss of equipment. The military position is back where it was in July, and it is now for General Franco to decide whether he will begin over again the push for Valencia which had to be abandoned after the Republican crossing of the Ebro, or launch an offensive on another front, conceivably along the line of the Pyrenees or in the Estremadura. Confident in the sustained benevolence of Signor Mussolini, the Generalissimo has returned a curt reply to Mr Hemming's advances on behalf of the British plan for withdrawal of volunteers. He will do nothing until belligerent rights are granted to him. Here is the deadlock. Under the British plan withdrawals from either side have to be proportional, and since the Spanish Government has withdrawn and expatriated, or is in the course of expatriating, virtually all its international volunteers, to earn his reward of belligerent rights, General Franco must now withdraw from the fighting-line and expatriate virtually all the foreign soldiers under his command. Those in this country who imagine that the insurgents have a good case for demanding belligerent rights, now that a paltry 10,000 Italians have gone back to Italy, are clearly ignorant of the terms of the British plan. Mr Chamberlain,

however, is not; and it may be asserted confidently that he went to Paris fully determined to agree with the French view that this was no time for helping the potential enemies of France and Britain towards another victory. This is no legitimate case for procrastination: it is a case for the application of justice, and in the eyes of the law General Franco is still a rebel.

* * *

Refugees.—On Monday Mr Chamberlain stated Britain's policy to aid Europe's refugees. He spoke as one taken by surprise by Germany's latest atrocities upon the Jews, and the programme he announced was almost wholly exploratory and tentative. There was little or no room for large-scale settlement in the Colonial Empire; but Kenya, Northern Rhodesia and Nyasaland would investigate the possibilities for moderate immigration and the prospects of more numerous settlement on 50,000 acres in Tanganyika and 10,000 acres in British Guiana (already proved unfit for Assyrian settlers) would be investigated. Months ago, a report of the International Labour Office on Migration for Settlement suggested that, in fact, there were many opportunities for immigration and land settlement not yet turned to account, in Australia and Kenya, as well as in Argentina, Brazil and Mexico. In any case, there is no excuse at this late date for an extemporised policy; the problem of a fresh flood of fugitives from German sadism and greed has been known in all its potential magnitude for many months. Ever since the *Anschluss* in March, expert observers like Sir John Hope Simpson have declared that the nations must prepare to receive at some early date, not merely more than half a million Jews from Greater Germany, but tens of thousands of political refugees from the Reich's borderlands and some part of the five million Jews in Central and Eastern Europe. The recent excesses of Dr Goebbels and General Goering have done no more than underline a problem already fully known. Yet Britain has done virtually nothing: the guarded policy of immigration which has let in only 11,000 refugees since 1933 still persists, apart from negligible token gestures, in gloomy contrast to the traditional generosity of France (only lately modified under unhappy conditions of stress) and to the open-handed offers of Holland and Belgium during the last few days. True, the problem can only be solved internationally, but the world's charity cannot exceed the nations' readiness to give, and Britain, imperial, democratic and well-to-do, has special duties—as too have the British Dominions. It is to be hoped that, when the Evian powers shortly meet to co-ordinate collective plans, so long sorely needed for the new dispersion, Britain will play her proper rôle. Very many more refugees, Jewish or Aryan, might be admitted into this country to seek work or to train for settlement and farming in distant lands, without danger to our standards of life or employment, and with tangible advantage from the introduction of new skills and enterprise.

The Technique of Railway Charges.—To understand the full scope of the railways' submission for the repeal of the statutory regulations which govern charges for conveying merchandise, together with such related requirements as classification, publication and undue preference, demands a knowledge of the immensely complicated railway rates structure which is given to no layman. By an Act of 1854 the companies are under the obligation to afford "all reasonable facilities" for traffic, while a Statute of 1845 provides that rates must be "at all times charged equally to all persons in respect of all goods in the same description passing between the same points under the same circumstances." Undue preference

towards any particular persons or classes of traffic is prohibited under the Act of 1888. These three Statutes together define the limitations of trading policy open to the railway companies. Railway charges are regulated under the Railways Act of 1921 and also the Road and Rail Traffic Act of 1933. Standard charges for the carriage of goods are fixed by the Railway Rates Tribunal and may not be modified except by fixing an exceptional rate. Further, no exceptional rate of more than 40 per cent. below standard rate may be operated without the consent of the Railway Rates Tribunal, while smaller reductions must be reported to the Minister of Transport. The tonnage of goods carried at exceptional rates increased between 1930 and 1935 from 75.53 per cent. to 83.87 per cent. of the whole, and the corresponding proportion of receipts increased from 59.84 per cent. to 69.21 per cent. in the same period. Moreover, it is officially computed that in 1937 the number of exceptional rates which were more than 40 per cent. below standard rates exceeded 10 per cent. of the whole, compared with less than 5 per cent. in 1934-35.

* * *

Under the Act of 1933 the regulations governing undue preference were modified to some extent by provision for agreed charges, made between the railway companies and any particular trader. Such charges are subject to review by the Railway Rates Tribunal and, moreover, any trader who regards an agreed charge as detrimental to his own business may apply for a similar charge on his own merchandise. Traffic carried at agreed charges is estimated to account for 2 per cent. of railway gross receipts. The proposals of the railways do not refer specifically to standard revenues, as defined by the Act of 1921. It may well be that, if statutory regulation of charges on merchandise were to disappear, the residual importance of standard revenues—or, indeed, of the jurisdiction of the Railway Rates Tribunal—would be small or non-existent.

* * *

The German Home Front.—The Foreign Minister and the Propaganda Minister of the Reich are both of them on the militant wing of the Nazi Party, and in their speeches we can catch echoes of the militants' hopes and fears. In his speech on the 17th at the funeral of Herr vom Rath, Herr von Ribbentrop was in a mood to defy the world. "A hostile world, paralysed by outmoded usages, thinks to stop the march of Fate. . . . Slowly but inevitably the Old World is declining"; but "after this world change eternal Germany will still stand united, strong and as great as before." Towards the close of his speech Herr von Ribbentrop contrasted the hostility of the world towards Germany with the German people's spirit. "A storm of rage sweeps through our people, and their intention to give themselves at any time for Fuehrer and Reich becomes only harder and more determined." Thus the Foreign Minister of the Reich, at least officially, takes it

for granted that he can rely to any extent on the solidity of the home front. The Propaganda Minister, on whose shoulders the responsibility for holding the home front largely rests, show more anxiety and petulance—like a driver who is flogging a heavily overloaded pack horse up a hill, without being sure that the animal has the stamina, however cruelly he may be lashed, to reach and pass the summit. In an interview, given on the 18th, on his conduct of his own department during the September crisis, Dr Goebbels has now admitted his awareness, at the time, that, for the German people, "much hung upon the outcome of the Conference"; "but," he continued, "I could take little account of inner needs." And he went on to admit that he had delayed for twenty-four hours the publication, in Germany, of President Roosevelt's messages in order to prevent interference with the psychological effect of Herr Hitler's militant speech in the Sportpalast. "Nothing is more dangerous than to leave the offensive to the opponent in time of crisis"; and at the same time nothing is more strange than to "show the works" of the propaganda machine to the public on whom the machine is operating. Dr Goebbels' revelations would, we should imagine, perceptibly increase the sense of uncertainty and mystification in Germany, and to that extent lower the German people's *moral*. It looks as though Dr Goebbels were conscious now of having to wrestle very hard with a private shrinking from public adventures, while at the same time he is convinced that these public risks must be taken now or never. "When the Goddess of History," as he put it at Reichenberg on the 19th, "steps down to earth and touches mankind with the hem of her cloak, responsible men must have the courage to grasp the hem of her cloak and not let go again." Can the German pack horse be flogged into performing the prodigies of a mettlesome charger? That is the question that confronts Dr Goebbels and his leader to-day; and we may guess that this problem of the German home front is causing them greater concern than anything that is happening in Paris or London or Washington.

* * *

Germany and the United States.—In the German retort to the outburst of indignation in the United States at the latest excesses of German persecution, temper has got the better of diplomacy. If the key-point in Herr Hitler's international strategy is, as it seems to be, to keep the two West European democratic Powers isolated and immobilised while he takes a free hand for himself in the rest of the Old World this side of Japan's field of operations, then the chief of his secondary aims ought to be to encourage the United States to hold aloof from the United Kingdom. In this task German diplomacy could have counted on seeing its work largely done for it by American isolationist sentiment and tradition. The news of Munich gave American isolationism a powerful impetus; and it is one of Herr Hitler's most extraordinary feats to have

thrown the movement of American public opinion into reverse by what he has been doing at home during these few intervening weeks. The expression of American feeling, as symbolised in the recall of the American Ambassador from Berlin, called for a soft answer on the German side if only in view of the date, which almost coincided with that of the signature of the long-suspended Anglo-American trade agreement. Nevertheless, Herr Hitler has hit back recklessly. The spontaneous expressions of feeling in the American Press have been answered by broadsides of Dr Goebbels' propaganda, in which the two great English-speaking countries are confounded in a common spate of vituperation. The recall of Mr Wilson from Berlin has been answered by that of Dr Dieckhoff from Washington. And the Anglo-American trade agreement has been castigated in the German Press as a Jewish instrument for putting a spoke in the wheels of Germany's policy of bilateral arrangements. A wiser line for Germany to take would have been to bless the Anglo-American Agreement and then seek a share in its benefits. As things have turned out, Germany's chance of being given most-favoured-nation treatment at Washington now seems to be faint; and the tragic irony is that the German industries that are going to be the hardest hit by this are the depressed industries of the Sudetenland. Before September these Sudeten industries found a valuable market in the United States under the aegis of the Czechoslovak-American trade treaty. At the moment they have lost the benefit of this particular favourable arrangement in consequence of their transfer from Czechoslovakia to Germany; their new fatherland's relations with the United States have suffered a catastrophic change for the worse. In truth, the Goddess of History, to the hem of whose cloak Dr Goebbels (as he tells us) is clutching so tightly, seems at least in this case to be repeating herself. She appears to be leading Dr Goebbels and his colleagues the same dance that she led their predecessors in 1915-17. In those fateful years German impolicy achieved something that was quite beyond the power of British statesmanship. It turned Americans and Britons into comrades in arms. To-day it begins to look as though the *chef d'œuvre* of the Kaiser and Herr von Papen may be going to be reperformed by Herren Hitler and Goebbels.

* * *

Plight of Central European Jews.—The Jewish sufferings in Germany have caused, and are causing, such revulsion and alarm in other countries as to have stripped from the façade of international relations much of the confidence engendered by Munich. In the Reich there is no repentance of last week's work. The measures then enacted are confirmed: others are added to them. To common protest the only reply is more violence and more recrimination. We are now in such a pass that M. Blum is thought by many to be prohibited automatically from candidature for the Prime Ministership of France, because he is a Jew. Nor is the moral lost on those with a political axe to grind. In other countries the temperature of anti-Semitism is naturally rising. Poland, for example, whose Jewish problem, by any rational test, is many times more urgent than any that exists in Germany, is being forced to wonder whether her comparative mildness towards the Jews is not leading to the Polish aspect of the Jewish problem being forgotten in international discussions. Already a Polish newspaper suggests that international action must find an outlet for the Jews, failing which "Eastern European Governments will sooner or later try to create such economic and political conditions for the Jews that they

will have to leave their respective countries." And this is no mere wild threat. The problem of the Jews, whether the world wills it or not, is becoming of world-wide significance. What has happened to the Jews so far is only a measure of what may happen to them in the future. For one effect of anti-Semitism in Germany is to breed anti-Semitism in the smaller countries of Europe. The motives may often be different: the result is always the same. The Czechoslovak concessions, based on the right of "self-determination," were calculated by pre-War census figures, which had counted as German and Magyar Jews who spoke those languages and who, once transferred, were set upon by their new rulers and denied citizenship. Thus it happens that Central and Eastern European States which contain Jewish German-speaking minorities are now understandably anxious to resist this new Trojan horse by diminishing the number of their Jews. This is one consequence of changing the political structure of Europe on an unscrupulous rendering of the principle of self-determination.

* * *

A Policy for the Special Areas.—Four years ago the Special Areas were marked out for special treatment as districts where the rate of unemployment was exceptionally above the national average. The definition still holds good. In the last twelve months the growth in the number of their unemployed has more than balanced the spread of work in armaments and new trades and the departure of transferees to other places. Yet the Government's policy for the Special Areas has not been insignificant, and the widespread fear that the present statutory system of Commissioners and special aids to enterprise is to be allowed to lapse is causing grave concern. Broadly the policy is threefold: to liquidate the problem of unemployment by transfer; to foster the entry into the area of new industrial undertakings; and to encourage services of social rehabilitation and betterment. Private finance has supplemented public funds through the Nuffield Trust; and last year's *reprise* of the Special Areas Act introduced remarkable inducements to new industries in the form of rate and tax remissions. Trading estates with State aid have been offered cheap sites and factories. Loans at low rates have been provided for new undertakings. Housing and public works have been given special help. The whole programme has been a new departure in guiding the location of industry. Yet speakers in this week's two discussions in the Commons, anxious as they were that the legislation should not lapse next spring, were by no means satisfied. The Special Areas are still "special."

* * *

The truth is that the Government must do much less or much more. The Commissioners' work has violated old economic canons: competitive enterprises have been aided and subsidised; preferential treatment has been given regionally; economic suitability of location has not been the first criterion for the settlement of new trades. It may be that social needs ought to outweigh purely economic considerations, and that subsidies directly or indirectly given in this cause are money well spent; it almost certainly is so. But the revolution in principle must be made a revolution in fact; large-scale extension of present methods in all places where unemployment is high (whether Special Areas or not) to redistribute industrial enterprise closer to regional needs is needed, if the experiments of the past four years are to bring into being more than a museum of strange devices without any appreciably potent effect, if tinkering is to become positive planning. The Government has spent £8,750,000 on aids to industry, public works, hospitals, child welfare, sewerage, housing, land settlement, social improvement and welfare; it is committed to spend £8,250,000 more. But "small means do not merely produce small effects; they produce no effects at all." Unless the Government is prepared to spend at many times this rate, to see the entire country's industrial problem as a whole, to take industrial location as a national province and to base

its direction logically upon researches into regional resources like Professor Marquand's for South Wales and the new survey of Tyneside markets just undertaken by King's College, Newcastle, the Special Areas may as well be left, wholly as now in part, to the waning chance of widening world markets for coal and iron and steel and textiles and the relentless attrition of industrial decay, to the normal process of adjustment in a free economy.

* * *

Workmen's Compensation.—That policy must wait upon the findings of Royal Commissions is a commonplace of our political practice; and it was perhaps inevitable that a private member's bill to reform the law relating to workmen's compensation should have been rejected by the Commons a week ago. Yet the present law has gone unamended for a complete generation, and its defects have been stated without contradiction by members of all parties for many years. Many callings are dangerous in themselves; silicosis and nystagmus in mines are outstanding examples. Many thousands of workers are killed and injured at work, and the privation of their dependants is not the least of the tales of poverty which disfigure our community's life. In cases of death, a widow without children can secure no more than £300 in complete and final discharge of compensation, and a widow with children no more than £600, regardless of the size of her family. The lump payments are commonly much smaller than this. In cases of total or partial incapacity, too, there is no proper provision for dependent and invalid children; a man deprived for ever of work, with a wife and three children, may receive less than 30s. a week in compensation, against the 55s. at least needed to keep the family in the barest health. A man partially incapacitated may be certified for light work which is never available; his compensation will be reduced accordingly. There is no provision under the present law for the rehabilitation of sufferers from industrial accident. In the Commons everyone seemed to be agreed that rates of compensation should be raised, both lump sums and weekly payments; that dependants should be specifically provided for; that the system of medical inspection should be reformed; and that more occupational diseases should be scheduled for special care. There was a fairly common feeling that compulsory insurance might be an appropriate procedure in many cases. But nothing can be done until the Royal Commission has said its say.

* * *

The Czechs Concede Still More.—Germany has concluded with Czechoslovakia a treaty defining problems of citizenship and rights of option such as were foreseen at Munich. Until July 10, 1939, the German Government has the right to demand that Czechoslovaks born in the ceded area before January 10, 1910, or part of those persons' families, or, in effect, those who settled in the ceded area since the formation of the Republic, should leave the Reich. Right of option into Czechoslovakia holds until March 29th next, again apart from *émigrés* who left Germany or Austria after January, 1933. Meanwhile, the Reich has obtained further concessions of territory, including certain districts in Bohemia, the town of Theblen and the key village of Devin on the Danube, and most striking of all a corridor of land 60 yards wide directly across the Republic from the frontier facing towards Breslau to that towards Vienna. The corridor will be used to build a motor-road, and in common with the project for an Oder-Danube canal, it forms a most important addition to Central European communications. It is said that a branch-road across Hungary towards the south-east is already a subject of serious discussion in Budapest; and it is certain that no time will be lost in building the Czech section of the route to Constantinople and Baghdad. In Prague the business of political reorganisation is almost completed. The new President is not yet elected, but with the Slovaks demanding representation either by the President or the Prime Minister (and the Czechs not much wanting the renaissance of Dr Hodza, the pre-

Munich Slovak Prime Minister) it became clear that the new President would have to be a Slovak, and after some deliberation, choice fell upon Dr Hacha, who is also a legal luminary and acceptable to all. And Parliament has passed emergency powers enabling the constitution to be altered even in advance of that election. Czechoslovakia is thus the first country in Europe to give a president-elect the right to create a new constitution, or so to alter it as to make it such as "changed relations demand." The pace of development in Central Europe hastens from week to week, and the signs are that all efforts to stem the German advance, whether they come from Poland or from the countries of the south-east, are out of date and ineffective.

* * *

Danubian Cross-currents.—In Budapest it is a matter of "those behind cried forward and those in front cried back!" Dr Imredy, the Prime Minister, under whose lead Hungary regained a part of her former trans-Danubian territories, has now fallen between his wish to maintain some form of Parliamentary government, and his need to silence the Right extremists, like Szalasi, by at least an appearance of totalitarian "efficiency." Last week Dr Imredy shuffled his Cabinet, excluding from it four members with Nazi leanings; but for those who are crying "Back!" that apparently was not enough, and this week a large number of deputies, not less than 59, have resigned from the Government's National Security Party, thus robbing the Prime Minister of his majority in the Chamber and obliging him to withdraw amendments to standing orders which he had intended should speed up the process of legislation. He was later defeated on a motion of confidence, and the whole political structure of the country is now in confusion. The same criterion explains Hungary's conduct towards Ruthenia. The extremists are all for marching in and taking by force that old land of St. Stephen's Crown, and some of them have done a little marching on their own account; but the Government must now consider Germany's wishes, and may not move so fast, or even move at all. True, they have Italian connivance to annexation, expressed in long despatches to the Italian Press from correspondents who tell of "tragic disorder and terror," of a minority of Ukrainian fanatics, Moscow paid, who run the Government at Chust, and of popular demonstrations in favour of return to Hungary. Signor Mussolini's connivance, however, no longer has much value north of the Alps; and with King Carol's rejection of Colonel Beck's plan for the partition of Ruthenia, the last word rests more than ever with Herr Hitler. And for him, this situation was bound to represent a golden opportunity of getting the Government in Budapest precisely where he wanted it. If Dr Imredy were ready to play an appropriate rôle in the German scheme of things for Central Europe, then Herr Hitler's help ensured his continued authority as

Prime Minister; but if Dr Imredy's intentions were not thus clear, that is sufficient reason for a new Government, or a new form of government, in Budapest. The Fuchrer will decide.

* * *

A Union of Australia?—Public men in Australia have felt for some time that all was not well with their system of Federal and State Government. As Mr Scullin pointed out in his important speech to the House of Representatives a week ago, when he explained his proposals for amending the Constitution, "no unity can be procured with seven sovereign Parliaments, each of practically equal status, embracing thirteen Houses, with more than 600 members, and 70 Ministers, with separate overseas representation and separate services." Indeed, the recent history of Australian government has been one of constant stress between the Commonwealth and the State legislatures, the one striving to unify, the others to individualise. In times of crisis, as over the issue of defence a few weeks ago, the Commonwealth has suffered from this lack of unity within itself; and devices such as the Loan Council and occasional conferences of the Prime Minister have sought to bridge the gaps and anneal the whole. And now the Commonwealth Government has taken what may be an historical decision. Mr Menzies, the Attorney-General, has announced that Mr Scullin's suggestion to hold a special session of Parliament to draw up amendments to the Constitution, is accepted by the Government, and it is expected that the session will take place early in 1939. During his speech announcing this decision Mr Menzies defined eight serious objections to the present condition of the Commonwealth's constitutional jurisdiction, outstanding among which were division of powers in trade and commerce into separate compartments, inability to control the conduct of trading corporations by general company law, lack of central jurisdiction over agriculture and over unemployment. The preponderant influence of High Court Judges in settling the fate of legislation here finds an echo from the United States: and Australia is to be congratulated on thus firmly deciding to resolve the conflict between theory and practice, and to face the issue which all Federal Government sooner or later must raise: whether it is to be a federation of independent States or an independent federation of States deriving its independence from a genuine delegation of powers.

* * *

Production and Efficiency.—How near is the time when man's command over the resources of nature will be so great that all the goods and services that are required can be produced without serious effort in a working day of perhaps not much more than four hours? This question was the subject of a number of illuminating comments from Professor A. L. Bowley in the course of his presidential address on "Production and Efficiency" to the Royal Statistical Society a week ago. In the main, possibilities of increased efficiency are confined to manufacture and in a lesser degree to agriculture. Energy is already so cheap that, if it were as free as air, the reduction in costs would not be substantial. In the factory trades the output per head increased at the rate of about 2 per cent. per annum between 1924 and 1935, and this increase is likely to continue. But any large reduction in working hours involves the inability—or unwillingness—of the public to spend on quality goods and services, not susceptible to mass-production economies, what they have saved on cheap standardised manufactures. So far, however, this is precisely what they have done. Employment in the services and in distribution has increased relatively to employment in manufacturing, and would have increased still more but for the development of *state* manufactures, such as motor cars, wireless sets, *ref* *ers*, etc. Clearly, the public's increasing demand for *asses* of Life, goods and services, which are comparatively *or* and General Insur^y the economies of mass production, may *ROAD STREET CO* any large reduction in

working hours. There is, however, one grim comfort in the trends observed by Professor Bowley. The most recent tendency marked in Germany and Italy, and increasingly evident elsewhere, has been a shift from the provision of luxuries and services back into manufacture, the manufacture of armaments; and a small increase in hours of work produces a vastly more imposing volume of armament material nowadays than was the case in 1914. But it is a small and doubtful mercy to be thankful for.

* * *

The War in China.—The Japanese are losing little time after the fall of Hankow in carrying hostilities south-eastwards. Their troops have advanced into Honan down the road from Sienning, have taken Yochow, and have engaged the main Chinese rear-guard, already retreating from Chang-sha. Other Japanese columns are moving up the Yangtse towards Ichang, on the Chinese extreme left wing. A warning to interested Powers states that provinces up till now comparatively untouched by aerial bombardment, such as Kwangsi and Honan, will not escape; and in Tokyo Prince Konoe, the Prime Minister, has brightened the home fires by remarking that "If there is anyone who thinks that, with the fall of Canton and Hankow, peace will come soon, he does not realise the meaning of the incident (*sic*). Japan wishes to undertake the reconstruction of a new East Asia..." Continuing to object against this ambition, the United States Government, through Mr Cordell Hull, has reiterated international obligations under the Nine-Power Treaty and re-affirmed the conclusions of the recent Brussels Conference, perhaps the most important of which (with Italy dissenting) denied that the issues between Japan and China were exclusive to those two countries, and affirmed "that the situation is of concern to all of them and in fact to all members of the family of nations." The Japanese reply, which is not considered by the United States Government as modifying the position, states that: "It is far from the thought of the Japanese Government to impair rights and interests of American citizens in China, or discriminate against their enterprises." The tone is conciliatory. The Japanese authorities have, however, refused to open to foreign shipping the Yangtse from Shanghai, on the excuse that the river is not yet safe for transit. Talk of mediation arising from the British Ambassador's brief meeting with Chiang, is clearly founded on a misconception, for the Marshal's resignation and surrender of his cause, which the Japanese demand as a *sine qua non* of any negotiation, is as far away as ever.

* * *

Another Royal Ambassador.—After King Boris of Bulgaria, after the Kings of Roumania and of the Hellenes, London receives a visit this week from the Prince-Regent of Yugoslavia. He comes in private, and therefore does not receive the pomp and circumstance bestowed upon King Carol, but his coming is probably none the less significant for that. It is not unexpected, for he would have come last month but for the political bad weather: what he comes for remains so close a secret that perhaps after all it is only to smell the autumn air in England and receive his meed of goodwill from a Power whose finger is no longer in the Balkan pie, but whose navy is still in the Mediterranean. It would be a graceful gesture that he should soften the flamboyant words of Dr Stoyadinovitch, and tell us that when all is said and done we are not such bad fellows and may even be useful on our day. After the magnanimity of Herr Funk it is clear that the Prince Regent can have little to ask of us: for whatever reason King Carol may have gone to the Guildhall no one will suspect Prince Paul of wanting our money or our merchandise. In that is no reason for complaint, but only reason for regret: it is not the Prince Regent's fault, and were Europe shaped differently the course of Yugoslav exchanges would no doubt be different too.

Overseas Correspondence

United States

Recovery Goes On

NEW YORK, November 15.—Current signs point to recovery vigorously continued. Steel operations are now well over 60 per cent. of capacity; the motor industry is fully under way; and the spending programme is now making its influence felt, not only in building contracts, but also in actual construction. Consumer demand in retail trade is still regarded as disappointing, but this is put down to the protracted warmth of the autumn. Some disappointment is expressed about the absence of more marked evidence of re-employment, but it must be remembered that the index of production is still below 100, and while this is infinitely better than six months ago, when it was below 80, it is still at a low level. An active demand for labour is not likely to appear until production is higher.

The November Bulletin of the Federal Reserve Board has tabulated the position of all banks in the United States as follows:—

	ALL BANKS		
	June, 1937	March, 1938	June, 1938
Number of banks	15,527	15,348	15,287
Total loans (\$ millions)	22,514	21,779	21,130
Total investments (\$ millions)	27,182	26,540	26,252
Total deposits* (\$ millions) ...	53,287	51,703	52,195

* Exclusive of inter-bank deposits.

For the banks as a whole, the period was one of contraction, but this contraction was no more than nominal among the Mutual Savings Banks, which are included in the table above.

Mutual savings banks are mainly located in New York, Massachusetts and Connecticut. In many States they do not exist; and in recent years, as a group, they have been declining in relative importance, with the increase in the postal savings system, and particularly with the introduction of the Treasury savings bonds.

Among member banks deposits rose sharply between March and June, although loans and investments were falling. This is largely attributable to the release of the Inactive Gold Fund, which flowed almost directly into member bank deposits and reserves.

MEMBER BANKS

	June, 1937	March, 1938	June, 1938
Number of banks	6,357	6,335	6,338
Total loans (\$ millions)	14,285	13,546	12,938
Total investments (\$ millions)	18,454	17,975	17,783
Deposits (\$ millions)	35,440	34,118	34,745

Among non-member banks, on the other hand, deposits continued to fall.

NON-MEMBER BANKS (Other than Mutual Savings)

	June, 1937	March, 1938	June, 1938
Number of banks	8,606	8,450	8,386
Total loans (\$ millions)	3,227	3,238	3,231
Total investments (\$ millions)	3,550	3,364	3,234
Deposits (\$ millions)	7,635	7,325	7,153

Small Banks Disappearing

The total number of banks in the country continues to decline, principally by the fall in the number of non-member banks. While the non-member banks are still an important part of the banking system, actually outnumbering the member banks, they have declined since 1929, greatly in number, but less so in magnitude. The principal change involved in the reduction in their number by almost half during the last ten years has been the elimination of the very small bank; but, with the reflation of deposits, there has been a big increase in their average size. The average non-member bank is still, however, relatively small, deposits averaging less than \$1,000,000.

The reporting member banks in 101 cities hold about one-

half of the deposits of all commercial banks (say \$20,000 millions out of \$40,000 millions); but it appears that a larger proportion of their assets are held in investments. In June the reporting member banks had about \$8,400 millions of loans, and \$12,300 millions of investments; the non-reporting member banks had about \$4,500 millions of loans and \$5,500 millions of investments; and the non-member banks about \$3,200 millions of each.

No comment on banking in the United States is complete without reference to Federal activities in the field. The Reconstruction Finance Corporation is the largest "bank" in the United States, with assets of \$1,716 millions; but the Home Owners' Loan Corporation, with about \$2,447 millions, and the Federal Farm Mortgage System with almost \$2,800 millions are active in fields which were formerly partly covered by the banks proper.

Bank Earnings Analysed

The question of bank earnings is often discussed, but not often fully understood. The Federal Reserve Bulletin for October tabulates the earnings of the member banks as follows:—

EARNINGS AND EXPENSES, MEMBER BANKS

	(\$000,000)				
	1936		1937		1938
	1st half	2nd half	1st half	2nd half	1st half
Total current earnings	617	654	652	669	631
Total current expenses	430	442	449	453	448
Net current earnings	187	212	203	216	183
Recoveries and profits	253	254	158	97	137
Losses, etc.	216	225	166	172	175
	+37	+29	-8	-75	-38
Net profits	224	241	195	141	145
Cash dividends	95	103	100	101	99

The two items, "recoveries and profits" and "losses and depreciation," are each large relative to the item of "net current earnings." Over the period, losses and recoveries have nearly balanced each other, leaving the net current earnings very roughly comparable to the net profits. In the first half of 1938 the net profits amounted to \$5.40 per \$100 of capital funds. The interest per \$100 of loans was \$3.99, less \$0.67 of loss, or \$3.32.

France

The Plan Proceeds

PARIS, November 24.—Longer working hours have been decided upon, and taxation has been increased. M. Reynaud declares that this discipline is inescapable if confidence in the currency is to be re-established and new credits passed into circulation to intensify production. It is the only alternative to exchange control, which the Senate has turned down. It is still uncertain whether the Chamber will accept or

The NATIONAL BANK of NEW ZEALAND, Limited

Reserve Fund - £1,000,000

Currency Reserve - £500,000

The Bank has branches throughout New Zealand and conducts every description of Banking business with that Dominion.

reject the Reynaud medicine, but the Minister of Finance states that he is not prepared to give way on any point of his programme.

The Stock Exchange has welcomed the new policy and rentes are being bought. The rate of interest on bonds has twice been lowered, and the rediscount rate of the Bank of France will be lowered also. Meanwhile politicians of the Left are speculating about the discontent caused by M. Reynaud's measures; and the "veterans" and certain Right wing groups speak similarly.

M. Reynaud, however, has gone on with the job. A commission to recommend economies in State expenditure has been appointed. Industrialists who now wait for one or even two years for payment for deliveries on State contracts will henceforward be paid immediately. Industrialists who launch new industries will benefit from a remission of taxes. M. Daladier has decided that stay-in strikes will not be tolerated, and undesirable aliens will be put in concentration camps. But all these measures are not sufficient to set the wheels moving again, as long as the political problem goes unsolved; and it is the possibility of a Ministerial crisis which is holding up the start of recovery.

Parties at Cross Purposes

The greatest confusion reigns among the parties. Socialists are in conflict with the Communists. The men of the Right are disputing among themselves about foreign policy. The Left as a whole still believes in exchange control, but the leader of the trade unions has stated that economy and not control is the prime need. The Right wing leaders are waging a campaign against the cession of colonies to Germany, but at the same time they declare their fidelity to the spirit of Munich. The employers' associations are now backing the Cabinet, but the Minister of Pensions had expressed official regret that the leaders of the "veterans" have refused to accept the sacrifices demanded by M. Daladier. The truth is that French public opinion has been gravely troubled and perplexed by the Munich settlement.

After the favourable vote given by the Finance Commission of the Chamber of Deputies to the Reynaud plan, the Right is hoping for Cabinet changes in a Rightward direction, possibly bringing in M. Flandin. The trade unions, on the other hand, although they have expelled the Communists, are threatening a general strike. The battle of the Cabinet against the double opposition of the dissatisfied on the Left and the would-be Ministers on the Right, takes the public eye, but the course of events in the markets is the crucial factor. Since November 1st, M. Reynaud claims, 1,500 millions francs of capital have come back, and subscriptions to bonds have increased from 8,000 to 20,000 millions. The needs of the Treasury are now covered until February, and the Government has ruled out any further borrowing for six months. The rate of interest has fallen. The solution by confidence is slowly maturing. But the politicians may still bring the whole structure about their heads.

A Fortnight for M. Reynaud

Against the politicians, the experts argue that there is no way to safety but by the Reynaud plan—which, according to the Government, may still be amended. Parliament will re-assemble on December 6th or 13th, and the question is whether M. Reynaud will have sufficient success before then to win him the full support of public opinion against the forces of disorder.

Exports of pig iron during the first ten months of 1938 amounted to 378,000 tons, compared with 316,000 tons in the corresponding period of 1937, 100,000 tons in 1936 and 378,000 tons in 1931. The level of exports is thus comparatively high. In the same period exports of iron ore was

13,156,000 tons against 15,870,000 tons in 1937 and 10,424,000 tons in 1934.

The following table shows the course of wholesale prices during the last six weeks:—

	Oct. 15	Oct. 22	Oct. 29	Nov. 5	Nov. 12	Nov. 19
General index	657	653	654	652	653	653

In the week ended November 12th the number of persons unemployed was 364,210, against 363,422 in the preceding week and 325,497 a year ago.

Germany

Aftermath of the Pogroms

BERLIN, November 23.—Everything is overshadowed here by the reaction, at home as well as abroad, to the anti-Jewish outrages of the past fortnight. Whatever was in the minds of the perpetrators, it is certain that they did not expect such a violent reaction, either in England and America, or among their own people. In a totalitarian State such as this it is generally impossible not only for the population to express its objection to "acts from above," but also for the unbiased observer to estimate such resentment. But during the last few days this has not been so.

Whether the differences of opinion in the Nazi Party itself about these outrages constitute a danger to the regime, time alone can show. But there can be no doubt about the indignation of the average German that he should be described as having "spontaneously" broken windows and fired synagogues. His sense of law and order, of propriety and of economic values has been bitterly insulted in a way which indicates that all the anti-Jewish propaganda of the Third Reich has not sunk in very deeply. Each day the Press seeks to divert attention by pointing the finger at English action in Palestine or lynching in the United States, without influencing the people here very much. They do not believe the stories of "an international Jewish plot" to destroy Germany as the basis of the Paris murder.

Among business people, great and small, the natural question is what will be the reaction of all this on Germany's foreign trade. In fact, there is strong evidence for saying that a halt was cried at the end of last week, mainly as the result of protestations from circles engaged in foreign trade, where the consequences were clearly foreseen. Already such consequences have made themselves felt through an intensified boycott on the part of Jewish business circles in America. Certain of the home industries of Thuringia and Silesia—toys, etc.—have had to report to Berlin that orders have been cancelled, even those for the coming Christmas, in some cases. The foreign trade deficit, which amounted to Rm. 8 millions in October, will certainly not be diminished by recent happenings.

The Anglo-American Trade Pact

The new Anglo-American trade treaty, too, is seen as a weapon which England and the United States can use, if they so desire, to hit this country's foreign trade still further and so reduce its supplies of foreign exchange. Germany, which will undoubtedly suffer in the American market in competition with England, since it will not benefit from the concessions granted in the Anglo-American treaty, would certainly be very badly hit if President Roosevelt were to decide to extend his powers against this country as a "discriminator" against America through its foreign exchange regulations, its special barter agreements and its subsidies.

Germany has no counter-weapon against America. In September, United States exports to Germany were valued at Rm. 11 millions, while United States imports from Germany were Rm. 50 millions. Moreover, German imports were largely composed of such essentials as cotton.

An important political event of the past week has been the visit of Mr Pirow, South African Defence Minister. Mr Pirow is believed to have expressed the view that the Union of South Africa would not be prepared, under any circumstances, to return the former German territory in South-West Africa to the Third Reich.

The problem of Germany's surplus population no longer plays an important part in discussions about colonies, because, owing to the Government's armament and building

programmes, there are practically no Germans out of work. But the economic argument has perhaps increased in importance: it is well known that Germany's raw material requirements are not easy to cover at present because of export difficulties and lack of foreign exchange.

The Case for Colonies

The German Government is of the opinion that an appreciable part of the raw materials needed could be obtained from the former German colonies, if they belonged to the Reich, if their markets were fully open to German goods and if payment could be made in Reichsmarks. On the basis of present output in these colonies, it is estimated that Germany could obtain food and materials to the annual value of some Rm. 500 millions, or 10 per cent. of the Reich's total yearly imports. This percentage is not very high, but it is said that colonial production could be increased to double the supplies available to Germany. On the other hand, people here realise that any expansion of planting, mining and other productive enterprises in the colonies would entail the investment of a great deal of capital.

The chief commodities which the former colonies could supply, and of which Germany is especially in need, are palm nuts, palm oil, ground nuts, sisal, cotton, hides and skins, tin ore, vanadium, copper, cocoa, coffee, gold, phosphates and diamonds. [A series of charts on page 302 of the issue of *The Economist* dated November 5th illustrated the relation between the output of the former German colonies and the requirements of the Third Reich.—Ed., *Econ.*]

Nevertheless, however important the economic arguments for the restitution of colonies may be, they are not, in German eyes, the decisive ones. Much more important for the very sensitive nationalism of the present regime in Germany is the scotching of the so-called "colonial guilt lie." In the Versailles Treaty, Germany was compelled to renounce her colonial possessions on the ground that she was not fit to administer them. In a speech to the Reichstag in 1936 Herr Hitler made the problem of colonies a point of honour, and the return of the former colonies is an integral part of the German claim to the full status of equality with other Powers.

The occasion of Mr Pirow's visit has been taken to put out a new German colonial map which gives the impression that German demands may even be raised still further. The map includes, for instance, not only the districts colonised by Austrians in the nineteenth century, in respect of which, since the *Anschluss*, Germany believes herself to be entitled to enter a claim, but also all those places colonised by individual German States or princely houses in past centuries. In the sixteenth century, for instance, a German princely house colonised part of Venezuela. In the seventeenth century another colonised Gambia, and more recently there were German settlements of this kind in Trinidad, Tobago and parts of South America and West Africa.

Significant Trends in Trade

A comparison of this year's trade figures with those of 1937 shows that imports have been maintained at about the same level. That is to say, although this year's harvest has been unusually good, Germany has been, in fact, importing just about the same quantity of wheat this year as last, when the harvest was far from satisfactory. The conclusion must be that Germany has been gathering stocks of foodstuffs against possible war-time contingencies. Again, imports of raw materials have risen by about Rm. 80 millions in the last ten months, and, as a result of this stocking-up of food and raw materials, imports of finished goods and semi-manufactures has shrunk to practically nothing.

Turning to exports, we find that during the first ten months of the year Germany's sales abroad were markedly reduced. Exports of raw materials, for instance, are down by about Rm. 45 millions compared with last year, and, in particular, coal exports have fallen appreciably because demand in France, Belgium and Luxembourg has diminished. Of prime importance for Germany's balance of trade and payments is her export of manufactures, and during the last ten months even this has fallen by close upon Rm. 300 millions.

Although the Government issued a loan only last month which brought in Rm. 1,850 millions, and although, more recently, the levy of Rm. 1,000 millions on the Jews and the confiscated Jewish insurance claims of about Rm. 500 millions have accrued, or are accruing, to the Treasury, the Government has already been constrained to issue another loan of Rm. 1,500 millions. This is the fourth loan this year. Since the beginning of the year the Government has issued loans amounting to more than Rm. 6,000 millions, and the total amount borrowed since 1935 amounts to Rm. 14,500 millions.

Latvia

Trade in 1937

RIGA, November 12.—The Latvian balance of payments for 1937 shows a credit total of 316 million lats and a debit total of 279 million lats, or an active balance of 37 millions. In 1936 the credit side of the balance stood at 176 million lats and the debit side at 157 million lats, respectively: the increased turnover is due partly to the recent devaluation of the lat, and partly to the encouraging condition of relations with foreign countries. Foreign goods traffic is the most important of the current items, showing in 1937 an export surplus of 29.5 million lats.

Interest payments and dividends owing abroad accounted for 3.9 million lats: limited companies accounted for some 2.3 millions; and the remainder fell to State and commercial debt obligations, both for public works in Kegguan and for a loan raised on the City of Riga by the London bank of Messrs Lazard Brothers. The revenues of the Latvian merchant fleet from foreign freights and time charters are up to 23.9 millions, or 13.1 millions more than in 1936. More than half of this trade was with England. The fleet's expenditure for 1937 was 12.1 millions. Latvian port traffic revenue in 1937 was as high as 7.1 millions. The remaining items in the balance (passenger traffic, posts and telegraphs, etc.) showed a fall of 3.9 millions, in which the transference of the wages of about 50,000 Polish seasonal workers, amounting to 5.5 millions, represented a considerable charge. Insurances with foreign countries were about balanced.

Among capital movements there was the long-term Swedish loan of 2.4 millions, and on the debit side foreign real estate purchases stood at 2.5 millions and transference of capital at 3.7 millions. Foreign capital in Latvia was reduced in 1937 from 64.1 millions to 60.5 million lats. Short-term dealings with foreign countries were 2.9 million lats, while Latvian foreign credits showed an increase of about 31.5 millions.

Falling Revenue

The balance of payments for 1938 may be expected to show a substantially different picture, in which the shipping revenue, reacting from depression in the freight market, will suffer a marked fall; foreign trade, too, is falling away.

In the first nine months of the current year, Latvia imported goods to the value of 167.7 million lats, against 169.6 millions for the corresponding period of the previous year. Exports were worth 158.5 millions, against 179 millions, or a reduction of 9.2 millions, and there was an import surplus of 9.4 millions. This reduction in exports is chiefly the consequence of lower prices and diminished demand in the world timber market, and this in turn has caused a restriction in plantings in the State forests. On the import side there has been an increase in supplies of machinery, metal goods, and electrical commodities, but imports of foodstuffs and raw materials have fallen. It is interesting to note that transit commerce with Russia has fallen from 144,000 tons to 80,000 tons.

Shipping traffic in Latvian harbours has also fallen. In the first eight months of 1938 there were dockings of 1,592 vessels with a total tonnage of 853,073, as against 1,688 vessels of 909,423 tons in the corresponding period of the previous year. The reduction in loadings and unloadings in these two periods was as much as from 2.1 to 1.6 million tons.

Heavy Grain Yields

According to recent estimates the summer grain harvest was a good deal heavier than that of 1937. Ninety-eight thousand

Ask for

WHITE HORSE

as a matter of course

Screw-cap flasks

on sale everywhere

tons of summer wheat were reaped, against 77,000 in the previous year, and corresponding figures for barley are 237,000 and 218,000 and for oats 475,000 and 405,000. Although the flax yield per hectare was higher than in 1937, the crop is slightly smaller because of a shrinkage in flax cultivation. Fibres fell from 23,000 to 22,000 tons, linseed from 22,000 to 20,500 tons. There was a lack of agricultural workers during the harvesting season, so that the import of 50,000 Polish workers became necessary. The greatest importance is accordingly attributed to the mechanisation of agriculture. On one estimate Latvia does not possess one-half of the necessary agricultural machines, although their import in recent years has notably increased. Thus in 1933 Latvia imported agricultural machinery to the value of 1.1 million lats, and in 1937 this figure had risen to 5.7 millions, and production has shown a strong growth.

So far Latvia's general commercial position carries no clear marks of depression. In sympathy with the international political crisis at the end of September there was a certain uneasiness caused by heavy withdrawals from the banks, but conditions soon returned to normal.

India

Japan and the Indians

CALCUTTA, November 11.—The profound changes of policy represented by the new European "line-up" and the latest declarations of Japan's mission on the Asiatic mainland have not been lost upon Indian politicians. The immediate domestic issue is Federation, which assumes new and pointed significance in a world that moves from one political concept to another almost overnight, and in which new forces are stirring Asia to a consciousness of power such as she has not known for centuries.

Indian sympathy and sentiment is mainly with China in her struggle against Japan, but is somewhat mixed when it is faced with the latter's adumbration of the principle of Asia for the Asiatic. The younger generation of Indian politicians are frankly interested in, if not envious of, Japan's methods and her advance against the nations. Upon Japan's handling of the present dispute with America about the open door in the Far East depends much of her future prestige in India, where nationalism, having scored many triumphs in the domestic sphere, increasingly tends to think in terms of international politics.

Towards Federation

With the return of the Viceroy and several of the Provincial Governors from leave it may be assumed that a practical time table is now set for the accomplishment of Federation. It is more than eight years since the Princes made their dramatic gesture at the first Round Table Conference. Since then there has come the new Constitution and the long and tortuous negotiations with literally hundreds of States. It is expected that Lord Linlithgow will take an early opportunity of indicating what may be called the Government's time schedule.

The comparative ease with which the Congress Ministries are functioning in a majority of the Provinces, and above

all the reality of political power which the past eighteen months have demonstrated, have entirely changed the outlook for Federation. There are not likely to be more revisions of the Act than can be accomplished by Orders in Council. The right wing of the Congress Working Committee, which includes amongst others Mr Bhulabai Desai, leader of the Party in the Central Assembly, and the Madras contingent, are known to be in favour of trying out the Federal scheme. The Left wing, led by Mr Subash Bose, this year's Congress President, and Pandit Nehru are loud in opposing the creation of what they regard as a dead weight of reaction at the Centre. But Congress's final word will rest with Mr. Gandhi.

Some of the more vigorous communalists of the Moslem League are objecting on the grounds that the accession of the States will swell the Hindu majority in the projected Delhi Parliament. Most of the States themselves are ready. Finally, all parties realise that the British Government, in the midst of many other pressing problems, is unlikely to take on itself the task of amending the India Act before it has become fully operative. Thus the stage is set, and the signs point to a substantial step forward in the next few months.

If not positively encouraging, the recent trend of Indian trade cannot be regarded as wholly disappointing. The half-yearly (April-September) figures show that exports amounted to Rs. 79.19 crores, re-exports to Rs. 2.65 crores and imports to Rs. 70.35 crores. All these totals show a decrease compared with the corresponding six months in 1937, when exports amounted to Rs. 98.14 crores, re-exports to Rs. 3.69 crores and imports to Rs. 85.08 crores. Set against the background of general international trade, however, the Indian figures reveal no more deterioration than can be ascribed to causes over which India by herself has had no control. A circumstance of some significance is that in September an export surplus on account of merchandise was sufficient to offset an adverse balance on account of treasure, for during that month imports of silver largely exceeded exports of gold.

Slackened Exports of Gold

Indeed, there are signs that gold exports, in spite of the continuing demand for gold in Europe and America, are drying up. A recent development in the local situation is the delivery of consignments of gold to the Reserve Bank of India. These commenced a fortnight ago and have continued at intervals since. At first the Calcutta and Bombay money markets inclined to the view that the Reserve Bank was employing a new technique to obtain sterling in face of a weakening rupee exchange. Purchases of gold in India and sales of a corresponding amount in London would, in any case, have been a crude method of achieving such an object. As the amounts of bullion held by the Reserve Bank in London and India, respectively, have shown no change during the last three weeks of October, the more rational interpretation of the bank's transactions is that it is acting as an agent in the matter, and that gold is being bought and stored in India, probably for the Bank of England.

Australia

Lower Prices for Wool and Wheat

MELBOURNE, November 10.—The business outlook is influenced by the prospect of low prices for wool and wheat and a reduced wheat harvest. The wool clip is not expected to reach even the 2,970,000 bales anticipated a few months ago and a further reduction of possibly 100,000 bales is now foreshadowed by the conference of wool selling brokers and the National Wool Council. A revised estimate is to be issued when November statistics are available.

The wheat harvest is difficult to estimate at the moment, even after recent rains in certain districts, but it will show a considerable reduction compared with the harvest of 188 million bushels in 1937-38. Exports of wheat and flour since December 1, 1937, now amount to over 124½ million bushels—with a few weeks still left to complete the season. The prospect of prices lower than those recorded in recent years has raised afresh the question of assisting the growers by arrangement between the Commonwealth and State Governments to fix a home consumption price, as well as to give direct assistance to drought stricken farmers.

The quarterly returns of the ten trading banks (excluding the Commonwealth Bank) up to September 30th show deposits of £312,049,728, an increase of £3,775,453 compared with a year ago; and advances of £288,606,581, an increase of £22,802,911. The large increase in advances reflects the greater trading activity during 1937-38, following the large

exports in the 1936-37 season. Government and municipal securities held by the banks amounted to £38,866,939, a decrease of £6,465,575 in the year and cash items £32,769,974, a decrease of £4,191,169. These movements leave a balance of several millions accounted for by a reduction in external assets.

The Commonwealth Government is about to issue a conversion loan to provide for two sums, amounting to £67,600,000, maturing on December 15th. The rate of interest is £3 17s. 6d. per cent., the price of issue par, and the loan will be redeemable between 14 and 16 years hence at the option of the Government. The price of £3 17s. 6d. per cent. compares with the redemption yield of £3 15s. 10d. for the loan issued last May. A defence loan of £4,000,000 is also to be issued.

Slightly Increased Expenditure

The Budgets of the six Australian States show total estimated expenditure of £128,972,642 for 1938-39, against £126,243,576 for 1937-38, an increase of £2,729,066. Revenue is estimated at £128,533,173, an increase of £2,311,107. Estimates of three States show a surplus, namely, New South Wales, Victoria and Tasmania, while Queensland, South Australia and Western Australia show deficits. The six States show a net estimated aggregate deficit for 1938-39 of £439,469, against a net deficit of £21,510 for 1937-38. (The various surpluses and deficits are shown after providing for sinking funds.)

The Commonwealth Budget for 1938-39 shows estimated expenditure of £93,136,000 and revenue of £93,162,000. The Commonwealth figures cannot be combined with those of the States owing to various duplications, but, taking taxation by itself, the estimated total for the Commonwealth is £71,560,000 for 1938-39, against £69,048,485 for 1937-38; and for the six States £42,444,225, against £40,975,919; the estimated total being £114,004,225, against £110,024,404. These figures do not include some forms of taxation for special funds outside the regular Budgets. The increase in the total is partly due to the need for providing for increased defence expenditure, which will in all probability require still further augmentation.

Canada

Trade Treaty Sceptics

OTTAWA, November 12.—The Federal Parliament will meet in the first or second week of January. Its first business will be the approval of the new trade treaty with the United States. If serious sacrifices of the preferential privileges now enjoyed by Canada in the British market are involved by its terms, it is certain to produce a very controversial debate. Opposition to such sacrifices will be intensified by the results of the recent Congressional elections in the United States, since they seem to open up at least a prospect of the return to power of the Republican Party in 1940. If the Republicans remain true to their high protectionist traditions, a Republican administration would serve notice for the abrogation of any trade treaty with Canada negotiated by their opponents. Canadians have unhappy memories of the unfortunate dislocations of their foreign trade arrangements and economic life on several occasions in the past through changes of administration and reversals of tariff policy at Washington; and the question will be raised by the Conservatives whether, in view of the uncertainty about the future of American tariff policy, it is worth while sacrificing valuable preferences in the British market for what may prove to be a very temporary compensation in the American market.

The Canadian Government has issued a proclamation to make operative on November 15th a section of the Transport Act passed last session, conceding to the Canadian railways the legal right to make contracts with shippers for the carriage of goods at rates below the regular schedules. Hitherto the railway freight structure has been characterised by a rigidity which deprived the companies of any effective means of competing with other forms of transport not under statutory regulation. It is true that the Transport Board, which has replaced the old Railway Commission, will retain authority over the agreed charges, but the latitude now available to the railways for meeting the unregulated competition of motor trucks will be much greater than in the past, and it is expected that both the railway systems will regain a substantial amount of lost traffic and thereby improve their earnings.

The hearing of evidence in the Bren gun inquiry has now been finished and after he has heard the arguments of counsel

next week, Mr Justice Davis will proceed to draft his report. Its publication will be awaited with keen interest, as the fate of a member of the King Ministry is apparently at stake. Some of the evidence given has aroused widespread disquietude about the administration of the Department of National Defence and *The Ottawa Citizen*, an independent Liberal paper, recently made the following comment:—

Evidence has been brought out before the Royal Commission of inquiry into the Bren gun contract fully to warrant a public demand for the drastic reorganisation of the Department of National Defence as well as for a more enlightened defence policy on the part of the Government. Even the efforts of Colonel Ralston, K.C., chief Government counsel, and Mr L. A. Forsyth associated with him have failed to present the Department in a reassuring light. It has been made plain that political patronage and profit influences operate at the expense of the public interest. The cash nexus of politics may place the security of Canada in jeopardy.

Business Slack

The abnormal mildness of October has been followed by unseasonably warm weather for November in Eastern Canada; and it is only within the last week that severe frost and any serious snowfall have been experienced on the prairies. The effect of such weather has been to retard sales of winter clothing, fuel and winter sports equipment; and retail trade has been disappointing. Another adverse factor has been the uncertainty about the terms of the projected trade agreement with the United States; manufacturers and merchants have hesitated to make heavy commitments until they get some idea of the increase in American competition which they fear will confront them, in both the Canadian and British markets.

Thus business has been marking time. The general economic index of the Bureau of Statistics, which stood at 108.2 for the week ended October 22nd, was at exactly the same figure in the week ended November 5th. The index for the week ended November 5th, however, was 2.8 points above the figure for the corresponding week in 1937; and there is some encouragement in this, since a survey recently published by the Bureau of Statistics shows that, during the first nine months of 1938, the general index of the physical volume of business averaged 110.8, compared with 121.8 in the parallel period of 1937, a decline of 9 per cent.

For the rest of the year comparatively little improvement in business conditions is now expected. There has been a welcome gain in railway earnings, largely as a result of the bigger wheat crop; for the ten-day period ended October 31st there was a gain of 7.3 per cent. in the combined gross traffic revenues of the two companies. The increase in industrial activity resulting from the first batch of aeroplane contracts placed by the British Government in Canada has been smaller than was expected; but hopes are entertained that further large orders will be forthcoming.

The production of newsprint in October was 254,872 tons, an increase of 9.8 per cent. compared with the September figure and the highest monthly figure since last December. Shipments of newsprint totalled 255,100 tons, which exceeded production and, as North American publishers' stocks of newsprint on October 31st were reported to be only 0.9 per cent. above normal, the outlook for the industry is considered to have improved in recent weeks. There has also been a betterment in the fortunes of the flour-milling industry, which owing to the low cost of wheat now finds itself better able to compete in foreign markets.

Letters to the Editor

French Financial Policy

TO THE EDITOR OF THE ECONOMIST

SIR,—A true friend of France and freedom, as Dr Balogh claims to be, and no doubt is, will surely not take in ill-part the answer of a true friend of Britain and freedom. His interesting letters published in your issues of October 15th and November 5th call for more comments. I should have thought recent events would have helped him to understand why such stubborn resistance was waged in France against devaluation up to 1936. No doubt the true grounds of that resistance were weakened by the untimely support of false orthodoxy: but with a middle-class already ruined by the previous inflation—with a class of investors (small or big) shown beyond expectation by a series of State bankruptcies, devaluation, and other currency manipulations—any new measure of devaluation must inexorably have led to a widespread and lasting fever of distrust: once bitten, twice shy.

The present panicky state of French investors has its roots far down in a past strewn with the disasters of currency depreciation. Earners of fixed incomes—whether in the form of interest, salaries or pensions—could hardly fail to seek refuge wherever they could hope to escape the full amount of a burden they alone have once again been forced to shoulder. The flight of capital before a roguish State certainly cannot be called unpatriotic, neither can it be ascribed to any kind of fetishism.

There never was much justification in the contention that devaluation was necessary to relieve the pressure on the overvalued franc. High prices in France were, and still are, in my opinion, largely the product of an economic legislation the importance of which Dr Balogh appears hardly to appreciate. Ferocious protectionism and restrictionism in every possible way; our transport policy; our wheat policy; our petrol policy; our fiscal policy—all these have been per-

manent factors which no measure of currency depreciation could alter. Depreciation could only bring a readjustment of French paper prices to the old equilibrium, at the cost of incalculable sufferings among the middle classes.

The second point I wish to answer is the contention that some measure of exchange control might stop the ruinous process of capital flight. May I respectfully remind Dr Balogh that what hampers recovery in France to-day (even leaving aside the problem of capital-repatriation stressed by M. Istel) is not that capital is being invested abroad; it is that capital is not being invested at home—a very different thing. The control of the exchanges might well, indeed, stop investors (small investors, at any rate) from sending their savings to Wall Street, but it could never compel them to invest the proceeds in French industrials or State loans. These savings will be hoarded—they will be stored up in banknotes, gold, jewels, land, stocks—but they will not be invested. Failing a "return of confidence," nothing, indeed, short of a totalitarian policy can achieve that purpose, for the sake of which Dr Balogh, who seems afraid, not without reason, of the destruction of democracy in France, would not shrink from imposing a "control of France." But this would precisely reduce what are now his fears to a certainty.

French history—with the exception of two relatively short periods in the nineteenth century—is a record of financial mismanagements. Some of them are not ascribable to French recklessness alone—especially the more recent ones. But, while I quite agree that France will never regain strength until she recovers from financial folly, I think the best advice our British friends can give us must come from their own traditions: monetary integrity—budgetary severity.

After having urged upon us devaluation, Dr Balogh now assures us that the only remedy is "credit expansion," propped up with totalitarian control. We have experienced, as he well says, the crudest type of underconsumptionism; now he would have us taste the crudest form of inflationism. It ill behoves us, he declares, who introduced quota systems, to talk of *laissez-faire*: this can only mean that, not content with having upset the bath water of international trade, we must in addition drop the baby of international money. Currency depreciations—exchange restrictions—we know these only too well. As early as a century and a half ago, Burke was calling them "the beggarly contrivances of narrow-minded wisdom." That precisely was one of the reasons why so many friends of freedom felt it so difficult, in those times, to be the friends of France.

I am, Sir,

Your obedient servant,
ETIENNE MANTOUX.

Paris.

German Trade Subsidies

TO THE EDITOR OF THE ECONOMIST

SIR,—Your comprehensive analysis of Germany's present trade offensive, in the issue of November 5th, fails in my opinion to give sufficient prominence to one aspect of Germany's trade methods, namely, her monetary subsidies. You state that: "At present the use of blocked marks in payment for German exports has almost completely ceased." There is evidence, however, that this is not the case, and that, in fact, purchases of blocked marks and depreciated bonds at a discount are still used extensively to subsidise German export trade. Only there has been a change of procedure; the buyer is now the *Golddiskontbank* itself, whereas under the old *Zusatzfuhr* system the German exporter was authorised to purchase depreciated marks or securities, if by so doing he could secure an order which he could not otherwise obtain.

In this connection the following translation from the Tenth Edition of *Die Devisengesetze* of January 20, 1938, is of special interest:—

Profit on Discount (of Credit Repayment Marks)

The Exchange Control Offices of the Reich or Central Exchange Office, shall decide to what extent permission shall be given for the utilisation of acquired blocked balances for the granting of credits, but only on condition that the lender hands over to the *Deutsche Golddiskontbank* Additional Export Department ("Abt. Zusatzfuhr") or to the borrower, all or part of the profit on discount.

The new method of operation whereby the *Golddiskontbank* is the sole buyer ensures a smoother working of the *Zusatzfuhr* scheme. If further illustration is needed it can be found in the active market which exists in the various categories of blocked marks centred in Amsterdam, Zurich and Paris, and in the sales of German international securities in London and elsewhere to the *Golddiskontbank*.

The following figures, taken from the semi-annual reports of the *Reichs-Kredit-Gesellschaft*, showing the reduction of German foreign debt, are interesting in this connection:—

Date.	Long Term	Short Term	Total
	(Thousand million reichsmarks)		
February, 1934	7.2	6.7	13.9
1935	6.4	6.7	13.1
1936	6.1	6.3	12.4
1937	5.4	5.4	10.8
1938	5.0	5.0	10.0

It will be seen that Germany in February, 1938, still had outstanding ten milliard marks of foreign debt, of which a substantial proportion may become available for subsidising her export trade.

This whole question of German monetary subsidies is, in my view, of the greatest importance. Unlike the usual internal Government subsidies they operate entirely at the expense of the foreign creditors of Germany, and do not depress the internal standard of living of the country. New

blocked marks are constantly being created (profits of foreign-controlled companies operating in Germany, emigrants' balances, etc.), and the amounts available are in consequence both substantial and continuous; there is no reason to suppose that, while these conditions remain unaltered, Germany will abandon the method which puts her in a unique competitive position.

I would therefore suggest that to your list of suggested remedies, in Part 4 of your admirable article, should be added:—

Final settlement of all outstanding and future claims on Germany by British nationals, involving the prevention of the sale of these claims to Germany at a discount.

Such action, supported perhaps by a flexible anti-dumping tariff, would have to be initiated by the British Government, since a modification of the Anglo-German Payments Agreement would be involved.

In view of the magnitude of the figures involved, it does seem to me important that the present "intolerable" situation, whereby one section of the community (those with monetary claims on Germany) are forced to subsidise German export trade, to the detriment of another section which depends on British exports for its livelihood, should be brought to an end.

Yours faithfully,
RALPH JARVIS.

London, E.C.2.

Books and Publications

Classical Economics Reprinted

THIS* is the first of a series of reprints to be published under the general title of the Library of Economics. The series is to be directed by an Editorial Board consisting of distinguished representatives of American, French, Italian, Swedish and English economists. Unlike many earlier reprints this volume is strongly and not inelegantly bound, while its price is more than reasonable. One may regret, however, that, doubtless for good reasons, it should have been found necessary to reproduce the dreary typography of the *Encyclopædia Metropolitana*.

The choice of Senior's only full length work on economic theory to open the series is an excellent one. Senior has suffered neglect during the last few years—how unmerited Dr Bowley's recent book amply if partially showed. He is brilliant as an analyst of terms, and perhaps unique among English economists in having the capacity to render a page of definitions good reading. Whether or not Senior was really influential in the development of the science in his lifetime there can be little doubt that he has been influential since and should continue to be.

This is not a book only for the historian or antiquarian. What Jevons said of its first pages—that "so far as they go, they form the best exposition of the basis of economics"—is still true and would be broadly true even without the qualification. That the "Outline" was published in 1836 scarcely affects the issue: few of us who were born in Georgian houses feel for that reason anachronisms.

There are further reprints to come in the series, as well as some "outstanding modern contributions to knowledge" (two of which, a volume on theory by Professor Lindahl and a history of theory by Dr Rosenstein-Rodan are announced). Thornton on "Paper Credit," J. S. Mill's early "Essays," Bentham's "Manual," and Böhm-Bawerk's "Positive Theory," are the titles so far promised, and, as these are all books that one would like to have easily accessible, it is greatly to be hoped that the Library will flourish. The tendency for good books on economics to be forgotten as quickly as good films is not a healthy one.

It needs little learning to see the limitations of the classics of political economy; but a great deal more than any ordinary student possesses to derive no stimulation from them. Ricardo, Malthus, Thornton, Torrens, Senior and their fellows were a group who, in their combination of wisdom and intellect, have rarely been matched. Intellectually

* An Outline of the Science of Political Economy. By Nassau Senior. George Allen and Unwin (London). 249 pages. 7s. 6d.

the science has, of course, raced forward, but economists are surely not much wiser than they were, while the need for wisdom has grown. Wisdom is a quality easily recognised and infectious by long contact and such a series as this does a real and direct service. But, this said, perhaps it would not be ungrateful or greedy to hope that the later members of the series will not be quite so dry as those already promised. The selection made so far is rather biased in the direction of precise theory, and it is doubtful whether it fully represents the good inaccessible work of the nineteenth century. Anyone turning over the pamphlets and journals of the years 1800-30 will find masses of material of the greatest interest and value which, even though little of it is of the calibre as theory of the three books by Thornton, Bentham, and J. S. Mill, is equally worth reading as common sense, and far more useful as lessons in controversy. May we not be given some of this? Perhaps, if we do our duties by the first instalments, we may.

discretion, and in the absence of any leading cases around which these discretionary powers can crystallise, the final effect of the Act must remain indefinite. Consequently, this admirably compact book by Mr A. C. Crane, although it may have to be brought up to date later, serves a very useful purpose. Mr Crane goes through the Act clause by clause, explaining the obscurities and generally interpreting it in the light of his legal experience. It is inevitable that a complex piece of legislation of this kind should in its undiluted form be beyond the grasp of the layman. Legal interpretation can be even more obscure than the original. But Mr Crane, by avoiding legal jargon as far as possible, makes the Act completely intelligible to the ordinary person, and it is the ordinary person who is, or should be, interested in the workings of the new Act. It is doubtful whether any attempt will be made by unscrupulous tradesmen to batten on ignorance and avoid the provisions of the Act—the risk is too great—but any attempt to reduce that ignorance is a move in the right direction. In fact, it would be a very good idea if everybody, before entering on any hire-purchase agreement, were to read through this book, particularly Chapters 4 and 11, which deal with the key sections of the Act. The blank forms of hire-purchase agreements printed in the Appendix are also useful in that they show what form of words agreements under the new Act may take, and any pronounced divergence from them should be regarded with suspicion.

"The Spanish Arena." By William Foss and Cecil Gerahy. Gifford. 517 pages. 18s.

The Spanish war has produced rich outcrops of special pleadings on both sides. Introduced by Dean Inge and the Duke of Alba, expensively produced, excellently illustrated and decked with all the devices of selected documentation, this book is just another pro-Franco pamphlet, no nearer the truth than any other piece of gross propaganda. Its theme is a gigantic Communist plot, "the struggle of Franco against the hydra-headed monster of International Communism"; and its burden a warning to the world that what has befallen Spain may happen in other places. The authors accuse the Press of England, among other countries, and the B.B.C. of servility and falsehood; and at the end leave the impression that little of what they themselves have said can really be believed.

THE BUSINESS WORLD

Arms and the Investor—II

The Aircraft Industry

THE expansion of the Air Force has become so rapid that investors themselves must take wings to keep up with the consequential changes in the structure of the aircraft industry. But the fifth official increase in the air programme, announced by Sir Kingsley Wood early this month, is obviously an important landmark by which the aircraft shareholder may take his bearings. The current increase is to be concentrated mainly on the fighter force, whose first-line strength is to be raised by 30 per cent., while for bombers the depth of reserves will be increased. As on the four previous occasions, the increase in the programme is linked to a drastic expansion of the aircraft industry itself. This time, however, the intended expansion in the capacity of the aircraft industry appears, even on a comparative basis, to be more far-reaching than any programme envisaged in the past.

The plan appears to have three main features. In the first place, it embodies a major extension of the "shadow" factory system. It is noticeable that the Air Ministry is now relying more on the professional aircraft companies to manage these factories than it did when the shadow scheme was first adopted. Thus, the Hawker-Siddeley group has been allotted two of the new factories, and it may possibly be given a third. Fairey Aviation has been allotted one, Rolls-Royce another, while the Ministry is financing extensions costing £1,500,000 to the Bristol Aeroplane works. The Ministry's early practice of enlisting shadow factory managers without first-hand experience of aircraft manufacture, it is not perhaps unfair to surmise, has led to some disappointments.

Secondly, the latest expansion programme involves a large-scale sub-contracting system. Sub-contracting is no new development for the aircraft industry; in any main contract there may be as many as fifty sub-contracts involved. But the recruiting of a large number of firms to manufacture parts for assembly in a central factory is a new departure in the manufacture of airframes. The Vickers organisation was an obvious choice for a scheme on these lines; the Vickers-Armstrong group and other firms will do the sub-contracting and Vickers itself the assembly. And a similar scheme, under the technical management of A. V. Roe, a member of the Hawker-Siddeley group, has been adopted for the Lancashire area, where Associated Electrical Industries will manage the assembly unit. The textile machinery manufacturers, such as Howard and Bullough and Dobson and Barlow, have also been brought into the Lancashire scheme.

Finally, firms formerly outside the aircraft industry—including some with no previous aircraft connections whatever—have now been brought within its scope. The outstanding example of this development is the financial interest which, first, John Brown, and later Associated Electric, have taken in the Westland Company. It will be noticed that Associated Electric now has two connections with the aircraft industry. Further, there is the arrangement between Handley Page and English Electric, under which the latter company will make parts for Handley Page and later the complete Handley Page machine. Again, the four main-line railway companies are to manufacture parts in their workshops for (among others) the Hawker and Blackburn machines. Indeed, there are now about 3,500 companies producing aircraft parts or components. And it can safely be said that the number is still increasing.

In the main, therefore, this further expansion in manufacturing capacity has not entailed any considerable capital expenditure by the professional aircraft companies. Nor do these new entrants into the industry undertake any major capital risk. The Government is bearing the greater part of the initial expenditure, and is thus becoming less the industry's customer and more its owner. Indeed, the point may well have been reached already where the Government, through the Air Ministry, owns the greater part of the capital equipment in the aircraft industry itself, if capital which it has not provided directly, but which it has guaranteed, is included. This position may eventually give rise to serious problems. If rearmament slows down, will all future Governments, for instance, be content to have their own factories idle while those in private ownership are employed? For the near term future at any rate, however, this development of Government ownership is desirable. For, with two major exceptions, the aircraft industry has been able to undertake this latest expansion without raising any additional capital in the market.

These two exceptions are Hawker-Siddeley and Bristol Aeroplane. The former has issued this week £3,500,000 4 per cent. debenture stock at 99, redeemable by 1946, while Bristol has announced a 75 per cent. capital bonus and an issue of one new 10s. ordinary share at par for every one held before the bonus. The Hawker-Siddeley debentures will be liquidated as the contracts which are to be financed by the new issue are completed. Thus, if everything goes according to plan, as it should do, there will be no permanent increase in the company's capital. Hawker-Siddeley is financing what is still thought to be a short-term programme by short-term finance. But it does

† Tax free. (a) On capital of £500,000; balance did not rank. (b) And capital bonus of 10 per cent. (c) Interim dividend of 10 per cent. paid on £124,466 capital and final on capital of £248,930. In addition capital bonuses of 100 per cent. and 50 per cent. were paid in December, 1937, and July, 1938. (d) Cum the rights to the new issue and capital bonus. (e) Equivalent to 69.5 per cent. on new capital. (f) 55-week period in 1935-36.

not necessarily follow that, if the Hawker-Siddeley method is right for Hawker-Siddeley, the Bristol policy of issuing ordinary shares is wrong for Bristol. Financial policy at this stage must be governed by the demand which each company can envisage for its products when the re-armament programme has passed its peak. Whatever happens, Bristol can expect a large replacement demand for, say, engines in the future. And as the company's present capital is low in relation to its effective earning assets—a position for an armament concern which has its disadvantages—the issue of ordinary shares is probably justified.

So much for the general structure which is at present envisaged for the aircraft industry. That structure is important, because it will largely govern the industry's future profits. If the Government follows its previous policy, the companies chosen as managers for shadow factories will receive an agent's fee while the factories are being erected, based, it is believed, on a percentage of total cost. When production starts the companies receive a management fee, which is based on actual output—for the present shadow factories this management payment is £200 or £225 per airframe and £75 per engine. The speech of Mr T. O. M. Sopwith at the Hawker-Siddeley meeting suggests, however, that the Air Ministry has adopted the policy of renting at least some of their new "shadow" factories to the companies concerned. If this is the case, the prices paid for airframes and aero engines produced in the "shadow" factories will presumably be fixed by the normal costing method, with no allowance for depreciation of the building or wear and tear of the machinery.

Prices and profit margins for the regular aircraft industry are still governed by the McIntock agreement, which was concluded shortly after the expansion commenced and has since been brought up to date. This agreement provides three alternative methods for fixing prices. The first is the normal bargaining between buyer and seller. If the two sides cannot reach agreement the Air Ministry then fixes a "target" price, which is based on the cost of pro-

ducing the first few batches, each batch comprising, say, twenty machines. If the actual cost of completing the contract is below the "target," then the Ministry and company share the gain. If the cost is above the target, then the company receives only a fixed profit, which consists of a fixed sum and not a fixed percentage. The final method, used only when agreement cannot be reached on the other two, is arbitration.

That agreement appears to have worked well enough in the circumstances. The Ministry's costing system is very comprehensive; it takes into account total turnover, the capital employed in the business, etc., but it seems to allow a fair margin of profit. It is certainly true that the industry is more contented on this price question than it was. And it is also true that the industry is now satisfied with its output programme, which, unlike that of a year ago, is based on long-term principles with a reduction in the number of types being produced. Profits will not expand in the same proportion as turnover—the amount spent on aircraft in 1939-40 may well be double the estimated expenditure of £51 millions in the current financial year. But there is a reasonable chance that earnings will increase, and a reasonable chance that shareholders in the leading aircraft concerns, whose recent earnings record is set out in the accompanying table, will obtain their due share of the benefit.

Subtle differentiation between one aircraft share and another would be out of place, for in the short run all companies will be fully occupied, and their profits should be uniformly satisfactory. Nor is there a case for exalting the shares of companies which concentrate on fighters, at the expense of those concerned with bombing planes, for an increased depth of reserves is in no way different from increased first-line strength, so far as the aircraft industry is concerned. On a longer-term view, of course, differentiation may be very necessary. But in the meantime, the speculative investor can hardly err seriously in holding a selection of the leading professional aircraft shares, of which the least invidious choice would perhaps be Bristol, Short Brothers, Fairey Aviation and Hawker-Siddeley.

Lead and Spelter

SINCE the beginning of this century the total world demand for the five base metals—copper, lead, spelter, tin and aluminium—has more than trebled. This increase has not been uniformly spread over the different metals, and substantial changes in their relative position have occurred. For instance, although lead and zinc are, as a rule, mined together, world consumption of the treated zinc ore, spelter, more than trebled between 1900 and 1937, while that of lead barely doubled. In 1937 zinc supplied 26.3 per cent. of the combined consumption of the five leading base metals against 24.4 per cent. in 1900, while the share of lead declined during the same period from 44.7 to 28.3 per cent. of the total.

These unequal movements are only partly due to changes

in consumption. The demand for lead has always come chiefly from two large consumers, the building and the electrical industries. The building trades absorb up to one-third of the total world production in the form of paint, sheets and pipes, while the electrical industry absorbs more than two-fifths for cable-covering material and storage batteries. Recently lead has been used to an increasing degree in the armament trades, where zinc, although important, plays a smaller part. No less than two-fifths of the world's spelter is usually required for galvanising; between one-quarter and one-third is absorbed by brass-makers, and an increasing, but still small, proportion is used in die-casting.

The recent expansion of the zinc industry has been due

less to new developments in the use of the metal than to the enormous changes that have occurred since the beginning of this century in the conditions of supply. Until shortly before the war it was very difficult to separate zinc from the complex lead-zinc ores, but the perfection of the selective flotation method of metal concentration enabled producers to recover separately the greater part of both the lead and zinc content from the ore. The treatment of zinc, however, still remains a more complicated process than the recovery of lead. Consequently, only about three-fifths of the world's zinc is recovered in the countries of production, while no less than 85 per cent. of the world's lead output is treated in the mining territories, and the proportion is tending to increase, to the disadvantage of the independent (or customs) smelters. On the other hand, the recent demand for high-grade spelter required for die-casting and armaments has given the zinc smelters a new lease of life, and their influence will continue to be important.

The world's lead and spelter industry can be divided into three territorial sections—the United States, the British Empire and the rest of the world. The first is the world's largest producer and consumer of the two metals, but it is a self-contained unit and has thus only an indirect influence on the world market. Exports are small and imports into the United States are rendered difficult by duties of 2½ cents per lb. on lead and 1½ cents per lb. on spelter. The British Empire is much less of a closed unit than the United States, although the introduction of the Ottawa duties in 1932 put some obstacles in the way of free international trade. These duties on Britain's imports of foreign lead and zinc amounted originally to 10 per cent. *ad valorem*, but they were reduced in August, 1935, to 7s. 6d. per ton for lead and 12s. 6d. per ton for spelter. At present the Import Duties Advisory Committee is examining an application for an increase in the spelter duty, which will probably be raised again to about 10 per cent. *ad valorem*. These duties have provided a considerable stimulus to the Empire production of lead and zinc, particularly in Canada, Australia and Newfoundland. Consumption has also increased sharply in recent years, both in the United Kingdom and in the other countries of the Empire; some of the Dominions, notably Australia and India, have erected their own paint, rolling and galvanising works. The United Kingdom now ranks second to the United States as a consumer of lead and spelter.

In the rest of the world, the German demand for the two metals is the dominating influence. Although Germany's ore production has been increased in recent years with the help of large State funds, the country is still dependent on foreign supplies. Belgium has maintained in recent years her position as a smelting country, working almost entirely on imported ore. Supplies from Mexico and Spain, two countries formerly of considerable

importance in the lead and spelter trade, have been affected by internal disturbances. New supplies have been developed in Russia, Yugoslavia and Peru to a sufficient extent to raise the world output of zinc in 1937 to a record level.

Unlike the copper, tin and aluminium industries, the production of lead and spelter is uncontrolled. Between 1929 and 1932, some of the main producers of lead endeavoured to stabilise the market through a pool, and in 1935 producers outside the United States arranged not to increase their production without notice, but neither of these arrangements were ever really effective. A cartel for zinc was in existence between the autumn of 1931 and the end of 1934. It comprised all the large producers except those in the United States, but collapsed because several members were unwilling to reduce their output sufficiently. The prevalence of isolated and protected markets, the differences in production costs (which have been intensified in recent years by currency devaluation and State subsidies), the importance on the zinc market of the customs smelters who work on imported ore—all these factors make it difficult for the producers of lead and spelter to exert unified and effective control over their total output.

Owing partly to this lack of regulation, the production of lead and spelter has been maintained during the last two years at levels considerably in excess of consumption, as is shown by the table on page 430. The statistics for the mines output in the current year are not yet available, but, according to the Metallgesellschaft, the output of lead outside the United States increased from 926,660 metric tons in the first nine months of 1937 to 939,338 tons in the corresponding period of the current year. During the same period the production of spelter outside the United States increased from 831,492 tons to 861,111 tons, while the consumption of lead (again excluding the United States) is estimated to have fallen by 10 to 15 per cent. and that of zinc by 15 to 20 per cent. Consequently, stocks of both metals must have risen considerably this year.

It is not, therefore, surprising that the prices of lead and spelter should have fallen in the past twelve months relatively to those of the other important base metals, or that fresh attempts should be made to introduce some form of production control. Last September, the main non-American producers of lead and zinc agreed to form a Lead Producers' Association, with this object in view. So far no details have been published, but it is understood that the completion of the lead agreement is to be followed by a similar scheme for the control of spelter production. Recent events on the copper and tin markets have demonstrated the advantages of production control. While the special conditions of these industries render centralised control difficult, the experience gained in the last few years may now make closer co-operation possible.

Valuation for Customs

THE last of the eight Exchanges of Notes appended to the Anglo-American Trade Agreement refers to the problem of determining the values of goods for the purposes of Customs duty. In these Notes the two Governments make reference to discussions that have occurred between them "concerning the bases and methods of determining dutiable value in the United Kingdom and the United States of America, and the desirability of removing, in so far as possible, any uncertainties in respect of these matters" and pledge themselves "to afford full opportunity . . . for consultation between representatives of the two Governments concerning general problems of valuation as well as specific difficulties of application which may arise from time to time."

The problem of valuation here referred to is not often mentioned in discussions of the tariff policies of the two countries concerned. In point of fact, however, among those acquainted with the facts of Anglo-American trade, fiercer controversy rages over this question than over any actual

rates of duty, and there are many informed Americans who are of the opinion that an alteration in British methods of valuation would be of far greater benefit to American trade than any practicable alterations of duty.

The practices of the two countries in the matter of valuation are almost diametrically opposed to each other. American tariff duties are levied on the value of the article in the exporting country and before it has had any costs of ocean freight or insurance added to it. The primary basis for valuation is the so-called "foreign value," which is defined in the Tariff Act of 1930 as "the market value or the price, at the time of exportation of such merchandise to the United States, at which such or similar merchandise is freely offered for sale to all purchasers in the principal markets of the country from which exported. . . ." Only if this "foreign value" or the "export value" (which is similarly defined) cannot be ascertained, are the appraisers entitled to refer to the United States value, and this is carefully defined as "the price . . . in the principal

market of the United States . . . with allowance made for duty, cost of transportation and insurance and other necessary expenses from the place of shipment to the place of delivery. . . . In brief, the American duty is levied on the f.o.b. value of imports.

The operative clause of the British Import Duties Act of 1932, on the other hand, lays it down that the dutiable value of imported goods "shall be taken to be the price which they would fetch on a sale in the open market at the time of importation"—i.e. in Great Britain. Duty is charged on the value of the goods in the exporting country *plus* the costs of shipping and insurance—in short, on the c.i.f. value.

From the administrative point of view, both systems have their advantages. Under the American f.o.b. system, value can be taken, in the great majority of cases, from the invoice. But it has been found necessary to station attachés of the United States Treasury Department in foreign countries to ensure the accuracy of invoice values. The British c.i.f. system avoids this necessity, and, for goods which have an open market, provides a very simple test of value. But where there is no open market, it provides no sure and easy way of establishing value.

It is obvious that a very considerable difference may emerge in practice between valuations established under the two systems. For one thing, comparisons of *ad valorem* duties in the two countries are impossible: a duty of 10 per cent. in the United States is considerably lower than a duty of 10 per cent. in Great Britain. This fact should be borne in mind in comparing the tariff schedules of the two countries.

An f.o.b. system works in favour of an importer who has to bring his goods a long way; a c.i.f. system in favour of the near-at-hand importer. Thus if, say, timber from the United States and Sweden is selling in competition in the British market at, say, £22 a standard, the c.i.f. value and duty on timber from the two countries will be the same—if the rate of duty is 10 per cent., both importers will be paying £2 a standard. But it may well be that of the £20 per standard received by the American seller, £10 represents freight and insurance, while the Swedish seller has only £5 to pay for these costs. On the basis of these illustrative figures, an application of the f.o.b. system would lead to a duty of £1 per standard on American wood and £1 10s. per standard on Swedish wood. It would be wrong to suggest that either method is inherently more fair than the other. It is natural, however, that American shippers to the British market, being accustomed to the f.o.b. system in their own country and having, for geographical reasons, to bear heavier shipping charges than many of their competitors, should feel themselves hardly used by the British system, especially since the bulk of their heavier shipping charges goes to British shipowners and insurers.

This disability applies more severely, of course, to goods whose bulk is large relatively to their value—that is, in the main, to raw materials. For the majority of manufactured goods, especially such goods as are sent to Great Britain by the United States, the difference between f.o.b. and c.i.f. valuation would, in itself, be of comparatively small importance. But the American importer of manufactured goods into the British market has another set of grievances against the British system of valuation. The great majority of manufactured goods cannot be valued by any open market quotation. Indeed, the Import Duties Act specifically exempts from this method of valuation patented, registered or trade-marked goods and any goods imported by sole agents or firms affiliated in any way with their suppliers—exemptions which cover nearly all American manufactured goods imported into this country.

For goods whose value cannot be determined in the open market, the Act, in effect, specifies that value shall be determined by the price at which the goods are sold in the United Kingdom "less an allowance in respect of duties of Customs and reasonable merchanting expenses and profits incidental to the marketing of the goods after importation." It is in the interpretation placed upon these words that difficulties arise. The Act enjoins the Customs to arrive at the duty payable by calculating backwards from the price. When, consequently, an American firm, wishing

to market its goods in this country, inquires what the duty would be, it is first asked to state its selling price. And since the selling price depends on the duty, it is difficult to give an answer.

Even this logical difficulty, however, does not create as much trouble as some of the methods of assessment. It has been decided that the only satisfactory way of determining what are the "reasonable merchanting expenses and profits incidental to the marketing of the goods after importation" is to examine the books of the importing firm or agency in Great Britain and to divide its actual expenses and profits into two categories—those that can and those that cannot be deducted from selling price to arrive at dutiable value.

This gives rise to remarkable anomalies. The Customs authorities have placed some rather curious definitions on what constitutes a post-importation expense. Thus no expenditure on advertising in Great Britain is usually allowed as a deduction. The theory is that if goodwill is built up by advertising a product in England, its value at the moment of importation is thereby enhanced. The logical point can be appreciated, but it has the curious effect that the more an American manufacturer spends on advertising in England, the more duty he will have to pay. The authorities have also been very parsimonious in allowing expenditure on such things as depreciation of stocks, losses on instalment sales, exchange losses, etc.

Apart altogether from these questions of definition, however, the system itself leads to peculiar results. When the allowable deductions of a firm have been totalled, they are, of course, divided by the number of units sold. In this way dutiable value will be higher in a year when sales fall off than in a good year. Perhaps the most serious complaint that is raised against the system, however, is its uncertainty. Dutiable value frequently cannot be finally established until long after the goods have been sold. In so far as the assessment depends upon the examination of balance sheets, such a result is almost inevitable. Moreover, for the same reason, values may change from year to year. The net effect is that the American firm selling goods in the British market is compelled, in self-protection, to quote a retail price which leaves a profit margin large enough to cover all contingencies, even though by so doing the valuation will be automatically increased.

The way in which the system works in practice can be illustrated by the actual experience of an American firm selling, through a British subsidiary, a certain variety of machinery. The machines are invoiced to the subsidiary at the same price as to other sellers in the United States, without any discount for the quantity taken. In 1932, when the Act came into force, the Customs agreed, for the time being, to take this invoice value as a fair valuation. In 1933, the valuation was revised upwards to invoice price plus 25 per cent., and finally, after very lengthy negotiations (during all of which duty was being paid at this higher valuation), the figure was revised to invoice plus 8 per cent., subject to annual review.

There can be little doubt that this system of valuation, by its uncertainty and its necessarily arbitrary character, imposes an "invisible trade barrier" to American imports into Great Britain. When an American duty of 10 per cent. is compared with a British duty of 10 per cent., therefore, it should be remembered not only that the British duty is levied on the c.i.f. value, but also that the value may be considerably higher than what is in fact the c.i.f. cost of the goods to the importer.

These are the arguments that have doubtless been raised by the Americans in the negotiations now concluded, and will be repeated in the consultations to come. So far as is known, there are no equivalent grievances on the British side. The Americans stand very little chance of persuading the British Government to modify the whole basis of its tariff system (and, incidentally, of its import statistics) from c.i.f. valuation to f.o.b. But even with the maintenance of a c.i.f. system, it would not seem entirely unreasonable to suggest that invoice prices (including freight and insurance) should be taken as the basis of valuation in all cases except where there is a reasonable suspicion of under-valuation. The yield to the British Treasury might be rather smaller; but there would be a very large saving in time, trouble and ill-will.

THE RAILWAYS ASK FOR A SQUARE DEAL

Much is being said about the poor financial position of the Railway Industry.

The real position can be stated in a few short sentences.

1. In fixing rates and conditions for carrying merchandise the Railways are bound by statutory controls and regulations which have lasted a hundred years and grown more rigid with age.
2. No other form of goods transport is subject to such restrictions or anything comparable with them.
3. Moreover, no other form of transport has or can have such basic duties and responsibilities to the State as those which the Railways must bear at all times and more especially in times of national emergency.
4. It will be impossible for the Railways adequately to discharge those national services and duties unless they are now set free to put their house in order, and to run their business on business lines.
5. The Railways have no desire whatsoever to interfere with other transport services or with any other business.
6. They merely want the chance to put themselves right so that they may be able to meet fair competition in a fair way. The main transport services should all start equal.
7. The time honoured shackles which fetter the Railways alone and well nigh strangle their goods traffic must go.
8. And they must go before it is too late.
9. A short Act of Parliament is required this Session to meet a crying national need.

The Railways ask for a Square Deal

ISSUED BY THE RAILWAY COMPANIES' ASSOCIATION

Finance and Banking

Sterling's Downward Path.—This week the pound has taken another step downwards, roughly, \$4.70 to \$4.65. This follows last week's decline from \$4.75 to \$4.70, and in each week the attendant circumstances were much the same. Both on November 14th and November 22nd the British Control remained out of the market, and it was on these days that the pound took its largest downward steps. On other days the Control has given vigorous support. Naturally the market is a little puzzled at what is happening. One theory is that the Anglo-American Trade Agreement is based on the tacit understanding that \$4.60 is the "natural" rate for the pound. It was, the theory runs, clearly undesirable for the pound to jump out of the window from \$4.75 to \$4.60 all at once, and it is therefore now coming down by the stairs. If so, it still has to descend another flight. But it is extremely improbable that any such understanding on a fixed rate formed part of the Agreement, and another market suggestion is that the authorities wish to encourage the market to become long of dollars, on the argument that the Exchange Account's gold will presently be reinforced by a draft on the Bank's gold, on the lines discussed in *The Economist* of November 12th. This may temporarily create an atmosphere unfavourable to sterling, but if the market is already short of pounds, it will be much easier to dispel that atmosphere by bringing about a rally in sterling. This, however, is all pure surmise. Its only importance lies in emphasising the market's difficulty in understanding the Control's policy. The time therefore may be opportune for some intimation how the authorities view the present trend of sterling, and what action they deem appropriate both on the short-term and the long-term view.

Control's New Tactics.—Little more than a month ago, the Exchange Equalisation Account began to operate systematically in forward dollars. During the last few weeks it has further extended the scope of its activities by embarking upon the control of the "day dollar" market. As is well known, speculators who buy spot dollars which are due for delivery in two days usually cover themselves the next day by selling "day dollars," which are to be delivered on the following day. Owing to the one-sided trend of speculative operations, there has for some time been a persistent selling pressure on day dollars, which at times went to a considerable discount in relation to spot dollars. As a result, arbitrageurs were able to earn 2 per cent. per annum, and more, by selling spot dollars against the purchase of day dollars. The authorities

intervened, however, and to a large extent took the place of the arbitrageurs by covering their sales of spot dollars through the purchase of day dollars. The result was that the discount on day dollars narrowed down to something like $1\frac{1}{4}$ to $1\frac{1}{2}$ per cent. per annum. Even that rate attracts a certain number of arbitrageurs, but most of the covering operations in "day dollars" are now provided by the authorities themselves. The Exchange Equalisation Account thus uses its funds at what may be regarded as fairly remunerative rates in the existing circumstances. At the same time, however, its tactics tend to encourage speculation in spot dollars, since the cost of covering through sales of day dollars has been materially reduced through official intervention.

To keep down the premium on forward dollars through official intervention serves a useful purpose, even though the cost of speculation is thereby reduced, because the evidence of the widening of the forward rate would tend to increase the selling pressure on spot sterling. In the case of the "day dollar" market, however, the rates are never published, and are known only to a comparatively small number of specialised dealers. For this reason the widening of the discount on "day dollars" would produce no psychological effect similar to that produced by the widening of the premium on forward dollars, and there seems to be little object in pursuing tactics which tend to stimulate speculation without at the same time discouraging genuine withdrawals. Indeed, it would perhaps be wiser for the authorities deliberately to widen the discount on day dollars in order to discourage speculation in spot dollars, which has lately assumed considerable proportions. Most of the short positions in spot sterling are carried by the sale of day dollars against the purchase of spot dollars. If the cost of these operations were raised to, say, 5 or 6 per cent. per annum, this might induce some of the more conservative speculators to cover.

New Zealand Bank Rate Increased.—The Reserve Bank of New Zealand decided at the end of last week to raise its official discount rate from 2 per cent., where it had stood since June, 1936, to 4 per cent. It is not difficult to interpret the general motives underlying this move, though it is definitely more difficult to follow the proposed mechanics by which the desired objective is to be attained. The unpalatable fact in New Zealand's monetary situation is the severity of the recent decline in the reserve of London funds. How to arrest and reverse that movement is the main financial problem facing the New Zealand authorities to-day. In this task they start with the handicap that the programme on which the Labour Party was recently re-elected provided for additional pensions and social services which, however commendable in principle, must to some extent inflate the cost and price structure in the Dominion and therefore bring further indirect pressure on the balance of payments. None the less, if the exchange rate is to remain at its current level, retrenchment of some kind appears to be called for. The doubling of the discount rate is the first answer to that call. It is unfortunately a wholly ineffective answer, for the discount rate of the Reserve Bank of New Zealand has little more than academic significance at the moment. The last annual report of the Bank admitted that, despite the low level of the rate (it had remained at 2 per cent. throughout the year), no bills had been presented for discount or re-discount. If any other indication of the ineffectiveness of this official rate were needed it would be provided by the fact that the doubling of the rate has made no difference whatever to the deposit or overdraft rates charged by the trading banks

in New Zealand. As there is no money market in New Zealand, the rise in Bank rate has occurred in a virtual vacuum. If, indeed, the Reserve Bank decides to make a reality of the policy of credit restriction it has better means at its disposal. Under the banking law of New Zealand the trading banks must maintain with the Reserve Bank certain proportionate reserve balances. The Reserve Bank, moreover, has the power to vary these minimum ratios. The weapon of contraction is thus ready to hand.

Bank of France.—This week's Bank of France return records the changes due to M. Reynaud's new proposals, classified in *The Economist* of November 19th. The Bank's gold has been duly written up from a basis of 43 to one of 27.5 milligrammes per franc, with the result that it has increased by Frs. 31,456 millions. The counterpart to this revaluation is a reduction of Frs. 27,507 millions in provisional advances, which are now consolidated under the Reynaud Convention of November 12, 1938. The permanent advances have also been duly raised by Frs. 6,800 millions to Frs. 10,000 millions. This last represents new borrowing facilities, while the repayment of provisional advances also falls Frs. 3,949 millions short of the increase in the Bank's gold. Incidentally, the whole of this last increase can be shown by a simple calculation to be due to revaluation, and none of it represents any acquisition of fresh gold.

	BANK OF FRANCE		Change
	Nov. 10	Nov. 17 (Frs. millions)	
Gold	55,808	87,264	+ 31,456
Commercial bills	14,239	13,499	- 740
Advances on securities...	4,005	3,971	- 34
Loans to State:—			
(a) General	3,200	10,000	+ 6,800
(b) Provisional	48,134	20,627	- 27,507
Note circulation	108,771	107,348	- 1,423
Deposits:—			
Public	3,548	6,181	+ 2,633
Private	23,322	31,492	+ 8,170

The total new borrowing, therefore, amounts apparently to Frs. 6,800 plus Frs. 3,949 millions, or to nearly Frs. 11,000 millions. Frs. 2,633 millions have been placed to the credit of the Treasury in public deposits, but the major part has gone into private deposits. It would be interesting to know

what this means. It is inconceivable that the whole of this Frs. 8,170 millions has already reached the banking system, for this would imply that it has been spent in one week.

English, Scottish and Australian Bank.—Mr S. M. Ward, in his speech at the annual meeting held on November 23rd, discussed the past year's change in Australia's balance of payments. The value of wool exports had been affected by the fall in prices, but as there had been improvements in other items, the total value of Australia's exports only showed a reduction of £stg. 3,500,000 between 1936-37 and 1937-38. Imports, however, were £stg. 21 millions higher, and so the export surplus had been reduced from £stg. 36.4 to £stg. 11.8 millions. Mr Ward's conclusion was that, for the two years taken together, Australia's export surplus was sufficient to cover her sterling debt service, and he also regarded last year's increase in imports as a passing phase. The outlook for Australian business was not altogether satisfactory, the adverse factors being drought, the fall in the price of wheat and increased Government expenditure. He regarded the banking position as thoroughly sound, and the banks had been able to meet all legitimate demands without unduly straining their resources. How far they will be able to do so in the near future is perhaps more debatable, but Mr Ward called attention to a remark made in September by the Federal Treasurer. The Commonwealth Bank, the Treasurer explained, could within the limits of sound finance be relied upon to use appropriate central banking measures to assist in counter-acting or lessening a decline in activity. Some indication of possible needs in this direction is given by the English, Scottish and Australian Bank's own accounts. The ratio of cash to current accounts during the past year has fallen from 79.2 per cent. to 57.5 per cent., and the ratio of cash to all deposits has fallen from 32.1 per cent. to 23.5 per cent. Meanwhile the ratio of advances to deposits has risen from 77.3 per cent. to 82.7 per cent. Thus the banking position is not quite so liquid as it was a year ago, and if the banks are to provide further assistance to agriculture and trade it looks as if some enlargement of the credit base might be necessary. Whether this is the best way of dealing with a possible recession is, of course, open to argument.

MONEY MARKET NOTES

Foreign Exchanges

THE broad aspects of this week's fall in sterling from \$4.70 to \$4.64½ are discussed in a Financial Note. The British Control gave no support on Tuesday, and only intervened intermittently on Wednesday and Thursday. There were also indications in the market that on Wednesday the Control may have been buying dollars. This week the movement in the rate was out of proportion to the limited volume of business actually passing. French francs were bid until Thursday, when labour troubles necessitated some support from the French authorities. Spot francs have been at Frs. 178½, with three months' francs at Frs. 21½ discount, or slightly better than a week ago. Belgas and Swiss francs moved with the dollar, their respective rates dropping from bel. 27.82 to bel. 27.46, and from Frs. 20.85 to Frs. 20.46. One month's belgas were quoted at 1 cent. premium to par, and three months' at 1 to 3 cents discount. Guilders continued to be bid in connection with the repayment of the French credit, and the spot rate has come down from Fl. 8.65½ to Fl. 8.54. The market still finds difficulty in taking a view

on sterling, but the general impression in both London and Paris is that the decline is not yet at an end.

The Money Market

MONEY has been distinctly less plentiful this week, and, contrary to the usual experience, the shortage has been most noticeable in the case of loans from the clearing banks. It is true that outside lenders have been inclined to call every morning, but equally regularly they have been offering money every afternoon. Thus bond-money has been $\frac{1}{2}$ per cent. in the morning and $\frac{1}{4}$ per cent. in the afternoon.

	Nov. 25, 1937	Nov. 17, 1938	Nov. 24, 1938
Bank Rate	2	2	2
London Deposit Rate...	$\frac{1}{2}$	$\frac{1}{2}$	$\frac{1}{2}$
Short Loan Rates:

Others	$\frac{1}{2}$ - $\frac{3}{4}$	$\frac{1}{2}$ - $\frac{3}{4}$	$\frac{1}{2}$ - $\frac{3}{4}$
Discount Rates:			
Treasury bills	$\frac{9}{16}$ - $\frac{1}{2}$	$\frac{1}{2}$	$\frac{3}{4}$
Three months' bank bills	$\frac{5}{8}$	$\frac{9}{16}$	$\frac{3}{4}$

* Viz. $\frac{1}{2}$ per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity. $\frac{3}{4}$ per cent. for loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

The Bank Return

THIS week has witnessed a further slight contraction in the note circulation, which is now at its lowest level immediately prior to the Christmas expansion. So far the fiduciary note issue has remained unchanged, but as the circulation is now only four millions less than it was a year ago, it looks as if the fiduciary note issue can hardly remain unaltered.

In the banking department the increase in the Reserve has been duly neutralised by a reduction in Government securities.

THE ECONOMIST BY AIR

To meet the growing demand from overseas readers for *The Economist* by air, we are introducing special subscription rates applicable to those countries to which Letter Mail is now normally transmitted by air. These are as follows:—

	12 months	6 months
	£ s. d.	£ s. d.
Europe	4 17 6	2 8 9
Empire Air Routes	6 10 0	3 5 0

These rates include all supplements, but the latter will be sent by the surface routes and not by Letter Mail.

Unexpired subscriptions may be transferred to the new category on application to

THE PUBLISHER, THE ECONOMIST,

London Transport Fares.—Last Thursday's announcement by the Standing Joint Committee of the London Passenger Transport Board and the main line railways brought within the realm of official discussion a matter which has for several weeks been more than an open secret. The Joint Committee decided to recommend its members to take steps to secure an increase of certain fares in the London Transport area. It now lies with the respective undertakings to devise, in co-operation, a scheme for fare adjustments. The Board has the power to adjust railway fares in cases where they are below the statutory maxima, to fix bus fares as it deems fit, and to adjust anomalous and reduced-rate fares, subject to any statutory limits. It is probable that the Board, for its own part, will seek a solution of the net revenue problem by concentrating primarily on fare anomalies rather than by seeking any given basic increase in charges. The main line railways, for their part, will need the sanction of the Railway Rates Tribunal for any increase in fares above existing statutory limits. The retention of a given basic increase may be easier for the main line companies, since the average length of passenger journeys is longer, and fare adjustments are simpler to devise. For London Transport, on the other hand, the revision of charges and modifications of tickets is a lengthy and detailed process. To enable London Transport to earn the standard dividend of 5½ per cent. on the "C" stock, net pool receipts would have to increase by £620,000 to cover the margin between a 4 per cent. dividend and the standard rate, or by £990,000 if allowance is made for the exceptional income-tax credit of £230,000 last year. These two sums represent respectively 1.5 per cent. and 2.4 per cent. on the Pool's gross takings for the year to June last.

A "C" Stock Guarantee?—The expectation that fare adjustments would permit the payment of standard dividends on London Transport "C" stock at a future date has been linked during the past month with the assumption that, in such circumstances, steps to seek the appointment of a receiver for the undertaking (since it has failed in each of three consecutive years to pay standard dividends) might not be taken. In letters to the Press this week, however, Mr J. F. Heaton (chairman of the Tilling group, which itself controls the requisite 5 per cent. of the "C" stock on which to base a receivership application) has argued that the Board is in default, and must remain so until the interest deficit for the past

year is made good. Hence, it follows in his view that holders of the "C" stock have a "more or less perpetual right to apply for a receivership." And Mr Heaton also concedes that the payment of a 5½ per cent. dividend or a possible maximum of 6 per cent. may be represented as an excessive burden upon the travelling public. He therefore proposes as a "permanent solution" that "C" stockholders should waive their existing rights (except those affecting redemption) in return for a fixed interest rate of 4 per cent., guaranteed, together with redemption, by the Government. The proposal would mean a loss of potential income, compared with the standard dividend of £385,482, which would be available for the travelling public.

The wheel has indeed come full circle. The "C" stock began as an equity, was granted the highest powers of a debenture under statutorily defined conditions of default and now, it is suggested, should be elevated to a status even superior to that of the "A" and "B" stocks of the Board. For a stock which was founded upon the equity capitals of the constituent companies taken over by London Transport (and offered, at the time of its creation, reasonable prospects that standard revenues would be achieved), this would indeed be a translation to a new sphere. At present, on a strict definition of earnings, the Board is not covering, by a margin of nearly 1 per cent., the rate of dividend which Mr Heaton would wish to be guaranteed, even though fare adjustments may bring the stock into the standard dividend zone, say, two years hence. The market price of such a stock would also present some striking anomalies. Taking 4 per cent. Funding as a model, the translated "C" stock would stand at 109, compared with 79 at present. It is not the difference in these prices which constitutes a necessary objection to the suggestion, although it would be striking enough to the public eye. From the investment aspect, the fact that the new stock would provide a flat yield of, say, 3½ per cent. compared with 4½ per cent. for the 5 per cent. "A" stock and 4½ per cent. for the 5 per cent. "B" stock (with similar margins for redemption yields) is sufficient illustration of the anomalies which would be involved by the suggested revision of status. It may, indeed, be asked why the statutory rights already in the hands of the "C" stockholders should be extended in a way which has no reference to the conditions contemplated under the Act of 1933.

There has been a slight change-over from public to bankers' deposits, easily explained by discrepancies in Treasury bill maturities and securities. Apart from the fact that last year the seasonal increase of £20 millions in the fiduciary note issue had already been made, this year's return bears a strong resemblance to that of a year ago. In particular, the present high level of public deposits and low level of bankers' deposits was paralleled last year. It may, therefore, be as much due to Treasury preparations for next week's War Loan dividend payments as to more spectacular causes.

The Bullion Market

UNTIL Thursday, business in gold was limited. The fall in sterling was so rapid as to make arbitrageurs fear that there might be a sudden recovery immediately after they had bought their gold and before they could cover their exchange. During the first three days of the week, therefore, the demand was mainly of a general character and was met largely out of resales. On Thursday there was a big increase in the demand, which had to be met mainly by official sales. This demand, however, came mostly from the Continent, and there was very little direct arbitrage. On the other hand, much of the buying has been by big interests, who buy gold as an indirect means of acquiring or borrowing dollars. This is more satisfactory than buying dollars direct at a time when the exchange market is very sensitive. Wednesday's and Thursday's prices at the fixing were only 2d. short of the March 6, 1935, record.

* Above or below American shipping price. This week's calculations are based on a "temporary parity," in which the war risk rate is taken as 1s. 3d. per cent.

† At fixing.

The New York price of silver remained at 43 cents per ounce .999 fine during the week.

The fact that Bombay silver prices are below London parity has made arbitrage profitable through spot purchases in Bombay and forward sales in London. As a result an initial shipment of six lakhs is already being made from Bombay. This week has witnessed some American trade buying for cash, and the margin between cash and forward has widened to 1/4d. per ounce.

Sharepushing Bill Second Reading.—The unopposed second reading of the Prevention of Fraud (Investments) Bill on Monday testifies to the general desire, irrespective of political opinion, to stop the vicious exploitation of the ignorance, credulity, or even the greed, of the small investor. At the outset of the debate, the President of the Board of Trade gave an assurance that he would accept any suggestions designed to strengthen the Bill, to make it as effective as possible in dealing with the rogue, and as little hampering as possible in dealing with the honest man. On the subject of Clause 10 (formerly Clause 9), Mr Oliver Stanley had little to add, but the revisions in the second version were not at all to the taste of Mr Tom Johnston, whose work in fighting sharepushing is universally acknowledged. Yet it was surely ungenerous of Mr Johnston to ascribe the modifications of the original Clause 9 to the clamour of certain financial journalists who "write up or write down companies in the columns of the daily newspapers." Undoubtedly, it is true, as *The Economist* pointed out when the first draft of the Bill was published, that financial journals stood to be liable for any statements which they might "reasonably be expected to know" to be false or misleading. And it is also true that the new Clause, although it represents an improvement on the old, still leaves the respectable financial Press, like other institutions, with an unwelcome additional burden. For this reason, the Clause will be closely scrutinised in Committee. If, as Government spokesmen insisted on Monday, the sharepushing evil is of minor importance compared with legitimate dealings in securities, that reason is the more cogent for avoiding any restrictions on the freedom of the Press to give *bona fide* advice to the genuine investor, and to expose with vigour the activities of the share-pusher.

L.M.S. Preference Position.—At their meeting on Thursday the directors of the London Midland and Scottish Railway decided to defer the recommendation of a dividend on the 5 per cent. redeemable preference stock until February 8, 1939, when the audited accounts will be available. This stock, of course, ranks *pari passu* with the 4 per cent. preference stock—a consideration which, together with the serious fall in receipts in recent months, is responsible for the deferment. The decision itself suggests a fall in net receipts of at least £3,048,082—the margin by which the 5 per cent. dividend was covered last year. The net decrease during the first half-year amounted to £1,496,000, and there has since been a gross fall in traffic of £1,749,000 during the past twenty weeks. It was not, of course, to be expected that any substantial savings in direct operating costs would be achieved to offset the gross fall in traffic during this period. Indeed, on the basis of the estimate published in *The Economist* of November 12th, it is probable that earnings for the 5 per cent. redeemable stock are running at the rate of about 4½ per cent., with approximately 3½ per cent. for the 4 per cent. preference stock. And if our basis of estimation is fairly near the mark, there will be no dramatic change in these potential earnings during the remaining weeks of this year.

New Unit Trusts.—At the present rate of development the number of unit trusts will reach treble figures by no distant date. Two further trusts have been launched this week. Of these, Universal Second Unit Trust provides a new unit of flexible type, which is available both for the new investor and also in exchange for existing sub-units of Universal Fixed Trust, for holders who desire to "switch" up to December 17th next. The terms of the exchange are no less interesting than the character of the new trust. Until the final date, Universal Second Trust will, in effect, remain a fixed trust, with a panel of securities identical with those held by Universal Fixed Trust. In other words, exchange will be on a basis of complete equality. After that date, the managers will have power, subject to the Trustee's veto, to invest in the securities of 320 companies, as compared with the pre-

sent number of 73 securities held by the fixed trust. The initial service charge will be 4 per cent. In this respect also, original purchasers of Universal Fixed Trust will be treated equitably, since the trust was formed four years ago, with a twenty-year life, and a loading charge of 5 per cent. In addition, a management charge of 1½ per cent. will be levied each half-year, of which one-half will be set aside in a "Trust Renewal Fund" to provide for the extension of the new trust, at the end of its sixteen-year life, if necessary. In general, the method of "flexing" the Universal Fixed Trust is optional, simple, and equitable. It is for the investor himself to decide whether to pay the extra charge for its advantages.

The second introduction, Cumulative Investment Trust, formed by the Allied Investors' group, is of the "appropriation" type, covering a range of 50 companies initially, and a permitted range of 78 concerns in all. The Trust also adopts the principle of reserve fund accumulation, which has recently been advanced by at least one other formation. Five-sixths of the income received during each distribution period will be paid out to unit holders, and the remainder put to reserve fund. While this provision for automatic saving has a legitimate investment appeal, it is somewhat counter to the usual conception of the needs of the smaller type of unit trust investor who, to judge by the relative success of different types of advertising, is most easily wooed when the cash payment is highest. From the technical point of view, it is important to note that the reserve portion of the Trust's income will be treated as capital, and will thus be costed in the price of units.

Insurance Share Index.—The moderate recovery in insurance share prices which occurred during the second quarter, did not continue between June and September. In general, insurance share quotations were barely maintained, and *The Economist* index of insurance share values shows a slight fall from 4,312 to 4,307 (based on an investment in 1913 of £1,000 in the ordinary shares of 24 insurance companies). The index takes account of bonus share issues, by assuming the sale of rights and purchase of an additional holding. Details are given below:—

BRITISH - AMERICAN UNITS

A Unit Trust of 26 leading American and 26 British Ordinary Stocks

Particulars from Stockbrokers and Banks or The Managers,

36-37 KING STREET, E.C.2

Some fairly considerable movements in individual shares are evident. Thirteen of the twenty-four shares registered a fall, but the combined effect was offset by an improvement in General Accident and North British and Mercantile, and to a lesser extent in London and Lancashire and London Assurance. Six shares were unchanged during the quarter.

Company Notes

Electric and Musical Prospects.—The sharp fall in profits of Electric and Musical Industries for 1937-38 (discussed on page 333 of *The Economist* of November 12th) was not, in Mr Alfred Clark's view at the annual meeting, such as to cause any surprise to those who had closely followed events in the radio, household appliance, and bicycle industries. In the course of his address, he explained how, after the second or third month of the past

financial year, sales of radio sets began to fall off, and the fall in profits was intensified by price reductions, which were later employed in an attempt to stimulate sales. Radio sets are largely bought on the hire-purchase system, and in times of serious political uncertainty would-be purchasers hesitate to enter into long-term engagements. To a smaller extent, the same factors are present in the household appliance and cycle trades. The bicycle section had, however, returned a loss for 1937-38 owing partly to additional expense in starting up the new factory at Hayes, where some of the facilities will be used for handling armaments orders which have been received. Government orders have been placed for products manufactured during the last war, and also for electrical goods. Mr Clark suggested that the contribution of Government work to profits would be small, but that it would spread overheads. Television sets were sold in 1937-38 in far greater number than in the previous year (the first of television broadcasting). Few company chairmen are bold enough to look forward, even in the most tentative words, to the "year after next." But while Mr Clark admitted that trading in the early part of the current year had not been good, and while he stressed the fact that the armaments work would not be in full swing for some time, he saw no reason why former earning power should not be resumed in 1939-40.

* * *

Charterhouse Investment Trust.—The fall in gross profits of Charterhouse Investment Trust from £196,430 to £110,456 is of a severity suggested by the dividend cut, but it is not surprising for a year of poor industrial issue activity. Although the ordinary dividend is reduced from 10 per cent. to 3 per cent., and there is some saving in expenses and taxation, the distribution is covered by earnings of no more than 3.7 per cent. as compared with 15.7 per cent. in 1936-37. The surplus is thus sufficient to cover little more than the usual allocation of £3,227 to premises reserve, for most of the special reserve provision of £6,686 is offset by a draft on the carry-forward, now reduced to £30,032. With the diminution in new issue activity, however, increasing importance must be attached to the investment trust side of the business, and the report is chiefly interesting for the information it discloses on the assets position. Quoted investments stand in the balance sheet (dated November 11, 1938) at £1,047,533, the valuation of £972,360 thus showing a depreciation of 7.18 per cent., while the original book cost appears to be about £1,230,000. This is in itself a moderate depreciation, and assuming the unquoted securities (which have increased from £7,759 to £68,059) to be fully represented, the over-all depreciation of 6.7 per cent. on book value is only 1 per cent. higher than that recorded a year ago, taking into account the internal reserve of £186,000. In addition to this reserve, however, there is now a visible securities reserve of £80,000, formed by a transfer from general reserve, which remains at £120,000. Although there has been some revival in large issues of fixed-interest securities, the outlook for a resumption of the kind of industrial issue activity in which this company is most concerned is not at the moment encouraging. Dependence on investment income will therefore probably continue, though some confidence in the company's future is suggested by a yield of no more than £4 16s. on the £1 units, which stand at 12s. 6d.

* * *

United Steel Finance.—New financing of some importance, though it will not be effected through a public offer, is announced by the United Steel Companies. Something over £2,000,000 of cash is involved, and though its exact uses are not specified, it appears that the need to augment the company's resources arises from important negotiations which are now taking place. The Appleby Frodingham works, which were originally expected to be completed in the second half of 1938, are—according to later information given by Sir Walter Benton Jones at the annual meeting—not expected to be ready before January next in the case of the coke ovens and before June in the case of the blast-furnaces. While the new negotiations

(possibly for armaments work, since the larger part of the fresh capital consists of short-term notes) are the major factor, it is not impossible that some of the new money is wanted in connection with these extensions already in hand. Ordinary stockholders are to be offered 882,180 £1 ordinary shares at par, on the basis of one new share for £10 of stock held, and at the reduced price of 24s. 9d. per share this represents a small bonus of about 6d. In addition the company has placed, through Messrs Morgan, Grenfell and Company, £1,500,000 of 4½ per cent. 10-year notes. The new money thus represents an important addition to the £11,166,000 of share and loan capital already in existence. The notes were dealt in on Thursday on the basis 101½-102.

* * *

Wall Paper Manufacturers' Outlook.—In the preliminary profits announcement at the end of October, shareholders were informed that total earnings of Wall Paper Manufacturers for the year to August 31st had fallen from £765,963 to £646,760. The disappointment aroused by this 17 per cent. reduction in earnings is not mollified by the full report. In the second half of the period sales were affected by the international situation, while profit margins were also smaller on the average. This reduction, as Mr Alan Sugden explained at this week's meeting, was due to increased costs, which it was not practicable to offset by raising selling prices. Although a consolidated profit and loss account is provided, it adds but little to the information in the parent company's profit and loss account, and no particulars of expenses are available apart from debenture interest. After charging £48,217 interest and paying £71,991 on the 5 per cent. preference stock and the maximum 10 per cent. dividend on the ordinary stock, earnings for the deferred stock show a fall from £480,273 to £361,070—a movement which corresponds exactly with the reduction in total earnings. The 12½ per cent. dividend is thus covered by earnings of 17.4 per cent., against 24.3 per cent., and £79,208 is written off goodwill, patents, etc.—after which this item will account for £1,100,000, out of total assets of £8,075,000. A year ago goodwill was reduced by £100,000, and in addition £65,000 was provided for the temporary depreciation of securities. After taking this reserve into account, the market value of the investments shows a surplus of £59,000 above book values. The latest results are not encouraging, and while 12½ per cent. has been paid on the deferred shares in each of the past five years, they show a rather defensive yield of £7 4s. per cent. at the current price of 34s. 9d.

* * *

Prospect for "Kaffirs."—This week has provided two statements of importance for the gold-mining shareholder. In the first place, the valuation price for Rand output in November has been fixed (subject to confirmation) at 146s. 6d. per ounce, thus exceeding the previous record of 146s. set up in March, 1935. Secondly, Sir Robert N. Kotzé, at the Johannesburg Consolidated meeting held in Johannesburg, has provided an able review not merely of the position of the constituent companies in the group (which may be regarded as generally favourable), but also of the gold mining industry as a whole. Sir Robert did not seek to minimise the industry's burden which arises from indirect costs, such as taxation and railway charges—the latter particularly important for coal—nor was his stress upon the continued need to ensure adequate supplies of labour excessive. The industry has succeeded, however, in combating the rising tendency of costs through increased efficiency and mechanisation. During the period 1928-30, when the average number of natives employed totalled 192,000, the output in tons milled per annum per native employed amounted to 159. Last year the native labourers employed numbered 285,000, but output per head had increased to 178 tons. But for this increase in efficiency which these figures indicate, the output actually attained would have been 10 per cent. lower. Further mechanical advance is still possible, and Sir Robert suggested that even if in certain operations it was not cheaper than manual labour, mechanisation provided a valuable insurance against labour shortage.

Announcing:

UNIVERSAL Second Unit Trust Certificates

A NEW UNIT TRUST INVESTMENT
IDENTICAL IN INITIAL PORTFOLIO WITH THE WELL-KNOWN
UNIVERSAL FIXED TRUST, BUT WITH NON-RIGID OPERATION
AND A WIDE LIST OF "PERMITTED" SECURITIES.

Here are some of the more important features:—

PORTFOLIO: Until 17th December, 1938, the investments of the Trust will be identical with the 73 diversified securities which constitute the portfolio of the present Universal Fixed Trust, whose invested funds now exceed £4,500,000. Thereafter the portfolio may, subject to the limitations set out in the Trust Deed, be varied by selection of securities from a list of some 320 Companies and from Trustee Investments and such other Investments as may, subject to the Trust Deed, be added by the Managers.

LOW SERVICE CHARGE: The initial service charge is 4 per cent. of the purchase price of sub-units plus any sum that may be required to make the price of each sub-unit an exact multiple of three-halfpence. The only additional charge is a semi-annual service charge which will be raised out of the Unit each half-year and will be equal to one-eighth of one per cent. of an amount to be determined in accordance with the Trust Deed based on the Stock Exchange offered prices of the investments comprised in the Unit during each half-yearly distribution period and of any uninvested capital produce and cash of a capital nature. Half of this semi-annual service charge will accrue to the benefit of sub-unit holders.

LONG TRUST PERIOD: The Trust period is 16 years but sub-unit holders will have the option, subject to the agreement of the holders of a certain minimum of sub-units as defined in the Trust Deed, to renew the Trust for a further 16 years. Thus the effective period may be 32 years in all.

YIELD: On the basis of the actual distributions made during the year ended 1st September, 1938, to Universal Fixed Trust Certificate Holders on the securities constituting the initial portfolio and at a price of 17s. 9d. per sub-unit, the price of the Universal Fixed Trust sub-units on 22nd November, 1938, the gross annual yield from cash dividends only was:—

£5 15s. 3d. per cent.

It is pointed out that this yield is not a fixed yield and is stated only as an indication of the return obtained during the past year on the type of investments which will form the initial portfolio of the new Trust.

TRUSTEE: National Provincial Bank Limited.

CONVERSION OPTION
open to holders of
UNIVERSAL FIXED TRUST
Sub-units.

Holders of Universal Fixed Trust Certificates are offered the right until 17th December, 1938, to convert their sub-units into an equal number of sub-units in the new Trust. This option is extended for the benefit of those who may prefer a somewhat less rigid method of operation than that of a Fixed Trust.

Sub-units of the new Trust may be purchased in minimum amounts of 10 sub-units, subject to an initial purchase of not less than 20 sub-units, through any Stockbroker, Bank or direct from the Managers. The Booklet, including the full Trust Deed, on which all transactions are based, may be obtained from any branch of National Provincial Bank Limited or by writing direct to:

Paid-up Capital and Reserves exceed £100,000
Invested Trust Funds exceed £3,500,000

Dealings commenced on Wednesday, 23rd Nov. in a
New Unit Trust created by Trust Deed dated Nov.
15th 1938 between the Managers and

THE MIDLAND BANK EXECUTOR AND
TRUSTEE CO. LTD.

known as

THE CUMULATIVE INVESTMENT TRUST

The Trust Fund is based on the shares of 50 leading British Industrial companies (with a possible range of 78), and constitutes in itself an absolutely first-class investment in British "equity" stocks.

A permanent holder of well-selected "equity" shares may rely upon a gradual appreciation of the capital value of his investment as the years go by. No single investment fact is better attested statistically than this.

The investor in equities, moreover, can afford to supplement this passive growth in the value of his holdings over a period of years by a *positive act of saving*. At the present time the Trust Fund of Cumulative Investment Trust, containing only first-class securities, yields over £5 5s. per cent. gross. British Government Securities yield no more than £3 10s. per cent. per annum for permanent investment. The investor in equities can spend substantially more than that, and yet reserve a proportion for accumulation which will rapidly augment the total value of his holdings.

This is the principle on which the Cumulative Investment Trust is based. Out of anticipated earnings at current unit price of £5 5s. per cent. per annum, from cash dividends only, the Trustees will place one-sixth (or the equivalent of 17s. 6d. per cent. per annum) to reserve and will distribute approx. £4 7s. 6d. per cent. gross.

The booklet of the Trust, which can be obtained free on application, explains the plan fully and contains interesting tables showing how it would have operated over the last 25 years.

Consolidated Gold Fields.—The reduction in the earnings of New Consolidated Gold Fields is at first sight spectacular, for income shows a fall of £993,170 to £1,221,440 for the year to June 30th. During the preceding year, however, profits increased by no less than £908,160, of which part may have been due to the profitable realisation of certain holdings, while the provision for the Jubilee bonus of 12½ per cent. doubtless contributed to the display. A comparison of last year's results with those of either 1935-36 or the preceding year shows no very material change; and the Consolidated Gold Fields dividend rate of 20 per cent. is the same. The latest balance sheet of New Consolidated Gold Fields shows a further substantial expansion in investments which is doubtless attributable in the main to participations in the developing undertakings. The operating company has again provided £100,000 for depreciation. Reserve account, however, is credited with £200,000, which raises the fund to £2,000,000. Recent reports of New Consolidated and Consolidated Gold Fields are summarised below:—

	Years to June 30th		
	1936	1937	1938
<i>New Consolidated Gold Fields</i>

Ordinary dividend.....	544,740	886,982	533,597
Do. per cent.....	20	32½*	20
Carried forward.....	26,485	30,933	35,425

* Includes special jubilee dividend of 12½ per cent.

Reduced dividends received from some holdings (such as Gold Fields Rhodesian and Mill Close Mines) must have been partly offset by larger distributions from other interests, such as Bulolo, Gold Coast Selection Trust and Marlu. But market conditions, of course, were not favourable for reaping substantial investment profits. A satisfactory account is given of the progress of the West Witwatersrand group and of Lake George Mining Corporation, whose annual meeting was held recently. The 1937-38 reports of the various producing undertakings in the gold-fields group have been reviewed in these columns as issued. On the basis of a 20 per cent. distribution, Gold Fields shares at current quotation of 70s. *ex* dividend offer a return of approximately 5½ per cent.

Burma Corporation Report.—The trading results of Burma Corporation for the year to June 30th are in sharp contrast to those of 1936-37. In the latest year the average London price per ton for lead fell by £5 12s. 8d. to £17 10s.; of zinc by £3 7s. to £16 15s.; and of electrolytic copper by £6 10s. 8d. to £48 18s. In view of the steady fall in base metal prices, it is not surprising that the first quarter of 1937-38 contributed 40 per cent. of the year's net profits, and the final quarter only 18 per cent. In addition, while the output of refined lead increased, production of zinc fell sharply owing to the lower content of the ore. Taxation was substantially reduced in consequence of the fall in working profits from £1,715,340 to £963,220, but net profits, at £656,950, did not greatly exceed half the amount of £1,236,790 secured in 1936-37; and the record dividend for that year has been almost halved, to a rate equivalent to 6.9 per cent. free of Indian and British tax. Features from the reports of the past three years are set out in the next column.

Development work is held to establish the fact that No. 11 level represents the bottom of the Meingtha Lode. Nevertheless, despite the extraction of 472,800 tons, the ore reserves at 3,764,650 tons show a decrease of less than 100,000 tons on the year. Exploration on several of the intermediate levels has indicated the existence of considerable quantities of commercial ore. The average values disclosed by the latest estimate show a slight reduction compared with a year ago. On the basis of last year's output, the quantity represents about eight years' supply. Any improvement in metal prices would tend to increase this life, and current quotations show improvement over those of last June. On the basis of last year's dividend, the shares at 9s. 4½d. give a yield of fully 9½ per cent. free of both British and Indian income tax.

Trepca Mines Report.—This mixed-metal producer suffered from last year's fall in prices, but in a somewhat greater degree than Burma Corporation, since it derived less advantage from the comparative steadiness of silver prices. Operating profit for 1937-38 thus fell to £343,280, compared with £943,940 for the year to September, 1937. General reserve receives only £25,000, against £125,000; but amalgamation and other expenses absorbed approximately £21,000. Depreciation, at £52,700, required slightly more, but taxation absorbed £88,440, against £266,680. The total dividend of 6d. per share, tax free, compares with 1s. 6d. for the previous year. The company's position has now been changed by the merger with the Kopaonik, Zletovo and Novo Brdo subsidiaries and by the share issue to finance the two smelting concerns formed under agreement with the Government of Yugoslavia. The Lead Smelter (Zvecan) has an initial capital equivalent to £286,000 and the Zinc Smelter (Sabac) a capital of £143,000. The former should be in operation by October, 1939, with an initial capacity of 12,000 tons; while the zinc smelter, due for completion in July, 1940, will handle 10,000 tons annually. In connection with the merger of the subsidiaries, 991,270 shares were allotted, and the financing of the smelting concerns entailed an issue of 1,683,790 5s. shares at par, raising the issued capital to £1,789,030. On September 30th, cash and government securities stood at £1,076,060. Ore reserves at the Stantrg mine increased last year by 300,000 tons to 4,100,000 tons, lead and silver values being slightly lower, and zinc values slightly higher. In addition, reserves at Vojetin (formerly Kopaonik) are estimated at 750,000 tons, averaging 9 per cent. lead, 6.5 per cent. zinc and 3.7 ozs. silver per ton, and at Dobrovo (Zletovo), 948,000 tons averaging 11.5 per cent. lead, 1.7 per cent. zinc and 3.5 ozs. silver per ton. Earnings last quarter showed a slight improvement upon those of the preceding quarter, the operating profit amounting to £61,980 as against £60,890.

The Week's Company Profits.—Some 35 companies (excluding five for which comparable figures are not available) swell our profits figures this week. These show net profits of £1,817,000 against £2,029,000 in the preceding year—a decline of 10½ per cent. The cumulative profits total for 2,167 companies this year is £272,558,000 as

compared with £250,996,000. Thus profits continue in the aggregate to run well above those for the previous year, but at a slowly diminishing rate, which by now has fallen to 8½ per cent. We discuss the week's results in preceding Notes, and on page 443 under the heading "Shorter Comments," while the profit and loss accounts are analysed on page 464.

Company Meetings of the Week.—In this issue reports of company meetings will be found from page 453. The part to be played by *Hawker Siddeley Aircraft Company* in the air programme is referred to in a leading article on page 429. The chairman's survey at the *English, Scottish and Australian Bank* meeting is referred to in a Note on page 435, and Mr Alfred Clark's review of *Electric and Musical Industries* developments is discussed on page 438. Shareholders of *Prices Tailors, Ltd.*, were informed by Sir Henry Price at the annual meeting that the number of depôts showed a net increase of 27 to 340. The chairman's speech at the *Wall Paper Manufacturers'* meeting is discussed in a Note on page 439. At the *North British Rayon* meeting, Mr Ernest Walls disclosed that

THE STOCK EXCHANGES

London

SETTLING DAYS

TICKET	ACCOUNT
DECEMBER 6	DECEMBER 8

THE volume of business and the general tone of the "House" remains sub-normal and dull. With the solitary exception of home rails, no group has given any decided leadership, and the special circumstances in this exceptional case need no emphasis. There was less discussion of immediate political factors, but investors with money to place were not eager buyers. It has, in fact, been the most apathetic week since Munich.

The *gilt-edged market* remains affected by the uncertain fiscal outlook, and would welcome some indication of the Government's intended division of the re-armament burden between taxation and borrowing. Dated stocks mainly suffered from small selling, which produced falls of about ¼ on Tuesday and Wednesday. The undated list remained steady, and War Loan even registered a slight improvement in mid-week, although it was not maintained. Further falls were recorded in New Zealand stocks.

In the *bond market* the continued fall in sterling assisted the Boxer loan, but Far Eastern issues were otherwise dull. European bonds were generally flat, and the South American list showed further falls.

The gloomy opening in the *home railway stocks* gave little promise of what was in store. At first prior charges were again sold, falls ranging up to 2 points. On the announcement of the discussion between the Minister of Transport and the companies, the bears sought cover on Tuesday, and the total traffic loss of £288,000, which in any other week would have plunged the market into dejection, was forgotten in consideration of the dramatic claims of the railways for freedom to fix charges unlimited by statute. Preference and guaranteed stocks were prominent in Wednesday's recovery, with gains ranging up to 3 points, but the further advance on Thursday morning was less decisive than some quarters had expected.

Official news on Monday that *Argentine rails* would be exempt from the recent exchange decree was followed by big rises of up to 3 points in the marginal preference stocks, but the benefit of the concession was soon spent, and the market relapsed into idle conditions.

This week the listlessness in the *industrial section* has been almost unrelieved. Prices on the whole drifted a little lower. Though changes were unimportant, iron and steel share quotations reacted, with the exception of Thornycroft, and United Steel fell on the new financing proposals, the notes opening at 101½-102. Coal shares were featureless, most changes being downwards. Though uninteresting, engineering issues behaved a little better than other groups, and some small gains were actually recorded. The motor section was irregular, a firm tone in the makers of the "heavies" early in the week not being maintained. Among aircraft issues, Bristol were weaker on the bonus proposals, and most prices gave way towards mid-week. Some independence was displayed by textiles, which again progressed on the Anglo-American trade agreement, and reacted only slightly on profit-taking. An easier tendency was evident among rayon shares. Carreras hardened on dividend expectations, but otherwise tobacco shares reacted. Ind Coope gained on the distribution and bonus, but after a firm

start brewery shares gave way. Provision and catering issues were irregular, and the stores group followed the general trend. The miscellaneous section was undecided and dull. United Molasses rose on dividend hopes and then reacted. There was more inquiry than usual for textile machinery companies on reports of aircraft developments. Shipping shares remained dull.

The *oil share* market was again idle, both investors and professionals holding aloof. The undertone, however, was satisfactory. Rubber shares were again inactive, but a tendency towards reactionary prices early in the week was arrested later on the improvement in the commodity. Tea shares were easier.

The *mining market* was no less dull than other sections, though price changes were unimportant. Among Kaffirs, the dividend-payers were firm, helped by Paris support. In contrast, the developing mines turned weak on Cape selling following the rumours (later denied) that Palmietkuil were suspending development work. Activity in Western Reefs revived in mid-week, but movements were irregular. Rhodesian copper shares drifted downwards at the opening. There was some recovery on the reimposition of restriction, but the best prices were not held. Tin shares were indifferent to the decision to leave the quota unchanged, and lead-zinc shares remained idle.

INVESTORS' INCOME & RESERVE TRUST

The new unit trust with the unique reserve plan

Against a common portfolio of no less than 175 first-class preference and ordinary shares, two types of sub-units are presented, on one of which 2/5ths of the income arising is held to reserve. You apportionate your investment to suit your needs and you can change from one type of sub-unit to the other.

Sub-units may be purchased at approximately 21/3d. and sums from approximately £50 can be invested.

Apply for the booklet C95, obtainable free from your stockbroker or bank manager (whom you should consult) or direct from Security Trust Managers Ltd., 15 Moorgate, London, E.C.2.

ACTUARIES' INVESTMENT INDEX

The stationary conditions of the past few weeks have continued, and on Tuesday, November 22, the Actuaries' index of 151 industrial ordinary share prices stood unchanged (compared with a week ago) at 63.8. A month ago the index was also practically the same, at 63.7. The average yield was 5.87 per cent., against 5.83 and 5.85 per cent., a week and a month ago respectively. A selection of the component indices follows:—

Group (and No. of Securities)	Prices (Dec. 31, 1928 = 100)			Price 1938 High

New York

WALL STREET has fallen back into lighter trading and unimpressive price movements. The post election boom had already evaporated only four days after it reached its peak, and this week has merely continued the unimpressive story since November 16. The decline in steel activity (according to *Iron Age*, from 62½ to 61½ per cent. of capacity) was generally expected, and formed no new factor in the market's action. The weakness of sterling caused some restraint, and Thursday's Thanksgiving Holiday prevented any general market movement. Sounding of warning notes regarding the lofty position of aircraft shares caused a general profit-taking movement in the group, which swamped the mid-week firmness of the steel, rubber, chemical and copper groups—the latter being favourably affected by the reimposition of restriction. Rail stocks continued firm on good car-loading indications.

Owing to the closing of the New York Exchange for Thanksgiving Day, we are unable to publish the usual Standard Statistics index figures. Last week's figures are repeated below for reference (1926 = 100).

Capital Issues

Two large debenture issues were made on Thursday this week. *London Power Company* 3½ per cent. debenture stock, 1952-72, at 98½ must be regarded as a first-class security of its type, for its service is, in effect, guaranteed by the London supply companies who take power in bulk from London Power. An eight-year debenture is something of a rarity in the industrial market, but the special reasons for the decision of the *Hawker Siddeley Aircraft* directors to use this medium for short-term finance are well known. The debenture offers a small premium on redemption, and should receive due support, particularly from the institutional investor. It is understood that redemption of the stock will be effected by the release of working capital from production in the new aircraft factories which are to be operated by the company, and that no amortisation charges against profits will arise. Statements for information have been published on behalf of *Doulton and Company* and *Brooke Tool Manufacturing*—a Birmingham concern with a rapidly expanding profits record.

PUBLIC OFFERS

London Power Co.—Issue of £1,000,000 3½ per cent. redeemable debenture stock 1952-72 at 98½. Ranks *pari passu* with existing stocks. Redeemable at par July, 1972, or from 1952 on notice. Stations' output, B.O.T. units: 1936, 2,161,743,639; 1937, 2,313,727,560. Installed capacity, k.w. 840,000; capital expenditure, £2

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

Industry and Trade

Our Changing Industries.—The annual exchange of unemployment books, which takes place at the beginning of July, provides accurate information of changes in the geographical and industrial distribution of insured persons. The results of last July's census of insured persons are analysed in the November issue of the *Ministry of Labour Gazette*. The number of insured persons aged 16 to 64 in the United Kingdom increased by 158,730 or 1.1 per cent. between July, 1937, and July, 1938. There was an increase in all administrative divisions. The highest increase was recorded in the South Western division, where the number of insured persons last July was 2.3 per cent. larger than a year earlier. But in contrast to the rapid growth in preceding years, the increase in London was only 1.1 per cent. The heavy influx of labour to London, therefore, has been arrested. So far as individual branches of activity are concerned, the increase in insured persons was most marked in explosives (+33.7 per cent.), constructional engineering (+15.9 per cent.), railway carriage and wagons (+15.3 per cent.), public works contracting (+11.6 per cent.), and motor vehicles, cycles, and aircraft (+9.9 per cent.). The majority of the expanding industries are those which have benefited from re-armament orders. The principal industries showing a decline in the number of insured persons are the cotton and wool textile, coal mining and railway industries. These statistics, however, relate to the total number of insured persons, and make no allowance for changes in unemployment. The analysis of changes in the number of insured persons actually employed, to be published in the December issue of the *Ministry of Labour Gazette*, will therefore throw further light on Britain's industrial changes during the past year.

* * *

Increase in Coal Output Quota.—The domestic demand for coal has shown an increase in recent weeks—a reflection of the improvement in industrial activity, especially in the iron and steel industry. In the second and third quarters of this year both domestic consumption and exports were substantially lower than in the corresponding quarters a year ago, and the quotas fixed for these quarters by the Central Council exceeded sales. The inland quota for the current quarter was originally fixed at 88 per cent. of the allocation made for October-December, 1937; this represented a cut from 46.7 million tons to 41.1 millions. Under the present system of output regulation the initial allocations are subject to modification if the Central Council can be satisfied of its justification. In view of the recent improvement in home consumption, the Central Council of Coal Owners decided last week to increase the inland quotas of all coal fields for the current quarter by 10 per cent. The export supply allocation, however, was left unchanged. As a result, the output quota for October-December has been increased from 56.5 million tons to just over 61 million tons. The pressure on the home market of excess production in the exporting districts was somewhat relieved in October, when exports were higher than in any other month this year. If the improvement in foreign trade continues, the export supply quota may also have to be increased.

Tin in Short Supply.—At its meeting on Tuesday the International Tin Committee decided to maintain the export quota for the first quarter of 1939 at its present level of 35 per cent. for the free market, plus 10 per cent. for the buffer pool. This decision seems to suggest that the I.T.C. is aiming at still higher prices, although the present level of nearly £215 per ton compares very favourably with the low price of £153 5s. per ton early in May, 1938. The maintenance of the 35 per cent. quota will keep the supplies of tin very low in the first few months of 1939. It allows exports from the seven restricting countries at an annual rate of 77,388 tons, to which about 25,000 tons must be added as the supply of non-restricting countries. According to the International Tin Research and Development Council, the world's apparent tin consumption reached 115,300 tons in the first nine months of 1938, which is equivalent to a yearly total of about 153,600 tons. In the first three months of next year, consumption will reach a seasonal maximum; as a fall in demand is unlikely, the free market will be short of supplies. The maintenance of the quota for the buffer pool means an increase in reserves from 10,000 to 15,000 tons. A pool of this size is certainly an important factor on the supply side of the market, although it is most unlikely that it will start to sell below £230 per ton. The continuation of the present low quota, therefore, indicates that the tin market is likely to return to those artificial conditions which prevailed between 1933 and 1935.

* * *

Revival of Copper Restriction.—The situation on the copper market is the reverse of that on the tin market. Since the reopening last month of a number of mines in the United States, and the lifting of copper restriction in the rest of the world on October 15th, the output of copper has been rising rapidly. The world's mining output reached 185,077 short tons in October, an increase of no less than 37,621 short tons on the month. Both in and outside the United States production last month was the highest for exactly one year. Under the influence of these developments, the standard cash quotation of copper in London fell on Tuesday afternoon to £43 15s. per ton, a reduction of £5 per ton from the recent high level. The co-operating producers, however, have taken swift action to stem the decline. On Wednesday it was officially announced that output restriction will be reimposed on January 1st, with a quota of 110 per cent. of the standard tonnages. The size of the standard tonnages has never been published, but it is believed to be 750,000 short tons. Hence, the output of the restricting producers under the new quota should be at an annual rate of 825,000 tons, a level only slightly, if at all, below last month's output. Nevertheless, the decision to reimpose restriction is of decisive influence, since it indicates that the co-operating producers are trying to keep prices as nearly as possible to £45 per ton. Should the high quota fail to have the desired effect—the first reaction to its announcement was very favourable—it may be reduced before long.

* * *

Mechanical Beet Lifting.—The cultivation of sugar beet, like that of other root crops, employs more labour than almost any other form of arable farming. The rise in agricultural wages since the war and the actual shortage of agricultural labour in some districts during the last few years have been one reason for the steady decline in the area under roots and for the growing interest in the use of machinery in the cultivation of beet. The use of tractors is now general in the beet-growing areas, and every effort has been made to reduce as far as possible the labour required in singling and hoeing the young plants. But the peak of labour requirements comes in the beet-lifting

season, which lasts from the end of October to the early days of January, and has been met by the employment of special gangs, organised and paid by their own contractors. In the last ten years, much attention has been given, both here and abroad, to the problems of mechanical lifting, but it has been found extremely difficult to design a machine which will lift from ground of varying degrees of hardness sugar beet of varying sizes, clean them of earth and "top" them—separate the beet from its leaves, which provide, after treatment, a valuable source of cattle fodder. During the present season, however, an improved lifting machine has been working, which seems to have met with considerable success. It is possible, therefore, that the next few years may see a further stage in the application of machinery to the arable farm and a further reduction in the demand for seasonal labour. As the cost of this very complicated machine is likely to be large, and its use is limited to a few weeks in the year, sales must necessarily be limited to the larger growers of beet; a certain number of such machines could find employment by being let on hire to the numerous small growers in the sugar beet districts.

* * *

Recovery in Hide Prices.—From July, 1937, until June, 1938, the price of hides, and of the immediate derivatives, pelts and leather, fell continuously. The international market, supplied mainly from South America and South Africa, was affected by a cessation of American buying, and the consequent fall in prices was later accentuated by the decline in business activity in the United States and Great Britain. The boot and shoe industry normally absorbs some two-thirds of the total supply of leather in this country; between June, 1937, and June, 1938, unemployment in this trade increased from 9.0 per cent. to 17.7 per cent. of the total number of persons insured. During the last few months, however, prices both in the international and in the English market have been fairly stable. The table here given shows the index of pelt prices compiled by the United Tanners' Federation, which is corrected for seasonal variations, and the separate indices for the two most important of its seven components:—

PELT PRICE INDEX
(Monthly average, 1923 = 100)

		Pelts from		Pelt
		English Hides all classes	South American wet-salted hides	Price Index
Average	1929.....	105	107	106
"	1932.....	52	55	56
"	1934.....	60	63	66
"	1936.....	74	80	79
"	1937.....	92	98	99
July	1937.....	98	107	105
October	1937.....	87	88	92
January	1938.....	70	70	76
April	1938.....	64	70	69
July	1938.....	57	69	65
October	1938.....	69	86	74

The international crisis at the end of September led to a certain amount of precautionary buying by merchants, but the better conditions in the boot and shoe trade, which have already induced an improved demand for "upper" leather, indicate that industrial demand is likely to expand in the immediate future. The rise in prices in October, therefore, is regarded as a hopeful sign, not only for the leather trade, but also for farmers in many countries, since the price they receive for their livestock is appreciably influenced by the value of the hide.

* * *

East African Sisal Co-operation.—Early this week it was learned that the East African sisal producers, mostly plantation companies of a considerable size, have formed an association to improve their position. As far as can be ascertained, no definite plan has yet been drawn up for immediate action, but there is no doubt that steps will soon be taken to improve the price of the product.

The price of East African No. 1 is now £16 15s. per ton, compared with £20 5s. per ton at the end of last year, £43 per ton in 1926, and an average of £29 per ton in the five immediate pre-war years. Sisal is used chiefly as binder twine for grain crops and in ropes, cordage, bags and mats, and the demand for it is on the increase. An exceptionally good market might have been expected in the current year, with a world wheat crop of record size, but the expansion in production has exceeded any likely increase in consumption. The output of the four largest producing countries—Mexico, Kenya, Tanganyika and the Dutch East Indies—is now in excess of 350,000 tons per annum, compared with less than 215,000 tons ten years ago. Sisal is now the most important commodity in Tanganyika's export trade and the second largest item in that of Kenya, where coffee holds the first place. The conclusion of an agreement between the East African producers is therefore of considerable importance to these two territories, though the control which the association can exercise over prices is limited.

* * *

Declining Cocoa Consumption.—The publications of the Imperial Economic Committee have won a high reputation for their comprehensive and accurate information. Its latest volume—"Plantation Crops"—maintains the high standard set up by its predecessors. Statistics of production, exports, consumption and prices are here collected for seven commodities, sugar, tea, coffee, cocoa, spices, tobacco and rubber. A few of these commodities are still plantation crops in the old sense of the phrase, but the cultivation of most of them is no longer limited to large estates; in some cases, notably cocoa in West Africa and rubber in the East Indies, the produce of small holdings farmed by native growers is now an

important factor in the trade. The statistics given for cocoa confirm the statements made by the Gold Coast Commission that the fall in the price of cocoa during 1937 was caused by a check to the steady increase in consumption which had taken place since the war. Apparent consumption in the United States is estimated to have fallen from 298,000 tons in 1936 to 229,000 tons in 1937; in the United Kingdom consumption fell from about 102,000 tons to 94,000 tons. World exports of cocoa, derived mainly from the Gold Coast, Nigeria and Brazil, fell from 712,000 tons in 1936 to 645,000 tons in 1937, largely owing to the hold-up of supplies in the Gold Coast, which resulted in an abnormally large proportion of the 1937 crop being marketed in the summer of 1938. The existence of these large stocks prevented the shortage of immediate supplies from exerting a favourable effect on prices, which declined continuously until June of this year. By that time the bulk of the Gold Coast supplies had been marketed and the price of Accra cocoa recovered to close the 1937-38 cocoa season on September 30th at 25s. per cwt. Since then demand has continued dull, and with the prospect of a large crop in the Gold Coast and Nigeria, prices have again declined to nearly 22s. per cwt.

* * *

British Tobacco Imports.—Imports of unmanufactured tobacco into this country have shown a steady upward trend during the last decade, with only a very slight break during the years of the depression, and again in 1937. For that year, however, as the table shows, the reduction in re-exports more than compensated for the decline in imports. During the first six months of the current year, imports were almost double those in the corresponding period of 1937, and though the excess was considerably smaller in the third quarter of the year, imports were still larger than in 1937. The increase in gross imports during the first nine months of 1938 of about

BRITISH IMPORTS OF UNMANUFACTURED TOBACCO
(Million lbs.)

	1929	1935	1936	1937	January-Sept. 1937	1938
Imports	240.0	251.6	270.9	268.9	139.4	210.6
Re-exports	9.4	11.3	6.1	11.7	4.1	6.9
Net imports	230.6	240.4	259.2	262.6	135.3	203.8

70 million lbs. was supplied mainly by the United States, but Empire countries, principally India, sent 23 million lbs. more in 1938 than in 1937. According to the figures published by the Imperial Economic Committee in *Tobacco Intelligence*, stocks of unmanufactured tobacco in bonded warehouses have been consistently higher than in 1937, but withdrawals from bond, which reflect more accurately than the level of imports the rate of consumption, were 3 per cent. larger in the first nine months of 1938 than in the corresponding months of 1937. There is evidence, however, that this rate of increase is tending to slow down, and it is not likely that the statistics for the completed year will show as large an increase in consumption as that which took place in the past two years.

INDUSTRIAL REPORTS

The improvement in the domestic demand for coal has been maintained; the Central Council has therefore decided to increase the inland supply quota for the last quarter of the year by 10 per cent. Business in iron and steel is being held up by the uncertainty concerning prices after the end of this year. Meanwhile, the position of the industry is much healthier as a result of the liquidation of surplus stocks. Business in cotton goods has been patchy, but improvement in the activity of the

cotton and wool textile trades has been maintained. The general trade outlook, as well as the position of individual industries, is discussed in the *Trade Supplement* accompanying this week's *Economist*.

Coal

Sheffield.—There is a distinct improvement in the demand for industrial coal, large screened being chiefly in request. Heavy deliveries are being made

Downward Turn in Prices.—The past fortnight has witnessed a set-back in both British and American wholesale prices. In England, both the complete *Economist* index number and the primary products index number have fallen by 0.4 per cent., and they are now at their lowest point for the year. In the United States, the complete Irving Fisher index number is fractionally lower, while *The Economist* primary products index number has decreased by 0.9 per cent. The Irving Fisher index number is still just above its low point for the year, while the primary products figure still has a fair margin in hand.

Wheat and maize prices were steadier during the past fortnight, but there was a further fall in bacon. Butter was higher in price, but there were declines in tea and cocoa. Cotton and flax were firmer and wool unchanged, but hemp and jute were cheaper. Tin was dearer, but copper and spelter cheaper. In the miscellaneous group, rubber reacted while linseed oil advanced in price.

scheme for co-ordinating district prices comes into operation. All supplies are ample, except of cobbles and trebles. Bunkers continue very quiet.

*

Newcastle-on-Tyne.—Apart from the usual foreign inquiries, the North-East coal market is featureless. The Norwegian State Railways are in the market for 85,000 tons of steam coals and it is expected that this district will obtain a good share of the order. Northumberland steam collieries continue to work regularly; the market in screened steam coal is firm, but it is difficult to clear smalls. The market in Durham manufacturing coal is steady, but gas coals are easy owing to the mild weather.

*

Workington.—More wintry conditions have brought a quickening in the coal trade. Supplies of house coal are promptly absorbed. The Irish trade is steady; the weekly shipments from Workington, the only port in use while repairs are being carried out at Whitehaven and Maryport, average nearly 10,000 tons. Industrial fuel is a poor trade because of the short-time employment of the coking plants which supply the furnaces on hematite pig iron.

*

Cardiff.—Under last week's decision of the Central Council to increase the original allocation for inland supply during the December quarter by 10 per cent., the South Wales coalfield received a supplementary inland quota of 376,609 tons and an additional output quota of 420,016 tons. But although the local volume of trade is better than a few months ago, it is doubtful if business will expand sufficiently to absorb these larger quotas.

Shipments in the foreign and coast-wise trades last week totalled 350,100 tons, compared with 368,900 tons in the previous week and 422,958 tons in the corresponding week last year. Exports to Italy continue moderately active, but to France they are down heavily compared with last year under the import restrictions, and German competition in the Mediterranean market is becoming more active. Best large steam and sized coals, as well as duffs among smalls, are well placed, but for other classes there are still large stocks. Prices are nominally unchanged.

Iron and Steel

London.—Some irregularity has developed in the iron and steel markets, but most branches of the industry are moderately busy, says the official report of the London Iron and Steel Exchange. There seems to be a general expectation that the volume of business will expand in the New Year. Most consumers persist in their attitude of buying limited quantities for near delivery only, until the prices which will rule after December 31st are known.

It is understood that pig iron consumers have allowed their stocks to fall to low levels in anticipation of a reduction in quotations, and it is suggested that when the new rates are made known there will be a considerable expansion in the demand. Most of

the business now passing in this department is limited to small supplementary tonnages for delivery over the next few weeks.

Business in the semi-finished steel branch of the industry is increasing as the stocks in consumers' hands decline. The production of this class of steel appears to be growing and larger quantities of British material are passing into consumption.

The home demand for finished steel is maintained at recent levels; but the producers are able to give early delivery and would welcome a more regular flow of orders. The export side of the market is rather more active than for some time, but most overseas buyers continue to pursue a cautious policy.

*

Sheffield.—The iron and steel market shows a slow but steady improvement; consumers are taking up slightly larger parcels for immediate delivery, indicating that stocks are falling. Not until an official intimation of next year's prices is made, however, is forward business likely to show expansion. Good parcels of foundry iron are being taken up, and forge is also beginning to show improvement. Basic pig is a good feature, and some readiness to enter into new business in hematites is noted. Business in finished iron continues dull, except in common and marked bars.

There is more interest in basic and acid steel billets, as well as in stainless steel sheets, wire rods and bright drawn steel.

Local industry is more active than at any time in the past two months, and some important orders are coming into this area from both home and overseas sources. The pressure of armament work is increasing, and the call for high class steels is bringing more furnaces into operation.

*

Middlesbrough.—Transactions in pig iron cover only prompt requirements; forward business is held up pending some official announcement regarding prices next year. Local foundries have consumed the bulk of the stocks of foreign iron and deliveries of foundry pig iron and hematite from local producers are steady.

Semi-finished steel is in rather better demand and more orders are being placed; the output of finished steel continues to increase. Specifications for heavy material are satisfactory, with one or two departments producing lighter steel rather better occupied. There is still room, however, for considerable improvement, and orders for shipbuilding material are desired.

Imports of foreign ore during the present month amounted to 63,270 tons, compared with 54,700 tons up to October 22nd. Blast furnace coke is in good supply with demand tending to expand.

*

Workington.—The North-West Coast hematite pig iron trade has undergone no change. It is not expected to improve until prices are revised, and it may be the turn of the year before demand expands. The present restricted make is adequate to satisfy needs, and as heavier deliveries to the motor and tinplate industries in Birmingham and South Wales, respectively, are offset by the smaller local consumption, stocks

are not being substantially reduced. Prices are at the fixed minimum.

There is hardly any demand for refined or malleable iron at £8 5s. per ton delivered at Birmingham, or for ferro-manganese at £18 15s. per ton home. A furnace at Workington on the last-named alloy has changed to hematite iron. Orders are few in the steel trade, while those on the books do not necessitate full-time working at the rolling mills at Workington and Barrow. Native ore, at 24s. 6d. per ton f.o.t., is in only fair local request.

*

Glasgow.—Conditions show little change. Steelmakers are moderately busy and bookings include practically every section. Orders for somewhat heavier tonnage of shipbuilding material have been placed than for some time past. Sheet makers in Glasgow are busy and a considerable proportion of the rolling and galvanising plant is steadily employed. Sheet metal workers in this district are also maintaining a high rate of output and many of them have sufficient work already on books to ensure regular employment for plant and men for some months to come.

*

Cardiff.—On the Swansea Metal Exchange on Tuesday business was quiet. As shipments from Swansea dropped to 2,085 tons last week, stocks in vans and warehouses were higher than at any other time since last July. Prices are steady at the basic figures of 21s. 6d. per box for regulated markets and 20s. 3d. per box for other destinations. Increasing anxiety is being shown over the repercussions of the Ebbw Vale works on the factories situated in West Wales. There is under consideration a scheme for the merging of five steel and tinplate plants at Llanelly, and of the installation of improved and more competitive processes of manufacture.

Textiles

Cotton (Manchester).—Spinners and manufacturers have been fairly busy dealing with inquiries, but sales have shown no expansion. Merchants have not been in the mood to anticipate future requirements. Speculative interest in raw cotton futures is dormant and prices again moved within narrow limits.

A miscellaneous business has been done in cloth, but no foreign outlet has been really active. A few more offers have been received for India, whilst there has been some improvement in demand for Egypt. Operations for South America have been irregular, but some useful sales have taken place for South Africa and Australia. Turnover for the home trade has been slightly better.

Spinners have had another poor week. Producers of American descriptions are in more urgent need of delivery instructions. In the Egyptian branch production is about 75 per cent. of capacity, but there is much difficulty in selling and clearing current output.

*

Wool (Bradford).—The opening of the final series of London Colonial wool sales for the current year has focussed interest on the Coleman Street

Wool Exchange. At the initial sales prices were well maintained, and the growing demand for the raw material can be taken as evidence of expanding consumption. The fact that merino and crossbred wool is now judged to be reasonably priced is helping to promote inquiry and stimulate the placing of new orders for fabrics. Competition on the part of both the home and Continental trade is keen, and this is likely to continue to the end of the series.

The West Riding of Yorkshire as well as other manufacturing centres received the news of the American trade Agreement last week-end with much satisfaction. While the reduction in the import duties is not great, it should help to promote a bigger trade between the two countries. It will certainly enable Yorkshire and Scottish manufacturers to export their specialities on a larger scale than for a good many years.

THE COMMODITY MARKETS

THE movement of the prices of primary products has shown no definite tendency during the past week, despite the further depreciation of the £ in terms of the dollar. The advance in wheat prices has been arrested, but that in raw sugar has continued. American raw cotton was also firmer, but rubber was marked down slightly in price. The International Tin Committee's decision not to increase the production quotas for the first quarter of next year and that of the co-operating copper producers to re-impose restriction at the beginning of next year, caused a sharp rise in the prices of the two metals. Lead was also marked up, but spelter was slightly cheaper.

In the United States the general price trend was slightly downwards. Moody's index of the prices of staple commodities (December 31, 1931=100) declined from 144.7 to 142.1 during the week ended last Wednesday. A month ago the index stood at 145.2 and a year ago at 145.0.

Metals

Copper.—After falling by £2 to £43 16s. 3d. per ton, the standard cash price of copper rallied sharply on Wednesday and closed at £44 18s. 9d. per ton, a net loss of only 17s. 6d. on the week. The earlier decline was due to the unfavourable effects of the Wall Street movements and the growing political tension in Europe, accentuated by fears that production might soon outpace consumption. In order to remove these fears the co-operating international copper producers decided on Wednesday to re-impose restriction with the beginning of the New Year. The quota is to be 110 per cent., i.e. 15 per cent. more than the operative quota immediately preceding the lifting of restriction on October 15th and at the same time the highest quota so far imposed under the present copper scheme. The swift re-imposition of restriction must be regarded as a sign that the co-operating producers are willing to keep the price of the metal at about £45 per ton.

Tins.—After falling sharply to £212 per ton, tin rallied rapidly on Wednesday and closed at £215 15s. per ton, a net gain of only 5s. on last week's close. The market was listless during the greater part of the period under review, but Tuesday's decision of the International Tin Committee to maintain the quotas for the first quarter of 1939 at their present low levels proved a great stimulus and led to a rush of buying orders. The effects and reasons for this decision are discussed in an Industrial Note on page 446.

Lead and Spelter.—Lead and spelter benefited from the movements of the other metal markets. The price of lead gained 7s. 6d. to close on Wednesday at £16 6s. 3d. per ton, while the price of spelter recovered to close at £14 2s. 6d., only 5s. down on the week. The daily rate of production of both metals remained very high in September, indicating that world production is still in excess of consumption. The British Metal Corporation's quarterly statistics showed the British spelter consumption in the September quarter at 44,000 tons, the same level as in the preceding quarter. On the other hand, Britain's lead consumption rose from 83,000 tons in the June quarter to 85,000 tons in the September quarter, but as no details of the consumption by individual industries have been given by the Corporation, it is difficult to trace the exact causes of the improvement.

Grains

DEMAND has been very slow for wheat, and prices have tended to sink to lower levels. The abolition as from January 1st of the import duty of 2s. per quarter on foreign wheat is not likely to have much effect on the wheat trade to this country; with a large world surplus, competition among suppliers has not been influenced by this relatively small duty. Its removal will, however, again permit the winter shipment of Canadian wheat from American ports, which, since the imposition of the duty, has been classified by the Customs as foreign wheat. There has been a moderate business in maize with a slightly rising price; exports from the Danube region are now increasing in volume. The steadiness of maize prices has given a firmer tone to the market for barley, where, however, there is little demand.

Other Foods

Provisions.—Bacon prices were further reduced at the end of last week, since when the market has been steadier. Dominion butters were again cheaper, but the price of Danish was higher on the week. There has been a fair trade in chilled meat, but demand for fresh has been slow.

Colonial Produce.—The market for raw sugar has been quiet but firm and prices for refined are unchanged. Accra cocoa has tended to fall in price, but demand at the tea auctions, after

a slow period at the end of last week, revived later and prices improved for all varieties.

Vegetables and Fruit.—Supplies of potatoes continue large in most districts, but prices are well maintained. Green vegetables have suffered from a poor demand and heavy supplies; only the best qualities have been cleared in London. There has been a moderate but steady trade in apples and pears.

Miscellaneous Commodities

Oils and Oilseeds.—The decision of the Argentine Government to fix minimum prices for linseed brought a firmer tone into the market, and Plate linseed is a little dearer than last week. A fair demand is reported from the Continent, but business in England is limited to the Indian crop. The price of linseed oil has again advanced in sympathy with that of linseed and is now about 25s. per ton higher than at the beginning of the month. The markets for other vegetable oils are steady without much fluctuation in prices. Trade in oilcakes has been below normal, owing to the long spell of warm weather.

Rubber.—The market was weak after the announcement of the decision of the Regulation Committee, and prices fell considerably below 8d. per lb. A firmer tone was apparent on Tuesday and the market closed on Wednesday at 8d. per lb. for standard smoked sheet on the spot, a decline of only 3d. per lb. on the week.

Furs.—During the current week the first silver fox sale of the new season was held in London, comprising only about 12,000 skins. There was a good demand both from home and Continental (chiefly Paris) sources and the greater part of the supply was sold. Prices showed a slight improvement of about 10 per cent. compared with the September sales, but were 10 per cent. lower than the prices paid at the opening sale of last season. In the free fur market a quiet and uninteresting tendency prevails at present and no change is expected until the New Year.

Milk.—The following table is compiled from statistics issued by the Milk Marketing Board:—

	Oct., 1937	Aug., 1938	Sept., 1938	Oct., 1938
Prices (per gall.)	d.	d.	d.	d.
Liquid	17	15	15	17
Av. manufacturing..	7.237	6.606	6.950	7.199
Av. pool	14.0	11.5	11.84	14.0
Contract sales (mill. galls.)				
Liquid	52.3	51.1	50.6	52.9
Manufacturing	15.3	32.1	24.2	20.6
Total contract	67.6	83.2	74.8	73.5
Used by farmhouse cheesemakers	2.1	3.3	2.8	2.2

Compared with October, 1937, total contract sales rose by 5.9 million gallons, of which only 600,000 gallons were absorbed by an expansion in liquid milk sales.

COMPANY MEETINGS

HAWKER SIDDELEY AIRCRAFT COMPANY, LIMITED

ENORMOUS ORDER BOOK

MR T. O. M. SOPWITH'S REVIEW

The third ordinary general meeting of the Hawker Siddeley Aircraft Company, Limited, was held, on the 21st instant, in London. Mr T. O. M. Sopwith, C.B.E., F.R.Ae.S., the chairman, in the course of his speech, said:—Ladies and Gentlemen,—You will notice that the accounts contain a consolidated statement of the assets and liabilities of the group. I do not think we should regard this as an established precedent, as under some circumstances publication might be contrary to the shareholders' interests.

The particular item in this consolidated statement to which I would direct your attention is stock and work in progress, which on July 31st last amounted to £6,397,875, which figure compares with that of £4,287,843 on the similar day last year, and the volume of work is, of course, now being increased from week to week and should continue to be so.

The accounts show that, after providing for the necessary reserves for depreciation, etc., we have brought in sufficient revenue from the operating accounts to provide the same dividend as last year and to increase our carry-forward by £45,400.

DIVIDEND AND BONUS

Dealing with the accounts in detail, you will see that the revenue for the year amounts to £821,953 13s. 6d., from which have been deducted income tax amounting to £219,491 2s. 9d., directors' fees amounting to £1,400, administration and other charges amounting to £6,869 10s. 11d., leaving a balance of £656,982 14s. 8d. available for payment of dividends on the preference and ordinary share capital. Out of this there has been paid or provided for dividends, less tax, on the 5 per cent. cumulative preference shares amounting to £57,236 3s. 7d., on the 5 per cent. redeemable cumulative preference shares £43,053 1s. 8d., and an interim dividend of 15 per cent. less tax, on the ordinary shares amounting to £158,295 2s. 10d., leaving a balance, including the amount brought forward, of £398,398 6s. 7d.

Out of this the directors recommend payment of a final dividend on the ordinary shares of 17½ per cent., together with a cash bonus of 10 per cent., both less tax, making, with the interim dividend already paid, a total dividend on the ordinary shares for the year to July 31st, 1938, of 32½ per cent., together with a cash bonus of 10 per cent., both less tax. This will absorb £290,207 15s. 2d., leaving a balance to be carried forward to next year of £108,190 11s. 5d., representing an increase of £45,400 over the previous year.

TRADING CONDITIONS

The year under review has in many respects been difficult for everybody. Although results are satisfactory, we have been called upon because of the political situation to concentrate to the utmost on the production of military aircraft, and this has been a contribution to the loss which has been sustained by one of our subsidiary companies in connection with a civil contract entered into with Imperial Airways prior to this company's existence. As this matter is still the subject of negotiation, it would be inadvisable to discuss it in detail.

The automobile section, in common with the motor trade generally, was affected by the prevalent depression, but the new models shown this year are, in our opinion, in advance of anything we have yet produced, and indications are that they will find an increasing market. We refer particularly to the new 16 h.p. and 20 h.p. types, which we are confident will become very popular both at home and abroad. We intend to develop a type embodying the benefit of the latest aeronautical research work, more of which may be said at a later date. The automobile market is admittedly subject to the effects of trade cycles, but I believe we have attained a standard which must be of value.

Our export trade, which we regard as of paramount importance, has been an appreciable asset, and, although liable to restriction dependent on the requirements of the Government, is a market which we shall continue to develop wherever possible. I am sure you will realise the great value to this country of a healthy overseas business.

The research departments have been extended, and we have made arrangements resulting in a friendly interchange of information with other organisations which have proved mutually beneficial.

GOVERNMENT TRIBUTE TO THE GROUP

During this financial year the Government decided to increase materially the strength of the Royal Air Force. All our operating

companies have grown, and are still growing, so as to do their share of providing the necessary equipment.

Without divulging any secrets, I would like to say that we are very proud of the way in which they have gone to work, and of the satisfactory proportion of aircraft which they have produced.

The Secretary of State for Air recently announced that orders have been given on behalf of the Government for the erection and equipment of two factories—one at Manchester and the other at Gloucester—at a cost of over two million pounds. These factories will be operated by two of your subsidiary companies, and this is the first occasion on which Government factories have been entrusted to the professional aircraft industry. It is a tribute, of which we may well be proud, to the proved productive ability of A. V. Roe and Company and the Gloster Aircraft Company that they have been selected to initiate and control these new organisations.

MEETING NATIONAL NEEDS

The programme for the immediate future is one of the utmost importance for the country. No stronger incentive than that indicated by the recent political crisis for the speeding up of our aircraft production programme need be advanced, and I feel that now is a suitable opportunity for me to express publicly your directors' conviction that an organisation, such as has been built up by your company, is not only at present rendering service of inestimable value to the country, but—as you will hear later—we are proposing to raise further capital so that, whatever the demands of the Government may be, private enterprise will be in a position to meet these demands in the most economical, speedy and efficient manner.

The essence of successful aircraft production is long-range planning based on a limited number of types, and to supply the numbers of aircraft required to-day will call for a greater and more sustained effort on the part of the industry.

In view, therefore, of the immediate and progressive expansion in the activities of the operating companies and the knowledge that this must continue, your directors have given very careful consideration to the question of finance. The order book is of very considerable magnitude. You will appreciate that to clarify "very considerable magnitude" is not permissible, but the phrase is accurate. The extra manufacturing capacity, plant and equipment are being provided by the Government, and your company will occupy these factories on a mutually agreed rental basis by arrangement with the Air Ministry.

ISSUE OF SHORT-TERM DEBENTURES

Your directors feel that it is imperative that the group should be adequately provided with funds to finance the actual work in progress, not only in the new factories but also the additional output in those existing. Your directors, having very carefully considered the matter and having consulted other authorities, are to-day asking you for permission to create £5,000,000 of short-term first debenture stock, of which, if sanctioned, it is proposed to issue £3,500,000 now and the balance as and when required. The advantages of this method lie in the fact that when the need for the finance is ended the debentures will be repaid and the company will not be left with capital which it no longer requires.

I must emphasise the fact that the money raised by these debentures will be used to finance the rapid and progressive increase in the company's aircraft business. No question of amortisation of the debentures arises, as they will be repaid when the contracts existing and envisaged have been completed and paid for.

COMPANY'S PROSPECTS

In view of the unsettled world political situation, it is difficult, and in any case probably unwise, to attempt to make any forecast as to the future. But it does seem reasonable to anticipate for this company a fair commercial return for the work and responsibility they are undertaking.

In conclusion, I am sure you will like me to convey to the officials and staff of the operating companies your thanks and appreciation of the work they have carried out during the past year.

The chairman concluded by moving the adoption of the report and accounts.

Mr Philip E. Hill seconded the resolution and it was carried unanimously.

The proposed dividends and cash bonus were approved; the retiring director, Mr Philip E. Hill, was re-elected; the auditors, Messrs Price, Waterhouse and Company, were re-appointed.

After discussion, a resolution extending the directors' borrowing powers was carried with only two dissentients.

At separate meetings of the holders of the 5 per cent. cumulative preference shares and of the holders of the 5 per cent. redeemable cumulative preference shares resolutions authorising the creation of £5,000,000 debenture stock were unanimously approved.

JOHANNESBURG CONSOLIDATED INVESTMENT COMPANY LIMITED

SUCCESSFUL YEAR'S OPERATIONS

SIR R. KOTZE ON LABOUR SUPPLY AND WORKING COSTS

The Johannesburg Consolidated Investment Company, Limited, announces the receipt from Johannesburg of the following summary of the chairman's speech at the annual meeting of shareholders held on the 22nd instant.

Sir Robert N. Kotze, who presided, said: The permanent chairman of the company has asked me to convey to you his hearty greetings and to express his regret that he is unable to be present to-day.

Notwithstanding the unsettled conditions prevailing during the year under review, the company had a successful year and maintained its strong financial position. The net profit for the year was £720,380 which, with balance of £168,753 brought forward, made a total of £889,133 available for distribution. £100,000 was transferred to reserve, which stands at the record figure of £3,050,000. A dividend of 3s. absorbed £592,500, leaving a balance of £196,633 to be carried forward.

Continuing, the chairman said: Expansion, which has been the main feature of the industry since the Union left the gold standard, continued during the year under review and more than 51,500,000 tons of ore were crushed. There was a further fall in the gold recovered per ton crushed and the yield fell to 4.414 dwts. for the first half of this calendar year. The working cost per ton crushed in terms of gold was 2.75 dwts. Working costs show a tendency to increase; the average cost per ton for 1935-36-37 was 18s. 10d. and for the first six months of this year 19s. 2d. The cost per ton crushed expressed in terms of gold is governed firstly by the sterling price of gold, over which the industry has no control and, secondly, by working costs in sterling.

The latter figure can be and is influenced by many factors; some of them which, like the sterling price of gold, are outside the control of the industry. The influence of indirect taxation is particularly unfortunate, and in this respect railway rates may be mentioned, as they are heavily weighted against the industry. One instance only need be quoted and that is the large profits made by the South African Railways from the coal traffic to the mines and power stations.

Organisation, under the group control system, which is the particular concern of the industry itself, continues to show further improvement, both in matters affecting the industry as a whole which are co-ordinated by the Transvaal Chamber of Mines, and in such organisation which is particularly the concern of mine managements.

A VITAL CONSIDERATION

It is fully realised that the trend of working costs is a vital consideration. The main reason for the present tendency for costs to rise is apparent. The prosperity of the industry made it possible to improve the remuneration of labour by means of extra leave, holiday and medical benefit allowances, savings fund and provident fund payments, which, in the aggregate, amount to 9d. per ton crushed. Recent Miners' Phthisis Amendment Acts added a further charge of over £200,000 per annum to the industry. These items represent an addition of approximately 5 per cent. to the working costs per ton.

A shortage of native labour seems to be inevitable in spite of great efforts of the native labour organisations, efforts which have met with deserved success, for during the first half of this calendar year the average number of natives employed was greater than in 1937 by over 14,000.

The mining industry can offset the effects of a labour shortage to some extent by improved organisation and methods, and efforts in this direction have not been relaxed; rather have they been intensified recently.

The effect of the better utilisation of labour is illustrated by the following figures: During the period 1928-30, the average number of natives employed on producing mines was approximately 192,000. Output in tons milled per annum per native employed was 159. In 1937, the average number of natives employed on producing mines was approximately 285,000, and the output in tons milled per annum per native was 178. The importance of this improvement can be gauged by the fact that had it not been brought about the number of natives required to produce the tons milled in 1937 would have been 319,000, an increase of 34,000 natives. It is certain that this number of natives was not available; in fact, every available native was employed by 1937. Therefore, had the output per native employed remained at 159 tons crushed, the total tonnage

crushed would have been less by more than five and a quarter million tons, equal to a reduction of 10 per cent. in the output, and the country would have had to be content with a proportionately smaller economic activity.

The maximum in the efficient usage of labour has not been reached, and further improvement will be obtained by more intensive mechanisation.

Mechanisation, which is now in an advanced stage, is expensive in first cost and in certain mining operations is not cheaper than manual labour. It is certain, however, that if the industry is not fully mechanised, it will be seriously affected in times of labour scarcity; the output will be below its capacity, and for that reason costs per ton will increase. Each mine has a duty to its neighbours in this respect, for if it operates wastefully it accentuates the general shortage.

It was emphasised at our last annual meeting that the employment of fewer natives on other work throughout the country would be the means of increasing the native labour supply to the mines. Expansion in secondary industries necessarily followed expansion in the gold mining industry, and their expansion requires more labour, but it is by no means a necessary corollary that Governmental schemes of expansion should be timed to synchronise with the expansion of industry. That they are so timed has the far-reaching effect that labour is diverted from the very industry whose expansion has permitted and encouraged such Governmental schemes.

RETURN TO THE STATE

It is generally appreciated that the foundation of the industry is native labour; that without labour of this class it could not exist. That this labour is well paid, fed, housed and cared for is acknowledged, but, perhaps, the value to the State of its employment by the gold-mining industry is not fully realised. The average number of natives employed by the industry in the year 1937 on producing mines was 285,000. The heavy income-tax of the mines produced £9,456,000, equal to £33.17 per native employed; Government share of profits from leases was estimated at £4,200,000, equal to £14.73 per native; in all, a direct revenue of £48 per native per year. The report of the Low Grade Ore Commission, which sat in 1930, stated that in the opinion of certain authorities the indirect revenue to the State amounted to 6s. 8d. per ton crushed, equal to £16,900,000 for the year 1937, or approximately £59 per native employed on producing mines. Direct and indirect revenue, therefore, amounts to approximately £107 per annum per native employed on producing mines, and in addition the country derives great benefit from the capital expenditure on new non-producing mines. These figures make it clear that the reaction should be fully appreciated by the Government before the native labour supply is unduly tapped for non-revenue producing schemes or for those industries producing less revenue.

GROUP MINING COMPANIES OF THE GROUP

A table is given in the directors' report summarising the principal details of the operations of the gold mining companies of the group for the year ended December 31, 1937, and the following are the aggregate results for the six months ended June 30, 1938: tons milled 6,156,000, yield (ozs.) 1,230,280, yield per ton (dwts.) 3.997, working costs £5,561,610, gross profit including sundry revenue £3,098,088.

The diamond trade was depressed during the year under review. It is well known that it is largely dependent on the business position in America, which was poor and uncertain. However, improvement is evident in the second half of the current calendar year, and sales are already substantially greater than in the first half.

COPPER

The annual reports of the three companies in which your company is interested all show a very satisfactory position. The Rhokana Corporation declared a final dividend of 3½ per cent., making a total of 62½ per cent. for the year ended June 30, 1938. Its total profit for the year amounted to £2,166,692, which included a dividend of £217,149 from the Mufulira Copper Mines. The Rhokana company spent considerable sums on development and equipment and is in a position to respond at once to a call for increased output. The company has subscribed large amounts of capital for the Mufulira and Nchanga properties; the former is already paying dividends and the latter promises to be a very profitable producer. Rhokana Corporation would appear to have a great future.

The enlarged reduction plant at Rustenburg to deal with sulphidic ore was brought into full production during the year. There is an unlimited supply of sulphidic ore, and it may be stated that from the technical view the future of the mine has been permanently secured; from the financial aspect prospects have improved.

The report and accounts were unanimously adopted.

ENGLISH, SCOTTISH, AND AUSTRALIAN BANK, LIMITED

ANOTHER SUCCESSFUL YEAR

MR S. M. WARD'S ADDRESS

The forty-sixth ordinary general meeting of the English, Scottish and Australian Bank, Limited, was held, on the 23rd instant, at 5 Gracechurch Street, London.

Mr S. M. Ward (the chairman), in the course of his speech, said:—When I last had the pleasure of addressing you, a year ago, the Commonwealth of Australia was passing through a period of great prosperity. With one exception all the classified lists of exports showed an increase over the preceding year, the total value of exports being higher by about £18,000,000. During the year now under review, notwithstanding many adverse factors, it is satisfactory to see that Australia has been able to maintain her high level of economic life. Employment was even better than the year before, the average trade union unemployment percentage being 8.5, compared with 10.6 in 1936-37. In like manner there was a noticeable increase in building activity, the value of building permits issued in Australia in 1937-38 being £56,000,000, compared with £48,000,000 in the preceding year.

WOOL AND WHEAT

When reviewing the wool position at this time last year it was evident that the 1936-37 level of prices would not be maintained, and the figures we have before us show that the average market value for greasy wool for the 1937-38 period was 12.5d. per pound, as against an average price of 16.4d. per pound for 1936-37. It is of interest to note, however, that the net production of the Commonwealth for the 1937-38 season amounted to the record figure of 3,338,038 bales, compared with 3,246,276 bales for the corresponding period in 1936-37. Wool exported during the year under review produced £A47,044,000, representing a falling-off of over £A15,000,000. It is believed in wool trading circles that the setback in prices is due more to political than to fundamental economic factors, and with a lessening of international tension it is not unreasonable to expect that such a movement should aid the wool market.

At the opening of the 1937-38 season wheat was attracting excellent prices, but as the season progressed the price became lower and lower, while to-day we find the markets for this commodity at low ebb. On account of the lack of good rains in part of the wheat-growing area in Australia the harvest for 1938-39 is estimated at 127,000,000 bushels, of which 72,000,000 bushels should be available for export. It will be seen from these estimates, coupled with the present low market price for wheat, that the prospects for the coming season are not bright. The production of Australian butter during the twelve months has shown considerable improvement, and the prices obtained have been satisfactory.

While the exports from the Dominion were slightly less than last year, the imports rose from £92,640,000 sterling to £113,648,000, an increase of £21,008,000, thus reducing the excess of exports over imports from £36,369,000 in 1936-37 to £11,848,000 in 1937-38. The estimated surplus required annually to meet the Federal Government's requirements for the sterling debt services may be put at about £24,000,000, but it will be seen the deficiency on this year's figures is more than met by the surplus of the previous year. This large increase in imports may be looked upon merely as a passing phase, resulting from the high prices realised on primary products in the preceding year.

BANKING POSITION

The banking position is thoroughly sound, and the facilities afforded by the banks have proved adequate to the needs of the community. Trade has been active during the past year, and the banks have been able to meet all legitimate demands for accommodation without unduly straining their resources. The changes in the figures of our own balance sheet, particularly the increase in advances, are symptomatic of this movement.

As regards the future, recent advices from our general manager in Australia indicate that the outlook is not altogether satisfactory. Dry seasons have adversely affected pastoral and agricultural areas, and the recent heavy fall in the price of wheat will be severely felt. On the other hand, the price of wool, though low, shows signs of improvement, and a hardening tendency has been noticeable in the recent wool sales. Metals have fluctuated considerably, but the present position is steady, and building activity continues in the principal centres. In short, general trading conditions are satisfactory at present, but the future prospects are uncertain. Higher taxation has to be faced, and the business turnover for the current year is likely to be lower than the last few years. Increased Government expenditure for defence purposes, however, for which a sum

of £16,700,000 has been provided in the Budget, will doubtless assist in counteracting the effect of shrinkage in other directions. That the Government and the Commonwealth Bank are alive to the possibility of some setback in business activity is evident from the Budget speech of the Federal treasurer in September last.

Last January the then governor of the Commonwealth Bank, Sir Ernest Riddle, was compelled to retire on account of ill-health, and Sir Harry Sheehan, the former secretary of the Federal Treasury, has been appointed governor of the bank in his place. The selection of Sir Harry to fill this important post was welcomed in banking circles, and will, I am convinced, go far to strengthen and maintain the spirit of mutual co-operation between the central institution and the trading banks, which is essential to the sound working of the system.

THE ACCOUNTS

Turning now to the balance sheet, the reserve fund has been increased by £15,000 and now stands at £1,710,000. Special reserve is unchanged at £1,585,000 and covers the depreciation in Australian currency, for which purpose it was set aside in 1931. Deposits at interest show a decrease of £384,000 and current accounts an increase of £290,000. Deposits and current accounts together at £35,188,000 show a small decrease of about £94,000. Our cash item at £8,400,000 shows a decrease compared with last year of £2,923,000, while investments have increased by £932,000. Advances and other assets are higher by £2,300,000.

The gross profit stands at £1,268,612, an increase over last year's figure of £87,132. The greater part of this increase, however, is absorbed by increases in the expenses of management £51,317, and in income and other taxes £31,347. Deducting the expenses from gross profit leaves us with a net profit for the year of £280,593, from which has been carried to reserve fund £15,000 and payment made of an interim dividend of 3½ per cent., subject to United Kingdom income tax, which absorbed £82,687. This leaves £182,906, which, with the amount of £305,978 brought into the account from last year, makes an available balance of £488,884, which it is proposed to deal with as follows: To officers' provident fund, £10,000; to a further dividend of 3½ per cent., less United Kingdom income tax, making 7 per cent. for the year, £86,187; to contingencies reserves, £50,000; to bank premises, £35,000; leaving a balance to be carried forward of £307,697.

The report and accounts were unanimously adopted.

PRICES, TAILORS, LIMITED

INCREASED PROFIT

The tenth annual meeting of Prices, Tailors, Limited, was held, on the 18th instant, in London.

Sir Henry Price (chairman and managing director) said that the trading profit amounted to £572,576, compared with £521,788 for the previous year. They had transferred by way of dividend upon their ordinary shares £200,000 to Prices Trust Company, Limited, and it was proposed to carry forward £257,831, compared with £226,415 brought in.

Their subsidiary company, Prices Tailors Properties, Limited, had now made a further issue of capital in order to take over additional properties. The additional ordinary shares would be taken up by Prices, Tailors, Limited, so that they would retain the whole of the equity. As the income of the Property Company was based upon rentals paid by Prices, Tailors, Limited, its debentures and preference shares constituted an investment of the first order.

The number of depots at 340 showed a net increase of 27. Efforts had been concentrated on improving products and giving better service so as to meet the most exacting individual requirements within the standard prices of 50s., 63s. and 75s. The business was now becoming established as a national institution with an ever-increasing goodwill.

Last year he stated that with the increased spending power of the public, consequent upon better employment returns, the outlook for the retail trade in this country would be good for some time to come. During the past year, however, events had happened in the political and international world which had given cause for reflection. However, the general outlook was, if anything, brighter, and if they could only steer clear of trouble he was sure that the retail trade of the country would be good. They were looking well ahead. Their stocks were in a very clean and healthy condition, and given reasonably settled conditions they should certainly move forward and make progress as in previous years.

The report was adopted.

At the fourth annual meeting of Prices Trust Company, Limited, held subsequently, Sir Henry Price said that the revenue of £200,193 compared with £192,579, and the total dividend of 50 per cent. with 45 per cent. for the previous year.

ANSELLS BREWERY LIMITED

38th ORDINARY GENERAL MEETING held in Birmingham on Wednesday, Nov. 23, 1938

PROFITS	£580,911	2	1
(12 months ended 30th Sept., 1938), after deducting all charges and expenses for management (including Directors' Fees) and making provision for interest on Debentures and Debenture Stock, Income Tax and National Defence Contribution, depreciation, bad and doubtful debts, and other contingencies.			
BROUGHT FORWARD	£226,837	12	5
DIVIDENDS ON PREFERENCE AND ORDINARY SHARES (paid and to be paid).....	£807,748	14	6
TO RESERVE FOR PROPERTIES	£367,500	0	0
TO RESERVE ACCOUNT ...	£50,000	0	0
	£150,000	0	0
	£567,500	0	0
TO BE CARRIED FORWARD	£240,248	14	6

Points from the Chairman's Speech

VERY CREDITABLE COMPARISON

It must be borne in mind that in last year's profits £5,000 refund from Income Tax was included, which was not actually earned in that year, so that if allowances are made for these matters a comparison with last year is very creditable.

IMPROVING DRAUGHT BEER

The largest increase has been in our bottled ales, which is the most expensive way of buying beer for our customers, because of the expensive bottling processes which are entailed. To cater for the public requirements in this direction, we have practically completed our new Bottling Stores and equipped it with the most up-to-date machinery in the country. Also, with the idea of countering this tendency towards bottled beers we are leaving no stone unturned to improve the manner in which our draught beer is served, by providing convenient insulated cellars which can be maintained at a constant temperature in our licensed premises.

THE COMPANY'S PRESENTS TO EMPLOYEES

Our directors have decided again to make a present, equivalent to one week's wages to each of the work people at the Brewery who has been with us for 12 months or more, and whose attendances have, in the opinion of the Management, been satisfactory, in addition to usual holiday pay.

NEW FINANCIAL YEAR BEGINS WELL

It has been announced by the Government that they intend to prosecute their armament programme without interfering with ordinary trade; if they attain this it will be to our advantage, and I am pleased to say that our output for the first six weeks of the new financial year compares favourably with the corresponding period last year, which was a good period.

INCREASED ASSESSMENTS

As far as the increased expenditure is concerned, on account of the House of Lords judgment in the Robinson case, I am afraid that we shall be faced with increased assessments for rating of some of our licensed houses, and, unfortunately, when this takes place Schedule A assessments are also increased, so automatically costing us more in licence duties.

£2,522,000 PAID IN TAXES

This Company and its subsidiaries have directly contributed to the Revenue in the current year by means of Beer Duty, Licence Duties, Wine and Spirit Duties, Income Tax and National Defence Contribution, the colossal sum of over £2,522,000, which does not include the Income Tax and Sur-tax paid by you as shareholders.

£558,000 CAPITAL EXPENDITURE

During the year the Company and its Subsidiaries have spent over £558,000 acquiring new houses, improving existing licensed properties, converting leasehold licensed properties into freeholds, and also in making additions to Brewery Bottling Stores, and Office Buildings, and adding to fixed and loose plant.

ENHANCING REPUTATION

I hope you will form the opinion that in the absence of any drastic additional Local or National Taxation, with the advantage of our conservative policy and capable management, we shall be able in the future to maintain and possibly enhance our reputation as being a sound and progressive undertaking.

Copies of the Chairman's Speech may be obtained from the Secretary, Park Road, Aston, Birmingham.

ELECTRIC AND MUSICAL INDUSTRIES, LIMITED

PROFITS AFFECTED BY THE CONDITIONS

The seventh ordinary general meeting of Electric and Musical Industries, Limited, was held, on the 18th instant, in London.

Mr Alfred Clark (the chairman), in the course of his speech, said: To those who follow the trend of trade, particularly in the Radio, the Household Appliance and the Bicycle Industries, the announcement to shareholders of a decreased profit for the year must have come as no surprise. This decrease is directly traceable to a drop in sales which has been general in the three industries concerned.

RADIO SALES

At our last meeting I was able to report to you that sales in the then new trading year were greater than for the same period of the previous year. There was a feeling of hope that, as far as the radio portion of our business was concerned, a period of sanity was at hand when we could expect that exceptional price-cutting would be a thing of the past. Very shortly after our meeting, however, figures began to arrive showing a beginning of diminishing sales. This was not, in any sense, confined to our own products, but was keenly felt throughout the industry. Reduced business, as we know, leads to forced selling, and as it was natural to expect, selling prices eventually were cut. The result has been a disappointing trading year, with a substantial reduction in our net profits because, as you know, this is the principal branch of our business.

Many people during this last anxious year, who otherwise would willingly have bought a new and more attractive model by hire purchase, have hesitated to commit themselves to a long-time obligation to pay instalments.

What has happened in the radio business has, to a lesser degree, happened in both household appliances and cycles. The decrease has been general throughout the trades, and here again the business depends very much upon hire purchase agreements. Our refrigerators retain their high standard of design and construction which has already put them amongst the leaders of the market, while the smaller articles such as the iron and the heater continue to be popular, and varied types of these are being added to our line.

That the gramophone record portion of the business has held its own is further evidence that it is still alive, in spite of the competition of broadcasting, and I might mention here that this is the only important feature of our business which does not depend largely upon the hire purchase system.

We are, in order to stimulate interest in records, offering to the public a record player, at a low price, which can be plugged in to almost any all-mains radio set and which will enable records to be played with a first-class quality of reproduction. The sales of this attachment are exceeding our expectations.

TELEVISION

Once more the progress made in television during the twelve months has been quite remarkable. At Olympia this year the Radio Show devoted its major effort to television, and the response of the public was considered highly satisfactory. We have now placed on sale improved television receivers, some of them at prices as low as 29 guineas. A great deal of time has been devoted to the consideration of systems which would enable the whole country to receive television programmes.

We believe that our work has resulted in a solution of the problem which, while permitting an immediate start for relaying television to the provinces is, at the same time, economical and will not stand in the way of future progress. It can be incorporated, and may become part of any relay system embodying future developments. A scheme embodying the results of our work has been submitted to the Television Advisory Committee and the Post Office, and we have every reason to believe it is being sympathetically considered by them at the present moment.

RE-ARMAMENT WORK

We have been asked to take our full share in the re-armament plans of the Government. Articles which we manufactured successfully in 1914-18 have, of course, been the first to be taken up, and, in addition, the company's new position in the electrical field has been recognised by the placing of important orders which are now in hand. These orders, we believe, will fill in many gaps caused by the recent diminished sales in our regular products.

The company's outlook for this year is that we are in a transitory period, but see no reason why in the following year we may not be expected to resume our former earning power. We therefore look forward to the future with confidence.

The report was adopted.

RHODESIAN ANGLO AMERICAN, LIMITED

INCREASED PROFIT

DIVIDEND OF 15 PER CENT.

The ninth ordinary general meeting of Rhodesian Anglo American Limited, was held, on the 22nd instant, in London, Sir Edmund Davis, J.P. (deputy-chairman), presiding.

The Chairman, in the course of his speech, after dealing with the balance sheet, said:—

The balance of profit for the year—namely, £826,401—is £9,124 more than the corresponding figure for the previous year. The allocation of this profit, after bringing in the balance unappropriated at June 30, 1937, is clearly set out in the appropriation account, and I need not go over it in detail. You will, however, possibly be interested to learn the reason for the reduction in the provision for income tax, which this year is £102,177, compared with £172,580 last year, although our revenue this year is higher.

DOMINION INCOME-TAX RELIEF INCREASED

In the first place, I should explain that this charge for income tax in our accounts does not represent tax paid directly by this company. It represents income tax deducted from the dividends received from Rhokana Corporation and other investments, less deductions of tax made on payments of interest by our own company and a recovery of tax in respect of our administration expenses. The reason for the decrease of about £70,000 in the charge for income tax this year is that Rhokana Corporation have been able to pass on a larger amount of dominion income-tax relief, the rate of relief received from that source being 2s. 6½d. in the £ compared with 7½d. last year.

The advances we received from the Anglo American Corporation of South Africa, Limited, were repaid during the year under review. In this connection perhaps I might mention that we all regret that the market price of our shares during the period of the option the Anglo American Corporation were given was not sufficiently high to warrant their calling the 150,000 reserve shares of the company at £2 per share, a regret, I am sure, you will all share with the members of your board.

RHOKANA AND NCHANGA HOLDINGS

Coming now to Rhokana Corporation, Limited, you will have gathered that our interest in that Corporation remains intact, and owing to the very large amount of capital it represents—at yesterday's price, a matter of 1,340,288 shares at £12 11s. 3d. per share, £16,837,368—that the future of the said Corporation is of very great interest to the members of this company. You will have learnt, from its report, of the decisions, firstly to increase production from 95 per cent. to 105 per cent. of the quota basis, and secondly to authorise unrestricted production, which is the present position. We can only hope that the consumption of copper will be such that this unrestricted production will last for some time to come and greatly benefit Rhokana Corporation.

Our present holding of 1,000,000 shares in Nchanga Consolidated Copper Mines, Limited, was, at yesterday's market price of £1 12s. 6d. per share, valued at £1,625,000, and it is sufficient for me now to say that progress in the development and equipment of the Nchanga Company's property is proceeding very satisfactory. The aggregate value of our holding of Rhokana and Nchanga at yesterday's date was £18,410,500.

RHODESIA BROKEN HILL

Some of you may not have seen the interim progress report recently issued by the Rhodesia Broken Hill Development Company, Limited, and so it will interest you to know that the Davis shaft, which is to be used exclusively for pumping, has reached its final depth and that the pumping plant is being installed; a site for the main hoisting shaft has been provisionally selected and is being tested by drilling. Additional power is being provided by the installation of a steam power plant with a capacity of 5,000 kws. Even more important are the recorded results of drilling, which show that at No. 1 Kopje there is an ore-body of 1,200 ft. in length with both ends open. Finally, a rough calculation shows probable ore reserves at date of 1,200,000 tons sulphide ore averaging 35.5 per cent. zinc, 23.5 per cent. lead and 17.5 per cent. sulphur, and also 2,200,000 tons oxide ore averaging approximately 23 per cent. zinc, 7 per cent. lead and 1 per cent. vanadium oxide.

The report and accounts were unanimously adopted, and a final dividend of 9½ per cent., less income tax, making with the interim dividend, already paid, 15 per cent., less income tax, for the year, was approved.

GOODE DURRANT AND MURRAY, LIMITED

EFFECT OF FALL IN MARKET VALUES

The fortieth ordinary general meeting of this company was held, on the 18th instant, in London.

In the absence of the chairman (Mr W. E. Pennick) the chair was taken by Mr W. S. Rose, who said:—I regret that we have not a better result to lay before you, but in common with most firms dealing in textiles we have experienced an unfortunate and unforeseen setback. In the first part of the year under review we enjoyed an encouraging increase in sales and the profit was sufficient, in the opinion of the board, to justify the payment of one half-year's arrears of preference dividend, but in the latter part of the year there was a serious fall in the market values, which made it impossible to sell our stocks at a fair margin of profit.

I want now briefly to refer to the reasons for Mr Pennick's visit to South Africa. Through our subsidiary company, Ochberg Robinson (Proprietary), Limited, we have been and are still doing a considerable business with C.T.C. Bazaars (S.A.), Limited, which has large stores in the principal cities of the Union of South Africa. This concern has made great strides during the past few years, and the directors launched out on an ambitious building scheme which left them short of liquid capital. Eventually it became necessary for us, as the largest creditors, to apply to the Court for judicial management of that company, in order to safeguard the assets. The application was granted on March 4th last, and my colleague Mr Kemp sailed at once for South Africa to investigate the position on our behalf. I am glad to tell you that the judicial managers report that the business is solvent and that there is actually a substantial surplus of assets over liabilities. Mr Pennick is in South Africa watching our interests.

The total profit for the year amounts to £19,644 17s. 9d., and the balance amounts to £10,018 19s. 5d. In April last one half-year's arrears of dividend on the preference shares was paid, which absorbs practically the whole of this profit.

The prosperity of South and Western Australia depends upon the yield and ruling price of wheat and wool. Given fair prices for these products, the outlook of this company would be considerably brighter than the present prospects indicate.

The report and accounts were unanimously adopted.

NORTH BRITISH RAYON, LIMITED

DIFFICULT TRADING CONDITIONS

The tenth ordinary general meeting of North British Rayon, Limited, was held, on the 18th instant, in London, Mr Ernest Walls (the chairman) presiding.

The Chairman, in the course of his speech, said that the course of events during the financial year could be divided into two phases. During the first period the company was working at full output and sales were large, but prices were at a low and unsatisfactory level. At the end of 1937 there was an advance in prices, but this was followed early in the year by a fall in demand, which gradually developed into what could only be described as a slump. The unsatisfactory state of all textile trades during 1938 was common knowledge and rayon had not escaped. As a result, the company had worked at about two-thirds capacity on average during the latter half of the financial year. This was the first time in their history that they had shut down a machine or laid off a worker for lack of orders.

The slump continued without any improvement during July-September, and output had to be reduced still further. Since October 1st, however, it had been possible for the works to increase output, and the increased production had been sold and stocks brought down to normal. The United Kingdom consumption of rayon during the six months April-September showed a decline of 30 per cent., compared with the previous year. This was a very serious decline. The situation which gradually developed during 1938 had been a real shock to the industry.

In his (the chairman's) opinion a further rise of rayon prices was needed, so as to give producers a margin sufficient to enable the contingencies inevitable in the industry to be provided for. He considered there was reasonable ground for expecting that the tide of demand would turn in their favour after Christmas. Customers' stocks of finished goods were getting low; confidence, which had been badly shaken, was slowly returning.

He expressed his appreciation of the spirit of co-operation and friendly goodwill now existing amongst the viscose rayon producers.

The report was unanimously adopted.

THE WALL PAPER MANUFACTURERS, LIMITED

DIFFICULT TRADING CONDITIONS

MR A. V. SUGDEN'S SPEECH

The thirty-ninth annual general meeting of The Wall Paper Manufacturers, Limited, was held on the 24th instant, at the Holborn Restaurant, London.

After commenting on the accounts, the chairman (Mr Alan V. Sugden, J.P.) said: In recommending the dividends the board had the following considerations before it: (1) adequate reserves had been made for every reasonable contingency; (2) £79,000 was left in the business by the reduction of goodwill; (3) the carry-forward would be more than sufficient to pay debenture interest and a full year's dividend on the preference and ordinary stock.

GENERAL CONDITIONS

The most notable feature of the year is the falling off in trading profit, a common experience of both parent company and most subsidiaries.

The international situation has had its effect on sales during the second half of the year. There has also been a reduction in building activity, which must have some reaction on wallpaper.

Unavoidable increases in costs (including N.D.C.) offset by no equal advance in selling prices has also diminished margin.

There may be people who will say it is possible for a powerful company to advance prices. This is only superficially true, for if customers think wallpaper prices are too high, they may postpone decorating or substitute some other article.

The decline in margin has been equally noticeable in export business accompanied by a considerable loss in volume.

It is the common experience of all trades which are not necessities, to find that the better quality range has suffered most in the past year, due to the fact that people who purchase such articles have been anxious about the future and the trend of local and national taxation.

The retail trade in shops on the other hand has been well maintained, though again domestic economy has played its part in the price paid.

As to wallpaper itself, I am sanguine that it possesses the qualities which will enable it to surmount all temporary recessions.

More thought, more artistic taste, more study of the needs of the consuming public, is devoted every year to the preparation of our varied range of productions, whilst at the same time wallpaper makes an appeal of comfort and beauty in the home which is surely without a rival.

THE WALPAMUR COMPANY, LIMITED

This subsidiary has again increased its turnover. The most widely used of its large range of products, Walpamur Water Paint, Duradio Enamel Paint and Muromatte Flat Oil Paint, have eclipsed all previous records. This justifies our belief that the vast number of customers of The Walpamur Company have every confidence in the quality of its goods.

A. SANDERSON AND SONS LIMITED

The added interest of the more discriminating in favour of wallpaper has increased the activities of this house, whose large show-rooms in Berners Street constitute one of the finest wallpaper displays in the world.

Sanderson Fabrics, in common with other concerns printing on fabrics or textiles, have found the profit margin to be small, but to offset this they have increased turnover in the home trade and abroad, where they deal with nearly every country in the world.

ACKNOWLEDGMENTS

I conclude by endorsing the value of the various pensions schemes and our appreciation of the loyal and devoted services of all members of our staff.

The report was adopted.

Slaters and Bodega, Ltd.—Total income for year ended September 30, 1938, £84,758, against £106,118. To tax and N.D.C., £10,908 (£11,381). No ordinary dividend, against 5 per cent. To property and general reserve, £8,000 (same). Balance carried forward is raised from £6,237 to £7,458.

United Railways of the Havana.—Total receipts for year to June 30, 1938, £1,266,553, against £1,407,041. Expenses are reduced from £1,426,391 to £1,405,648, leaving a debit for year of £139,095, compared with £19,350. Profit from warehouses, etc., worked out lower at £26,688, against £32,093, making debit £112,407.

Stewarts and Lloyds of South Africa.—Trading profit year to June 30, 1938, £330,155, against £253,410. To depreciation, £49,133 (£38,487). Ordinary dividend again 10 per cent. To writing £15,000 off investments and placing a total of £189,871 to reserves. Carry forward raised from £53,693 to £62,389.

AUSTRALIAN, MERCANTILE, LAND AND FINANCE COMPANY, LIMITED

DIFFICULT CONDITIONS

The seventy-fourth annual general meeting of this company was held, on the 24th instant, in London.

Sir John Sanderson, K.B.E. (the chairman), said that last year he had stated that unless there was an improvement in the wool market, the company's returns for the current year would be adversely affected. In addition, shareholders were advised of the difficult seasonal conditions which obtained over wide areas of New South Wales and Queensland. Unfortunately, their anxieties with regard to both wool market and seasonal conditions had proved to be well-founded, as was shown by the company's profits for the twelve months ended June 30th last having sharply declined as compared with the previous year.

Dealing first with the wool market, the 1937-38 selling season in Australia, which had ended in June last, proved to be one of the most difficult experienced for many years, and competition from countries which in previous years had been much in evidence was either absent or greatly lessened. That applies particularly to Japan and the United States of America, the latter country being practically out of the market and Japan buying but sparingly.

Lower prices, together with quantities of wool unsold, had inevitably affected the company's commission-earning accounts. It was some satisfaction, however, to be able to say that when the 1938-39 selling season opened in Australia in August of the current year prices for the better classes of wool were rather firmer than in June, but, while the market had since shown an all-round improvement, prices were still about 30 per cent. below those ruling at the end of June, 1937.

Because of the drought and the lower wool prices now obtaining, the prospects for the current station year, which ended December 31, 1938, were not encouraging. In Argentina their business had been satisfactorily maintained but showed no expansion.

As to prospects generally, the market and seasonal conditions must affect all engaged in the wool-growing industry and, unless there was a much greater improvement than at present appeared likely, they must be prepared for a further decline in their profits for the current year ending June 30th next.

The report was unanimously adopted.

SUMATRA PARA RUBBER PLANTATIONS, LIMITED

The thirty-first annual ordinary general meeting of this company was held, on the 22nd instant, in London.

Mr H. A. Barrett (chairman) said: Considering the adverse factors, the results of the past year are not unsatisfactory. The net balance of £12,802 represents a profit of 2½d. per pound of rubber, as compared with the 1936-37 figure of 3½d. per lb. This shrinkage is in no way due to higher production costs which, in fact, were rather less last year than for 1937, owing to the larger quantity of rubber handled and to the more favourable rate of exchange. The dividend recommendation is 4½ per cent.—that is, 10d. per £1 of stock—as compared with 7½ per cent. for 1936-37.

The balance sheet shows in detail the appropriation of the sum received for the sale of the subsidiary company's land, by the help of which the reserves for special cultivation and replacement of old areas are placed in credit to the substantial extent of £3,579 and £5,177 respectively.

No change was made in our investments during the year. Their value at the close of the financial period was £22,250, and, in addition, we had as at the same date cash to a total of £10,530. While this is a satisfactory position, I would emphasise that we have a programme of reclamation work ahead of us.

The International Rubber Regulation Committee has fixed the exportable allowance for the January-March quarter of 1939 at 50 per cent. I think this decision is to be regretted, coming at a time when an over-abundant world stock is being only very gradually reduced. Doubtless, the Committee was influenced by the prospect of trade improvement in America and anticipates that there will be a much larger consumption of rubber in the future. I can only trust this assumption will prove correct.

The report was unanimously adopted.

Shifts in Industry, 1937-38

The following charts are based on the annual census of persons insured against unemployment taken in July and published in the November issue of the *Ministry of Labour Gazette*. Chart I refers to all persons insured in the United Kingdom and Chart II to men aged 16-64 in Great Britain. Chart III excludes agriculture and children under 16. Chart IV refers to Great Britain. The normal wastage from insurance consists, in the case of men, mainly of deaths and persons reaching the age of 65.

Finance

GOVERNMENT RETURNS

For the week ended November 19, 1938, total ordinary revenue was £15,471,000, against ordinary expenditure of £13,059,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £195,827,000, against a deficit of £122,042,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On November 18th applications at £99 16s. 2d. per cent. for bills to be paid for on any day except Saturday of the following week were accepted as to about 38 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications for bills to be paid for on Saturday at £99 16s. 3d. per cent. and above were allotted in full. £35.0 millions of Treasury bills are being offered on November 25th.

SHORTER COMMENTS

(Continued from page 443)

Stewart and Arden, Ltd.—Net profit for year to September 30, 1938, £56,687, against £55,838. To tax and contingencies reserve, £6,750 (£6,000). Ordinary dividend maintained at 12½ per cent. Carry forward raised from £5,402 to £5,589.

Amalgamated Press, Ltd.—(Acquisition of Kelly's Directories, Ltd.)—Lord Liffie has disposed of his controlling interests in Kelly's Directories, Ltd., to the Amalgamated Press, Ltd., as from December 31st, his deputy chairmanship of Allied Newspapers, Ltd. He is retiring from active business at the end of the year. Amalgamated Press have also acquired Lord Kemsley's holding in Kelly's Directories, and thus now own about 75 per cent. of the ordinary shares. Interim dividend on Amalgamated Press ordinary shares has been reduced from 5 to 3 per cent.

Bah Lias Rubber Estate.—This company is to acquire Bila (Sumatra) Rubber Lands and Wampoe Tobacco and Rubber Estates as from November 1, 1938. If the proposed merger is approved, Bah Lias will have an issue capital of £506,885 in £1 units. For every £2 of Bila Stock £1 of Bah Lias stock will be exchanged and for every £2 of Wampoe £1 of Bah Lias stock. Meetings will be held on December 16.

M. Daladier's Chance

IF the organised representatives of the French workers have suffered a complete and humiliating defeat they have only themselves to blame. The Confédération Générale du Travail deliberately chose to use the weapon of the general strike against M. Paul Reynaud's decrees; and it has broken in their hands. According to reports, there were no industries on Wednesday where more than half the workers went on strike, and all the essential public services were functioning as usual. The reasons for the failure are not far to seek. In the first place, the unions had a bad case. It is widely realised, even among the workers, that the forty-hour week has been not only a failure so far as concerned, but also a danger to the economic structure of the nation. The general strike is a weapon that has no chance of success unless it is used in a cause that is generally acknowledged to be just; for since it is general, it can be aimed only at the community itself, and the public has difficulty in seeing itself as beneficiary and victim at once. On Wednesday, the leaders of the C.G.T. seem to have shared the general belief that they were fighting in an impossible cause. The strike was called for one day only, which put it more into the class of a political demonstration than of a serious attempt to force the issue; and, even so, the union leaders were at some pains to apologise for it,

and they would have been glad to have been presented with an opportunity for calling it off. As it

half the truth. Labour and Capital both have a contribution to make to French salvation; and it is not in Labour's interest that Capital alone should be called upon to contribute, any more than it is in Capital's interest that a solution should be sought solely at the expense of Labour. Labour advocates restraints on Capital, which would be useless without an increase in working hours. And Capital advocates the reversal of the social laws of 1936, which will have no effect unless French capital is once more poured into French industry.

Wednesday's events thus constitute a defeat for the peculiarly mistaken tactics of the C.G.T., but not for the French worker, whose standard of life is more likely to be raised than lowered as a result. Who was the victor? M. Daladier, doubtless; but what does M. Daladier stand for in these days? If he allows himself to convert his victory into a heresy hunt against "Reds," into an offensive against the workers, or into an invitation to explore the paths of undemocratic government, he will be justifying retrospectively the action of the C.G.T. in calling the strike. Indeed, it is true to say that the outcome of the strike gives him a mandate to put pressure now on the Right. It has been shown beyond doubt that no demagoguery of the Left is going to be allowed to interfere with the working of the Reynaud Plan. But the real threat to the Plan was never to be expected from the Left. There was not very much dispute about the 40-hour week or much doubt (despite the fulminations of the Socialists and the C.G.T.) about what should be done. But on the methods of securing the co-operation of Capital fierce controversy has raged. This controversy, and the doubts about the Plan's chances of success, still remain. The Government still faces its most difficult task, that of resolving the controversies and removing the doubts

that prevail about the proper treatment of Capital. The defeat of the strike does not ensure the success of the Plan. It merely gives it a chance.

Capital can be either cozened or compelled. MM. Daladier and Reynaud have chosen cozening. But they are fully entitled—indeed, they are morally bound—to apply the same tactics towards the Right as the Left. If the co-operation of Capital can be secured by consent, that will be by far the best solution, just as an alteration of the social laws by consent, as can now be seen, would have been far better for all parties than the method of the decree and the strike. But to the capitalist as to the worker it must be clearly said that the interests of the community must in the last resort be paramount. France needs her savings fully as much as she needs her workers' right arms. M. Blum's policy was weakened in 1936 because he was unwilling to use force against even the most clearly anti-social activities of the workers. If M. Daladier is unwilling to take any attitude towards the taxpayer, the rentier, the employer and the capitalist than that of gentle persuasion, he will make himself the prisoner of the extremists of the Right, just as M. Blum was hampered by the extremists of the Left. Wednesday's events have made the real issue clearer than ever: will the moneyed classes of the Republic risk their substance for its salvation? If not, then some French Government will sooner or later send the Garde Mobile out requisitioning once again.

There may be other poets more popular in France to-day as a source of slogans than Goethe. But M. Daladier's attitude to the unions this week has been a clear case of "Und bist du nicht willig, so brauch' ich Gewalt." If he makes that his motto and applies it impartially, there is a great chance for democratic reconstruction before him.

Prison Reform

PUBLIC opinion, that wind which bloweth where it listeth but is nevertheless susceptible to applied influence, has been veering steadily to a point very favourable for Sir Samuel Hoare's new prison Bill. On Tuesday, in the Commons, when the Home Secretary introduced his measure, he reaped a merited reward of approbation from all quarters of the House. Never before have so many people been interested in the life of prisons; never has the public been so well informed; never has it been so ready to receive with sympathy and understanding a reasonable measure of reform. For this surprising change of outlook credit is due to a number of people—to the enthusiasts of the Howard League, and (whatever may be thought of their views) to the conscientious objectors who were able to blow the trumpet of reform without having a criminal record thrown up against them. Let those who welcome the Criminal Justice Bill pay their tribute to the pioneers who blazed the trail.

The most important part of this Bill is the section which deals with young offenders, and if the provisions of that part alone were to become law, a great and beneficent reform would have been brought about. It was here that Sir Samuel's declared desire "to hold fast to the humanities" was most welcomed by the House. It has long been recognised that the worst thing which can happen to a boy or girl is to be sent to prison, and anyone who has seen and talked to a class of boys in a prison such as Wormwood Scrubs must look back on that experience as one of the saddest and most disheartening of his life. The place in the world where a boy is least likely to be reformed is prison, and it needs no special gift of foresight to know that the young prisoners of 1938, with the pores of their souls open to the atmosphere of prison, will be the recidivists of 1950.

At present the law is that no person under seventeen may, save in exceptional circumstances, be sent to prison. But there is always a substantial population of convicted prisoners from seventeen to twenty-one; there are boys and girls on remand waiting trial; and there are boys who, having been sentenced to Borstal in order to avoid the prison atmosphere, hang about (incredible paradox) in the prison atmosphere until Borstal is ready to receive them. The new Bill sets up machinery for dealing with these problems. It provides that no magistrate's court may imprison a person under twenty-one without first finding out all the circumstances, weighing them, and deciding that no method other than imprisonment is suitable. Having come to that decision the Court must "specify the reason in the warrant of commitment." The Bill, in fact, says to the magistrates what examiners say to examinees: State your reasons—a most admirable device for imposing caution on the more dashing type of J.P.

The Bill makes provision for four new types of institutions, which have been given the names of State Remand Homes, Remand Centres, Compulsory Attendance Centres, and Howard Houses. The purpose of the Remand Centres is to provide a place where young persons up to the age of twenty-three can be sent while on remand instead of going to prison. The most interesting of these new institutions are the attendance centres and the Howard Houses. The attendance centres provide for young offenders from seventeen to twenty-three the punishment which we used to know and hate in our school days as being "kept in"; and juvenile centres will perform the same office for offenders aged from twelve to seventeen. While their innocent companions are enjoying the pictures or watching football these young people will go to their centres and submit themselves to "appropriate occupation and instruction"—

and how they will detest it. There will be no glamour about this punishment and, if the scheme can be made to function, it will, we may hope, have solved the problem of an unpleasant discipline free of prison taint.

The Howard Houses will cater for a different type. They will be residential, and offenders between 16 and 21 will live there under conditions of strict discipline but will have regular outside occupation—going to their work in the morning and returning to sleep in the Howard House at night. This represents, in fact, an attempt to deal with young offenders in the spirit of the Wakefield experiment and the open prison, and it is greatly to be hoped that the scheme will prove workable, for it may mark a further stage in the road to that ideal system which will be rid of the constricting, soul-killing atmosphere of the fortress gaol.

When it comes to the adult offender, the Bill is less revolutionary, consisting largely of provisions to tidy up the present system—to clear away what Sir Samuel called on Tuesday "the stage properties of Victorian melodrama." It abolishes the distinction between hard labour and the second division, an anachronism that has long ceased to mean anything. It does away with penal servitude and substitutes for ticket-of-leave a device by which the discharged prisoner must keep in touch with an appointed society (presumably a discharged prisoners' aid society) and must report at a police station only if he fails to keep the society informed of his address. The arrangements for preventive detention are altered, and for any one of eight scheduled crimes the Bill authorises, in certain circumstances, a sentence of ten years' detention.

Canada in Recession and Revival

THE 1937-38 business recession in Canada was by no means as intense as that in the United States, and the revival which commenced in the United States last June now appears to be getting underway at last in Canada. It may be said at once that Canadian business was not supported by "pump-priming" during the recession: the net debt of the Dominion Government rose by only \$14 millions during the year ended March 31, 1938, and the recent cash deficits of provinces and municipalities have, on the whole, been similarly moderate. What explanation, then, can be given for Canada's escape from the severity of the American recession?

Actually, only a part of the Canadian economy is directly affected by changes in American business. The influence of American security markets on Canadian stock and bond prices is, of course, pronounced. At least one-third of the total value of stock trading on both the Montreal and Toronto exchanges is done in shares also listed on American markets; and financial sentiment in Canada is conditioned by the huge volume of Canadian trading in American securities. But the direct dependence of industry is certainly not so close. It is confined to Canadian exports to the United States, which amount to between 10 per cent. and 15 per cent. of Canada's national income, and, if invisible exports are included, to American tourist expenditure in Canada as well, which makes up an additional 5 per cent. to 10 per cent. The indirect effects on Canada of economic fluctuations in the United States consist, first, in the effect of, say, a stock market slump on business expectations and on purchases of consumers' durable goods; secondly, in the effect on the rest of the Canadian economy of, say, a slump in the newsprint industry, which is utterly dependent on American demand; and, thirdly, in the general repercussions of an American depression on world demand for Canadian exports. In a long, severe depression these indirect effects are bound to be far-reaching, but in

Whatever merit there may be in these new regulations for adult offenders it would be a mistake to suppose that the Bill touches the core of the problem, which cannot be solved by legislation, but only by the expenditure of money on the prisons themselves. What is needed is a chain of prisons in which the men can be classified on lines far more careful, far more scientific, than those which are at present followed; in which they can be subjected to the treatment and the discipline suitable to their individual offences and needs; in which the influence of the governor, the deputy-governor and the chaplain can be brought to bear directly on every man who comes inside the gates; in which the sex pervert and the defaulting financier and the young burglar and the bigamist and the sneak thief do not as now go through the same mill side by side; in which there will never be at one time more than 150 or 200 men; in which the high cell window and the small exercise ground will be unknown. At present it is an open question whether a vast caravanserai like Wormwood Scrubs or the small provincial prison is the more unsatisfactory. What is certain is that reforming influences will never give of their best until the segregation of different types is made complete and until it is no longer possible to find in the same prison and working in the same shop, men on remand, men serving long sentences for murder, first offenders and old lags. The country, though it may not know it, is served to-day by governors and deputy-governors who are deeply and scientifically interested in their work, but while our present prisons stand they are skilled workmen essaying the most difficult of jobs with a set of worn-out tools.

a short depression, such as the latest one, they can be offset by internal policy or by sustained foreign (i.e. non-United States) demand.

The chart overleaf, although based on statistics only roughly comparable, gives a bird's-eye view of the current recession in the two countries. American business began to decline in the summer of 1937, Canadian business only in November. That the Canadian index of production dropped very sharply from December to January is due largely to the fact that the newsprint industry was filling large orders at the 1937 price until the very end of last year; with the advent of the New Year and a higher price, production fell by 23 per cent. in one month. The decline after January was partly due to a further drop in newsprint output and partly to a sharp drop in automobile production resulting from lower sales. The demand for industrial equipment, too, was diminished by the American recession; the Stock Exchange slump led to changes in inventory policy and in plans for capital expenditure. But Canada, the chart suggests, was much less hard hit than her neighbour.

The divergence in the chart is too great to be explained by differences in the composition of the two indices; it is obvious that the Canadian recession was much the milder of the two. The factors responsible for this are to be found in the "independent" sector of the Canadian economy. For instance, the now very important mining industry has remained active. Gold output has expanded. Exports of base metals have continued at a high level, since increased exports to Europe and Japan have offset the reduced demand (mainly for nickel) from the United States. And, although the 1937 drought reduced Western agricultural income and railroad revenues from wheat car-loadings, the net value of all agricultural production in 1937 was only 1½ per cent. lower than in 1936.

Monetary conditions and the state of business confidence both played a part. The policy of the Bank of

Canada throughout the period has been to maintain bank cash, and to support the Government bond market; and money has remained easy. It is more difficult to determine the influence of business confidence. But this much at least can be said: big business in Canada controls a larger share of the total production, and is far more tied-up by interlocking directorates than big business in the United States. Hence, business confidence (or its opposite) tends to be even more homogeneous in Canada than over the border. Since 1935 business in Canada has enjoyed a *laissez-faire* Federal Government; while in the two industrial provinces the Governments of Mr Duplessis in Quebec and of Mr Hepburn in Ontario (since the episode of the power contracts) have both been highly conservative. Consequently, confidence about Canada among Canadian business men has been high.

What of the future? Briefly, Canada's immediate economic prospects look as fair as her more distant ones look less attractive. The immediate outlook is governed by several favourable signs. Inasmuch as the American revival promises to be vigorous until at least the spring of 1939, we can expect a continued revival in newsprint, nickel and other Canadian exports to the United States. Lower prices

PRODUCTION 1936-38

The United States index is that of the Federal Reserve Board; the Canadian index that of the Dominion Bureau of Statistics.

and considerable changes in style will probably create a strong demand for the 1939 automobile models. Intensification of the world armaments race will increase the foreign demand for base metals; and, specifically, Canadian industry is expecting a steady increase in munition orders from Great Britain. It will be some time, however, before Canadian production of munitions becomes at all substantial; and profits for new contracts are likely to be strictly limited as a result of the present Federal judicial inquiry into the contract for the production of Bren machine-guns. Finally, in spite of the drastic fall in wheat prices, the national income derived from wheat exports will be larger in the present season than for some years past. It is true that, with a probable prairie commercial wheat crop of 300 million bushels, the Dominion Government stands to lose \$3 millions for each cent that the world price falls below the minimum price (for No. 1 wheat) of 80 cents, and it is not likely that prices will rise much above their present level of under 60 cents. But this may be partly offset by a lower deficit on the Canadian National Railway; and Eastern Canada will benefit from larger orders for railroad and agricultural equipment and from larger mail order sales.

Much of the ground lost during the recession, therefore, may well be regained during the next six months. But

there are certain fundamental conditions affecting Canadian economy which it is dangerous to forget. In the first place, Canada is still primarily dependent on foreign demand for wheat and flour, pulp and paper, base metals and other products, all of which fluctuate violently in supply, demand and price. Wheat is undoubtedly the Canadian staple whose future must be viewed with the gravest concern. With the demand for wheat by Continental Europe still heavily reduced and wheat acreage in exporting countries continuing at a high level, any "normal" yield in the exporting countries is bound to result in a burdensome world carry-over. This year's Canadian crop was affected by rust. Next year, if the new rust-resistant wheats—Thatcher, Renown and Apex—are widely used, and if rainfall is again adequate, the Western crop may well exceed 400 million bushels. Great Britain's preference for Empire wheat never was a very valuable protection for Canada, for competition is merely intensified in extra-Empire markets and the price situation is unaffected. In any case, the preference is now to be abolished.

Again, aggravating the stresses and strains resulting from volatile industries, there are Canada's high overhead costs. There is the heavy fixed-interest debt—both Governmental and private. There is the cost to the primary producers of heavily protected secondary industries. There are heavy transport costs. And there is the cost of a cumbersome system of Federal and local government due both to geography and to history.

Indeed, Canadian politics during the 1930's have seen an increasingly bitter struggle between conflicting economic interests—although the issues have usually been confused. It is important to bear in mind, for example, that Mr Aberhart does not simply represent Social Credit but also agrarian revolt against Eastern protected industry and Eastern finance. In return, many in the East regard the West as a dependant, constantly clamouring for more support. In the East, the balance of power between industries has been upset by the rise of non-ferrous mining, an industry which draws no benefit from the protective tariff and is very anxious to keep down its labour and material costs. The labour movement received an impetus from the rise of the Committee for Industrial Organisation in the States, and the recent affiliation of the United Mine Workers' locals in Nova Scotia with the Co-operative Commonwealth Federation, the Federal "third party," is not an isolated example of Canadian labour's growing political consciousness. Conversely, the fear of a powerful labour movement has led to tacit support in Quebec for Mr Duplessis's opposition to international (i.e. Canadian-American) unions and for his anti-Communist campaign. It has also led, to a lesser extent, to tacit support for the still numerically small national Fascist party, led by Mr Adrien Arcand.

All these conflicts of interest have been more or less involved in the constitutional struggles between the Dominion, the Provinces, and the municipalities. The Rowell Commission on Dominion-Provincial Relations has inevitably been confronted by them. They have led to widening divisions within both the Liberal and the Conservative parties. During his present regime, Mr Mackenzie King has once again displayed his consummate skill in obtaining compromises, delaying crises and holding tensions. But another long depression is almost sure to create both local and national political crises. The American magazine *Fortune* recently delivered judgment on Canada in these words:—

Under her legends and her *laissez-faire*, her prosperous statistics and her suave business clubs, her undiscovered mines and her \$6,800,000,000 worth of imported capital, she conceals one of the most precarious economies in the world.

An exaggeration, without doubt. But Canada and her friends would be foolish to deny or ignore its foundation of truth.

Cheap Books

THE book trade, like farming, is always supposed to be on its last legs. Authors, publishers and booksellers have said so ever since the expensive three-decker Victorian novel ceased to sell. Nowadays, when Book Clubs offer their members new books at half a crown, instead of seven and sixpence, and sixpenny reprints are all the rage, the lament is louder than ever. Books, they say, are becoming too cheap for bookmen to earn a living.

The latest developments have indeed been sudden and sweeping. Eight clubs of various sorts and creeds, choosing books for their members and supplying them at cut prices, have as many as 150,000 members between them. And some 200 Penguin and Pelican sixpennies, issued in the last three years, have each sold between 40,000 and 150,000 copies in their first year after publication.* The enterprise of Mr Gollancz, whose Left Book Club comprises over a third of all the members of Book Clubs, and of Mr Allen Lane, who launched the Penguins in 1935 and the Pelicans last year, has revolutionised the book business.

It is, of course, true that books have been becoming cheaper for fifty years. Equally, cheap reprints (and the great majority of Penguins and Pelicans is reprinted matter) have been part and parcel of publishing for a very long time. In fact, it is the extent and *tempo* of recent changes, rather than their direction, which is questioned by the critics, who accuse Messrs Gollancz and Lane of undermining prevailing book values, creating a cult of cheapness among readers and whittling away the earnings of authors, publishers and booksellers. The trade's view was simply stated last month in the eighth J. M. Dent Memorial lecture (organised by Mr Hugh Dent, whose death recently was a sad loss to the world of books); Mr Harold Raymond said: "The stability of our trade and a reasonable remuneration for author, publisher and bookseller can only be preserved by maintaining a fairly high initial price for general literature, and avoiding too rapid and too steep a reduction in price in a subsequent cheap edition."† The initial price is ordinarily seven and sixpence; and cheap editions follow gradually, first, say, at five shillings, then at three and sixpence, and then two shillings. Mr Gollancz and his lesser *confrères* offer new books at a third of the accepted price; Mr Lane reprints in handsome form at a mere sixpence.

The non-economic arguments in favour of the pioneers are strong. Book production is a public service as well as a business, and seven and sixpence is far beyond the pockets of most purchasers. Indeed, three-and-sixpenny reprints cannot be afforded by the majority of working people, who would boggle at a florin or even a shilling. It is this economic helplessness which has made a majority of the population regard book-buying as an esoteric pursuit and bookshops as places of privilege for the select few. To bring serious books, well-printed books and genuine literature to homes where cheap ephemeral trash has been the staple diet is a notable step.

But is it worth while, in terms of pounds, shillings and pence? Clearly, Messrs Gollancz and Lane, for their part, have found it profitable so far. Other branches of the trade have not fared so well; magazines have been hard hit, as they were earlier by the twopenny libraries; best sellers' reprints at four or seven times sixpence have suffered; and expensive books on politics and economics have found the competition of Left Book Club choices hard to bear. Are the cheap books and reprints simply diverting custom from

more costly books in general? If they are, then the business of publishing, already an ill-organised congestion of avid competitors, is in grave danger. In default of facts and figures—statistics about the book business are scandalously lacking—we can only guess: but critics like Mrs Cole and publishers like Mr Raymond combine to confirm the impression gained casually by meeting Book Club members and seeing Penguins bought in general stores, shops and tobacconists, namely, that it is a largely new public which the heretical publishers have plumbed. People who never thought of *buying* books now join Book Clubs. People who were diffident about going into booksellers now buy Penguins from stalls and counters. People who could not afford books before now can. And, which is very important indeed, many people buy Penguins *in addition* to other books, not instead of them.

If this is so, the new departures are a boon to the trade, not a bane. The present practice of pricing books and reprints is founded on the view that demand for books is inelastic: that the possible purchasers or *purchases* of books at any price is strictly limited. The policy stated by Mr Raymond of a high initial price and a slow declension is designed to play a rigidly defined market most profitably. But if the demand for books can be widely increased, the whole outlook changes. The crux of the book business, in fact, is the quest for means to increase the demand for books, to break down the barrier created by education, social cleavage, habit and divergent purchasing powers between the few who can buy books and the many who cannot—or to make those who can buy books buy more. If Mr Gollancz's 50,000 perivert politicians are fresh grist to the mill; if a great part of Mr Lane's 50,000, 100,000 or 150,000 sales is new business; the ululations of an apprehensive trade are premature. And there is no reason *a priori* why cheap books should kill expensive ones. Cheap fashions, cheap motor cars and cheap furniture have not destroyed the demand for their rarer and more costly counterparts.

Nevertheless, plausible guesswork is not enough ground for striking a balance between new and old ways of selling books. The matter can be put more concretely. On the basis of seven and sixpence a copy and a royalty of 20-25 per cent. a new author, Mrs Cole's book suggests, can expect to make between £25 and £100 if his book sells from 1,000 to 4,000 copies. If no more than 4,000 at the most can be sold (and only the very few can command five-figure sales, and they reap the reward of rare favour) it would be ruinous for all concerned to sell initially at less than seven and six. That sort of calculation is the basis of present pricing: seven and six (or, for outsizes, ten and six or even fifteen shillings) leaves a fair share for each of the trinity of author, publisher and bookseller, even within the restricted circle of practising book-buyers; and, commonly, four-fifths of the proceeds come from sales at the initial price and only one-fifth from reprints. Seven and sixpence for as long as possible, with a graded marking-down into cheap editions when the turnover slows down seriously seems, under these conditions, just common sense.

But what if the magic circle of purchasers can be enlarged? The Right Book Club offers a guaranteed 25,000 buyers for its choices; the Book Club the same number; the Left Book Club twice as many. The *rationale* for an initial price of seven and sixpence flies away at once: the makers of the book can all reap their reward from a *lower* price. It has always been clear in the trade that chief among the *desiderata* of bookmen was more purchasers—or, what comes to the same thing, more *purchases*. The National Book Council and the annual Book Fair are co-operative means to this end. The trick of cheapness had

* "Books and the People." By Margaret Cole. Hogarth Press. 48 pages. 1s. 6d.—by which much of this discussion has been inspired.

† "Publishing and Bookselling." By Harold Raymond. Dent. 54 pages. 1s. 6d.

often been tried in past years, but never very successfully. The Book Society by guaranteeing sales of its chosen books to 8,000 members without cutting prices showed the way to the Book Clubs who did. The Penguins and Pelicans succeeded, where decades of sixpennies had failed, for several reasons: they are better produced (costing two-pence each to produce against a gross profit of the same sum), and of better quality; they are more recently written works than earlier cheap reprints; and, very important, they are distributed with splendid efficiency and economy through all sorts of outlets all over the world. For the first time the sixpenny has tapped a sufficiently large sure market to make cheapness worth while. Says Mr Raymond in effect: "When the sale of an eight-year-old novel has dwindled to 500 copies a year at 3s. 6d., bringing in £8 to the author, he will jump at a five- or six-figure Penguin sale, bringing in £30-£50." But it still is more profitable for an author to take a twenty-five per cent. royalty from the sale of one seven and sixpenny book than to take four per cent. from the sale of ninety-three sixpennies.

Topics of the Week

The Railways and the Transport Problem.—The railway companies are carrying on an extensive programme of propaganda, both by advertisements in the newspapers and by posters in their own stations, in favour of their request to be relieved of all restrictions on their competitive freedom. It is too early yet to estimate the nature of the public response. To most members of the public, the problem is so new that they have formed no opinion on it. Among transport experts, those who are not committed to one side or the other of the controversy have shown themselves, in general, to be aware of the justice, at least, of the railways' claim, though many doubts have been expressed about the wisdom, in the public interest, of granting the railways' request. The road transport industry, rather than oppose a case which has such a strong grounding in equity, has decided to press for the removal of its own restrictions, such as the licensing provisions which hinder its expansion and what it regards as excessive taxation. What Parliament will do cannot yet be guessed, and the Minister of Transport is only beginning his examination of the claim. The great virtue of the action of the four railway companies is that it has forced the question of transport co-ordination to the front of public discussion. But the problem is so vast and complex that an extensive process of public education on its essentials will have to be undertaken before there will be any chance of carrying a really sweeping measure through Parliament. That some such sweeping measure will eventually be necessary has now been made clear; and the Government will have to decide whether the railways are to spend the interval waiting for it with or without the present restrictions on their freedom of action.

It is singularly appropriate that the report of the Committee, under the chairmanship of Sir William McIntock, appointed in February last by the Government of Northern Ireland to enquire into the causes of the very imperfect success achieved in its first three years by the Northern Ireland Road Transport Board should appear at this moment. The Northern Ireland Board (which was the subject of two articles in *The Economist* of January 29 and February 5, 1938) is the most ambitious experiment in full transport co-ordination that has been tried in any British country. The Board was given a monopoly of the carriage for hire by road not only of passengers but also of goods (subject to some exceptions, of which the passenger transport undertaking of the Belfast Corporation is the most important). In its first three years, the Board has piled up a deficiency on revenue account that is estimated to amount to £464,000. These

The new sixpennies have not yet struck at the basis of book pricing. They have merely short-circuited the process of reprinting. But only the threshold has been crossed so far: Penguins and Pelicans are more and more up to date; several now are newly-written. And competition will hasten this tendency. If the new public can be held and swollen to fresh dimensions, the book trade will indeed be in danger of *bouleversement*. Initial prices will fall sharply. But, until Mr Gollancz's public and Mr Lane's public are available *in toto* for the mass of publishers and authors, present prices and practices will rule. The well-to-do 4,000 will pay 7s. 6d.; the politically-conscious 50,000 will pay 2s. 6d.; tens of thousands in trains, trams and tubes, including both the present book-buyers and others, will pay sixpence. The day of cheap books for all, dream alike of enlightened bookmen and democrats, has not yet dawned. But it has been brought much nearer: the 100,000 purchasers of Penguins, who represent in number a market of a size otherwise reached only by best-sellers, may yet become half a million habitual book-buyers; then indeed will the book trade take wings.

losses have been incurred, in the main, in goods traffic. The Committee consider that too much was paid by the Board for the transfer of small goods undertakings, while the Board has not secured the transport business of the undertakings acquired, whose proprietors have, in many cases, continued in business in evasion or defiance of the Act. Unfair competition with the Board under the cover of the exceptions to the Act, and increased use of their own vehicles by merchants and traders, have also cut into the Board's resources. Whatever may have been at fault in the Northern Ireland Road Transport Board, it is evidently not, in the Committee's opinion, the principle of amalgamation, for their major recommendations would carry the principle still further into effect. They recommend that the railways of the Province should be amalgamated with the Road Transport Board. An exception has to be made, reluctantly, for the Great Northern Railway, which also operates in Eire, but the new transport monopoly and the Great Northern Railway are to pool their receipts. The Belfast Corporation undertaking is also to be merged as soon as the Board is on a paying basis. The operation of goods vehicles by persons other than the Board is to be very severely restricted and controlled. The complete prohibition of the carriage of goods by traders in their own vehicles is rejected. But they are to apply for a licence, which will not be granted as of right, and the licence holder will be compelled to prove that he is not carrying on an illicit haulage business; he will also have to pay the standard rate of wages. The British railway companies will also be interested in the provision that the new monopoly is to be exempted for five years from the requirement for the publication of fares and for the avoidance of unfair preference. These recommendations are very drastic, and are unlikely to be popular. If they are carried out, they will put Northern Ireland still further in advance of other experimenters in the field of transport co-ordination. The move of the railways in Great Britain has added new interest to the further progress of the experiment.

Financing the Deficit.—The Chancellor of the Exchequer responded on Tuesday to an invitation to give, with a view to allaying anxiety, "some indication of the methods by which he proposed to finance the re-armament programme during the forthcoming year." The gist of Sir John's Simon's statement was that the borrowing limit of £400 millions laid down in the Defence Loans Act of 1936 is to be increased. Of the original £400 millions some £220 millions will remain at the end of the present financial

year. This year's borrowing will be about £115 millions. The country has already been warned that the Air Estimates alone will show an increase of £80 millions, and further increases can presumably be expected on the Army and Navy Estimates and for Air Raid Precautions and similar expenditure. Apart altogether from civil expenditure, next year's prospective deficit may thus be more than £220 millions. It does not, of course, follow that nothing can or will be raised from extra taxation. But the yields of most taxes will be starting to fall next year, and an attempt to impose really drastic increases in the rates of tax, such as would be needed to cover a large part of the deficit, would, at this stage of the trade cycle, be economically unwise as well as politically unpopular. It seems likely, then, that there will be very little of the original £400 millions left by March 31, 1940. The Chancellor's announcement has been, if not popular, at least less unpopular than would have been an expression of determination to raise the largest possible amount by taxation. But no one who looks more than a few months ahead can rejoice in the prospect of such very heavy additions to the National Debt—and in such an unproductive cause.

A British Expeditionary Force?—It was widely reported at the time of Mr Chamberlain's visit to Paris last week that one of the subjects of discussion between the French and British Ministers related to the possibility of an undertaking by Britain to support France, in case of war, by a large Continental expeditionary force. The present explicit policy is that a British expeditionary force, if one were sent at all, would be of no more than "token" proportions, and Mr Chamberlain has declared that no fresh obligations have been assumed. Controversy on this topic has also been raging in the Press, and nothing could more clearly illustrate the extent to which many Englishmen are still living in Cloud-Cuckoo Land than the nature of the arguments put forward. The favourite reason urged against a large Expeditionary Force is that the large army of the last war led to intolerable casualties! On the same basis it might be argued that we should not have lost nearly as many ships at Jutland if we had confined the Navy to a few gunboats and a "token" cruiser. If the only question at issue were whether it will be pleasant or convenient for this country to raise and equip a sizeable army now and to suffer heavy casualty lists in military operations on the Continent if war breaks out, there would be nothing to argue about. But surely the question is becoming very urgent whether something of the sort will not be necessary. If a war should break out in which Germany and Italy were on one side and Britain and France on the other, could France defend her frontiers without the help of a British army? If it is the confident opinion of the General Staffs that she could, well and good. If she could not, then the question arises for us. Shall we face the expense and the inconvenience of arming to support France on land? Or shall we admit that France and Britain cannot defend themselves? And we shall be foolish if we make the mistake of assuming that the two countries can be considered in any other way than as a unit. For if the French frontiers cannot be held, then either we shall have hostile troops at the Channel ports, or else France will be compelled to make her own terms and leave us, before or during the war, in a state of most inglorious isolation. These, stated crudely, are the essentials of the problem. It is to be hoped that they were discussed at Paris in realistic terms, and not merely in terms of what could safely be confessed to the people at the moment. We cannot defend ourselves with one hand in our pocket, merely because it is more comfortable there.

Axes and Triangles.—Two official visits across the front between the Axis and the Democracies are now pending. Herr von Ribbentrop is to go to Paris for the signature of a Franco-German Pact—and he would have

gone, signed, and come back again, already by this time if his visit had not been postponed on account of Wednesday's strike. The Franco-German Pact, which is now in draft, is said to follow in a general way the pattern of the Chamberlain-Hitler Pact that was signed at Munich in September, but it would appear to be less vague, if there is truth in the report that it covers three definite points: first, a declaration that peaceful and neighbourly relations between France and Germany are of importance for the consolidation of Europe and for the maintenance of the peace of the world; second, a declaration that the present Franco-German frontier is accepted by both parties as permanent; and, third, an undertaking to consult together on difficulties and disputes that are of concern to both parties. This third point is evidently the most difficult, as well as the most crucial, for it touches the question of France's obligations—whether in virtue of the Covenant of the League or in consequence of treaties made within the framework of the Covenant—to come to the assistance of third parties. As for Mr Chamberlain's forthcoming visit to Rome, it appears to have arisen out of an invitation that was extended to the Prime Minister by Signor Mussolini during the meeting at Munich. It is now announced that a visit from the Prime Minister some time during the first half of January would be welcome "in principle" to Signor Mussolini. In spite of this cryptic phrase, the date of this Anglo-Italian meeting now seems rather less uncertain than the agenda. The obvious subject for a heart-to-heart Anglo-Italian talk is Spain, in regard to which there has really been no change since the days before Mr Eden's resignation. Signor Mussolini is still, apparently, determined to make General Franco win, while the British Government are still unwilling to grant General Franco belligerent rights until he has carried out his part of the British plan by a proportionate disbandment of the foreign troops in his service. Spain is thus a burning question, but it is possibly one that is too hot to be handled. Perhaps Mr Chamberlain is going to ask Signor Mussolini to show less hostility towards France. And perhaps Signor Mussolini is going to tell Mr Chamberlain that Italy has no great desire to convert the Italo-German-Japanese Anti-Comintern Pact into a three-Power military alliance. This is, after all, a question that may concern Mr Chamberlain no less closely than M. Litvinov.

The initiative for the Rome visit plainly came from London, and Signor Mussolini is at some pains to emphasise his loyalty to the Axis. Count Ciano's speech to the Fascist Chamber on Wednesday revealed in very great detail the diplomatic support that Italy gave to Germany in August and September and the military support she was ready to give if the planned German invasion of

Czechoslovakia led to a general war "on ideological lines." The conclusion of Count Ciano's speech was given a very sinister turn by organised shouts from his audience of "Tunisia," "Corsica" and "Nice." Franco-phobe sentiment is being deliberately whipped up in Italy. Mr Chamberlain will be wise to make it very clear that if Great Britain has to choose between France and Italy, there can be no question which is the more valuable partner. This matter of her relations with France is, indeed, the touchstone of Italy's sincerity in the pursuit of appeasement. Whatever else appeasement may mean, it cannot be reconciled with aggressive designs against the territory of a Great Power.

* * *

Poland, Germany and Russia.—No country in Europe was more immediately and directly menaced as a result of the events of September than Poland—and the danger has not been lessened by the rapid development of Germany's plans for using Sub-Carpathian Ruthenia as a base for pan-Ukrainian propaganda. Poland's first counter-move was to try to secure a common frontier with Hungary by forcing a revision of the Munich award. She tried to bring about the re-annexation to Hungary of the whole of Ruthenia. But this, in spite of Italy's discreet support of the Polish-Hungarian move, seems now definitely to have miscarried. German diplomatic pressure on Hungary has produced a domestic political crisis at Budapest, and in consequence Hungary has now acquiesced, apparently, in the Munich award as defined in the recent German-Italian arbitration. This having failed, the Poles have now taken the more momentous new departure of attempting a *rapprochement* with Russia. Last week-end it was announced simultaneously in both countries that conversations in Moscow between M. Litvinov and the Polish Ambassador had resulted in an agreement on three points. All existing Polish-Russian agreements are to remain in full force—particularly the non-aggression pact of 1932, which has already been prolonged until 1945. There is to be an increase of Polish-Russian trade. And there is to be a "positive settlement" of all questions arising out of treaty relations and recent frontier incidents. What are the political implications of this *communiqué*? Presumably it means that Poland will not join the Anti-Comintern Pact. But then, would she ever have been willing to take an active part in a concerted attack on Russia by the Rome-Berlin-Tokyo triangle? She almost certainly would never willingly have allowed German armies to invade Russia across Polish territory. Conversely, it seems unlikely that, even now, she would dream of inviting Russian armies into Poland in order to help in warding off a German attack on Poland herself. If Poland is to preserve her independence, she must keep both Russian and German trespassers at arm's length. Her difficulty lies in holding either of her gigantic neighbours at

bay without throwing herself into the arms of the other. At the same time, she has links with both of them. A common fear of Ukrainian irredentism binds her to Russia, a common fear of Bolshevism to Germany. Which of these two fears is going to prove the stronger? The answer to this question will give the key to Poland's future foreign policy.

* * *

The Milk Bill Sabotaged.—Protest against the Milk Bill announced last week has grown *crescendo*, and on Thursday it was postponed *sine die*. Strong criticism of the proposed Milk Commission's power to supervise and regulate the sale of milk has come from the National Farmers' Union, the Milk Marketing Boards and a powerful group of Conservative members of Parliament; and vague and not very well-informed alarm about the spread of State interference has been voiced by a section of the daily Press and echoed in such individual utterances as the sermon of a Buckinghamshire parson last Sunday which denounced the Bill as contrary to Christian ethics. For the most part the critics have been barking up the wrong tree. If we assume, as we must, that the prime objective of milk policy should be to secure a plentiful supply of cheap and clean milk for all consumers, the withdrawn Bill is at fault, not because the authority given to the Milk Commission is too great, but rather because it is not great enough. It is common ground that the retail price of milk is too high in part at least because of the wasteful and expensive competition in delivery rounds and extra retail services which is the result of minimum retail margins being fixed by the Marketing Boards. But the Commission's power to rationalise retailing in the interests of consumers is largely confined to the registration of no more than ten schemes put forward by majority groups of local distributors. The effect of the Bill upon distribution therefore would very likely be simply to confirm certain existing local monopolies rather than, as the critics suggest, to create a new bureaucratic tyranny through the Commission itself. And, in any case, the Bashaws of Thames House are scarcely well placed to complain about bureaucratic monopoly, since the Marketing Boards themselves represent producers' monopolies. Admittedly, the drafted Bill gives the Commission authority to regulate the delivery and grading of retailed milk, but this represents no more than the power to ensure orderly and reliable trading which inheres in most local bye-laws. It is true that any thorough-going plan to rationalise milk distribution would probably hit small producer-retailers hard, because there are too many retail units for efficiency, and many of them are too small; but the Bill envisages no such plan. The disquieting feature about the opposition to the Government's proposals is not so much the critics' dislike of the Bill, which, as it stands, is admittedly an unsatisfactory measure, but rather their attack upon principles of regulation which, although not in fact made operative by the Bill, should have been included in the public interest. Again an industry is asking for the right, as the result of sectional pressure, to legislate for itself in its own interests rather than those of the community at large. If they win we shall see a Government which, in the matters of defence and foreign policy, ignores the views of nearly half the nation, capitulating before a tiny but very vocal minority on an important issue of public health and public nutrition.

* * *

A Voluntary National Register.—The Government's eagerly awaited pronouncement on the question of national service proved in the event to be pitched in the same key as the remainder of their policy for defence. They have changed their minds under pressure but not very drastically. On Thursday, Sir John Anderson stated that a register of men and women in readiness for service in an emergency would be set up forthwith. This will be quite voluntary, as the Government still consider that compulsion to enrol and train will not be necessary until an emergency actually arises. There will be five registers for which voluntary enrolment will be called for: one for the auxiliary and civil defence services and others for reserves

for these services and unallocated reserves; one for persons with special technical and professional qualifications, and another for workers in vital occupations. Twenty million copies of a handbook describing the various services available will be distributed by mid-January; a nation-wide recruitment campaign will be conducted; and simple courses of instruction about the general problems of civil defence will be organised. The Government has given an ell where its critics clamoured for something more like a mile. It is all-important that the authorities should know the numbers and capacities of all the nation's man-power; and that the population should know the needs they are to supply. To a great degree the voluntary register and enrolment drive will certainly serve these requirements. But it is most important of all that the whole of the personnel desired for the country's security should be put in training as soon as possible; and this cannot be surely accomplished without some measure of the compulsion from which the Government still flinches.

Parliament and Exports.—The fiscal policy adopted during the last seven years has considerably swollen the importance of domestic markets for British industry, and the most striking expansion has been in trades supplying home needs. But the basic pattern of our economy has not been altered; the dependence of our staple trades upon overseas sales is pointed by the sad plight of Lancashire and the Special Areas; and rumours of war have drawn renewed attention to Britain's necessary reliance upon foreign trade for the greater part of her food and raw materials. In Parliament on Wednesday some apprehension was voiced about the outlook for British exports, whose volume has been diminished by more than one-sixth since 1929. Exports of cotton manufactures fell in value from £145 millions in 1928 to £68 millions last year (although the value of cotton exports to British Colonies has doubled in five years), and up to the end of October this year their volume was only two-thirds of the quantity sold abroad in the first ten months of 1937. Our surplus of merchandise imports over exports has lately grown; its increase in the early months of this year caused somewhat needless alarm in some quarters; and the reversal of this trend in September was in part due to the slowing-up of inward shipments due to the dislocating effects of the crisis. In general, however, the position is by no means so bad as some critics suggest. The chief cause of the decline in the volume of British exports since 1929 has been the growing disparity between import and export prices: the terms of trade have moved mainly in our favour, and there has been no appreciable displacement of British goods in world markets. Take out cotton from the accounts and the fall in exports is not dismaying. Lancashire is a special case; inexorably other countries, and especially Japan, now manufacture textile goods; and one significant token of this trend, cited on Wednesday, has been the export from this country in the last decade of textile machinery to the value of £75 millions, of which over £22 millions' worth went to British India alone.

* * *

Export Policy.—It is true that the National Government has not been over-agile in preparing policy in concert with other countries to free world trade; a fondness for the most-favoured-nation clause in its strictest form has been an obstacle to the formation of lower tariff groups, and the consequences of the Ottawa Agreements, which affect only half our exports, have not been conducive to the clearing of trade channels. Yet agreements with Scandinavian countries, for instance, have increased the value of our exports, especially of cotton and coal, by £125 millions in six years; and, as the Commons were very ready to say on Wednesday, the new Anglo-American Trade Pact represents a signal success for the policy of loosening world trade. The immediate bogey for the British exporter, who has nowadays to battle in most countries against a serried array of restrictive devices, is Germany. German subsidised

exports are known in every market, including our own; and Germany's barter and clearing agreements, reinforced by bizarre methods of currency manipulation and blocked debts, have captured the markets of South-Eastern Europe and lately brought Poland closer to the Third Reich in commerce. Hitherto it has seemed that considerations of higher diplomacy precluded any riposte from Britain; King Carol's recent visit to London has so far borne no commercial fruit. But, speaking for the Government on Wednesday, Mr R. S. Hudson was not so complaisant. He fore-shadowed no direct reply by the British Government to Germany's policy of offering (if not actually paying) prices well above world levels to win markets; but he spoke of organising British industries to speak as units to their opposite numbers in the Reich and to threaten retaliation unless unfair competition ceased. Whether it is wise, in the public interest, to hand over the weapon of bargaining to industrial monopolies is by no means certain, though it is undeniable that the unorganised state of, say, our cotton industry is a disadvantage, *vis-à-vis* the State concentrations of other countries. That the Government should express its preparedness to face the German challenge, on the other hand, is wholly welcome. The danger is not in South-Eastern Europe, where our trade is small, but in South America and wherever else the Germans may choose to turn in the near future. But the Government may find itself compelled to take up the burden itself, and add the protection of exports to the other items of national defence.

* * *

The Waste Land.—A week ago the Commons gave a second reading to a privately introduced Public Health Bill designed to induce local authorities to deal summarily with the conspicuous nuisance of burning pit-heaps. There are probably more than 5,000 unsightly dumps of colliery refuse in England and Wales, and 266 are on fire. One covers 50 acres; another is as high as Big Ben. Evil smelling, these burning mountains scatter clouds of dust and sulphuric dirt far and wide; paintwork and woodwork are corroded; and the lungs of near-by dwellers are choked with noxious fumes. Not far short of 10,000,000 tons of refuse are placed on the pit-heaps every year; foul and hideous, they are the chief feature of the landscape in the British coalfields. It is easy to agree, as the Commons did, that the heaps should be dealt with summarily, but not so easy to decide what to do with them. To replace the waste of mining underground is only partially possible. To spread it over fields beneath a layer of soil is expensive, though an assistance to farming in waterlogged areas. To tip it into disused quarries is not feasible everywhere. To make it into bricks, as is already done in Scotland and the Midlands, is not always practicable. Yet the nuisance of these grave eyesores has been better abated in countries like Germany than it has been here, and a combination of these

devices, enforced under the terms of Mr Lawson's Bill, with local authorities and the Department of Mines constantly on the alert to point the collieries' responsibility to the community, might remove the nuisance. Moreover, the problem of pit-heaps is only part of a wider problem. Industry is seldom a pleasant neighbour, and for a century it has laid Wales, the Midlands, the North and Scotland waste. It has been no one's duty to prevent or cure the scars: gaping quarries and stark, rusting factories and machinery stand side by side with coal's pit-heaps and iron's slag-tips, mountains of shale and dumps of chemical waste; acid smokes and cement dust sterilise the soil. Only when a positive nuisance is proved is legal action possible, apart from certain special provisions for some offensive trades. For the most part the damage is done before remedial steps can be taken; and the problem of the industrial damage which has made the older industrial areas infernal regions is one with the problem of pollution which has lessened the amenities of Britain's coasts and rivers, and the problem of domestic smoke which has blackened our towns. A Departmental Committee is now sitting to consider the restoration of land affected by iron-ore working. In the Special Areas salutary action has sometimes been taken, as in the Team Valley, to clear away industrial debris. But public health, public amenity and public economy require a more positive preventive policy over the whole field of industry and a definite apportionment of responsibility between public authorities and private enterprise for keeping England's land as green and pleasant—and productive—as possible.

* * *

Czech Swords and Ploughshares.—According to German estimates the productive capacity of the Czechoslovak munitions industry is put at about 50 per cent. of that of the Reich. At present little of this is turned to the production of non-military goods; and it is Prague's concern to encourage and increase the transition. In 1937 the Czechoslovak export of munitions was Kc.434 millions (about £3,100,000), of which Kc.237 millions went in arms, Kc.104 millions in ammunition, and Kc.93 millions in military aircraft and equipment. The most important markets were Roumania, Yugoslavia, Turkey, China, Iran and Brazil, though a great deal of this military production was for home requirements which have now disappeared. In German circles the point of view is being put that these industries should be nationalised, and that export markets could thereby be widened, but people in Prague are wondering if this wish may not be father to a number of very different thoughts. The Prague banks are meanwhile anxious to increase the production of "peace" goods. Skoda is concentrating on its machinery, electrical, and automobile activities, and the second most important concern in Czechoslovakia, the Kolben engineering works in Prague, is following suit; while the State-controlled arms works at Brno is turning out typewriters, bicycles, and precision instruments. Other firms, like the Sellier and Bellot A.G., will also be affected by this effort to convert the sinews of war into those of peace. It is denied that there will be a change in the share-ownership of Skoda. The majority of shares will remain in the hands of the Union Européenne, the Paris holding-company of Schneider-Creuzot, though it seems probable that Germany will buy for her own needs the greater part of Czech arms production.

* * *

Industrial interests in the Reich are already trying to prevent the establishment in Bohemia-Moravia of industries which could compete with those in the ceded areas. A demand has been made by the German Government that all property, amounting to about £60 millions and even including currency and bar gold, which was removed by Jewish or Czech refugees, shall be returned; and in another direction the industrialists of the Sudetenland (whose prospects are bad enough already) are claiming that the cartel agreements made under the old Republic are still valid, and that no new industries may

therefore be established without their consent. The new Prime Minister, the reactionary Agrarian M. Beran, may find the answers to this and similar questions no more easy and satisfactory than the answers to other problems which M. Benes found and for which M. Beran constantly criticised him. The election as President of M. Hacha, a Slovak jurist without any political past or, as far as one knows, any political views, completes the formal reconstruction of Czechoslovakia. It will indeed be a different country from that of Masaryk and Benes. Whether even this truncated "Second Republic" will continue for long to enjoy its very modified independence is a very open question. The autonomous Governments of Slovakia and Ruthenia are fully under German influence, and the Slovak "Hlinka Guard" stands in close relationship to the German Nazi formations. An appeal for help in "pacifying" the country, followed by complete occupation by German troops, would be in the tradition of German policy.

* * *

An End to the Iron Guard? — Just five years after the Iron Guard murdered its enemy, M. Duca, who, as Prime Minister of Roumania, had placed a ban upon its activities, its leader Corneliu Codreanu and thirteen of his followers were shot on Wednesday while attempting to escape from their prison guard. The incident, which can eventually become either a national saga or an entry in forgotten police records, but is in any case of great immediate importance to Roumania, took place in open country during transport of the men from one prison to another. Shots from ambush halted the prison lorry, and while the guards were engaged in shooting back, the prisoners leapt out and ran for cover. All of them are dead. The fact that in such circumstances the death of a strong leader can make or mar a revolution was not lost on King Carol. The same evening he issued through the Government orders to the gendarmerie which make clear his intention to stamp out the Iron Guard. "Political terrorists are to be attacked at once," runs the order, "without necessity of complying with the usual regulations for warning before shooting." This is war to the knife; and after the outburst of terrorism which signalled the King's recent absence from Roumania in attempted murder, arson, and widespread intimidation, its declaration does not come too soon. The King's method in the past has been one of patient and concealed gathering of forces until in an apt moment he could surprise his opponent; what with this technique, which is not at all in the flamboyant Balkan tradition, and the example of his treatment last winter of M. Goga's anti-semitic excesses and fascist-minded followers, there is good hope that the movement of M. Codreanu will lose no time in going the way of its leader.

Iceland's Anniversary.—On November 30, 1918, when the world had good excuse to forget the very existence of such a place, Denmark's equivalent of the Statute of Westminster gave Iceland, after 500 years of Danish dominion, the rank of sovereign and independent state. King Christian the Tenth is King of Denmark and of Iceland, the symbol of a union of two friendly peoples entered into voluntarily and equally; and in this week's twentieth anniversary celebrations there was no trace of that bitterness which a subject people might have felt. For the high conception of civil dignity which enables Iceland's tiny population of 115,000 (or just over one to the square mile) to stand thus firmly on their own feet, the sea is mainly to thank. The sea may surround Iceland with imposing horizons; but it also maintains the Icelanders. Seven thousand of them live by fishing, and in 1935 by means of 81 steam vessels and 316 motor vessels they brought ashore over 313,000 tons of fish. Foreign trade *per capita* is very large. Their exports consist in canned and fresh fish, tallow and oils, in order of importance to Portugal, Great Britain, Germany, Sweden, and the United States; their main imports are textiles, hardware, machinery, timber, coal and cereals, from Great Britain, Denmark, Germany and

Norway. Iceland is without railways, and before 1918 was practically without roads. But the last twenty years have been richer in progress than any other period of Iceland's history. Industry, transport, agriculture and social sciences have all shown a growth that is as pleasing as it is astonishing. Education, for instance, is now free and compulsory up to the age of 14, and a free course at Reykjavik University awaits those with ability. Europe seldom hears from Iceland, save in a meteorological sense; but this is a case for the old proverb—no news means good news.

* * *

Other Aryans!—It is a thesis not unheard in Germany to-day that the English are "more Aryan" even than the race which produced Herr Rosenberg. This doubtful compliment is also extended to Scandinavians; but they, living nearby, have perhaps more reason than we for looking this gift horse in the mouth. Sweden above all may not forget that her goodwill—and, by extension, her iron mines—are necessary to the fruition of Herr Hitler's plans. German influence would seem to take three main forms in Scandinavia, and each of these has come up for public notice in recent weeks: propaganda among Germans living in Scandinavia, and among Scandinavians proper, action through the diplomatic channel, and espionage. In North Schleswig and South Jutland the German minority of 30,000 has for some time exhibited characteristics already familiar in other German minorities subjected to *völkisch* propaganda, though in Denmark the sting is drawn from their agitation by the well-balanced liberalism of Danish policy; and a comparison of election

results since the War shows a decline in votes polled for German deputies to the Folketing. What amounted to 25 per cent. in 1920 in North Schleswig was only 13.2 per cent. in 1932, and after the coming of Herr Hitler only 15.5 per cent. in 1935. Propaganda among Scandinavians can make little headway as long as the velvet glove so transparently covers a mailed fist: meanwhile, the failure to deceive is ascribed at home to the spiteful workings of international Jewry, and in default of subtler methods the blunter weapon of direct diplomatic action is not forgotten.

* * *

Finland was startled the other day by the resignation of its distinguished Foreign Minister, M. Holsti, on the pretext of insufficient salary; and among the unofficial reasons for his demise were none that did not include a demand from the German Government. In Denmark a similar request has procured the removal of M. Blaedel, foreign editor of the *Berlingske Tidende*. Other offenders are presumably invited to take note. The third outcrop of German influence, that of espionage, is one which raises few delicate problems, for its tradition goes back far enough to have established certain well-understood rights of procedure. After the recent unmasking of a German spy ring in Denmark, both that country and Sweden have announced that they will take intensive precautions to forestall further activities in espionage. So far the honours may be about even: but it would be a mistake to think that the German Government will miss any chance of spreading among these countries of the Sterling bloc the impression that politically they are safest when they behave as good Aryans should.

France

M. Daladier Wins

PARIS, December 1.—The general strike was a complete failure. The firm measures taken by M. Daladier and the further steps he threatened were decisive. But it was the advent of a new atmosphere which suggested these measures and made them so easily effective. The working classes are tired of the policy of the now-dead Popular Front. The French people are not interested in revolutionary changes and economic regimentation. Wages and hours are their chief preoccupation, and the increases in wages which they have won under the Popular Front have been dissipated in higher prices. In addition, the slogan "Guns and munitions for Spain" has lost its appeal; and, most important, the working classes, like the rest of the nation, were deeply worried about the threat of war in September. In short, ideology has lost ground, confusion reigns in the trade unions and Left political groups, and the way is open for the renewal of the authority of the Government. This is M. Daladier's hour, and behind him are all the liberal forces of the country.

M. Daladier has for his Finance Minister M. Reynaud, who is a first-class economist. M. Reynaud's recent analysis of the French economy was unique, and he has advanced arguments for the freer working of capitalist enterprise which have not been heard for many years. This time the appeal to capital will not be hindered by inordinately high French prices as it was at the epoch of the gold franc; nor will it be blocked by the 40-hour week, which has now been revised. The competing attraction of prosperity overseas has also diminished. Sterling is weak, and there is uncertainty in Wall Street. Finally, the fear of foreign conflicts has somewhat abated since Munich and the renewal of Franco-British collaboration has increased confidence. It was these factors

and the Government's strength in face of direct action in contravention of constitutional methods which caused the franc and the Stock Exchange to show unexpected firmness on the eve of the general strike.

The strike's failure is without doubt a great gain for the Cabinet. By refusing to strike the man in the street has to some extent endorsed the decrees which would otherwise have met with serious opposition in Parliament. Yet the game is not finished. There will be rancour and a desire for revenge. The all-important questions now are how far the capitalists, in their turn, will help M. Reynaud's policy to succeed, and to what extent it is a policy capable of success.

Gold Stock Revalued

The discount rate of the Bank of France has been lowered from 3 per cent. to 2½ per cent. and the rate for advances from 4 per cent. to 3½ per cent. The weekly return dated November 17th shows the new position of the bank's accounts after the revaluation of the gold stock and the application of the proceeds to the reimbursement of the advances to the Government. The revaluation of gold produced 31,455 million francs against a total of 52,000 millions of provisional advances to the State. There remains a balance of 20,600 millions of provisional advances, which will be reimbursed at the time when the franc is finally stabilised by a final revaluation and the liquidation of the Equalisation Fund and the Fund for the support of public funds. The "permanent loan" of the bank to the State was increased from 3,200 million francs to 10,000 millions.

At the same time, the rate of interest on the National Defence Bonds was lowered from 4 per cent. to 3.5. The rate of interest on Treasury Bonds was also lowered: on one-year bonds from 3.75 to 3 per cent.; and on six-month bonds from 3.25 to 2.75 per cent. Thus another step has been taken on the road to cheap money.

Output and Prices

Pig iron production in October amounted to 490,000 tons, against 446,000 tons in September, 419,000 tons in August, and 705,000 tons in October, 1937. Steel production was 509,000 tons, against 467,000 tons in September, 419,000 tons in August, and 703,000 tons a year ago. The number of furnaces in use increased from 78 in September to 81 in October, compared with 107 in October, 1937. And in the week ended November 19th the total number of persons unemployed in all trades was 367,947, against 364,210 on November 12th and 327,494 a year ago.

Wholesale prices are still fairly steady, though last week's movement was distinctly upwards. All prices rose very slightly, the prices of industrial goods and imports most of all.

	November, 5th	November, 12th	November, 19th	November, 26th
General Index ...	652	653	653	658
Domestic products	670	670	674	678
Imported products	619	623	617	623
Foodstuffs	635	631	635	637
Industrial products	667	673	670	678

In general, however, the most impressive feature revealed by this table of recent price movements is the extent to which all prices have been relatively stabilised.

Germany

Progress in Agriculture

BERLIN, November 29.—Owing to the great prominence given to the Four-Year Plan for German industry during the last two years, agriculture has been rather relegated to the background. At the Sixth Annual Congress of Agriculture, which has just ended at Goslar, the Minister of Food and Reich peasant leader, Herr Darré, surveyed the record of Nazi policy for farming, and stressed the special problems which had still to be solved. The food authorities, that is the Reich organisation of all concerned with food supplies from the peasant to the retailer, had now the special task of supervising the feeding of Austria and the Sudetenland and of organising the agricultural production of those areas. In addition, the 100,000 workmen employed on defence works in the West had to be fed; and it was necessary to find supplies to compensate for the lost output of the agricultural land now used for fortifications.

Recent harvests have been satisfactory. The increase in the production of cereals and root crops, especially of sugar beet and potatoes, has been the most spectacular success in "the battle for production."

The wheat harvest of 25.9 million tons is the largest the Reich has ever had, although the acreage cultivated was 13 per cent. lower than in 1913. Barley, beet sugar, potato and hemp crops were all appreciably higher than in most post-war years; and the raising of hemp production by 70 per cent. compared with last year is remarkable. Meat production, too, was above the average of the last five years; but much still remains to be done to improve and increase milk production and to bring supplies of root crops and fodder up to requirements. Thus the agricultural scene presents a mixed picture of striking success and important deficiencies.

Herr Darré expressed the opinion that a successful blockade of Germany was now impossible. Figures show, however, that Germany's needs can by no means be met from domestic production, and that a blockade could only be withstood by very severe rationing. In fats, for instance, Germany is dependent upon imports for almost half her requirements. And there are difficulties in the way of increasing agricultural output. After 1933 the Nazi Government raised prices considerably to assist farmers, and the index of farm prices (on a pre-war base) rose from 78 in 1933 to 102 in 1936, and is now slightly higher than this. At first, farmers' margins increased but, as a result of the Government's commercial policy, agriculturalists had to pay more for machinery and in other expenses; and, in general, prices moved to the disadvantage of the peasants.

Shortage of Farm Labour

The greatest problem with which German agriculture is faced to-day is a shortage of workers. The numbers have fallen, though the farm wages bill has risen by Rm. 370 millions in the last four years to its present level of Rm. 1,740 millions. Herr Darré estimated that the present shortage of agricultural labourers was between 700,000 and 800,000. There has been a flight from the land due to lighter work and higher wages in the towns; and this, Herr Darré said, could not be overcome simply by legislation. Only an appeal to the youth of the nation could be effective.

The introduction of compulsory labour and military conscription, together with the execution of the Four-Year Plan, have brought young people from the countryside to the towns and the industrial centres. The countryside has suffered because the Four-Year Plan has had first claim on labour, materials and capital. Rural housing, for instance, is very inadequate. Thus German farming has no other course but to fall back upon imported labour. There are already thousands of Italians on German farms, and it is now expected that to these will be added Slovaks and, possibly, Croats and Hungarians.

Another method of coping to some extent with the problem is to speed up the mechanisation of agriculture—which is quite contrary to pure Nazi doctrine. Expenditure for agricultural machinery has increased from Rm. 138 millions in 1932-33 to Rm. 460 millions in 1937-38. The chief outstanding problem is the provision of cheap electric power for farms.

The importance of agriculture in the German economy, industrialised though Germany is, is very great. The value of Germany's annual milk production, amounting to some Rm. 2,500 millions, considerably exceeds the value of its output of hard coal; and the value of its meat production, which is some Rm. 4,500 millions per year, is almost equal to the value of Germany's exports of finished goods in 1937.

Distraining upon the Jews

The Jewish problem is still a source of disquietude for many Germans. Jewish professional men, who were arrested a fortnight ago, are now coming back with stories of incredible happenings in the concentration camps, and they are straining every nerve to secure permission to emigrate. Last week, Field Marshal Goering conferred with local Nazi leaders about the levying of the fine on the Jews. The levy of 20 per cent. on Jewish property is to be raised in four instalments. As Jewish property is officially valued at Rm. 5,000 millions, which is much too high, it will probably be necessary to raise the percentages levied and, since the Jews have not enough actual cash to meet the demand, the collectors will have to accept bonds and some immovable property in part payment. Places for the sale of jewellery and works of art have been set up to enable Jewish possessions to be realised and, since there must be pressure on the markets for jewels, furniture, bonds, etc., prices will tend to fall.

An example of the way in which the Jews are being mulcted is given by the following authentic case. One Jew had property worth Rm. 100,000, which, after having been dealt with by various agencies, was cut down to a mere Rm. 2,100 in foreign exchange. The City of Berlin took Rm. 30,000, the Jewish levy took Rm. 14,000, the flight tax took another Rm. 14,000 and a further tax of Rm. 7,000 was levied on the possessions which this Jew hoped to take abroad. This left him with Rm. 35,000; and he now considers himself fortunate to be permitted by the Gold Discount Bank to take out of the country in foreign exchange 6 per cent. of this sum, or Rm. 2,100. At current exchange rates, this amounts to less than £184, instead of £8,333, which his original property represented.

The Anglo-American Pact

The conclusion of an Anglo-American Trade Treaty has been received with lively misgivings by German export industries. It is expected that American competition in the British market will be especially strengthened; and, in the American market itself, the aversion of the United States to German political and commercial methods is likely, not only to deprive German traders of most-favoured-nation treatment, but also to create further obstacles to the import of German goods. Dr. Schacht's newspaper argues, however, that the concessions given to the United States in the British colonies will open up colonial trade and enable Germany to obtain greater supplies of materials from British possessions. And it is officially expected that the Treaty will give a fresh fillip to world trade from which Germany will benefit. Privately, on the other hand, it is feared that the Treaty may prove to be the beginning of an economic bloc which will include, not only the Oslo States of Northern Europe, but also the countries of South America in which Germany is interested. Already, German opinion is being voiced against attempts by the United States to dominate South America by granting large dollar credits; and the inclusion of South American security among the grounds for the United States' new re-armament programme is interpreted as yet another attempt by the United States to gain hegemony in South America.

Trade Policy

Dr Schacht, in a speech to-day, declared that the Reich's control of foreign trade was due to the "consequences of the war-tributes" levied on defeated Germany. He looked forward to freer multilateral trade and a free international flow of money. Meanwhile, "as long as our shortage of foreign currency lasts, the control of foreign trade must continue"; though Dr Schacht hoped it could soon be abandoned. Between 1934 and 1937 imports of finished goods had fallen 63 per cent., he said, while imports of ores, petroleum and grain had risen by well over 100 per cent.

Dr Schacht emphasised that armaments could only be financed in the long run out of savings. He claimed that, whereas State credits had paid for arms output at first, it was now met out of loans and taxes. "Armaments cannot be financed by creating money."

Sweden

Co-operation in Industry

STOCKHOLM, November 24.—To the honour of the Swedish Labour Party it must be said that the striking political advance which it has recorded during the past years has by no means diminished its willingness to co-operate with capital and production. That the spirit of co-operation is gaining strength on both sides is particularly noticeable over labour disputes, where methods of settling conflicts have undergone substantial changes. While strikes and lockouts are not entirely outmoded as means of obtaining material concessions, they are coming to be considered more and more as *ultima ratio*, and direct negotiations between employers and employees have become the usual procedure for settling conflicts. A further contribution to better understanding between State and private business was recently made by the Minister of Finance, M. Wigforss, when in a public speech he proposed for State authorities and representatives of private business direct conversations on their most salient differences of opinion and practice. The proposal was well received by a wide section of the Press; and it is expected that M. Wigforss will define the procedure for such conversations in a speech which he is to make at a forthcoming meeting of an important Swedish business club.

Turn Towards Improvement

In spite of a rather uncertain outlook for most Swedish staple industries, there has been an improvement lately in the general economic situation. Thus the general index of Swedish business activity, which, with the exception of a seasonal rise in February, steadily declined throughout the current year, recorded in August a rise of 1.3 points to 113.1 (100 = average 1935), and it can be taken for granted that there will be a further rise in the September index. The building boom, entailing increased consumption of iron and steel

and consequently improved employment in the iron and steel industry, and well-maintained employment in the engineering industry, is one of the main supporting factors. It is rather doubtful, however, whether this improvement can last with declining exports, and this in turn depends on the situation in the United States and in Great Britain. Owing to the building boom, employment is on the whole good; and the number of registered unemployed stood in September at 9,200 as against 10,000 in September, 1937.

Poorer Export Trade

The building industry is working to full capacity under favourable conditions of exceptionally cheap money, and the volume of mortgage loans granted by commercial banks increased from Kr. 1,770 millions in February to Kr. 2,005 millions in September. This has naturally caused a growing demand for commercial steel, and iron and steel works producing lower quality steels report a good supply of orders. Less good is the situation of manufacturers of high quality steels, the bulk of which is destined for export; but the American recovery is already being felt and will, if it gains in strength, further increase employment. The pulp market, unfortunately, has not shown signs of real improvement and the outlook is far from being bright. The warehouses of most pulp mills are filled with unsold goods waiting for foreign orders, while pulp stocks in American harbours show no signs of diminishing, and the mills also have considerable stocks of pulp wood bought at higher than current prices. New business almost entirely consists in the conversion of old contracts. Exports of sulphite pulp, which amounted to 938,000 tons for the period January-September, 1937, fell for the corresponding period in 1938 to 686,000 tons. On the paper market stagnation continues. The timber market is dull, and by the middle of November timber sales, including box boards, had not exceeded 675,000 standards, compared with 800,000 standards at the corresponding date in 1937.

The weakness of the timber, pulp and paper industries is to some extent compensated by a certain liveliness in the engineering industry. Exports of ball bearings for the period January-September were valued at Kr. 36.2 millions compared with Kr. 30.4 millions for the corresponding period in 1937; exports of electrical equipment at Kr. 12 millions against Kr. 11 millions, and of telephone equipment at Kr. 7 millions against Kr. 5 millions. Employment in Swedish shipyards is also very good owing to a satisfactory supply of foreign orders, especially from Norwegian shipping companies.

The situation in the pulp, paper and timber markets has naturally resulted in a marked decline of exports in respect of volume as well as value. Foreign trade figures for the period January-September are shown in the following table:

	(in million kronor)	
	January-September 1938	1937
Imports	1,480.6	1,542.0
Exports	1,339.0	1,414.7
Import surplus	141.6	127.3

Trade with Great Britain during the same period was as follows:—

	(in million kronor)	
	January-September 1938	1937
Exports to U.K. ...	321.0	328.4
Imports from U.K. ...	272.3	292.6
Export Surplus	48.7	35.8

Wholesale prices, which from an index figure of 137 in January, 1938, have gradually declined to one of 123 in September, remained at 123 in October. Consumption goods,

however, show a striking stability, and the index of retail prices has during January-September oscillated between 105.5 and 105.9.

Slack Money Market

An active balance of payments, the influx of refugee money and decreasing opportunities for remunerative investment, have combined to increase the easiness of the Swedish money market. Interest rates are also tending to decline. It is characteristic of the situation that a 3½ per cent. loan of the State of Denmark, a country which has introduced foreign exchange control, was issued in Sweden at par value and immediately covered. This abnormal condition of the money market is causing great concern to commercial banks, insurance companies and saving banks; and these three groups are now trying to find ways and means of putting a stop to this trend towards low interest rates—a trend which threatens to paralyse the progress of savings and the building up of capital, besides causing losses to people with capital investments, and forcing insurance companies to raise their premiums. Co-operation between the three above-mentioned groups has been proposed as a means of stabilising interest rates.

The war threat in September caused an unprecedented rush from foreign currencies into the krona, Swedish holders of foreign currencies selling out their balances and foreigners buying kronor balances. As a result, cash holdings of the Swedish joint-stock banks rose to Kr.841 millions, their indebtedness to foreign banks and private depositors from Kr.371 millions to Kr.495 millions, while their foreign holdings fell from Kr.248 millions to Kr.201 millions. The Riksbank, as ultimate recipient of foreign currencies, had to increase its net balances with foreign banks from Kr.244 millions to Kr.478 millions, and its total gold reserve from Kr.617 millions to Kr.684 millions, valued at the statutory gold value. These holdings of foreign deposits mean that the Swedish banks must maintain very high cash balances in order to meet possible withdrawals.

Fluctuations on the Swedish Stock Exchange during September and October were largely reflections of Wall Street. In September, the general Stock Exchange index declined from 167.8 to 166.2, but rose in October to 177.5 (100 = par value). For obvious reasons big international stocks, such as S.K.F., Swedish Match, Elekrolux, etc., were subject to particularly violent fluctuations during the political crisis in September.

Spain

New Financial Laws and Taxes

BARCELONA, November 20.—In the sessions of the Spanish Cortes on September 30th and October 1st several important financial laws were voted and Señor Aspe, Minister of Finance, presented the Budget for 1939. The Budget, duly approved by the appropriate parliamentary Commission and voted unanimously, fixes expenditure at 8,403,042,633 pesetas and receipts at 8,309,636,320, or a deficit of 93.4 million pesetas.

The financial laws included one by which the Government is empowered to float, in one or several parts, loans amounting to a total of 2,500 million pesetas, to be offered at a rate of interest not higher than 3½ per cent., refundable after five years or more. There will be bonds of two classes, popular bonds of 100 pesetas, and ordinary bonds of 1,000, 5,000, 25,000 and 100,000 pesetas face value. The popular bonds will be issued without coupons, and the interest paid by the bank at which they have been subscribed.

Among a number of extraordinary credits voted for public works appeared one for 20 million pesetas for building new roads, another for 12 millions for repairing the existing ones, and a third for 8 millions for building bridges, etc. In the decree approved by the Cortes with the Budget, the amount of uncovered debt the Government is authorised to incur during the financial year of 1939 is limited to a maximum of 25 per cent. of the Budget income.

The Cortes also empowered Señor Aspe to increase the existing taxes and create new ones. The following changes were made:—A charge, with a maximum of 25 per cent., on the sale of articles which, though not luxury goods, are not indispensable; an increase in the tax on landed property; an increase of 20 per cent. in the tax for motor cars, excepting lorries used for transporting essential goods or raw materials for war industries.

New taxes on profits were also passed through the Cortes. The Minister of Finance is authorised to adopt the following measures to enable the State to obtain a share in the profits of establishments of all kinds.

(a) For establishments seized, the share of the State may be as high as 25 per cent. of net profits;

(b) For establishments neither seized nor controlled by the State, the maximum profits realised may in no case exceed 7 per cent. of the invested capital, after deduction of all expenses. If higher profits are made, the balance is to go to the State.

(c) A new turnover tax, of no more than 3 per cent., on transactions of all kinds, such as sales, loans, agency business, etc.;

(d) Taxes on all meals, etc., in most restaurants and cafés, on betting at dog races and the game of "pelota." This tax will be fixed at between 5 and 10 per cent.

Court for Foreign Claims

At the outset of the rebellion, consulates of foreign nations at Barcelona provided their respective nationals with safe-conducts stamped by the various authorities and committees then in power. Later on, in August, 1937, when things had somewhat settled down, a special Commission was founded for the examination of claims for damages brought forward by alien subjects and companies. By a decree of September 7th last, which cancels all those previously in force, Dr Negrin has now substituted for this Commission a Special Court, attached to the Supreme Court of Justice, called *Sala de Reclamaciones de Extranjeros* or Court for Foreign Claims. One of the Court's most interesting features is the admission of foreign lawyers charged with the defence of the rights of their respective countrymen.

The Court will be ruled by a President and composed of three judges taken from the Supreme Court and three assessors named from high officials on the staff of the Prime Minister's Department, the Ministry of Foreign Affairs, and the Ministry of Finance and Economy. The President will be chosen by the Government from the presidents and judges of the various benches of the Supreme Court; and the technical staff of the new Court will be appointed by the Minister of Justice. Each Ministry has to designate a Counsellor of State for the defence of public interests within his particular sphere of action, and in case several Departments are involved the one appointed by the Prime Minister is to represent all of them. The fourth article of the decree states that the new Court is the only one competent in cases of claims against the Spanish Treasury by persons or companies recognised as foreign before February 16, 1936.

The procedure at the Court for Foreign Claims comprises: filing of a claim, pleading by the special Counsellor of State on behalf of the Government, evidence of witnesses proposed by both parties and admitted by the Court, public session and verdict. According to Article 5 of the decree, judgments given by the Court are to be based upon international agreements and special agreements that may exist between the Spanish Republic and the country of the claimant, subject to the principles of reciprocity and others usually recognised. Article 6 stipulates that the claimant's counsel may be a foreign subject, provided the latter is able to prove that he belongs to the Bar in his own country and is capable of expressing himself fluently in either Spanish or French. If in French, then the claimant must provide a sworn translation.

Foreign Bank of Spain Expropriation

The text of a law expropriating shareholders of the Foreign Bank of Spain (*Banco Exterior de España*) was issued in October and passed by the Cortes. In use of the power accorded to the Government by Article 44 of the Constitution, all shares at present in the hands of the public and representing the capital of the bank will be expropriated and taken over by the State without loss to holders.

The Government has asked the Cortes to approve the following mode of expropriation. The State shall superintend the working of the Foreign Bank of Spain by means of expropriating the bank's 195,844 shares. The value of the shares will be fixed at their highest quotation on the Madrid exchange between January 1 and July 30, 1936. The total amount due to shareholders on this basis will be deposited for them in a special account at the Bank of Spain in Barcelona. A Commission formed by one counsellor or shareholder appointed before July 18, 1936, and one member of the board of the bank appointed by a decree of August 28, 1936, and presided over by the governor of the Foreign Bank of Spain, will attend to the settlement and payment of the shareholders. The State will be assumed as having been in possession of the shares from July 1, 1936, so that all transactions made by the bank since then will be recognised by the State in its quality of sole shareholder.

Greece

Need for Exports

ATHENS, November 23.—A law to foster export trade has been prepared by the Minister of National Economy. In his introductory report the Minister states that the export trade for a country like Greece, which produces valuable agricultural articles of which only a very small part can be consumed at home, is of especial importance. This importance is at present particularly marked, since restrictions on the free movement of goods, capital and services all over the world prevent surpluses of imports over exports from being covered by the migration or the transfer of capital, as was the case before the last war. The new law is designed, *inter alia*, to penalise exporters who, in order to realise illegitimate profits, break their obligations to foreign purchasers.

The following table shows foreign trade in 1929 and 1937:—

	Imports		Exports	
	Volume ('000 tons)	Value (£ mills.)	Volume ('000 tons)	Value (£ mills.)
1929	2,773	35.4	754	18.6
1937	2,731	27.6	1,377	17.4

In the current year provisional figures for the first nine months show a small decline in volume and a slight increase in value for both imports and exports, with, as a result, a very slight reduction in the import surplus.

Germany's Trade Gains

The change in the relative position of the United Kingdom and Germany in Greek trade is noteworthy.

	(Millions of drachmæ)			
	1929	1933	1936	1937
Imports from:—				
Great Britain ...	1,688	1,209	1,926	1,667
Germany	1,249	864	2,676	4,134
Exports to:—				
Great Britain ...	815	973	899	922
Germany	1,613	918	2,688	2,959

The increase in imports from Germany is associated with the growth of exports to that country. In accordance with the clearing agreements regulating trade between the two countries, the balances in blocked marks which accumulated in favour of Greece, as a result of larger German purchases, had to be liquidated in German goods. Hence the recent increase in imports from Germany—particularly in 1937.

Exports of tobacco—Greece's principal product—during the "tobacco year" ended August 31, 1938, amounted to 46,000 tons, valued at Drs. 4,844 millions; this was an increase compared with the previous year of 6,500 tons in quantity and Drs. 900 millions in value. The largest purchaser of Greek tobacco was, as usual, Germany: German purchases were 21,700 tons, against 17,700 the year before. Second came the United States, with purchases of 9,900 tons, while Great Britain bought only 229 tons. Thus, about half of the total exports of tobacco were taken by Germany.

Export prices for tobacco were higher for the year ended August 31st, averaging Drs. 105.66, against Drs. 100.56 per kilogramme the year before. This year's output is estimated at 46,100 tons, against 68,800 tons in 1937, the decline being due to inclement weather and restrictions on cultivation. Tobacco production has also fallen in Bulgaria and Turkey; stocks are not abnormal; and this year's prospects for both sales and prices are favourable.

Stimulating Cultivation

Successful efforts to encourage the cultivation of rice and cotton have been made by the authorities in recent years. Since the country's requirements of these two commodities were formerly covered almost entirely by imports from abroad, an appreciable saving in foreign exchange is now made. The Agricultural Bank has recently undertaken to make. The Agricultural Bank has recently undertaken to make take up the total rice production at fixed prices and dispose of it afterwards to the trade. The same procedure is followed in the case of home-grown wheat, and the growers secure an automatic sale of their produce at favourable prices.

Cotton output has considerably increased since 1931, when it amounted to only 9,900 tons. Last year production reached 63,000 tons; but this year, owing to unfavourable weather, it is estimated at only 48,000 tons. A further increase in the area cultivated is foreshadowed, and it is hoped that eventually domestic cotton production will not only entirely cover the needs of the home market, but will also leave a surplus available for export.

The production of olive oil for this year is estimated at 81,000 tons, compared with 167,000 tons in 1937. To en-

courage exports of olive oil the authorities have just abolished all taxes hitherto imposed on this produce. The output of currants, estimated at 248,000,000 Venetian pounds, is about the same as last year.

Bulgaria

A New Cabinet

SOFIA, November 24.—At the voting of the supplementary State Budget for 1938 the Kiosseivanov Government failed to obtain the necessary majority in Parliament and was forced to resign. Until then the Government had maintained that it was not responsible to Parliament, since the party regime had been prohibited by law. In the event, opposition came from several deputies that had up to that time supported the Government. A new Cabinet was formed at the beginning of the week, again under the Presidency of M. Kiosseivanov, with six new Ministers, two of them deputies.

Negotiations will begin this month in London with the bondholders of the Bulgarian pre- and post-war loans. The agreement which is now due to expire was concluded for a period of two years, and provides for the payment of 32.5 per cent. of the interest due. The Bulgarian delegation, composed of the Minister of Finance, the ex-Governor of the National Bank and the Deputy-Governor of the Bank, will probably ask for a renewal of the old agreement, since this year's poor crop has seriously reduced Bulgaria's ability to acquire free exchanges. And the State Budget is heavily burdened with important armament expenditure.

The Burden of Arms

At the end of October last, Parliament voted extraordinary armament expenditure totalling 4,250 million leva (about £10.5 millions). Since the Government has found it impossible to contract domestic loans, it intends to resort to foreign long-term credits for these supplies. It is considered that Bulgaria's defences have lagged far behind her present requirements owing to budgetary difficulties up to 1936, since when only a little over 2,000 million leva have been spent on armaments. A further extraordinary credit of 1,000 million leva has been voted for the construction of new railways.

The ordinary Budget, which enters into force on January 1st next, is also being prepared, and provides for considerable increases in both estimated receipts and expenditure. Whereas ordinary receipts for the first nine months of the current year reached 7,095 million leva (including railway receipts), against 6,422 million leva in the corresponding period of 1937, or an increase of 8 per cent., the new estimates provide for 9,800 million leva of receipts, against estimates of 9,000 million leva for this year. It is difficult to forecast Budget possibilities, since the final results of this year's undoubtedly poor crop will not be felt before the beginning of 1939.

Germany's Trade Advance

The volume of foreign trade is satisfactory. But the foreign exchange position of the National Bank has not improved, since the considerable exports of fruit, vegetables and meat went mainly to Germany. The Bank's foreign exchange reserve did increase from 630 million leva at the end of August to 836 millions at the end of October, but this was chiefly due to a big advance in Reichsmark balances. The demand for free *devisen* is acute, and although the exchange premium has gone beyond the legal maximum of 35 per cent. Germany's share in Bulgarian export trade has increased from 45 to 50 per cent., a factor which is increasingly important.

The general economic situation in Bulgaria has not, on the whole, grown worse, in spite of the poor crop, and domestic prices have risen. But only slight improvement is perceptible in industrial output and local trade.

Letters to the Editor

French Financial Policy

TO THE EDITOR OF THE ECONOMIST

SIR,—M. Mantoux (in his letter on page 426 of your issue of November 26) still complains that French prices are too high. High in terms of what? The rapidly improving balance of trade shows that the successive devaluations have taken effect and the French franc is now, if anything, rather undervalued—in spite of the Blum policy of raising wages.

I quite agree that the relative price structure has been distorted by the successive "Rightist" Governments trying to "protect" the franc by impeding *laissez passer*. But is M. Reynaud doing anything about that? No! Will the return of confidence do anything about that? No! Can anybody do anything about it? No! Because, of course, the elimination of lop-sided protectionism would upset the "confidence" of those who are protected—i.e. some entrenched vested interests.

I remain not only unrepentant but proud of my advocacy of devaluation for France in 1934 and 1935. I did not advocate or anticipate, of course, that its therapeutic effects would be nullified by the inauguration of a great re-armament programme accompanied by an artificial reduction of the labour supply in the decisive years of growing German military strength.

M. Mantoux says that exchange control would not cure the present discontent, because even if current savings could not be exported they would be hoarded. Hoarded? The French Budget at present is unbalanced to the tune of some 50,000 million francs. If national income was merely Frs. 250,000 millions, as M. Reynaud says, savings certainly could not be much higher than Frs. 25,000 millions. Hence, as soon as the export of capital is prohibited, the problem will not be how to coax hoarders into investment, but how to prevent a vehement inflation of prices on account of the excessive loan expenditure of the State, whose effects would not be counterbalanced any more by the export of capital.

I am in favour of an increase in the productive capacity not only of labour (i.e. by the abolition of the 40-hour week), but also of capital (making good the appalling obsolescence due to the export of non-reinvested depreciation allowances). If this hole is plugged, I am not afraid of the hoarding of banknotes: that can always be offset by an open market operation. But open market operations are not possible—as M. Bonnet, M. Flandin, *et al.*, ought to know—as long as there is a possibility of the export of capital. As far as the purchase of "real assets" is concerned (also called hoarding by M. Mantoux), that would tend to depress the rate of interest and further accelerate expansion. As soon as expansion began to take place, taxation would have to (and could) be increased—and not merely that borne by low income groups.

My first letters were published prior to the publication of the Reynaud plan. It is, in brief, an attempt to reduce public loan expenditure, in the hope that this demonstration of "soundness" will induce private *entrepreneurs* to increase their own investment activity to such an extent as to offset, or more than offset, the deflation caused by the economy measures reducing consumption. The increase in the weekly hours of work should at the same time extend the limits of expansion. Hence, all sacrifice is to be borne by labour.

This plan presupposes a rise in the expected rate of profits and/or the decrease of the risk premium, in spite of the cut in consumption demand. It also presupposes a fall in interest rates. In the absence of international tension the psychological effect of these "sound measures," and the "victory" over

labour might have been sufficient to achieve this effect. With the international political situation as it is, it seems to be somewhat reckless to confide the future of the country to the realisation of such hopes, the more so as internal strife must necessarily be made more violent on account of the one-sidedness of the sacrifices extracted. Success can only be expected if the present measures are followed up by further measures increasing profits sufficiently to offset risk. This seems to be well-nigh impracticable, for it would imply further redistribution of the national income in favour of capital.

Thus, even though the general strike has been broken, it would be foolish to hope for a sufficiently immediate and strong revival. So we drift on what seems, though M. Reynaud may not realise it or want it, the road of Czechoslovakia. No doubt that the elimination of France, even as a second-rate Power, and the loss of colonies, are of small importance to the material interests of some in France. It is, after all, a real pact with, hence a complete submission to, Hitler which would eliminate uncertainty and reduce the risk premium which now clogs and wrecks individualist economic systems. Then, as these proceedings will not be to the liking of labour, in the name of law and order, totalitarianism will nevertheless be introduced and nobody will dare to protest.

I am, yours faithfully,
T. BALOGH.

University College, London.

TO THE EDITOR OF THE ECONOMIST

SIR,—I have read your article on "The Reynaud Plan" and your excellent translation of the Reynaud Report. One does not object to your view that it is "forceful and brilliant," but it does remind one of our May Report in some ways. You do not, in your article, point out what Reynaud more than once stresses—the strain "of an arms race unprecedented in modern times" (page 365), and "the armament policy imposed upon us by the international situation" (page 367). If France is not apparently to be a "safe and profitable place" (your words) for the French investor and capitalist, then it seems she cannot be saved.

Building at a standstill—even down by 40 per cent.; public works to be restricted; direct taxation to be hesitant and perilously inadequate; labour to be "liberalised" into "ca-canny" (following the example of the financiers) if hours are increased; increased indirect taxation which is put on with as much will as the tax on "all" wages; and basing of "all our hopes on a rebirth of the spirit of enterprise": after all, the "brilliance" wears off a bit. How can Reynaud succeed? Will the French not upset this apple-cart?

Yours faithfully,
JEFFREY WILLIAMS.

London, N.W.8.

Road and Rail

TO THE EDITOR OF THE ECONOMIST

SIR,—Certainly, as you argue, the interests of the public should be the main consideration. But it is more in the public interest to send goods by railway than to send them by road. If they go by rail, the whole expense is borne by the railway shareholder; if they go by road, part of the expense falls on the ratepayer—and, in the case of heavy vehicles travelling at a good pace for a long distance, the expense is serious.

Certainly, road and rail should be complementary rather than competitive: I interpret this to mean that long-distance traffic should go by railway. May I suggest two fiscal changes which the Chancellor of the Exchequer might find useful in his next Budget? These are: (1) to apply the income tax or progressive principle to the licence duties payable in respect of commercial vehicles, e.g. £20 for one ton unladen, £50 for two tons, £90 for three tons, and so on; and (2) to divide licences into *local* and *national*: local licences being restricted to a radius of, say, 20 miles from the garage, paying the present rates, and *national*, unrestricted as to distance, and paying a sur-tax of 25 or 50 per cent.

Yours faithfully,
J. E. ALLEN.

Books and Publications

Anglo-American Friendship

IN these days when the question most frequently asked of students of American politics is "Will the United States enter the next war in time to prevent the other democracies from being defeated?" it requires an effort to recall the days, only forty years ago, when war between Britain and the United States was not yet "unthinkable." When Secretary of State Olney informed Great Britain in 1895 that "the United States is practically sovereign on this continent, and its fiat is law upon the subjects to which it confines its interposition," there were still outstanding between Great Britain and the United States several awkward questions, as well as the disputed boundary between British Guiana and Venezuela which actually gave rise to so provocative a note from President Cleveland's Secretary of State.

Chief among these questions were the disputed boundary between the American territory of Alaska and the British Dominion of Canada, and the difference of opinion between Britain and America about the right of the United States to disregard the Clayton-Bulwer Treaty and go ahead with a purely American project for a canal through the Isthmus of Panama. Mr Gelber's able study* brings out clearly how uncompromising was the attitude of the United States on these matters, and how necessary for the avoidance of war was the amazing restraint shown throughout this critical period by the administrations of Lord Salisbury and Mr Balfour.

It required an unusual willingness to give way, even in matters where important interests were at stake, for Britain to achieve the marked improvement in Anglo-American relations which took place during the eight years, 1898-1906, with which Mr Gelber's study is concerned. The restraint with which Lord Salisbury received Mr Olney's unusually peremptory note was similar to the conciliatory way in which the British Government handled all other issues arising during this period between themselves and the United States Government. Britain was indeed so eager for a settlement of all possible points of friction with the United States as to be willing to sacrifice in this cause the interests of the Dominion of Canada, which was made the victim of the most unjudicial Alaska Arbitration. Britain endured with great patience and good humour the attitude of an American Senate which was throwing into the worst of humours the then American Secretary of State, John Hay. And in the end Britain reaped at Algiers and in the Far East the rewards of its moderation when British statesmen had the satisfaction of seeing the United States assuming the active rôle of a World Power, and doing so in areas, on occasions, and in a manner, best calculated to strengthen the interests of Britain herself.

Had it not been for the foundations built during these years by Lord Salisbury, Lord Lansdowne, Mr Balfour and Mr Joseph Chamberlain, on the British side, and by John Hay and Theodore Roosevelt on the American—and, perhaps above all, by Lord Pauncefoot and Sir Cecil Spring Rice from their diplomatic vantage points—the unwritten Anglo-American naval understanding, which enabled us to use henceforth nearer home naval units previously needed in American waters, and the intervention of the United States in the Great War as an associate of Britain, might both, even if they had ever taken place, have been dangerously delayed. A study of these critical years for Anglo-American relations is therefore of great importance. And Mr Gelber has covered the ground with admirable clarity and fullness.

This was a period of great importance in international relations as a whole, as well as in the more restricted field of Anglo-American relations. It was the period in which Britain moved from the isolation of the late nineteenth century into alliance with Japan in the Orient and into *entente* with France in Europe. Mr Gelber has therefore to give some attention to the broader problems of European and Far Eastern affairs. His study throws an interesting light on the growing American intervention in world affairs which was so marked a characteristic of this period. The contrast

* The Rise of Anglo-American Friendship. Lionel M. Gelber. Oxford University Press. 292 pages. 16s.

which it brings out between the German and the British approach to the United States—and there was constant German effort to create friction between Britain and America—is striking. Britain has much reason to be grateful for the methods of the Kaiser, as she has to-day for those of Herr Hitler.

But the tactlessness of other countries and their leaders, and their failure to understand the United States, would not have been sufficient to lay a basis for Anglo-American friendship during this period, had it not been for a surprising tactfulness and understanding on the part of Britain. When one considers how seldom tactfulness and understanding have been qualities exhibited by British statesmen in dealing with the United States since the War of Independence, the unique interest of Mr Gelber's study is the more apparent.

Shorter Notices

"Report on Agricultural Research in Great Britain." By Political and Economic Planning. 137 pages. 8s. 6d.

This, the latest of the P.E.P. reports, maintains the high standards set by its predecessors. It gives an informative and comprehensive account of the agricultural research now carried on in Great Britain, its scope, methods and administration. Ninety per cent. of the funds devoted to agricultural research is provided by the State, whose expenditure on this account amounts to more than £400,000 yearly, not £79,000, as a misprint on page 360 of *The Economist* on November 19th implied. The report comments on the indifference shown by many farmers to this practical help given them by the State and puts forward useful suggestions for improving the liaisons between the research worker, the agricultural advisory services and the many small farmers who are most in need of the benefits of modern scientific knowledge.

"Statistics in Theory and Practice." By L. R. Connor. Pitman. 383 pages. 12s. 6d.

This is the third edition of a book which many teachers and students regard as a standard work. It has been completely revised and in part rewritten.

THE BUSINESS WORLD

Arms and the Investor—III

Armament Industrials

THE day has passed when armament companies formed a clear-cut category to themselves. After three years of re-armament, it would be easier to say what is not, rather than what is, an armament share. Electric and Musical Industries, to take one example, is turning from the music to the discord of the spheres, by undertaking defence orders. And the traditional divisions of armament work have become blurred. John Brown and Company and Harland and Wolff, the naval shipbuilders, and Associated Electrical Industries, the electrical engineering concern, are now actively participating in military aviation. There is scarcely a corner of industry to-day which does not share, directly or indirectly, in re-armament.

First among the direct beneficiaries is the naval shipbuilding group. Leaving aside the question of mercantile business, how are the principal companies placed in relation to naval building? The first stage in the answer is that the major naval expansion was planned in 1936 and 1937, and is approaching fruition. Five contract-built battleships are due for completion in 1940, two from the 1936 programme and three from 1937. Four aircraft carriers will be finished in 1939 and 1940, while the nine cruisers now under construction will be completed next year. The gross estimate for contract shipbuilding and repair work shows a natural increase from £32 millions to £39 millions during the current year. But unless there is a significant expansion of the naval building programme during the next few years, it is possible that expenditure at this rate may not be maintained. This year's programme consists of two capital ships, one aircraft carrier, four large and three small cruisers, and various small craft. It represents a useful volume of work for builders of large capital ships and liners, but it does not offset the fact that new mercantile orders are almost non-existent to-day.

This is a point of major importance for Swan, Hunter and Wigham Richardson; John Brown has important non-shipbuilding interests in Firth-Brown and aviation, while Vickers-Armstrongs' shipbuilding yards are only part—though an important part—of the Vickers undertaking. Shareholders in the smaller shipbuilding concerns may also note that the 1938 building programme includes no destroyers. Sixteen vessels are due for completion this year, and sixteen next year, leaving eight destroyers of the 1937 programme to be built. But the larger builders, as well as the specialist destroyer companies like Yarrow, Hawthorn Leslie, John I. Thornycroft, and J. Samuel White, will have berths available. The chairman of Yarrow referred rather significantly a fortnight ago to the probability that naval building would tend to slacken. If this suggestion is valid—and it appears to be—naval shipbuilders may be near, if not past, the peak of construction work under the current programme. Moreover, suppliers of heavy armour and gun mountings (whose work is completed at a relatively early stage of a naval contract) may also experience this slackening.

It is, perhaps, under the Army votes that the industrial coverage is highest, for the items range from heavy guns, produced by a few specialist firms, to small components which can be made with a minimum of specialisation by

general engineering concerns. The largest single item in the Army estimates is for warlike stores, the gross estimate for which has increased from £28,880,000 to £41,242,000 for the current year. Guns, small arms and ammunition will cost £23,720,000 against £13,888,000, and mechanical transport £7,870,000 against £6,372,000. Expenditure under these heads is not confined to private industry—the ordnance factories will expend £20,276,000 during the current year, against £16,164,400 gross in 1937, and are charging £10 millions to the three defence services for production—but there is still room for a substantial increase in the volume of business for private suppliers.

Among the obvious participants, Vickers, Birmingham Small Arms, Thos. Firth and John Brown, Projectile and Engineering, and Hadfields spring to the mind. There are a number of factors which affect this group of companies. Several of them have financed large capital expenditure during recent years. Projectile and Engineering—a company with loan and share capital amounting to £361,600—has spent nearly £250,000 on capital extensions during the past four years. Firth-Brown's total for five years is £1,293,766; Hadfields undertook important capital expenditure in 1936; while B.S.A. has ploughed back more than £900,000 upon improvements during the past five years. Major capital extensions may be less urgent in future, but the need for adequate depreciation provisions will still remain. Shareholders in particular companies may expect somewhat higher distributable earnings over the next year or two. The directors of Birmingham Small Arms, to quote one example, have announced their intention of paying out a larger share of earnings in the future. But this is a special case, in which ordinary shareholders have exercised their patience for years; there is less reason to expect a substantial increase in dividends from the general run of armament companies. The chairman of Vickers Limited has repeatedly warned shareholders that, while gross profits should continue to expand, divisible profits would not necessarily expand in corresponding proportion. And the last accounts of Vickers-Armstrongs included a provision for contingencies "partly arising out of the re-armament programme." Meanwhile, the maintenance of the John Brown and Hadfields interim dividends illustrates the present tendency to maintain dividends on a satisfactory but not extravagant level.

There remains a large group of companies, mainly in the engineering industry, whose present re-armament work is an important part of their business. In the accompanying table, these are designated, for want of a better name, "armament industrials." The choice of a mere handful of companies from this class involves invidious distinctions, and the group selected illustrates the industrial range covered by the group, rather than a list of investment priorities. Some indication of the scope of Government work should be of interest to investors in this field, provided that the importance of commercial work is kept clearly in view. Clarke Chapman are "busy with important Government work," and have orders for anti-aircraft equipment which will keep the company occupied for two or three years. The latest Henry Meadows report records

that the volume of orders in hand is greater than at any time in the company's history; in addition to large Government contracts, increased civil business has been obtained. Mirrlees Bickerton—a general machinery making concern—reported last June that a substantial amount of munitions work was in hand. Ruston and Hornsby, which specialises on oil engines, attributed the substantial increase in home business last year indirectly to Government orders, and in addition, the company has considerable Admiralty contracts.

A complete listing of general industrial companies with an armaments equity (covering sub-contractors, of which there are now 3,500 serving the aircraft industry alone) would have to include not merely concerns like Carrier Engineering and R.F.D. (which are interested in anti-aircraft defence) but the legionary concerns which have derived indirect benefit from defence expenditure. For the latter, new construction work for the defence services is of primary importance. In the following table, we have made a rough analysis, so far as the Estimates permit, of the course of expenditure on works and buildings and on plant from 1936-37 to the current year:—

ARMY, ORDNANCE, NAVY AND AIR EXPENDITURE

	(£'000)			
	1936-37	1937-38	1938-39	
Works and buildings, etc....	15,539	33,119	44,995	
Plant*.....	2,728	10,231	8,080	
	18,267	43,350	53,075	

* Excluding contributions towards plant under other votes.

There is some ground for thinking that indirect expenditure on building materials, constructional steelwork, cement, and certain types of machinery, is near its peak, unless civil defence is hastened. The total charge will still run at a high level over the next year or two, but perhaps not so high as to counteract a serious fall in civil investment. It is fortunate, therefore, that the industrial recession has been arrested, and may give place to real recovery next year—in the absence of political disturbance. But a mere connection with re-armament is not enough for the investor who seeks a financial interest in defence. And even for shares which are predominantly of an armaments character, certain reservations must be considered. Dividends may not increase in proportion to gross profits; a high level of activity may entail a correspondingly high provision for depreciation; the prudent

companies, remembering the post-war period, will be anxious to guard against the consequence of over-inflated capacity when the re-armament programme is completed. The direct armament companies, therefore, may retain a generous proportion of earnings in the next few years—though dividends should be satisfactory. Naval shipbuilders and industrial concerns with one leg in re-armament and the other in civil business have a closer concern with the latter than at any time in the past three years. There are no immediate signs of a new arms drive; and if there were, it might well happen that an increased measure of industrial control would in turn affect profits and dividends.

Commercial Vehicles

THE commercial motor industry is not only largely separate on the production side from the private car industry, its economics are also notably different. Sales of new private cars are now generally acknowledged to show an almost exact correlation with fluctuations in the level of economic activity as a whole and to afford a highly sensitive index of the trend of trade; their direction changed decisively downwards in August, 1929, upwards in August, 1932, and downwards again in September, 1937. Commercial vehicle sales, on the other hand, although showing course a broad tendency to follow the trade cycle, depend on such a wide variety of factors that it is quite impossible to reduce their economics to the same simple terms that fit the private car. In the first place, running costs have entirely different implications for the two classes of vehicle. Few private cars are costed very carefully by their owners, and the use of a car is, within broad limits, optional. If a motorist feels more prosperous than he was, he uses his car freely and considers changing it for a new or newer model; if he feels poorer, he keeps his old car and uses it less. On the other hand, commercial vehicles are properly costed, at least so far as the larger operators are concerned, and their annual mileage is determined simply by the amount of work to be done and not by the owner's feeling of prosperity or otherwise. Replacement programmes are planned with a view to providing cheap transport over a period, and, being regular, tend to stabilise demand. In so far as con-

siderations of the value of the vehicle as an advertising medium also enter into the picture, replacement may be advanced a little in times of boom and postponed in time of depression; while furthermore, when industry is active, purchases of additional vehicles tend to be high because of the greater volume of work to be done. On the other hand, the immediate effect of depression may sometimes be to stimulate sales, as happened in 1930, when falling industrial and commercial profits accelerated the transfer to the roads of those classes of traffic that could be carried more cheaply by that means. In recent years Government policy has also been a major factor determining the level of sales. The number of omnibuses in use was stabilised in 1930 and the number of public haulage vehicles in 1933, thus reducing both these important sections of the market to a replacement basis, and in the latter case directly contributing to an increase in the number of ancillary users' vehicles. At the present time sales are also directly affected on a considerable scale by the volume of Government orders, which, with the development of the re-armament programme, last year amounted to one-fifth of the total civilian demand.

During the past season the decline in industrial and commercial activity has checked the demand for additional vehicles. The total number of civilian goods vehicles in use rose by 11,000 in 1938, from 479,000 to 490,000, compared with an increase of 20,000 between 1936 and 1937.

It is not surprising, therefore, that new goods vehicle sales have fallen, for eleven months of the season, from 73,641 to 64,639. The heaviest decrease, of 14.8 per cent., has occurred in the production of vehicles of not exceeding 2 tons unladen weight, which are mainly operated by ancillary users and which also most frequently serve as advertising media as well as agents of transport. Vehicles of 2 to 2½ tons capacity, the smallest class commonly used by haulage contractors, which have been forging ahead for several years at the expense of the true heavy-weights of over 2½ tons, have registered a decline in production over the 11 months of 9.2 per cent., from 22,556 to 20,489, while heavy-weights have decreased by 0.9 per cent., from 5,991 to 5,935.

Just as the first effect of declining activity has been to stimulate sales of small private cars at the expense of large, so it has on a relative basis encouraged large commercial vehicles at the expense of small—and for the same reason, economy. The small car is more economical than the large for any normal load of passengers and for any normal mileage, but, with the commercial vehicle, the larger load which the heavy-weight can carry, and the higher annual mileage it can run without incurring unduly costly repair bills, make it more economical than the small vehicle, provided that the business is capable of being organised in terms of big loads and intensive use of large vehicles. Declining profit levels, of course, provide an incentive for such reorganisation. Heavy-weights are expensive to buy in the first place, even in relation to their carrying capacity, but, as commercial transport differs from private transport in being reckoned in terms of cost per vehicle-mile and cost per ton-mile, this does not prove a serious deterrent to potential buyers.

A large and increasing proportion of the costs of operating road transport, whether goods or passenger, is in the nature of statutory charges. Taxes, insurance premiums and licence fees are, of course, on the same basis for all operators; the scope for substantial variations in depreciation allowances and repair costs is much less than used to be the case, now that the examiners appointed under the Road and Rail Traffic Act are gradually enforcing the same standards of mechanical fitness for all vehicles; the Road Haulage Wages Act of last July will also in due course eliminate the possibility of important variations in the wages paid by different operators. All these items have been or are being taken out of the control of the individual operator and standardised; the only directions remaining in which savings can be effected are in the better organisation of the work, so that the most suitable vehicles are used for every task and kept fully employed, and in the reduction of the fuel bill.

With the petrol tax, at 9d. a gallon, accounting for more than half the retail price of commercial grade petrol, a very strong incentive is given to the use of alternative fuels, which are either more economical in consumption or are at present exempt from tax. The most important of such fuels is heavy oil, which, with a diesel engine, although subject to the same rate of tax as petrol, reduces consumption in terms of gallons per mile by nearly 40 per cent., representing a saving of about 1d. a mile on the running costs of the average omnibus. Omnibus sales for eleven months of the season have increased from 5,921 to 6,020, and the proportion of diesel bus sales reached 60 per cent., compared with 47 per cent. two years ago. The progress of the diesel engine on the goods side has been slower, but diesel lorry sales increased last season from 1,533 to 1,780. Development on this side is checked chiefly by the greater weight of the diesel engine. Goods vehicle taxation and speed limits are based on unladen weight, and the diesel lorry must therefore either pay a heavier tax than the corresponding petrol lorry, or sacrifice something in carrying capacity. These considerations do not apply to omnibuses, as hackney vehicle taxation depends solely on seating capacity and all omnibuses are subject to the same speed restrictions.

Other alternative fuels include coal, electricity, and gas. The steam vehicle has lost ground steadily of recent years, in spite of exemption from any form of fuel tax and favourable treatment in other respects; its chief handicap has been its weight. Electricity continues to make pro-

gress, although not spectacularly, and sales of electric vehicles last season increased from 821 to 842 vehicles; the majority of these were bought by local authorities, electricity undertakings, and certain retail distributors whose work involves low mileages and frequent stops. Development is checked by the size of the batteries and the difficulty of changing them over or of re-charging them. Coal-gas has made negligible progress, only four new vehicles running on coal-gas having been sold during the season; again, the weight of the cylinders and the difficulty of picking up supplies act as a deterrent. Producer-gas vehicles burning anthracite or coke are expected to be marketed during the present season, but experience abroad suggests that it is only where their use is made compulsory, as it is in France, for one vehicle in every ten in fleets of over ten vehicles, that they can sell in competition with petrol or diesel vehicles. It broadly remains true that alternative fuels to petrol and heavy oil can only flourish under the shadow of the petrol tax. As the rate of tax increases, the incentive to develop substitute fuel grows stronger, but, although small inroads in the £52 millions revenue which the Government now obtains from the motor fuel duties would no doubt be ignored, and might even be encouraged up to a point, with a view to reducing the country's dependence on imported products, no substantial reduction in the yield of the duties would be permitted, and sooner or later the loss would be recouped by extending some form of special taxation to vehicles using the alternative fuels.

Diesel vehicles are still only manufactured by the omnibus and heavy lorry manufacturers, principally, of course, by Leyland, A.E.C., Albion and Dennis, other manufacturers in this class usually making only the chassis themselves and buying the engine. It will not be possible, however, for the private car manufacturers, who have the lion's share of the light commercial vehicle market, viz. General Motors (Bedford), Ford, Morris Commercial, and in the current season Austin Commercial also, permanently to ignore the trend towards the diesel, and it is not surprising, therefore, that Morris Commercial is planning to enter this field and has acquired the manufacturing rights of the Saurer diesel engine. In the United States, General Motors are marketing a very successful diesel vehicle, but so far are doing nothing in this country. The Austin Commercial programme is at present confined to petrol vehicles.

The output of commercial vehicles last season probably reached 107,000, a decrease of 10 per cent. on the previous year's record figure of 119,000. Home sales of commercial vehicles fell from 101,000 to 95,000, and imports from 3,700 to 3,300; exports declined from 20,700 to 15,500. It is naturally much more difficult for motor manufacturers to take positive steps to enlarge the commercial market than is the case with private cars but, at present, the most promising lines of attack are those directed against the onerous legal restrictions on the expansion of commercial transport and the physical restrictions on its use set by the inadequacy of the road system. This was the gist of the industry's reply to last week's railway manifesto. Motor transport needs better exits from large towns and faster roads to link them up and to by-pass smaller places. Direct collective action by manufacturers with a view to supporting the secondhand price structure for commercial vehicles would probably not be so effective as it might be in the case of private cars, as the limiting factor in commercial vehicle sales is not the initial cost to the buyer but the operating costs. Better results might be expected if users of commercial vehicles could be induced to realise that it would often pay them, through lower operating costs, to scrap their old vehicles rather earlier than they do at present. There is undoubtedly still an unduly high proportion of old vehicles on the road. Old vehicles are usually extravagant to run and often dangerous, and any tightening up of the standards required by the Government examiners would have beneficial results, both for manufacturers and for the public, while such a move would not be prejudicial to operators. The larger concerns, with proper costing systems, fully appreciate that old vehicles are not economical, and in general they are used by small concerns which do not realise their costliness.

Germany's Clearing Debts

AN article on German methods of foreign trade in *The Economist* of November 5th discussed the important use made by Germany of her debts on clearing accounts as a lever to force German exports, particularly towards the Balkans. As is generally known, these clearing accounts are not published in Germany, although some information has been given officially, or semi-officially, regarding the total debt outstanding at certain times. On the other hand, a few other countries publish regular monthly figures regarding their clearings (with Germany as well as with other countries); but generally information is somewhat fragmentary, and it is difficult to obtain a clear picture of the position at any particular moment. A careful collection and collation of available material is sufficient, however, to give a general idea of the long-term development of Germany's clearing accounts in recent years.

Indications of the total debt on clearing accounts given from time to time by Reichsbank officials and in the Annual Report of the Reichsbank are shown in the following table, bringing together the figures in a way in which they may be compared:—

	Rm. millions	Authority
1934 December	about 450	Dr Eicke (<i>see below</i>).
1935 March	... about 567	Dr Blessing at Bremen (<i>see below</i>).
April	... about 500	Dr Blessing at Cologne (<i>see below</i>).
November	about 515	Dr Blessing at Bremen (<i>see below</i>).
1936 April	... not above 500	Dr Blessing in a speech at Cologne in April, 1936, gave Rm. 500 millions for April, 1935, and said that this figure had since "not increased."
November	about 415	Dr Blessing in a speech at Bremen in November, 1936, gave the total in March, 1935 (the highest reached) at Rm. 567 millions; he said the figure was "now" Rm. 415 millions, which was Rm. 100 millions less than "a year ago."
December	about 463	Reichsbank Annual Report for 1937 (<i>see below</i>).
1937 November	about 200	Dr Eicke in his book "Warum Aussenhandel?" gives totals of Rm. 450 millions "end of 1934" and Rm. 200 millions for November, 1937.
December	about 313	Reichsbank Annual Report, 1937, gives Rm. 313 millions for the end of 1937, "a reduction of around 150 millions on the year."
1938 March	... about 250	Dr Eicke in a speech at Berlin to the Deutsche Arbeitsfront on March 10, 1938.

In no case was it stated whether these figures were gross or net, i.e. whether they were an aggregate of Germany's debts only or whether assets on some accounts had been deducted from the total debts. It is believed, however, that in all cases the gross indebtedness was referred to. These figures, it must be emphasised, related to only the "Spitzen" on "Verrechnungs-, Reichsbank- und ASKI-Konten," i.e. to amounts actually due for payment and not paid. No account was taken, therefore, of trade credits which might be outstanding at any time on either side. In this connection it may be mentioned that, particularly since 1935, German exporters' credits have grown in volume and length of maturity. It was estimated, for example, in the middle of 1936, when the German clearing debt to Holland was around Rm. 90 millions, that this sum was approximately equalled by the volume of German credits to Dutch importers.

Although the figures in the table are incomplete, they clearly show the steady reduction from the high point in March, 1935, with an apparent temporary increase of indebtedness at the end of each year.

A more interesting approach to the question can be made by the somewhat laborious assembly of information where

it is published on "the other side," i.e. in the countries having clearing accounts with Germany, and by converting these amounts into Reichsmarks for comparison. This has been done in the following table, which gives half-yearly figures (and, in addition, the high point of March, 1935) for those countries where the clearing figures are published or where reasonable estimates of the position may be made:—

Rm. millions.

This table calls for the following comments:—

Great Britain.—The figure of £4½ millions was given by the President of the Board of Trade to the House of Commons in December, 1934. Towards the end of the month the first payments were made to English exporters from the credit granted to the Reichsbank by the Bank of England. The figures for 1935 have been estimated, taking account of further distributions from the credit and also the allocation, under Article 6 of the Anglo-German Payments Agreement, of 10 per cent. monthly from the proceeds of German exports to England. The figures in the table may be one or two million Reichsmarks out on either side, but published statements confirm the estimate that the debt was extinguished in the spring of 1936. By the working of the Payments Agreement, no such debts can arise in future.

Holland.—The apparent increase in the Dutch total from December, 1934, to March, 1935, was partly due to the admission of further items to the total of frozen commercial debts in arrears. The amounts on the Sonderkonto and Treuhänderkonto at the Nederlandsche Bank are included in the figures with the clearing account proper until their liquidation around the end of 1936. Early in 1935 Holland was by far the greatest creditor of Germany on clearing accounts, but the debt was steadily reduced during the following two years and in the autumn of 1937 there was a small Dutch debt on the account. This situation did not last long and the German debt, which reappeared in December, 1937, grew to Rm. 32 millions by September, 1938. Since October 1st a new agreement has been in force.

France.—The fall in the German clearing debt to France in the spring of 1935 was due to the taking over of the Saar territory (and its credits against Germany). In the summer of 1935 the debt reached its highest level (Rm. 100 millions in July and August), from which a steady reduction took place. No figures have been published since the new Payments Agreement was negotiated in July, 1937, but early in August, 1938, it was stated that the debt was then completely liquidated from the monthly payments of the Reichsbank. The figures given for December, 1937, and June, 1938, assume equal monthly repayments. Under the working of the Payments Agreement such debts cannot arise in future.

Czechoslovakia.—This account was published regularly until February, 1938 (Rm. 24 millions). The Anschluss necessitated a new agreement; publication of current figures was suspended and has not been resumed. A quarterly census of Czechoslovakian exporters' claims (i.e. including credits granted) showed generally some Rm. 20 millions above the clearing debt due from Germany.

Yugoslavia.—This account has been published regularly and appears to have worked fairly smoothly. The German debt was at its highest early in 1937 (February, 1937, Rm. 38 millions).

Greece.—This debt was at its highest point in the autumn of 1936 (October, 1936, Rm. 38 millions), and was

later reduced considerably under a special arrangement for liquidation. In June, 1938, and following months a small Greek debt appeared for the first time.

Switzerland.—This account has never shown a debt of less than Rm. 20 millions, but for the past two years has fluctuated at somewhat less than half the high level (above Rm. 60 millions) reached in the summer of 1935.

Italy.—The blanks for December, 1935, and June, 1936, are due to the non-publication of the account in Italy during the sanctions period. Since October, 1937, the account has shown a credit for Germany amounting in June, 1938, to Rm. 9 millions.

Scandinavia.—The clearing accounts of Norway and Finland with Germany are published but have been omitted from the table since the "Spitzen" against Germany have generally been negligible (at their highest in March, 1935, only Rm. 14 millions together). The clearing with Sweden is also understood to work to the satisfaction of both parties. It is believed that the Danish clearing ran into difficulties in the summer of 1936, but no figures were published. Any German debts to these countries appear, therefore, under the heading of "Others."

Others.—Perhaps the most surprising thing in the table is the seeming stability of the debt to other countries from March, 1935, to December, 1937. Although these other accounts are not published, enough is known, particularly owing to the leakage of details during negotiations between the parties, to realise that big changes have in fact taken place. For example, the debt on clearing account to Belgium, which was estimated at about Rm. 30 millions early in 1935, was, it is known, extinguished before the end of 1936, and under the Payments Agreement now in force such deficits cannot arise. On the other hand, the debt to Poland, which was negligible or non-existent at the end of 1934, rose steadily throughout 1935 until the autumn of 1936, when it was given at Rm. 50 millions, being chiefly amounts due in connection with the transit of the Reichsbahn through the Polish Corridor. This debt is being reduced by deliveries from Germany (which account for the high level of Polish imports). No indication was given of the debt to Turkey until the arrears accumulated to some Rm. 60-80 millions early in 1937. Since August, 1937, monthly figures have been published showing the reduction of the debt to Rm. 8 millions in June, 1938.

Little is known of the clearings with Bulgaria, Roumania and Hungary except that Germany has had fairly considerable debts on these accounts, amounting perhaps at the highest point in each case to around Rm. 20 millions (but probably also in each case much reduced at the present time through special deliveries with the specific object of repaying the clearing debt).

Still less is known of the German debts to South American countries represented by the volume of ASKI-marks outstanding. The Banco de la Republica in Colombia has published monthly figures since January, 1936, but they are unimportant—the highest being Rm. 4 millions in March, 1938. In other cases debts are known

to have been substantial but no figures have been published. In particular, German trade with Brazil was temporarily interrupted only four months ago, when the Bank of Brazil refused to buy ASKI-marks as its holding was already "unwieldy." This situation contrasts with that in 1934, when Brazilian debts to Germany were considerable.

The broad outlines of the picture can now be seen with some degree of clarity. The year 1934 was one of exceptional difficulty for the German foreign exchange position. In the first half of the year the quotas of foreign exchange allotted for imports were greatly reduced, but imports continued and, consequently, commercial debts to foreign countries grew rapidly. In September, 1934, Dr Schacht introduced the "New Plan" for balancing imports and exports, and the effect of this plan was the gradual reduction of debts which took place after March, 1935.

This reduction was, however, essentially towards those countries of Western Europe—Great Britain, France, Belgium and Holland—whose trade position was strong enough to force repayment by an allocation from the proceeds of Germany's exports. Towards other countries, particularly those of Eastern and South-Eastern Europe (and probably also South American countries) the debts tended to increase. But this increase was slower than the reduction of debt towards the Western countries, chiefly because special arrangements were made by Germany from time to time for deliveries of goods to cover the mounting "Spitzen."

Dr Eicke's figure of Rm. 250 millions for March, 1938, was given a few days before the *Anschluss*, which automatically reduced the aggregate clearing debt by the amount owing to Austria, i.e. Rm. 30 millions—more, in fact, since Austria was a creditor on clearing accounts with other countries also. Again, the new boundaries of Czechoslovakia further reduce the German debt, which cannot now be more than Rm. 200 millions, divided, at a guess, in roughly equal proportions between European and non-European (i.e. particularly South American) countries. Germany has a net credit balance on some accounts which must be set against the total of debts.

It would seem, then, that the heyday of the German clearing manipulation is probably near its end. Payments agreements have now been concluded by Germany with about ten different countries, and the system is spreading, for, in spite of its disadvantages, it is a great improvement on clearings, since it permits the resumption of normal trade financing and avoids the accumulation of frozen trade debts. This is recognised by the German experts. For example, Dr Eicke, the Reichsbank expert on foreign trade, says in his book "Warum Aussenhandel?" ("Why Foreign Trade?") that "in many countries there is a twilight of the clearings" ("in manchen Ländern kann heute von einer Clearingdämmerung gesprochen werden"). Germany's trade drive will have to be pursued—is already being pursued—with other weapons.

Finance and Banking

The Rally in Sterling.—The current week has witnessed a spectacular rally in the pound. After being offered at \$4.62½ on Monday morning, the New York rate rapidly rose until on Wednesday evening it touched \$4.69. On Thursday the rate fell at one time to 4.67½ in a natural reaction, but it closed at 4.68, aided by the "Control." There are three explanations of the rally. First and foremost, almost every operator had for the previous two months been making heavy purchases of both dollars and gold in the spot and forward markets. Most people, therefore, had become seriously short of sterling, and so the dollar was technically in a weak position. The earlier of the forward contracts are already beginning to mature, while a number of houses were urgently in need of replenishing their holdings of sterling in readiness for their December 31st balance sheets. It was also realised that the normal autumn commercial demand for dollars was drawing to its end. For these reasons it is possible that some January and Feb-

ruary positions were hurriedly closed this week. The rally in the franc, due to M. Daladier's success in meeting the French labour troubles, found its reflection in the strengthening of three months' francs to only Frs. 2-1½ discount. But in addition fresh movements of funds to Paris from New York as well as London occurred. Finally, there was a recrudescence on the Continent of the perennial rumour that a further devaluation of the dollar was contemplated in Washington. This time the rumour was linked with the suggestion that the American Authorities wished to counteract the depreciation of the pound. The British "Control" has thus had an easy task this week. It gave some support to sterling early on Monday, but then practically dropped out of the market for two days. On Wednesday and for a time on Thursday it bought dollars, both to "smooth out" the appreciation of sterling and to replenish its own stocks. It operated through a number of channels to disguise its intervention, and is believed to have acquired on

Wednesday a large quantity of dollars. The French "Control" has also been active, buying a large amount of sterling, some of which was re-sold for dollars, while some dollars were bought directly in exchange for francs. The fact that French official sales of sterling did not check the rise in the pound is a further indication of the volume of this week's demand for sterling. Whatever doubts may have been aroused by official action in London and Paris in recent weeks, during the last few days the laugh has been on the side of the authorities.

* * *

German Standstill Agreement.—The Consultative Committee set up under the German Credit Agreement of 1938 met in London between November 15th and 23rd and decided to extend the duration of the Standstill Agreement, due to expire next February, to the end of May, 1939. Hitherto the Agreement has been prolonged from year to year, and the mere three months' extension on this occasion has occasioned considerable comment. The most popular surmise is that the uncertainties of the Central European situation debarred the creditors from extending the Agreement for any greater period. No explanation, however, could be further from the mark. The Agreement of 1938, in fact, provided specifically for the option of a three months' extension which has been exercised by common consent, in order to avoid the disagreeable climatic conditions which normally attended Standstill conferences held in Berlin in the early weeks of each New Year. Several modifications, however, have been made to the Standstill Agreement as a result of the recent London discussions. In the first place, the inclusion of Austrian short-term debts to foreign banks and commercial and industrial concerns in the German Standstill Agreement has now been confirmed. The question of the inclusion of similar claims in the Sudeten areas was also discussed, but was finally rejected—largely at the instigation of the creditors concerned, who considered that in view of the present abnormal flow of *devisen* to Czechoslovakia they might get better terms from their Czech banking debtors in respect of credits granted in Sudeten territories by keeping them outside the Standstill Agreement. If those hopes are not realised the question of the inclusion of Sudeten credits may be raised at the next meeting in April.

* * *

Register Mark Changes.—It has also been decided to raise the licence fee on the sale of travel marks from 10s. to 15s. per 100 marks, as from December 1st. As before, the proceeds of the fees will provide for repayments of outstanding Standstill credits, but whereas, in the past, the licence fee was paid by the buyer of travel marks as a separate item from the exchange transaction, the larger fee will in future be included in the rate at which travel marks are sold. Thus, on Wednesday of this week, travel marks were quoted at 25 to the £ *ex* the licence fee, but on Thursday they were quoted at 21 to the £ *cum* the fee. In order to encourage the sale of registered marks (which have been seriously curtailed by the slump in tourist traffic to Germany) the German representatives have agreed to raise from 200 marks to 300 marks per month the amounts of "benevolent remittances" which can be made to any one person living in Germany through the registered marks market. In future these remittances will have to bear the licence fee of 15s. per 100 marks. In other respects the Agreement is substantially unchanged. The principle of "re-commercialisation" initiated with the 1938 Agreement has justified itself sufficiently to merit further trial. In any case, it is bound to meet with greater success as the amount of Standstill credits are gradually reduced. That process is making good headway, and during the past year the commitments of British creditors have fallen by about 6 per cent. At this rate, given even a moderate expansion of German trade with free *devisen* countries, the Standstill problem should soon cease to be a problem at all.

The Jump in Bill Rates.—Discount rates normally become firmer in December, as the clearing banks reduce their purchases of bills. For various reasons, however, this year rates began to stiffen in the middle of November. The syndicate reduced its tender price from £99 17s. 4d. per cent. on November 11th to £99 16s. 2d. per cent. a week later, thereby raising the average tender rate from about ½ to nearly ¾ per cent. In spite of this drop in its price, its allotment only fell from 52 to 38 per cent. On November 25th the syndicate left alone the bills payable on Monday and Tuesday, as these were respectively 92- and 91-day bills. Instead it went for the 90-day bills maturing in March and issued later in the week, and although it reduced its price to £99 15s. 7d. per cent., it secured a 32 per cent. allotment. The average tender rate for November 25th was just over ¾ per cent. There were various motives behind the syndicate's tactics. First the continued efflux of funds from London has reduced the demand for bills, and a fortnight ago the clearing banks were inclined to buy more sparingly. In any case, the banks are due to curtail their buying very shortly in preparation for the end of the year. Moreover, bills taken up now will have to be carried over the New Year, and as December 31st falls on a Saturday, the market will be unable to adjust its Treasury Bill payments and maturities so as to force the Treasury to borrow at the Bank. In addition to these technical reasons, the market was probably impressed by the fact that the Exchange Equalisation Account's gold sales were recently diverting cash into public deposits at the Bank. On November 16th public deposits were as high as £35 millions, while on November 23rd they stood at £31.7 millions. Since they have fallen this week to £23.1 millions, it is clear that too much emphasis was laid on this factor, for an increase is normal in November when cash has to be accumulated for the December 1st War Loan dividend payment. Discrepancies between Treasury bill payments and maturities account for some of the fluctuations in public deposits. Past experience has shown that the authorities can quickly restore the Exchange Account's surplus cash to the banking system, and can also maintain cheap money in spite of an efflux of funds. Firmer money rates may not therefore persist in the New Year.

* * *

Lloyds Bank Appointments.—The impending retirement of Mr G. F. Abell, the chief general manager of Lloyds Bank, has led to a succession of new appointments. Two of the present joint general managers, Mr R. A. Wilson and Mr Sydney Parkes, are to be chief general managers. This reverts to the practice of several years ago, when Mr F. A. Beane, the present vice-chairman of the bank, was a colleague of Mr Abell. Mr Wilson is this year's

THE ECONOMIST BY AIR

To meet the growing demand from overseas readers for *The Economist* by air, we are introducing special subscription rates applicable to those countries to which Letter Mail is now normally transmitted by air. These are as follows:

	12 months			6 months		
	£	s.	d.	£	s.	d.
Europe	4	17	6	2	8	9
Empire Air Routes	6	10	0	3	5	0

These rates include all supplements, but the latter will be sent by the surface routes and not by Letter Mail.

Unexpired subscriptions may be transferred to the new category on application to

THE PUBLISHER, THE ECONOMIST,
8 BOUVERIE STREET, LONDON, E.C.4

President of the Institute of Bankers, and he also has a long and wide knowledge of North Country banking. Mr Parkes is equally known for his activities in the City of London. In succession to Mr Wilson and Mr Parkes, Mr L. A. Stanley and Mr G. D. Gold are appointed joint general managers. Mr Stanley is now the assistant general manager in charge of administration, and he is being succeeded by Mr A. H. Ensor. Mr Gold is joint manager of the bank's City office, and his place will be filled by Mr T. G. Raine. The whole City will regret Mr Abell's retirement, for he will leave a noticeable gap in the banking world. The City, however, will equally agree that that gap will be well filled by his two successors, and will also be

glad to know that Mr Abell has been invited to join the board. Thus he will not entirely lose touch with the banking world, in which he has for some time been one of the leaders.

* * *

Bank of New South Wales.—Mr Robert Gillespie, the new president of the Bank of New South Wales, gave an interesting review of Australian economic conditions at the ordinary general meeting of the bank. The key to his review is the fall in Australian export prices, amounting to 27.5 per cent. between the third quarters of 1937 and 1938. This, rather than any diminution in the volume of Aus-

MONEY MARKET NOTES

Foreign Exchanges

THE rally in sterling and the franc, described in a Financial Note, was checked on Thursday by nervousness in Paris over Count Ciano's speech. It is true that spot francs continued to be bid, the rate strengthening to Frs. 178.20 and the French Control having to give francs. Three months' francs, however, eased from Frs. $\frac{3}{4}$ - $\frac{1}{2}$ to Frs. $1\frac{1}{2}$ discount. The reaction in sterling was more noticeable, for the spot rate came down to \$4.67 $\frac{1}{2}$, recovering later in the day to \$4.67 $\frac{3}{4}$. The British Control was buying dollars early in the morning and selling them later in the day. During the week guilders depreciated from Fl. 8.50 on Monday to Fl. 8.67 $\frac{1}{2}$ on Thursday morning, coming back later in the day to Fl. 8.60 $\frac{1}{2}$. This depreciation was not only in sympathy with the dollar, but was also due to the cessation of covering purchases of guilders against the repayment of the French credit. Swiss francs followed the dollar in an idle market, the rate rising from Frs. 20.37 to Frs. 20.62, and falling back on Thursday afternoon to Frs. 20.59. Belgas also followed the dollar, the rate moving from bel. 27.34 to bel. 27.73 $\frac{1}{2}$ and falling back to bel. 27.68. Forward belgas widened to slight discounts for both the chief positions. The market this week was very active in dollars and French francs, but the total repatriation of French funds up to Wednesday may prove less than might have been expected from the general atmosphere created by M. Daladier's success.

*

The Bank Return

THE Christmas expansion in the note circulation has begun, even though most of this week's increase of £4.7 millions probably represents currency withdrawn for end-of-month payments. There is still no increase in the fiduciary note issue, so that the reserve is down to £45.6 millions. The circulation is now only £4.9 millions less than last year, when it was thought neces-

	Dec. 1, 1937	Nov. 16, 1937	Nov. 23, 1937	Nov. 30, 1937	Nov. 30, 1938	Nov. 30, 1938
Issue Dept.: Gold.....	326.4	326.4	326.4	326.4		
Notes in circulation	485.7	478.6	476.1	480.8

Bankers' Deps.	105.7	89.5	92.2	97.1		
Other Deps.	36.6	35.0	35.0	37.2		
Govt. Secs.	78.8	95.2	91.8	90.2		
Discounts & Advances	10.5	12.4	12.2	17.6		
Other Secs.	20.7	20.6	21.1	20.1		
Proportion.....	40.2%	30.7%	32.4%	29.7%		

sary to raise the fiduciary note issue by £20 millions.

In the banking department there has been a drop of £8.6 millions in public deposits. This is not due to the War Loan dividend, which, unlike last year, was only paid the day after this week's return. The money market, however, had concentrated most of its Treasury bill payments towards the latter end of this week, and this is probably the chief reason why public deposits are lower. Discounts and advances have risen by £5.4 millions. Part of this increase may represent further drawings against the Czech credit. It is also possible that some of this money is for the moment on deposit with the Bank, for other deposits have risen by £2.2 millions. The increase in discounts and advances outweighs the drop in the Reserve, which may be why Government securities have been reduced by £1.6 millions. As a result of all these movements bankers' deposits have risen by £4.9 millions.

*

The Money Market

PARTLY because the market had no Treasury bills to pay for on Monday and Tuesday and only a few bills on Wednesday, money has become definitely easier. Last week bond money was being bid for each morning at $\frac{3}{4}$ per cent. but this week it was freely offered at the same rate, while large borrowers had no difficulty in securing loans at $\frac{1}{2}$ per cent. There was a fair demand for money on Thursday, when the market had a large part of its week's bills to pay for, but by then the War Loan dividend money was beginning to come through, and so conditions remained easy. By next week the whole of the War Loan dividend will have reached the market, and so, pending the further withdrawal of Christmas currency, money should for a short time be more plentiful.

	Dec. 1, 1937	Nov. 16, 1937	Nov. 23, 1937	Nov. 30, 1937	Nov. 30, 1938
Bank Rate	2	2	2	2	2
London Deposit Rate.....	2	2	2	2	2
Short Loan Rates:					
Clearing Banks	1 $\frac{1}{2}$ -3 $\frac{1}{4}$	1 $\frac{1}{2}$ -1 $\frac{1}{2}$	1 $\frac{1}{2}$ -1 $\frac{1}{2}$	1 $\frac{1}{2}$ -1 $\frac{1}{2}$	1 $\frac{1}{2}$ -1 $\frac{1}{2}$
Others	1 $\frac{1}{2}$ -3 $\frac{1}{4}$	1 $\frac{1}{2}$ -3 $\frac{1}{4}$	1 $\frac{1}{2}$ -3 $\frac{1}{4}$	1 $\frac{1}{2}$ -3 $\frac{1}{4}$	1 $\frac{1}{2}$ -3 $\frac{1}{4}$
Discount Rates:					
Treasury bills	11 $\frac{1}{2}$ -3 $\frac{1}{4}$	3 $\frac{1}{4}$	13 $\frac{1}{8}$		
Three months' bank bills	5 $\frac{1}{2}$	3 $\frac{1}{4}$	13 $\frac{1}{8}$		

* Viz. $\frac{1}{2}$ per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity. $\frac{3}{4}$ per cent. for loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral.

ruary were being taken at $\frac{1}{2}$ per cent., but later on the banks were prepared to pay $\frac{3}{4}$ per cent. for suitable February dates. January maturities are, of course, less popular, as they mature relatively soon after the New Year and its disturbances; they therefore remained at $\frac{1}{2}$ per cent. The rate for bills with a full three months to run was also $\frac{1}{2}$ per cent. These rates are fractionally higher than last week, but indicate no more than the usual December stiffening.

*

The Bullion Market

ON November 26th the London price of gold touched a new high record, which actually was 150s. 4d. for a small deal after the fixing. Since then there has been the sharp recovery in sterling, which has brought the price of gold down again. On Monday and Tuesday there was an incipient "dollar scare" on the Continent, which led to fresh Continental buying of gold, and at one time on Monday threatened to establish a big premium. This demand was met by Continental resales and official sales. There was no arbitrage on Monday or Tuesday, as the pound was appreciating. On Wednesday there was very little business, but on Thursday, when the exchange turned against the pound, arbitrage began once more, in addition to further Continental purchases. Over half this day's demand had to be met from official sources.

* Above or below American shopping price. This week's calculations are based on a "temporary parity," in which the war risk rate is taken as 1s. 3d. per cent.

† At fixing.
The New York price of silver remained at 43 cents per ounce .999 fine during the week.

The silver market also established a record, as the premium of cash over forward rose to $\frac{1}{4}$ d. per ounce, which is the widest margin since January, 1924. London stocks of silver have become depleted through the steady stream of American trade purchases, all of which are for cash, and as a result of this shortage the cash price rose on Tuesday to above the New York parity.

lian exports, explains why an active balance of payments of £stg7 millions for 1936-37 has given place to a passive balance of £stg20 millions for the following year. It equally explains the year's reduction in London funds and so in the trading banks' cash. Meanwhile the fall in export prices, in conjunction with the drought, placed many primary producers in need of additional assistance. The result was that the trading banks' advances rose by £A23 millions during the year to the third quarter of 1938, while their deposits only rose by £A3.8 millions, their cash fell by £A4.2 millions and their Treasury bills by £A5.5 millions. This reduced their cash ratio from 12.0 to 10.5 per cent., and raised their advance ratio from 86.0 to 92.3 per cent., or nearly to the record 1936 ratio of 93.6 per cent. The Bank of New South Wales's figures followed this general trend. Mr Gillespie takes the view that this has created a banking stringency, from which there is no prospect of escape through an early rectification of the trade balance. Indeed, the 1938-39 wool clip will in his opinion prove to have been affected by the drought of 1937-38. He equally holds that internal monetary policy can be directed in such a way as to cut short any tendency for total spending power to be reduced to levels where enterprise is discouraged and factors of production thrown out of employment. He argues that Australia is in a stronger position than in 1928-29, for she is no longer dependent upon a large annual inflow of capital, while she also has a greater diversification of home industries. Yet it is obvious that he does not view the outlook with equanimity, and his whole speech carries the implication that the authorities must adopt a liberal monetary policy to carry Australia through the present setback in export prices.

Royal Bank of Scotland.—As the Duke of Buccleuch explained at the Annual General Court, held on Wednesday last, the accounts of the bank were made up to October 8th, a date which this year fell immediately after the crisis. This has to some extent vitiated comparisons with previous years. As the Duke revealed, there were certain withdrawals of deposits during the crisis, and had it not been for these the increase of £247,000 in deposits, from £69.7 millions to £69.9 millions, during the year, would probably have been greater still. Cash, call money and short loans, at £15.7 millions, were slightly higher than in the previous year and again represented 21.5 per cent. of the bank's deposits. Advances rose during the year from £26.4 millions to £27.4 millions. The Duke of Buccleuch revealed that this increase was well spread and reflected conditions in the areas served by the bank. It had, however, necessitated a reduction from £27.7 millions to £27.2 millions in the bank's holdings of British Government securities, while discounts had fallen from £3.9 millions to £3.5 millions, largely as the result of a contraction in the commercial bill portfolio. Net profits showed a slight reduction compared with the previous year, owing to an increase in management charges and also to the heavier incidence of taxation. Scottish trade and industries generally enjoyed a fair year, but the Duke of Buccleuch declared that the heavy industries in the West of Scotland had been saved from depression mainly by re-armament. He emphasised the need for stimulating and developing our export trade, and claimed that there was a margin of productive capacity available towards this end, even after meeting the needs of re-armament.

Investment

Course of Share Values.—Since the middle of the year, the paths of Throgmorton Street and Wall Street have tended to diverge—except when they were united by

BRITISH AND AMERICAN INDUSTRIAL SHARE VALUES DURING THE PAST TWO YEARS (July 1, 1935 = 100)

British: *Financial News* Index of 30 Ordinary Shares.
American: *Standard Statistics* Index of 50 Common Stocks.

common political fears. America has provided a jump in stock values which, even after the post-Election reaction, still leaves prices about 30 per cent. higher than in the

third week of June. By comparison, British equity prices display a solidity which is not, in the circumstances, unremarkable, though it provides no advertisement for new investors. The current level of British equities, indeed, is approximately the same as that recorded towards the end of June, and also in the latter part of March. If the investor disregards the sharpest effect of the crisis, which pushed the *Financial News* index as low as 73.7 on September 28th, the market's behaviour during recent months is broadly in line with the economic facts. In New York, the steepness of the ascent in June and July would not have been maintained in any event, and if the same process of smoothing is applied, it would seem that the market's intrinsic momentum slowed down towards the election peak, and has subsequently reacted—again in strict conformity with the economic indicators. The investor's pre-occupations with the future of appeasement and re-armament in Europe are too real to dismiss political considerations from the scene—they have clearly contributed towards the decline of business to low ebb in recent weeks. Political factors are united at first hand with the financing of re-armament, on which the market has recently sought enlightenment. Sir John Simon's guarded statement of re-armament finance

policy (which is discussed more fully on page 470) does not, perhaps, supply the guidance which the gilt-edged market, in particular, would have liked. It certainly does not assure (as some interpreters appear to have assumed) the maintenance of the existing level of taxation and complete resort to borrowing next year. In either event, however, it is difficult to find positive encouragement for the gilt-edged market. And the check to recession has not yet gone sufficiently far to provide new buying points for high-grade industrials.

* * *

Bulgarian Loan Offer.—At present, coupons are being paid at the rate of 32½ per cent. on the two Bulgarian League Loans and the six pre-war loans. The arrangements, made at the end of 1936, covered only specific coupons and expire at the end of this year. A new agreement has now been reached, covering coupons maturing in 1939 (including those due January 1, 1940), and providing for higher rates of payment. In effect the Bulgarian Government propose to retain 61½ per cent. of the interest due, instead of 67½ per cent. as at present, but the rate now payable to bondholders is to be raised in two steps. The half-yearly coupons first falling due in 1939 will be paid at the rate of 36½ per cent., and the second coupons at 40 per cent., making an average rate of 38½ per cent., while any provisional payments on account of coupons due in 1940 will also be at 40 per cent. The various bondholders' organisations recommend acceptance. Indeed, Bulgaria's recognition of the claim of her creditors to increased payments sets an example which other debtors might well copy. Bondholders, however, will hope that the shortness of the period covered by the new offer will bring nearer the possibility of more permanent and normal payments.

* * *

Capital Issues in November.—The November totals of capital issues, both on our old and new bases, are larger than for many months past. Though the amounts are, at £14,758,000 and £24,858,000 respectively, due largely to the Woolworth and Ranks and Hawker Siddeley offers (all from the same issuing house) there has been a significant increase in the amount of new money raised in other directions. Our new issue figures for recent months are set out in the following table:

(000's omitted) Excluding Conversions

Monthly Average	United Kingdom	British Possessions	Foreign Countries	Total
1937	£	£	£	£

On balance, industrial borrowers are still concentrating upon issues of fixed interest securities, and their terms,

in some cases, have not been made sufficiently attractive for the general investor in quiet market conditions. The considerable revival in the number of Stock Exchange introductions is marked in the expansion of our "new basis" figures last month.

* * *

P. & O. Progress.—After giving a warm reception to the doubled deferred stock distribution three weeks ago, the market awaited the report with expectancy tinged with scepticism. The accounts for the year to September 30th (based on voyage accounts to June 30th) clearly show, however, that the 8 per cent. payment is not too good to be true. Net voyage receipts have increased from £1,115,837 to £1,326,264—a rise of 19 per cent. The increase is due to a combination of favourable factors, including higher conference rates, the residuum of high profits in 1937, reduced Suez Canal dues, and lower laying-up expenses. Dividends from the shipping subsidiaries have increased from £413,612 to £564,134, and total profits have advanced from £1,975,695 to £2,360,424. The deferred stock has, in effect, a double gearing, for the main items of cost, including £880,000 (as before) for depreciation, and administration expenses, show little change. Hence the rise in deferred stock earnings is spectacular—from £79,888 (excluding last year's special credits of £244,920) to £385,335. On the strictest calculation of deferred stock earnings (adopted in the following table) the 8 per cent. dividend is covered with a small margin:—

	Years ended Sept. 30th	1936	1937	1938
Voyage net receipts.....	£	1,284,923	1,115,837	1,326,264

* Including £75,000 to Provident Good Service Account.

The following chart shows the movement of deferred stock dividends during the past decade:—

P. & O. DISTRIBUTIONS, 1929-38

The curve of total profits would actually lie slightly below the cumulative total of debtenture, preference and deferred stock payments, if special income were excluded.

Reference to the consolidated balance sheet suggests that these results fairly reflect the trading experience of the group, for while the balance at profit and loss is reduced by roughly £83,000, general and contingency reserves in the subsidiaries' books have increased by some £269,000. It is fortunate that continued disturbance in the Far East was offset by good Indian, Australian and Straits trade. The consolidated balance sheet reflects the great strength of the group. Amounts written off the cost of ships exceed depreciation at a 5 per cent. rate by £8,815,000 (though the parent company's allocation in the past two years has been below that rate). Net floating assets (taking into account investments of £16,420,819 and cash holdings of £2,189,956) of £11,139,457 are impressive, since the parent company, and to some extent its subsidiaries, have replaced a considerable proportion of tonnage at advantageous prices. But the market, viewing the deferred stock by the stern test of potential earnings for the current year, is paying due regard to the fact that the directors themselves designated 3 per cent. of the 8 per cent. distribution as "bonus," and shipping conditions during the latter part of the group's accounting period suffered a setback. The deferred stock, at 22s. 6d. yields £7 2s. per cent. on an 8 per cent. distribution and £4 9s. per cent. on the more conservative hypothesis of a 5 per cent. distribution for the current year.

* * *

British Celanese Reverse.—The directors of British Celanese have always declared that, if capacity could be employed more advantageously, shareholders would come into their own, after years of patience. These hopes are duly repeated in the latest report. Even at the present low selling prices, an increase in demand which would enable the company to operate at a rate in closer relation to capacity would permit "satisfactory" earnings to be made. Unfortunately, these hopes are accompanied, not for the first time, by discouraging trading results. The company claims to have increased its proportion of the diminished total trade of the industry during the year to July 2nd last. But the reduction in trading profits from £2,195,760 to £1,939,468 would have been more serious but for reductions in costs to offset lower selling prices. After providing for expenses, commutation of royalties, research, depreciation and debtenture service on a lower scale than in 1936-37, the residue available for preference dividends has shrunk from £247,078 to £29,781—an amount which does not cover half of the six months' dividend on the first preference capital to October, 1937. Results for the past three years are analysed below:—

	Years to June 30 (approx.)	1936	1937	1938
	£	£	£	£
Trading profit		2,306,107	2,195,760	1,939,468

* Half-year to October, 1937. † 3 years' arrears, bringing div. up to date, Apr. 30th, 1936. ‡ Year to April 30th, 1937. § Half-year to October, 1930.

At last year's meeting the chairman made a cryptic reference to the possibility of co-operation in the industry. In the present report it is stated specifically that during the past few months contact has been established with Courtaulds, though the directors decline to discuss the scope of the discussions. Obviously, the possibility of a firm price agree-

ment in the acetate section of the industry—linked, of course, with the arrangements which already exist in the viscose section—would have an important bearing on the company's future prospects. The first step, clearly, is to establish a reasonably stable basis of earning power; the second is to bring the existing capitalisation into line with that earning power and to eliminate intangibles (which exceed £3 millions out of a balance-sheet total of £13.2 millions) from the assets. Until these steps are achieved, existing quotations of 9s. 3d. for the first preference, 5s. for the second preference, and 3s. 6d. for the 10s. ordinary shares must surely be regarded as generous.

* * *

Amalgamated Anthracite Scheme.—The need for a capital reconstruction for Amalgamated Anthracite has long been recognised. No cash ordinary dividends have been paid since 1924-25, preference dividend arrears will amount by the end of this year to £591,104 (and would be much larger but for the issue of funding certificates in 1933), and a capital loss computed at £6,154,484 can be met only to the extent of £1,236,145 from reserves. The proposed scheme is complicated in detail, but its effects can best be summarised as follows:—

Existing Share Capital	New Share Capital
£2,386,850 7% pref.*	£1,193,425 5% "A" cum. pref. part. pref.
	£1,193,425 5% "B" non-cum. pref.
	£456,269 new ord.
	£1,343,652 new ord.
£6,718,260 ord.	£4,904,330 reduced.
	£14,009 fractions cancelled.

* Of which £1,964,821 is "original" issue and £422,029 is "1937" issue, with different dividend rights.

Each of the 6,718,260 ordinary shares at present issued will be written down to 4s. The sum of £4,918,339 will be released for the reduction of assets, and about one-quarter of the new equity will be transferred to preference shareholders, in discharge of arrears and in consideration of a change in preference rights. The present preference capital is not to be cut, but it is proposed to divide it equally into two classes. The "A" preference shares will carry a 5 per cent. cumulative dividend, and the "B" preference shares a 5 per cent. non-cumulative dividend with rights *pari passu* with the ordinary shares up to a further 2 per cent. And in addition, the 10s. preference shares of each class are entitled to a 2s. premium on winding-up.

* * *

At present, the 7 per cent. preference dividend would require £167,076 gross annually. The reduced preferential dividends will require only £119,340, but if maximum participating rights are to be obtained, net profits must exceed £179,200. Further, if preference shareholders are to receive their original income, profits would have to exceed £237,700, and the ordinary dividend 5½ per cent. With profits at that level, holders would receive £59,670 in respect of their "A" shares, the maximum of £83,538 in respect of their "B" shares, and some £24,000 in respect of their share in the equity. Total profits in 1937 were £294,052, but the fixed charges (including provision for redemption) are heavy, and the balance available for distribution was no more than £63,103. Thus, unless there is a

sharp recovery in total profits, or until the existing £1,357,355 of 5 per cent. debenture stock and £444,265 of 4½ per cent. Funding Certificates are paid off, shareholders may not experience much tangible benefit from the scheme. The proposals may tidy up the balance sheet. But the re-apportionment of earnings on the new share capital does not appear to be sufficiently far reaching, in relation to immediately prospective earning power, to reward the preference shareholders' sacrifices equitably.

* * *

Crompton Parkinson's Future.—Crompton Parkinson's profits record in the last decade has been meteoric. Ten years ago the company earned £89,110; during the year to September 30, 1937, profits amounted to £432,114. The lesson of economic history is that such rapid advance cannot indefinitely be maintained, and Crompton Parkinson appears to have reached stable earnings with unexpected suddenness. Profits for the year to September 30, 1938, are practically unchanged at £431,046 against £432,114. There was some decline in orders during the year, although it began with a well-filled order-book. Yet the scope of the business has further increased, for shares in subsidiaries stand in the balance sheet at £635,096 against £608,164, current accounts with subsidiaries show a net increase of £93,000, and a new item of £20,190 appears for trade investments. But the contemplated *liaison* with Callender's Cable has been abandoned, and it is also evident from higher cash distribution (and confirmed by the chairman's speech which accompanies the report) that profits are not expected to expand in future at the rapid rate of recent years. Earnings for the ordinary and "A" ordinary shares, at £354,388, are a mere £818 less than in 1936-37 and represent 48.2 per cent. on the increased capital. But the regular dividend is raised from 12½ per cent. to 15 per cent., a special cash bonus of 15 per cent. is to be paid, and in addition a capital bonus of 50 per cent. is proposed. The dividends absorb £245,889 against £73,008, while the capital bonus entails a draft of £409,814 on reserves. The allocation of £106,419 to general reserve reinstates the fund at £500,000. The chairman explains that six years ago a basic cash dividend of 12½ per cent. and a 7 per cent. capital bonus were aimed at, with special capital bonuses from time to time. By this means the company has built up substantial liquid resources, which are now adequate, and the expansion of earnings is not expected to continue at the same rate. The directors' objective will now be a basic dividend of 15 per cent., with a cash bonus when profits permit. Assuming that a 15 per cent. dividend is paid on the increased capital (it would, of course, be comfortably covered by last year's earnings), the ordinary and "A" ordinary shares yield £4 8s. 3d. per cent. at a current price of 26s. 7½d., cum dividend and bonus. The fact that the company's order book is little lower than a year ago, coupled with the benefit of Government orders, appears to justify the chairman's "quiet confidence."

* * *

Tate and Lyle Report.—Stability has been the keynote of Tate and Lyle's profits and ordinary dividends since 1934. A 2 per cent. increase in last year's total profits is in the right direction, but it does not suggest that the long-term benefits of extensions and technical improvements have begun to materialise. And the capital bonus of two new shares for every five held (which will reduce the general reserve from £2,100,000 to £100,000) is intended to bring the capitalisation more into line with the assets employed in the business. The latest balance sheet to October 1st shows that fixed assets and invest-

ments amount between them to £8,735,805 apart from stocks totalling £2,678,777, but share and debenture capital totals only £7,798,000. Unless the stability of profits in recent years is succeeded by another jump in profits, such as occurred in 1935 when a 40 per cent. capital bonus was also distributed, the maintenance of the 18½ per cent. dividend may be problematical. It is worth noting, however, that last year's earnings rate of 27 per cent., as shown below, is equivalent to 19.3 per cent. on the increased capital:—

	Years ended September 30		
	1936	1937	1938†
Total profits	1,324,416	1,325,362	1,357,884
Expenses	7,013	7,972	8,222
Debt interest	90,562	89,837	89,072
Preference dividend...	71,500	71,500	71,500
Ordinary shares—			
Earned	1,155,341	1,156,053	1,189,090
Paid	868,700	868,700	883,027
Earned %	26.1	26.3	27.0
Paid %	18¼	18¼	18¼*
To reserve	284,000	300,000	300,000
Carried forward	58,874	46,227	52,290

† 366 days to October 1st. * Also 40 per cent. capital bonus.

The following chart illustrates the progress of Tate and Lyle ordinary dividends since 1930:—

In 1929 some £3,312,000 of ordinary capital ranked for dividend. To-day the total is £5,000,000, and in future it will be £7,000,000. Last year's additions to fixed assets are not exceptional at £370,659, but investments in subsidiaries have risen from £296,089 to £865,714. This expansion covers the purchase of the ordinary shares of Macfie & Sons for 240,000 ordinary shares of Tate and Lyle, the formation of a private lighterage company with a capital of £300,000, and the purchase by a West Indian subsidiary of a factory for £350,000 cash. At the current price of 80s. 6d., the ordinary shares would be worth 57s. 6d. ex rights. On this basis they would offer an earnings yield of £6 14s. 3d. per cent. and a dividend yield of £4 10s. 9d. per cent., assuming that earnings and distribution policy remained unchanged.

* * *

Dorman Long Prospects.—The favourable impression created by the preliminary results and dividend of Dorman Long (on which we commented on November 19th, page 386) have been confirmed this week by the full report. The directors, however, do not discuss the reason for the substantial increase in trading profits from £1,396,701 to £1,498,517 in a year in which district steel output declined by 7 per cent. The increased provision for taxation (which is up from £152,208 to £245,896) absorbs the bulk of the increase in profits; net earnings after taxation and their distribution have virtually remained

stable during the past year, as the following table indicates:—

	Years ended Sept. 30th		
	1936	1937	1938
Total profits.....	1,128,916	1,396,701	1,498,517

To reserve	113,235	200,000	200,000
Carried forward	142,967	152,130	154,712

* After reserve allocation.

The chart below portrays the continuous progress which the company has achieved since 1932:—

During the past six years, in fact, the company has converted a loss of £215,534 into distributable earnings of £924,583.

* * *

Dorman Long is one of the few companies which provides a four-year balance sheet and profit-and-loss comparison in its report, and it is eloquent of the progress achieved since 1935. Fixed assets show comparatively little change—their values were, in fact, largely determined under the capital reorganisation of 1934. But stocks and work in progress have advanced from £1,328,714 at September, 1935, to £1,698,468 at September last, while capital has increased at the end of 1936 from £831,148 to £1,581,148; general reserve stands at £1,543,008 compared with £200,000 in 1935; and a workmen's compensation reserve has grown from £18,182 to £302,237. These are considerable achievements even for a period of prosperity. The company would be fortunate indeed if the next four years were as favourable, and the immediate outlook is fairly summed up in a yield of 8 per cent. on the ordinary shares at 25s.

* * *

Tube Investments' Report.—The 5 per cent. increase in Tube Investments' profits is a much better result than might have been anticipated from the maintenance of the 23½ per cent. dividend. Moreover, at last year's meeting, Mr Chamberlain was cautious in his

view of 1937-38 prospects. He stressed that the arms programme could not affect the company until 1939, and believed that, though turnover would probably be larger, the rate of profit would fall. In the event, total profits have increased from £836,668 to £883,726, and the bulk of the increase is available for the ordinary and the *liaison* stockholders. The following table shows that the 23½ per cent. dividend is covered with the increased margin of 6¼ per cent.:—

	Years ended October 31		
	1936	1937	1938
Total revenue	639,561	836,668	883,726
Interest, fees, etc.	13,679	11,578	16,469
Preference divs.	44,220	43,490	42,045
Ord. and <i>liaison</i> † shares:—			
Earned	581,662	781,594	825,212
Paid	421,117	666,043	643,842
Earned % (ord.)	24.2	27.9	30.4
Paid % (ord.)	17½	23½	23½
Reserve	150,000	150,000	177,458
Carry forward	112,669*	128,220	132,132

* After £5,152 capital increase expenses. † Each £1 *liaison* share carries the rights of £1,000 deferred stock.

The already close working connection between the company and Stewarts and Lloyds has been strengthened during the year, for a further £203,278 of Stewarts and Lloyds deferred stock has been bought by the company at 35s. (raising the total holding to £329,888 nominal). In accordance with custom, the additional holding has been written down to its par value, and the resulting allocation to general reserve of £177,458 represents £25,000 in excess of the £152,458 premium at which the stock was bought. This acquisition appears to be the main change since the previous balance sheet, for a rise of £107,000 in land and buildings in the consolidated balance sheet and of £277,000 in plant is largely offset by a fall of £347,000 in trade interests. The current year should see a satisfactory level of activity owing to the arms programme, and a yield of £5 15s. 3d. is now obtainable on the ordinary stock units at 82s. 6d.

* * *

United Molasses' Strong Position.—The increase in United Molasses' dividend from 21½ to 22½ per cent., announced at the end of last week, disappointed some optimists, but there will be no complaint with the position disclosed by the detailed and highly informative report. The company's total income increased from £1,139,284 to £1,192,185, while the consolidated profit, after providing £279,607 for taxation, was reduced to £877,714, compared with £946,241 in 1936-37, after an undisclosed appropriation for tax. The depreciation provision, however, has been reduced from £318,101 to £205,701, and the directors contemplate that the provision will approximate to £200,000 in future—a level which will still write off the assets of the group many years before the expiration of their working life. After providing £45,000 for staff funds (this item, again, should not exceed

Compared with the dark days of 1930-33, the company's position is immensely strong. The sale of the "Athelchief" for £130,950 net compared with a written-down value of £36,024, is typical of the conservative value at which the fleet now stands in the books. Indeed, it is calculated that it would require £9 millions to replace the group's existing investments and equipment, compared with a total issued capital of £3,204,500—a position which, as the directors point out, is relevant when calculating the percentage of profits earned by the company. As for the trading outlook, the company is making further headway in offsetting the decline in molasses business in the U.S.A. and the Far East by increased sales in this country and Europe. A large increase in European demand has followed a fall in prices to the lowest recorded levels, but the tanker outlook is improving, and the company has the benefit of certain time charters. The directors forecast that, although earnings are unlikely to equal last year's level, they should justify the maintenance of the dividend, should satisfy ordinary shareholders. The 6s. 8d. shares stand at 22s. 10½d. to yield £6 17s. per cent.

Lautaro Nitrate Position.—The accounts of Lautaro Nitrate for the year to June 30, 1938, must be considered good in the circumstances. Not only was the important Spanish demand again severely curtailed, but lower agricultural prices might have been expected to reduce sales. The company's actual share of sales for the year, however, was scarcely changed at 414,995 metric tons, against 416,654 tons, while gross nitrate and iodine profits fell only from £568,766 to £548,981. The net profit of £450,454 fell short of the previous year's level by only a few pounds. Owing partly to the rather smaller prior interest requirements on the diminishing frozen bank loan, and partly to smaller bond and debenture service, this year's profits provide a full 4 per cent. on all bonds and debentures—last year the first mortgage income bonds only received 3½ per cent.—and there was a surplus for amortisation of £127,643, against £108,672 last year. Bond and debenture interest and amortisation absorb the entire profits for the year, and, under the scheme of 1936, must continue to do so until the frozen bank loans have been paid off by the liquidation of the corresponding frozen stocks of nitrate, which form the loan's security. When this process is completed, the company will be able to meet the whole of current demand out of its own production, instead of meeting a minimum of 20 per cent. out of stocks on which the profits, if any, must go to the bank creditors. In addition, only 80 per cent., instead of 100 per cent., of profits will be earmarked for debenture service, the balance of 20 per cent. being earmarked for ordinary dividends. Lautaro shareholders therefore have an immediate interest in the company's progress in liquidating the frozen stocks and repaying its bank creditors. The reduction of £334,699 effected last year brings the debt down to £1,541,924, a sum

which, on present performance, should comfortably be cleared by June 30, 1943, the intended date. At 3s. 3d. the £1 shares can only be considered a likely speculation, in which a five-year time element is involved.

Kaffir Dividend Prospects.—In the light of the substantial rise in the price of gold during the current half year, the Kaffir market contemplates the approaching dividend season with a degree of indifference which is superficially surprising. The explanation is, of course, partly to be found in the companies' trading policy and partly in the market's concern with Colonial discussions. Nevertheless, for the four months July to October inclusive the Rand gold output reached the record level of 4,146,135 ozs., showing an increase of 232,719 ozs. on the first four months of the year, and in the aggregate higher profits and a net increase in the total amounts of dividends distributed are to be anticipated. Next year some of the new producers will make an appreciable contribution, but on this occasion only Van Dyk, which may make a small initial distribution, is likely to appear as a newcomer to the dividend list. Both "Sallies" and Grootvlei have begun to make profits, but they can hardly make up the leeway of the earlier months sufficiently to justify a distribution this month. Among the fairly clear cases in which an increase is to be expected is East Geduld, whose production position has been stabilised and which has, therefore, no problems of capital expenditure to consider. In June the distribution was raised by 6d. to 5s. 6d., and a further increase to 6s. would now appear to be justified.

Simmer and Jack is a contrasting case. In this instance, profits are rising steadily, but with the approaching completion of one expansion scheme the directors, with every technical justification, have announced another. To finance this a new issue is to be made, which will provide a small surplus over the estimated total expenditure. Hence a moderate increase in the distribution, possibly from 5d. to 7d. per share, is looked for. For Modder East, owing to the fall in capital expenditure this year and a moderate increase in profits, an increase of 6d. in the distribution to 3s. 6d. may be possible. Rand Leases working profits for the four months in the present period have been £238,615, as against £184,796 in the corresponding period of the first half of this year, when the distribution was 1s. The market is therefore expecting an increase in the distribution from 1s. to 1s. 6d. New Kleinfontein and Rose Deep are also among the possibilities, but in both cases a larger capital ranks. Despite the fall in profits it is hoped that Randfontein will be able to maintain its distribution, although there is an admitted element of uncertainty. On the other hand, Brakpan, Langlaagte Estates, Modder B, New Modderfontein and Van Ryn Gold may well shade their distributions to conform with the trend of profits.

Gold Coast Mining Results.—Shareholders in Marlu and Gold Coast Selection Trust are now receiving substantial dividends. Increasing output and continuous operations produced very satisfactory earnings of £529,400 for Marlu for the year to July 31st. After providing £149,500 for taxation, dividends totalling 25 per cent., less tax, were paid; and an interim of 15 per cent., tax free, has been declared on account of the current year. The development position of the two principal properties, however, qualifies the immediate outlook; and although the reserve tonnage has been increased by acquisition of additional properties (of low average values), the report intimates that alterations and adjustments to the treatment plant "will probably enable the monthly profit to be maintained at approximately the current rate." Work on the 400 ft. and 600 ft. levels of Marlu and Bogosu North continues to provide negative results. Nothing is said in the reports of Marlu or Gold Coast Selection regarding the purchase price of the properties lately acquired by the former from the latter, but the property account of Marlu has increased by £102,060

to £1,087,080. Gold Coast Selection, whose income consists chiefly of dividends on its shareholdings, shows a profit of £172,860 and paid a dividend of 10 per cent., tax free, for the year ended March 31st last. An interim of 15 per cent., tax free, has been declared on account of the current year. Property account has risen from £154,290 to £260,050, while cash in hand has dropped from £139,350 to £28,280. Investments stand in the latest balance sheet at £1,045,000, of which shares entered at £967,430 had on March 31st a market value of £4,402,210. Marlu 5s. shares stand at 13s. 1½d. and Gold Coast Selection 5s. shares at 23s. 9d.

Whither Wiluna?—A year in which gold was recovered to the value of nearly £A1,000,000, but without benefit to the shareholders, must certainly be written down as a disappointment. In the twelve months to last March 31st the income of the operating company—the Wiluna Gold Mines—amounted to £965,560, of which a surplus of £109,600 remained after various provisions. From the balance of £281,200 shown by the appropriation account (including the sum brought forward from the previous year) £159,550 has been written off, leaving the carry-forward at £121,660. The grade of ore treated fell from 5.1 dwts. to 4.45 dwts., while costs, including smelting but excluding all exploration and development, rose by 3s. 7d. per ton, owing to higher wages and reduced hours. The percentage of extraction improved, although it entailed a rather appreciable addition to expenses. Certain sections of the plant, however, are still not giving really satisfactory results. At 1,920,000 tons, value 4.3 dwts., the ore reserves show a decrease of 390,600 tons in quantity and of nearly ½ dwt. in value. It is notable that "positive" ore now figures at 1,217,100 tons, compared with 2,200,500 tons. The special programme of diamond drilling and exploration recommended at the end of last year has so far failed to disclose any sustained improvement in values in the main property, although interesting discoveries have been made on the neighbouring Bulletin and Happy Jack leases. The report of the general manager certainly fails to disclose any ground for the wave of optimism which swept through the market a few months ago. The future of the company depends upon the development of more pay-

able ore, and its financial resources are distinctly limited. The last dividend was 10 per cent., paid as interim on account of 1935-36, and the £1 shares now stand at 13s. 10½d.

The Week's Company Profits.—This week's company results are numerous and important. The results of some 58 companies are analysed in our usual table on page 519, and their net profits (excluding two cases where comparable figures are not available) amount to £11,360,000, against £11,681,000, a fall of only 2½ per cent. The cumulative total for 2,225 companies reporting during the year to date is £283,918,000, an increase of 8 per cent. on the total of £262,677,000 for the previous year. The week's results are discussed in earlier Notes and on page 500 under the heading "Shorter Comments."

Company Meetings of the Week.—Reports of company meetings will be found in this issue from page 508. The speeches at the *Royal Bank of Scotland* and *Bank of New South Wales* meetings are discussed on pages 488 and 489. Mr John A. Agnew, at the *Consolidated Gold Fields* meeting, discussed the position on the developing properties, and referred in particular to the promising results at Venterspost. At the *Central Uruguay Railway* meeting, Mr G. H. Harrison stressed three matters of vital importance to the company—the exchange rate, the co-ordination of transport, and the settlement of the claim against the Government. Discussing the expansion of the *Bristol Aeroplane* works, Mr W. G. Verdon Smith pointed out that a large proportion of the extensions would be of a permanent profit-earning character. Mr A. Chester Beatty referred hopefully to the effect of the lead restriction agreement at the *Trepca Mines* meeting. Addressing shareholders of *Ratanui Rubber*, Mr W. Arthur Addinsell described the criticism of the Control Committee's decision to fix production at 50 per cent. for January-March, 1939, as "premature," and suggested that the position warranted "moderate optimism." At the *Kwahu Mining* meeting Lieut.-Col. Frank Johnson described the changes in the company's Gold Coast Main Reef and Marlu holdings.

THE STOCK EXCHANGES

London

SETTLING DAYS

TICKET	ACCOUNT
DECEMBER 6	DECEMBER 8

THE victory of M. Daladier over the C.G.T., the smart recovery in the pound, and Sir John Simon's statement regarding defence finance have all contributed some quota towards this week's modest improvement. Not that the tale of the markets is lively; turnover remains small, with perhaps some slight expansion towards the end of the week. The rally has been one of prices, rather than expanding business.

Gilt-edged were depressed at first owing to nervousness regarding the French situation and the uncertain movements of the pound. These losses were limited to ¼ on the undated stocks, and on Tuesday further falls were regained, modest improvements being recorded on the day. The continued improvement in sterling was marked in mid-week by a further recovery, and the market was also assisted by Sir John Simon's statement on defence finance. The collapse of the general strike in France led initially to rises of up to ¼ in gilt-edged on Thursday, but these were not maintained.

Dominion stocks were still affected by the weakness of New Zealand issues.

In the *foreign bond market*, Japanese issues were depressed at first, but recovered in mid-week on bear closing. Bulgarian loans were favourably affected by the new debt agreement (discussed on page 490), and small improvements were recorded later in Brazilian bonds. French rail issues made a smart response to the collapse of the strike, and some improvement was reported in German bonds.

Home rail stocks opened in gloomy fashion, with falls ranging up to two points in the debentures and slightly less in the guaranteed stocks. A smaller setback occurred on Tuesday, but it was followed by a moderate recovery in mid-week, despite a total fall in traffic of £300,000. The ordinary stocks showed smaller movements, but obtained little support. Argentine rail issues remained quietly firm, without attracting much business.

Industrial shares opened in unimpressive fashion, but prices moved a shade higher as the week went on, though business remained on a modest scale. Iron and steel shares remained dull until Wednesday, and movements were not uniform. Thornycroft were again a good feature, John Brown gave

way on disappointment with the interim dividend but rallied on news of an Admiralty order, while Tube Investments failed to respond to the satisfactory report (discussed on page 493). In the coal group, Glass Houghton were depressed on the decision to omit a final dividend, and the weakness spread to other issues; the Amalgamated Anthracite scheme was well received. Engineering shares were irregular. J. Brockhouse gave way following the reduced dividend, but Henry Meadows were firm on the record profits. Prices of electrical equipment issues reacted. The motor section was subdued on the A.E.C. profits reduction. Aircraft shares were uninteresting but steady, though a wider interest was noticeable from mid-week. There was some enquiry for the leading tobacco issues. On Wednesday, brewery shares brightened considerably on calculations of a smaller chance of heavier taxation. British Celanese were not much affected by the report (see page 491), but Courtaulds were firmer on the news of negotiations. Among provision and catering issues, Tate and Lyle were indifferent to the report (analysed on page 492), while A.B.C. hardened on the maintenance of the dividend. Stores were uncertain. Though miscellaneous issues made a mixed showing, the underlying tone of indecision was less.

marked than in recent weeks. United Molasses improved slightly on the report. Cement shares improved after early weakness. The shipping group was quiet, but P. and O. deferred gained slightly on the full report (see page 490).

★

Conditions in the oil share market were unchanged. The tone was heavy, price changes slight, and the small business was confined to the leaders. Continental dealings were too small to be decisive. Nothing happened to awaken the rubber share market from its state of coma; changes were trifling and mostly downwards. Tea shares strengthened slightly as the week went on.

The mining market behaved similarly to other sections, and, except for Monday's session, the tone was rather brighter. At first the record gold price was without effect on Kafirs, and support (mostly from the Cape) was mainly for the developing mines. Dividend payers were relatively neglected, Paris dealers turning for the time being to domestic stocks. On Thursday, Cape buying was more in evidence, in advance of the November profits statements. West African gold shares were more active than in recent weeks. At first, Rhodesian copper issues reacted, except for temporary gains on Tuesday afternoon, but they improved a little in mid-week. Among base metals, Trepcia went ahead on Paris support.

ACTUARIES' INVESTMENT INDEX

The Actuaries' index of 151 industrial ordinary share prices on Tuesday last, November 29, 1938, stood at 63.1, compared with 63.7 five weeks ago and 73.6 a year ago. The corresponding average yields are 5.94, 5.85 and 4.95 per cent. We give below a selection of the separate indices, and also the usual monthly particulars of fixed interest securities. One of the chief changes, however, is the fall as compared with five weeks ago in the index of industrial (distributive) debentures from 107.8 to 105.7, and in the corresponding preference stocks from 72.3 to 70.5, owing to the decline in home rails.

New York

AFTER a weak close last Saturday, Wall Street reopened with a further display of selling pressure, which depressed the Dow Jones industrial average 2.31 points, despite a fair closing rally. The rally provided a signal that a resistance point had been met, for on Tuesday there was a fractional advance of a technical character, while in mid-week the Dow average jumped 2½ points in response to the news from France and the newly-found strength of sterling. The slight setback in steel operations, estimated by *Iron Age* to be running at 60½ per cent. of capacity, compared with 61½ per cent. last week, tended to confirm the market's impression that business news will show no decisive change for better or for worse during the next few weeks. The current decline in steel activity is attributed partly to smaller orders from consumers as the year-end stock-taking approaches. Thin trading remains a feature of the market, and is liable to cause rather extreme price movements. Government bonds reacted on the Treasury's borrowing schedule for December, but second-grade bonds responded to the recovery of stocks in mid-week.

Paris

UNTIL the last day of the month November proved a trying time for the Bourse. Popular dissatisfaction with M. Reynaud's economic measures dominated consideration of the decrees themselves. On reopening after the Toussaint holiday, the market received M. Reynaud's appointment as Finance

Minister well, but irregularity followed on rumours that political changes might prove more extensive. Business thus improved considerably before the announcement of the decrees and but for a check induced by profit-taking, the second week of November was one of the best for a long time. Though increased taxation was to nobody's taste, the belief prevailed that national recovery would follow, and the immediate response to the decrees was favourable. Very soon, however, weakness set in: it could partly be excused on the grounds of a weak technical position and disturbances in Germany, but the real cause was consternation at Labour's reaction to the decrees. Growing anxiety prevailed over such factors as Mr Chamberlain's visit to Paris, the preliminaries of a Franco-German pact, and the reduction of Bank rate. The collapse of the general strike led to an all-round recovery in rentes and bank shares, Bank of France reaching a new "high" for the year.

Berlin

DURING the first ten days of November the Berlin Bourse showed the same characteristics as October—unimportant price changes, small turnover, and a little inquiry for specialities on hopes of increased dividends. There was some demand for mines, the Hoesch dividend increase providing a useful stimulus, but trading generally became more and more listless. Towards the middle of the month pronounced weakness followed the anti-Jewish disturbances. Restriction on dealings by Jews prevented any large scale realisations, but there was a complete absence of buying, and modest though persistent sales depressed prices and gave a gloomy tone to the market. Renewed dullness and anxiety at the end of November followed a short-lived improvement.

Amsterdam

LIKE the London market, Amsterdam was more than usually dull in November. Although there were occasional active sessions, average turnover was at a minimum, and the month ended with prices little changed on balance, but below the best. Domestic factors provided no impetus in either direction, and such changes as occurred were governed mainly by the behaviour of Wall Street, foreign politics and the exchanges. The second week of November was the best of the month, for business was stimulated for a time by the United States election results. Greater reserve, however, was shown later, on fears of the international repercussions of the anti-Jewish disturbances in Germany. Further anxiety was caused by the labour situation in France

and the weakness of sterling. Sugar shares were active on better Java prices, but rubber issues lost ground on the quota decision.

Canada

THE Canadian stock markets up to the middle of November displayed a much healthier tone. The public was more actively interested and the volume of trading increased. During October the collateral borrowings of Montreal Stock Exchange firms totalled \$14,508,907, an increase of \$1,131,861 over September. Stocks of companies due to benefit from British Government orders for aeroplanes and other armaments were popular speculative favourites. Liquor stocks also gained ground, and there was some improvement in newsprint and construction issues, while western grain stocks were in better favour. But the decline in other sections prevented any general improvement in the stock averages. Prices turned downwards again after mid-November, and though the fall was checked, the latter part of the month was disappointing. The market failed to respond to the Anglo-American trade agreement. In the mining market base metal issues were strong, though active conditions were not maintained throughout November. The bond market has been firm, without showing any material change in the price level. The "Investors' Index of the Bureau of Statistics, which stood at 111.0 on October 14th had risen to 119.9 by October 25th, but by November 3rd it had fallen back to 110.8. The Bureau's index for the price of long-term Dominion bonds for the week ending November 3rd was 117.4, as compared with 117.3 for the previous week and 114.3 for the corresponding week of 1937.

Capital Issues

THE issue of 4½ per cent. £1 preference shares of *British Power and Light Corporation* at 21s. should meet with a satisfactory investment demand. On the basis of the 1937 profits (which the directors anticipate will be approximately maintained this year) the cover for the existing 6 per cent. preference shares and the new capital, taken jointly, would be just under 2½ times. *Hargreaves Collieries* 5 per cent. debenture stock, issued at par, is secured on the existing assets of the company and two subsidiaries, which in turn guarantee the service of the stock. Average net profits for the group for the past three years would cover the interest on the present issue five times,

and on the authorised total amount nearly four times. The debenture is of reasonable standing, although it may not command a wide market. Among

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

after at 104 per cent. Final redemption January 1, 1954, at 102. Messrs Cazenove Akroyds and Greenwood and Company have agreed to purchase the stock at 98½ per cent. less ½ per cent. commission.

Grant (James) and Company, Ltd.—Particulars of issue of £150,000 5½ per cent. registered notes. Redeemable at par November, 1939–53, or from 1943 at 102 on notice. Stelland Trust, Ltd., take issue at 100 less 2 per cent. commission.

United Steel Companies.—Particulars of an issue of £1,500,000 4½ per cent. ten-year notes, 1948, unsecured, repayable at par December, 1948, or on notice 1940–42 at 102, or 1942–47 at 101. Morgan Grenfell and Company take issue at par, less 1½ per cent. commission. At same time, 882,180 £1 shares offered to stockholders at par (1 in 10).

Ultramar Exploration Company, Ltd.—Issued capital, 1,764,425 10s. ordinary shares. Owns (itself or through subsidiaries) large concessions over lands in the Venezuelan Orinoco basin which are in process of being proved as oil-bearing. Total assets, end 1937, £525,480.

Newman Industries, Ltd.—Particulars concerning 100,000 6 per cent. redeemable cumulative £1 preference and 200,000 2s. ordinary shares. Preference are redeemable by 1975 by sinking fund at 22s. (or under by purchase), or on notice. Formed April, 1936, to take over existing engineering business.

UNIT TRUST

Supervised Shares, Inc.—Dealings in the shares of Supervised Shares, Inc., will commence on Monday next in London, under the auspices of the National group of unit trusts, at around \$11 per share.

ISSUE TO SHAREHOLDERS ONLY

Gold Coast Main Reef.—Issue of £300,000 non-interest bearing notes redeemable in 1943 at 120. The notes are convertible into shares at any time on the basis of three shares for every £1 notes. Gold Coast Selection Trust is to take £60,000 notes in exchange for loans, and the remainder of the loan from that company is to be repaid in cash.

RESULT OF ISSUE

London Power Company.—Underwriters to the issue at 98½ of £1,000,000 3½ per cent. debenture stock have had to take up 73 per cent.

SHORTER COMMENTS

Company Results of the Week.—Breweries continue to make a mixed showing, one of the larger companies, WOLVERHAMPTON AND DUDLEY BREWERIES, earned trading profits of £259,231 against £270,214, but the 16 per cent. dividend is maintained. A slight improvement in profits is shown by TOBACCO SECURITIES TRUST, whose net profits for 1937–38 are £577,152. The heavy industries again have a satisfactory record. WEARDALE STEEL COAL AND COKE have earned about £15,000 more at £114,901, and the dividend is increased from 12½ per cent. to 17½ per cent. SHORT BROTHERS (ROCHESTER AND BEDFORD) have issued an excellent report, showing an increase of £78,000 in total profits at £211,580, but the dividend is raised conservatively from 40 to 42½ per cent. A decline in the total profits of ASSOCIATED EQUIPMENT from £443,968 to £382,717 is somewhat disappointing, though the 7½ per cent. tax-free dividend is maintained. DENNIS BROTHERS, LTD., on the other hand, have maintained net profits at £99,303, but are reducing their dividend from 11½ to 100 per cent. Though a decline in profits from the motor industry was only to be expected, the setback experienced by HUMBER, LTD., is of some severity. Trading profits are £219,885 against £322,044. Disorganisation due to rebuilding is the main reason for a drop in O.K. BAZAARS' net profits from £241,560 to £219,220. Net profits of BRITISH ELECTRIC TRANSFORMER are practically stable at £79,681. The business of BRITISH TYRE AND RUBBER COMPANY was fully maintained during the year, and net profits of £162,293 are only £5,500 lower. Satisfactory progress has been made by the CRITTALL MANUFACTURING COMPANY, and although the 25 per cent. dividend is maintained, net profits are £17,000 higher at £266,721.

MISCELLANEOUS

British Industrial Plastics.—The report for year to September 30, 1938, shows gross profits £97,565, against £105,569. Net profits have declined from £31,098 to £22,184, after £21,331 for depreciation and taxation reserve. Consolidated account shows £26,642 in all for these purposes. Dividend recommended 6 per cent., against 8 per cent. Forward £5,697.

Redpath, Brown and Company.—Net profit year to July 31, 1938, £223,396, an advance of £15,593. To reserve, nil against £70,000. The directors recommend a free of tax dividend of £215,784 against £52,500 net. Carry-forward unchanged at £172,244.

Henry Meadows.—Profit year to August 31, 1938, £35,832 (£27,167). Ordinary dividend unchanged at 20 per cent. To reserve for obsolescence, £5,000 (nil); forward, £8,396 (£6,564).

Siemens and Halske.—Holders of 6½ per cent. 25-year sinking fund gold debentures, 1951, are offered payment of interest in U.S. dollars at reduced rate of 3½ per cent., payable half-yearly, beginning March 1, 1939. All unpaid coupons attached to

assented debentures will be redeemed at \$16.25 per coupon. Holders accepting will receive a cash payment of 2 per cent.—that is, \$20 per \$1,000 debenture.

Associated Equipment Company, Ltd.—Report for year to September 30, 1938, shows trading profit £377,745 (£130,428). To depreciation, £103,117 (£104,368). To taxation, £100,000 (£120,000). Ordinary dividend again 7½ per cent. tax free. Carry-forward raised from £260,000 to £262,000.

Weardale Steel, Coal and Coke.—Net trading profit year to September 30, 1938, £99,479 (£110,515). Deferred dividend raised from 12.667 per cent. to 17.111 per cent. To general reserve, £20,000 (£25,000). Carry-forward increased from £28,402 to £29,803.

Investment Trust Units.—Progress Report No. 3 covers half-year to October 22, 1938. Distribution, 3.0028d. per unit net after tax, making for year 6.5374d. net (equivalent to a gross yield of over 5½ per cent. on current price of 13s. 9d. xd.). Revenue available for ordinary shareholders of 27 companies paying final dividends during period was £1,451,296; distribution, £1,047,819. The Progress Report shows composition of Trust Fund, and rate of dividends received.

British Tyre and Rubber.—Net profits year to September 30, 1938, have risen by £8,405 to £177,112. Dividend 10 per cent. (same). Tax and N.D.C. £45,043 (£33,521); written off goodwill, etc., £12,500 (same); £25,000 to general reserve. Carry forward £51,743 (against £39,133, after £10,000 to employees' fund).

Crittall Manufacturing.—Profits for year to August 31, 1938, reached record of £304,970, an increase of £16,975. Dividend maintained at 25 per cent. on larger capital; after allowing for reserves, carry forward raised by £16,664 to £40,863.

Stanley Motors.—Second report shows profit £30,855 for year to June 30, 1938, (against £7,503, September 1, 1936, to June 30, 1937). Preference dividend again met; nil to reserve for doubtful debts, etc. (£11,646); forward, after taxation, £14,866 (£952).

Woolwich Equitable Building Society (Interest Rate Raised).—This Society is raising the rate of interest on its "D2" shares from 3 to 3½ per cent. tax free, as from the beginning of 1939. This puts the "D2" and "D" shares on exactly the same footing.

Bowater-Lloyds Acquisition.—The acquisition is announced of 5,000 square miles of timber areas from the Reid interests, with permission to ship a minimum of 50,000 cords of unmanufactured pulpwood annually from the area. The agreement includes a provision for the increase of sulphite production at Corner Brook by 30,000 tons annually. The price was not disclosed, but is reported to be \$3,500,000.

London Transport "C" Stock.—A private meeting of a number of large holders was held on November 30, but no conclusion on the steps to be taken was reached. It was decided, however, to set up a representative committee of "C" stockholders.

(Continued on page 517)

Industry and Trade

Worst Spinning Control Scheme.—A further step has been taken in the attempts that are being made by the Yorkshire worsted spinning trade to reorganise the industry. Reference was made in *The Economist* of July 30th to a proposal made by a provisional Committee for a scheme of fixing minimum conversion margins between the prices of tops and yarns of different varieties. During August a Committee representing all sections of the industry was elected by the trade, and this body has decided, after full examination of the price control scheme, that it shall not be proceeded with for the present. This decision, it is understood, is due partly to the difficulty of defining with any precision the different varieties of tops and yarns, and partly to the widespread belief that it would be difficult to maintain a control of prices so long as the basic difficulty, the existence of a considerable spinning capacity surplus to requirements, was not being dealt with. This was the comment made on the price-control scheme at the time by *The Economist*. The new Committee has wisely decided to tackle the question of excess capacity. In very round figures, there are about 3,000,000 spindles in existence. At last year's peak only some 2,600,000 to 2,700,000 spindles were in use, and then only for a month or two. The average figure for 1937 would be about 2,400,000 and the present average utilisation may be put at about 2,100,000. The Committee thus estimates that there is a permanent over-capacity of about 10 or 12 per cent. of the total spindles in existence, in addition to the temporary over-capacity that exists in times of bad trade, such as the present. The outline of the scheme now proposed is that the members of the trade shall impose a levy on themselves (a rate of ¾d. per spindle per month is suggested, bringing in a revenue of £93,750 on the assumption that mills owning 2,500,000 spindles join the scheme), and that the proceeds shall be used to buy up redundant spindles for scrapping. At the moment, the scheme has only got to the stage of being presented to the trade. It remains to be seen whether the worsted spinners (who have not hitherto been noted for an excess of the co-operative spirit) will be ready to tax themselves in this way, and whether a sufficient number of spindles will be offered to the Committee to ensure the success of the scheme. The danger of all such schemes is that they may be too successful and lead to a real shortage. This result has not been unknown in other sections of the woollen and worsted industry. But the risk of its happening with the present body of some 250 separate worsted spinning firms is very small.

Raw Wool Prospects.—In common with those of many other raw materials, raw wool prices have suffered a substantial decline. Thus, the *Weekly Wool Chart's* index of raw wool prices (July, 1914=100) declined from 124 in August, 1937, to 78 in July this year. The collapse of wool prices was due to the fact that production in the principal exporting countries was maintained in the 1937–38 season, when consumption showed a decline. During the past two months, however, there has been a slight improvement in wool prices, which raised the *Weekly Wool Chart's* index from 78 in September to 80 in October and November. This improvement can be attributed chiefly to the decline in the Australian clip, from 1,015 million lbs. in 1937–38 to 920 million lbs. in the current season. This reduction has only partly been offset by the slight increases in the current season's clips in New Zealand, South Africa and Argentina. But if the reduction in the Australian clip has justified a slight increase in prices, a sustained improvement is unlikely to take place in the absence of an appreciable expansion of consumption. There are indications that consumption is, in fact, tending to increase in this country and in the United

States, though the course of the intake in a number of other countries has not been such as to justify a major rise in the prices of wool in the near future.

* * *

Continuous Sheet Mills.—No single development in the manipulation of steel has effected so profound a change in works practice as the advent of the continuous sheet or strip mill. When the Morgan bar and hoop mills made their initial appearance—they are post-war products so far as Great Britain is concerned—the steel bar trade was startled by the prodigious output obtained from these continuous bar-mills, and by the reduction in the cost of production of bars and hoops to less than one-third of that of the older hand-operated mills. The Morgan and other similar types of bar-mills, however, are completely overshadowed by the output of the continuous sheet or strip mills, of which there are thirty operating in the United States. The effective productive capacity of these mills ranges from 300,000 to 700,000 tons per annum, and one of the latest of them—the new 44-in. mill of the Inland Steel Company—can roll a mile of strip steel in less than three minutes. There is also a continuous sheet mill in the U.S.S.R. and in Germany, and one is reported to be in process of construction in France. The new continuous sheet mill of Messrs Richard Thomas, at Ebbw Vale, which is already in partial operation and is expected to be in full production this year, is claimed to have a capacity of 600,000 tons per annum. It has been constructed by arrangement with, and will be operated under licence from, the American Rolling Mill Company, which holds certain patent rights in the method of manufacture and processing. Until June 30th an agreement existed between Messrs John Summers and Sons and the American Rolling Mill Company whereby the former produced in this country the Armco sheets extensively advertised by the American firm throughout the world. This agreement has apparently been transferred to the Ebbw Vale concern. Rumour is now associating Messrs Summers' name with the United Steel Companies, and an amalgamation between the concerns, if this is actually contemplated, may foreshadow further developments in continuous

mills. The modern continuous sheet mill is an enormously costly thing to construct, but is not beyond the united resources of these two prosperous concerns.

* * *

How many continuous mills could be supported by Britain's sheet consumption? It could be argued that if the United States, producing 15,000,000 tons of sheets and strips in 1937, could support 30 continuous sheet mills, Great Britain, with a production last year of 2,382,800 tons of black, galvanised and tinned sheets, should be able to support four continuous mills. But the continuous sheet mill demands bulk orders, i.e. large quantities of one size and thickness, and in America these are forthcoming from three principal consuming industries—the motor car, container, and metal furniture trades. Last year the American motor-car industry consumed 5,651,900 tons of steel, representing 17.4 per cent. of the total output of finished steel, but then the number of cars produced in the United States was 5,015,974. Our production of cars in the twelve months ended on September 30, 1937, totalled 507,749, and, on the average, our cars are much smaller and lighter than the American. The probability is that not more than 450,000 tons of sheets were used in the construction of the 507,749 British cars, even allowing for the waste in blanking and pressing. The container industry of America ranks third on the list of steel consumers, with a total consumption in 1937 of 3,180,000 tons, or 9.8 per cent. of the total finished steel output. In the regrettable absence of an up-to-date steel consumption analysis in this country, it is only possible to conjecture that a large proportion of the tin, terne and black plates produced in 1937, amounting to 957,800 tons, were for containers (including 444,477 tons of tinplates shipped abroad). A proportion of the black sheets produced were probably also used as containers in the form of oil drums, light tanks, etc. The following table shows the proportion of the tonnage of each item which might be produced by continuous sheet mills:—

	British sheet production 1937 Tons	Estimated tonnage suitable for continuous mills Tons
Medium plates 3 mm. and under $\frac{3}{8}$ in.	152,600	20,000
Black sheets under 3 mm. (other than galvd. or tinplates)	926,600	350,000
Tin and terne plates and black plates	957,800	700,000
Galvanised sheets	345,800	250,000
	2,382,800	1,320,000

Although the estimate is of necessity largely conjectural, there would appear to be sheet tonnage sufficient for three continuous mills in Great Britain. Owing to their enormous cost, and the consequent heavy capital and depreciation charges on them, continuous sheet mills require to be operated at a high percentage of capacity to be profitable. Formerly a 5 per cent. annual depreciation allowance was considered adequate, but the modern steel plant becomes obsolescent so quickly that a 10 per cent. annual depreciation may not be excessive. During a period of bad trade, the depreciation charges might amount to two or three pounds per ton. The superior finish and closer rolling tolerances of continuous sheet mills, quite apart from their economy in labour and materials, make their adoption in this country essential if we are to maintain our position in the world's sheet trade. Their adoption in this country will inevitably and regrettably mean a displacement of labour, but jobbing sheet mills of the older two-high and three-high types will survive for many a day in supplying small lots of special plates.

* * *

Iron and Steel Prices.—The British Iron and Steel Federation's decision on price policy in 1939 is awaited with interest. It appears that the decision is to be based

partly on the results of a special investigation into costs. But the cost of raw materials and overhead costs per ton differ owing to the varying structure of individual concerns. The following table, based on the results of the 1935 Census of Production, shows the relative importance of the elements entering into the manufacture of pig iron:—

COST ELEMENTS IN THE MANUFACTURE OF PIG IRON		
	£'000	Per cent. of gross output
Iron ore	7,415	35.2
Limestone	492	2.3
Fuel and electricity	6,773	32.2
Scrap	462	2.2
Other materials	1,822	8.7
Total materials	16,964	80.6
Wages*	3,785	18.0
All other costs	298	1.4
Value of gross output	21,047	100.0

* Represent 92.7 per cent. of the value of the net output of £4.08 millions.

A calculation, based on the prices of iron ore, fuel and scrap and on their relative importance in the total cost of pig-iron production in 1935, shows that the cost of these elements at the end of 1937 was 33 per cent. higher than at the end of 1936, but that it has since fallen by about 20 per cent. The cost of the remaining elements has risen less during this period. In comparison, pig iron prices at the end of 1937 were no less than 35.9 per cent. higher than a year earlier and, despite the fall in raw material costs, they have not been reduced in the current year. The next table analyses the costs of steel production, again on the basis of the 1935 Census of Production:—

COST ELEMENTS IN THE MANUFACTURE OF STEEL PRODUCTS		
	£'000	Per cent. of gross output
Pig iron and ferro-alloys	15,708	15.5
Scrap	12,054	11.8
Semis	18,816	18.5
Fuel and electricity	6,287	6.2
All other purchased materials and fuel	14,507	14.3
Total materials	67,372	66.3
Amount paid for work given out	814	0.8
Wages*	25,551	25.2
All other costs†	7,805	7.7
Value of gross output	101,542	100.0

* Represent 76.6 per cent. of the value of "net output" of £33.36 millions, which is the difference between the value of "gross output" and costs of materials, including payments for work given out. According to the census of 1930 wages represented 76.6 per cent. of net output and in the absence of a later figure the same percentage has been used for 1935.

† Difference between value of net output and wages.

Compared with the figure for the end of 1936, the combined cost of raw materials representing 52 per cent. of the total cost of steel showed an increase of 21 per cent. in May and 30 per cent. at the end of December, 1937. Steel prices, on the other hand, were raised by about 20 per cent. in May, 1937, and have since been maintained at that level. The rise in costs during the remainder of 1937 was largely offset by reduced overhead charges, due to a rise in output, while this year's advance in overhead costs coincided with a fall in raw material prices, which has not been passed on to the consumer.

* * *

Competition in Cement.—In his speech at the inauguration of a memorial to Mr Joseph Aspdin, Lord Wolmer, chairman of the Cement Makers' Federation, pointed to the tendency of newcomers to enter the industry as a dangerous development likely to lead to indiscriminate price-cutting. Bouts of price-cutting are not new in the cement industry. Only four years ago a price war was terminated by the conclusion of agreements which, together with the expansion in demand, brought prosperity to the industry. This prosperity is now being challenged by a decline in consumption and by the reported intention of an outside concern to secure a piece of the cake by the erection of factories in Devonshire and Kent. The erection of

cement factories, however, is a costly business, and if the Cement Cartel's selling prices justify such expenditure by a newcomer, it seems to have little reason for complaint.

* * *

Sole Leather Combine.—The British output of sole leather was seriously affected by the 1930 slump. Production in 1928 amounted to 80,000 tons, and this level was not again attained until 1936, when the output was estimated at slightly more than 78,000 tons. A record output was expected in 1937, but last autumn the declining activity in the boot and shoe trade led to an overstocked market, and output of sole leather declined in the last quarter of the year. In March, 1938, various leather producers decided to curtail their output on a voluntary basis, but the continuous fall in leather exports, as well as in the demand from domestic leather consumers during the summer, necessitated more drastic measures. A British Sole Leather Tanners Association has now been formed with the object of controlling production. It is also proposed to set up a National Council for the industry which would include the leading associations of the leather trades and the corresponding sections of the trade unions. Meanwhile, the firmer market for hides and the improved activity in the boot and shoe trade have given a more hopeful tone to the leather market.

* * *

Price Insurance for Manufactured Milk.—Under the Milk Act of 1934, as amended in 1937, the Government guaranteed to the Milk Marketing Boards minimum prices for milk sold for manufacture of 5d. per gallon in the summer half-year and 6d. per gallon in the winter half-year. The new Bill (which has now been withdrawn for further consideration) proposed to limit the Exchequer guarantee to 250 million gallons of milk sold per annum for manufacture into butter and cheese; this represents a slightly smaller quantity than that converted into butter and cheese in 1935-36, the year of the largest surplus. The new subsidy was related, not to the realised value of the milk, but to a certain level of wholesale prices for the products; for butter the minimum prices were to be 112s. per cwt. in summer and 120s. per cwt. in winter, and for cheese 62s. 6d. per cwt. in summer and 67s. 6d. per cwt. in winter. On a rough estimate, the corresponding minimum prices per gallon for the milk would be about 4d. and 4½d. in the case of butter and 5d. and 5½d. in the case of cheese. The Bill empowered the Board of Trade to regulate quantitatively the imports of butter and cheese, in addition to those of other milk products, in order to "preserve the stability of the market."

* * *

Another clause which was much criticised by representatives of the farming community is that relating to quality premiums. The premiums for "accredited" milk and milk from "attested" herds were to be raised by ½d. and 1d. per gallon respectively; by arrangement with the Milk Marketing Board these increased premiums were paid from October 1st. The Exchequer contributions towards the premiums for "accredited" and tuberculin tested milk were to diminish during the four years covered by the clause; at the end of the four years the level both of these premiums and of the Exchequer contributions was to be reviewed by the Milk Commission, which was to determine some time in 1940-41 the level of the other premiums—those for attested herds—for the two succeeding years. The diminishing rate of Government contributions would mean a higher payment from the general funds of the Marketing Boards and an increasing burden on those producers who have not qualified for graded milk production. The English Milk Marketing Board has condemned the proposals on this ground, but, in view of the urgent necessity to improve the quality of the milk supply, it is perhaps desirable that producers of ungraded milk should have an added inducement to improve their production.

Increase in Beer Production.—For the first nine months of the current year the production of beer in the United Kingdom showed an increase of 2.1 per cent. over that in the corresponding period of 1937. The latest figures, relating to the month of October, indicate that production remains slightly above last year's level. Output in October

BEER PRODUCTION IN THE UNITED KINGDOM				
	(000 standard barrels)			
Month	1935	1936	1937	1938
January	1,185	1,115	1,163	1,177
February	1,006	1,045	1,131	1,231
March	1,195	1,360	1,473	1,561
April	1,455	1,356	1,534	1,533
May	1,526	1,469	1,511	1,587
June	1,247	1,462	1,608	1,593
July	1,692	1,726	1,772	1,701
August	1,550	1,445	1,636	1,721
September	1,301	1,498	1,539	1,550
October	1,366	1,379	1,436	1,445
November	1,294	1,324	1,455	...
December	1,447	1,560	1,596	...
	16,254	16,739	17,854	15,104

amounted to 1,445,000 standard barrels, an increase of 0.6 per cent. over production in October, 1937; the decline of 6.8 per cent. compared with the previous month represents a normal seasonal decline. The amount retained for home consumption in October amounted to 1,417,000 barrels, compared with 1,521,000 barrels in September.

* * *

Collapse of Barley Prices.—In spite of the increase in beer output, the price of malting barley has fallen very considerably compared with that obtained last year. As this fall has coincided with a sharp fall in sheep prices, the East Anglian farms which concentrate on sheep and barley have been doubly hit this year, and they have taken steps to inform the Government of their plight. The fall in

LIVERPOOL

The port of the North—with easy access to the Midlands—just over three hours from London—and everything necessary to the smooth running of modern industry.

Labour, warehousing, power, transport (by ship, rail, road, air or canal) all 'laid on'—in planned factory estates.

for industry

Manufacturers and Industrialists are invited to write for illustrated brochure "INDUSTRIAL LIVERPOOL" which will be sent on request. Application should be made to the Town Clerk, Corporation of Liverpool, Municipal Buildings, Liverpool 2

barley prices is, in fact, not due to any decline in the brewers' purchases of malting barley, but to the coincidence of a high yield with an increased acreage. Compared with 1937 (which was an exceptionally poor year for barley), the acreage under barley in England and Wales increased by 7.6 per cent., the yield by about 21 per cent. and total production by about 30 per cent. Consequently, while the best samples of malting barley fetch about 40s. per quarter, lots of poor quality can at present hardly find any market at all. Unless the barley growers are prepared to set up a Marketing Board to control, like the Potato Marketing Board, the marketing of a bumper crop, it is difficult to see what remedy can be found for the occasional year of fine weather and high yields.

* * *

Rise in Quicksilver Prices.—During the past fortnight the London price of quicksilver has been increased twice. The total increase, amounting to 14s. per flask, raised the price of quicksilver to £15 4s. per flask of 76 lbs., compared with £12 10s. per flask last spring. There was no obvious reason for the rise in the quicksilver price. As the Spanish insurgents' attacks on the Almaden mines were frustrated, they are still in the hands of the legitimate Government. Exports of quicksilver from Spain continue without undue delay and Italy is also shipping quite freely. The retained quicksilver imports of the United Kingdom amounted to 1,508,136 lbs. in the first ten months of this year, against 1,919,235 lbs. in the corresponding period of last year. Despite the decline, imports this year were still comparatively high. Moreover, as substantial stocks must have been accumulated in this country last year, there is no shortage of supplies, in spite of the large armament requirements. The latest increase in prices indicates that the breakdown of the Italo-Spanish quicksilver cartel at the beginning of last year has not been followed by a complete cessation of co-operation, and that the London agents of the Spanish and Italian producers are still at one in striving for higher prices.

INDUSTRIAL REPORTS

THE industries which experienced a spurt in demand for re-stocking purposes during October have suffered a temporary decline in new business. These trades include coal and cotton textiles, for example. Nevertheless, activity in the coal trade is well maintained, and the output of cotton goods remains at a higher level than at the beginning of October. The consumption of iron and steel shows a tendency to expand, though, owing to the uncertainty concerning prices next year, the improvement is as yet scarcely reflected in heavier forward purchases. The upward trend of activity in the tinplate industry has not been maintained, and the proportion of the industry's capacity in operation has fallen from 54.5 per cent. to 49.5 per cent. during the past month. The jute industry remains active, but the accumulation of heavy stocks of materials in Calcutta is preventing an improvement in prices.

Coal

Sheffield.—With the improvement in the steel trade there is a better demand for industrial coal, and prices are firm. Small coal is plentiful and a weak market, though good deliveries under contract are being taken by electricity undertakings. Gas coal shows improvement, but household requirements are less than usual during this season. Coke is a quiet market owing to the poor level of demand for blast furnace qualities. Local works, however, are taking fair quantities of large

selected patent oven coke, and more business is passing in graded qualities for central heating.

In the export trade all classes of large screened coal are fairly well taken up over the next month, but new business is largely in abeyance pending the fixing of prices under the co-ordination proposals. There is little business in bunker coal, and transactions in coke are disappointing.

*

Newcastle-on-Tyne.—The North-East coal market remains quietly steady, and foreign inquiry is limited to small quantities for delivery over the early part of next year. Northumberland steam collieries are working regularly, and, except in the case of smalls, are well stemmed. Durham manufacturing coal is now offered more freely, and in the gas coal section a number of collieries have difficulty in finding an outlet owing to the mild autumn. Patent oven coke is plentiful, but the lack of export quota prohibits operations abroad.

*

Glasgow.—The Scottish coal market remains dull. While the household trade is expanding, demand from the utility undertakings is below normal, due apparently to the heavy purchases made previously; so far as London is concerned, the trade from Scotland has been affected by the larger business done with other districts. Industrial demand is also disappointing on the whole. The export trade presents no

Retail Trade in October.—The latest figures of the course of retail trade show a continuation of the trends of the earlier months of the year. In the country as a whole, according to the latest issue of the *Board of Trade Journal*, the average daily value of retail sales in October was 2 per cent. higher than in October, 1937. The increase was most marked in Scotland and in the South of England; sales in Central and West London declined by 8.9 per cent. compared with a year ago. Sales of food increased in all districts except Central and West London, where the decline in the turnover of these departments amounted to 8.2 per cent. For the ten months of the current year, the daily value of sales was 2.4 per cent. higher than in the corresponding period of 1937; this average covers geographical variations from an increase of 4.6 per cent. in Scotland to a fall of 7.3 per cent. in Central and West London.

* * *

Czechoslovakia's Coal Losses.—The cession to Germany and Poland of parts of the former Czechoslovakia has seriously diminished the coal production of that country. In 1936 Czechoslovakia raised 12 million metric tons of coal and 16 million tons of lignite, and she had a net export of 2 million tons of mineral fuel. Lignite production was concentrated in Northern Bohemia, and it is estimated by German official sources that production in the transferred areas of the Sudeten district amounted in 1936 to 15 million tons of lignite and 1½ million tons of coal. In addition, mines producing about 8 million tons of coal have been transferred to Poland. Consequently, the new Czechoslovakia will be a net importer of mineral fuel, while Germany and Poland, who were also net exporters, will have an increased output in the future. Owing to political sentiment, customs restrictions and exchange controls, these shifts in international boundaries may involve a considerable shift in markets. An attempt is being made in Czechoslovakia to arrange a barter exchange of British coal for certain Czechoslovakian exports, and it is probable that the Anglo-Polish agreement on exports of coal will have to be adapted to the changed circumstances.

new feature. Contract business is moving steadily, but new business is proving difficult to arrange. Tenders were lodged during the week for the Norwegian railways' contract for 85,000 tons of locomotive coal. This order, however, has usually gone to the North-East Coast in the past.

*

Cardiff.—There is very little current inquiry; the volume of contract business affecting 1939 deliveries is disappointing, and shipments in the foreign and coastwise trades last week totalled only 318,900 tons, compared with 350,100 tons the previous week and 422,417 tons in the corresponding week last year. The recent contraction, however, in the volume of traffic may be due largely to the gales, which have considerably impeded the movements of shipping, and the state of colliery stems justifies the expectation of more active loading when weather conditions become more favourable. There has been no further alteration in official prices, and the task of co-ordinating the minimum schedules of the various districts of the country, recently directed by the Central Council, is now in progress. There has been a slight expansion in the inland trade both for household and industrial coals.

Iron and Steel

London.—Most sections of the iron and steel markets have developed some activity, although current busi-

ness consists largely of consumers' purchases of supplementary parcels to carry them over the remainder of this year, says the official report of the London Iron and Steel Exchange. Although most of the steelworks are operating well below capacity, outputs appear to have increased of late, and the tone of the market has become stronger. An expansion in the volume of business early in the New Year is generally anticipated, and for this reason the announcement of the new prices is awaited with some impatience.

The demand for pig iron is restricted to small parcels for quick delivery. Most consumers seem to have allowed their reserves to dwindle in the expectation that prices will be reduced at the end of the year.

Business in semi-finished steel seems to be gradually expanding. The rigid control of imports and the reduction in consumers' stocks have resulted in a better flow of orders to the British works, and this section of the industry has more business in hand than for some time past.

Business in finished steel has expanded somewhat of late, but it is still spread irregularly over the market. Demand is limited to small parcels, but in the aggregate it amounts to a respectable tonnage. Buying on export account is restricted, but there is a fair volume of inquiry on the market.

*

Sheffield.—Quiet conditions prevail in the iron and steel market, and are likely to continue until a decision regarding prices in the coming year has been announced. Forward business is being held up, and buying relates only to limited lots for immediate delivery.

So far as pig iron is concerned, it is becoming clear that stocks in users' hands are dwindling, for heavier deliveries under existing contracts are being specified. This, however, is not causing a drain on producers' supplies sufficient to warrant any increase of production at present.

Transactions in basic steel billets are fewer, buyers being disinclined to enter into commitments pending price decisions. There is a steady call for small bars, stainless steel sheets, and structural steel.

The iron and steel scrap market is quietly steady, with a better demand for heavy basic steel for melting up to 67s. 6d. per ton.

*

Middlesbrough.—Pending an official announcement regarding prices in 1939, the local market is marking time. Small transactions in foundry pig iron continue for early delivery. East Coast hematite deliveries continue to be made under existing contracts. It is understood that the price of basic iron is under revision. The announcement that the price of ferro-manganese will be reduced by £2 per ton from January 1, 1939, is welcomed.

It is expected that large orders for rails will be placed, and whilst shipbuilding orders continue to come in slowly, any reduction in the price of shipbuilding steel would materially affect the position. Better requests are being made for semi-steel by re-rollers, whilst black sheets are in increased demand.

There is no change in the price of heavy steel scrap, although works are

taking rather larger deliveries, under contract, from merchants.

*

Glasgow.—As is usual at this time of the year there is some slackening in the demand for steel. This is largely due to the fact that in the west of Scotland many firms have their stock-taking at the end of December and are consequently buying only to meet immediate requirements. The uncertainty as regards prices in 1939 also tends to restrict buying. There has been no material reduction in the amount of plant in operation. At the shipyards there is still much need for additional work. It was announced this week that Messrs John Brown and Company, Limited, of Clydebank, are to be entrusted with the building of a destroyer depot ship for the Admiralty. Clyde machinery makers have secured further contracts and practically all the machinery makers in this district have well-filled order books.

*

Cardiff.—The trend of business in the tinplate trade is not as favourable as it was a few weeks ago. Under the pooling scheme the percentage of output capacity has receded to 49.54, compared with 54.47 a month ago. Shipments at Swansea last week showed an improvement on those of the previous week and compared favourably with those for the corresponding week last year, but current consignments are mainly under contracts and new business is very limited both for the home market and the export trade. There is a fairly good inquiry for steel sheets and other semi-finished materials for inland consumption, but the export market for galvanised sheets is featureless. Prices are unchanged.

Textiles

Cotton (Manchester).—Spinners and manufacturers have met with a fair amount of inquiry, but only a miscellaneous business has been done. Buyers have continued a policy of extreme caution, and there is a disposition to restrict commitments as much as possible, pending a more favourable political outlook.

sible, pending a more favourable political outlook.

The raw cotton situation has shown no change. Owing to the relatively high prices prevailing in the United States, the importation of American cotton to the United Kingdom is very difficult. Washington officials are undoubtedly disturbed, and it is probable that further efforts will be made for the freer movement of supplies to the mills. There have been rumours that the loan terms for next season will be revised. In the circumstances there has been a persistent demand for South American and Indian cottons, with very little activity in American qualities.

Demand for cloth for export has been limited. Manufacturers' order lists are running down rather rapidly. The reported contracts under the re-armament plan will be placed with a small number of firms. Home trade clearances are on a better scale, and demand has been encouraging. There has been no improvement in the turnover in American and Egyptian yarns. Curtailment of production remains on a large scale.

*

Jute (Dundee).—There are few complaints heard in the jute market. Both spinners and manufacturers are still busy, with more inquiries for forward delivery. Producers of yarns and cloth are able to maintain their prices and offers of business at less are being turned down. The price of common 8-lb. cops is firm at 2s. 2d. and hessians are not obtainable at under 2½d. for 10-oz. 40-in. and 2½d. for 8-oz. Prices of Calcutta goods have wavered slightly, with little change over the past fortnight. If anything, prices are a little lower, in spite of the fact that seven mills have been idle in the Titaghur area owing to strikes. One mill has now resumed work. The Indian Jute Mills' Association has not yet succeeded in obtaining unanimous agreement on working arrangements. Two mills are refusing to sign the agreement as drawn up by the Association.

Although the production of the Indian jute mills was reduced by 64 million yards of hessians between September and October as a result of the

COMPANY MEETINGS

ROYAL BANK OF SCOTLAND

ANNUAL GENERAL COURT OF PROPRIETORS

SATISFACTORY RESULTS—DIVIDEND MAINTAINED

CONDITIONS OF TRADE AND INDUSTRY IN SCOTLAND

DUKE OF BUCCLEUCH'S ADDRESS

The Annual General Court of Proprietors of The Royal Bank of Scotland was held at Edinburgh, on the 30th ultimo, his Grace the Duke of Buccleuch and Queensberry, G.C.V.O., Governor of the Bank, presiding.

His Grace said: Before presenting the directors' report and passing to the general affairs of the bank, I must refer to the great loss the bank sustained by the death of Sir Thomas Dunlop, Bt., G.B.E., on January 29th of this year. Sir Thomas had been a director for twenty-one years, and during that period rendered important services to the bank. His sound judgment was of great value to his colleagues, who miss his cheery and kindly personality.

To fill the vacancy on the board Sir Iain Colquhoun of Luss, Bt., K.T., D.S.O., who is well known throughout Scotland, was elected.

Sir Iain holds office until this Court, when he comes up for re-election.

In moving the adoption of the report, His Grace said: I assume it will be your pleasure that the annual report and balance sheet, with auditors' report, will be taken as read.

The directors are pleased again to submit to you a statement which they consider is very satisfactory.

DEPOSITS

As you are aware, the date of our annual balance took place within a few days of the termination of the recent European crisis. In common with all banks who do a wide business, withdrawals of deposits were experienced during the anxious days of September. In spite of withdrawals, we have not only maintained the high figure of our deposits, but show an increase of £247,000 under that heading, bringing the total up to the record figure of £69,921,933.

We are again glad to record an increase in notes in circulation—an indication, doubtless, not only of the popularity of the Scottish bank note, but also that employment conditions in Scotland have been fairly well maintained.

There is a small decrease of £110,000 under the heading of acceptances and indorsements of foreign bills, and other obligations. That calls for no special comment.

LIQUID ASSETS AND INVESTMENTS

Turning to the assets side of the balance sheet, you will see plenty of evidence of the bank's usual liquid position. Cash in hand and with the Bank of England and other London bankers, and money in London at call and short notice, amount to the substantial figure of approximately £15½ millions.

That sum represents 21.5 per cent. of our liability for deposits and notes issued.

We have to record a decrease of £525,000 in our holding of British Government securities. This is due to the larger demands of our clients for accommodation—a movement which we welcome.

We can again say that a large proportion of our Government securities is in short- and medium-dated stocks, and that all our investments are valued at or under the market prices ruling on the date of our balance.

ADVANCES

The expansion of over £1 million under the heading "Advances" is well spread and reflects an activity in industry in the areas we serve, and the steadily increasing business of our bank.

BILLS DISCOUNTED

The total of our bills discounted is some £300,000 lower than we showed in our last year's statement—the decrease being mainly

accounted for by a reduction in our commercial bill portfolio. Considering the general shrinkage in the amount of bills available nowadays, we consider the decline in our bill holding as very moderate.

PROFITS

The net profit for the year at £613,257 is £23,162 less than the amount declared last year. This is after providing for all taxation, including, for the first time, a National Defence Contribution for a full year, while charges of management show a growth over the figures of a year ago. I might here mention that, for the second half of our year we were operating under the increased income tax imposed by the last Budget.

APPROPRIATIONS

The directors are pleased to be in a position to recommend that a dividend for the half-year, payable at Christmas, at the same rate as formerly—17 per cent. per annum—be declared, and that the same appropriations as last year be made to bank buildings and heritable property and pension reserve fund.

After these appropriations there remains the sum of £87,348 13s. 5d., which it is proposed to carry to rest or reserve, bringing it up to £4,125,965 5s. 10d.

BUSINESS OF THE BANK

It is gratifying to record that the general business of the bank continues to expand, and also that our associate bank—Williams Deacon's Bank Limited—reports a similar condition in their business, despite a dullness in some of the bigger industries in the areas in which they operate.

SCOTTISH TRADE AND INDUSTRY

While Scotland has not escaped the trade recession, which has, perhaps, been more pronounced in the South, I think it can be claimed that on the whole Scottish trade and industry have had a fair year. It is, however, apparent that the heavy industries in the West of Scotland have been saved from depression mainly by the Government re-armament and defence programme.

Shipbuilders are receiving very few orders for new merchant tonnage, with the result that, on the completion of ships already in hand, building slips are remaining empty. Fortunately, orders from the Admiralty are keeping some yards busy. An improvement in the international situation would benefit trade and stimulate a demand for new tonnage for some of the big shipowners who are undoubtedly in need of new ships.

Exports in coal have shown a serious fall in the past few months, partly owing to trade restrictions and to severe competition from Germany and Poland. In both these countries the coal export trade has the benefit of a subsidy which enables them to undercut our prices. Conditions in the home market are at the moment quiet, and consumption has been affected by the mild unseasonable weather.

It is not surprising that the iron and steel industry should be quieter than last year, when the steel industry was working under heavy pressure for deliveries. These demands have been satisfied, and there is now a tendency to delay buying until the announcement regarding future prices of steel which is expected shortly. Deliveries to shipbuilding yards for admiralty work are still substantial, and, on the whole, prospects seem brighter for the immediate future.

The year 1938 has been an anxious and difficult one for agriculture. Owing to weather conditions the harvest has been the worst for at least 20 years. The collapse in sheep and wool prices has caused serious losses in those districts where sheep-farming is the

BRISTOL AEROPLANE COMPANY, LIMITED

INCREASE OF CAPITAL APPROVED

An extraordinary general meeting of the Bristol Aeroplane Company, Limited, was held, on the 29th ultimo, at Filton House, Filton, Bristol.

Mr W. G. Verdon Smith, C.B.E. (the chairman of the company), said: You are being asked to-day to pass resolutions providing for (1) the increase of the ordinary capital and (2) the capitalisation and appropriation of that portion of the reserve fund derived from premiums received in 1936 on the ordinary shares issued at that date. The reasons which have led your directors to recommend this increase of capital have been explained in the circular letter issued to the ordinary shareholders with the notice of this meeting.

The necessity for a substantial enlargement of the company's capital will not come as a surprise. National requirements have placed heavy demands on the aircraft industry, and your company is making an invaluable contribution to the rapid building up of the country's air defences.

ADDITIONAL FACTORIES AND EXTENSIONS

With this object additional factories and additions to the existing factories have had to be erected and equipped with the necessary plant and machinery; indeed, the whole organisation has had to be replanned on a greatly enlarged basis.

Some of the new buildings and equipment are being provided by the Government inasmuch as the Government has required for a Royal Air Force expansion programme a scale of production which cannot be regarded as likely to continue beyond a limited period. A large proportion of the additions, however, will represent assets of a permanent character which there are good grounds for anticipating will remain productive of reasonable profits even after a return to more normal conditions.

Naturally the proceeds of the new shares subscribed for cash will be utilised in the first place in repayment of present indebtedness. Outlays on stocks and work in progress, however, are likely to be so heavy in amount for some time to come that there will undoubtedly be further cash requirements, and these it is intended to meet by temporary bank advances from time to time.

In the prevailing circumstances the proposals with regard to capital now submitted are recommended by your directors as sound policy and in the best interests of the company.

The resolutions as set out in the notice convening the meeting were then submitted and carried unanimously.

CENTRAL URUGUAY RAILWAY COMPANY OF MONTE VIDEO, LIMITED

The sixty-second ordinary general meeting of this company was held, on the 29th ultimo, in London.

Mr G. H. Harrison, C.M.G., M.Inst.C.E. (the chairman), said that it was pleasing to be able to lay before the stockholders figures showing an increase in the net receipts of about £33,000. Though the results could not be looked upon as satisfactory remuneration for the capital employed or for the services rendered to the people of Uruguay, it was a small step in the right direction.

The profit for the year had enabled them to meet the interest on their first debenture stock and to set aside £114,726 to renewals, carrying forward £13,304. The most significant increase in receipts arose from passenger traffic, which had given excellent returns. Greater use had been made of the light petrol-driven motor coaches, which enabled them to give a rapid and economical service, and that was increasing in popularity with the public. Those vehicles were owned by the State Railways and leased to the company on the basis of an agreed figure per coach mile.

In the near future further additions of that type of service would be available by the introduction into traffic of a number of Diesel cars which had arrived in Uruguay and had undergone preliminary trials. In addition, increasing numbers were carried by the special Phono-electric excursion trains, which continued to be a popular feature.

To summarise, there were three matters of vital importance—an improvement in the rate of exchange, or at least the maintenance of the rates at present applied to their remittances; the co-ordination of transport and the settlement of their outstanding claim against the Government in respect of the rate of exchange for the payment of past guarantees.

The report was unanimously adopted.

main industry. Prices for fat stock and oats are also below an economic level. The Government have indicated that they are aware of the seriousness of the situation, and their proposals are eagerly awaited. A considerable benefit in certain directions from marketing schemes and other Government measures has been helpful. Proposals have been put forward in connection with pigs, poultry, and quite recently with the milk industry. Other questions, such as the volume of imports of foodstuffs and the fluctuation of world prices, have also to be taken into account. The outlook for the agricultural industry is not therefore at the moment very bright.

There is no improvement in the fishing industry, which is still depressed, but there are hopes that the new Herring Board may find a solution of the problem and bring back to the industry some measure of prosperity which would be reflected in increased purchasing power in the fishing centres in the East and North of Scotland.

Jute is also experiencing a continued depression, and there seems no prospect of this industry returning to normal so long as Calcutta is allowed to dump its manufactured jute surplus—which has increased enormously in recent years—into this country free of duty.

The Anglo-American Trade Agreement is a factor of real political and economic value, and its effect is expected to be beneficial to some of the basic Scottish industries.

OVERSEAS TRADE

When addressing you at this time last year, I expressed certain apprehensions regarding our foreign trade situation, which demands more than ever our earnest attention. Faced again with a large adverse trade balance for the year 1938, a warning signal has been given by the unfavourable movement in sterling exchange.

The internal depression of the last twelve months has shown that the national effort is not so completely occupied with the re-armament and defence programme as to leave no margin for the production of additional exports to reduce the deficit in our overseas trade balance. This is a matter to which far too little attention is paid, and especially in these days when trade is being driven into bilateral channels through barter arrangements, blocked currencies, and certain kinds of trade agreements.

There is a strong case for comprehensive enquiry into the whole subject of overseas trade with a view to the organisation of effort by manufacturers and exporters on national lines. In Scotland the Economic Committee of the Scottish National Development Council is doing good work. Much more use, however, might advantageously be made of the facilities offered by the Department of Overseas Trade through the Exports Credits Guarantee Department. In the present condition of the commercial world it is essential that our export trade should be more forcefully directed if it is to compete successfully against the opposition that has reduced it to a mere fraction of its former size.

Many of our former troubles at present can be ascribed to a very considerable and natural lack of confidence caused by anxieties in connection with the European situation. A return of confidence is most necessary for real recovery in all our industries, and for this reason it is most important to have the better understanding in our international relationships which our Government are now actively seeking.

THANKS TO OFFICIALS AND STAFF

I know it will be your wish that I should convey to the general manager, assistant general manager, the officials and staff at head office, London, Glasgow and Dundee offices and the branches, our sincere appreciation of their valuable services throughout the year. We have an efficient and loyal staff, and I am sure that at no time has the relationship between staff and management been happier than it is to-day. I am confident that Mr Whyte, our general manager, to whom our sincere thanks are due for his devoted service to the bank, would be the first to say that the excellent results which have been placed before you to-day could only have been obtained by loyal co-operation.

APPROVAL OF ACCOUNTS—DIVIDEND

I now beg to propose that the report, containing a statement of the accounts and balance sheet, be approved, and that out of the profits of the year a dividend at the rate of 17 per cent. per annum for the half-year, under deduction of tax, be declared in conformity therewith.

The report was approved, and the governor, deputy-governor, extra-ordinary directors, and the retiring ordinary directors were re-elected, and auditors were re-appointed for the ensuing year.

BANK OF NEW SOUTH WALES

CONTINUED GROWTH

TRADE POSITION AND OUTLOOK

MR ROBERT GILLESPIE'S REVIEW

The ordinary general meeting of the Bank of New South Wales was held at Sydney on November 25th.

Mr Robert W. Gillespie (President of the Bank), in the course of his speech, said: We are to-day commemorating the one hundred and twenty-first year of the existence of the bank and the first occasion in its history when the total deposits at the annual balance have exceeded the sum of £100,000,000. This is a record of which we can all feel proud.

The balance of the year's profits at £547,835 shows an increase of £4,593. Your directors recommend a payment for the fourth and final quarter's dividend at the rate of 6s. per share in Australian currency.

THE WORLD SITUATION

You were reminded last year that the international situation was causing some concern. Unfortunately that is still so; there has, indeed, been a substantial deterioration in the position during the past year. On the whole, the outlook is not very promising. There are, however, features that would lead us to believe that the set-back we are experiencing will be neither as severe nor as prolonged as the last depression. The chief currencies of the world are now on a firmer basis, and there is more effective co-operation between national monetary authorities. It is almost certain that there will have to be further readjustments as, for instance, between sterling and the dollar, but the facilities for adjustments are better than formerly. There has also been a certain adjustment of debts, which will not now be so great an obstacle to recovery. Most important of all, the stocks of principal raw materials are not as great as they were in the last depression. The relatively high prices of last year were in fact due to a belief that there would be a shortage, which induced speculators to enter the market. Stocks have risen slightly, but are not necessarily excessive. That does not perhaps apply to some commodities, including wheat, in which trade has been so reduced that even much smaller stocks than hitherto may prove an embarrassment, but over the whole range of commodities entering world trade it is roughly true.

Taking only economic circumstances into account, we may therefore reasonably expect a recession much milder than that of 1929-32. But there is, on the other hand, such a disturbed political situation both in Europe and the Far East that any prediction would be futile. If we are to cling precariously to peace we may expect a general reduction of activity despite the increase in armaments expenditure; if a general war breaks out no one can foretell its economic repercussions.

CONDITIONS IN AUSTRALIA

When my predecessor addressed you last year Australia had progressed beyond the stage of economic recovery and had reached a stage of general prosperity. The warning then given that the existing level of prosperity had some uncertain foundations has unfortunately been justified in the record of the past year. Certain danger spots have shown themselves in what was otherwise a successful time for producers and consumers alike.

During the past twelve months primary producers have borne the double burden of steadily falling overseas prices and droughts widespread throughout the pastoral areas of the country. The bank's index of export prices fell from 138 in the first quarter of 1937 to 107 in the first quarter and 100 in the third quarter of 1938. This handicap was offset last season by increased shipments, but drought conditions have lowered both the quantity and quality of the wool clip in the present season and damaged the wheat crop. We must, on present prices, expect a much lower increase from our exports in 1938-39.

Activity in secondary industry has been high, the index of employment in factories having remained fairly steady in recent months slightly above the 1936-37 level. During the last twelve months investment in factory construction, plant and machinery has been strong at a time when employment has been high, efficient labour scarce and money wages rising. The danger in this position is that at the same time as buoyant spending-power encourages entrepreneurs to take rosy views of the future, unit costs rise; these drive prices upward and a state of instability is reached in which the inevitable slackening of the rise in prices not only causes immediate losses as costs overtake prices, but also necessitates a drastic purge of capital resources misdirected because of anticipations of profitability that are not fulfilled. It is difficult to estimate how far this tendency has

gone in Australia, but there seems little cause for uneasiness about most kinds of development.

As to the steps which we must take to set Australia's house in order and eliminate instability, one cannot exaggerate the importance for primary industry of efficient methods, pasture improvement, fodder conservation, soil protection and careful tillage in increasing output per unit cost and so bringing within range profitability at present prices. The other economic fact to which we must give due importance is that an upward movement of costs and prices in secondary industry will not only produce the risk of uneconomic expansion, but also will severely prejudice primary producers whose prices are determined in world markets.

There is no cause for pessimism. Australia's constitution is sound and her reserves of strength are adequate. Moreover, in the monetary sphere she may expect responsible leadership from the Loan Council and the Governments.

PRIMARY AND SECONDARY INDUSTRIES

From the point of view of production, Australian primary industry enjoyed a good year. The wheat crop was the fourth largest on record, the wool clip was about the average size and production in most other primary industries was satisfactory. Unfortunately, prices of wool and wheat showed a considerable decline over the year and, particularly in the case of wheat, seem to have little prospect of any immediate improvement. The dairying industry on the whole had a satisfactory year and prospects for the early part of this season are encouraging.

The many limitations on the potential expansion of our primary industries and the tremendous fluctuations over a period of years in the export income from those sources, together with the agricultural policy of the British Government, have made it imperative that Australia should pay some attention to her secondary industries. The activities of the recent Australian Trade Delegation in London seem destined to have far-reaching effects on the future lines of this development, for it has been determined that the fundamental basis of Empire trade agreements will be defence, and the development of Australia's secondary industries is an important factor in Empire defence.

The announcement of these proposals has come just when the need for increasing and strengthening Australia's defences and her whole defence economy has been brought home forcefully to the Australian people. We have been informed during the past year that the Commonwealth Government has taken steps towards the organisation of secondary industry on a defence basis and it is to be hoped that a comprehensive survey of Australia's needs and potentialities will be made. It should be possible to lay down a plan of development over a period, taking into account Australia's need of encouraging secondary industries and Great Britain's need of maintaining her exports. Further, by giving our trading customers access to our home market in those industries which we consider could not with advantage be established in Australia, we should be performing an important service towards the attainment of a liberal trade policy in the best interests of Australia and the world. Steps have been taken during the past year to establish various new industries.

On the whole, the activity of Australian secondary industry has remained at a high level. The progress of the heavy industries continued during the year. The State budgets for 1938-39 all anticipate higher revenue. Stock Exchanges have reflected the disturbed conditions of the past twelve months and, in general, have been depressed.

NEW ZEALAND

During the past year the economic position of New Zealand has shown some deterioration. With the prospect of a lower export income and rising internal prices, it seems that the Government, returned to office at the recent elections, may have difficulty in carrying out its policy, which entails heavy spending. I would strongly emphasise the danger of inflationary methods of finance which keep the national income at a nominally high level but reduce the purchasing power of money, with inevitable dislocation in the economy through rising costs and prices.

The report and accounts were adopted.

The foregoing is an abstract from Mr R. W. Gillespie's speech, full copies of which may be obtained on application to the London Office of the Bank of New South Wales, 29 Threadneedle Street, E.C.

CONSOLIDATED GOLD FIELDS OF SOUTH AFRICA, LIMITED

A DIFFICULT YEAR

The ordinary general meeting of the Consolidated Gold Fields of South Africa, Limited, was held, on the 1st instant, at 20 Aldermanbury, London.

Mr John A. Agnew (the chairman) said that he was sure that the position presented, showing, as it did, a considerable falling off in the profits earned from a year ago, would have occasioned the shareholders no surprise. The year had been one of extreme difficulty. In the early part the slump caused by the so-called "gold scare" had continued, to be followed by doubt and uncertainty due to the depression on the other side of the Atlantic and, more recently and coming nearer home, the European situation, creating as it did, and as it continued to do, intense unrest and anxiety. All these factors had contributed to the hesitancy on the part of the investing public, which had had its effect on every section of the market. In the circumstances they could regard it as satisfactory that they had still been able to show a position more or less comparable with that of the year ended June 30, 1936. The results to June, 1937, had been, of course, of an exceptional character, the profits achieved, largely owing to very active markets, constituting a record for the company.

The profits of New Consolidated Gold Fields, Limited, amounted to £1,221,439, against £2,214,610 for last year, a decrease of £993,171. The available balance was £762,127, out of which a dividend had been declared of 2s. 9d. per share (13½ per cent.) making a total distribution for the year of 4s. per share, which enabled the Consolidated Gold Fields of South Africa, Limited, to pay a similar amount, carrying forward £35,425, against £30,933.

Dealing with the company's South African interests in considerable detail, the chairman described the satisfactory position at Robinson Deep, Simmer and Jack, Luipaards Vlei, Sub Nigel, Vlakfontein and Vogelstruisbult, which latter company would probably pay a modest dividend in June of next year.

On the Spaarwater property, now that two connections had been established, a more rapid rate of development could be expected, while on West Vlakfontein Gold Mining Company good progress was being made with operations there.

THE WEST WITS LINE

Encouraging borehole disclosures were made during the year ended June 30th last on what had come to be popularly known as the "West Wits Line." An outstanding feature of the year had been the extremely gratifying results of development obtained at Venterspost, results which augured even better for the future of the property than the disclosures made in boreholes put down from the surface. Although the area in which development had so far been carried out was extremely small, relative to the whole Venterspost mining area, and almost negligible relative to the total area of the "West Wits Line," the development results at Venterspost, in that they more than confirmed the results obtained by drilling, must be regarded as enhancing the prospects of the line as a whole.

The Minister of Mines had just approved of a mining lease covering an area comprising 4,769 claims situated on the eastern portion of the farm Blyvooruitzicht No. 71 and on the farm Driefontein No. 118, and Witwatersrand Areas, Limited, was taking the necessary steps to form a company to acquire this lease. The new company, West Driefontein Gold Mining Company, Limited, would be the second company to operate in the western section.

Last year he had been able to state that Witwatersrand Areas had entered upon a new stage in its career, and great progress had since been made. In the eastern section the first subsidiary, Venterspost, had shown such highly successful development results that it had been decided to proceed to production, which, it was expected, would commence in less than a year's time. On the second subsidiary, Libanon, one shaft was within striking distance of the Main Reef horizon, and a second shaft was in process of sinking, while, in the western section, the third subsidiary, the West Driefontein Company, was selecting the site for its first shaft; in addition, good progress was being made with the sinking of two shafts on the Blyvooruitzicht property. All that was rather a far cry from the conditions obtaining on the "West Wits Line" eight years ago. Where at that time was bare veldt, to-day there could be seen the headgears, surface works and dwellings of three mines in the making, the first of which was fast approaching production, while a fourth mining company was now commencing operations.

The report and accounts were unanimously adopted.

KWAHU MINING COMPANY (1925) LIMITED

IMPORTANT INTERESTS

The ordinary general meeting of the Kwahu Mining Company (1925), Limited, was held, on the 1st instant, in London.

Lieut.-Col. Frank Johnson, D.S.O. (the chairman), said that the areas, etc., owned by or under option to the company consisted of 11 separate properties. On only 6 of them prospecting work had been carried on during the year ending June last. In all, it comprised no less than 148½ miles of lines cut and traversed, 26,844 cubic feet of trenching with nearly 9,000 feet of pitting or shafts. That work, while resulting in no discoveries of commercial value, had disclosed gold occurrences in the majority of cases.

They had a very large shareholding in the Gold Coast Main Reef, on which they placed the highest possible value, and the time had arrived when an extensive reduction plant was more than justified and would be erected at once. How the Kwahu Mining Company was to retain its proportionate interest in the mine by taking up its share in the new capital required for that purpose had been the subject of anxious concern to the board; £76,500 was needed for that purpose, to raise which they had had to face two alternatives, either to increase the capital of the Kwahu Mining Company or to sell a portion of their holding in Marlu. In the circumstances they had had no hesitation in sacrificing what they held to be a smaller sum in immediate Marlu dividends in order to secure in two years' time, and for a great number of succeeding years, larger dividends from their increased Gold Coast Main Reef holdings. They still held a very substantial interest in Marlu. Their other shareholding was in the London and African Mining Trust, into which their holdings in Gold Coast Associated, Obuom, Tarkwa Banket West and Tarkwa Gold Mines had been exchanged. In view of the consolidated interests and large cash resources of the company, he looked forward to its ultimately becoming a source of substantial revenue to the company. Last year he had stated that the Siwum area and mine had been handed over on option to Morkwa, Limited, for development. Within the last few days satisfactory arrangements had been made whereby the property immediately came back to the Kwahu company.

The report was unanimously adopted.

TREPÇA MINES, LIMITED

SATISFACTORY DEVELOPMENTS

The eleventh annual general meeting of Trepça Mines, Limited, was held, on the 1st instant, at 20 Aldermanbury, London.

Mr A. Chester Beatty (the chairman) said that the decline in profits from the record figure of the previous year was due entirely to the fall in metal prices, the average price of lead during the year having been £15 11s. 2d., as against £24 11s. 3d. in 1936-7, and of zinc £14 9s. 2d., against £22 5s. 2d. Since the summer there had been some improvement in the level of metal prices, and he hoped that the agreement recently reached between some of the principal lead producers would help to maintain the price at a figure fair and reasonable to producer and consumer alike.

Ore treated for their own account amounted to the record figure of 655,892 tons, from which were produced 72,989 tons of lead concentrates and 70,120 tons of zinc concentrates, practically all of which was exported and sold under running contracts. Operating costs for the year rose from 19s. 3d. to 19s. 10d. per ton of ore treated, an increase of 7d. per ton.

With regard to the development of the Stantrg Mine, results had been highly satisfactory. Additional bodies of ore had been opened up on the 485-metre level, and the total area at this horizon now amounted to 8,939 square metres averaging 8.12 per cent. lead, 3.49 per cent. zinc, 0.17 per cent. copper, and 4.27 ounces of silver per ton.

The isolated ore bodies which he stated last year they had found on the 485- and 545-metre levels had since been proved to extend upwards to the 610 metres level, and further bodies had been discovered. The effect of this had been an addition to the tonnage above the 485-metre level, sufficient not only to compensate for the 650,000 tons treated during the year, but also to raise the ore reserve figure by some 200,000 tons. The ore reserves at Stantrg now amounted to 4,100,000 tons of an average assay value of 9.2 per cent. lead, 5.6 per cent. zinc, and 3.8 ounces of silver per ton, and since the acquisition of the properties of the Kopaonik and Zletovo companies they had available for immediate exploitation an additional tonnage of partly-proved and indicated ore on those properties amounting to about 1,700,000 tons.

The report was unanimously adopted.

RATANUI RUBBER, LIMITED

ECONOMY AND EFFICIENCY

The fourth annual general meeting of Ratanui Rubber, Limited, was held on the 1st instant at 7 Martin's Lane, London.

Mr W. Arthur Addinsell, chairman of the company, moved the adoption of the report and accounts and the declaration of a dividend of 5 per cent., less income tax. He said: The result of the year's working as compared with the previous year was a decline in net profits of approximately one-half. The resolution adopted at our last annual meeting provided for a dividend of 10 per cent., so that the recommendation now before you is a percentage reduction at about the same rate as the decline in profits.

In all the unfavourable circumstances attendant upon the last year, which embraced a lower average export quota and a fall in the price realised by over 2½d. per lb., it is almost a matter for congratulation that we have done so well. A total of £1,750 is

apportioned to reserves and depreciation, and the net carry forward will approximate £1,844 as against £1,548 brought in.

During that period of the current financial year which has so far elapsed, an export quota at the rate of 45 per cent. of standard assessments has operated. This low rate was fixed as a consequence of the downward trend of the price of rubber which occurred in the first half of the year—the price fell to 5½d. per lb. in April. There has since been some recovery and recently the Control Committee fixed the quota at 50 per cent. for January-March, 1939. That action has been criticised in some quarters, but such criticism is premature. Many factors outside the domestic affairs of the rubber industry come into play in affecting the trend of the market price, but recent indications of an increase in consumption in the United States, and the fall in stocks arising from the severe cut in the quota rate, surely justify moderate optimism.

So far as the affairs of this company are concerned, economy and efficiency are being maintained, as the past year's results prove, but in existing uncertainties you will not expect me to be more than hopeful that at our next meeting we shall be able to regard the year's working as satisfactory.

The report and accounts were unanimously adopted.

(Continued from page 505)

reduction in working hours from 54 to 45 hours per week, the stocks of hessians in Calcutta fell by only 24,500,000 yards; at the end of October they stood at 441,409,137 yards, while stocks on spot in the United States were 207 million yards, and those afloat between Calcutta and that country 118 million yards. While these large stocks exist there is little hope of an improvement in the prices of jute goods. There are hopes in Calcutta that the Bengal Government will further reduce the working hours to 40 per week.

Raw jute has tended to decline in price, and £18 5s. per ton has been quoted for the full group of Daisee-2/3, December/January shipment.

THE COMMODITY MARKETS

The movements of the prices of primary products in this country and in the United States were influenced by variations in the pound-dollar exchange rate. In the United States, prices continued to sag until Tuesday, when the pound showed a recovery. Despite the recovery on Tuesday and Wednesday, Moody's index of the prices of staple commodities fell during the week ended last Wednesday, from 142.1 (December 31, 1931 = 100) to 141.2.

In this country, prices showed a slightly firmer tendency towards the end of last week, but the improvement was not fully maintained this week, when the pound tended to appreciate. On balance, the principal commodities subject to international arbitrage are scarcely changed on the week. Wheat, raw sugar and American raw cotton stood at almost the same price on Wednesday as a week earlier, while rubber and the principal non-ferrous metals were slightly cheaper.

Metals

Copper.—Although well above the low level of the week, the closing price of standard cash copper, at £43 13s. 9d. per ton, showed a loss of £1 5s. on the week. At times liquidations were large, due chiefly to the unsatisfactory tone on Wall Street and to reports that the United States domestic copper price may be cut. While offerings were thus substantial, consumers were marking time; seasonal influences will reduce

consumption next month, and the further outlook appears less secured than had been anticipated.

★

Tin.—Tin fluctuated widely in price, but closed only 10s. down at £215 5s. per ton. This market also was adversely affected by the political outlook and the poorer reports from the United States, but was supported by the low level of supplies. Even if the other metal markets should continue to show an uncertain and nervous tendency, tin prices are likely to remain firm and during the next four months they should even experience a further substantial improvement.

According to Messrs A. Strauss and Company, the total visible supply of tin declined in November by 826 tons to 29,371 tons. New supplies at 7,055 tons were 1,282 tons lower on the month, but deliveries also declined by 730 tons to 7,428. The feature of the November statistics was the low level of Straits shipments and of American deliveries. Both were about 1,000 tons lower than had been expected, but as the falls compensated each other, the decline in stocks was in conformity with market expectations.

★

Lead and Spelter.—The prices of both metals were affected, as other markets, by less optimistic reports from America. Consequently lead closed 7s. 6d. down at £15 18s. 9d. per ton, while spelter lost 3s. 9d. to close at £13 18s. 9d. per ton. There is a possibility that the new decline will induce producers of the two metals to hasten their cartel negotiations. So far, however, no progress in the discussions has been recorded. As the new lead and spelter consuming season will not start until early next year, the absence of optimistic cartel news and the prevalence of very substantial supplies may keep the two markets under pressure during the next few weeks.

Grains

The wheat market was steadier during the last week. Demand for Manitoba grades improved and prices are a little higher; quotations for European wheat also tended to rise. Estimates of the Australian wheat crop continue to vary substantially, but a considerable market for Australian wheat has developed in India, where continued drought has affected the native crop. During the week, the absence of selling pressure

improved prices on the maize market, and Plate rose to a slight premium above American varieties, which it is likely to hold for the remainder of the season, as supplies in the Argentine are not large. In sympathy with other grains, the barley market improved during the week; shipment from the St. Lawrence is nearly ended and European supplies are believed to be on the small side.

Other Foods

Provisions.—Markets for both bacon and butter were firm, and prices were higher on the week. The demand for meat remains poor, veal being most in demand. Prices of English eggs show little change, but the best grades of imported were dearer on the week.

★

Colonial Produce.—The raw sugar market has been quiet, and prices for refined were reduced by 1½d. per cwt. early in the week. The demand for tea improved steadily and prices on Wednesday were higher for most varieties. The cocoa and coffee markets have been steady.

★

Fruit and Vegetables.—The continued mild weather has affected trade in all departments, but improvement is expected shortly from Christmas buying. Growers' prices for good quality potatoes have improved, but prices on wholesale markets show little change as yet. The trade in apples has slackened off and prices are lower.

Miscellaneous Commodities

Oils and Oilseeds.—After the improvement noted last week, these markets have been quiet, with only a moderate volume of business. Linseed prices are steady at a level below the best recorded last week; Egyptian cotton seed continues to advance in price. There has been little forward business in linseed oil, whose price has tended to fall. Demand for oilcakes continues below normal.

★

Rubber.—Business on the market has been small and fluctuations in prices narrow. On the week, prices showed a fall of ¼d. per lb., the price of standard sheet closing on Wednesday at 7½d. per lb.

Industry in Wales

We present below a number of charts, showing recent trends in Welsh industry. The figures of population, agricultural workers and insured persons in employment relate to mid-years; those of coal miners are annual averages. Estimates of coal output and exports, output of steel ingots and castings and exports of the principal iron and steel products have been made for 1938 on the basis of returns for nine or ten months.

Finance

GOVERNMENT RETURNS

For the week ended November 26, 1938, total ordinary revenue was £9,352,000, against ordinary expenditure of £11,942,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £198,418,000, against a deficit of £121,706,000 a year ago.

Bills are paid for during following week, on any working day at applicant's option. When normal length is 92 days, bills paid for Saturday are 91-day bills and there are no Monday maturities. When normal length is 90 days, bills paid for on Monday are 89-day bills. Bills paid for in February are 89-day bills, except those paid for each Tuesday, which are 88-day bills.

On November 25th applications at £99 15s. 7d. per cent. for bills to be paid for on any day except Monday and Tuesday of the following week were accepted as to about 32 per cent. of the amount applied for. Applications at higher prices were accepted in full. Applications for bills to be paid for on Monday at £99 16s. 6d. per cent. and above and on Tuesday at £99 15s. 7d. and above were allotted in full. £35.6 millions of Treasury bills are being offered on December 2nd.

Economic Weapons

EVER since the annexation of Austria last spring unlocked the door of the Danube valley for Germany's commercial penetration, there has been a growing volume both of thought and of discussion in this country on the probability that British export trade will soon be faced with competition from Germany of a kind it has never known before. These apprehensions have naturally been on the increase since the events of September added to Germany's economic sinews the export industries of the Sudetenland and a far more than Sudeten access of prestige. The prospect of an economic conflict is now officially accepted and publicly discussed.

To anyone who based his judgment solely on the published figures of past trade, the excitement thus generated might seem exaggerated. It is true that the value of British exports in the course of 1938 has been well below the figures of 1937. But it would be very difficult to establish that more than an insignificant fraction of this decline is due to German competition, and that part of the world where Germany's successes have been proportionately largest, South-Eastern Europe, is not by any stretch of calculation a vital area for our commerce. The apprehensions, however, are not so much quantitative as qualitative;

they arise from knowledge of what Germany's unorthodox methods might achieve rather than from experience of what they have actually achieved to date. Herr Funk's far-flung tours, in which, by his own admission, politics and economics are inseparable, show only too clearly that German penetration in the Balkans is to be intensified. The promised exchange of official visits between Germany and Iran and certain attentions paid to Egypt indicate that the Near East—pre-eminently an area of interest to Great Britain—is to be the next field of German operations. Moreover, it is common knowledge that after a period of comparative ease through the summer of this year while the foreign exchange obtained with Austria was drawn upon, Germany's exchange problem has again become extremely severe. A supreme effort is to be made in 1939 to secure a very considerable expansion of Germany's exports, and the methods adopted in the past and present leave no room for doubt that this increase, if it is secured, will be at the expense of other countries exporting goods similar to Germany's. As a measure of the seriousness with which the development of exports is regarded in Berlin—and, by the same token, of the seriousness with which it must be regarded in London—it may be mentioned

that production for export to countries with unrestricted currencies has recently, according to report, been given priority even over military requirements.

With such a big push in prospect, what weapons are available to repel it—or, more accurately, to ensure that such increase in her exports as Germany can achieve shall be a genuine increase in international trade and not merely a diversion of trade from other channels? It is almost a self-evident truth that the old technique of commercial treaties and tariff adjustments is unavailing against the ingenuity of the German devices. New methods are required. In his speech last week the new method upon which Mr Hudson laid greatest stress was the organisation of British industries for the purpose of bargaining as units. The proposal appears to be that each industry should equip itself with a fighting fund which could be used to intervene in those markets where assistance is most needed. It may be agreed that if private industry can solve the problem without more assistance from the Government than encouragement to organise itself, that would be the ideal solution. But if this suggestion were to stand alone as the Government's policy, it would be open to serious objections. It cannot be supposed, for example, that these "fighting funds" will be provided by the owners of the industries in question. The proposal amounts, in fact, to one that industry should subsidise its exports out of its sales in the home market. This is, indeed, to cast out the devil of German dumping by a legion of British Beelzebubs. Moreover, most industries would stipulate that funds raised equitably from their members shall not be used discriminately. But discrimination is of the essence of the problem. It is likely that, if export subsidisation out of private funds were practised on a large scale, the result would be either to provoke endless jealousies or to waste large sums in the effort to be impartial.

If this suggestion stood alone, it would provoke the belief that the Government were more anxious to pass off their responsibility to private industry than to seek a satisfactory solution. Fortunately, however, the introduction of the Exports Credits Bill into the House of Commons this week shows that the Government are not relying upon a one-stringed bow. The first purpose of the Bill is to allow the Export Credits Guarantee Department to expand both the

scale and the variety of its operations. The Department has assisted, since 1926, in the financing of no less than £180 millions of British exports, and nearly a quarter of this sum has fallen within the latest completed year. The Bill raises the total of the Department's guarantees to be outstanding at any one time from £50 to £75 millions, and enables it to insure re-exports as well as the sale of home-produced goods. Its work has been done throughout without any loss to the taxpayer, and this eminently successful result has been largely due to the fact that no piece of business has ever been approved by the Department on any but strictly commercial grounds. It has been very wisely decided to adhere to this resolve, and the extension of the Department's sphere of usefulness is not alloyed with any departure from the purest commercial principles.

The Bill, however, has a second part and a second purpose. A separate fund of £10 millions is to be set up and placed at the disposal of the Board of Trade for the assistance of export trade. Of the total, £8 millions is specifically allocated for the export of home-produced goods, the remaining £2 millions being left for other purposes; but the whole sum represents, in effect, a national fighting fund. Ten million pounds is not very much with which to fight the millions of Herren Schacht and Funk. But the potency of this new departure must not be measured by the sum named in the first instance.

There is a very direct parallel between measures of this nature and the more familiar forms of re-armament. It is strictly true that every pound spent on guns or shells or battleships or bombers is a pound wasted, which a sane world would save. Similarly, the creation of fighting funds for subsidising exports is a practice which, on any reading of economic principles, must be deplored. But in the one case as in the other, Great Britain can justly claim that she has acted only in self-defence against the ominous accumulation of weapons in the hands of others. In the one case as in the other, we can hope that the possession of these weapons will lead to a mutual agreement not to use them rather than to that competition in impoverishment for which they are designed. And, finally, in the one case as in the other, having entered upon re-armament, we must be clear that the one way of ensuring that the effort is wasted is to pursue it half-heartedly.

Peace and the Axis

THE joint Franco-German declaration, which has been on the stocks since the meeting of the Big Four at Munich, was duly signed in Paris by Herr von Ribbentrop and M. Bonnet on Tuesday afternoon. The signature would no doubt have taken place a week earlier if Herr von Ribbentrop's visit had not been postponed owing to the French strikes. As it was, the German Minister for Foreign Affairs arrived—with an almost obtrusive unobtrusiveness—at the Gare des Invalides a few hours before the ceremony of signature was carried out. Elaborate precautions against all possibility of "incidents" were taken by the French authorities, but the public mood in Paris was not excitable. The German visitor was received by the Parisians in silence—as though they were stupefied by the inexplicable contrast between the foreboding of a European catastrophe and the text of a political declaration which, if it is to be taken *au pied de la lettre*, puts an end to the millennial Franco-German feud that, during the last few hundred years, has been the deadliest of all the political wounds in the body social of Europe.

But how is the text to be read? In this brief document the first of the three articles puts on record the common conviction of the two signatory Governments that peaceful and neighbourly relations between France and Ger-

many constitute one of the essential elements for the consolidation of the situation in Europe and the maintenance of general peace, and this is followed by a declaration that the two Governments "will use all their efforts to ensure the development in this direction of the relations between their two countries." It will be noticed that this formula goes much less far than the Kellogg-Briand Pact. There is no explicit renunciation of war between France and Germany, much less any positive pledge to refrain from settling their disputes by any but peaceful means. Conciliation, arbitration, collective security—all these methods of peaceful settlement are conspicuous by their absence from the text. The second article declares that between the two countries there is no territorial question outstanding, and that they solemnly recognise as final the frontiers as they now exist. Apparently this undertaking only covers the Franco-German frontier in Europe between Switzerland and Luxembourg. At the moment there are no African frontiers in existence between the two Powers; and, in spite of the plain meaning of the statement that "there is no territorial question outstanding," it appears that, at any rate in the German view, this does not mean that Germany renounces colonial claims against France. The third and last article provides that—"due account being

taken of their relations with other Powers"—the two Governments are to remain in contact over questions of mutual interest, and are to consult together if any of these questions should later threaten to give rise to difficulties.

When this last of the three provisions was foreshadowed, it was assumed that it was a French proviso for reserving France's treaty obligations towards her East European allies, and particularly towards Russia. It now, however, seems to be turning into a German proviso in favour of the Axis and the Triangle. On the morrow of the signature of the declaration no time was lost in Germany in emphatically reaffirming that the Axis and the Anti-Comintern Pact still remain the bases of Germany's foreign policy. There has been no corresponding declaration in France in regard to the Franco-Russian Pact; and the "particular relation" with another Power which has become a burning question—not on the morrow but already on the eve of Herr von Ribbentrop's visit to Paris—is not that of German designs against the integrity of the Soviet Union, but that of Italian territorial demands on France herself.

The Italian demands were sprung upon France with a studied air of spontaneity at a meeting of the Fascist Chamber in Rome on November 30th. The proceedings began with an official statement by Count Ciano of the military measures that the Italian Government alleges that it took in September in support of Germany's claim to the Sudetenland. And then—at what seemed like a pre-arranged cue in the Minister's speech—shouts of "Nice," "Corsica," "Tunisia" were raised not only on the floor but also in the galleries of the House. In reply to prompt and energetic French and British diplomatic protests, Count Ciano afterwards professed that these demonstrations were "spontaneous" and that they must therefore not be taken to represent the policy of the Italian Government. It is a strange doctrine that "spontaneity" may be offered as a valid excuse in a Fascist representative assembly when the spontaneous acts and words of Messrs Eden, Churchill, Duff Cooper and Greenwood in the House of Commons may not. This is, perhaps, no more than a debating point, since it is really obvious that, in a totalitarian State, political spontaneity is non-existent. Count Ciano's speech and his audience's ejaculations must be regarded as two parts of a single political manoeuvre; and the meaning of it is transparent. On the eve of Herr von Ribbentrop's visit to Paris, the Italian Government decided to say to the German Government: "We consider that Italy did yeoman service for Germany in September; but we, as well as you, have our *terra irredenta*, and we expect you not to enter into any arrangement with France that might debar you from helping us, on some future occasion, as we helped you last autumn."

What is Germany's relation and attitude towards this latest Italian manoeuvre? Was it sprung on her, as well as on France, as a surprise? Or was it prearranged with the Wilhelmstrasse, as well as with the "spontaneous" Italian demonstrators? And if it was "a put-up job" between Italy and Germany, how far does Germany mean to go, in this matter, in support of her ally?

There are several strong reasons for supposing that Germany does not mean to go very far. To begin with, it seems to be her immediate policy not to involve herself in a major war with other Great Powers—at any rate, not in the West—and whereas the realisation of Germany's own ambitions in Austria and the Sudetenland could be, and actually was, achieved without any war at all, Italy's present claims against France could not conceivably be vindicated without a major war in which Italy and any allies of hers would find themselves in conflict with France. And not only with France. Lord Perth was instructed to make it clear in Rome that the British Government would regard any Italian designs on French territory as a breach

of the newly-ratified Anglo-Italian Agreement, in which Italy pledged herself not to disturb the *status quo* in the Mediterranean. Indeed, it is obvious that the domination of both banks of the Mediterranean narrows by Italy would be dangerous to vital British interests within their narrowest latter-day definition—even if the integrity of France were not, in itself, regarded as a British interest. If the object is to split Britain and France, claims to Mediterranean territory are the worst possible means.

Any attempt to secure Tunis, Corsica or Nice by arms would thus involve a general war—far more certainly than Germany's designs on Czecho-Slovakia. It is hard to believe that Germany seriously intends to involve herself in a general war for Italy's sake. It seems more likely that she will support Italy's claims against France to the extent, not of attempting to secure their realisation by force of arms, but merely of keeping France on the defensive and thereby making doubly sure that Germany shall have a free hand, as far as France is concerned, for her own designs in the East. That Germany's next offensive will be in an easterly direction is suggested by a number of symptoms: the road-building across Czecho-Slovakia (with which we deal elsewhere); the Press campaign against King Carol of Roumania following the shooting of the leaders of the Roumanian "Iron Guard"; the sudden militancy of the Ukrainian national movement in Poland. Germany, surely, will not allow herself to be diverted from these East European operations by the new Italian claims against France; she will rather seek to profit by these claims to facilitate her own designs in the opposite quarter.

It is not impossible, however, that if and when Germany has achieved her own next aims in Eastern Europe, she may then support the Italian claims in the Mediterranean in good earnest, and that some German assurance in this sense accounts for Signor Mussolini's otherwise apparently rash action in staking his prestige on demands that cannot be realised without a general European war. There is, after all, one important way in which these Italian claims might be made to serve German ambitions—this time not in Eastern Europe but in Tropical Africa. Germany's prospect of obtaining colonies through an agreement with the Western Powers has receded almost to vanishing point as a result of the recent pogroms in the Reich; and the German navy cannot just go and seize the colonies, owing to the naval preponderance of Great Britain and France. There is, however, a back door from Central Europe into Africa across the Mediterranean; and, on this strategic route, Italy, Sicily and Tunisia are the three stepping-stones. At the moment, all this may be rather remote; yet, in Germany's view, it would be all to the good to have up her sleeve a second string to her colonial bow.

On the whole, we shall be prudent to take the Germans at their word when they tell us that, in spite of the Franco-German declaration signed in Paris this week, the Rome-Berlin Axis still remains the foundation of German foreign policy. And another forecast which can safely be made on the basis of past experience is that Signor Mussolini can be relied upon to make the maximum possible amount of trouble. That such impudent claims can be made is a sign of the post-Munich discredit of the democratic Powers. The greater probability is that they have been put forward only so that their temporary abandonment can be offered as a *quid pro quo* for the grant of belligerent rights to General Franco or for concessions in the Red Sea. But unless the resistance, both by France herself and by Great Britain, is immediate and unyielding, Signor Mussolini may take the further step of engaging his own prestige inextricably in the demand for Tunis. Mr Neville Chamberlain has refused to postpone his visit to Rome next month. He will be able to make it clear that demands such as have been formulated this week will, if persisted in, smash the slender hopes of appeasement in Europe.

Inquest on the Highlands

MORE than two years ago the semi-official Scottish Economic Committee set up a sub-committee on the problems of the Highlands and Islands. The long-awaited report of this sub-committee has now been issued.* It is an open secret that, although stopping short of hereditary blood feuds, the Committee unfortunately maintained the old Highland traditions in certain respects. The report must therefore be judged rather as a useful pile of salvage to find on the battlefield after the smoke has cleared and the clansmen have departed than as a solidly built structure of thought and information erected by a homogeneous team of workers. The most valuable sections are probably the descriptive and statistical appendices: of the rest, the many smaller practical recommendations are far better worked out than the larger proposals.

The Report covers the seven counties of Argyll, Inverness, Ross and Cromarty, Sutherland, Caithness, Orkney and Zetland. The Highlands thus defined cover nearly nine million acres (about 47 per cent. of Scotland), two-thirds of the surface being rough grazing. There are great variations in land use, Orkney having well over 40 per cent. of its area under crops and grass, while Sutherland has less than 3 per cent. The whole cultivated extent of the Highlands is less than that of Essex or Shropshire, while livestock are also relatively unimportant, even sheep amounting to only 27.5 per cent. of the Scottish total.

This substantial area, roughly the size of Holland, contained in 1936 only 292,000 persons. In 1755 the population was ascertained to be 257,000. By 1801 it exceeded the present figure, the peak of 396,000 being reached as long ago as 1841. Emigration, by which the Highlands contributed to the Empire their leading product, man-power, has given to other areas since 1860 some 300,000 persons, or more than the present total Highland population. Since 1931, however, the outward balance of migration has virtually ceased, and the population fall has been nearly arrested for the time being, although there is now only one baby born in the region for every four born fifty years ago.

Highland economics are simple if depressing. Public expenditure, central and local, in 1934-35 amounted in the region to £4,300,000, of which £1,700,000 was distributed directly to individuals in the form of benefits, chiefly pensions (about £1,000,000), poor relief (£188,000), unemployment payments (£300,000), and National Health benefit (£200,000). These cash disbursements represent an average of £5 17s. 6d. per man, woman and child, or about £23 10s. per family, but as a substantial number of families do not participate, the average per family among recipients is probably over £25, and the maximum is, of course, much higher. It is a commentary on current ideas of sound public finance that, with the exception of a few thousand pounds, "much of this expenditure of £4,300,000 was of a character scarcely calculated to bring about redevelopment of the area, and producing comparatively few assets to show for itself if it were curtailed or brought to an end." While it is impossible to estimate exactly the annual net subsidy being paid to the Highlands from national public funds, there is reason to believe that it must approach £2,000,000, much of which must be regarded as simply poured down the drain through sheer lack of constructive policy. If it is agreed that the Highland contribution to the nation of healthy and educated man-power is one which should be preserved, there is a case for expect-

ing other regions to subscribe towards its cost. The remoteness of the region, its sparsity of population, and the difficulties of communication make for high service costs per head. The Highland population is roughly equal to that of the administrative county of East Sussex, but it is spread over an area eighteen times as large, and total Highland county council expenditure exceeds the East Sussex total by about a million pounds, or over 60 per cent., which is apparently accounted for almost wholly by extra government grants. The most striking difference in individual services is for education, which costs well over £2 per head of population in the Highlands, or nearly double as much as in East Sussex. While the State meets a large share of this burden the Highlands still have to raise apparently something like 15s. a head. The Report unfortunately leaves the reader to work out analyses and comparisons of this sort. It does, however, show the very large gain accruing to the Highlands from the 1937 revision of block grants, the gain being worth as much as a rate of 2s. in the £ in Inverness and 3s. 5d. in Zetland.

It is questionable whether the ordinary framework of local government can be expected to work in Highland conditions, with a rateable value only equivalent to that of Harrow or Willesden available for servicing something like one-fifth of Great Britain. The Report is very timid on this point. It asks for more delegation of powers, and for a special review of general legislation before its provisions are applied to the Highlands. But it refuses to face any serious modification even of the local government of the Outer Hebrides, although these are administered from small mainland towns which may be as remote in distance as Swanage is from London, and more remote in time.

The main constructive proposals of the Report are for a Highland Development Commissioner and a Central Marketing Agency. The Commissioner, to be appointed experimentally for five years, is intended to carry out investigations and surveys, to consider methods of reducing burdens and promoting development and to exercise a number of administrative functions which cannot be effectively discharged by existing authorities.

The Central Marketing Agency would be established with local branches "with assistance from public funds, to encourage the use of co-operative methods, and, in particular, to organise arrangements for the packing and marketing of all classes of produce and for making suitable transport arrangements." Appointed by the Secretary of State for Scotland, it would be representative of the interests of the Highlands, and the Development Commissioner would be represented on it. The Report somewhat optimistically envisages that the Agency would eventually become self-supporting, but assumes that an unspecified amount of financial assistance will be needed during its "initial period." It is intended to handle "all types of agricultural, fishing and other industrial produce" with, if necessary, separate schemes for such special products as eggs. It would therefore be unlike all statutory marketing schemes, which deal with specific products, and would in some cases apparently cut across them, for instance, in the case of fish, pigs and potatoes. The nearest parallel, not mentioned in the Report, is probably the central sales department of the Land Settlement Association. The general principles suggested in the Report are:—

(1) The conditions of life in which work will be carried out in the Highlands must be made to approximate so far as possible to conditions obtainable elsewhere.

(2) Inequalities due to distance from centres of consumption must be minimised by attention to Communications and Freight Charges.

* "The Highlands and Islands of Scotland." A Review of Economic Conditions with Recommendations for Improvement. Scottish Economic Committee, 19 Blythswood Square, Glasgow, 1938. 2s.

(3) The application of modern methods, and the utilisation of scientific discovery must be energetically pursued and demonstrated in the interests of Agriculture, Fishing and Forestry.

(4) Industries appropriate to the area, and in harmony with the Highland temperament must be established, and the great part which Water Power can take in this development must be examined to the full.

The remaining proposals, although practical and in the aggregate important, are of too detailed a nature for description here. They include improvement of roads, especially the neglected minor roads and approach roads, to piers and harbours, building of a number of new roads, the taking over and maintenance by the counties of all ferries on classified roads, reduction of sea freight rates through greater traffic development and State subsidies, bulking of consignments, improved transport services and the creation of land and sea training centres for instruction in appropriate occupations. For all local expenditure involving a rate of over 3s. 6d. in the £, Exchequer grants are suggested. Other proposals include firm action against the "squatter," unemployment relief works to assist develop-

ment of the region, a number of adjustments affecting the crofter, improvement of livestock and of veterinary services, redevelopment of local fishing industries, intensified afforestation and further development of local industries, water-power resources and tourist traffic.

Such is the impetus of our machinery of government that the Highlands have had to wait for fifty-four years since their pressing and relatively straightforward problems were reviewed even on this very modest scale. Moreover, unlike the Napier Report of 1884, these present proposals are not even entirely official and may easily be shelved if public opinion permits it. Perhaps what the Highlands most urgently need is leadership, energy, and a more dour determination to make life rather less pleasant for the politicians and officials who think and act in these easy-going terms. The Report, so far as it goes, is mainly on the right lines, but it has only scratched the surface of some of the fundamental issues, and we must therefore endorse its plea that a Highland Commissioner should be appointed without delay and that he should have much more thorough survey work done while the simpler reforms which are most clearly needed are being carried through on his initiative.

The French Air Force

(By a Correspondent)

JUST as Britain, surrounded by the seas, has always relied chiefly on her navy against attack, France's geographical position has prompted her Governments to seek protection behind a powerful army. All the ingenuity of France's military thinkers has traditionally been concentrated on the perfection of the army, which, by common consent, is still the most powerful and efficient in the world. Both countries were slow to appreciate the potentialities of the air arm as a means of attack upon their vitals. The crisis over Czechoslovakia found them in a position of inferiority compared with Germany, both in the attack and in defence against air raids. The controversy over the importance of the air arm was settled at Munich, once and for all, and both countries are now making strenuous efforts to repair their deficiencies in the air.

But if France's air force is much inferior to those of Germany and Italy, it is also considerably weaker than Britain's. Indeed, the French Air Force is in an unsatisfactory state, not because of a lack of pilots and officers, but owing to the paucity of machines and their comparatively low standard of efficiency.

When Colonel Fonck, the famous war pilot, was recently asked what should be done to remedy France's weakness in the air, he replied cynically that it was first necessary to establish an Air Ministry. The Air Ministry has, in fact, been in existence for ten years, but it has always been hard put to it to defend its independence against the War Ministry, some of whose officials were loth to surrender the control over what they regarded as one of their own weapons. This official attitude towards the air arm also found reflection in the allocation of credits. M. Pierre Cot, when criticised for the lack of progress of the Air Force, pointed out that France allocated only 20 per cent. of her defence expenditure to the Air Force, compared with Germany's 30 per cent. Moreover, political conditions have not favoured the rapid progress of the new arm, for since 1928 France has had no less than 26 Governments and the head of the Air Ministry has changed ten times.

The weakness of the French Air Force was revealed for the first time in 1935, when the extent of Germany's air armament gradually became known. France had done very little to increase the efficiency and size of her air arm, concentrating mainly on civil aviation. As a result of private

initiative, a number of modern designs and prototypes were at the disposal of the Air Ministry, but nothing had been done to equip the Air Force with modern machines. Indeed, its machines were largely obsolete or obsolescent; the main fighters were *Nieuport* 29 and 62, with a speed of 125-145 m.p.h., and the chief bomber the even less speedy *Loire* 20. General Denain, who succeeded M. Pierre Cot as Air Minister in 1935, prepared a programme for remedying the deficiency; this provided for the construction of 1,060 first line machines by the middle of 1936. But this programme was not finally completed until August, 1937, and France, instead of gaining ground on Germany, had fallen further behind.

In June, 1936, M. Léon Blum formed his first Government, and M. Pierre Cot was again put in charge of the Air Ministry. General Denain's programme had fallen into arrears, while Germany's Air Force had made rapid headway. Against the *Dewoitine* of France, whose speed did not exceed 212 miles per hour, Germany was able to set pursuit planes reaching 280 miles per hour. M. Cot therefore enlarged General Denain's programme by providing for a first line strength of 1,500 machines, including, as fighters, the advanced *Morane* 405.

M. Blum's labour reforms, however, hardly favoured the rapid execution of M. Cot's plan. The establishment of the 40-hour week with paid holidays and the wage increases did not have the expected favourable results, so far, at least, as the aircraft industry was concerned. The reduction in hours of work did little to reduce the total unemployment; and the expansion of output in the industry was seriously retarded by the alarming shortage of skilled labour. Moreover, production was interrupted by repeated strikes, while the cost of production was raised appreciably by the sudden increase in wages.

The organisation of the French aircraft industry, moreover, was considerably modified under M. Blum, by a partial nationalisation of the production of aircraft, prompted by the Socialist Government's natural desire to eliminate the element of profits in armament manufacture. There was also a need for decentralisation in the industry, which was concentrated in the Paris region, and was therefore vulnerable to air raids. As a consequence of this reorganisation, the industry was divided into six companies

on a regional basis. Each of these companies is managed by a board of directors, including representatives of the Ministry of France, of the Air Ministry and of the Confédération Générale du Travail. The Government acquired 66 per cent. of the share capital of these companies; but their executives were selected from existing managers, in order to assist in the smooth transition from private to public control. The new arrangement is shown below:—

GEOGRAPHICAL DISTRIBUTION OF THE FRENCH AIRCRAFT INDUSTRY.		
	Constituent Companies	Location of Plant
1. Société nationale de constructions aéronautiques de l'Ouest.	Louis Bréguet Loire Nieuport	Nantes St. Nazaire Issy-les-Moulineaux
2. S.N.C.A. du Sud-Ouest.	Marcel Bloch Blériot Lioré Olivier	Courbevoie Suresnes Rocheport
3. S.N.C.A. du Nord	Potez C.A.M.S. Potez Amiot Les Mureaux	Meaulte Sartrouville Caudebec-en-Caux Mureaux
4. S.N.C.A. du Centre	Hanriot Farman	Bourges Billancourt
5. S.N.C.A. du Sud-Est.	Lioré Olivier Potez Romano Sté. provençale de C. Aér.	Argenteuil Berre and Vitrolle Cannes La Ciotat Marseille
6. S.N.C.A. du Midi...	Dewoitine	Toulouse

The initial capital of the six new companies was fixed at 100,000 francs, equivalent at the time to just less than £1,000. The private concerns were taken over by amicable arrangement or by expropriation. The credits granted for the purpose of compensating the previous owners initially amounted to only 250 million francs (about £2.4 millions), but they were subsequently raised to 600 million francs by further advances totalling 350 million francs (about £3.3 millions). Actually nationalisation was only partial. A certain number of concerns, especially those engaged in the production of civil aircraft—e.g. Latécoère, Morane-Saulnier, Caudron, Renault, Levasseur, and Gourdou-Lesseurre—were excluded. Again, in the case of other concerns, only part of their plant was included in the six new companies controlled by the Government. Thus, the works of Louis Bréguet at Villacoublay and of Félix Amiot at Courbevoie escaped nationalisation. All the firms not taken over by the Government were permitted to continue the construction of civil aircraft, and they were given financial assistance in research for military aircraft. Subsequently, however, all these firms were asked to assist the nationalised concerns in the production of military aircraft.

The manufacture of engines, as distinct from the production of airframes, was left in private hands. The Government only acquired one concern (Lorraine) and part of the shares in Hispano and Gnome.

The expenditure of the State on the Air Force has been substantially increased in recent years, as the next table shows:—

BUDGET OF THE AIR MINISTRY				
	Total (excl. civil aviation and naval air arm)	Military Air frames and engines	Research	Naval Air Arm
	(In millions of francs)			
1934	1,800	520	77	210
1935	2,200	750	73	255
1936	2,800	1,050	93	288
1937	4,200	1,320	150	295
1938	8,200	3,140	340	420
	(Equivalent in millions of £'s)			
1934 (£=frs. 75)	24.0	6.9	1.02	2.8
1935 (£=frs. 75)	29.3	10.0	0.97	3.4
1936 (£=frs. 105)	26.7	10.0	0.88	2.7
1937 (£=frs. 140)	30.0	9.4	1.07	2.1
1938 (£=frs. 178)	46.0	17.6	1.91	2.4

Between 1934 and 1938 the credits voted for airframes and engines were increased sixfold. The increase looks less formidable when translated into British currency. But costs of production have probably not risen in proportion to the depreciation of the franc.

Yet, in spite of the reorganisation of the aircraft industry and the increase in expenditure, all too little headway has been made with the provision of an adequate Air Force. Early in 1938, when M. Pierre Cor relinquished his control of the Air Ministry, France's relative weakness was as marked as ever. Fighter squadrons were still equipped with *Dewoitine 500* and *510*, *Loire* and *Spad*, whose speed did not exceed 190 miles per hour; the bomber squadrons consisted mainly of the comparatively slow *Bloch 200* and *210*. The nature of the chaos existing in the industry can be judged from the fact that, although the *Morane 405*, a well-designed machine, was available as a prototype in 1936, only three or four machines had been manufactured two years later. Moreover, a number of serious accidents focused attention on defects of quality.

It is difficult to apportion the blame for this sorry state of affairs. The temporary dislocation, caused by the partial nationalisation of the manufacture of aircraft, appears not to have been a serious factor in the lack of progress. The labour legislation of M. Blum's Governments, on the other hand, must bear much of the blame. But those in charge of the Air Ministry must also have a share of responsibility.

M. Pierre Cor's successor, M. Guy la Chambre, who took office early this year, resolved to repair the deficiencies by a more vigorous effort. He decided that the number of first-line machines should be increased to 2,617 and that all of them should be modern types. An order for a hundred Curtiss machines, placed in the United States, helped to render the public conscious of the serious shortage of modern aircraft. General Vuillemin, who had proved his capacity during the last war, was called in as chief of staff.

But reorganisation at the Air Ministry was not enough, and the chief problem was, and still is, how to secure a speedy increase in production. The capacity of the aircraft factories was increased, and more than 1,000 million francs has been spent on plant and tools. Moreover, much has been done to render possible an acceleration of production by better co-ordination between the Ministry and the factories and by the simplification of processes.

None of these measures, however, is sufficient to bring about the desired result without a relaxation of the labour regulations made by M. Blum's Governments. The number of workers in the aircraft industry increased from 36,000 to 49,000 in two years, but the output of aircraft has been kept down to 40-60 per month, and only 240 of the 2,617 modern machines for which the new plan provides had been completed at the end of last September. Everything is being done to speed up output by the mechanisation of processes, and the number of man-hours required per aircraft is said to have been reduced to 10,000 for certain types, compared with the figure of 20,000 to 80,000 recently quoted by Sir Kingsley Wood for the British industry. But it is highly doubtful whether the industry's output could reach the 200 per month envisaged for 1939 by the present programme without the far-reaching modification of the existing labour regulations envisaged by M. Paul Reynaud's decree-laws. Much is expected from M. Caquot, a well-known engineer and industrialist, who has recently been put in charge of the six new aircraft manufacturing concerns. But time is pressing, and it is clear that nothing but a co-ordinated and vigorous effort on the part of the Air Ministry, the industrialists and the trade unions will now enable France to regain even part of the ground lost to Germany and Italy.

Topics of the Week

No Colonial Concessions?—The British Government have at last added their official voice to the colonial chorus which, lately swollen in volume by Italian claims upon France, is setting the world's nerves on edge. Mr Malcolm MacDonald won the applause of all parts of the House of Commons on Wednesday when he declared that he did not believe any section of opinion in this country was disposed to hand over colonies or mandates to any other Power. "We are not discussing this matter. We are not considering it. It is not now an issue in practical politics." The implications of the Dominions Secretary's "now" ought perhaps to be read in the light of a speech made by Lord De La Warr on December 4th and later defended by the Prime Minister himself in the Commons: "There is a deep and growing feeling that there is nothing we can do that can satisfy them [the Germans], that friendly words and friendly actions are mistaken for cowardice, and that only armaments can speak effectively" was the view then expressed by the President of the Board of Education. After Munich, colonial concessions seemed the inevitable next step in the policy of appeasement; the Fuehrer spoke of colonies when the Anglo-German declaration of amity was made, and expressed the view that Germany's claims could be met without conflict; and in the last few weeks Mr Pirow, South African Minister of Defence, has stumped over Europe as the Empire's colonial bagman. But the scene has changed since early October; the Jewish pogroms have not added lustre to Nazi Germany's scarcely shining reputation as a ruler of alien minorities; and the cynical interpolation of Italy's outcry for Tunis, Corsica and Nice has shown up the sort of peace that is purchased by concessions to the dictators.

The Issues at Stake.—Yet the colonial question has not been altered in substance by recent events. Germany's colonies were wrested from her by force of arms; and insult was added to injury when the conquest was excused by false and trumped-up proofs that pre-war Germany was unfit to govern colonial possessions. Since the advent of Herr Hitler, patriotic irredentism in Nazi propaganda has been peculiarly associated with the colonial guilt lie; and the return of the Reich's former territories overseas has been claimed unconditionally as a matter of right. The economic grounds for the German claims are less substantial than those of prestige or politics. The possession of, say, the Reich's old African territories would admittedly provide some very slight relief to her exchange difficulties by providing certain materials which are at present bought elsewhere and so releasing foreign exchange to purchase more essential commodities, such as iron, copper, bauxite, cotton and wool, from other places. And in the case of oils, sisal and phosphates the former colonies, including those in the Pacific, could be directly helpful to the Four Year Plan. But the exports of these territories amount in total value to less than 4 per cent. of the value of Germany's imports, and to increase their contribution appreciably would entail an amount of investment which the Reich at present could ill afford. Nevertheless, it is scarcely in order for the possessors of colonies to base their refusal to surrender a part of their property on demonstrations that the Imperial game is not economically worth the candle. Nor are Britons with their colour-bar, or the remote Americans with their negro problem, on very secure ground when they base their denial of Germany's demands on German racial doctrines. It does not follow, as night the day, that Jew-baiters will oppress natives. If moral issues were decisive, the unconditional surrender of colonies to Germany would be wrong because broad considerations of justice require, as Mr Noel Baker argued on Wednesday, not unilateral concessions, but the application of the principle of trusteeship to all colonies whatever their ownership, the abatement of sovereign interests and the world-wide recognition of the open door

in colonial commerce. The mandatory principle itself imposes respect for these considerations. As it is, questions of expediency and power politics probably prevail: and it is not practicable to transfer colonies, simply because it would be strategically unsafe to do so and nothing would be gained. If, on the other hand, an effective *quid pro quo* could be gained, if some guarantee of lasting peace could be assured, then some sort of deal might reasonably be done.

National Service.—The extent to which Sir John Anderson's plans for a voluntary register of citizens willing and able to serve their country in time of need are likely to meet the nation's urgent requirements remains to be seen. For the voluntary method, it is argued that the determination of a democratic people to defend themselves can best be shown by free enlistment; and, as Tuesday's debate in the Commons demonstrated, the Labour Opposition are afraid of military conscription and interference with trade union rules and regulations. For compulsion, and here the Government's own back-bench followers were most critical on Tuesday, it is contended that, only by compelling every citizen to register and to train for his or her appointed rôle in the structure of defence, can the country be rendered speedily secure; that to wait until the need for defence actually arises is to court disaster and, in the interim, hopelessly to weaken our power in diplomatic negotiations. Some concessions to the view that guaranteed training is as important as the compilation of a roster of man-power is made in the Government's proposal to place volunteers under some contractual obligation, as yet unspecified, to pursue a course of preparation; and a rush of recruits may yet falsify the critics' opinion that a voluntary roll will be incomplete in many particulars.

The problem is far wider than the provision of adequate trained strength for the civil defences. The last war showed how obdurate a problem was the speedy segregation of men and occupations essential at home in war-time; it showed how haphazard the mobilisation of brains for war-time administration and industry must be without previous preparation. The first item to be decided is the required size of the fighting services in war-time, including the strength of the overseas expeditionary force which, despite denials, would inevitably be needed. The second requirement is the full manning of munitions and export trades; the third, and one of the most immediately urgent in view of the important influence of feared surprises in diplomatic manœuvring, is to bring our civil defenders to their complete complement. If a voluntary register, with some sort of contractual training for air raid precautions, anti-aircraft work and the like, will provide all the necessary information for this prior planning, as well as ensuring the fullest state of preparation before the emergency arises, well and good. If not, we in this country who will the end of national safety, must will the means. If the efficient and economic allocation of Britain's resources requires a compulsory register, we must accept it as no more burdensome than compulsory censuses or returns of income. If the provision with some speed of trained personnel for national purposes requires compulsory training, we must meet the need willingly, with the reflection that compulsion based on common consent is scarcely tyranny, and remembering that in many countries conscription itself has been proved not incompatible with democracy. It may very cogently be argued that the present Government's policy is not best calculated to win common consent from all quarters. But the trade unions themselves, who have now agreed to confer with Sir John, would agree that contracting-out is a more fruitful method of recruitment than contracting-in; and this is no time for either shibboleths or sectional interests to be permitted to put the nation in peril.

M. Daladier and the Chamber.—There is nothing triumphal about the reassembly of the French Parliament after a holiday of nearly half a year, broken only by the perfunctory 24-hour session which approved the Munich agreement and gave M. Daladier power of decree at the beginning of October. The Front Populaire and France's post-war foreign policy have both fallen into ruins during this vacation. M. Daladier, after a resounding victory over the trade unions whom he accepted as allies three and a half years ago, must look for his majority to the parties of the Right which hounded him into the wilderness in February, 1934. The catastrophe which has overtaken the C.G.T. and the collapse of the Front Populaire itself are largely due to the irresponsibility of the new recruits who joined the trade unions during the strikes of 1936, increasing the C.G.T. membership from 1,200,000 to 5,000,000. These new recruits, of whom a million and a half had already lapsed before the general strike, transferred the leadership of many important unions from experienced veterans to Communists mainly inspired by political motives. They were still strong enough to force the C.G.T. into the general strike against the better judgment of the veteran trade unionists; it was the unions with old membership which struck, those without trade union traditions which were cowed. Still more of the 1936 recruits are now expected to lapse, and the C.G.T., at enormous cost to French labour and to the cause of democracy in Europe, is at last back at a position from which it may be possible to build up sound trade unionism in France.

* * *

—And Reactions to M. Reynaud.—The strike's collapse has not made the Reynaud decrees more popular, and M. Daladier is not finding it easy or painless to transfer himself and his Government from one horse to another in midstream. He is, however, reasonably sure of a not very impressive majority after the debate on general policy, and probably also for the Budget, even though he refuses the demand of the Right that the promised Bill for introducing proportional representation should be given priority. The importance of this Bill lies in the fact that it is hoped, by destroying the single-member constituencies, to do away with the electoral alliances which have so often linked Radicals and Socialists at the polls, and, therefore, to a great extent also in the Chamber. At present the members of the Left wing of M. Daladier's own party, the Radicals, and of the U.S.R. (Republican Socialist Union) are keenly aware that their electors sent them to Paris to form part of a Left majority and did not expect them to impose direct taxation at a flat rate on all wage earners. Defections from M. Daladier's majority are to be expected in these quarters. The principal representative of the U.S.R. in the Cabinet, M. de Monzie, was at pains to dissociate himself from M. Reynaud's policy when warning the railwaymen of the consequences of striking. The representatives of the Centre and moderate Right in the Cabinet, notably M. Paul Reynaud himself, were chosen last April because of their sympathy in questions of foreign policy with the non-Pacifist Left, and are therefore amongst the opponents of the Munich policy. For this reason they are now the members of the Government who come in for most criticism from the Nationalist pro-Munich Press. M. Reynaud's enemies on the Right do not scruple to exploit against him the unpopularity of his decrees with the working class, while simultaneously accusing him of intriguing with the "Marxists." Thus on foreign policy the Left wing of the Cabinet sympathises with the Right opposition, and the Right wing with the Left opposition. As in England, views on foreign policy now override all party distinctions, but the unpopularity of M. Reynaud's measures has had the effect of giving much greater cohesion to the pro-Munich camp which extends from the environment of M. Flandin to M. de Monzie, who is a close political friend of M. Bonnet. It is evident that, whatever else Munich and the General Strike may between them have achieved, they have not lessened the confusions of the French political scene.

German Justice for the Jews.—A number of decrees which further exclude Jews in Germany from economic and social life have appeared since the week-end. Jews may no longer drive motor cars, because "the cowardly deed of the Jew Grynspan, which was directed at the whole German people, shows Jews to be untrustworthy and unsuited to own or drive motor vehicles." According to a message from the German official news agency, this new restriction complies with "the healthy sense of justice of the German people"; but it can hardly be said to comply with any people's healthy sense of relevance or logic. Indeed, it is reminiscent of the doubtless apocryphal story of one of Herr Hitler's public meetings before he attained power. "All Germany's woes," said the future Fuehrer, "are due to the Jews." "And the cyclists," added a voice at the back of the hall. "The cyclists?" said the Fuehrer. "Why the cyclists?" "Well, come to that," said the voice, "why the Jews?" Similarly, we may now ask, "Why on earth motor-cars?" The Minister of Economics has carried justice several steps further by ordering that all Jewish property shall be placed in the hands, if not theoretically in the possession, of the authorities, without whose permission no Jew may henceforth sell estate or other property, stocks or shares or any securities. It is to be marked that this order applies also to foreign Jews with property in Germany. The immediate reason for the order seems to be a fear that Jewish selling in preparation for paying the fine of a milliard Reichsmarks, might provide another slump on the Berlin Bourse—the more because even a healthy sense of justice has failed to dissuade speculators from taking their profits. Jewellery and precious metals, the last resort of frightened property-owners in totalitarian countries, are the subject of regulations which permit Jews to buy and sell only through special offices established for the purpose. A rider to the first batch of decrees after the pogrom, circulated by the Minister of Finance, states that pensions and similar annuities are not to be capitalised when estimating Jewish resources; the justice of this apparent alleviation would seem to be that otherwise (as many foresaw) the full amount of the fine could not physically be produced. Many Berlin streets are now closed to Jews, who may only pass through them by special permit. It is a very short way from there to the mediaeval Ghetto.

* * *

From the East a worried Poland looks on at this ruthless process and wonders whether the same methods might not better answer her own purpose. The proportion of Jews in Poland is far higher than in Germany; and once the concept of anti-Semitism is allowed international status, and one people is willing to connive or be silent at another's brutality, Poland's case must be admitted to be far stronger than Germany's. For the time being the Polish Government is showing a good deal of restraint in regard to the Jews, but there is no great hope that this restraint will continue. With varying degrees of uncertainty the same feeling of nervousness may be detected in all the small countries of east and south-east Europe, and particularly in Roumania: that in the world-wide protest against the persecution in Germany, their own troubles from the possession of what they judge an excessive number of Jews may be forgotten. The implication is that rather than have that happen, and miss what may be a golden opportunity in more senses than one, they will issue reminders after the German pattern.

* * *

Poland Accepts the Challenge.—The Polish Government were pleased with their elections, and when M. Kwiatkowski, Minister of Finance and deputy Prime Minister, spoke at the opening of the Sejm this week he pursued a vein calculated to soothe and disarm the Opposition parties who were going to read his speech in the next day's papers. For the moment, though nothing is decided on their fate, the Government seem to have set aside thoughts of suppressing these parties, as they had threatened to do before the elections of November 6th. The burden of M. Kwiatkowski's speech was that, however desirable would be a return to liberal economics, lower

tariffs, disarmament, and other millennial ambitions, the Poles must sternly adapt themselves to circumstances: and circumstances called for national unity (i.e. a truce on Government criticism of the President), a drive for industrial self-sufficiency, and large-scale defence preparations. What this means in practice became clear when the Government announced a 15-year plan for economic and social development, or five periods of three years each concerned with one aspect of affairs, respectively national defence, communications and transport, education and agriculture, urban and industrial development, and economic unification. Each period will use three-fifths of its total scheduled investment on the particular task in view. Thus, in the next three years two milliard zlotys (about £80 millions) will be invested in defence works. The modesty of this sum and the rigid limitation of aims are striking proofs of the strain which power politics is placing on the Polish economy. Plans dear to the heart of Government spokesmen: expenditure on the new industrial centre in Galicia, the deepening of the Vistula as far as Sandomir, new canals, social services, agricultural development, all necessary to Poland as a would-be Great Power, must be postponed for at least three years. And three years in these days may mean the Greek Kalends. Meanwhile, the Ukrainians are making the best of the limelight shed on Ruthenia by asking once again for regional autonomy, and they mean to put a Bill to that effect before the Sejm. In Teschen economic problems are further complicated by a number of political demands from the German minority there, but this contrasts with improved relations with Lithuania. But the central fact in Polish foreign policy is that in making an agreement with the U.S.S.R., the Government has refused to conform to German plans. In accepting this challenge to Poland's prestige as a Great Power the Government takes upon itself a responsibility which can be discharged only by long years of economic sacrifice.

* * *

Czechoslovakia and Germany.—Last week we recorded the election of the Slovak jurist Dr Hacha to be President and of the Czech Agrarian statesman M. Beran to be Prime Minister of the new Federal Republic of Czechoslovakia (*sic*, for the double-barrelled name has now officially acquired a hyphen, in deference to Slovak susceptibilities). M. Beran formed his Cabinet on December 1st, with Dr Chvalkovsky still holding the portfolio for Foreign Affairs, Dr Kalfus at the Ministry of Finance, and General Sirovy, the late Prime Minister, now transferred to the Ministry of War. These three Ministries, together with the Prime Minister's office, are the only common organs of the Federal Government. For the rest, each of the three component States of the Federation now has a Ministry of its own; and all three of these were likewise formed on the 1st. The policy of the new regime is close economic collaboration with Germany. On December 2nd the Agrarian newspaper *Venkov*, of Prague, published an article advocating an adaptation of the Czechoslovak economy to fit in with that of the Reich; and indeed, what other policy would now be open to any Government at Prague, whatever its political complexion? Co-operation with the Republic's "greatest neighbour" was the keynote of M. Beran's broadcast statement of policy on the 3rd; and he and his colleague, Dr Chvalkovsky, are shortly to visit Berlin, where they will discuss, among other things, the problems of railways and coal. Forecasts of a German-Czechoslovak customs and monetary union are described at Prague as being premature; and the truth may be that these old-fashioned means of unification are now rather out of date. The same results can perhaps be achieved in other ways. For instance, one of the first acts of the new Government at Prague was to pass a decree declaring that all German citizens working on the new Reichsautobahn from Silesia to Vienna across the waist of Czechoslovakia will be under the jurisdiction of the German public authorities so long as they are on the strip of territory through which the road is to run; and this confirms the fact that this ribbon—cutting Czechoslovakia in half—has virtually been ceded to the Reich. Is this the

first of a number of tentacles which the German octopus intends to shoot out, twisting and turning this way and that, over the body of Central Europe, till the whole region is gripped fast in Germany's clutches? In the Sudetenland, at the gates of Eger, on September 2nd, Herr Hess cut the first sod of another strip of highway which is to run round the newly acquired territory and to lash it fast to the main body of the Reich. "The Reichsautobahn," said the Fuehrer's deputy in his speech on this occasion, "is a great socialistic work. . . . But, if need arises, the military forces of the German nation roll along it, too—our divisions, our guns, our tanks." How far south-eastwards are these new German roads going to open the way for the passage of German troops and arms? Czechoslovakia has had to yield them passage this autumn. Whose turn comes next?

* * *

The Milk Bill and the Community.—Last week the Milk Bill was slain by a vehement and extremely disingenuous campaign of vilification which ended in success because it was largely organised within the ranks of the Government's own supporters. Mr Morrison's measure was not the best one which might have been devised to achieve the object of securing an increased consumption of cheaper and cleaner milk. The reforms it envisaged in the distribution of milk, where the greatest opportunity for an immediate lowering of price lies, were half-hearted; but that did not prevent the meretricious banner of Anti-Socialism from being raised by all sorts and conditions of farmers and Conservatives against the proposed Milk Commission. The powers to be given to local authorities to compel pasteurisation were also rendered in part ineffective because they were only optional; even so, the National Farmers' Union continues to contend that producer-retailers would be driven out of business because the cost of pasteurisation plants is prohibitive. While the public, whose need for more and cheaper milk makes this matter one of urgent national concern, is waiting for a chastened Government to produce a remodelled Bill more acceptable to the intransigent farmers and Milk Marketing Boards, certain sentences included in a letter recently sent to *The Times* by a number of eminent doctors and dieticians might well be pondered by all concerned. The writers approach the matter solely from the viewpoint of public health: they cite recent statistics to show that the total amount of infective disease spread by unpasteurised milk is very large; they add, unexceptionally, that

All authorities are agreed that it is desirable that our people, and especially our children, should drink more milk;

and they conclude that

It is due to the producer-retailer that his claims should

WILLS & TRUSTS

In acting as an executor or trustee, the Westminster Bank aims at putting itself in the position of a private trustee. It is therefore its practice to employ the family solicitor, if there is one, or any other solicitor the client may name; by such means the Bank succeeds in combining domestic tradition with business efficiency. A book showing the advantages of corporate executorship and the terms of appointment may be had at any branch

WESTMINSTER BANK LIMITED
Trustee Dept., 53 Threadneedle Street, E.C.2
Also in Piccadilly, Bristol, Liverpool, and Manchester

be considered; but he is not entitled to have them considered without regard to the well-being of other members of the community.

The issue is clear. The interests of a minority seemingly run counter to the interests of the community at large. If health and nutrition were the criteria of policy, the revised Bill which we may expect next year would radically reduce the costs involved in the present wasteful and expensive methods of retailing, and rigorously enforce the sale of only "safe" milk. As it is, the Government have surrendered their authority to legislate in the public interest; and if there is a new Bill it is likely to be more water than milk.

Steel Prices.—As we go to press, the steelmakers are holding another meeting to continue the lengthy discussion on the prices to be fixed for next year, and it is possible that an announcement of the 1939 prices will be made. Great pressure has been brought to bear upon the steel industry from outside to make substantial reductions; and since one of the purposes for which an independent Chairman was appointed to the Iron and Steel Federation was that he might be able to interpret the public interest to the embattled steelmasters, it is to be presumed that Sir Andrew Duncan has been doing his best. If very widespread report is to be believed, his best will turn out to be a reduction, on the heavier varieties, of 15s. a ton, made up of a lowering of the price by 10s. and an increase of 5s. in the rebate. It is worth recalling the interest of the community in the matter; for not only is steel a peculiarly essential raw material, whose price affects all sections of the nation, but the ability of the steelmakers to sit in conclave and fix prices as they choose is itself a gift to them from the community. And having established the public interest, we must go further and say that a reduction of 15s. on a present price of about £10 a ton does not come within gunshot of being adequate.

The arguments in support of this statement were developed in an article in *The Economist* of October 22nd last, and the need for repeating them here is all the less because of the powerful support that has been given to them this week by the speech, at the annual meeting of Tube Investments, Ltd., of Mr Arthur Chamberlain, who is not only an eminently successful industrialist but a far-sighted and shrewd analyst of business conditions. (The speech will be found in our Company Meetings section.) Mr Chamberlain, after recalling that the steel industry has, against all advice or supplication, maintained its prices during the present year ("and English trade is the worse for it") mentioned the rumoured figure of 15s. a ton. "If rumour is correct," he said,

I should designate such a reduction as about one-half of what it ought to be on their present costs, and about one-quarter of what it ought to be had they spent their money wisely and laid themselves out to make steel as cheaply as it could be produced under English conditions.

Mr Chamberlain, as a consumer of steel, might be thought to be a biased witness. But his criticism was founded on grounds far wider than the effect on his own company, which, as he pointed out, could defend itself:

The seriousness of to-day's position is that our foreign competitors are everywhere obtaining their steel more cheaply than we, and are building up their general trade at our expense. Was it for this that the steel trade five years ago were granted protection? I thought that protection was given them on the explicit promise that they would not exploit the home market, but would put their ruined house in order and install plant capable of making steel as cheaply as any of their foreign competitors. Has this been the case? . . . If the price of their steel is any criterion, the answer must undoubtedly be "No." . . . In the old days the steel trade's mistakes hurt themselves only. We could exhort the foreigner if they could not produce the Moods; but now that protection forces us to buy our steel it is home the steel people can, and apparently do, foist the Strike may befall on the rest of the country. Was it for lessened the confusions afforded them?

It is rapidly becoming an urgent matter—urgent alike for the credit of the Government's economic policy and for the soundness of British industry—that questions such as Mr Chamberlain asks should be enquired into by a body whose composition excludes the possibility of whitewash.

The Railways' Square Deal.—A fortnight ago the Minister of Transport invited the railway delegation to amplify its "Square Deal" manifesto. On Thursday the delegation complied, with a second memorandum setting out the nature of the legislative measures which they contemplated and their reasons in support. The Minister subsequently announced that the proposals would be referred to the Transport Advisory Council for an "urgent report." From the memorandum it appears that the railways have in mind a short comprehensive Act repealing Part III of the Railways Act of 1921 (which deals with railway charges) and also various other Acts and Sections of Acts. Passenger fares would not be affected, but would remain under the control of the Railway Rates Tribunal. Nothing less than these changes, in the railways' view, will put them on terms of equality with road transport, and they submit that their record since the amalgamations of 1923 is a sufficient answer to any suggestion that the freedom for which they ask would be abused. They have replied to the concern of Dr Burgin that monopoly powers would, in effect, continue over coal and steel traffics by the counter-suggestion that existing monopoly power in these branches is limited, that diversion would follow any general increase of railway charges on heavy industrial traffics, and that firms in such industries could easily increase their road transport in retaliation for any inequitable railway action. They conclude, accordingly, that special safeguards applicable to the heavy industries are not really necessary. What use would the railways make of equality of charging and carrying powers with the roads? They have, it seems, no scheme for an increase in rates, either in general or for particular industries. Nor do they contemplate making wholesale reductions and plunging into a rate war with other forms of transport. They argue further that a co-ordinated transport industry is the more likely to result from their proposals—in the same way that the railways employed their road powers in 1928 to achieve a striking degree of co-ordination with the road passenger industry. For this purpose of unified control the existing system of railway rates is inapplicable—indeed, it would prevent any possibility of unified control—but equality of conditions between road and rail would foster the observance of a general rates structure. It is clear, indeed, that the railways see no likelihood of getting together with the road industry, while a less responsible part of it enjoys a completely free hand. It now remains to await the report of the Transport Advisory Council, which is expected in a few days' time.

The Canadian-American Trade Treaty.—Canadians have now had time to appraise the pair of complementary trade treaties which were signed at Washington on November 18th, and on the whole their verdict is favourable. Some manufacturers regret their reduced protection, and fruit-growers in the Annapolis, Okanagan, and other regions, feel that the sacrifices imposed upon them in regard to the British market might well have fallen on other shoulders, whilst people in Halifax and St. John fear that the abolition of the wheat preference will divert grain traffic to American ports. The dominant feeling is that, while sectional interests may lose something, the nation as a whole will gain in two ways, by opening up markets to Canada's raw material products, and, more important, by the timely demonstration of co-operation between the three leading Anglo-Saxon democracies. Even protectionist papers are prepared to admit that Canadian sacrifices may prove worth while. In the political field, the Liberals think they now have in their hands a winning card for the Federal elections. Some of them would like to appeal to the country at once, but for various reasons it is improbable that a new mandate will be sought before the autumn of 1939, and perhaps not even then. The Liberals realise

that seats like Halifax and St. John, certain fruit-growing divisions, and industrial divisions in Ontario and Quebec, which they now hold, have been endangered; but against such possible losses they think they have enlisted the goodwill of agriculturists like the dairymen, the cattle raisers, the potato growers, and the producers of maple syrup, whose gratitude for the benefits of the Treaty will enable them to hold a number of rural seat, which they would probably have lost otherwise through the normal swing of the political pendulum. Cuts in the industrial duties should silence the group of radical insurgents from the prairie country; and it is by no means certain that the Ministry's opponents will be able to gain much in the prairie provinces over the abolition of the wheat preference, because there seems to be a sharp division of opinion as to whether the preference had any real value for the Canadian grain grower. The Conservatives were hoping to secure in the Canadian-American treaty a live issue for the revival of their rather enfeebled fortunes, but in the end their leaders are not opposing the treaty outright; and Dr Manion, the new Conservative front-bencher, contented himself with some very moderate criticisms. To those who fear that Germany and Japan will be able to pour in cheap goods by virtue of the most-favoured-nation clause, the Treaty's advocates reply that two safeguards exist: reservation of concessions for goods which come into Canada mainly from the United States, and power to raise the duty if and when the chief benefit of the lowered rate is going elsewhere than to the United States. The trade treaty will, however, complicate the Budget problem, for the special import excise duty of 3 per cent., which is now wiped out, brought in as much as 18 million dollars in one year, and showed an average return of about 15 million dollars.

Belgian Political Difficulties.—The Belgian Prime Minister and Socialist leader, M. Spaak, is in difficulties of a kind that often beset the representatives of parties of the Left, accustomed to living in the wilderness, when at last they find themselves in power. Loaded with the cares of office in an exceptionally grave hour, conscious of the exigencies of state and of the political strength of parties other than his own, and fearing that, in Belgium as elsewhere, Socialism may be broken if it does not bend betimes, M. Spaak has been trying to lead his own party into courses which they detest. On the other side, the rank and file of the Socialist Party seem to see in M. Spaak's present attitude nothing less sinister than a betrayal of Socialism by a Socialist in office. The first shock was the announcement of the Belgian Government's intention to send a diplomatic representative to Burgos and to withdraw from the Non-Intervention Committee. The ground for these contentious new departures in Belgian foreign policy was ill concealed by the plea of commercial considerations (Belgium's trade with Nationalist Spain is very small) and of the present ineffectiveness of the Non-Intervention Committee (for when has it ever been effective?). The real ground, of course, was the pressure of the Catholic wing in the present coalition. The decision has already resulted in a breaking-off of diplomatic relations between Barcelona and Brussels. Meanwhile, on December 1st, M. Spaak's embarrassments were increased by a speech from his Minister for Finance, M. Gérard, which was condemned by the Socialist Ministers as deflationary. The Prime Minister has thrown M. Gérard over in the hope of placating his own party on home affairs while remaining intransigent on the Spanish issue. M. Gérard resigned on the 3rd, and has been succeeded by a banker and professor, M. Janssen. This Monday M. Spaak had to face the music at the Socialist Congress. By a card vote of 372,450 to 187,598, with 7,870 abstentions, the Congress called upon Socialist Ministers to resign if the project of sending a Belgian representative to Burgos was carried out. This was followed by meetings, first of the Socialist Ministers and then of the whole Cabinet, and M. Spaak announced that he would put his fate in the hands of the Chamber. On the 6th he there won a vote of confidence by 111 votes to 49, with 21 abstentions. Of the 70 Socialist deputies some

abstained, while 14 of them voted for the Prime Minister. In opening the debate M. Spaak declared that he was in agreement with his party on all points (e.g. in financial matters) except that of entering into relations with Burgos; and although the general council of the Socialist Party decided that Socialist Ministers ought to resign, the Prime Minister and his colleagues have decided to remain in office, at least until the Budget and defence estimates are through the Chamber. The Government's ultimate fate seems now to depend on M. Spaak's ability in this breathing-space to persuade his party congress that breaking is really their only alternative to bending.

King Carol and the Iron Guard.—The recent troubles in Roumania, resulting in a series of attacks by members of the Iron Guard against Jews and representatives of the authorities on one side and the no less brutal governmental repression on the other, point the distinction that must be drawn between the temporary muzzling of the Iron Guard with its definite suppression. The sudden recrudescence of this revolutionary activity in Roumania is certainly a direct consequence of the progress of Nazi ideas and Nazi power towards the South-East; it may be doubted only whether Berlin gave an order to that end to its Roumanian shock-troops or whether they started an untimely action on their own responsibility. The odds, so far as physical force is concerned, are heavily on the Government. Discipline in the army has been strengthened during the last few months and Iron Guard influence in it has been damped down. This, of course, could not be done without the dismissal of able officers, the most notable of whom was General Antonescu, commander of one of the army corps. Relying on the army and on the rural police, the Government will be able to bring into concentration camps those of the leaders of the Iron Guard who are not yet confined there. But in the general elections just a year ago the Iron Guard obtained 15 per cent. of the votes, and there are no signs that a wholesale conversion of its adherents has taken place since.

The two slogans of the Iron Guard are anti-Semitism and the fight against corruption. While the Government of the Patriarch Miron Christea has included anti-Semitism among its official policies, and while a recent communiqué announces a new legal regulation of the Jewish problem, it is much more difficult to foster the conviction of the masses that the present regime is the right one to outroot corruption, since it is too closely allied to the personalities of previous governments under which corruption flourished. The Government is further embarrassed by the fact that several

persons in the closest neighbourhood of King Carol are widely supposed to have misused their influence for their own profit. This group, the camarilla, was the stumbling-block between King Carol and M. Maniu, and it is questionable whether the present regime has, in its struggle against anarchy, the unconditional moral support of the leaders of the National Peasant Party, whose influence on the broad masses should not be underrated, even if the leaders are safely muzzled. At present King Carol and his Government, failing to run the Iron Guard down, are endeavouring to take the wind out of its sails. The first consequence will be a recrudescence of anti-Semitism and this may for a time divert the attention of public opinion from the kernel of the problem: governmental corruption and inefficient administration. This breathing spell could be used for improving and simplifying the civil administration, for building a broader base for the national economy and persuading the masses of the population that it is not only among the minor functionaries that corruption is prosecuted. If the Government is able to make progress with this task before the further progress of Germany towards the south-east compels King Carol to come to terms with the totalitarian element in his country, the Iron Guard will be vanquished not only in the streets but also in the mind of the Roumanian people. At present, and for a few years, it will continue to form a potential menace to King Carol and his system of Government.

Official Secrets.—Monday's debate in the Commons on the Sandys case partook of the nature of a wake celebrated over a long-dead subject. The ploys of the Member for Norwood were never important in themselves; and the manoeuvres of his superiors were merely inept. What was important was the distressing state of London's defences which Mr Sandys's researches threatened to reveal; and, oddly, this seems at the time to have been a secondary consideration in the official mind to the formal maintenance of secrecy. The wider question of Members' status under the present dangerously elastic interpretation of the Official Secrets Act is admittedly important, too; and, oddly again, this was ruled out of order in Monday's discussion because a further motion had been tabled to set up a Select Committee to examine the larger issue. Nor are Members of Parliament alone affected, as Mr Mander told the House on Wednesday. Despite Mr Mander's apprehensions we have as yet no censorship of the Press; but, not least among disquieting devices which limit Press discussion of the conduct of administration, civil as well as military, is the labelling of all sorts of subjects as official secrets. So used, the Official Secrets Acts, originally passed to provide means of combatting espionage and the leakage of important information to alien Powers, are, at the best, irritating, and, at the worst, redolent of the malpractices of eighteenth-century Governments. To imprison one reporter for obtaining advance information about wills from Somerset House, and to fine another for disclosing facts drawn from a police circular, as has been done under the regime of the present Government, is to show how cramping the extraordinary powers given by the Acts can be when employed outside their proper province. No one, in any party, would deny the vital need to keep secret essential facts about our defences and forces. But the Acts require re-definition to ensure that this sole purpose is sought by their use; and—which is perhaps a more difficult nut to crack—a formula needs to be found to ensure that, while secrecy is safeguarded, Members of Parliament are as free as possible to pursue their criticisms into matters concerning the nation's security into which, as elected representatives, they are pledged to inquire. Recent experience suggests that arms and defence cannot simply be left to the unquestioned care of Ministers. On Wednesday the Home Secretary again promised to use the extraordinary powers given by the Act to further the safety and welfare of the State. But the implementation of Sir Samuel's further pledge to consider statutory emendation remains imperative.

Open Country at Last.—The cause of national health promises to score a signal success by the passage into law of a private member's Bill to render all citizens free to walk on uncultivated mountains, heaths, moorland and downs. Fifty years ago the first Access to Mountains Bill was rejected by Parliament; a week ago the Commons gave a second reading to the latest version. Half a century's failures have added fuel to the fiery enthusiasm of the supporters of this reform, for we have become more than ever a nation of town dwellers. New modes of transport bear us from our town boxes into the open country, but great tracts of uncultivated land are closed to our feet. Fitness and healthy recreation are now orders of the day; one-third of Wales, over two-thirds of Scotland and one-eighth of England are heathland, moorland, commons and rough grazing; one-tenth of all Britain would remain outside of cultivation even if the land were thoroughly re-conditioned. Yet, off the roads and lanes, we walk everywhere on sufferance, and in many places (though by no means all) and commonly at holiday seasons we are barred out entirely. In the sixteenth century the sheep devoured the land of England; to-day the deer in Scotland and the grouse in Lancashire, Yorkshire and Derbyshire hold the hills and mountains in fee. The profit of private shootings cannot lightly be set aside, but the ramblers of the industrial North who claim their Pennine lungs have long argued that the walking poor need not ruin the rich man's sport. The Bill which the Commons have passed on to Committee, pending negotiation between walkers' organisations and the alarmed landowners, contains safeguards for vested rights; no dogs or firearms may be taken to the moors; no eggs may be lifted, no fires lit or camps pitched. The townsman abroad is often destructive; but he can scarcely mend his ways until he knows the open country better; nor has he ruined the Lake District where he wanders largely at will. The Bill may be lost or stultified in Committee, which would be scandalous at a time when we are paying loud lip service to public health. More likely, it will pass amended by mutual concessions; and a long-standing public wrong will be righted.

* * *

Food in Spain.—The third winter of the Spanish war has now arrived. General Franco is already intensifying his blockade in the hope of achieving by siege and famine the victory which he has failed to win by force of arms. What chances has he of success? Normally Spain is self-supporting in foodstuffs. But conditions in Government Spain are far from normal, not merely because of military operations and lack of transport, but also because the influx of refugees has enormously increased the number of mouths to be fed. Government Spain to-day covers about a third of the whole country and produces about a third of its wheat, but it has to feed nearly half its population. Only in potatoes are the loyal provinces self-supporting, and even here (as will be seen from the charts on page 573) this is the net result of a surplus in Catalonia and a deficiency in the provinces cut off by the insurgent advance to the sea last summer. The food problem is one of feeding these provinces. So long as she maintains her road and rail communications with France, Catalonia cannot be starved out. But food has to be brought by sea to Valencia and Madrid, whether it comes from Catalonia or from abroad. And in this area there is a shortage of beans and potatoes, as well as of wheat. The diet of the half-million or so inhabitants still in Madrid has been reduced to the point where resistance to disease is dangerously weakened, and the civil death-rate is rising. It consists of beans and potatoes plus an occasional egg and, now that the citrus season has arrived, some oranges. In pre-war days, Spain obtained meat and milk from Galicia and the Asturias. To-day what little is consumed has to be obtained from abroad. Wheat, beans and codfish are also imported, and now seed potatoes are being added to the list. The granting to General Franco of the right to stop ships bringing food to Spain might not crush the well-nigh indomitable spirit of the people of the severed provinces, but it would certainly bring starvation perilously near.

Effects of Motor Car Revival

NEW YORK, November 30.—The index of production for October proved to be a point above earlier estimates, and six points above the figure for September.

	FEDERAL RESERVE BOARD BUSINESS INDICES (1923-5 = 100. Adjusted for Seasonal Variations)		
	October, 1938	September, 1938	October, 1937
	Preliminary		
Industrial production (total)	96	90	102
Manufacture	95	89	101
Minerals	100	97	113
Construction contracts (total)	86	78	52
Residential	57	56	36
All others	110	96	65
Factory employment (total)	87.5	86.9	105.1
Durable goods	78.0	75.8	105.4
Non-durable goods	96.7	97.6	104.7
Factory payrolls (total)	83.7	81.0	104.5
Durable goods	75.0	68.7	108.2
Non-durable goods	83.5	94.9	100.3
Freight car loadings (total)	68	64	76
Miscellaneous	72	69	81
Department store sales	84	86	93
Department store stocks	66	67	76

A new item has been added to the list—miscellaneous wagon loadings. It is believed that this item is more sensitive than the total figure, which includes such bulky staples as coal, grain, etc. Miscellaneous wagon loadings amount to about one-third of the total.

The rise in the index of manufacturing is mostly in durable goods, as would be inferred from the employment figures, and is directly associated with the revival in the motor-car industry.

INDICES OF MANUFACTURING (ADJUSTED)

	June, 1938	September, 1938	October, 1938
Iron and steel	46	76	90
Pig iron	36	59	67
Steel ingots	47	77	93
Automobiles	46	46	84
Locomotives	14	4	...
Cement	69	69	80
Plate glass	80	107	155

The effects of the activity of the motor-car industry are seen in the iron and steel trades and in glass. The cement figures are just beginning to show the effects of the spending programme, and these effects appear spectacularly in "all other" building contracts, which rose from 64 in June to 110 in October. So far it is difficult to trace the precise influence of the spending programme, although presumably every series is influenced by it. Its maximum tangible effect is not expected before the second quarter of next year.

With November virtually over, preliminary estimates for the index of production are slightly above 100; and this again is largely an effect of the rate of motor car production, now in the vicinity of 100,000 cars a week. The data suggest that our production indices are to a great extent dominated by the motor industry, and that they represent the general economy only to the extent that the motor industry is itself representative or symbolic of all industry. Probably it is; but in the weeks immediately following the introduction of the annual models, a large output is required merely to stock the dealers, taking little account of retail sales. This year, however, retail sales seem to be quite satisfactory.

Hesitation and Fall in Sterling

So far as your Correspondent can observe, business in general has risen less speedily since June than the index of production—or perhaps it would be more accurate to say that business sentiment has risen less rapidly than the statis-

tics. This may be attributable to the fact (if it be a fact) that miscellaneous business has not recovered as rapidly as motor car production; or to the possibility that profits are still disappointing. After all, the most impressive figures to the business man are in his profit and loss account, and there is widespread comment that the profit margin is still discouraging. Whatever the reasons may be, sentiment is still cautious, although in view of the meteoric behaviour of the indices, one might have expected it to be buoyant.

One factor making for caution, at least in sentiment, is apprehension arising from the fall in sterling. Remembering the results of September, 1931, when Britain went off gold, business and financial circles have become extremely sensitive to movements of sterling. On a British analogy one might say that those same sentiments which in England attached to the "over-valuation" of the pound after 1925 attach to the dollar whenever sterling is below its historic parity. A decline in sterling below its historic parity may be said to be viewed with the same apprehension as rising money rates would be in London. That is, falling sterling is regarded as a deflationary influence; and is regarded as an excuse for hesitancy. The physical influence may be over-rated; but the psychological influence is a real operative factor.

The October foreign trade figures show increases in both imports and exports. While seasonal factors are undoubtedly considerable, the fact remains that both are following a cyclical pattern upwards, from a low point reached in July.

MERCHANDISE TRADE

	\$000,000	Imports	Exports
October, 1937		224	333
July, 1938		141	228
August		166	231
September		168	246
October		178	278
Ten months, 1937	2,652		2,711
Ten months, 1938	1,613		2,573

Gold and the Export Trade

It is remarkable that the export figures have remained (during the ten-month period) quite stable, while imports have fallen. The consequence is that an almost balanced merchandise trade in 1937 has been converted into a heavy active balance in 1938. One can look at this in one of two ways. Either the change has greatly strengthened the dollar in international markets, and the apparent weakness of foreign currencies actually represents the strength the dollar derives from an active trade balance. Or one can find an

explanation in gold movements. In the first ten months of 1937 our gold imports amounted to \$1,546 millions; in the first ten months of 1938, net gold imports were almost identical—\$1,555 millions, of which approximately \$1,100 millions came in the two months September and October. It appears that there is some relation between these gold movements and our export trade. In 1937, the gold was exchanged for dollar balances and securities. In 1938, much of it seems to have been used in paying for the excess of American merchandise exports—combined with the so-called outflow of foreign balances.

France

Calm After the Storm

PARIS, December 8.—The fiasco of the general strike has provided witness, if that were necessary, to the confusion which exists in the workers' organisations. Work has been resumed without loss of time because the majority of workers, even if exasperated with Daladier, are much more angry with their own trade union leaders. Genuine trade union interests were completely lost sight of for a time as a result of Communist influence which led the unions into purely political fields. Discipline has now been re-established in the factories at the expense of the trade unions' prestige, and their leader, M. Jouhaux, now says that they are ready to collaborate in securing the increase in production which the national and international situation demands.

The technical measures of M. Reynaud have so far been successful. The franc now stands at 177.60 to the £, compared with 179 on November 25th. That is the highest quotation for six months. There has been an appreciable repatriation of capital and considerable purchases of French stocks and public funds by hot money. It was accordingly possible to lower the rate of interest on short-term bonds further to 1.75 per cent., against 3 per cent. two weeks ago. The rise in the public funds has been steady, as the following table shows:—

	Lowest, 1938	Sept. 28th	Nov. 14th	Dec. 6th
3%	65.30	74.10	81.10	81.85
4% 1918	62.40	64.30	81.00	83.90
4% 1925	104.00	124.00	139.40	146.95
4½% 1932 "A" ..	68.20	75.00	85.00	87.10
4½% 1937	103.75	124.25	140.20	141.00

Finally, by an odd coincidence, the failure of the general strike and the voicing of Italian colonial claims happened on the same day, so that M. Daladier, backed by a general recovery in the nation's confidence, could pronounce a categorical "No," which was refreshing to all parties, on the Right as well as on the Left. The Stock Exchange, shaken for a moment, speedily became firm again. If public opinion could be tested, the Prime Minister, now that the industrial danger has been set aside, the franc made firm, capital attracted home, interest rates lowered and the Anglo-German peace pact accompanied by a resolute answer to Italy, would gain a great majority.

The Course of Production

This atmosphere of confidence will pervade Parliament when the deputies return from the recess on Thursday. An opening debate on the general policy of the Government will probably end with a vote of confidence showing the same majority as after Munich. This first debate and vote on general issues will influence the course of the later discussions: on the reform of the electoral system; on the Budget; and on the decree-laws. They will all be favourable to the views of the Cabinet—especially as M. Daladier is expected to launch a plan to increase industrial production.

Cheaper money and longer hours of work are now facts. But thirty months of social troubles have weakened the taste for initiative and work, so that the future will depend on two

main factors: the achievement of political stability and the support which the Government can give to production.

Meanwhile, the course of production, too, is encouraging. Coal output in October was 4,335,000 tons in 23.6 working days, against 4,043,000 tons in September in 22.8 working days and 4,142,000 in October, 1937, in 23.16 working days. Average daily output was thus 183,869 tons, against 177,406 tons last month and 178,560 tons a year ago. Production of pig iron and steel has moved as follows:—

	(Thousands of tons)		
	Oct., 1937	Oct., 1938	Sept., 1938
Pig iron	701	494	447
Steel	705	512	470
Furnaces in activity.....	107	82	76

Unemployment showed a decline last week, which was quite unexpected at this time of year. The number of persons out of work was 367,106, against 367,947 in the previous week and 332,850 a year ago.

Next Year's Accounts

The ordinary Budget for 1939 forecasts expenditure of 66,317 million francs and receipts of 66,345 millions, a surplus of 28 millions. Expenditure in 1938 was 54,739 millions, so that the estimated increase for next year amounts to 11,578 million francs, of which 3,500 millions is due to the reinclusion in the ordinary Budget of the War Pension Department's outlay; 3,000 millions is for ordinary military expenditure and 1,200 millions for public debt; and 2,280 millions is to cover increased cost of civil administration due to the rise in the cost of living. This increase in expenditure will be wholly covered by taxation. Ordinary fiscal receipts are estimated at 57,500 million francs, against 45,600 millions in 1938; and the extra income is expected from the increase in taxation made by the latest decrees, and from a rise in the yield of direct taxation expected to accrue from the revival of business.

Expenditure on the extraordinary Budget to be covered by loans is estimated at 27,616 millions. Some 26,550 millions is for re-armament, against 11,250 millions this year; 1,425 millions for public works and 640 millions for temporary advances.

Germany

The Economic Role of the State

BERLIN, December 6.—German business now stands at the parting of the ways. It must decide whether future developments shall proceed on normal commercial principles and according to more liberal methods, or whether in the long run national political necessities shall prevail. The more moderate view, to which Dr Schacht, State Secretary Brinckmann, Herr von Schwerin-Krosigk, Herr Funk and Field-Marshal Goering subscribe, a view which is even supported by a part of the National Socialist Press, is that it is now impossible to proceed much further on existing lines and that Germany must go back to a system of greater personal responsibility on the part of individual business men, back to what in liberal business language is called free competition. These circles see with regret that the pursuit of the present foreign policy constantly increases the extent of Government control over finance and production because of the overriding claims of armaments, and seems finally to lead to a species of State-Socialism.

Other circles, no less influential, are of the opinion that the present diplomatic programme must be maintained and that, in view of English, French and even American re-armament, German armament be intensified. An article in the *Kölnische Zeitung*, which was probably authoritatively inspired, forecasts that German re-armament and the attainment of self-sufficiency will involve still more severe claims upon industrial capacity and financial resources. At the same time, exports must be fostered, in order to obtain necessary raw materials, and this can only be done at the expense of internal needs. Steel production in the current year will reach 23 million tons, while the Four-Year Plan itself envisaged an output of 24 million tons for the first time as far hence as 1940. Yet, in spite of the increase in steel production beyond the requirements of the plan, domestic demand cannot be fully met. And the cement industry, which has had to increase its productive capacity to provide materials for fortifications, can scarcely get any iron for new buildings. If the State continues to requisition still more industrial capacity to meet its needs, and internal demand

consequently receives a still smaller allotment, then direction by the State must be vigorously accentuated.

There is the same problem in the money and capital markets. The higher the State screws up its demands, the less capital can private business obtain. Private enterprises must reckon more than hitherto on having to finance themselves. The business situation in Germany resembles a race between the State's requirements of goods and money and the country's manufacturing and financial capacity, a race in which the State's requirements leave capacity ever further behind.

With increasing State requirements new sources of finance must be found. This must mean that taxation will be raised still higher in the future and private consumption will shrink still further. This policy will reach its limit when the standard of living of the general mass of the population can be no further depressed. Dr Schacht recently alluded to this when he said that the State's needs could in the last resort only be financed, not by an expansion of credit or the piling up of debts, but from savings and a reduction in the standard of living.

The Bourse is very weak. In the market for fixed interest bearing securities the ever-increasing demands of the State on the nation's capital is the chief feature. The volume of State issues is constantly growing, and the volume of private issues steadily shrinking. Strong propaganda, based on the political achievements of the regime and on national sentiment, is used to exert moral pressure on investors. Savings banks and insurance institutions must contribute the greater part of their funds to Government loans; and similarly municipalities are forced to give three-quarters of their reserves. Under these conditions industrial debentures, mortgages and other fixed interest bearing securities have ceased to be attractive and the market in them is steadily crumbling away.

Export Policy

German export trade is encountering increasing difficulties not only in the United States of America and in South America, but also in some European countries. For the rising objections to German goods, not only considerations of quality and price, but also, to a great extent, psychological considerations, are responsible. Germany seeks the grounds for these objections not in the Reich's policy, but in the malevolence of foreign countries, especially America and England, who are unwilling to recognise the "necessities of existence for the Reich." Because it is apparently not possible to put pressure on or influence foreign countries the Third Reich seeks to increase its exports by all kinds of expedients.

Reich Minister Funk recently underlined the need for more exports and forecast closer co-operation between the State and exporters. In future German export firms will have to work together in foreign markets to a greater extent than hitherto, and in particular publicity and canvassing will be carried out conjointly. The Government has already taken compulsory measures to force private business into the export trade. Firms which do a specially large export business will be favourably treated in allocation of Government orders.

Germany, England and the United States

The views expressed by Mr Hudson, Secretary of the British Department of Overseas Trade, about German commercial policy in Middle and South-Eastern Europe has caused resentment. The Press expresses astonishment that the Reich is thus attacked, particularly since the German-British trade agreement has so far worked comparatively satisfactorily. Printed reference is made to the Ottawa Agreements; and it is contended that the Western Powers, by their protective policy and currency depreciation, have involved other countries in exchange difficulties. Therefore Germany cannot be blamed if she seeks to stimulate trade with certain countries; German methods of foreign trade have, so it is argued, the great advantage of a stable exchange (or barter) of goods guaranteed for an appreciable period.

Official circles, however, are not very disturbed by Mr Hudson's attack. They point out that price agreements between certain British and German industries have already been discussed; and that negotiations between British and German firms for a working agreement in neutral markets have been suspended while the attempt is made to come to such agreements.

More thought has now been given to the reaction of the Anglo-American Trade Treaty upon Germany's foreign trade. A period of sharp competition with British and American exports is expected. It is not so much English competition which is feared as that of certain other countries with most-favoured-nation concessions in the United States. Whether

this situation can be met by higher export subsidies is uncertain, since industry at home is already carrying as heavy levies as practicable. German exports in the first six months of 1938 were valued at Rm. 178.6 millions to England and Rm. 67.4 millions to the United States. In the English market German goods will now have to compete with American, especially in the case of machinery, iron and steel and electro-technical goods; and England was Germany's best customer for electrical tools in the first half of this year.

Banking in Sudetenland

The Sudetenland is particularly vulnerable under the Treaty, because of the competition from England which its glass, china, wool and leather gloves will meet in the American market. On the other hand, Germans argue that the countries of South-Eastern Europe will now have to abandon their hopes of selling more wheat and tobacco to England. The reorganisation of the banking system throughout Sudetenland has led to an abandonment of the regional principle. All the banks which remain there will now be incorporated in the Reich system, since it is argued that they must be dependent upon Germany for their capital. The various German banks are now negotiating with the Czech institutions for the necessary transfers: the Deutsche Bank with the Boehm. Unionbank, the Dresdner with the Zivnos-tenska, and so on.

Germany's increasing interest in the Danube, since the annexation of Austria and the intensification of the economic drive towards the Balkans, is again evident in the report that the Reich is about to complete the purchase of the Italian share of the Danube Shipping Company in the former Austria, amounting to 49 per cent. of the total of 21,600,000 Austrian schillings. All details have been settled, it is understood, except the rate of exchange at which the purchase is to be made and the method of transfer.

The expropriation of Jewish property continues in the form of decrees which come now from one Department and now from another in a manner which would make any lawyer despair. But the desired effect is being achieved, namely, the almost complete pauperisation of the Jews before they leave for the new homes which it is hoped will be found for them overseas. Jews are now forbidden to buy real estate or mortgages, deprived of the right to dispose of their own property and have to deposit their stocks and bonds in authorised foreign exchange banks. A further clause makes it clear that the bulk of Jewish real estate will come under Aryan trusteeship with Government supervision.

Switzerland

Exports Well Maintained

BERNE, November 30.—Exports which increased in value after the devaluation of the Swiss franc by 46 per cent. have suffered very little from the recent international depression. In the September quarter the value of exports was slightly below the level of 1937, but in October it was 12 per cent. higher than in October last year. The official index of the

Chief Office: BROAD STREET CORNER, BIRMINGHAM

volume of exports (1921-31 = 100) has moved as follows:—

	Metals, machinery, watches	Watches only	Chemicals	Textiles	Total index
1937					
October	132	199	114	39	98.4
1938					
August	115	157	100	40	72.7
September ...	144	188	132	36	91.9
October	160	191	156	39	103.1

In October, 1938, the value of exports was higher than in any month since 1931. This was mainly due to the increased sales of the engineering and chemical industries, though sales of watches fell slightly because of the slump in the United States. Textile exports, on the other hand, are still far below their former level.

Trade and Eastern Europe

Since the Munich agreement several German economic journals, such as the *Deutscher Volkswirt*, have published articles, recommending to Switzerland closer trade relations with the Danubian and Balkan countries, as well as an expansion of capital investments there. The present share of these countries in Swiss trade is as follows:—

	Share of imports		Share of exports	
	1929	1937	1929	1937
	%	%	%	%
Hungary	1.3	2.1	0.6	1.0
Jugoslavia	0.5	0.3	0.6	0.8
Greece	0.2	0.2	0.2	0.3
Bulgaria	0.2	0.4	0.4	0.4
Roumania	0.4	2.5	1.1	1.2
Turkey	0.2	0.5	0.1	0.2
Total	1.8	6.0	3.0	3.9

The comments of the Press show that Switzerland is not much inclined to follow this advice. There is, of course, a desire to increase Swiss exports, but all the countries mentioned are only able to pay with goods, and goods for which they ask generally higher prices than those ruling in the world market. That is why Switzerland increased exports to "free markets" after devaluation much more than to countries with restrictions on payment.

The same obstacles hinder any extension of capital investment in these countries. It is already difficult to secure payment of interest on present investments. Furthermore, the recent increase in exports from the Danubian and Balkan States to Germany are not encouraging to other small States who do not wish to fall into a position of economic dependence upon Germany.

Financial Policy

During the last few years financial policy has been a controversial subject. One group has clamoured for a strictly balanced Budget obtained by economies in expenditure; another has demanded considerable State outlay on public works, etc. After a proposal made by the Government for drastic financial reform had been defeated in Parliament in June, 1938, the parties agreed to a compromise suggestion, including several economies and retaining the new "crisis" taxes introduced since 1933, and improving the Budget position by more than 200 million Swiss francs. On November 27th this proposal was accepted in a popular vote by 508,000 votes against 194,000—though some of the measures taken so far have not in fact been very popular. This big majority is probably a reflection of the serious international situation and it shows that the Swiss people are willing to take all necessary steps to defend their independence.

Czecho-Slovakia

Retrospect

PRAGUE, December 2.—The economic situation of Czecho-Slovakia has been profoundly influenced by the events of the last two months. The system of alliances and Western friendships, which prevented Czecho-Slovakia from seeking better understanding with her immediate neighbours, has proved a

complete failure. If Czecho-Slovakia had not relied implicitly on help from her Western allies she could probably have obtained far better terms by direct negotiations with Germany, Hungary and Poland than she has now had to accept. In the event, the new settlement and revision of frontiers have patently ignored important economic considerations. Lord Runciman's report on the Sudeten question did not show any great understanding of the economic aspects of the problem, while Mr Chamberlain, whose forthright action raised the curtain on the last act of the Czech drama, did not concern himself very much about the economic consequences of the solution proposed at Munich. The Munich agreement contained none of the economic or financial clauses which ought to have been agreed upon before the cession of territory, leaving all these questions to the Ambassadors' Commission.

The result is that Czecho-Slovakia is practically at the mercy of Germany. The Munich agreement decreed the immediate cession of the predominantly German territory. The Commission took as a basis of definition the pre-war census of 1910, based not on nationality but on the language then in current use. This under the Austrian rule of 1910 was German in the minority districts, although a large part of the people concerned was Czech. The same principles were applied in the delimitation of the Polish acquisitions and in the Vienna settlement of territory to be ceded to Hungary—where the pre-war census was even less reliable than in the Austrian districts. On the basis of the most up-to-date census it may be estimated that Czecho-Slovakia has lost 29 per cent. of her territory and over 33 per cent. of her inhabitants—more than 4.8 million people, of whom just about a quarter are Czechs and Slovaks.

The economic needs of Czecho-Slovakia have been entirely neglected. Railway lines and roads are severed in several places by the new frontiers; many towns have been cut off from their hinterland; supplies of coal and electrical power to urban and industrial districts have been rendered difficult; in brief, agricultural, industrial and commercial units have been divided wholesale by the new frontier lines. The final demarcation of the Czech-German frontiers did bring slight rectification at some points, but it also involved still more heavy losses of purely Czech territory for strategic reasons, to help German communications and even to serve the interests of big German landowners or industrialists—though an agreement with Germany was concluded for the mutual protection of minorities. The settlement of the minority question with Hungary and Poland will in all probability be more difficult; and the status of Carpathian Russia has not yet been definitely accepted by these Powers.

An Economy Split Asunder

Politically and economically the new Czecho-Slovakia depends upon the good will of Germany. The new changes have cut very deeply into the body economic. In the old Czecho-Slovakia the economic interdependence of Germans and Czechs was vital: German industry produced for the Czech market and *vice versa*; the network of communications and finance was closely integrated; now these secular links have been broken.

The first consequence of the changes in the territorial configuration must be a new orientation of foreign and commercial policy. Sudeten-German industry now forms part of the great German market. Silesia's great coal mines and iron works have been ceded to Poland. The southern parts of Slovakia and Carpathian Russia with a highly developed agriculture have gone to Hungary.

In the new Czecho-Slovakia the balance between agricultural and industrial occupations will be only slightly changed: 37.6 per cent. will be engaged in agriculture against 32.1 in industry; previously the percentages were 34.6 per cent. and 34.9 per cent., respectively. The important industries in the ceded regions, especially textiles, glass and porcelain, are characteristically cyclical industries which suffered notably during the last depression. Their loss will be somewhat compensated by greater stability. But the basis of Czech foreign trade will become correspondingly narrower. Czech industry will be less dependent on exports, but it will have a sounder footing in the home market.

In agriculture Czecho-Slovakia has lost the fertile regions of Southern Slovakia and Carpathian Russia, about 60 per cent. of her hop area, about two-fifths of the woods of Bohemia and Moravia and the greater part of her wine and tobacco production. In raw materials the heaviest losses are all her graphite and zinc, 97 per cent. of her lignite, 76 per cent. of her china clay, 68 per cent. of her copper and nearly 55 per cent. of her coal.

According to figures published by the Statistical Office the

greatest losses in industrial production are, in percentages of total output, as follows:—

	%		%
Stone industry	53.5	Laces, embroidery	74.5
Fine ceramics	89.9	Cellulose, cardboards ...	60.5
China	98.0	Paper	62.8
Sheet glass	100.0	Bentwood furniture ...	57.1
Hollow and pressed glass	62.5	Wooden articles	53.8
Glass jewellery	69.6	Musical instruments ...	86.2
Heavy chemical industry	39.8	Toys	63.0
Oil, fat, soap and candles	62.7	Fish preserves	66.4
Dyes	50.8	Vegetable preserves ...	57.4
Mineral waters	73.4	Hats	42.6
Yarns	39.2	Leather gloves	51.9
Hosiery	75.4	Artificial flowers,	
Haberdashery, buttons	86.7	feathers	92.4
		Umbrellas	48.0

The Task of Reconstruction

It will be necessary to take stock of the changed structure of the industrial production and to adapt the whole of Czech economic policy accordingly. The chief task will be to encourage fresh private enterprise in order to fill the gaps caused by these losses and to find employment for demobilised soldiers, Czech refugees and people who have lost their businesses or occupations.

The altered character of foreign trade will require a revision of the customs tariff and of existing commercial treaties, quotas and clearing agreements. The country's transport facilities will have to be entirely reorganised. In State and other public administration the greatest economy will be unavoidable. And a number of financial complications will arise from the federalisation of the new State.

The Government is negotiating with Germany for temporary economic arrangements. Trade between Sudetenland and the Reich is now free of duty and the same is to be the case for trade between Sudetenland and Czecho-Slovakia. Railway and postal communications have now been resumed; and a number of questions relating to payments has been settled by an agreement between the National Bank and the Reichsbank. Special agreements have been signed with Germany concerning the Donau-Oder Canal and the new German motor road Breslau-Brno-Vienna.

Brazil

Trade and Indebtedness

SAO PAULO, November 20.—On November 10th, which was the first anniversary of the "New State," President Vargas pointed out that the circumstances which led, a year ago, to the suspension of all payments on Brazil's foreign debt have not yet improved. "Yet," said Dr Vargas, "the Government are now ready to consider any practical scheme which, without injury or damage to our own economic life, could improve the position of our creditors." Those in close touch with the situation in Brazil believe that it was more than a pleasant but empty phrase. The authorities can scarcely be charged with deliberate illwill. Brazil's import surplus is rising, and the first six months of 1938 showed a total surplus of nearly £2,000,000. This deficit was due partly to restrictions on export markets and partly to the fall of world prices; while, on the other hand, inflationary tendencies in Brazil itself have made for a considerable rise in imports.

Brazil's exports compete with the protected tropical produce of the African possessions of Great Britain, France, Belgium and Italy, and there is little she can do to increase exports to Europe. She has, however, considerably increased her export tonnage; tonnage shipped in the first six months of 1938 amounting to 1,837,920 metric tons, compared with 907,566 metric tons in the corresponding period of 1933. This increase was offset by a considerable fall in the prices of coffee and cotton; shipping revenue, in United States dollars, increased by only 40 per cent., compared with an increase of 100 per cent. in tonnage shipped. A rise in the purchasing power of the American markets, or a general increase in world commodity prices, would enable Brazil to resume part payments on her foreign debt.

Rising Imports

Rapidly growing imports also contribute to Brazil's inability to arrive at a practical solution of her debt problem. Inflationary budgets; additional purchasing power in milreis resulting from the suspension of foreign debt service; the accumulation of foreign-owned blocked milreis balances seeking reinvestment; the decline of the external purchasing

power of the milreis and the resulting exchange protection for domestic industries; a building boom created by nervous Brazilians holding milreis balances—all these elements have brought about a considerable increase in luxury imports, as well as purchases of capital goods. The President has announced his intention of regulating imports by restricting purchases of luxury goods in favour of industrial equipment and machinery. This measure is not designed to benefit the foreign creditor, but may, in the long run, prove useful to him.

A strong wave of nationalism, however, is sweeping Brazil. A return to the "bondage of debt slavery," a slogan implanted in Brazil by the Integralistas, would be most unpopular. Economic facts and popular sentiment combine to make unlikely an early resumption of payments.

This situation is being slowly offset by other considerations. Increasing difficulties in her export trade are forcing Brazil to intensify internal trade and production. But the first requisite for the successful development of her internal economy is an expansion of her railway system and of coastal shipping. Till recently she hoped to obtain the equipment she urgently needs from Germany, but the compensation trade with that country has proved disappointing. Responsible leaders in Brazil are once more turning their eyes towards New York and London.

Official control of imports has been discussed in Brazil since 1929. Control would be of the greatest importance to British trade and involve grave difficulties for British exporters. Brazil would be obliged, the President said on November 10th, to change trade policy by restricting imports of consumers' goods in favour of the capital goods needed for industrial development. The new measures would affect not the main purchasers of Brazilian commodities, like the United States, but countries with an export surplus in trade with Brazil, such as Great Britain, Argentina and Germany. "Brazil can no longer tolerate present conditions," said Dr Vargas, "under which our main suppliers are not willing to balance their trade with us by buying corresponding quantities of Brazilian commodities." Legislation will follow in the near future. It is not known whether this will take the form of an import licence system, similar to those in force in Germany and Denmark, or whether the Bank of Brazil will apply a foreign exchange quota system, like that employed until recently by Argentina.

Nationalisation Plans

The threat of nationalisation hangs like the sword of Damocles over all foreign banks established in Brazil. The Constitution promulgated on November 10, 1937, states, in rather vague terms, that ownership of shares in "deposit banks" will be limited to Brazilian citizens. Foreign banks would be granted "reasonable" time to adjust themselves to the new situation. The law as it stands is most obscure. The President's speech urged the establishment of a Central Bank and the development of commercial banking. Brazil's national industries, he said, depend on banking credits, and no foreign bank could be interested in supporting local industries which compete with goods imported from the bank's country of origin.

Yet, he added, Brazil has no intention of discriminating against foreign capital. Nationalisation of foreign banks should not be considered a political measure. Its purpose is to engage all productive forces in developing the national economy of Brazil. "We wish to put an end to the exploitation of Brazilian capital for the benefit of foreign interests." It is true that British and American banks in Rio and Sao Paulo are highly thought of and that a large percentage of their deposits are of "Brazilian nationality." Italian, Portuguese and German banks attract considerable deposits of their respective "national extraction," all at the expense of "national" banks. Whether a generally satisfactory solution

Ask for

WHITE HORSE

as a matter of course

Screw-cap flasks
on sale everywhere

can be found it is difficult to say. The most probable way out—as the president's speech seems to confirm—is the maintenance of the *status quo* with the sword still threatening but not descending.

In the case of foreign insurance companies the situation is different. The "nationalisation" clause of the 1937 Constitution applies equally to banks and insurance companies. But the struggle for the elimination of foreign insurance companies has already lasted for more than forty years. A Re-insurance Institute will shortly be established, a controlling body endowed with a monopoly for all reinsurance business in Brazil. All foreign insurance companies will be nationalised and legislation to that effect will follow almost at once.

Argentina

Financing Minimum Grain Prices

BUENOS AIRES, November 26.—Congress met in extraordinary session on November 21st mainly to consider the Budget. The passage of the Bills for the State purchase of the Argentine Transandine and Córdoba Central Railways by the Senate is now almost assured.

On November 7th the Government rather unexpectedly changed the official import rate of exchange from 16 pesos to 17 pesos to the £. The reason given was the reduced offers of foreign currency caused by the decline in exports and the withdrawal of capital and floating funds. At the same time it was announced that, after December 1st, all imports would require prior permits, to enable the Government to anticipate the trend of the market. Previously, prior permits were needed for imports paid for at the official rate of exchange, but not for imports paid for at the free market rate. It will be recalled that the official import rate was changed from 17 pesos to 16 pesos to the £ on December 9, 1936. As the official export rate of exchange remains at 15 pesos to the £ the Government's exchange profits will now be doubled.

This measure was interpreted as the prelude to the restoration of minimum grain prices to be financed from the Government's exchange profits. This turned out to be the case, and on November 14th the basic prices of wheat and linseed were fixed at 7 pesos and 13 pesos respectively per 100 kilos. The Government agrees to buy the crops from the growers at the basic prices, selling afterwards to the exporters at the market price. The basic prices are only slightly higher than the market prices lately ruling, and are very far from, say, the price of 9 pesos per 100 kilos for wheat which was recently suggested in some quarters. The new regulation applies only to the coming crops, existing stocks of old wheat and linseed being unaffected.

The Government claims to be simply following the example of other countries which subsidise wheat; and the newspaper *La Nación* considers that basic prices are preferable to a direct subsidy, because a subsidy helps the exporter rather than the grower. *La Prensa*, on the other hand, regards it as economically unsound for a country to subsidise directly or otherwise its own chief source of wealth; and observes that when, in November, 1933, the official import and export rates of exchange were fixed, the difference between the two rates was supposed to finance the minimum grain prices. But by the end of 1937, when the minimum prices were removed, only 1.43 per cent. of the sum collected had been used to help the growers. Since the grower receives only 15 pesos for every pound sterling worth of produce exported, and must pay 17 pesos for every pound sterling worth imported, *La Prensa* considers that it is a case of losing a peso to gain ten cents.

The outlook for the coming crops is on the whole very good—except in the south-west of the cereal zone, where damage has been done by drought and frost. Ample rains have fallen in the cereal zone during the last week, and the season is far enough advanced for further frost to be nearly impossible. But the outlook for linseed is not so good as that for wheat.

Import Surplus this Year

Exports in October amounted to 894,378 tons, valued at 118,522,514 pesos, against 1,270,472 tons, valued at 161,435,554 pesos, in the same month of 1937. The volume of exports has steadily and greatly increased since last April, but owing to falling prices the advantage has been practically lost. Imports in October were valued at 109,226,334 pesos, compared with 149,998,461 pesos in the corresponding month last year. Last month, therefore, recorded a small

export surplus. Nevertheless, whereas in 1937 there was for the whole year an export surplus of no less than 753,313,422 pesos, the current year will almost surely close with an import surplus. This is indicated in the following table:—

1938	(In Pesos) Exports	Imports	Surplus of Exports (+) or Imports (—)
January	145,993,968	145,801,423	+ 192,545
February	127,714,064	123,959,819	+ 3,754,245
March	118,578,386	144,403,619	-25,825,233
April	103,690,644	116,733,359	-13,042,715
May	110,173,828	110,831,148	- 657,320
June	106,371,841	105,561,480	+ 810,361
July	107,760,397	114,381,836	- 6,621,439
August	109,042,907	120,096,850	-11,053,943
September	109,275,486	118,420,971	- 9,145,485
October	118,522,514	109,226,334	+ 9,296,180
Total	1,157,124,035	1,209,416,839	-52,292,804

Comparing the tariff value of imports in the first ten months of 1938 with the corresponding figures for 1937 the only items which have risen are machinery and vehicles, fuel and lubricants and tobacco.

New Zealand

After the Elections

CHRISTCHURCH, October 21.—Now that the triennial parliamentary elections are over, and the Labour Government has been returned with a substantial majority of 54 seats, political excitement has died down, but the economic situation has reached an interesting stage. The Labour Government took office when the long period of severe depression was giving way to a strong and rapid recovery.

Partly in response to the buoyancy of conditions, partly to implement its election programme, the Government embarked upon a policy of social betterment and carried it a long way towards completion. It restored the pre-depression rates of wages; re-established the Arbitration Court; reduced hours of work; increased its control over industry, trade and banking; and provided generous additions to existing social services.

Conditions have now changed. The rapid advance in prices and in prosperity, which marked its previous term, has been checked. Receipts for exports have fallen 10 per cent. since the end of 1937, and internal business appears to be contracting; while public expenditure continues at a very high level and the Government's commitments for public works and social security are heavy. Money is much scarcer than it was, confidence for the future is lower, and interest rates are tending to rise.

The steady export of capital, which has been going on quietly for some time, has been accelerated by the election results. The trading banks have raised their exchange rates on London and Australia by $\frac{1}{4}$ per cent., and the banks are making attempts to reduce the outflow of funds. The accumulation of money in the Post Office Savings Bank, on which the Government relied for much of its capital for public works, has been reduced, bank advances have risen while deposits have fallen, and the overseas funds held by the banks have fallen heavily during recent months.

The Government is faced with the necessity of financing a public works programme estimated to cost £NZ14 millions in the present year, of re-paying £NZ5.5 millions borrowed by Treasury bills from the Reserve Bank (presumably for public works in the main) and of implementing its Social Security Act while keeping the Budget balanced.

At present New Zealand is chiefly concerned about the rapid decline in overseas funds. In the first half of 1936 these amounted to £NZ45 millions; but they had fallen to £NZ28 millions by May, 1938, and to £NZ20 millions by the end of last August, the latest figure for which trading bank returns are available. The Reserve Bank's sterling exchange amounted to £NZ18.25 millions at the end of May, 1938, to £NZ13.7 millions at the end of August, and fell to £NZ9.1 millions by October 17th.

A decline in overseas funds is usually accompanied by internal credit stringency, and has been met in the past by small and temporary increases in the exchange rate, accompanied by increases in the banks' discount and overdraft rates. Such methods are usually sufficient to check imports of goods and the export of capital. But it appears that the adoption of some method of official control is probable.

Letters to the Editor

Valuation for Customs

TO THE EDITOR OF THE ECONOMIST

SIR,—I read with very great interest the article on "Valuation for Customs" in your issue of November 26th. I think that only those who are in the position of the company with which I am associated can appreciate how very arbitrary and cumbersome the working of the British regulations is. You mentioned that perhaps the most serious complaint is the uncertainty with regard to duties. This is one of the principal difficulties, and it is also definitely the case that values for duty may change from year to year, in accordance with trading results in this country. The working of the British regulations entails an inquisition in great detail by the Customs and Excise authorities into the relations between British firms and overseas suppliers, which may have to be repeated annually. There is nothing in this inquisition which a company with a clear conscience need fear, but the time and trouble which it takes, both for the Customs authorities and the importer, are really formidable.

The company of which I am writing depends for its prosperity upon obtaining as many new ideas as possible for incorporation in the specialised machinery which it manufactures. We do our best to obtain the latest ideas from foreign countries and manufacture machines according to them, if necessary under licence. After we have started manufacture, we sometimes import special parts or ancillary parts not easily obtained in this country from the country where the idea originated.

This is one of the cases which gives us most trouble, as we pay a royalty on the whole machine to the patentee, and the Customs authorities insist that a portion of the royalty must be included in the value for customs of any imported part used in the machine. We can only arrive at this by an elaborate calculation of the proportion which the value of the part represents to the whole of our works costs, and then dividing up the royalty in that ratio and adding the appropriate amount to the price which we have paid for the part. At times the problem is insoluble, as we use the imported parts on a machine for which no selling price has been fixed and for which the royalty is not yet known.

To take an extreme case, we incorporated certain knives costing about 7s. 6d. in machines the selling price of which was about £500, and in compliance with the regulations were supposed to add to the 7s. 6d. the appropriate proportion of the royalty paid on the whole machine. The royalty was based on the selling price of the machine, and we frequently imported a supply of knives, some for use on machines the selling price of which was known, some for use on later machines, and some for re-sale as replace parts. According to the regulations, different rates of duty ought to have been charged on the knives according to the use to which they were put. Both we and the Customs were at our wits' end, when it occurred to us that the American patentee himself did not make the knife, and we were able to order direct from his supplier and pay on a uniform basis because his supplier had no interest in the royalty.

In some cases we have sole selling rights for machines the demand for which does not justify manufacture in this country, or for which the patentee is not willing to give a licence. As our machines are mainly supplied to deal with the particular processes or sizes of the client, our own orders are normally sent to our overseas suppliers against special orders received by us. Here we run up against what appears to us a most arbitrary distinction. In the case of special orders, such as we must send owing to the nature of our business, the machine is valued for duty at the price at which we sell it to our clients (less inland freight, erection and service, and the Customs duty itself when the machine is sold at an inclusive price). If, on the other hand, our business were of a simpler nature, such as the sale of standard motor cars, and we were able to carry a stock of machines and sell from it, we should only have to pay duty on the price which the foreign supplier charges us.

So far as I know we are the only country which has adopted our particular method of valuation, and it would be an immense relief to us if the usual method of valuation could be adopted in this country.

Yours faithfully,

X.Y.Z.

TO THE EDITOR OF THE ECONOMIST

SIR,—The article on "Valuation for Customs" on page 431 of *The Economist* of November 26th was of particular interest to me because of my considerable professional experience as a solicitor with regard to Customs. In one or two particulars, however, the article is somewhat inaccurate. It states:—

For goods whose value cannot be determined in the open market, the Act, in effect, specifies that the value shall be determined by the price at which the goods are sold in the United Kingdom "less an allowance in respect of duties of Customs and reasonable merchandising expenses and profits incidental to the marketing of the goods after importation."

That is what the 1932 Act provided (Sec. 15 (2) (b)), but this and other provisions were repealed by the Finance Act, 1935.

The only directions now given to the Commissioners are those contained in Sec. 10 of the 1935 Act which provides, in effect, that the value shall be taken to be

the price the goods would fetch in a market in which the assumptions mentioned in sub-sections (2) and/or (3) and/or (4) (as the case may be) apply to every sale therein of similar goods.

If there is a market answering that description, then the value is the price the goods at the time of importation are fetching in it. If, on the other hand, there is no market answering that description, then the Commissioners must do what they can to ascertain what the goods would fetch in a notional market answering that description.

I do not think the writer has grasped this, for he says—

the great majority of manufactured goods cannot be valued by any open market quotation,

which is no doubt correct, but he goes on to say—

Indeed, the Import Duties Act specifically exempts from this method of valuation patented, registered or trade marked goods.

Issued by The Imperial Tobacco Company (of Great Britain & Ireland), Ltd.

This clearly is not so. All the 1935 Act (Sub-secs. (3) and (4)) says, is, in effect, that in computing the price such goods would fetch in the open market the Commissioners shall assume that the buyer is getting the benefit of any enhanced value attached to the goods by reason of their being patented, or of a registered design, or being put upon the market here for sale under a Trade Mark. There may, of course, be an existing market at sales in which buyers purchase similar goods with the advantages of their being patented, etc., in which case an "open market quotation" would be obtainable, and the writer's statement that the Act "specifically exempts" such goods from this method of valuation is clearly erroneous.

I ought, perhaps, to add that notwithstanding the above, it is a fact, that although there is no longer a statutory direction that the Commissioners shall take the selling price as a basis in cases where there is no actual market, they still in practice do so.

Yours very sincerely,
H. L. NATHAN.

London, E.C.2.

[As is apparent from the last paragraph of Colonel Nathan's letter, the procedure of valuation is, in fact, as stated in our article. The inaccuracies—or rather the incompleteness—in our statement of the law arose from the attempt to make a complicated matter clear in a short space. The effect of the 1935 Act has been to change the legal basis of the Commissioners' procedure without changing the procedure itself. It seemed sufficient, in our article, to quote the original definition (which is more intelligible than that in the 1935 Act) and add that this definition still "in effect" applies. The same process of abbreviation is responsible for the words "specifically exempts" to which Colonel Nathan takes exception. At full length, the sentence should read: "The Import Duties Act, as amended by the Finance Act of 1935, contains provisions specifically referring to trade-marked, registered and patented goods and goods imported by sole agents or firms affiliated in any way with their suppliers, the effect of which is to exempt them from this method of valuation." It is true that it is possible to conceive of an open market for patented goods, but it must be very rare indeed.

We are grateful to Colonel Nathan for raising these detailed points, and feel sure he would not wish to imply that our article was in fact misleading.—EDITOR.]

Railway Problems

TO THE EDITOR OF THE ECONOMIST

SIR,—Your leader on "Railway Problems" in *The Economist* of November 26th was most timely. I agree with a great deal of what you said, especially in your last column. But I cannot agree that regulation of railway charging, particularly the prohibition of undue preference, is "no longer in the least necessary to protect the public" even though the railways are not "ravaging monopolies." To free railways from "undue preference," with road haulage restricted as it is at present, will perpetuate a grave inequity between traders. If "undue preference" is not prohibited, some traders, more fortunate to-day than their competitors in having cheap road service at their disposal, will in future continue to be more fortunate in having lower railway rates as well.

Release from "undue preference" allows the railways to reduce rates to individual traders to meet road competition for their traffic. But the operation of the system of licensing road vehicles is such that not all competing traders can obtain road service. Many who could and would use road transport cannot do so, because not enough vehicles and operators are being licensed. It may be impossible, as you say, to gainsay the elementary justice of the railways' case. But the public interest is surely paramount, and public interest requires that if the railways are to be freed from restriction, the road haulier must be too.

I cannot altogether agree either that the liberty of the railways to vary their rates is in fact restricted by the Act of 1921. "Undue preference" is the significant impediment, not control by the Railway Rates Tribunal. As long as railway net revenue is less than the standard net revenue, the Tribunal must and will allow any exceptional rate, however low, which a railway company may put in, if the rate will improve the company's net revenue. The railway companies, I admit, cannot quote rates as promptly as their road competitors. But that is the fault of their large size and highly

centralised organisation, and not the result of legal regulation.

I am with you in fearing the outbreak of local rate wars. Road rates are chaotic to-day. But is not that largely because of the excessive secrecy which shrouds each haulier's business? To give the railway companies the right to conceal would make confusion only worse confounded. Let us better insist as well on publicity for road rates.

To form a system of rates appropriate to a competitive transport market requires a wholesale reorganisation of railway rates, and fundamental changes in the internal structure of railway companies. Nor will the present practice of road hauliers remain unaltered. Railways must submit to change, because their rates and structure are appropriate to monopoly; road haulage practice will be changed because it has grown up so far in the shadow of a regulated monopoly, and has thus been forced into the wrong mould.

I am, Sir,
Your obedient servant,
GILBERT WALKER.

University of Birmingham.

TO THE EDITOR OF THE ECONOMIST

SIR,—The railway companies' proposals are aimed at placing road and rail transport upon a fairer basis for competition, and to that extent will be met with general approval. To some, however, the prospect of the removal from the railways of the legal obligation not to show undue preference may seem alarming. It savours of vesting in the railway companies powers of influence and discrimination which are altogether too great.

A distinction must surely be made between a rates policy which is "discriminatory" or "preferential" as between different traders and one which is differential as between different traffics. The former denotes the carriage of goods for firm A on more favourable terms than for firm B, on no other accountable ground than that it is firm A rather than firm B. Such a practice is surely wholly undesirable, and is what the legislature has rightly desired, and should continue, to prevent. The latter, i.e. freedom to differentiate between different traffics consigned under different circumstances, is of a wholly different order. It involves, *inter alia*, charging differently for traffics that make good wagon- and/or trainloads, as against those that make bad ones; between traffics that incur much, as opposed to little, clerical expense. It may further involve charging at a lower level at slack than at busy times, with a view to utilising otherwise unused capacity; or even charging differently from A to B than from B to A, with a view to obtaining a better balanced traffic.

None of these practices should, in my view, be labelled discriminatory or preferential. They incorporate differentials based on principles which are anything but arbitrary, and should be encouraged rather than discouraged by the legislature. I take it, and it is to be hoped, that the railway companies are seeking the removal of those legal restrictions which prevent them from applying such differentials to the extent to which they would like, and that it is not their intention to "discriminate" in the sense defined above.

But, it may well be asked, would not this abstention on the part of the railways prevent that very equality of circumstance between road and rail which it is the object of the new proposals to bring about? Is it fair that the railways should refrain, voluntarily or otherwise, from discrimination while operators need not do so? The answer to that question is that, in the case of road transport, there is still a multitude of operators, and therefore competition; and that a reasonably competitive market is as good a safeguard against discrimination—except within the narrowest limits—as any legal enactment. Differentiation, yes. But there can be little discrimination. For it is always open to those against whom discrimination is exercised to transfer their patronage to those able and willing to quote competitive rates. It is not, therefore, inconsistent with a fair basis for competition for the railways to refrain from deliberate discrimination, seeing that, by reason of their enormity and the fact that they frequently act in concert as a single unit, they are still believed to enjoy a certain degree of monopoly over some traffics.

With this new freedom, the railways will be able to select, and offer differential charges between, traffics. Thereby they can encourage those traffics which they are technically best suited to carry. A step towards a more appropriate division of function between road and rail will have been made.

Yours, etc.,
G. J. PONSONBY.

London, S.W.19.

Books and Publications

The Capital Market

"Or making books on money there is no end." Even the prophet himself would forgive this mis-quotation to anyone who had conscientiously tried to keep up with recent literature on the subject of money and capital. The onus is definitely on any author who wishes to add to the flood to prove that his contribution can really be justified.

Yet, despite their great number, few of the recent works have sought to give a full account of the facts of the capital market and its workings, although changes in this field are fully as inevitable and important as changes in prevailing theories, and perhaps even more in need of prompt and accurate recording. The author of this study of the English capital market* is therefore to be congratulated on his choice of terrain for research.

He is also to be congratulated on his handling of the subject. There is not much in the book which can strictly be called original, though Dr Frey has used personal questioning to supplement knowledge derived from official records, evidence given before the Macmillan committee, and so on. But the book does give us that clear, comprehensive and up-to-date account of the capital market which is just what the student needs.

Special attention has been paid to the financing of British industry, and a whole section is devoted to the various ways in which money is secured by businesses large and small. It is interesting, in view of the emphasis laid in recent monetary works on the retention of company profits, to find that Dr Frey deals with this method first, and lays great stress upon its importance, in addition to describing the numerous other private, or semi-private, sources of funds which rendered British industry so astonishingly independent of the London new issue market before the war—and which still play a far larger rôle than their inevitable lack of publicity might lead one to expect. The topic is thrown into relief by useful illustrations from the financial history of the mining, shipbuilding, shipping and cotton industries.

The first part of the book deals with the various kinds of seekers after capital, tracing historical changes in every case. It is perhaps a little surprising to find so much importance attached to the demand on the Government (including local authorities), not merely in our own times, of war, rearmament and large-scale house-building, but also in the relatively placid years of the nineteenth century. This initial description of the various demands to be met very greatly facilitates an understanding of the different parts of the market's machinery.

These parts are brought under review, one after the other, in the main part of the book, and in each case the necessary historical account is given, which explains so many apparent anomalies. The Bank of England and the joint-stock banks are described in the traditional way. Then Dr Frey deals with the broker's rôle in the making of new issues, and of the special functions of a provincial broker. There follow useful descriptions of the merchant bankers, the finance companies (including a review of some leading firms), the Stock Exchanges and the investment trusts; in view of the depreciation shown by so many portfolios, the author might have been a little more critical of the benefits supposed to accrue from "expert management."

The insurance companies and savings banks receive only a few pages, but the working of building societies, which have no real equivalent in Dr Frey's Switzerland, is described in some detail. In discussing their charges, and the rôle of cheap money in stimulating the building boom, the author unfortunately fails to distinguish between the charge to new borrowers and the average charge on outstanding loans (page 238); this is fatal to the argument in question, but the account as a whole, like the rest of the book, is satisfactory.

* "Der englische Kapitalmarkt." By Dr Edwin Frey. Schulthess & Co., Zürich. 296 pages. 7.50 Swiss francs.

Shorter Notice

"The Legal Aspect of Money." By F. A. Mann. Oxford University Press. 334 pages. 21s.

Dr Mann writes as a lawyer for lawyers; his learned book is an exhaustive examination of the law relating to money, mainly in England, but also in the Dominions, the United States and some European countries. Yet some knowledge of the terrain he covers is indispensable to economists, bankers and many business men. Dr Mann has surveyed the whole field of statute and case law about the nature and uses of money, systems of currency and legal tender, monetary obligations and indebtedness; and the result is a mosaic picture of the meaning of money in actual institutional practice. Without this background monetary theory is quite unreal: the passages on the gold clause and on foreign money obligations, for instance, are more than matters of legal record only; they throw light upon the most pressing of contemporary discussions of money, as well as upon vital topics of political and diplomatic debate. Not all legal experts, and perhaps not all economists, will agree with all Dr Mann says, but they are all bound to buy and read his book, and to subscribe to its authoritative character as a needed work of reference.

THE BUSINESS WORLD

Exchange Control in New Zealand

WITH a rapidity and efficiency which should put the "old hands" at totalitarian economics to shame, New Zealand has this week imposed virtual control over the foreign exchange market. Three simultaneous moves sufficed to achieve this object. In the first place, the convertibility of the New Zealand notes into sterling was suspended. Secondly, all exports from New Zealand have been made subject to licence granted by the Government. Thirdly, all imports into New Zealand are to require the sanction of the Government. Thus in three strokes the whole—or virtually the whole—of the Dominion's foreign exchange machine has been placed under the control of the authorities.

Before discussing the mechanics of this control and its broad economic implications for the Dominion, let us glance at the conditions which called it into being. The October elections had ensured not merely a continuation but an acceleration of an economic policy which over the past two years has found its most significant reflection in a persistent and recently severe weakening of the reserve position. The reserve of London funds held by the New

Zealand Reserve Bank and by the trading banks has fallen from £28 millions (New Zealand) at the end of 1936 to £23,700,000 at the end of 1937 and to £17 millions at the end of September, 1938. The decline has continued since, as may be seen from the fact that the part of these London funds held by the Reserve Bank has fallen from £11,450,000 at the end of September to £4,828,000 on November 28th. This draining away of the reserve has occurred despite the incidence of comparatively good export seasons. As against annual exports of around £47 millions for the years 1934 and 1935 the exports for 1936 rose to £56,800,000, for 1937 to £66,700,000 and for the first nine months of this year totalled £48,100,000. Export prices have been falling recently, the latest available index number, that for August, being 103.6 (1930 = 100), as against 113.1 for August, 1937. This decline in export prices has accelerated the drain on London funds, because there has been no corresponding reduction in the volume or value of imports. The maintenance of imports is, in part, the inevitable after-effect of good export seasons, the customary time-lag making itself felt in New Zealand as in other primary producing countries. In addition, it arises from the public works programme of the Government and of its expanding expenditure on social services. There is no going back on this part of the Government's programme. Only this week we have had news of another substantial public works loan, while the Social Security Act, with its admirable but expensive provisions for medical services of all kinds, only comes into operation next April. The costs borne by primary producers in New Zealand are being increased both by the rising level of taxation, by minimum wages and hours legislation, and by State competition for labour and materials for the ambitious public works programme. The fundamental factors that lie behind the deterioration in the reserve position were therefore likely to gain rather than lose strength—if left to develop in a comparatively free economy.

There is a less fundamental but equally potent factor which in recent months has been contributing to the deterioration of the reserve position. This is the outflow of capital from New Zealand to other countries—mostly to Australia and Great Britain. The power of this influence can be approximately measured by comparing recent trade figures with the decline in London balances, keeping in mind the fact that the remittances which New Zealand must make yearly in respect of external debt charges and other invisible imports amount to between £10 millions and £12 millions (N.Z.). In 1936, with a favourable trade balance of £12,493,000, the overseas assets of the Dominion fell by £8,008,000. In that year, therefore, capital exports must have amounted to over £10 millions. In 1937, the favourable balance amounted to £10,553,000 and the decline in overseas assets to £4,425,000, indicating capital exports of the order of about £4,000,000. For the first nine months of 1938 the export surplus amounted to £6,495,000 and the decline in overseas assets to £5,959,000, providing further evidence of an outflow of capital. This outflow has taken the form of New Zealand purchases of British and Australian securities, and to a lesser extent has been effected by the non-repatriation of the proceeds of New Zealand export trade. Its main motive power has, of

course, been the distrust felt in certain New Zealand quarters for the policy of the Savage administration.

What of the means that are being taken to meet this situation? The abolition of the convertibility into sterling of the notes of the Reserve Bank of New Zealand is obviously the first of these defensive measures. New Zealand has hitherto been on a free sterling exchange standard. Section 16 of the Reserve Bank of New Zealand Act, 1933, provides that "on presentation at the head office of the Reserve Bank in Wellington of notes of the Bank to any amount of not less than £5,000, it shall be the duty of the Bank to give in exchange for such notes sterling for immediate delivery in London." This provision has been the foundation-stone of the whole foreign exchange market in New Zealand, and it had to be removed with the transition of that market from a free to a controlled status. The New Zealand pound, none the less, remains based on sterling, and there is no suggestion whatever that the rate at which the two are now linked will be severed or changed in the near future. Indeed, the establishment of exchange control can be regarded as an alternative to exchange depreciation, and at least it removes that possibility to a fairly distant future.

The licensing of exports is intended solely to give the Dominion authorities complete control over the foreign exchange proceeds of New Zealand export trade. It does not, as far as can be gathered, imply a further extension of Government interference in the export trade beyond the agricultural and other produce covered by the guaranteed price scheme. Licences to export will be granted freely, but on the understanding that the sterling or other foreign exchange proceeds of the export transactions are left with a New Zealand trading bank, which, in turn, will have to hold this foreign exchange at the disposal of the Reserve Bank of New Zealand. The details of the new exchange machinery have not yet been worked out. It is still uncertain whether the trading banks will, in fact, have to hand over their exchange to the Reserve Bank and re-obtain that exchange when selling to importers, or whether they will be able to marry their exchange transactions as they have hitherto done. The latter course, provided of course exchange is bought and sold through channels authorised by the authorities, is the more likely one, since it cannot be the intention of the New Zealand Government to penalise the trading banks to the extent of robbing them of what remains of their exchange business.

The control of imports is the most direct measure to be taken for combating the weakening of the Reserve position. In future, all imports will have to be licensed, though goods already ordered will be allowed to come in unauthorised between now and the end of the year and all goods which were actually on the water by last Monday will also be admitted without licence. The Finance Minister has announced that this control of imports will be used in order to strengthen the preference already enjoyed by British goods in the New Zealand market. Even so, however, it is likely to mean a fairly substantial curtailment of non-essential imports into New Zealand from this country.

New Zealand begins its experiment in controlled exchanges with considerable advantages. In the first place, it is insular and far from other territory and particularly well equipped, therefore, to tackle the problem of currency smuggling which tends to arise whenever exchange control is imposed. Secondly, its population is not "exchange conscious" in the Continental sense of that term. Despite recent years, there is no serious distrust of the currency among New Zealanders as a whole. Thirdly, the market in New Zealand pounds is an extremely small one, centralised in the hands of a few highly respected trading banks, which in the would not lend themselves to any evasion of the official control. None the less, it is almost inevitable that a "black" market in New Zealand currency will develop. Such a market might assume appreciable proportions if a thoroughly unsound financial policy by the Government were to give the controlled exchange rates a character of artificiality. There is no lack of channels through which

Application will be made to the Committee of the Stock Exchange, London, for permission to deal in the Preference Stock now offered and, in due course, for an official quotation. The Subscription List will open and close on Monday, 12th December, 1938.

NORTH METROPOLITAN ELECTRIC POWER SUPPLY COMPANY

(Incorporated by Act of Parliament.)

CAPITAL :	
AUTHORISED	£8,000,000
ISSUED AND PAID UP—	
8 per cent. Cumulative Preference Stock	£1,595,315
Ordinary Stock	3,192,393
	£4,787,708

LOAN CAPITAL :	
AUTHORISED—Up to one-half of the issued Capital provided one-half thereof has been paid up.	
OUTSTANDING	£1,997,966

ISSUE OF
£1,000,000 4 per cent. Cumulative Preference Stock at par.

PAYABLE AS FOLLOWS:—

On Application, 2s. 6d. per £1 of Stock; on Allotment, 7s. 6d. per £1 of Stock; On 18th January, 1939, balance of 10s. 0d. per £1 of Stock.

Payment may be made in full on Allotment, but no discount will be allowed.

Board of Directors:

THE RT. HON. LORD ASHFIELD, P.C., Chairman and Managing Director.
SIR JAMES DEVONSHIRE, K.B.E., M.I.E.E., Deputy Chairman.
G. W. SPENCER HAWES, O.B.E., M.I.E.E. C. J. SPENCER, O.B.E., M.I.E.E.
E. R. SOAMES. C. G. TEGTMEIER. ARCHER VASSALL.

ABRIDGED PROSPECTUS.

The Stock now offered is entitled to a fixed Cumulative Preferential Dividend at the rate of 4 per cent. per annum; otherwise the Stock ranks *pari passu* in all respects with the existing 6 per cent. Cumulative Preference Stock, both as regards Capital and Dividend and in priority to the Ordinary Stock of the Company, but will be entitled to no participation in the assets or profits of the Company beyond repayment of capital and any arrears of dividend. The dividend on the Stock will be payable half-yearly on 30th April and 31st October in each year.

The Company was incorporated by Act of Parliament in 1900. The several Acts obtained by the Company from the date of its incorporation until 1927 were consolidated, and the powers of the Company are now contained in the North Metropolitan Electric Power Supply (Consolidation) Act, 1928, and subsequent Acts obtained in 1932, 1936 and 1937 and in a number of Electricity Orders. These Acts and Orders empower the Company to supply electricity for all purposes (subject to limitations in some areas) in an area of approximately 670 square miles in Middlesex, Hertfordshire and Essex, extending from the northern suburbs of London to the northern boundary of Hertfordshire.

The Company's powers under its Acts of Parliament are almost entirely held in perpetuity. Those undertakings which are operated under Electricity Orders are subject to rights of purchase by the Local Authorities. The Company supplies electricity direct to over 270,000 consumers for Domestic, Public Lighting and Industrial purposes, to the London Passenger Transport Board for use in connection with portions of their railway, tramway and trolleybus systems and in bulk to supply authorities for distribution by them in the boroughs or districts of Hendon, Hitchin, Northwood, Pinner, Welwyn Garden City and Willesden.

The Company's power stations at Brimsdown and at Willesden are "selected" stations for the purposes of the South-East England Electricity Scheme 1927 and are interconnected with the "grid" system of the Central Electricity Board. The two stations at Brimsdown are held by the Company under lease from The North Metropolitan Power Station Company Limited, all the Share Capital of which is owned by the Company.

The Assets of the Company, as shown by the audited Balance Sheet at the 31st December, 1937, were £12,029,993*

Less—	
Mortgages and Debenture Stocks outstanding	£2,035,171
Sundry Creditors, accrued liabilities, income tax reserve and final dividends payable	1,007,674
	3,042,845
	£8,987,148

* The total amount of the Company's Reserves, including Reserve for Depreciation and undistributed profits, at 31st December, 1937, was £4,805,640.

The Auditors of the Company, Messrs. Price, Waterhouse & Co., report that the profits for the four years ended 31st December, 1937, were as set out below. These profits are stated after charging all expenses of working and management, including depreciation and the rentals payable to The North Metropolitan Power Station Company Limited, and after deducting interest on mortgages, debenture stocks and loans, but before deducting income tax:

Year ended	Profits on above basis.	Debt redemption provisions charged against these profits.	Balance of profits after charging debt redemption provisions.
31st December, 1934	£384,875	£31,782	£353,113
" " 1935	£402,124	£31,782	£370,362
" " 1936	£437,717	£31,782	£405,935
" " 1937	£450,239	£47,387	£402,852

The dividends on the existing 6 per cent. Cumulative Preference Stock and the 4 per cent. Cumulative Preference Stock now offered will amount to £135,719 per annum.

The proceeds of the issue will be applied to the general development of the Company's business.

Special consideration will be given to applications from Preference and Ordinary Stockholders of the Company if made on the pink form accompanying the full Prospectus.

Copies of the full Prospectus, upon the terms of which alone applications will be received, and Forms of Application, can be obtained from:—

Bankers:
WESTMINSTER BANK LIMITED, New Issue Department, 9, Old Broad Street, E.C.2, and Branches.

Brokers:
W. A. SIMPSON & CO., Winchester House, Old Broad Street, E.C.2, and Stock Exchange.

Secretary and Head Office:
EVELYN BOYS, F.C.I.S., Northmet House, Southgate, N.14.

PETERSON PIPES

KAPP AND PETERSON LTD., DUBLIN AND LONDON

such a "black" market could be fed. The fund of external investments held by New Zealanders provides an ample source from which such a market could be supplied with sterling and other foreign currency. Any repatriation of capital to New Zealand from such a fund might tend to use the channels of the unofficial or "black" market if the rates offered in it were sufficiently advantageous and the means of operating in it not unduly dangerous. One can conceive of all kinds of remittances to New Zealand which would follow the same route under those circumstances—for example, maturing insurance policies held by New Zealanders with British offices, legacies left to relations in New Zealand by people in Great Britain, and the like.

In other words, it is evident that the success of the New Zealand Government's control scheme depends, not so much upon the effectiveness with which it is worked, as

upon the manner in which the fundamental economic problems of New Zealand are tackled. If the New Zealand Government temper their grandiose public works schemes and their progressive policy of social services with caution, and if they have the luck of good export prices, the exchange control scheme may happily prove to have been a valuable, but temporary, expedient to tide over a difficult period. Mr Savage, however, has gone far to shatter this hope by his declaration that these measures were intended to form a permanent part of the Government's plan for "insulating the economic life of New Zealand from outside disturbance." If, in the course of this insulation policy, the control scheme is merely used as a means of evading the fundamental issues involved, if it serves only to "plug the clinical thermometer," it will land the patient in a much graver crisis than that in which he finds himself to-day.

The Cement Industry

SOMETHING approaching a scare in the ranks of investors in cement companies was created last month by an outspoken speech by Lord Wolmer, chairman of the Cement Makers' Federation. Lord Wolmer foretold not merely increased competition for markets owing to the invasion of newcomers, but also a decline in the total demand for cement to be shared out among the existing companies and the new entrants. As a result he expected another bout of that price-cutting that has always afflicted the industry.

The demand for cement is intimately linked with the activity of the building and contracting industries. As much as one-third of the annual output of cement is now used in residential building; and large quantities are employed in the construction of factories and public buildings, and in public works, such as roads, bridges and tunnels. Until about fifteen years ago the demand for cement showed little increase from year to year. Thus, the output actually declined from 2,886,000 tons in 1907 to 2,722,000 tons in 1912; even in 1924 production was only 3,281,000 tons. But, as the following table shows, both output and home consumption have increased fairly rapidly between 1924 and 1937:—

PRODUCTION, HOME CONSUMPTION AND AVERAGE PRICE OF CEMENT

	Output Thous. tons	Home Consumption Thous. tons	Average Price s. per ton
1924	3,281	2,790	...
1930	5,056	4,241	46.00
1931	5,880	5,355	45.14
1932	4,250	3,731	44.72
1933	4,686	4,286	44.76
1934	5,584	5,108	40.34
1935	5,958	5,564	39.94
1936	6,500	6,002	39.10
1937	7,300	6,763	42.00

The rapid expansion in the use of cement since 1924 has been mainly due to the growth in the motor industry, with its derived demand for concrete roads, to building expansion and, latterly, to the increase in expenditure on armaments. Cement has also tended to be substituted for other materials—for example, in road-making and house construction. A closer examination of the figures shows that consumption continued to increase even in 1931, when general business activity showed a decline. This was due mainly to an increase in road construction, loans sanctioned for this and similar purposes having increased from £7,130,000 in 1927-28 to £11,642,000 in 1930-31. The sharp decline in consumption in 1932 was likewise due, in part, to the retrenchment on capital expenditure by public authorities, loans sanctioned for roads, etc., in 1932-33 amounting to only £4,738,000. After this check, however, the consumption of cement grew rapidly under the influence of the building boom, increased expenditure on public works and the re-armament programme. The industry has witnessed a setback which may

be ascribed to the recession in general business activity. Chalk and certain varieties of mud are the main raw materials of the industry, and the location of cement production is conditioned, in a large measure, by the location of these materials. The structure and organisation of the industry have undergone far-reaching changes since the beginning of the present century. Cement factories, for example, require a heavy capital outlay. Consequently the desire of producers to spread overhead charges over as large an output as possible has prompted individual producers to operate at a high rate of capacity, which in turn has led to periods of intense competition and price-cutting. The disadvantages of competitive price-cutting and heavy overhead charges set in motion a tendency towards concentration of output. This process began in 1900, when some thirty units were merged into the Associated Portland Cement Manufacturers, Ltd. In 1912 this body gained control over thirty-three of its competitors, which were merged into the British Portland Cement Manufacturers, Ltd., a subsidiary of the former concern. The tendency towards concentration continued after the war, the most important developments being the rise of the Tunnel and Alpha groups. In 1930, one-third of the total output of cement was produced by firms employing over 500 persons, and a further third by concerns employing between 200 and 500 persons.

This concentration of production made it easier to set limits to competition within the industry, though the agreements made (for example, in 1928) to abstain from price-cutting did not always last very long. A more drastic agreement was reached in 1934. A feature of this agreement was the allotment of quotas to producers, based on their average output over a period of years; these quotas were flexible in that they could be adjusted, if necessary, by a central committee representative of the members of the cartel. At the end of 1937, however, the quota system was abandoned; simultaneously the price of cement was raised by 3s. per ton to 42s. per ton. The significance of these steps became evident in January this year, when the Associated-Alpha-Tunnel groups, controlling 80 per cent. of the industry's total capacity, entered into a close working agreement which included the co-ordination of selling policies. This agreement was made effective by an interchange of shares between the three groups.

The profits of the leading concerns in the industry have been substantial in recent years, thanks to the increase in demand on the one hand, and to the elimination of price-cutting on the other hand. Indeed, the manufacture of cement has been so profitable that newcomers have been prompted to risk the heavy capital expenditure involved in the construction of cement factories in order to share the prosperity. If the industry is now deploring this encroachment of its preserves, it has only itself to blame for pursuing a price policy which has tempted outsiders to cut into the market.

The adaptation of the industry's structure and organisation to modern developments was accompanied by a steady

reduction in costs of production. Thus, the net output per worker rose from £116 in 1912 to £361 in 1924, £430 in 1930, and £559 in 1935. According to an estimate of the chairman of Associated Portland Cement in 1935, costs of production were reduced by no less than 42 per cent. and prices by 46 per cent. during the preceding ten years. During the same period that company had been able to raise wages, reduce working hours and earn higher profits. The rapid decline in prices has been responsible, in no small measure, for the increase in consumption, for it led to the substitution of cement for other materials. In the past year, for example, the increase in steel prices gave a strong impetus to the use of reinforced concrete. Thus, the new Waterloo Bridge will be a reinforced concrete structure and substantial sections of the new tunnels in process of construction by London Transport will be lined with reinforced concrete instead of steel plates. Indeed, the benefits that price reductions have brought to the industry are so manifest that the recent tendency towards combination to secure higher prices can only be regarded as a retrograde step. There is very little justification for the industry's surprise, and none at all for its resentment, at the appearance of newcomers and the threatened resumption of under-cutting.

The long-term trend of the demand for cement undoubtedly remains upwards. The immediate outlook, how-

ever, is less reassuring. The industry's total capacity is about 10,000,000 tons per annum, and production in 1937 was estimated at 7,300,000 tons. According to Lord Wolmer, the industry is working at only 60 per cent. of its capacity this year, and the rate of operations may be expected to fall to 50 per cent. in 1939. In view of the marked seasonal variations in the demand for cement, working to full capacity is impossible except for short periods. The figures are therefore not as unsatisfactory as might appear at first sight. But the drop forecast by Lord Wolmer is difficult to reconcile with the statement by Sir Malcolm Stewart, chairman of Associated Portland Cement, in April that a decline in consumption was not expected until the re-armament demand began to fall off. Whether the average rate of operations will in fact fall to 50 per cent. of the industry's capacity next year will depend, in no small measure, on the Government's defence policy, especially as far as A.R.P. is concerned. In view of the extension of the capacity of the industry by the entrance of outsiders, a reduction in prices can in any case hardly be avoided. The industry may feel a grievance that, unlike other industries which have received the blessing of Governmental "organisation," it is unable to prevent competition keeping its prices down. But the growing list of important industries for which cement has become a vital raw material will naturally entertain a different opinion.

Finance and Banking

Fiduciary Note Issue Increased.—On December 6th the Chancellor of the Exchequer announced that there would be a seasonal increase in the fiduciary note issue, from £200 to £230 millions, to take effect forthwith. This statement came several weeks later than the corresponding statement last year, and the increase is also £10 millions more than it was a year ago. Its likely effect is illustrated in the following table, which is based on the assumption that this year's Christmas increase in the note circulation will be the same as last year:—

	1937	1938
	Nov. 24	Dec. 22
	(Millions)	Nov. 23
		Peak
Note circulation	480.4	509.3
Fiduciary note issue	220.0	220.0
Reserve	67.4	38.0
		51.6
		505.0
		230.0
		52.7

Last year, without the seasonal increase of £20 millions the reserve would have dropped to £18 millions; whereas this year, without the increase of £30 millions, it is possible that the reserve might have dropped to £23 millions. These hypothetical calculations suggest that the increase of £30 millions this year will leave an ample margin in hand, and indeed last year's increase of £20 millions would probably have been enough. But it is satisfactory that this seasonal expansion of the fiduciary note issue has taken place. As a matter of course it should be added that the increase, which only involves the transfer of securities from the banking to the issue department, does not prevent the joint stock banks' cash from being depleted by the Christmas withdrawals of currency; nor does it save the money market from any stringency which may result from this depletion. For this there are other appropriate remedies which could be applied in case of need.

The Control's New Tactics.—The systematic intervention of the authorities in the forward dollar market since October, and in the "day dollar" market during the last few weeks, has given rise to much speculation regarding their motives. According to one theory, the object is to avoid the unfavourable impression created by a too wide forward discount on sterling. But this theory could not account for the intervention in "day dollar" rates, which are never published and which can safely be ignored from the point of view of their psychological effect. According to another theory, intervention

in both the forward dollar market and "day dollar" markets was intended to avert a sharp rise in bill rates and call money rates in London, which would otherwise have been caused by an unduly high yield on "swap" transactions. This theory sounded convincing—until the "control" abandoned its intervention in forward dollars and "day dollars" this week. The result of its change of tactics was a widening of the premium on forward dollars and of the discount on "day dollars" exactly at a time when it was becoming increasingly important to avoid an undue rise of money rates and discount rates in London. It now seems that both these theories impute much more subtle and scientific motives than those which probably prompted the authorities to adopt these tactics. Presumably, when they bought spot dollars against forward dollars, and also bought "day dollars," during the adverse pressure on sterling, they simply wished to replenish their supply of dollars, pending the execution of gold operations which would provide them with the dollars required. The fact that the authorities stopped operating in forward dollars (allowing the premium to widen to 2 per cent. per annum), and in "day dollars" (allowing the discount to widen to 1½ per cent. per annum) simultaneously with the recovery of sterling, seems to confirm this theory. During the current week they received ample supplies of dollars through bear covering, and there was no need for employing the new tactics to replenish the supply of dollars. Thus, the new tactics do not involve far-reaching aims of monetary policy or even foreign exchange policy; they were dictated by purely empirical considerations.

* * *

Gold Deposits in South Africa.—The earmarking of gold in South Africa, introduced by the Exchange Equalisation Account during the September crisis, has now been extended to provide for private holders. The South African banks in London announced last week that arrangements had been made whereby gold can be deposited in London and an approximate equivalent of gold held in South Africa to the order of the London depositor. These facilities are intended to appeal to hoarders, who prefer to have their gold deposited at a greater distance from the European centres of political disturbance. Transactions will take the following form. The gold deposited with a South African bank in London will be re-deposited by that bank with the Bank of England. The Bank of England will

then earmark a corresponding amount of gold with the South African Reserve Bank. These deposits will be for certain specified periods. If at maturity the depositor wishes to realise the gold he will not be able to sell spot on the London bullion market. He will either have to sell the gold forward or arrange for the shipment to this country, or, if he can, effect a sale of the gold in South Africa. The consequent delay and the intrusion of the Bank of England and the South African Reserve Bank into the operations is likely to militate against any considerable development of this type of business. The large Continental hoarder of gold wishes, above all things, to be able to sell his gold, if he so wishes, at a moment's notice, and the

last thing he desires is to give the authorities of any country the slightest inkling of his dispositions.

Australia's Balance of Payments.—A transposition of figures in a Note in this section last week dealing with the annual meeting of the Bank of New South Wales referred to the active balance of payments of Australia in 1936-37 as amounting to £stg7 millions and the passive balance in 1937-38 as amounting to £stg20 millions. The figures should be reversed. There was an active balance of £stg20 millions in the earlier year and a passive balance of £stg7 millions last year.

MONEY MARKET NOTES

Foreign Exchanges

FRENCH repatriation was the chief influence upon the foreign exchange market this week. According to a statement by M. Reynaud, the amount repatriated during the past few weeks is Frs. 6,000 millions, equal to about £34 millions. In consequence of this movement, spot francs were bid down to Frs. 177½, while one month's francs went temporarily to Frs. ½ premium. On Thursday the spot rate reacted to Frs. 177½, and one month's francs went to Frs. ½ discount. Three months' francs were at Frs. ½ discount. The French authorities made heavy purchases of sterling to meet this repatriation demand for francs. Initially, sterling was helped by this movement, which affected French money in New York as well as in London, and the New York rate rose until it just touched \$4.70. The French authorities, however, were unable to hold sterling, and so began buying dollars heavily in London. This sent the New York rate back to \$4.66½ by Thursday afternoon. Belgas were affected by M. Spaak's vicissitudes. Early in the week the spot rate depreciated to bel. 27.92, and the three months' rate to 35 cents discount. M. Spaak's vote of confidence restored the spot rate to bel. 27.70, and the three months' rate to 11 cents discount. Then came the resignation of one of his Ministers, and on Thursday, the spot rate went to bel. 27.74, and the three months' rate to 16½ cents discount.

The Bank Return

THIS week's return reflects the increase of £30 millions in the fiduciary note issue referred to in a Financial Note. The result is that, notwithstanding the seasonal increase in the note circulation, amounting this week to £7.0 millions, the reserve is increased by £23.1 millions.

Issue Dept.:	Dec. 8, 1937	Nov. 23, 1937	Nov. 30, 1937	Dec. 7, 1937
Gold	326.4	326.4	326.4	326.4
Notes in circulation	492.8	476.1	480.8	487.8
Banking Dept.:				
Reserve	54.7	50.4	45.6	68.7
Public Deps.	11.7	31.7	23.1	18.6
Bankers' Deps.	106.3	92.2	97.1	102.9
Other Deps.	36.7	35.0	37.2	35.9
Govt. Secs.	87.2	91.8	90.2	66.1
Discounts & Advances	9.6	12.2	17.6	17.9
Other Secs.	21.0	21.1	20.1	21.5
Proportion	35.3%	32.4%	29.7%	44.3%

In the banking department, Government securities are reduced by £24.1 millions. £30 millions were transferred to the issue department to cover the

increase in the fiduciary note issue, so that there has also been an acquisition of £5.9 millions, this being made in order to neutralise the effect on bankers' deposits of the week's increase in the note circulation. In spite of the payment of the War Loan dividend, public deposits have only fallen by £4.5 millions. There were heavy Treasury bill payments at the end of last week, and possibly the past fortnight's reduction of £13.1 millions in payable deposits is a better measure of the effects of the War Loan dividend payment. The position must also have been complicated by Exchange Account operations in connection with the repatriation of French funds. As a result of all these movements bankers' deposits have risen by £5.8 millions and now stand at over £100 millions.

The Money Market

At the tender of December 2nd, the discount market reduced its price from £99 15s. 7d. to £99 15s. 6d. per cent., but was only able to secure an allotment of 18 per cent. Current discount rates are high enough, however, to compensate for this meagre allotment, for while the bulk of the bills were taken by outside applicants, the market hopes to be able to repurchase some of them at rates which yield a small profit margin. This week the clearing banks have only been buying bills sparingly, though they have taken January and February Treasury bills for special dates at ½ and ½ per cent. Three months' bank bills were dealt in at ¾ per cent.

	Dec. 9, 1937	Dec. 1, 1938	Dec. 8, 1938
Bank Rate	2	2	2
London Deposit Rate	12	12	12
Short Loan Rates:			
Clearing Banks	12-34-1*	12-1*	12-1*
Others	12	12-34	12-34
Discount Rates:			
Treasury bills	¾ nom.	13½	27½
Three months' bank bills	7½	13½	7½

* Viz. 12 per cent. for loans against Treasury bills and other approved bills and British Government securities within six months of maturity. ¾ per cent. for loans against 1 per cent. Treasury bonds and other gilt-edged stocks within six months of maturity. 1 per cent. for loans against other collateral. Money has been variable. The leading houses have had no difficulty in securing bond-money at ¾ per cent., but other borrowers have had to pay ¾ per cent. Loans into the New Year already cost 1½ per cent., and the rate was expected to rise to 1½ per cent. by the end of the week. The market anticipates considerable stringency at the end of the year. The Bank return shows that not very much money was released by the War Loan dividend, but some of this money was absorbed by War Loan

dividend payments during the latter half of last week.

The Bullion Market

It has been a difficult week in the bullion market, for arbitrageurs were not able to find any definite trend on which to work. On December 2nd, when they took a lot of gold, the exchange promptly turned against them, so that they were caught. On December 3rd there was a fair amount of Continental re-selling, which met most of the day's arbitrage and Continental demand. On Monday there was no arbitrage, while the Continent was operating both ways. On Tuesday arbitrageurs came in, notwithstanding the higher premium, and there was a large amount of business after the fixing. Wednesday proved a good day for arbitrageurs, for the two-penny premium was more than offset by the day's trend of the exchange. There was further Continental re-selling. On Thursday the demand was again of a Continental and arbitrage character and the authorities had to supply two-thirds of the market's needs.

	Price per fine oz.	Prem. or Discount	Amt. dealt in	Cash	Two Mths.
1938	s. d.	d. pm	£'000	d.	d.
Dec. 2	148 11	12 pm	1,638	203½	193½
" 3	148 7½	12 pm	407	201½	193½
" 5	148 3½	1 pm	146	20	193½
" 6	148 1	2 pm	522	201½	197½
" 7	148 5	2 pm	789	201½	197½
" 8	148 11	1½ pm	534	203½	199½

* Above or below American shipping parity. This week's calculations are based on a "temporary parity," in which the war risk rate is taken as 1s. 3d. per cent.
† At fixing.
‡ The New York price of silver remained at 43 cents per ounce .999 fine during the week.

The cash price of silver was several times this week fixed at above the New York parity, and this brought out some American re-selling. This suggests that the United States has not over-much confidence in the present level of London prices, and there has already been one unofficial forecast of a reduction in American prices next year. This rumour has not had the smallest effect upon India, but in any case the heavy discount on forward silver is a strong deterrent against forward bear sales. The week's demand has come mainly from American trade sources. It has now spread to the forward market, which may explain the slight narrowing of the spread between the cash and forward prices.

November Clearing Bank Averages.—The accumulation of cash in public deposits during November, in preparation for the War Loan dividend, came too late in the month to make much difference to the Clearing Bank averages between October and November, especially as at times in both months the Exchange Equalisation Account was replete with cash. The clearing banks' average cash holdings, therefore, show little change, though they continue to run lower than in the summer. Discounts were higher in November, in spite of the Exchange Account's support of sterling. The increase in the tap Treasury bill issue due to these official operations was largely off-set by the seasonal expansion in the floating debt, but even so the average volume of tender issues of Treasury bills was slightly less in November than in October. It would seem, therefore, that in the early weeks of November the banks were ready takers of bills, even though their demand eased towards the end of the month. Our usual table appears below:—

	Nov., 1937	July, 1938	Aug., 1938	Sept., 1938	Oct., 1938	Nov., 1938
Capital and reserves	132.5	136.0	136.0	136.0	136.0	136.0
Acceptances, etc.	114.9	114.9	115.5	121.9	129.3	128.5
Deposits (including undivided profits, etc.)	2,272.9	2,272.1	2,262.4	2,233.4	2,219.7	2,212.2
Total liabilities	2,520.3	2,523.0	2,513.9	2,491.3	2,485.0	2,476.7
Cash	231.6	241.0	237.8	230.7	230.7	229.3
Cheques, balances and items in transit	65.8	63.2	59.2	54.5	61.8	62.1
Money at call	154.8	154.9	150.2	145.6	145.4	144.9
Discounts	296.0	299.9	303.2	287.5	266.8	271.0
Investments	619.4	618.8	627.2	631.4	631.1	628.0
Loans and advances	969.8	962.8	953.1	951.9	952.0	944.6
Investments in affiliated banks	23.6	23.9	23.9	23.9	23.9	23.9
Cover for acceptances, etc.	159.3	158.5	159.3	165.8	173.3	172.9
Total assets	2,520.3	2,523.0	2,513.9	2,491.3	2,485.0	2,476.7

Advances have fallen since October by £7.4 millions—a point which is referred to in a Financial Note. Investments are also slightly lower. There was a reduction of £7.5 millions in deposits, which may well reflect the continued outflow of funds from London.

Bank Advances.—The current issue of the Bank of England's Statistical Summary contains the annual analysis of the clearing banks' advances. On this occasion, three consecutive years' figures are given, but unfortunately the dates are not entirely comparable. Broadly, the table covers the period embracing the rise to the 1937 trade peak and the subsequent recession; but the 1938 figures are dated some little time after the recession had received its first check. The figures, to which we have added the percentage distribution, are set out below:—

	1936*		1937†		1938‡	
	£mn.	%	£mn.	%	£mn.	%
Textiles	39.9	4.58	43.8	4.55	38.1	3.99
Heavy industries	40.7	4.68	49.9	5.18	45.9	4.80
Agriculture and fishing	57.7	6.62	60.1	6.24	62.5	6.54
Mining and quarrying	18.1	2.08	15.1	1.57	15.2	1.59
Food, drink and tobacco	29.4	3.37	32.5	3.38	36.1	3.77
Leather, rubber and chemicals	12.6	1.45	15.3	1.59	14.0	1.47
Shipping and transport	23.2	2.68	20.1	2.08	26.5	2.78
Building	61.5	7.07	68.2	7.10	68.1	7.14
Miscellaneous	67.4	7.74	74.7	7.77	69.1	7.24
Retail trades	50.1	5.80	54.2	5.64	59.2	6.20
Municipalities and public utilities	40.5	4.64	44.5	4.66	46.6	4.88
Amusements, clubs, churches, charities	109.6	12.60	118.2	12.28	109.0	11.44
Financial	258.5	29.70	300.4	31.30	298.0	31.20
Other advances	869.5	100.00	961.0	100.00	954.3	100.00

* Nearest available date to October 31, 1936. † Various dates between August 4th and October 26th, 1937; and between August 3rd and October 31st, 1938.

A recession in trade exerts, in its earlier stages, two contrary influences upon bank advances. First there is a contraction in the general demand for credit, roughly proportionate to the shrinkage in the volume of business and the

fall in commodity prices. On the other hand, those undertakings which suffer most from the recession may find themselves in additional need of bank credit; or, if not, may not be able to pay off outstanding advances. It is thus not surprising that a comparison of the 1937 and 1938 returns presents an indeterminate picture, with little net change in the aggregate. On the whole, advances are falling, and the returns for dates subsequent to the table show that this decline is continuing. Thus the first of the two influences has the greater weight, and it is justifiable, therefore, to infer that the 1937-38 recession was not serious enough to create a new mass of frozen loans.

Barclays Bank (D.C. and O.). Sir John Caulcutt at this week's meeting of Barclays Bank (D.C. and O.), gave the shareholders an interesting and, on the whole, a hopeful review of conditions in the territories served by the bank. Business in South Africa has been well maintained, despite some decline in the demand for and the prices of the Union's agricultural products. Gold-mining continues to prosper, and Sir John's remarks suggest the inference that this is the chief factor which has enabled South Africa largely to escape the depression. Northern Rhodesia has equally been helped by the current prospects of the base metal mines, while Southern Rhodesia has benefited both from mining and also from the satisfactory prices obtained for certain farm products. Trade in Nyasaland has been well maintained, but the year has been disappointing in East Africa, where prices have been poor. Trade in Egypt and the Sudan has been fair, but there has been a severe setback in Palestine as a result of political disturbances. In the West Indies and British Guiana trade has been fairly well maintained. Sir John also alluded to the recent difficulties of the Gold Coast. The bank's accounts show an increase of £3,000,000 in deposits and a contraction of

COMMERCIAL SERVICE

The Bank has over 380 Branches in Africa, and Agents and Correspondents throughout the world. The closest touch with Trade and Industrial conditions is maintained, with special attention to Commercial and Credit Intelligence. This service is available to Exporters, Importers and others wishing to develop trade with South, East and Central Africa.

THE STANDARD BANK MONTHLY REVIEW, which is sent post free on application, gives the latest information on all South, East and Central African matters of Trade and Commercial Interest.

£2,750,000 in advances. Cash is £3,821,000 higher, and equals 26 per cent. of deposits and notes in circulation and call money. Bills are lower than a year ago, but investments are £4.3 millions higher. Net profits, at £439,244, are some £8,000 higher than last year. The dividend on the "A" and "B" shares is 6½ per cent., compared with 6 per cent. the year before. Thus the bank has enjoyed a satisfactory year. Its activities, of course, are very widely spread, and it would be interesting to know how it has fared as regards deposits, advances and earnings in each of the many territories which it serves.

* * *

Bank of London and South America.—In view of the recession in export trade and the decline in export prices experienced this year by most of the countries served by this bank, the contraction in most of the items on both sides of the bank's balance sheet is not surprising. An additional cause of this contraction lies in the fact that with the principal exception of Argentina, the currencies of these various countries have depreciated in terms of sterling during the past year, which has involved a corresponding writing-down of the sterling value of most of the bank's assets and liabilities. Even the Argentine exchange has depreciated from 16 to 17 pesos to the pound since the date of the latest balance sheet, and in the absence of a recovery this will affect next year's accounts.

	September 30		
	1936	1937	1938
Liabilities:—	£'000	£'000	£'000
Capital	4,040	4,040	4,040

Net profits	253	462	466
Dividend	3%	5%	5%

The contraction in deposits and in the various bill items reflects less trade, lower prices, and as a result less money in the hands of the bank's customers. Advances show little change, doubtless because many of the customers are in need of more accommodation. Gross profits have fallen from £1,827,000 to £1,783,000, as a result of the shrinkage in the bank's resources, but net profits are slightly greater than last year. On the whole the bank's deposits and resources have stood up reasonably well to this year's recession in trade and prices.

* * *

British Overseas Bank.—Having much of its business in Europe, including Spain, the British Overseas Bank must obviously have had an extremely anxious year once more, and the difficulties which it has experienced are reflected in the report. Briefly, its net profits for the year to October 31, 1938, were only £29,823, and £20,000 of this is allotted to contingencies, while the remainder is added to the sum carried forward. The report states that discounts, advances, and liabilities of customers for acceptances include balances subject to standstill agreements and exchange restrictions and also those due by customers in Spain; while it adds that recent international trouble has adversely affected the immediate value of certain assets, including investments, to an unknown extent. Arrangements have therefore been made for the provision of a deferred deposit of sufficient amount, together with the liquid assets, to cover the existing liabilities of the bank to its creditors and depositors. The accounts show that deposits have fallen from £3,840,000 to £2,465,000 and acceptances from £3,089,000 to £1,782,000. Cash has shrunk from £278,000 to £85,000 and call money from £1,149,000 to £246,000, but advances have only fallen from £3,031,000 to £2,608,000. These figures show the extent to which the bank has suffered in liquidity from events beyond its control. The chairman will no doubt reveal at the meeting more about the steps being taken to guard against this loss of liquidity, and further comment must therefore be reserved. Meanwhile all will sympathise with the bank in its undeserved difficulties, and will be glad to know that these are not being allowed to prejudice the safety of its liabilities.

Investment

Sharepushing Bill in Committee.—A Select Committee of the House of Commons is now considering the Prevention of Fraud (Investments) Bill. It sat on Tuesday and Thursday this week, and adjourned its labours at an important point in Clause 8, which deals with property societies. So far, modifications have been concerned with detail rather than general principles. These lie round the corner—particularly in Clause 10. On Tuesday an amendment to exclude unit trusts from the exemption provisions under Clause 1 was defeated. As a result, the anomaly remains that unit trusts with approved trustees are automatically exempt, while the banks (who in most cases act as their trustees) must obtain specific exemption from the Board of Trade. It is intended, however, to amend the Clause 14, which defines an approved trustee, to provide for the insertion in trust deeds of certain conditions, to be prescribed by the Board of Trade. These, in Mr Oliver

Stanley's words, would enable the Board of Trade to indicate, both in existing and future trust deeds, the sort of conditions which were laid down by the Anderson Committee. This revision, which arose from the fact that the trustee in many unit trusts has no powers over investment, might, in fact, cover ground no less wide than that originally contemplated in the rejected amendment. The principle of a cash deposit, urged by Mr Johnston, was partially accepted by Mr Oliver Stanley. A £500 deposit, as Mr Johnston admitted, would not stop the rogue, but equally it might inflict hardship on the small man. It is proposed, therefore, to consider the possibility of remitting the deposit where hardship would be involved. The London Stock Exchange, having other pressing cares, has so far taken less account of the Bill than it deserves. The building societies appear to accept the widest executive powers under Clause 9 with complete assurance. City opinion is unanimous on the need for clearing out the share-pusher, and would not be averse to over-strong measures to effect this object, provided that they are strictly defined. It is unfortunate that the powers contemplated under the present Bill must be diffused over a wide area of legitimate trading; and they do not, as Mr Oliver Stanley admitted on Tuesday, guarantee that the share-pusher will find no loopholes.

* * *

Australia Pays More.—Australia's latest conversion offer, to holders of £2,517,800 South Australia 3½ per cent. stock, due January, 1939, into Commonwealth 4 per cent.

stock, 1955-70, is a relatively small operation. But the terms are of particular interest, in view of the projected visit of the Commonwealth to the London market for defence borrowing. The new stock, offered at par, is the first Australian issue to be made since July, 1933, on a 4 per cent. basis. It is also the first conversion operation of recent years to involve a heavier interest charge to the Commonwealth. The additional ½ per cent. interest may be of some attraction to existing holders of the South Australian loan, which appears to have remained largely in investment hands, and has not been extensively acquired by the money houses. But the new stock will provide an addition to the existing £9,322,446 4 per cent. stock, 1955-70, quoted at 99½, but subject, of course, to stamp and fee. It is somewhat anomalous, moreover, that the 4 per cent. stock, 1943-48, is currently obtainable at 99½, offering a similar interest return and a more favourable redemption date. Response to the offer (cash lists closed on December 8th, and conversion lists remain open a week longer) is not on present indications likely to be enthusiastic. Its fate, following the 66 per cent. under-subscription of the £7 millions issue in May, will have a close bearing on forthcoming defence borrowing. Australia's three-year defence programme is to cost £A63,000,000, compared with earlier estimates of £A43,000,000. Some £A8,000,000 has been covered by internal loan operations, and £2,000,000 from last May's issue in London. It is not yet known how much of the £A10,000,000 borrowing under the Defence Loan Bill will come to London. Meanwhile, Australia's trade continues to fight unequally against the discouraging decline in world trade. For the year to June, 1938, the favourable commodity balance of trade was no more than £stg516,000, but for the three months to September an unfavourable balance of £5,866,000, against £4,020,000 a year earlier, is recorded. There is good reason, therefore, for a certain measure of defence borrowing in London, since a significant part of the orders must be placed in this country.

* * *

Supervised Shares, Inc.—The offer for sale of shares of Supervised Shares, Inc., provides difficult reading even for those versed in the complexities of unit trust affairs. The company is an American-managed investment company of the Boston type—one, in short, which undertakes to re-purchase its own shares at "or approximately at" liquidating value. London and Boston Securities, an affiliate of the National group of unit trusts, has acquired the right to purchase shares of the company, not directly, but via Massachusetts Distributors, Inc. The latter concern acts as direct selling agent for Supervised Shares, Inc., purchases its shares at liquidating value, and offers them to the public at approximately 108.7 per cent. of liquidating value (i.e. making an inclusive charge of 8 per cent. on the offered price). London and Boston Securities will receive a 6 per cent. discount on the offered price and repay 2 per cent. brokerage on sale and 1 per cent. on re-purchase. Supervised Shares has an authorised capital of purchase. Supervised Shares has an authorised capital of two million shares of \$1 par value, of which 938,027 4/8 shares are held by the public and 71,656 3/8 shares (fully paid) are held in the Corporation's treasury, available for re-issue. The liquidating value at which the shares are sold at the first instance is equivalent to the "net worth" per share after deducting from the assets "all ascertained liabilities, expenses and management charges." But the intervention of a selling agent between the public and the Corporation itself (and, in this country, of a sub-selling agent, whose activities are subject to the five hours' diffidence in time across the Atlantic) leads to considerable complication. In the first place, Supervised Shares, Inc., receives only the effective liquidating price for each share issued—i.e. the offered price to the public, less 8 per cent. But that effective liquidating value is determined at the close of business (4 p.m. Eastern Standard Time) on the previous day. Hence it follows that, if the market is rising, a purchaser on the following day would secure an uncovenanted benefit, while the rest of the shareholders would suffer a *pro rata* diminution of liquidating value. This is a principle which finds little counterpart in the British

unit trust movement, where the majority of trusts use up-to-date dealing prices of the underlying securities for calculating the offered and bid prices of their units.

* * *

It is difficult, similarly, to compare the charges attaching to the shares of Supervised Shares, Inc., with those of a representative British unit trust. The initial loading charge appears distinctly high compared with British practice, and since it accrues, not to the Corporation itself, but to distributing agents, no part is presumably available for covering future management expenses. In addition, the directors (who have power to fix their own remuneration, but have no intention to adopt "any substantial variation" of the present basis), together with the officers and advisory board, all of whom are of high standing, are remunerated by a quarterly payment of 1/8 of 1 per cent. of the average liquidating value of the common stock, estimated to cost \$23,000 in 1938. It is not clear from the context whether this charge is levied on the fund (or on the "paid-in surplus") or against income, although the section of the offer dealing with liquidating value suggests the former alternative. Re-purchase provisions are of a dual character. The Corporation is obliged to re-purchase shares presented by holders through the London transfer agents, Brown, Shipley and Company, at the liquidating value at the close of business on the day following the tendering of the shares—entailing a possible delay of two days. Alternatively, London and Boston Securities is prepared to offer shares for re-purchase at the current bid price, maintaining a market like a unit trust manager. It would seem, however, that after allowance for the agency charge of 8 per cent. inclusive, the price "spread" between offered and bid prices may be appreciably higher than that which commonly operates for British unit trusts. One final point remains. It is stated that ample funds are available for the re-purchase of shares, since assets available amount to more than nine times the nominal value of the outstanding shares. But since the average price per share received during the past two years was \$10.93 per share (of which \$9.93 per share would have been credited to "paid-up surplus") it would indeed be surprising if the Corporation could not show satisfactory cover for the nominal value of its stock. It will be interesting to follow the reception of this somewhat unfamiliar type of trust.

* * *

Foreign Bonds Fall Further.—Of all sections of the Stock Exchange the foreign bond market is most vulnerable to political uncertainty. During November the index of foreign bond prices computed by Municipal and General Securities Company fell nearly 6 per cent. from 67.8 to 63.9—the lowest level yet recorded. Movements in the total index and its components over the past year are shown in the following table:—

AVERAGE JANUARY-JUNE, 1934 = 100.

End of Month	Europe	Near & Far East	Egypt	South and Central America			Complete Index	Under-liquidated Bonds	De-faulted Bonds

A Unit Trust of 26 leading American and 26 British Ordinary Stocks

Particulars from Stockbrokers and Banks or The Managers,

36-37 KING STREET, E.C.2

GREENWOOD

Czecho-Slovakian 8 per cent. bonds rose sharply last month—the only exception among numerous European falls. Chinese railway loans fell particularly severely, and, apart from Peru Guano loan, which responded to the resumption of service, South and Central American issues were all lower. The present *malaise* in the foreign bond market is well attested by the fall in the Egyptian index—normally one of the steadiest in the list—from 95.2 to 91.7.

* * *

Industrial Profits in November.—The profits of 231 companies reporting in November showed a fall of 6.53 per cent. as compared with the profits of the same companies in the preceding year. The following table shows the recorded profits for each month over the past two years:—

INDUSTRIAL PROFITS 1936-38

Year and Month	No. of Cos.	Net Profits*	Inc. on prev. year	Year and Month	No. of Cos.	Net Profits*	Inc. on prev. year

* After debenture interest.

(a) Decrease.

Rubber companies' profits, however, have swelled the decrease, out of proportion to their absolute importance. Last month they accounted for 16 per cent. of the fall in profits, but for about 2 per cent. only of total profits. The month's results are also depressed by textile companies. Iron, coal and steel companies, however, show a 10 per cent. rise in profits.

* * *

P. and O. Policy.—Few dividends have created the same stir in recent months as the doubled 8 per cent. distribution of Peninsular and Oriental Steam Navigation. The report published last week showed that it had been genuinely earned. And Sir William Crawford Currie's speech—his first as chairman of the P. and O.—made it clear that it indicated no departure from the group's traditional policy of conservatism—indeed, some 3 per cent. was specifically described as "bonus." Sir William's review did much to explain the favourable results of the past year. The adjustment of liner freights—always subject to a certain time-lag—was projected, for some trades, into the current year, at least six months after the improvement in world freight rates. Together with larger cargoes, these higher freights produced higher voyage balances. Secondly, the depreciation policy of recent years was confirmed. The provision of £880,000, although not equal to 5 per cent. on the original cost of the ships in service is, in the board's view, sufficient for the present. But, when reviewing the current year's prospects, Sir William was necessarily cautious. He praised the efforts of the tramp and liner industries to limit uneconomic competition through agreement. P. and O., for example, is participating in the new Far Eastern Passenger Conference; while the minimum tramp freight schemes have been appreciated, and assisted, by the liner industry. Yet Sir William confessed that the present position of world trade and the consequent decline of cargoes was causing the shipping industry

some concern. Political amelioration and closer economic co-operation between the nations necessarily provide the ultimate hope for the industry. It costs the group 4,000 tons of oil fuel to follow the "Nyon route" in the Mediterranean. There is no sign of returning peace and prosperity in the Far East, where dwindling cargoes are only partially made good by higher freight rates. Increased shipments of wool, fruit, and chilled beef have been encouraged by freight reductions in the Australian trade and the chilled beef traffic in particular appears to be increasing rapidly. Finally, there are hopes of a successful outcome from the Indo-British trade negotiations. Stockholders, therefore, must contemplate the current year without sanguine optimism. But they may perhaps hope that, if all goes well, the company will be able to maintain the 5 per cent. dividend, and thus provide a yield of £4 8s. 9d. per cent. on the deferred stock, now quoted at 20s. 3d.

* * *

Carreras Bonus.—The market was distinctly gratified by the Carreras dividend announcement last week, for while it showed no change in the cash distribution of 35 per cent., it included an unsuspected scrip bonus of 50 per cent., requiring in all the capitalisation of £1,240,100. Four 2s. 6d. "B" shares are to be distributed for each £1 ordinary or "A" ordinary share, and one "B" ordinary share for every two "B" shares at present held. The preliminary statement shows that net trading profits, before taxation and staff funds, but after other charges, are 18 per cent. higher than for 1936-37, reaching the new record of £1,604,634, as shown in the following table:—

	Years to October 31		
	1936	1937	1938
Net trading profit, after depreciation and fees	1,234,833	1,351,596	1,604,634
Taxation	70,666	124,212	185,354
Staff funds	17,324	22,747	28,203
Preference divs.	65,000	65,000	65,000
"A" and "B" Ordinary:—			
Earned	1,081,843	1,139,637	1,326,077
Paid	797,204	868,067	868,067
Earned %	66.1	49.6	60.5
Paid %	45†	35	35‡

Contingencies fund 50,000 50,000 ...
Carried forward 808,847 1,026,671‡ 244,581‡
† And 40 per cent. capital bonus, absorbing £708,626. § After £3,745 issue expenses. ‡ In addition, 50 per cent. capital bonus; carry forward shown after deducting £1,241,100 for the bonus.

Mr Baron spoke hopefully a year ago of the prospects for 1937-38, but these results are better than were generally expected. So substantial a rise suggests that, in a period of quiet industrial conditions, Carreras' competitive position has improved. The full report and the chairman's disclosures at the annual meeting will provide an eagerly awaited indication whether the progress made last year should continue. If profits are no more than maintained in 1938-39, it would still be comfortably possible to repeat the 35 per cent. dividend on the increased capital; and since this rate has been stabilised for eight years (and supplemented on occasion by cash bonuses) it seems fair to calculate the yield on the ordinary shares at the current price of 8½ cum rights, at £6 7s. 6d. per cent.

* * *

Tube Investments Prospects.—Mr Arthur Chamberlain's speeches at the annual meetings of Tube Investments have—and deserve—a wider audience than the majority of their kind. Mr Chamberlain is frank and forthright (consider, for example, his outspoken comments on steel price policy, to which we refer on page 530), yet he takes shareholders into his confidence more willingly than many chairmen. Last year's profits, contrary to his expectation, were higher; regarding this year's profits Mr Chamberlain declined to give a forecast. He is quite prepared to find that they turn out considerably less, but sees no reason

why, if trade keeps up, they should not be greater. One thing, however, does appear to be certain—the dividend is likely to be maintained at 23½ per cent. Perhaps because Mr Chamberlain has, in his own words, been so wrong in the past, he may have under-stressed the potential earning capacity of the new productive capacity—on which £2,005,000 will have been expended between 1936 and 1939, entailing a further depreciation charge of £130,000. In the first instance, this capacity will be employed for defence purposes, though it should ultimately be occupied for commercial purposes. But Mr Chamberlain is unwilling to commit the board to a higher dividend rate before he sees how world trade stands the shock of the defence "boom." If the company's calculations are correct, there is ground for expecting that profits now being retained in the business may be capitalised and distributed. Tube Investments, of course, is not given to miscalculations—witness the success of the *liaison* with Stewarts and Lloyds, which Mr Chamberlain justifiably described as the outstanding success of modern rationalisation. The Stewarts and Lloyds holding (including the additional £203,278 of deferred stock acquired this year) stands in Tube Investments' books at par, after an allocation of £152,000 from profits last year. The question of a reserve against other investments might come forward next year—at October 31st they showed an appreciation of only £5,000 against £200,000 at an earlier date. Mr Chamberlain refuses to wear sackcloth on this account; the truth is, as he declared, that the board are manufacturers and not financiers. They can meet any criticism on the first count.

* * *

Commercial Motor Results.—An article on page 483 of last week's issue of *The Economist* showed that the total demand for commercial vehicles was not subject to the same precise cyclical influences as private cars. This conclusion is supported by the profits records both of Associated Equipment Company and Dennis Bros., which,

viewed over a long period, conform to no particular pattern. Nor do the 1937-38 results bear an identical relationship to the previous year. To the market's disappointment, the total profits of A.E.C. for the year to September 30th were 12½ per cent. lower than for 1936-37, while Dennis Bros. showed a decline of unimportant extent. For A.E.C., however, 1937-38 was not wholly unsatisfactory. Higher costs played their part, but the main cause of the setback, as Mr C. W. Reeve explained at the annual meeting this week, is that London Transport are obtaining longer working life from the buses; in consequence, replacement demand has been, and will remain, smaller. Yet ordinary business was satisfactory—the year one of the best in A.E.C.'s history. Dennis Bros. total profits are only 1½ per cent. lower than in 1936-37—a year, however, which witnessed a disappointing drop in earnings. Viewing the company's record over the past four years, it shows no positive response to recovery, but at least a commendable resistance to recession. But the directors, as we show in the following table, were determined on caution last year:—

Years to September 30th	A.E.C.			Dennis Bros.		
	1936	1937	1938	1936	1937	1938
Total profits	355,180	435,952	382,717	151,714	117,006	115,037
Depreciation	69,578	104,368	103,117	13,501	14,808	11,936
Taxation	60,000	120,000	100,000	...	...	...
Fees and other expenses	2,534	2,100	2,100	5,026	5,024	4,797
Ordinary shares:—						
Earned	223,068	209,484	177,500	133,187	97,174	98,304

† Tax free. ‡ After bringing in £8,016 balance of reserve against loan on mortgage not required.

Reduced profits have not affected A.E.C.'s 7½ per cent. tax-free dividend, and its earnings cover is still satisfactory.

ABRIDGED PARTICULARS FOR INFORMATION ONLY.

This proposal has been considered by the Foreign Transactions Advisory Committee and by the Chancellor of the Exchequer; no objection is raised to the issue but it must be clearly understood that no responsibility is taken for the financial soundness of the scheme or for the correctness of any statement made or opinion expressed in connection with it.

LONDON & BOSTON SECURITIES LTD., which is a wholly owned subsidiary company of the NATIONAL GROUP OF FIXED TRUSTS LTD., is making an

OFFER FOR SALE

of Shares of

SUPERVISED SHARES INC.

(Incorporated with Limited Liability in the State of Delaware, U.S.A.)

London Transfer Agents: BROWN, SHIPLEY & CO., Founders Court, Lothbury, London, E.C. 2.

The Offer for Sale shows *inter alia* that:

- Supervised Shares Inc. is a managed investment trust company of the Boston type, formed in the United States in 1932 to provide a convenient medium for investment in American Common Stocks. The authorised capital consists of 2,000,000 Shares of \$1 each, all of one class and all having equal voting rights.
- The management of the Corporation is closely associated with that of Massachusetts Investors Trust, the oldest and largest investment trust Company of the Boston type in the United States.
- The price at which the Shares of the Corporation are offered varies daily according to the market value of its investments, and includes a charge of approximately 8.7 per cent. of the liquidating value of the Shares. The Shares are readily marketable, as under the Certificate of Incorporation of the Corporation it is required to repurchase its own shares at the liquidating value.
- An investment in 1,000 Shares of the Corporation on 15th August, 1934, when the present management assumed control, had a liquidating value of \$9,120 on that date, and could have been purchased at that price plus the above mentioned charge. Approximately four years later, on the 31st October, 1938, the liquidating value of those shares was \$10,530, representing an increase in the liquidating value of 3.67 per cent. per annum over the period. Income paid out as dividend on such an investment during the same period is equivalent to an income yield of 4.89 per cent. per annum on the liquidating value.

Copies of the Offer for Sale, on the terms of which alone applications will be accepted, may be obtained from ANY STOCKBROKER, ANY BANK, THE LONDON TRANSFER AGENTS, or from

LONDON & BOSTON SECURITIES LIMITED

London: 5 Walbrook, E.C.4, and 45 Pall Mall, S.W.1.

Dennis Bros., on the other hand, has such a singular capitalisation that a modest net gain of £1,130 represents an increase of 9 per cent. in earnings for the 1s. shares. Commercial motor shares have some re-armament angle, but it is significant that last year Government orders represented less than 10 per cent. of A.E.C. sales. On the other hand, trolley bus manufacture has developed into an important branch of the company's activities, while London Transport replacement business will still have a considerable bearing on the company's prospects. At current prices of 31s. 10½d. and 17s. 9d., A.E.C. and Dennis yield respectively £6 10s. per cent. on a gross basis and £5 12s. 6d. per cent.

* * *

Dorman Long and South Durham.—Lord Greenwood's speech to the shareholders of Dorman Long this week was perhaps more significant for its review of the past than for its promise of the future. He emphasised, with every justification, the great technical strides which the company has made during the past few years. He showed how, in a year of falling activity (Dorman Long's own ingot output fell by 9 per cent. from 1,500,000 tons to 1,366,000 tons), the company had maintained its net profits by concentrating output on the most efficient units. This factor, indeed, may be of some importance for other steel companies, for costs were generally inflated in 1937 by abnormal pressure on plant, but may have been brought under closer control during the past year. The chairman's definition of steel cost and price policy was distinctly moderate, compared with statements made by some other spokesmen. A reasonable return on capital and provision for renewals requires a margin between costs and prices; but in Lord Greenwood's view costs should be determined neither by reference to a boom year like 1937, nor to a sub-normal year like 1935. Shareholders, however, received but little guidance on the present trend of business. The temporary stoppage of the Acklam rolling mills should not be exaggerated, for it probably results largely from price uncertainty. But short of real encouragement to demand, it is unlikely that the current year's results will be so favourable as those of last year. The full report of South Durham Steel and Iron shows that the parent company's profits fell from £258,343 to £226,161. The depreciation provision is reduced by £10,000 to £100,000, but after charging an increased sum for interest, net earnings available for the ordinary capital are reduced from £87,890 to £59,355—a sum which covers the 10 per cent. ordinary and 4 per cent. "B" ordinary dividends with a small margin. Cargo Fleet, the principal subsidiary, has suffered a more serious reduction in profits, before tax, from £284,832 to £170,085; the depreciation provision is cut from £150,000 to £100,000; and earnings for ordinary dividend are reduced from £50,143 to £5,121. Hence, no ordinary dividend is paid—a matter of £50,000 gross for South Durham. In the balance sheet, stocks have fallen significantly from £414,000 to £268,000; and there is a corresponding reduction in South Durham's stocks from £457,408 to £314,499. Such figures are a sufficient commentary on the present course of business.

* * *

Chilean Nitrate Position.—The only direct investment interest in the Chilean Nitrate and Iodine Sales Corporation report concerns the ex-Cosach debentures, for the service (but not principal) of which the Corporation has assumed liability. This service, requiring £624,143 in

1937-38, is a first charge on 75 per cent. of the Corporation's gross profit—the other 25 per cent. going to the Chilean State—and it was very comfortably covered by the profit of £1,699,013 available this year. This profit was only exceeded in 1936-37, when £1,811,282 was earned, and this year's fall was not due to lower sales, but to higher costs. In general, therefore, the investor's direct interest in the concern is well cared for. The indirect interest mainly consists of the Lautaro sterling debentures, dollar bonds, and sterling ordinary shares. The entire available profits of Lautaro (mainly derived from its share in the Sales Corporation's profits) must go to debenture and bond service, until the frozen bank loans contracted in 1930-31 have been paid off by liquidation of the frozen nitrate and iodine stocks standing against those loans. Thereafter dividends will become payable on the ordinary shares, and are likely to be justified by the higher earnings which should accrue through meeting the whole demand from new production, instead of to the extent of at least 20 per cent. from stocks. Consequently the progress made in the liquidation of these frozen stocks and loans is one of the most interesting points recorded in the accounts. The 1937-38 record of liquidation is satisfactory. Once again frozen stocks of nitrate have been reduced by approximately £1,000,000 (from £4,105,931 in 1937 to £3,017,321 in 1938), thus fully maintaining the rate of liquidation achieved in recent years. At this rate the stocks should be fully disposed of by June 30, 1941, or two years before the date contemplated. But meanwhile, though the bankers' stocks are falling, the "new production" stocks are rising. At June 30, 1938, these amounted to £587,563, against £360,926 in 1937 and £204,603 in 1936. There need, so far, be no alarm at this increase, since it is clearly necessary to build up a stock to work on after the bankers' stocks have been completely liquidated. If the movement of the two types of stock continues at its present rate, there will be no danger of a serious excess above commercial needs in 1941.

* * *

Malayan Tin.—The reports of Malayan Tin Dredging and Southern Malayan Tin confirm the suggestion of the dividend announcements—that net earnings are roughly one-third lower than in 1936-37. In both cases lower prices and production have prevailed, and further, the dredging of larger quantities of less valuable ground has resulted in a higher total of direct costs. And in both cases increased taxation has been met in part by a reduction in depreciation, which was provided in the previous year at an exceptionally generous level. While both companies have experienced about the same rate of decline in net earnings, the processes by which this result is determined are not quite identical. The drop in total revenue of Malayan Tin to £316,247 amounts to 13 per cent., for ore produced fell by only 123 tons to 2,303 tons (suggesting that quota rights were purchased on a more extensive scale than a year ago), while the average price realised was £131 7s. 3d. against £145 4s. 11d. per ton. Owing to an increase in the number of cubic yards treated, mining costs were 5½ per cent. higher; taxation requires £32,700; but depreciation takes £21,700 less. In consequence, earnings for dividend amount to £125,728 against £186,851. In recent years it has been the company's policy to distribute earnings more or less in full, and the 65 per cent. dividend is, in fact, short-earned by 2.9 per cent. The fall in Southern Malayan Tin ore recovery from 3,649 to 3,201 tons corresponds more closely to the reduction in Malayan output from 73 to 64½ per cent. of standard quotas. Total profits in this case are only 16 per cent. lower at £410,117. The net fall, however, was increased by a rise in mining costs, while taxation required £70,500. Only £4,620, against £87,397, was set aside for depreciation. The net result is that earnings are reduced to £165,955 against £251,595, to which dividends of 38½ per cent. in 1937-38 and 57½ per cent. for the previous year conformed closely. Tin companies may view the price position more hopefully than a year ago, but it is being won at the expense of a general tin quota of no more than 45 per cent., of which 10 per cent. is devoted to the buffer pool.

THE BRITISH OVERSEAS BANK, LIMITED.

ESTABLISHED 1919

Report by the Board of Directors to the NINETEENTH ANNUAL GENERAL MEETING of SHAREHOLDERS to be held in the BANK PREMISES, 33, GRACECHURCH STREET (LOMBARD COURT), LONDON, E.C.3, on WEDNESDAY, the FOURTEENTH day of DECEMBER, 1938, at 12 noon.

The Directors submit to the Shareholders the Balance Sheet of the Bank, as at 31st October, 1938, and Profit and Loss Account, together with copy of the Auditors' Certificate.

The Profit, after allowing rebate of interest and providing for all bad and doubtful debts (other than provided for out of Contingencies Account), for the year ended 31st October, 1938, amounts to

Balance available from last account

Making a total of

which it is proposed to appropriate as follows:—

To Contingencies Account

„ carry forward to next year

As a result of conditions ruling in several of the countries in which the Bank has done business some of the assets of the Bank have become difficult of immediate realisation. Arrangements have therefore been made for the provision of a deferred deposit of sufficient amount, together with the liquid assets, to cover the existing liabilities of the Bank to its creditors and depositors.

The term of office of Mr. Duncan A. Stirling as Deputy Chairman, having expired on 31st October, 1938, Mr. Louis E. Meinertzhagen has been appointed to succeed him.

The directors retiring by rotation are Mr. Arthur C. D. Gairdner, Mr. Louis E. Meinertzhagen and Mr. Duncan A. Stirling, who, being eligible, offer themselves for re-election.

The Auditors, Messrs. George A. Touche & Co., and Messrs. McClelland, Ker & Co., also retire, and, being eligible, offer themselves for re-appointment.

By Order of the Board,

London, E.C. 6th December, 1938.

A. E. THORNE, Secretary.

AUDITORS' REPORT TO THE MEMBERS.

We have examined the above Balance Sheet and compared it with the books of the Bank. We have satisfied ourselves as to the correctness of the Cash Balances and the Bills of Exchange, and have verified the Securities. We have obtained all the information and explanations we have required, and are of the opinion that the Balance Sheet is properly drawn up so as to exhibit a true and correct view of the state of the Bank's affairs, according to the best of our information and the explanations given to us, and as shown by the books of the Bank.

MATURED AND BOTTLED AT CHATEAU DE COGNAC

The Week's Company Profits.—An unusually large number of companies have issued reports during the week, and our weekly analysis of profit and loss accounts on page 579 covers 81 companies, excluding six for which comparable figures are not available. These companies have reported net profits of £5,518,000, a decline of 7 per cent. compared with total earnings of £5,944,000 for their preceding financial years. The aggregate net profits of 2,306 companies reporting this year to date amount to £289,436,000 against £268,621,000—an increase of 7½ per cent. We discuss the week's results in preceding Notes and on page 558 under the heading "Shorter Comments."

Company Meetings of the Week.—In this issue, reports of company meetings begin on page 566. Sir J. Caulett's speech at the *Barclays Bank (Dominion, Colonial and Overseas)* meeting is discussed in a Note on page 548. On pages 550 and 552 we comment upon the speeches at the *Peninsular and Oriental Steam Navigation, Tube Investments* and *Dorman Long* annual meetings. Addressing members of *Strand Hotel*, Major M. Gluckstein disclosed that the profit balance of £123,000 had been arrived at after setting aside for contingencies a smaller amount than in the preceding year. At the *Charterhouse Investment Trust* meeting, Sir Arthur H. Marshall explained the advisability of segregating the new issue and finance activities into a separate but wholly-owned subsidiary. Shareholders of *Cam and Motor Gold Mining* were informed by Viscount Elibank that at June 30th last

the tonnage of payable ore reserves was nearly five years ahead of the mill. At the *Oroville Dredging* meeting, Mr Frederick W. Baker informed members that with the commissioning of the fifth dredge, the construction programme of *Pato Consolidated Gold Dredging* had been completed. At the *Gold Coast Main Reef* meeting, Major E. Seaborn Marks said that the company now had a mine capable of an output of 6,000 tons a month, while the ore was enough to keep the mill operating for over three years. At the *Tobacco Securities Trust* meeting, Lord Catto of Cairncatto discussed the Trust's policy of confining its investments mainly to the parent company and to Tobacco Investments, Limited. Sir Trevredyn Wynne, addressing members of *Bengal Nagpur Railway*, explained that more roads were wanted in India and that they should be built as feeders to Indian railways. Reasons for last year's disappointing experience were suggested by Mr Fred. Hopper at the *Elswick-Hopper Cycle and Motor* meeting. The chairman suggested that purchasers, having forestalled the rise in material costs before it became operative in increased selling prices, had in fact over-stocked, and consequently placed lower orders last year. At the *British Tyre and Rubber* meeting, Sir Walfrond Sinclair pointed out that the company's profits had increased for the seventh consecutive year. Successful drilling of the Offin River alluvial areas was described by Mr H. G. Latilla at the *Gold Coast Selection Trust* meeting. At the *Marlu Gold Mining* areas meeting, Mr Latilla declared there was reason to think that in the near future some 75,000 tons a month would pass through the mill.

THE STOCK EXCHANGES

London

SETTLING DAYS

TICKET ACCOUNT
DECEMBER 20 DECEMBER 22

AFTER two weak opening days, the Stock Exchange managed to find a more stable dealing basis in mid-week, but a renewal of selling from home and abroad again produced substantial falls on Thursday. Therepatiation of French funds found a counterpart in selling of gilt-edged and Kaffirs, which led in the first group to falls of up to half a point on the undated stocks both on Monday and Tuesday. Political fears continued to depress the market, and Earl De la Warr's week-end speech was followed by Mr Pirow's gloomy prophecies. Until mid-week, the Franco-German Pact had little effect on business and even then its coincidence with the growing colonial agitation in Italy did not encourage much new business. On Thursday, Mr Malcolm MacDonald's statement regarding the Government's attitude towards colonies assisted the Kaffir market, but only temporarily.

After a weak opening, *gilt-edged*

stocks were further depressed by heavy selling from Paris, and Old Consols closed ½ lower. Depression continued on Tuesday, and despite a closing rally further losses ranging up to ½ were recorded. These losses were temporarily regained in mid-week, only to be repeated on Thursday when selling was resumed. Among Dominion stocks, New Zealand issues were quoted on a lower and wider basis following the announcement of trade and exchange regulations, despite the fact that these are officially attributed to the need for safeguarding the debt service. The Australian stocks moved to lower levels on the conversion announcement (discussed on page 548).

Interest in *foreign bonds* was small. European issues reflected the outbreak of political irritation, while Brazilian issues lost ground on balance, despite the small mid-week rally. The heavy increase in Japan's budget produced significant losses in the bonds, though Chinese issues generally remained firm.

Home rail debenture and guaranteed stocks remained the target for selling and the week's traffic loss of £319,000

caused further concern regarding the position of the marginal stocks. In the debenture list, Southern 4 per cents. lost a point on Wednesday, while L. & N.E. guaranteed stocks, whose position is most vulnerable in this section, were especially flat. Interest in the Argentine rail market was concentrated mainly upon Cordoba debenture issues, in anticipation of the Argentine Senate's approval of the Purchase Bill.

In accordance with a pattern which has now become familiar, industrial shares opened in dull fashion, but conditions became slightly brighter in mid-week. The undertone was helped on Wednesday by the signing of the Franco-German pact and by a good tone on Wall Street. But this gave no inkling of the heavy falls which occurred in leading industrial shares on Thursday. With some notable exceptions, iron and steel shares were dull to start with, and irregularity was intensified by discussions on the probable trend of steel prices. Thornycroft were again in demand, and Swan, Hunter went ahead on news of the big order for merchant ships for Turkey. South Durham gave way slightly on the report. Coal shares were consistently dull, and the Doncaster Amalgamated dividend decision did not help matters. Engineering issues were irregular. R. A. Lister improved on the good report, while Henry Meadows gained on trade news, reacted after the meeting, and then recovered. J. Brockhouse were weak. Electrical equipment shares were uninteresting and inclined to react. On Thursday, British Insulated Cables and Callenders' Cable were unsettled. The undertone in motor shares continued weak. Except for some momentary support for A.E.C., the "heavy" group weakened, and Raleigh Cycle gave way on the issue of the full report. Nor did aircraft shares show a consistent trend. The brightest spots were Boulton and Paul, Airspeed Preferred and Westland.

INVESTORS' INCOME & RESERVE TRUST

The new unit trust with the unique reserve plan

Against a common portfolio of no less than 175 first-class preference and ordinary shares, two types of sub-units are presented, on one of which 2/5ths of the income arising is held to reserve. You apportion your investment to suit your needs and you can change from one type of sub-unit to the other.

Sub-units may be purchased at approximately 21/- and sums from approximately £50 can be invested.

Apply for the booklet D19, obtainable free from your stockbroker or bank manager (whom you should consult) or direct from Security Trust Managers Ltd., 15 Moorgate, London, E.C.2.

Rayon shares and textiles generally continued neglected. Tobacco shares were helped by the good Carreras results, but reacted sharply on Thursday. Breweries gave way slightly, and then in mid-week remained fairly steady, though Seager Evans fell back on the reduced dividend. Provision and catering issues were uncertain; pending the meeting, Tate and Lyle fell back, then rallied slightly. Quotations for store shares were generally easier. Miscellaneous industrials were seriously affected by Thursday's selling. Falls of 1s. were recorded in Woolworth, and smaller reactions in Courtaulds and Imperial Chemical Industries.

Business in the oil share market opened on a trifling scale. There was some Paris selling on Monday, a tendency towards slightly firmer conditions on Tuesday, before severe selling occurred on Thursday in the leaders. Rubber shares were not helped by the slight improvement on Wednesday and remained inactive in the extreme. Price changes, where they occurred, were adverse. The tone in tea shares was relatively satisfactory.

Mining shares followed the general trend, and while at no time was there a marked improvement in turnover, sentiment hardened in mid-week after an uninspiring start. Among Kaffirs, dividend-payers opened weak, mainly on Paris selling; when this selling stopped, and Cape support for the developing mines revived a little, the tone improved. Rhodesian copper shares were weak at first, but improved on news that output would be further restricted. Business, however, failed to broaden. Other base metal shares were neglected.

New York

WALL STREET cannot make up its mind. Price movements have been irregular, and compared with a month ago, turnover has been falling. Monday was a thoroughly idle day, with sagging prices, thin trading, and a turnover of no more than 680,000 shares. There was a noticeable improvement on Tuesday, but the advance lacked any solid basis, and towards mid-week prices and activity again began to react. The unsatisfactory tendency could in part be attributed to end-of-year tax sales, but the fundamental trouble was lack of buying support until the situation in Europe is clarified. Steels, however, made a relatively good showing, despite the reduction in steel output (as estimated by the American Iron and Steel Institute) from 60.7 to 59.9 per cent., since it was believed that the December decline would be less than had been feared. The aircraft section was the most active and led Tuesday's upswing. At one time railroad stocks were supported on indications of higher carloadings.

Capital Issues

THE capital market this week has seen the resumption of trustee borrowing—but on a 4 per cent. basis. The terms of this latest *Australia* conversion operation are discussed on page 548. The shares of *Supervised Shares, Inc.*, though marketed by an offer for sale, are closely allied to a unit trust offer. Some points arising from the offer are discussed on page 549. The 5½ per cent. £1 preference shares of *Taylor Tunnicliffe (Electrical Industries)*, offered at 21s., are well secured by profits, which have shown a consistent expansion during the past five years. Statements for information issued this week relate to the 5½ per cent. cumulative £1 preference shares of *Dutton's Lancashire and Yorkshire Brewery Corporation* (unconditionally guaranteed by Dutton's Blackburn Brewery), and to the 5½ per cent. redeemable cumulative preference shares of *Boosey and Hawkes*.

LONDON ACTIVE SECURITY PRICES AND YIELDS

In calculating yields of fixed interest stocks allowance is made for interest accrued since the last date of payment, less income tax at the standard rate. Where stocks are definitely redeemable at a certain date the yield includes any profit or loss on redemption; where stocks are redeemable at or before a certain date the final date of redemption is taken when the stock stands at a discount and the earliest date when the quotation is above par. The return on ordinary stocks and shares is calculated by reference to the latest dividends, account being taken of any increase or reduction of interim dividends. Allowance is made for accrued dividends in calculating the yield on "cum div." shares.

Note.—"Old Basis" includes only public issues and issues to shareholders only. "New Basis" includes all new capital in which permission to deal has been granted.

CONVERSIONS AND REPAYMENTS

Commonwealth of Australia.—Issue of £2,517,800 4 per cent. registered stock at 100, offered in conversion to holders of South Australia 3½ per cent. inscribed stock, due January, 1939. New stock (identical with £9,322,446 already quoted) redeemable at par July, 1970, or from 1955 on notice. Population, 1938: 6,864,000. Public debt per head, £stg. 165 10s. 6d. Total revenue, 1937-38, £89,458,154.

BY OFFER FOR SALE

Taylor Tunnicliff (Electrical Industries).—Offer for sale of 200,000 5½ per cent. cumulative £1 preference shares at 21s. Acquires capitals of three companies (one with a subsidiary) making insulators and special porcelain. Combined profits after depreciation: 1935, £58,346; 1936, £75,826; 1937, £91,096. Combined net assets, £368,294. Standard Industrial Trust sell operating companies' shares to company for £510,000 (£210,000 cash and 1,200,000 5s. ordinary shares), and take this issue at 21s., or 20s. 8½d. net, allowing for dividend receivable and expenses. List closed at 9.5 a.m. December 7th. Oversubscribed.

BY STOCK EXCHANGE INTRODUCTION

Dutton's Lancashire and Yorkshire Brewery Company.—Particulars of £480,000 5 per cent. (Seed's) debenture stock; and of 350,000 5½ per cent. cumulative guaranteed £1 preference shares, guaranteed by Dutton's Blackburn Brewery unconditionally. Profits of company and subsidiaries, years ending in 1936-37, £101,024; 1937-38, £112,974. Net assets (after other debenture issues), £1,366,555. 5 per cent. (Seed's) debenture stock issued as part of £706,000 purchase price (rest in cash) for Richard Seed and Company. John Prust and Company take preference shares at 19s. 8½d.

Boosey and Hawkes.—Particulars relating to £300,000 5½ per cent. cumulative £1 first preference shares (taken by Anglo-French Banking Corporation at 19s. net). Music publishers, etc. Net proceeds of £282,000 to redeem loans, etc. Total assets end 1937, £563,219. Combined profits: 1935, £26,877; 1936, £31,346; 1937, £46,278.

FORTHCOMING ISSUE

North Metropolitan Electric Power.—Lists will open and close on Monday next, December 12th, for an issue of £1,000,000 4 per cent. cumulative preference stock at par. The stock will rank *pari passu* with the existing 6 per cent. preference stock for capital and dividend. The company supplies an area of 670 square miles, extending from North London to North Herts. Proceeds of the issue will be applied to the general development of the business. Profits, after working expenses and depreciation, debenture interest and debt redemption provisions: 1934, £353,113; 1935, £370,362; 1936, £405,955; 1937, £402,852.

UNIT TRUSTS

Supervised Shares Inc.—London and Boston Securities, Ltd. (associated with National Group of Fixed Trusts) have acquired right to purchase these shares, and offer them for sale. Managed investment company of Boston type, undertaking to repurchase own shares. (Share capital, \$1 shares: authorised 2,000,000; with public, 938,027; held by corporation, 71,656). Invests mainly in common stocks. Earned per share outstanding: 1935, \$0.453; 1936, \$0.581; 1937, \$0.470.

The Commodity Share Trust.—Flexible unit trust of cash fund type, with authorised list of investments in base metal, coal, plantation, pastoral, oil, etc., companies. Managers, Improving Securities Trust, Ltd. Custodian trustee, Martins Bank, Ltd. Distribution, January 31st, July 31st. Life, 21 years. Service charge, 5 per cent. included in the price plus price adjustments, and half-yearly charge of ¼ per cent of trust fund.

BONUS SHARES

Carreras, Limited.—It is proposed to distribute bonus shares in the proportion of four "B" ordinary shares of 2s. 6d. for each £1 ordinary or "A" ordinary, and one "B" ordinary share for every two "B" ordinary held on January 4, 1939.

Scottish Motor Traction.—It is proposed to capitalise £214,610 of undivided profits and to make a free bonus distribution of £1 ordinary for every four held on December 21st.

PRIVATE PLACINGS

British American Oil.—Robert Benson and Company have subscribed for an issue at \$20 of 150,000 common shares of no par value of this company.

Atkinsons Brewery.—This company is placing privately £325,000 4½ per cent. debenture stock, thus raising the amount in issue to the authorised total of £600,000.

Venesta, Ltd.—This company has placed privately £119,600 4½ per cent. first mortgage redeemable debenture stock to repay 4½ per cent. registered notes.

Llanely Electric Supply.—This company has issued privately 40,000 6 per cent. £1 cumulative preference and 40,000 £1 ordinary shares.

ISSUES TO SHAREHOLDERS ONLY

Beacon Insurance.—Issue of 20,000 16s. 3d. shares, 5s. to be paid up, at 45s., in proportion of one new share for eight held. These shares will be entitled to a full year's dividend for 1939.

Boulton Paul Aircraft.—Issue of 400,000 5s. shares at 6s., to ordinary shareholders, on November 28th at rate of one new ordinary for four ordinary held.

East Daggafontein Mines.—Issue of 900,000 10s. shares at 20s., in the ratio of one for every three held on December 17th.

Guy Motors.—Issue of 800,946 1s. shares at 2s. to existing holders of preference and ordinary shares, in proportion of one for four held.

SHORTER COMMENTS

Company Results of the Week.—Profits of brewery companies continue to make a mixed showing. Thus BENSIN's

WATFORD and P. PHIPPS AND COMPANY are reducing their dividends from 20 per cent. and 15 per cent. tax free to 18½ per cent. and 13½ per cent. tax free, respectively, while a small improvement is shown by the BRICKWOOD AND COMPANY profits from £261,388 to £268,949. The heavy fall in wool prices, and drought in Victoria and New South Wales have affected NEW ZEALAND LOAN AND MERCANTILE AGENCY profits, which have fallen from £136,012 to £82,365. The net profits of SECOND COVENT GARDEN PROPERTY are practically unchanged at £66,300, and the 7½ per cent. dividend is maintained. GLASS HOUGHTON COLLIERIES profits, at £52,057, are less than half those for 1936-37, a disappointing result which is matched by the cut in dividend from 12½ to 4 per cent., through the omission of a final dividend. A satisfactory improvement in profits is recorded by R. A. LISTER AND COMPANY, who show trading profits of £265,922 against £204,142. The full report of RALEIGH CYCLE HOLDINGS confirms the impression made by the preliminary figures; net profits are £54,000 lower at £224,383. Though the four investment trusts to issue reports this week have all maintained their dividend, net revenue is in each case lower. Having achieved a new sales record, AVON INDIA RUBBER show a small but satisfactory increase in profits, and the dividend is raised by 1 per cent. to 8 per cent. J. BROCKHOUSE AND COMPANY have earned nearly £30,000 less at £111,543, but the prosperity of previous years was somewhat exceptional. Total profits of ILFORD LTD., are £132,962 against £138,337, but the 8 per cent. dividend is maintained. RONEO, LTD., report that some progress has been made in increasing turnover, and dividends are resumed with a payment of 10 per cent. A satisfactory improvement in profits is shown by WATERLOW AND SONS, whose distribution is raised from 6½ to 7½ per cent., after earning £22,000 more at £235,441. MANBRE AND GARTON, LTD., show net profits of £387,043 against £375,193, but no change is made in the dividend. HARRODS (BUENOS AIRES), LTD., have made further progress, net profits of £317,175 comparing with £282,725, while the 1½ per cent. dividend is repeated. During 1937-38 total sales of AGAR CROSS AND COMPANY improved, and the trading balance is £246,459 against £176,247. Since, however, £84,673 was obtained in 1936-37 from interest over-provided in previous years, net profits are £194,787 against £227,505, and the debit balance forward has been reduced to £115,408.

MISCELLANEOUS

Westland Aircraft, Ltd.—Profit year to June 30, 1938, £37,531, against £25,755. To taxation reserve £13,000 (£7,500). Ordinary dividend raised from 5 to 8 per cent. To general reserve £10,000. Carry forward £8,154.

Brickwood and Company.—Net profit for year to September 30, 1938, £237,073 (against £225,963) before £76,572 (£66,844) for income tax and N.D.C. Ordinary dividend maintained at 15 per cent. To general reserve £35,000 as before. Carry forward increased from £75,098 to £82,750.

Walker and Homfrays, Ltd.—Net profit for year to September 30, 1938, £15,021 against £15,763. Carry forward £15,000 higher at £48,729.

Bensin's Watford Brewery.—Net profit year ended September 30, 1938, shows a fall from £266,100 to £255,167. Ordinary dividend reduced from 20 to 18½ per cent. To reserve £37,000 (£25,000). To improvements reserve £25,000 as before. To pension fund £5,000. Carry forward £163,925.

Horrockses Crewdson and Company.—Trading loss year to October 31, 1938, £49,525 against a trading profit of £26,985. Net loss £94,426, increasing debit forward to £104,630.

(Continued on page 577)

Industry and Trade

Rise in Unemployment.—The changes in employment between October 17th and November 14th still give no definite indication of the course of business activity. The number of registered unemployed in Great Britain (inclusive of agriculture) rose by 47,000 during this period, compared with an increase of 109,000 a year ago. But although the increase between October and November this year was not as large as in 1937, the deterioration cannot be ascribed to seasonal influences. Indeed, our index of unemployment, which is adjusted for seasonal variations, rose from 87.6 (1935 = 100) in October to 89.6 in November. The most unsatisfactory feature is the rapid growth in the number of wholly unemployed persons. The decline in the number of insured persons aged 16 to 64 employed in Great Britain (exclusive of agriculture) was less marked between October and November than the increase in unemployment; it amounted to 27,000 against 84,000 a year ago. The fall, moreover, was not large enough to alter our index of employment, which has remained unchanged at 110 (1935 = 100) since July. A monthly record of changes in unemployment and employment since September, 1937, is given below:—

EMPLOYMENT AND UNEMPLOYMENT IN GREAT BRITAIN							
Date of Return	Unemployment				Employment		
	Registered unemployed aged 14 and over (incl. agriculture)			Percentage of insured persons (aged 16-64) unemployed (excl. agriculture)	Insured persons aged 16-64 employed (excl. agriculture)		
	Total		Of whom wholly unemployed		Number	Index, adjusted for seasonal variations	
	Number	Index, adjusted for seasonal variations					
1937	'000	1935 = 100	'000	%	'000	1935 = 100	
Sept. 13	1,339	66.1	1,091	9.5	11,707	112½	
Oct. 18	1,390	68.5	1,160	9.9	11,664	112	
Nov. 15	1,499	73.4	1,228	10.7	11,580	111½	
Dec. 13	1,665	83.5	1,284	11.8	11,444	109½	
1938							
Jan. 17	1,828	83.5	1,419	12.9	11,319	110½	
Feb. 14	1,810	84.0	1,405	12.8	11,338	110	
March 14	1,749	85.8	1,350	12.5	11,390	109½	
April 4	1,748	87.9	1,321	12.5	11,412	109½	
May 16	1,779	89.5	1,314	12.7	11,406	109½	
June 13	1,803	91.0	1,269	13.0	11,369	109	
July 18	1,773	87.4	1,244	12.9	11,413	110	
Aug. 15	1,759	86.4	1,262	12.7	11,447	110	
Sept. 12	1,799	88.6	1,324	12.9	11,429	110	
Oct. 17	1,781	87.6	1,409	12.7	11,455	110	
Nov. 14	1,828	89.6	1,456	...	11,428	110	

An examination of the incidence of changes in unemployment between October and November throws further light on the aftermath of the political crisis in September. The improvement in the coal and iron and steel industries is revealed to have been temporary, for unemployment showed an increase in both trades. On the other hand, the fillip given to the cotton and wool textile industries by the spurt in new orders in October was responsible for a further reduction in unemployment in these branches of activity. The fall in unemployment in the metal goods manufacturing trades and in the motor and aircraft industries may be ascribed, at least in part, to the increase in armament orders, though the production of private motor cars is also believed to have shown an increase. The increase of 16,618 in the number of unemployed persons in building and public works contracting, on the other hand, can be attributed largely to seasonal influences. Industry is thus still marking time.

Cotton Trade Enabling Bill.—The first draft of an Enabling Bill for the cotton industry prepared by the Joint Committee of Cotton Trade Organisations was referred back by the Board of Trade in May of this year for further examination with a view to securing a

greater measure of common agreement in the trade. It has reappeared in its revised form this week. The general structure of the proposals remains as previously adumbrated—namely, a central Cotton Industry Board with subsidiary bodies appointed to administer schemes for different sections of the industry. The nature of these schemes has been reduced to two—proposals for the elimination or reduction of surplus plant and for the maintenance of minimum prices or margins. A praiseworthy effort has been made to meet the objections raised against some provisions of the earlier Bill. Thus, the independent Chairman is to be assisted by two other independent members. Further, there are to be impartial investigators into costs to ensure that minimum prices are no more than sufficient to cover the costs, including interest and depreciation, on a reasonable capital basis, of efficient and well-equipped mills working full-time. Finally, there are special provisions for export trade, permitting the Chairman and the independent members of the Board to allow departures from the fixed prices for export business. Levies for scientific, technical and economic research are also provided for. With these safeguards, and in the circumstances of the cotton industry, the Bill has been purged of all power to harm the community at large. It is a question, however, whether it has not also been purged of most of its power to help Lancashire. The difficulties of the Enabling Bill method have, indeed, been shown up. There is inevitably an element of conflict between what the members of an industry would like to do if they had monopoly powers and what it is in the public interest that they should be allowed to do. If the safeguards in the present Bill had been applied, for example, to the steel industry, the country would have been better off as a result. But the steel industry might not. The question arises whether there is such a thing as a cartel of individual firms that is both beneficial to its members and harmless to the general interest.

Tinplates at Ebbw Vale.—By a provisional agreement under the South Wales Tinplate Pooling Scheme, the tinplate output quota of the new strip mills of Messrs Richard Thomas, at Ebbw Vale, was fixed at 3 million boxes (approximately 150,000 tons) per annum. The output of tinplates will thus employ 25 per cent. of the total estimated capacity of the new mills. Some time ago it was reported that this quota would include about 75,000 tons of tinplates transferred from the existing works of the Company in other parts of South Wales and Monmouthshire. If this arrangement has been confirmed, the quota of the company and its subsidiaries will be equivalent to

about 60 per cent. of the total output of the industry, amounting to 18,126,285 boxes in 1937. But, like that of the existing mills, the actual output of the new strip mill in 1937 will be regulated by the provisions of the pooling system and, therefore, will be subject to fluctuations in trade. During the past week the repercussions of the new Ebbw Vale works on the existing factories in South Wales and Monmouthshire were the subject of questions in Parliament and of discussions in South Wales by the associated manufacturers and by the Joint Industrial Council for the industry. It is admitted that there is a considerable quantity of out-of-date and redundant plant in the industry, and at a meeting of the Industrial Council on Tuesday a Joint Committee was appointed to investigate the effect on employment by the temporary or permanent closing down of some of the existing mills and to consider how the hardships of persons thrown out of work might be mitigated.

* * *

Third Quarter's Coal-mining Results.—The Mines Department has provisionally estimated the credit balance of the British coal-mining industry in the third quarter of the current year at about 9d. per ton, compared with 8.18d. per ton in the second quarter and 7.82d. per ton in the corresponding period of 1937. The third quarter is normally one of the quietest periods in the coal trade, and this year the usual seasonal inactivity in the demand for coal for household consumption was accompanied by a sharp contraction in the fuel requirements of industry, especially of the iron and steel trade. An unexpected expansion in coke exports led to a slight increase in the total volume of the coal, coke and patent fuel trade. Total production in the third quarter, at 52.4 million tons, was about 1½ million tons less than in the second quarter and 5 million tons less than in the corresponding quarter of 1937, while the quantity of coal available for consumption in Great Britain was 2.2 million tons less than in the second quarter and 2.1 million tons less than in the third quarter of 1937. Moreover, market prices were lower; the Board of Trade index shows a decrease of 3.6 per cent. between the second and third quarters of this year. The various districts, however, were unequally affected by these changes. In some of them contracts extended over longer periods and provided for higher prices than in others. The Midland coalfields were more adversely affected by seasonal influences than those of South Wales, Northumberland, and Durham. Again, changes in wage rates affected labour costs in some districts but not in others where the guaranteed minimum wage rates were above the rates certified by the joint accountants under the monthly or quarterly ascertainties. All the leading districts show credit balances for the third quarter. In Nottinghamshire and Derby they rose from £8,627 in the second to £346,050 in the third quarter; in Scotland from £361,882 to £366,151; and in Northumberland from £166,344 to £170,542. On the other hand, the credit balance fell from £258,374 to £176,152 in Durham; from £302,626 to £135,967 in Lancashire, Cheshire and N. Staffordshire; from £198,737 to £184,630 in Yorkshire; and from £108,275 to £41,559 in South Wales. For the industry as a whole the credit balance was just under £1,600,000 in the third quarter, compared with £1,604,106 in the second quarter and £1,676,228 in the corresponding period last year. The prospects point to an improvement in the last three months of the year. Scotland would appear to be one of the best organised coalfields for marketing purposes under the existing system of regulation, and in that coalfield in the month of October there was a credit balance of £269,634, compared with £260,298 in October, 1937.

International Coal Negotiations.—The recent announcement in the House of Commons that the Secretary for Mines hoped shortly to make a statement on the question of subsidising British coal exports has aroused interest in quarters concerned with the preparation of an international coal scheme. The basis for the conclusion of such an agreement was discussed in *The Economist* of September 10th. Owing to the political crisis, these negotiations were interrupted, and the suggested conference in September did not take place. Although an advanced stage has been reached with regard to the statistical basis of the proposed agreement, the differences of opinion concerning the period on which quotas are to be based are as marked as ever. Whereas the recent loss of orders from consumers which have hitherto been supplied almost exclusively by Welsh exporters has strengthened the desire of British coal owners to come to an international understanding, German exporters, although professing to favour an agreement, are not inclined to facilitate a solution by making even the slightest sacrifices. Maintaining that the British plan of subsidising coal exports does not constitute a serious threat, German exporters feel sure that their system of promoting exports cannot easily be imitated by other countries and that, therefore, their quota demands will have to be accepted if an understanding is to be reached. In these circumstances, a provisional solution might possibly be found by price agreements on a number of markets without allocation of quotas. Ultimately, however, no price agreement could be made effective without the control of supplies.

* * *

The New Business Committee for Armaments.—In normal times, the large purchases of the various Ministries are made on a system of tender. Firms are invited to tender for contracts about to be placed; the quotations so obtained are compared and one is selected which, to use the customary phrase, is "fair and reasonable." Given a considerable degree of competition between the contractors, this long established practice ensures that the State obtains good value for its expenditure, even if it involves considerable delay. But the magnitude of the present re-armament programme and the speed at which it must be executed necessitates the employment of every firm that can contribute to the supply of materials. Hence, the economic safeguards which the State obtains by competition among contractors, have come to be the exception rather than the rule. Contracts can no longer be adequately checked against each other; the price quoted by a firm to which the production of some re-armament requisite has been allotted must be checked item by item, so as to reveal, not only exorbitant charges, but also expensive methods of production. Not infrequently, much time and money can be saved in production by making some apparently insignificant modification in design, but only men with both technical and commercial experience are competent to scrutinise in detail a quotation and to confer effectively with the contractors. Unfortunately, the staffs of the contract departments in the various Ministries have, as a rule, rather inadequate experience of the commercial and the technical problems of the industries which supply the goods required by the State. Thus, there is need for an intermediary, possessing very considerable commercial experience, between the various contract departments and the contractors throughout the country. It is apparently intended that the new Committee of business men, whose appointment was announced some days ago by the Prime Minister, should act as such an intermediary. It is to be hoped that the new Committee will keep very closely in touch with the contractors and will have power to co-opt, as occasion might require, additional temporary members to advise them on particular subjects.

* * *

An International Wheat Agreement.—In *The Economist* of October 15th we recorded the initiative taken by the United States in an attempt to conclude an international wheat marketing agreement. Earlier this

week it was learned that two international wheat conferences are to be held shortly. The first will take place in Winnipeg in the next few days, and will be largely concerned with the marketing of the Canadian wheat crop, which, at 358.4 million bushels, is practically twice as large as last year's harvest. But as the conference is to be attended by the United States' Under-Secretary of Agriculture and—on the intervention of the United States—by a Government representative from Argentina, it will be a prelude to the meeting of the International Wheat Advisory Committee on January 10, 1939. The Committee, which is to meet in London, will consider, and recommend to the Governments concerned, a course of action designed to mitigate the present world wheat crisis. So far as can be ascertained, the Government of the United States is anxious to secure the conclusion of an international marketing agreement. The aim of the United States is likely to be supported by Australia, the United Kingdom, France, Canada and the Danubian exporting countries. Russia, too, is expected to co-operate. The most difficult member of the Committee is likely to be Argentina, which, though not opposed to co-operation, would apparently prefer not to inaugurate export control before August 1, 1939, the beginning of the next crop year. This suggestion does not meet with favour in the United States, for, according to the International Institute of Agriculture, the world's exportable supplies of wheat this season, at 1,135 million bushels, are 60 per cent. higher than in 1937-38, while the world's estimated import requirements, at 540 million bushels, are only 3 per cent. up on the year. Should the Argentina refuse to join the proposed agreement, the United States may initiate a wheat export drive to Brazil (one of Argentina's best markets), which may eventually force her to yield to the American demand. The prospects of the London meeting, therefore, are not unfavourable, though the solution of the wheat problem is an exceedingly difficult task.

Fall in Shipping Freight Rates.—Following a slight recovery in August and September, tramp shipping freight rates resumed their downward trend in October. As our index shows, the past month witnessed a further decline:—

The Economist INDEX OF FREIGHT RATES
(1898 = 1913 = 100)

	Average, 1913	Nov. 1937	Aug. 1938	Sept. 1938	Oct. 1938	Nov. 1938
European waters	110.0	164.2	103.8	107.7	110.5	108.0
North America	113.1	130.2	110.1	110.2	110.8	111.0
South America	123.4	125.0	124.8	121.3	117.2	116.0
India	106.3	161.9	110.0	113.7	112.7	108.1
Far East and Pacific	117.4	149.1	106.2	112.8	104.5	101.3
Australia	127.9	146.3	113.0	112.2	111.6	112.2
Total	116.3	146.1	111.3	113.0	111.2	109.4
1913 = 100	100.0	125.6	95.7	97.2	95.6	94.1

The more detailed analysis of changes in freight rates between October and November reveals that few shipping routes escaped the downward trend:—

	Index No.	Inc. or Dec. Points		Index No.	Inc. or Dec. Points
Home trade	95.2	- 1.8	South America:—	78.6	- 2.3

The immediate outlook, moreover, is not very promising, for there are no indications of an early increase in chartering. While the downward trend of freight rates is due, largely, to the contraction of international trade, British shipping is also suffering from subsidised competition, against which it is almost helpless. It is scarcely surprising, therefore, that the demand for some form of Government assistance to shipping and shipbuilding is growing more insistent.

Wholesale Prices Fall Again.—There has been a fresh fall in British wholesale prices, which has carried both *Economist* sterling index numbers to a low point for the year. During the past fortnight the complete British index has fallen by 0.9 per cent. and the primary products index by 0.5 per cent. American prices are firmer, for the complete Irving Fisher index number has only fallen from 116.7 to 116.6, while *The Economist* primary products index has risen by 0.5 per cent. There is little change in Continental prices.

LIVERPOOL

The port of the North—with easy access to the Midlands—just over three hours from London—and everything necessary to the smooth running of modern industry.

Labour, warehousing, power, transport (by ship, rail, road, air or canal) all "laid on"—in planned factory estates.

Build your factory in the ideal spot—Liverpool Corporation have sites available and can help to finance the cost of land and buildings

for industry

Manufacturers and Industrialists are invited to write for illustrated brochure "INDUSTRIAL LIVERPOOL," which will be sent on request. Application should be made to the Town Clerk, Corporation of Liverpool, Municipal Buildings, Liverpool 2

The Economist INDEX
(1927 = 100)

	Sept. 18, 1931	Dec. 1, 1937	Nov. 23, 1938	Dec. 7, 1938

Textiles	43.7	58.9	53.6	52.7
Minerals	67.4	95.9	95.5	94.2
Miscellaneous	65.8	79.3	75.5	75.3
Complete index	60.4	77.0	69.0	68.4
1913 = 100	83.1	105.9	95.0	94.2
1924 = 100	52.2	66.5	59.7	59.2

Grain prices were steadier, and there was an advance in bacon, but meat is cheaper. There were only minor changes in the other foods group. Cotton and wool prices were easier, but there was a recovery in flax. Non-ferrous metals are mostly lower. Among miscellaneous materials, there were small declines in hides, linseed oil, tallow and rubber, offset by advances in soda crystals and sulphate of ammonia.

* * *

Lead and Spelter Co-operation.—At the annual meeting of the Mexican Corporation early this week, Mr F. W. Baker, the chairman, briefly referred to the recently formed international lead cartel. "Should this cartel continue to operate with benefit to those interested,"

Mr Baker said, "... we should secure a fair price for the product. I am not without hope that this effort to stabilise the price of lead may be followed by a similar effort to stabilise the price of zinc." Although no official announcement has been made, this statement indicated that the international lead scheme has already come into operation. It also indicated that the discussions between zinc producers have not yet been concluded. The formation of the International Lead Producers' Association early in September is the first endeavour to control the output of lead. Unfortunately there is reason to believe that the present lead scheme is not a very effective one. The obstacles in the way of an effective lead restriction agreement are considerable, and if the producers had been able to agree on drastic action, the Producers' Association would probably have lost no time in publishing the details of the scheme. Consequently, it was not surprising that Mr Baker's statement had little effect on prices. Actually the first official London quotation for lead following his statement was the lowest since the aftermath of the September crisis. Moreover, the statement did not prevent a drop of 1.5 cents per lb. to 4.85 cents per lb. in the United States' lead price. This new pressure on prices should convince the co-operating producers that output must be drastically reduced to keep the lead market in equilibrium, and that the formation of a producers' association has comparatively little psychological influence on prices during a period of declining building activity.

INDUSTRIAL REPORTS

On the whole, business is marking time. The demand for coal was a little better in some districts, but remained disappointing in others. In the steel trade, business has been virtually suspended pending the announcement of the new price schedules. Activity in the tinplate trade has shown a decline. The quota allocated to the new strip mills of Messrs Richard Thomas is discussed on page 559. A feature has been a contract for 11 merchant vessels of 900 to 1,800 tons each obtained by Messrs Swan, Hunter and Wigham-Richardson from the Turkish Ministry of National Economy. This order was placed under the Anglo-Turkish Pact signed last May, when Britain granted credit facilities up to £16 millions to Turkey. It is understood, however, that Turkey has also placed substantial orders for vessels in Germany. Business in cotton goods was again disappointing; the wool textile trade is now operating at about 75 per cent. of its capacity.

Coal

Sheffield.—With increased quotas permitting almost full-time working at many pits for the rest of the year, the position is more favourable. Inland demand is better, especially in gas coal and other qualities for public utility undertakings. Small coal is plentiful. The call for house coal is below normal for the time of year, though improving. Industrial steams are moving steadily. Blast-furnace coke is disappointing, but demand for central heating qualities shows a welcome improvement.

Export inquiry shows more life. Best hards and washed trebles are in better request, but there is little inquiry for forward shipment. It is hoped that contracts may be secured with French importers for South Yorkshire coal. Scandinavia is also in the market for supplies. Prices for both inland and export are generally unchanged.

Newcastle-on-Tyne.—With the exception of steam smalls, the North-East coal market is steady for prompt shipment, most classes of steam and coking coals being well stemmed until the end of the year. Inquiry for Durham coking coal for delivery ahead was better and sales have been made to consumers both in Scandinavia and the Continent. There are steady shipments of patent oven coke to Scandinavia, but there is little additional trade in the home section and most works are carrying large stocks.

*

Glasgow.—Quiet conditions rule in the Scottish coal market. Industrial business, though moving steadily, is much less than at this time last year. Coastwise trade is fairly satisfactory on the whole, but the London market is still causing some disappointment. Shipments during the week were better at 235,000 tons, thus bringing the year's figure to date to 9,913,000 tons, compared with 11,391,000 tons in the same period last year. Output in October was 2,554,893 tons, compared with 2,638,860 tons in October, 1937. Total proceeds, however, increased from £1,935,959 to £1,987,552, the profit balance coming out at £269,634, against £260,298. Prices generally remain around previous levels.

*

Cardiff.—Negotiations for contracts in 1939 are still impeded by uncertainty as to the effect on prices of the discussions on the question of an international agreement, and of the Government's pledge to support the industry against foreign subsidised competition. But some business has been arranged for deliveries in the New Year, including contracts placed by the Egyptian State Railways and the Monte Video Electricity Works. Current shipments continue below the average for the year, and in the week ended December 4th exports in the foreign and coastwise trades totalled only 323,700 tons, com-

pared with 410,145 tons in the corresponding period last year. The decrease for the year to that date amounts to nearly 1.4 million tons. Prices are nominally unchanged. Best large steam coals, as well as sized grades, are in steady demand, but there is no improvement in the market for ordinary smalls, and coking classes are very weak.

Iron and Steel

London.—To a great extent business in iron and steel products is suspended pending the announcement of the new prices, which it is expected will be made shortly, says the official report of the London Iron and Steel Exchange. Trading has been principally confined to small prompt parcels sufficient to carry consumers over until the end of the year.

Business in pig iron in particular has declined, although it is anticipated that there will be an expansion in the demand when the new prices are known. Trading in foundry iron also is restricted as a result of the poor requirements of the light castings industry; but the engineering trades, especially those engaged in armament work, are taking good quantities of high quality irons.

Business in semi-finished steel has broadened, although in this department, too, it is restricted to small supplementary tonnages. The gradual clearing of stocks has strengthened the position, and a considerable volume of new business is expected to come on the market when the new prices are declared.

The position in the finished steel section of the market is not altogether satisfactory and many of the works are short of orders. There is a tendency, however, to increase output and optimism is expressed with regard to conditions in the New Year. Export business is quiet and overseas buyers are limiting their purchases to small quantities.

Sheffield.—The iron, steel and scrap markets are all awaiting official announcements concerning next year's prices. The investigations have been concluded, and there are many rumours concerning the outcome. There is a fairly general impression that any reductions will be insignificant, and that the period of stabilisation will not be longer than six months, if so long. Business this week has been confined to small lots of material to cover immediate requirements.

The output of pig iron in this area is further restricted by the temporary damping down of a blast-furnace at Renishaw.

*

Middlesbrough.—Only business of a hand-to-mouth nature is being transacted. Consumers are limiting their purchases of pig iron to the very minimum, and for this month's delivery. When the new price schedules are issued considerable improvement in trade is expected, and also an increase in steel output, which has been well maintained during November. Steel plants are not working to capacity and are in a position to deal with further orders, but the recent ship-building orders which have been booked on the Tyne will provide a steady outlet.

The production of foundry pig iron is likely to be accelerated early in the New Year. The output of East Coast hematite is ample to satisfy the present requirements, and the production of basic iron is consumed by local works.

Foreign and coastwise shipments of all classes of pig iron, manufactured iron and manufactured steel from the Tees during November amounted to 34,941 tons, an increase of 2,000 tons over the previous month.

It is understood that the price of heavy steel scrap will be reduced by 8s. 6d. per ton for the first six months of 1939.

*

Cardiff.—There has been no improvement during the past week in the conditions of the tinplate industry, while both home and export markets for galvanised sheets are also very quiet. Prices are nominally unchanged, but a reduction is anticipated in the course of the next few weeks, and it is hoped that business will revive at a lower price level. Other re-rolling branches of the industry are a little more active, and the outputs of pig iron and steel are better than they were in August and September.

Textiles

Cotton (Manchester).—The position of spinners and manufacturers has tended to become worse. Traders were disturbed by the sharp decline in raw cotton prices at the end of last week, but since then there has been some recovery in prices. The New York and Liverpool markets have been affected by European political news and the increasing supplies of material in the United States with a poor offtake. The American Government is becoming disturbed by the fall in exports and by the fact that over 10 million bales have now gone into the loan; it is feared that the Washington officials may decide to cut some of their losses and sell cotton at less than the cost of production.

In the yarn market the event of interest has been the decision to reduce the margin under the American coarse

counts agreement by $\frac{1}{4}$ d. to $\frac{1}{4}$ d. per lb., but the agreement has been renewed for a further six months. Buyers, however, fear a further reduction and sales of all kinds of American yarns have been small. Irregular operations have occurred in Egyptian spinnings, but some big weights have been booked in Sea Island qualities for Government cloth contracts.

Numerous small sales of piece goods have been arranged, but the turnover remains disappointing and more cases have been reported of looms being stopped for want of work. Only isolated sales have been arranged for India. Some makers of tanjibs have booked a few more orders for Egypt, and irregular buying has occurred for South America. Dyed goods have moved off a little more freely for Scandinavia. Home trade reports continue fairly encouraging and some retailers are meeting with better clearances.

*

Wool (Bradford).—The final results of the last series of wool sales of the year must be regarded as creditable. Ordinary topmaking wools lost ground by 5 per cent. on opening rates, but prices of good qualities were maintained, and the year is finishing with prices fully in front of what can be made for the combed and spun article in Yorkshire. Wool has continued to sell better than corresponding prices for tops and yarn, and that is the outstanding strength of to-day's position. Both the home and Continental trades have been active competitors.

Last Tuesday the National Council of Wool Selling Brokers of Australia reduced their estimate of the current clip by 50,000 bales, to 2,920,000 bales.

In manufacturing centres, machinery is being run at about 75 per cent. of capacity. There is still ample room for improvement, particularly at the combining end of the trade, and prices for all qualities of tops, particularly merinos, during the past fortnight have given way slightly.

THE COMMODITY MARKETS

In the United States the general trend of the prices of sensitive commodities continued downwards; Moody's index for Wednesday was 140.0 (December 31, 1931 = 100), against 141.2 a week earlier. In this country, on the other hand, prices generally showed little change. On the whole, turnover this week was not large, and consumers were not anxious to cover their requirements for longer periods ahead.

The feature of the metal markets was the decision of the co-operating copper producers to reduce their output to 105 per cent. of the agreed basic tonnages from December 15th and to 100 per cent. from January 1, 1939. This news caused a rally in prices, though Wednesday's quotation remained below that of a week ago. While the market in tin remained firm, lead and spelter were marked down in price. There was a sharp drop in the price of American cotton, but rubber was slightly firmer. Raw sugar and wheat are scarcely changed in price, the market in wheat being sustained, to some extent, by the hope that an international export agreement might soon come to its rescue.

Metals

Copper.—The price of standard cash copper closed on Wednesday at £43 7s. 6d. per ton, a net loss of 6s. 3d. on the week, but a gain of £1 6s. 3d. from the lowest level recorded during the week. The improvement was due to the decision of the copper producers to advance from January 1st to December 15th the beginning of output restriction. It was also announced that the initial quota will be reduced from 110 per cent. of the basic outputs to 105 per cent. and that a further reduction to 100 per cent. will be enforced from January 1st. This prompt action again proves that the co-operating producers are aiming to stabilise the price around £45 per ton; as they control about two-thirds of the present output and a substantial part of the remainder is produced at fairly high costs, they will probably achieve their aim, though short term fluctuations are inevitable.

*

Tin.—The price of tin fell to a minimum of £212 15s. per ton, but recovered later to close on Wednesday at £215 per ton, a net loss on the week of only 5s. Demand contracted during the last few days, owing to the approach of the end of the year. As most of the consumers, however, are not very well stocked, a revival in buying is likely early next year. The tin price prospects continue to be exceedingly favourable and a further rise to about £230 per ton appears almost certain within the next three months unless the world's industrial activity should seriously decline.

*

Lead and Spelter.—Lead lost this week 16s. 3d. to close at £15 2s. 6d. per ton, while spelter declined by 5s. to close at £13 13s. 9d. per ton. The demand for the two metals is at present restricted owing to seasonal causes, while supplies continue to be quite substantial. The speech of Mr Baker at the annual meeting of the Mexican Corporation is discussed on page 562.

Grains

The undertone of the wheat market has been steady during the last week, with prices firmly held. The news that the Federal Surplus Commodities Corporation has arranged with British millers to sell some 20 million bushels of wheat in this country before July, 1939, had little effect on the market, either in Liverpool or Chicago. The decline in the remaining supplies of Argentine maize continues to support the maize market; in the past week, prices have risen by about 1s. per quarter. Reports of the coming Argentine barley crop are not favourable, and with the end of the Canadian shipping season, the market is mainly supplied from Poland; consequently, prices of feeding barley remain firm with an upward tendency.

Other Foods

Provisions.—The bacon market continued very active during the past week and prices show an increase of 6s. to 7s. per cwt. compared with those ruling a week ago. The demand for butter has been firm and prices have

(Continued on page 572.)

COMPANY MEETINGS

BARCLAYS BANK (DOMINION, COLONIAL AND OVERSEAS)

FURTHER GROWTH OF BUSINESS

SIR JOHN CAULCUTT'S SURVEY OF OVERSEAS CONDITIONS

The thirteenth ordinary general meeting of Barclays Bank (Dominion, Colonial and Overseas) was held, on the 8th instant, at Southern House, Cannon Street, London.

Sir John Caulcutt, K.C.M.G., the chairman of the bank, presided, and having first referred in detail to the changes in the directorate and personnel of the bank during the year under review, said:—

Turning to the balance sheet, current, deposit and other accounts amount to £99 millions, a figure more than £3 millions larger than a year ago. Cash in hand and with bankers stands at £26,579,000, an increase of £3,821,000 on the previous year, and represents a ratio to current, deposit and other accounts and note circulation of over 26 per cent. Investments, at £32,652,000, are greater by £4,318,000. The policy of keeping a very large portion of these in short-dated Government investments has been maintained. Advances, at £33,175,000, are approximately £2½ millions lower than a year ago. The net profit for the period under review is £439,244, which is a slight increase—of about £8,000—on the previous year. A sum of £100,000 has been carried to contingency account, and a further sum of £75,000 to the reserve fund, compared with £100,000 last year; the total of that fund now stands at £2,100,000. The board now recommends the payment of final dividends at the rate of 8 per cent. per annum on the cumulative preference shares, and at the rate of 7 per cent. per annum on the "A" and "B" shares, less income tax in each case at the rate of 4s. 8d. in the £. The dividend for the year on the "A" and "B" shares is at the rate of 6½ per cent.

BUSINESS ACTIVITY IN SOUTH AFRICA

Turning to South Africa, business conditions during the twelve months under review have generally been maintained at a reasonably satisfactory level.

Unsettled conditions in the principal overseas markets for Union products have, however, resulted in some reduction in demand, coupled with a decline in the average price for several staple agricultural commodities. Despite these adverse external factors, reports, nevertheless, indicate that the agricultural industry has progressed and that action aimed at protecting and strengthening the country's farming resources has had satisfactory results.

The maintenance of the gold price has enabled the gold mining industry to continue to expand at a satisfactory rate, and the production of gold during the year 1937 constituted a fresh record for the industry in the Union. On the basis of valuation of average price realised the total output for 1937 was valued at approximately £82½ millions as compared with £79½ millions in the previous year. The significance of these figures is enhanced by the fact that they have been achieved on lower pay limits. The Minister of Finance stated in his budget speech in August last that receipts credited to the revenue account from gold mining for the financial year 1937-38 totalled nearly £10 millions, and, whilst warning the country of the need for care in undertaking fresh commitments in State expenditure, he emphasised that there was no indication that the recession was likely to assume large proportions.

In South-West Africa a slight decline has occurred in imports, but exports were well maintained, chiefly owing to increased shipments of mineral products and karakul pelts.

RHODESIA AND OTHER TERRITORIES

In Southern Rhodesia, as a result of continued prosperity in the mining industry, together with satisfactory prices which have been obtained for certain agricultural products, general trading conditions have been good throughout the year, while in Northern Rhodesia the prosperity enjoyed by the great base metal mining industry was reflected in general trading conditions.

In Nyasaland, general trade has been well maintained, while prospects for the coming year are considered satisfactory, provided that the prices of the staple products—tobacco, tea and cotton—are reasonably remunerative.

In East Africa the past year has been a disappointing one, owing to the decline in the selling price of certain of the chief products of those territories, namely, cotton, sisal and coffee.

The effect of the lower prices received by native cotton growers in Uganda has, fortunately, been partly offset by a record crop in that territory. Coffee prices, which have ruled on low levels throughout the greater part of the year, have recently shown some improvement, but the price of sisal, unfortunately, remains at a low figure.

Trade in Egypt and the Sudan has been fair. Last year, in common with almost all cotton producing countries, Egypt was favoured with an exceptionally large crop, which, however, was disposed of without an excessive carry-over. The official estimate for the current crop is between 25 and 30 per cent. smaller than that of last year at slightly under 8,000,000 cantars.

An arrangement has recently been arrived at under which Lancashire's portion of textile exports to Egypt should be substantially increased.

The 1938 Sudan cotton crop again amounted to about 1½ million cantars, and cotton auctions were held in Port Sudan. In spite of abnormal rains, the crops for the coming season are reported to be satisfactory.

In Palestine, owing to the continued disturbances, the country has suffered a severe economic setback. Cereal crops, on the whole, have been poor, and there has been the added difficulty of marketing arrangements. The citrus crop, however, was satisfactory, and exports increased.

In Cyprus, trade has been well maintained, crops have been good and exports have increased.

Throughout the British West Indies and British Guiana, trade has, on the whole, been fairly well maintained. The total sugar crops of Barbados, Trinidad, Jamaica and British Guiana—the four largest producers—amounted to 568,000 tons, showing a small reduction over the previous year, while prices also ruled at a slightly lower level.

Trinidad maintains its position as the largest mineral oil producer of the Empire, and the output has been further increased. Production for the current year is still making satisfactory progress.

In British West Africa, owing to lower prices for the principal products, there was a large carry-over from last season of imported goods.

This situation on the Gold Coast reached such a point that trade was almost at a standstill, and the Government Commission, whose report has recently been published, was sent to examine the situation on the spot. Fortunately for this Colony, however, the production of gold and manganese ore continued to show satisfactory increases.

In Nigeria the decline in both the volume and value of the principal products has been reflected in the figures for Customs revenue and railway earnings for the current year.

I am pleased to tell the shareholders that Barclays Bank (Canada), in which this bank has an interest, continues to make good progress.

NEED FOR CO-OPERATION IN MARKETING

Perhaps, therefore, in concluding such a brief survey as this, it is not inappropriate for me to say a few words on the subject of overseas trade.

The importance of Empire trade has been enhanced during a period when the exchange of goods with many parts of the world has been hampered by impediments of one form or another, but the value of trade with foreign countries cannot be ignored.

In recent times much attention has been directed to this aspect of the question, especially owing to the new difficulties which exporters have to overcome in selling their goods in certain parts of the world. I think it would be of assistance of some greater degree of co-operation in the field of marketing for export could be arranged.

So far as the United Kingdom in particular is concerned, there would also appear to be a greater need than ever to-day of developing our export business by co-operation in certain trades not only in marketing, but also in representation abroad. By this means the requirements of some markets could be ascertained more precisely, and steps taken to meet them.

The report and accounts were unanimously adopted.

TUBE INVESTMENTS LIMITED

INCREASED TURNOVER AND PROFIT
MR ARTHUR CHAMBERLAIN'S REVIEW

The nineteenth annual general meeting of Tube Investments, Limited, was held on Wednesday at Birmingham, Mr Arthur Chamberlain (chairman) presiding.

In moving the adoption of the report and balance sheet, the Chairman said the unexpected had happened, and the company's turnover and profit were both greater than they were in 1937. In the last five years the turnover had increased by 79.3 per cent. Out of this year's profits they had had to set aside no less than £194,000 more than they did last year for taxation. Although in 1936 they foresaw the probability of having to spend largely on capital account, and issued 600,000 odd shares, providing £910,000 towards the money so required, they had, nevertheless, been disturbed by the magnitude of their actual expenditure, which during 1936, 1937, 1938 and 1939 will have amounted to something over £2,005,000. They were committed to pay dividends on this new capital, and if it did not earn any profits they would, out of the old profits, have to find not only the extra dividend, but the extra depreciation. The directors thought that this money, although at first largely employable for defence purposes, would ultimately be occupied with peace-time activities. But these were not ordinary times, and until the defence boom had run its course, and they could see how the world's trade had withstood the shock, they did not feel inclined to take any chances, and distribute a larger dividend and live to regret it two or three years hence.

THE INVESTMENTS

Referring to the depreciation of investments, the Chairman said the fluctuation in investment values would repeat itself. The company's investments were bought with reserves of temporarily unneeded cash, and the directors chose for the most part sound industrial equities, on the assumption that English trade would continue to flourish, and if their funds were wisely invested therein they would flourish automatically with English trade. They were not attempting to make money by buying or selling, nor were they trained to undertake that sort of work. They had set aside out of the subsidiaries' profits £50,000 as an additional and precautionary reserve against general investments.

COMPANY'S LIAISON WITH STEWARTS AND LLOYDS

Reference was made in the report to the company's liaison with Stewarts and Lloyds. Instead of consolidating their businesses they separated them, but retained the equivalent of their former direct interest by the indirect interest of the issue of liaison shares, the one to the other. They worked on the principle that the further they were apart the more they were together, and it had worked perfectly—so perfectly that this year they had made a further great advance in this direction and transferred to single ownership a number of businesses or trades in which up to now the two concerns had been jointly interested. He was certain this arrangement would again confer material benefit on both companies. There was now little left in manufacture in which their individual interests could clash or coincide. He considered that Tube Investments and the Stewarts and Lloyds liaison to be one of the outstanding successes. The net result of this year's liaison negotiations was that they handed over more than they received, and as they considered the tube business to be as sound an investment for the company's capital as any other they were likely to find, they acquired a further £203,278 deferred stock in Stewarts and Lloyds on a basis equivalent to 35s. per £1 of stock.

SATISFACTORY RESULTS

If the shareholders studied the report and balance sheet, and the statement of combined assets and liabilities, they would have no cause to be dissatisfied with 1938. After making sundry reserves and write-offs not specifically mentioned, but among which was the £50,000 reserve against investments he had mentioned, the directors had added £250,000 to their obsolescence reserve, written £180,000 off their assets in connection with liaison arrangements, paid the same dividend as last year, and increased their surplus of assets over liabilities by £114,000. Whether the profits were down or up next year the directors would find them sufficient to recommend a dividend of just twenty-three and three-quarters per cent.

IRON AND STEEL TRADE

Last year he ventured to give some advice to the Iron and Steel Trades. It seemed to be so wrong, not only in the country's interests but in their own interests, that steel prices should not be

immediately reduced that he expressed the opinion that it would be impossible to stabilise prices, as was announced, for another twelve months. Well, they had stuck to their prices and English trade was the worse for it. To-day, it was rumoured that a hot discussion was going on among the steel makers as to what reduction should now be made, and that 15s. was spoken of as the probable figure. If rumour was correct he should designate such a reduction as about one-half of what it ought to be on their present costs, and about one-quarter of what it ought to be had they spent their money wisely and laid themselves out to make steel as cheaply as it could be produced under English conditions. He was not complaining directly on behalf of Tube Investments. Those who thought that forgot their liaison with Stewarts and Lloyds, who owned the most efficient steelworks for tube manufacture in Great Britain, if not in the world. It was not to make more profit on their present turnover that he asked for a sensible reduction in steel prices; it was because the prosperity of England depends on cheap coal, iron and steel. By cheap he meant cheap in comparison with other countries. The benefit of lower steel prices to Tube Investments would consist in the greater number of tubes they would be able to supply, and the benefit to the steel trade would likewise consist in greater demand.

The seriousness of to-day's position was that foreign competitors were obtaining their steel more cheaply than we, and were building up their general trade at our expense. "Was it for this," Mr Chamberlain continued, "that the steel trade five years ago were granted Protection? I thought that Protection was given them on the explicit promise that they would not exploit the home market but would put their ruined house in order and install plants capable of making steel as cheaply as any of their foreign competitors. Has this been done? Large sums of money, of course, have been spent, some of it very wisely spent, as we here have the best of reasons for knowing; but do you think the steel trade as a whole has put itself in a position to compete with the world? If the price of their steel is any criterion the answer must undoubtedly be 'No.' There have been some ghastly miscalculations, and I think lack of long vision in connection with steel capital expenditure. One hears also of appalling lack of judgment, involving millions of money, in the purchase of steel scrap. Do these sort of things inspire you with confidence in the steel trade? In the old days the steel trade's mistakes hurt themselves only. We could buy from the foreigner if they could not produce the goods, but now that Protection forces us to buy our steel at home the steel people can and apparently do foist the cost of their follies on the rest of the country. Was it for this that Protection was afforded them?"

Adverting to coal, Mr Chamberlain said that here again Government-planned reorganisation had not produced cheap coal for the consumer. Was it possible, he asked, if the efficient collieries were allowed to sell all they could produce at prices satisfactory to them we should be getting cheaper coal, they would be getting more export trade, and England would be mining more coal?

TRIBUTE TO PRIME MINISTER

He had frequently told them, he continued, that all efforts to build up a sound industrial unit hung on the issue of peace or war. He thought therefore it would be lacking in common decency and gratitude if they did not take this, the first, opportunity of saying how greatly they appreciated the wonderful and successful work of the Prime Minister, the Foreign Minister, and the whole Government in preserving the inestimable blessing of peace for us and for mankind this autumn. (Hear, hear.) He did not always see eye to eye with his cousin, and his method of attempting to make world war impossible was not apparently one that appealed to the Prime Minister as the most practicable or likely to win success. (Hear, hear.) But on the handling of the crisis he made no reservations, and was devoutly thankful the Prime Minister was in charge, and deeply grateful for all he said and did. He believed the outcome would be an important step on the road towards making war a more and more unlikely method of settling European differences. He was not in the Prime Minister's confidence, but he did know something of the family characteristics, and had, therefore, a pretty strong conviction that the Prime Minister knew and kept always before him a whole lot of things that he hoped to see achieved during his term of office and had also clearly before him the steps that must be taken if his programme was to be realised.

The report was adopted.

OROVILLE DREDGING COMPANY, LIMITED

DIVIDEND OF 3½ PER CENT.

MR F. W. BAKER'S REVIEW

The twenty-seventh ordinary general meeting of the Oroville Dredging Company, Limited, was held, on the 6th instant, in London.

Mr Fredk. W. Baker (the chairman of the company), who presided, said that the profit and loss account showed that dividends were received amounting to £69,107; other credits increased this amount to £75,373. After deducting all charges, the balance to the credit of profit and loss account was £62,568. Adding £136,253, the credit balance of the previous year, and deducting the final dividend paid in December in respect of the year 1937, and the interim dividend paid in April, 1938, amounting in total to the net sum of £51,562, a balance of £147,049 was carried forward as at September 30, 1938, out of which the directors recommended a final dividend of 9d., less tax, representing a distribution of 3½ per cent. for the year to September 30, 1938.

Referring to Pato Mines (Colombia), Limited, he said that the profit and loss account of that company for the year to September 30, 1938, showed a debit of £1,910, due to the fact that the company had received no dividend during the period from its holding in Pato Consolidated Gold Dredging, Limited, as the latter company had utilised its profits towards financing the capital expenditure necessary to carry out its equipment programme.

CONSTRUCTION PROGRAMME COMPLETED

With regard to Pato Consolidated Gold Dredging, Limited, for the financial year to April 30, 1938, Dredges Nos. 1 and 2 operated throughout the whole period. He was pleased to report that with the commissioning of the fifth dredge the company's construction programme had been completed and that no further extension to the fleet of dredges would be considered for the present. With three large and two small dredges operating, it was expected that approximately 16,000,000 cubic yards of gravel would be dredged annually and, in addition, the hydraulic units now in operation should handle over 1,000,000 cubic yards per annum.

By taking the estimated yardage reported at last year's meeting—viz. 600,000,000 cubic yards of dredgeable gravel, with a recoverable value of between 14c. and 15c. per cubic yard, and 37,000,000 cubic yards of gravel suitable for hydraulic of a recoverable value of 25c. per cubic yard, a life of approximately 37 years was indicated, both for dredging and hydraulic with the present equipment.

Mr Banks, the managing director of Pato Consolidated Gold Dredging, Limited, at the general meeting of that company held in Vancouver on November 9th, stated that for the first six months of the current year, to November 1st, 6,825,000 cubic yards were handled for a recovery of \$894,320, equivalent to 13.10 cents per yard. The values should gradually increase throughout the next 12 months in keeping with the drilling ahead.

The results, to date, indicated that expectations, both as regards recoveries and costs, would be realised, and that it was expected that the company would be in a position to declare a dividend about the middle of 1939.

The Pato Consolidated Gold Dredging, Limited, had during the year further extended its holdings in Colombia by the purchase of several additional alluvial claims in the vicinity of its main holdings.

He was satisfied that, with the completion of their equipment programme, their patience would, within a reasonable time, secure an adequate reward, through receipt by them of substantial returns from their Pato Consolidated interests.

OTHER INTERESTS

The company's holding in Asnazu Gold Dredging, Limited, remained unaltered, being 41 per cent. of the issued capital of the company. Dividends amounting to 20 per cent. per share were paid during the year to April 30, 1938, and a further dividend of 10 per cent. had been paid on account of the current year.

The company's holding in Bulolo Gold Dredging, Limited, remained at 73,843 shares. They had received two interim dividends amounting to \$3 per share, equal to 60 per cent. at par, and on November 9th a further dividend for the current financial year of \$1.50 (Canadian) per share was declared.

The chairman also referred to the company's interests in Talbot Alluvials, Limited, Homebush Gold Mining Company, Limited, Dutch New Guinea Mining Company, and Golden Queen Mining Company.

The report was unanimously adopted.

STRAND HOTEL, LIMITED

STEADY DIVIDEND RECORD

The thirty-first ordinary general meeting of the Strand Hotel, Limited, was held, on the 2nd instant, at the Trocadero Restaurant, London.

Major M. Gluckstein (the chairman) said that the company's trade over a course of years had kept at a fairly constant level, and they could show a steady dividend record.

At the Regent and Strand Palace Hotels, during the period now under review, they almost maintained the level of the previous years apartments business; but the restaurant side of the business was to some extent lower than in the two preceding years, when internal trade was on the increase and received additional stimulus from outstanding national events. The Royal Palace Hotel, being of a type where business was more subject to fluctuation, showed a diminution in turnover.

The ratio of costs and expenses to turnover, to which he had called attention at their last meeting, was again higher this year. In addition, he would remind them that the whole of the current year's accounts were subject to the National Defence Contribution, compared with a liability in respect of only six months of the previous year.

Against the foregoing factors, however, the amount the board considered it necessary to reserve for contingencies, before arriving at the available trading balance, was less than last year. Accordingly, it had been possible to show the final balance at £123,000, a figure similar to that of the two preceding years.

They proposed a final payment of 10½ per cent. on the participating preferred ordinary shares, which will again make a distribution of 14 per cent. for the year. The profit and loss account balance to be carried forward to next year will be £23,795.

The directors had conceived it their duty to make some provision against the more general consequences of air attack. It was obvious that their hotels, situated in the heart of London, would be particularly vulnerable from the air. They all hoped that the proposed measures might prove needless, but in the meantime the expenditure thereon would be a costly form of insurance.

The report was unanimously adopted.

CHARTERHOUSE INVESTMENT TRUST, LIMITED

SEGREGATION OF FINANCE ACTIVITIES

The thirteenth annual general meeting of the Charterhouse Investment Trust, Limited, was held, on the 2nd instant, at Southern House, London.

Sir Arthur H. Marshall, K.B.E. (the chairman), said that the gross profit and the net profit had contracted by £86,000 and £74,500 respectively. Before providing for reserves, the earnings on the ordinary stock were equivalent to almost exactly 4½ per cent. Owing, however, to the necessity of keeping their income-tax reserve up to the increased rate, and to the obligation to place 10 per cent. of their earnings to the special reserve, they had felt that it would not be sound to recommend a higher dividend than 3 per cent., which itself had the effect of lowering the carry-forward by £6,000. However, after providing for all liabilities, including depreciation of investments, and after allowing that their preference stock was repayable in a winding-up at 22s. for each unit of £1, there remained assets equivalent to a little over 27s. for each ordinary stock unit of £1.

They had built up substantial reserves which had enabled them to deal with the depreciation in the market value of their securities, but for which it would not have been possible to pay a dividend on either preference or ordinary capital. That was because they were at present constituted as a finance company.

An investment trust company was not faced with that difficulty, and in order to deal with the dual activities of their company each in the best way, the directors had come to the conclusion that their structure could be improved and the security for capital and income strengthened by segregating the new issue and finance activities which had hitherto been carried on by the trust into a separate but wholly owned subsidiary company.

After this change their assets would be comparable with those of the normal investment trusts except for three special investments, the whole of the shares of the new finance company, the controlling interest in the Charterhouse Industrial Development Company, and their large holding which at present constituted control of the Monument Property Trust.

The report was unanimously adopted.

BRITISH TYRE AND RUBBER COMPANY, LIMITED

FURTHER EXPANSION OF INTERESTS

The annual general meeting of the British Tyre and Rubber Company, Limited, was held, on the 8th instant, in London.

Sir Walrond Sinclair, K.B.E. (the chairman and managing director), who presided, said that trading conditions during the year had been much less favourable than those in 1937, and it was therefore with particular satisfaction that the directors presented a report clearly indicating further steady progress. As foreshadowed last year, the directors had extended the interests of the company by acquiring interests in the Spalding Companies, and in a newly-erected rubber factory in South Africa. Financing those acquisitions had naturally meant a reduction in surplus liquid assets, which, however, were still ample for present needs with the necessary margin for all possible contingencies. There was a total available for appropriation of £216,246, and the directors now recommended a final dividend of 4½ per cent. with a cash bonus of 2 per cent., bringing the total distribution to 10 per cent. They were again maintaining a conservative policy of reserve allocations.

This was now the seventh consecutive year in which there had been a progressive increase in the company's profits during which the period industry as a whole had seen wide fluctuations. That the company in such a period had been able steadily to increase its earnings year by year was, he thought, a tribute to the stability of the business, the consistent quality of its products, the efficiency of its service organisations and the soundness of its financial policy. The company had Stability was the word he wanted to emphasise. The company had made no excessive profits in good times, and had suffered no exceptional setbacks in bad times—the ideal, he submitted, at which every industrial company should aim.

As to the future, they appeared to be starting the new financial year under more favourable conditions, while the quality of the company's products continued to be as greatly appreciated as ever, and they now had the additional assets of the valuable goodwill in the name of Spalding.

The report and accounts were unanimously adopted.

ELSWICK-HOPPER CYCLE AND MOTOR COMPANY, LIMITED

FACTORS AFFECTING RESULTS

The meeting of the Elswick-Hopper Cycle and Motor Company, Limited, was held, on the 8th instant, at Barton-on-Humber.

Mr Fred. Hopper (chairman of the company), who presided, said that no one was more disappointed than himself and his colleagues that they had been unable, despite hard work and effort, to repeat results of the past few years. Trade conditions had been abnormal, and it was the more disappointing as the company started the year with an increased turnover of about 37½ per cent. for the first three months. That experience was not theirs alone; one of their largest competitors, according to their report, had had the same experience.

As to the reason for the very poor year through which they had passed, he was of the opinion that the rise in the cost of raw materials, due to the steel position, which had resulted in the advancing of bicycle prices, had had a marked effect because buyers, anticipating increases, bought heavily prior to the advances becoming operative, and that, coupled with the fact that sales fell off towards the end of 1937, had resulted in heavy stocks, which had had to be reduced before purchasers could order new supplies.

Most overseas markets had been exceptionally dull, while the international position in Europe and elsewhere had not tended to improve the state of affairs, and the low commodity prices which had prevailed in overseas markets reduced the purchasing power of the natives, so that they could not fulfil their desire to purchase anything of a luxury nature, which was what a bicycle was to them. The Malayan market had suffered a severe slump towards the end of last year and was only now showing signs of a slight revival. As to the current trading position, the November figures showed an increased turnover over the previous month of nearly £5,000, showing that things were moving in the right direction, though he did not wish shareholders to believe that the company was again in its normal stride. At the same time, he did not wish them to get alarmed, as every trade must have its setbacks. It had been suggested that they might have taken up armament work of some sort, but he believed that their factory would be fully occupied in the future with their own business.

The report and accounts were unanimously adopted.

GOLD COAST SELECTION TRUST, LIMITED

CONSIDERABLE DIVIDEND POSSIBILITIES

The ninth ordinary general meeting of the Gold Coast Selection Trust, Limited, was held, on the 8th instant, in London.

Mr H. G. Latilla (the chairman) said that in January they had paid a 10 per cent. dividend, free of tax, and there was a balance of £103,873 carried forward. The directors had now declared an interim dividend of 15 per cent., free of tax, for the current year. In view of the fact that the Marlu company's second dividend was declared after the close of the Gold Coast Selection Trust's financial year, it was not possible to pay a further dividend for the year under review, but he thought shareholders could look forward with confidence to the payment of a further dividend for the current year.

The companies which they were sponsoring, namely, Amalgamated Banket Areas, Ariston, Bremang and Gold Coast Main Reef, were, he thought he could safely say, on the eve of illustrious careers. Marlu, of course, had already made good. He could foresee, taking very conservative estimates of the dividend possibilities of those companies, that the Trust would be in a position to make very satisfactory dividend distributions for years to come. Recently they had taken a financial interest in the Nanwa Gold Mines and he understood that the reports coming forward were highly encouraging.

The drilling of their Offin River alluvial areas had been very successful and, so soon as they had had an opportunity of seeing the results of the performance of the dredges on the Bremang company's areas, they would formulate a scheme for the installation of dredges on the Offin areas. That should prove a highly remunerative proposition.

Their prospecting had been largely confined to the main line of strike between Prestea and Konongo, passing through Marlu and Ashanti Goldfields Corporation. They were considering joining in a scheme for the development of some three miles of ground directly on the strike of the ore bodies now being worked by the Marlu and Ariston companies.

Mr J. A. Agnew said that on the company's property and on those held under option on the Offin River, an enormous yardage of gravel had already been proved, and while it would require some few months' further work to complete the exploration of those areas, it now appeared certain that a new company would be formed in due course to take over the whole of them. As to the properties in which the company owned a large shareholding, in the main those were progressing most satisfactorily.

Amalgamated Banket Areas, by reason of the very large tonnage of ore indicated as being made available ultimately, could call for a reduction plant of a capacity considerably in excess of any on the Gold Coast. The average grade of ore to be won would not be very high, but the cost should be correspondingly low. The work at Ariston was rapidly approaching the stage at which an output of more than 20,000 tons per month could be safely looked for, while the developments at the bottom of the mine continued to be of an excellent character.

Bremang Gold Dredging might be said to be still in the stage of getting over early mechanical difficulties unimportant in themselves and susceptible to immediate remedial treatment. Two dredges were now in operation. The recent developments on Gold Coast Main Reef had been of a highly satisfactory nature. Their interest in Nanwa was confined to financing, with others, a programme of development. The results to date had been most promising.

The report was unanimously adopted.

GOLD COAST MAIN REEF, LIMITED

PROMISING DEVELOPMENTS

The fifth ordinary general meeting of the Gold Coast Main Reef, Limited, was held, on the 5th instant, at River Plate House, London.

Major E. Seaborn Marks, who presided, in the course of his speech said:—The last 12 months have been a period of great difficulty, both politically and financially. The company had reached a position where its development warranted the installation of a treatment plant, but conditions were such that it was not considered expedient to propose an issue to supply the necessary finance required. The Gold Coast Selection Trust, Limited, for mere interest at the rate of 4 per cent. and a right at a future date to participate in any issue that was made, on the same terms as these offered to shareholders, agreed to advance us whatever money we required, without security.

The board have decided to create £300,000 of non-interest-bearing registered notes, to be redeemed on March 31, 1943, at a premium

of 20 per cent. The subscribers to these notes will have the option of converting their notes into shares of the company on a basis of three shares for every £1 of notes held; that is, at 6s. 8d. per share. Whether or not the issue is taken by shareholders, the whole of the money will be forthcoming, as again our friends, Gold Coast Selection Trust, Limited, have agreed to subscribe for any notes not applied for by shareholders. To provide shares for the note conversion right, a resolution will later be put to the meeting to increase the nominal capital of the company by £300,000 to £900,000. This increase will leave £75,000 in reserve.

At the mining end there is nothing but good to report. We have now developed a mine capable at the present time of an output of 6,000 tons per month, and have sufficient ore to keep the proposed mill operating for over three years. The equipment of the mine is proceeding apace, and we anticipate that we shall start crushing towards the end of next year. We have already reached the seventh level in the Bondage shaft and the third level at Tuappim. Cable advices just received inform us that on the seventh level Bondage the main reef has been exposed for a length of 175 feet, both faces being still in ore. One hundred and fifty feet have been sampled and show a value of 13.3 dwts. per ton over 104 in.

The report was adopted and the proposed issue of capital was approved.

MARLU GOLD MINING AREAS, LIMITED

INCREASING OUTPUT

The fourth ordinary general meeting of the Marlu Gold Mining Areas, Limited, was held, on the 8th instant, in London.

Mr H. G. Latilla (the chairman) said that operations during the year had resulted in gold being produced to the market value of £844,840 from 549,863 tons of ore mined and treated. Mine working costs, including realisation, gold tax and development expenditure, but not amortisation, averaged 10s. per ton. Working costs for November, including gold premium tax, but excluding development expenditure, had been reduced to 7s. 8½d. per ton. The ore reserves, computed at over 5½ million tons, averaging 3.72 dwts. per ton, showed a substantial increase, although a slightly lower value, mainly attributable to the proved tonnage on the New Dainsu Concession lately acquired.

The fourth unit of treatment plant had come into operation at the end of January. Since then an average of approximately 53,000 tons of ore had been treated monthly. Further modifications and some slight additions were expected to provide a progressive increase in output, and they had reason to believe that in the near future a monthly tonnage in the neighbourhood of 75,000 tons would pass through the mill. That increased tonnage would offset the lower grade of ore to be treated but would, they believed, at least maintain the monthly profits round about the present figure of a little over £50,000.

All the ore mined to date had been by mechanical shovels, from the crush zone section. They felt quite satisfied with the year's work and had no doubt that shareholders would agree with them.

They regarded the future with optimism. As stated in the report, a first interim dividend of 15 per cent., free of tax, had been declared in respect of the current year. The warrants for that dividend would be posted on January 16th. It was not necessary to obtain sanction for that dividend; although if it were it would meet, without doubt, with entire approval.

Mr J. A. Agnew said that on the New Dainsu Concession the mine railway system had been extended to the Chujah deposits, and

from now on the ore would be drawn from that section, the quantity dealt with being gradually increased up to 15,000 tons per month. As the grade of that ore was about 3 dwts. per ton, the average mill recovery would fall to some extent, but it was expected that it would be offset by the increase in tonnage treated.

Development results in the sulphide zone had been to a certain extent disappointing. That portion of the drive on the 600-ft. level which had been expected to disclose the continuation in depth of the Marlu shoot of ore, would appear to have been driven in the vicinity of a large dyke, which might have affected adversely the deposition of gold in the ore body. A winze was now being sunk, and it was proposed to drive north under the Marlu shoot, when it was hoped that the influence of the dyke would not be apparent. The programme for the exploration of Chujah and Ablifa ore bodies below the oxidised zone was in hand, and any ground of a likely character would be examined. Arrangements were being made for the enlargement of the treatment plant; further thickeners, an additional precipitation press and extra filters would be installed. The capital cost of the whole of those would be relatively very small.

The report was unanimously adopted.

TOBACCO SECURITIES TRUST COMPANY, LIMITED

BOARD'S INVESTMENT POLICY

The eleventh annual general meeting of this company was held, on the 8th instant, in London.

The Rt. Hon. Lord Catto of Cairncatto, the chairman, said that political, economic and financial conditions had in no way improved during the year under review; indeed, they might be said to have deteriorated. He thought, therefore, they might all congratulate themselves that the results disclosed in the accounts were slightly better than those of the previous year.

"Advances to a subsidiary company and dividends receivable" was again reduced by the very considerable sum of £747,294, which was in confirmation of what he explained last year would happen as they developed their policy, now nearly completed, of confining their investments mainly to the parent company and to Tobacco Investments, Limited. They were large shareholders in the Tobacco Insurance Company, Limited, in common with the British-American Tobacco Company, Limited. The bulk of the business of Tobacco Insurance Company was insurances of the British-American Company and its subsidiaries, and complications arose as the Insurance Company grew stronger on certain questions of policy. It was eventually agreed that the best arrangement to both sides was for the British-American Tobacco Company to purchase the whole of this company's investment in the Insurance Company at its current value, which constituted a considerable capital profit to this company direct and through Tobacco Investments, Limited. So much so, indeed, that re-investment of the amount received from the sale was actually returning them income somewhat in excess of the dividends they had previously been receiving from Tobacco Insurance Company, Limited.

With regard to shellac, during the financial year under review they had entered into an agreement with Messrs Ralli Brothers, Limited, which had worked most satisfactorily to an extent which left the remaining stock of a size and value that, in the opinion of the board, need be of no further anxiety.

The report and accounts were unanimously adopted, and a final dividend on the ordinary capital of 11 per cent., less income tax, and a first and final dividend on the deferred capital of 4.5714 per cent., less income tax, were approved.

Miscellaneous Commodities

Oilseeds and Oils.—Dealings in linseed are likely to remain at a low level until the official estimate of the Argentinian

linseed crop is published. The demand for cottonseed has improved; £6 15s. per ton has been paid for Egyptian black cottonseed for December loading to Hull. The price of linseed oil is steady at levels slightly below the highest recorded last week. Trade in cottonseed oil is quiet and Egyptian crude is available at £18 per ton ex Hull for prompt shipment.

Rubber.—Dealings have been on a small scale and price fluctuations have been within ¼d. per lb.; the closing price for standard sheet at 7½d. per lb. shows no change on the week. Reports from New York indicate that buying there is proceeding steadily.

Finance

GOVERNMENT RETURNS

For the week ended December 3, 1938, total ordinary revenue was £11,318,000, against ordinary expenditure of £4,707,000. Thus, excluding sinking fund allocations, the deficit accrued since April 1st last is £234,137,000, against a deficit of £157,533,000 a year ago.
